Mr. John Brett said he had felt rather disappointed to hear Mr. Sedding take so desponding a view of circumstances, for he thought that if there was one thing remarkable in connection with the rising generation, it was the taste for craftsmanship. He scarcely knew a boy who did not long either to be an architect or an engineer, and who did not desire to know how to use tools, work wood, and chip stones. Therefore, on the whole, there was a splendid prospect for the rise of craftsmanship in England. In his own department they had seen the commencement of it, and his craft had begun to learn from the foundation. Before coming to this meeting, he asked the librarian at the Athenæum if he could see any book there on Italian domestic architecture. The librarian inquired whether he desired to know something about the internal construction of the Italian villa, to which he replied that that was what he wanted. “Then,” said the librarian, after turning over the pages of the index, “you know the word ‘architecture’ applies to the outside of a building, and not to the inside?” (laughter). This was a most interesting commentary on Mr. Sedding's contention that the paper designer was not the man that was wanted,—at all events not in connection with domestic architecture, which, he believed, would be the architecture of the future. The churches were likely to last a long time, and very beautiful they were; but the wealth of this country was great and increasing, and what he would like to say to the Conference was that the manner in which the wealthier classes were housed did not do them credit. “The stately homes of England” had been celebrated by poets; but if he were asked what was their style, he would reply that it was the rabbit-hutch style. To make a rabbit-hutch it was merely necessary to get some tea-chests, and to nail in the fronts, so that the rabbit might be able to look out, and that the attendant might pass his food through. The tea-chests were then stacked in the smallest possible compass, and then they arrived at the external arrangement of the houses of the wealthier classes in Britain (laughter). The business of the architect was to provide an outside to the tea-chest; he was required to produce a kind of tank in stone or brick, or some other material, such as marble, which should enshrine them beautifully. Now this arrangement provided certain peculiarities of structure; one was that there was nothing to see within; another, that there was no light to see by; another, that it stank horribly; and again, that disease and toil prevailed within. The master was a mere minor figure, and the chief question in the production of the house was to afford accommodation for a herd of menials kept at a large expense to poke the owner's face through the grating (laughter). Now these things ought not to be, and he had two suggestions to offer. The first was that, as the climate of this country was rather a depressing one, and as there was not much to be seen on the outside, it was of importance in domestic architecture that the properties of the owner should be well seen. His second suggestion was that the occupants should be able to breathe well, viz., that the lighting and ventilation of a domestic structure were the principal considerations for the owner. The time would come when the sculptor would be the architect's right-hand man; but at present that was not the case, and there seemed to be no immediate prospect of it. When men were found willing to give 9,500 guineas for one picture, it showed that, in spite of the hardness of the times,

there was still sufficient incentive to spend large sums upon art. In domestic architecture there was one common defect, which militated against pictures being properly seen, and that was cross-lighting. Another defect in modern houses was the absence of vistas, such as were seen even in Italian villas.

The Chairman at this point drew Mr. Brett's attention to the fact that the Conference had met to discuss Mr. Sedding's paper on architecture in connexion with the handicrafts; therefore, Mr. Brett was not quite in order in discussing the question of cross-lights.

Mr. Brett explained that he merely referred to the question of cross-lighting as having some bearing on the proper exhibition of examples of one particular handicraft, viz., that of the painter.

Professor Kerr said he rose to propose a vote of thanks to Mr. Sedding, who was one of those delightful essayists who did not expect people to agree with them. At the same time, they could not but feel there was a great deal in the paper which provoked reflection. Mr. Sedding's paper had a very wide range, although it was professedly confined to a narrow issue, and seeing as he did around him so many young architects, he had no doubt that a large number of them would not fail to remember that evening, in after life, as an occasion upon which they had received considerable,—although not always direct,—instruction. He proposed to offer his contribution to the discussion that evening by making a few remarks, not in contradiction to Mr. Sedding, for it was his rule never to contradict anybody (laughter). It was poor criticism which could only contradict. True criticism, on the other hand, was that which selected those truths which were prominent in discussion, and dwelt upon them with still greater profit to the audience. But before proceeding to criticise the paper he would like to refer to what had been said by their eminent visitor, Mr. Brett. Mr. Brett was not justified in saying that the English country-houses were collections of rabbit-hutches. He knew one or two intimately which he could not allow to be called a collection of tea-chests, and he believed he knew some in which a picture by Mr. Brett would be displayed to the utmost possible advantage. He also knew a hook, although he could not cite the page in it, giving the rule that architects had to follow in providing for pictures. Now, with regard to Mr. Sedding, the scope of his paper had been this,—that he seriously mourned over the decadence of English architectural art and identified it with the neglect of the craftsman. They could clearly understand and thoroughly grasp the strength and the truth of the idea, and could all agree with him in the abstract. But whether it was possible to combine with the conditions of the present day, which were unalterable, and for which they were not responsible, as they were historical conditions, the results of ages that could not be varied—whether it was by any means possible to combine the conditions under which they were now happily living with the peculiar circumstances Mr. Sedding had referred to, was a question which was not to be lightly disposed of. They must not follow Mr. Sedding seriously in the view that it was desirable to restore in the nineteenth century the social conditions of the sixteenth. In the first place, the young men might try to do so as hard as they pleased, but they would never succeed; and in the second place, if they were to succeed, they would not thank God for success. Mr. Sedding dwelt upon what he spoke of as the Gothic and Renaissance revivals. There had been no Renaissance revival. The Renaissance had gone on uninterruptedly, and it was the Gothic which had been revived, to the great credit of English architects. And in spite of what Mr. Sedding might think, it had resulted in the administration of a tonic to English art which had been immensely beneficial, and from which that art, whatever turn it might take in future, had inevitably derived great and signal advantage. He was not a Gothic man, and never should be one, but the revival of the Gothic was, properly speaking, a local English revival, arising especially out of the peculiar conditions of England at the present day, having its origin in the Oxford movement, proceeding and progressing with that movement, and falling now with it. The idea which Mr. Sedding appeared to have of architecture getting back into the hands of the

craftsman would, if it could be managed, be welcomed by the craftsman. The craftsman would say to Mr. Sedding:—“If you will be content to live on 35s. a week I shall be highly pleased with the arrangement.” But Mr. Sedding did not intend to do that, very far from it, and he could not go to the craftsman and say:—“I will give you a thousand a year.” This was a short and pungent illustration of a fallacy which seemed to run through Mr. Sedding's paper. The conditions of the present day tended to separate the architect, and the designer generally, from the handicraftsman more and more. He agreed very much with Mr. Sedding on the question of design, and had been trying for years to disparage mere paper design. He spoke of it disrespectfully for the moment, because Mr. Sedding had done so,—not that he (the speaker) liked to speak of anything disrespectfully (laughter). What the younger members of the profession had to be told was, not to depend too much on draughtsmanship (hear, hear). He admired the draughtsmen and their wonderful productions of the present day; indeed, the drawings they saw in the illustrated journals were wonderful as regarded quality, but at the same time there was greater necessity for not relying upon that which was so facile. Let them look at the red brick buildings scattered over the country, and remember how charming these appeared upon paper, and yet how ugly many of them were in reality (laughter). They had heard that a great many people did not like Victorian art, and no doubt many tried to persuade themselves of this. They did not know what they really wanted, and they did not like what they had. Victorian art was the product of a long process of inevitable development, and out of which they could not and would not wish to get. The arts at the present moment in England were most prosperous and promising; the number of men who were making a living by the practice of design was increasing every day, and it was a pity to discourage the rising generation in regard to their hopes and expectations. The subsidiary arts connected with architecture were springing up into bloom and blossom, into flower and fruit, in England in a way that was most creditable to the intellect and intelligence of the country, and he was disposed to say again, as he had said before, that the next generation and the generation following would see English art predominant on this globe (oh, oh!). He had no doubt of it whatever. He was told by a friend the other day that he had walked into the schools in Vienna and found English specimens as the typical examples of art which the children were to be taught. Now, Vienna was a long way off, and lay to the eastward, where imagination was perhaps a little brighter even than in the cloudy skies of the west. Mr. Sedding had said that architects were out of touch with the trades. That was so, but Mr. Lawrence Harvey was very laudably trying to bring them into touch, and a good many others were doing the same. Looking down the list of studies going on in the Architectural Association, he was pleasantly surprised to find that great efforts were being made to bring architects into touch with the crafts through that excellent institution. Therefore, they were not in such a hopeless state as had been depicted; and he believed that when Mr. Sedding had slept and reflected on what he heard that evening he would take heart and go forward with more hope, and with a determination to make the best of what was not a bad job but really a good one. Mr. Sedding lastly said that things should be got back to their normal condition. He could not agree with that contention at all. “Through the ages one increasing purpose runs,” and they were only at their own point of the course. The generation that followed would be ahead; the generation that followed that would be still further ahead, and, therefore, what they had to do was not to go back now, but to look forward for the best. (Applause.)

Mr. E. C. Robins, F.S.A., in seconding the vote of thanks, remarked that what they had heard had been most inspiring. There was no doubt much need for a closer approximation to the handicrafts from their standpoint as architects. The spread of technical education was a matter of much gratification, and even the great universities were now introducing the study of such things as chemistry and physics. People were beginning to see the necessity for using their hands as well as their heads in the

development of every kind of knowledge. That being so, architects ought to feel that a closer association with the workman was a good suggestion. He believed, with Professor Kerr, that the present condition of things had grown out of circumstances over which they had no control; but a time was coming when they would have more control, and it would be necessary to show themselves in advance of those who were so well taught in the various institutions. He need only refer to Mr. Brophy, at the Finsbury Technical Institution, to show what an excellent training was within the reach of the craftsman of to-day. At the same time, the difference between the architect and workman must remain, for they could never change places. The mere individuality of the workman would not do much for him, but there was a feeling abroad that something should be done for the craftsman, and he would gladly see him receiving higher wages.

Mr. Walter Crane said he was sorry he had come in somewhat late, but from his knowledge of Mr. Sedding's views on this great subject he felt sure that he should be able to support the generality of the paper. He felt that it was only by working in a contrary direction to turning the whole force of education into a kind of professional machine that they could get back to the condition of things that had existed in the past. A revival was going on, but it was a movement more or less fostered by the spirit of the age, and was really built up on the wreckage of the museums. Mr. Brett had made rather a large assertion when he said that the dwellings of the wealthier classes did them no credit. They might rather get a little lower and find a good deal more for discreditable reflection in the buildings not occupied by the wealthier classes. Professor Kerr seemed perfectly confident as to the condition of things, and that they were occupying their places, in much the same way as the bricks made up a wall; but he should not lose sight of the fact that the wall might be thrown down at any moment, and it was impossible to look back upon history without feeling that such confidence might be much shaken. Art had gone through periods of development and perfection the same as the growths of nature, and it was very hard to kill. This sort of protest against the things that were was an indication of some great change, and it was in that hope that he looked forward.

Mr. William White, F.S.A., added a few words of thanks to Mr. Sedding for his interesting and amusing paper. He felt with Mr. Sedding that there ought to be a strong bond of interest between the architect and the handicraftsman. That it was not so in the present day was evident. He believed the principles of art and design alone,—apart from the practical questions,—had enormously advanced within the last fifty years ago. In old days the connexion between architect and handicraftsman was one of gradual development. He could not altogether agree with Mr. Sedding in his view of the omnipotent peasant handicraftsman bringing forth his intuitive perceptions to such perfection as they were told he did in Mediaeval art. What were his intuitive perceptions or scientific knowledge apart from that which was brought to him by the guilds and confraternities who visited him? No doubt an amount of art feeling did reach every village in the kingdom, but he could not believe it was indigenous. It was the product of oral tradition and of the development of art by those who had education and literature and a perfect bond of union amongst themselves, working in the same direction wherever they came together. There was much hopeful promise in the establishment of the rising technical schools and in the mode in which they were being conducted, and that was the only direction, he believed, to which they could look for obtaining any sort of sympathetic union between two classes that were so entirely separated. He might mention that in his younger days he had tried to instil into village country smiths a little of the knowledge of what had gone before in the early art-work of iron, and he was glad to say that they took hold of and valued his instruction. Such instruction, however, which was of an isolated kind, could be of little use.

The Chairman, before putting the vote of thanks, said they were much indebted to Mr. Sedding for his very suggestive paper, and for the interesting remarks it had elicited. He

would like to make one little suggestion on the subject, and that was that while lamenting the divorce between architecture and the handicrafts, he ventured to think it might be traced to the way in which archaeology governed all their art procedure. Whilst they were archaeologists they must be more or less learned architects, and therefore they must dictate the different features of the building to the handicraftsmen. When they left archaeology and returned to tradition in architecture there would be some hope for the handicraftsman.

The vote of thanks was then put to the meeting and carried by acclamation.

Mr. Sedding, in replying, said that like Professor Kerr he never contradicted any one, though he was very much inclined to do so during that gentleman's speech (laughter). Professor Kerr had spoken of Victorian art, and of how much they were indebted to it, but he wished to know what Victorian art was? Professor Kerr had also done a little bit of special pleading in the interests of the designer, when speaking with such satisfaction of the numbers of designers; and the pity of it was that he appeared to prefer the interests of the designer to those of the architect. His (Mr. Sedding's) point of view was the interest of the architect and of the handicraftsman, and he had merely alluded to South Kensington as something from which they had much to learn. Mr. Sparkes had compiled in an interesting book almost the whole history of South Kensington, and its different stages of growth. One was delighted to find a little common sense in connexion with South Kensington, and to learn that one man really thought it a mistake to encourage paper designers. He wished to speak kindly of architectural draughtsmen, who were their good friends, but at the same time he must say that he preferred the future of architecture and of the handicrafts to that of the designer. It had been said that at Vienna they were studying English design; but though that might be complimentary to us, it should be remembered that "evil communications corrupt good manners." (Laughter.) Mr. Sedding next dealt with Mr. White's remarks. He remembered a country parson saying that Mr. Butterfield had done many ugly things, and never a pretty thing, but that he was a master because he had actually on one occasion shown a workman how to drive in a nail! Now Mr. White, in this nineteenth century, had actually taught a "dear old smith" a thing or two which he ought to have already known.

Votes of thanks were passed to the architects of the several buildings visited during the day, and the Conference adjourned.

THE ART-UNION OF LONDON:  
ANNUAL MEETING AND PRIZE DISTRIBUTION.

The fifty-first annual meeting of this Association took place on Tuesday last in the Adelphi Theatre (kindly granted for the occasion by Messrs. A. & S. Gatti). The Right Hon. the Earl of Derby (President) occupied the chair.

Mr. J. A. Hallett then read the Report, from which we quote the following passages:—

"The continued depression in trade prevailing both in this country and the Colonies fully accounts for the decline in the amount of subscriptions for the year which the Council have to announce to-day, and this has been greatly increased by the demand on spare funds made by subscriptions for the celebration of Her Majesty's Jubilee. The total amount is 7,073 17s.

The accounts of the year have been audited by Messrs. J. A. Hallett and W. Wright.

The amount to be expended on prizes will be thus allotted:—

The original oil-painting, 'Streetsley-on-Thames,' by B. W. Leader, R.A., 300l.; 1 work at 100l.; 1 work at 75l.; 1 work at 50l.; 2 works at 45l. each; 2 works at 40l. each; 4 works at 35l. each; 4 works at 30l. each; 3 works at 25l. each; 9 works at 20l. each; 18 works at 15l. each; 18 works at 10l. each; 3 framed drawings from original designs in the Westminster Palace, by C. W. Cone, R.A.; 4 sets of original drawings, by H. O. Selous, illustrating Kingsley's 'Hereward the Wake'; 30 silver and 40 bronze Jubilee medals; 80 sets of designs from English history, making, with the prizes given to unsuccessful members, 421 prizes.

The following is a brief summary of the receipts and expenditure; a detailed account will, as usual, be printed in the report.

|                                                                                   |             |
|-----------------------------------------------------------------------------------|-------------|
| Amount of subscriptions .....                                                     | 27,073 17 0 |
| Unallocated prizes .....                                                          | 25,625 10 0 |
| Set apart towards providing works of art for accumulations .....                  | 465 17 0    |
| For prints of the year, exhibition, report, and reserve .....                     | 1,914 14 5  |
| Agents' commission and charges, advertisements, printing, postage, rent, &c. .... | 2,650 18 7  |
|                                                                                   | 27,073 17 0 |

We have to record the death of one or two individuals connected with the Art-Union, and some well-known artists, during the past year.

On the eve of the last annual meeting, the Council were deprived by the death of the valuable aid of Mr. Anthonis, who had been a member of their body since the year 1853. In the year 1874 he was elected to succeed, as Honorary Secretary, Mr. Geo. Godwin, who then retired and was elected Vice-President, having devoted himself heart and soul to the advancement of the society since the day of its inauguration in 1836.

Mr. Anthonis was most punctual and painstaking in discharging his duties, always present at the meetings of Council, and generally calling once or twice a week to look into the business of the office. His genial and urban character deservedly endeared him to his colleagues, and his clear common sense often intervened to solve difficult questions. He was especially active and judicious in carrying out the duty of selecting works for prize-holders, much of which fell on the Prize-Selection Committee, both from the delegated privilege of prize-holders, and from the necessity of selecting works for those in distant lands, with whom there is no opportunity of communicating before the close of the Exhibitions.

In the autumn of last year, Mr. Arthur Grote was taken from us. Mr. Grote had for ten years been a very active and useful member of your Council.

Mr. Thomas Webster, one of the very oldest members of the Royal Academy, died on the 22nd September last, in his eighty-seventh year. His contributions to the exhibitions of the Royal Academy ranged over half a century. He was elected an A.R.A. in 1840, in which year he painted the 'Panorama of the Pyramids,' 'The Smiles,' and 'The Frown,' by which, perhaps, he is best known to the present generation, through two engravings by Messrs. C. W. Sharp and W. D. Taylor, produced by the 'Panorama of the Pyramids,' which some 11,000 impressions had been distributed. In 1846 he became R.A., and from that time all his principal pictures were to be seen on the walls of the Academy. One of his last contributions was a portrait of himself in 1874.

Mr. Lilwellin Jewitt, F.S.A., died on the 6th June last, at his residence in Duffield, Derbyshire, in his seventieth year. He was born at Kimbolton, near Rotham, the youngest son of a country gentleman, and a distinguished writer. He was appointed Chief Librarian of the Plymouth Public Library. He greatly assisted, by his pencil, the admirable labours of his brother Orlando Jewitt, the eminent architectural engraver, in Parker's 'Glossary of Architecture,' and many other works.

Mr. Geo. Thomas Doo, R.A., F.R.S., the well-known engraver, died on the 14th November last, at Sutton, Surrey, in his eighty-seventh year.

On the 15th March last died Mr. W. Collingwood Smith, at the age of seventy-one,—one of the oldest and most respected members of the Royal Society of Painters in Water-Colours. He succeeded Mr. E. Macdonald as treasurer of the Society, and held that office continuously for upwards of twenty years.

The death has been lately recorded of Mr. Frederick Bacon, engraver,—who was a pupil of the Findaus. He was for some time a student at the Royal Academy, under Fuseli. He was extensively employed on illustrations for the 'Waverley Novels,' 'Heath's Annals,' &c. He engraved for the Art-Union the 'Prisoner of Olsors,' after Wehnert.

The art of mezzotint-engraving has suffered a great loss by the death of Mr. C. W. Campbell,—an artist hitherto not widely known, but among a select few it was discovered that he had devoted high technical power, choice taste, and indomitable perseverance to his art. A most delicate plate of 'The Birth of Osakates,' after Mr. E. Burne Jones, first drew attention to his power. Another remarkable work was his 'Pan and Psyche,' after the same painter; and he had with the delicacy, finish, and firmness of a gem-cutter, engraved 'Ophelia,' after his own design. A portrait of Miss Ellen Terry was another triumph of his, and he left unfinished several works which would have placed him very high in the rank of mezzotint engravers.

After a reference to the Royal Holloway College at Egham, and its pictures, the report proceeded:—

"The duty of 30 per cent. imposed on all pictures imported into the United States, and 45 per cent. on all works of statutory, tends to keep down the amount of pictures which the Art Union receives from the States and the Continent. Last year the total subscription from the States amounted to 174 guineas, while from Australia we gathered 1,107. A decision of considerable importance to American purchasers of European works of art was passed in October last. What effect the high rate of duty has had on American art in the picture-market and on the morality of dealers and importers can be easily imagined. It has reduced the purchasing power of the dollar, in the only markets where the goods could be bought, by just one-third. It has starved the American collections, public and private, and sent young Americans over in crowds in Paris to study art in the ateliers, and to take back with them what has often proved to be a curiously hybrid style. It has led to the creation of a complete system of evasion and mystification on the part of those who deal in works of art, as regards the American Customs, the Customs officers, and there are few such men who are not of the opinion of the eminent diplomatist who declared he believed smuggling, in such a case, to be a moral duty. There is nothing of which it is so difficult to fix the rate, as to a work of art; nothing which requires such keen discrimination and such large experience. The dealer has these gifts, the Custom's officer has not, and the former has naturally placed a game of skill against the latter, in which he will often bring them to an end.

Of all these drawbacks and scandals the United States Government has long been aware, and it is a healthy sign that at last one of their members has taken an effective step towards bringing them to an end.

Mr. H. Marquand is an American amateur who is well known in Europe for his fine taste. He is forming a collection, of the advantages of which, it is believed, that his country will one day get a large share; and as is necessary, he buys his works of art in Europe. Of his transactions in modern art nothing need be said; but lately he purchased in England four pictures by Vanderkemp, Massacio, and Luca Van Leyden. Naturally he was anxious to transfer them to his home without having to pay the fine of some 4,000l., which would have been inflicted according to the old interpretation of the tariff, and he left the pictures in the hands of the British Treasury on the subject. His contention was that the pictures were antiquities, and, as such, that it was impossible they could come into competition with the works

of the home artists, in whose interest the tax was held to be levied. Antiquities, whatever the term may mean, are free of duty, and it is thus clearly to the interest of the collector of old pictures to have them classed as 'antiquities.' To this plea the Customs officers turned deaf ears, and for a long time Mr. Marquand could not get a hearing at the Treasury. At last the Under-Secretary, Mr. Fairchild, wrote to him that the Customs House agreed that old pictures were to be considered as Mr. Marquand had wished them to be considered. But in interpreting a tariff, which is an artificial arrangement full of snarls and pitfalls, it is necessary to draw a line somewhere, and in this particular case the under-secretary fixed it at the year 1700. By his receipt all pictures painted before that time are 'antiquities'; all painted later are 'works of art.' The distinction sounds flattering to the eighteenth and nineteenth centuries,—to Sir Joshua Reynolds and Messieurs, to Alms Tadiema and Sir John Millais,—though we suspect that the moderns would be very glad to dispense with the compliment if they could be relieved of the duty.

But the reformers and collectors must be thankful for small mercies, and accept as an instalment the boon which allows them to import, without a special penalty, the works of the great Italian and Spanish schools, of Vasquez and Murillo, and of the schools of Flanders and Holland.

The change that we are recording is one that has been effected by simple administrative order. No law has been passed or repealed, the Gaston House under the prompting of the Secretary of State, has merely said "such and such articles shall be taken out of one category and put into another"—consequently there is no principle involved, and any restriction which has been drawn has been shown to be faulty, it will be easily shifted. No school of painting is more in favour just now with collectors, on both sides of the Atlantic, than the English and French schools of the nineteenth century, and it will be impossible for the United States Treasury long to maintain that pictures of these schools are to be chargeable with the duty. The best of the American artists have always been ashamed of the restriction which the very nature puts them in an inferior position; their pride revolts at the notion that they cannot compete with English and French artists unless the latter are heavily handicapped. The picture-trade of the present day is a restriction which brands the pictures that they buy as inferior to their foreign rivals. In spite, then, of the general antipathy to Free Trade which is felt by the majority of Americans, there is good reason to hope that the exception now made in favour of an art-master will shortly be extended to their modern successors. When pictures and prints are as easy to buy in New York as in London, there will be a better chance than there now is for the education of American taste, and it is quite certain that the introduction of such facilities will immensely increase the sphere of the operations of the Art Union in the States.

The report next went on to refer to the controversy which arose last autumn as to the permanence of water-colour paintings; and after mentioning with commendation Mr. Gambier Parry's recent book on "The Ministry of Fine Art to the Happiness of Life," concluded by announcing that as the engraving for the coming year the Council have provided a figure-subject of moderate dimensions, "The Spanish Letter Writer," engraved by Mr. Lumb Stocks, R.A., from the painting by Mr. J. B. Burgess, A.R.A.

The Earl of Derby, in moving the adoption of the report, said that nothing was gained by refusing to look facts in the face. It was useless to deny that the position of the Art Union, as compared with that which it had held in former years, was not altogether one of prosperity. There had been a large falling-off in the subscriptions, as compared with some years ago, though, he believed there had been next to no falling-off as between the present year and the last. They had no reason, however, to blame themselves or the management for so unsatisfactory a result, nor had they any reason to think that less interest in art was felt than formerly. That interest had never been so great as in the present day. Every year, as the Hanging Committee of the Royal Academy well knew, produced an increasing number of pictures for exhibition; and, outside the Academy, new galleries had to be opened for the reception of works not hung in that and in the other exhibitions. There seemed also to be no falling-off in the average quality, and when they heard of sums of 6,000l., 9,000l., and upwards being given for single pictures, and 1,000l. for a single engraving, it showed that, whatever art might suffer, it would not suffer from want of pecuniary encouragement. It might be that this Art-Union had received some injury as a consequence of its success. Its object was half a century ago to popularise art, and that object had been accomplished in a very great degree. The result was that other agencies were now doing similar work, and the Art-Union had no longer the almost monopoly it possessed at the first start. They might be losers by that state of things, but they could hardly complain of it. Bad times and the shrinkage of people's incomes had also, doubtless, affected them, but that was a state of things which would pass away in course of time. If, therefore, they continued to deserve success, he believed it would come to them in future, as it had come in the past. Meanwhile they had no debt or liability, but possessed some property available

in case of need; therefore, while they could hope and trust for the best, they had nothing to fear from the very worst that could happen. He cordially agreed with the warning given in the report, both to artists and buyers, as to the avoidance of works on which perishable colours had been used. It was really a fraud on the public, if the artist knew what he was doing, and, if he did not, it was a clear proof of his ignorance. In purchasing a picture, whether in oil or water-colours, people believed they were acquiring a permanent possession, and, if there should be a general distrust in the permanence of artistic work, a considerable falling-off in the demand for such work would ensue. He hoped for better things, and, by the nature of the case, artists were the very last persons who should be indifferent to the permanence of their work.

Mr. George Godwin, F.R.S., in seconding the adoption of the report, said that the falling-off in receipts was stated to be due to the result of bad times, not merely in England but also in the colonies. For instance, Adelaide, which had subscribed 700 guineas on more than one occasion had only sent 96 guineas last year; yet that colony, according to the newspapers, had paid 2,700 guineas for a charming picture by Mr. Orchardson. Then there were the instances the Chairman had alluded to of the Gainsborough fetching 9,500 guineas and the Turner 7,500 guineas, while scores of artists were complaining of the very bad times. Only a few of the artists were able to command those large prices, and younger members of the profession had still to look to the Art-Union and similar bodies for assistance. It was too much the practice of the present day to forget what the Art-Union had done. This was distressing to those who had bad worked in it for many years, and who had remembered how painters like Maclise, Frith, Copley Fielding, and others, were at one time most anxious for the aid of the Art-Union though they had since attained to the top of the profession. Only lately a lecture was given by an eminent man on medal die engraving, without any reference being made to what had been done in this direction by the Art-Union, but for whom medal die engraving would have died out. The Art-Union Council had persisted every year in producing a medal in honour of British artists, and this had kept alive the small body of medal-die-engravers, a body who were now on the increase. He was happy to find, however, that the Art-Union was not always forgotten. He had the honour to propose the health of the late Lord Idlesleigh not long before his death at one of the Artists' Fund Dinners, and he took occasion to remind the noble lord of the opposition with which he had met their endeavours, many years ago, to obtain an Act of Parliament and a Charter. Lord Idlesleigh, instead of maintaining his former position, then said he remembered the circumstance perfectly well, and had always felt gratified that he had been beaten upon that occasion, for he had watched the progress of the Art Union, and had seen the great good it had done in spreading a knowledge of art and enabling large bodies of persons to possess works of art they could not otherwise have obtained. In selecting prizes it was well to aid rising talent, and they would find that by doing that they would at the same time be benefiting themselves.

The motion was then put and carried unanimously.

Votes of thanks were accorded to the Hon. Sec., Mr. Zouch Troughton (on the motion of the Chairman, seconded by Mr. James Hoggood); to Messrs. A. & S. Gatti, for kindly granting the use of the Adelphi Theatre; to Miss Matthews and Miss Dobson for assisting in the prize-drawing; and to the Chairman (on the motion of Mr. Francis Bennock, who incidentally referred to the way in which, some years ago, "Old Masters" were fabricated in Paris for exportation to the United States of America).

In the prize-drawing, the principal prize, the oil painting of "Strentley-on-Thames," by Mr. B. W. Leader, A.R.A., fell to Mr. A. Wildsen, of Brecknock-road, London.

**Truro.**—A new Wesleyan chapel at Lemon, Truro, has been commenced. It will cost about 1,000l. Mr. Silvanus Trevail is the architect. The contractors for the work are Mr. M. Clemens (mason) and Mr. W. Battersbill (carpenter).

LIME IN SEWAGE.

STR.—In the description of the process adopted at Hendon Sewage Works, in your issue of the 30th ult., it is said\* that "it is only dissolved lime, or that in solution, which is effectual" in sewage treatment. Further, that owing to the presence of carbonic acid in sewage, lime particles cannot be dissolved therein, as the acid combining with the lime forms an insoluble coating on their outside. In order, therefore, to get the lime dissolved before setting it to work in the sewage, one-sixth part of the sewage is withdrawn and mixed with 90 grains of lime per gallon, added in the form of milk of lime. The "lime is thoroughly dissolved, and the lime-water so obtained is added to the remaining five parts of raw sewage," equal to 15 grains per gallon in the latter. This curious proceeding seems in need of some explanation. Here we have learned that lime is insoluble in sewage, but that when put in sewage "in a continuous mixing-vessel" it "is thoroughly dissolved." Are we to understand from this that lime in the proportion of 90 grains per gallon is enough to overcome the malign influence of the carbonic acid, and also leave certain particles still uncoated, and therefore soluble? If so, what proportion do the effectual hear to the ineffectual particles? and would it not be more economical to dissolve that effectual proportion in clean water and save the ineffectual right off? There is plenty of clean water at Hendon Sewage Works. Or, why withdraw one-sixth of the sewage, and add lime enough to overcome its carbonic acid, with a residue of soluble lime for the other five-sixths of the sewage? Why not add the milk of lime to the sewage direct, as other people with a limo process do, with very decent results? The same lime would produce the same results thus, as when added in one-sixth of the flow first, and the whole flow afterwards. The Hendon process is like the illogical housewife's. She imagined that two lumps of sugar per cup of tea were insoluble when put in the cups separately, but soluble when she added the whole sugar for a tea-party in one-sixth of the tea; and, therefore, when she made tea for six, she put twelve lumps of sugar in one cup of tea, and then mixed up the resulting syrup in the tea-pot for the company. Truly the researches of the chemical advisors of the Metropolitan Board of Works are leading to strange practices amongst the unsophisticated rural authorities, and Mr. Gladstone, with what his enemies call his constitutional predilection for an *ovis fatuus*, has solemnly pronounced his benediction on one of the strangest yet recorded.

FIELD WORK AND INSTRUMENTS.—XIX.

Leveling Instruments.

III.—THE LEVEL IN THE FIELD.

**I**N order to avoid straining the parallel plate-screws, the instrument is first set up as nearly level as possible by working one of the legs of the tripod stand and then finally adjusting the longitudinal bubble by means of the parallel plate-screws. Move the telescope till it lies in the direction of two opposite plate-screws, as shown in fig. 1, and then select the most convenient leg of the tripod to work with. If the leg marked as No. 2 be chosen and the legs marked as No. 1 and No. 3 be regarded as fixed on the ground, notice the end to which the bubble retires and lift the leg marked as No. 2 just clear of the ground, so as to be able to shift it either to the right or the left hand in the direction of the curved arrows, until the bubble appears approximately in the centre of its run. Then twist the telescope a quarter round until it assumes the position shown in fig. 2 over the other two parallel plate-screws, and shift the same leg (No. 2) in a line approximately at right angles to the direction in which it was moved in fig. 1, as indicated by the straight arrows, until the bubble appears in the centre of its run or nearly so in this direction. Turn the telescope back to the position shown in fig. 1 and repeat the adjustment indicated by the curved arrows. Then complete the correction by the parallel plate-screws with the telescope in both positions (figs. 1 and 2).

The level is set up in the most convenient position, and, as far as the situation will permit, midway between the first and last sights to be taken with the instrument in any single position. The place of the staff is localised, not the place of the level. Upon side-long ground it is well to keep upon the high side of the line along which levels are being taken, the height of the instrument above the ground being

\* Not by us. We only reported the confession of faith of the engineers of the Hendon Works, prefacing them by "it is considered," &c.—Ed.

THE LEVEL

FIGURE 4

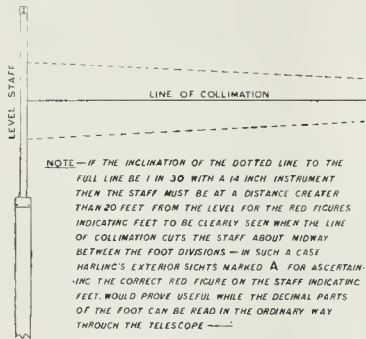

FIGURE 3

IRON FOOT PLATE FOR LEVEL STAFF

FIGURE 6

IRON PEG FOR LEVEL STAFF

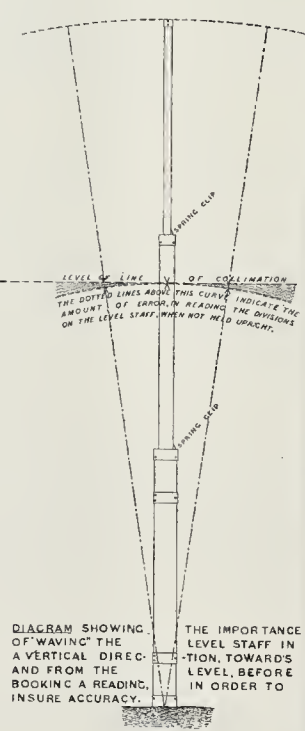

DIAGRAM SHOWING OF "WAVING" THE LEVEL STAFF IN A VERTICAL DIRECTION, TOWARDS THE LEVEL, BEFORE IN ORDER TO INSURE ACCURACY.

limited by the length of the tripod legs, whereas the length of the level staff usually provides a limit of at least three times that length. The height at which the level itself is set up does not affect the result, but care must be taken that the line of sight does not range above the top of the level staff, or cut the ground below its foot.

The lower end of the staff is shod with brass. It is important in continuous levelling that the staff should be held over the same spot before and after changing the position of the level. Upon hard ground a small metal-plate, as shown in fig. 5, is generally employed for this purpose, the chain which is attached to it being for the convenience of the staffholder in lifting it from the ground and carrying it from one change station to another. Upon soft ground, the form of iron peg shown in fig. 7 is preferable, the peg being put into the ground by the staff-holder, and then made firm by pressing the flat plate with his foot. The square top of this station peg forms a very reliable temporary bench mark for securing accuracy in the position in which the staff is held. When the telescope of a level is directed towards the staff, it is first adjusted to focus by means of the draw tube worked by the rack and pinion motion, and the longitudinal bubble is next observed and set accurately in the centre of its run by working (if necessary) the two opposite parallel plate-screws which come nearest in the direction of the telescope. If the adjustment for reversion is correct, no more than a very slight movement of these screws should be necessary when the instrument has been properly set up. If the line of collimation is truly horizontal the number of feet and decimals of a foot at which the horizontal cross hair of the diaphragm appears to cross the inverted readings on the face of the level staff will show the height of the line of collimation above the point on which the staff is held; but in order that this amount may accurately furnish the

vertical depth of the point upon which the lower end of the staff stands, it is necessary for the staff-holder to wave the staff towards and from the instrument over this vertical line as shown in fig. 6. The shortest reading will then express the amount to be booked. When the line of sight cuts across a division upon the staff and the surveyor is in doubt which subdivision to book, it will be by experience that the most accurate final results are obtained by booking the shortest reading.

Books.

*Lawn's Builders' Price-Book for 1887.* Seventieth Edition. London: Kelly & Co. and Simpkin, Marshall, & Co.

This old-established work, which reaches its seventieth edition this year, has many important alterations and additions. Several of the prices we noted last year as high have been reduced.

The digging, page 8, has been raised to 8d. per yard cube, and this was necessary; 7d. was very low, and far below the scale of prices kept through the largest part of the book. The next item of 9d. in gravel or stiff clay is not enough; the difference is worth more than 1d. The drain-pipes still keep at the gross list, while the prices for digging and laying are too low.

The prices of stock brickwork and grissel ditto are very fair for the best work and material, and the extras for raising on old walls are also fair and not at all excessive; the labour to openings in brickwork is one that surveyors do not generally take, although, of course, a large number of openings greatly increases the cost of work, as each reveal must be plumbed and the angles returned. Some of the materials in daywork have been lowered. The prices of glazed bricks, on page 33, should be given delivered at some London station, to be of use. The Carpenter and Joiner has been transposed to its proper position before the Plasterer. The memoranda seem to increase in value and quantity every year; the book is largely stocked with them.

We do not think the prices for labour only are of much use practically; to be of use these must be exceedingly close, and those given are not so. The prices for framed oak timber are increased; they were low in the 1886 edition. The prices of the joiners' work, as we pointed out before, are more than high in most cases. In the Ironmonger, the relacquering list is rather erratic.

In the Plasterer, prices are added for Johnson's patent rolled iron wire fireproof lathing, Hitchin's fireproof floor, and also Wilkinson's. In the Gasfitter, tubes are still kept at the gross list price; the prices for lead in the Plumber are a little high. A price-book should at no time be trusted for these, as lead varies so in price during a year.

There are some additional notes in sanitary work, and some few prices also added. Altogether this year's edition is a good one.

*How to Appeal against your Rates (outside the Metropolis), with Forms and Full Instructions.* By A. D. LAWRIE, Barrister-at-Law. Edinbrough Wilson & Co. 1887.

This is a very clear little book, and in the course of a few pages it gives the owner or occupier of property a clear notion of how and when to appeal against a poor-rate.

The author points out, for example, in considering the question of the rate itself, that "the actual rent paid is not necessarily conclusive of the value of any property for the purpose of assessment." It is a very common idea that the rent paid is, *ipso facto*, a measure of the rateable value. There are various little tabular forms which will assist the unprofessional reader, and much useful information in a small space. It is enough, however, when noticing a small work of this kind, to say that it can be confidently recommended to any one who desires a servicable handy book on this particular subject.

*The Law and Practice as to Paving Streets according to the Public Health Act, 1875; together with Digests of all Cases bearing on the Same.* By WILLIAM SPINKS, Assoc. M. Inst. C.E. London: E. & E. F. N. Spon. 1887.

This is a useful little work. The first part is essentially practical, and deals with the law as it now stands, and also contains suggestions for

its improvement. But while in a paper read at a meeting this treatment is satisfactory, we have some doubt whether it is so in a book, however small. The man of business does not wish to be troubled with questions of this sort that improvement in a book which is bought by him for use. The Appendix of Cases will be found useful, and the author has wisely given references in each case to the several current law reports.

*Street's Indian and Colonial Mercantile Directory, 1886-7.* London: Street & Co., 80, Cornhill.

THE Eleventh Issue of this admirable Directory is before us. It bears evidence of careful compilation, and increases in bulk year by year. In addition to the usual matter of a directory, it contains the trade returns, tariffs, populations, &c., together with concise descriptions of each country and town, with special reference to their products and requirements. The number of towns and cities has again been increased, and maps are given of all the principal countries, showing the positions of the chief towns and ports. These maps are very clear and distinct, and we are informed in the preface that they have been revised up to date. Tables of weights and measures and the value in English money of foreign coins are given. In some of the colonial cities—Sydney and Melbourne, for instance—architects and builders are mentioned; let us hope that they are all flourishing.

MEETINGS.

SATURDAY, MAY 7.

General Conference of Architects.—(Sixth day) Visit to the new Rooms of the National Gallery. 11 a.m. Visit to the Diploma Gallery of the Royal Academy, &c. 12 noon.  
Royal Institute of British Architects.—Members' Dinner, Freemasons' Tavern, 7 p.m.  
Architectural Association.—Visit to the National Liberal Club. 3 p.m.  
Association of Public Sanitary Inspectors.—Address by the President, Mr. Edwin Chadwick, C.B., F.R.S. 6 p.m.

MONDAY, MAY 9.

Surveyors' Institution.—Adjourned discussion on the papers read by Mr. Wheeler, Q.C., and Mr. P. E. Piddich on "Disapidations." 8 p.m.  
Society of Antiquaries of Scotland (Edinburgh).—3 p.m.

TUESDAY, MAY 10.

Society of Arts (Applied Art Section).—Mr. E. J. Tarrant, F.S.A., on "The Architecture of London Streets." 8 p.m.  
Institution of Civil Engineers.—Mr. L. H. Ramsome on "The Conversion of Timber by Circular and Band Saws in the Saginaw Valley, U.S.A." 8 p.m.  
Parkes Museum (Lectures for Sanitary Inspectors).—Dr. R. Thorne Thorne on "Infectious Diseases and Methods of Disinfection." 6 p.m.  
Royal Institution.—Professor W. E. Ayrton, F.R.S., on "Electricity." IV. 3 p.m.  
Glasgow Architectural Association.—Mr. John Kippie will read a paper on "A Tour in Italy."

WEDNESDAY, MAY 11.

Society of Arts.—Mrs. Ernest Hart on "Cottage Industries in Ireland." 6 p.m.  
Civil and Mechanical Engineers' Society.—General meeting. 7 p.m.

THURSDAY, MAY 12.

Society of Telegraph, Engineers and Electricians.—Paper by Professor W. E. Ayrton and Professor John Perry. 8 p.m.  
Edinburgh Architectural Association.—Annual general meeting. Closing address by the President, Mr. Hippolyte J. Blanc. 6 p.m.

FRIDAY, MAY 13.

*Parkers Museum Lectures for Sanitary Inspectors*.—Mr. J. F. J. Sykes, B.Sc., M.F.C.S., on "General Powers and Duties of Inspectors of Nuisances; Method of Inspection." 8 p.m.

SATURDAY, MAY 14.

*Edinburgh Architectural Association*.—Visit to Linlithgow Palace and St. Michael's Church.

Miscellaneous.

**Stoppage of Water Supply for Non-Payment.**—There can be no question as to the serious inconvenience occasioned in a household by the stoppage of its water supply. A frequent result of continued cold weather, and an occasional but not infrequent consequence of non-payment of dues, it is at any time a source of much annoyance, and, what is more important, of a train of diseases which are bred and fostered by uncleanness. We need not dwell on the connexion between sewer air and infectious fevers, on the absolute necessity of water, under our present system, for the removal of excreta, and for flushing freely and fully all waste-pipes, on its utility for cooking purposes, and its natural place as a beverage. All these are matters of common information. It is well to note, however, that the consequences of a want of water are not necessarily limited to the house which is primarily affected by it. If, for example, the sewage arrangements of that house be thrown out of working order, those of neighbouring buildings are not unlikely to become indirectly involved. Thus, one focus of disease readily becomes a parent of others. It is with a view to the prevention of such risks as these that certain members of the House of Commons have brought forward a proposal that water companies should be restrained in future from cutting off the water-supply of any house in default of payment of the water-rate, and should be allowed as compensation a preferential claim on the revenue derivable from the said house. The plan, as drafted on paper, seems as if it would work well, though perhaps it might be objected on behalf of the companies that it does not cover a number of cases where houses are let to a very poor class of tenants, whose payment of rent or of any dues whatever is a very precarious possibility. It may well be doubted, however, if their present power of stopping the supply is of much use to the companies in such cases. In so far as it is wont to be applied, the local authorities might perhaps be induced to meet them in the public interest on the question of payment, in order to prevent its application. At all events, the proposal to which we have referred is one worthy of consideration, and if it can be effectively carried out will do something to limit the spread of disease.—*The Lancet*.

**Presentation Key of the Royal Jubilee Exhibition, Manchester.**—The key presented to H.R.H. The Prince of Wales on the occasion of the opening of this Exhibition is thus described by the makers:—The column or stem is fluted as a Classic pillar, with composite capital, and small Lancaster roses in the achaes. An acanthus pliatum is the basis from which springs a heart-shaped head rising with an added circle round the Manchester globe and surmounted by the coronet of the Prince. On the obverse the full blazon of the arms of the City is given in enamel colours, with supporters, crest and motto, the sword of justice and civic mace being placed as correlative emblems in silhouette. The reverse of the key-head bears the plumes of H.R.H. The Prince of Wales, with a series of artistic and industrial emblems, besides the shield for inscription. All these emblems relate to the purpose of the Exhibition. The work was executed by Messrs. Chubb.

**Lambeth Palace Library.**—During the months of May, June, and July this library is open from 10 to 5 p.m. (Saturday excepted), at other times of the year from 10 to 4 p.m. The collection of pamphlets on monastic history continues to increase, and contributions are asked from writers who have made this a special study, in order that a complete series of papers on the conventual buildings of each county may be obtained. The pamphlets will thus form a valuable adjunct to the MSS. here on the religious houses of England, which are also described in the Archbishop's "Visitations" in the registers of the See of Canterbury, from Archbishop Peckham, 1279, to those of a comparatively modern date.

**Settlement of the Birmingham Building Trade Strike.**—The adjourned conference between the master builders and the representatives of the various branches of operatives in their employ was held on the afternoon of Thursday last week at the Grand Hotel, Colmore Row. Mr. J. Bowen, chairman of the Master Builders' Association, again presided, and the whole of the representatives who attended the previous meeting were present. The conference, which lasted four hours, was conducted with closed doors. According to the *Birmingham Gazette*, nearly the whole of the working rules were agreed to, with slight modifications, but a long discussion took place in regard to the rate of wages and the arbitration clause of the rules. The employers expressed their willingness to continue the present rate of wages if the operatives would consent to submit future disputes to arbitration. The whole of the operative delegates acquiesced in this proposal except those representing the bricklayers, who were disinclined to accept arbitration unless the prices of building contracts were ascertained by an inspection of the masters' books, which the employers strongly objected to. It was eventually decided to continue the existing rate of wages for a period of three years from the 1st inst., and it was resolved that the trade should be regulated by a Conciliation Board, composed of six representatives on each side, and that, failing an agreement between them, each side should appoint an arbitrator, and in the event of their still being unable to agree within a month a third person should be appointed as umpire, whose decision should be final. The result was received by the men with much satisfaction. The present rate of wages is 8d. an hour for the carpenters and plasterers, and 5d. for the plumbers and stonemasons.

**St. James's Church, Moss Side, Manchester.**—The foundation-stone of this church was laid on the 30th ult. The site is at the junction of Prince's-road and Great Western-street. The church consists of nave, 93 ft. by 33 ft. wide, with north and south aisles, each 93 ft. by 13 ft., divided from the nave by an arcade of six bays, supported on pillars of red granite, with moulded caps and bases. The chancel is 33 ft. by 27 ft., on the south side of which is a lofty organ chamber, and on the north, vestries for the clergy and choir, with lavatory attached. The principal entrances are from Great Western-street and Prince's-road. The style adopted is the Late Decorated period of Gothic architecture, the aisles being kept low, to give greater effect to the lofty clerestory. At the junction of Prince's-road and Great Western-street is a campanile 100 ft. high. The roof is open-timbered, with framed principals. The church externally will be faced with Ruabon red stock bricks and terra-cotta, with tracery of windows, and bands of stone. The seats will be of pitch pine, and afford accommodation for 800 persons, inclusive of the choir. Messrs. Robert Neill & Sons, of Strangeways, are the contractors for the whole of the works, involving an outlay of about £5,000, under the superintendence of the architect, Mr. John Lowe, of Manchester, whose design was selected in a limited competition.

**Oxford.**—The new buildings for Cutler Bouter's Medical Dispensary have just been completed. This building stands on the north side of a new street leading from Worcester-street to the Cattle Market, and contains a waiting-hall, with two lobbies for the patients desiring to see the medical officers or to obtain medicine. The wing of the building next Worcester-street contains two consulting-rooms for medical officers, and an office on the ground-floor, with committee-rooms on the first floor. Besides the entrance for patients, there is in Worcester-street a special entrance for medical officers, committee, &c., and staircase for the same. The style of the building is that known as Free Classic, with walls faced with pressed Ruabon red bricks, with plinth mouldings, cornices, arched heads, and other window dressings, pedimented door-heads, and copings of Bath stone. The roofs are covered with Broseley brindled tiles. The building was erected from the designs and under the superintendence of Mr. Edward G. Bruton, F.S.A., City and Diocesan Surveyor. The builder was Mr. Charles Curtis, of Oxford, and the fittings of the dispensers' shops were supplied by Messrs. Hawke & Son, of London. Mr. Jones was clerk of works.

**New Pier at Ventnor, Isle of Wight.**—This newly-constructed pier is rapidly approaching completion. Mr. F. Grace is in charge of the new works, managing for Messrs. Burleigh & Co., the contractors. The total cost will be about £15,000. There are landing-stages for passenger steamers, workable at most tides. The top of the pier is about forty feet from the clear line below. A large band stand is in the course of erection, but not yet finished. The raised platform on which the stand is to be built will hold about 4,000 people. The pier itself will find walking-room for 15,000 or 16,000 people at one time. The ironwork has been supplied from Glasgow, Newcastle, and Nine Elms, the timber and woodwork is now mostly from Poole and London; railed across the island. A tessellated floor entrance is now being laid. The pier will be ready for opening in about three weeks. The old one was washed away some few years ago.

**Lechlade Water Supply.**—On Thursday last week, Mr. S. Harding Terry, A.M., Inst. C.E., one of the inspectors of the Local Government Board, held an enquiry at Lechlade, Gloucestershire, with reference to an application by the Faringdon Rural Sanitary Authority, for a loan of £1,500 for a proposed water supply to the town of Lechlade. The scheme has been prepared, and was explained by Mr. F. H. Barfield, F.S.I., of Faringdon, Berks.

**Carving at Wimbledon and in Brook-street.**—Mr. Gilbert Seale, of Walworth, writes to say that he did all the stone and brick carving at the new buildings for the South Western Bank, Wimbledon, described in our last (p. 658). He adds that he also executed all the carving to frieze, capitals, &c., and the wainscot window-heads, to the new buildings, Brook-street, an illustration of which we gave in our last week's number.

**Drainage Experiments at Acton.**—We quote the following paragraph from the *Sanitary World* of April 29:—  
"We regret to find that the account of these experiments, which appeared in our issue of the 15th instant, was taken (without the knowledge of the Editor of this journal) from an article which appeared in the *Builder* of the 9th instant, and at the request of the proprietors of that journal we readily apologise for the omission on the part of our contributor to acknowledge the source from which the account was derived."

Depredations of this kind on our columns have been far too frequent of late.

**Whitby.**—The Whitby Harbour Trustees recently held a special meeting, at which the agreement whereby the Public Works Loan Commissioners grant a loan of 10,000l., for the purpose of harbour and sewerage improvement, the Local Board giving a guarantee on the rates, was submitted and duly signed and sealed.

**New Wesleyan Schools, in connexion with St. Mary's Chapel, Truro, have been commenced. They will cost 2,500l. The contract for the work has been let to Mr. John Farley (mason) and Mr. William Tippet (carpenter). The architect is Mr. Silvanus Trevail.**

Asphalts.—The Seyssel and Metallic Lava Asphaltic Company (Mr. H. Glenn), Office, 88, Poultry, E.C.—The best and cheapest material for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk rooms, granaries, tum-rooms, and terraces. [ADVT.]

Asphalte.

Seyssel, Patent Metallic Lava, and White Asphalts. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [ADVT.]

NOTICE.—THE BANNER SANITATION CO. beg to give Notice that having sold over 10,000 BANNER'S PATENT VENTILATORS, also a proportionate number of other Sanitary Appliances, and wishing to keep pace with the times, they have decided to reduce the prices of their goods from 25 per cent. to 40 per cent., thus offering to the public the best appliances at the lowest prices.

BANNER VENTILATORS.

The Strongest Exhaust Ventilators for all Buildings, Public Halls, Churches, Billiard-Rooms, &c.

HIGHEST PRIZES at all the most Important EXHIBITIONS

Gold Medal. Health Exhibition, 1884.

For further Particulars and Revised Prices, apply to

BANNER SANITATION COMPANY.

Wessex House, Northumberland Avenue, Charing Cross, London, W.C.

# Supplement to The Builder,

MAY 7, 1887.

## GENERAL CONFERENCE OF ARCHITECTS.

THE EIGHTH\* General Conference of Architects, held under the auspices of the Royal Institute of British Architects, was formally opened on Monday evening last, when the President of the Institute, Mr. Edward P'Anson, F.G.S., and the Council, held a reception in the West Gallery on the ground-floor of No. 9, Conduit-street. On the walls of the Gallery were displayed an interesting exhibition of drawings of works by the late Mr. George Vallianny and the late Mr. Ambrose Poynter, as well as a series of rubbings of brasses lent by Mr. A. Oliver. The reception took place at half-past seven, and at eight o'clock the company proceeded upstairs to the rooms of the Institute, where the fifty-third annual meeting of that body was held. The annual report, of which we gave the salient passages in last week's *Builder* (p. 651, ante), was unanimously adopted, the new Council was elected, and other formal business transacted.

It may be mentioned that a few hours before the formal opening of the Conference, viz., at three o'clock on Monday afternoon, some two hundred members of the Conference visited the Stock Exchange, as enlarged and completed, where they were received and conducted over the building by the architect, Mr. J. J. Cole, and his son, Mr. Langton Cole. We will say a little more about this building next week.

On Tuesday morning a party of about 150 members of the Conference visited the New National Liberal Club-house, Victoria Embankment, under the guidance of the architect, Mr. Alfred Waterhouse, R.A. They next proceeded to the large block of residential mansions in flats adjoining the new Club-house, where they were received by Messrs. Archer & Green, the architects. Next, they visited the new Hotel Victoria, in Northumberland-avenue (istly known as "The Northumberland Avenue Hotel"). Here the visitors were met by Mr. H. L. Florence, of the firm of Isaacs & Florence, the architects of the building. Of all these buildings we shall have more to say next week. In the afternoon a party of about seventy-five members went by train from Waterloo to Egham, where they visited the Royal Holloway College, under the guidance of the architect, Mr. W. H. Crossland, who entertained the visitors at luncheon.

It was not until Tuesday evening that the Conference proper was actually commenced. The attendance, though large, was by no means so great as on some previous opening nights, owing, perhaps, to the numerous visits to buildings which preceded it. The programme, perhaps, was somewhat over-crowded in this respect, and those members who visited all the buildings named must have been tired out. The chair having been taken at 8 o'clock by Mr. Alfred Waterhouse, R.A.,

Mr. J. D. Sedding at once proceeded to read the following paper

### ON THE RELATIONS OF ARCHITECTURE AND THE HANDICRAFTS.

"Watchman, what of the night?"

ALTHOUGH the relations of design to the handicrafts is of deep concern to us, and is likely as time runs on to become the problem of problems, yet there is much in the present state of things to hide it from the sight of such as care not to confront it.

\* The first of these Conferences was held in 1871, the second in 1872, the third in 1874, the fourth in 1876, the fifth in 1878, the sixth in 1881, and the seventh in 1884. Copious notes of the proceedings will be found in the volumes of the *Builder* for the years named; and this year, as we did three years ago, we report the proceedings in special Supplements, of which this is the first. Our second Conference Supplement this year will be given next week.

So long as clever and interesting designs can be turned out, such as were seen in the photographs of modern buildings forwarded the other day to the Adelaide Exhibition; so long as historic art has the same enthralling interest for us, and for the young eagles we hatch that it has now; so long as her Majesty's mails afford us such cheap and ample facilities for keeping up our relations with the craftsmen who have the honour of more or less faithfully representing our ideas in the buildings we are rearing in various parts of the country; just so long may we evade this question if we will. It does not visibly obtrude itself in such peremptory fashion that we are bound to face it at once. We may keep our skeleton safe locked in the cupboard a little longer till we have more courage to face it.

The question is so new and unparalleled. We have kept it hitherto dark from the critics, who worm out most things; and there are possibly such ugly issues hanging to its tail that we are naturally disinclined to touch it. It is not that we are not a little uneasy about things at times. We cannot but feel that, with all its merits, our design fails to correspond in many vital points with all good art that ever was. There are two ways of drawing a horse,—one starting from the head and the other from the tail; and though the first is undoubtedly the right way, it is not ours. We know that the old ways of art and the old methods of producing art are not our ways and methods. We feel, too, at times that life under the present system of conducting design is an irksome business,—nay, that the stress and strain of it have sent some of our best men into an early grave. Yet to pause and quietly take stock of things seems scarcely possible,—matters move at such a pace nowadays. The mill of Victorian design has had to encounter such strange antics of veering winds, the wheels have had to run so fast, the grain we had to grind is of such various kinds, and the people outside were so mad to get at everything we have turned out,—even before it was properly sorted or bagged,—that, really, what with the hustle, the confusion, the uproar, and the dust, we have had no opportunity for calm reflection.

And yet I will be bound to say you have had your opportunities for realising the march of things. We are all diligent students of old art, and old art is never silent to those who will hear. Perhaps, the occasion came in the well-earned pauses of a day's diligent sketching, when, shut in with Nature and her twin sister Art, away from the sound of the grinding-mill, within the precincts of some sequestered old abbey buildings, the desire came upon us to learn somewhat of the secrets of the strength of the old work and somewhat of the secrets of the weakness of our own work. What,—we have then asked,—is that quality in the architecture of old days that stamps it with inherent nobleness? How came it with that inimitable touch that gives it this lasting human effectiveness? From whence did the old men get that subtle alchemy which, somehow or other, seems to have been infused into the dead stone and wood which makes these old walls resound with ever fresh human interest? What is that specific something which is ever present in old design and always absent from new design? What was there in the manner of the making of the old detail that ensures its success, and what in the manner of the making of the new detail that bars its success?

Now the answer to all these questions is, I think, contained within the four corners of our subject. And as to this subject let me say that without wishing to push the significance of our conference upon it to-night too far, I cannot but accept the permission so kindly accorded to me of bringing it before you as witness that

you consider it as timely a question as those other subjects down for conference of "Education," of "New Materials and Inventions," of "The Federation of Architects," of "The Registration of Architects."

Our relations with the handicrafts! Well, no one discusses his relations with his relations until matters are uncomfortable. No one chatters of the relations between the members of a family or of a body corporate unless old ties and interests are in danger. It were impossible to conceive of William of Wykeham or Alsn of Walsingham, or Christopher Wren, or, Inigo Jones, discussing the relation of architecture to the handicrafts, even though the two last-named worthies were often seen with ominous-looking portfolios under their arms. And why is the notion so preposterous? Is it not that the leaders of design in those days were in active touch with the trades,—the two first-named in closer touch than the other two,—because the architect and the craftsman were not, as now, twain, but one? "So they were not, both of them together."

Now, I am about to ask you to let me treat this subject in what may appear a roundabout fashion: anyhow, it is the fashion in which your roundabout studies of old art have led me to look at it. You see, I assume at once that we must judge of it from an historic standpoint. The past of art elucidates the present: "What has been shall be." The past of art is prophecy as well as history. So I shall hinge all that I have to say upon these four propositions.

1. English architecture is not what it was. 2. The architect is not what he was. 3. The handicraftsman is not what he was. 4. The relations of architectural designer and craftsman are not what they were. In our treatment of these propositions I hope we shall find the key to the situation which causes us uneasiness. Only let me say now, what I shall desire you to remember when I have finished, that this hastily-compiled paper lays no claim to completeness, and makes no pretence to adequacy.

1. English architecture is not what it was,—not simply as regards what we do, but how we do it,—not simply as to the types we have or want, but as regards the initiative and character of design. Architecture under the conditions of these days is becoming more and more a thing of schools and classes, of geometry, of lectures, of manuals of design, of book illustrations, of criticism, of draughtsmanship and sketching, of classification and demonstration. No one will, I think, contradict me when I say that so far as architecture is now conducted as an art and a profession it means design, not craftsmanship. Let me give an illustration to explain my meaning. Suppose that a Tory Government, desiring to exercise a little art-coercion, were to pass a Bill for the extermination of all architects and architects' assistants throughout the land! What would happen would be that English architecture would simply lie with the architects dead and buried in the same grave. And if the Bill were to apply "for ever and ever," such English architecture as we have initiated would cease from off the face of the earth. But suppose that some ruffianly monarch had tried the same game on the Innocents of old days, what would have happened? Why nothing would have happened. The effect upon English architecture would have been simply nil! because the handicrafts would have carried on things exactly as they had been before. You might as well expect to stamp out the English language by putting to death the professors at the Universities.

Old architecture is craftsmanship or it is nothing. The thews and sinews of old design were in the trades. Old architecture was not what modern architecture is, the creation of the architect's office; it was the creation of the workshop: the workshop was its home, the

tradesman's bench was its cradle, tradition was its foster-mother. The momentum of old art came through the trades. Its inspiration came direct from the heart of things, and there were no mediums in the shape of draughtsmen, with their *abracadabra* plans and sections, that prevent the night-watches of the honest British workman of to-day. Old architecture is not like the new, a fortuitous concourse of atoms; in spite of its wide range and free developments it was, in truth, a compact homogeneous whole, where nothing appears suddenly and without preparation, and nothing disappears until it has played out its part and fertilised the ground for that which takes its place. The style of old architecture is far-reaching tradition. It was nurtured on the sustained enthusiasm of successive generations of tradesmen. It was developed sympathetically and coincidentally by men who in their handling of things could maintain firm hold on the past, yet keep their developments so closely neck and neck as almost to suggest the existence of a sort of art-telephone by whose aid the schools of workmen far and near were made aware of the tune going on, so that all alike could be simultaneously working at the same theme or motif, yet without restraint to local genius, or prejudice to local necessities.

Old architecture was, above all things, local in its practice and development. Its strength was to sit still. It was not, as ours, an art of excursions,—an art carried out by architects always on the wing, who, like Ulysses, after his long roaming, can say,—

"I am a part of all that I have met."

Old detail was applied by the craftsman who invented it, and was not drawn out by a draughtsman situated, it may be, hundreds of miles from the building being erected, who could have nothing in common with the workman, and no other mode of communicating with him than her Majesty's mails supply.

Old detail was the product of a fertile field. It passed through the brain of a horny-handed workman, deep skilled in the lore of the trades, and rich with the mellowed harvests of bygone days. It did not, like modern detail, owe its origin and such charm as it possesses to the volunteer notions and precocious maturity of some masterful soft-handed occupant of an office-stool, whose practical knowledge may not always equal his aspirations.

In regard to this matter of the propagation of architecture by schools of workmen, I will trouble you with a few illustrations taken from British examples, as I wish to trace things home to ourselves to-day.

The effect of the old schools or gangs of workmen is seen in two ways,—1. By the distinct types or varieties of types that prevail within a given area; 2. By the recurrence of similar or identical details in distant structures, which marks the wanderings of gangs who carry along with them the mouldings or plans used by them at their last or previous jobs.

Mr. Street, in his masterly report upon Christ Church, Dublin, incidentally mentions an interesting example of this in the splendid abbeys of the counties of Cork, Limerick, Tipperary, Kilkenny, Wexford, Meath, and Down. He says, "It is not as works of art worthy of attentive study that they interest me so much, as the way they illustrate the manner in which art was carried from land to land in the Middle Ages. The feature in question is this,—I find in these buildings the most unmistakable marks of their having been erected by the same men who were engaged at the same time in England and Wales." Of Christ Church, Dublin, and St. Canice's, Kilkenny, Mr. Street observes, "These two churches possess certain features so peculiar and so exactly like what we see in St. David's, Llandaff, Wells Cathedral, and Glastonbury Abbey, that they must have been erected by the same troop of workmen, and from the designs of the same architect."

It was, I may remind you, to Mr. Street also that we are indebted for the discovery by internal evidence that Stone Church, Kent (which he handled so ably in his restoration) was the handiwork of masons from Westminster Abbey.

We must all, in the course of our studies or professional work, have come across instances of the same kind. I will give a few that have fallen under my own observation. To cap that of Mr. Street's, I may say that I find the handiwork of the builders of Sherborne Minster in Orewkerne Church. Again, Tideswell Church, Derbyshire, is a remarkable specimen of four-

teenth-century work. We can plainly trace the Tideswell arcades, windows, doors, and porches in Chesterfield Church, erected later on; and I can further run these identical features to ground at Tamworth, some long way off.

Of the repetition of the same designs and details in the same county, I may mention how the noble Perpendicular towers at Isle Abbots, Huish Episcopi, and Bishop's Lydeard, Somerset, are so exceedingly alike that, were it not for their different surroundings, you would not from your sketches of the three be able to tell "t'other from which."

Speaking of this county, I may recall to your recollection how a gang of Somersetshire workmen put up a completely typical Somersetshire tower at Llandaff Cathedral in the fifteenth century. Further, that another gang of Somersetshire masons built Wadham College, Oxford, in the seventeenth century.

Perhaps it may not be out of place if I here venture to give as my opinion that the vast majority of our parish churches were both designed and built by schools of workmen. To me they represent peasants' art. They are local, not only in regard to conformity to certain types, but local in the thought and character expressed in them. They are of the soil, and made by children of the soil. While the stone of which they are built was quarried in the field hard by, the ideas they clothe were quarried out of the no less home fields of the local peasants' brains. And, for my own part, I like to feel that just as the Gospel preached within the walls of our parish churches had its peasant apostles, so the art proclaimed in the walls had its peasant apostles; and I am no less the humble disciple of the one than of the other. What little I know of art I have mostly got at the feet of the humble, but immortal, peasant craftsman of olden times. The critic, who is "cute or nothing," tells us that the marks of irregular composition and crude handiwork found almost invariably in Gothic buildings are essential to the style, and that they are there because they were purposely put there, forgetting that these traits are but the accidents of the work which are found equally in Roman or in any other phase of art where the culture of the workman tallies with this case. It were best to drop such theories, and to see in the simple *naïveté* of these buildings, and in the unexpectedness of their composition, only the state of the handicrafts of the time. Art has its address as well as its full dress Academic costume, and here we have but the product of men whose invention was in their finger-ends, whose imaginative grasp was not great, whose ignorance of the rules of selection, and whose work,—delightful and elevating thought be,—has none of the distinction and the *Atticism* of fastidious times. Were architects employed to design our village churches? I doubt it. But if so, methinks that the British architect of the present day has something to learn from them of the beauty of simplicity, and of the value of restraint in design.

The strongly local flavour of old architecture is, I say, an indirect testimony to the community of effort and art-motive. The distribution of plants and birds in a locality is not more marked in England than the distribution of types of old-world design and handiwork. If the hotanist can tell us where to find the bee-orebis or the *Osmunda* fern, or the ornithologist can tell us where to find the stonechat or the turtle-dove, we architects can tell them where, and where only, certain architectural types are to be found. Nay, we can tell them the marks of borderland influences,—how differences exist, and yet the identity of the original types will still be preserved. We can tell them how a Sussex tower differs from an Oxford tower, and a Derbyshire tower from both. I remember tracing the likeness of the tower of St. John's, Cardiff, to the tower of Gloucester Cathedral, and I found afterwards that the living of the parish was still in the gift of the Gloucester Chapter; so that goes to support the theory that the same gang of masons built both.

Again, we can tell almost by the feel of an enriched hench-end whether it be the work of the tribes of Somerset, or Devon, or Cornwall. Show us an oak chest in Wardour-street, and we can tell in what county it was produced. We can tell at a glance whether the tracery and make of a church screen be of Welsh, Yorkshire, or Norfolk origin. I once went a long journey

in the wilds of Cornwall to see what Murray calls "an elaborate screen," and I remember my disgust as I pronounced at a glance that the thing was of Midland County origin. My instinct was right, but it was proved right in a manner I did not anticipate, for later on I broke blade after blade of my friend's knife over the tracery, which, though looking like oak, was in reality Brummagem cast-iron!

Here are a few other testimonies of local schools of art shown by the presence of one type and the absence of another. Thus the barrel roof is the only existing type of roof in Cornish churches. In Devon the type exists, but in a less degree; in Somerset it exists, but in a still less degree. In the churches of these three western counties there is, again, the same peculiar continuation of the nave aisles to the full extent of the chancel, and the aisles almost always have pitched roofs. There are only four instances of clearstories in Cornwall,—at Callington, Lostwithiel, Fowey, and North Petherwin. Again, in Cornwall, I know of only two chancel arches,—at Bodmin and at Towdnack.

And so with other features elsewhere. If you draw a line from Newmarket to Fen Stanton there is a preponderance of towers over spires in the proportion of nearly ten to one; while at that village the character changes, and there are a line drawn from thence through Huntingdonshire and Northants into Rutland, a tower would scarcely be found. From the same School of art influences Oxfordshire houses get their gables and Northamptonshire houses their special type of chimneys. Such methods of local developments of types conduced to the growth of individuality of character.

Another special phase of architecture is that, where local types are temporarily coloured by foreign influences. This phase is, of course, represented in a wholesale degree in Spain under the Moor, or in Flanders under the Spaniard, and oddly, too, in Spain when the Spaniards evacuated their diggings, but took Flemish tricks of building away with them. The Flemish stepped-gables, for instance, crop up in Spain. But we must not wander from England, and I will only note two examples here. There is the strong influence exerted over Norfolk and Suffolk art after the wealthy traders had imported Flemish craftsmen to those parts. Again, my rambles in Devonshire have enabled me to trace the work of a small gang of sixteenth-century Flemish carpenters over that part of the country that lies south-west of Kingsbridge-road Station. Their work is to be found in the screens of several churches in that neighbourhood. The "grand climac-teric" of the school was arrived at in the side-chancel screens at Holbeton, but I found their work also at Chivestone, Kingsbridge, and Ugborough. The work is singularly beautiful, and it loses none of its interest by the admixture of foreign and local characters.

2. The architect of to-day, I said, was not what he was. In touching upon this point I shall say as little as I may upon the vexed question of the functions of the architect in old days and to what extent he corresponded with ourselves. I am led to think that from whatever source the general scheme of a building came,—whether from patron-builder, architect-builder, or master-workman, whether the building were church, castle, country-house, monastery, or cathedral,—the details were left pretty much to the trades.

That the names of architects are not connected with the traditions of old English buildings does not necessarily imply that the people of the place were unconcerned about the history of their buildings, but it implies, I think, that their erection was a joint-stock affair. Even in Italy,—where one would suppose from hooks that art was the great business of life,—even there Vasari has to note to how few, especially of the notable earlier buildings, he can assign an architect's name. The reason he gives for this is the than modesty of the profession! He "cannot but marvel at the simplicity and indifference to glory exhibited by the men of that period." Now although one feels that for me to "differ" from Vasari almost parallels the old woman who "differed from Paul," yet in spite of this, and in spite of seeming to rob the profession of the merit of a virtue they can ill afford to lose, I do venture to think that Giorgio Vasari was on a wrong tack here. Is it not a singular fact that whenever a *foreigner* has anything to do with a building,—a man, that is, who is not of the

crowd of local craftsmen,—we are sure to hear of him? Thus we hear of Buschetto, "the Greek," at Pisa, of Master Harduin, at Bologna; of Wilhelm of Innsbruck, at Orvieto; of Maestro Jacopo the German, at Arezzo; and so forth.

But what I particularly desire to emphasise here is the little influence the foreign architect can exert when his sympathies run counter to those of the craftsmen. How different is it now! The ground-plans of the churches, their proportions, their roofs, and their traditional features remain as before, in spite of the foreign "boss." It is only in the window traceries and the form of the arches that he makes any appreciable mark. One swallow does not make a summer. And so Messers Giovanni and Tommaso and the rest of the brown-faced workmen complacently smile at the foreigner as he shakes his shaggy locks and rolls out his Germanic oaths: they know that the running is in their hands. Gothic is queer stuff to them, but they know that Gothic is not Gothic when smothered in Classic clothes from top to toe. And we know it too.

To revert to English work. I would, for the purposes of this paper, divide English design into three phases, each phase representing a different relationship or degree of relationship to the crafts. 1. There is the art which ranges from the earliest times down to the Classic Renaissance of the sixteenth century. 2nd. The art which ranges from the introduction of the Classic to the Gothic Renaissance of this century. 3rd. The art which represents the Renaissance of the Gothic and of the Renaissance now going on.

The first phase expresses more exactly than the second what is the true native style of the English people. I do not say that it is the better or the worse for that. The second phase is English enough, yet English with a difference. In the first, or Gothic phase, we have art as it sprang spontaneously into existence, fresh and untrammelled from the rock of the genius of the people, and here architects,—who in the history of English architecture have mostly been employed as translators,—were a superfluity, except in a big effort. There was no call for the translator in the development of the Gothic; it was the common people's language. In the second phase we have a certain interference with the methods of origination,—a certain tampering with the springs of design at their source. There are, as you know, two sorts of interference with deep-rooted design,—the accidental and the wilful. Interference like that of the Moor in Spain or the Spaniard in Flanders was accidental. But the interference that I now speak of was wilful,—and here, as was the case with the Gothic revival, it was carried out by "superior persons." Men travelled more, and discussed and desired to reproduce at home what they had seen abroad. The influences of travel and culture upset, as far as they could, the traditions of the workshops. Kings and courtiers, scholars and churchmen, cast their eyes about them abroad, and when they got home threw in all the weight of their wealth and patronage to prepare the new Classic. Naturally enough the situation demanded the professional services of masters of design, like Holbein and the ubiquitous John Thorpe. At first, I suppose, you could have counted "the profession" on the fingers of one hand. But there were brighter days in store. Gothic churches might be designed and built, as we have seen, by peasant tradesmen, but not so Elizabethan mansions. These must have some of the grace and elegance of the buildings from whence their *motif* came. You will, I think, agree with me that the Elizabethan and Jacobean styles need wealth to build, and refinement to design, or the quality of dignity essential to their proper representation is absent. They represent Academic art, courtly art, an art of distinction and selection. Renaissance art needs a well-furnished mind, learned in literature, apt at Classic allusion and at rendering antique symbolism. Here clearly is an art that demands the professional services of an architect.

Now, the point I am coming to is that, in spite of the difficulties of the situation as regards the character of the architectural design then needed, and in spite of the disparity of culture of the designer and the craftsman, their relations are entirely pleasant and friendly. The common workman is not ousted from his old place in relation to the initiative, or, at all events, to the development of design.

Design did not all at once begin, as it did with us at the time of the Gothic revival, to be *paper* development. Of course, you may explain the situation by reminding me of what I know already, that the designer then was only a specialist, and specialists are never up to much! You may say that the architect or the patron-architect knew precious little about details, and so left the workman to supply his deficiencies. But that does not cover the whole case. Even a specialist may be a master, too, occasionally.

What we may infer from observation of the Early Renaissance work is that, by some means or other, Tom, Dick, and Harry, who had "allers done Squire's work," were made acquainted with the round arch, pilasters, halustrades, and friezes, and they took kindly enough to them and worked "overtime" in the evenings, scheming fresh planes for "them tricky new-fangled mouldings." But the Classic imagery stumped them, as we see by our old country houses to this day. Here was clearly a case for calling in their betters.

But while things moved so sweetly in the yards, the "superior persons" who wrote about art were not content. We all know, and like no less, that dear old pedagogue John Evelyn's "Parallels," which, as you may remember, also contains the significant "Explanation of certain Terms particularly affected by Architects," which looks very like making architecture an exact science. In his Apology for ancient Architecture, Evelyn refers with something like scorn to the "simple workmen, whose trade dwells all upon their finger-ends only. But, says he, "we shall not appeal to such scribes as these; there are others to be found that, having their first studies well founded on the principles of geometry,"—we know the sort of thing that follows.

The architects of those days, however, were not going to be led by the nose by the "superior persons." They were not going to kill the goose that laid the golden eggs. The "simple workmen whose trade dwells all upon their finger-ends only" had an honored and a conspicuous place in the making of English Renaissance design. The architect did not swamp the craftsman or destroy his individuality, or play the masterful dictator by putting a clause into his specification to the effect that "No moulded work, or work involving the design of the architect, to be put in hand without previous application to him for, and supply by him of, the necessary full-size and detail drawings."

This piece of supreme folly and suicidal presumption it was left for the architect of the nineteenth century to inaugurate.

Time and your patience would fail me were I to go properly into this phase of the subject, or to show how even an old stickler like Thomas Tresham lets the workman work his will, as where, in the Triangular Lodge, he lets the local mason put in the local crocketed gables seen in Perpendicular work at Higham Ferrers; or, at Rothwell and Lyveden, the familiar Tudor features of angle staircases, ranged heraldry, bay windows, &c.

To see concisely and easily what were the relations of the architectural designers and craftsmen we cannot do better than go to Oxford. Take such work as Fox's at Corpus (1516), or Wadhams (1613), or Pembroke (1620), or the various phases of Renaissance at St. John's, including Inigo Jones's inner quad. (1635). And what I would ask you to specially notice is that all the work,—in spite of its Classicism,—is as Gothic as New College, as fully local (harring a Somerset touch in Wadhams) as Merton or Magdalen, as fully English as it well could be. It matters not the date of the Oxford buildings, they are Oxford work. The door to the qualities of all alike open to one master-key. The big-sounding architects' names attached to their initiation do not count for very much. Old architecture, as I said, is craftsmanship or nothing, and this proud city of learning is indebted for her architectural triumphs, whose fame is in all the world, to the "simple workmen whose trade dwells all upon their finger-ends." Verily, there is a place in the exercise of our craft for learning, geometry, and refinement just as there was a place for the polished weapons from Saul's armoury in the battle against the Philistines, but none the less is there a place for the native invention of the local genius with his five smooth stones out of the brook of common local art. Saul may slay his thousands, but David,—said the singing women,—his ten thousands. Even Inigo Jones, with his big

name, big individuality, and big reputation in "the profession" submits like a man to the embrace of the genius of the place, and lets the local handicraftsman have his say in the details, even to the plumber who made those magnificent stack-pipe heads you and I have sketched and tried to reproduce.

Of the art of the third phase of this section of my subject,—the art of the Gothic and other revivals,—I need only say, at this moment, that these revivals arrested workshop traditions. The revival was also a revolution in which the poor decrepit handicrafts which represented tradition went to the wall; and the Voltaire of the revolution,—the writer who with his pen shook down the whole fabric of tradition by appealing to the individual's own sense of beauty,—was Mr. Ruskin.

My next point (3), that the handicraftsman is not what he was,—in skill, practical knowledge, design, or imaginative talent,—needs, alas! but little argument to prove.

In judging of the architecture of old days,—say of Italy in the fifteenth century, of England or Germany in the sixteenth century,—you do not look merely at the plan or scheme of the buildings, but at their fittings and furniture inside. The bare walls are but the frame for the picture, the casket for the gems inside. In other words, we look at what is being turned out by the craftsmen all round. The touchstone we apply to test the merit of a nation's art is the condition of the trades. We go to the minutiae of the mason's, carpenter's, smith's, weaver's, painter's, plasterer's work to tell us the state of architecture. On visiting an old house the stamped leadwork on the waterbutt at the door that the wine-leaves will soon shrond from sight, the big stack-pipe head that two families of sparrows have appropriated during this long bout of dry weather, the moulded door, the brasswork on the mantelpiece, the clock, the panelling, the plaster ceiling, the chairs, grates, staircase,—in fact, everything your eyes light upon, bears witness of the then state of architecture. It is different now, when the British matron has to go for her home treasures to Tottenham-court-road, or when the British parson has to yield himself a prey to the handiworkings of an eminent Birmingham firm or to the eloquent self-adulatory notices of the Barnum of the West.

Of course the handicrafts and architecture went to the wall together, and were both in an equally bad state at the end of the eighteenth century. The handicrafts will not prosper without proper encouragement and proper nurture: and the humdrum existence, the bad wars, the niggardly art-patronage, the mechanical utilitarian spirit, and the Quakerish religion of the times, all contrived to their downfall. Think of the Dutch doll-houses people had the face to put up then! See, too, what Puritanism had done for England when the relations of art with religion were represented by some such entry in the churchwardens' account as this:—"To altering the Commendments, to mending the Belief, and to making a new Lord's Prayer, 4l. 10s."

Now, in making this broad and not very complimentary statement about the handicraftsman of to-day, I blame him not. I pity him from the bottom of my heart; for I know how the stars in their courses have fought against him. The domineering architect, the scornful critic, the capricious public, the steam-joinery builder, all these and many more things are against him, and all have contributed to degrade him. But when the parson explained to the rustic the three causes for a certain thing the latter forcibly remarked that "A hog h'aint got three fathers"! So here there must be one great cause for the downfall of the craftsman from the high estate he held in better times, which I have done my best to bring before you: and I take the root of the mischief to be this,—the lack of definite art-types. No trades can exist,—no, and no architecture can live,—without these. Workshop traditions were everything to the trades in old days, and nothing lasting can come out of our design till the workshops again have their stock-in-trade of types. The trades live only by the circulation of good, stable art-*motifs* and types. These are their life-blood. Check their flow and the trades languish; stop their flow and the trades die.

Now I have dwelt upon the Classic Renaissance thus long and fully so that I might be the better able to point a moral for ourselves in our conduct of the Gothic and Renaissance revivals now going on. And there is quite

enough similarly in the conditions of the times which saw their inauguration to warrant comparison. Each came on the heel of a decrepit art that after a process of soft antinatural dissolution was now seemingly at its last gasp. Each found a ready welcome from art patrons and designers. Each found the world eagerly looking for it as a sick man looks for his tonic.

There has been a tendency lately to speak disparagingly of the Gothic Revival. Too often have I been guilty of this, because one had a vague idea that the Gothic revival slew traditional art and ruined the handicrafts. But this is scarcely fair. To be honest, there was nothing that was necessarily destructive to the handicrafts in the mere revival of the Gothic. Nor was it the Gothic revival that did the mischief, but it was the idiotic, needless, abominably selfish way in which it has been conducted. The Gothic revival has been a glorious boon to paper design, because paper design was all we architects cared for. The carrying forward of the Gothic revival has been no boon to the handicrafts, because it was not our game to make it so. The craftsmen went down as the architect went up. The Classic had been an effective tonic and stimulant to the decrepit Gothic of the sixteenth century, because the tonic reached the right persons; and the Gothic was not an effective tonic to the decrepit Classic of the nineteenth century, just because it didn't reach everybody, and was only applied to the paper designer and not to the handicraftsman.

I now come to the fourth point,—The present relations of architectural design to the handicrafts. When I approach it, and ask for myself and for you, "Watchman, what of the night?" I am bound to say that I dread a too candid reply. Of course, we are accustomed to carry on design in such a grand, creative, cosmopolitan sort of way, that some may resent even the notion of inquiring as to the march of things. The view from this Olympus of ours at Conduit-street, cold and bare though its top be, brings home to us a sense of being monarchs of all that we survey. The very photographs sent to the Colonies demonstrate this, and I am sure the natives will have sense enough to see it too. But in a Jubilee retrospect of English architecture, we should have to go farther afield, and note such noble works as Barry's Houses of Parliament, Scott's Colonial Offices, Burgess's Cork Cathedral, Street's Law Courts, Shaw's "Adocate" and his "Alliance" offices, Waterhouse's Manchester Town-hall, Pearson's Truro Cathedral, Bodley's Hoar Cross Church; to say nothing of Morris's manufactures, that have done more for the workshops and the home arts of England than the efforts of all paper-designers whatsoever.

We know, then, how great is our inventive power: yet if we may dare to be honest, we must own that this gorgeous garment of Victorian art is, after all, but a patched-up thing. Its tricky devices, delightful though they be, show no community of art-motive and effort in the troop of the designers; the designs are anything but all of a piece woven through and through. Ah! what waste of brain-tissue is here! What specious success does not this art represent! In what an abnormal state must design be to admit of such concoctions! Yes, verily,—

"The time is out of joint; oh! cursed spite,  
That we were born to set it right."

At the outset I hinted that our relations with the craftsman who, at our various works throughout the land is extinguishing himself as he distinguishes us, and emphasising our individuality at the expense of his own,—our relations, I said, are only such as her Majesty's mails supply. In other words, we are dictators, and the craftsmen are our bumble slaves. Designers are completely out of touch with the trades. Design has run miles and miles away from the knowledge and sympathies of the craftsman, and that clause in our specifications which forbids the execution of any work "involving the design of the architect" signifies that we mean to keep him exiled where he is. Whether we shall ever get things back to their normal state is more than I can tell; perhaps English architecture, with its steam joinery works and architects' offices, forming one grand department of science and art, may "bust up" before remedial measures are applied at all.

My closing words shall be a summing-up of the lessons of the situation, and these I put for the sake of conciseness under the head of

fallacies that seem to me to underlie and take the heart out of all our modern efforts in design.

Fallacy No. 1.—That museums, exhibitions, schools of art, sketching excursions, manuals of design, photographs of old art, will regenerate the dead handicrafts of England. However these may stimulate the design of designers, I cannot see how workshop types can spring from such agencies.

Fallacy No. 2.—That the multiplication of able designers will regenerate art. We have too many eagles among us already, it seems to me, and too few wrens. The lessons of South Kensington upon this head should not be lost upon architects. Nothing could be less true than that the triumphs of old art were won by paper draughtsmen.

Fallacy No. 3.—That steam joinery is art. I have no faith in that "kittle of steam" that is fast enabling the builder, with the devil's help, to all but dispense with the services of the tradesmen.

Fallacy No. 4.—That art can be developed by means of our paper designs. Development means freedom to adapt and to combine during the processes of making a thing, freedom to bring a familiar type to perfection by easy stages and "happy thoughts." We never can attain good lasting results by setting men to work in the types of styles of which they have no familiar knowledge and with which they are out of sympathy. Now, whatever your views may be about current politics, there is one point in regard to this matter of workshop union of design and handicraft where you, Sirs, will certainly agree with me, and that is that Home Rule is better than Coercion.

Fallacy No. 5.—That somehow a vernacular style will spring, Phoenix-like, from the ashes of our present topsy-turviness. There is nothing in history that warrants the opinion. It requires an inconceivable miracle to make licence into law. It took a God to bring order out of chaos.

Fallacy No. 6.—That adequate working designs can be expressed on paper. Possibly so, yet to me the incidental in old art is its chief charm. To fasten an able craftsman down to strict adherence to some feeble effusion from an architect's office is to degrade the man. Fancy the Heckington Sepulchre, or the Antwerp Well, or the Hampton Court gates, being evolved out of paper designs and working drawings!

Now, at the bottom of all these fallacies is the one great cause of the lost relations of architecture and the handicrafts. We are hindered by the lessons of history, of old art, no less than by our common sense, and the convictions of our own hearts, to return with all the speed we may to the old fraternal relations of designer and craftsman. The rift in the lute has been too long active to be mended all at once, yet there are obvious ways in which remedies may be tried, and the music of English art regain its sweetness. For architects to cultivate, each one for himself, at least some one branch of the handicrafts, that is one way. To make ourselves and our pupils familiar with the insides of workshops; possibly to turn architect-holders "ourselves, or to ally ourselves with trusty builders whose staffs of workmen shall get to know our types and methods,—these and many other ways may suggest themselves to you. Granted that the desire is present in our minds, that the Brotherhood of Art is a flesh-and-blood reality to us,—granted that the claims of the Esau and Ishmaels, whom we have driven into the wilderness, are before us,—"Love will find out the way," as the old song says, to help him.

But let my last words upon the relations of architectural designer and craftsman be the golden words of the great Master Himself,—

"He that is greatest among you, let him be as the younger: and he that is chief as he that doth serve."

In the discussion which followed, Mr. Brett (the landscape painter), Professor Kerr, Mr. E. C. Robins, Mr. Walter Craze, Mr. William White, F.S.A., and the Chairman took part. A report of this discussion will be found in another portion of this week's *Builder*.

At Wednesday afternoon's meeting, Mr. Arthur Cates, who occupied the chair, prefaced the reading of the paper on "Education" by a few remarks. He said that the subject to be considered at that meeting was the most important allotted for the consideration of the Conference. The burning questions of "Federation" and "Registration," which were

to be considered at succeeding meetings, were less important to the well-being and prosperity of the profession than this vital one of education, which must largely influence any decision upon either of the others. At former Conferences and ordinary meetings in various places this subject of education had in various phases been fully discussed. The systems adopted in Continental universities and fine-art academies had been fully explained, but little progress had been made towards establishing any systematic course of education which would provide a sound and extensive foundation on which the young architect might build up that superstructure of professional knowledge necessary for the successful practice of his art. The obligatory Examination established by the Institute had done much to point out to the student the extent of the knowledge which should be acquired; and the course of study required to be gone through by the candidate to enable him to pass had been highly beneficial in its results. And when, in future years, the standard could be raised, be anticipated from such obligatory Examination, the happiest results in advancing the status of the profession. The chief difficulty with reference to the present Examination arose from deficiency of preliminary education, a want of training in mathematical and geometrical accuracy, and generally an absence of precision and exact knowledge in those technical subjects a thorough acquaintance with which lay at the root of an architect's success. But here they had no exact course of study which could be followed by the student as a certain guide for his education. There was a very large amount of educational opportunity available in London and in various centres throughout the country, but as yet there had been no uniform action, no combination of power and opportunity, nor had any definite guidance been as yet offered to the student who, either unaware of the opportunities within his reach, or bewildered by their number and want of organisation, was too often content to limit himself to office work, or, if the artistic spirit was strong within him, to devote all his energies to brilliant sketching and design before he had mastered even the rudiments of either of the scientific or artistic branches of the profession. A committee of the Institute had been for some time engaged in the consideration of this special matter, and would, he hoped, succeed in producing a students' text-book, which would bring all this scattered information into one hand-book properly arranged for the guidance of the student; but on the other side of the Atlantic a great advance had been made in this direction. In No. 9 of the "Journal of Proceedings," for February 17 last, there was an interesting notice of Mr. Richard M. Roe setting out recent particulars respecting the course of a Diploma in Architecture in France. Mr. Arthur Hill, of Cork, from whom they would have a valuable communication that afternoon, supplied detailed information respecting the curriculum of education for architects at the Massachusetts Institute of Technology at Boston and at the Columbia College, New York. Mr. W. H. White had supplied similar information respecting the course leading to the degree of Bachelor of Science in Architecture at the Cornell University, Ithaca, New York. This information deserved careful study, and had, he hoped, received attention from most of those present. With reference to the curriculum at the Cornell University, they had the advantage and honour of the presence at the Conference of Professor Babcock, by whom that curriculum was arranged. That gentleman, in order to aid and assist the consideration of the subject, had not only kindly undertaken to prepare a paper, but had hastened his departure from New York by some days in order to be present at the Conference, and personally favour them with his advice,—an act inspired by generous feeling for which their warmest thanks were due to the learned Professor (applause). The papers to be read that afternoon would necessarily be short and closely confined to the subject treated, in order that ample time might be allowed for discussion. The papers might be divided broadly into two groups, one dealing with the curriculum which should be followed in the education of an architect, and the means by which such curriculum might be established; and the other with the not less important question of the position which the Institute should take in reference to education;

and the results that influence must have in aiding that knitting together of the scattered members of the profession, and in helping Architecture to take its place in public estimation as a recognised profession, like Law or Medicine. The result of that afternoon's discussion would, he hoped, be to materially advance both objects, and he trusted that they would not separate without taking some steps towards their realisation.

Professor Babcock (Cornell University, U.S.A.) then read the following paper:—

#### A COURSE OF INSTRUCTION IN ARCHITECTURE.

MAY I not assume, in the presence of the educated gentlemen whom I have the honour to address, that the question of the *desirability* of educating young men specially for the profession of architecture, is one that needs no discussion? May I not take it for granted that a technical education is necessary in order that architects may keep up with the times? They must have a knowledge of art, of science, and of certain mechanical and trade work. How can that knowledge best be acquired? Will the young man get it most readily and thoroughly in an office, through the casual and hurried hints of his employer and the directions given by the chief draughtsman, supplemented by such reading as he can find time for? Or in a proper school, under skilled teachers, whose sole business it is to instruct?

I will not waste your time by arguing in favour of technical schools of architecture, and I can say nothing against them. Across the Channel there seems to be no doubt as to their utility; and in the United States, whence I am summoned to address you, there are at least three flourishing schools, parts of large colleges, each with a curriculum extending over four years, and attended, altogether, by about 150 students. Your invitation to read a paper here on the subject of architectural education came to me so recently that I had no time, before preparing it, to learn whether it would be most agreeable to you that I should state the *raison d'être*, or the *modus operandi*, or the practical results, of special training, in special schools, for our particular profession, or consider the possibility of teaching our art at all in such a way as to make it worth while for the student to spend the time and money required for a systematic study of it. I could readily fill up the time allotted to me with my views on any one of these points.

I think, however, that I can most profitably discuss that part of the whole matter, which I have had occasion to work out in detail, viz., the subjects of instruction that ought to be included in "A Course in Architecture," and the extent to which each one should be pursued. The courses now prescribed in the American colleges referred to have been printed in your "Journal of Proceedings," so that you have the opportunity of examining their arrangement and details, and of comparing them with one another. I will not take any one of them as a model, but rather state what seem to me the important things to be included in any such curriculum, and the best way of treating them.

The object of a course in architecture should be, if I may quote from the register of the institution in which I am employed, "not merely," it might perhaps better be "not chiefly," "to develop the artistic powers of the student, but to lay that foundation of knowledge without which there can be no true art." Architecture is a fine art, based upon a mechanical art. Before the architect can become a true artist he must be master of the art of building. He need not be, ordinarily he cannot be, a mason or a carpenter, or a stone-cutter. But he must know how to design good masonry and good carpentry, and be able to pass judgment upon completed work.

He must also, to meet the demands of the present time, which in the main are just, be a man of science; that is, he must know the scientific principles of buildings, the laws of mechanics to which structures are amenable, and the application of those laws in designing architectural structures. Then there are certain trades whose work is commonly essential to the comfort or protection of buildings, and which he must therefore condescend to recognise, such as painting and plumbing. The latter, if one may judge from the prominence given to it in architectural journals, is of immense importance. There was a period, just

ended, when, on both sides of the Atlantic, it might have been inferred, from the leading articles in some of those papers whose special function it is to disseminate a knowledge of architecture and the allied arts, that the one thing that the student should acquire, and the aged practitioner, too, if his early education was neglected, is a knowledge of traps, their nature in general, their particular forms, their uses, the materials of which they are composed, the mysteries of their operation, the derangements to which they are liable, and the dangers that lurk unseen in their hidden depths. When these and some other matters are disposed of, the architect may turn his attention to designing, which is his particular art.

Let me state the proper subjects of study under the following heads:—

Building, Mathematics, Mechanics, general Sciences, History of Styles, Drawing and Designing, and Language.

How much of each of these is it necessary for a thoroughly-equipped architect to know? How much knowledge of each can be communicated in a school? Your programme calls for short papers, and I shall give you only an abstract of the longer document that I would have been glad to offer.

1. As to Building.—It is evidently impracticable, for want of time, to put the student through a course of practice in masonry, carpentry, and the like. We cannot train him in the manual of the shovel, the hod, and the hoe, nor oblige him to dress stone and lay it by line, level, and plumb, each piece on its natural bed and all properly hounded; we cannot make him an expert in the use of planes, saws, chisels, and such like. It would do him no special good if we could. It is not necessary that a man should be able to do certain work in order to gain a knowledge of it and be a judge of it, as all critics will maintain; nor will the ability to make a door be of any particular use in enabling a student to design a door. He can learn how a door is made by seeing somebody else make it, or from instruction in a class-room. By the use of his eyes and his ears he can learn all that he need know of the processes of building. Shop practice, in my judgment, is time thrown away, unless it be taken as physical exercise. The object of a course in architecture is not to make skilled mechanics. As to plumbing, steam-heating, electric lighting, &c., things which do not materially affect the planning of the building, nor in any way the character of the design, there are certain general principles of arrangement and operation that can be systematically taught, and a multiplicity of details that can be learned only by examination of apparatus and inspection of work in progress. Here, as in the case of masonry and carpentry, lectures and text-books are to be supplemented, illustrated, enforced, by visits to buildings in which the mechanics can be seen at their work. When once the student has learned how any particular kind of work ought to be done, he is capable of specifying it, and of deciding whether it is good, bad, or indifferent. The instruction in these subjects comes under the heads of Construction and Specifications, which should go together, and be begun early in the course. Fortunately, there are several excellent text-books on these subjects.

2. Mathematics and Mechanics may be spoken of together, as the required amount of the former will depend upon the use to be made of it in the latter. The Mechanics of Architecture, properly presented, is not an intricate or difficult subject. It is simply the statics of rigid bodies. Dynamics, phonomics, kinematics, hydrostatics, may all be omitted. They are necessary to the engineer, but not to the architect. Under "Strength of Materials" the laws of tension, shearing, compression, and transverse strain must be explained; but they may be expressed in formulae which involve no other mathematics than arithmetic and algebra, and the application of these to ties, struts, beams, and piers is very easy. For analytical investigation, however, geometry, trigonometry, analytical geometry, and the calculus, will be necessary. But if the student may be allowed to content himself with the results of other men's labours, if he does not care to rank as a man of science and find out how the results were obtained, he may very properly dispense with analytics and calculus.

As a matter of fact, when he gets into the practice of his profession, he will never see them. If he wants a rolled iron I hear to

carry a given load, he will not proceed to design one with scientifically proportioned flanges and web. He will take a manufacturer's table and pick out one that will answer his purpose. The maker guarantees the strength of the beam; and the architect troubles himself no more about it. If he designed it according to the accepted formulae, he would use a factor of safety, which one of our engineers has happily named "a factor of ignorance." It is best, of course, that a student should understand the theories of things, but it is not necessary. And furthermore, owing to the lack of homogeneity in the materials we use, the factor in the formula which is derived from experiment on small pieces of comparatively perfect stuff, may be entirely unreliable in the case of large pieces. For example, we have recently learned, on our side of the water, that the average strength of wooden beams taken from the lumber-yards is very much less than the commonly-accepted formulae would allow.

In the determination of the strains in beams and trusses, and of the line of pressure in piers and arches, the graphical method has, for practical purposes, superseded the analytical, and it is so simple that any one may use it and he made to understand the principles on which it is based.

3rd. As to general sciences.—Physics must, of course, be the beginning of any studies in science. The other necessary branches are Chemistry, Botany, Geology, and Mineralogy, the uses of which, in a course of Architecture, are too obvious to require explanation.

4th. History.—An architect, like any other professional man, ought to know what has been done by those who have preceded him. This knowledge he will get by the study of architecture in the historical order. The field is a vast one, and it takes a long time to traverse it thoroughly. But there are many books on the subject. Why not, then, let the student gain his knowledge by reading, rather than by instruction given in a school? Why is a teacher necessary?

My answer to these questions is that the book which will give full, correct, well-arranged information on the subject is yet to be written. The popular histories are usually either limited or superficial. Fergusson's, which contains a very valuable collection of examples, is imperfect, badly arranged, unsatisfactory in the treatment of important details, and padded with his theories and criticisms. What the student wants is a clear, complete, well-illustrated statement of architectural facts. Theories are interesting, but at this stage of his education they will do him little good. Criticisms will tend to bias his judgment, and prevent the free exercise of his taste when he is more mature. He wants to know what the Egyptians, and the Greeks, and the Romans, and all other people have built, when, why, and in what manner. He should make himself acquainted with the constructive devices employed, and their application to various classes of building. All is plain enough in the books generally so far as the Classical period is concerned; but when the student comes to Byzantine and Romanesque, he needs a guide, and a much better informed one than has yet written a book. The earlier authors will probably tell him that those styles are mere degraded Roman, and not worth his attention. The later ones will admit that they are interesting as phases of art, but that there is little to be learned from them,—at least, for any purposes of modern use. Mr. Fergusson, so far as he understands them, does them justice. But no writer seems yet to have discovered the fact that the time included between the years 400 and 1200 is the great period of architectural invention. We are taught to regard the Gothic architects as the most inventive. But what is there, among features that may be called constructive, which appears for the first time in Gothic? Really, scarcely anything but tracery. Buttresses, both common and flying, rib vaulting, pointed arches, compound piers,—all were in use long before there was any Gothic architecture.

As to the proper historical status and logical position of Romanesque, your Oxford professor of history, Dr. Freeman, has pointed out the fact that it, and not Roman, is the true representative of the arcuated system. Roman is really a transition from Greek to Romanesque; and I do not hesitate to say that I regard the Romanesque period as the one upon which the student should receive the most careful

instruction. But when he looks into his books he finds them lacking in the very points that he wants to know about. The use of the compound vault in Roman architecture was limited to two or three forms.

The Romanesque builders employed many more. What were they? Is there to be found in any history any approximation to a complete statement of the varieties, their geometrical development, their geographical distribution? The Byzantine architects (Pergusson says the Roman, but neither he nor any one else has proved it) devised a pendentive for making the transition from the corner of a square to a quadrant of a circle so that a dome might be made to cover a square space. The Western architects modified this so that it might be carried on pointed arches. They also invented numerous other forms for getting from the corner to a straight line above, so that an octagonal vault might cover a square room, or an octagonal spire be placed on a square tower. Now, let the student turn to the histories and see what he can learn about pendentives. He will find that the information is very scanty. There are a few examples, but no one has gathered them together and classified them. Many forms are evidently unknown to the writers. Allow me to develop the forms of pendentives descriptively. It will not take long. The subject is almost entirely, as to form, a matter of geometry. Take first the preparation for an octagonal vault. A heavy stone slab may be laid across the corner of the scale of the building is not too large, and the job is done. Or a series of advancing corbel tables may be used on any scale. If the corners of the corbel courses be cut away to form a continuous plane surface, the pendentive may be regarded as an inverted triangular pyramid.

If the surface of this be curved on an arc of a circle vertically, a cylindrical surface is produced; if horizontally, a conical; if both ways, a spherical or spheroidal. There are also irregular forms, such as a transition from a cone to a half-dome. The same end may be attained by throwing arches across the corner, your familiar English squinch. To get to the quadrant of a circle a firm is first employed whose surface is that of a sphere whose diameter is the diagonal of the square to be covered, or something more. This is adapted for being carried by walls or by segmental or semicircular arches. By means of it a dome may be used to cover a polygonal space of any number of sides. When a spherical pendentive is to be supported by pointed arches there is a geometrical difficulty. The surface, if accurate, would be composed of two spherical surfaces intersecting at an obtuse angle, and the line of intersection would have a reflex curvature at the top, as Sir Gilbert Scott has stated. But neither the angle nor the reflex curve has ever, so far as I am aware, been found. Sir Gilbert suggests, if I remember rightly, that it was obliterated by rule of thumb. In France, however, the problem was geometrically solved simply by taking the pendentive surface from a convex, conoid, or pointed dome instead of from a sphere. The above is an instance of what may be done by an instructor to aid a student in getting a clear, systematic, comprehensive knowledge of an important constructive device, which the books fail to explain.

The history of architecture should unquestionably be a leading feature in the instruction provided for in the course, and should be taught, in my judgment, not from any text-book, but by means of lectures carefully prepared so as to cover all necessary points and eliminate what is superfluous and irrelevant. These will be illustrated by photographs, drawings, lantern slides, and coloured prints, and for the detail of structural forms, which I regard as all-important, by models. Unfortunately such models are not to be found. The Five Orders, ornamental work in relief, and such like, are abundant; but models of domes, of vaulting (excepting the simpler forms), of pendentives, of the methods of making or covering the transition from the corner of a tower to the side of an octagonal spire, of corbelling from the side of an octagon to the corner of a square above, of the varieties of cusps, and of many other things, are not to be purchased. I have a collection of two hundred and more, most of which have been made by myself or under my direction. They are invaluable, as a model is usually worth any number of drawings for purposes of illustration.

5th.—Drawing and Designing.—Drawing, both instrumental and freehand, being the architect's means of expressing himself, should be taught with great care. Accuracy and clearness are the points to be insisted on. Every line in a drawing should mean something, and its meaning should be plain. Descriptive geometry, the science of drawing, is of the utmost importance, and the student must be thoroughly drilled in it, as he will have to apply it in stereotomy, in perspective, and in finding the limiting lines of shades and shadows. It is not necessary to make every student a line draughtsman; but it is necessary that he should be able to draw with unflinching precision. Rapidity is desirable, but may be regarded as merely an accomplishment, though it has a commercial value. As to the higher art of painting in water colours, while the class ought to have some instruction in it, few will take to it readily, or become experts. I would include it in a course, but not always require it. There are many, who will become good architects, that will never learn to make a passably good coloured perspective. In fact, according to my observation, the best draughtsmen do not make the best designers. One who is intent upon expressing an idea will not stop to refine his means of expression.

As to designing, there are those who question whether it is possible to teach it. It is often considered as one of the things the power to excel in which is a special gift, the prerogative of genius. Doubtless there are men who will become good designers without training in a school; and there are some whom no amount of training will make skilful; but the average student can be taught the elements of the art in such a way as to develop his latent power. I have been astonished at the progress made by some of the bright young fellows under my charge.

As to languages, it is not practicable to require more than a year of French and a year of German, or two years of one. It would be better, I think, that the student should have Greek and Latin, which furnish most of the terminology of architecture, than any modern languages, but they are ruled out of the "new education" for scientific and practical ends. If taught in a Course in Architecture a considerable advance in them should be required as a condition of entrance. As to a choice between French and German, I incline decidedly to the former, if for no other reason than that it will enable the student to consult the best work on architecture ever written, Viollet-le-Duc's "Dictionnaire Raisonné." Until that is translated into our tongue, no English or American architect who aspires to any approximation to a full outfit for his profession can afford to dispense with the knowledge of French.

A few words in regard to the practical results of the efforts which our schools are making to teach architecture. Students who graduate from the four years' course are enabled at once to get employment. Their acquirements in drawing, designing, and mathematics make them particularly useful to their employers, and they commonly get rapid promotion. Whatever can be learned in an office they are peculiarly well qualified to profit by. Their habits of study lead them to investigate anything that on first presentation may not be quite clear. Their education has given them a power of absorption and assimilation by which they take in and digest knowledge from every available source. They soon learn the business methods of an office, and after two or three years of service may safely venture upon the practice of the profession.

Mr. E. C. Robins, F.S.A., next read the following paper

#### ON THE TECHNICAL EDUCATION OF STUDENTS OF ARCHITECTURE.

THE Examination of Architects has long been an established fact. Its first start was in the form of voluntary examination. The present Examination is compulsory for all who aspire to be associated with the Royal Institute of British Architects.

The Education of Architects is by no means an established fact, it is but an inference. It is taken for granted that architects are educated men, and that the Examination was all that was needed to show their title to the diploma, which it was contended was necessary to give to the

public the confidence they required, and to the architect the distinction he deserved.

But if the Examination has served any good purpose, it has certainly been the means of opening our eyes to the necessity for more education, both general and technical.

The admirable circular letter of the President has appropriately followed the remarks contained in his opening address to the Institute, wherein he urged the importance of making articles of apprenticeship something more than a formal introduction to the profession.

And I congratulate the Institute upon the fact that the Amended Charter has removed the *non possumus* which stood in the way of beneficent action in the direction of architectural education.

The Royal Institute of British Architects is now empowered to appropriate any available funds for the furtherance of professional education, and can not only bestow the laurel wreath, but may nurture the growth of the candidates' ambitions of its honours, without infringing its chartered rights. In these circumstances it has seemed to some of us a proper time to consider seriously in what way architectural education may best be promoted.

The fiftieth year of the reign of her Majesty will be celebrated in many ways, and by architects it will be remembered as the year upon which their chartered liberties were confirmed and enlarged,—may it also record the recognition of the necessity for extending architectural knowledge, and the establishment of an organisation by which young men intended for the architectural profession may be thoroughly fitted for the position in life they contemplate, in so far as a preliminary training may contribute to that end.

Entrance to the Church, the Army, the Law, and Medicine is guarded by special courses of instruction, through which candidates for admission must pass before presenting themselves for examination; and if any value is to be attached to the Institute examinations they must also be preceded by preparatory studies of a technical character. The nature of these studies is indicated by the pamphlet circulated by the Institute, but no special curriculum has yet been formulated.

The general spread of technical education among the masses is beginning to make itself felt, and if the pre-eminence of the architect in all building operations is to be maintained, he also must be technically educated; therefore evidence of preparatory technical acquirements must be superadded.

Specialists of all kinds are rising up around us, and are perpetually narrowing the range of an architect's sphere of action. To maintain his position as chief constructor he must become the capable master and not the slave of specialists.

Some few years ago, at the request of the Council, I drew the attention of the Institute to the supplanting work of the specialists in sanitary construction, who were rapidly undermining the influence of the architect, by proving his incompetence to build a healthy residence. The result of that paper on "The Relation of Sanitary Science to Civil Architecture" has been to awaken architects out of their sleep in this particular, so that now it is as rare to find an architect neglecting the drainage and water supply of his buildings as it was common before.

Subsequently also, at the request of the Council, I have given to the Institute the results of my enquiries into the construction and fitting of applied science buildings, a subject to which my attention had been drawn through my early association with the Executive Committee of the City and Guilds of London Institute for the Advancement of Technical Education.

My travels at home and abroad in following out this subject have made me acquainted with the extraordinary advances now being made to raise the technical aptitude of modern students all over the world. Even at home, at the two extremes of the social scale, the elementary workmen's trade schools and the University of Cambridge and Oxford are making ready for the applied science teaching demanded, and middle-class colleges are growing in number and completeness every day, whose curriculum of education are exclusively technical. Professional men associated with the arts,—like engineers and architects,—can no longer be satisfied with purely academic knowledge.

an age of laboratory instruction in the applied sciences.

The Polytechnicum has never been an English institution, but its correlative, the Technical College, is every day growing in importance and influence, as it is seen and felt that the continued scientific and commercial supremacy of the nation depends upon its appreciation and extension.

The chance knowledge picked up by a pupil in an architect's office brought there straight from an ordinary middle-class school, innocent of either art or science, with everything to learn and nobody to teach him, is not the sort of person calculated to do honour to the Institute, though he may have just squeezed through and obtained a pass entitling him to become an Associate of the Institute.

The standard of the Institute Examination will certainly have to be raised in the near future, but it must be gradually done, and that in connexion with some well-organised scheme for imparting to architects the special knowledge they are admitted to require as professional men and practising architects seeking the Institute diploma.

We are all well aware that an architect must be an artist as well as a scientific man. It is his artistic abilities which distinguish him from the civil engineer. Nevertheless, if he too exclusively devotes himself to art in his early life, he will soon get a distaste for the scientific side of his profession. It is better that a youth intended for an architect should take courses in the sciences underlying his proposed occupation for a year or two before he goes as a pupil into an architect's office for three or five years, as the case may be, his cultivation of the fine arts being rather a relaxation from his severer and more exact studies. There is no fear of losing the artistic fervour, if it ever existed; nothing to hinder the use of the sketch-book at odd times and holidays, and, if he fails to do so, no better evidence could be given that his time would be better spent in finding out in what else his genius lies. There is a wide field of usefulness for an architect of good understanding and strong common sense, even if he be not artistic. And it does not fall to the lot of every architect to pick and choose the business he likes best.

As Mr. Conder wrote to me, just before he returned to Japan, "I am strongly for the more technical education of architects; in the present age, the antiquarian and 'exclusively artistic' side of the profession can only be of much value to a very select few, or to moneyed men who take up architecture as a pastime."

The object of this paper is tentative, not empirical; dogmatically to insist on any particular course of action is quite out of place in the present position of the subject. I simply propose to make a few practical suggestions, with the view of provoking discussion, and thus to lead to the careful consideration of the question and ultimate solution of the problem. To this end let us consider

1. The preparation of a syllabus of studies.
2. The organisation of a system for imparting a knowledge of the same.
3. The revision of the rules by which the Obligatory Examination shall be conducted on the completion of the foregoing arrangements.

Preparatory to addressing myself to each of these topics, it is necessary to have a pretty clear idea of what we want to do and how it is to be done.

1. Negatively speaking, we are not ambitious to increase the number of architects, but rather to improve the quality of future members of the Royal Institute of British Architects.

2. While we should welcome natural talent and self-taught powers wherever their merits entitle them to distinction, we are not thinking of lowering the tone and standing of an honourable profession, but are distinctly desirous of raising it, so that the titles "an architect and a gentleman" shall be convertible terms.

3. While we are not satisfied with the old system of apprenticeship, and think it is not now sufficient for the needs of the profession, we are not proposing to do away with apprenticeship, but, on the contrary, to render it more effective.

4. Without revolutionising the present system, we propose to build up gradually, but firmly, a more complete system, on the old lines, but in the new manner required by the circumstances and exigencies of the present environment.

Speaking affirmatively, I have already asserted that technical education is as neces-

sary to the architectural student as to the artisan over whom he is destined to rule as a future practitioner. This point has been very clearly and tersely put by Professor Ayrton in the following paragraph:—

"Not only by means of technical education is the practical man trained to use his brain when he uses his hands, but what is quite as important for the country's welfare, the scholar, by receiving technical education, learns to use his hands when using his brains. Technical education, then, is not only the means by which scientific knowledge may be acquired by the manufacturing classes, but it also puts the scholar on a par with the country's needs, and shows him what are the battles waiting to be won, with his all-powerful mathematical and scientific weapons."

The obvious result of technically educating the masses is this, that more exact knowledge of the applied sciences will be expected and required of architects throughout the land. Fortunately for us, the means of education are widening every day, and honest workers will not fail to take advantage of their privileges. For example, the City and Guilds of London Institute for the Advancement of Technical Education have founded three important metropolitan institutions:—1. The Kennington Applied Art Schools, in the South, where life classes for drawing and painting, modelling and sculpture, are carried on under many advantages. 2. The Finsbury Technical College and School of Applied Science and Art, in the East. The life classes and decoration courses are conducted by Mr. Brophy. Both these institutions are crowded with evening students, in addition to the day classes. 3. The Central Institution in Exhibition-road, South Kensington, which has no evening classes, but it is situated in the near neighbourhood of the Natural History Museum and the National Collection of Art Treasures.

The sciences of Mechanics, Physics, Chemistry, and Mathematics are already in full swing, and a chair of Architecture is in contemplation.

The professors of these institutions are ready and willing to second the efforts of the Royal Institute of British Architects by arranging special courses of study for architectural students should they ever be required. But it will first be necessary that the Royal Institute should know its own mind, and tabulate the educational provision it thinks desirable for would-be candidates for its honours; in short, we are thus brought face to face with my first proposition.

I.—The Preparation of a Syllabus of Studies. The first question which arises here is the length and duration of the classes. Shall we go in for day as well as evening classes? If the former, shall they embrace both science and art, and extend to a three or four years' course as in American and Continental technical colleges? Or shall we be content with one year's devotion to science, almost exclusively, before entering an architect's office as a pupil, and one day a week during the pupillage for the continuation of day studies in science and in art? (Of course, no earnest worker would fail to join evening classes and lectures, of which there is every variety.) I am inclined to think that the latter course would be all that could be attempted with success at the present stage of the movement, especially since we wish to retain the pupillage system.

Even so small a variation as this from prevailing custom would need an authoritative recommendation to be published by the Royal Institute of British Architects (similar to its papers regulating fees and competitions) addressed to parents and guardians, and the profession generally, informing them that in the opinion of the Royal Institute of British Architects the following is the legitimate mode by which entrance shall be made into the profession, after due notice and from a certain fixed date, viz.:—

"On the completion of the usual general education, youths intending to enter the profession of architecture shall have sufficiently prepared themselves to pass a preliminary examination, entitling them to the privilege of joining the first year's classes for science and art provided at the Central Institution or other accredited technical college in London or the provinces.

On the completion of this one year's course of three terms, the youths to be articled to an architect for three or five years as the circumstances of the case may dictate, during which time the architect is to allow his pupil to be absent for one day in each week, or fifty-two days in the year, for the purpose of attending day classes for continued instruction in literature, science, and art as a fine art. He is also to interest himself in the evening studies of his

pupils, taking care that they are fully informed of the various classes available; the duty of the architect, as a rule, being confined to teaching the practice of the profession, unless he has a special aptitude for teaching generally.

One or more years after the completion of his articles the pupil may become a candidate for examination by the Board of Examiners of the Royal Institute of British Architects, upon the presentation of sufficient preparatory work and other credentials to satisfy the examiners that he is a fit and proper person to be examined. And if he passes creditably, he may become an Associate of the Royal Institute of British Architects, if elected in the usual manner. But no person shall present himself for examination who has not been a *bonâ fide* student of architecture, literary, scientific, and artistic, for at least five years."

Proceeding on some such lines as these, the syllabus of studies applicable for the first year prior to the introduction to an architect's office will have to be considered in the first instance. And it must not be supposed necessary or desirable to know only a little of everything in that first year, but rather to know thoroughly some few subjects, which, well grasped, will be of life-long value to the student.

The Journal of the Proceedings of the Institute (Nos. 8 and 9) contains full descriptions of three modern American technical colleges,—the Cornell University, at Ithaca, New York, described by Mr. W. H. White; the Columbia College, New York, and the Massachusetts Institute of Technology, both described by Mr. Arthur Hill.

They together represent an Americanised version of the Continental curriculum for the education of civil architects before passing a sufficient examination to entitle them to practise as architects.

And, like its foreign prototypes, this curriculum, when completed, in four years' time, takes the place of the usual term of apprenticeship; the student then entering an architect's office as an improver till he has picked up the business part of the profession with more or less readiness.

In these American institutions the course for architects in the first year is the same as that of other students, with the exception that architects and engineers are specially required to practise geometrical and freehand drawing. I propose to adopt a similar course, and by tabulating their first year's requirements the following is the resulting syllabus:—

**Mathematics.**—Geometry, plane and solid, descriptive and analytical, conic sections, trigonometry, mensuration, and algebra.

**Art.**—The history of the architecture of all ages and countries, freehand and linear drawing, projection and tinting, mechanical drawing, and the elements of perspective.

**Physics.**—Experimental mechanics, heat, optics, electricity, acoustics, laboratory practice in all.

**Chemistry.**—The chemistry of physics, materials, elementary chemistry, and laboratory practice; hygiene.

**Language.**—Either French or German, or both.

The above are together comprised in the first year's course of the American colleges, but they separately differ.

The value of this first year's course, which is necessarily an elementary one to be afterwards developed, is chiefly its preparative character,—its introduction to scientific accuracy and method, its alternate theoretical training and laboratory practice, its general sharpening of the wits and storing of the mind with scientific facts and formulae.

The ordinary education of middle-class schools is presumably sufficient to enable a youth of seventeen to pass the preliminary examination entitling him to pursue the above studies at an applied science college.

During the period of his articles, the student will make use of his evenings and of the fifty-two days in the year which his master will allow him to be absent from the office to acquire the further information which is given at the American colleges during the last three of the four years' course.

Both the Cornell University and the Massachusetts Institute provide a special course of Architecture, extending over two years only, and it may be sufficient to tabulate the subjects included therein as a guide to what is expected to be done during pupillage in addition to the continuation of the first year's applied science course already given in the syllabus for the year prior to entering an office, thus:—

**Primarily.**—Architectural history generally; Egyptian, Greek, and Roman architecture;

Romanesque architecture; Gothic architecture; building materials and construction; mechanics and graphical statics; mechanical and free-hand drawing; projections, shades, shadows, and perspective; sketching and water-colouring; and principles of design.

*Secondarily.*—Renaissance architecture; modern architecture; ornament and decoration; construction and planning; working drawings and framing; specifications and contracts; original designing and drawing; schools, churches, and theatres, &c.; ventilation and heating; surveying and geology and mechanics; and acoustics, chemistry, and mathematics.

More or less acquaintanceship with the subjects enumerated in addition to the professional practice acquired in the routine of a general practitioner should enable a young man to pass a highly creditable examination entitling him to the *Aspirant* prize.

II.—I have now arrived at the second division, viz., the organisation of a system for imparting a knowledge of the subjects contained in the foregoing curriculum.

I am of opinion that the first year's course can only be efficiently taught at one or other of the technical schools or colleges, metropolitan or provincial, and I have satisfied myself that as soon as the demand is created so soon will the supply arise. I have found that the disposition of professors generally is to strive to meet the expectations of the public and to organise courses of education suitable to forthcoming students. At all events, I can answer for the professors attached to the metropolitan technical colleges.

As to the day courses for pupils in offices, here again the want will create its means of satisfaction. And it is not altogether visionary to suppose that the Institute itself might organise a system of teachers and lecturers for architects' pupils.

As regards the evening classes, no difficulty at all can arise. Besides the courses at the Academy, the University and King's Colleges, and technical schools and colleges, there are the Architectural Association and other federated societies; in short, it will not be want of means but want of will and energy to use them that will be lacking wherever failure occurs. Therefore I may at once proceed to the third and last division of my subject, viz.,—

III.—The Revision of the Rules by which the Obligatory Examination shall be conducted.

Probably this last head is one which may be more appropriately discussed at the Board of Examiners than at the present gathering, and all I care to say upon it is this,—that the proportion of marks which shall be sufficient to entitle a student to pass must always be regulated by the means of education provided to enable him to reach the required standard. That standard also must be adjustable to the general growth of intelligence, until the organisation is complete; not only for examinations, but for teaching the knowledge required to creditably pass them, very little variation upon our present system would be possible.

But too much stress cannot be laid upon the great importance of starting fair with a year's scientific training before entering the office of an architect, to be followed up thereafter by day and evening classes, as artistic as may be.

Enthusiasm for work and for art will take away the drudgery. Armstead, the great sculptor, supported himself by designing silversmiths' work for fourteen years before he took to sculpture as a profession. He worked from nine to five for his livelihood, attended life classes from seven to nine, and then went to play at home work, and study till twelve or one, and this he kept up for several years. Verily, genius is but another name for enthusiastic work and study.

Mr. Arthur Hill, B.E., of Cork, next read the following paper:—

#### COLLEGE TRAINING FOR ARCHITECTS.

In all professions special training of some kind is an acknowledged necessity. The old-fashioned system of apprenticeship, whatever advantages it possessed, is now as much out of date for professions as it is for trades.

If any one desired to make his son a doctor, would he bind him apprentice to the old family physician; to trace prescriptions; to read such medical books as might come in his way indis-

criminate; and occasionally, perhaps, to have the benefit of a little carriage exercise in his master's brougham? Would this process be likely to produce the highly-trained body of scientific men who, as physicians and surgeons, are now to be found in every corner of the kingdom? Would he not rather send his son to some recognised school of medicine, where he would learn the theory of his profession before coming in contact with its practice from men who had already made a study of the art of teaching; and where every aid to learning that could be devised was at the student's command? It is the same with many other professions. The public know very well that preliminary college training for them is simply essential, and institutions are to be found everywhere ready to take a student and teach him exactly what he needs. With architecture it is quite different. People fancy that the routine of an office and the payment of a fee will supply all the education that is needed from the time a boy leaves school until he is expected to be able to swim for himself. And even if any one thinks otherwise, where will he find the professional training he requires? Outside London it is not to be had anywhere in a complete form, and even in London itself teaching must be sought for in three or four different places, wholly unconnected and without system. In any case, the student is left pretty much to direct the course of his own studies according to his own fancy.

There is no reason why architecture should not stand on the same platform as Medicine and other professions, and be included in the curriculum of the several universities of the kingdom, one direct effect of which would be that it would give architecture as a learned profession,—a status the public would not be slow to acknowledge. Arrangements could easily be made, at least in those colleges where schools of engineering already exist, which would enable young architects and young engineers to pursue their studies side by side,—an association which would be of manifest benefit to both.

The problem has been already solved in America. In several colleges in that country Departments of Architecture are to be found. In Columbia College, New York, which I may take as an example, there are seven parallel courses, all leading to a degree, viz., 1, Mining; 2, Civil Engineering; 3, Metallurgy; 4, Geology; 5, Chemistry; 6, Architecture; 7, Sanitary Engineering. The first year's course, which is the same for the students of all the different departments, embraces mathematics, some of the physical sciences, and drawing. The second year's begins to take a special professional direction, introducing the history of architecture into a course which is mainly an extension of the former. In the third year, the higher mechanics, strength of materials, and other scientific studies are linked with architectural design, decoration, and drawing; while in the fourth year the student's time is more devoted to art and professional work, and science is only treated in its application to technical subjects.

In England we are quite as well able to provide a system of professional college training as they are in America; and the facility we enjoy of being able to study ancient monuments without crossing the Atlantic Ocean is at least one important point in our favour.

In Liverpool, a most admirable School of Civil and Mechanical Engineering has recently been established. There is a similar school in Bristol. Owens College, Manchester, is well known; and in other towns besides London technical schools are springing up, mostly due to private munificence, such as the Mason Institute, where scientific training is to be had, but where,—unfortunately for scientific men, as well as for others,—science is taught without the smallest shade of art in the prevailing atmosphere.

Now every one of these Institutions, as well as the Irish and Scotch Universities, could be utilised for the purpose, and Cambridge, with its magnificent School of Archaeology and its Slade Professorship, and the recently-established School of Applied Mechanics, might also aid in the movement.

At Bristol an effort has already been made to associate architecture with engineering in one department. How far it has been successful I am unable to say, but an isolated and tentative effort of this kind, without general professional connexion, cannot hope to effect the title of

what a united effort would, with the assistance of the profession at large.

At the Conference of 1874 a paper of mine was read advocating the addition of a Professorship of Architecture to those colleges where a school of engineering already existed. In repeating the suggestion as I do now, after an interval of thirteen years, I believe the necessity of some system of education for architects is no longer in question; that nothing remains but to devise the way and the means. Since then the Royal Institute of British Architects' Examination has come into existence, and any system of education that may now be devised should be so built up that this examination may become the key-stone of the whole.

Now examinations conducted without a properly connected underlying system of tuition cannot be productive of any uniformity of result, a defect fatal to any broad influence of general benefit to the profession. But with a system of collegiate training, not confined to the metropolis, but scattered in many parts of the kingdom, all working in harmony, preparing candidates for this Examination, a very different result would be attained, for there can be no doubt young men who had spent two or three years in some college where their time was wholly devoted to study, and not frittered away in the commonplace duties of a drawing clerk, would ineffably surpass those whose reading was of the present promiscuous type, thereby tending (1) to raise the standard of the examinations and consequently of the profession at large; (2) to impress the public with the advantage of proper preliminary training.

Theoretical college work is not intended as a substitute for pupillage in an architect's office, but as a preliminary step thereto, for business habits cannot be acquired by theory, and the various details of practical work must be learned by contact with them. But an architect, once accustomed to pupils or assistants who had a knowledge of drawing, of the nature and properties of materials, and some idea of mouldings and other architectural details before entering his office, would never again take a raw youngster, no matter what fee was offered, but would recommend the youth to study in some college for a couple of years or so, and then, and not until then, to think of office-work.

Of course, any scheme of education would be doomed to failure unless it were taken up by the profession at large with the intention of making it an ultimate success; and it is upon this particular aspect of the education question that the Conference may be so influential.

It is not necessary to refer in detail to the subjects to be taught; the extent or balance of the various studies; how they should be taught; and who should teach them; as these matters do not affect the main question, and are comparatively easy to arrange; but examinations, the award of diplomas, and the general control and direction of the system are questions of primary importance and demand more particular reference.

Each of the several colleges already referred to might set up independent schools of architecture, and grant any degrees or diplomas they chose, having no connexion with the Institute or profession in any way,—a state of things undesirable, but not at all unlikely to arise unless the profession take an initial step and appoint a General Board of Professional Education, whose duty it should be to organise, control, and direct everything connected with education throughout the whole country. This Board should consist, in the first instance, of those gentlemen who form the present Examination Committee of the Institute, who have devoted so much time and labour to this matter, and who have brought it into the position it now occupies, together with representatives of the Architectural Association, and possibly of the leading provincial societies also. Some of the professors of the different colleges which, from time to time, join the scheme, should, *ex officio*, have seats on the Board, or, at least, a consultative voice in the settlement of technical questions. But the Board should act as the representative of the Institute, and be responsible to that body.

Their first duty should be to enter into negotiations with some college or colleges to be selected for the purpose of experiment,—say, for example, King's or University College, London, and in the provinces, Liverpool, or Owens College, Manchester,—and secure the

appointment of a professor, or professors, of architecture, who would lecture on professional subjects, and superintend the drawing school and class of design. Then a proper course of study should be arranged. In these colleges many of the courses on scientific subjects and languages would be found exactly suitable for the purpose without requiring any alteration, and the special lectures now intended for engineers might be utilised to a large extent, so that in this way a very comprehensive education might be afforded to the future members of our profession, without any expense save that of the special architectural course, and the cost of this, together with any illustrations or books that it may be necessary to provide could not under any circumstances be very serious, and might be divided in some ratio between the Institute and the colleges themselves.

From year to year further efforts should be made to induce other colleges to join and become affiliated to the Board of Education, so that ultimately all parts of the kingdom may be included in the system.

Having so far provided for "education," the next duty of the Board would be that of "examination." To insure uniformity of teaching amongst the different colleges, all examinations should be conducted by examiners appointed by the Board. The examiners might visit and hold examinations in the different centres, or all the candidates might assemble in London for the purpose. The final examination for the degree or diploma which, under the new Charter, the Institute have taken powers to confer, might be found preferable to conduct in this latter way.

A student should give his whole time to study for the first two years, but the third year's course might be so arranged, by giving the lectures in the afternoon or evening, that the student could commence practical work in an architect's office at the same time if he were disposed to do so.

The examinations should be divided in the same way. One to be held at the end of the second year's course, equivalent to what is called the "half degree" in some universities, and carrying with it admission to the Institute as an Associate. And after the third year's course, a still higher examination for the Diploma in Architecture and Fellowship of the Institute.

Of course, the scheme is here indicated in general outline only, and yet requires a great deal of consideration before all the details can be filled in, but I believe it is quite capable of being brought to a successful issue. Its main features are:—

1. Decentralisation.
2. Education conducted by trained teachers.
3. Professional control.
4. Maximum of result combined with the minimum of expense.
5. The association from the beginning, of art and science in the same course of technical education.

The adoption of some such scheme as this, which can be effected without an Act of Parliament, will tend more than anything else to produce the federation so many seem now to desire, but in what I believe to be its true form, namely, the federation of learning.

Professor Aitchison, A.R.A., then followed with a paper

#### ON ARCHITECTURAL EDUCATION.

GENTLEMEN,—It seemed to me that a conference where there was no conferring was a waste of time; that when we were visited by able men, practising in the large manufacturing, mercantile, and agricultural centres, or coming from the North,—one of the main sources of the sap and vigour of our nation,—it would be culpable negligence on our part if all these means of mutual knowledge and improvement were to come and go in vain. Diamonds can only be cut by other diamonds.

The burning questions of the day, architecturally speaking, are, in my opinion, these:—

1. How can the public be made to desire architecture and to appreciate its excellence?
2. How can architects be adequately rewarded for their skill and knowledge; for, under the present system, they are obliged to present all their artistic work for nothing?
3. What can be done to aid the progress of architecture?

This third question has for one of its factors, at least, the education of students, and it is to

this particular factor that I propose devoting the few minutes that are allowed me.

In his "Essay on Studies" Bacon says:—"Read not to contradict and confute, nor to believe and take for granted, nor to find talk and discourse, but to weigh and consider." I have, therefore, tried to weigh and consider this subject, and to put the results before you as well as I can, even in spite of being dull, hearing also in mind another of his precepts, that "some in their discourse desire rather commendation of wit, in being able to bold all arguments, than of judgment in discerning what is true, as if it were a praise to know what might be said and not what should be thought," and I hope that those present may throw more light on the subject, fill up omissions, and correct errors.

The subject seems to me of paramount importance, for it deals with the future excellence of our art, and I feel certain that there is not one architect or architectural student amongst us who would not sacrifice himself if he felt sure that by so doing he would insure a more brilliant future for the art he has embraced.

I think we may be proud of what has already been done in our time by architects, but that is no reason for not striving to do better. We have lately been overhauling the weapons in our own conquering army, not without advantage, and doubtless there are points in its drill, discipline, equipment, and skill that are capable of improvement.

The first thing that strikes us is that when an art is native, and when it is the expression of a popular want, we find no schools of it. I may instance, in the arts of the day, novel writing and engineering. Schools are mostly founded for one of two reasons,—either to start an art that does not exist, or to prop up one on the verge of decay.

We could form, too, a better notion of the value of schools, if we found that where there has been the best school there has been the best architecture; but it is not easy to know which country had the best school, unless we take it for granted from its having the best architecture.

I think if the civilised world were polled at the present day each nation would place French architecture in the second place, i.e., after their own, and France has in the Ecole des Beaux-Arts an excellent central school, though some of its former pupils think that French architecture is good rather from the natural gifts of the nation than from the teaching of its school.

We have only one good architectural school in England, the Architectural Association, and that is rather a mutual improvement society than a school.

It is very curious we should know so little about the schools of past times. What were the Greek and Roman schools like? We do know, however, that the Roman Emperors founded schools in Gaul, but these, I imagine, were what we should call grammar schools. I believe the technical schools were the Roman trade guilds. We know, too, that Charlemagne established schools in his empire, and that some of the professors were got through Haroun Alraschid from the Saracens. We know that the Saracens established schools in connexion with their great mosques, and devoted themselves to studying the geometry of the Greeks, and that at the beginning of the ninth century, viz., 813-834, in the time of Mamoun, Haroun Alraschid's son, algebra was introduced to the West from Mohamed Ben Musa's Arabic translation of the Hindoo algebra.

The first start of Saracenic architecture was in A.D. 855, and by a Christian architect; and Gothic began towards the end of the twelfth century. Although this may seem a little beside the point, particularly as we know so little about it, it is dropped as a suggestion of the effect produced, by the study of mathematics, on the new styles of architecture of those times.

The Benedictines we know had workshops for glaziers, jewellers, and goldsmiths attached to their monasteries, and must also have had architectural schools as well, for as early as 1009 A.D. they furnished the main dimensions of the monasteries to be erected in distant parts.

Nearly all our great poets have been to one of the Universities, though we must except Shakespeare and Burns.

Of the great seventeenth-century architects, neither Wren nor Perrault was educated for

an architect, and it is doubtful if Vanbrugh was.

It seems to me that as we cannot produce men with great intellects and with a taste for architecture, our only plan is to look at what is wanted, and to render the acquisition of the necessary knowledge as easy as possible, and, above all things, to bear in mind that though we cannot produce a genius we may well spoil one by smothering his talent under a mass of knowledge. As Mark Pattison says, "Accumulated learning stifles the mental powers."

It is comparatively easy to state what a man should know to be an architect,—at any rate, if you exclude the fine art,—but we have to consider what chance there is of his being able to learn it; for, to be a great architect requires a combination of qualities very rarely found to exist in the same person. Great architects are not "like two single gentlemen rolled into one," but, as was lately said, like eight or ten.

I think we ought to be careful that our student is not equipped like the knight with a mousetrap and a beehive, lest he should sleep at a place overrun with mice or meet a swarm of bees in his travels.

It seems to me that every architect must be able to construct soundly, for without that he is no architect at all. It is a great advantage to him if he knows mathematics, and when I say know, I mean that he can use the higher branches, or else he must take theory on trust, and be indebted to some one else for the solution of difficult problems. But he must know arithmetic. He ought to know descriptive geometry for developments, the interpenetration of curved surfaces, for the setting out of staircases, and of groins, vaults, and domes, with their ribs or panellings. With the Greeks, the Saracens, and the Mediaevals, geometry was the foundation for architecture.

We know from the "Arabian Nights" that the Saracen architects are always called mathematicians or geometers, even if we had never seen their elaborate geometrical patterns; we also know what a deep knowledge of practical geometry the Mediaevals must have had, from their works. To revert to our student, he must know the statical problems that are met with in building, or he must have great observation, and great memory, and then, too, he will probably only feel safe, when he is within the limits of works already executed. He must, too, have a thoroughly practical acquaintance with the materials he uses, if he is to escape serious failure, and as few architects have any real practical knowledge, he must have it theoretically.

He must, too, be a master of geometrical drawing.

He must have a fair notion of how his rooms are to be lit, warmed, and ventilated, and of those requirements for health, in the shape of drainage, &c., and precautions against heat, cold, and damp.

He wants some small knowledge of the law of contracts, and of the laws of easements, &c.

The fine art part stands in a very different position.

It is a thousand to one against any student having any architectural invention, and, as far as I know, invention cannot be taught, though there is now a proverbial belief that a good school is like that American machine where, if live pigs go in at one end, pickled pork, snaffles, and hair brushes must be turned out at the other.

We have therefore not only to provide the proper instruction for the one born architect, but we have to furnish the others with something, that will more or less take the place of natural powers and invention.

I will put a case which, I think, will make my proposition clearer. Suppose we want to make musical composers out of a thousand-and-one young fellows, and, as our first test, we take only those who can whistle a tune or play "Jim Crow" on the Jew's-harp, what provision should we make for their teaching?

I have used this illustration because it strikes architects that musical composition is a rare gift, while it is commonly supposed that architectural composition is a common gift, although it is not more common than the other.

The utmost we can do is to cut, polish, and set the stones we have picked up on the beach, the bulk will be flints and Brighton emeralds. We are lucky if we get a few agates, some rock crystals, and a few common amethysts amongst them, and we can hardly expect to find a ruby, an emerald, a sapphire, or a diamond.

Let us see what we can do in the way of cutting, polishing, and setting.

You cannot have architecture without proportion, and scarcely without mouldings.

The ordinary method of teaching harmonic proportion is to let the student draw out the Greek orders, and a few Greek buildings, and learn the ratios, and perhaps to draw one, and calculate the ratio of a few other buildings celebrated for their proportions, and try by these means to cultivate his taste.

We do the same with the Greek mouldings, but too frequently forget to teach him that these were executed in marble for a clear atmosphere and a sunny climate, while our material is brick or stone, our climate is misty, not to speak of the fog in large towns, and the climate is the reverse of sunny.

Gothic mouldings will at least show him how to get shade in a sunless clime, and also the devices used to produce lines of light, and he should be made to design mouldings for various positions, as elegant as Greek ones, and as logical for our climate as the Gothic ones.

Study will give him more or less insight into the harmonies of lines and shapes.

Style we cannot teach, for no style peculiar to our time exists in any civilised nation of the world.

Our only hope is that, by showing him the real styles that have existed, Greek, Byzantine, Saracenic, and Gothic, and by letting him take an artless structure built in accordance with purely logical deduction, he will try to make it beautiful.

Eccentric ugliness is better than second-hand beauty, if it be the right step forward.

Viollet-le-Duc's humorous comparison of architects to an opera chorus where they all sing "Let us go," and never move, is as true now as it was when he wrote it.

Queen Elizabeth's stinging repartee to Raleigh seems to be acted on by all architects in a contrary sense:—

Raleigh.—I fear to climb as high lest I do fall.  
Queen Elizabeth.—If thy heart fail thee, do not climb at all.

If an architect has time and talent enough to be a sculptor as well, by all means let him be one, but our buildings are covered with archaic ornament because the architect thinks he ought to design it and have it carved by a mason. The public encourage this; they care nothing for sculpture, and know if it is an architect's work they get it for nothing or next to nothing.

If Ferguson was right in his statement that the only cause for our not being superior to all past times in the fine arts is because we go the wrong way to work, it would be of the very first importance to find out how the Greeks, the Byzantine-Romans, Saracens, and Mediaevals were taught and worked; but I fear the causes lie deeper than that. Nevertheless, much improvement is lost by isolated work, and more by not making a second building in correction of the first. All that we know is how the Italian Renaissance architects were taught. The Italians first apprenticed a youth with a taste for the arts to a goldsmith to make him handy with his fingers, and to assure him of a livelihood should he fail in the arts, they taught him to draw the figure, and if he wanted to be an architect, he picked up architecture by measuring ruins, and seeing how new buildings were built.

Though "self-taught is well taught," real systematic instruction is, in my opinion, invaluable; it not only saves time, but it is more thorough and complete; only the teaching must not be by pedants, however learned or able, but by men who know that their teaching is towards another end, and who will render it as useful as possible to that end.

Professor Ayrton, in a lecture given at the house of one of our professional brothers, put this very well:—

"Let us make a student understand that a certain knowledge is of real service to him, and he will then, unless he is exceptionally lazy,—exert himself to gain what he feels the need of. This most important element in human nature, the desire to get what we want, seems to me to have been sadly overlooked in the educational system of the past."

From a lack of preliminary knowledge pupils seem to me to leave an office at the very time the knowledge they can only get there, is beginning to be of use to them.

The three main things nineteenth-century architecture seems to me to lack is more original and daring construction more inven-

tion, more perfect subordination of parts, and greater finish.

If you agree with me, it is for you to say how we are to compass this.

Professor T. Roger Smith next read the paper immediately following:—

#### A STUDIO FOR ARCHITECTURE: A SUGGESTION.

No proposal for architectural education is, in the judgment of most of us,—certainly in mine,—likely to supersede pupillage as the most valuable way of fitting a youth for the practice of architecture. But something is needed that shall supplement pupillage.

I have a recollection of a most influential public meeting held under this roof, now many years ago, which appointed a committee and set on foot an organisation for architectural education on a somewhat grand scale, with such men as Rnskin, Scott, and Burges upon it; and the effort led to no result. My suggestion to-day is, that the attempt should be made in quite a different manner, with a comparatively modest and unpretending equipment, and under the sole guidance of one or two suitable men who can give time and attention to it, and, I believe, that a modest commencement of that sort might have a better chance.

What appears to me desirable is an organisation for giving regular systematic instruction day by day, at the drawing-board chiefly, and therefore different from and in addition to the classes at King's College or University College or the Architectural Association.

Instruction in architecture obtainable in the day-time at moderate, yet fairly remunerative fees, in the metropolis, and the great centres, such as Edinburgh, Glasgow, Manchester, and Liverpool, ought to attract students of at least three distinct classes. (1.) Youths destined for the architectural profession who have left school or college, but whose friends are very wisely advised that they will be better prepared to reap benefit from being architects' pupils if they have some instruction in the rudiments of architecture before being articulated. It is, let me observe in passing, of great importance to provide for youths at this stage something which shall form a kind of bridge between the regular routine of school, when all the work is cut out before hand, and every hour accounted for, and the freedom from restraint, and usually also from guidance, of an office. (2.) Pupils whose masters recognise that their offices are not places where much definite instruction is possible, and embrace an opportunity of securing such teaching outside. (3.) Young men of older standing preparing to pass the Institute Examinations. Classes 1 and 2 would furnish the junior students; class 3, the seniors, some of whom would be fitted to act as monitors, with advantage to themselves and to the juniors, as some of the elder men did in Mr. Harvey's excellent masonry class.

The object of this paper is to suggest that it would be perfectly feasible, and not difficult to establish for the benefit of such students, by private enterprise, what I propose to call an architect's studio; not on the lines of the ateliers in which architects, painters, and sculptors in Paris learn their art, but with some resemblance thereto, though more like some private drawing studios, such as Lee's, which have done good work in London at one time. I believe that such an establishment set up by the right man, would be successful, and would be of great service.

Why should not a properly-qualified architect,—or better, two friends, of whom one inclines to the art and the other to the science of our profession,—open a large well-lighted room, fitted like a drawing-office, but with the addition of a good supply of the needful books, prints, and plaster casts, where students could attend five days and a half in the week, and receive instruction, and draw, under constant, or at least daily, guidance and supervision?

The subjects to be taught ought to be those which the master is thoroughly competent to teach, and such as the students most require to learn. Some or all of the following suggest themselves:—

1. First, draughtsmanship.—Every drawing made should be scrutinised from the point of view of how it is done, as well as what it represents, and each day's work, as far as it is done with the pencil, should be a drawing lesson as well as an architectural lesson.

2. Architectural forms and details.—In the case of junior students I would limit this to a somewhat complete study of Greek from prints and drawings, and, where possible, casts; and of some one period of English Gothic from actual buildings and plaster casts. Perhaps I may be permitted, as it is necessary to make this paper short, to refer to my syllabus on the study of architecture issued by the Department of Science and Art, for a statement of the reasons for this programme, for which there is not space here. In the case of advanced students I would add work in that style of architecture with which the teacher has made himself most familiar, or in which he has won distinction, and if this were to lead to the formation round an able teacher of something like a school I do not think the result would be a bad one.

3. Designing architecture, general principles of composition, consistency in the use of examples, and practice in making designs to conform to a fixed programme, and to embody the forms and details of a definite style.

4. Perspective and sciography.

5. Water-colour drawing.

6. Measuring, sketching, and drawing out portions of some existing building, and drawing up a written description of the same.

7. Descriptive geometry, and the modern graphic methods of investigating the strains in trusses, beams, arches, and other structures.

8. Building construction.

If it were possible to combine with the studio a workshop where the students could do some carpenter's, joiner's, or mason's work, under a competent foreman, this would add to the value of the course.

Students who attend a studio could consult the master about their private reading and how best to employ their evenings, and which of the various institutions or classes open affords them the instruction suited to their individual needs. I do not think the studio should itself have evening classes, unless it were drawing-classes. Some of the students might, perhaps, spend part of the day-time as well as their evenings in attending classes for the study of some cognate subject, such as mathematics, geology, mineralogy, or hygiene.

The experiment would have the best chance of success if tried first in London, or better still Westminster, close to the Abbey and the Architectural Museum, and within easy reach of the South Kensington Museum, and accessible from most parts.

The most difficult and most essential part remains, viz., to find the right man for the undertaking, and to deter the wrong one from attempting it. He who might with advantage start and carry on such a studio must be an educated and cultivated person, both as to general knowledge and as to architecture. If he is to teach and train he must first know and be trained. He must also be apt to teach. This aptitude is to some extent a natural gift.

Further, he must be thoroughly in touch with the students. This is perhaps oftenest met with in a young or youngish man, but mature age need not be a disqualification. There are many men past middle life still capable of feeling all a young man's difficulties, winning his confidence, and rousing his enthusiasm. Who, for example, that knows our friend the present Director of the British School of Archaeology at Athens could imagine that his years and his honours would ever prevent any student from feeling at home under his guidance?

A last qualification, but I think an essential one if the experiment is to succeed, is that the master must be to some little extent a man of mark. I do not mean that he must be a Royal Academician or some one of that standing, but he must be sufficiently a marked man to command the confidence of students, of the body of architects, and to a certain extent of the outside public; otherwise students will be slow to find him and their friends backward in sending them. He must also be able to devote a considerable amount of time to the work; not, indeed, all day, but some part of every day, and with energy and devotedness it appears practically certain that the starter of such a studio would render a great service to his profession, and that his undertaking would serve to introduce a much-needed improvement.

Mr. R. Bené Spiers, F.S.A., read the next paper, on

#### THE ARCHITECTURAL SCHOOL OF THE ROYAL ACADEMY.

As it is now close upon eighteen years since I was appointed Master of the Architectural School of the Royal Academy, it has seemed to me, on the present occasion, that a few words might not be out of place on the experience which I have there gained in the training of students in architectural design and draughtsmanship.

It may further be of advantage if in the discussion which may follow, some hints are given as to any development in the programme there carried out.

I feel strongly, in these days of progress in education, that it is impossible to stand still, and although the advance in architectural design which has taken place in England during the last fifteen years is greater than the most sanguine of us could have hoped, that very progress should give us hope, and incite us to further endeavours in the promotion of greater development.

As it is always necessary to commence on some foundation, when appointed by the Council of the Royal Academy, I began by an attempt to carry out those principles in which I had myself been brought up, viz., the curriculum of the Ecole des Beaux Arts in Paris. I soon found out two difficulties.

1. The time at the disposal of the students was too short to allow me to hope that I could give them more than a smattering of French traditional teaching; and

2. In many cases I had to deal with students whose taste and predilection were in favour of almost every known period of art, and the utmost I could do was to accept their version of what was the correct style to design in, and to confine my advice within the limits of the styles they selected.

In 1876 or 1877, the late Mr. George Edmond Street proposed to the Council of the Royal Academy that the Architect Members of the Academy should be allowed to contribute their quota of instruction in the school, as had always been done by the painters and sculptors. At first, I did not think the scheme was likely to succeed, for it seemed difficult to understand how architects in large practice, and who were obliged to be frequently absent from town, could attend regularly. I was mistaken; the Visitors (as they are called) made it an engagement, and from then till now have carried out completely the programme which Mr. Street laid down.

It is needless to say that it has been productive of the greatest good; after many years of teaching there is a natural tendency to settle in a groove: it was not observable at the time, but now, as I look back on the old days when I was Sole Director, I see I was running in a groove out of which I have been taken by the Visitors, and I have probably learned more from their teaching than perhaps even the students.

The Visitors are, of course, men of different views, but they have all of them recognised that they had to deal with students designing in various phases of style, and have given their advice accordingly. I remember when Mr. Street first came down he began by presenting each student with a design of his own. He found, however, that when they came to a second subject they expected another design, gratis, to be made for them, and he saw that it was better to take the students' idea, and suggest how it could be improved. It was interesting to note how, with his profound knowledge of the value of mouldings, a poor, commonplace cardboard design developed itself gradually into a fair example of serious work, reasonable in its plan and in its construction, and in some cases of great artistic merit. It is on this principle that the instruction in the Academy is given, and I consider that if the student is required to frame his plan on the actual requirements and their best distribution, to base his elevation and section on the plan, and to keep the whole design within the limits of sound construction, it is better to leave alone the question of style for the moment to the taste of the student, and to trust that in course of time artistic design will naturally develop itself. If, for instance, a student brings down a design bristling with Dutch impurities (and I am afraid Mr. Norman Shaw has passed many a

*mauvais quart d'heure* over some), it is of no use trying to make it pure Italian. Keep within the style (if it can be called one), but insist upon the construction being properly shown, and the scale being preserved throughout, trusting that in course of time the impurities will pass away; everything must have a beginning. I do not mean to say that this is always done. Owing to office and other engagements, there is not that regularity of attendance which enables the Visitors or myself to see our advice carried out to the full, but it is the principle on which the instruction is based, and I am sure of this, that, so far as construction is concerned, there is rarely a drawing sent in by an Academy student which would not make a much better *working drawing* than the finest example sent up in competition in the Ecole des Beaux Arts. The English architectural student has fortunately never even heard of that pale pink tint which is generally passed over all the sectional parts of French drawings, even in those which are sent to the contractor as working drawings. Now in making these observations, it must not be supposed that I wish in any way to diminish the immense value of an academical course of training, such as is given in the Ecole des Beaux Arts at Paris; having passed through it myself, I should be most ungrateful if I did. But we have to take things as they are. There is no National School of Architecture here; there is no traditional teaching of 200 years, as in France; so far as architectural design is concerned, I am inclined to think this is a positive advantage, and that in consequence English architecture is at present in a much more healthy state than that of either France or Germany. In Ecclesiastical architecture it has always been so, and of late the progress made in domestic and town architecture has been such as to outstrip entirely our foreign contemporaries. In speaking of town architecture I am referring to single buildings only, and not the arrangements of streets and squares, in which, unfortunately, the advice of architects is entirely ignored. There are various causes to which I attribute this, and if I venture now to express my opinion on them it is (1) to challenge criticism, and (2), if I am right, to emphasise their existence, so as to guide students in their future studies.

Firstly, to the influence of the Gothic revival we owe the foundation of our modern school. The practice of constant measurement and delineation of our ancient cathedrals and churches for the purpose of their restoration led of necessity to the study of the principles on which their designs were based, and English architects, instead of trusting to pattern-books for their ideas, went to nature; that is to say, having no traditional school of teaching, they sought for the principles of design in ancient work. It was a much longer process, and the full measure of its value was becoming apparent about fifteen years ago when, singular to say, one of those peculiar changes of taste took place to which, in the absence of traditional workmanship, we are liable, and the later phase of the Renaissance styles gradually forced themselves to the front; but the seeds were already sown, and the interpretation of a phase of style (say, for example, of the architecture of Francis I.) by an English architect approaches much nearer to the spirit of its design than that which can be conceived by a student who has followed the traditional teaching of a foreign Classic school.

Secondly, we have to take into account the more practical mind of an English student, who bases his design on the nature of the materials he has to employ, and who, in default of abundance of stone and to waste, as in France, has to turn to the best account the simpler materials of brick, terra-cotta, and what is known in England as half-timber construction. Now, the economical and artistic treatment of these materials forms no part of the curriculum of study in foreign schools; if brick is used it is employed decoratively, and not as the elementary means of construction. It is in the employment of these materials, and their artistic development, that the English architect has made that extraordinary progress to which I have already alluded.

It will suffice if I draw attention to one example in London,—the Regent's Park Lodge, by Mr. W. Eden Nesfield,—and ask you to compare that building with any of the hundred and more villas of the better sort which have sprung up round Paris, at Auteuil, Passy, and other

places. The plan is about the same in both cases, and of square form: in the French villas the walls are all carried up to an equal height, decorated in various fantastic ways, and crowned with an ordinary pitched roof and an iron cresting. Mr. Nesfield, on the other hand, has by an ingenious arrangement of roof and the employment of bow windows, oriels, dormers, half-timber and tile-hung construction, created a world of artistic design, and at something like half the cost per cubic foot of the French stone villa.

Mr. Nesfield's design is a brilliant example of what I may call *material architecture*, in which the economic and artistic treatment of simple materials is turned to the best account. The French villas are examples of what I may call *paper architecture*, that is to say, designs which on paper with graduated tints look very well, but in execution are not only commonplace, but sometimes at variance with the proper and consistent use of the material. Now, I think that this is a very important consideration. You will remember that Victor Hugo in his novel, "Notre Dame de Paris," points out with remarkable sagacity the real cause of the decadence of modern art. Gazing from the printed book to the magnificent Cathedral of Paris, he puts these words into the mouth of one of his characters, "Ceci tuera cela, le livre tuera l'édifice." I may now go further, and turning from the elaborately-finished drawings of the present day to one of our ancient monuments erected when drawing materials were of the scantiest description, exclaim, "Ceci tuera cela, le dessin tuera l'architecture."

In these days of expert draughtsmanship this is what we have to fear most, and the best advice I can give to students is to accustom themselves to measure and draw continually from old work, and not to take their ideas from pattern books. In this respect I consider that the late William Burges, in his admirable work on architectural drawing, has left us a book which may always be held up as a model of the kind of measuring and drawing which every student should pursue. His aim was not to make pretty and effective drawings, but to analyse and dissect ancient work, and thereby deduce the principles which governed its design. The good influence which Burges exerted in his lifetime was greater than that, I think, of any other artist; let us hope that the legacy he left in this work above alluded to will continue to exert that beneficial influence.

The following paper by Mr. Lawrence Booth, F.R.I.B.A., President of the Manchester Architectural Association, and President of the Manchester and District Society of Surveyors and Valuers, was read for him, in his unavoidable absence, by Mr. Herbert D. Appleton, one of the Honorary Secretaries of the Conference:—

#### THE INSTITUTE AND ARCHITECTURAL EDUCATION.

THE Institute having obtained, under royal sanction, enlarged powers, intended to increase its usefulness, there appears to be an implied obligation that no time should be lost in applying them to some practical purpose.

The primary object of this paper is to suggest how the authority and usefulness of the Institute could be increased by the adoption of an educational scheme, which, if successful in its working, would, within a few years, lay the solid foundation for an application to Parliament for those stringent powers of repression against all unqualified practitioners to which so many of us are inclined.

Hitherto the promotion of this latter project has induced some little friction between men who were practically agreed as to its desirability, because divided in opinion as to the opportunity of the time and circumstances under which it should be thrust forward.

Henceforth the several sections of the army can march in the same direction, and combine their forces for the attainment, ultimately, of common objects worthy of their best efforts,—the statutory recognition of the importance of the duties we are called upon to perform as architects, and plenary powers to prescribe and enforce a high standard of professional competency and moral rectitude on the part of those who assume to enter the ranks of the profession.

If this great work is to be achieved by and through the Royal Institute,—and it appears

hopeless to expect it from any other source,—the Institute will require to be strengthened both within and from without. How is this to be done?

In no way more surely and in no way more worthily than by a beneficent assistance, supervision, and direction of the educational efforts now being put forth by numerous local architectural societies on behalf of those who are honestly and industriously endeavouring to qualify themselves as proficient architects; and the stimulus which would, incidentally, be given to the formation of numerous combinations for similar purposes in districts which are at present apathetic, if not absolutely antagonistic to the Institute's pretensions.

The writer's sympathy and observations are the result of a somewhat lengthened experience of the isolated efforts of provincial societies, and they may not, therefore, secure the complete acquiescence of metropolitan brethren, who are in more immediate "touch" with the Institute and other educational resources.

But if the Institute would only assume its proper position as the Alma Mater of the whole profession, receiving and distributing valuable assistance without distinction or favour, it would at once become apparent that the provinces are capable of giving, as well as receiving, something substantial for the general good.

One example in illustration. It is probable that in the matter of taking out quantities, measuring up and pricing builders' work, and writing a specification, an average architectural student in the provinces would far outstrip his metropolitan brother; and although the varying custom in metropolitan and provincial practice may differentiate the value of such knowledge, it will hardly be denied that it is in itself desirable, if not absolutely essential, for the proper equipment of an architect who assumes to watch over and guard the financial interests of his clients, even if its exercise should be confined to supervision only.

The writer is within his experience in mentioning several "pupils" fairly possessed of such knowledge and capable also, and at the same time of surveying and levelling, or making a perspective drawing, and all with equal facility.

His purpose is, however, not to stir up strife, but rather to bring about a spirit of friendly emulation, and an impartial recognition of meritorious work in whatever branch or branches of the profession it may be exhibited.

Some of the artistic excellence displayed by those who are nearest to the "light" might well be exchanged for some of the practical knowledge possessed by the outsiders, to their mutual advantage.

A proverbially dangerous word of prophecy in passing:—If the practice of the architectural profession is destined to become a close one under statutory enactment, and whether the Institute is to hold the key of entrance or not, the "Open Sesame" will not be either artistic or linguistic attainments, but rather a thorough knowledge of sanitary science and construction; because the public, our masters, are daily becoming more convinced of the fact, which is a fact, that such matters are to them a question of life and death.

No more useful hint could be given to the "rising hope" of our profession than the importance which will in the future attach to this branch of the architect's responsibility, and those who apply themselves to its consideration will in any event have their reward in the approval and patronage of a discriminating and recently-enlightened community.

Either by federation or affiliation,—the name is not of much importance if only the object be secured,—every available ray of professional light should focus to the Institute as a centre to be thence distributed for the guidance of those especially, our destined heirs and successors, who are in their present isolation mere pilgrims of the night.

In the writer's earlier experience the Institute was little more than a superior kind of office for the registration of the fact, sometimes doubtful, that N or M had, without any cause for a feeling of gratitude to the registry office for help received therefrom, established himself as a well-known practising architect, able and willing to pay his admission fee, and likely to continue the payment of his annual subscription for the privilege of appending a few mysterious letters to his signature, the significance of which the general public have

not, even yet, been sufficiently educated by observation and experience to comprehend.

A considerable advance in the right direction has been made since then; and the road is now clear for one of supreme importance.

Let the Institute, like a true, fostering mother, henceforth seek to secure the affection of its children by *early adoption*, and such acts of kindly and timely help in their juvenile efforts as will make them, when arrived at manhood's estate, the firm adherents and the staunch supporters of its best traditions and interests.

Every architectural student ought to have the chance of a recognised status in its ranks, to be obtained, in the first instance, by a preliminary examination as to his general knowledge and special aptitude for the work before him.

A second or intermediate examination should follow in due course, wherein he would be expected to give evidence of proficiency in technical knowledge and manipulative skill.

A successful pass at the third or final examination should entitle him to admission as an Associate; and in this and the other stages provision should be made for the recognition of exceptional ability by the grant of "honours."

The Institute would, of course, suggest the curriculum of study; and in its collective wisdom formulate the examination papers, which would be distributed simultaneously to the several provincial centres.

No enforced attendance of candidates in London for purposes of examination should be necessary; because effectual guarantees as to fairness could easily be provided under deputed authority and supervision in the provinces.

With a common standard of proficiency thus set up for our younger brethren, in their several degrees, there would soon be developed such a spirit of emulation on their part as could not fail to arouse the most lethargic student to exertion.

The facilities afforded by gentle guidance for graduating step by step, and without the necessity of having to make a journey or journeys to London for the purpose of being "plucked" or otherwise, would encourage and induce many a modest youth to try his luck near home, who would hesitate to ask, if may be, a widowed mother to equip him for what he might think a hazardous and costly experiment.

But above all, there would be opened out for the Institute itself such a sphere of beneficent educational administration as would enable it to justify even its regal title; and by exhibiting to the world a body of high-minded men unselfishly seeking to qualify those of their own "calling" as efficient and useful members of the community, it would assuage the doubts of those who, with an instinct pronouncedly national, might otherwise suspect in any application for the power of absolute control over the entry into the practice of our profession only an attempt at a selfish monopoly, or, in other words, a mere development of trade unionism.

The Institute would be raised immeasurably both in the public and in its own estimation, and would soon attract all that is worthy and desirable to its support.

More work would have to be done, but there would be more willing hands to do it.

Once placed the education and training of students in the fore-front as one at least of the Institute's most important aims, recognised by it both as a privilege and as a responsibility, with equal earnestness, and there would be such an accession of numbers and strength as has not been either developed or even suspected to have an existence.

The transformation would direct the latent energies of those,—some inside and many outside the ranks of the Institute,—who are now simply looking on at a comparatively few well-known members engaged in writing papers at each other, to a field of much more useful work, in which they could do yeomen's service in giving the benefit of their practical experience, not to those who have too much, but in aid of the young, the hungry, and the deserving, thus realising the beautiful picture of the double blessing for the giver and the receiver.

Mr. J. A. Gotch, President of the Architectural Association, read the last paper of this series, as follows,—

#### LEARNING TO BE AN ARCHITECT.

LEARNING to be an architect is about as arduous a task as a young man can undertake;

and yet in this country, at any rate, there is no task as to which less definite information exists for the young man's guidance. The only thing certainly known to be necessary is to article him somewhere,—to a friend, a relation, a cheap man, or a man in the nearest town, so that he is not far from home; but not by any means necessarily to a man who will make a good architect of him, though it by no means follows that none of the aforesaid could do so. And when he is article'd, what does his apprenticeship do for him? In nine cases out of ten it makes him at the best an architectural practitioner; but as for being an architect,—with a desire to tread the higher and nobler paths of the profession,—very few offices make him that,—at least, provincial offices. If he can spend a year or two in another office, and can then settle down somewhere as an assistant, or perhaps scrape together a practice in his own town, learning as he goes along, his ambition is satisfied; for he has had no higher ideal placed before him, and if he reads in the professional papers of Designs and Essays, he regards them as wholly outside his province, and meant only for those lucky people whose parents live in London. It does not occur to him that he too might try his hand at design, for he has never been taught to do anything but grub along from day to day at his tracings, and his dull brick villas with Bath stone beads and sills and 6-in. hands by way of ornament. And as for travelling studentships, he hardly knows what purpose they serve, for no one has opened his eyes to the instruction, the interest, the poetry, and the never-ending delight which every village in his country-side holds out to those who seek it with intelligence and a desire to gain knowledge. From the force of circumstances, from the absence of any defined track to follow or of fixed goal to reach, he moves in a narrow circle, with no ideals, and no ambition beyond avoiding some disaster, which his scanty knowledge renders imminent several times in a twelvemonth.

No doubt the pupil whose lot is cast in a large town, and particularly in the largest of all towns, is more fortunate and less handicapped by want of guidance. If he gets little from his master, he has, at least, more friends of occupations similar to his own with whose help he is better able to struggle towards the light. But he, too, suffers from the absence of a defined track and fixed goals.

I take it to be one of the objects of this Conference to do something towards defining the track and fixing the goals. One such goal exists now in the shape of the Examination for admittance to the Association of the Institute, but this is, comparatively, far along the path of life, when the student has passed his youth and is entering into manhood. What we ought to do is to get at him at the outset, to give him a good start upon the track, and to let him feel that there is some one who has an intelligent interest in his welfare,—some one to whom he can apply for help in his needs and for guidance in his studies, and some one who will reward him for his exertions. This position must be filled by the Institute, which must first make known what advantages it will offer to those who seek its help, and then must define the conditions on which that help shall be given.

At the outset I think we must make up our minds that the Institute can at present be not a teaching body, but only an examining body. It can give a direction to studies and reward success in them, but cannot superintend them from day to day. If it can give the right direction to studies it will do a great service, for by its means energies now liable to be frittered away will be concentrated upon a definite end. But it must begin early enough. It must have an influence even upon school education, and this it can do by instituting a Preliminary Examination, the object of which shall be not to test the student's knowledge of architecture, but his general knowledge, which will be all the more useful if it has a leaning towards architecture. This present is not the occasion to define what subjects such an examination shall embrace, but it might include, in addition to ordinary school subjects, such as algebra, geometry, trigonometry, and conic sections,—one modern foreign language, elementary mechanics, drawing, and, perhaps, a certain amount of the history of architecture. Its object being, in fact, to make sure that the intending architect shall have a decent general

education before he applies himself to the particular pursuit of architecture.

This examination passed, the student is in touch with the Institute. To it he will look as the governing body of his profession; from it, and especially from its library, he will receive assistance; and for its prizes he will be able to compete. The advantage of thus reaching the student at the outset and of keeping a hold on him is obvious.

One goal, therefore, we have now fixed.

The next would be an Intermediate Examination, which might dispose of elementary matters in materials, construction, and history, and pave the way for the third goal in the shape of the Associate Examination.

By these means the interest of the student would be maintained throughout his course of study, and his studies would be concentrated towards a definite end; he would have a palpable series of objects to strive after, and he would have a certain amount of assistance afforded him in the process.

But, gentlemen, it is one thing to set up goals, it is another thing to provide the means of attaining them. As to the first or Preliminary Examination, if it were once established there is little doubt that plenty of schools would shape their course of study to meet it, for it would embrace little besides ordinary school knowledge. But once fairly committed to the profession and working for the Intermediate Examination, there exists at present no satisfactory guidance and no adequate agency to impart instruction. It is generally admitted that, however much the system of pupillage may suit our English character, it does not and cannot impart certain branches of knowledge which are becoming essential to the architect. It is true that in London there are many isolated sources for obtaining this extra-official learning, but they are not known to all; they are scattered here and there, they keep all sorts of hours, and no one has yet offered a clue to the labyrinth of their conflicting positions and times of work. Such a clue the Institute might certainly give, and I believe it is about to do so. That is to say, it will recommend to the student a course of study to be followed at one or more of the existing institutions, and no doubt that will be of the highest utility; in fact, it will be the most that can be done in the present state of things. But it will be a curious patchwork of an education, with a lecture here and a lecture there, extracted from courses which only touch architecture incidentally, and to which architectural students are admitted, as it were, by grace. However, if we grumble, let it be understood that we grumble not that other people do so much for us, but that we have done so little for ourselves. However, we are beginning to stir now. Our Supplemental Charter will give us greater scope, and it will be one great step towards improving our system of education if we establish such a series of examinations as has been sketched. It will bring the question into focus. There will yet remain the more difficult task of providing the agency by which the instruction necessary to meet these examinations is to be obtained. As a stopgap, the course of study to be followed at existing institutions will be of great use; but I for one shall hardly be content till the function now fulfilled on a voluntary system by the Architectural Association has developed upon an authority recognised by the profession, and in a manner to reach not only students living in London, but those whose lot is cast in the obscurity of the provinces.

In the discussion which followed, Professor Roger Smith, Professor Aitchison, Mr. Stannus, Mr. John Slater, and other gentlemen, took part. We necessarily defer a report until next week.

On Wednesday evening, at 8 p.m., Professor Aitchison, A.R.A., presided, and Mr. John Slater, B.A., read the following paper on

#### NEW MATERIALS AND INVENTIONS.

In treating such a subject as new inventions connected with building operations and architecture before an assembly of practical men, it may be as well to state at the outset that there are three things which it will be impossible for me to do. First, I cannot attempt to notice all the varied new inventions which the last few

years have brought to light; secondly, I cannot avoid describing some inventions which are not new to many here; and thirdly, I cannot help omitting some which, in the opinion of many persons, are superior in interest to those which I shall describe. All that I can hope to do is,—taking my own personal experience as a guide,—to bring before your notice certain comparatively modern inventions which have interested me either on account of their ingenuity or of their practical usefulness. It must be borne in mind that it takes a very considerable time before a new invention becomes so well known and its utility so thoroughly recognised for its use to become almost universal; and, moreover, no one has a right to recommend the employment of new methods simply because they are new; a certain amount of experience of them is necessary first, and this experience can only be obtained in time. I believe it is just twelve years since a paper on this subject was read in this room by Professor Roger Smith, and it is curious to notice that some of the novelties which he called attention to then remain almost novelties still,—so conservative are we in matters connected with building. Our course across the water are far more inventive than we are, and I have had to go to them for several of the novelties which I shall bring before you. The American intellect seems to take nothing for granted, to look upon nothing as final, and to lend its whole endeavours to find out some way of improving any mechanical operation which has for some time been in use. I think new inventions and discoveries are rarer in the domain of architecture than in other branches of industry, and for this reason: all new invention must be in a mechanical direction towards saving of labour, and as the best building has as much art about it as science, and as art cares far more for the variety obtained by individual effort than for the precision and exactness of mechanical repetition, architects (who, after all, exercise far more influence indirectly upon building than is sometimes imagined) are disposed to look somewhat shyly upon the facilities for doing away with individual labour, and to decry the reproduction of ornamental features by mechanical means. We are inclined to agree with Mr. Ruskin, and to prefer a tiny bit of carving into which the workman has put his head and his heart as well as his fingers, to any number of yards of machine-made moulding. And, within certain limits we are right in this preference. But when we turn from the purely artistic to the practical and scientific side of architecture, we cannot be blind to the immense advantages which modern scientific discoveries give us over our forefathers, and we should be foolish if we did not make use of them. Take, for example, the use of iron in building. It has completely revolutionised our methods and enables us to economise space and to erect buildings in positions where it would have been impossible to do so without its employment. And it is for the architect to take any new materials which assert their structural superiority, and to adapt them to artistic forms and treatment; and granting the requisite ability, I do not believe there is anything that cannot be "invested with artistic merit," so use a phrase which we heard a good deal of a year or two ago, even though it be so utilitarian and, to most of us, utterly detestable, as a cast-iron front to a warehouse.

My remarks this evening must necessarily be somewhat unconnected, for the reason that the inventions which I have to describe have little or no connexion with each other, but I will endeavour to work as much as possible upon the lines of our own specifications, that is from the more purely constructive to the decorative portion of a builder's work. We are all of us now so thoroughly imbued with the necessity of properly trapping and ventilating house-drains, and cutting them off from the sewers, that it is scarcely necessary to allude to these matters at all; but in connexion with sanitation there is one discovery that has been made comparatively recently that demands a word or two of notice: I allude to the unsealing of traps. It used to be considered sufficient, if closets were trapped, to ventilate the soil-pipe alone, but the experiments made in the United States, at the instance of the Washington National Board of Health, and in this country by Mr. Stevens Hellyer, have proved to absolute demonstration that unless the traps themselves are ventilated they will be liable to be unsealed. There are two ways by which traps can be unsealed,—first, by the

momentum of any discharge passing through the trap itself; secondly, by the passage of a considerable quantity of water through a pipe with which the trap is connected. The passage of this water causes a momentary vacuum, by means of which the water is sucked out of the trap, and it is absolutely necessary, if the trap is to be a safe one, that all the trap branches into the main pipe should have an ample ventilating-pipe carried up from them and branched into the main pipe above the point where the highest trap branch enters it. This important fact cannot be too widely known, as it is certainly still the exception rather than the rule to have these branches ventilated. Before passing from the subject of drains and pipes, I should mention that increased experience all seems to point to the desirability of decreasing rather than enlarging the size of pipes; 4-in. glazed earthenware pipes for house-drains, and 3½-in. lead pipes for soil-pipes, if properly connected and laid, will suffice for all purposes, and will keep much cleaner than those of larger bore, always supposing they are properly flushed out. In fact, Mr. Hellyer has used soil-pipes of no more than 2½ in. diameter.

I do not think I need occupy your time in describing concrete as a building material, as there have been more than one evening in the last few years devoted to the subject, nor shall I attempt to enumerate the various kinds of ornamental bricks for walls which are now produced by various manufacturers of excellent quality and design. I will merely ask you to examine two comparatively recent forms of concrete paving,—Stewart's granolithic and what is called the "impenetrable" paving, both of which appear to me to be excellent. Terra-cotta also is so well known to all of you, and its usefulness as a building material is so thoroughly established that I need not detain you on this subject further than to mention a new form of nosing for stone or concrete steps invented by Messrs. Doulton. This is called the silicon tread, and is a kind of terra-cotta, i.e., clay burnt as hard as it is possible to make it. These treads were used for three years at the recent exhibition at South Kensington, and must have had several millions of persons passing over them. There is one comparatively recent invention somewhat in the nature of brick, which is not, I think, so well known as it deserves to be. The impossibility of getting good fixing to ordinary brick walls has necessitated the use of wood bricks or plugs, which have two drawbacks,—(1) that they are liable to shrink, and therefore lose their hold on a wall; and (2) that they are certain sooner or later to decay. Mr. Wright has endeavoured, with much success, to get over this difficulty by making what he calls "coke-breeze fixing blocks." These are made of the same size as an ordinary brick, and can be built in the walls wherever required, and their constitution is such that they will hold nails as well as wood. For the purpose of fixing skirtings, dados, and linings of all kinds on the interiors of brick walls, I consider them admirable, and even more useful are they for external use if portion of a wall is to be hung with tiles. Every one knows how unsatisfactory wooden fillets are in such situations, as they are certain to get rotten before long, but these coke-breeze blocks are practically indestructible. Another method of using them is when wooden floor-boards are required over a concrete floor, as they obviate the necessity of bedding wood blocks in the concrete, a plan which never commended itself to my mind.

The next subject to which I shall ask your attention is that of fireproof construction. The enormous losses which such huge conflagrations as have been seen too often of late years in the city of London cause to the insurance companies have had the effect of making these companies exceedingly shy of insuring large warehouses except at very high rates of premium, notwithstanding their being what is called fireproof. The reason is that, practically, such buildings do not turn out to be fireproof at all. If the insurance companies could be convinced that a building were really and not theoretically fireproof from top to bottom, they would not decline the insurance; and it is well worth the while of those who are erecting these gigantic piles of buildings which we see around us to consider whether the sum that would have to be expended to bring about this result would not be, in the long run, a most wise economy. Iron and stone used to be considered fireproof

materials, but sad experience has shown the fallacy of this opinion time after time. In America the system of fireproofing has been carried much further than with us, and it is there laid down as an axiom that no building can be considered fireproof unless the whole of the structural ironwork used in it be covered with a real fireproof substance. I wrote to one of the largest firms in the States who make a special business of fireproofing, and asked for particulars of their practice,—the Wight Fireproofing Company,—and they were kind enough to send me an illustrated pamphlet from which some diagrams have been prepared. Some of the methods adopted do not differ widely from those in use in this country, such as Hornblower's system, but as the whole subject is one of great practical interest and importance I will endeavour to explain the American systems somewhat in detail. The first kind shows a combination of iron joists, concrete, and hollow fireclay tiles of different depths. The hollow tiles are temporarily supported by centering, and are set in cement, the middle tile acting as a key-stone. The bottom edges of the tiles are grooved, in order to give a good key for the plaster of the ceiling, and on the top of the flat arch thus formed concrete may be laid of any thickness that seems desirable, thus entirely encasing the iron girder. The weight of the deeper arch is about 35 lb. per foot super. In erecting a new building there is, of course, no difficulty in providing a floor of this kind, but if one has to deal with ordinary wooden joisted floors in actual existence, it would be a very expensive matter to replace them with iron and concrete floors. The next diagram shows a method of making wooden floors practically fireproof on the under-side. This is done by flat interlocking fireclay tiles carried by iron clips screwed to the joists, the underside of these tiles being grooved to form a key to the plaster. A space of 2 in. is thus left between the plaster and the wooden joists, and as the tiles themselves will stand almost any heat that can be brought to bear on them, the joists are absolutely protected; on the upper side fine concrete or pugging might be used. This system of fire-clay ceilings can be affixed to existing floors by simply hacking off the lath and plaster. I believe this system to be absolutely new to this country, and it appears to me both simple and effective. If iron columns are to be fireproofed, it is done by encasing them with fire-clay blocks, which are grooved and are secured by iron plates with claws, which fit on the rivet-heads. In circular cast-iron columns a metal band is brought round the column, bolted together, and dropped into the groove of the blocks. In either case a heavy bed of mortar is next applied, and then another course of blocks is added, or, as the Americans say, "crowded down" over the band or plate. This process is continued till the column is entirely encased, then it is plastered with Keene's or Parisian cement, making a good surface for decoration. No words of mine are needed to show how much more perfect such a system as this is if thoroughly carried out than what we are in the habit of doing here. Soon after I had obtained these particulars from the Wight Company, Mr. Doulton, of Lambeth, kindly sent me a notice of his new patent, the Doulton-Peto fireproof blocks. These are extraordinarily like the first kind of American arch blocks which I described; in fact, I believe the idea was obtained from the American system, and I have no doubt that Mr. Doulton will carry this system further in the way of casting columns, &c. I do not think, however, he has as yet manufactured anything like the flat tiles for wooden joists. I am not going to occupy your time further on this subject of fireproof floors, except to call your attention to an English system, whose merits I estimate very highly; I allude to Lindsay's steel decking, of which I have a model here. This consists of a series of steel troughs riveted together and supported either on walls or on girders, and filled in with concrete. The strength and rigidity of the small troughs are most surprising, and the small space which they occupy is even more astonishing, as for a space of 30 ft. the depth of the decking need only be 5 in. to support a load of 11 cwt. per foot super. Another great advantage is that brick partitions can be placed on this decking and concrete in any position independent of walls or girders underneath. This flooring is largely used in the National Liberal Club.

With regard to this steel decking, it is a curious fact that many years ago a manufacturer, whose name I have forgotten, patented every form of corrugated iron which he thought could be manufactured, and left out the very one which has proved most useful. This form is based on the strictest scientific methods, as the top table is made thicker than the sides, and the sectional strength thereby greatly increased, and the various sections are riveted together at a point which is very close indeed to the neutral axis. The concrete used by Messrs. Lindsay is called by them pumice concrete, as it is very light and tough, and it is a good material for constructing roofs, domes, &c.

You will perhaps have noticed that I alluded to the wrought-iron columns of the Phoenix Company. Until the completion of the Inner Circle of the Metropolitan Railway, I do not think wrought-iron columns were much used in this country, but I believe their use will rapidly extend. We have been told for a length of time that when columns are beyond a certain length in proportion to their diameter, they fail by bending and not by crushing, and we also know that wrought-iron is much stronger to resist tension than cast-iron, and as it is an undoubted fact that connexions can be made to wrought-iron much better than to cast, we have here a combination of advantages where long columns have to be used which cannot but be appreciated, and which our American cousins are not slow to avail themselves of. Messrs. Lindsay have been on this tack for some time, and they have sent me here a section of their wrought-iron column, the strength of which is patent to all. The use of steel for constructional purposes is increasing rapidly, as it is so much more reliable than iron, and Messrs. Lindsay roll many sections of steel which can very easily be formed into columns by riveting. The safe loads which such columns will sustain are very great; for instance, a column made of a series of steel troughs, such as I have described, the total external dimensions being 16 in., would bear a safe load of 115 tons if 30 ft. long, and the weight would be 74 lb. per foot only. I have roughly calculated the weight, and the safe load on a cast-iron column 16 in. in diameter, 30 ft. long,  $1\frac{1}{2}$  in. thickness of metal; I find the weight would be 220 lb. per foot run, and the safe load 100 tons. I do not think the day is far distant when steel will have almost superseded iron for structural purposes.

Anything of the nature of fireproof material seems to me worth attention, and I will therefore briefly notice a substitute for wood lathing, either for partitions or ceilings, of which I have a model in the room. This consists of galvanised iron netting, which is fixed by staples to hoop-iron slips, which are themselves secured edgewise to the studs or joists. The wire netting is then covered with plaster in the ordinary way. The wooden framework of the partition may be replaced by a construction of angle iron, which takes up only half the space of an ordinary quarter or brick-nog partition, and this saving of space may sometimes be of considerable importance. The only thing that I am doubtful about is its permeability to sound; but, after all, ordinary partitions, or even brick party-walls, are, as many of us know to our sorrow, far from impervious to sound. I should say that a small structure formed by this iron lathing was severely tested about a year ago in Manchester, and the chief of the Fire Brigade reported very strongly in its favour.

Next to preserving the interiors of buildings from fire, one of the most difficult tasks is to preserve the exterior from the ravages of time and the weather, and it is, in fact, almost impossible to find a natural stone that will withstand the damaging effects of such an atmosphere as we have in London. In many parts of the country, too, beautiful old stone edifices are going rapidly to decay. The work of restoration of stone buildings is always difficult and expensive, but a means of doing this with comparative cheapness has been invented by M. Talary, whose metallic cement has been extensively used on the Continent. This consists of a trachytic stone reduced to powder and then rammed by an acid without being decomposed. The material thus formed is permanent, and harder than the stone itself; it is not moulded, but carved to match any pattern exactly like stone, and the surface and colour can be made so precisely to resemble the original stone that the joint cannot be perceived. Mr. Blomfield and Prof. Lewis made a careful examination of several buildings in France

where restorations had been made in this metallic cement, and they reported most enthusiastically of it, and since then Mr. Blomfield has used it in many of his restorations in England. I cannot help thinking that this invention ought to prove of enormous value, because it will enable us at a small cost to stop decay of the stone at the outset. With stone itself one always has to wait till a sufficient mass of the stone can be removed, because of the difficulty of adding small pieces to what is left, but this difficulty is now entirely overcome.

Many gentlemen who were present a few weeks ago at the reading of Mr. Crossland's paper on the Holloway College must have been much interested by the short notice which he gave of a system by which the pressure on the water mains of a building could be very largely increased at will in the event of a fire breaking out. The instances have been numerous in which, although the fire hydrants have been in perfect working order, considerable damage has been done through there being insufficient pressure to put out a fire before it has got beyond control. In London the pressure in the fire mains at the ground level averages from 25 lb. to 30 lb. per square inch, which is reduced one-half at a height of 35 ft. from the ground, i.e. the pressure diminishes as it becomes more urgently needed, because it is on the upper floors and at the roof of a building that water supply would be most effective. In order to remedy this it has often been thought necessary in the case of important buildings to erect a large tank at the top of a building or even to build a water tower at considerable expense and even where a head of water of 144 ft. can be obtained the pressure per square inch in the mains is only 63 lb. Now the system which I have alluded to is the invention of Mr. Vinning, and is called the High-pressure Fire Hydrant system. It consists in connecting with the ordinary mains one or more closed steel tanks charged with water which can be at any moment submitted to any desired pressure up to 100 lb. or 120 lb. per square inch. This pressure is maintained by a series of wrought-iron cylinders filled with compressed air by means of a small air-pump or by other means, and kept permanently at the required pressure. These cylinders can be placed in any convenient position at a distance from the water-tank, and are connected together by small pipes so as to form practically one vessel, the bottom of which is connected by a small air-pipe about  $\frac{3}{4}$  in. internal diameter with the water-tank. The means for throwing the apparatus into use is a stop-valve, which, when shut, confines the compressed air to the cylinders, but by turning the handle the valve is opened. At the base of the water-container there is a large float half-valve which closes the access to the mains as soon as the water is discharged, and thus prevents the air entering these mains. The water-container can be made of any required size, but for a large building it would probably be preferable to increase the number rather than the size of the containers. It is calculated that a vessel containing 2,000 gallons would give, with ordinary-sized pipes, a delivery of 50 gallons per minute for 40 minutes, and the extinguishing power of water is much increased by very high pressure, this amount would generally suffice for the suppression of a large fire. Of course, after once going off, all air-cylinders require re-charging, but an air-pump is not absolutely indispensable, as steel bottles containing air at a pressure of 200 lb. per square inch can be carried about to any extent. Mr. Vinning is now engaged in putting up this apparatus at the South Kensington Museum, by order of the Science and Art Department.

While on the subject of water-pipes, I should like to call your attention to a very beautiful invention which again comes from the other side of the Atlantic. Everybody is familiar with the corrosive action of water on metal pipes, and, in some cases, very serious effects upon health have resulted from the combination of certain chemical constituents in the water with the material of which the pipes were composed. But I have here some glass-lined pipes to which nothing could be more cleanly, as they can be made to any bend that may be desired. These pipes have been patented for some few years, but there was found considerable difficulty in making the joints sound; this has, however, now been overcome, as the joints are all ground by an emery wheel

and special washers are used, and I think there ought to be a great future before this invention. In addition to these pipes being non-corrosive, it has been found practically that it requires a much more severe frost to congeal the water in these pipes than in ordinary metal ones. This is due partly to the packing and partly to the bad conducting power of the glass. These pipes can be jointed with much greater ease and speed than lead pipes, and when this is taken into account, their cost will be hardly any more than lead pipe. For breweries, acid works, and other places where ordinary pipes are soon destroyed, these glass-lined pipes will be most useful.

As land increases in value in London and other large cities, the tendency is to increase the height of all business premises, and thus gain more room. We see this in the new warehouses which are constantly being erected, but we do not go anything like so far in this direction as they do in the States, where buildings of ten stories are not uncommon. These high buildings would be comparatively useless without a very complete system of lifts, and the one to which I shall call your attention seems to me to combine, in a high degree, mechanical skill, ease in working, and safety. You are, of course, aware that elevators may be divided into two main classes—those in which the cage is suspended, and those in which it is fixed at the top of a ram, which is generally worked by hydraulic machinery. Ordinary suspending tackle answers very well for good lifts, but there is considerable risk in relying upon it for passenger-lifts, even when provided with safety catches, and, in fact, in many Continental cities suspended passenger-lifts were absolutely forbidden. With hydraulic-ram lifts, of the usual construction, it was necessary to excavate a chamber for the ram of the full height of the working of the lift, and in the case of hard soils, such as rock, this would entail very great expense. One method of overcoming the difficulty was devised by Messrs. Stevens, who formed their ram in a series of cylinders, working one inside the other; but I am not able to state whether this principle has been found to answer well. The Otis elevator is a suspended lift, worked by hydraulic power, but the arrangements are such that I believe it to be absolutely safe. The cage is carried by four iron wire ropes, which pass to a wrought-iron yoke, and then, dividing into two pairs, are carried down to two timber beams, upon which the frame of the cage stands. The wire ropes pass over a guide pulley, and also over a loose pulley, and are fastened to a strong beam at the top of the building. The ropes are not connected directly with the cross-beam, but with a balanced lever-beam, the action of which I shall refer to again.

The framework of the cage carries gun-metal guides, which slide on each side of the timber uprights. The motive power is water, but no excavation for a ram is required, as the cylinder and piston which constitute the driving power can be fixed on the ground bed. By the intervention of the loose pulley just mentioned, the ascent or descent of the piston in the cylinder for any distance lowers or raises the cage just twice as much, and there would of course be no difficulty in increasing the mechanical advantage by the use of more pulleys. [The action of the lift was explained by means of diagrams.] Now, everything depends upon the safety appliance of such an elevator as this. The causes of danger are three: first, breaking of the supporting ropes; second, too rapid a descent in consequence of heavy weights; third, the counterweight carrying up a lightly-loaded cage higher than intended, and thus breaking the connexion with the flanges. The latter was the cause of the accident at the Grand Hotel, Paris. As the cage is in itself slightly heavier than the counterweight, the latter accident cannot happen; and even if it could, and the piston-rod were broken, the only tendency would be for the cage to fall rapidly, and this cannot occur. In case of the breaking of any one rope, the balance-beam is acted on, and a wedge-grip is brought into action on both sides of the lift. If all the ropes were to break, and the cage were to commence to hurry to the bottom, a second safety device is provided which comes into play as soon as a certain speed is attained, and this brings the wedge into play at once and stops the descent of the cage. As soon as these wedges have acted, they cannot be released except by raising the

cage. I believe, however, that no case is known of all the ropes breaking. It is important to notice that the mere stretching of one of the ropes affects the balance-beam, and thus advertises itself to the attendant, who must at once see what the matter with the ropes, and properly adjust them. I believe that experience has proved that the wire ropes made by the American Elevator Company last, on the average, five years.

Another important point to be noticed is that this lift can be worked at a very low pressure, say 40 lb. to the square inch, whereas other hydraulic elevators require a very high pressure, that would have been almost impossible to obtain a few years ago before the introduction of the hydraulic power system of high-pressure mains, where pressure up to 700 lb. per square inch can be obtained. This is not the place to enter upon a discussion as to the relative merits of low and high pressure, but no notice of modern inventions would be complete that did not include this most valuable system,—in the starting of which our late President, Mr. Winchmore, took very great interest,—by which hydraulic power can be laid on to any building in London from a central station.

To turn to a very different subject, viz., heating, I should like to say a few words about a new stove which has come under my notice and which I have lately introduced into one of my buildings. This is the invention of Mr. Lofis, of Cambridge, and acts upon the principle of giving as large an amount as possible of radiant heat, by compelling the smoke and heated air to take a circuitous course, warming a large surface of metal before it goes up the chimney. It thus differs from the majority of improved stoves which have been manufactured of late years, and which for the most part rely upon warming a large amount of air and causing it to enter the room. Several tests of this stove have been made, and its economical consumption of coal has been clearly established.

It has probably been the lot of some of us to have to design buildings for clients in whose eyes economy is a virtue far exceeding artistic effect, and I believe it is not an unknown proceeding to be obliged to go through the drawings and specification with a hilder in order to reduce the estimate. I have known cases in which an architect has been at considerable trouble to design a staircase, and to put a little of what is known as "feeling" into his halusters, &c. These are precisely the features which a hilder will pitch upon with the remark, "There's a lot of work in that staircase, air; I can get some very nice turned halusters that will look quite as well as this, and not cost half so much," and your staircase looks just like any other speculating hilder's. Some very great improvement has been in turning machinery lately, and halusters and newels can be got now "square turned." I confess I do not know how it is done, as I believe the machines are kept in jealous seclusion, but I have some specimens of square-turned halusters which will give you an idea of what is, at any rate, a little variety from the ordinary run. These have been kindly lent me by Messrs. Carter & Aynsley, of Bishopsgate-street. I must not be understood as in any way approving the design of these, but the fact that it is possible to turn things square was quite unknown to me a few months ago, and I thought it might be of interest to this meeting to know that such a thing is possible.

In connexion with house fittings I would call attention to Kay's locks, several specimens of which are on the table. The simplicity of construction of these locks seems to me very commendable, and they have given great satisfaction in cases where I have used them. I would particularly call attention to an automatic cupboard lock.

Among decorative appliances I may mention Radeke's compressed wood pulp, which has been used to some considerable extent abroad, although it has not found its way at all largely in England. Some kind of composition is used as a basis, and is laid on a thin veneer of any kind of wood, such as oak, walnut, &c., and the whole is then compressed by hydraulic power into moulds, which can be made of any required design, except that it is impossible to have deeply under-cut mouldings. The grain of the wood is excellently preserved, and the effect of the finished product as a means of wall decoration is certainly good. I believe it can be

treated in all respects as wood, viz., cut, sawn, or planed.

Artificial illumination is a subject that has attracted great attention during the last few years, and the threatened rivalry of electricity has given a strong impetus to the improvement of gas-burners, in order to obtain more perfect combustion. Among these I may mention the Albo-Carbon light, the Wenham lamp, Sugg's Cromarty burner, the Siemens regenerative gas-burner, and the Welshach incandescent lamp, which latter consists in the combination with the gas flame of a thin cylinder of some refractory substance which glows at a white heat. Although electricity has not ousted gas from the field, as it was at one time thought it would do, it has yet made more progress than many people imagine, and no architect would now think of designing a theatre, music-hall, hotel, or restaurant without fitting it with incandescent electric lamps, which do not give off as much heat as gas, and,—more important still,—do not contaminate the atmosphere. The invention of storage batteries as a sort of buffer between the machine and the lights, and as a means of avoiding the risk of breakdown of the engine, did much to render electric lighting more generally available, and considerable improvements have been made in these storage batteries during the last few years. In the earlier forms of storage battery,—for instance, the Farnes-Sellon-Volckmar type, which is most largely in use,—there is always a certain amount of local action going on between the lead plates; but in the battery of the Union Electrical Power Light Co., which they have been kind enough to lend me to-night, there is no local action at all. The elements consist of solid slabs of peroxide of lead and plates of sponge lead, and are immersed in dilute sulphuric acid. The peculiarity of the peroxide plates is that the material used in its construction causes it to set into a perfectly hard and durable form, so that it is not injured by transport. The size of the plates is 7 in. by 4 in. and the total weight of the cell complete in a case is 20 lb. 11 oz. only. This lightness is achieved partly by the plates being loosely held by strips of celluloid, which material is also used to cover the strips of platinum by which contact is made. The elements are connected together by platinum wires dipping into small wells of mercury. Professor Forbes made some very careful tests of one cell of this battery, and obtained a discharge of about 8½ ampères for nearly fourteen hours. He also reported that the efficiency of the cell was between 80 and 90 per cent. The cells are contained in small wooden boxes, which are readily transported from place to place. When the elements are exhausted fresh ones can be supplied, and the old ones recharged, but spare plates can always be kept ready for use at any time. A battery of fifteen cells will run twelve ten-candle incandescent lamps, and occupies a few feet only. The recharging of the plates must of course be done by a dynamo machine.

While on this subject, I must mention a small primary battery and lamp combined, which will enable any one to have an electric lamp on his table at any time, and which can be recharged by simply pouring into the cell containing the plates the necessary liquid. These lamps are made in very ornamental cases, and one of the size here will run about three hours, i.e., during the continuance of dinner; but if a larger size were adopted, they would, of course, last longer.

I now come to a subject which cannot be called in any sense an invention, but it is a discovery of very great importance as affecting the strength of materials, and although it affects engineers more than architects, I think we ought to be acquainted with its main features. For a considerable period it was considered sufficient to ascertain, with more or less exactness, the ultimate tensile or compressive strength of a timber beam or an iron bar, or any such material subjected to stresses or strains, and then to take a certain factor of this ultimate strength as a fairly safe working strength. But so long ago as 1870 a German engineer, named Wöhler, made a very large number of experiments which showed conclusively that the breaking strength of any material depends not so much on the statical load, but on the *extreme variations* of load which the piece has to undergo. For instance, taking 45,000 per square inch as the average breaking tensile strength of wrought iron, a rod which would be subjected to a steady load of 90,000 lb. ought to have a sectional area of 8 square inches,

using a factor of safety of 4; but if, instead of the steady load, the rod would be subject to alternate changes of load varying from 10,000 to 90,000 lb., its sectional area would have to be 11½ square inches. If the same rod were subjected to alternate compression and tension it would require to be even stronger. Wöhler expresses this law as follows: the fracture of a material can be effected by variations of stress repeated a great number of times, none of which reaches the breaking limit, the difference between the extreme stresses determining the breaking strength. Wöhler's experiments were purely empirical, and their results have considerably exercised the minds of scientific men, but another German, Professor Bauschinger, of the Munich Polytechnic School, has been carrying on for several years a most exhaustive series of experiments, the result of which are published in a series of memoirs to which Professor Unwin was kind enough to call my attention, and of which he has published a short *résumé*. The puzzling anomaly of Wöhler's experiments lay in the fact that when subjected to alternate tension and compression a bar broke down at a stress lower than its elastic limit, and Bauschinger thinks he has discovered the explanation to be that in many materials the elastic limit has been raised artificially in the process of manufacture. I have not time to pursue this question further, but one illustration will show how it may affect our work. In an iron roof of ordinary construction, in which the pressure on one of the struts under ordinary circumstances is 1,500 lb., a heavy gale of wind would just double this, and this variation of pressure would reduce the ultimate strength of the strut nearly 20 per cent.

Professor Bauschinger has also carried out a large number of most careful and elaborate experiments on the behaviour of full-size cast-iron columns and wrought-iron stanchions, under the influence of heat and sudden cooling, and he found that cast-iron did not warp so much as wrought, but that if cast-iron was heated to a certain point and then had a stream of water directed on it it bent so much that it broke in two. He has also experimented on piers of stone and concrete, and comes to the following general conclusions:—(1) That no natural stone will withstand fire, but that granite did so the best; (2) that brickwork behaved much better than any stone; and (3) Portland cement concrete was best of all. It is impossible to give any idea of the exhaustive and minute character of Professor Bauschinger's experiments, and he is, I believe, still continuing them, and their results must have a very important bearing upon our knowledge of the strength of materials.

The experiments from which the formulae for the strength of timber beams, joists, &c., were deduced, were in almost all cases made on very small pieces, and it has been a pure assumption that large pieces would behave in the same way. During the last few years a number of experiments have been made in the States, chiefly by Mr. Lanza at the Massachusetts Institute, on full-size pieces of timber; the results show that our ordinary formulae require considerable revision. For instance, a spruce beam 12 in. by 2 in. by 15 ft. long, broke with a central load of 5,894 lb. According to Tredgold's formula, it ought to have supported a load of 8,928 lb. before breaking. This result was corroborated by other tests, and the general conclusion arrived at is, that whereas we have been accustomed to use as a constant in the familiar formula 
$$W = \frac{c b d^2}{l} \text{ 4 cwt. for fir or pine beams, — in fact,}$$
 in one of Tredgold's examples 530 lb. is used,—we ought really to use a constant of not more than 2½ cwt. The more thoroughly large size specimens, whether of wood or iron, are tested the more will our knowledge of their strength be increased, and we shall be less dependent upon theory.

In conclusion, I will only say that one most important discovery has been made in the last few years to which I have not yet alluded, and that is that one necessity for an architect is a thorough education, and the result of this discovery must have very far-reaching effects on our profession.

In the discussion which followed Mr. Slater's paper the following gentlemen took part, viz., Professor Bahcock, Professor Kerr, and Messrs. Woodward, Neville, W. White, Hall,

Smallpeice, Doulton, Seddon, and Gibson; but our report is necessarily deferred till next week, when we shall detail the further progress of the Conference. We may, however, here briefly mention the order of proceedings:—

Thursday, May 5th.—11 a.m. Visit to the City and Guilds of London Institute, Central Institution, Exhibition-road.—3 p.m. Conference Meeting (Mr. John Holden, Fellow (Manchester), in the chair). Discussion of the Report of the Special Federation Committee, R.I.B.A., prior to its consideration by the Council.—9 p.m. Conversation of the President and Members, R.I.B.A., held by permission of the Lords of the Committee of Council on Education at the South Kensington Museum.

Friday, May 6th.—11 a.m. Visit to the Drainage Works of the Houses of Parliament.—3 p.m. Conference Meeting (Professor T. Roger Smith, Member of Council, in the Chair). Short Papers on the "Registration of Architects," by Mr. Charles Aldridge (Liverpool); Mr. G. W. Cannon (Leeds); Mr. David Thomson (Glasgow); Mr. E. T. Hall, and others.—8 p.m. Ordinary Meeting of R.I.B.A., for the Presentation of the Royal Gold Medal to Mr. Ewan Christian, and for presenting the Institute Prizes. The President, who will take the chair, will deliver an address.

Saturday, May 7th.—11 a.m. Visit to the new rooms of the National Gallery.—12 noon. Visit to the Diploma Gallery, &c., of the Royal Academy, Burlington House, Piccadilly.—7 for 7.30. Members' Dinner, at the Freemasons' Tavern.

#### STAINED GLASS.

*Great Barr (near Birmingham).*—Another Munich window, by Mayer & Co., has just been placed on the north side of the Parish Church of Great Barr, near Birmingham. It consists of two lights, through which is represented the "Presentation in the Temple," and it has been erected "In memoriam Mahel Augusta Jaffray, died 1886."

*Kingston (near Taunton).*—A stained-glass window has just been placed in the west end of the north aisle of the parish church of Kingston, near Taunton, in memory of the late Mrs. Gale. The subject is a copy of Holman Hunt's picture "The Light of the World," and it has been executed by Messrs. Payne & Green, of London.

*Leigh (Essex).*—A window in painted glass, designed and drawn by Mr. Wm. White, F.S.A., has been placed in the north wall of the church of Leigh, Essex, as a memorial to Bishop Eden. In the centre light is a figure of St. Andrew, and in a medallion beneath is a small ship. The inscription at the bottom is as follows:—"To the glory of God and in grateful memory of Robert Eden, Bishop of Moray and Ross, Primate of Scotland, formerly rector of this parish sixteen years. He presented to Bishop Edward Field, of Newfoundland, a church mission ship, the *Hawk*. He deceased August 26, 1886, aged 82 years. Also in memory of Emma, his wife, who deceased March 24, 1880, aged 77 years."

*Manchester.*—The *Manchester Guardian* says that it is proposed to celebrate the Jubilee year of the Queen, and at the same time perpetuate the memory of the late Bishop Fraser, by erecting in the Albert Memorial Church, at the western end, a stained-glass window. Messrs. Hemming & Co., of Margaret-street, London, are to be entrusted with the execution of the work, which has been designed by the curate, the Rev. W. J. Mooney. The window will contain the royal arms and those of the Prince Consort, also the arms of the See of Manchester and of the late Dr. Fraser. The illustrations are of scenes in the life of St. Paul. The cost of this *in memoriam* work will be about £500.

*Oldham.*—A new chancel window in St. Mary's Church, High Crompton, has just been unveiled. The work has been designed and executed by M. J. B. Capronnier, of Brussels.

*Wiveliscombe.*—A stained-glass window, executed by Messrs. Clayton & Bell, has just been erected in the north aisle of the parish church of Wiveliscombe, by Miss Pocock, in memory of her late parents.

\* This report was printed *in extenso* in the *Builder* for April 23, p. 602.

#### RECENT PATENTS.

##### ABSTRACTS OF SPECIFICATIONS.

6,640, Water-closets, &c. J. Shanks.

The improvements embodied in this invention are mainly to limit the use of water while securing the full effective cleansing power of the same; an "after service" is arranged which with a wash-down basin completes the flushing. The distinguishing feature of the valve is a piston in the cover of the valve-box arranged to open the valve by diminishing the pressure on the outer side of the diaphragm.

6,943, Ventilating Rooms. E. G. Wright.

A tube with conical baffles is placed between the ceiling and floor, or behind the cornice. The ends of the apparatus are provided with inlet and exhaust cowls respectively; the cones by increasing the pressure attract the vitiated air quicker to the top of the room.

17,116, Damp Walls. E. C. S. Moore.

Portland cement is used as the basis of the patentee's system, and is applied on the inside of the building in two coats, afterwards covered over with a third coating of Parian or Keene's cement. The first coating is pure cement ½ in. thick, and the second is mixed with sand one part in three, so as to exclude the damp. The condensation on the surface of the wall is prevented by the application of Parian or Keene's cement or plaster.

15,983, Kitchen Ranges. G. W. Courtier.

This invention relates principally to an oven attached to the range, and consists in making an inner casing of iron; so that when the oven is to be enlarged the casing can be drawn out telescopically, and the baking area thus increased.

1,758, Sash Fasteners. J. Harrington.

The object of this invention is to prevent the pushing back of the lever by a knife or blade between the sashes. An additional hinged piece of metal is fastened in such a way that it falls over the two sashes, and covers the junction of them for some distance to protect the lever of the fastener when the latter is bolted.

1,881, Fire Alarm. W. E. Heys.

This invention relates to a system of electric alarm with an automatic device for opening or closing the electric circuit.

##### NEW APPLICATIONS FOR PATENTS.

April 22.—5,847, H. Hagen, Chimney Pot for Smoky Chimneys.—5,848, J. Ditchfield, Water Taps for joining to Lead Pipes.—5,876, A. Barton & C. Arnold, Window or Sash Fasteners.—5,901, J. L. Doulton, Earthenware Blocks and Tiles.

April 23.—5,928, H. Richardson, Piercing or Boring Holes in Walls constructed of Bricks, Stone, &c.

April 25.—6,021, A. Le Marquand, Sewerage or Drainage of Houses, &c.—6,027, A. Rhodes, Window Fastener.—6,033, G. Sharpe and Others, Cement for Plastering or Moulding.

April 26.—6,048, A. Smith, Fixing Door-handles to Spindles.—6,075, F. Tuerk, jun., and Others, Water Meters.—6,080, J. Eves, Water-closets.—6,108, J. Sheehy, Window Sashes.—6,111, A. J. Davies, Supplying Water to Water-closets, &c.

April 27.—H. Wake, Lowering and Depositing Concrete under Water.—6,137, S. Pickersgill, Open Fire-grates or Stoves.—6,152, W. Thompson, Portable Buildings.

April 28.—6,187, H. Longdon, Step Ladders and Trestles.—6,242, C. Clarke and F. Williams, Soldering Irons.—6,244, C. Clarke and F. Williams, Flushing Water-closets.

##### PROVISIONAL SPECIFICATIONS ACCEPTED.

3,380, J. McKee, Register Grates or Stoves for House Fireplaces.—3,404, S. Coombs, Frictional Door Check.—4,255, M. Snyr, Siphon Water Waste Preventer.—4,321, F. Jarsul, Door Locks.—5,310, E. Deacon, Locks, Catches, or Latches.—5,392, W. Brailey, Locks and Latches.—15,607, G. and M. Stowe, Bolt for Doors and Windows.—3,757, W. Pilditch, Adjusting and Hanging Doors and Casements.—4,544, J. Williams, Metallic Window Sashes and Frames.—4,598, S. Eshott, Metal Water Bars for Windows and Doors opening inwards.—4,618, R. Haddan, Brick or Block for Building Purposes.—4,689, W. Froussier, Artificial Stone.

##### COMPLETE SPECIFICATIONS ACCEPTED.

###### Open to Opposition for Two Months.

7,163, T. March, Horticultural and Other Buildings and Structures.—12,331, C. Swindell, Store Grates, Fire Grates, or Fireplaces.—2,937, D. Deyn, Closing and Seaming Doors.—7,039, W. Smeaton, senior, Flushing Water Closets, Lavatories, &c.—8,081, F. Morgan, Casement Fasteners.—8,593, J. Luke, Paper Floor and Wall Coverings.—12,174, T. Barnett, Register Stoves.—15,904, R. Davison and W. Creed, Wood Block Flooring.—3,850, J. Gooch, Shop Fronts.—4,244, A. O'Leary, Frames for Portable Structures.—4,427, D. O'Leary, Hinge for Gates, Shutters, &c.

# The Builder.

### Architecture at the Paris Salon.

FOR two years past, while there has been a superfluity of pictures and statues at the Palais d'Industrie, the architectural exhibits have progressively diminished. This is no doubt because, with the exception of premediated designs afterwards carried out and designs submitted for diplomas, the management has begun to discountenance the admission of the numerous waifs and strays of competitions from all quarters which have formerly invaded the architectural galleries to the prejudice of designs seriously intended, and which have no interest to any one except to the authors who gain a free admission in virtue of them. As quantity is never the real charm of an exhibition, we are in no way shocked at this evisceration on the part of the judges. It facilitates our task, and we might even wish it further exercised, especially in regard to those sketches of tourists which become every year more and more numerous. Sketches of this kind certainly have the interest of representing the first impressions of youth; they form an excellent gymnastic exercise for the taste and the touch, and usefully complete the education of young pupils by giving them an independence and originality in the use of the pencil which they could not have acquired in the École des Beaux Arts; but still, a discretion ought to be exercised in regard to this crowd of sketches, at least so far as to confine them to those whose subject is architectural. Some of the exhibits are far too omnivorous in this respect, a reproach particularly to be addressed to M. Ghesquier, who has accumulated in immense frames all his tourist *souvenirs* with an almost puerile exuberance, with the sole end of proving that he has not wasted his time or squandered his money for naught.

In this category of work M. Courtois-Suffit, whose remarkable sketches we noticed last year, exhibits this year an interior view of Siena Cathedral, very finely executed. Charming also is the little atrium at Pompeii, painted by M. Paul Blondel, the young "Prix de Rome" holder, who has been commissioned by the municipality to design the pedestal for the statue of Étienne Dolet.

Italy and the East are the object of most of the sketching architects. M. Saladin brings the best sketches from the neighbourhood of Tunis. M. Renaut exhibits watercolours from Greece and Constantinople. The drawings of

M. Micoud and M. Dezermaux are from subjects in France, which itself presents such a great field of architectural study. The former has confined himself to the central provinces, the Loire and the Upper Loire, &c.; his views of the Château de Polignac and of La Chaise Dieu are exceedingly interesting: the latter has occupied himself with Chartres. M. Chas. Normand also has made various studies of picturesque houses in France. M. Normand is a zealous defender of the antiquities of Paris, and his special taste for archaeology is fortunately supplemented by genuine talent as an artist.

As usual, ecclesiastical buildings, either restored or in their actual state, occupy an important place in the architectural room at the Salon. We may mention especially the fine water-colour drawings of M. Baudot, very accurate though rather hard, representing the splendid Cathedral of Clermont-Ferrand. M. Camut, for his part, has faithfully reproduced the church of Notre Dame de Port (also at Clermont), the most ancient and, perhaps, the most perfect example of the eleventh-century architecture of the Auvergne type. There are also two exceedingly careful and well-executed sketches by M. H. Chaîne of the ancient collegiate church of Eymontiers (in the district of Haute Vienne), celebrated for its fifteenth-century windows. Why is the drawing by M. Georges Farcy of the portal of St. Trophime at Arles hung so high? It is certainly a great deal superior to that by M. Louzier, which is hung lower. The same artist gives us, further on, a design for a church intended for a village in Normandy, which is well conceived and without pretension,—a rare merit in the present day. There are also to be mentioned two frames containing sketches by M. Rouillard from the Church of St. Sauveur at Petit Andelys; the Church of Puiseaux by M. Paulin, and the curious drawing by M. Pettigrand, reproducing a wooden door from the Cathedral of Puy, with great finish of detail and remarkable ability. We must also mention specially the interesting water-colours by M. Gaïda, executed after the paintings of the thirteenth century in the Cathedral of Bayeux, and the exhibits of M. Ernest Monnier, representing the Church of Vauvres, with the new flèche which he erected on it some years ago, and which shows some degree of novelty in the treatment of Gothic detail.

The designs for civil architecture may be classed under the two heads of public buildings and private houses. One of the most important of the former class is the Library and Museum which has been in course of construction at Toulon, from 1882 to 1887, from the designs of M. Allar, brother of the eminent sculptor of that name. This is a

remarkable work, showing obviously the influence of his master, Esperandieu. It is a fine design, with superposed orders, the principal story being relieved with polychromatic decoration. The grand staircase, with its double windings, recalls that of the Palais des Arts at Marseilles, so admirably decorated by M. Puvis de Chavannes.

M. Anhurтин (a native of Metz, who has remained a Frenchman) exhibits a design for the enlargement of the Museum at Metz, a good design and plan of great simplicity of lines. The same cannot be said of the design for the Fine Arts Museum at Lauzanne, by M. Fivaz. His new façade for the Church of St. Nicholas at Fribourg is much better.

Scholastic architecture is represented by M. Dornay and M. Bonnenfaut. The former exhibits the drawings of the Lycée de Saint Étienne, which recalls, as regards polychromy, the Chaptal College. M. Bonnenfaut exhibits the designs for the schools of Choisy-le-roi and Viroflay, the cold and depressing architecture of which is a mere repetition of other buildings of the same class. M. Ulysse Gravigny, who is just completing a new Mairie for Arcueil-cachan, in the Department of the Seine, has not confined himself, like many other architects of the same class of building, to the production of a purely decorative work, a piece of show architecture. He would have been hampered in such an attempt, in any case, by the difficulties presented by the shape of the site, and the acute angle formed by the intersection of the two steep streets where the new building is placed. In spite of these difficulties, the author has developed an admirably-arranged plan. The façade is well studied for the situation, though a little over-weighted by the campanile which surmounts it; but it has not the refinement of detail of some of the Paris Mairies which we have illustrated.

M. Hermant, who last year exhibited a design for a Mairie, is represented this year by a design for a republican barrack,—a sober and practical piece of architecture, well thought out in all its utilitarian provisions, and with a gaïde but sufficiently architectural exterior design. M. Lheureux's design for the enlargement of the "École de Droit" is another good example of practical architecture with the same kind of merit.

The new Casino for Dieppe, the work of M. Durville, is certainly not high art; but this rather hybrid-looking polychromatic design, presenting such a gay appearance, is the kind of thing very well suited to a Channel watering-place, which, in summer at least, hasks under a warm sun and almost as blue a sky as on the Mediterranean shore.

The designs for private dwelling-houses are of special interest, because it is really in this

field that there is the most scope for the exercise of the taste and invention of the architect in the present day. In this respect, the *Salon* of 1886 showed a collection of interesting works which promised well for this class of architecture; but our hopes in regard to it are hardly fulfilled in the show of the present year. Mediocre is the design of M. Barhaux for a "Maison de Campagne," mediocre also the house design by M. Bonnier. There are some pretty details in that by M. Chabat, and the little villa for Varenne, designed by M. Farge, is cleverly treated; but most of the designs for domestic architecture want style and character, and are desperately commonplace.

There is a whole series of restored châteaux, many of them very interesting: the manor-house of Chemazé by M. Ridet, that of Tournai by M. Jarrier, &c. The Château of Chalncet, by M. Benouville, is particularly curious; and M. Daujoy has rendered in a masterly manner in all its details the majestic chateau of Villersexel belonging to the Count de Grammont, and which was burned in 1871 during the engagement of General Bourbaki with the Germans.

By the side of these actual buildings carried out, and restorations of ancient buildings, there are, as usual, many designs of the kind which we prefer to regard as works of pure imagination, in the sense, at least, that they are not susceptible of any immediate or practical application. It is evident, for instance, that the immense caravanseraï which MM. Carle and Grémally propose for a winter station hotel would be in practice a very inconvenient and wearisome place to live in, and had much better remain on the drawings of its two architects, without making any endeavour to go further into realisation. It is also evident that the "Ile de Cité," at Paris, is not really likely to have anything to do with the monument with which M. Deverin proposes to adorn it,—an enormous model of the prow of an ancient galley, carrying a colossal figure representing Lulétia. That is what may be termed architectural utility of the first order. M. Hamelin, again, haunted by a utopian scheme for an ideal observatory, exhibits a drawing of an incomprehensible aspect which one would be disposed to take at first sight for a design for an immense cremation structure. There are every year a series of things of this kind, designs which make one feel sincere pity for the misguided architects who have given themselves seriously to the production of this kind of work. The design for an "École de Droit," however, by M. Joannis, may be named as an exception, being a conscientiously studied and practical design, the only fault of which is that it is rather too obviously inspired by the façade of the Palais de Justice of the late M. Duc. It is true that no better model could have been chosen.

M. Wable proposes, in view of the Exhibition of 1889, a palace or pavilion for Algerian or Tunisian exhibition. That of 1875 was copied from an Algerian mosque. M. Wable proposes to substitute for Arabian religious architecture a specimen of the style of its civil architecture; and his design, well studied and graceful in form, deserves serious consideration.

Although the site of the Tuileries appears to be absolutely reserved for a monument to the Revolution,—unless, indeed, a Museum should be erected there,—M. Cassien Bernard thinks nevertheless to erect there a monument in honour of Victor Hugo, which has the serious fault of reminding one of a great many other monuments already in existence, especially the Palais des Arts at Marseilles and the monument to Victor Emanuel, which M. Nenot exhibited two years ago. It is a vast semicircle lined out by colonnades, and terminating in a pavilion at each extremity. In the centre is a large triumphal arch, on the axis of which is placed the statue of the poet, in front of which is a long stone balustrade mounted on a flight of many steps. The aspect of the whole is fine and decorative in effect; it has only the mistake, as already observed, of being too much of a reminiscence. By the side of this apothecosis in marble and granite is the monu-

ment which the fraternal piety of M. Ambroise Baudry has led him to design for Pere la Chaise, to receive the remains of his illustrious brother. The monument is quiet and dignified in effect and in idea. A bronze female figure leans, in an attitude expressive of deep grief, over a sarcophagus covered with palm branches, among which may be seen the palette and brushes of the painter. A large figure of Fame, also in bronze, shading beneath its wings the bust of Baudry, places a crown of laurel on his brow. Behind rises a tall granite stele.

Among the designs for funeral monuments, not very numerous, may be mentioned also that to the memory of Armand Carrel, executed for the city of Rouen. The statue is by M. Albert Lefevre, and the pedestal, designed by M. Touzet, is very simple, but has the rare merit of being proportioned to the dimensions of the statue.

A little while before his death Victor Hugo was still entertaining the wish to build a house for himself. It was one of the last pre-occupations of his thoughts. "Je veux un hôtel entre cour et jardin," he said in 1884. "Quand donc me haitrez-vous ma maison?" he inquired some few months before his death of M. Leidenfrost, who, to satisfy the old poet, prepared the design which is now exhibited here. It is a pavilion in Louis XIII style, of brick with stone dressings. Victor Hugo loved the architecture of that manner and date, which recalled to him the Place Royale where the generation of 1830 used to visit him. The design is abnormal enough in character, composed of an *avant-corps* with terraces, colonnades, painted gables, Renaissance dormers, roofs à la Mansard, a verandah ornamented with rare plants, &c.; a kind of poet's and artist's dream of a house, very charming in effect, and which does great credit to the taste and imagination of the designer.

Among the works of the pupils of the Academy de France at Rome, not very numerous this year, those by M. Deglane and M. Esquie are, perhaps, the most interesting. The first exhibits his very careful studies of the Temple of Mars Ultor, the Temple of Concord, and the Tomb of the Matæstas at Rimini. M. Esquie gives us the restoration of a ruinous vault without ribs (*voute d'arête*) at the Villa Madama, and also some details of Classic architecture very carefully made out.

M. Gayet, member of the French *Mission Archéologique* at Cairo, exhibits six frames of very interesting drawings, comprising a complete restoration of the Great Temple of Luxor, based on the researches of M. Maspero. These studies are forced and violent in colour, bright yellows and strong reds predominating; but this is, we imagine, really the kind of effect which the original work in its freshness would have had, and its over-pronounced effect must not be charged against the author of the drawings, which are very conscientious and well executed. This restoration is the only one of importance of its class, and we regret not to have seen this year any work analogous to those by M. Lalou and M. Blavette, exhibited last year.

Generally, it may be said that the architectural exhibits of the *Salon* of 1887 include no work of great note or genius. Certainly there are, as there always are, some good elevations, some ingenious restorations, some interesting schemes, and some pretty drawings, but no breath of genius animates these works, which for the most part do not pass beyond the level of an honourable mediocrity.

#### THE MANCHESTER EXHIBITION.

**O**NLY the demand on our space made by such a number of matters of interest in London during the last week or two,—the Architectural Conference, the Academy and Grosvenor exhibitions, &c., all coming to the front at once,—has induced us to postpone even for a week any notice of the remarkable exhibition at Manchester, which in interest ranks second to nothing at the moment, and which is in some respects one of the most remarkable exhibi-

tions of its kind that has been seen in England. It is a thing that has been thoroughly well done in every way. The building for the exhibition, of which we gave a view some time back, when the competition for it was first decided, has, in the first place, been well planned and constructed; it is not quite so striking an edifice architecturally as the Manchester papers make out,—and probably no one knows that better than the architects themselves; but it is a well-constructed temporary structure, laid out in a manner, at once effective and suitable for its purpose. A great deal of trouble and care has been bestowed upon the decorative treatment of the interior, which is much more carefully thought out and more homogeneous in plan and principle than is generally the case in a structure of this kind. Then the Manchester Exhibition has earned the great distinction (certainly a great one among exhibitions of this class) of having been practically complete on its opening day, instead of leaving many weeks of confusion and getting things into their places to follow the opening. Manchester has the repute of being emphatically a place of business, and in regard to the exhibition her business-like character has been thoroughly borne out. Then the promoters of the exhibition have got together the most remarkable and typical collection of English paintings, extending over a considerable period, that has ever been seen in one place. They have an "Old Manchester" which beats the famous "Old London" of the Kensington Exhibitions in scale and finish. They have arranged their industrial art exhibits in a systematic manner, so that it is really possible, in most cases, to find what one wants. They have got out a very complete catalogue. They have a large exhibition of machinery in motion, much of it connected with the staple industry of the city,—the spinning of cotton. They have a special exhibition of Irish work, which, at the present moment, is likely to be a matter of interest to many persons. It is not a mere pleasure exhibition; it is one where much that is of practical interest is to be seen; but added to these more serious objects of study are the more joyous attractions of fountains, hands, a fine organ, and an elaborate system of electric lighting and "effects"; so that it may be said there is something for all tastes.

We propose to give a general idea here of the contents and arrangement of the exhibition, taking the opportunity of going more into detail in regard to some of its departments hereafter.

Entering from the "Chester Road" we find ourselves at the end of a pretty long gallery or avenue stretching down in an oblique direction towards the central space or "crossing" of the exhibition building. But before going down it, we can turn aside to the left into the gardens and wander about the "Old Manchester and Salford." This, as observed, is more elaborate than Old London, but we must remember that Old London and its designer, Mr. Birch, led the way in this kind of show. There is a good deal of stage effect,—men in armour and in costumes of various ages, according to the buildings to which they are specially attached; and the street is entered through a rather nondescript structure supposed to represent the Roman gateway of the town of Mancunium. The streets are mostly of houses of a sixteenth and seventeenth century date, many of them reproductions from old engravings (some of which are to be seen in a room in one of the "old" buildings); there is old Salford bridge and Manchester Cathedral tower, and one or two of the small prim old Classic buildings which have been swept away to make way for the larger buildings required by the growth of the city and its population. The thing is exceedingly well done, and there are many pretty hits in it, but we would just hint a question whether, now that the novelty of the idea is gone, this scenery is quite worth all the trouble and expense of making it. There will probably be an impulse towards making an old town wherever there is an exhibition now, and it is a kind of thing that may be overdone

It was overdoing it to put up an imitation of the cathedral tower there. It is a poor, weak tower in itself, and the imitation, of course, looks weaker still, and besides, why have the sham when the reality is at hand? The use of such an old town is to reproduce what has passed away.

Returning, and going down the entrance avenue (on one side of which may be seen some of the work done in the Technical and the Art Schools of Manchester), we enter the north transept of the exhibition building proper, devoted to a portion of Section I. (Industrial design), on the right samples of cotton stuffs and materials, on the left of silk and some of the operations of treating it. In front is the large open platform, covered by the dome, and surrounded by a terra-cotta screen or arcade, in a semi-Byzantine style, by Messrs. Doulton; very good work, but it would have looked better with a plinth of the same material, instead of the slender shafts springing off the wood floor. The main avenues run east and west (approximately). The centre alley is devoted to industrial art, the centre space being occupied by separate stands of various manufactures, such as porcelain, glass, &c., and the sides are lined with small rooms or booths, open towards the main avenues, and arranged for the display of various classes of goods. Those in the eastern avenue are entirely devoted to artistic furniture and upholstery. This part of the exhibition is very well arranged; the front of the whole forms a continuous design, broken at regular intervals by gables of black and white work (rather a sham this); the openings of the booths are treated decoratively with a certain degree of variety, but a broad band of bold foliated ornament, in two shades of red, running above the whole, binds it all together, and gives it an appearance of studied unity of effect; indeed, the amount of trouble which has been bestowed on the mere setting or framing of the exhibits in this part of the building is noteworthy, and highly creditable to both the spirit and the taste of all concerned in it. We understand Mr. Burne Jones had a considerable hand in the designing and arrangement of these decorative accessories.

Behind these booths, on the northern side of the nave, are the galleries for the exhibition of paintings executed during the present reign. This is a most entrancing exhibition, and in itself fully sufficient to occupy a whole long day, without looking to any other portion of the collection. The oil paintings fill ten large rooms with not far from a thousand paintings, all, be it remembered, picked specimens of various authors. One conclusion we at once came to on looking through them, viz., that the progress in modern English painting during the last half century, is, in most branches of the art, a real and quite unmistakable one. It is curious to look now at some of the works which in our younger days were among the most important things in our annual exhibitions, and to see how they stand now in comparison with the best recent painting; curious to notice who have and who have not stood the test of time. The progress is most marked and most emphatic in regard to figure painting. In landscape painting, there was a person called Turner painting during the present reign, who is represented by several of his oil paintings from the National Gallery; a proceeding which we hope is not to be a precedent. The National Gallery pictures are not supposed to be lent about the country. But apart from such an indisputable giant as Turner, there are some of the landscapists of the past generation whose works are no doubt very different from what passes for fine landscape painting now, but who are not to be lightly dismissed. There is Calcott, for instance, whose colour is, of course, exceedingly conventional (as is that of Claude, for that matter); but there is a grand style about his larger works which cannot be denied. There is Stanfield, who was a great sea painter of a generation ago, and who is well represented here. His seas were very deficient in depth and transparency: his composition and his effects are starchy, more or less. "The entrance

to Zyuder Zee," for instance, is a regular *made picture*; the craft put just in the proper place on the top of a heap of waves, &c.; but there is a life and movement about his sea-pieces, and "The Abandoned," which is here, is a grand idea, though rather melodramatic in its working out.

To give a rapid note of what is to be seen; in the first room the main interest is in the works of Mr. Holman Hunt, which include "The Shadow of Death," "The Scapegoat," and that little gem, "The Strayed Sheep." The latter will hold its own anywhere and everywhere; but we doubt if "The Shadow of Death," now the property of the Corporation of Manchester, will continue to be regarded with the reverence once lavished on it. Mr. Madox Brown's "Work" is here; it will not do; but the "Romeo and Juliet" is a truly powerful painting of intensity of passion. Two or three of Mr. Alfred Hunt's landscapes, notably "Leafy June," look glorious here; and it may be remarked that the rooms are so well lighted that many pictures we know well look finer here than we have seen them anywhere else. Mr. Pettie occupies a considerable space in the second gallery, not satisfactorily; but Mr. Mark's paintings, of which there are a good many in a row, impress one very much with the thoroughness and delicacy of their execution. Mr. Brett's "Britannia's Realm" looks resplendent. Then in the third gallery is an apotheosis of Mr. Burne Jones, whose "Story of Pygmalion" and "The Golden Stair" come out with especial beauty. Mr. Watts is enthroned in state at the other end of the room; "Love and Death," "Love and Life," "Hope," and a whole row of portraits, and "Psyche," and other lesser works represent him nobly; the "Hope" looks finer and more impressive than it did in the Grosvenor; it is placed centrally. Mr. Calderon is here with "Home after Victory," but no one can regard that seriously after Tenniel's rendering of it with "Dizzy" as the hero; and Mr. Leslie, whose "School Revisited" is as charming as ever. Mr. Alma Tadema has a place of honour in Gallery IV.; "The Oleander" and the "Sculptor's Studio" are the most important of the set; but we are glad to see here a little gem called "a Pomona Festival," which was at an Academy a few years ago, and is not much known. Mr. W. P. Frith is great in this room; his "Before Dinner at Boswell's Lodgings" retains its interest; but "Rams-gate Sands" and the "Derby Day"? Alas, alas! Is it true that these were once thought among the important achievements of English art? Mr. Britton Riviere is in the same room, with a number of capital animals and very weak figures, and Mr. Orchardson, whose works include "Mariage de Convenience" and "After," or "Alone," as it is called in the Manchester catalogue. These, compared with the one now in the Academy, lead one to look for yet greater things from Mr. Orchardson; there is steady and unmistakable progress; the first one struck every one two years ago, but it is comparatively coarse in execution compared with this year's picture.

Mr. F. Holl's portraits are collected in the Fifth room, and works by Sir F. Leighton, including the "Hercules and Death" and "Summer Moon"; the latter we have always thought the most poetic of his works, but it is not quite equal in colour to what we fancied it from the recollection of a good many years ago, when it appeared in the long room of the R.A. exhibition. Sir John Millais is in the same room with a good many of his landscapes and portraits, and the "Vale of Rest," which holds its own well against the more recent ones. In the next gallery we come on Mr. Poynter's beautiful "Visit to Æsculapius," and his two dragon combats, and "Atalanta" and "Nausicaa." Sir F. Leighton's "Daphnephoria" is here, and we like it as well as ever (except those trees); and Sir J. Millais's "Aaron and Hur," which is a finer thing than some people supposed; and there is Mr. Long's "Babylonish Marriage Market," which makes one wonder what all the fuss was about when it appeared at the Academy.

Certain specimens of Etty in the seventh

gallery make one hold up one's hands. Look at the "Bivouac of Cupids," and better still, the "Andromeda"! Etty, we fear, has gone into limbo; he could paint flesh, but he was irredeemably vulgar. Nor does John Philip retain his place, nor a once greater light, Landseer. He is pretty largely represented here, but the result is not happy. There are certain landscape painters not much talked of now, who assert themselves notably in this and the succeeding gallery. Müller is one of these; a true follower of Constable, for whom one or two of his works might be mistaken. Another is Henry Dawson: who hears of him now? But there are some large works of his here of great power and in a grand style; one in Gallery X., of "Greenwich," looks like a large Turner of the early period. The discreet visitor, especially if he be one who takes an interest in architecture, should also look at everything with the name of James Holland over it; large architectural scenes painted with a remarkable combination of accuracy and effectiveness; one of them is worth a dozen Canaletti's, and they are every bit as good now as when they were painted.

In Gallery VIII. is a selection of George Mason's works. Some of the smaller ones, a "Pastoral Symphony," for instance, are not so fine or so delicate in colour as our memory fancied. On the other hand, Frederick Walker, who is well represented, is a complete success in the race: his "Harbour of Refuge" and "The Plough" are as impressive now as when they first gave the world assurance of a new genius, to be, unhappily, so soon taken from us. At the top of the same room is a collection of Rossetti's, including the best of his larger works, "Sybilla Palmifera," and "The Beloved," for instance,—gorgeous in colour, but it is a false school of art, and the day will come when its value will be, at least, much depreciated. Another disappointing painter among the old set is Egg. He will not attract many admirers now; nor Dyce, nor Elmore. A single Copley Fielding in the Ninth Gallery, by the way, gives one pause, "Vessels in a Breeze off Bridlington." Copley Fielding was a better man than he has sometimes been thought; there is nothing as good, as free as this, in Stanfield. And Maclise? Just look at "Merry Christmas in the Baron's Hall," and think that this was one of the eminent English painters. However, Maclise did better things than that. David Cox, of course, holds his own; and Mulready is another man who, at his best, will stand the test of time (see "The Whistonian Controversy"; and Eastlake's "Gaston de Foix" too, seems as beautiful and tender as ever. Mr. Wallis's "Elaine" is a remarkable work of his pre-Raffaellite days; and Mr. Calderon's "Aphrodite" looks twice as well here as at the Grosvenor; it quite sparkles in the midst of the other paintings.

We merely give a kind of hint of what is to be seen among the paintings, and of the interest attaching to this remarkable collection. Among the furniture and upholstery exhibits in the booths before referred to, there is a great deal of good work to be seen. Messrs. Morris & Co. occupy considerable space, and have some splendid designs in arras tapestry; large conventional foliage patterns of grand and bold character among them. Into these portions of the exhibition we must go on another occasion. Some of the Manchester decorators and furniture makers have exhibits of special interest.

Among the separate exhibits in the centre of the avenue (west side) is a model in relief, one foot to the mile, of the Manchester Ship Canal and the country it passes through, which naturally attracts a good deal of interest. Viewed in this manner, and in its full proportions, it seems, we must confess, a considerable distance of country to take large ships for unloading, and by a rather tortuous route.

The Irish section occupies the portion of the plan on the west side of the crossing corresponding to that occupied by the picture galleries on the east side. It includes an immense variety of things, from locomotive engines down to bog-oak carvings, an industry which still seems to keep a place. Among the

exhibits is a stand representing the Wigham lighthouse lights and reflectors, on the merits of which, as against the electric light for lighthouses, so much has been said of late.

The section of machinery in motion, forming a separate set of buildings, reached across the Talbot-road by a bridge, covers a large space of ground, and includes a great variety of machines. Looms, and spinning and weaving machinery generally, are largely represented, and many of them can be studied in action. About these we will say more in detail on another occasion. The dynamo department is at the east end of this portion of the building. On the south side of this portion of the exhibition is the machinery not in motion, including several fine specimens of locomotive engines. Among these is a new goods engine, on Mr. Webb's compound system with the additional low-pressure cylinder beneath the boiler, using the waste steam from the high-pressure cylinders. This is the first goods engine made on this type, so that we presume the report that it was intended to abandon this model, as being expensive in regard to coal, is incorrect. We should be sorry to hear of the failure of this type of engines. They appear to run splendidly when once fairly under weigh, and to be then steadier in running than the ordinary model of locomotive; but the difficulty at starting, when the two sets of cylinders do not seem always to hit it off together, has not yet been got over; during the first minute after starting there is frequently a perceptible unevenness in the pull, making itself felt in a succession of little jerks, until a fair speed is attained: it is to be hoped this drawback will in time be remedied. Another speciality in the locomotives is Messrs. Sharp, Stewart, & Co.'s, eight-wheels-coupled "Consolidation" engine, four small wheels on each side coupled. This is a metre-gauge engine, intended, we believe, for a South American railway, and evidently designed for heavy gradients.

Section III., devoted to "Chemical and Allied Industries," is close to the Machinery department, with which, indeed, it has in many respects very intimate relations. This section also includes building materials. One of the items in this section is a model of the Dietzsch cement-kiln, of which we gave an illustration recently. The section of building materials is not large, however, nor does it appear to contain, in the main, very much of novelty or of special interest. The pictures and the machinery are the two strong sections of the exhibition.

The architectural drawings are hung on the walls facing the main avenue at the east end. They form a very fine collection of drawings, and most of the leading architects of the day are represented among them; but the collection is not as representative of the present reign as that of the pictures, the number of drawings by deceased architects being very small in proportion to the rest. The reason for this is obvious; architectural drawings have not the same general interest as pictures, and, therefore, are not bought and carefully preserved by collectors as paintings. They are, we fear, chiefly interesting to the architects themselves. Accordingly, while the majority of the paintings are lent by owners who have purchased them from the painters, the majority of the architectural drawings are lent by the architects themselves. A few drawings by Mr. Decimus Burton, Sir C. Barry, Sir G. Scott, and other deceased architects, have been lent by their representatives, but otherwise the architects not now living are very meagrely represented. As illustrations of the architectural work of the present generation they form, however, a fine collection, and we hope that more facility will be given to the public to get at them than was the case on the day of our visit, when chairs were ranged up on either side so as to leave no space to get to the drawings, which, of course, are not such as can be well seen at 15 ft. or 20 ft. distance. The public are slow enough to take interest in architectural designs under the most favourable circumstances, and they might, at least, be given every facility for doing so, in case their interest or curiosity is awakened in that direction.

## NOTES.

**T**HE recently-decided case of Drew & Co. v. Josolyne (Law Reports 18 Q.B.D., p. 590), is one of so much practical importance to those who have to do with building contracts that it is desirable to point out its main features. It is of greater importance as being a decision of the Court of Appeal, and must necessarily serve as a guide in the future. The contract was one in which there was the customary clause that in case the contractors should at any time during the execution of the works become bankrupt or commit an act of bankruptcy then the building owner might dismiss and discharge the contractors from the further execution of the works and employ some other person to complete them, and in such case the several materials brought on to the ground for the purpose of the works were to become the property of the building owners, and the sum or sums to be paid to such other persons to complete the works should be deducted from the amount of the contract, and the balance, if any, after making any deductions which the building owners might be entitled to make, was to be paid to the contractor. There was also the equally common clause that twenty per cent. of the sums due from the building owner were to be paid on the completion of the work, eighty per cent. of the sum certified being paid from time to time. In due course the contractors became bankrupt, and the committee of inspection passed a resolution that the trustee should carry out the pending contracts of the debtors. How he was to find money and materials it is unnecessary to state; the main point is that he was thus empowered and acted accordingly. Previously, however, to the contractors' bankruptcy they had assigned by way of mortgage to Messrs. Drew & Co. the sum of 1,000*l.* due and owing to them, or which might thereafter become due and owing to them under the building contract, and being part of the retention money mentioned in the specification. The contest in the law courts was whether the mortgage of these retention moneys or the trustee in bankruptcy who completed the contract was entitled to these moneys. Mr. Justice Field decided that the trustee had a right to them on the authority of a case called *Tooth v. Hallett*: the Court of Appeal reversed his decision, and awarded the sums to the mortgagee. What, then, is the test by which it is to be decided in future cases of a similar kind in whom the right to the retention moneys lies? The criterion is whether the building owner has put an end, as he is entitled to do, on the contractor's bankruptcy, to the old contract, and has entered into a new arrangement with the trustee to complete the work. That was what happened in *Tooth v. Hallett*. "Under those circumstances it was held that, as the building owners could deduct from the money coming to the original contractors the sums paid to the person employed to complete the work, and there was, when that deduction was made, no balance due under the old contract, the claim of the mortgagee failed. Here the retention moneys are due under the original contract, and the assignment must operate upon them." This quotation from the judgment of Lord Justice Bowen puts the point with perfect clearness. The case shows both the danger to a person who takes mortgages of such retention moneys, and to a trustee of a bankrupt contractor who completes works. The former may lose his lien if the contract is not completed under the original contract; the latter may, if he carries out the works without a fresh contract, find himself out of pocket by so doing. In either case there is a dilemma. The practical moral seems to be that a prudent man should not lend money on such security without some collateral security, or without guarantee from a third party; and that a trustee should not undertake to complete a contract unless he can do so with the certainty of being paid the retention money.

**T**HE four papers read at the Conference meeting, on Friday last week, on the sub-

ject of the Registration of Architects as members of a closed profession, are worthy of careful attention, and show a thoughtful consideration, on the part of each of the authors, of the advantages and difficulties connected with the proposition as seen from his own point of view. The subject has far too many hearings, however, to be decided on in any way in a hurry, and it is well that the meeting was committed to nothing more than a recommendation to the Council to give the subject special consideration. The effrontery displayed by the knot of persons who have been endeavouring to advertise themselves, in opposition to the Institute, as the leaders in the reform of the profession, in coming down to the Institute rooms and making use of the occasion for further advertisement, needs no comment, except that a more stringent chairman than the amiable Professor who presided that afternoon would have disallowed this misuse of the meeting. The chairman, indeed, ruled, when the question was raised by a member, that this subject of the drafting of a Registration Act by persons belonging to a society not recognised by the Institute, was not a subject before the meeting—in other words, was out of order; as it unquestionably was. But if so, why was not this performance stopped at the outset?

**M**R. PILDITCH'S paper on dilapidations, which was read at the Surveyors' Institute, and is published in vol. xix., part ix., of the Transactions of that body, is one which may be usefully perused by all who have any interest in the subject. It is a careful summary of the practice, with some notes on recent decisions. Mr. Pilditch cites an instance which exemplifies the absurdity of hard-and-fast rules, as to painting at stated times. He recently surveyed a terrace at the West End; one house, which had been quite recently painted, either from neglect or had workmanship ought, in his opinion, to be repainted and papered; in the next house, though nothing had been done for forty years, "both paper and paint, though drier and rusty, were in such an excellent state of preservation that there could be no justification for demanding it again." There can be no doubt that a careful tenant will often leave a house which has been thoroughly well painted and papered in the first instance, in a better condition,—nothing having been done to it,—than a tenant who is careless and has the house repainted and papered by second-class workmen. But having regard to the state of the London atmosphere, paper which does not require restoring at the end of forty years would be worth exhibiting, as well as the occupier and his servants who had had charge of the house.

**M**R. TOMKINSON, in obtaining an injunction to prevent the South-Eastern Railway from giving a donation to the Imperial Institute, took a proper, though perhaps an unpopular, step. If public companies once begin to subscribe to this or that object a very wide door is open to all kinds of johbery. Moreover, a gift by a railway company is not a voluntary donation so far as many shareholders are concerned. It is a compulsory tax, though small in amount, levied at the will and pleasure of the directors. If these corporate commercial donations were to become common they would tend to close individual purses and to raise prejudice against the objects of such misplaced generosity.

**T**HE *Nineteenth Century* for the current month, in an article entitled "How to ensure Breathing Spaces," suggests, or rather adopts a suggestion made by the Rev. James Johnson in 1885, that where land is laid out for building a certain proportion of such land shall be set aside to be kept open in perpetuity for the health and recreation of the people. The author acknowledges that the idea is opposed to commonly-received opinions as regards the rights of property, but points out that there are precedents for the proposal in the case of the by-law under the Metropolitan Local Management Act regulating the width of streets, and the provisions of the

Metropolitan Building Act and of the Metropolitan Building Act and Metropolis Management Amendment Act requiring a certain open space to be left at the side or the rear of dwelling-houses. The requirements with regard to open spaces are even now inadequate to insure healthy and well-ventilated dwellings, and, as has been well pointed out by Miss Octavia Hill, whose experience of the homes of the poor entitles her to respect, the open space should vary in proportion to the height rather than the frontage of a house instead of being a fixed quantity or one varying with the frontage. The author of the article in the *Nineteenth Century* in the precedents he has cited overlooks the fact that the restrictions he refers to do not affect the landowner, but only the lessee or builder, and that any proposal which would affect the value of land for building purposes would be certain to meet with the most strenuous opposition in both Houses of Parliament, the majority of whose members are landowners.

A VERY striking addition has just been made to the Etruscan Room of the British Museum, to which, in the *Classical Review* (May), Mr. A. H. Smith draws attention. This addition consists of a large terracotta sarcophagus, on the lid of which a life-sized woman reclines. Flesh, drapery, and ornaments are painted in colours still vivid, and the whole effect is startlingly life-like. The figure, it was at once seen, has the closest resemblance to the famous sarcophagus at Florence, the date of which, from coins found with it, can safely be made out as the early half of the second century B.C. If we may trust our own memory, refreshed by a glance at the coloured plate ("Monumenti," xi., tav. 1), the Florence specimen is the finer of the two. But the Etruscan antiquities of the Via Colonna Museum are arranged in a peculiarly happy way in a room with a subdued light, so that their coarse realism appears less blatant. For full particulars we refer to Mr. Smith's note (p. 118), which should be read in front of the sarcophagus. He gives the inscription, *Seianti Thunmia Thesmasia*, and for comparison we add that of the Florence sarcophagus, which, oddly enough, also contained the body of a *Seianti*,—"Seianti Villania Tareti." By notes of this description, the *Classical Review* is doing excellent service to archaeology, and will, if we are not much mistaken, sensibly increase the number of intelligent visitors to the Museum.

IN the *Gazette des Beaux Arts* (No. 356, xxxv., pp. 87—108), M. Collignon has an article on "La Sculpture antique au British Museum," which gives an interesting popular view of the chief treasures of our national collection. Some account is given of the gradual accumulation of the various antiquities during the last 150 years, of the Hamilton and Townley collections, the Parthenon marbles, Cockerell's discoveries, and the more recent finds by Mr. Newton at Halicarnassos, and Mr. Wood at Ephesus. Then follows an excellent historical conspectus in the easy, lucid manner for which M. Collignon is well known. The paper is illustrated by six woodcuts. Any one who wishes to get a general view, good as far as it goes, of the British Museum collections could not do better than read the essay, and they will do well to take, in connexion with it, Mr. Newton's two papers "On the Study of Archaeology," and on the "Arrangement of the Collections of Art and Antiquities in the British Museum."

THE statue of King Victor Emanuel at Venice was unveiled on May 1st, in the presence of the King and Queen and a vast assemblage of people. Touching this statue, the *Venice News* remarks, "As to this monument itself, perhaps the less said the better. Its history is not the most happy one possible. Begun with a loyal desire to perpetuate the memory of King Victor Emanuel, an unfortunate site was chosen in the first instance, namely, the little piazzetta of the Leoncini, on the north side of St. Mark's. Then a design

or model was selected which had no companionship in artistic feeling, no suitability in outline, composition, or style with the position it was to occupy (and in this the artist must be considered to have been in error as the Executive Committee), and when the work was well advanced a rough full-size model was put up in the chosen position, and shifted here and there until everybody was convinced that the case was hopeless, and that another site would have to be found." The model was dragged about the Piazzetta and the Molo, each new position finding advocates and admirers, until, as a last resource, the present site was chosen,—not well or advisedly by any means, as it crowds up a part already not too wide, and, worse than this, renders the monument practically invisible from one side, as the space between it and the neighbouring houses is very small indeed. The best view is, of course, from the water, though the architecturally indifferent *Hôtel d'Angleterre*."

ON St. George's Day last, April 23, the Duke of Westminster formally opened a new Vestry-hall for the parish of St. George, Hanover-square. The site, in Mount-street, Berkeley-square, was obtained for 11,624*l*. The hall has cost 15,362*l*. The vestry dates from 1662, in which year they were appointed for the out-wards of St. Martin-in-the-Fields by the then Bishop of London. These outlying wards, representing the ancient manor of Eia, were constituted into a separate parish in 1719, since sub-divided (1844), and a ratepayers' vestry established. The lease expired in 1884 of the old vestry buildings, which was granted in 1789 by Richard, first Earl Grosvenor, grand-nephew of the Sir Thomas Grosvenor who married Mary Davies, the wealthy heiress to the Ebury property in Westminster.

IT is gratifying to notice the continued interest of the Institute Transactions in regard to illustrations. In place of a dry volume of papers with, perhaps, a few small explanatory diagrams here and there, we have now in the "Transactions" volumes a series of fine illustrations of various details connected with architecture. The last issue contains a number of illustrations of the decorative use of marble, in connexion with Mr. Brindley's paper, and drawings of Japanese house planning and construction, in connexion with the paper on Japanese architecture by Mr. Conder. Professor Hayter Lewis's Notes in Greece are of considerable interest.

MR. E. J. TARVER'S paper on Street Architecture, at the Society of Arts on Tuesday evening, was original and suggestive, and deserved a larger audience than that which it succeeded in attracting, although those who attended were sympathetic and attentive. The proposal that in the case of laying out a street improvement the elevations of proposed new buildings should be set up to a uniform scale by an official appointed for that purpose, and that if the designs should be found to be inharmonious the architects should be invited to reconsider their designs, is about as Quixotic a scheme as ever was promulgated. Architects are notoriously as irritable with regard to their own productions as literary men are said to be, and to expect a man to modify his design spontaneously in the interests of harmony and the public good, is to indicate a simplicity of character and a belief in the possibilities of human nature which is very refreshing. Mr. Tarver's proposal to connect the arch at the top of Constitution-hill with the screen at the entrance to Hyde-park by means of a vista of statues of famous generals, terminating with a statue of Wellington in the park, is not likely to excite any general enthusiasm, any more than Professor Kerr's proposition to celebrate the Jubilee by placing a statue of the late Duke of Kent on the vacant pedestal in Trafalgar-square as a pendant to Chantrey's statue of George IV. An irreverent wit once suggested filling the pedestal with a statue of Brunnel, asking (pointing to the other side of the square), "Who's your fat friend?"

THE Ramsey School Board seem to have resolved to distance other Boards and Committees in the matter of obliging offers to competing architects. They invite any architects who are fools enough to do so (that is not, we admit, the literal wording of the advertisement) to send plans and specifications for school and school-house for Parkeston, Essex, the school to accommodate 350 children. The Board will retain the set of plans and specifications which pleases them best, "on a payment to the sender thereof of 5*l*. 5s., but it shall not be necessary or incumbent upon them to employ such sender in superintending the building of the school for which the plans and specifications are used." This must be sheer ignorance. No set of people who had any idea of what is properly due to an architect for planning (without superintending) a building of that class could have had the face to make such an offer.

ANOTHER example of the liberality of competition advertisers, and of the cool way in which they propose to victimise architects, has been sent to us in the shape of the conditions of competition for a cottage-hospital at Romford, Essex. It was advertised in our columns that the architect whose design was selected would be employed "on the usual terms"; but in the conditions sent to competitors it is stated that, "Being a Jubilee charity, it is expected that half the usual fee will be remitted." This is what we call not only an unreasonable bid, under the circumstances, an impudent proceeding. It amounts to this, that the promoters advertised in our columns a wilful misrepresentation; stating that they were going to employ architects on the usual terms, and then rescinding that statement in the privately-circulated particulars. We hope they will not get a single response.

WE have received from Messrs. Chubb illustrations of the two ceremonial keys manufactured by them for the opening of the Manchester Exhibition, with the usual paragraphs which are circulated "for the Press" on such occasions, describing the artistic interest of the keys, &c. We use our own judgment on such matters, and we can assure Messrs. Chubb that, however good may be the workmanship of these keys (as we have no doubt it is), they are entirely destitute of artistic value or interest, and therefore not worth illustrating from our point of view. Why do not manufacturers go to an artist to design a key for an important function of that kind? When they do that, and produce something that is really artistic, we will illustrate their keys,—and not before.

SANTA MARIA DEI MIRACOLI,

IN VENICE.

BY SIGR. GIACOMO BONI.

Few people have seen the interior of this church, "the most interesting and finished example in Venice of the Byzantine Renaissance" during the last twenty-five years. Repairs have been proceeding slowly or have been suspended altogether during long intervals. It is as yet closed, but in a few weeks its new pavement will be swept for the last time and its doors will be opened to the public. People who come to Venice will go and see this church, and I hope they may find useful some of the notes which I translate here concerning the foundation of the building and the ceremonies of its consecration.

Some time ago I examined a MS. book of the Gradenigo collection, in our Museum (No. 119), bearing the title "Memorie lasciate da Francesco Amadi della sua famiglia." It begins by original memoranda, written towards the end of the fifteenth century, when the church *doi Miracoli* was built. I then studied a small anonymous book in the Marcian Library, bearing the following title: "Cromichetta dell'origine

\* "Stones of Venice." Mr. Ruskin has criticised the ornaments of the pedestal of a pilaster. The photographs, taken from a valuable collection done by G. B. Brusa, represent the details of the same, which have aroused so much admiration and blame from art-critics and historians. All, however, agree in judging it an unrivalled example of delicate execution in our Early Renaissance.

principio e fondazione della Chiesa e Monasterio della Beata Vergine de' Miracoli, — mdcxliii." The author says he has taken it from a MS. book, about two hundred years old, and from some old papers, much torn and confused. It was easy to recognise the passages of the fifteenth-century MS. chronicle, which appear in a slightly altered form in the compilation of the seventeenth century, but as this compilation has several passages taken from other memoranda which have not come down to us, I extracted what I found most interesting in it bearing upon the history of the building, and incorporating cursive letters, sentences, and paragraphs of the original MS., which either deserve to be given in full or which do not appear in the printed Chronicle. I hope that the literal translations retain some of the charming characteristics of the originals.

## CHAPTER I.

## On the Universal Adoration of the Virgin.

## I.

Amongst the principal churches dedicated to the Virgin is that of the Miracles, a building well kept and adorned, to which is added the Monastery of the Claustral Nuns of S. Chiara. It was named *Doi Miracoli*, as it continued to work wonders.

## II.

The year 1408 there was living in this town of Venice Ser. Francesco degli Amadi, a pious man who caused an image of the Virgin, with the Son on her arm, to be painted by Master Nicolo, much celebrated in that time, and, "according to our Venetian fashion," he hung it on the corner of a house of Alvise Barozzi, close to his own, which was nearer to the public street, where it remained some time without effecting miracles.

In the year 1430 Messer Marco de Rasti lights lamps and candles before that image, especially on Saturdays, and adorns it with flowers and green leaves (verdure), from which it received greater veneration of the people.

## III.

An omen foretells the place where the church would be built.

## IV.

The reverence towards the image increases; the owner of the house wants to take it to his own parish church, "hut I (Angelo Amadi, born in 1425, during the Calends of December, the vigil of S. Thomas, towards day-break) about the fifth hour of the night I took to my house the said ancona, which is a painted image of the Madonna holding the Son on her arm, and two more figures, one of S. James the Apostle and the other of S. Anthony, and at the same time I had an apparatus made of a wooden altar, covered with a silk cloth and adorned with laurels, bossi, cypresses, junipers, and other worthy leaves; this was (done) in our court, in the parish of S. Marina, the Greek holy virgin." The enemy of human species suggests to the owner of the house to resent this alienation.

## V.

Barozzi persuades the Patriarch to moderate the adoration of that image.

## VI.

The parson of S. Marina dissuades the Patriarch.

## VII.

The alms increase. Procurators of the Madonna are elected.

## VIII.

The 6th of September, 1480, four houses are bought for 700 ducats.

## IX.

The 28th of September, 1480, the demolition begins; a hut of planks is prepared in the centre of the area to be occupied by the building, in order to protect the image.

## X.

Barozzi has recourse to Doge Giovanni Mocenigo, claiming the property of the image, hut being proved that one Amadi had it painted, it was decreed to belong to that family.

## XI.

Barozzi refuses to sell his houses.

## XII.

The 21st of October, 1480, the Procurators obtain from the Patriarch a licence to build the church; he signed it with his ordinary seal, and wrote with his own hand that he would give 25 ducats, and beforehand, the Serenity of our Prince John Mocenigo promised to give 25 ducats for the building of the church.

## XIII.

The Procurators, following the advice of the Savi (Counsellors) ask and obtain (the 15th of January, 1481) a diplom from Pope Sixtus IV. for the erection of the church.

## XIV.

In the first of January, 1481, the parson of S. Marina was elected a chaplain of the image.

## XVI.

The 25th of February, 1481, takes place the translation of the image from Ca' d'Amadi to the wooden hut, with the concurrence of the schools (companies) of the Misericordia, of the Carita, of S. Marco, of S. Giovanni Evangelista, and of S. Rono, the brethren of which, dressed with sack (canvas) strike themselves with disciplines (whips) and iron chains. The image is borne upon a platform, covered with a cloth of gold and crimson, silver candlesticks, "with certain Oriental figurations on it," under a canopy, whose field is gold and crimson. And we, Ser. Alvise and T. Angelo Amadi, under this canopy, bore upon our shoulders the said platform, as a thing of our own, just as the people of Constantinople did with their prodigious Pamera. We were all dressed with purple, scarlets, and silk gowns. "Trumpets and fifes." The Patriarch with the cross, the mitre, and the pastoral. . . . and the clergy and magistratos. A numberless multitude of men and women, singing

with stones from Verona, red and black, of the best kind that can be found, from the basement to the top cornice, for the price of one thousand ducats, viz., ducats 1,000. This appears from the stipulations and drawing of the model, kept by Ser. Francesco Len, a Procurator of the church.

## XVII.

During the year 1481 a cross of crystal [is] offered to the altar, and a new illuminated missal and many alms. The 1st of April, 1481, an indulgence of one thousand eight hundred days is obtained from Rome, for those who visit and give alms to the church.

## XVIII.

The 2nd day of May, 1481, as the church was founded. I had a large bronze medal put under the plaster at the left corner of the façade. This medal shows the head of myself, Angelo Amadi, in relief, taken from nature, with ancient letters around, like these:— ANGELVS DE AMATIS; and on

Plan of S. Maria dei Miracoli.

psalms in praise of this glorious Virgin. When it passes, the people prostrate (kneeling) to the ground devoutly, with many tears, and the hands folded on the breast, they asked mercy.

## XVIII.

The procession reaches the place, the Patriarch blesses it, and lays the first stone. The image is placed behind an open screen of (gilt) iron, "with several silver offerings."

## XIX.

The Procurators consult the most skillful builders for a model of the church, and the 4th of March, 1481, they contract with Master Piero Lombardo, the same who made the tomb of Ser. Piero Mocenigo, Prince of Venice, at SS. John and Paul, to do the work at his own expense, either of bricks of baked clay, as of stone and lime, and iron bars at the windows. And three doors with three marble figures, viz., a Madonna with two angels at the sides, above the entrance door, and two prophets above the two others. Lined with marbles all around the outside—that is to say, with Pisan slabs from Carrara, which must be veined and beautiful or with Greek ones beautiful and veined, bounded

the back of it a festoon or garland of ears of corn, including the arm (shield) of the Amadi family, divided in two. The half below it is of gold, and the one above has two golden mounds, one besides the other, and another upon them, with a little bird on the top, in azure field; and across the said medal, where is the festoon or garland, are ancient letters, which say: ANNO XPI. OPTIMI. MCCCCLXXXI.

The 3th ditto I had another medal put under the corner on the right; the 16th ditto, one under the corner on the right side of the main entrance; and the 30th of July I had another medal put under the left corner at the head of the church.

## XXI.

The church is already paid for, but the chapel of the great altar is yet to be built, and, together with the roof and the rest of the church above the cornice, will cost 4,000 ducats. As somebody must take care of the church afterwards, the first Procurators had resolved to found a Monastery of Virgins, under the discipline of S. Chiara, who are not visible; they officiate better in a church, and keep it very well. The deliberation is postponed till next day.

XXII.

The election of the Monastery is approved.

XXIII.

Everybody praises Lombardo, and the nobility assemble every day to venerate and look on; many people come also from distant places; the alms are increasing. Barozzi sells his houses at last, and their demolition is undertaken to erect the Monastery.

XXIV.

The Procurators give to Pietro Lombardo the care of doing the drawing of the chapel and the vault of the church, and the 26th of February, 1484, they contract with him that he will superintend the work for 70 ducats a year. More workmen are engaged, materials provided, and the chapel is begun; things go on so well that they could not go better.

XXV.

Up to the time when the nuns enter in the Monastery, there is spent in building it, including what was paid for the houses, as much as 15,000 ducats.

XXVI.

The Procurators agree, every now and then, each in his turn, to see how things go, notwithstanding that Lombardo be a foreman and assistant of the work, and assisting with great diligence indeed, and never goes away, and, so to speak, the visit of the Procurators is superfluous; yet, in order to encourage the workmen, and so that people who give the alms see that the Procurators take care of their being spent rightly, and for the benefit and honour of the holy image.

The buildings rising quickly towards the end of 1488; (March, 1489) they are nearly finished, and one may hope that towards the end of 1489 (March, 1490), the nuns may enter the monastery, but the Procurators want it to remain one year finished, so that the nuns may not be hurt by the freshness of the building.

In the mean time, the church and chapel will be finished, only a portion of the roof still remains to be done.

The church looks beautiful and well built, with thick and large iron (clamps) to hold it together, sparing no expense to consecrate it to eternity; so it may please the Virgin to guard and preserve it.

In November, 1489, the Procurators determine to ask the Patriarch which day he could come to do laudate the nuns, and bless the church and the place; everything being ready,—work for fifteen or twenty days only remaining to be done.

XXVII.

Having arranged the 30th of December with the Patriarch, during the night the image is taken out of the wooden chapel, and placed upon the main altar.

XXVIII.

The last day of December, 1480, the Procurators meet in the Monastery, more than two hours before daybreak, waiting for the Patriarch. Gondoliers twelve in number, like the Apostles; their names are:—Mother Margarita, being old and practised, is elected an abbess; and the mothers Isabetta, Cristina, Lodovica, Franceschina, Benedetta, Cecilia, Brigida, Chiara Teodosia, Aurelia, and Valeria.

They appeared at twelve hours (six o'clock) covered with thick black veils reaching to the ground, thick mantles, with their hands under them and naked feet.

The Procurators met them at the landing and showed them the church and the Monastery, saying that if anything was missing or did not satisfy them they would have it built, and left them in the Capitol, where is an altar with the Madonna and the Child, S. Francis on one side, S. Chiara on the other, several chairs for the Patriarch and attendants, and stools for the nuns.

XXIX.

When the Patriarch arrives it is already clear daylight; he blesses the church, prays before the image, says it is truly well placed, and going thence to the Monastery, where the nuns are kneeling six on each side of the altar, and sitting himself on a chair higher than the others, and having read the papal diploma (*Bulle*), he invests the Abbess, gives her the keys of the Monastery, and crosses the clausum.

THE END.

Here the chronicler of the fifteenth century related the miracles in a chronological order; the compiler of the seventeenth century has distributed them in a physiological order, going from the head to the feet. Besides ordinary determined diseases some general maladies are mentioned, either undetermined, hypothetical, superstitious, or moral turnations, and the *ex voto* of the culprits who succeeded to escape from human justice. These miracles are dated from 1480 to 1486. As time went on the votive tablets covered the walls all around the interior of the church, so that the Procurators, towards the middle of the last century, caused them to be taken away, fearing they might injure the walls.

Ducal Palace, Venice.

## ARCHITECTURE AT THE ROYAL ACADEMY.—IV.

1509, "Church of the Sacred Heart, Liverpool," Messrs. Goldie, Child, & Goldie. A sepia drawing of the interior of this very pleasing and pure example of modern Gothic, of which we published an exterior view some time back. The view looks towards the chancel, showing a portion of a nave arcade of very simple design, octagonal piers with moulded caps; no carving. A figure beneath a canopy is placed on a pedestal against each respond of the arcade. Roof with solid moulded principals cut into arch form (not the purest kind of timber work this), and hoarded over in cants.

1600, "View of Great Northern Central Hospital, Holloway-road," Messrs. H. Hall and K. D. Young. Given as a design merely, without plan. A very good pen drawing, and a design with a certain unobtrusive originality in the details; the windows are very well grouped and differentiated, so as to give a certain variety of expression without departing from the utilitarian character proper to a hospital.

1601, "Local Examinations Syndicate's Office, Cambridge," Mr. W. M. Fawcett. *Simplex munditiis*. A Queen Anne building of the plainest type, but showing distinct perception of the architectural fitness of things, especially in the arrangement of the first-floor windows between the pilasters, and the connexion of the whole by the series of mouldings (it can hardly be called a cornice) over the windows, and breaking round the pilasters. The finials flanking the gables are very ugly. The whole drawing suggests that its author could do something much better if he did not choose to adopt a style with ugly detail.

1602, "Design for proposed Church of All Saints, Peterborough," Mr. J. Martin Brooks. A good drawing of an exceedingly simple and solid design in Early English style, which we had the pleasure of illustrating in the *Builder* of Nov. 20, 1886. We do not quite like the effect of the low slate spire appearing above the tower parapet; it looks somehow as if it should have been higher and had slipped down. But the author has solved the problem of designing a cheap church which does not look mean or flimsy.

1603, "Town-hall, Carlisle: proposed new Wing and Additional Story," Mr. C. J. Ferguson. The new wing, we presume, is the left-hand portion, but there is nothing to show this: horizontally, one can understand the divisions better. As it stands it is an exceedingly simple building, with (as the drawing appears to indicate from the manner of shading), a stone basement story with low windows divided by a mullion and brick walls in the story above. The upper windows are large, of one opening, and with architrave; we gather that the architect proposes to slightly raise the cornice and insert *oils de bois* over the existing windows, and add an attic with square windows, making the original cornice a string course. It would have been much more to the purpose if the author had added some indication as to what his own additions consist in, which he only has done in a general way. It appears to be a case of a very simple and unpretending old building added to in a manner quiet in keeping with the style of the existing portion.

1604, "Church of the Holy Innocents, Hammersmith," Mr. Jas. Brooks, architect. A delightfully solid and monumental looking brick (♯) church, shown in a fine pen-drawing; the aisles narrow, and used for passage only; the upper buttresses of the main wall sloping down in solid masses on to the aisle buttresses; each extreme angle of the building (the main roof runs right through from end to end) is strengthened by an octagonal turret, apparently for stairs, with the walls nearly solid. There is a double-gabled transept with two tiers of lancets under each gable. The windows are all plain lancet; almost the only decoration is over the west doorway, where there are some niches and figures. A small plan is appended. Students should examine carefully this design, to see how much architectural effect and expression may be obtained by mere arrangement of wall-masses, sufficiently accentuated by a few mouldings.

1605, "New Municipal Buildings, Sunderland," Mr. Brightwell Binyon. Hung too high to be well seen; a very municipal-looking Classic building, rusticated ground-story and an order above, and Mansard roof, which are somewhat too lofty, and overpower the substructure.

The central entrance is marked by a wroté with a cupola termination.

1606, "Poroh, Keyford House, Frome," Mr. A. S. Haynes. A pretty little bit of a porch, with a projecting upper story, forming what in church work would be a "parvise" over it; the projection is rather too great, however, and seems to "honnet" the ground-story unnecessarily.

1607, "Staircase Decoration, 4, Ainslie-place, Edinburgh," and labelled "Mr. T. Hall, Decorator, 8, George-street, Edinburgh," in large white letters on the dark ground at the foot of the drawing. This is far too like an advertisement, and the design does not justify the prominence accorded to it. It is well drawn, and shows a good eye for balance of colour, but there is nothing but the merest commonplace in the design.

1608, "Chiorio, Fontegiusta, Siena," Mr. R. Barratt. This is one of several very good illustrative drawings by the same hand, which we may as well notice together. The present one illustrates a pretty Classic chiorium, of a vase form below, with a miniature Corinthian colonnade and entablature above, and a domical porch with a lantern crowning it, and a figure crowning the lantern. The perspective of the drawing is rather too sharp, and the curves in the upper part and base are unsatisfactory to the eye in consequence. By the same author are, 1694, "Altar Shrine, St. Mark's, Venice," and 1696, "La Lupa, Siena." The latter is the best thing Mr. Barratt has here. It is a water-colour sketch, on grey paper, of a Gothic-looking she-wolf, with an immense neck and shoulders, designed, though rudely, with great power, and sketched with equal power. It is, perhaps, as a drawing, the most artistic bit of work in the room. 1694 is an admirably delicate and refined pencil drawing. 1700, by the same artist, is a pencil drawing of a portion of St. Mark's, Venice, equally good. As a point of detail, we may notice the excellent manner in which the effect of the polished marble shaft is given, both in this and No. 1694; not an easy thing to render satisfactorily in pencil drawing. 1751, "Ponte del Paradiso, Venice," is a slighter pencil sketch. Mr. Barratt, we believe, is intending to devote himself to the illustration of architecture. His exhibits in the architectural room show no ordinary powers in this branch of art.

1610, "Entrance and Loggia, 49, Upper Grosvenor-street," Mr. W. H. Powell. A pen-drawing of an arched porch, and arched loggia over, apparently in terra-cotta, and effectively treated with a good deal of decoration. The insertion of hits like this will soon do a good deal to lighten up the architectural deadness of the streets in that fashionable but architecturally dull neighbourhood.

1611, "A Quiet Nook," Mr. Arthur H. Belcher. A little water-colour drawing of a small morning room or study, very tastefully furnished in a quiet way, and the details very well shown considering the small scale of the drawing.

1612, "A Bell-turret, Asciano," Mr. E. G. Hardy. A characteristic little bit of brick work.

1613, "Two Fireside in an Architect's Home," Mr. T. Raffles Davison. Prettily sketched in pen and ink, as their author knows so well how to sketch, but not especially interesting.

1614, "Chelsea Town Hall: Interior Views," Mr. John M. Brydon. These are hung rather too high to be well seen; they appear to be good and careful sketches exhibiting interiors in a style suitable to the general style of the building, which is one very suitable to its object and the associations of its locality, though we think it runs too much into copying of Queen Anne details merely for the sake of repeating them in a neighbourhood so congenial to them as Chelsea.

1615, "Portion of Ancient Retable, Westminster Abbey,—real size," Mr. Gerald Horsley. This is rather an unusual piece of work, being a copy in colour of an ancient piece of coloured decoration, the full size of the original; copied geometrically; a *fac-simile* in colour, in fact. It is admirably done, and shows a great perception of the representation of texture and surface in water colour; whether the result is quite worth the trouble, except as a study, may be questioned. Like Mr. Barratt, Mr. Horsley exhibits several drawings of old work. His next is 1630, "Carving from the Stalls, Amiens Cathedral," and "Trinity

over West Door, Abbaye - aux - Dames, Caen." These are pencil sketches, in rather light pencil, on smooth paper,—the real way to sketch architecture when pencil is employed; and we are glad to see this method of execution, which has been too much neglected by architectural draughtsmen, coming into use again in the hands of good workmen. In the upper of these two sketches the shading and modelling is entirely in line, not in tint; it is like a good drawing for wood engraving. Mr. Horsley sends also a frame of three drawings (1638), "Two Doorways and a Wall Tomb from St. Frediano, Lucca." These are in one sense sketches, inasmuch as the details are not completed in all parts, but for truth and clearness of line and delicacy of effect it would be difficult to surpass them as specimens of illustration of architectural detail. Some architect, who probably could not draw as well as this, wrote to the *Pall Mall Gazette* to complain of the intrusion of so many of these sketches into a room professedly dedicated, as he assumed, to buildings in execution or to be executed. The architectural room may not be the right place for them; but we can only say that they are among the most interesting things in the collection.

#### MARGATE CLOCK TOWER COMPETITION.

From the point of view of professional interests it is to be regretted that this competition has drawn nearly sixty architects into submitting designs, notwithstanding the fact that there was no undertaking in the conditions to employ a professional arbitrator, but only a promise to do so "if thought necessary." We cannot believe that this vague promise has been sufficient to induce any one who signed the competitions memorial to compete, but if it has not done so there must be a considerable number of members of the profession to whom the desirability of signing it remains to be brought home.

The drawings, which were exhibited last week, were fairly well arranged in a well-lighted room in the White Hart Hotel, Margate, though a little confusion was created by the separation, in one or two instances, of the plans of a design from its elevation by nearly the length of the room. The designs show a great variety of opinion as to what may be done for 800*l.*, the sum allowed, but there are at least three or four which, while coming within the limit of cost, represent very neat and architecturally effective monuments. A great mistake was made in not allowing perspective drawings in a competition of this kind, where the appearance is everything, and the plan and other arrangements of merely secondary importance. Many competitors have felt this, and have attempted by carefully coloured or shaded elevations to meet the difficulty, but the deceptive effect of such drawings does not need to be pointed out to any architect.

One of the best designs in the collection is No. 60, submitted under the motto "Comme il faut," and the coloured elevation by which it was shown was quite the best drawing in the room. It represents a small stone structure, of Renaissance design, surmounted by a roof and lantern of wood and metal, and crowned with a pole and falling time-ball. The lower stage is short and rusticated, and separated from the clock-stage by a strong cornice with triglyphs; it contains on one side the entrance-door, surmounted by a medallion of the Queen's head in an architectural framework, and on the other sides neatly-designed drinking-fountains. The clock stage has octagonal pinnacles at the angles, and the four dials between are worked into decorative features surmounted by a well-designed open parapet.

No. 30, "Auspicium melioris ævi," also shows in his design, No. 1, a structure that would do no discredit to the town. The tower consists of a small and rather attenuated square stone shaft entirely undecorated except for four small figures at the base and a niche to contain a statue; the dials at the summit are surrounded by an architectural framework of Early Renaissance character, and surmounted by dormers which break into a high tile hipped roof crowned with a small lantern. The other designs under the same motto are in the early Gothic style, and comparatively poor.

"Karl," No. 48, is an unpretentious design of early Gothic character; the tower is of stone, generally square in plan, but with many projections and breaks; the drawings are unfinished, and possibly do not do the design justice; as shown, there seems too little repose and refinement.

"Tempus" shows a quiet and appropriate design by careful drawings, rather heavily shaded, in Indian ink. The tower is of stone, and designed in the modern French style; like most of the others, it is square in plan. The clock stage consists of four winged figures on the angles, whose wings meet over the dials on the four faces, an arrangement which produces a more pleasing effect than might have been expected. The tower is surmounted by a wooden lantern.

"Zodiac," No. 59. Rather a squat structure, Late French Gothic in style,—the plan an irregular octagon; the clock stage consists of figures in niches on the angles, between which are rather small dials. The lantern is of stone, and surmounted by a gilt crown.

"Forward," No. 18, submits drawings of a very neat and appropriate little structure in stone of Classic character, surmounted by a wooden lantern; at the angles of the clock-stage are shown in neat outline figures of boys holding electric lamps.

No. 1 (monogram of O. F.) has a tall and elaborate structure, consisting of a diminishing shaft of stone rising out of a well-designed Renaissance base, on which, in front of the shaft, stands a bronze statue of her Majesty in her youth, and not as she is in this jubilee year, of which the tower is to be a memorial. The clock-stage rather spoils the design. It is a heavy projecting mass, carried on corbel tables, and consisting of a variety of architectural features, in which some Roman Doric columns carrying but little more than some big Gothic gargoyles are conspicuous. The whole structure is surmounted by an iron framework, in which are hung the chiming bells.

"God save the Queen" submits a design for a tall stone shaft with projecting balconies to large windows just under the clock-stage. At the summit is a statue of the Queen, and at the angles of the base are four lions.

"Vivat Regina" shows a neat design of Classic character, and, in an extra drawing, a very good and effective arrangement of steps and fountains as a base for it to rise from.

We also noticed "Brick," a high structure of Flemish character; "St. Hilda," an elaborate and not ineffective design; "Corona," a solid-looking building in red and buff stone; "Marine," and "Margate."

One or other of the clock-towers represented in the collection shown in the room is to be erected on a good site at the foot of the Marine-terrace Green, nearly opposite the Kent Hotel, and if the committee choose well there is every reason to believe that Margate may have a very good architectural monument by which to remember the jubilee year of her Majesty's reign.

#### FURTHER NOTES ON ACADEMY PICTURES.

HAVING spoken in our last of the pictures which form the salient points of this year's exhibition, we will add some further notes on pictures which claim attention, taking them mainly in the order of hanging, or, at least, in the numerical order of the galleries.

Gallery I. boasts of three portraits of mark, Mr. Onless's "Sir Horace Jones, Architect to the City of London" (12); Mr. Holl's "Sir George Trevelyan" (36); and Mr. Orchardson's "Mrs. Joseph" (67). The latter is the only one of the three which aims at a special artistic effect apart from portraiture; it is a study in colour, to some extent, and an interesting and effective one, but regarding it as a portrait, we must confess that we never like Mr. Orchardson's flesh painting when he deals with figures life size. The face, in this case, seems hoodless and the texture coarse. Mr. Holl's is a very vigorous portrait, as his always are, but with that rather over-acted energy which tends to become a little theatrical. "Sir Horace Jones" is simply a good likeness, with the face very well painted, and, as a portrait, is the best achievement of the three.

Mr. Peter Graham and Mr. Colin Hunter, in Nos. 13 and 23, present repetitions of their

respective receipts for painting sea, of which Mr. Graham's is much the best,—only when we have seen one we have seen all. Mr. F. Walton's "New Year's Eve" (39) is a powerful study of a special effect, bare trees making a network over a golden sunset sky, but it is too yellow in the light. In "Dame Nature's School" (57) Mr. J. White gives us a pretty and characteristic children's group, rather carelessly painted. Mr. Boughton's "Dancing down the Hay, Orkneys: Sea Fog Blowing Away" (64) is interesting as a study of a special *locale* and a special effect; it is hardly one of the most interesting or effective of his paintings. Mr. Storey's "A Young Prodigal" (91) is a picture one regrets to see from a clever painter; the very old joke of the man who gives an entertainment to his friends and cannot pay the bill, illustrated by a gaudy painting of a company of "guys" in gaudy dresses round a table; it is apparently intended to be humorous, but it is very small and humour.

The largest work in Gallery II. is Mr. J. W. Waterhouse's "Marianne" (134), the scene where Herod's falsely-accused wife is sentenced to death. She, with hands chained, and clad in white, stands on the steps in the centre of the scene, the other actors in it forming a semicircle behind her. She half turns her face to Herod, whose head is bowed on his hands. There is some capital painting in this picture: architectural and decorative detail is very well studied, and the grouping very effective; but it does not rise to the expression of the situation; it is a well-arranged tableau, that is all. Mr. W. F. Calderon's painting (147) represents Hampden, when he had ridden, mortally wounded, from Chalgrove Field. He is on horseback, in the midst of quiet meadows and trees, pausing before a brook which he apparently feels unable to leap in his wounded state. This picture of the statesman, patriot, and warrior, alone in this peaceful scene, with his life ebbing away from him, is of pathetic interest; but we have to go to the quotation in the catalogue to realise it. There is nothing to study in the countenance of the figure. It is a man in a musing mood; more might certainly have been made of it than that. The most pointed and characteristic figure picture in the room is Mr. Dendy Sadler's "The Old Squire and the Young Squire" (117)—an interior, with three figures in hunting costume, a kind of Squire Western and his son along with the huntsman, drinking together. This is a capital painting, and there is real character in the figures, especially in that of the good-looking but venacious young man, who is bound to grow into just such an old boozier as his father before him. Miss Dicksee's, "A Dawning Life" (109), an aged woman looking at a new-born baby, is a picture with a story in it, and carefully painted in both figures and accessories. Mr. W. B. Richmond's "The Thoughts of Youth are long, long Thoughts" is one of the frequent irritating examples of total want of intellectual perception on the part of painters of what they are professing to paint. The picture is a brilliant piece of colour, a half-length portrait of a girl, draped for the occasion in sumptuous silks; but where is the expression in the face of anything like the feeling expressed in Longfellow's beautiful line? Among other things in this room are Mr. Hemy's "The Smelt-net" (96), a sea and shipping painting in his best way; Mr. East's, "The Land between the Lochs," a cold and grim landscape, but not commonplace; Mr. Pettie's unnlucky piece of vulgarity, "Two Strings to her Bow" (152,—it should have been rather "Two Beaux to her String"); Mr. Joseph Clark's "Orphans" (166), not equal in interest to many things he has done; Mr. Bridgman's "Horse Market, Cairo" (172), and Mr. F. Morgan's "The favoured Swain" (124), which must have been placed on the line rather on account of what the author has previously done than on its own merits.

Two portraits have the chief interest (next to Mr. Oakes's landscape before mentioned), on the top wall of Gallery III. Mr. Luke Fildes's portrait of Mrs. Fildes (185), a very highly finished and brilliant piece of work, and Mr. Sargent's "Mrs. William Playfair" (197), which shows another sort of brilliancy. The realism of effect obtained with very little elaboration of detail, both in the face and the dress, bears strong testimony to the great powers of Mr. Sargent, sometimes misappropriated (as in the work already noticed in Gallery IV.), in the production of ugly eccentricities; but this is a

very good specimen of portraiture, one of the cleverest of this year; that it is not a more pleasing picture is owing partly to circumstances over which the painter could have no control. Mr. Holl's "Junius S. Morgan, Esq." (222) is, perhaps, the most firm, brilliant, and life-like portrait he has exhibited this year, which is saying a good deal for it. Mr. Britton Rivière's "Portrait of a Lady" (212), an old lady seated with a little "King Charles" in her lap, is a very delicately-executed work. Mr. Faed's principal picture is here (239), an old Scotch guide-wife escorting home her affectionate but tipsy husband; there is a certain character in it, and the man's incapable gait is well conveyed: but was this worth doing? Mr. Tom M. Hemy, who sends a spirited and clever shipwreck picture, "Women and Children First" (240), inherits a good name in sea-painting, and seems likely to do credit to it. Another sea painting of the first order, accidentally omitted in our previous notice, is Mr. H. Moore's "The First Boat's Away" (254), a picture full of freshness, air, and movement. Mr. MacWhirter's "Edinburgh from the Salisbury Craigs" (253) is a very good likeness of "And Reckie" as seen from that particular spot, and makes, as may be supposed, an effective picture. A pretty though affected little figure, by Mr. Marcus Stone, "Morning" (246), a small upright with a young lady in a white dress, will catch most eyes in passing; so also will Mr. W. D. Richmond's "Portrait of Mrs. Baird Smith" (269), an expressive portraiture of a very expressive countenance. Mr. Hodgson has aimed at giving us Burns turning up the mouse in ploughing, "Robert Burns, November, 1785" (270). He has not attempted to bring out the poet in the figure of Burns. He shows us a stalwart figure at the plough, turning round to look at the mouse, with a face not so remarkable or forcible in expression as some portraits of Burns give us. Did Burns really say "I'll immortalise that mouse"? The speech is not very like him. M. Fantin's "Grapes" (262) strikes one at first as very deficient in brilliancy for a still-life picture of that kind, but his grapes will bear looking into, and we are led to question whether some painters of similar subjects have overdone the brilliancy. Among other paintings in this room may be mentioned Bokelman's "Fire in a Village" (178), spirited in grouping and expression, but detestable in colour; Mr. Val Prinsep's "Ayesha" (277), a half-length of an Eastern woman holding a long-necked brass vessel, very effective; Mr. Sant's "A Thorn among the Roses" (312), a graceful group, which recalls some of his earlier pictures; and Mr. Frith's "Sir Roger de Coverley" calling on the beautiful widow, against which we fling a protest at Mr. Frith's ideal of the widow (who "had the finest hand of any woman in the country") as this stout vulgar-looking woman. The same artist's half-length of a flower-girl, "Violets" (95), in Gallery II, is a very pretty and carefully-painted work.

In Gallery IV, Mr. Coodall is in the centre with a very large picture of Christ and the woman taken in adultery, entitled "Misery and Mercy" (338); it is after "the accusers" had departed, and the two figures only are seen in the middle of a large portico of a Classic temple, which seems to be Mr. Coodall's notion of the architecture of the Temple at Jerusalem. The Christ is a more conventional figure with a halo; the woman kneeling on the floor, with her head bared, is both a finely-drawn and an expressive and pathetic figure. Mr. Albert Coodwin's "Shipwreck: Sinbad the Sailor Storing his Raft" (332), is one of his imaginative landscapes; a pile of rocks on the right, with the ship on them, and her masts and cordage black against a lurid red sky; it is a very fine work, a poem in the form of a landscape. Among other landscapes in this room are Mr. Johnson's "Kings of the Forest" (339), a woodland landscape, with the trunks of two massive oaks in the foreground; and Mr. Mark Fisher's "Cattle in Berkshire Meadows" (362), a style of work very admirable and very much removed from commonplace in itself, but which Mr. Fisher has repeated so often that one can really hardly tell one work of the kind from another; his manner of working by minute touches is admirable, and tends towards something like the real infinity of colour of nature, but it is marred by a want of light: there is no sunshine, only a leaden gleam over his scenes.

Mr. David Murray's "Cross on the Dunes, Picardy" (321), a sand landscape, with one peasant crossing himself before a rude cross, should be looked at; and Mr. Anderson Hague's little work, "Ripening Corn" (370), and Mr. Haye's "Sea Grotto" (393), a study of rocks. Among the figure pictures in this room not previously noticed are Mr. Marks's "The Minstrel" (368), a Jongleur proposing a song to a company of monks—there is not, to say the truth, very much of point or humour in the work; Mr. Fildes's portrait of "Mrs. Agnew" (386), a fine effective life-size portrait of a lady in white; and Mr. Pettie's portrait of "Lady Ripley" (400), a three-quarter length, relieved against a red wainscot.

Gallery V. includes a very good likeness of Mr. Herkomer by Mr. Herrman G. Herkomer (413) (the catalogue spells it "Herman," which we presume is a misprint), and what we must consider but a weak and tame portrait of Lord Hartington by Sir J. Millais; also a pleasing portrait of "Mrs. Henry Whitehead" (431), by Mr. Stuart Wortley. Mr. Hindley's cleverly painted picture "The Music Lesson" (452) does not tell its story. There are two very interesting landscapes; "In Clondland,—on the Crest of a Yorkshire Moor" (467) by Mr. T. H. McLachlan, a painting in a broad and powerful but sombre style, reminding one a little of De König; and "Assisi,—Sleeping in the Moonlight" (472), by Mr. Albert Goodwin. This latter, like all the artist's works, is highly original, and, perhaps, one of the nearest approaches to moonlight effect that we have seen in a picture, but there is too much light and definition of objects in it for a true moonlight effect, as there is in nearly every moonlight picture that we see. Mr. Arthur Waase's large painting of "Lancashire Pit-Lasses at Work" (479) has a social interest, but is very ugly in colour.

Mr. Leslie's full-size figure of "Sylvia" (488) in Gallery VI. is a very pretty painting of a fair dame in a green dress with a flowered brocade skirt showing under it, carrying a silver vase of red and white roses; the painting is a change from the painter's usual style of picture, and so successful that one may hope to see more work of this type from his hands. Mr. Nettleship's "Caliban upon Setebos" (497) can only be appreciated by those (but a small proportion of visitors to the Academy, we fear) who have read Browning's remarkable poem under that title. The conception of Caliban is admirable; he is represented writing "prodigious words" in a hook, in imitation of Prospero's magic volumes; the "lumpish seahes" who was his Caliban is seen in the background, and the crane, who is his Ariel, is present. Mr. Browning's Caliban, however, made a hook of "broad leaves," leaves of trees we presume; Mr. Nettleship's Caliban seems to have got a paper hook; but all who know the poem will find the picture worth looking at. Mr. A. C. Gow's painting, "The Garrison Marching out with the Honours of War: Lille, A.D. 1708" (504), is a new subject, and a rather telling one; the garrison, thin and starved, and many of them wounded, march along with a sad dignity, Marlborough and his staff raising their hats as the defeated troops pass them: there is a fine chivalrous feeling in the work, and the groups of the conquerors and conquered are effectively contrasted.

Mr. Laslett Pott's "News of a Victory" (517), in the stagecoach days, is spirited, but coarsely executed, and deficient in grouping; it can hardly be called a picture. There are much worse ones on the line in the same room, however, which we forbear to particularise. Miss Marianne Stokes has a delightful bit of humour in "The Magic Flute" (523), a boy playing on a tin pipe, with his face twisted in grotesque energy. Mr. E. J. Gregory's "When the Cat's away" (525) is a brilliant portrait of a little girl in a light yellow satin dress playing with a tame mouse. Mr. G. G. Kilburne has a very good little work, "An Appeal" (538); a young widow and child wait in the hall of a large house, whilst her late husband's father, seen through the open door of the dining room, reads a letter of appeal; the young widow, though very pretty, is evidently not distinguished, the son had married against the will of his family; the picture is conscientiously finished in every part, and it has the great merit of telling its story thoroughly. Mr. Kilburne, jun., shows his ability in a spirited little painting of greyhounds "in training" (511). Then there is Mr. Macbeth's "Ambrosia" (530), a sort of

grotesque pendant to Mr. Leslie's "Sylvia," a buxom waiting-maid carrying a tray with beer and oysters; it would have done very well half the size, but certainly does not justify the space it occupies, nor does Mr. Fahey's large piece of absolutely mechanical landscape, "On the Buro" (522), as hard as a tea-tray. Miss Clara Montalba has a brilliant Venetian painting in her usual remarkable style (540). Mr. F. W. Calderon's "Running the Gauntlet" (539), a snow scene, where a boy passing on horseback is pelted with snowballs, is well enough painted, but was it worth doing? That is the question that a good many Academy pictures, well enough painted in themselves, suggest to one. Among things in this room which were worth painting is Mr. Stanhope Forbes's "Their ever-shifting Home" (543), a strange-looking dingy painting of a caravan of strollers descending a road, a woman and her infant walking in advance of it; there is a curious pathos in the work, which has a strongly-marked character of its own, though it is unpleasant in colour. Mr. Otto Weber's "Seaweed Gatherers" (548) should be looked at, and Mr. Lobloy's "Village Choir" (555) practising, a small picture with very clever definition of character in it, as also M. Carolus-Duran's portrait of his daughter, not that we admire the style of painting at all, but its brilliancy and effectiveness are undeniable.

Gallery VII. contains a beautiful little work by Mr. Chevallier Taylor—"Hess, O Lord, these thy gifts to our use" (604), grace said in a cottage interior; every figure is thoroughly studied and has its own character; the reverential attitude of the wrinkled old woman at the end of the table has a touch at once of the ludicrous and the pathetic. Mr. Mark Fisher's "Sheep crossing Hill-side,—Moonlight" (628) ought to have been better hung; it is a work of great originality. A fine landscape is that by Mr. Milne, "Tay Backwater, Kirkcubins" (590), and Mr. Waterlow's "The White Sands of Connamara" (607), whose whiteness is intensified by the rich colour of the seaweed which is being piled on the back of a donkey in the foreground. Mr. David Murray's "Autumn's Tinge of Gold,—Picardy" (576)—looks a little like a Corot with colour added; it is from the country of Corot. Near it is an example of Mr. Hook in an inland landscape (583), built up in terraces; fine in itself, but the brook in the foreground is a failure; it hardly looks like water. Mr. Blair Leighton's "Romola" (591) is hardly a success, and Mr. Gindoni's "Council of War after the Landing of the Prince of Orange" is a failure; there is no point or interest in it. But "The Last Long Voyage" (630), by Mr. W. H. Bartlett, is one of the best things we have seen from him for some time. It is the landing of a coffin from a ship, for a funeral at a little desolate-looking church on the left of the picture. The story is well told and the whole of the figures contribute to it. This room also contains the portrait of Mr. David Plunket by Mr. Frank Holl, a rather odd and only partially effective painting in which there is a remarkable predominance of blue tones; and that of Sir E. Henderson, by Mr. Long, in a silver-trimmed uniform, which comes in very well for picturesque treatment.

Mr. Waller's large picture called "The Challenge" (654), in Gallery VIII., tells no comprehensible story and thus entirely fails of interest. It has been a general puzzle to make out what the painter means by it. Mr. Armitage's coloured painting for a fresco for St. John's Catholic Church, Islington, representing "The Institution of the Franciscan Order" (681), has a fine decorative effect; the Pope (Innocent III.) and other gorgeously-draped ecclesiastics occupy the right of the picture, giving a fine body of colour here, though not too rich to be suitable for fresco; the sombre dresses of the monks form an opposing group on the left; their faces have much variety and individuality of character. The whole composition is connected by a background consisting of an arcade with parti-coloured vousoirs on coupled shafts. This is a good example of strictly decorative painting on a large scale, and it is to be regretted that our painters are not often given the opportunity of designing on this scale for mural decoration. Among other pictures in this room is Mr. Leader's best this year, "An April Day" (682), a bright level rural landscape, in which, however, that small church, large tree, and ha-ha fence are old friends, who have done duty rather too often in

Recent works by this artist. Mr. Farquharson's "Summer Days" (670) is a fine landscape, finely composed and good in colour. A painting of people looking out from a pier in a storm, under the title "Ho! Ho! the Breakers roared" (679), by Mr. E. S. Harper, has a certain originality and power; we do not see the sea, but judge of what is going on from the action and countenance of the people on the pier: the young woman stooping forward in anxiety is not quite satisfactory in drawing, but there is something in the picture. Mr. Carter's "Lady Milbank" (684), and Mr. Long's "Cardinal Manning" (680) are two good portraits; a better one is Mr. Herkomer's likeness of "Mr. Britton Riviere" (683). "Evening Reflection" (696), a small landscape by Mr. J. Clayton Adams, is painted but pretty; "Lingering Light" (702), a pendant to it, by Mr. E. Sherwood Calvert, is a better work, but wants force and local colour in the foreground. Mr. MacWhirter has a large and important landscape in this room, "Misty Gleams,—Loch Horn" (715); a sheet of water between the opposing slopes of great hills; there is fine painting and drawing of mountains, and a very Highland feeling about it. Can any one explain for what merits the foolish affair entitled "Rescue" (714) has got placed on the line in this corner of the Gallery?

Gallery IX., once the water-colour room, but now devoted to small cabinet paintings in oil, contains some very clever little things, more than we can particularise. Among them may be mentioned Mr. Logsdail's "The Bank," a study of the old lady in Threadneedle-street, and as a piece of architectural painting very true and correct, except as to the colour of the stonework, which is hardly according to nature (if we may call a wall and columns of hewn stone "nature"). The same artist has a view of St. Paul's looking up Ludgate-hill (846), in which the general street view and the crowd are admirably given, but St. Paul's is not well drawn. The whole scene, however, is more true than that given by Mr. O'Connor in Gallery V.: "Ludgate, Evening" (427), where Ludgate-hill and the Ludgate-circus are shrunk up into half their real extent as seen from Fleet-street (indeed, the circus opening is hardly discernible), in order to give an exaggerated comparative scale to the cathedral, which in this case also is badly drawn,—the gable out of perspective, &c. But to return to Gallery IX.: Mr. Grimmond's "A Scotch Police-court" (768) is a small but admirably finished work; Miss Shorthouse's "Azaleas" (757) are very fine; Mr. Marks's picture of Gilbert White and "the Old Tortoise" (804) is remarkable for the expression he has put into the head and eye of the tortoise plodding over the grass to its benefactor. Mr. Eyre Crowe's "Convicts at Work, Portsmouth" (807) is one of his small highly-finished pictures with a painful kind of interest in the studies of the type of countenance of the men at work. Mr. Leslie's "This is the Way we wash our Clothes" (853) is a pretty study of a child standing on a chair engaged with great earnestness in the operation referred to.

The central portion of Gallery X. is occupied by M. Carolus Duran's brilliant and flashy painting of "Madame la Vicomtesse Grefulhe" (904), a picture of which the force and brilliancy are undeniable; but it is a superficial brilliancy, concentrated on the sheen of a satin dress; the colouring of the face is almost neglected by comparison, and the flesh appears dull and bloodless. The painter has put the required kind of "go" into it, however, as a fashionable portrait,—a painting of what the Comte de Flore would have called "The High-life." Mr. Mackworth's "Christ calming the Sea" (891) is a solemn though shadowy composition; the painter seems to have purposely shrunk from any grappling with the realism of the supposed event; the storm goes off in an indistinct mass of clouds and darkness on the right; but the figures of Christ and of the astonished Apostles are really fine and expressive, though (purposely, perhaps) little more than silhouettes. Mr. Allan's "The Haven under the Hill" (903) is a creditable imitation of Mr. Napier Hemy; Mr. Ratray's "Arran from the Kyles of Bute" (908), a fine and powerfully-painted coast scene. "Idlesse" (927), by Mr. T. B. Kennington, is a very clever study of a nude child on a white sheep-skin rug, with white hangings behind her, looking at gold-fish in a vase. It is essentially a study of colour. Mr. Fletcher's "Evicted" (960) has

feeling and good execution, but would have done as well on a smaller scale, and fills up more room than it is quite worth. Mr. Shannon's "Mrs. Nicholls" (968) is a good portrait, both in flesh-painting and costume.

Gallery XI. contains a very beautiful landscape by Mr. Adrian Stokes, "An Afternoon in February" (985), one of those rare works in which, while the execution is entirely satisfactory, it seems quite subordinate to the feeling of the scene. It is a level pasture-land with cows moving slowly across it through long dank grass, woods behind: a very broad style of handling, and a movement in the whole which reminds us of Browning's lines:—

"The level wind carried above the firs  
Clouds the irrevocable travellers,  
Onward."

There is no landscape in the exhibition we have looked at with more pleasure, though it is not what is termed a "striking" picture. Mr. Colin Hunter's "Beneath Blue Skies" (990) is the best of his coast scenes; also may be mentioned "A Ghost Story" (976), by Mr. Howard Helmick, and "Your Humble Servant" (984), by Mr. Dollman, a kind of Dick Turpin howling low before an announcement of a reward for his own capture, dead or alive; good specimens of the more refined order of artistic joke. Mr. R. Herdman has a good portrait of "Mrs. Hamilton Buchan" (1,052); Miss Rae's charming "Naïad" we have mentioned; and M. Eugène de Blaas exhibits an admirably-drawn and painted life-size figure of a "Venetian Fruit-seller" (1,011), which has, however, no point or interest except as an excellent piece of workmanship.

Of the sculpture we will say something separately.

## Illustrations.

### QUEEN'S HALL, PEOPLE'S PALACE, MILE END ROAD.

THE Queen's Hall, illustrated in our issue of to-day, forms merely a fragment of the scheme of the "People's Palace"; but it is the central feature, and the only one likely to be ornate or interesting to architects. Eventually it will be approached through a "Social Room" on the south end. There will be Technical Schools on the east side, and a small concert-hall, refreshment-room, and Art Schools on the west side, whilst at the north there will be a library, reading-rooms, and trades' shops. The outside of the Queen's Hall as at present seen will thus, when the whole is completed, be entirely concealed.\* Hence the plain exterior. The Hall is 130 ft. long, 75 ft. broad, and 60 ft. high, the roof being elliptical.

The entrances, three in number, face the Mile End Road, and are enclosed by a temporary porch, the doors being hinged so as to open both inwards and outwards, as required in the Metropolis for public buildings. There are other doors for egress provided at the east and west sides and north end of the hall, so that it could be emptied in a very short time.

The orchestra recess is elliptical in form, and half-domed, so as to throw out the sound, the ceiling being divided by radiating, vertical, and horizontal ribs, richly inlaid with panels and mouldings.

A magnificent organ, the gift of Mr. Dyer Edwardes, has been built, but it was not thought judicious to erect it whilst the dust created by the workmen remained. The orchestra will accommodate about 140 performers.

On either side of the hall there is a gallery, supported by iron columns masked or ornamented by very graceful caryatides of Greek type by Mr. Verheyden. About 240 people are provided for in the galleries. The seats are of polished oak, panelled and shaped to the form of the front of the gallery, which is bowed out for acoustic reasons between the supports similarly to the gallery in the Prince's Hall, Piccadilly, by the same architect.

The roof, elliptical in form (as already stated), is divided into nine bays by very broad ribs or principals, the under-side being moulded into panels of various forms, deeply moulded and richly ornamented, the spaces between being coffered in a similar manner. The visible roof or ceiling thus formed is supported by double

\* We gave a plan of the whole group of buildings in the Builder for June 23, last year, accompanied by an elevation of the front.

columns, fitted on the upper part. Between these are placed in standing posture the statues of twenty-two queens, supported on carved pedestals. The queens have been selected from those who have been useful to their country or in sympathy with their people. They are as follows:—

|                                   |           |
|-----------------------------------|-----------|
| 1. Esther of Persia.....          | B.C. 518  |
| 2. Boadicea of Britain.....       | A.D. 61   |
| 3. Zenobia of Palmyra.....        | 273       |
| 4. Helena of Rome.....            | 328       |
| 5. Clotilda of France.....        | 511       |
| 6. Bertha of Kent.....            | 600       |
| 7. Osburga of England.....        | 860       |
| 8. Matilda of Germany.....        | 904-940   |
| 9. Margaret of Scotland.....      | 1093      |
| 10. Maude of England.....         | 1118      |
| 11. Elizabeth of Hungary.....     | 1207-1231 |
| 12. Blanche of Castille.....      | 1253      |
| 13. Eleanor of England.....       | 1292      |
| 14. Philippa of England.....      | 1313-1370 |
| 15. Margaret of Denmark.....      | 1380-1412 |
| 16. Margaret of England.....      | 1423-1482 |
| 17. Isabella of Castille.....     | 1489-1504 |
| 18. Anne of Brittany.....         | 1514      |
| 19. Elizabeth of England.....     | 1534-1603 |
| 20. Anne of England.....          | 1702      |
| 21. Maria Theresa of Hungary..... | 1717-1780 |
| 22. Louise of Prussia.....        | 1806      |

Immediately over the entrance is the figure of her Majesty Queen Victoria seated on a chair (similar to that used on the occasion of her coronation), the whole of the statues, the work of Mr. Verheyden, being worthy of attention as works of art.

The floor of the hall is composed of solid wood blocks laid on fireproof concrete arches, the space underneath the floor being utilised for the storage of the chairs and for other purposes incident to the daily use of the hall.

The lighting is entirely from the roof, the counterlights in the ceiling being filled with painted glass, the centre panels, oval-shaped, being embellished with the Prince of Wales's Feathers, Royal Arms, Royal Monogram, Royal Arms of England, and the Arms of Australia, Canada, India, Wales, and Scotland.

The whole effect is that of a bright sunny light diffused over the interior, which is maintained throughout by the decorations, gilding, and colour.

The hall is ventilated by means of a double continuous ridge, the openings to which are screened off by perforated foliated panels.

The hall is heated by means of hot water, the pipes passing in panels underneath the floor, the warmth being admitted through iron gratings.

The whole work has been carried out from the drawings, and under the superintendence of Mr. E. R. Robson, F.S.A., by the following:—The main structure, Messrs. Perry & Co.; the statues, by Mr. Verheyden; decoration and painted glass, by Messrs. Collinson & Lock; ornamental plaster work, Mr. McCulloch; fireproof flooring and iron construction of roof, by Messrs. Dennett & Ingle; the heating and gas lighting, by Mr. Cannon; the glazing to roof, by Messrs. Mellows & Darby, on their improved system, no putty being required. The clerk of works is Mr. Softly.

The hall is to be opened by the Queen this Saturday, May 14, when her Majesty will also lay the first stone of the Technical Schools.

### DINING-ROOM AND FURNITURE.

THIS is an illustration of a room in a house lately built for Mr. H. Goschalk, the wood-work of which has been executed in pine, and painted, the ceiling being also of the same material.

The furniture has been executed in walnut and covered with stamped leather. The settle back and cover is of Lincrusta, highly gilt. Brackets have been arranged on the panelling of walls to carry pieces of statuary. The drawing is by the architect, Mr. R. A. Briggs.

### ALMSHOUSES AT CHARLTON, KENT.

THESE almshouses have been built by the Trustees of the Dutch Church, Austinfriars, at Charlton. The wings provide accommodation for ten inmates, and the centre portion is used as a convalescent home for a small number of children. The building is faced with stock brick, and the dressings are of red brick and Portland stone. The roofs are covered with slates. The buildings were erected from the design of Messrs. E. P. Anson & Son, Messrs. Balaam Bros., of Old Kent-road, were the builders, and Mr. Unwin efficiently discharged the duties of clerk of works.

THE UNIVERSITY OF CHICAGO

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

PRESENTATION OF THE ROYAL GOLD MEDAL.

An ordinary meeting of the Institute, for the presentation of the Royal Gold Medal and the Institute Prizes, was held on Friday, the 6th instant, and was open to all gentlemen attending the General Conference of Architects. Mr. Edward P. Anson, F.G.S. (President), occupied the chair, and the following Gold Medalists of previous years were present, viz., Messrs. Charles Barry, F.S.A.; J. L. Pearson, R.A., F.S.A.; and Alfred Waterhouse, R.A.

The President, addressing the meeting, said: Gentlemen,—You, and more especially those who have held the same position in this Institute as I now have the honour to do, will appreciate how great a privilege I feel it, and how pleasant it is, to be in the position to confer on those whom you desire to honour the Gold Medal which, on the recommendation of this body, our Sovereign Lady the Queen is graciously pleased to place at our disposal. I have already been the channel through which your appreciation of the distinguished merit of M. Charles Garnier, a most able and accomplished foreign architect, was expressed; and now I rejoice in being in the position to offer a similar mark of appreciation and esteem to our respected Fellow and Ex-President, Mr. Christian. But before doing so, it may not be amiss to recapitulate some of the events, now almost historical, connected with this annual token of the Queen's sympathy with those of her subjects who belong to the architectural profession. It may not be generally known that this Royal Medal was originally offered as a student's prize. On the 26th of April, 1847,—a little more than forty years ago,—the Institute was informed that the Queen had been graciously pleased to modify the terms of the original gift, and to permit a Royal Medal to be conferred on such distinguished architect or man of science of any country as had designed or executed a building of high merit, or produced a work tending to promote or facilitate the knowledge of Architecture, or of the various branches of science connected therewith, and that the Council would, in January, 1848, take into consideration the appropriation of the Royal Medal accordingly. The following month a notice relative to the proposed award was inserted in certain newspapers; and towards the close of the year (1847) a similar notice was inserted in *Galignani's Messenger*, the *Times*, the *Athenaeum*, the *Literary Gazette*, the *Builder*, and the *Civil Engineer and Architect's Journal*; and copies were forwarded to the Corresponding Members of the Institute. Mr. Wyon, R.A., was commissioned by Her Majesty's Keeper of the Privy Purse to execute the medal. The reverse of the medal was designed by Mr. Ambrose Poynter, then Vice-President, who died only a few months ago; and some subsequent modification made in it by Mr. Wyon was approved. When, however, this design was submitted to the Prince Consort, His Royal Highness suggested that an inscription should be introduced to show clearly that the medal was the Queen's gift. The words "Victoria Regina cudi jussit" were consequently introduced on the obverse; and the first medal was delivered by Mr. Wyon into the hands of the President, Earl de Grey, previous to November, 1848. In the early years of the award notices were sent to foreign societies, and foreign architects were therein invited to make application for the honour. Several well-known men connected with architecture and the allied arts sent in applications, others were recommended through friends. In England applications were also made. The esteem in which it is held on the Continent is seen in a not unusual mode of affix, such as "décoré de la grande médaille de la reine," &c.; while in Great Britain it is necessarily coveted, from historical as well as social and professional reasons. Professor Cockerell was the first recipient of the Medal, and he acknowledging the award, stated,

"I find it difficult to express the very high sense I am bound to entertain of an honour conferred by the united testimony of professional colleagues . . . who stand collectively and individually before her Majesty and the public as the responsible guardians of our noble art and science. . . . Such an honour, as the reward of the sincerity, at least, of the Professor's labours, can be regarded no otherwise than as the triumph of a life, whilst it offers the highest possible incentive to the prosecution of those labours. Since then the medal has been presented,

among Englishmen, to Sir Charles Barry, Professor Donaldson, Sir Robert Smirke, Philip Hardwick, Sir William Tite, Owen Jones, Sir Gilbert Scott, Sydney Smirke, Professor Willis, Anthony Salvin, Sir James Pennethorne, Sir Matthew Digby Wyatt, Benjamin Ferrey, James Fergusson, Thomas Henry Wyatt, George Edmund Street, and Edmund Sharpe, all now deceased, as well as to six other British architects, and one distinguished archaeologist, whom we have, happily, still with us. Fourteen foreigners, four of whom are still living, have also received the medal. Mr. Christian is the twenty-sixth recipient, among our own countrymen, of this honour, and if I keep him waiting yet a little I must ask him to pardon me, and you, gentlemen, to bear with me for a few minutes more. The present year is an exceptional one for all Britons spread over sea and land,—aye, and I venture to think, for all the English-speaking race. It is also an exceptional year for the whole profession of architecture throughout the empire, and, if I dwell on the fact somewhat fondly, it is because I am one of the comparatively few who were working at their several professions or trades when William IV. granted the Original Charter of this body politic and corporate, and when the Queen, barely emerging from girlhood, was suddenly called to the throne, amid the rejoicings of the nation, inspired thus early with the promise of a long, a prosperous, and a progressive reign. I have also had the rare privilege of filling this chair at a moment when the Queen, in the fiftieth year of her beneficent rule, has signed a deed granting to this body increased powers and privileges, not the least being those laid down in the 17th clause of our Supplemental Charter,—that we may "apply the funds of the Royal Institute in furthering professional education and in conducting all Examinations which the Royal Institute may hold or now is or may hereafter be empowered or required by statute to hold." That, gentlemen, is the most important, in my opinion, of the obligations which we have incurred under the terms of the deed just received from the Privy Council office; and I pray that I may live long enough to witness the results of a serious effort to establish, in this country, some complete course of systematic study for architects. So, it may almost be said, shall the original intentions of the Royal giver of our Gold Medal be fulfilled, and in her lifetime. Students who, forty years ago, lost their chance of a great prize, will be eventually recompensed by the substantial and lasting advantages which it is now in the power of the Royal Institute to confer upon them. Nor, indeed, can the time that has elapsed since the Medal was offered as a prize to students be regarded even by them as lost or wasted. In the interim, a corporate body has been consolidated, a profession has been established, an Examination secured. While the Royal Gold Medal remains the great and justly coveted reward of maturity, the seniors, acknowledging a debt to the youth of our profession, offer, so to speak, educational advantages to the whole body of architectural students throughout the empire. And now for the immediate duty before us. Mr. Christian's career is so well known that I need not enter into any details respecting it; moreover, I know that those details, so far as executed works go, are already before you, and that they are the best records of a long and busy life. We know also that that life has been spent in conscientious, honourable work, evincing throughout a thorough knowledge of our art; I am sure that no architect could have more conscientiously studied the best interests of the Ecclesiastical Commissioners of England, by whom he has been so extensively employed, than has Mr. Christian. It is a good many years ago since I was engaged on some business in which he represented the Ecclesiastical Commissioners. I was concerned for an adverse, or, at all events, a different interest, and, as is not unusual, I took a different view of the subject we were upon. I differed from our friend, and I confess I strongly objected to the view which he as strongly advocated. All the time I could not help feeling that I was dealing with a man who was very zealous and faithful in his duty to his employers, and, though I believe I was not convinced, I could not help mentally saying, "Well done, thou good and faithful servant." Mr. Christian, it is my most pleasurable duty to place in your worthy hands this Royal Gold Medal. It is the highest tribute of esteem which your brother

architects can offer to you; and, gentlemen, let me add that, I shall always remember with gratification, during the remaining years I may still be spared to move in the profession in which my already long life has been passed, that I have been allowed to place the Royal Gold Medal in the hands of Ewan Christian.

Mr. Ewan Christian, who was received with much applause, said: Mr. President,—I thank you most cordially for the kind words you have spoken; and you, gentlemen, for the manner in which you have received them. Mine has been a life of independent service, not of exploits. I have undoubtedly done much work, and some I hope of a valuable kind to those most interested; but I could not think of comparing myself with many of the men of mark who have preceded me in receiving this distinction; with the indomitable explorers, or the great architects and archaeologists of our own and other countries. My highest ambition has been that of doing to the best of my ability the duty from time to time set before me to accomplish, and of maintaining unsullied in every sense the high character of an honourable and independent architect. This Medal, the gift, on your recommendation, of her most gracious Majesty the Queen, I take to represent the general opinion of my brother architects that I have not been unsuccessful in attaining that end, and for that reason I accept, and must ever most highly value it, as the best reward and greatest honour I could possibly desire, after a long career of professional labour. We most of us know what a laborious life is that of an architect; how numerous its risks; how many its disappointments; and although these are not unmixed with joys and delights of no ordinary kind, yet the burden is sometimes heavy, and the ordinary rewards hardly proportionate in value. At such times the possession of this visible token of your regard cannot fail to be cheering, and therefore, instead of regretting that it comes so late, I would rather rejoice that it has not reached me until the time when the evening light is approaching, and soothing thoughts are not unwelcome (applause). Gentlemen, again I thank you for your kind welcome.

A letter was read from Sir Horace Jones, expressing regret at his inability to be present at the presentation of the Royal Gold Medal to his old and excellent friend, Mr. Ewan Christian.

Mr. Charles Barry, F.S.A.—Sir, in the eloquent address which you have delivered to us, you have told us the history of the Royal Gold Medal; how, originally, it was intended for the younger members of the profession, and how afterwards it was changed to a reward for those who had had a long and laborious career. You could not possibly have a more fitting example of those two conditions of the medal than the recipient of it this evening. It must be known to many in this room, and in the profession, that one peculiarity of our late President, and one which does him such infinite honour, is connected with those who are young in the profession, and who are striving to attain the celebrity which he has achieved. It must be known to many how numerous have been the almost daily applications by young members of the profession for many years past to our good friend, Mr. Christian, for advice, counsel, and suggestion, and how invariably he has never complained of the time or pains involved in supplying them with information gathered from his own ripe experience (applause).

Other Medals and Prizes.

The President then distributed the prizes to the successful competitors.

The *Pugin Travelling Studentship* was gained this year by Mr. Thomas Maclaren; and in the same studentship a medal was awarded to Mr. Arnold Bidlake Mitchell, B.A. The latter gentleman being laid up through overwork, Mr. Gerald Horsley received the medal on his behalf. In the same competition a medal was also awarded to Mr. Selby, who was heartily complimented by the President on his beautiful set of drawings. A Certificate of Honour was awarded to Mr. Rowland W. Paul, of 31, Spring-gardens.

The *Tite Prize* of 30*l.*, and a Certificate, were won by Mr. Frank W. Simon, of Edinburgh, and a Medal of Merit fell to Mr. John Keppie, of Glasgow, and a Certificate of Honour to Mr. William Stirling, of Upper Chadwell-street, London. The two first-named gentlemen were

unable to be present. In presenting the Certificate of Honour to Mr. Stirling, the President, remarked upon the fact that the three successful competitors in the Tite Prize were Scotchmen. There was no doubt, he added, that in Scotland the love for Classic architecture had been kept alive.

The *Grissell Gold Medal* and the sum of Ten Guineas were awarded to Mr. James Strong, of Liverpool, who, when at Chester, gained the Institute Silver Medal for Measured Drawings. Mr. J. H. Cook, of Liverpool, received the medal for Mr. Strong.

For *Measured Drawings* Mr. Cook received on his own account the Institute Silver Medal and Ten Guineas for measured drawings of Stokesay Castle. In the same competition a Medal of Merit and Five Guineas were awarded to Mr. Frank Bellis for measured drawings of Haddon Hall.

The *Soane Medallion* and 50*l.*, subject to certain conditions relating to travelling for six months, were awarded to Mr. Francis Edward Masey, of 18, Gordon-street, Gordon-square; and the same competition Certificates of Honour fell to Mr. Alfred Whitehead, of Leeds, and Mr. Arthur Sykes, of Brunswick-square.

For *Essays*, the Institute Silver Medal and 25 guineas were won this year by Mr. R. Elsey Smith for his essay on "Detached Wall-Piers, Balusters, and Buttresses." Mr. Smith, being on his way to study in Venice, the prize was received by his father, Professor T. Roger Smith.

#### The Royal Jubilee.

The President referred to the great pleasure it gave him to hand Professor Smith a medal for his son.

Mr. Charles Barry.—I have a suggestion to make before we separate, which, I believe, will receive the unanimous support of every gentleman in the room. It is that the Council may be requested to consider, during this year of Jubilee of our gracious Majesty the Queen, a proper address to be as our patron (applause). We have especial reason this year to do so, inasmuch as we have received an additional mark of royal favour at her hands, and I think in the midst of the loyalty which is showing itself throughout the length and breadth of the land, it would ill become the Royal Institute of British Architects to be found wanting (applause).

The President.—Certainly; this matter, I can promise you, will be taken up by the Council.

The meeting was then adjourned until the 23rd of May, when a paper will be read by Mr. John Phillips on "The Drainage of the City and Palace of Westminster."

#### DINNER OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The completion of the fifty-first year of the corporate life of the Institute, the conclusion of the General Conference of Architects, held last week under the Institute's auspices, as well as the recent grant of the new Supplemental Charter of the Institute, were celebrated by a dinner, held in the large banqueting hall of the Freemasons' Tavern on Saturday evening last.

Mr. Edward Panson, President of the Institute, was in the chair, and the company, which numbered about 130, included Lord Crewe, Sir Frederic Leighton (President of the Royal Academy), Professor Babcock, Mr. H. S. Milman, Mr. Edward Woods (President of the Institution of Civil Engineers), Sir John Coode, Mr. Ewan Christian, Mr. Charles Barry, Sir John Pringle, Mr. E. J. Poynter, R.A., Professor Hayter Lewis, Mr. Edward Ryde, Mr. William Simpson, Mr. Henry Currey, Mr. Alma Tadema, R.A., Mr. Thomas Hawksley, F.R.S., the Hon. H. A. Dillon, Mr. A. Waterhouse, R.A., and a large number of provincial architects, mostly members of the Institute.

The loyal toasts having been duly honoured, Mr. Charles Barry, F.S.A., a past President of the Institute, proposed the toast of "Art, Literature, Science, and Practice." In the course of his speech he reviewed the position held at the present time by the various departments of activity included in the toast, and, with reference to art, he remarked that an old proverb said "Art is long and life is short," and that all artists could dare to hope to do was to add

some suitable link to the golden chain which bound the art of the present to that of the past, and to be sufficiently pure and good in their artistic ideas to offer the link which they had forged as one of sufficient value to those who should forge the links of the future.

Sir Frederic Leighton, P.R.A., in responding for "Art," said,—It often, I know it seems to me, Sir, that the most fitting acknowledgment of that part of the toast for which you have asked me to rise and respond is not a speech, but rather a well-filled and pregnant pause of silence; for art is the most eloquent form of human utterance, and I cannot but think that the evoked memory of one only of its masterpieces is a fitter sequel than any words that man can devise to the toast which has just been proposed. But you, Sir, have preferred the beaten track. You have suffered yourself to miss an opportunity of encouraging a practice which would have conferred a benefit upon you as well as upon myself, and you have summoned, through the mouth of Mr. Barry, an individual who, believe me, rejoices that he has the opportunity to be here among you on an occasion so full of significance, both prospective and retrospective, to the great institution of which we are the guests. Permit me to thank you, Mr. Barry, most sincerely for the very friendly and flattering terms in which you have introduced not my name only, but the names of certain brilliant colleagues of mine in a body of which your illustrious father and lamented brother were distinguished ornaments. Well, Sir, this toast of "Art" is, I rejoice to think, very frequently proposed at festive boards like this, sometimes alone and sometimes in noble connexion with literature and science; but as proposed and received here this toast has distinctive characteristics and a distinctive complexion. In responding to it, stand before you an initiated one amongst initiated ones; I stand here as an artist whose art is of faith, and before artists who share that faith with me. I venture also to think that your choice of a representative to respond for "Art" on this occasion has another characteristic and significant feature. The individual on whom you have called is one who generally describes himself in his passports as a painter, but he is one also of whom his friends, in their more indulgent moments, speak of as being in some degree and in some kind a sculptor; and I cannot refrain from expressing the hope that Mr. Barry, in associating my name with this toast, has desired to re-assert, in the name of British architects, the close and intimate kinship between the art of the builder and the work of the painter and sculptor which every true artist should constantly keep before him.

When I say this, I have not merely by-gone and past days in my mind; I am not merely thinking of those days when simpler scientific problems and conditions obtained, and—I am afraid I must add,—when more rudely-equipped human intellects suffered the same hand to build, to carve, and to paint. Nor am I thinking only of those days in which the dignity of every edifice was enhanced and crowned by the labours of the sculptor and the painter, and when the work of the painter and sculptor was in its turn chastened and restrained by the graver art with which you are associated. I was thinking also of the present day, and of the future, and of the power for good which the three arts may still exercise one upon the other. It is not without very considerable diffidence that I venture to hint at the advantages which architecture and architects may derive from the study of the graphic and the glyptic arts, but perhaps I may be permitted to say that at a time when the utilitarian spirit confronts the architect in all his studies, and in some degree tends to modify his practice, he may perhaps find some strength and assistance in contact with the arts in which the eternal principles of beauty have free scope, untrammelled by the tyranny of utilitarianism. And this certainly I will take upon myself to say, that the study of the graver art of architecture is now,—and never was so more than now,—a wholesome one for those who practise the calling of the painter or the sculptor. We live in times marked, I think, by a rather restless craving for novelty, and characterised by a singular impatience of every form of restraint and discipline and tradition,—a period in which the young seem tempted to write down as foolishness that which the sanction of many generations has pronounced to be wise, perhaps on

account of that sanction. Well, gentlemen, I am, I assure you, not of those who are prone to be horrified at the impatience of ebullient young life; indeed, I should be almost inclined to whisper, if I thought it would go no further, that I rather like it. Of this I am profoundly convinced, that the study of architecture,—as an art in which proportion, balance, purity of form, and other kindred qualities, are either cardinal virtues or elements of stability and greatness,—furnishes a most wholesome corrective to the rebellious appetites of the young of our generation. Therefore, it is quite as much for the sake of the vast influence which the arts might exercise upon each other, and it is in view of the splendid results that they may jointly attain, that I heartily desire to see the union between the three arts of architecture, painting, and sculpture grow every day more close, more intimate, more beneficent to their mutual strength; and in giving utterance to this desire I believe that I am simply re-echoing the sentiments of those on whose behalf I have been called upon to respond. (Applause.)

The Hon. H. A. Dillon (representing the Society of Antiquaries) responded for "Literature." Mr. Edward Woods (President of the Institution of Civil Engineers) for "Science," and Mr. Edward Ryde (a past President of the Surveyors' Institution) for "Practice."

Mr. Ewan Christian, F.S.A., proposed the toast of "Our American Professional Brethren," and this was responded to by Professor Babcock, of Cornell University, Ithaca, United States of America, who expressed his conviction, at some length, that a style based on the Romanesque was that best adapted for all public buildings of a monumental character. That conviction was rapidly gaining ground in America, and it was largely shared in and acted upon by the late H. H. Richardson.

Mr. Alfred Waterhouse, R.A., proposed the next toast, that of "The British Architectural Societies in correspondence with the Institute." Mr. Waterhouse said they all knew the good work which those societies were doing—the anxiety which prevailed both at headquarters and at distant centres to secure more systematic education for the architect of the future, and a higher status in consequence of having passed a qualifying examination. They were conscious also of the recently revived freemasonry of the craft,—of the way in which one architect shared his ideas, his inventions, his experience, with others quite ungrudgingly. For that change they had to thank the Institute, the different local societies, and, above all, the Conferences.

Mr. J. Wreggitt Connon, of Leeds, and Mr. W. H. Ellerker, Vice-President of the Victorian Institute of Architects, Melbourne, responded.

Mr. H. S. Milman, M.A., Director of the Society of Antiquaries, in proposing "The Prosperity of the Institute and the Health of the President," said he thought the Institute was to be congratulated on the hopeful prospects of increased usefulness and influence under its new Charter. In spite of much criticism levelled against architects, he thought that all persons who had known London as long as he had would see how great was the progress which had been made in its street architecture, and would realise how desirable it was that Architecture should be under the tutelage of a great society like the Royal Institute of British Architects. In the words of the old Roman poet—

"Diruit, aedificat, mutat quadrata rotundas."

Great changes were going on continually in London: old buildings were removed, new ones put up, and the appearance of our streets was altered—on the whole greatly to the credit of the architects concerned.

#### THE ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS' EXAMINATIONS.

The following gentlemen, having satisfied the Examiners at the Examination held in London on the 22nd and 23rd ult., have been granted certificates of competency by the Council of the Association, viz. :—

|                                |                                 |
|--------------------------------|---------------------------------|
| Adeock, C., Liverpool.         | Nichols, F. J., Leeds.          |
| Cooper, F. E., Liverpool.      | Rich, E. W., Poplar.            |
| Doarlen, H., Leeds.            | Sanders, Jas., Newark-on-Trent. |
| Franks, T. W., West Brom-wich. | Verschoyle, B., Liverpool.      |
| Nichols, A. E., Leeds.         |                                 |

The next Examination will be held at Manchester in October.

ARCHITECTURAL ASSOCIATION.

REMINISCENCES OF EXCURSIONS.

THE thirteenth ordinary meeting of this Association for the present session was held on the 6th instant at 9, Conduit-street, Mr. J. A. Gotch (President) in the chair.

A vote of thanks was passed to the churchwardens of St. Bartholomew-the-Great, Smithfield, for allowing the members to visit that church.

Mr. H. D. Appleton (Hon. Sec.) read the following letter from the President of the Chicago Architectural Sketching Club:—

"115, Dearborn-street, Chicago, April 19, 1887.

To the Sec. of the London Architectural Association.

Dear Sir,—As President of the Chicago Architectural Sketch Club, I have constant applications from architects in the different States for first-class Assistants at good salaries. At present, the demand far exceeds the supply, and it just now occurred to me that I should be doing my countrymen a good turn by notifying you of this fact. Good steady men cannot make a mistake in coming out, and to any really good draughtsman calling at my office, I shall be pleased to give the best advice and instruction I can. Young men just out of their studies, quantity surveyors, architectural fossils, and drunkards are of no use here. My being a Member of the R.I.B.A. should be a sufficient guarantee that this communication is in good faith.

Yours faithfully,  
(Signed) GEORGE BRACKMONT."

Mr. John L. Robinson, R.H.A., of Dublin, then read a paper entitled "An Irishman and his Camera in England,—a Dark Seance," illustrated with dissolving views. Mr. Robinson said,—

Last session Mr. S. Flint Clarkson read a paper before the Association on Architectural Photography, and pointed out how useful a knowledge of the art of photography must prove to the architectural student. I do not intend to go over the same ground, but simply propose to bring under your notice this evening a selection from the series of views taken by me during the last seven excursions of the Architectural Association, and claim your indulgence for any defects which may appear in them, as the transparencies, as well as the original negatives, have all been prepared by myself.

The first excursion in which I took part was in 1880, when Norfolk was visited, with Norwich as our headquarters. The Church of St. Peter Mancroft was being restored at the time, the scaffolding affording the members unusual facilities for examining and measuring the roof, timbers, &c. Norwich Cathedral stands well in a close, called Tombland, entered by four gates, St. Eithelbert's, Erpingham, the Bishop's, and Water Gate, and has a remarkably fine Norman nave, with Perpendicular groining, ornamented with a very fine series of bosses. The west front and central tower were being restored at the time of our visit. The cloisters are well preserved, and the grammar school, deanery, and remains of Bishop's Palace, are interesting. There are forty-nine churches in town, all built during the fifteenth century, and so much alike in detail as to become monotonous. The Guildhall, with its chequer work in stone and flints, and some timber houses, were visited and sketched. As almost all the places visited during the week lay some distance from the town, we proceeded each day by rail to the nearest station, where the carriages met us. Several fine Perpendicular churches with beautiful open-timber oak roofs, were seen at Cawston, Aylsham, Salle, Walsham, Trunch, Knapton, Worstead, East Dereham, Walshingham, Wymondham, Edingtonthorpe, Atleborough, Ellingham, Hingham, and Deopham. Aylsham is a cruciform church, with a good font and rood-screen; Cawston also has a fine rood-screen, with paintings in the lower panels in tolerable preservation. Salle Church has a good square tower, with angle pinnacles. North Walsham Church is Late Decorated, with a rich south-west porch. The font-cover is very elaborate with tabernacle work and pinnacles. Trunch and Knapton have two fine fonts, and were in a most neglected condition,—the roofs leaking, the walls damp, and an air of dirt and desolation everywhere: the chancel-stalls in the latter church were falling to pieces, and the entire fabric seemed likely to follow their example. Edingtonthorpe Church has a round tower, the upper stage being octagonal, and the roof is covered with thatch. There is a good rood-screen, on which I recollect the Christmas story and decorations were still hanging in August. Worstead Church has a good hammer-corn roof. East Dereham has two towers, one at the crossing and the other detached, the

central tower being found too weak to carry the bells. At Walshingham are the ruins of the Augustinian Priory,—the refectory and gatehouse are full of good early detail. Houghton-in-the-Dale is a little wayside chapel, now a farmer's house, which was much frequented in the Middle Ages by pilgrims to Walshingham. Wymondham has two towers,—a square one at the west end and an octagonal one at the crossing. The nave piers and arches are Norman, with a Perpendicular clearstory and roof. Hingham Church has a beautiful tower in six stages. Flint panelling is largely used in all the Norfolk churches, which are chiefly remarkable for their fine open-timber roofs, rood-screens, and fonts,—the latter being lofty and well-proportioned, with oak covers, in some cases, as at Salle, reaching nearly to the roof of the church. The mansions visited were Blickling Hall and East Barsham. Blickling is a fine brick mansion with stone dressings, and has a good entrance doorway and courtyard. The library ceiling is a good example of Jacobean plaster work, the panels filled with allegorical subjects. East Barsham, now a farmhouse, is a remarkably good example of Tudor cut brickwork and terracotta.

In 1881 we had an opportunity of seeing a totally different class of work in Worcestershire. The cathedral at Worcester has been too much restored externally, our friend the late Sir Edmond Beckett having had a finger in the pie. The transepts and Lady-chapel are very fine, the tomb of Prince Arthur being an elaborate specimen of Perpendicular work. Almost all the Domestic work seen during this excursion was half-timbered, including several old houses in Worcester, Tewkesbury, and Ledbury, the splendid manor-houses at Svern End and Mere Hall and the Court-house at Haddington, the exceptions being Woolas Hall and Madresfield Court. Even one of the churches, Besford, and portion of Droitwich Church are also half-timbered. Tewkesbury Abbey, with its fine Norman nave arcade and Perpendicular groining and deeply-recessed west window; Pershore, with its Early English choir and tower; and Malvern, were the most important churches visited. Huddington, remarkable for its oak porch and general dilapidation, and Ledbury were also seen. Madresfield Court, the seat of Earl Beauchamp, has been practically rebuilt. Westwood Park is a brick Elizabethan mansion with angle towers, covered with high-pitched roofs, and is approached through an interesting gate-house of the same date as the mansion.

Kettering, with its fine church, was our headquarters in 1882, our worthy President acting as our guide, philosopher, and friend. Amongst the churches visited was that of Oakham, in Rutlandshire, a fine building with wide nave and lofty tower and spire. The Shire Hall, hard by, is of the Transitional period, and has some good carved corbels. One of the walls is covered with horsehoes deposited by each peer of the realm who has passed through the town. There are two good market crosses, and the village stocks are still preserved. Exton church has a good octagonal lantern, and Elizabethan monuments. The Elizabethan hall, which is in a ruinous condition, has many points of interest. The other churches seen were Warkton, which has been turned into a heathen mansoleum; Weekly; Geddington, where there is an ancient bridge and Eleanor cross; Rushton; and Brigstock, a portion of which is of Saxon date. Lyddington Church and bedehouse form a most picturesque group, and Ledwick is remarkable for its fine tower and octagon lantern and monuments to Ralph Green and his wife, 1420, and Edward Stafford, Earl of Wiltshire, dated 1499. This excursion was rich in domestic work, the members having an opportunity of inspecting the most important works of Sir Thomas Tresham at Lyveden, Rothwell Market-house, and the curious symbolical triangular lodge at Rushton. The principal building, was without doubt, Kirby Hall, which has been so often sketched, and which is still grand and imposing notwithstanding its sadly-dilapidated and ruinous condition. Rushton, with its fine quadrangle and Elizabethan gables; Rockingham Castle, forming a picturesque group of buildings of various dates; and Drayton House, where the owner gave us every facility to inspect the grouched cellars, beautiful Italian gardens, and exquisite ironwork in the gates and railings surrounding the mansion, were also visited.

In Somersetshire, the following year, Montacute was the most important Domestic building. This is a fine Elizabethan mansion, the garden front being particularly good. The garden is enclosed with an ornamental balustrade, with quaint summer-houses at the angles. Barrington Court is another interesting Elizabethan mansion, a portion of which is used as a farmhouse, the remainder being a cheese and cider store. Lytes Cary is a manor-house; portion dating from the Decorated period, with a Perpendicular room, with oriel and plaster ceiling. The Domestic chapel is still to be seen, but it, as well as the rest of the building, is in a very indifferent state of preservation. Trent, Somerton, and Newtown, near Yeovil, are small and interesting manor-houses. An entire day was spent at Sherborne, the Abbey, Almhause, Coudait, and Castle affording sufficient material for the day. At Cerne Abbas and Mulchelney were seen the remains of two fine abbeys; and in the churches at Trent and Queen's Camel good open roofs; Bradford Abbas, Cerne Abbas, Yetminster, Stok-sub-Hamdon, South Petherton, and Martock were visited. The best of all the churches, in my opinion, was Huish Episcopi, with its noble Perpendicular tower, enriched with panelled bands, with a highly-ornamental crenellated parapet. The stone used in this neighbourhood is of a warm colour, and in almost every village the majority of the houses are of stone, with mullioned windows, quaint gables, and oriels, the style being that generally known as Late and Flat. The fonts also are characteristic, the bowls being octagonal, with square pendants at the angles, as at Queen's Camel and Mulchelney. The surrounding country is very beautiful, several of our drives being through lanes cut in the stone to reduce the hills, the sides being covered with ferns, mosses, and verdant foliage.

In 1884, that portion of East Anglia known as Suffolk was visited, with Bury St. Edmund's as our headquarters. Little remains of the once splendid abbey except the abby-gate and Bishop's Bridge, the position of the other buildings being indicated by shapeless masses of masonry. One of the natives, who was evidently proud of the care now taken of them, assured us that they were the best preserved ruins in Europe. The Norman gate has been rebuilt near St. Mary's Church. The two churches of St. Mary and St. James are long and lofty, Late Perpendicular in style, and a pretty fair type of all the churches seen during the excursion. The nave arcades are slight and gaunt, the wall space in clearstory reduced as much as possible, the effect being that you are in a house of glass, like—

"Hardwick Hall,  
More glass than wall."

When the large and numerous windows were filled with stained glass the large amount of light was, of course, mellowed and tinted to an extent that must now be left to the imagination. Lavenham and Long Melford were the two largest churches visited. The latter church deserves its prefix, for if the Clopton Chapel to the east be included it must be the longest parish church in England. Icklingham, a good fourteenth-century church, with a thatched roof, was found to be in a most neglected condition. Mildenhall has good oak open roofs to nave and aisles, and there is an octagonal cross in the village covered with lead, bearing a close resemblance to that of Oakham. Woolpit is a very late church, with nave and ill-proportioned detail, particularly in the south porch. Hengrave Hall, a white brick Tudor mansion; Rushbrooke and Kentwell Hall (both moated), and Coldham Hall were the principal mansions seen during this excursion. The materials of the three latter being red brick, with stucco dressings, in imitation of stone. Rushbrooke and Kentwell are E-shaped on plan, with octagonal turrets at the angles. The manor-house at Bardwell is quaint, and has a good gable with cut brick chimneys.

Our next excursion, to Banbury and its neighbourhood, was one of the best that I have joined in. The beautiful mansion at Compton Winayates, seen on the first day, is the most charming old house I have ever visited. Its position in a vale at the foot of a steep hill, the beautiful colour of its brick and stonework and tiled roofs, and picturesque grouping of gables, tower, and chimneys continue to form a picture that can never be forgotten. There is a small courtyard leading to the hall, which has a good oriel and is hung with tapestry. In Banbury there are a number of picturesque houses, and

the Reindeer Inn has a room panelled in oak, with an elaborate plaster ceiling. At Canons Ashby our genial host, Sir Henry Dryden, was indefatigable in his attention to our party, whether in pointing out the beauties of his house or of the church hard by, or in pressing his hospitality upon us. Broughton Castle is a large mansion of various dates, where nearly four hours were profitably spent in sketching the castle and church, which contains several interesting monuments. King's Sutton Church has a graceful spire; Adderbury, a large church, was being restored; Bloxham, Swalcliffe, Cropredy, Clipping Warden, Middleton Cheney, Deddington, Alkerton, and Wigginton were amongst the churches visited.

The professional journals have given such full descriptions of the excursion to Kent last year that I shall simply say that the most important churches visited were Rochester Cathedral and Maidstone, and that Penshurst Place and Coham were the principal mansions.

Having thus, as briefly as possible, given a résumé of the last seven excursions, I may be permitted to record the impressions made on my mind by them. I have been in the first place very much struck at the manner in which local materials have always been used in olden times, and the influence which such materials have had on the style of building. In Norfolk and Suffolk flint is largely used from the thirteenth century to the present day, and the flint panelling in Norfolk is more delicate and better proportioned than in Suffolk. In Worcestershire timber framing and tiled roofs are to be seen of all dates; in Northamptonshire, a stone district, all the buildings are of stone, and the type of work is that known as late and flat. In Somerset a warm-tinted limestone is used, and is so plentiful that nearly all the cottages can boast of mullioned windows, stone forges, and other extravagances; whilst in Kent timber framing is largely used, and almost all the cottages are of the one type. In the same manner, the churches in each district all bear a family resemblance to one another, and the same may be said of the fittings. I was particularly struck with the manner in which the same type is repeated in the fonts in each district, notably about Banbury, where the earliest fonts are stunted and ill-proportioned like washing-tubs, as at Broughton, and preserve the same form, notwithstanding how they may be covered with panelling, as at Wroxton or Bloxham. I bring two cameras with me, one for views 8 in. by 10 in., and the other for smaller pictures, 5 in. by 4 in. I have on the seven excursions taken about 705 photographs, and shall now, with the aid of the optical lantern, place before you a selection of the places visited on each excursion.

Mr. Robinson subsequently exhibited on the screen a large number of photographic transparencies of buildings visited by the Association. Each view called forth some characteristically racy remark from the lecturer, who was accorded a hearty vote of thanks at the close.

The nomination of officers and committee for session 1887-88 then took place, Mr. John Slater, B.A., being nominated President. The election of officers will take place at the next meeting.

#### THE MONEY VALUE OF SANITATION.

At the closing meeting for the session of the Association of Public Sanitary Inspectors, held on Saturday, at the Westminster Town Hall, an address was delivered, written by the President of the Association, by Mr. Edwin Chadwick, C.B., Mr. Alexander (Shoreditch Vestry) occupying the chair in the absence of Mr. Jerram, the Chairman of the Council. There were present with Mr. Chadwick, Earl Fortescue and Dr. B. W. Richardson, honorary members, Lord Fortescue reading the address for Mr. Chadwick, who was suffering from a cold.

Mr. Chadwick, taking up his favorite financial argument to show the cost in money and life of sanitary ignorance, compared the aggregate annual incomes of the life insurance companies and the provident societies with the annual charges for the defence of the nation by the Army and Navy, and arrived at the conclusion that the neglect of sanitation and the continued bad condition of the defences against it were as fatal and costly as an annual invasion by a great army of enemies. Preventive disease was, in fact, an enemy which annually slew 100,000 people, and the total monetary

loss of the killed and wounded in civil life might be estimated at two-thirds of the estimates voted by Parliament for the government of the empire. Even in this metropolis, which in comparison with any European capital, or any of the great towns of America, had a low death-rate, 20,000 were annually killed or wounded by disease, whom efficient sanitary measures of defence might have saved. In a subsequent portion of the paper, the President stated that, with all the shortcomings still existent in our local administration, the sanitary improvements made during the reign of her Majesty the Queen had been greater than in any other country. In France the death-rate was 3 per 1,000 higher than in England, which meant a preventible slaughter of 112,000 lives more than at present in England. In Germany, with a mortality in its army the lowest in Europe, the death-rate of the civil population was 6 per 1,000 higher than here, representing a sacrifice of 135,000 lives more than in England. The waste of life in Italy was 8 per 1,000 more, and in Austria 11 per 1,000 more, a total loss in these two countries of 624,000 lives annually over and above the corresponding waste in England and Wales, while Russian statistics showed a still more terrible state of things, both in the army and among the civil population. In the United Kingdom the mean duration of life had advanced during the reign of Queen Victoria from thirty years to thirty-eight years. These favourable results were due in a great measure to improved administration, and the substitution of permanent officers giving undivided attention to the application of their sanitary knowledge for the unpaid and incompetent officials to whom sanitary duties were formerly too often entrusted. It was a great fact which ought no longer to go unnoticed that the services of some 20,000 paid union officers, of whom 5,000 exercised sanitary functions, saved the country 3,000,000l. annually, as compared with the expenditure for similar purposes under the régime of unpaid parish overseers and officers. Further reductions, both in the money expenditure and in the waste of vital power, could be effected in carrying further that principle, and by returning to the first principles of the measure propounded in 1832, and in the Report of 1839, for the organisation of a police force. Addressing himself especially to the sanitary inspectors, Mr. Chadwick thus concluded:—When you are doing what some would call unmenial service; when you are taking part in the removal of the most offensive causes of disease and death, you are conveying a practical lesson to the world of the methods whereby the happiness, the brightness, the comfort, and the strength of the world is secured. You are giving health to man, and out of this some poet may even extract poetry in a future day. Meantime, accept it as true, from one who has seen eighty-six summers, that yours is as good a work as the sun ever shone upon, and that long before another eighty-six summers shall have passed away it will be recognised as work which deserves the fullest recognitions and the most hefting rewards if it be carried out,—as I am sure it will be,—in the spirit as in the letter, faithfully, vigorously, hopefully, manfully.

Earl Fortescue, Dr. Richardson, and several members of the Association, subsequently addressed the meeting, Lord Fortescue testifying to the enormous decrease in the death-rate of the Army by the improved sanitary arrangements of the barracks buildings. The Army death-rate used to be far higher than the civil death-rate, but now it was scarcely half as high. Dr. Richardson, while not agreeing with all the views of the President, said he believed there was no one living in this kingdom who could have drawn from the rich stores of his experience so valuable a body of facts as he had given them in his address. Although we stood quite ahead of the rest of the world in sanitary matters, there still remained an immense work to be done by the future, even in London alone. Germany and Italy were making rapid advances, and so was America, where medical officers and sanitary inspectors were better treated than in this country, but in some of the new countries, where one would have expected to find the wealthiest places in the world, the conditions were often worse than in the countries of the old world. In Sydney, Melbourne, and Adelaide, for example, they found the death-rate among children three times as high as that of the worst of London slums.

#### OBITUARY.

Mr. Samuel Cousins, R.A., the well-known engraver, died on the 7th inst. He was eighty-six years of age.

Mr. Thomas Stevenson, C.E., died on the 8th inst., at his residence in Edinburgh. He had been in ill-health for some time. Born in 1818, Mr. Stevenson was a son of Mr. Robert Stevenson who built the Bell Rock Lighthouse. He was engineer to the Commissioners of Northern Lighthouses from 1855.

#### VISITS IN CONNEXION WITH THE GENERAL CONFERENCE OF ARCHITECTS.

IN our Supplement this week we give particulars of several of the visits made by members of the Architectural Conference last week, and we here append notes of those visits, which we had no space to mention in the Supplement.

#### The City and Guilds of London Central Institute, South Kensington.

A party of the members of the Conference visited the Central Technical Institution on the morning of Thursday, the 5th inst. They began by inspecting the Mathematical Classroom, where the members were received by Professor Henrici and Mr. Lawrence Harvey, the models illustrating Professor Henrici's teaching in geometry being exhibited with the models made by the Architectural Association's Class of Masonry, theoretic geometry and scientific masonry being closely connected subjects. Professor Henrici explained to the members his system of teaching the higher branches of geometry by means of models made of threads, geometry being in his tuition the foundation of many of the other branches of mathematics. Mr. Harvey described how the Class of Masonry had been carried on, and of the great importance of both masonry and geometry to the artistic development of architecture; he referred the members to models showing the lines of curvature of surfaces, lines which the joints of masonry must follow, and which also served as a guide to the decoration of plastered surfaces,—good decoration being intended to bring out the character of surfaces.

The visitors then passed to the Laboratory of Chemistry, where Professor Armstrong explained the construction of the stink closets and the ventilation of the laboratory generally; after which the Electrical and Physical Department was visited, under the guidance of Professor Ayrton, beginning, firstly, with the laboratory, where experiments on heat and dilatation of metals were carried on. For the dilatation of metals tubes are used heated by water; the results are examined with the aid of the microscope. Secondly, the laboratory for the study of acoustics was visited. Thirdly, the electrical experimental laboratory for beginners. Fourthly, the laboratory for testing lightning conductors. An electric machine was shown which Professor Ayrton compared in its principle to the effect produced by moving clouds during storms. In the same laboratory the use of an optical bench was explained for making experiments on light, its rapidity, its absorption by various substances, such as different qualities of glass, the measurement of the amount of light received in any part of a building, as is required in light and air cases, chemical analysis by measure of the absorption of light by various liquids, photoprisms, &c. Fifthly, the visitors inspected the laboratory in the basement at the south end of the building for the most delicate experiments, such as the measurement of very weak electric currents. The instruments are placed on blocks of masonry built quite independently of the building; to diminish vibrations from the earth itself caused by carts in the streets, these blocks of masonry are constructed hollow and filled in with slag wool, the slab of stone forming the table resting directly on the slag wool and not on the masonry. Professor Ayrton explained that on account of the iron girders which support the floors of the building, experiments on earth magnetism were rendered impossible. All the above laboratories being destined in general for delicate experiments are placed on the south side of the building, so as to be as far as possible from the dynamo-room at the north end of basement, where experiments requiring great electric power

were carried on. In the dynamo-room Professor Ayrton explained how mechanical energy was converted at one end into electric power, whereas by means of a converter, electric power was at the other end converted into mechanical power, thus furnishing the means of using the power of distant waterfalls. Then Professor Ayrton showed the working of the dynamo-machine invented by himself, by which he can regulate its speed to a nicety. It is very simple in principle, consisting in a gearing made to pass over

two parallel cones opposed in direction, so that the strap passes over the thin end of the one cone to the broad end of the other, or on any intermediate space *ad libitum*, thereby varying the proportions of the radii of the circles on which the gearing acts.

Professor Henrici showed some of his machines for studying the law of motion, and Professor Unwin made experiments in the large physical laboratory with the 100-ton testing-machine, and showed the results of the crushing of various sandstones wherein their planes of shearing were made apparent. Professor Unwin showed the company also the results of a series of experiments he had made with various qualities of Portland cement, by which it is quite evident that all kinds of Portland cement swell in setting. The visitors left the premises much gratified with what they had seen.

*The Drainage Works of the Houses of Parliament.*

On the morning of Friday, the 6th inst., the members of the Conference visited the new drainage works of the Houses of Parliament, under the guidance of Mr. John Phillips. It is only a few months since we very fully

nearly full of sewage, which enters by gravitation through the pipe A. D is an inverted cup, attached to a rod connected below to another similar cup, turned upwards (E), and above to the lever opening the compressed-air valve. When the sewage rises above the cup D, the air is compressed within the cup and lifts it to the top of the chamber, opening the valve and admitting the compressed air at C. The sewage is immediately forced downwards and up the exit pipe B, the inlet A (fig. 2) being stopped by the pressure forcing the ball into its seat. As the ejector becomes nearly empty the cup E is left full of sewage, the weight of which pulls it down again to the position in fig. 1, shuts off the compressed air, and releases the ball at A, and the process of filling is at once repeated.

*The National Gallery and Royal Academy.*

On Saturday morning a large party of members visited the new National Gallery, where the new central staircase, as well as four or five new galleries, are approaching completion, under the direction of Mr. John Taylor, of H.M. Office of Works. Of these we will say more in a future number. Unfortunately while the party of visitors was inspecting the work a painter named Snowden, in the employment of Messrs. Grace, fell from a high scaffolding on to the new staircase, and he died very shortly afterwards.

Some of the party afterwards visited the Diploma and Flaxman Galleries of the Royal Academy, which contain many pictures and some sculpture well worth seeing. It is not generally known that these galleries are open daily, free. The visitors also had an opportunity of inspecting some of the Academy Schools, under the guidance of Mr. Pickersgil, R.A., the Keeper, and Mr. Phené Spiers.

In the evening a great many of the members who had been attending the week's Conference were present at the Dinner of the Royal Institute of British Architects, which is reported on another page of this week's *Builder*.

AN ARCHITECTURAL STUDIO.

SIR,—Will you kindly allow me to state that an "Architectural Studio" such as that advocated by Professor Roger Smith in his paper at the General Conference of Architects, has already been organised, and is now being successfully carried on at the Royal Architectural Museum, Westminster.

R. STEPHEN AYLING.  
Royal Architectural Museum, Westminster,  
May 10th.

NELSON COLUMN.

SIR,—I have endeavoured to find a measured drawing of the Nelson Column and base, but without success. Perhaps some of the readers of your journal may know if such a drawing exists, and where it is to be seen. Neither can I find any dimensions or proportions of the column in any of the standard works on architecture.

JOHN M. WOOD.

TRABEATED CONSTRUCTION.

SIR,—It is pleasant to hail Mr. Sedding a convert to the modern school of architecture, as evidenced in his design for a church in your last issue.

Will he kindly explain the construction of the entablatures? This is a point that was discussed in several numbers of the *Builder* two or three years ago, on my suggestion that concrete hearers, with an iron core, would provide great facilities in that direction.

EDWARD J. TARVER.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

2,736, Hip-and-Valley Tiles. A. Jones.  
The principal improvement embodied in this invention is in the use of special dies for producing hip-and-valley tiles, and of a cutting-off and finishing apparatus used in conjunction with the dies.  
5,031, Water-closet Apparatus, &c. R. Weaver.  
The main feature in this invention is the "flush fan" attachment, whereby the water delivered from the flush-tank is divided into streams flowing along each side of the basin, and the water, after thoroughly scouring the basin sides, descends vertically into the basin, and thoroughly washes out the trap. The trap is also contracted in the water-way so as to ensure the full force of the water in flushing.

6,817, Metal Doors and Frames. John Partington.  
Doors are made with one or more corrugations run

around the outer edge, and a centre space, either plain or embossed. The configuration is obtained by passing the sheet metal through rolls. The frames for doors and windows are also nitrated in a somewhat similar way, the nitrated angles being also formed by rolling the bars or plates before fixing.

5,391, Cistern for Flushing Closets. W. C. Baldwin.  
In siphon cisterns used in combination with this water-waste-preventer it is claimed that it is impossible for any water to run into the cistern when the lever is pulled for discharge or otherwise tied down. A lock ball-valve is the essential feature of the invention, and this lock is actuated by an eccentric cam upon the lever, which shuts the ball-valve.

10,055, Windows and Door Fasteners. A. S. Andrews.  
The fastener constructed in accordance with this invention is secured in the ordinary way, but to the inner sash is affixed a plate to receive a slotted pin for the knob, which being pressed down into a socket when the fastener is fixed, effectually secures the bolt from being forced backward.  
2,435, Packing for Doors and Windows. G. B. Thornton.  
This invention consists in the use of india-rubber tubing triangular in section. It is, therefore, more easily forced into the crevices or joints which it is desired to make draught-proof. It may be fixed with cement, and yielding to the pressure of the door or window when closing it entirely prevents draughts from the joints or openings where it is used.

NEW APPLICATIONS FOR PATENTS.

April 28.—6,251, H. Skerrett, Doretalting Machine.—6,256, W. Kneen, Latches for Doors, &c.—6,265, T. Robson, Safety Cleaning Sliding Window-Casbes.—6,283, A. Murray, Bricks, Mouldings, Ridges, &c.—6,288, A. Boulé, Shelf Brackets.  
April 30.—6,307, E. Zahn, Water Tap.—6,309, E. Marston, Fittings for Baths and Lavatories.—6,345, A. Morse, Roofing and Wall Tiles.  
May 2.—6,351, F. Ferguson, Clay, Terra Cotta, or Cement Blocks having a Hollow Tube formed in same, and Constructed to form a Continuous Pipe on the Faces of Buildings.—6,353, F. Bosshardt, Levels.—6,410, G. Rodfern, Lime Kilns.  
May 3.—6,435, J. Woodfield, Door and Window Fastenings.—6,478, W. Thompson, Wood-working Machines.—6,494, L. Sagendorf, Metallic Roofing.—6,496, C. Chambers, jun., Brickmaking Machines.—6,513, A. Itter, Facing Bricks, Tiles, &c.  
May 4.—6,528, J. Balhime, Fireplaces, Grates, and Stoves.—6,548, S. Fisher, Wall or Ceiling Coverings.—6,573, J. Kiehl and W. Garland, Preventing the Escape of Noxious Gases from Drains, and Sewers, &c.—6,582, P. Molyneux, Paint or Coating.  
May 5.—6,605, J. Tucker, Cisterns.—6,616, L. Marguerie, Vitro-Metallic Material for Glazing, &c.—6,630, C. Winstone, Cooking Ranges.

PROVISIONAL SPECIFICATIONS ACCEPTED.

2,820, A. Boulé, Paving.—4,463, H. Allan, Soil Pipe Connections for Water-closets, Lavatories, &c.—4,593, W. Murray, Stone-dressing Machines.—4,594, E. Sturdy, Fastening Doors.—4,909, A. Nicholas, Door-hells, &c.—5,037, Asher and Buttress, Locks and Latches for Doors, &c.—5,288, G. Wooliscroft, Attaching Door Knobs to Spindles.—5,667, J. Drummond, Chimney Cows.—5,751, J. Horrocks, Ventilating Buildings, &c.—4,415, T. Latham, Locks and Bolts.—4,855, W. and N. Haigh, Flooring Cramp.—5,115, D. Cowan, Stoves or Detached Fireplaces.—5,188, M. Syar, Water-waste-Preventer.—5,234, J. Bousfield, Funneled or Straight Smoke Ventilators for Bottoms of Chimneys.

COMPLETE SPECIFICATIONS ACCEPTED.

*Open to Opposition for Two Months.*  
7,338, E. Picard, Manufacture of Glass.—7,438, Kery and Campbell, Bricks.—7,670, G. Mason, Fastenings for Window Sashes.—13,621, E. Hancock, Metallic Lattice Work for Ventilators.—16,697, W. Buchanan, Feed Mechanism for Logs or Deals in Vertical Saw Frames.—3,442, W. Thomas, Flushing Sewers.—6,121, J. and W. Matthews, Brick-making Machinery.—6,212, E. Edwards, Compressed Blocks for Building Purposes.—7,068, W. Smeaton, sen., Flushing Water-closets, &c.—3,607, P. Milligan, Bricks.—3,665, W. BaracloUGH, Door Chains and Locks.—5,699, R. Meubush, Wood-workers' Cramp.—3,725, J. Bennett, Pigments.—5,139, P. Born, Flushing Apparatus.

OPEN TO OPPOSITION FOR TWO MONTHS.

The New Council of the R.I.B.A.—By an unfortunate omission on the part of our printers last week, the name of Mr. James Brooks was not included in the list of the new Council of the Institute which we published on p. 663; and we regret that in the pressure of work entailed by our detailed reports of the Conference, the omission remained undetected until the whole of our impression had been published. We understand that in the election Mr. Brooks stood nearly at the top of the voting.

The Student's Column.

FIELD WORK AND INSTRUMENTS.—XX.

Levelling Instruments.

IV.—THE LEVEL BOOK.

**WE** illustrate this week four different forms of level-books. The same readings upon the level staff are used in each case in order that the reader may be able to compare the merits of each form of Level Book. In form No. 1 all the staff readings are entered in the same column. This system will therefore show the order in which the staff readings booked in forms Nos. 2, 3, and 4 are taken. In forms Nos. 2 and 3 the staff readings are divided into back-sights and fore-sights, all readings after the first with the level in any single position being entered as fore-sights.

*Intermediate Sight.*—In form No. 4 all

readings between the first and last sights before changing the position of the instrument are entered as intermediate sights.

*Back Sight.*—The first sight read off the level staff is hooked in forms Nos. 2, 3, and 4, as a back-sight, and gives, as shown in form No. 1, the height of the line of collimation in the instrument, above the point upon which the level staff is placed.

*Fore Sight.*—In forms Nos. 2 and 3, all sights read off the level staff after the back-sight, and in form No. 4 the last sight or reading read off the level staff before changing the position of the instrument, are booked as fore-sights.

Horizontal distances are expressed in links, and are localised by description in the column headed Remarks, which usually occupies the whole of the right-hand side of each double page of the book.

The reading of each intermediate and fore

sight gives the vertical distance between the line of collimation, found as above, and the points upon which the level staff is held. The next back-sight is booked in its own column upon the same line as the last fore-sight, in forms Nos. 2, 3, and 4, because the description of that point is the same, the level staff being replaced upon the same point as that upon which the last fore-sight is taken, for ascertaining the figures to be hooked, when reading the next back-sight, with the instrument in a new position. In continuous levelling great attention must be paid to this.

In form No. 1 the column headed Distances and Staff are entered in the field. The columns headed Reduced Levels and Line of Collimation are subsequently arrived at by addition and subtraction. In forms Nos. 2, 3, and 4, the columns headed Back Sight, Intermediate, Fore Sight, and Lengths, denote the entries

Eber's Patent Hydrofuge Floors.

made in the field, while the columns headed Rise, Fall, and Reduced Levels, denote the entries afterwards made in the office. The columns marked Reduced Levels and Distances or Lengths are the columns used in plotting the levels. Sometimes the location of the level staff is referred to by a letter, without any measured distance or length being taken. A very accurate plan is in this case necessary to localise the description.

In reducing the levels to a common datum, an intermediate sight, in form No. 4, serves as a fore-sight to the sight booked in the line before it, and as a back-sight to the sight hooked in the line following it. The difference between the sum of the back-sights and the sum of the fore-sights is equal to the difference between the total rise and fall, and also to the difference between the last and first reduced level. To check the accuracy of the column of reduced levels in form No. 1 the first sights and last sights are each distinguished at the side by a special mark, and then separately added up. In form No. 2 the previous fore-sight is written as a back-sight, unless the instrument has changed its position. In form No. 3 these sights are treated in the reduction as back-sights, as well as fore-sights, without being rewritten in the back-sight column. In form No. 4 they are written in a separate column, and headed as intermediate sights, there being no occasion to add the same figures to both sides as in form No. 2, in order to obtain the total rise or fall between the first and last reduced level. The letters B. M. at the top of the column for lengths, indicate a heuch mark, the level of which is given in the column of reduced levels, and from which all the succeeding levels are calculated.

EBNER'S PATENT HYDROFUGE FLOORS.

MR. J. F. EBNER, of Clerkenwell-road, has called our attention to the most recent improvement in fixing parquet or wood blocks direct on to a concrete or stone bed, or any fire-proof construction, without the aid of joists or wood underflooring. The system is based on that of M. M. Dammann & Cassard, of Brussels, the English patent for which Mr. Ebner has acquired, and simplified, with a view of reducing the cost of such flooring, and adapting it to the requirements of English architects.

Among the special features claimed for this system, as improved by Mr. Ebner, are—First, perfect direct keying of the wood to the concrete (not the bitumen) by means of a hard-setting bituminous composition which runs into the undercut recesses both of wood and cement, and dovetails them securely together. Secondly, the difficulty of cutting or making satisfactorily the undercut grooves in the cement is overcome by introducing specially-made corrugated iron channels, and fixing them into the floating of the concrete whilst it is plastic, the very shape of the iron channels holding them firmly in the cement, the straight flange A of the iron effectually protecting the edges against breakage whilst the builder's work proceeds. The channels are not intended to be removed.

It will be seen that the concrete bed in the lower section has undercut channels the same as the wood; thus a direct key into the bed by means of a bituminous damp-course is provided, which makes it impossible for the wood to become detached from the foundation. The upper section shows the use of a grooved tile between the mastic and the cement bed.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

**The Wesleyan Centenary Hall in the City.**—A large company was attracted to the Auction Mart on Wednesday last on the occasion of the Wesleyan Centenary Hall and Mission-house, in Bishopsgate Within, being offered for sale by Messrs. Fox & Bonfield. The building was offered in consequence of the Wesleyan body being about to remove their chief business centre to the Thames Embankment, where a large and costly new hall and mission-house will shortly be erected. The premises in Bishopsgate were built in the year 1839, now nearly half a century since, in order to commemorate the then centenary period of the Wesleyan body. The building covers an area of 8,030 ft., having a frontage of about 66 ft. and a depth of 165 ft. It was described as occupying a position unequalled within the monetary and trading area of the city, and as the last site of equal prominence in that locality available for the construction of a banking house, insurance office, or for a pile of offices. Mr. Fox, the auctioneer, before offering the property, made some lengthened remarks as to its great value. Judging from the price at which freehold land in the locality had been sold during the last few years,—in some instances for as much as 32*l.* per foot,—he considered that the minimum value of this particular land was 20*l.* per foot, which, according to the area it occupied, amounted to 166,000*l.*, and to that must be added the value of the building itself. The biddings commenced by an offer of 70,000*l.*, upon which there was an immediate advance to 75,000*l.*, and by similar advances of 5,000*l.* each, 100,000*l.* was quickly reached. The biddings having arrived at 119,100*l.*, and there being no higher offer, the property was bought in at 135,000*l.*

**Addington, Kent.**—A new stained-glass window, representing the Ascension of Our Lord, has recently been placed in the church here; the work has been designed and executed by Messrs. Warrington & Co., of London.

Statistical Society.—Mr. Charles Booth on "The Inhabitants of the Tower Hamlets (School Board Division), their Condition and Occupations." 7-45 p.m.

Birmingham Architectural Association.—Election of officers. 7.30 p.m.

WEDNESDAY, MAY 12. Society of Arts.—Mr. William Henry Preece on "Progress in Telegraphy." 8 p.m.

Civil and Mechanical Engineers' Society.—Annual dinner (Holborn Restaurant), 6.30 p.m.

Royal Meteorological Society.—7 p.m.

THURSDAY, MAY 13. Society for the Encouragement of the Fine Arts.—Mr. Louis Fagan on "The English School of Engraving," 8 p.m.

Parke's Museum of Hygiene.—Major Lamourck Flower on "The River Lark," 8 p.m.

Institution of Mechanical Engineers.—7.30 p.m.

FRIDAY, MAY 20. Architectural Association.—Mr. R. W. Paul will read a paper entitled "A Travelling Student's Notes in Gloucestershire," 7.30 p.m.

Royal Institution.—Mr. Benjamin Baker on "Bridging the Firth of Forth," 8 p.m.

Parke's Museum (Lectures for Sanitary Inspectors).—Dr. Charles Kelly on "Sanitary Law.—General Enactments, Public Health Act, 1875, Model By-Laws." 8 p.m.

Institution of Mechanical Engineers.—7.30 p.m.

Miscellaneous.

The Railway and Canal Traffic Bill.—At the ordinary monthly meeting of the Council of the Railway and Canal Traffic Bill.

That the Council, having considered the Railway and Canal Traffic Bill, as amended on report, read their resolutions of the 20th of April (see Builder, p. 685, ante), having reference to the Bill as amended in Committee, and hereby express their regret at the numerous amendments which have been made in the interests of railway companies, the most objectionable of which are those to Clause 7, to the effect that the Board of Trade may require security for costs as a condition of granting certificates to Associations and other bodies as to their fitness to make complaint before the Railway Commissioners, and to Clause 12, which provides that claims for repayment of overcharges must be limited to one year before the complaint is made.

The Sun and Planet Engine.—Messrs. Whitbread & Co. have offered to the Association of Foremen Engineers, through Mr. Joseph Newton, the venerable Sun and Planet engine which was constructed for them 102 years since by James Watt, the condition being that the Association or any of its members should find a home for it. The owners of the engine, who are no longer able to find room for it in their establishment, are naturally anxious to prevent its becoming converted into old iron, which would be a regrettable fate for this historical piece of mechanism. We understand that, since this offer was made, Messrs. Whitbread have extended it to the engineering profession at large, from which it would appear that the Association has not accepted it, and that the engine is going begging. We hope, however, it will be preserved to the profession by one or other of our engineering institutions. The Patent Office Museum would form the most appropriate repository for this memento of James Watt, but it would seem that the limited space at command there is already hopelessly overstocked.—Iron.

The New National Liberal Club.—The eighth Saturday afternoon visit of the Architectural Association was made to the new National Liberal Club, Victoria Embankment, on Saturday last. The members were conducted over the building by Mr. Thomas Warburton, the Clerk of the Works, by whom the drawings were laid out for the members to examine. We have a detailed description of this important building (which was visited by the members of the Architectural Conference last week) in type, accompanied by plans, but want of space obliges us to hold it over until next week.

Registration of Plumbers.—At the meeting of the quarterly court on Monday, April 25, Mr. Alderman Knill, Master of the Company, presiding, it was resolved, on the motion of Mr. George Shaw, G.C., Chairman of the Registration Committee, that plumbers passing the theoretical and practical examination of the City and Guilds Institute should be entitled, on the production of the Institute certificates, accompanied by satisfactory testimonials, to be enrolled upon the Company's register for plumbers.—City Press.

Comber (Ireland).—The re-opening of Comber First Presbyterian Church, after alterations and enlargements, is reported by the Belfast Newsletter, which says that the old church was built about 300 years ago, after the shape and appearance of an ordinary barn building. Its first enlargement was an extension of the western gable, which made the building 79 ft. long by 29 ft. wide. That was about 250 years ago. Another addition was made fifty years later, when a wing or return gave the structure the form of the Roman letter T, and a further extension, made in the year 1740, gave it a cruciform shape. The present alteration consists of a complete removal of the roof, galleries, flooring, and pews, as well as the internal projections of the Greek cross-diagonal walls, and the former four corners of the projections are supplanted by massive granite and stone pillars, supporting arches from the junction of the old and the new walls. The whole of the works of construction have been carried out by Mr. W. Kerr, of Lagan Village, Belfast, from designs by and under the supervision of Mr. A. H. De Wind, C.E., architect.

Birmingham Architectural Association.—At the eleventh ordinary meeting of the current session, held at Queen's College on Tuesday evening last, the following gentlemen were elected to serve as the officers for session 1887—1888:—President, Mr. F. B. Osborn, F.R.I.B.A.; Vice-President, Mr. W. Doubleday; Hon. Treasurer, Mr. F. Cross; Hon. Librarian, Mr. W. H. Bidlake, M.A.; Hon. Secretary, Mr. Victor Scruton, A.R.I.B.A. As other members of the Committee: Messrs. H. Beck; H. H. McConnell, A.R.I.B.A.; A. Reading, A.R.I.B.A.; A. V. Ingall, W. H. Kendrick, T. W. F. Newton, and F. B. Peacock. A hearty vote of thanks was accorded to Mr. John Cotton on his retiring from the office of Vice-President,—an office which he had held most efficiently and disinterestedly for the past three sessions.

Proposed Hospital for Montreal.—Sir George Stephen, President of the Canadian Pacific Railway, and Sir Donald Smith, one of the directors, have just addressed a letter to the Mayor of Montreal, offering to contribute a sum of 1,000,000 dol., or 200,000l., for the erection of a hospital in that city. The hospital, which is intended for the benefit of the poorer class of the city, will, if permission is granted, be constructed on the declivity of the Mont Royal. The institution will be insectarian, and it is proposed to call it the "Royal Victoria Hospital." The money will be placed in the hands of the Governor-General as soon as certain conditions stipulated for by the donors have been accepted by the Corporation of the city. The site selected for the structure is a most appropriate one, and it is to be hoped that the founders will succeed in obtaining it, since their efforts to procure a suitable plot of land elsewhere have proved fruitless.

Cathcart, Cape Colony.—The new English Church, dedicated to St. Alban, was opened for divine service in February last. The consecration service has been postponed owing to an accident incapacitating the Bishop of Grahamstown. The church is built of local stone, pointed on both sides, and the roofs, seats, and other joiner's work are of pitch-pine. The architect is Mr. Lennox Canning, of Bloemfontein, Orange Free State, and London.

Trinity College, Connecticut.—According to the American papers, Mr. Junius S. Morgan, the well-known London banker, recently presented Trinity College, at Hartford, Connecticut, with 6,000 dollars towards the cost of erecting a new building for scientific purposes. A spacious gymnasium has just been completed in connexion with the college, the cost of which has also been partly defrayed by the liberality of Mr. Morgan.

Sonthampton.—The new Catholic Schools erected in Middle-street, Sonthampton, and which will accommodate about 150 children, have been completed. They have been built by Messrs. W. R. & C. Light, of Portsmouth, from the designs of Mr. W. Lunn, architect, Portsmouth.

Kendal "Jubilee" Market.—The Town Council have selected the design submitted in competition by Mr. D. Brade, of Kendal, for the above.

New Pier at Ventnor, Isle of Wight.—Messrs. H. R. Trehearne & Co., of Battersea, write to say that they are the contractors for this work, and not Messrs. Burligh & Co.

PRICES CURRENT OF MATERIALS.

Table with columns for material names (e.g., Greenheart, Oak, Pine, Lath, Deals, etc.) and prices in £, s., d. and other units.

TENDERS

- ANERLEY.—For the erection of two pairs of semi-detached houses at Wheathill-road, Anerley. Mr. F. C. Dyer, architect, Gracechurch-street, B.C.
BEXLEY.—For the erection of a new house and stable for Mrs. F. J. Newman. Messrs. Newman & Newman, architects, Tooley-street, London E.C.
CROYDON.—For a pair of semi-detached villas in Dingwall-avenue, Wellesley-road. Mr. Alfred Broad, architect, Great George-street, Croydon.

# Supplement to The Builder,

MAY 14, 1887.

## GENERAL CONFERENCE OF ARCHITECTS.

**W**e resume our report of the proceedings of the Eighth General Conference of Architects, held last week under the auspices of the Royal Institute of British Architects.\* We will take first of all the Conference matter proper, and will then proceed to describe the visits made to new buildings and public institutions by members of the Conference.

### ARCHITECTURAL EDUCATION.

In the discussion which took place on the eight papers read on this subject by Professor Babcock (of Cornell University, U.S.), Mr. E. C. Robins, Mr. Arthur Hill, Professor Aitchison, A.R.A., Professor T. Roger Smith, Mr. R. Phœnix Spiers, Mr. Lawrence Booth, and Mr. J. A. Gotch (the whole of which papers were printed *in extenso* in our supplement last week).

The Chairman (Mr. Arthur Cates) said that as touching Mr. Robins's paper, he had received a letter from Sir Philip Magnus, Director of the City and Guilds of London Institute. He was unable to be present at the meeting, being in Italy, otherwise he would have been present to speak for himself. Sir Philip's letter was as follows:—

"For some little time I have been instituting inquiries as to the best course of education for those who are training to become architects. As you are aware, there is a special course of instruction occupying four or five years at most of the polytechnic schools of Germany. At Berlin, for instance, there were 133 students in attendance last winter in the Architectural Department of the school. These students receive a training that qualifies them to act as architects, and the system of sending a youth to an architect's office to receive there his training does not prevail to anything like the same extent abroad as here. It seems to me that there are distinct advantages in our own system; but having regard to the scientific knowledge which architects now require in the construction of all buildings, our present system, I venture to think, needs to be supplemented by special instruction in a technical school. Without going into details, for which, on the eve of my departure, I have not now time, I may say that I should think the best course would be to recommend all youths, prior to their being articled, to spend a year at some technical institution, where they would receive instruction in the principles of science that would be applicable to their future work, and in geometrical drawing, specialised according to their future requirements. Such a systematic course of study would be of great advantage to them as supplementing their school education, and would better enable them to profit by the valuable experience they would acquire in an architect's office. But alone this would not suffice. After going through this course, and passing a satisfactory examination, the student should be articled, say for three years, to an architect; and during this time he should be required to attend at the technical institution for a decreasing number of hours each year. During the first year he might be required to attend on three or four afternoons a week. During the second year, when he would be more useful to his employer, it might suffice if he attended on parts of two afternoons a week; and during the third year he might attend some special courses only after the ordinary office hours. The instruction during these three years would embrace such subjects as the strength of building materials, the principles of building construction, the application of geometry to construction, the history of architecture, and special applications of physics to the problems of ventilation, acoustical arrangement, &c. The designing of buildings, and all the practical details connected with his work, the student would, it seems to me, learn best in the architect's office as he now does."

Professor Roger Smith asked to be allowed to anticipate the discussion and to suggest that a special vote of thanks should be accorded by the Conference to Professor Babcock for having come amongst them from the other side of the Atlantic and shown that he was willing to help architects in this country by pointing out the way in which the American architects had secured for themselves that which we were hoping also to secure, namely, systematic education. He would not add a single word more except that it was a great pleasure to all of them, and it had been exceptionally so to himself, that an architect from the other side of the ocean should come there that day and give them the benefit of his experience (applause).

\* See last week's *Builder*, p. 653, and Supplement thereto, pp. 691-706.

Professor Aitchison, A.R.A., seconded the proposition that a vote of thanks be given to Professor Babcock for coming to England and giving the Conference the advantage of his knowledge and experience of how architectural teaching was carried on in the United States. Although, perhaps, it was rather ungracious to do so, he wished to take one slight objection to what Professor Babcock had said when he excluded any knowledge of hydraulics from the education of an architect. In view of the provision of cisterns and large tanks it was important that an architect should have some elementary knowledge of hydraulics. Most of them knew that one division of St. George's Hospital was washed down and several persons killed, through the failure of a tank, some years ago. He was exceedingly pleased to hear the remarks Professor Babcock made on the subject of Byzantine architecture, partly, perhaps, out of vanity, because he had arrived, from entirely independent sources, at the same conclusion himself. When he had had occasion to read papers on the subject of architecture, he had pointed out that which Professor Babcock had pointed out that day, viz., that the true Roman architecture was the Byzantine. He might say that he did not know of any buildings that were so fine as the great Byzantine buildings he had seen. He did not know anything to surpass some of the churches in Ravenna, and St. Mark's, Venice. He thought he might say all architects, and more especially the young ones, owed a great debt of gratitude to Mr. Phœnix Spiers, who organised and carried on so admirably the Architectural School at the Royal Academy (hear, hear). When he (Professor Aitchison) was a student there was no architectural teaching there at all except the six lectures.

The motion was then put and agreed to.

The Chairman, addressing Professor Babcock, said that he had pleasure in conveying to him not only the thanks of the meeting, but also the thanks of the Institute and the thanks of the profession at large in this country for his great kindness in coming over here, at an earlier period than he had intended, for the express purpose of attending that meeting and reading his paper, and for the very valuable results they all hoped would follow from the paper with which he had favoured them.

Professor Babcock expressed his sincere and hearty appreciation of the kindness of the meeting in the reception they had given him. If he had been or could be of any service to them in formulating their ideas in regard to architectural education he should feel himself amply repaid for the trouble he had taken in order to enable him to come to the Conference. Had he had notice at an earlier period he could have come in comparative ease, but as it was he was obliged to crowd two months' work into two weeks, and he had not therefore been able to devote the time he could have wished to the preparation of his paper. His paper, from his own point of view, was extremely imperfect. He was almost ashamed it should make its appearance in print alongside the much more finished papers which had been read. Inasmuch as Professor Aitchison had taken occasion to criticise a portion of the paper in which he had spoken of the architect not dealing with hydraulics, he wished to say that in America they were coming to the conclusion that architects had better not undertake to do what an engineer could do better. An engineer was a specialist in these matters, and architects were not specialists. It gave them time to attend more particularly to the architectural and artistic part of the design. They (American architects) put all that was mechanical upon those who made a speciality of it. He should not have ventured to make that

remark except that it might be the only opportunity he might have. He thanked the Conference for the honour they had conferred upon him and his country. It was hardly customary for an older country to call upon the younger, for the mother to call upon the daughter, but they must not be surprised if the daughter soon got up alongside the parent; but be that as it might, he felt that the honour conferred upon him was a great one.

Mr. Hugh Stannus said that he had intended to propose a vote of thanks to all the readers of the papers, and he felt that Professor Roger Smith and Professor Aitchison had taken the nicest plum out of his pudding. He was sure, however, it would be more pleasing to Professor Babcock to have had the thanks of the meeting proposed by men so much abler and better known in the profession. He would, however, ask that the best thanks of the Conference be given to the other gentlemen who had prepared such exceedingly interesting and exhaustive papers as those to which they had listened. He took it that the general consensus of all that had been said appeared to be that a young fellow ought to learn the underlying science before he learned the art of his profession, and that he ought to learn both the science and the art before going into an office at all. The point was, at what age should he commence, speaking roughly and generally, and not with regard to any particular cases. Suppose a young man remained at school until he was eighteen, and went to some architectural college until he was twenty or twenty-one. It would be exceedingly difficult to article any young man when about twenty years of age, because no contract would bind him after he was twenty-one. Therefore, he had better continue at College until he was twenty-one, and he could then go into an office until he was twenty-three. As his parents would have spent a great deal of money in fitting him for the profession, he considered it would be a proper thing, seeing that he would go into any office at twenty-one much better fitted than at an earlier age,—not to ask for a premium. The 200 guineas or thereabouts that would be asked would have been expended in a far better way upon his preliminary education at an architectural college. If he stayed with his principal until he was twenty-three he could become a clerk of the works at twenty-four, and, therefore, at twenty-five he might hope, if he had an uncle who was a capitalist or large estate agent, to enter into practice. He knew some young fellows who had paid heavy premiums, and had gone to gentlemen of mature age in large practices, and he had known others who had paid smaller premiums, and had gone with younger men, and they spoke with far more gratitude than those who had gone with older men. In the first place, the young man preserved more of his enthusiasm than the older one; and again, he was not too far removed by age from his pupil. He would also have more leisure to attend to his pupils, and in a smaller office the pupil would be put to a greater variety of work in the different branches of the profession. During his pupillage he should be allowed to attend lectures. Mr. Robins's suggestion of one day a week for such instruction was an admirable one; but two or three days, if possible, alternately with office practice, would be desirable. There were things to be learned in the office that could not be learned academically, and there was no royal road to what a man learned during his pupillage, but lectures that he might bear at a college were of exceeding value. They could have approached that subject in one of two ways. They might, as in the *Jeu-de-Paume*, take an oath that they would not separate that afternoon until they had settled a scheme of education for the profession, and then, having settled it, they

could consider how it was to be carried out; or they might consider how the existing means of education could be improved and consolidated for the common benefit. Much as he sympathised with Prof. Smith's idea of setting up the atelier, he would prefer that they should endeavour to consolidate what they possessed. If they considered for a moment, they had the Royal Academy, King's College, University College, the Science and Art Department, Technical Institute, and last, but not least, the Architectural Association. It was possible for the Institute to consider itself not so much an educating body as an examining body, a body which was to act as a go-between of all the others; if they could approach the Royal Academy and unite the professors,—Prof. Roger Smith, Prof. Kerr, Prof. Aitchison, and others,—and invite the Architectural Association to arrange some common ground of work, so that there should not be such dissipation of energy, he thought there would be some practical outcome of their conference that afternoon. While Prof. Bagnall was speaking he filled him (Mr. Stannus) with envy, for he longed to have had the privilege of sitting under such a man, and to have learned that thorough way of treating the subject which he so slightly touched upon. They of course knew that their American cousins started with nothing to unlearn. They were able to make a perfectly symmetrical scheme of education.

Mr. John Slater, B.A., said he had listened with great pleasure to the various papers that had been read. He did not think any one could appreciate, who had not investigated the subject, all the difficulties there were in the way of consolidating the present system of education to which Mr. Stannus had referred. Those difficulties were very great indeed, but he was sure that considerable help would be given by what had been done, and that a great impetus would be given to the educational work of the Institute by what had transpired that afternoon.

The Chairman said that Professor Roger Smith in his paper indicated an ideal teacher who should establish such a studio as he shadowed forth. Some little time ago he (the Chairman) happened to be in correspondence on the subject of education with a gentleman who had distinguished himself in the highest degree in the profession in the academical point of view, and in writing on the subject this correspondent referred to a gentleman whose unselfish and untiring energies in helping the students, and whose influence upon the circle of which he had been the centre, had been exceedingly beneficial to him in his studies, and from whose instruction and advice he had derived the greatest possible advantage. He (the Chairman) had also received an intimation entirely apart and distinct from Professor Roger Smith's paper that two gentlemen who were well known in the Institute, and who had distinguished themselves in various ways, had arranged and matured a scheme very similar to that which Professor Smith had shadowed forth. They had had the matter in hand for some months past, and were now actually in treaty for premises suitable for the purpose which they had in view in the immediate neighbourhood of the Institute; and when he said that one of those gentlemen was Mr. F. T. Bagnall, who had distinguished himself at the Institute,—as Pugin Student and otherwise,—and that the other was Mr. Walter Millard (the gentleman referred to,—and deservedly so,—in each high term by his correspondent), he thought they would say that in that combination Professor Roger Smith was seeking had been found. If those gentlemen succeeded in establishing the studio they must heartily wish them every success.

Mr. W. J. N. Millard said that what he and Mr. Bagnall had in their minds was almost the very scheme Professor Roger Smith had put before the Conference in his paper, though they had not been aware of what Professor Smith's proposal was. They were negotiating for suitable rooms, and they proposed to keep their atelier open all day, and also in the evening, at reasonable fees. It was proposed to have a library, casts, and models, and they hoped the whole thing would supply both a preliminary training to young men before they went into offices, and a supplementary training to those already in offices. There were a great

many things they thought of an office than in one. These things they proposed to assist the student in.

Mr. F. B. Osborn (Birmingham), on behalf of the Society he represented (the Birmingham Architectural Association), assured the Conference of the great interest they were taking in this question of education. Only recently the Mason Technical College in Birmingham had decided to open a course of lectures on Architecture and Engineering, and that course would, no doubt, be of great assistance. Those who resided in Birmingham were at a considerable disadvantage compared with the advantages gentlemen residing in London had in the Architectural Association and in the Royal Institute and the Academy school. They felt that in any scheme of education and examination which was established there should be guided from the commencement, so that he could know he was pursuing the right course and reading the right books. If there was only one examination a student in the country might easily find at the end that he was on the wrong course altogether, and for that reason he believed that there should be a division of the examinations,—preliminary, intermediate, and final. On that account they thought the guidance of this educational question should be left to the Royal Institute of British Architects. He thought the outcome of the papers and discussion that afternoon would be to that effect, and he would, therefore, move:—

"That it is desirable that the guidance and direction of the education of those entering the architectural profession should be undertaken by the Royal Institute of British Architects."

Professor Kerr seconded the motion. It was, he said, one of the most important functions which must depend upon the Institute very soon,—to become a more academical institution than it had been. He then explained what was done at King's College. A young man might enter King's College at sixteen years of age, and in the course of two years, if he had a head on his shoulders and paid attention, he would pass through the entire curriculum of applied science, including drawing, mathematics, physical science, engineering, and building generally. At the end of two years he might leave, and he was then fit to go into an architect's office under a very great advantage. Young men did pass out of King's College classes into engineers' offices at a salary. If on leaving the College he entered into articles with an architect for two or three years, and attended an atelier and the Royal Academy classes, at twenty-one he might become as thoroughly well educated as anywhere in Europe. He, therefore, strongly recommended that King's College should be kept in view, and he presumed University College also.

The resolution was put and carried unanimously.

Mr. Charles Aldridge (Liverpool) then proposed:—

"That, to realise this end, the Royal Institute of British Architects should prepare a scheme of a complete system of examination."

He, in common with most gentlemen present, had always felt the great want and the necessity for some supplementary system of education over and above that which the pupil received in a working office. In this matter he could remember the great advantage he received through being a member of the Architectural Association in London. When he went to Liverpool seventeen years ago, he endeavoured to bring before the Society a very similar system of education and classes to those existing in London, but unfortunately he did not meet with the success he anticipated. It was true that classes for design were formed, and were now going on; but he wanted other classes, more particularly for the study of construction; and in conjunction with some older members of the profession in Liverpool, he drew up a syllabus of lectures to be delivered. There were forty students belonging to the Society, and at the first lecture there were only two present, which was a discouragement to him. In consequence of that the lectures were abandoned. Recently, however, there had been some excellent lectures delivered for the assistance of students in architecture and civil engineering in connexion with University College, Liverpool, under Professor Hele Shaw, and several architectural students had availed themselves of those lectures, and he believed derived considerable advantage from them. As to the suggested system of education, he

thought it would be of immense advantage to young men in the provinces, and it could be best brought about by the system of federation which had been before the Royal Institute of British Architects for some time. He had always believed that that was to be one of the most valuable outcomes of federation; that was to say, that the Institute would give to provincial architects some of the advantages which gentlemen in London possessed, and which he was sorry to say they were still lacking in the country. Those in the country had none of the advantages of the courses of lectures that were delivered in the colleges in London, and they had no South Kensington Museum. If, however, the Institute would put them in the right way, and help to formulate a proper system of education in conjunction with the training that the students received in architects' offices, he believed it would be of immense value; and if federation produced only that result, it would be no small or mean one. The great difficulty they had to contend with in the provinces, and in every town, was to provide some stimulus to young men. How were they to persuade young men that there was something more to be learned than during the few hours they were in an architect's office? Unfortunately, some young men had got it into their heads that they had only to spend three or five years in an architect's office, and would then be turned out full-fledged architects. They could not do too much in enforcing upon young men that that was not efficient, and that, however clever they might be, they were not competent to practise as architects at the end of their articles. If the Institute, by formulating a system of education, would assist in that way, architects in the provinces and elsewhere would be very thankful to them.

Mr. G. A. T. Middleton seconded the motion, and, referring to a proposed Federation Bill, read one clause which, he said, permitted him to enjoin such a resolution as that. Of course, a qualifying examination was made compulsory in the Bill. It was intended to be compulsory that men should go through an examination before they were allowed to practise as architects. That Bill placed the Royal Institute of British Architects in its proper position as the sole professional examining body for the United Kingdom, and on that ground he had great pleasure in seconding Mr. Aldridge's motion.

The Chairman said although some little time must elapse before they could persuade Parliament to grant those powers to them or any other body, it was desirable that the Institute should pave the way to show how it could be done.

Professor Aitchison said he should be very glad if he could get his suggestion seconded, namely, that in drawing up this scheme for architectural education, the Royal Institute be particularly asked to make one course of examination to take in that which was purely necessary to enable the architect to design what was wanted properly; he wanted to have that which was necessary to know separated from that which was unnecessary.

The resolution was then adopted unanimously.

Mr. J. A. Gotch, President of the Architectural Association, moved:—

"That such system should comprise,—1st. Preliminary, for pupils entering the profession, as a test of general knowledge, those passing this to be 'Probationers, R.I.B.A.' 2nd. Intermediate,—for pupils in their third year or earlier, for those general principles of art and construction,—those passing this to be 'Students, R.I.B.A.' 3rd. Final,—pass examination to qualify for 'A.R.I.B.A.' at twenty-three years of age, or earlier. Note.—No subscription to be required from Probationers or from Students."

Continuing, Mr. Gotch said that no subscriptions need be demanded from the students or probationers, and some title should be given them. If they were called "Probationers" and "Students" they would assume a dignity and feel an interest in the Institute which they might otherwise not do. As the reason for proposing this resolution were practically given in his paper, he would not detain the Conference further.

Mr. J. Wreghitt Cannon (Leeds) seconded the motion, which was agreed to unanimously.

Mr. J. L. Robinson (Dublin) next proposed:—

"That this system should be arranged with the co-operation of the local societies, by whose agency

the details of the Examinations could be carried out."

He represented the Royal Institute of the Architects of Ireland at the Conference, and he might say on their behalf that they would be very willing to undertake the examination of all candidates who would present themselves in Dublin for examination. So far as he could see, the three questions of examination, registration, and federation were mixed up.

Mr. J. C. Moncrieff (Bristol) seconded the motion.

The Chairman said that in regard to Bristol he had a letter from Mr. Hansom, of that city, urging that Bristol should be made one of the centres for the Institute examinations, and stating that steps were now being taken to reorganise and bring into active operation the Bristol Society of Architects, and that hopes were entertained of good results. He had no doubt that what they had done that day would give fresh life in provincial centres, and if the co-operation of local societies could be obtained the examinations would attain an end they all desired.

The resolution was put and agreed to.

The Chairman said that it would be his duty as Chairman of the meeting to formally communicate the resolutions that had been passed to the Council of the Institute, and to request in the name of the Conference that they would take the necessary steps to organise a scheme for carrying them into effect.

Mr. Lawrence Harvey said he was entirely opposed to examination. There were other ways by which they could test a man's capacity. The competitions for the various medals of the Institutes could be made use of for examining men much better than any such examination as suggested.

The Conference then adjourned.

#### NEW MATERIALS AND INVENTIONS.

We last week\* published the paper by Mr. John Slater, B.A., on this subject. The paper, it may be mentioned, was very fully illustrated by drawings and specimens.

In the discussion which followed,

Professor Unwin said that the Chairman had called on him very unexpectedly to open the discussion. He had listened with great interest to Mr. Slater's paper, which dealt chiefly with matters which were not specially within the experience of an engineer. But he should like to correct one impression conveyed in the paper before it crystallised into an accepted conclusion. It was rather implied in the paper that wrought-iron columns were first used in America. In fact, they were used certainly as early as 1860 in this country. His first chief, Sir W. Fairbairn, had been mainly instrumental in introducing the so-called fireproof construction, in which cast-iron columns, cast-iron girders, and brick arches were used. The defects of these came to be understood, and certainly about 1860 Sir W. Fairbairn constructed buildings with wrought-iron columns, wrought-iron girders, and brick arches. Mr. Slater had referred to the experiments of Wöhler, as showing that the breaking-weight of a material depended on the variation of stress and the number of repetitions of the loading. Strictly speaking, the law that the breaking-weight depended on the variations of stress was known much earlier, but it took a long time before the demonstration of a law was succeeded by a full and practical recognition of its consequences. In the early experiments of the Railway Commission, in 1849, it was shown that cast-iron bars broke with half the statical breaking-weight when subjected to continued repetitions of load. Subsequently Sir W. Fairbairn carried out an experiment on a riveted girder, the results of which were registered from week to week by himself. The girder was subjected to continual loading and unloading for a period of two or three years. It broke with two-fifths of the statical breaking-load, and, after repairing, with one-third the statical breaking-weight after over one million changes of load in each case. He believed that this experiment suggested Wöhler's researches. What Bauschinger had done was to find the rationale of Wöhler's results. He had shown that the range of stress through which a bar was perfectly elastic was dependent on the kind

of variations of stress to which the bar was subjected. Now, if in any case the elastic limit came very near to the actual stress the bar rapidly deteriorated and broke. This matter was one more interesting to engineers than to architects, because engineers had continually to deal with cases in which there was continual variation or reversal of stress. A railway axle might be subjected to 200 million reversals of stress before it became unsafe. Still it was desirable that it should be known that the statical breaking stress was not, as commonly assumed, the exact measure of the structural value of a material. Two materials might have the same breaking stress in the testing-machine, and yet not be equally safe for given working stresses, when those stresses were continually varying. Professor Unwin apologised for saying so much on this point, but Mr. Slater had rather challenged him to say something further with regard to Bauschinger's experiments. He hoped that next day some of the members when visiting the Central Technical Institute at South Kensington would see ordinary statical testing of materials carried out.

Professor Babcock, of Cornell University, U.S.A., said that Mr. Slater's paper had interested him exceedingly. He would like to ask whether the use of porous terra cotta was at all prevalent in this country? It was made simply by mixing saw-dust with the clay. The value of it was that, having been burnt at a certain heat, it was perfectly fireproof, and although spongy, unless dipped in water it was not absorbent, but was rather a dry material, besides being one of the best non-conductors of heat and of sound. It weighed only about half as much as ordinary brick, and if it was desired to make a fireproof partition it could be laid on wood joists. It did not weigh more when plastered on both sides with one coat of plaster than an ordinary lath-and-plaster partition with three coats of plaster on it. It was of value to line outside walls with, in order that they should be perfectly dry; and nothing could be more admirable than porous terra cotta for fixing-blocks, because the nail could be driven into it more easily than into deals or ordinary pine, and held very strongly. Then, again, it was the best material for a fireproof roof. It was customary to take a T-bar and put the flange downwards, and between the flanges to lay sheets of the material, which could be had in pieces of almost any size. These were laid between the T-bars, and came up a little higher than the edge. The slates or tiles were nailed directly on this, and thus there was an absolutely fireproof roof inside and out. He might also add that fireproof flooring bricks were made of terra cotta, and were a great saving of weight. Now, supposing they wanted to leave their houses for a year, what did they do with the traps? The best thing to do was to take ordinary calcium chloride, which was the by-product of a chemical process, and was very cheap. This was exceedingly hygroscopic, having a great affinity for water; consequently, on leaving a house for some time the best thing to do was to flush out the traps, and leaving them full of fresh water and putting some of this material in, so that the traps would remain full of water for any length of time. Mention had been made of a simple small portable battery, but in America they had an invention which was exceedingly useful in connexion with the exhibition of lantern slides for the purpose of illustrating lectures. A simple portable machine had been invented into which a certain fluid was put, and which was able to supply an electric light for the lantern, sufficient for four hours' exhibition. Some reference had been made to the use of stamped wood-pulp for ornament. That had been used a good deal, but had been now superseded by real wood ornament. The great objection to those things was that they were so "inferentially cheap" that everybody used them. There was no doubt they were exquisite specimens of what could be done by machinery; they were done on the end of the grain, and in many different kinds of wood, which was steamed, and by heavy pressure from a steel die. The ornament was produced as sharp and clean as anything could possibly be made. Indeed, as far as it went, it was the very perfection of ornament.

Mr. William Woodward remarked that it might be due to his obtuseness or want of due appreciation, but for some considerable time past he had been under the impression that the readers of papers at that Institute had somewhat disregarded their audiences by reading

communications which were, to his mind, more fitted for the Architectural Association, or for students of architecture (oh, oh!). In saying this he did not wish to say a disrespectful word about the Architectural Association. But that night they had had a paper of a different character to what they had been accustomed to hear in that room for many years, a paper full of the greatest possible interest to many who were practising as architects. And although many of the inventions and materials mentioned by Mr. Slater were well known to them, he had shown such a remarkable grasp of the details connected with these inventions and materials that he had been able to produce a paper of considerable value, and to teach them a great deal more than they knew before. As to the steel decking, some years ago Mr. Lindsay pointed out to him its wonderful advantages, particularly with reference to the enormous weight it would bear and the slight depth of the floor. With regard to lifts, he would be very pleased if any man who manufactured these would do something to prevent accidents, and deaths, such as had recently occurred through persons falling down the shafts made for the lifts. He was not aware from Mr. Slater's description of the Otis lift whether the immediate stoppage necessitated action on the part of some of the attendants. Referring to the veneering material, for cheapness, sharpness, and beauty there was nothing that struck him so much at the recent Building Exhibition.

Professor Kerr remarked that though Mr. Woodward was an exceedingly able man, he sometimes allowed his words to run away with him, and on that occasion he ought not to have cast discredit on the papers that had been read before the Institute, and some of which were exceedingly valuable (applause). He would like to ask if any one present could tell them a little more about the probable services of steel in building? They knew that rolled iron, although an invaluable material, had very serious faults; and that as regarded fireproof work, when they came to the City of London and the wharfs by the water-side it was hopeless to produce anything unless it were a building similar to what engineers erected for resisting shot. The use of iron, he might say, had never yet been brought into such a condition as to be absolutely safe, and he would like to know if there was any chance of improving on this state of things by the introduction of steel? The question of fireproof building was a most important one, not merely in regard to Mr. Slater's suggestion that the offices which were now chary of insuring these buildings might be induced to do so if they were better constructed, but also with regard to the comfort of the whole community and the general safety of property, which now became a large consideration in a place like this metropolis. Professor Kerr concluded by moving a vote of thanks in the very warmest manner to Mr. Slater, who, he said, was a man of great promise and one whom he had admired for years for his behaviour in that room.

Mr. Ralph Nevill, F.S.A., remarked that he had endeavoured to find some way of improving the fixing of weather tiles, because he had worked a good deal in Surrey. He was discontented with the manner in which they were generally fixed, by either being nailed to the battens or boards. One constantly found the boards rotting away in about twenty years at the outside, and there were many other difficulties and objections. People had tried nailing them into the joints, but that, again, was objected to by many; and there seemed also to be the difficulty of the gauge coming wrong. A gauge of 3 in. was too small for tiles, 4 in. being about the ordinary gauge for weather tiling. What he had done was to get some blocks made, 1½ in. in thickness, and generally for the top story of buildings to run in the inside of the wall two carriers and stretchers and a course of headers. They thus got a course to each course of tiles. The objection might be met by varying the battens, but in the arrangement before them the battens came only 3 in., and it was not practicable. Weather tiling ought to be headed between the two tiles, and if they could get close to the wall, the little space between the wall and the heading might be filled up with cement. He was sorry that the veneered wood had been brought there. They would agree with him that they could not have cheap art; they might have plain things, and do well; but when they went in for ornament, it should be good and costly.

\* *Builder*, May 7, Supplement, pp. 703-6.

Mr. William White, F.S.A., seconded the vote of thanks, and added that they must have all learned a great deal from Mr. Slater's paper. At the same time, he should be sorry indeed to pass any intimation that certain papers delivered in that room had not been equally valuable, although they took a very different line. Theory and practice were equally essential, though practice came down more to the level of everyday life in working out to a great extent what theory had been able to suggest. With reference to the use of overhanging tiles, it appeared that the porous terra-cotta could be produced as cheaply as brick, and if the outer half brick of the wall were built with that material it would receive the nails for the tiling at whatever place they might choose, without there being any necessity for limiting the bond to the brick courses. They had seen some interesting specimens of square turning that evening, and he remembered being shown the mode of drilling a square hole by a very simple contrivance. Therefore, if that could be done, he did not see why a square haluster should not be turned.

Mr. Edwin T. Hall said that Mr. Ralph Novill had referred to the difficulty in fixing tile hanging on 3 in. courses. There were, however, two ways of getting over the difficulty. He did not see why the bricks should not be used on edge  $\frac{1}{2}$  in. high, when the tile-hanging could always be fixed to the joint. No doubt in some local districts, among them, he believed, Tunbridge Wells, it was against the rules to use bricks on edge, but there again the difficulty was easily got over. He invariably nailed the tile into the joints, using as a rule 3 in. nails, and preferably French nails. Where the 4 in. gange would not work the tiler punched out a small hole at the side of the tile, the result being that the 4 in. gange was got and the nail driven through the side of the tile. With regard to the mode of fixing hooks for floors he could never see why it was necessary to have a space under the floor-board at all any more than to have a space at the back of the dado. In his practice he had constructed floors with coke breeze concrete, nailing the floor-board into it. The concrete could be floated to a perfect surface and the nail would hold absolutely. Of the merits of the P-trap, which had been referred to, there could be no question, but he considered that the separate air-shaft shown could be dispensed with and a much better thing introduced. That shaft was, to a certain extent, charged with foul air, and when a flood of water came running down the large soil-pipe it drew this air down the smaller one. Some time since he had to erect a building containing 120 water-closets in various ranges, and in lieu of having a second shaft he carried the small pipe through the wall to the open air, and used a mica valve. By that means fresh air was constantly brought into the branch, and this was more sanitary than having two shafts balanced with foul air. Mica valves were stated to have a tendency to decay, but that had not come under his notice.

Mr. Lindsay, of Paddington, said that his firm had tested mild steel very fully, and that the experience thus gained had led them to make the material used in their flooring as nearly as possible approximating to best Low Moor iron, namely, having an ultimate tensile strain of from 26 to 28 tons per square inch, and giving an elongation of about 24 per cent. So tough was the material that a hole might be punched within one sixteenth of an inch of the edge of a bar without hursting or breaking the steel.

Mr. Smallpeice (Assoc. M. Inst. C.E.) remarked that the mild steel spoken of was in reality almost pure iron. The difference between cast iron and steel was only in the proportion of the carbon, pure iron containing no carbon whatever. The steel generally used for girder-work and plates contained perhaps two-tenths per cent. of carbon, and directly it got to 0.5 it became almost tool steel, while at 1 and  $1\frac{1}{2}$  it became cast iron. He wished to know what proportion of carbon the mild steel contained, so as to be able to understand what it was, and to find out its strength to resist compression. What had been spoken of was in reality pure iron.

Mr. James Donlon said he had seen the slabs mentioned by Professor Balcock at Chicago some time since. He understood they were used for tiling at the waterworks after the very severe fire in that city. He brought some away with him. It was no doubt sur-

prising to find that the introduction of sawdust enabled one to drive a nail into the material as firmly as into wood. While it was a good fireproof material, he failed to see that it could be used for the fireproofing of floors. It seemed to him that by the introduction of the sawdust the clay lost a great deal of its density, and would be liable to be crushed up under very heavy strains. He was quite willing to admit that they had derived the idea of their floor from America, and in consort with Mr. Basil Peto had carried out a system which they believed to be very valuable.

Mr. J. P. Seddon remarked that they all knew the extreme difficulty of finding any material that would take colour decoration. Colour when applied to walls continually failed, while mosaic was difficult, and not altogether satisfactory. He had, however, lately seen a material invented by Mr. Heaton which was well deserving the attention of architects. It was on the principle of *cloisonné* work, and could be applied in large sheets of about 6 ft. by 3 ft. There was a metal lining, as in *cloisonné*, and it was filled in with colour. The material was washable, and altogether was most admirable for decoration.

Mr. Gibson (of the American Lift Co.) said that on the Continent the suspended lift had been prohibited, on the ground of being unsafe, and quite recently a contract had been taken in the City of Berlin, but the carrying out of it had been prohibited. A report had, however, since been prepared on the question, and the result was that permission had now been granted, for the first time, to erect the suspended lift.

Mr. H. H. Collins remarked that he would have liked to have heard something about the cost of the different materials referred to that evening. As a practical man he found that the glass-lined pipes, such as Mr. Slater had mentioned, might be beautiful and useful, yet if he were to specify them, he was sure it would so enhance the cost of the building that it would frighten his client, and the quantity surveyor would, in reduction of estimate, omit the item from the contract. He remembered a tin-lined pipe, but he found the utmost difficulty in getting plumbers and engineers to use it, on account of its expense, and the labour involved in fixing it. This was also the case with many new inventions, which, though they appeared so admirable when brought to their notice, yet were really prohibitive on account of cost. He hoped, therefore, before the paper became part of the Transactions of the Institute, that Mr. Slater would give some idea of the cost of the several inventions referred to by him.

The Chairman (Professor Aitchison, A.R.A.) added that he had had considerable experience of such prices, and knew they were utterly fallacious.

The vote of thanks was then put, and was most cordially received.

Mr. Slater, in his reply, said he had thought of mentioning the cost of some of the things he had referred to. In the case of the glass-lined pipes, however, it was only within the last few days that they had become a practical thing, and, to the best of his knowledge, he believed that when the trouble of making the joint was taken into account, they could be put into a building at a little beyond the cost of lead piping. He had only intended to call attention to the several inventions, and if his hearers wished to know the prices, they must apply personally to the manufacturers. He knew as a fact that the glass-lined pipes had been in use for two years at a large vinegar factory, and that very great improvements in the jointing of them had since been made. From what he had seen of the American lift, he believed it was, humanly speaking, absolutely safe. It had often been found desirable to have square water-pipes on the fronts of buildings, and after experiments extending over some years, Mr. Hellier had at last devised a square-drawn lead soil-pipe. He had to thank Prof. Balcock for his remarks, because he had been able to tell them from practical experience a great many things they did not know.

The Conference then adjourned to the next day.

#### ARCHITECTURAL FEDERATION.

The fifth meeting of the Conference was held on Thursday afternoon in last week. The business before this meeting was to discuss the Report of the Special Federation

Committee of the Royal Institute of British Architects, prior to its consideration by the Council.\*

The Chairman (Mr. John Holden, of Manchester), said that the question before them was that of Architectural Federation. The Committee appointed on the 1st of March had gone into the matter very carefully, and he need hardly say that it was a subject requiring care to ensure the matter being dealt with both on a broad basis and also with a view of meeting the wishes of the metropolitan and provincial members of the Institute. They would see that in addition to the metropolis, the following towns were represented on the Committee itself, namely, Bristol, Darlington, Glasgow, Liverpool, Leeds, Leicester, Manchester, Nottingham, and Winchester, thus embracing a wide range of country. The question was one that was deeply interesting to the whole of the members of the profession, as the object was to form some sort of union between the members of the profession throughout the country, which did not at present exist. It was true that there were already architectural societies in different parts which were doing good work, but they were, for the most part, entirely local, and unconnected either with the Institute or with the corresponding societies in towns in their immediate vicinity. Of course he did not mean when saying "unconnected" to infer that there was no interchange of courtesies or ordinary civilities between them, such as the passage of papers, but so far as their work was concerned they were absolutely alone. That want of connexion between the societies appeared to him to be a great disadvantage, not only to local societies, but to the Institute; indeed, perhaps more to the former than to the latter, because the Institute, from its position, its age, and numerical strength, must of necessity exercise a very great control over the profession wherever the members were situated. The public were also interested in obtaining the best advice they could have, and when the public found that customs differed in different towns and places, they were sure to come to a conclusion somewhat disparaging to the profession at large. In the consideration of this question by the Committee the first thing was to find out really what "Federation" meant, and that was not at all an easy matter. Different people had different views, and they would see from the Report the view the Committee took of it, namely, that the object of federation was "to establish a closer union than now exists between architects generally throughout the British Empire, with a view to promoting the advancement of their art, harmony of practice, and intercommunication." Many people did not take this idea of federation, their view being that it was some sort of trade union. The Committee, however, did not take that view. In considering the question, a few matters seemed to force themselves upon the Committee almost as precedent conditions. The first was that the Institute, as the best known and oldest chartered body of architects, as well as being the largest numerically, and being located in the Metropolis, should be the centre of any scheme of federation. Secondly, that the provincial architects might be most readily reached through the existing societies, which already had gathered to themselves a considerable number of individual members from the surrounding districts. Thirdly, that as each local society would naturally feel itself of great importance in its own district, as little interferences possible should be suggested with it, and that in each case it should retain its identity and control the expenditure of its own funds. Fourthly, that no financial or other responsibility should be assumed by the Institute or by any of the other societies with respect to others. Those four conditions seemed, as it were, to force themselves upon the notice of the Committee first; but then, as all federated bodies must have a common basis to start from, it seemed to follow naturally that the scale of professional charges and practice should be that basis; therefore the one recommended by the Institute was proposed to be adopted in its entirety by the whole of the societies. He thought he might at once say that that scale or schedule was adopted by almost all the societies,—certainly in spirit, and by many even to the letter. If he was not mistaken, Leeds, Liverpool, and certainly

\* This was printed in extenso in the Builder for April 23.

Manchester had adopted it in its entirety. It was very probable that some little alteration or revision would be required in the schedule to meet little local customs, but when that was done, it was proposed there should be one scale or schedule ruling throughout the country. It should be borne in mind that that schedule or scale was not a compulsory one. It had never been put forth by the Institute as compulsory, and was not proposed to be so put forth now. It would leave each member to use his own discretion in dealing with his own clients, so long as he made no arrangements that were not absolutely antagonistic to it. And with the view now of carrying out that scheme of professional union, it was suggested that the Institute should organise visits to certain towns where there were not at present any societies, and that it should assist as much as possible in the formation of such. Conferences should be held, sometimes in provincial towns, and sometimes in London, and every encouragement should be given by the Institute to provincial societies in promoting the education of the younger members of the profession, and also in the formation of libraries and in dealing with Examinations. Those Examinations in Architecture should be established in different towns wherever the society which represented it could bring together a certain number of candidates. At present those Examinations had been held in Glasgow, Manchester, and Leeds, but what was proposed was rather a different affair altogether. Under the present arrangements the Examinations were held at the option of the Institute, and the provincial society had to come to the Institute and ask where they would hold an Examination. That was rather an awkward thing to do, because the local society could not begin to look up the students or candidates until they knew whether the Examination would be held. It was one of the difficulties they had in Manchester, but it was now proposed to leave that entirely in the hands of the local society. It would be a permanent institution, and as soon as the society could bring together a certain number of candidates, they would go to the Institute and ask that an Examination should be arranged. That Examination, of course, would qualify, as now, for the admission of Associates. Then, with the view of giving the provincial societies a direct interest in the Institute, it was proposed that the President of a provincial society, should be a Fellow of the Institute, should be *ex officio* a member of the Council of the Institute, and that would, of course, give the provincial members a full representation in all the discussions of that body. The provincial members would, in fact, be as well represented as the Fellows themselves. Now, with a view to strengthen both the Institute and the provincial societies, and to meet an objection which had been made, it was also proposed that any Fellow or Associate of the Institute who was also a member of a provincial society should be entitled to a drawback on his subscription to the amount of 25 per cent. That would practically clear him from his subscription to the local society, for he believed that the subscription to most of these societies was about a guinea per annum. That would certainly be a benefit both to the local society and to the Institute, because there would be no reason for any member of the Institute not belonging to a local society. It would cost him nothing, and any person would naturally wish to have the benefit of both societies (applause). It was also hoped that it would induce many provincial members to become members of the Institute itself. It was further suggested that the vexed question of quantities should be dealt with by an authoritative statement from the Institute. That, he believed, would be welcomed by all the members of the provincial societies, as it was most important that something should be done, and the Institute was the only body that could do it. A statement reported to have been made by Lord Coleridge, in a case recently before him, showed the necessity for positive action with regard to the question by the architects of the country, and that action could only be taken through the Institute. The statement made was this,—that, apart from actual contract, it was quite monstrous that the employer should pay for quantities,—that was, that he should pay for that which it was the duty of the architect to do. That judgment would show the necessity for dealing with the question. Some other suggestions had

been made which interested the members of the Institute perhaps more than the provincial members. One was in respect to the issue of certificates to those members of the Institute who were in a practice. The object of that was to give some distinguishing mark to the members of the Institute, and of course the same thing could be done by the provincial societies if they thought proper. He referred to some distinguishing mark by which the public would know that a gentleman holding the certificate belonged to some learned society; and it was hoped that, being put up and exhibited in the offices of the holders, in time they would be looked for by the public, and recognised as some guarantee, not only of the holder's efficiency, but also of his honourable conduct and position. Finally, he would remind the meeting that under the existing regulations all Associates were required to pass an Examination before admission, and, after a certain time, even the Fellows would not be elected, except under certain circumstances, without satisfying the Council as to their ability and proficiency. In that way the status of the coming generation of the profession would be kept up, and it was of course anticipated that provincial societies would show every care in respect of the parties whom they admitted to their bodies. That was a matter of great importance, because there always had and would be a large number of gentlemen practising as architects,—or at least doing work which architects thought ought to come to them,—who, neither by education nor by position, were entitled to admission either to the Institute or to the local societies. It was impossible to get rid of those gentlemen. They were satisfying the public, and it would be a long time before they could be prevented from accepting commissions from their clients. The aim of the Conference, therefore, should be to make the membership of the Institute and of the societies a guarantee, as much as possible, to the public of the efficiency of the members, so that in time the public would find out that if they travelled beyond the societies in their search for an architect they were on dangerous ground (applause).

Mr. J. A. Gotch remarked that he would like in the first place to refer to the question of the Probationers. Clause 2 of the second page of the Report said:—

"That as the Royal Institute is the recognised representative body of the profession throughout the Empire, the prestige and advantages of membership of the Royal Institute shall not be obtainable by any person in any way short of actual membership."

It had been decided "to establish," as it were, two other orders of the Institute, namely, "Probationers" and "Students," who were to have certain advantages through belonging to the Institute, without having to pay a subscription. In so far as that arrangement conflicted with clause No. 2 he had no doubt the Council would arrange matters so as to embrace members of those two orders which he had referred to, who, while not being actual members, at the same time would have a certain prestige attaching to them from their new position. In asking provincial architects to become members of the Institute he thought that body should be careful how far they treated those gentlemen in matters not strictly connected with architecture as an art. In large towns it very often happened that an architect was an architect pure and simple, and had little surveying work to do. Such a man was not called in as a surveyor only, his chief work being designing buildings and superintending their erection. On the other hand, in smaller towns it so happened that architects had to undertake additional duties. From the force of circumstances they were compelled to be surveyors to the various local authorities, and it seemed to him that the Institute should be careful how it approved of regulations likely to hamper such persons, because it was obvious that gentlemen practising in the country could not escape those engagements if they were to be efficient members of society. If, therefore, such appointments were to clash with the regulations to be laid down by the Institute, the latter would be in danger of losing a great many men who would be of advantage to it. He would like to point that out at an early stage so that the matter might have full consideration (hear, hear).

The Chairman remarked that he had not noticed anything likely to clash with the duties of the provincial architect, which must, of necessity, have a somewhat wide range. Nothing

should be done in the way of hampering the provincial members, though they would, of course, have to satisfy the Council of the Institute as to their eligibility to become Fellows or Associates.

Mr. Gotch said it was the rule that a Fellow of the Institute could not survey other people's work, except as a referee.

Professor Roger Smith said he did not think the question of the Fellowship of the Institute was before the Conference. What they had to deal with was the question of a federation of societies.

Mr. H. D. Appleton (Hon. Sec. of the Conference) then read the several numbered clauses of the Report.

In considering Clause 1 of the Committee's recommendations,—

"That this object may be best attained by connecting the various local societies which exist, or which may hereafter be formed, with the Royal Institute of British Architects,"

Professor T. Roger Smith said he thought it was not sufficiently definite. It was desirable that it should be distinctly understood that the societies were composed of architects, and were not merely archaeological or antiquarian societies.

Mr. Charles Fowler said he believed that most of the antiquarian societies were chiefly composed of architects.

Mr. J. W. Cannon (Leeds) said he thought it would be well to leave the clause as it stood. If a line were drawn too tightly, it might exclude some society which was a combination of architects and archaeologists. It was a positive necessity for the cause of Federation that this clause should be passed in its present form.

Professor Smith moved the insertion of the word "architectural" before the word "societies," but on being put to the meeting, it was lost, and the original wording was agreed to.

On Clause 2,—

"That as the Royal Institute is the recognised representative body of the profession throughout the Empire, the prestige and advantages of membership of the Royal Institute shall not be obtainable by any person in any way short of actual membership."

Mr. Gotch said he thought that Students and Probationers should not be excluded from the use of the Library.

Professor Kerr said he considered that the word "prestige" ought not to be used by professional architects. It was a term involving a certain idea which might be better expressed by the word "position." He would, therefore, move that "position" should be substituted for "prestige."

Mr. Ralph Nevill said he agreed with Professor Kerr, believing at the same time it was well to avoid using foreign words. He did not know that he had any objection to Probationers, but he did object to the multiplication of orders and degrees in an Institute of that sort, which had quite enough of them already.

Professor Kerr's suggestion was then agreed to, and the clause was passed as amended.

Clause 3 was next discussed,—

"That for the purpose of making known in country districts the advantages of professional union, and in order that societies may be formed where they do not now exist, with a view to federation, the Council of the Royal Institute shall organise visits to such localities as may be deemed expedient."

Professor Roger Smith inquired what was meant by a "visit." Did it mean a deputation?

Mr. E. T. Hall said he believed it would mean that a gentleman would go down to speak on the advantages of the Institute, and meet the members of the profession in the district.

The clause was agreed to.

The following clauses were agreed to without comment:—

"4. That, with the object of bringing provincial architects more in direct association with the Royal Institute, the Council be requested to arrange that, in future, Conferences be held sometimes in London and sometimes in the provinces."

"5. That, in the case of any candidate for membership of the Royal Institute not being personally acquainted with the number of Fellows required by the By-laws to propose him, power shall be given to the Council, if satisfied with his qualifications, to nominate him by special resolution."

"6. That the subscription for provincial or colonial members in each class of the Royal Institute shall be the same as that for metropolitan members, less the amount paid by the former to any local society federated with the Royal Institute, but in no event less than three-fourths of that paid by metropolitan members."

The next clause elicited some discussion. It stood as follows in the Report:—

"7. That, in any arrangement to be made, the federated Societies may retain their identity and name, and shall

still, as now form local centres; and that they may style themselves the "Royal Society, federated with the Royal Institute of British Architects."

Professor Roger Smith remarked that the Chairman in his opening address had stated that not only would the Institute issue certificates of membership, but that the local societies had also a perfect right to do so.

The Chairman.—May do so.

Professor Smith said that a gentleman who could not become a member of the Institute might yet, as a member of one of the federated societies, procure a certificate. That would be very much the same in the eyes of the general public as if he had a certificate of the Royal Institute of British Architects hanging up in his office. Therefore the addition of title seemed rather a dangerous thing and should be looked at with some degree of caution before being adopted.

Mr. J. Douglass Mathews said he thought that any addition to the certificate proposed to be given was very undesirable.

Mr. J. L. Robinson (Dublin) said he believed that the members of local societies would find it to their advantage to become members of the Institute. It would really be of advantage to them to give up their own societies (No. 10).

Mr. E. T. Hall explained that the result would be quite the other way, the object being that members should have the benefit of the two societies.

Mr. Edwin Seward (Cardiff) said that, as a country member, he had always regarded his membership of the Institute as extremely valuable, because of the position of that body in the capital of the Empire. Therefore as the status of membership must hang very much on the centre of the Institute in London, the ability of any local society to grant certificates of efficiency must of necessity endanger the position occupied by the members. Local societies might be well or imperfectly governed, and any imperfect government would reflect upon the value of the certificates.

Mr. Ralph Nevill said he did not see how it was possible to prevent a local society from giving a certificate, and if the society was federated with the Institute he could see no objection to the arrangement. What they wished was that the local societies should have some benefit out of their federation.

Mr. Hall remarked that the By-laws of every federated society would have to be submitted to the Institute, and care would be taken that only competent provincial men were admitted.

Clause 7 was then put and agreed to.

The following clauses were also agreed to *nem. con.* :—

"8. That the constitutional rules or By-laws of federated Societies shall be subject to the approval of the Royal Institute.

9. That the Royal Institute shall not interfere in the management of any federated society, and *vice versa*.

10. That the Royal Institute shall not be responsible for any acts, expenses, or other liabilities, which may be done or incurred by any federated Society, and *vice versa*."

Clause 11 was next taken into consideration. It was submitted as follows:—

"That each federated Society shall adopt the 'Schedule of Professional Practice and Charges of Architects' sanctioned by the Royal Institute as the custom of the profession, and may, so far as may not be inconsistent with the spirit of such Schedule, arrange specific terms for the guidance of its own members."

Professor Kerr asked what was meant by local societies arranging specific terms for the guidance of their own members.

Mr. F. N. Kemp suggested that that the word "sanctioned" should be altered to "authorised."

Mr. E. T. Hall remarked that in certain localities there were branches of architectural practice which did not obtain in London. It was therefore suggested that those words should be put in, and it seemed to the Council to be a reasonable thing to do.

Mr. Dawson said he thought they were fully protected by the words,—"so far as may not be inconsistent with the spirit of the Schedule."

Professor Kerr said he considered the clause a dangerous one. He was told by a gentleman present that he had a letter in his pocket in which the writer affirmed that the Schedule of the Institute had no effect in law. Now, the matter had been thoroughly threshed out two or three weeks back, and it would be well to publish the discussion which then took place for the information of gentlemen such as the writer of that letter. It was the custom of the

profession, and was recognised as such in all courts of law throughout the country. It was only when a dispute came on that the Schedule was in request, and then the dispute was settled by the universal custom of the profession. The Schedule, indeed, represented what they had ascertained twenty-five years ago in those rooms, after careful investigation, to be the recognised and universal custom.

Mr. Robinson (Dublin) remarked that the scale of the Institute had been adopted by the Irish Institute and by the Irish judges. The only difficulty he had found was that the architects had no legal right to the drawings.

Mr. Octavius Hansard moved that the words beginning with "and may," to the end of the clause, should be excluded.

Mr. L. C. Riddett seconded the proposition.

Mr. Dawson deprecated too much dictation to provincial societies, such as preventing an arrangement with clients. Perhaps the word "specific" was somewhat ambiguous, and that part of the clause would read better as follows: "arrange terms for special works for the guidance of its own members."

Professor Kerr suggested that the meeting should pass the first part of the clause down to the words "of the profession." In the year 1872 the word "Rules" was inadvertently introduced into the heading of the Schedule, and had done infinite mischief. In 1882 it was obliterated, and the document now stood as the "Schedule of Professional Charges sanctioned by the Institute." It had no force except as a declaration of ascertained custom, so that if the society in Liverpool wished to make any rule for its own guidance it would only be for ascertaining, and recording, and proving the custom in a court of law. The document had no force but as an affirmation of that which could be proved as the custom. Therefore provincial societies could make what rules they pleased so long as their clients would agree to them, but those rules could not be introduced into a court of law except as a declaration of custom they were prepared to prove. He suggested the use of the term "supplementary" instead of "specific."

The Chairman said that the Schedule published by the Institute, and adopted by the federated societies, was the only one that could go forth as the custom. But there was no reason why the Liverpool or any other society should not make additional rules for their own guidance, though only as a supplement.

Mr. David Thomson (Glasgow) said that the Institute of Architects in Glasgow had had a similar schedule to that of the Royal Institute of British Architects for a considerable period of time. It differed in some things from the R.I.B.A. schedule, but he had no doubt that the Glasgow Institute would be ready to co-operate in the arrangement for one schedule. But as there were a good many "agents" practising in Glasgow, he was afraid it might prevent that, as in many things the custom in Scotland was different from that prevailing in England.

After some further discussion, the clause was passed in the following form:—

"That each federated society shall adopt the 'Schedule of Professional Practice and Charges of Architects' sanctioned by the Royal Institute as the custom of the profession, and may, so far as may not be inconsistent with the spirit of such Schedule, arrange terms for the guidance of its own members in questions not covered by the Schedule."

Clause 12 was next considered. It ran as follows:—

"That the President of any federated society which numbers twenty-five members in independent practice (provided that such President be a Fellow of the Royal Institute) shall, during his term of office, be *ex officio* a Member of Council of the Royal Institute."

Professor Kerr said he thought this clause objectionable, because how could they have twenty or thirty *ex officio* members on the Council?

Mr. Worthington said he did not believe there were more than three societies that would number more than twenty-five members.

Mr. Hall explained that in this case the precedent of the Incorporated Law Society had been followed.

Mr. Aldridge (Liverpool) said he considered this the most important part of the whole thing, and he was sorry that the clause met with any opposition. It was the great connecting link desired to be established. In the case of Liverpool, they had only once had the privilege of being represented on the Council of the Institute, in the person of Sir James Picton.

Mr. Cole A. Adams said he agreed with Mr. Aldridge.

Mr. Connon (Leeds) added that if the clause were not agreed to in spirit he believed the country members would have nothing to do with "Federation." He would, however, move as an amendment:—

"That any federated society which numbers twenty-five members in actual practice may appoint one person as a Member of Council of the Royal Institute of British Architects, provided always that such person is a Fellow of the Institute."

Mr. Moncrieff (Bristol) seconded the amendment.

Mr. Robinson said he considered that the whole value of the Federation scheme centred in the clause being passed.

Professor Kerr then proposed that the words "*ex officio*" be omitted, which was seconded.

Mr. Silvanus Trevail (Truro) said he thought that if a gentleman became the president of a society of architects in a provincial city or town it should be sufficient guarantee of his being fitted for election on the governing council of the Federation.

Professor Smith said that after what he had heard he was prepared to vote for the clause.

After some further discussion and voting the clause was passed without change.

The following clauses were also agreed to:—

"13. That the Architectural Association of London shall be always represented on the Council of the Royal Institute.

14. That the federated societies be encouraged by the Royal Institute to afford every practicable assistance to students in their preparation for the Examination in Architecture, and with that view to form libraries of books of reference in accordance with the list issued by the Royal Institute.

15. That local Examinations in Architecture, to qualify for candidature as Associate of the Royal Institute, shall be held, under the control of the Royal Institute, at the instance of any federated society, or group of such societies, which shall bring together a minimum of applicants for such Examination.

16. That professional members of all federated societies, and although not members of the Royal Institute, and residing not less than twenty-five miles from London, shall, on showing their cards, have the privilege of attending meetings and using the Library of the Royal Institute during a stay in London for a period not exceeding one month.

17. That the federated societies shall transmit to the Royal Institute information affecting the profession generally, together with short reports of the proceedings of such Societies, which may, if considered desirable, be published in the *Journal of Proceedings*.

18. That, as a means of intercommunication, professional notes and remarks shall be published (referring to Papers read at the Royal Institute, or to other subjects of interest) in the *Journal of Proceedings*, which may be communicated by members and others."

The meeting next discussed the first part of Clause 13, viz.:—

"The Committee also recommend, as a means of furthering the interests of the Royal Institute in particular and of the profession generally, that the Royal Institute shall give its opinion publicly to the effect,—" (a) That the taking out of 'quantities' is no part of an architect's duty to his client as an architect."

On the motion of Mr. Riddett, seconded by Mr. Hall, the words "as a means of furthering the interests of the Royal Institute in particular and of the profession generally," were omitted from the clause.

On the second part of the clause, ("b) That there is no reason which should debar an architect from practising as a quantity-surveyor, should he think proper to do so, and from receiving payment for such services."

Mr. Cole A. Adams said he would require to hear some strong arguments before he voted for quantity surveyors being elected to the Fellowship of the Institute.

Mr. Thomson (Glasgow) remarked that in Scotland the taking out of quantities was not altogether a separate occupation, and was done by what were termed "house-measurers." In Scotland the architect was permitted to take out his own quantities, but on no account to take out quantities for another architect's plans. Scottish architects would consequently look on a clause of this sort with some considerable distrust.

Mr. Thomas M. Rickman contended that it would be a great advantage if quantities were prepared more generally by special practitioners, when they would be able to get rid of some of the very grave scandals which had arisen in London and the country. He hoped the object of this clause would be recognised,—not that they wished to alter the present position of affairs for the purpose of benefiting any particular branch of the profession, but that they desired to place the By-laws of the Institute in such a state that the members generally who were practising in the country could join the Institute.

After some further discussion the following amendment was carried with only two dissentients:—

"That there is no reason which should debar an architect from preparing the quantities for the works to be

executed under his own superintendence, and from receiving payment for such services."

The third section of Clause 19 was next considered,—

"(c) That when an architect acts both as architect and as quantity surveyor for the same building, he should act in his capacity only with the previously-expressed concurrence of his client, who should also be informed in what way the charges for the 'quantities' are to be paid."

Mr. Watkins proposed as an amendment:—

"That the following words be added to the clause,— 'That when an architect employs an independent surveyor to take on the quantities for any building work for which he is himself the architect, he should do so with the previously-expressed concurrence of his client, who should also be informed in what way the charges for the quantities are to be paid.'"

A further amendment was also proposed to the effect that all the words of this section of the clause after the word "client" should be omitted.

Both amendments were defeated, and this part of the clause was passed as originally submitted.

The meeting then passed the following clauses of the Committee's Report:—

"20. That the foregoing paragraphs (a), (b), and (c) shall be incorporated in the 'Schedule of Professional Practice and Charges of Architects,' sanctioned by the Royal Institute; and that the Royal Institute shall draft rules for the guidance of those of its members who practise as quantity surveyors."

They further invite the consideration of the following:—

A. That the Royal Institute shall issue certificates under its seal to all and every of its members who are in practice, which certificates the Royal Institute suggests shall be exhibited by the members in their offices as evidence to the public of the holder's efficiency and assumed responsibility, and that the certificates shall be the property of the Royal Institute, liable to be revoked, and to be re-called, if considered advisable, by the Council.

B. That the use in the Royal Institute, for certain purposes, of voting papers transmissible by post, and the extension of the Associates' privileges provided for in the Supplemental Charter, will tend largely to the expansion of the Royal Institute itself, and greatly aid the objects of Registration.

The large question of compulsory registration is not within the scope of the Reference to the Committee, but they desire to point out that, should the proposals they have made be adopted, there will have been established a better organisation than now exists for eliciting the opinions of the profession generally on that important subject."

Mr. Herbert D. Appleton then read the concluding clause:—

"The Committee also feel that the following suggestion, made by Mr. Rickman, does not come within the scope of the Reference to the Committee:— 'That the employment of an architect to prepare quantities for works under his own superintendence, or the concurrence of the client in the appointment by the architect of a quantity surveyor, will give the quantities so prepared the same position in the contract as that of the drawings and specification.'"

Mr. Rickman said he would be sorry if the Conference endorsed the opinion expressed by the Federation Committee. There had been strong arguments put forward in favour of making the quantities furnished by the architect, or any one he employed with the client's consent, a part of the contract. The moment those papers were recognised as having been put forward before the builder to prepare his estimate as any part of the basis of his calculations, they became as much a part of the contract as the drawings and specification. He should be sorry if the Conference lacked the strength of mind necessary to attack this subject.

Mr. Murgatroyd (Manchester) thought the Conference was not in a position to upset that part of the circular.

Mr. Riddett said that as the Committee had only one quantity-man upon it, its recommendations on that point did not carry much weight.

The sitting was closed by the passing of the following resolution:—

"That the Conference, having discussed the Federation Committee's Report, do recommend it to the Council as amended."

## THE REGISTRATION OF ARCHITECTS.

The final meeting of the Conference proper was opened at three p.m. on the afternoon of Friday in last week, Professor T. Roger Smith in the chair. There was but a thin attendance, only about thirty persons being present.

Professor Roger Smith, in opening the proceedings, said:—The subject which we are to consider this afternoon is the Registration of Architects. Four papers are to be read to you,—by Mr. Cannon, Mr. Hall, Mr. Thomson, and Mr. Aldridge,—and I propose to ask those gentlemen to read them in the order in which I have given them out. I do not think that the subject which we have before us is so ripe for discussion as the question of Federation, which we had before us at the last sitting, in the shape of a carefully-digested report which had been considered by a Committee, and which led to a very interesting discussion in many

respects. We, of course, have not got any document of that sort, nor have we even got the draft of a Bill before us, as another body, which has paid attention to the subject, has had. It appears to me it would be fallacious and discourteous to ignore the fact that another body of architects have been considering the subject. If registration is a good thing for architects, we ought to be very glad it should be as universally discussed as possible. At the same time, we cannot but regret that a course has been taken which at present seems to make it difficult for the two sets of architects, who are paying attention to the subject, to cordially co-operate. Whatever causes difference I hope will in time cease to exist, supposing the two bodies should continue, and their co-operation should really be desirable (applause). I am not going to inflict my opinions upon you now; I have simply to observe that I think there are two different things which must present themselves in the course of the discussion. First of all, there is the question of something being desiderated; we desire to remove evils, and we desire to gain some advantages. Now, I do urge upon you rather strongly not to exaggerate either of these. Pray do not exaggerate the evils that afflict the profession. Let us be well aware of what they are, but do not let us go saying that everything is as bad as it could possibly be, because it really is not so. Somehow or other a very large number of buildings get designed and erected, of which, while some are very bad, a great many are very good, and a credit rather than otherwise to the architecture of this country. Many enlightened critics consider that at the present moment the modern architecture of England is in advance of that of any country in Europe; and that being so, it is idle to say there are not a great many good points in our profession, in spite of the most salient defects. On the other hand, supposing we make alterations that are advantageous, do not let us exaggerate the good which may come to us. Probably we are quite as liable to that class of exaggeration as to the other, and let us, therefore, endeavour to be moderate in our view of both. But admitting that there are constitutional evils that we should be glad to see eliminated; admitting that we may in many respects improve the position of practising architects generally, the question remains,—and I think it is a most important one,—whether "Registration," whatever may be meant by it, is a measure calculated to remedy the evils, and introduce the benefits. These, I think, are the two divisions into which our view of the subject will naturally separate itself,—the question of what can be got, and of whether in Registration we have any adequate means for procuring this good. What is meant by Registration is not, I think, quite clearly defined in the minds of all persons who have paid attention to it. Some persons consider a voluntary, and others a compulsory, registration is desirable, and that and other difficulties will no doubt be to some extent threshed out. It appears to me if we agree that the matter ought to be considered by a smaller body in the same way as Federation has been, we shall very likely do as much as this Conference can usefully accomplish at the present day (applause). I will now call upon Mr. Cannon, of Leeds, to read his paper.

### Mr. Cannon's Paper.

WITHIN the twenty minutes to which my remarks have to be confined, it would be impossible to treat the subject before us at all comprehensively, and I must claim your consideration for the necessarily insufficient and disjointed manner in which they have to be presented to you. Whatever apologies may be required for the fashion of its presentation, none are needed for the subject itself. However various may be the views held regarding the question of registration, it will be conceded by all that it is a matter well worthy our serious attention.

The moment chosen for its consideration is an opportune one. The grant of a New Charter to the Royal Institute of British Architects has removed a barrier that for long has dammed back the tide of progress in our profession, and held in sullen check all efforts towards reform. For the first time in fifty years the tide of regeneration is again on the flow; and it will be to the dishonour of all lovers of the architectural section of society if it be permitted to ebb

before full advantage has been taken of its sweeping flood. Whether the legal registration of architects constitutes one of the blessings that should be snatched from the wave of reform, is for us to decide, with more or less certainty, by this afternoon's discussion; and I trust that the subject will meet with something like definite treatment during this Conference of 1887.

Surely, amongst all professions, there are none built up of such heterogeneous atoms as our own. (Hear, hear.) In it the contemptible Pecksniff finds an apotheosis in a Street or a Shaw, yet from charlatan to genius there is no line of demarcation, nothing to designate,—before laborious years have purchased reputation,—that the one is less worthy of the common title than the other; or that the difference between them is generic, and not merely specific.

For the removal of this disorder of the body corporate there is but one prescription,—the adoption of legal registration of architects, preceded by an examination test of fitness. (Hear, hear.) The remedy cannot, however, be applied without certain drawbacks. The nauseous physic precedes the restorative results, and perhaps some may be forgiven even a child-like revolt at the dose, especially in the case of those who doubt the efficacy of the specific.

In the first place, we may take it as conclusive that no Act could possibly be obtained which did not insist on registering the whole body of practising architects, whatever their qualifications, or however complete their absence. The tinkers and tailors and candlestick makers dubbing themselves architects will be included in the same roll with the illustrious and cultivated of the august Royal Institute of British Architects. The advertising gentleman, confident in the possession of universal gifts, which naturally included those of an architect, who on the front pages of a daily paper invited "persons intending to build to enquire as to his terms, and investigate his mode of doing business before going elsewhere," will rest in the list next to and on equal legal terms with, say our Honorary Secretary, whose horror at the proximity we shudder at, even whilst the actuality is, as yet, no more than that of a dream.

The prospect is not a pleasant one, and the realisation would not immediately benefit the profession, so that no one can be blamed for seriously asking if the ultimate result will be worth the first price to be paid for it.

I believe it will be; for the punishment of being held in a real bond of brotherhood with some of the charlatans who are self-styled architects, though almost more than we can bear, will be of comparatively short duration; and its effects will be speedily removed by the gradual elision of the original, and the gradual admission of the subsequent, entrants, who will have had to qualify in a way worthy of their profession.

The embarrassment will be wholly of a temporary character. Its full and entire burden will rest on the shoulders of the present race of architects. Their successors will inherit only the beneficial portion of the change. We may thus console ourselves with the knowledge that any inconveniences which registration may bring are but an unselfish contribution towards the welfare of our heirs.

A far more serious objection is the possibility that an Act of Registration might result in separating art from construction, or dividing architects into two camps.

We may rest assured that any type of examination which may ultimately be settled as the qualifying one prior to registration, will be a scientific and not an artistic one. The only claim that can be made entitling architects to a protective Act must necessarily be based on the need for guarding the interests of the public; certainly not on the ground that we desire an improved position for ourselves. (Hear, hear.)

The demand for an Act must be founded on the fact that the health and the purse of the building community are endangered by unlicensed architects, whose ignorance of sanitary and constructive laws makes their presence amongst us imperil the public health and the public safety. (Hear, hear.)

That art in architecture should be protected is a proposition which the Legislature would never concede. People prefer to buy their own ideas of design, and would rather have it bad, or pay for that which is not art at all,

than be restricted in their choice in matters of taste. Education and not Parliament is the mistress of the arts; and we must look to our own teaching powers, and not to law, for any improvement in the general appreciation of architectural design.

The restriction of the future qualifying examination to scientific acquirements will be forced upon us by the might of circumstances, and not by our own choice, which would naturally be more comprehensive than any Act is likely to be. We may not forget that, whilst we may draft such Act, the shape into which it will pass will not rest with architects.

This very curtailment of the qualifying test for registered architects brings us face to face with the possibility that the result might be to divide our body into two schools,—registered architects, who could be relied on to build in a manner satisfactory from a hygienic and constructive aspect; and unregistered architects, who would rely solely on their designing powers for acquiring a practice. It is undoubtedly the case that there are many men whose very excess of artistic insight brings with it a repugnance to the practical and business requirements of life, such as induces them to forego many advantages rather than undergo the drudgery of the preliminary study of un congenial subjects, requisite to enable a scientific examination to be creditably borne.

The art-loving section of the public will forgive much to the one who leads in the way of design. I am acquainted with many instances where architects of deserved repute have erected buildings showing extraordinary errors of construction, or singular ignorance of the laws of sanitation; yet their great skill in design has commended them so urgently to those who specially value this phase of an architect's work, above more solid attainments, that their practices are seemingly little affected by their constructive blunders.

The fact that this is so confirms the idea that one of the earliest results of registration may be to divorce the cleverest artistic practitioners from the best scientific ones, and may thus add one more horror to the first years of an Act that will, temporarily at least, lower the general level of architects.

The objection is one which, like that of the levelling up and levelling down which will follow registration, will not, I imagine, be of long duration. The public, however much value they may attach to art, will soon realise the advantages of selecting their architects from amongst those, skilled in design, whose diplomas assure them have also received a proper scientific training.

The existence of this separation would be gradually eliminated by the institution of the custom, which it may confidently be expected public authorities would adopt, of restricting appointments and competitions to registered men.

Government in this country, both Imperial and local, whilst it holds art in the most sovereign contempt, attains an equivoque by the exercise of the most abject veneration for science. It thus may happen that, if the mystic "F.R.I.B.A." comes to denote the possessor of a well-earned technical diploma, we may live to find these singular letters revered with a fulness which will somewhat surprise their ancient owners, who will have grown grey in the days when scorn was too often the only feeling that their appendix evoked.

For the existence of the contempt for architects which unquestionably animates some high quarters, we have ourselves mainly to blame. The feeling has been created by the undue value set by us on art over the science which is the fundamental basis of architecture. We show our preference for the first in our prize competitions, in our papers, in the preponderance of time spent in discussing art or archaeology, over that devoted to constructional or technical questions. The public can hardly be severely judged for drawing a natural conclusion, and alleging that we prefer pretty clothing to a sound body, or admiring that we follow fashion rather than truth.

A scientific examination test for all architects would remove this impression by proving that we do hold it to be essential for constructional knowledge to precede and inspire architectural design.

Registration, it may be expected, will increase the burden of legal responsibility already borne by architects. Protection brings its obliga-

tions along with its privileges, and a State-contemned profession will doubtless have its liability for carelessness in the execution of duties less leniently judged in the courts than when it worked in the enjoyment of unlicensed freedom and expected ignorance.

Such a result may not be one wholly to be deprecated. Possibly greater responsibility may have a tendency to check the formation of practices too unwieldy to be within the control of one mind; and may eventuate in those most highly gifted and most widely honoured practising largely as consulting architects. There can be no doubt that if registration, by increasing our legal obligations, had this effect it would not necessarily be one for regret; and would probably tend to raise the degree of respect in which architects would be held.

As a mere thought in passing it may be asked what effect protection would have on foreign architects practising in this country. Probably their position would be identical with that of unregistered native architects. Their employers would have to accept their services with the knowledge that they, in doing so, deprived themselves of the legal right to recover damages in case of mismanagement of their building operations, whilst the foreign architect would have to rely on the honour of his client for the settlement of his charges.

Minor questions of disadvantages attending registration I have no time to discuss, but there is one benefit it would confer on our profession which, to my mind, would outweigh all injuries a thousand-fold. The thoughtful amongst us, long before Wednesday afternoon, must have recognised how thoroughly inefficient are the existing means of education offered the architectural student. The discussion on that day brought to a culminating point the sense of our weakness in this respect, and must have impressed every one with a perception of the immediate need for an entire remodelling of present methods of instruction.

The desired improvement will come with registration. Until a systematic course of technical training is a necessity to an architect before he can enter on an independent career, the general body of students will pass into the ranks of practitioners half trained, and little fitted for their duties. I have little hesitation in saying that the greater number of architects learn the practical part of their work at the expense of their clients (hear, hear). It is well for most of them in early life that the public are seldom alive to all the errors of others for which they have to pay, or ever learn of the many blunders whose knowledge rests in after life a heavy burden upon the tender consciences of their architects.

So soon as through the gates of examination the rising architect must inevitably pass, so soon, and not before, will his training assume a character wholly different to what it has at present. No longer will the youthful student meander joyously through the pleasant paths of the Architectural Association, carelessly gathering only the flowers of his art which please his delicate fancy as he passes by. Before his eyes will then for ever stand the dread figure of Mr. Arthur Cates, even as an avenging angel, before whom he will have to answer for wasted opportunities, and misdirected efforts (laughter).

The value of an examination test rests not so much with its analytical purposes, as on the incentive it forms towards keeping the student's attention directed equally to the un congenial, as to the attractive sections of his education.

Whilst there is no compulsory examination, no dread tribunal before whose stern presence the young architect must eventually stand, he will inevitably more or less confine his studies to those portions of his education which possess for him the greatest charm. Human nature is the same everywhere, and can only be driven in directions un congenial to it.

With the compulsory education which registration will require, will come the desiccated colleges, and the longed for university chairs. What models of ordered method do the medical schemes of education present! Would these ever have been realised, in their present form, without the powerful incentive offered by the Medical Registration Act, and its accompanying obligations?

Necessity, the mother of invention, will find the means for thoroughly and systematically training our students when necessity has been created. The first step in the direction of a real architectural education will have been

taken when the absolute need for it is forced on the attention of everyone entering our profession. Given the compulsory diploma, and the problem of founding the means of methodical and wisely directed instruction will solve itself.

Until we arrive at the era of diploma-ed architects, the day of classified and directed architectural education will not be reached. Youthful caprice, without such incentive, will not fasten its attention on distasteful objects. Thrifty guardianship will not lavish money on the education of its wards unless the stern logic of facts proves it to be beyond eluding; and will prudently blind itself to its advisability. The undiscriminating public will encourage both by declining to display any preference for the wise Associate of the Royal Institute of British Architects, over his ignorant rival, who airily assumes a virtue if he has it not, and who makes an assumption of wisdom answer all the practical purposes of the other's years of laborious research and conscientious toil.

It may be urged that this class of impostors could not, by the passing of a Registration Act, be excluded from practice; and that, indeed, they could not, in common fairness, be shut out from employment, so long as they could find clients; and that they would consequently form a formidable body of competitors with those who had, by examination, entitled themselves to registration.

This danger would not be one of moment. Such men would be identical with the "quacks" outside the medical profession, and would occupy the same position in reference to the organised body. They would be employed by those foolishly credulous enough to believe the loud-sounding advertisements which would form their stock-in-trade; but would be held in contempt by all persons of solid worth or reputation. They would be shut out from public appointments or public honours, and would, as with their prototypes of another profession, serve as a foil to point the superiority of the duly-qualified architects.

A great gain to the profession by Registration would be the homogeneity which would result from it. It would then no longer be a question of attaining to a faceted sort of federation of different societies,—none of them powerful,—to a central Institute little more influential; but the realisation of a perfect combination on the part of every true architect (hear, hear), with a central head, powerful, far-reaching, and representative. The council of the body would no longer rule on mere suzerainty, with weak authority, and the timidity born of feebleness, but would speak with imperial conclusiveness, because supported by the loyal zeal of the whole body of architects.

With this firm cohesion of the profession would be created a revival of *esprit de corps* such as cannot animate an un cemented aggregate of individuals. All members of the body corporate having undergone the same training, passed the same examination, entered the one class, would to a far greater extent than is possible now, possess an identity of sympathies, and a consequent fidelity to each other and to the common ideals.

Along with this would come the corollary of proper observance of professional etiquette,—a virtue which, for want of congenial soil in which to cultivate it, is becoming a rare and precious thing in our profession. It cannot be otherwise; its very existence depends on a unity of interests, an equality of education, and a mutual self-respect, which is at present absent from our ranks.

Registration, if obtained, would doubtless mean that only those admitted to its privileges would be heard as witnesses in the courts of law on questions of building customs. Certainly this would come to be the habitual practice, even though it were not actually the law, and would assist in giving a position of supremacy to the registered architect over his unlicensed competitor.

Probably from time to time legislation would recognise in one way or another the standing of the class it had itself created, and would, in any fresh appointments necessitated by future Acts relating to building or sanitation, confine them to persons on the official roll of architects.

There can be no doubt that that years, as in the case of other protected professions, would tend to increase rather than diminish the value of the privileges conferred by registration,

and it may be expected that such advantages as would be gained by registration would be multiplied by the passage of time.

No doubt the registration of the profession of architecture would eventuate in the schedule of charges, authorised by the Central Council, becoming the basis upon which fees could be recovered, without its being needful, as it now is, for anyone suing a client to call many witnesses to prove that five per cent. is the customary commission charged by architects. No law could, of course, prevent any member of our profession agreeing to work for less than this if so disposed; but it would be a removal of much annoyance if certain fixed charges on the part of architects could be recognised in a court of law as customary ones without calling evidence.

Part from the least of the advantages resulting from registration would be the creation of an atmosphere of terrorism, which would then envelope the evil-doers amongst us. No Act would be acceptable or complete that did not contain a clause enabling the Central Council to strike off the roll those who had been convicted of acting in a manner conclusively derogatory to the interests and dignity of the profession. (Applause.)

The punishment of expulsion is not infrequently demanded for, and awarded to, sinners even within the temple of the Institute,—to those who have felt strong enough in their sense of rectitude to promise compliance with the honourable standard set up by the stringent Charter of that body; but, even when sentence has been pronounced, the loving kindness of the Council leads them to carry out the punishment with so much delicacy and secrecy that the result is like that of the terrible curse of the Bishop of Rheims:—

"But what gave rise  
To no little surprise  
Nobody seemed one penny the worse."

Yet even this slight check on doubtful practices can be applied only to those who, in the main, "have no need of salvation." The residuum of the profession are beyond any influence that the Institute can exert, and can be reached by no regulations, however skilfully framed. Registration would, at least, remedy this difficulty, as it has done in the professions of Law and Medicine.

It would enable us to cast out of our ranks the fraudulent recipient of illicit commissions (hear, hear), the betrayer of his client's trust, the false brother who had in any way disgraced irretrievably his profession, and thus to purify our body by the forcible ejection of the basest of its constituents. (Applause.)

To my mind it seems incontrovertible that the advantages of registration outweigh immeasurably the disadvantages with which it may be credited. At the worst, these latter are of a temporary rather than a permanent character, and might be endured for the sake of future gains. On the other hand, the advantages of registration are of a kind likely to increase in number, in force, and magnitude with time.

The problem of education cannot be solved until a sufficient incentive can be held before every student impelling him to confine his studies in such directions as wiser and more experienced minds than his own have shown to be the true ones. That incentive it is impossible to create, except by the institution of tests which all alike must submit themselves to; and which can only be made universal in their application through the medium of registration.

The problem of creating a real union amongst the members of our profession can alone be solved by an Act which will join all together by the bond of equal qualifications and mutual respect, and by the exclusion of those whose presence amongst us now makes confederacy, of a comprehensive character, a simple impossibility. Only by an Act of Registration can this be made practicable.

The task of obtaining this Act, if undertaken, will be no light one. It will require the exercise of every means of influence at our command, and for this reason, and because there is no essential point of difference between our body and theirs, I should advocate obtaining the assistance of engineers and surveyors in forwarding the work. (Hear, hear.)

The minimum qualifying examination might be identical for the three professions, leaving each free to adopt its own standard of investigation before granting the right to use the titles

attaching to membership of the central associations.

Just as in the medical profession few doctors are content to practise with the lowest degree actually necessary, but pursue their studies until they are entitled to affix to their names letters showing a higher education than that essential merely for business purposes, so few architects would be satisfied to commence life as such before they had, by an honour's examination, earned the right to annex "A.R.I.B.A." or "F.R.I.B.A." to their title of vocation.

This is, however, only a matter of detail; the principle involved in the proposal has not yet been accepted by the Royal Institute of British Architects, the only body that can possibly head the movement with any probability of success. (Applause.)

It is my earnest hope that the meeting to-day will take the initiatory step of approving the promotion of an Act of Registration, and thus inaugurate the official commencement of the most important movement that the history of architects has yet known.

I am not hold enough to urge that this would not mean some degree of self-sacrifice and an immense sum of labour, but surely the objects to be ultimately secured,—the efficient education of students, the purification of the profession, and the realisation of a union of architects of genuine value and manageable quality,—may stimulate us to forget fears of personal inconveniences, to sink private differences of opinion, and impel us to unite harmoniously and with single-mindedness of intention to secure a brighter and more honourable future for our illustrious and ancient profession.

#### Mr. Edwin T. Hall's Paper.

The advocates of the compulsory registration of architects claim that the time has come when the Legislature may be asked to close the profession of architecture to all who cannot hereafter pass a qualifying examination.

Among the evils which are pointed out as remediable by such a measure, the following are stated to be the chief.

First. Under the present system it is alleged that houses generally, i.e. for the masses, are ignorantly built without the assistance of an architect and without regard to any scientific laws of construction or sanitation,—that while the medical profession is aiming at the prolongation of life and the improvement of the species by developing the *mens sana in corpore sano*, its efforts are frustrated and rendered of no avail in consequence of the unsanitary construction of the habitations of man and beast,—the neglect of proper drainage, ventilation, lighting, and warming.

The second evil is that the public has no means of learning authoritatively if the professed architect has any claim to competence in undertaking the work required to be done. As any person may call himself an architect, and it is alleged many do so who have never studied architecture at all, the lay employer, who may be excused for being ignorant of design, construction, and sanitation, cannot discriminate between the quack and the expert. By the law of averages it is probable in such a state of things that the former gets as much work as the latter, and the result is that architecture is not shown at its best, and the average ability of architects is rated very low.

This creates a third evil,—a grievance under which the *bona-fide* architect labours. If his calling suffers in repute he participates in the disrepute, and he calls for the exclusion from the profession of those men who injure it.

Now, with regard to the first evil, it is at least questionable if the present unsanitary construction of houses can be admitted in argument as at all relevant to the question of closing the profession. It seems to me that the proper remedy for that evil would be in more stringent building regulations, and in strengthening the hands of the public officials administering those regulations.

It is apparently assumed that the remedy would be effected by enacting that no person shall erect a house of any sort or kind without a registered architect to design and superintend it. To say the least, I think it will be a very long time before the public can be brought to such an appreciation of an architect's services as to render such an enactment possible.

I believe, however, that when the practice of

architecture has taken the same hold of the public mind as that of Medicine has, then it is probable the Legislature will grant the same privileges to our profession as to those of Medicine and Law. (Hear, hear.)

Meantime, I think the second and third evils referred to are capable of remedy, and, being evils, that steps should be taken to remedy them.

To assist the public to distinguish between the competent architect and the quack, and to show the public that it is to its own interests to entrust all buildings to a qualified architect, are functions of this Institute in particular, and generally of the professional societies throughout the empire.

It is the interest and public duty of all *bona-fide* architects to strengthen the hands of their representatives in this work.

The Royal Institute has adopted the principle that the coming generation of architects shall be men who by passing a qualifying examination shall establish a right to recognition as competent architects. But as the Institute now is, and claims to be, the recognised representative body of the whole profession as at present constituted, it should, I suggest, register the whole profession. It is practically certain that when the Architectural Act is obtained, the Legislature will require some public body to make and keep such a register. This register will, following precedent, enrol the names not only of men who are members of the Institute, or who have passed or shall thereafter pass a qualifying examination, but of other *bona-fide* architects who can comply with some other test. The Legislature will further constitute that body the examining body for future admissions to the profession. The Chartered Institute will, I should think there can be little doubt, be that body, and its claim to that position will be all the greater if it has already of its own initiative fulfilled the duties which an Act of Parliament would prescribe. It has taken in hand examination, it should take in hand registration. If this be so, and if *bona-fide* architects now practising are willing to assist the Institute in its endeavours to raise the status of our profession, there should be no difficulty in securing the co-operation of all in perfecting the register.

In propounding a voluntary registration scheme, I shall carefully bear in mind the spirit of the affirmation of the Federation Committee that the position and advantages of membership of the Royal Institute shall not be obtainable by any person short of actual membership. We know, as a fact, that many architects are excluded from membership by the conditions attaching thereto. The Twenty-third By-law, rightly or wrongly, shuts out a certain number. If it be right, they must continue to be shut out; if its cessation from the Institute's laws, or its modification he considered compatible with the maintenance of the best interests of the profession as a whole, these gentlemen can and ought to join the Institute. The By-law will shortly have to be considered in General Meeting, and doubtless the combined wisdom of the members of the Institute will arrive at a decision just and honourable to the profession. But when architects eligible for the Fellowship in length of practice and in the quality of their work are dealt with, there remain a large number who having been engaged in practice for a shorter period than will qualify them for this rank are yet too busy and too preoccupied with the responsibilities of their position to prepare for the examination necessary to qualify them for the Associateship,—gentlemen who missed or did not appreciate the opportunity afforded them of joining the Institute before the examination was compulsory. I say did not appreciate the opportunity, for it must not be forgotten that the subject of general professional co-operation has only within the last year or two been brought within the domain of "practical politics." The federation scheme proposed by the Institute's Committee (containing representatives of every Society in Great Britain) is the outcome of this awakening to the importance of co-operation.

What can be done to meet the case of these gentlemen, for the present excluded from the Institute? I wish at once to say that I do not propose the creation of a new class. Much might be said, perhaps, in favour of this, but there are grave difficulties in its way, if not valid objections to it, so we will dismiss it. The admission to the Associateship is definitely

settled to be only by passing an examination. I should deprecate, even if it were possible, the reversal of a policy deliberately adopted, after mature consideration. The admission to the Fellowship is, at all events for the next five years, on a different footing. Within that period architects are eligible for election to this rank without passing an examination. There are, therefore, existing architects not now in the Institute who are admittedly fit persons to join its ranks in the future. They are *bona-fide* architects who now have been at least two years in practice, or they would not become eligible in five years for the Fellowship. I propose that all these should be permitted, now or at any time within the five years, to apply for nomination as candidates for the Fellowship. Within the four corners of the Charter, By-laws can provide for this,—can fix the qualifications, forms of application, nomination, &c., necessary for entry on the roll of candidates, and if the Council is satisfied that an applicant complies with the By-laws, I propose that his name shall be enrolled under the heading of "Probationers, or candidates whose nomination for election to the Fellowship when they have been in practice seven years, is approved by the Council."

Parentetically I would here remark that, in my opinion, By-laws should specify the actual machinery by which there shall be an investigation into the fitness of every candidate for nomination. At present this does not exist.

Prior to being put on the roll, the candidate shall pay a registration fee, and annually, until his election comes on, shall subscribe, say two guineas, to the Institute, for a copy of its "Journal of Proceedings and Transactions." I define the object of this subscription, in order that he may not acquire equitable rights in the property of the Institute by subscribing to its general funds. As a registered candidate he shall be permitted to attend the meetings of the Institute, and take part in its discussions, but he shall not, unless and until he is elected, be a member of the Institute, nor be entitled to any right or privileges other than those specified. He shall, in his application form, undertake, during his term of probation, to practise only in accordance with the terms of the Charter and By-laws of the Royal Institute. Assuming the Federation scheme to be adopted, if he be a member of any federated society he shall be entitled to such relate on his subscriptions as he would be were he an actual member of the Institute.

A careful study of this proposal will show that it would enable the Fellows and members of nearly all the principal architectural societies throughout the kingdom to secure for themselves at once a nomination to future candidature for the Fellowship of the Royal Institute.

I submit that the adoption of this scheme would be reasonable and logical to bridge over the transition period between the old *régime* and the new.

And now to the framing of our General Register of Architects. In our Calendar we have a register of the members of the Institute. I propose to name this "The Register of the Royal Institute of British Architects."

Under this heading would come the Fellows, the Associates, and the Probationers.

Following this in the Calendar would come, "The Register of Practitioners and Others not Members or Probationers of the Royal Institute."

First in order should be placed "Professional Members of Societies Federated with the Royal Institute," and as the By-laws of these societies have to be approved by the Institute, a standard will be agreed on with the societies which will give all the necessary professional safeguards.

Under another division the "Members of the Architectural Association not included in the Register of the Royal Institute" would be given.

Members of the Societies and Association should pay, either individually or collectively, a certain fee for registration, to defray the necessary expenses. The details of this I refrain from going into in this place.

As the Association is primarily a society of juniors,—assistants and pupils,—it will be seen that provision is made for including in the two registers the members of every branch of the profession.

A sub-heading to each division should set out clearly, by quotation from the Charter or By-Laws of the Institute, the qualifications or conditions (as the case may be) under which the names are inserted in the register. Every man's

status can then be ascertained at a glance. We should have not only the police of the Institute, but of every affiliated society, ranged on the side of safeguarding the register, so that it should include the names of worthy men, and worthy men alone. Such a register under such sanctions would become an authoritative guide to the public, and exclusion from its pages would and should carry with it a stigma to the prejudice of any only *soi-disant* architect.

It may be urged that certain gentlemen of undoubted ability and honour would hold aloof from any society. We cannot provide for these exceptions. If architects elect to stand outside from caprice they are lacking in *esprit de corps*, and deserve to pay a penalty.

I will add that if my scheme be adopted, the increased circulation of the Journal of Proceedings incidentally resulting from the working of the scheme would tend to a greater and more personal diffusion of knowledge on professional subjects, so that individual architects would be benefited and the reputation of the Royal Institute would be enhanced. Again, the provincial societies would be benefited, for the country practitioner who now stands aloof an independent atom, but who would seek to be admitted to the register, either as a member or as a probationer of the Royal Institute, would, by joining his local society, be entitled to a rebate on his Institute subscription or registration fee which would pay or nearly pay the subscription to the local society, and in joining this he would have more frequent opportunity of giving the profession the benefit of his experience and advice on current questions than he would if he joined the Institute alone, whose meetings, owing to distance, he could rarely attend.

It is, in my opinion, wise on the part of the Institute to encourage the expansion of provincial societies. A bundle of thick sticks is stronger than one of an equal number of thin sticks, and strong local centres of architectural life will strengthen the Royal Institute.

On the question of the Institute's relation to the registers I may refer to two precedents.

The Incorporated Law Society is bound by Act of Parliament to keep a register of all practising solicitors, whether members of the Society or not. It may be urged that in the profession of the law there is a great distinction, which vitiates the precedent, in that all solicitors have to pass an examination. I answer that, with the exception of students or assistants, all whose names would be on the Architectural Register must be shown to be architects complying with a standard fixed or approved by the Royal Institute. In the legal profession the standard is a qualifying examination, but this is only the test of the *bona-fide* solicitor, while, for the present, at all events, another test is applied to the *bona-fide* architect.

My second precedent is that of the Royal College of Veterinary Surgeons, the latest of the closed professions. By the Act of 1851 the Royal College was bound to keep, in addition to a register of its own members, a separate register, under the heading of "Existing Practitioners," of persons who for five consecutive years previous to the date of the Act were in the *bona-fide* practice of veterinary surgery, but who had not passed an examination. They are expressly declared in the Act not to be members of the Royal College. This is a precedent exactly on all fours with our case, and the "Register of Existing Practitioners" regularly appears in the Calendar of the College. (Hear, hear.)

In conclusion, I feel that this project requires more consideration than can be given to it at a short meeting, but I trust that it will commend itself to the members of the Institute and the profession generally. I submit that if registration he desirable in itself to exclude the unqualified practitioner, the voluntary scheme I suggest (subject, of course, to development and probably to amendment in detail) meets the reasonable requirements of the case, and it has this commendable feature about it, *viz.*, that it is in our own hands to do the work at once, while if we have to await the leisure of a congested Parliament we may have to wait until the Greek Kalends.

The Chairman said he wished to draw attention to a slight inaccuracy into which Mr. Hall had no doubt unintentionally fallen. Mr. Hall said,— "I would remark that, in my opinion, By-laws should specify some machinery by which there shall be an actual investigation into the fitness

of every candidate for nomination; at present this does not exist." Mr. Hall did not seem to quite apprehend what happened when a candidate was nominated for election as an Associate or Fellow of the Institute. A nomination paper had to be deposited, signed by three Fellows who could testify from personal knowledge as to the fitness of the applicant. If the signatories were conscientious men, they would not do that without actually having such personal knowledge. Then, again, some account had to be given by the candidate himself of the whole course of his professional education and life, as well as of the work he had done. His proposer also had to write a letter on that subject, and all those papers came before the Council, one of the things that occupied the constant attention of that body being the consideration of such proposals. This was not done in a perfunctory manner, but each case was carefully looked into.

Mr. Hall explained that he had all that information before writing his paper, but still he thought it did not meet what he suggested. What he had more especially in his mind was the machinery of the American Institute of Architects. Under that machinery, supposing a man was recommended from any State, the by-laws of the American Institute specified that the Council should send the papers to the President of the local society, and ask him to make the necessary inquiries. That would relieve the Council individually.

The Chairman added that he still thought they had machinery which might be considered worthy of confidence. However, without further delay, he would call upon

Mr. David Thomson, President of the Glasgow Institute of Architects, to read his paper.

#### Mr. Thomson's Paper.

GENTLEMEN.—When your secretary invited me to prepare a short paper for this Conference on the subject of the Registration of Architects, I had not considered the matter very seriously, and had read but little of the correspondence on this subject which has, for the past year or two, occupied so much space in the building journals.

I will not, therefore, attempt any review of the proposals which have been brought forward, but state to you as shortly and clearly as I can the method I would propose for combining all the architects of the kingdom into one corporate society.

I find that there are seventeen architectural societies in the United Kingdom, in correspondence with the Royal Institute of British Architects, and that of these only five, including the Institute, are societies of architects, the others being associations of architects and other persons who desire to promote a love for and knowledge of architecture. I find, also, that of the five societies of architects, only one restricts its actions to operations proper to a guild of architects, and has no meetings for discussing matters of antiquarian, literary, or artistic interest, while the remaining four have a dual character, that is to say, they have regular meetings for the consideration of matters connected with architecture as a science and as a fine art, and others for adjudicating on matters connected with professional practice.

The Glasgow Institute of Architects is the only one, so far as I know, which has no meetings for the reading of papers, and whose members, as such, occupy themselves only with the consideration of matters connected with professional practice, and with such public questions as affect their interests or come peculiarly within the province of architects to consider.

When I came to consider this difference which distinguishes the Glasgow Institute from all the other institutes and societies of architects, it occurred to me that, upon the lines of our Institute, it would be a simple matter for all the architects in practice in the kingdom to combine and form one society, whose sole aim would be to further the interests of the profession, and to speak with one voice on all public questions in which architects are interested, or on which an expression of their corporate opinion would be of advantage to the public (hear, hear).

I hope no one will refuse consideration of this proposal because it may, at first sight, appear to be opposed to the continued pre-eminence of the Royal Institute. I certainly

have no wish to see the Institute lessened in its influence and position, and will take no part in the raising up of a rival institution; but I think the dual character of the Institute prevents its expansion, and that by some modification of its regulations, provincial members might be incorporated with it in the discharge of its functions as the Metropolitan Guild on professional matters, while they took no part with it in its operations "for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith."

I have found that, as a Fellow of the Institute, residing at a great distance from London, it was impossible for me to take part in its proceedings, and consequently, up till now, I have never attended one of its meetings, though for many years I enjoyed the honour of membership. I have no doubt that the reason why so few of the provincial architects are found upon the roll of the Institute is just this, that they cannot afford the time and expense requisite to attend its numerous meetings, and as they cannot take part in its proceedings and discussions they see no sufficient reason why they should contribute to its funds.

Had the Royal Institute been founded upon the same lines as the Glasgow Institute of Architects, there would have been no need for these handsome and commodious premises, for its costly library, nor for the great outlay in printing and circulating of its paper. I grant you that its meetings would have been much less interesting and instructive to those who attended, but the necessary expenses would have been reduced to a very small sum. I put the matter this way to draw attention specially to the large expenditure required to carry on the work of an Institute having for its object the furtherance of the study of architecture, as compared with an Institute which engages itself only with the interests of the profession, and my proposal is that all the architects in practice within the kingdom shall be incorporated into one Society, which shall have its headquarters in London, with branches in all parts of the kingdom. I propose that each branch-institute shall be formed exclusively of architects in practice, and that they shall each have corporate and independent existence, be governed by their own officials, and regulated by their own by-laws, with power to fix entrance and yearly subscriptions and qualification for admission,—each member, however, being bound to subscribe the same "form of declaration" as that required for admission of Fellows into the Royal Institute of Architects.

Further, I propose that each branch-institute shall annually elect from among its members representatives, who shall be formed into Provincial Chapters, which shall meet quarterly in the most convenient town within the province, and each branch-institute shall also annually elect from among its members representatives to a Grand Chapter, which shall meet annually, and alternately, in London, Edinburgh, and Dublin. The number of members which shall be elected to the Provincial and Grand Chapters shall be proportioned to the number of members in each branch-institute, and every member of the branch-institutes shall contribute an equal sum to defray the necessary expenses of these quarterly and yearly meetings; and as no payments shall be made to the representatives attending these meetings, the expenses will not be great, and a small annual payment from each member will suffice.

While permitting each branch-institute to regulate its own affairs, and to have its meetings for discussing all subjects relating to architectural and professional practice, I would advocate the restricting of the subjects to be brought forward at the meetings of the provincial and Grand Chapters, to those hearing upon professional practice, and such public questions as lie peculiarly within the province of architects to advise upon. This would reduce them to business meetings of short duration, and though they might be found sometimes wanting in interest, their chief purpose would nevertheless be served, viz., that of bringing the whole fraternity into touch with each other, and providing a medium through which every member would exercise his influence in determining all questions affecting his profession; it would at the same time provide an effectual bond of union, and be a means of promoting our common interests.

In order to prevent the new society ever becoming a rival to the Royal Institute of

British Architects, I propose that its President shall always be the President of the Grand Chapter.

I will not occupy your time in attempting to formulate in more detail this scheme for the amalgamation and registration of architects. Should the proposals be approved of by you, it will be the work of a committee to draw up the requisite rules and regulations, defining all the duties, powers, and privileges to be exercised by the provincial and Grand Chapters, and for devising the means whereby their decisions may be given effect to.

I will add but a word or two on the qualifications for membership.

By the Articles of Association of the Glasgow Institute of Architects it is declared that "in order to constitute eligibility to membership, every person applying for admission shall at the time of application be engaged in carrying on the business or profession of an architect on his own account, and shall besides belong to one or other of the following categories:—

"1. Persons who have served six years at least as apprentices or assistants with members of the Institute, or with persons eligible to become such.

"2. Members of other architectural institutes, associations, or societies.

"3. On the recommendation of at least two-thirds of the Council, and on a resolution to that effect being passed at two consecutive general meetings of the Institute, a member may be admitted who is otherwise qualified."

These rules for the admission of members are, I think, as restrictive as present circumstances require, and I would not advocate any change till after this scheme has been in operation for some years.

I do not think it would be advisable to incorporate the whole of the architects, civil and mechanical engineers, and surveyors, into our corporate body, under an Act of Parliament, making it compulsory for all of them to hold a Government diploma; but I am of opinion that were all the architects amalgamated in some such way as I have now proposed, the way would be paved and made easy for the adoption of some such scheme of statutory registration as is advocated by Mr. W. H. Seth-Smith.

In conclusion, and lest any one should suppose from what has been said that the architects of Glasgow neglect the cultivation of the knowledge of architecture, I beg to state that we have a separate Architectural Society for this purpose, which forms a branch of our Philosophical Society, and is composed of architects and other persons interested in the study of our art, and at its meetings all matters connected with the arts, the crafts, and the sciences are discussed. This separation of matters purely professional from others of a literary, artistic, and scientific nature is of great advantage, and I can recommend its adoption in all places where architects are numerous enough to form a purely professional society.

#### Mr. Aldridge's Paper.

Mr. Charles Aldridge (Liverpool) then read the following paper:—

I SHOULD like first of all, in introducing this subject of the Compulsory Registration of Architects to your notice, to say a few words with respect to the action of the Special Committee of the Institute on "Federation," complaints having been made "elsewhere" and in sundry letters addressed to the professional journals of the slowness and do-nothing policy of the Institute. These complaints arise chiefly, I believe, from the younger and less responsible members of the profession, who fail to appreciate the difficulties that have to be overcome, and become impatient because the Institute prefers to treat the important subjects of "Federation" and "Registration" in a business-like manner, and have them thoroughly discussed by representative architects in London and from various important centres in the provinces, who by reason of their experience and position are able to treat these subjects in a businesslike way, and hear all that has to be said. Such an opportunity has fortunately now occurred during this triennial Conference of the Institute, and I venture to hope that one of the outcomes of this meeting between London and provincial architects in London will be to give the questions of "Federation" and "Registration" some definite shape, and, if thought desirable, bring them within the range of practical politics.

These two subjects, which have been engaging our attention for some time, although in my opinion intimately connected, are really each

of such importance that the Conference Committee have, I think, wisely separated them and given each a separate afternoon for discussion. The Special Committee on Federation also very wisely declined to take up this latter subject in connexion with their report, but have referred to it in a separate clause as an addendum at the end in the following words:—

"The larger question of compulsory registration is not within the scope of reference to this Committee; but they desire to point out that, should the proposals they have made be adopted, if only in principle, there will have been established a better organisation than now exists for eliciting the opinions of the profession generally on that important subject."

**Necessity for "Registration."**—The movement for imposing some restriction upon the ever-increasing numbers who call themselves "architects" is a natural one. Those who, at considerable expense, much study, and perseverance, have duly qualified themselves to undertake the multifarious duties of an architect, are naturally indignant and disappointed to find that they are obliged, in the battle of life, to compete with men who have slipped into the profession by some back door, as it were, and have never gone through a proper period of probation and apprenticeship with an architect, belong to no architectural society, observe no rules either of etiquette or architectural practice, and are, in fact, free lances, who carry on their business in any way they think most profitable, and very often combine the profession of architecture with a little speculative building, auctioneering, or other kindred occupations. (Hear, hear.) With such the contest is, of course, an unequal one, as the duly-qualified architect cannot compete with these nondescript architects on equal terms. This state of things, which will probably get rather worse than better as the population increases, has at last found a vent in the cry for protection of some sort.

**Status.**—Another point intimately connected with this subject is the professional standing or status of an architect, which I am sure we should all like, if possible, to see more defined. The public, as a rule, understand what is meant by the Church, Law, and Medicine, but very few persons know what is an architect, or whether he is a professional man, an artist, or a tradesman. (Hear, hear.) If "registration" would once for all solve this question and place the architect in a definite and recognised position, so that the public could be taught to distinguish an architect from a civil engineer, land surveyor, auctioneer, house agent, builder, &c., I think we provincial architects will admit that it would do some good.

**Harmony of Practice.**—Assuming that "registration" would define the professional status of an architect, another important point would be to bring the whole profession into perfect harmony of practice, and settle what are the duties, responsibilities, and remuneration of an architect; for we must remember that, although tolerable uniformity exists amongst architects belonging to the Institute or other Architectural Societies, there are a much larger number of outsiders to whom I have just referred who only recognise the rules of the profession in these matters just so far as may be convenient to them.

**Qualification.**—It is manifest that before an architect can have his name registered as that of one duly qualified to practise, he must show, in some way, that he is really competent, and here we touch at once on the all-important question of education and examination. With regard to the former, although we must all admit that there is much room for improvement in the system of apprenticeship, still there is a great deal to be said in its favour, for, even if Institutes or Colleges were established in some of our large towns for the sole purpose of providing for the training and education of students in architecture, it is very doubtful whether these could supply the practical training and experience that the industrious pupil must gain during, say a five years' term of apprenticeship in a good office. Supposing, therefore, that the student makes the most of his time during his office hours, and supplements this by attending a school of art or classes and lectures, or, where he is unable to obtain these, a careful course of study in the theory, construction, and history of architecture, in well-selected books, it is difficult to understand why he should not be able to pass

an examination at the end of his term of apprenticeship.

**Stimulus to Students.**—Before leaving the subject of education, there is an important point bearing on this and compulsory examination, about which I should like to say a few words; and this is the want of application and enthusiasm so often displayed by the ordinary pupil or student, the lack of which makes it impossible for a young man to become really competent or successful architect. Now, the reason for this is not far to seek. In the first place, the student is aware from the outset that he need not necessarily pass any examination, or test how he has spent the term of his apprenticeship, and what advantages he has taken of the various opportunities of instruction he has received. He knows that there is no law to prevent him calling himself an architect and commencing practice at any time when he sees a chance of obtaining business, and that a friendly quantity surveyor, and a good assistant draughtsman, will supply the technical knowledge and power to design in which he may feel he is deficient. (Hear, hear, and laughter.) It is true that sooner or later the incompetent architect will become known and find his own level; but very likely not before he has had the opportunity of committing several blunders at the expense of his client, and perhaps the health of his fellow-citizens. Now, it is quite certain that, whatever objections may be raised against compulsory examination and registration, they must put a stop to this state of things. The pupil in an architect's office would be placed in a similar position to the student in Law, Medicine, or theology, and all through his term of apprenticeship or study would have the knowledge that he has to undergo two or three examinations before he can be qualified to commence practice and call himself an architect. The dreaded examinations which he is bound to pass would be ever present to his mind, and his failing to do so would be a proof that he has not taken full advantage of the opportunities for study which have been provided for him, either by reason of idleness or mental incapacity. It is manifest, therefore, that compulsory examination would, at least, provide the student with the necessary incentive or stimulus to study.

It will be said, however, that the Institute has now provided an examination which all students must pass before they are eligible to join its ranks. Granted; but this is not compulsory, and, speaking from experience as a provincial architect, I fear the percentage of young men in the provinces who will take the trouble to qualify themselves to pass this examination will always be a small one (hear, hear), although I hope that the scheme of federation may do much to improve this. It is not because there is any special lack of energy or spirit amongst young men in the provinces, but because it is almost impossible to persuade architects, in Liverpool for instance, that they will gain any commensurate advantage by joining the Royal Institute of British Architects.

**Objects of Registration.**—It certainly seems strange that, in this nineteenth century of progress and age of competition, when scarcely any post or situation can be obtained without some test or examination, a profession so important in its relation to the daily life of all as that of architecture should have been allowed to continue up to the present time without any compulsory examination or test as to the efficiency of its members (hear, hear), or a guarantee to the public that their interests will be protected by a duly-qualified professional man; in addition to this, it is said by those who strongly advocate compulsory examination and registration,—

"The examination test will do more to unite the scattered and divided factions of architects than has been supposed. It will unite the profession into a brotherhood. However divergent in practice or natural abilities, essential differences of thought will disappear, for the qualifications once settled will bring the profession more into one mind. In all that is essential in knowledge and technical skill, one architect will be equal to another, and a higher intellectual tone will pervade the order, yet without in one degree destroying that individuality and those artistic aptitudes which vary in different individuals. It will be manifestly fairer to the public. They, at least, will not fall into the error they do now, in supposing one man as good as his fellow-craftsman, when such is not the case. They, at least, will be guaranteed against that kind of incompetency and charlatanism from which they now often suffer. Every architect they employ will, at least, be a skilful constructor, will understand material and the nature and duties of structures; he will be expert in sanitary science, and be able to control the arrangements of drainage and ventilation; he will be able to protect his client against unnecessary legal obligations, to which he would be liable by ignorance of the law of easements, and other legal questions; and,

in a word, he would guarantee to his client such an amount of general knowledge, education, and skill befitting the employment of a professional adviser. That the architect will derive advantages from a measure calculated to improve his position and status in society cannot be doubted. His authority will be accepted in a manner it has never before, his opinion in matters relating to professional questions, which are constantly being broached in the public Press, will carry more weight than they do now, when every amateur has a word to say, and often with more purpose, being devoid of narrow professional bias and rivalry."

Concluding with this extract from the public press, which I think very ably sums up the advantages to be derived from registration, I will now say a few words as to the difficulties and objections, for it cannot be denied, even by those who are most strongly in favour of the scheme, that there are many and great difficulties in the way; and, however anxious they may be to promote this object, nothing should be done hastily or without most careful deliberation and discussion.

One of the first questions to arise is that of the proposed amalgamation of architects with civil engineers and surveyors. Many are of opinion that the differences between these professions are so slight, and all have so much in common, that it would be impossible to separate them in any scheme of registration and compulsory examination; but is it so certain that this harmony and brotherhood could be established? and is it desirable? Many architects, no doubt, would prefer to continue on the old lines; and it is by no means certain that civil engineers would care to be associated in the same profession with architects and surveyors. (Hear, hear.) It is true that there are many architects who are duly qualified as civil engineers, and vice versa; as there are many architects who are land surveyors, and some few quantity surveyors; but in my opinion, these amalgamations are to be deprecated rather than encouraged. Surely there is room for all; and it would be far better to let each keep to his own profession.

We have also to consider whether it is advisable that architects should be licensed to practice, and would it be possible to prevent outsiders from drawing plans, &c., and if they did, could they be punished?

It is a matter of common notoriety and complaint that architects are so little employed to design and superintend the erection of ordinary dwelling-houses. No doubt the builders of these houses find they can get on very well without employing a properly qualified architect; and it is doubtful whether compulsory registration would be likely to improve this. Then, again, there are many estate agents, auctioneers, and land surveyors, who regularly employ draughtsmen to draw plans of houses and schemes for alterations. Would "registration" prevent this? I think not; indeed, it is not probable that it might rather augment the evil than put a stop to it (hear, hear), and it is difficult to see how builders and others are to be prevented by law from drawing plans for their own houses.

The next point to which I would call your attention, as a possible objection to "registration," is a larger and more important one. The question often arises, Is it possible to establish any uniformity of opinion in a matter of taste, or to set up any uniform tests thereon? In other words, can an architect's ability as an architect be gauged? Architecture is an art as well as a profession. This, no doubt, is a great difficulty in the way of registration. It is no secret that there are many in the profession whose artistic powers are largely in excess of their knowledge of the practical portion of architecture, while on the other hand there are others who are totally deficient in artistic power, and yet, owing to practical knowledge and business-like habits, are able to carry on a very successful and lucrative practice.

Would it be possible to devise a test for each of these classes, and might not obligatory examination deprive the profession of many a clever artistic genius? (Hear, hear, and "No.")

Many will say, too, *Cui bono* this cry for registration and compulsory examination? Are not the professions of architecture, civil engineering, and surveying already sufficiently protected? ("No.") For what purpose do the Royal Institute of British Architects, the Institution of Civil Engineers, and the Surveyors' Institution exist? Are there not examining bodies with power to grant certificates of competency? (Hear, hear, and "Voluntary.") Let all architects, civil engineers, and surveyors

whose conscience will not allow them to practise without a certificate of competency go to their respective Institutes and be duly examined (hear, hear); they will then have all that any Act of Parliament could give to show to the public that they are not as other men. But is it advisable to compel all architects to do likewise, and is it certain that all the advantages to the public and the profession that the advocates for compulsory examination and registration expect would be realised? Let us look for a moment at the three professions of the Church, the Law, and Medicine, where compulsory examination exists. Do we find a dead level of efficiency? And is there not as much difference in the knowledge, experience, and capabilities in these professions as in Architecture? (Hear, hear.) And does compulsory examination prevent incompetent men from practising either Law or Medicine? Examination is not all that is required to prove efficiency. (Hear, hear.) There are many who will acquire the necessary amount of knowledge to get them through, who, when the examination is over, soon forget all they have learnt, think they have done all that is required of them, are too lazy to go on studying, and turn out in the end helpless and incompetent; while, on the other hand, there are many men who by reason of nervousness shirk examinations, who are really clever and studious (hear, hear), possessed also with great artistic power.

**Foreign Architects.**—Let us turn abroad and see what system is adopted in other countries. Do we find compulsory examination and registration on the Continent? Nowhere, except in Spain; and it is a remarkable fact that nowhere do we find modern architecture at such a low ebb as in that country (laughter), where no one can be an architect unless he passes a State examination. In Vienna the *builder* is required to pass the examination, the architect may do as he pleases (laughter). In Germany those architects employed by the State are required to pass certain examinations before they are duly qualified to act as Baumeister, and they become inspectors only or architects accordingly. During the last twenty-five years architects intending to practise on their own account have found it worth while to obtain the title of Baumeister by examination, but it is not obligatory; and some of the most artistic work in Berlin is done by architects who are not Baumeisters by examination. I received this morning a letter from Berlin which I will read:—

"Berlin, May 3, 1887.  
Dear Sir,—To my letter I add a translation, in bad English, which may, perhaps, be of some use to you.

Your letter of the 27th of April came into my hands only yesterday, in the evening. I answer therefore in a hurry, fearing notwithstanding to be too late, as you are to read your paper this very week.

Asking for the mode of education and training of German architects, you must make a difference between architects of the Government and private architects. As for the former ones, I send you herewith the regulations from the 6th of July, 1884, which will give you the best information about this matter. They concern not only architecture (*Hochbaufach*), but as well the constructors of hydro-technical works, roads, bridges, railways (*Angewandte Baufach*), and the constructors of engines (*Maschinenbau*). The most important points of the regulations, especially for architects, are, in short, the following:—

—Going through a German gymnasium or Prussian *Realschule* (schools) to be compared with yours at Eton and Harrow). Examination of maturity before leaving these schools.

Two years' study in a technical high-school (at Berlin, Aachen, Hanover, or similar ones). Preliminary examination.

Further two years' study in the same high schools. First chief examination.

Three years' practical training. Second chief examination.

After the first chief examination, the Minister gives them the title "*Kaiserlich-Regierungsbauführer*," after the second, the title "*Kaiserlich-Regierungs-Baumeister*." They are then held fit for any appointments as Government architects.

Many private architects go through the same education and training as the Government architects. But there is in Germany no compulsory examination for private architects. As we have liberty of trade, everybody may be a private architect, no matter where educated and trained.

In this field there is completely free competition. Lately there have given up aspirations for making examinations compulsory in private architects, but they have as yet had no success.

As to the scale of charges of German architects, which are rather the so-called "*Zwangsgebühren*," which are rather generally observed, though nobody is bound to adhere to them.

About the social position of architects I cannot say much in a hurry. State or Government architects are equal to all other officials of the Government. Of the private architects those will have the best social position who know best their profession. . . .

I am, Dear Sir, faithfully yours,

HOUSSLER

(Substitute of the President of the  
Architectenverein in Berlin.)

P.S.—I add the statute of our Society (Architectural Society), which is perhaps of some interest to you. I beg you not to be misled by the name. In spite of it, a great portion of our members are engineers. I, for instance, am a railway-engineer.

HOUSSÉLLE.

In France the Government places the winners of the Grand Prix on their return from Rome in charge of some State building, sometimes with residence and at a nominal salary, and they have to prove their capabilities.

In Italy I hear that some three years ago it was decided to establish institutes at Rome, Milan, and Florence, for definite instruction in architecture. These are sanctioned by the Government, and have the power of granting diplomas, and enable those upon whom they are conferred to direct the construction of civil and rural buildings, and to exercise the functions of a town or country surveyor; but whether this course of instruction, and obtaining a diploma of efficiency, is obligatory upon all Italian practising architects, I am not certain.

A few words now to those who are really desirous to see "registration" take some definite form, and become the law of the land. The first thing to be done is to make federation a reality. (Hear, hear.) Let all the architectural societies throughout the United Kingdom and colonies join with the Institute, and let all architects who do not belong to any society at once join the Association in their neighbourhood; or, failing this, the Institute. (Hear, hear.) By this means the power and position of the Institute as the central governing body may be enormously increased, and become really representative of the bulk of the profession. Annual conferences could be held in London and various centres, where questions of this kind could be thoroughly debated; and it is certain that if the Institute, as really representing the bulk of the profession, were to take this matter seriously in hand, and its members, or the great majority of them, were really desirous to have registration and compulsory examination, the State would eventually grant the Institute the necessary power of examining and giving certificates of competency. (Hear, hear, and "It has done that.")

Mr. Chairman and Gentlemen.—I have now endeavoured briefly to put before you the question of "registration" in an impartial manner, with some remarks for and against the scheme. In conclusion I should like to add that the question has been discussed at a special meeting of the Liverpool Architectural Society, who, while taking a warm interest in the movement, are not prepared at present to pronounce any definite opinion, preferring to await the outcome of this discussion. (Hear, hear.)

The Chairman, in inviting discussion, said that the Conference had before it four very carefully written and extremely suggestive papers. He had only to suggest that the gentlemen who spoke would be good enough to condense their observations as much as was consistent with stating what was in their minds.

Mr. H. R. Gough remarked that it had given him great pleasure to hear that subject discussed in the rooms of the Institute. The matter had been before the public for fully twelve months. It had been in the minds of himself and some of his colleagues for something like three or four years, and he naturally took a great interest in the matter. It was not to be wondered at, perhaps, that some of those who had taken up the subject, without giving much thought to it, should have fallen into some slight mistakes. As to Mr. Connon's paper, he must say that in the main he fully concurred in it. One observation had been made about unregistered architects. The very object of the Registration Bill would be to compel all architects to be registered and to leave none outside, because one of its natural provisions would be,—as in the medical and similar professions,—to prevent any unregistered practitioner recovering fees. If course there would be nothing to prevent a man having clients, but he would not be able to recover any fees for his work. The committee had the honour of representing had spent a vast amount of time on the matter, and had drafted a Bill, which, of course, was open to criticism and correction. A great deal of importance seemed to be attached by some to the Federation scheme. It was, no doubt, an important subject; but even when they had federated all the societies, they would not then have a strong body to appeal to. The Institute and all the provincial societies only numbered, he believed, about

1,650 practising architects. That had been proved by statistics furnished by the secretaries of the various societies about twelve months ago; 1,700 would be the utmost number at the present time if they were all federated, which he imagined would take some years to effect. Now, the total number of architects in the United Kingdom, in round numbers, was between 9,000 and 10,000. To get the feeling of the profession as to whether compulsory registration was desirable or not, was a very simple matter. There was no need to have conferences, necessitating men coming from Scotland and Ireland. A letter sent to every architect in the kingdom would be likely to bring an expression of opinion quite sufficient for the purpose. An Act was undoubtedly required by the profession. Out of a picked list of 1,500 architects, not belonging to any society, who had been written to on the subject, 1,100 took the trouble to reply to what was merely a circular letter. What they had before them was to consider the best Bill that could be drafted, to make it as perfect as possible, and to have the different societies well represented. It would be absurd for a few London architects to attempt legislation for the entire members of the profession. There would undoubtedly always be a strong difference of opinion on the question of including engineers with architects under a Registration Act. He for one had always maintained, and always should,—that an engineer was simply a member of their own profession. If the engineer was not a constructor, he would like to know who was one? Where was the engineer fifty years ago? The architect, of course, was then the engineer, and it was only by a mere accident that the two professions had been severed and had become specialists in construction, to the misfortune of architecture and also to the misfortune of the country. The engineer was, as a rule, a much better constructionist than the architect, but the latter should know as much of construction as the former. He did not think it would be possible so to define an architect as to legislate for him to the exclusion of the engineer, as the professions were so constantly overlapping. When speaking of engineers he could allude to many Fellows of the Institute who were quite as much engineers as architects; the man who built a large brewery, for instance, was certainly an engineer. Then again, the engineer who built railway stations was in reality doing the architect's work. He hoped that some great good would arise from a discussion of the matter, and that before long such a Bill as he had referred to would be carried through the House. He had written to a great number of people, and had communicated with many members of both Houses of Parliament, the one reply being "I wonder it was never thought of before. It ought to be done, and it shall have my warmest support." He had also been told that if the profession did not do this for themselves, the Government would force it upon them. He did not think that it would be carried, as a Government measure, in the present congested state of the House, but that it would have the warmest support of all sections in Parliament he was morally certain.

Mr. Lucy W. Ridge said he had been struck with the difficulty which the writers of all the papers seemed to have met with, and that was in defining exactly what was meant by "Compulsory Registration," and how it was to be brought about. Mr. Gough had gone a little further into the subject, and had realised more fully than the gentlemen who had read the papers where the real difficulties of the matter rested. There was no doubt that if any man were asked whether he would like to have his own profession protected from outsiders, his reply would be in the affirmative. Therefore he had heard without the slightest surprise that Mr. Gough had received answers to that effect from a large number of gentlemen to whom he had written. But that was not a subject to be looked at solely from the architect's point of view, or with the ideas of those who would like to be protected. The chief industry of the country at the present time was crying for protection without the slightest chance of its being protected. [A voice: "What industry?"] Agriculture, of course. And it was unlikely, if agriculture were not protected, that architects would be protected from their point of view. He had listened very carefully to find out what form this proposition was to take, and the only definite remark made on the

subject was that people might be prevented from recovering fees for making plans. Now he did not think that that was within the range of practical legislation. Did they believe that either House of Parliament would pass an Act to prevent people recovering fees for making drawings? ("Yes!") It seemed entirely outside the range of reasonable belief ("No, no!"). Well, on that point they differed; but it seemed to him to condemn the whole thing at the beginning. They had no right to ask that any man should be debarred from receiving money for making drawings. The days of that sort of thing were gone. Gentlemen laughed at the idea of protection being applied to agriculture, and yet they wished to go back to the Medieval times, and apply protection to architecture! Mr. Gough had realised the difficulties of the thing, and had found it absolutely necessary to include the engineers. It was a melancholy thing when the engineers went to the front as they did, because to that they owed some of the most hideous monstrosities that had covered the face of the earth (laughter). However, it would be a long time before the two professions could be worked together, as things were. Then, again, the builders presented very material difficulties. Was it proposed to take in all the sanitary engineers and inspectors of nuisances, and every one who had to do with anything scientific? It had been stated by Mr. Connon that an appeal would have to be made to the Legislature to confer those special powers entirely on the scientific side of the case. He agreed with Mr. Connon. But, even if that course were taken, they must emphasize tremendously the sanitary question, and they could not turn off the people who made sanitation their special study. It, therefore, seemed that they might have a registered body of sanitarians and scientific constructors, but that art and architecture were to go absolutely to the wall! ("No, no.")

Mr. Walter Emden said that the profession did not want protection at all. They simply wished to get the profession free from quacks and charlatans,—men who came into it without any experience and crept into the societies as well as into the profession (hear, hear). Lawyers made agreements, and doctors prescribed medicine, and they only could recover fees in each of their professions. Under the circumstances, it seemed to him perfectly natural that, with registration, an architect, being a qualified man, could recover his fees, and that the man who was not registered or qualified could not recover them. That seemed to him a perfectly equitable arrangement, though possibly at the present moment it might not be so, because if only qualified people were admitted into registration a large number at present would have to stand outside. Vested interests were very properly considered in connexion with any Act of Parliament. In the first instance, therefore, a certain number of unqualified men might be brought into the profession, but he would say this distinctly, that if there were ten thousand architects at the present moment, and two, four, or even eight thousand were unqualified, if the present state of things went on it would not be long before the total number would be increased to twenty thousand, with probably eighteen thousand of that number unqualified (laughter). It was necessary that the line should be drawn as quickly as due and proper consideration of the question would allow, and it was essential at the present moment to all architects who had the welfare of the public and of themselves at heart that they should give their best attention to the question of the compulsory registration of architects, so that as soon as possible unqualified men might be prevented from entering the profession. The last speaker had said that it would be many a long day, if ever, before engineers and architects were brought together. But both professions were originally one. He had himself for five or six years practised entirely as a civil engineer, and since then fourteen or fifteen years as an architect, and he had never found that there was any difference in the two professions, excepting that the one sometimes forgot the art portion, which it ought to know more of, and the other sometimes knew nothing of construction. If the two professions were brought together under one Registration Act, and the matter carefully considered by a properly-constituted Council, would it not be self-evident to everyone that those differences

would gradually, and even quickly, disappear? Doctors and surgeons, when they came to register, were entirely separate bodies, and were practically so still, yet they were registered and worked together. Why, therefore, should not architects and engineers do so under one Registration Act? Those who were opposing such an Act were standing in the way of helping the public to have proper dwellings, and were to a certain extent indirectly answerable for a good deal of the bad construction and bad sanitation which only such an Act as was now proposed could prevent. (Hear, hear.)

Mr. Robert Walker (Cork) remarked that he had been very much struck at a meeting held that week in another place, in which a Chinese visitor made a comparison between the professions of Medicine, Divinity, and Law. The Chinese gentleman said,—"I am not an architect or an engineer, but I am an amateur architect, engineer, and surveyor. A comparison has been made between Medicine, Law, and Religion. These refer to the external man, while architecture, engineering, and surveying apply to all that is external to man and his external wants." The author of one of the papers read had considered it best to keep the professions separate, but he did not see why that should be so. The architect practised engineering, while the engineer practised architecture, in the pursuit of their lawful callings. Parliament would never give power to prevent engineers doing that portion of their work properly described as architecture. Nor would Parliament debar architects from performing that part of their duties which could only be correctly described as engineering (hear, hear). Mr. Walker then went into the question of the young architect's education, and proceeded to discuss the draft Bill previously referred to.

Mr. H. H. Statham here rose to order. He submitted that they had met for the discussion of the papers just read, and not to consider a draft Bill which was put forward by a society unrecognised by the Institute.

Mr. Walker pointed out that the papers read that day had referred to an abstract Act.

The Chairman.—No, I do not think the papers can be taken to refer to an abstract Act. Of course, we all know such a thing exists, but we have not got it before us.

Mr. Walker then said he would move the following resolution:—

"That this meeting is of opinion that it is desirable that all architects, civil engineers, and surveyors practising in the United Kingdom should be registered, and to this end it is necessary that an Act of Parliament should be obtained. This meeting is also of opinion that the Council of the Royal Institute of British Architects, or such Committee as they may appoint, should communicate and co-operate with the Architects and Engineers' Registration Act Committee, who have already drafted a Bill on the subject."

Mr. Trevail (Truro) seconded the resolution, although, he said, he considered it might have been made shorter. His idea in supporting it was that it was most desirable to have a Registration Act such as had been referred to that day.

The Chairman asked the mover and seconder to limit themselves to the first part of the resolution, namely,

"That this meeting is of opinion that it is desirable that all architects, civil engineers, and surveyors practising in the United Kingdom should be registered, and to this end it is necessary that an Act of Parliament should be obtained."

Mr. Walker said that he would adopt that suggestion with the greatest pleasure.

Mr. Trevail said he was glad that the latter portion of the resolution had been eliminated. Any registration, to be effectual, should be compulsory. Most of the professions were registered, and now the last to seek registration was that of the accountants. If the question were put to members of the registered professions, whether they would do without registration, it would be looked upon as ridiculous from a professional point of view. Architects ought to be all agreed on this question without having to make out any case amongst themselves. The case that required to be made out was before the public, and he believed it might take some years to be carried through, but it would be done in the end. He had been much struck by the opinions he had heard on the subject from medical men, especially in the matter of sanitation. The most important thing to decide was, Who should take the matter up? Those from the country who were not members of the Royal Institute of British Architects yet looked upon that body with the greatest respect, and it was a pleasure to come up and see men like the chairman, whose name had been familiar to

him for many years, and like Mr. Ridge, whom he was delighted to see. He hoped, therefore, that the Institute would take the lead in the matter, but if it would not do so, then the outsiders would show that they were determined to carry through the question, and to take it up even in spite of what he wished to speak of without offence as the inner ring of the profession. No doubt the inner ring were the best men to deal with the subject, but if they did not do so, the outside members of the profession must take some action, and the result would be a Registration Act. As to "tinkers and tailors" being included in the first registration, a test should be devised which would be accepted by the Legislature. From a public as well as from a private point of view, there would be an immense gain to the profession and the public if they could get rid of the various quacks now so much complained of. Referring to the Examination prescribed by the Institute, he had the greatest admiration for it, but it was utterly impossible for the majority of practising architects to drop their business and come up for Examination. He was struck with the remarks that fell from Mr. Hall on that point, and in a spirit which he was glad to see displayed; and the more that spirit was displayed the better it would be for the Institute as well as for the country practitioners. In the matter of federation he was afraid that good men would be excluded who were practising in the smaller towns ("Question!"). In Plymouth and Exeter, for instance, neither town would have an architectural society sufficiently large to be federated, although in Exeter there were gentlemen who might be regarded as good practitioners.

Mr. Edwin T. Hall explained that the Institute scheme made provision for all this, and that new societies should be formed to meet the difficulty.

Mr. Trevail, continuing, said that with regard to artistic work, any gentleman who showed artistic ability would always command his position in the profession, and what they wanted to have was a certain standard of qualification.

Mr. Hall said he was prepared to move an amendment to the proposal before the meeting. Mr. Gough had mentioned that there were ten thousand architects in the United Kingdom. He had made a calculation, however, and had found out that, if that were so, there was one architect to every five hundred householders in England, Ireland, and Scotland, and he could not conceive such a state of things to be possible. If there were fifteen thousand architects, that would make one to every two hundred and seventy-five householders (laughter). He proposed as an amendment:—

"That this meeting recommends the careful consideration of the Council the question of the Registration, either compulsorily or voluntarily, of bona-fide architects and architectural students, and suggests the appointment of a committee to deal with the subject."

The proper course, to his mind, was to appoint a Committee which would, as a matter of procedure, communicate with the societies in their respective centres, and procure valuable statistical information on which the Council would possibly take some action.

Mr. Aldridge seconded the amendment. Mr. Edgar Farman supported Mr. Walker's resolution. He thought the subject had been treated more from the architects' point of view than from that of the general public, though it was far more important to the public than to the architectural profession that a Bill of this nature should be passed. The meeting was a small one, and the Committee of the Institute would be a still smaller body to consider such a Bill.

Mr. Hall rose to order, on the ground that though Mr. Farman's observations might be valuable to the Council, they could not be dealt with by the present Conference.

The Chairman interposed, saying that there had been a considerable divergence of opinion in the papers they had heard, while many of the points on which they differed had not been discussed at all. He could not help thinking that the wisest thing to do would be, that if they could go home and think over the matter, the question might be further sifted, and public and professional opinion matured upon it. He felt, after what he had heard, that he should have great hesitation in coming to a conclusion as to the desirability of registration, but he was unquestionably convinced that the subject was one that ought to have the most careful investigation. He was, therefore, personally

disposed to think that the Conference would be going a little too far in adopting the resolution, and if the mover could see his way to agree to some such course as Mr. Hall had suggested in his amendment, it would probably be as far as they could go under the present circumstances.

Mr. Walker said he was prepared to amend his resolution as follows:—

"That this Conference requests that the Council of the Institute, or some committee appointed by them, take into consideration the question of a Registration Act."

A Voice.—"They have done so."

Mr. Trevail said he was ready to second Mr. Walker's resolution as amended.

After some remarks by Mr. Cowper and Mr. G. H. Guillaume, Mr. Walker submitted an amended resolution in the following form:—

"That this Conference requests the Council of the Institute, or some Committee appointed by them, to take into consideration the question of a Registration Act; and that this Conference is of opinion that a Registration Act is desirable in the interests of the public."

This was seconded by Mr. Trevail. The Chairman then put Mr. Hall's amendment to the meeting, when fifteen voted in its favour and fifteen against. The Chairman gave his casting vote in favour of the amendment, which he declared carried.

Mr. William Woodward remarked that he thought that any body appointed to consider the matter should avail themselves of the co-operation of the gentlemen who had expended so much time and money already on the subject.

Votes of thanks to the readers of the papers and to the Chairman closed the proceedings.

The following letter, addressed to the Hon. Secretaries of the Conference, has been communicated to us:—

"10, Lancaster-place, W.C.  
7th May, 1887.

DEAR SIRS,  
I shall, as Chairman of the Meeting held yesterday on the subject of the Registration of Architects, feel obliged if, in reporting the resolution (arrived at by the casting-vote of the Chairman) to the Council, you will draw attention to the fact that, notwithstanding the even numbers, that resolution really represents the general sense of the meeting, and so has a higher value than appears at first sight.

Those who voted against the resolution did so with the wish to substitute a motion very similar in wording and sense, but combining with the desire that the Council would refer the matter to a Committee for further deliberation.

I think it would be quite permissible to draw the attention of the professional press to these circumstances, and to communicate copies of this letter.—I remain, dear Sirs, yours faithfully,

T. ROGER SMITH.

The Hon. Secretaries,  
The Conference Committee."

#### VISIT TO THE NATIONAL LIBERAL CLUB.

FOR want of space we are compelled to hold over our account of the new building for the National Liberal Club, which was visited by the members of the Conference on the 3rd inst. under the guidance of the architect, Mr. Warburton, R.A. We have a detailed description of the building in type, which, together with plans of several of the floors, we hope to be able to give next week.

#### VISIT TO WHITEHALL COURT.

A VISIT was next paid to the important block of residential mansions in flats known as Whitehall Court, and which immediately adjoins the new building of the National Liberal Club. Messrs. Archer & Green are the architects. We gave a view and description of these buildings in the *Builder* for January 2, 1886, but may now give some additional particulars. The area of the site is 157 ft. by 365 ft.—57.3 superficial feet, or 1½ acre. The area of the main building is 38,000 ft. (about). The height of the building, from the pavement level to the top of the general roof, is 112 ft.; while the height from the pavement level to the top of the towers will be 206 ft. The height of the walls from the bottom of the footings to the top of the general cornice is 112 ft. The concrete foundations go to a depth of 22 ft. below the pavement, the continuous walls of concrete being 10 ft. 6 in. high and 8 ft. wide at the top and 10 ft. at the bottom. The soil at this level was found to be composed of gravel and sand with water, the entire height above having been "made ground" and Thames mud. The pressure distributed on the soil is ½ ton to the foot. The thickness of the walls of the basement floors averages 4½ bricks, and they have been planned that the weight on them nowhere

ceeds 15 tons on the foot. All constructional walls are built in Ellistown brickwork up to the second-floor level, and in "shippers" above that level. All floors are of fire-proof construction. The roofs are of timber construction, rendered fire-resisting. The whole building is divided into thirteen blocks, twelve of them being 54 ft. by 45 ft. Four blocks are grouped together as one building, and are accessible by a central staircase, and served by two elevators. The construction of the staircases will be of iron and concrete, with marble steps; that of the passages of iron and glass; while the decoration will be of marble. The buildings have a lower-ground, a ground, and an upper-ground floor, and seven stories above, with an eighth in the towers, making, in all, eleven floors. There will be suites extending over one floor only, averaging eight rooms each; others extending over one floor and a half, averaging twelve rooms each; others occupying two floors, and averaging sixteen rooms each. The total number of suites will be ninety-eight, with a total number of 1,028 rooms. It may be added that the exteriors are of Portland stone throughout, and that the carving, which is very good and not too abundant, is being done by Mr. John Hale. Mr. John Richards is the clerk of works. The builders are Messrs. J. W. Hobbs & Co. (Limited).

#### VISIT TO THE HOTEL VICTORIA, NORTHUMBERLAND AVENUE.

The members of the Conference next visited this building, which is now practically completed, and forms the latest addition to the hotel accommodation of London. Lately known as the "Northumberland Avenue Hotel," the building occupies one of the best positions in the metropolis. The site covers an area of some 32,000 square feet, and has a frontage of 300 ft. to the Northumberland Avenue. A contract having been entered into with Messrs. Perry & Co., of Tredegar Works, Bow, building operations were commenced in 1884. In preparing the site to receive the superstructure great difficulties were encountered from the treacherous nature of the ground. To reach a solid foundation it was necessary to carry down the excavations for the principal walls to the unusual depth of 50 ft. While these works were in progress a large quantity of running water was met with, which was traced and found to come from an old rivulet which had its rise in Highgate and fell into the Thames below this point. To keep this in check a 10 h.p. engine and powerful pumps had to be kept at work night and day for six or seven months, while a bed of concrete, 6 ft. thick, was being laid over the whole site. Shortly after the building had risen above the ground-floor level the property was acquired by the Building Services Company, who arranged with Messrs. J. W. Hobbs & Co., of Croydon and Queen's-buildings, Southwark, to carry on the works. The new owners retained the services of the architects, Messrs. Isaacs & Florence, from whose design the building had already been commenced.

The building consists of nine floors and a lofty basement, and its roof rises to a height of 122 ft. above the level of the Avenue. It contains some 500 bed and sitting rooms in addition to rooms in the basement set apart for servants, stores, and other purposes connected with the working of the hotel. The front elevation is faced throughout with Portland stone from the quarries of Messrs. Steward & Co. and Messrs. Crickmay & Co. The stone carving of the upper floors has been executed by Messrs. Daymond & Sons, and the whole of the remainder by Mr. Boekbinder. Of the ironwork used in the construction of the building the cast-iron stanchions have been supplied by Messrs. Young & Co., and the wrought-iron girders and stanchions by Messrs. Dibley & Son. The floors have been constructed throughout of a concrete composed of coke breeze and Portland cement, and for interior lobbies solid slabs of the same fireproof material have been employed.

The elevation\* is designed in the style of the French Renaissance, the combined dignity and freedom of which renders it, in the opinion of the architects, peculiarly adapted to a

building of this description. The monotony of a long façade has been relieved by the projection from the general frontage line of a central and two terminal pavilions. The provision of so large a number of windows, each tier marking a successive floor, rendered a horizontal treatment almost a matter of necessity. In order, however, to prevent an appearance of mere superimposition of disconnected stories, a certain amount of vertical grouping has been attained by the employment of a range of hold pilasters marking the principal divisions of the façade. These rise through and link together the three central stories. The two lower floors, which have been treated simply, combine to form a solid substructure upon which these pilasters stand. They are surmounted by a massive cornice running the whole length of the building, the frieze of which is deepened to include a range of windows. A double-storied row of coupled dormers, linked together by a flying arch, rises above this cornice. A triplet of these dormers crowns each pavilion. The intermediate portions, consisting of six bays each, have been treated with simplicity on the same general lines as the pavilions, but they have as a distinguishing feature a series of bay windows on the first floor, with projecting cornice carrying a continuous balcony, on to which the second-floor windows open. The principal entrance to the building in the central pavilion has been emphasised by a lofty and handsomely-carved arch the height of two stories. On either side the keystone are two carved figures, illustrative of Day and Night, the work of Mr. Boekbinder. This, the centre of the whole façade, is still further enriched by the introduction above the arch of a three-storied oriel, with caryatids and other decorative features, crowned by an ornamental balustrade.

The internal planning has been devised to provide as compactly as possible, considering the extent of the frontage, all the accommodation required for a modern first-class hotel. Simplicity of arrangement has been specially aimed at, and this has been obtained by the repetition on every floor from basement to roof of one main internal corridor, 8 ft. wide, extending from end to end of the building parallel to its front. The staircases and lifts open on to this corridor, and from it access is obtained to all the public and private sitting-rooms, and to the principal bedrooms. The remainder of the rooms on the upper floors are reached by two corridors running at right-angles to the principal one. All these have tiled dados, and that on the ground-floor has also a filling of gilded tiles arranged in panels, the tilework being thus carried up to the cornice level. All these tiles have been supplied by Messrs. Balfour & Co., of Longton. The approach to the hotel will be sheltered by an elaborate covered way, the work of the Coalbrookdale Co. The lofty portico, under the arch which spans the entrance, has its semi-circular ceiling lined with coffered panels of Patience, the work of Messrs. Simpson & Sons, of St. Martin's-lane. Passing through the entrance doors and lobby, the spacious vestibule is reached, the walls of which are entirely lined with alabaster, relieved with bands of Bardiglio. The latter marble is also used for the architraves of the doorways, and for other mouldings throughout. Round the whole a dado is carried, having its capping and base of Verde de Prato with a die of Sanguino. A similar combination of marbles has been used for the columns. Out of this vestibule, paved with veined marble squares with ornamental borders, a grand marble staircase, 13 ft. in width, having return flights on either side, rises to the first floor. At the foot of this staircase, and again on the halfway landing, its solid balustrading is terminated by massive marble piers, which serve as pedestals for lofty standard electro-gasaliers. The columns and pilasters are in alabaster, the pedestals having a die of rich red Numidian marble. The marble work is carried up to the cornice level of the first floor with pilasters of breccia. The wall of the staircase is enclosed by a marble balustrading in alabaster and breccia. The caps to all the marble pilasters and columns are finished a rich gold or bronze. All the marble work in the entrance hall and staircase has been supplied by Messrs. Farmer & Brindley, of the Westminster Bridge-road. The staircase is well lighted by a large lantern with decorated cove, which rises immediately over the main cornice. The public rooms on the ground-floor are

broadly grouped into three divisions. Those for the use of ladies and general visitors are placed at the southern end of the main corridor, and the gentlemen's at the northern end, while the rooms set apart for meals are to be found round and behind the grand staircase. A corridor, which passes beneath the halfway landing of the staircase, and is entered immediately from the entrance-hall, serves to connect and form a means of access to the Salle-à-manger, coffee-room, and haquetting-room. Fronting the general reception-room a domically vaulted vestibule, in close connexion with which the ladies' retiring-rooms are placed, forms the principal entrance to the Salle-à-manger. This apartment is 100 ft. long by 42 ft. wide, exclusive of the apse at the further end and the wings on each side. It rises through two floors, and thus has a height of over 30 ft. Although this room is chiefly designed for evening use, a lofty range of windows along the southern side renders it light and cheerful by day, this being still further secured by the admission of the morning sun through the glazed roof of the apse. A walnut dado, some 8 ft. in height, is carried round the room, and above it the various bays into which the walls are subdivided by the pilastered and arcaded treatment which has been adopted are filled with bevelled mirrors or with tapestries. These latter illustrate a series of subjects in connexion with her Majesty's Jubilee, and represent her as Queen and Empress receiving gifts and homage from her colonies and dependencies. All the tapestries employed here and in other rooms have been executed by Mr. Boekbinder, who has also, under the immediate superintendence of the architects, carried out in a very creditable manner the whole of the carton-pierre work and the general decoration. The ceiling is divided into domed panels, which are freely treated with gold, thus harmonising with the prevailing treatment of the room, in gold and cream. From the centre of these domes are suspended electroliers of special design. Double doors lead from the Salle into the coffee-room, which is an apartment 56 ft. long by 30 ft. wide. This room, like the Salle, has a high walnut dado; above this a dark leather paper is hung; the walnut work gives the key to the general decoration of the room and to that of the panelled ceiling. Between this room and the haquetting-room, which latter can also be approached from the northern end of the main corridor, are located the general lavatories and the room for hats and coats. In the former the fittings have been supplied by Messrs. Finch & Co., who have also provided a group of specially-designed oval wash-hand basins with flushing-rims.

The banquetting-room, the various approaches to which have been noticed above, is more Jacobean in treatment. It has a high dado of fumigated oak; above this a series of paintings are continued round the room, illustrating the sports and occupations connected with the daily supply of food and drink. On the right of the main corridor is the general reading-room. In the decoration of this a departure from the styles employed in the other public rooms has been effected by the use of the Flemish Renaissance. At the end of the corridor is the large smoking-room, 53 ft. by 37 ft. It is provided with large windows at either end, by means of which efficient through ventilation has been secured. The suite of public rooms at the southern end of the main corridor, which form more especially the ladies' quarter, consist of a reception-room, ante-room, and drawing-room. In these a light and cheerful scheme of French Renaissance decoration has been adopted, the drawing-room being finished an ivory white. The walls are panelled and hung with damasks, and the ceilings are delicately moulded. All these rooms are light and cheerful, as they are lighted directly from the Avenue. In addition to these public rooms the accommodation provided on the ground-floor includes two large private dining-rooms, a number of private sitting-rooms, and a range of bedrooms, together with the various offices required for the manager's department.

The upper floors are reached by a wide staircase at either end of the building, or by the four lifts, which are situated in pairs on each side of the centre. They have been provided and fitted up by the American Elevator Company, and the tanks which supply the water to work them are filled by a Worthington pump in the basement. All the newest and most

\* We gave a large view of it, together with the ground-floor plan, in the Builder for May 1, 1885; and a few months later, viz. on Nov. 6 last, we gave some of the carved details of the main entrance arch.

effectual precautions for insuring a safe and easy working are combined in the arrangements connected with these lifts. The hydraulic power to work them is provided from large tanks situated in the roof and the basement, the water of which is re-used continually.

The staircases have a wrought-iron balustrading supplied by Messrs. Starkie, Gardner, & Co., who have also furnished all the wrought-iron work in the exterior. Every floor throughout the building is provided with an ample supply of appliances for use in case of fire, the whole of this department having been carried out by Messrs. Sband & Mason.

The whole of the papering, with the exception of that in the public rooms on the ground-floor, has been supplied by Mr. W. Phillips, of Upper Thames-street. The papers in the reception-rooms were supplied to Mr. Boskinder by M. L'hoeste, of Liège.

The kitchen and offices are located on the fourth floor; the series of rooms over the *Salle* being entirely devoted to these purposes. The whole of the cooking apparatus, adapted almost entirely for the use of gas, has been supplied and fitted up by Messrs. James Slater & Co., of the Holborn Engineering Works.

The kitchen proper is surmounted by a large skylight, and has windows on three sides. Throughout this department, every precaution has been taken to secure a cool temperature and thorough ventilation. In addition to the several large and airy larders provided, an ice-room has been fitted up by Mr. Stockwell on his patent system. Opening out of the kitchen there are a pair of lifts, also the work of the American Elevator Company, communicating directly with the service-rooms for *Salle-à-manger* and coffee-room. The general service lift is close at hand, and as it opens on every floor into a service-room, any meals required in either the bed or sitting rooms can easily be supplied. An auxiliary kitchen is provided in the basement for the supply of private banquets, dinners, and other minor requirements.

The electric light, in the form of incandescent lamps, is supplied all over the building, but to guard against the possibility of mishap, it is generally duplicated with gas. The Wigham gas-lamp has been introduced into several of the public and private rooms. The whole of the work in connexion with the electric light installation has been carried out by Messrs. Thompson & Ritchie, who have also provided the electric bells, with signal semaphores and speaking-tubes. The fittings for the electric light are supplied by the Walsall Electrical Company, and those for the gas by Messrs. Hughes & Co., of the Atlas Works, Hatton-garden.

A large billiard-room for the use of visitors staying in the hotel is provided in the basement under the *Salle*. Here is ample room for five tables. A bar for refreshments, and all necessary lavatory accommodation, is in close connexion. A special staircase leads directly from the coffee-room corridor down to this room.

The basement, over 14 ft. high, contains further a good suite of bedrooms, hair-cutting and bath-rooms, a range of offices, and various servants' apartments, the auxiliary kitchen mentioned above, numerous cellars and store-rooms, and last, but not least, the boiler-house, engine-room, and engineer's quarters. In the former are two large Lancashire boilers, each 30 ft. long and 7 ft. 6 in. in diameter. These supply the steam power for electric lighting and for heating and cooking purposes. They are fed by a small Worthington pump. Another of these pumps supplies the motive power to the lifts, while a third is used for lifting water required for all purposes from the receiving tank in the basement to the various supply-tanks throughout the building as well as to the 10,000 gallon fire-tank in the highest point of the roof.

The hot-water supply is obtained by means of a Berryman's heater, and is carried to every part. The general heating of the building is effected by coils of hot-water pipes, which are liberally dispersed throughout the public rooms and corridors.

The engines for the electric light have been made by Messrs. Browett & Lindsay, and to these and to the dynamos separate rooms have been devoted.

The building is furnished throughout by Messrs. Maple & Co., who have received directions to complete everything in a style suitable to a building of this importance. So

far as the furnishing was completed when the building was visited they had been very successful in complying with this instruction. The wooden chimney-pieces and over-mantels are by Messrs. Wm. Walker & Sons, of Bunhill-row. All the floors of the principal rooms, viz., those of the *Salle-à-manger*, coffee-room, smoking-room, banquetting-room, and ante-room of the *Salle-à-manger*, covering altogether an area of 150 squares, are laid with Mr. J. F. Ebor's solid parquet floors, of simple but effective design.

The whole of the works in connexion with the erection and completion of this building have been carried out under the immediate superintendence of the architects, Messrs. Isaacs & Florence, of Verulam-buildings, Gray's Inn. Mr. Charles Till has acted throughout as clerk of the works.

#### VISIT TO THE ROYAL HOLLOWAY COLLEGE, EGHAM.

On the afternoon of Tuesday, the 3rd inst., a party of gentlemen attending the Conference proceeded by rail to Egham, to visit the Royal Holloway College, as mentioned in our last. We have so recently \* illustrated and described this remarkable building that we need say nothing more about it now.

#### VISIT TO COLLINGHAM GARDENS.

On the morning of Wednesday, the 4th inst., the members of the Conference visited several houses in Collingham Gardens, erected from the designs of Messrs. Ernest George and Peto. One of the houses visited adjoins that of Mr. W. S. Gilbert, and has been erected for Messrs. Cassell and Co., the well-known publishers, for the residential accommodation, as we understand, of some of the members of their editorial staff. This house is already furnished.

#### VISIT TO KENSINGTON COURT.

The visit of the members of the Conference on the same morning to the houses occupying the site of Baron Grant's mansion, and collectively known as Kensington Court, was largely attended, and marked interest was shown by the visitors in this estate, which is one of the most complete among recent undertakings at the West End, possessing several advantages in its self-contained area. The attention of the party was first drawn to the subway which runs under the centre of the roads all round the estate, and which is of sufficient size for a man to walk in, and containing under the bottom the main drainage pipes, with access to connexions of each house, and in the subway itself the gas and water mains and electric cables. The advantage of this ready access to drains, pipes, &c., is obvious, and has frequently been pointed out in our pages. The pumping station next received attention. It has been erected under the direction of Messrs. Ellington and Woodall, for the Hydraulic Power Company, from which the water supply to work the passenger-lifts is distributed at high pressure through mains in the subway. The machinery, &c., for this purpose appears to have been thoroughly and carefully carried out. The visitors made a careful inspection of the electric lighting works, also situated on the estate. These have been erected by Messrs. Crompton & Co., of Cbelemsford, and fitted on the system of storage by means of accumulators of sufficient capacity to contain electricity for one night's consumption of all the houses, in addition to the current from the dynamos, thereby ensuring immunity from interruption of the light by the temporary cessation of the machinery. The machinery and plant, already of ample power, are capable of being extended up to 10,000 lights without derangement of the present working.

The exteriors and arrangement of the houses (the work of Mr. J. J. Stevenson) received considerable attention, and favourable comments were made on the elevations, which are of red brick and grey terra-cotta, carefully chosen.

The interiors vary in size, the larger houses containing three reception-rooms on the ground floor, and boudoir on upper floor; and the smaller with dining-room and library on ground, and drawing-room and boudoir on first floor. A

special feature is the entrance-hall,—often conspicuous by its mean dimensions, or even by its total absence, in a London house of similar size,—which is roomy and carried up with open well in the larger houses. The steps at the entrance leading to the ground-floor level are either in the vestibule or under cover, which is a great advantage in wet weather. The basements are well lighted, and the rooms throughout well proportioned, with good window space and special provisions for ventilation. The continuous balcony at the first-floor level made in this case a pleasing architectural feature, and is well suited for pot plants and creepers.

The finishing and decorations of the interiors of the houses is being carried out under the direction of Mr. William Rolfe, who acts as resident architect to the estate. Somewhat attention has been paid to the fireplaces, with a view of ensuring comfort combined with economy of fuel. The mantelpieces are specially made, and painted with the other woodwork and dados, which are panelled out in some cases on the plaster. The ceilings, either enriched with mouldings or plain, are light in treatment, and where possible wall-papers of good but not heavy colouring have been chosen, with a view of obtaining a fresh and cheerful appearance, which end is further attained by the use of ivory white paint.

The electric lighting, now for some time in use, is by incandescent lamps, adapted, where desired, to existing candelabra, &c., and the occupiers fully realise the advantages of the light over coal gas, not only in the improved temperature of the rooms, but also in the saving of the decorations. The difference in cost between this and gas is found to be but small.

The passenger-lifts, an important part in the convenience of the houses, are capable of carrying four persons, and supply the place of back stairs for the servants' use between the basement and upper floors, as well as for carrying the tray for meals. The action of these lifts is well worthy of notice, and is by means of continuous rods inside and outside the cage for setting the lift in motion, the doors to the well-holes being self-closing and fixed until the cage comes to the floor level, when the bolt is released and the door can be opened. This arrangement, which has been successfully carried out, reduces the risk of accident to a minimum.

One or two other houses which have been specially built for private persons, were visited, notably the one at the corner at the entrance to the estate, from designs of Mr. T. G. Jackson, where the interior has been worked out with the same care as the elevations, making the most of the very fine position overlooking Kensington Gardens.

Attention also was given to the compact stables, arranged with carriage-houses on the ground floor and horses on the upper floor, and rooms accommodated over these; in sets for four or more horses. A private set, specially built to meet tenants' wishes, and attached to one of the houses, provides standings for nine horses on the ground-floor, with carriage-houses over, the vehicles being taken up by a carriage-lift. The interior finish of the stables, the electric lighting, and the way in which the most had been made of a small space, are among the points which were deservedly commended by the visitors.

[Accounts of a few other visits will be found in another part of this week's *Builder*.]

#### THE CONVERSAZIONE.

The *conversazione* given by the President and Mrs. P'Anson at the South Kensington Museum on the evening of Thursday, the 5th inst., was a great success. There were nearly 1,200 guests, including Mr. and Mrs. Cavendish Bentinck; Mr. and Mrs. A. Stuart Wortley; the Hon. Mrs. J. Stuart Wortley; Mr. W. Holman Hunt; Dr. Dohme (Emperor's Librarian at Berlin); Mr. H. Schutz Wilson; Mr. Edwin Freshfield, LL.D., and Mrs. Freshfield; Mr. Edward A. Freeman, D.C.L.; Sir J. Whitaker Ellis; Mr. Owen Roberts; Mr. T. G. Jackson; Sir Fred. Goldsmid and two Misses Goldsmid; Mr. W. Calder Marshall, R.A.; Mr. F. W. Cattermole; Sir Edward and Miss Sieveking; the President of the Institution of Civil Engineers; Sir John Code, V.P. Inst. C.E.; Mr. H. W. B. Davis, R.A.; Mr. Lumb Stocks, R.A.; Mr. H. Treaceman Wood; Mr. George Corson, of Leeds; and an unusually large number of non-metropolitan members of the Institute, and several well-known contractors.

### Recent Excavations in the Presbytery of Lincoln Minster.

THE Cathedral of Lincoln, in common with the majority of our English cathedrals and minsters, has successively received more than one eastward prolongation. As originally

built by Remigius, the first Norman bishop of the great Mercian diocese, by whom the see was removed from Dorchester-on-Thames to Lincoln and the first cathedral church erected (1092), the eastern limb of the cathedral was short, and apparently not provided with aisles. After standing for a century the Norman choir was removed to make way for that of Bishop Hugh of Avalon, the "St. Hugh" of Lincoln tradition and Carthusian hagiology (d. 1200). The Burgundian prelate's building was in every way larger and more lately than the stern and simple fabric of his Norman predecessor, and was considerably more than twice its length. This new extension terminated in an apse, which, after an existence of not more than forty or fifty years, was demolished for the further prolongation of the church by the erection of the presbytery or angel choir, for the reception of the shrine of the then recently canonised bishop and his wonder-working remains. This last addition to the fabric was made between 1255 (when permission was given by Henry III. for the removal of the eastern city wall to allow of the extension of the cathedral) and 1280, when the relics of St. Hugh were solemnly translated, with circumstances of the latest pomp, to their new home.

With the last of these extensions, the so-called "angel choir," we are not now concerned. Happily no restoring or devastating work (the words are too often synonymous) has been laid upon it, and it stands the same as all its main architectural features as it was by its builders, confessedly the most perfect example of the best period of Gothic architecture, and, in Mr. Freeman's eulogistic words, "one of the loveliest of human works." In the eastern terminations of the churches of Remigius and St. Hugh the case is different. Both have been entirely demolished down to the foundations, which afford the means of determining their form and arrangement. For this purpose, however, materials, some long since known and some only recently brought to light, though they are sufficient, and enable us to lay out with accuracy the ground plan of the

buildings, and, by comparison with other parts of the same dates, to give a reasonable guess at their architectural composition and general contour.

essential for the erection of the new. So when Geoffrey of Noyers, Bishop Hugh's architect, was engaged on the erection of the present choir, he did not trouble himself to pull down

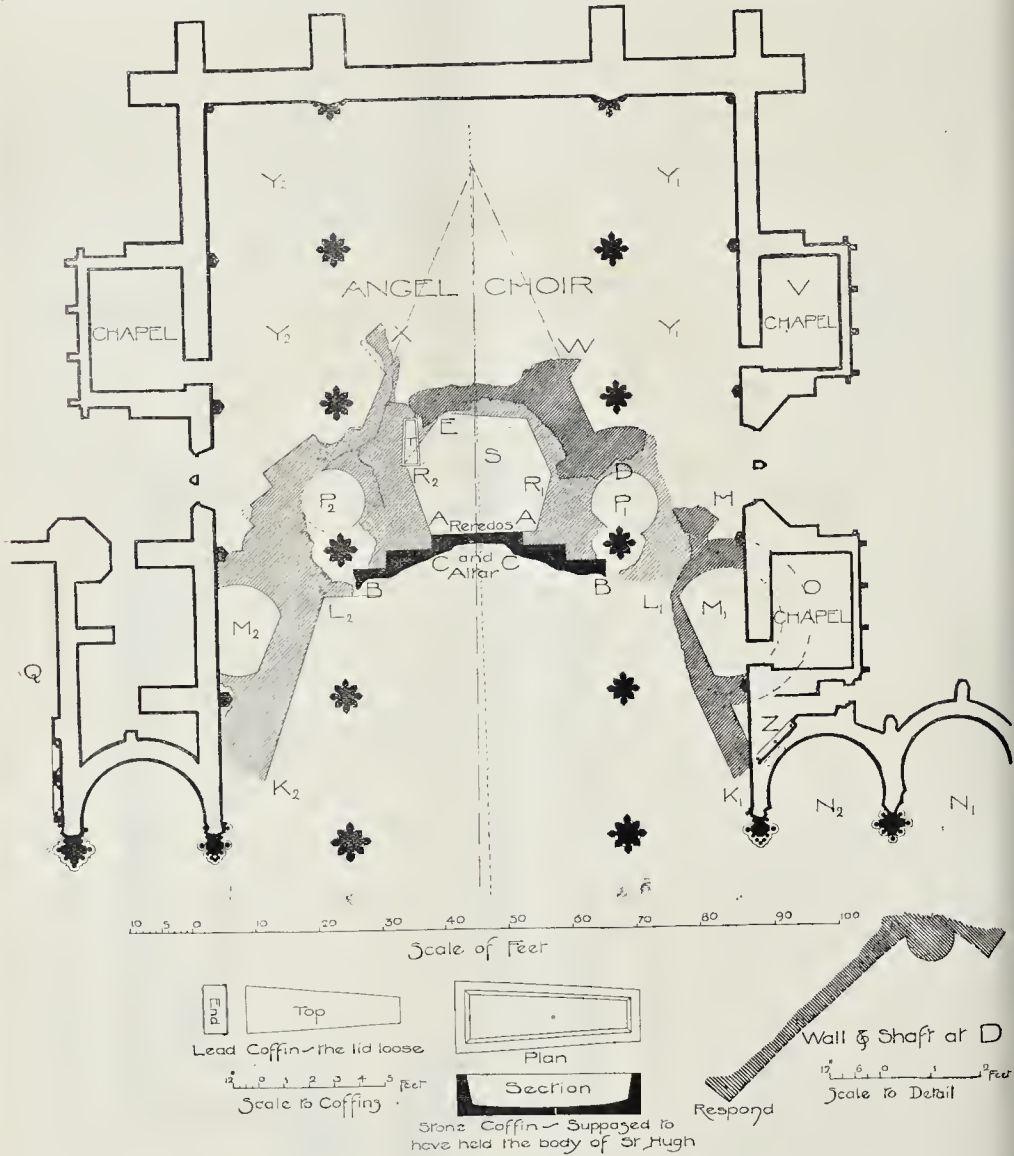

Plan I.—The Foundations of the Norman Choir of Lincoln Cathedral.

To begin with the eastern limb of the Church of Remigius (plan I). Mediaeval builders were, as a rule, very sparing of their labour, and, when rebuilding or enlarging a church, never removed a foot more of old work than was absolutely the whole of Remigius's work, but left the lower courses of the walls standing, knowing that the side portions would be concealed by the raised platform of the choir stalls, and the central part hurried in the new and higher

floor. Whether the existence of these precious traces of the old work was previously known is uncertain. Probably the cathedral workmen, in the course of their operations, became acquainted with them. But for all practical purposes they were discovered in 1853 by Mr. T. J. Willson, the son of one whose name deserves honourable mention, the late Mr. E. J. Willson, the contemporary and fellow labourer of Britton and Pugin in those great architectural publications which did so much in the early part of

measurement by the present clerk of the works under Mr. Pearson, Mr. J. J. Smith, will explain the nature of the remains better than any description. The lighter shade represents the Norman foundations, the darker tint indicates the framework of the choir stalls. It will be seen that the Norman choir was very short, not reaching beyond the second bay of the existing choir, and was 10 ft. narrower. A fragment of an external pilaster buttress to the north-east of the apse (A) proves that, as at St.

The first extension of the choir or eastern limb was made, as has been already said, when the reconstruction of the cathedral was commenced by St. Hugh in the erection of a new and much enlarged eastern limb. The foundation of this work was laid in 1192, and St. Hugh died in 1200. Between these two dates, therefore, St. Hugh's work must be placed. St. Hugh's addition comprised a ritual choir of four bays, succeeded by a second transept, as at Canterbury, Salisbury, Beverley, Worcester,

Plan II.—The Foundations of St. Hugh's Apse, Lincoln Cathedral.

the century to familiarise the world with the forms and details of our cathedrals and ancient churches. This gentleman, by doing what it would seem his father had never done,—close as were his investigations of every part of the cathedral, of which he at one time proposed to write the history, viz., by descending with a lantern beneath the floor of the stalls, discovered the foundation of the whole eastern limb of the Norman church, with the springings of its semicircular apse. The accompanying ground-plan (plan L), taken from actual

Stephen's at Caen, and originally at Peterborough, the apse had no surrounding aisle or procession path. Two rough blocks of masonry projecting from the wall at the west end (B<sub>1</sub>, B<sub>2</sub>) mark the position of the great transverse arch of the choir. The length of the chord of the apse was 25 ft., and the walls were 8 ft. thick.\*

\* The letters a<sub>1</sub>, a<sub>2</sub>, b<sub>1</sub>, b<sub>2</sub>, c<sub>1</sub>, c<sub>2</sub>, in the plan indicate the lower parts of the vaulting or wall shafts of St. Hugh's choir, the middle portions of which were removed to make room for the backing of the new stalls erected by Treasurer Welbourne (d. 1399), the stumps being fitted with corbels

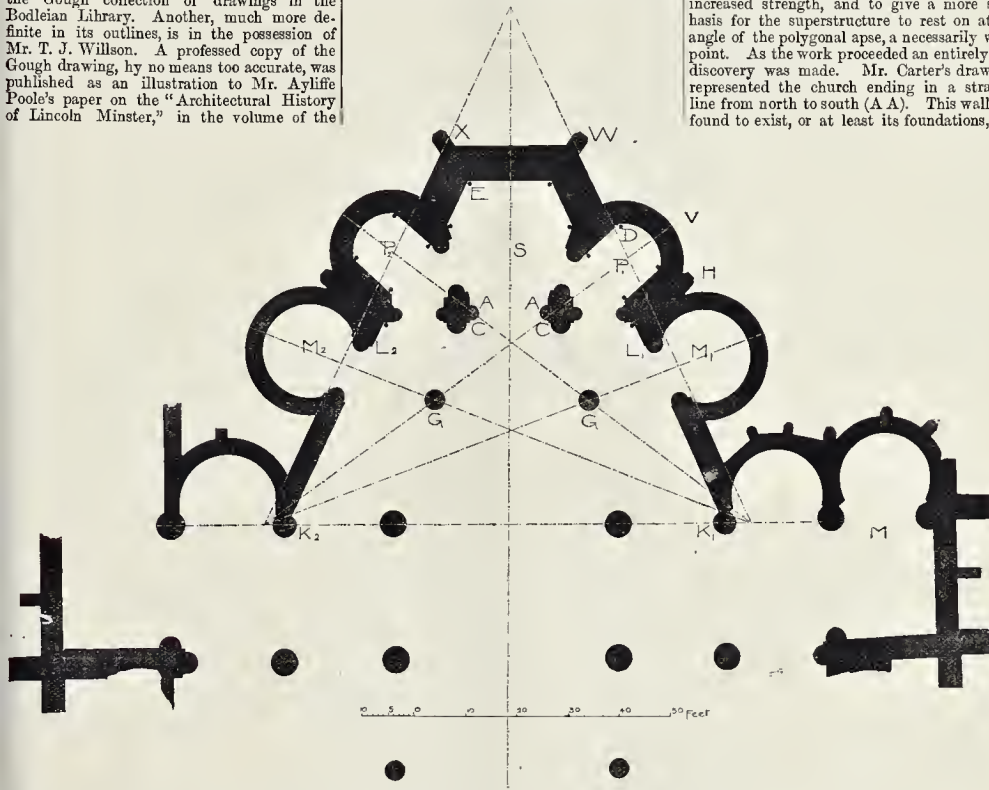

and Rochester, and, though with smaller projection and now absorbed in the widened aisle at York. Each arm of the transept had two semicircular or segmental chapels attached to the eastern wall. How far St. Hugh's building extended beyond the transept, and what form was, there was no visible evidence to determine, the whole having been taken down

of the same date. The economy of labour characteristic of the Medieval workmen is shown by their allowing shafts to remain as soon as they got below the floor of stalls, and were therefore out of sight.

on the erection of the thirteenth-century extension, the presbytery or Angel Choir. On these points, however, sufficient evidence has always existed, and still exists, beneath the pavement of the church, as the foundations which, originally discovered on the paving of the cathedral in 1791, and imperfectly measured and planned at that time, have been again laid here in the last few months, and accurately measured and drawn by Mr. Smith. The earlier plans were made by the Rev. John Carter, then the head-master of the Lincoln Grammar School, who had a very intelligent love for Gothic architecture, and was an adequate draughtsman. One of his plans, made "from memory," in 1792, is preserved among the Gough collection of drawings in the Bodleian Library. Another, much more definite in its outlines, is in the possession of Mr. T. J. Willson. A professed copy of the Gough drawing, by no means too accurate, was published as an illustration to Mr. Ayliffe Poole's paper on the "Architectural History of Lincoln Minster," in the volume of the

follows. At the end of November last year (1886) a portion of the pavement at the south-west angle of the south aisle of the presbytery ( $K_1$  plans II. III.) requiring repair, the slabs were taken up. Those who directed the work knew that the foundations drawn by Mr. Carter probably existed on this very spot, and desired the workmen to be on the look out for them. They very speedily came upon the south wall of the semi-hexagonal apse ( $K_1, L_1$ ) and the walls of a segmental chapel ( $M_1$ ), corresponding in form to the southernmost chapel of the south-eastern transept ( $N_1$ ) attached to it. These were traced as far as Bishop Longland's chantry ( $O$ ), which had been

churches, as at Chartres and St. Ouen at Rouen, wedged in, as it were, between chapels of larger dimensions and greater projection. Mr. Pearson's development of the ground-plan from the existing remains is given in plan III. It will be seen that he considers that the foundations are those of two small chapels with an external curved wall ( $V$ ), hut quadrangular within, vaulted from four wall shafts, and approached from the aisle or procession path by a triangular vaulted severy, such as we see at Ely behind the diagonal arches of the octagon. The circular form of the interior Mr. Pearson considers to be due to the builders having carried the foundations through uniformly from the outer wall for the sake of increased strength, and to give a more solid basis for the superstructure to rest on at the angle of the polygonal apse, a necessarily weak point. As the work proceeded an entirely new discovery was made. Mr. Carter's drawings represented the church ending in a straight line from north to south ( $A$ ). This wall was found to exist, or at least its foundations, hut

Plan III.—Development of the Ground Plan of St. Hugh's Apse, by Mr. J. I. Pearson, R.A.

Transactions of the Associated Architectural Societies for 1857. This was the first time this ground plan had been given to the world. A notice of the original form of the east end of St. Hugh's church, as derived from these explorations, was to be found in a note to Wild's "Lincoln Cathedral," p. 8,\* hut to Mr. Poole belongs the merit of having made it generally known, and of interpreting the indications afforded by the foundations, if not with perfect accuracy, yet as nearly so as the drawings allowed. The suggestion made by Mr. Poole that St. Hugh's church "terminated in a semi-hexagon with a chapel attached to each side," has been fully confirmed by the recent excavations, hut the theory that the "circular appendages" at the eastern angles of the apse were "stair-turrets," like those which flank the apse at Peterborough, which has been generally accepted, has been as completely disproved by them.

Of these explorations the history is as

partially built on its site, allowed. When at a later period the investigation was extended to the northern side, the results exactly corresponded with those on the south. There was the same sloping wall ( $K_1, L_1$ ) and the same annexed segmental chapel ( $M_1$ ). The investigation now became so interesting that it was determined to carry it out thoroughly, irrespective of any supposed repairs required by the pavement. The next part examined was what Mr. Poole calls the "circular appendages" at the northern and southern angles of the end wall of the apse ( $P_1, P_2$ ). The idea previously entertained that these had been stair-turrets was negatived by the discovery of a fragment of two dressed walls, one partially curved, the other straight, meeting at an angle ( $D$ ) with the footing of a small wall shaft still *in situ* at the junction,\* while careful digging in the centre of the circular void failed to discover any trace of the foundation of a newel. Mr. Pearson, after devoting much time and thought to the subject, has come to the conclusion that these appendages represent actual chapels of small dimensions, such as are found in some of the French

\* This wall and the annexed shaft will be seen drawn on a larger scale in the margin of plan II.

not as a terminal wall, hut either as a honing wall below the ground to tie the angles of the hexagon together for greater strength (as was the case with the segmental chapels), or as the base of a screen or reredos. But beyond this wall the foundations of a hexagonal chapel of 23 ft. internal diameter were discovered ( $S$ ), occupying a corresponding position to the chapel popularly known as "Becket's Crown" at the east end of Canterbury Cathedral. As will be seen on plan II, the plan of this chapel was laid out inaccurately, its transverse axis  $R_1, R_2$ , not being at right angles with the longitudinal axis of the church. The external angles of this and the other chapels were strengthened by buttresses ( $WX$ ), of which the best preserved was that between the segmental and the smaller chapel on the south side ( $H$ ).

Such a group of apsidal chapels surrounding the chief apse was more a Continental than an English arrangement. We find examples at Norwich and at Tewkesbury, and in Westminster Abbey, where the Continental influence is very evident throughout the eastern part of the building; and recent excavations prove that they existed at the great Cluniac Priory at Lewes. But it was a foreign feature which

\* "When this part of the church was new paved in 1791 some foundations were discovered, by which it appeared that St. Hugh's Church terminated in a half hexagon, of which two sides extended from the angles of the east transept to a line somewhat within the present altar-screen."—Wild's Lincoln, p.

did not take root in our island. The ground plans of French churches given by M. Viollet-le-Duc in the first volume of his "Dictionnaire" offer several curious parallels to the Lincoln arrangement in the alternation of larger and smaller apsidal chapels surrounding the great apse,\* and similar examples are presented by some of the German churches. One point of remarkable interest has become apparent in Mr. Pearson's investigations, and is shown on his ground plan (plan III). This is that a triangle, the base of which is given by a line drawn through the centre of the columns on a line with the east wall of the eastern transept, gives the lines on which much of the work is set out. The centres of the little chapels (P<sub>1</sub>, P<sub>2</sub>) fall almost in the centres of the sides of this triangle. Mr. Pearson remarks that there are parallels in Germany, especially in Bohemia, where churches and annexed chapels are found with triangular endings, and with some chapels of a hexagonal form added on at the extreme end.†

It should be mentioned that through the larger extent of the explorations, rude concrete foundations, marked by a lighter tint in plan II., alone remained, the upper surface being 1 ft. 4 in. or 1 ft. 5 in. below the surface. The portions of actual walling above the original floor-line which were discovered are shaded in a darker tint. The wall here reaches to within about 8 in. of the present floor. The most considerable fragments were those of the south diagonal wall of the semihexagon, K<sub>1</sub>, L, and the springing of the curved wall of the annexed chapel (M<sub>1</sub>), together with a considerable portion of the eastern and southern walls of the eastern hexagonal chapel W X, and of the walls of the smaller southern chapel at (D). A very important piece of wall at the north-eastern angle of the hexagonal chapel at E determines its form and dimensions. To preserve a permanent record of the discoveries all the chief lines of the building have been marked by lines deeply incised in the pavement.

It should be remarked that the recent discoveries give a clue to one of the many architectural puzzles suggested by this cathedral, as shown on plan II. The northern wall of the northernmost chapel of the south-eastern transept (N<sub>1</sub>), originally dedicated to St. Paul, is straight instead of curved, and has on its outer face a portion of a shafted arcade (Z). This has every appearance of having been originally internal, and it seems to indicate the existence of a little chapel squeezed in in the space between the two larger segmental chapels, N<sub>2</sub>, M<sub>1</sub>.

The supposed sepulchre of St. Hugh, which occupied the north-east angle of the eastern hexagonal chapel (T), over which a Renaissance table tomb had been erected by Bishop Fuller after the Restoration, proved, on investigation, to be quite empty of human remains. A stone coffin was discovered containing one rudely formed of sheets of lead unsoldered. This inner coffin was shown by the stains on its sides to have once contained a human body, but this had been abstracted, leaving only portions of decaying vestments. Microscopical and chemical investigation showed remains of flaxen and silken tissues, intermingled with fine gold threads, but any traces of human remains were entirely absent. The whole, coffin and contents, were carefully replaced.

#### NOTES.

We have received from the "Société Centrale d'Architecture" of Belgium a pamphlet on public architectural competitions.‡ The pamphlet includes two Reports, addressed by the Société to the Government and to communal and provincial administrations, the committees of hospitals, and other persons in positions of public trust : the first considering

\* We may refer to Vicoquery-sur-Marna, p. 169; Fontevraud, p. 171; St. Etienne de Nevers, p. 173; Ronce, p. 237; Chartres, p. 235; St. Omer, p. 230.

† Grueber's "Kunst der Mittelalter in Böhmen" may be consulted. See Hohensretz, p. 62, fig. 139; Strakonice, p. 67, fig. 169; Humpolec, p. 43, fig. 75; Braunau, p. 44, fig. 77.

‡ Concours Publics; leur Utilité, leur Organisation. Bruxelles: Alliance Typographique. 1887.

the advantages and disadvantages of competitions; the second treating of the best method of organising them. The first Report sums up in favour of competitions, which it appears have been little countenanced in Belgium, with the consequence, says the Report, that Belgian architects are obliged to go into foreign competitions in search of fame and reputation, being "cartés dans leur pays." Another consequence is, according to the Report, that many buildings are not given to the best men, and that certain public buildings, of which a list is given, would have fallen into very different hands and shown a very different type of architectural design if they had been opened to public competition. The Report on the Organisation of Competitions mentions some instances of the victimisation of architects, which it is interesting to compare with our experiences in this country. In the case of the Hospice de l'Harmonie at Verviers, the successful architect was expected, for a premium amounting to one per cent. on the estimated outlay, to furnish the working drawings and every instruction necessary for the execution of the building, without further remuneration. In regard to the double system of competition (sketches first and finished designs afterwards), the Report sums up some of the reasons for and against it, the most important reason in its favour being that put forward at the Paris Congress of Architects, that an architect whose main idea in the design is a bad one "ne s'en rend pas compte toujours" (which we should think very probable); he finishes his design laboriously in faith and hope, only to lose his labour; whereas the badness of his idea would have been at once apparent on the sketch competition, and he would have been put out of his pain with no further waste of tissue over it. On the other hand, M. Hermant's opinion is quoted, "Le concours a deux degrés me gêne un peu," and the drawback is noted, either that one competitor may appropriate another's ideas when the sketches are exhibited, or that the sketches must not be publicly exhibited; which latter the Report regards (justly, we think), as the greater evil of the two. After all, it ought to be easy to get over this objection by simply giving competitors to understand that their finished designs were expected to be on the main lines of their sketches. If we rightly understand, the principle of the double competition has been formally approved by the Belgian Society, but only in the case of buildings the cost of which would exceed 100,000 fr.; much too low a limit, in our opinion. Nothing under 10,000 l. value should be put up to double competition, if to public competition at all. To the Report is attached a proposed schedule of rules for public architectural competitions in Belgium. The 5th article provides that architects should send in two sealed envelopes, one containing, as usual, the name and address, with the motto outside, the other containing the names of two architects whom the competitor desires to see on the jury. The two architects having the greatest number of votes are to be elected on the jury. But the rules do not seem to provide for the very probable case of one or both of these being among the competitors. What is to be done then?

THE recent decision of Mr. Justice Kay in the case of MacManus v. Cooke should be taken note of by house-owners. The plaintiff and the defendant made a verbal agreement by which each party agreed to make certain alterations in their premises so as to give to the premises of each a sufficient quantity of light. The plaintiff had partially performed his portion of the agreement when the defendant refused to make the alterations which he had undertaken to do. The Statute of Frauds is an Act well known to successive generations of lawyers, and the question arose whether a part performance by the plaintiff was sufficient to enable him to compel the defendant to fulfil the agreement on his side, so that the absence of a written agreement should not cause the Statute of Frauds to prevent him from succeeding in his action. Mr. Justice Kay decided that the doctrine of part

performance applied, and gave judgment for the plaintiff. This decision is satisfactory; but, at the same time, owners of property should be careful to put such agreements as these into writing, because it is laid down by the fourth section of the Statute of Frauds that no action shall be brought upon "any contract or sale of lands, tenements, or hereditaments, or any interest in or concerning them, or upon any agreement that is not to be performed within the space of one year from the making thereof, unless the agreement upon which such action shall be brought, or some memorandum or note thereof shall be in writing or signed by the party to be charged therewith."

THE Society of Italian Engineers and Architects of Rome have recently published their annual report, which is preceded by a note on the progress and scope of the Society. On the 1st of January, 1871, at a time that numerous associations of a variety of form and object were founded, a society called the Technical Club was formed, which, although the definite purpose was of a scientific character, did not exclude festivities and similar objects common to other urban clubs. A desire to bring the association more in conformity with its true proper mission suggested the first change of name in 1876 to the College of Engineers, Architects, and Land Surveyors of Rome, the establishment of monthly meetings for the reading and discussion of papers, and the substitution of the publication of regular proceedings for a journal called *Young Rome*, which was the organ of the Club. In 1877, the surveyors having constituted a separate association for themselves, the institution took the name of the College of Engineers and Architects of Rome, retaining as members such of the surveyors as desired to remain. From that time until 1884, when the fourth Congress of Italian Engineers and Architects took place in Rome, there have been few noteworthy changes. In 1885 four volumes of "Transactions" were published, and the number of members, which had previously decreased to 140, rose in that year to 225. In the following year the society was reconstituted as the Society of Italian Engineers and Architects, chiefly through the exertions of the engineer Giovanni Cadolini, a member of Parliament. The society is more a college of engineers than of architects, as may be seen by the titles of some of the papers read before it, such as, "On Wood Pavements for Streets in Towns," "On the Construction of Railways over Boggy Lands," "On a Formula of Poncelet," "The Transmission of Electric Power at the Monaco Exhibition," &c.

THE Church of Santa Maria dei Miracoli at Venice, was re-opened on the 8th inst. after having been closed to the public for more than twenty years. The *Venice News*, in commenting on the re-opening, remarks that the work of restoration has been carried out with much greater respect for work than has been exhibited in Venice here and elsewhere (alluding, we presume, to St. Mark's), and that the sculptured parts, which are by far the most important, have been respected and preserved. Most of the marble facing, both inside and out, has, however, been removed or scraped, and, unfortunately, it appears has been left without that polishing which is necessary to display the real colour of the marble, and to preserve it from the weather. We gave a plan of the church, with a translation of some antiquarian notes relating to the fabric by Signor Giacomo Boni from a monograph in the "Archivio Veneto" (2nd series, vol. xxxiii, part I.), in our last week's number (pp. 711-13).

IT has been long supposed that the story of Perseus and the Grey Sisters with their one eye, though familiar in Greek literature, was unknown to Greek art. In the last issue of the German *Mittheilungen* (xi. 4), Dr. Boeblau puts an end to this supposition. He republishes a beautiful little Athenian pyxis, on which the scene of the stealing of the eye is represented with singular directness and simplicity. "Republishes," we advisedly say, for the pyxis had

long been known to archaeologists, but unfortunately only through a careless inaccurate drawing published in 1879 by Dr. Gaedeche. In this drawing the one eye, the main point of the story, was omitted, and the three sisters were drawn with seeing instead of blind eyes. The pyxis was found close to the ὄρφαντροφεῖον at the Peireos; it belonged to the Philemon collection, and passed with that collection into the possession of the Athenian Archaeological Society. The three sisters are represented as young maidens with dark hair, a characteristic euphemism of the vase-painter; he chooses to forget that they were "hoary from their birth" (ὅτι γυναικὲς πολλάς), though he remembers that they were fair of face (καλλισταρμούς); they are all three seated and hold sceptres in their hands, for they are princesses, daughters of the old sea-king Phorkys. The sister to the right holds the eye in her hand, and reaches it out to the second sister, but Perseus, who has just flown up, throws himself in between them. The eyes of all three sisters are drawn blind, according to the conventional Greek manner, i.e., without pupil. On the other side of the pyxis is a gathering of the gods interested in Perseus.—Athene, Poseidon (the lover of Medusa), Hermes, and old Phorkys himself. Dr. Boehlau traces in an interesting paper the various literary forms of the myth.

IN the *'Acro* (No. 77) a rough reproduction is given of a monument recently discovered on the Acropolis, and, so far, unique of its kind. This remarkable piece of work is a bronze relief, made up of two thin plates, each of which represents one side of a figure. The two plates are fastened together by small nails. Their joint thickness is 3-4 mm. The relief is worked *à jour*. It is almost flat, but on one (the right) side, there is slight modelling, to which the opposite side does not correspond. The whole working of the right side is superior; traces of gold on the hair and garment are visible only on this side. The relief represents the goddess Athene. She wears chiton and peplos, and a large ægis, but no helmet. It is possible that she may have carried this in her left hand, which has suffered much from oxidation. Her right probably held a phial. The style is much more natural than that of the numerous archaic female figures in company with which it was found; but from traces of fire in the gold work, it is supposed to be previous to the Persian invasion. The monument is so remarkable that we deferred our note of it till reliable particulars appeared in the German *Mittheilungen*.

IT appears that the leading of the Fairfield windows is now so insecure that new work is absolutely required. We are glad to find that no attempt is to be made to "restore" these remarkable windows, but that the glass is to be replaced in its new setting exactly as it is at this moment. This judicious decision will give confidence to those who subscribe to the repairs fund, now being collected by the vicar, that under the guise of reparation, new work will not be introduced. There are few places which better repay a visit than Fairfield, not only on account of these quaint windows, but because this Gloucestershire village is a singularly pleasing example of picturesque English scenery.

A RECENT fire and a sale of salvage will have completed the devastation of Sir Christopher Wren's Church of St. Mary Magdalen (Old Fish-street) in Knightrider-street, by Doctors' Commons. Tenders have been invited for the purchase of the remaining materials and fittings, including the bell, some lead, timber, ironwork, and woodwork, as recovered from the conflagration of last year. Steps are already taken by the Bishop of London for uniting the two parishes of St. Mary Magdalen and St. Gregory-by-St. Paul with that of St. Martin, Ludgate, under provisions of the late Bishop's Union of Benefices Act as applicable to the City of London.

A WELL-KNOWN firm of auctioneers have received instructions for the sale of the freehold manorial estate of Horton, in Northamptonshire. The property extends over some 4,000 acres in all, and includes numerous farms, with their houses, buildings, &c., together with several homesteads and holdings in Hackleton, Quinton, and Piddington parishes. Horton House, seat of the Gunning family, was originally erected by the celebrated Lord Halifax. Situated on the county's border, it lies about seven miles south-east of Northampton, on the road to Newport Pagnell, in the midst of a good shooting and fishing country, and in the neighbourhood of the Pytchley and Grafton hunts.

SIR FREDERICK LEIGHTON'S suggestion at the dinner of the Institute that the toast of "Art" would be more appropriately honoured by "a well-filled and pregnant pause of silence" than by speech was anticipated by Artemus Ward on an occasion when he was called upon to respond to the toast of "The Press" at a Ben. Franklin festival held in Cleveland. He rose to his feet, hung his head for a few minutes in silence, and then sat down, having said nothing. In his account of the festival in the next day's issue of his paper, the *Plaindealer*, his speech was reported by a blank space of about half a column of eloquent silence.

LORD GRIMTHORPE addresses to one of the Hertfordshire papers an *In memoriam* letter in praise of the late Mr. Longmire, the contractor, who, we very well believe, deserved all Lord Grimthorpe could say of him. On the celebrated occasion of pushing up the wall of the nave at St. Alhans, Mr. Longmire and his men were certainly the only persons concerned who understood their business. It appears, however, that Mr. Longmire had a good deal also to say in regard to the decorative details of the restoration, and that Lord Grimthorpe was surprised, considering how little Mr. Longmire had been concerned in ecclesiastical work, at the extent of his knowledge and taste in these matters. It would be easy to have taste enough to astonish Lord Grimthorpe, no doubt; but it is rather hard upon poor Mr. Longmire, who is dead, and cannot defend himself, that Lord Grimthorpe should attempt to fix upon him part of the responsibility of the architectural bungling at St. Alhans, though it is interesting to know how the restoration of one of our most valuable ancient buildings was carried on by a kind of happy-family committee of taste between a lawyer, the clerk of works, and the contractor. Lord Grimthorpe observes in the same letter that it was not true, "as a foolish person had said in the *Builder*," that he never deferred to any one except Mr. Chapple, the late clerk of works. A "foolish person" in Lord Grimthorpe's vocabulary means "a person who does not believe in my omniscience," and in that sense we are foolish enough; but the statement in regard to what was said in our columns is, of course, no more true than any other of Lord Grimthorpe's imaginary quotations from us; indeed, the idea of Lord Grimthorpe "deferring" to any one would have seemed rather too grotesque for publication. We should recommend some of the local journals, however, who are Lord Grimthorpe's most obedient servants, to be a little careful how they publish statements about this journal on no better authority than his assertion.

A Memorial of the late Lord Iddesleigh.—A reredos with super altar is to be erected in Upton Pyne Church, near Exeter, the gift of the Countess of Iddesleigh, in memory of her husband, the late Earl of Iddesleigh. The central panel will contain a valuable oil painting of the "Last Supper," purchased by the Earl of Iddesleigh (then Sir Stafford Northcote), during his travels some years since in Italy. The reredos has been designed by Mr. Medley Fulford, architect, and it is to be made and carved in oak and stone, by Messrs. Laseombe & Son, of Exeter.

#### ARCHITECTURE AT THE ROYAL ACADEMY.—IV.

1616, "Small drawing-room, 1, Grosvenor crescent," Mr. G. Aitchison, A.R.A. A coloured elevation of a portion of the wall, showing a dark dado, doors, and pilasters, relieved with white arabesque ornament in the panels, and on the architrave of one of the doors, whether painted or inlaid does not appear. Similar decoration is applied to the blocks which form a kind of rustication on the dark fluted pilasters. The architrave of the door seems to require a rather more filled up and continuous ornament than the alternating sprigs shown here. The folding-doors in the next compartment, and the fan-light over them, are filled with stained glass, and here the woodwork is left undecorated so as to give the glazed decoration its full effect. The wall decoration is in two shades of green, relieved with gold. Above is a frieze of birds and arabesque scrolls on a delicate buff ground. This frieze is very pretty in itself, but does not seem quite to belong to the rest of the scheme. This is Mr. Aitchison's only contribution to the exhibition this year, which is to be regretted.

1617, "Oakfield, near Chester," Messrs. Grayson and Onid. A well-treated drawing of a very plain Late Gothic house, with mullions, labels, and battlements; heavy-looking. The picturesque element seems to be relegated to the gate-house in the distance.

1618, "Decoration for a Boudoir," Mr. G. Crichton Hannal. A well-executed small coloured perspective interior of a room, covered on walls and ceilings with the usual elements and emblems which go to make up Louis Seize decoration. The cove of the ceiling is painted with a dark blue ground, with figures and gilt arabesques in relief. The whole is well carried out, but it is a mere repetition of the details of a bad style.

1619, "Design for Upper Panels of Stained-glass Window, Bolton Infirmary," Mr. P. H. Newman. A small coloured drawing showing three panels filled with gracefully drawn figures of Faith, Hope, and Charity, the margins filled up with ornamental devices of a Renaissance type, not over-refined in idea, but well drawn and coloured, and the colour effect is harmonious; the attic, with rusticated blocks in perspective, on each side of the "Charity" subject, is a mistake for stained-glass design.

1622, "St. Nicholas Church, Newcastle-on-Tyne; now the Cathedral: Reredos, Bishop's Throne, and Choir Fittings," Mr. R. J. Johnson. A large but rather coarse pen interior, showing a lofty reredos, with a rich effect of canopies over rather absurd-looking figures, the heads of which are too large for the bodies. The bishop's throne runs up into a very lofty crocketed spire springing out of an octagonal pinnacled base in several stages; the choir stalls show late Gothic detail, with large "poppy-heads." The best point is the connexion of the reredos with the main walls by a lower panelled wing wall on each side of it.

1623, "3, Hertford-street, Mayfair," Mr. W. Flockhart. A coloured drawing of a brick front of Jacobean character of detail, with modern variations: the main centre window of the principal floor is picturesquely treated, but the composition seems very scrappy, and the hanging on of pilasters to the upper part of the walls, where they perform no constructive function, is an absurdity which fashion cannot reconcile us to. The author has done much better things than this. A plan of the ground-floor of the house is appended.

1624, "Design for a Country Bank," Mr. Arnold B. Mitchell. A very good drawing, and a building with a very picturesque arrangement of windows; somewhat spoiled by the bottle-stopper ornaments and other bits of rococo in the upper portion. There is nothing specially to give it the character of a bank. The drawing was published in the *Builder* for October 31, 1885.

1626, "Abbeystead, Wyresdale, Lancashire," Messrs. Douglas & Fordham. A very good tinted drawing of a large and solid-looking Gothic house, another view of which appeared in last year's Academy. A plan might have shown the meaning of the somewhat castellated treatment and more solid and massive style of the block on the left, as compared with the remainder of the house, which can only be connected. This drawing and No. 1617, we may observe, though with different architects' names, are obviously by the same hand; both exhibitors being apparently indebted to one

draughtsman for their position on the walls: in which case the draughtsman might at least be allowed to share credit in the catalogue.

1627, "Business Promises, 86, Strand," Mr. A. Drewe. A somewhat picturesque street front in the upper portion, or, meant to be so; but the author's enthusiasm seems to have failed in the ground or shop story, which does not seem in any way to belong to the building above it.

1628, "Three Blocks of Insurance Buildings, Castle-street, Liverpool," Messrs. Grayson & Ould. The nearest of the three is a very well treated street front, and here the shop ground-floor has been properly treated; it is made into a plain basement with massive piers and large elliptic arches over the windows of the shops; a strong cornice cuts this off from the upper portion, which partakes of a Francis I. character, with flat panelled pilasters and millioned windows; the upper-story windows are arched. The two other buildings of the group appear to become more Classic as they recede from the eye. The whole forms a good and carefully-worked-out group of street fronts to business buildings, and might have claimed to have been hung where it could be better seen.

1629, "Interior View of the proposed Cathedral at Liverpool, looking East," Mr. T. Garner. A fine and effective water-colour drawing, with plenty of polished marble floor, and those reflections which are so effective in a drawing, but which we seldom see developed to this extent in reality. The general character of the design our readers are aware of from former illustrations in our pages; it is a very fine, massive, and dignified resuscitation of the finest type of Mediaeval cathedral architecture. The scale of the interior is, however, somewhat dwarfed by the proportion and great projection of the base mouldings and plinth of the nave piers, which gives the impression of their being only about half the height which they must be.

1632, "Church of the Holy Trinity, Long Melford, Suffolk," Mr. E. L. Conder. A careful and minutely-executed measured drawing of the side elevation (south) of this celebrated church, showing also, with cruel fidelity, the beauties of the "compo" tower which disfigures it.

1634, "In Normandy," Mr. E. Jeaffreson Jackson. A good freely-touched pen drawing of a bit of late Gothic building, but hardly of sufficient interest for its position in the hanging.

1636, "Buildings in Progress in Arlington-street and Piccadilly," Mr. W. O. Milne. A very well-executed drawing, but rather deficient in force, which may also be said of the building; it is very flat in effect, and though generally pleasing and in good taste, does not make the most of its splendid situation.

1637, "New Church of the Epiphany, Port Said: Exterior," Mr. W. Bucknall. The interior and a plan and section are shown in 1648. They are both small pen drawings, and the latter hung too high to be seen at all. As an English church in Byzantine style in that part of the world, this is a little architectural event of some interest. The architect might have sent better and larger drawings, but the two he has sent might at any rate have been hung together and so that the drawings could have been seen. It is a very plain building domed over the middle of the nave (there are no aisles), and with semi-domes over transepts and apse. Judging from the drawings the materials would appear to be brick with concrete domes, or the domes cemented.

1640, "Interior of the Church of the Redeemer, Clerkenwell," Mr. J. D. Sedding. One of the finest drawings and one of the most interesting and original designs in the room, upon which, however, we made some comment when we published a reproduction of the drawing (*Builder*, May 7 last). We could have wished, however, we that the connexion between the columns and the springing of the main transverse vaulting ribs had been achieved in some rather less commonplace and well-worn manner than by that of breaking out little slices of the architrave over each capital, a device rather unworthy of the rest of the design.

1641, "105, 107, and 109, Oxford-street," Messrs. Christopher and White. The three numbers appear to be one property and are combined into one design, with a centre and symmetrical sides. The upper portion is solid and well designed, but the whole would have been far more satisfactory if the authors had taken a bolder step and treated the shop base-

ment architecturally, instead of leaving a mere void, only broken by two insufficient-looking columns. In such a case, the more solid the superstructure, the more it seems to call for a solidly-treated basement story. Owners of shop property very likely imagine this is prejudicial to light and the transaction of business, but some of them are beginning to see that the superior architectural effect of an architecturally-treated front has a value, even from the point of view of mere attractiveness to customers; and architects, above all others, should endeavour to impress this on their clients, if they wish to see shop architecture improved.

1642, "Timber and Plaster Ceiling for Bickling Hall," Mr. John H. Pollen. A most extraordinary-looking drawing; a coloured plan of ceiling, treated on more or less Celtic motives; the under sides of the beams and joists are strongly coloured with decorative designs in irregular oblique bands of colour or of small geometric or interlacing pattern, which run over the edges of the joists, and are, therefore, only seen piecemeal, being presumably concluded or further made out on the sides. The soffit of the main beam is decorated by what appears to be an elongated dragon, but we confess its position and anatomy are not very easy to make out on the drawing,—possibly a view of the sides of the beam would assist in the development of this portion also of the design. The space between the rafters in part of the ceiling is occupied apparently by low-relief decoration in plaster; the other portion shows a bold coloured design in large scrolls (intercepted by the joists, and as if continued behind them) intermixed with birds and with knots of interlacing ornament, &c. The treatment of constructional timbers with ornament which entirely ignores their edges or their shape and function generally, and runs riot over the angles, though common enough in Japanese work, is, to our thinking, a decorative mistake; but the author may be congratulated on having done something which is, at all events, quite original, and which compels one to look at it; and, moreover, *outré* as the design is, the colour harmony of the whole is very fine. It would be impossible to say how far one could regard it as a satisfactory decorative treatment of the ceiling, unless we knew the decorative scheme of the room under it.

1643, "Metropolitan Police New Central Offices," Mr. R. Norman Shaw, R.A. This does not, we believe, represent the final form of the design, which is undergoing some alteration. It is an exceedingly solid-looking building, the lower two stories of stone, the upper of brick, the latter portion containing the principal window tiers, which are Classical in treatment, with architraves and pediments to the lower ones, and heavy keystones to the upper ones. A strongly-marked cornice crowns the whole, and at the angles and in the centre of one side are projecting bays, segmental on plan and rising as low turrets above the cornice line, the cornice stopping against them. The brickwork in the upper stories is relieved by horizontal bands of stone. The building as shown here does not display much of its architect's play of fancy, perhaps considered out of place in a building of this class; but it is a capital piece of solid, unpretentious architecture, and it is gratifying to find the authorities going to an architect like Mr. Shaw for such a building, instead of inflicting official architecture upon us. The drawing, a perspective in pen and ink, is an admirable piece of architectural drawing; clear, clean, and precise, without being too formal or hard in touch.

1644, "Entrance to a Provincial Public Building," Mr. Maurice H. Pocock. A coloured piece of detailed elevation. Is this an executed work? It is a good drawing of its kind, and we should suggest that detail elevations like this are a class of drawing of which we might very well have more in the Architecture Room at the Academy. There is some variety and novelty in the detail, but the repetition of three couples of pilasters in three stages, each on its separate subbase, is rather too much of a good thing; and if the cornice over the first-floor order is intended for the main cornice of the building, then the story over it is much too heavy, and out of proportion for an "attic." The stone pilasters stand against a brick wall, and, judging from the shadowing (which would have better more decisive and darker) they must be rather flat, and deficient in projection.

1645, "The Steeple of St. Michael's, Coventry, as restored," Mr. J. Oldrid Scott. A most

delicate and beautifully-executed pen drawing of this remarkable rich tower and slender spire, a *tour de force* of building which has revenged itself upon its too adventurous constructors by threatening ruin, and having to be taken down and built up again from the base.

#### THE PARIS SALON OF 1887.

The Palais d'Industrie contains 2,521 pictures and 1,042 drawings or cartoons. These numbers explain eloquently the difficulty of such a selection as would enable one to give, in a limited space, a general outline of the *Salon*. Many remarkable paintings, too, claim special attention as indications of the strong current setting in the direction of realism and the endeavour to get at the facts of Nature, which is a characteristic of recent art, and the Classic school seem to fervent disciples of the Classic school seem to strive in vain. Others, like M. Puyis de Chavannes, applaud this realistic tendency in others, while choosing themselves to remain on the heights of Helicon, where no envious competitions or jealousies can trouble their poetic serenity. M. de Chavannes carries to its height this principle of abstraction from reality, and his immense cartoon for the decoration of the Sorbonne is the most complete practical demonstration of his aesthetic theory which has appeared.

This composition is divided into three parts, symbolising Literature, Science, and History and Philosophy. In the centre, on a block of marble, is seated the ancient Sorbonne personified by a tall and fine female figure. At her side are two giant carrying palms and crowns, in homage to illustrious names, dead and living. Eloquence, standing before her, celebrates with a slightly mannered gesture the victories of the "esprit humain." To right and left are grouped figures representing various schools of poetry. From the rock between the two groups gushes a stream, from which young and old eagerly drink. The left compartment is devoted to Philosophy and History. The first group shows the contest between materialism and spiritualism, the latter depicted by a woman in a sombre raiment, who touches with one hand a skull held by a seated figure, and raises the other as pointing to the sky. History, or perhaps, we should say, archaeology, is shown as a female figure reading the annals of the past on inscribed stones which are dug up for her study, and further on, by a seated figure of an old man engaged in the study of manuscripts. The figures representing Philosophy and Archaeology form a noble and most expressive group, beautifully composed and contrasted. The compartment on the right, dedicated to Science, is not equal to the last named; it shows a group of young men around a statue of Science, vowing themselves to her service with a fervour of expression which shows that M. de Chavannes understands the ardour which inspires the scientific student of to-day; other figures are shown absorbed in the study of botany, zoology, and geometry. This is certainly allegory in its purest and most immaterial form, and the artist has had the opportunity of realising on a great scale his own special aspirations in art. Unfortunately, the drawing of the figures leaves something to be desired, and the cartoon does not give a full idea of what the work will be when finished with that delicate harmony of colour which distinguishes the paintings of M. Puyis de Chavannes, and makes one pass over those deficiencies of execution which his friends wish to reckon among his special merits.

Opposite this huge triptych is another very large work by M. Besnard, who has not troubled mythology in order to find a poetic allegory for the decoration of the Mairie of the First Arrondissement. On the threshold of a house, lighted internally by fire-light, a very old couple are placed, the wife sleeping, leaning on the shoulder of the companion of her life. The latter leans in his turn on a staff, and looks up towards the stars; a young mother and child behind him represent the earlier stages of human life. The contrast between age and death, youth and life, is finely brought out; the figures are expressive and well modelled, the colour fine and satisfactory as to decorative effect. It is altogether a composition which stamps M. Besnard as one of the masters of the new school. This is an allegory simple and obvious in meaning and which is eternally true, and addresses itself to the feelings and experience of all; after which one cares very little for

such allegorical prettinesses as M. Bongreard's "L'Amour Vainqueur," which is among the popular things of this Salon.

It is also for a Paris Mairie that M. Lévy has painted his "La Gloire décernant des Palmes," a pendant to his work in last year's exhibition, but not equal to it in colour. The ceiling by M. Maillard, symbolising "Instruction donnée par la Ville de Paris à ses Enfants," is intended for the Mairie of the Third Arrondissement; an array of stout personages of a remarkably vulgar type. It is odd that the pictures executed for the municipality have never been so classic in character as since the establishment of the public competitions, which were supposed to lead a re-action against the classicity of the Institut.

M. Clairin, who up till now has followed piously in the steps of his former friend, Henri Regnault, and painted Oriental scenes with a richness of colour which made one forgive their theatrical character and composition, has also taken up an unfortunate whim for allegory. His "Apothéose de Victor Hugo" takes us back to the night of the obsequies: Chiraociers sitting motionless on their horses hold torches which light up a catafalque covered with flowers; while a diaphanous figure, apparently representing Poetry lamenting over the bier, hovers above the line of troops. The colour is false, the effect is false, and the figure which should be the principal becomes only an accessory, the soldiers with their long cloaks forming the most prominent portion of the picture: the whole thing is an absurd mingling of realism and fantasy.

The rest of the allegories are not much happier. The "Armide abandonnée" of M. Jacquinet surprises one by a complete absence of anatomical structure or modelling, and the "Andromède" of M. Caroux Duran, in spite of its unquestionably fine qualities of colour and technique, cannot be counted among the best productions of that accomplished painter. If we pass to historical painting, we find in the "Cleopatra" of M. Cahanel the same precision of drawing, the same finish, the same hardness which have usually characterised the works of this correct painter, who has had such an unfortunate influence on many of the rising generation of painters. The subject, too, is a cruel and revolting one; it represents Cleopatra reclining languidly on a lion skin, watching the effect of various poisons on the unfortunate wretches who have been selected *à corpora vita* for experiment.\* The scene wants atmosphere. The marble-looking figure does not seem to detach itself from the draperies, and seems rather as if a part of the decoration of the Egyptian palace which M. Cahanel has painted with great minuteness of detail.

M. Cormon's "Vainqueur de Salamine" is surrounded by an enthusiastic crowd, in which the feminine element predominates. This large picture, commissioned by the State, would do exceedingly well to decorate the "Foyer de la Danse" at the Opera House, or (better still) for the Cirque Olympique, and the figurants in the short skirt recall the well-known type of the grisettes of Batignolles and Montmartre. One cannot deny to this work, however, the praise of spirit and good decorative effect, as well as a great deal of ability in composition. M. Roghegros, of course, gives us one of his usual scenes of slaughter. This time it is the Roman conspirators setting on the body of Caesar, and all desirous, as Pintarich tells us, "to have a hand in shedding his blood, as if it were the libation at a sacrifice." The picture, painted, one may say, with a kind of fury, shows great deficiencies of technical training, but certainly reveals the true temperament of an artist.

M. François Flameng, more fortunate than M. Paris de Chavannes, has been able to completely finish, before the Salon, the decorative painting commissioned from him for the Sorbonne. The picture, intended for the staircase of the "Faculté des Lettres," is divided into three parts: First, St. Louis giving to Robert le Sorbon the charter of foundation of the Sorbonne; next, Abelard instructing his disciples on the hill of St. Geneviève; and, lastly, the Prior Jean Heynin installing, in the cellars of the Sorbonne, the first printing-press established in France. M. Flameng has been unfortunate in not being content to remain himself and depend on his own style; he has gone

into imitation of early masters; his triptych includes great merits and vexatious defects; his Abelard in particular seems almost like a caricature. The scene is full, however, of curious details, and presents much of interest in an archaeological point of view.

M. Paul Laurens, that conscientious and unpretending but really learned artist, takes from the war against the Albigenses the subject for a small painting, of great interest. His "Agitateur du Languedoc" is a work of great power. The monk with the ascetic profile, threatening figure, and coarse garment, forms a striking contrast with the bishop in rich chaubles, immovable in their stalls.

Owing to the official direction given to the subjects of painting during the last few years, religious pictures are becoming more and more rare, since neither the State nor the municipality ever commission a work of this kind, and the church revenue are not sufficient for the ecclesiastical authorities to play the part of Mecenas. Accordingly, most paintings dealing with subjects from the Bible are treated rather as scenes of *genre*, as in the "Salomé" of M. Roghegros, or as studies, like the "Herodias" of M. Henner. The "Last Supper" of M. Uhde stands out, however, as an exception. Two years ago this artist exhibited a Biblical composition treated with very modern feeling, and with much originality. His present work has the same characteristics, and his Christ and Apostles are completely free from the trammels of the traditional church painter. Unfortunately, the colouring is dull and grey, and the work is not equal to his former painting. M. Dietz's "Adoration des Bergères" goes to an exaggerated extent in the direction of modern realism, and his "Virgin" is a Parisian grisette, whose type is certainly not in any sense Biblical.

M. Girardot goes to the Old Testament for the subject of his large painting with two figures, "Ruth and Boaz." This composition, painted in a very broad style, is one of real power; the pale and indistinct moonlight effect is finely rendered.

We referred to M. Henner just now. His "Herodias" has, in fact, not the least claim to any Biblical name; but there is a great charm in this young girl, whose blonde and pretty hair is familiar enough by this time. Last year it appeared on M. Henner's canvas as "Orpheline," and emerged from a black hood. To-day it emerges, with bare neck, from a red drapery, which gives full value to the whiteness of the arms and bosom; but, in spite of the painter's great ability, this repetition of the same model becomes wearisome.

Military subjects are exceptionally numerous this year; perhaps these are a kind of artistic reflection of the ideas which have been hovering on the political horizon lately. It must be observed that the Government have commissioned a certain number of works for the *salles d'honneur* of various regiments, and the artists who have received these commissions are here in great force. We notice no less than a dozen pictures of this class, worse than mediocre; but one may except from this emmury M. Delahaye, M. Morot, and M. J. Lewis Brown.

The first-named has painted with great vigour the charge of the 12th Hussars at Marengo, a picture full of movement and of good detail. Unfortunately the painter, who apparently was not sufficiently up in the anatomy of the horse, has thought well to supplement his studies by instantaneous photographs, the odd results from which are puzzling enough to the public, and which give to the animals the appearance of wooden horses. This result is most of all perceptible in a picture by M. Arus "the Eleventh Artillery at Solferino," which, nevertheless, is not without a certain amount of what is called "go." In M. Aimé Morot's "Bataille de Reischaffen" we find the same powerful qualities which distinguished his "Rezonville" of last year. In the foreground the cuirassiers are in headlong charge; behind them other squadrons remain motionless, waiting for the order to charge. The helmets flash in the sun, and the line of French *trouvailles* stretches far over the green country, the bright aspect of which contrasts forcibly with the painful incidents of war.

Mr. John Lewis Brown's "Hohenlinden," presented by the State to the eleventh regiment of Chasseurs, is a cleverly composed scene, full of aerial effect, where the wind blows freely over a landscape covered with deep snow. In the foreground the French cavalry are charging the

Austrian squares. There is extraordinary life and vigour in this painting, a thorough knowledge of horse painting, and an ability in the treatment of colour which stamps this as one of the best battle pictures in the Salon. The Government has unhappily not always been so fortunate in its commissions of this kind. With the exception of one work by M. Sargent, we find among the remainder only such paintings as we prefer to pass over in silence.

By the side of these pictures, in glorification of special events of modern warfare, appears the "Guerre" of M. Roll in all its sad and sanguinary realism. He does not paint the heroic deeds of hand-to-hand fighting. We are here opposed to an invincible enemy, who strikes from a distance. Personal heroism is replaced by the perfection of science. The scene is what may be called brutally real and painted in a masterly manner. The "Aérostation Militaire" of M. Loustannan makes a pleasant contrast to this. It is a curious scene, carefully observed and depicted. We may equally compliment M. Chaperon on his amusing scene of harrack life, "La Douche au Régiment."

We come here, however, into the field of *genre* painting, which this year, as usual, has numerous votaries, among whom M. Gervex is certainly in the first rank. His "Opération Chirurgicale" is a splendid bit of painting, telling its story admirably. A woman under anaesthetics and half undressed is stretched on a camp bed, surrounded by surgeons, pupils, "religieuses," and nurses. Near her is a table covered with instruments. A clear light illumines the scene and falls on the young patient. The heads of the spectators are expertly modelled, and the whole scene exhibits remarkable executive power. M. Brouillet has also gone to the hospital in search of artistic inspirations, and enables us to assist at a clinical lecture by Dr. Charcot, at a scene of hysteria, which impresses one like a night-mare. In these days, when hypnotism is so much disused, this picture naturally obtains a success, but its great artistic merit consists in the perfect resemblance in the portraits of Parisian celebrities among the spectators of the scene.

Another scene of modern life is illustrated by M. Béraud, who takes us to the Hall of the Palais de Justice, crowded with black-robed advocates and plaintiffs and defendants of various types. The "Salle des États" at the Louvre, by M. Béraud, where the idlers crowd round the easels of the amateur painters, is another well-studied scene of every-day life.

M. Alhot Fourie is making great progress. His "Noce d'Ouvrier" is a picture of amusing naturalism and wonderfully true. The scene passes on the green before a rural tavern at Yport; all the good people are in their "Sunday things," and rejoicing in this diversion from their usual labours; the bride, charming under her white garland, drinks gaily with an old peasant. Shafts of sunlight stream through the trees and sparkle on the bottles and glasses full of foaming cider.

The paintings of M. Jules Breton recall us to the more tranquil side of country life. Here, robust villagers gather in their crops; there, the peasants return homeward at the end of the day, across fields purpled with the evening light. These pictures give one the impression of the colour of nature at the close of a summer day. This impression is still more vividly given in M. Skredsvig's Norwegian scene, entitled "Le Soir de Saint-Jean," which has the charm and simplicity of Millet. "La Fenaïson" of M. Lhermitte recalls the vigorously-painted scenes and true feeling of the lamented Bastien-Lepage; it is a beautiful picture full of nature, though a little uniform in its tonality. The "Pain" of M. Démost Breton should also be mentioned. Before an open oven, the fire from which throws a red gleam over him, a peasant is looking to the baking of the bread; a young wife is looking on with interest, holding two stout children, who jostle each other while the elder looks with a curious eye at the labour of his father. A striking contrast between these healthy children and the *gamins* of M. Pelez "Nid de Misère," where two poor children, blue with cold, sleep with arms interlaced, scarcely covered with mean rags. M. Pelez like this class of subject, and parades before us every year these dramas of misery. This may be overdone, but there is more of human interest in them than in the fashionable prettinesses of M.M. Heilth and Stewart, whose favourite

\* "She hath pursued conclusions infinite Of easy ways to die."

Anthony and Cleopatra.

scene is Bougival, the Paradise of Parisian boating people.

The "Theodora" of M. Benjamin Constant, impassible amid Byzantine luxury, is a worthy pendant to his "Justinien" of last year; and M. Worms re-edits once more his inevitable Spaniards with wearisome persistence. We may notice also the singular picture which M. Raffaelli entitles "La Belle Matinée," and which deserves a better place.

In still life, the admirable fruit paintings of M. Vollon are perfect in their illusive realism, which, in this class of painting at all events, is the object to be aimed at. Those of M. Bergeret are of more precise but also more hard execution. M. Claude exhibits some fish which rival, in realism, the rabbits of M. Philippe Rousseau; and M. Gilbert combines poultry and game successfully on a big canvas, which certainly might with advantage have been reduced to more modest proportions. As for M. Bizet Desgoffes, who has always something of interest for those who admire his perfect execution (devout, however, of all sentiment), there are some peaches and grapes of his which seem to be carved out of the same onyx as the marvellous vase which accompanies them.

The school of landscape-painters still includes some artists whose works bear the indelible stamp of their former successes. In this category of forgotten talents are the names of MM. Bellot, Benouville, de Curzon, and Ciceri, whose pictures, most conscientiously painted, appear to-day singularly old-fashioned. For them the study of nature was subordinate to certain conventions which they could not escape from. The sky, the trees, the distances, are painted, not as they really appear, but after a traditional and almost mathematical formula. M. François himself, in spite of his great talent, has barely escaped these dogmatic exigencies, and his decorative panel, "Winter," although a very clever work, presents a hard metallic aspect, which contrasts disagreeably with the clear green of M. Bernier, the deep-toned landscape of M. Binet, the misty light in M. Péraire's scenes, or, still more, the fresh verdure of M. Pelouze, whose "Source Bergerette" is particularly remarkable. M. Normann, who for some time has given us landscapes painted in a bizarre tone, has this year made a great success with a midnight sun, the strange purple colour of which takes by surprise a public who are little acquainted with Norwegian atmospheric phenomena. We must humbly confess that we much prefer to these *tours de force*, the simple and true landscapes of MM. Hareux, Rapin, and Harpignies.

After having, up to the present time, confined himself exclusively to *genre* painting, M. Duez has resolutely attacked landscapes, and with this first attempt has at once established himself as a master. The cows resting in the grass, on the top of a cliff in Normandy, seem to be gazing placidly at the moon, which is reflected in the sea. There is a real artistic sentiment in this simple composition, a great deal of poetry, a remarkable power of execution. As powerful in effect, and as simple in the means employed, is the "Bœufs au Labourage" of M. Vayson; the strong animals stand out in relief against a blue sky. This picture gives a sense of reality; a faithful interpretation of nature. We must also mention a picture representing a shepherdess watching in the twilight, by the same painter.

There are always plenty of sea-pieces. The picturesque shores of the Mediterranean have tempted many painters, amongst whom M. Olive, after M. Vollon, is the only one who has thought of painting the Port of Marseilles with its true colouring. The same faithful interpretation characterises the two views of Havre by M. Maurice Courant. Very curious also are the two sea-pieces of M. Meudag, especially the view of Scheveningen, and the view of the Thames by M. Lionel Walden, where the steamboats are silhouetted against a rosy mist.

We will conclude by a glance at the portraits. Naturally enough there are plenty of repetitions of General Bonlangier. M. Debat-Ponsan represents him on horseback, in full uniform, saluting the public with a pretentious gesture; and M. Armand Dumaresq gives us a bust portrait of him, with a grave and pre-occupied air. Resemblance apart, the merits of these official portraits is small enough. They entirely want sincerity and simplicity. The portrait of M. Alexandre Dumas is remarkable for an intensity of life, a vivacity of expression, which

places it among the best productions of M. Donnât. It is a pity that he has exaggerated, by a wilful coarseness of handling, the accentuation of the features, which thus lose the *finesse* of expression so characteristic of the author of the "Dame aux Camélias." We do not care for M. Bonneron's expressionless portrait of a little girl. M. Léon Comerre exhibits two good portraits, especially that of a young blonde lady in a ball dress. All the best qualities of M. Morot are to be recognised in a portrait of a young lady in white satin, a work of very distinctive character. M. Pille exhibits an excellent portrait of M. Vayson, the painter, in his studio, full of various æsthetic necessities carefully painted. M. Jacomb-Hood, who has studied under M. Laurens, sends a very interesting portrait of a young girl, whose delicate beauty is finely contrasted with the deep mourning dress she wears. We may note also a very good portrait of M. Mounet-Sully in the part of Hamlet, by M. Chartran.

Naturally, in this rapid survey we have had to pass over entirely many more or less able works, the enumeration of which would have occupied too much space, but which go to swell a total of good work which renders this Salon superior to that of last year. The sculpture exhibits also include some remarkable works, to be noticed hereafter.

#### OBITUARY.

Mr. William Longmire.—On the 11th inst., in his seventy-fifth year, died Mr. William Longmire, senior partner in the firm of Longmire & Burge. One who knew him well writes:—"As a builder, few men ever enjoyed a higher reputation for sound and good work, or retained in the same degree the unbroken confidence of his customers. He was eminently a man of thought, and there were not wanting some professional men who would gladly avail themselves of his sound judgment, the result of a life-long and varied experience. By those acquainted with him in business life, he will long be remembered for the genial courtesy of his manner and the almost inexhaustible fund of anecdote and humour which ever lent an air of pleasantness to all personal transactions." His funeral was attended by almost all the employes, amidst ample evidence of sincere and deep regard.

#### THE ARTISTS' GENERAL BENEVOLENT INSTITUTION.

THE seventy-second anniversary dinner of this institution was held on Saturday last at the Freemasons' Tavern, under the presidency of the Right Hon. E. Stanhope, M.P. Among those present were Sir J. Millais, R.A.; Mr. W. P. Frith, R.A.; Sir J. Gilbert, R.A.; Sir J. Fowler, Sir C. Mills, Mr. J. Pettie, R.A.; Mr. B. W. Leader, R.A.; Mr. J. Barlow, R.A.; Lord Crew, Baron de Stern, Mr. Henry T. Wells, R.A.; Mr. J. Oldham Barlow, R.A.; Mr. E. Crowe, R.A.; Mr. H. Moore, R.A.; Mr. Oscar Wilde, and Mr. Comyns Carr. The Chairman, proposing the "Artists' General Benevolent Institution," dwelt upon the difficulties attending the pursuit of any of the arts and professions in this country. No matter what branch they entered upon, great obstacles had to be overcome, but the difficulties in the way of the artist's calling appeared to him particularly great. He could imagine the struggles for public recognition, and the bitter disappointments they had often to experience. In many cases the hand of sympathy held out at the proper moment would save from utter ruin a clever but struggling artist, and it was for an institution which gave such assistance in a most unostentatious and economical manner that he appealed for support that night. The toast of the "Royal Academy" also proposed by Mr. Stanhope, was responded to by Mr. Wells, R.A., in the unavoidable absence of Sir Frederic Leighton. The Treasurer, Mr. P. Hardwicke, announced the receipt of subscriptions amounting to 2,220*l.* He also stated that the late Mr. Cousins, R.A., had bequeathed 5,000*l.* for the benefit of the Institution. One hundred and sixty-one applicants had been relieved during 1886 with the sum of 3,011*l.* Since the establishment of the Institution in the year 1814, 4,644 donations have been granted amounting in the aggregate to 78,386*l.*

#### SANITARY LEGISLATION CONFERENCE.

OUR readers will remember that this Conference was convened by the Sanitary Assurance Association to consider and report upon the Sanitary Registration of Buildings Bill, and that the following institutions appointed representatives as members of the Conference, namely, the Royal Institute of British Architects, the Surveyors' Institution, the Public Health Medical Society, the London Sanitary Protection Association, the Association of Municipal and Sanitary Engineers and Surveyors, and the Royal Institute of Architects of Ireland. At its first two meetings the principle of the Bill was unanimously approved, and six out of the seventeen sections of which the Bill consists were, with amendments, agreed to.

The third meeting of the Conference was held at the rooms of the Sanitary Assurance Association, 5, Argyle-place, Regent-street, W., on Monday afternoon, when the President, Sir Joseph Fayer, K.C.S.I., M.D., F.R.S., again presided. After the confirmation of the minutes of the second meeting, and the reading of correspondence, the Conference resumed its consideration of the details of the Bill, Section 7 of which was in part agreed to at the last meeting. Mr. Mark H. Judge, A.R.I.B.A., proposed, and Mr. H. D. Appleton, F.R.I.B.A., seconded, that the Institution of Surveyors be added to those mentioned in Clause 1 of the section. This was agreed to, as were also two other amendments, one substituting five years for three years in Clause 2, and the other adding to Clause 3 a provision that the certifying officers of the Sanitary Associations should be qualified under the Act. The discussion of this section was a protracted one, in which the Chairman, Mr. C. C. Lacey, M.P., Mr. David Finlay, Mr. Joseph Smith, M.R.C.S., Mr. H. Leonard, C.E., Mr. Charles Jones, A. Inst. C.E., and Mr. Judge took part. Ultimately the section was agreed to as follows *mem. com.*—

"7. The Local Government Board, or corresponding authority, shall issue Licenses in Sanitary Practice to the following persons and Corporations, that is to say (1) Members of the Royal Institute of British Architects, Members of the Institution of Civil Engineers, Members of the Royal Institute of Architects of Ireland, Members of the Association of Municipal and Sanitary Engineers and Surveyors, and Members of the Surveyors' Institution, who are registered in accordance with this Act as qualified in Sanitary Practice. (2) Architects and Civil Engineers who have been in practice three years at the passing of this Act and who shall before January 1, 1890, prove to the satisfaction of the Local Government Board that their practice as Architects or Civil Engineers has been a *bona fide* one, and has included the designing and carrying out of constructive sanitary works. (3) Sanitary Associations incorporated by license of the Board of Trade provided their certifying officers are registered as qualified in Sanitary Practice in accordance with this Act. (4) Medical practitioners registered as qualified in sanitary science. (5) Persons who are Medical Officers of Health at the passing of this Act. (6) Persons who at the passing of this Act hold appointments as Engineers or Surveyors under the Public Health Act, provided they are members of one of the institutions mentioned in subsection 1 of this section. (7) Such other persons as the Local Government Board or corresponding authority may consider qualified after examination."

Considerable discussion also took place on the 8th and 9th sections, but they were agreed to with verbal amendments.

The Conference then adjourned till Monday next at two o'clock.

**The Disinfection of the London Sewage.**—At the meeting of the Metropolitan Board of Works announced for Friday, the 20th inst., the Works and General Purposes Committee will present a report recommending the Board to advertise for a quantity of manganate of soda, not exceeding 6,000 tons and not less than 2,000 tons, to be delivered in such quantities and at such places and times as the Board may from time to time require. Mr. E. Rider Cook has given notice that he will move, as an amendment:—

"That no further purchases of manganate of soda be made until Sir Henry Hoare shall have reported upon the advisability of using it in the sewers, and that it be referred to the Works and General Purposes Committee to consider if some less costly disinfecting agent cannot be obtained for use at the outfalls in the event of the condition of the river Thames becoming such as to render the use of disinfectants desirable in connexion with the discharge of sewage."

**Proposed Cathedral for Brisbane.**—The Bishop of Brisbane suggests, in a letter written to the *Brisbane Courier*, that a cathedral shall be erected for the diocese of that city, to serve as a memorial to the Queen's Jubilee. The letter has been received with general approval, and a meeting is about to be held in favour of the movement.

**Illustrations.**

**BRANCH BANK OF ENGLAND,  
FLEET-STREET.**

**T**HIS building is being erected by the Bank of England at the corner of Bell-yard and Fleet-street (partly on the site of the famous "Cock" Tavern) to take the business now carried on in certain rooms allotted for the purpose in the Law Courts.

It will contain the usual arrangements of a bank on the ground-floor and basement, and a residence for the Agent on the upper floors.

The entrance to the bank will be in Fleet-street; that to the Agent's house in Bell-yard, which will be widened considerably.

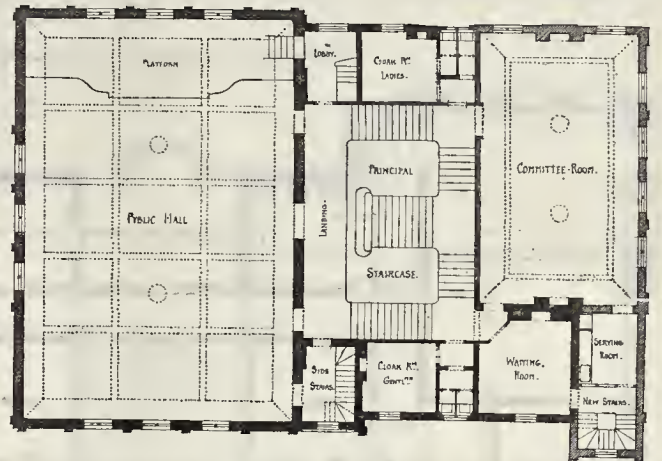

The rusticated base shown on the drawing is of Aberdeen granite. At the nearest angle the height of this base is 11 ft. from the pavement, which it is necessary to state, as the figures, having been unfortunately drawn much too large, give a false idea of the scale of the building.

The superstructure will be of Portland stone, polished granite being used for the columns and for the panels of pilasters and spandrels of arches.

The building will be fireproof throughout, Messrs. Lindsay's system being used for floors and roof.

The contractors are Messrs. Dove Bros., who are carrying out the building from the designs and under the superintendence of the architect, Mr. A. W. Blomfield, M.A.

The drawing from which the illustration is taken is at present hung in the Architectural Room at the Royal Academy.

**FIRST-FLOOR-PLAN.**

*Plan of Hampstead Vestry Hall, showing recent Additions.—Mr. Frederick Mew, Architect.*

**SUNDERLAND MUNICIPAL BUILDINGS.**

The illustration which we give of this building is from a drawing now in the exhibition of the Royal Academy. Mr. Brightwen Binyon, F.S.A., of Ipswich, is the architect, his design having been selected in a competition held in the spring of 1886.

The contract has been let to Messrs. E. H. & S. Allison of Sunderland, for 25,120l. The architect's estimate sent in with the competitive design was 25,500l. Mr. John Robinson has been appointed clerk of works. Mr. Frank Ashwell, of Leicester, will supply the heating and ventilation. The heating will be effected by means of low-pressure steam, each room being supplied with coils and fresh air inlet, and ventilated by means of extraction flues carried into an upright shaft in the tower.

The floors generally will be constructed of Homan & Rodgers's patent fireproof flooring, and the walls of the court-yards and areas for light will be faced with the Farnley Iron Company's glazed bricks.

The walls externally will be faced with Prudham stone, and the entrance hall and main staircase will be worked in Dennick stone with columns of polished red granite.

The building is now in course of erection, and the foundation-stone will, it is anticipated, be laid on "Jubilee Day." The work is to be completed in the course of two years.

**ADDITIONS TO ST. SEPULCHRE'S  
SCHOOLS, NORTHAMPTON.**

These additions consist of an infants' room, 45 ft. by 19 ft., and a babies' room, 25 ft. by 17 ft. 6 in. (giving together gallery accommodation for 169 children), with a hat and cloak lobby, 8 ft. wide, between the two rooms, which also communicates with the existing schools. A passageway, 5 ft. wide, is preserved on the north side to give a separate entrance for the infants, and as an approach to the playground and offices at the back. The old school being placed almost in the centre of a rather limited site, necessitated the addition being brought up to the boundary. Funds did not permit of the front fence being included in the contract. The front walls are built of yellow Daston stone lined with brick, the dressings of hard brown. All the floors are of wood block. Both rooms have fresh-air ventilating stoves, and gratings in the ceiling communicate by zinc tubes with a Ferguson's extract ventilator.

The works were carried out last summer by Messrs. Reynolds & Son, builders, Northampton, for a total cost (including some slight additional works to the old building) of 476l. 15s., under the superintendence of Mr. Thos. Garratt, architect, London.

**BUSINESS PREMISES AND RESIDENCE,  
WIMBLEDON.**

THESE buildings were erected at the corner of Hill-road and Woodside for Messrs. D. Thomson & Sons, florists. The large conservatory showing at the front is the general entrance for customers, and leads to the flower-room and offices, whilst another entrance is provided in Woodside for the seed-shop and general sale-room. In the rear, and communicating with the business portion, is the house, consisting, on the ground-floor, of dining and drawing rooms, kitchen, scullery, &c.; and upstairs are six bedrooms, bath and water-closet, with a large lumber-attic in the roof. The materials are red brick and tile, with rough-cast to upper story, and, with the picturesque surroundings, make a pleasant group. They were carried out by Mr. W. Harmer, of Wimbledon, at a cost of about 2,200l., from the plans and under the superintendence of Messrs. Potts, Sulman, and Hennings, architects.

**VESTRY-HALL, HAMPSTEAD, SHOWING  
THE RECENT ADDITIONS.**

THE alterations and additions to the Vestry-hall, Hampstead, which, together with the finishing and decoration of the entire building, were completed last year, consist mainly of the erection of a new committee-room in the rear of the existing structure on the upper floor, with a staircase and serving lobby adjoining. A retiring-room for musicians and others has been provided over the ladies' cloak-room and closets, approached from the lobby next the public hall, and also extended lavatory accommodation in connexion with the Board-room on the ground-floor.

Messrs. Gould & Brand, of High-street, Camden Town, were the contractors for the whole of the works, which, including the decoration of the principal apartments, have been executed from the designs and under the superintendence of Mr. Frederick Mew, architect.

**CHURCH OF ST. JOHN THE BAPTIST  
(R.C.), BRIGHTON.**

THE church was erected in 1835 on the model of St. Mary's, Moorfields, with a portico in *antis* as the feature of the exterior, the interior having a bold cornice, but an otherwise flat and unrelieved ceiling, 35 ft. 6 in. in width; there were, however, a handsome marble altar and font; a fine altar-piece in statuary marble with the Baptism of Our Lord, by Carew; and other sculpture, notably the monument to Mrs. Fitzherbert, who is buried near to the monument. A sanctuary, Italian in character, with side chapels, was added a few years since, designed by the late Gilbert Blount;

and the side windows have been filled with good stained glass by Messrs. Lavers & Westlake.

The constructional roof of the nave, hitherto concealed by the flat ceiling, has very substantial queen-post trusses, and it is now proposed to remove the ceiling, to case up and otherwise decorate the timbers, and by a few other carefully-designed modifications, to which the present construction lends itself, to gain a regular and interesting architectural effect for the interior, all the old constructional and monumental work being preserved intact.

The columns of the portico are constructed of brickwork cemented, and are dilapidated, besides being much in the way, as only the central intercolumniation is wide enough for ingress; it is therefore proposed to remove them, and to substitute an enriched arch, with a sculptured tympanum over the double doorway; and, as the interior is dull in effect, to brighten it by raising the windows in the façade, and piercing the pediment by a large circular window. The projected work also includes the bell-tower shown in the drawing, the lower part of which is planned as the baptistery, in which the present marble font and the marble group of the Baptism, now very badly lighted, will be placed.

The design for the whole of the work has been prepared by Mr. S. J. Nicholl, architect, London. The illustration is from the drawing exhibited at the Royal Academy this year.

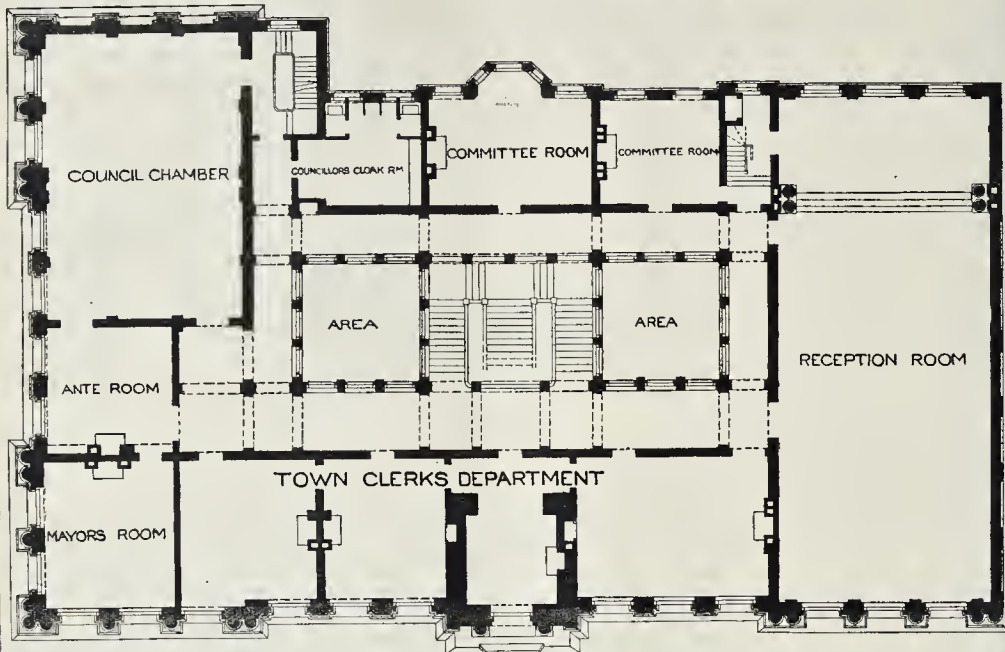

**Proposed New Square at Sydney.—**The

Government of New South Wales is considering a scheme which has been submitted to it proposing to transform a block of land in Sydney into a fine square. The site is on the west side of George-street, between the Town-hall and Market-street, on which now stand the Central Police-court and Markets. It is understood that the Minister of Justice is quite prepared to hand over the site of the police-court on condition that the corporation at the same time gives up that of the markets, and in view of the fact that the City Council is to be granted 8,000l. annually for ten consecutive years, provided they will give their support to the proposal, there ought to be no difficulty in carrying out the project. In the event of the land being obtained the square will be called the Centennial-square, in commemoration of the hundredth anniversary of the foundation of Sydney.

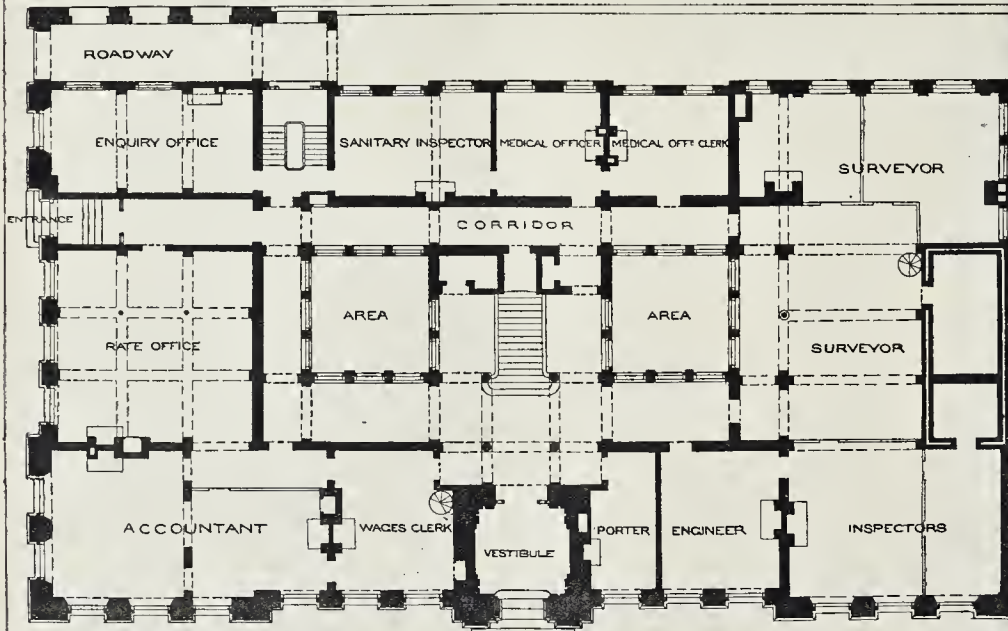

**Edinburgh Architectural Association.**

It has been decided by the President (Mr. Hippolyte J. Blanc) to change the subject of the competition in which he has offered prizes, "Designs for Workmen's Dwellings," to "Suggestions for the Restoration of Falside Castle" (near Musselburgh). The competition is open to all members of the Association who are not more than twenty-five years of age.

THE UNIVERSITY OF CHICAGO PRESS

THE NEW CLUB-HOUSE FOR THE  
NATIONAL LIBERAL CLUB.

THIS new building, visited by the members of the General Conference of Architects the other day, is fast approaching completion, and will be formally taken possession of by the members of the Club on Monday, June 20, in time for the Jubilee celebrations. By the kindness of the architect, Mr. Alfred Waterhouse, R.A., and of the Secretary to the Club, Mr. William Digby, C.I.E., we are enabled to give plans of six of the floors, together with such descriptive notes of the building as we have been able to get together within a comparatively limited space. Although the plans we give are of necessity very considerably reduced, they will suffice to make clear our description. We may mention here that in the *Builder* for May 9, 1885, we gave a view of the Club-house, together with the plan of the upper ground-floor. The plan of this floor has not been departed from in execution, although one or two of the apartments have been allocated to different uses than was intended two years ago; therefore, for convenience, we repeat the plan now, showing the allocation of the rooms as finally decided upon. We hope to be able to give views of some of the interiors soon after the Club-house has been opened. Without further preface we will proceed to describe the new building somewhat in detail.

With regard to the foundations, although the Club-house stands on what was the foreshore of the river at this point before the Embankment was made, very little difficulty was experienced. It was found that the Embankment work, executed by Mr. Webster for the Metropolitan Board of Works, and carried down into the line play, formed a complete cofferdam, and quite shut off the tidal water from the ground, whatever might be the height of the tide. The foundations of the building are carried down some 25 ft. below the level of the street pavement in Whitehall-place, and rest on solid masses of concrete applied or stepped at the sides in order to obtain a wide and solid bearing. These footings, which are of Portland cement concrete of extra good quality, rest on a hard and compact bed of yellow sand and gravel just above the level of the ground-water. In order to get down to this depth it was necessary to remove, firstly, a layer, about 10 ft. thick, of made ground and soft stuff; secondly, a layer, about 7 ft. thick, chiefly the residue of alluvial mud; and, thirdly, a layer of grey sandy loam from 3 ft. to 5 ft. thick. The brick bondings of piers and walls, which sustain great superincumbent weight, are of hard gault bricks supplied by Mr. Joseph Hamblet) set in Haslemort.

Having said thus much as to the foundations, we will briefly describe the chief features of the building which they support, beginning with the wine-cellar, which really forms a sub-basement, and is the lowest apartment in the building, with the exception of the sub-basement of the tower, which is on the same level and will be utilised as a beer-cellar, approached by one of the two staircases leading to the wine-cellar. The floors of the wine and beer cellars are about 17 ft. below the pavement level of Whitehall-place. The wine-cellar is 97 ft. long, with a general width of 35 ft., and is about 6 in. high from floor to ceiling. In recesses along the sides some of the wine-bins are placed, but by far the greater number of these are ranged in two double tiers erected along the centre of the cellar in the direction of its greatest length. These bins, of which there are upwards of 400, are built of brick and stone, the side partitions and back division walls being of brick, while the shelves are of York stone flags. These two double-ranges of bins along the centre of the wine-cellar are built right up to the underside of the ceiling, and, indeed, serve a secondary purpose, that of giving support to the floor of the Smoking-room above.

Ascending to the basement-floor, the general level of which is about 12 ft. below Whitehall-place, the most important apartment to be noticed is the Smoking-room, which has its floor 8 ft. 6 in. below the level of Whitehall-place. (See plan of basement floor.) It is made over the wine-cellar, and is nearly 100 ft. long by 35 ft. wide, not reckoning the space gained by the two large bay windows facing Whitehall-place, nor the deep recess on the other side of the room. In this recess, by the way, is a fireplace, and there will be two other fireplaces in this room, one at each end. The

room is about 23 ft. high from floor to ceiling. In addition to the three fireplaces just mentioned warmth will be supplied, when necessary, by means of steam-heated coils, some of which will rise through the centre of the floor and be concealed by ottomans. Ventilation will be provided for by inlets for fresh air at the skirting level, as well as at a height of some 10 ft. or 12 ft. This fresh air will be forced into the room in regulated quantities at each aperture, and will be warmed when necessary. These arrangements are referred to further on. Apertures in the ceiling and elsewhere at the top of the room will be provided for extraction purposes. These apertures lead into trunks and upcast flues or shafts, the extractive action being maintained and accelerated by means of steam-heated coils. The lighting will be by means of electricity, on the Swan-Edison system, as hereafter described. In the large Smoking-room, of which we are now speaking, the lamps will be suspended a few feet below the level of the ceiling, but in some other apartments the lights will be nearer the ceiling. Architecturally, the interior of the smoking-room is very effective. The ends are played or canted at each side, with fireplaces in the centre, as before mentioned. These canted ends, the two large bay windows, and the deep fireplace recess on the opposite side of the room, are emphasised by projecting piers and detached columns,—the latter being constructive as well as decorative, for they stand well away from the walls, and diminish the bearings of the girders which take the weight of the floor above, besides lightning the load on the walls. These columns consist internally of wrought-iron stanchions, built up in sections, on Lindsay's principle. The ironwork is surrounded by a core of coke-breeze concrete, which, while being light in weight, will serve to protect the ironwork in case of fire. This core of coke-breeze is put on to the columns by means of moulds specially contrived so as to obtain correctness of diameter and entasis. It also affords an admirable "key" for the Burnmantoffs faience work with which the columns, in common with the greater part of the wall-surfaces and certain portions of the ceiling, are decorated. It may here be mentioned that, as will be seen by the plans, detached columns of this kind, serving the double purpose of construction and decoration, are to be found in the Dining-room, Grill-room, Reading and Writing Rooms, and Gladstone Library, the design and colour of the faience and tiles differing in each apartment. The floor of the Smoking-room, like the floors of all the larger apartments of the Club-house, is of fire-proof construction, being arched in concrete over the wine-cellar, in which respect, however, it is exceptional, as the floor construction generally is on Lindsay's system of steel decking, hereafter referred to. The floor surface of the Smoking-room is of Eber's marble mosaic work. The three mantel-pieces in this room are of Hopton Wood stone, with walnut over-mantels. The doors, sashes, and other joinery in this room are in walnut, well designed and admirably executed. Before leaving the Smoking-room, we may mention that it is served from a bar contained in the basement of the tower, a bar above the level of wine and beer cellars. To mention the other apartments in the basement, immediately beneath the Club entrance and vestibule is a large dressing-room for the men-servants, with bath-rooms adjacent. Lighted from the open area fronting Whitehall-avenue are two large bed-rooms or dormitories for men-servants. Adjacent to these are the Steward's office and the Receiver's office, opening on to a corridor leading to the tradesmen's and servants' entrance. At the end of this corridor (which is bounded on one side by the party-wall between the club-house and the residential-chambers known as Whitehall-court) are lifts for stores and provisions. Adjoining these lifts is the men-servants' dining-room, served by two more lifts, and well lighted from the large open area between the buildings known as Whitehall-court. Still nearer the river, and within the main walls of the building, at its south-east angle, is the boiler-room. Close by, but in the basement of the terrace which overlooks the gardens and the river, are the dynamo and engine rooms. At this end of the terrace is the open area for the admission of fresh air for the supply of the building. It will be drawn in by means of a Blackman air-propeller, and conducted by means of air-trunks to the various parts of the building,

being warmed when necessary by steam coils on Mr. Phipson's system. Of the heating and ventilation arrangements generally we give a description further on. Northward of the boiler-room, and divided therefrom by a corridor, is large storage space for members' luggage, &c. This space extends up to the north-east angle of the Smoking-room. In an irregularly-shaped space, surrounded by the various apartments and offices which we have described, is disposed the bottom flight of the grand staircase, which latter is planned within an oval, 42 ft. by 31 ft., and brought down to this level from the entrance vestibule for giving access to the Smoking-room. In the lower part of this staircase further storage-space is obtained. Before leaving the basement floor we may add that, in the basement of the terrace, and lighted by a large bay window at the north-east corner, is another dormitory for men-servants.

Ascending to the next floor, namely, the "Lower Ground Floor" (see plan), we find ourselves on a general level with Whitehall-place. We may here mention that the Club-house has a frontage of about 130 ft. towards the river and Embankment gardens; a frontage of nearly 160 ft. to Whitehall-place, and a frontage of about 94 ft. to Whitehall-avenue. The party-wall dividing the Club-house from Whitehall-court is 127 ft. long. The Club entrance is at the angle formed by the junction of the new street known as Whitehall-avenue with Whitehall-place, and consists of a boldly-projecting and sculptured doorway leading into a vestibule and hall some 15 ft. wide, leading direct to the grand staircase, of which more hereafter. The sculptured figures surmounting the doorway are by Mr. Christopher Smith. Most of the other carved work has been done by Messrs. Daymond & Son. On the left of the vestibule is a small reception lobby, and on the right is the porter's office, with his bed-room below, reached by a circular staircase. Further on, on the right-hand side of the entrance-hall, is a large waiting-hall, accessible to the porter's office from two points. Adjoining this waiting-hall, and lighted from Whitehall-avenue, is the Conference-room, 38 ft. by 35 ft. Accessible from a corridor leading to the grand staircase are the members' hat and coat rooms, retiring-rooms, and lavatory. On the opposite side of the corridor just named are ranges of bath-rooms and dressing-rooms for members. On this floor of the building, and immediately beneath the terrace walk overlooking the Embankment gardens, are a series of billiard-rooms and card-rooms, some of which are top-lighted. At the north-east corner of the building, a porch (shown to the right of the plan of the lower ground-floor), beneath the small detached circular helvedere on the terrace (see right-hand corner of plan of upper ground-floor) gives access to a passage leading to the staircase in the tower, which leads up to the Gladstone Library and to the members' chambers on the upper floor. The remainder of the lower ground-floor is occupied by the upper part of the Smoking-room.

We will now ascend to the "Upper Ground-Floor" by the grand staircase, which, as we have already mentioned, is elliptical in plan. It has been executed by Messrs. Farmer & Bridley, and consists of three flights of solid Sicilian marble steps, 8 ft. in width, and landings. A solid alabaster cornice runs up the whole height, on which rest pedestals, with plinths and capping of Pavonazetto marble, and discs of alabaster, carrying columns of choice Broccia Africana, with caps and bases of cream-coloured statuary, the balustrade between having a Pavonazetto plinth and capping, and alabaster balusters, the whole being finished on top with white alabaster arches. The lower part of the wall is lined with alabaster slabs on a Pavonazetto plinth, the architraves, arches, and soffits to doorways being in the latter material. The principal apartments on the upper ground-floor (see plan) are the Dining-room, 110 ft. long by 38 ft. wide, facing the river and overlooking the terrace which has before been mentioned.\* This is the largest apartment in the building. At the north-east end access is obtained, through a door on the

\* From this terrace, but not shown on the plans, a short flight of stairs, just by the first pier from the left-hand corner, leads down to the corridor on the lower ground-floor.

right, to a loggia opening on to the river terrace, and through a door on the left to the large Reading and Writing Room, which faces Whitehall-place, and is of the same size as the large Smoking-room below it. Over the entrance-hall and vestibule, and approached from the grand staircase, is the Drawing-room. Next comes the Grill-room, overlooking Whitehall-avenue. Between the Grill-room and the Dining-room is a corridor for members, and a large serving-room lighted from the area of Whitehall-court. Over this serving-room is a mezzanine containing retiring-rooms, lavatories, &c.

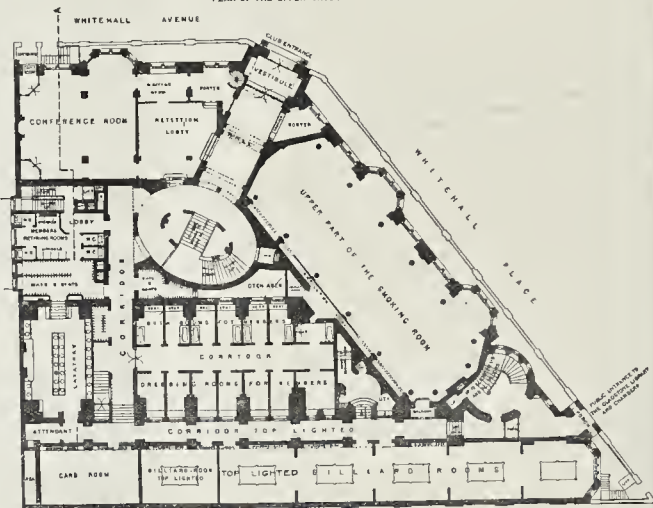

The principal apartment on the first floor (see plan) is the Gladstone Library, which is over the Reading and Writing Room, and of the same size as the latter and the Smoking-room, viz., about 97 ft. long, 85 ft. wide (exclusive of bays), and 24 ft. high. This Library will be approached from the grand staircase at one end and from the staircase in the tower at the other end. It will also open into the Smokers' Reading and Writing Room, which will overlook the river. This apartment is about 72 ft. long, and at one end has a large open loggia giving access to a balcony. Adjoining this room, and also overlooking the river, will be a private dining-room, 38 ft. by 35 ft. Behind this room will be another serving-room, and beyond that, and looking into Whitehall-avenue, will be the Committee-room, also available as a dining-room. Next will come the clerks' office and the Secretary's room, and, over the Drawing-room, the Members' Private Smoking-room. Over the service-room is a mezzanine giving more retiring-room and lavatory accommodation, and over the clerks' office is an additional room for clerks if needed. The grand staircase ends at the level of the first floor, and is lighted by a large lantern light, leaving the whole of the large internal area above it available for lighting the members' chambers and the domestic offices on the upper floors.

The second floor (see plan) contains about forty bedrooms, some of the larger ones having a recess, partly partitioned-off and partly intended to be curtained, for the bed. There are also bath-rooms, closets, &c. The third floor, which is almost identical in plan with the second floor, contains forty more bedrooms, besides bath-rooms, &c.; on both the second and third floors these chambers are disposed on each side of a continuous corridor running round the building, some of the chambers looking out from the three frontages, and others looking into the large inner area. On the fourth floor, however (see plan), accommodation has to be found for the kitchen, larders, pantry, scullery, &c., as well as for a number of the servants. The kitchen occupies the whole of the Whitehall-avenue frontage on this floor. The other portions of this floor are occupied as members' chambers and by servants' apartments and officers. Twenty bedrooms for members are obtained in the frontages towards Whitehall-place and the Embankment, but the servants' apartments and offices all look into the inner area, and are kept quite separate from the members' apartments by distinct though parallel corridors, approached by different stairs. The rooms on the fifth floor are, for the most part, located in the roof, and are largely devoted to storage purposes, and to bedrooms for the maid-servants. The Manager, Steward, and Housekeeper will also have their apartments here. The Manager's bedroom will be the topmost room in the tower, just below the open belvedere under the conical roof of the tower. From this belvedere, it may be remarked, a splendid view of London and its environs is to be had on a clear day. Above this open space, and beneath the slated conical roof, is an enormous tank containing about 100 tons of water, for working the hydraulic lifts, hydrants, &c. This tank will be supplied from the Chelsea Water Company's mains. It will thus be seen that the upper floors provide 100 bedrooms for members, besides kitchen and other domestic offices and servants' bedrooms. The building is 100 ft. high to the general line of coping. The gables and dormers go up above this, while the tower is 180 ft. high to the top. The building is faced with Portland stone externally, chiefly from the quarries of The Portland Stone Company, and roofed with green Westmoreland slates.

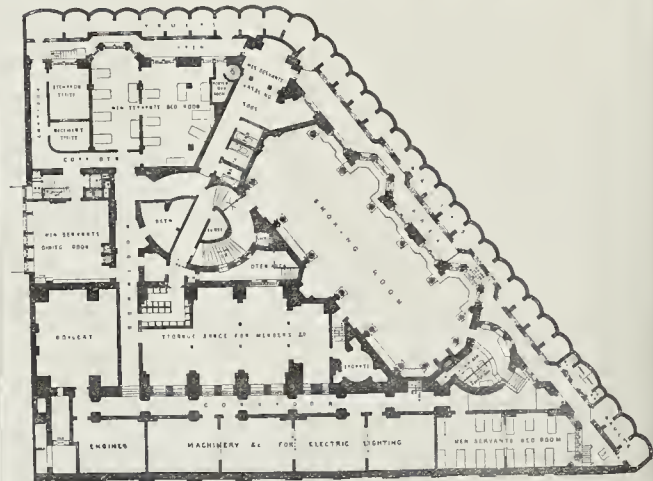

Having given this general description of the building, we proceed to describe in more detail some portions of its arrangement and construction.

PLAN OF THE FIRST FLOOR

The National Liberal Club.

dressing rooms, and the servants' rooms, are paved with 3 in. pitch pine blocks. The floors of the large Smoking-room, the Grill-room, and the large Dining-room have, for cleanliness' sake, been laid in mosaic, and it is intended to have small movable carpets under the tables and where else required. These floors are of Roman Meschiato, with rich borders between the columns. The entrance and staircase hall will also be laid with mosaic. The Billiard-room-corridor and other subsidiary corridors and retiring-rooms are laid with Ebner's improved Terrazzo mosaic, which makes an excellent floor, and is a cheap substitute for the more expensive Italian mosaics.

The ceilings, cornices, and casings to beams for the principal rooms have been executed by Messrs. George Jackson & Sons, of Rathbone-place, in their patent fibrous plaster. The enrichments were all specially modelled from designs supplied by the architect, Mr. Waterhouse. This fibrous plaster, as our readers know, has the great advantage of being fixed dry. It is screwed in large pieces to existing joists, no bracketing being required.

The staircase in the tower is fireproof, and has been constructed by Messrs. Dennett & Ingle. The wrought-iron balusters are by Mr. Peard (Hart, Son, Peard, & Co.).

In the decoration of the interior of the Club-house Mr. Waterhouse has adopted the use of Burmantofts faience, made and supplied by Messrs. Wilcock & Co. on a very comprehensive scale. For a building of this description it was thought desirable that as far as practicable the decoration should combine the qualifications of permanence, architectural treatment, and cleanliness. With this view the architect has adopted the material in a variety of ways, the result being effective without over-elaboration of ornament or cruddity of colouring. The large Smoking-room has its walls panelled in faience, the mouldings being old gold in colour, the panels a diaper of pale primrose, and the margin ivory and grey. Down each side of the room are columns, the cores of which are of iron and cement, as already described, with a covering of faience. The general result is very successful, the panels of the pedestals and the diapers of the shafts being especially noticeable. The colour of the lower portion of the pedestals is brown, picked out with bronze green, and the shafts are of the colour of old gold. These columns support an entablature, also treated in faience. The ceiling is cut up into square and hexagonal forms, arabesqued with designs in relief, supported by moulded ribs of canary wood screwed to wood framing bolted to the underside of the decking of the floor above. The larger panels are about 3 ft. square, each in four separate plaques supported at the intersection by a small metal boss. The arched and frieze on one side of the room are pleasing in effect. The workmanship is very good, and the appearance of the silver-grey tiles in the frieze panels is satisfactory. A pleasing feature is a faience balcony at one end of the room with access to it from one of the corridors on the lower ground-floor. The same material is being largely used in the Dining-room and in the Smokers' Reading and Writing Room. In the former the faience arches to the windows are full of character, and the rich brown employed in combination with the walnut fittings of the room when complete will give a distinctive feeling of comfort and character to this important room. In the Smokers' Reading and Writing Room the walls have been treated in panels on a distinct line from any other portion of the building, the methods employed being simple and the result satisfactory. The columns in this room, as throughout the building, including both pedestals, shafts, and caps, are all in Burmantofts faience. The billiard-rooms on the lower ground-floor, seven in number, are lined with faience up to 10 ft., panel and diaper treatment being again adopted, although there is considerable variety both in design and colouring. In a small room, originally intended to be used as the card-room, but subsequently appropriated as the principal lavatory, there is a very good faience frieze, and some well-executed pilasters in the same material. The principal corridors throughout the Club proper are lined with faience, and this treatment is also adopted for all the architraves to archways leading from main corridors. The outer wall of the grand staircase is being covered with faience in colours which harmonise with the general tone of the statbaster and marble. The entrance hall is being treated in

All the floors are of fireproof construction. As has been already stated, Lindsay's steel decking has been adopted by the architect for the principal floors, owing to its great strength and the saving of space obtained in being able to lay spans up to 30 ft. and 35 ft., with a floor thickness (including concrete) of only 15 in. Messrs. Lindsay's patent steel columns have also been used throughout the building, and while the floors may be said to be like so many diaphragms connecting and tying the building together, the weights are transmitted down the steel columns to the basement, thus relieving the walls of all undue strain or vibration.

The floors of all the principal apartments have been covered by Mr. J. F. Ebner, of Clerkenwell-road, either with parquet or mosaic. All the

parquet is laid on a new system patented by Mr. Ebner, described and illustrated in our last, and which consists in firmly attaching the wood to the concrete by means of specially constructed tiles with under-cut recesses on both sides; the tiles are floated on to the concrete, and the parquet is fixed to the tiles by a hard-setting bituminous composition, the whole forming a capital floor. All the members' chambers on the fourth, third, and second floors are paved with parquet in herring-bone pattern; but the Drawing-room, the Reading and Writing Rooms, the Cladstone Library, the Conference-room, the Billiard-rooms, and the private dining-room are of more elaborate but withal simple and effective designs. The corridors on the chamber floors, also the bath and

faience, the whole of the openings being arched; and the reveals and soffit panels to doors, balconies, windows, and other openings from the staircase, are also constructed in faience and panned. The tile-work in the Billiard-room-coriidor is by Messrs. Carter, Johnson, & Co.

The heating and ventilating arrangements were entrusted to Mr. W. W. Phipson. Two 97-horse power Babcock-Wilcox steam boilers are fixed in the basement. For the general steam service of the building, including the heating and ventilation, hot-water service supply, culinary department, electric lighting, pumping the return water from the hydraulic lifts up to the large cistern in the tower; and for each of the services, separate steam mains are provided and fitted with regulating valves. The Porter-Clark process will be adopted for softening the supply water for the steam boilers, and will also be used for the water supplied to the members' lavatories, baths, &c. The system of heating and ventilation adopted is a forced supply of fresh air, warmed or not, as may be required, in the several air-chambers previous to its distribution over the building, the points of admission into the apartments being at a low and at a middle level, with means for regulating it at will, as before mentioned. The diameter of the Blackman air-propeller is 6 ft., and it is capable of supplying at a moderate velocity 2,000,000 cubic feet of air per hour. The heating of the air-chambers is effected by low-pressure steam, passing through a series of coils or batteries of gill-pipes fixed in the same, with suitable means of moistening the air when necessary. These chambers are worked in series by a separate steam main, the whole being under control in the boiler-room, where the main distributor and main return collector are fixed. The steam having circulated through these chambers, and returned to the main collector, is then carried into the lower receiver of the return trap, and by an automatic action the water of condensation is lifted into the upper receiver of this trap, and is then forced by the alternative action of the valves into the boilers. The working pressure of the boilers being 70 lb. per square inch, this pressure is reduced, before the steam is admitted into the main distributor for heating, by a Royle reducing valve. By this means steam at any pressure can be used for heating purposes as low as 3 lb. per square inch, and the water of condensation, by means of the return trap, as above described, is automatically returned to the boilers. In the Billiard-rooms and Smoking-room direct radiation is used for heating, while for ventilation all these rooms are connected to the air-propeller. For the extraction of the vitiated air five up-cast shafts are provided, and the air in the same is rarefied by means of steam coils. By the construction of the floors, air-spaces over the whole of the ceilings are formed between the troughs of the decking, and by numerous perforations made in the ceiling an efficient outlet for the air is provided, the space between the ceilings and the under side of the steel deck floors being placed in direct communication with the extracting-shafts before mentioned. Valves are fixed on all the inlets, and also on the air supplies to chambers, and thus control will be obtained of the several main air deliveries. Sprays of water for cleansing the air are fixed near the propeller, and worked at high pressure. The whole of this work, including the steam boilers, &c., has been carried out by Mr. Wilson W. Phipson, M.I.C.E., of John-street, Adelphi. The grates and stoves used were supplied by Mr. D. O. Boyd.

The building is to be lighted by about 850 Edison-Swan incandescent lamps. In most of the rooms these will be suspended singly from the ceilings and enclosed in cut-glass globes. The suspending silk cords are of pale yellow silk, and are all but invisible when the lights are in use, an arrangement which gives the lamps an extremely light and airy appearance, and also ensures a perfect and equal distribution of the light. In the case of the Gladstone Library and the Reading and Writing Rooms, the lamps are to be placed close to the ceilings in the body of the rooms, supplemented by two-light pendants in the bays and recesses. Each of the large rooms is divided into several circuits, so as to admit of partial lighting, and each lamp in the members' chambers on the upper floors will be under separate control. All the dressing-rooms and water-closets are fitted with automatic switches, which cut off the light when the rooms are not in use, thereby

preventing waste of current. It is believed that this is probably a unique instance of a large installation in which every single lamp is controlled by a separate fusible cut-out; it has been carried out in strict conformity with the regulations which have been adopted by the fire insurance companies. There are in addition double pole cut-outs on the mains and sub-mains. The engine-room is on the river front, as before said, and in order to prevent any noise or vibration being perceptible in the billiard-rooms above, the utmost care has been taken in constructing the foundations of the machinery, which are isolated from the general foundations, and are of an exceptionally solid character. In addition the room will have a counter-ceiling below the iron decking, with layers of felt between the engine-bed and the brickwork supporting the same. The main switch-board is constructed of slate, on which are mounted massive gun-metal bars, so arranged as to admit of the complete control of each of the fifteen main circuits into which the lighting of the building is divided. Provision is also made for connecting a large battery of accumulators, with which it is contemplated to supplement the engine power, and the whole is so arranged as to admit of the connexions between the two sets of circuits, dynamo, and accumulators being interchangeable. The dynamo machines are of the Edison-Hopkinson type, constructed to run at 450 revolutions per minute. The engines are a pair of twin cylinder high-pressure horizontal engines, by Messrs. Marshall, of Gainsborough, and are fitted with special governing apparatus to ensure an equal and steady light under varying loads. The work has been carried out by the Edison & Swan United Electric Light Company, under the superintendence of Mr. T. O. Belslaw.

The kitchen, serving-rooms, &c., have been fitted up by Messrs. James Slater & Co., of the Holborn Engineering Works, with their own patent gas and steam cooking apparatus. The kitchen, sculleries, and larders have been arranged by the same firm, and all cooking apparatus is heated solely by either gas or steam. The sculleries are supplied with Messrs. Slater & Co.'s washing troughs, fitted with their combined water and steam inlet and waste outlet valves. The Grill-room is supplied with a large patent double gas grill, by which the whole of the grilling will be done, and with hot closets. The Smoking-room bar has also been arranged and fitted up by Messrs. Slater.

With regard to the lifts, the American Elevator Company is fixing one main staircase elevator, to rise from the Smoking-room floor level to the first floor, a distance of 58 ft. This will have an elegant car, with ample power, and will work in a brick shaft provided for it. There will be also a chambers lift, rising from the Lower Ground Floor to the fourth floor, a distance of 76 ft. This will be smaller than the staircase lift; it will also work in a brick shaft, and since, especially at certain hours of the day, its work will be heavy, it will run at high speed. There will also be a service lift, rising from the basement to the fifth floor, a distance of 112 ft. This, as its name implies, will be for the service of the Club-house, and for the servants as well. This also will have ample power, and will run at high speed. There will also be a wine lift, to take casks of wine, &c., from the ground to the basement level. This, however, will be a direct lift. The three first-named are of the American Elevator Company's Standard type of low-pressure hydraulic elevator. A large iron tank is fixed in the tower of the building, the water from which will be the motive-power for the elevators, and will also be available in case of fire. Since in this building steam-power is necessary for electric-lighting purposes, the elevators will discharge water as fast as it is used into a tank in the basement, and a Worthington steam-pump will be employed to lift the water back again to the tower tank, so that the water will be used over and over again continually, so far as the lifts are concerned; but water from this tank will also be used for other purposes, and the consequent continual fresh supply will keep the water in good condition. The cost of working the lifts in the building will therefore be merely the cost of pumping the water; and the working of the lifts only calls upon the steam- boiler employed for other purposes for the power required for the elevators, and this is estimated to not exceed three horse-power.

In order that the drainage arrangements of the building should be as perfect and complete

as it is possible to make them, the architect has adopted the Shone hydro-pneumatic system of sewerage. This system has been adopted as being the most effectual means by which the sewage in the metropolitan sewer could be prevented, in times of heavy rainfall, from flowing into the main and branch sewers of the building, and thereby flooding the basement. The sewage in the metropolitan sewer has been known to rise 13 ft. above Ordnance datum, which might, in case the flaps at the outlets into the metropolitan sewer failed, flood the basement to a height of 6 ft., if the building were drained on the ordinary plan, namely, that of allowing the gravitation sewers to discharge direct into the metropolitan sewer. But by interposing a Pneumatic Sewage Ejector between the Club premises and the metropolitan sewer, an effectual barrier is interposed against not only sewage gas, but also against the sewage itself, however high it may rise in the metropolitan sewer. The whole of the sewage and rainfall is conducted by means of 6 in. pipes into four manholes, situated in various parts of the basement. These manholes are each connected with a 6-in. outlet pipe, the gradients of which vary from 1 in 70 to 1 in 140, and by which the sewage gravitates to a manhole adjoining the ejector station, in the latter of which there are two of Shone's pneumatic ejectors, each of fifty gallons capacity; so that all the sewage and rainfall is collected at one point, and flows into the ejectors, which discharge it direct into the metropolitan sewer, even if the sewer is full. The compressed air which actuates the pneumatic ejectors will be supplied by a Westinghouse air compressor having a 6-in. steam cylinder and a 7½-in. air cylinder. The compressor is so arranged as to work automatically. The sanitary fittings, such as water-closets, lavatories, urinals, baths, &c., are by Messrs. Tylor & Sons.

Mr. James Hill, of Queen Victoria-street, has been entrusted with the contract for the whole of the locks and door furniture, together with the swing-door hinges, grip handles, sash and casement fittings, and all the brass-foundry work throughout. The locks are all under master-key arrangements, and Mr. Waterhouse's own designs have been carried out in the work generally. Mr. Pearse has supplied the metal ornaments, and Mr. Julius Sax has fitted the electric bells.

The cost of the building, exclusive of site, has been about 150,000l.

It only remains for us to add that the general contract was taken by Mr. George Shaw, of Westminster, and is being carried out now by his executors. The foundations were put in by Mr. Henry Lovatt, of Wolverhampton. The building, as a whole, reflects much credit upon the architect, Mr. Waterhouse, R.A. The design is Early Renaissance in character. The clerk of works, to whom we are much indebted for conducting us over the building, is Mr. Thomas Warhurton, a thoroughly practical and able man.

#### PUSH AND PULL LOCKS.

KAYE V. CHUBB AND SONS.

ON the 25th November last year, in an action for infringement of patent, brought by Messrs. Kaye against Chubb & Sons' Lock and Safe Company (Limited), Mr. Justice Mathew, sitting without a jury, gave judgment for the plaintiffs with costs. From this decision Messrs. Chubb appealed.

The question was whether a push and pull lock made by Messrs. Chubb was an infringement of the plaintiffs' patent of 1857. Messrs. Chubb contended either that Messrs. Kaye's patent was bad for want of novelty, or that, if good, the lock made by them (Chubb's) was no infringement; and they relied principally upon the prior inventions of Mr. Brodie and Mr. Inray in support of their case.

After hearing lengthened arguments of counsel on both sides, the Master of the Rolls, in giving judgment on Monday, the 16th inst., in favour of the defendants, Messrs. Chubb, said he had come to the opinion that what Mr. Kaye had done was to take the second alternative of Mr. Inray's specification and to claim a patent for that. That in law he could not do. He was aware that in this case he was assisted in that performance by Mr. Inray himself, but that could make no difference as to the construction. Mr. Inray was applying himself to that which was part of his professional skill, namely, to draw patents for people which should do exactly what his patent did in one of the alternatives, but without saying so. His judgment went on this ground, that the plaintiffs' patent was bad, because it was identical with the second alternative in Mr. Inray's patent. Therefore the defendants were

entitled to succeed in their appeal, and would receive costs in the action as well as the costs in the appeal.

Lords Justices Fry and Lopes concurred. Judgment was entered for Messrs. Chubb, the defendants, accordingly.

ON THE QUESTION OF LIFTS.

SIR,—May we ask the favour of space for one or two comments upon the remarks on lifts in Mr. Slater's paper on "New Materials and Inventions," read before the General Conference of Architects? (See *Builder*, p. 703, ante).

Our principal object in writing is to point out a very serious error into which Mr. Slater has fallen, no doubt inadvertently. He states (quoting your report) that the Otis Elevator "can be worked at a very low pressure, say 40 lb. to the square inch, whereas other hydraulic elevators require a very high pressure, that would have been almost impossible to obtain a few years ago, before the introduction of the hydraulic power system of high-pressure mains, where pressure up to 700 lb. per square inch can be obtained." In correction we beg to say—First, that twenty-five years ago we were erecting lifts working at 80 lb. per square inch. We have in London one passenger-lift working at 23 lb. per square inch, several between that pressure and 80 lb., and a large number at 30 lb. We think we are well within the mark in saying there are at least 30 hydraulic lifts, other than the Otis Elevator, working in London at pressures not exceeding 30 lb. Secondly, before the formation of the Hydraulic Power Co. we had erected many lifts working at 700 lb. pressure per square inch,—there is practically no difficulty in obtaining the pressure if it is required. Thirdly, there is scarcely a lift erected in connexion with the Hydraulic Power Co.'s mains which could not have been worked at 30 lb. pressure per square inch had it been considered desirable or advantageous to do so.

With Mr. Slater's remarks upon the safeguards requisite with suspended lifts we entirely agree, merely adding that we shall be pleased to show him lifts of English manufacture which comprise all the precautions he enumerates, and from which the serious danger he ascribes to the Otis lift is absent. The English lift, being absolutely controlled by its valve, cannot run down if overloaded; in it, overloading must be carried to the fracturing point before danger can arise.

Mr. Slater avoids the question of pressures, high or low. Much misconception exists upon this subject, and perhaps we may be allowed a few words upon it.

Each system has its proper place, and a few instances will make this clear.

1. A building in a position where a natural supply, or an ordinary town's supply, of fair pressure is available, no external high pressure to be had, and for a dozen conceivable reasons pumping machinery inadmissible. Low pressure is clearly the only possible resource.

2. A building of larger dimensions requiring, say, two or more lifts frequently in use; no natural head of water available, and the town's supply either too far away, or supplied at a price ranging from 6d. to 10d. per 1,000 gallons. It would generally be economical for such an establishment to pump its water up, and in so large a building a suitable position could be found for the machinery. Under these conditions we may have any pressure we please; we may pump into tanks within the building, giving a pressure up to perhaps 30 lb. per square inch, or tanks on a hill-side giving say 100 lb. to 150 lb. pressure, or we may pump into an accumulator, dispensing with tanks, and obtaining a pressure of from 500 lb. to 800 lb. according to fancy. Which shall it be? Economy of power, as measured by consumption of coal or gas, will be the same for all pressures, notwithstanding interested statements to the contrary. Wear and tear practically the same.

First cost of low-pressure lifts and pipes will be greater than the high pressure; but, on the other hand, low-pressure pumps and tanks will mostly be cheaper than high-pressure pumps and accumulator, and the difference for an entire system of slight difference will not be great,—the balance occasionally tipping to either side. Convenience will in this case decide. Suppose the building is residential; during the day, with the various noises of the daily routine in progress, with the majority of residents out, or moving about, the lift pumps would be unobtrusive; but in the evening the various conditions would all be reversed, and the slight noise of the pumps prove objectionable. Pumps must consequently be stopped, but lifts must continue working occasionally till all have retired for the night; and to meet this requirement considerable storage is requisite. Now, low-pressure tanks are cheap, and easily increased if required; high-pressure accumulator storage is the exact reverse, and therefore, in this case, low-pressure gain wins.

But if our building had been a warehouse or a factory, where the pumps may run as long as the lifts are required, and where the building, being comparatively low, no considerable height could be obtained for the tanks, then the balance of convenience would be in favour of the high-pressure system.

3. A building which can be supplied either by the low-pressure town's supply, with 30 lb. pressure, at say 10d. per 1,000 gallons, or by the Hydraulic Power Company, with 700 lb. pressure. Pumps inadmissible. Here the high-pressure lift will cost from two-thirds to three-fourths only the price of the low-pressure. The high-pressure pipes will cost a little over half. The high-pressure water for a given amount of work will cost one-fifth the price of the low-pressure. The space occupied by the high-pressure lift machinery will be only three-fourths that of the low-pressure. A 1½ in. high-pressure pipe will do the work of a 4 in. low-pressure.

With these facts before him, what purchaser would choose the low-pressure in this case?

To sum up, there is no inherent evil or difficulty in the use of high-pressure. On the other hand, the user's interests lie in its direction, and he should always endeavour to get the highest pressure available, assuming that he can get it without accompanying inconvenience. Let him not be frightened by the alleged dangers of high pressure, such as the bursting of cylinders and pipes, the "blowing out of valves," &c.; they are purely imaginary. We predict that some of this machinery, one five years and the other four years ago, and have never had to attend to either since.

ARCHD. SMITH & STEVENS.

May 11, 1887.

THE HOTEL BOURGTHEROLDE.

SIR,—It may interest your readers to know that the window in the Hotel Bourgethrolde, Rouen, illustrated in your impression of the 7th inst., is the one a plate of which, accompanied by highly laudatory remarks appears in Mr. Ruskin's somewhat scarce book "Lectures on Architecture and Painting."

T. G. ABBOT.

A CORRECTION.

SIR,—By your special report of the education meeting of the late Conference, I see that the Chairman, speaking very kindly of Mr. Millard and my intention to found an *atelier*, said that I had been a Pugin Student. That is a distinction of which those who have earned it are rightly proud, but, unfortunately, I am not one of the number; Mr. Cates was probably thinking of my colleague, who is,

FRANK T. BAGGALLAT.

A PROTEST.

SIR,—Mr. Beaumont, in his letter to the Architectural Association (*vide Builder*, May 14th), classifies quantity surveyors along with "young men just out of their articles" (which infers incompetence), "architectural fossils, and drunkards." Possibly Mr. Beaumont did not intend to cast any aspersions, but is not his particular form of expressing himself a little rough on the humble quantity surveyor? ONE OF THEM.

\* The sentence appears to us to be in exceedingly bad taste, to say the least.—ED.

STEAM-ROLLERS.

SIR,—The Court of Queen's Bench, presided over by Mr. Justice Grove, has recently been engaged on a very peculiar interest and of some importance to local authorities. The action in question was brought by the Gas Light and Coke Company to restrain the Vestry of St. George's, Hanover-square, from using steam road-rollers of such weight as would fracture or injure the gas-mains of the Company, and also for damages in respect of certain mains actually fractured by the Vestry's steam-roller. The weight of the roller used by the defendants was 15 tons, which weight, speaking without prejudice, but from a practical point of view, is not essential for making good roads. Macadamised roads are not much better now than they were some years ago in the days of the inventor of this particular kind of road, Sir John MacAdam, and before steam-rollers were invented; and though it cannot be denied for a moment that steam-rollers have great advantages, or that road authorities are entitled to use them for promptly and efficiently repairing the streets, yet it must appear to both practical and non-practical men that the weight of the roller used by the defendants was neither reasonable nor necessary.

The principle of the formation of macadam roads is that the stones, by reason of their angularity, should bond and key together, and if a light roller is used, the effect is produced, the stones being gradually consolidated and fitted into each other, forming an almost homogeneous mass. If a heavy roller is brought on them, the stones do not get pressed or wedged into this position, but are washed together, the angles of the small granite cubes being pulverised, and the holding power diminished. The passage of a heavy wagon, or even of a heavily-laden trolley, would not, as the Vestry have endeavoured to show, have the same damaging effect on underground pipes and mains as the steam-roller, and although their weight might be as great as the roller it would probably only pass over the mains for a short length, and then off again; whereas, a roller in rolling a street

passes and re-passes over the same spot scores of times before the road is properly consolidated.

Of course, it cannot be contended that work is as quickly or as cheaply done by the employment of light rollers; but there are other elements in the case than those of speed and economy, and where danger both to person and property is likely to follow the employment of rollers of such crushing weights as 15 tons, the road authorities should at least take care to ascertain the positions, size, and age of all mains likely to be affected, prior to the work of the formation of roads, by means of steam-rollers, being commenced. E. F. S.

RECENT PATENTS.

ABSTRACTS OF PATENTIFICATIONS.

5,442, Square Turning. J. C. V. Stacey.

The method of square turning by means of attaching the articles, newels, balusters, table and sofa legs, &c., by attaching them to a large revolving drum, is not here claimed as new, but the novel features claimed are: (1) The manner of securing the various articles inside the circumference of the drum by a recessed flange and two small steel pins. (2) Four loose iron sections of rings and four cramps are also used for securing; and (3) A large wooden ring attached to the inner circumference of the drum, diminishing the size of the drum, so that a smaller number of articles may be turned.

7,100, Wedge for Doors. J. G. Rollason.

The subject of this invention is a little wedge-shaped appliance with an inverted horn piece, so fixed that while the top part of the catch presses into the door or window the end of the inverted horn sinks into the wood of the floor or frame and effectually prevents it from being forced open.

7,282, Door Checks. J. H. Jefferys.

The subject of this invention claims to be an improvement on the ordinary form of pneumatic door-checks in the direction of greater compactness and, by hinging the arm of the appliance, greater ease and certainty in working.

9,824, Mitreing Machines. A. Muir.

This invention relates to a hand mitre-cutting machine consisting of a knife or cutter mounted on a triangular frame having a stud fixed on one side which carries a lever with a long slot; which slot operates on a stud fixed on centre of knife or cutter carrier. The lever operates at right angles to the machine. The machine is pivoted in front of a triangular frame, which enables it to be adjusted to any angle, so that all mitres, simple or acute, can be executed with ease and expedition.

15,965, Moulded Slag Paving. C. J. Dobbe.

According to this invention Glets are formed upon the side of the paving blocks, to obviate the use of the wooden strips generally employed. The fillets keep the blocks a proper distance apart, and form also a narrow channel between them, into which cement is run to bind the whole paving together.

1,908, Casement Fastenings. Kristensen and Jensen (Copenhagen).

This patent relates to a fastener designed with a view to extreme simplicity, and to operate in all sorts of weather, so as to enable the casement to be readily opened or closed. The lever, which slips into an ordinary catch, has two arms, a long and a short one, and when the short arm is moved across the opening or joint it fastens the casement securely. The longer arm also affords a means of drawing the sashes firmly together, or when opening to force them a little apart so that the casement may be readily opened.

The Student's Column.

FIELD WORK AND INSTRUMENTS.—XXI.

Leveling Instruments.  
V.—CUSHING'S LEVEL.

Cushing's level the object-glass and the eye-piece are constructed to be interchangeable. Figs. 1 and 2 show the eye-piece and object-glass ends, marked A and B, removed from the telescope. A gun-metal socket is fixed, as shown in section in fig. 3, upon one end of the inner brass tube and also upon the opposite end of the outer brass tube, both sockets being flanged to receive either the eye-piece or the object-glass fittings. The object-glass fitting at B is made somewhat longer than the fitting at A, because it has to carry the shade cover, but in other respects the bearing surfaces to receive either the object-glass or the eye-piece ends are identical. The eye-piece is attached to the telescope by a kind of bayonet fixing, in which it is brought to its proper position against stops, and secured to the flange of the socket by means of two screws. The object-glass end is fixed in a similar manner. The eye-piece end carries the

diaphragm plate, which contains fine lines ruled upon plain and parallel glass instead of spider's lines. Away from a town or city, where a mathematical instrument maker could not be found except at a considerable distance, the possession of a diaphragm of this character may be an argument in favour of its use, but the amount of light lost by the reflection and absorption of the glass plate gives to the ordinary open form of spider's web diaphragm a decided advantage. In Cushing's level the adjustable diaphragm plate being attached to the removable eye-piece end, it might be dangerous to remove it in the open field unless the diaphragm was of this permanent nature. The telescope is supported by the ends of the horizontal limb containing the compass, as shown in fig. 3, the support at one end (where a means is provided for lifting the compass needle), being capable of a slight rocking motion in the direction of the axis of the telescope, while the support at the other end has a lifting or lowering arrangement for adjustment in setting the axis of the telescope at right angles to the vertical axis of the instrument. The vertical axis is fixed rigidly to the limb, and revolves in a socket made in the central boss of the upper parallel plate, being secured by a nut at its lower end. The parallel plates as shown in plan in fig. 4, are constructed upon the tribrach principle explained in article xi. (March 12th, p. 412).

Having made the longitudinal bubble reverse by means of the capstan-headed nuts attached to the screws fixed at the end opposite to the transverse bubble, the parallelism of the optical axis in the telescope to the run of the longitudinal bubble can be tested by reversing the eye and object glass ends. If any adjustment is needed it is effected by means of the vertical capstan-headed nuts in the eyepiece. In thus testing the line of collimation it is, of course, necessary to traverse the telescope half-round, after reversing the ends A and B, so that the point in a distant object viewed with the eye-piece at one end of the telescope may be again observed with the eye-piece attached to the other end. It is important, in changing the object-glass from one end to the other in this adjustment, to observe that the part of the cell which has the small screw-hole in it is kept uppermost, and that the eye-piece is reversed without turning the diaphragm plate vertically over.

New R.C. Church for Liverpool.—In a limited competition for the new Catholic Church of St. Sylvester, Liverpool, the design with the motto "Lux" has been accepted. The authors of the design are Messrs. Pugin & Pugin.

MEETINGS.

SATURDAY, MAY 21.  
Architectural Association.—Visit to St. Thomas's eminary and Chelsea Church. 2.30 p.m. (See Advertisement.)  
Liverpool Engineering Society.—Visit to the Liverpool United Gas Light Company's Works at Linacre.

MONDAY, MAY 23.  
Royal Institute of British Architects.—Mr. John R.S., on "The Drainage of the Palace and City of Westminster." 8 p.m.  
Surgeons' Institution.—Mr. W. Simms on "The Agent's Park Estate: its Origin and Development."  
Sanitary Legislation Conference.—Discussion of the Sanitary Registration of Buildings Bill. 2 p.m.

TUESDAY, MAY 24.  
Royal Institute of British Architects.—Mr. Walter R.S., on "The Importance of the Applied Arts, and their relation to Common Life." Prof. Herkimer in the Chair. 8 p.m.  
Institution of Civil Engineers.—Sir Frederick Abel, R.S., on "Accidents in Mines." Part I. 8 p.m.  
Parkes Museum (Lectures for Sanitary Inspectors).—R. A. Wynter Blyth, M.R.C.S., L.S.A., on "Metropolitan Acts, By-laws of Metropolitan Board of Works."  
Glasgow Architectural Association.—Visit to Linnithgow.

WEDNESDAY, MAY 25.

Society of Arts.—8 p.m.  
Artists' Benevolent Fund.—75th Anniversary Dinner, Freemasons' Tavern. Mr. Alma Tadema, R.A., in the Chair. 7 p.m.

THURSDAY, MAY 26.

Society of Telegraph Engineers and Electricians.—(1) Mr. Charles Fleetwood on "Underground Telegraphs." (2) Professor W. Ayton, F.R.S., and John Perry, F.R.S., on "Driving a Dynamo with a very short Belt." 8 p.m.

FRIDAY, MAY 28.

Association of Public Sanitary Inspectors.—Meeting at Eastbourne.

Miscellaneous.

**Liverpool Engineering Society.**—A meeting of this Society was held at the Royal Institution, Colquhoun-street, Liverpool, on Wednesday, May 11th, Mr. John J. Webster, M.Inst.C.E., President, in the chair. A paper was read by Mr. J. F. Waddington on "Submarine Vessels." In commencing the paper, the author gave a brief history of what had been done in submarine navigation. Few persons, he said, would be aware that the idea of a vessel to travel under water was anything but a new idea. There were records of submarine vessels as far back as 1648, and a very interesting series of experiments were made by Fulton in 1801. Submarine vessels, he stated, were used in the American Civil War, and numbers of patents had been taken out in America, none of which, however, had come to anything. He then referred to the submarine vessel the *Nezucrang*, designed by Mr. Garratt, and tried in the Birkenhead Float in 1879, and also the Nordenfolt boats, which were also from Mr. Garratt's designs. His own submarine vessel, the *Porpoise*, which was tried last year before the representatives of the British and Foreign Admiralties, was then described. She was, he said, 37 ft. long by 6 ft. 6 in. beam, and was arranged to be propelled by electricity. The *Porpoise* was submerged when under way by means of inclined planes, which, when the buoyancy of the vessel had been sufficiently reduced by taking in water, were set over at an angle, and so guide the vessel below the surface. He also described the horizontal propellers, working in vertical tubes, used in his boats for the purpose of driving below in cases of emergency when there was no way on the boat. The great danger with submarine vessels of suddenly diving by the head when going at any great speed, was then dealt with, and he showed how, by means of a horizontal rudder arrangement, actuated by an automatic electric steering gear, he had met this danger. Compressed air for consumption by the crew was, he said, carried in two compartments at the ends. For the propulsion of the vessel, and for driving the various machinery on board the vessel, the electricity was stored in forty-five accumulators of 600 ampere-hours capacity.

**Formation of an Architectural Society in Sheffield.**—Last week, on the initiative of Mr. T. J. Flockton, a meeting was held to consider a proposal to establish an architectural society in Sheffield. Mr. Flockton presided, and the meeting was addressed by Mr. C. Hadfield, who pointed out that Sheffield had no representative body for dealing with professional questions and for communicating with other societies thereon. The R.I.B.A. was inaugurating compulsory examinations, and it was important that pupils and assistants should be prepared to pass the examinations, and encouraged to avail themselves of every opportunity for improving their technical education. Such a society would accomplish this end. Good work was being done in this direction in Liverpool, Manchester, Leeds, and other large towns by similar societies. Eventually it was resolved to form a society. Mr. W. C. Fenton was appointed hon. sec. pro tem. of the provisional committee.

**Stamford Hill.**—A three-light stained-glass window, representing "The Crucifixion," has just been placed in the new Church of St. John, Stamford Hill. The work has been carried out by Messrs. T. J. Marshall & Co., under design by Mr. John Stacy, and under the superintendence of the architect of the church, Mr. Spencer W. Grant.

**The "Hotel Victoria."**—Referring to the notice in our Supplement last week of the "Hotel Victoria," Northumberland Avenue, Messrs. Hayward Bros. & Eckstein ask us to mention that the whole of the basements are illuminated by Hayward's reflecting pavement lights.

Melbourne Centennial Exhibition.—It

has been decided by the Government of the Colony of Victoria to hold an International Exhibition of Arts, Manufactures, Agricultural and Industrial Processes and Products, in the City of Melbourne, in Celebration of the Centenary of the Settlement of Australia, and the Exhibition is to be opened on August 1, 1888, and will close on January 31, 1889. An Executive Commission has been appointed by the Governor under the Seal of the Colony to conduct the Exhibition; and its London Committee, who have control of all questions concerning the Exhibitors of the United Kingdom, has its offices at 8, Victoria-chambers, Westminster, adjoining the offices of the Agent-General for the Colony.

**Shepherd's Bush.**—A stained-glass window of two lights, containing respectively figures, "The Light of the World," and "The Good Shepherd," with tracery containing "The Crucifixion," has been placed at the east end of St. Mary's Church, Stamford-brook, Shepherd's-bush (presented by a friend). This was also designed by Mr. J. Stacy, and executed by Messrs. T. J. Marshall & Co.

**The Newcastle, Saltaire, and Liverpool Exhibitions.**—We will say something about these three exhibitions next week.

**Bestwood.**—For several years past the vicars of Bestwood have conducted Divine Service once on Sundays in the schoolroom at Bestwood Colliery, but the want of a more suitable building has been painfully felt. At length, mainly by the liberality of the Duke of St. Albans and of the Bestwood Coal and Iron Company, a mission church has been built, from the designs of Mr. Medland Taylor, architect, Manchester, and it was opened on a little inst. It is built mainly of brick, with a little stone at the principal doorway, and in the chancel windows. The roof is covered with red tiles. There is a broad nave with transepts, which are to be used more as class-rooms and for secular purposes; but which can, when occasion requires, be thrown open to the nave, and so largely increase the accommodation of the church. The chancel,—that part of it which contains the altar, credence, and altar rail,—is built and arranged as it would be in a more costly and regular church. The choir seats are arranged on a platform, three steps up from the nave, and projecting from the sanctuary into the nave. There is a dwarf screen round, and at the end next the nave is an oak arch, surmounted by a cross. On the one side is the lectern, and on the other the pulpit, projecting slightly from the screen, and entered from the chancel. The choir fittings and the chief doors are principally of oak. In the gable wall of the chancel are two two-light windows, and between them in the centre is a stone altar cross. There is a marble altar ledge above the Lord's table, and a credence shelf on the side. The chancel windows are filled with tinted glass, in lead work, of a lace-like pattern, with a tux in ruby glass at the foot of the lights. The font (as it may occasionally have to be removed) is of oak, pentagonal in form (an ancient form, by the way), standing on an oak platform, that the administration of the Sacrament may be duly witnessed. The seats in the nave are low, open, comfortable benches. In the transepts are convertible seats, usable either as forms and tables, or as church seats with backs. There are two side porches opening into the church and class-rooms. The girls' and young women's class-room contains a cooking-range, and a convenient china pantry, with sink, &c., adjoins it. On the other side, the west class-room will be available for use as a choristers' vestry. Adjoining it is a lavatory and cloak-room. There is a ventilating gabled turret on the middle of the roof, and a belfry on the front gable. When the transepts are thrown open to the nave, so as to use the whole building, there is comfortable sitting and kneeling room for about 360 adults. The contract sum for the entire building, fit for use, excepting only the fittings, is 1,250*l.* The builders, working under the architect's directions, are Messrs. Dennett & Inglo, of Nottingham.

**The Printing-Machine Managers' Superannuation Fund.**—The annual excursion to Hastings and St. Leonards, in aid of the funds of this charity, will take place on Saturday, July 2. The fund was established fourteen years ago, to provide a small allowance to printing-machine managers who from age or blindness become incapacitated from following their trade.

**Wallasey.**—The report of Mr. A. Salmon, surveyor to the Wallasey Local Board, upon the work executed in his department during the year 1886, has just been issued. It states that a further improvement in the property recently scheduled as insanitary has been made, by alterations in accordance with recommendations contained in a former report. The erection of the hospital for infectious diseases in Mill-lane having been commenced in April last, the buildings are now approaching completion. They consist of administrative block, isolation wards, disinfecting station, laundry, ambulance house, &c. The isolation block for the accommodation of patients consists of four wards and two rooms for nurses; two of the former contain three beds each, and the other two one bed each. The area of the hospital site is two acres in extent. The cost of the buildings, with the boundary fences, carriage-drives, and drainage will be about 3,000l., an apparently excessive figure for the number of beds at present provided; but it must be remembered (says the report) that the administrative building and the laundry and disinfecting station have been designed to afford the necessary accommodation for the requirements of forty-four beds, that being the number which there will be when the scheme is carried to completion. The additional thirty-six beds will be provided at a comparatively small outlay in three pavilions, and the cost of the whole of the beds will then compare favourably with the cost of any other similar institution in the country. It is hoped, however, that the existing buildings will be all that the district will require for some years to come, but as the population increases, one pavilion, containing twelve beds, can be erected at a time. The population of the town at the present time is stated to be 29,800,—an increase of 8,600 since April, 1881.

**Worcester.**—Since the opening of the new church at St. Paul's in November last, the old church has been undergoing alterations to make it adaptable for a school, so as to increase the accommodation which was urgently needed in the parish. The building is connected with the old school, which has been converted into a school for infants, and the former infants' school has been fitted up as class-rooms. The schools now afford accommodation for upwards of 800 children, the total accommodation previously having been for 445. The alterations, repairs, and improvements have cost about 1,300l. The work has been carried on by Mr. Inward, under the superintendence of Mr. L. Sheppard, architect.

**Best Bath Stone.**

CORSHAM DOWN. | FARLEIGH DOWN.

BOX GROUND. COMBE DOWN.  
WESTWOOD GROUND.

RANDELL, SAUNDERS, & CO., LD.,  
CORSHAM, WILTS.

**Bath Stone.**

Pictor's Monks' Park. Combe Down.  
Corsham Down. Stoke Ground.

Box Ground. Winsley Ground.  
Farleigh Down. West Wood.

PICTOR & SONS, Box, Wilts. [Adv.]

**Doubling Freestone.**

The stone from these quarries is known as the "Wesley Beds," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England. It is of the same crystalline nature as the Chelchyn Stone, but finer in texture, and more suitable for the moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice.

Prices, and every information given, on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [Adv.]

**Doubling Free Stone.** For prices, &c., address S. & J. STAPLE, Quarry Owners, Stone, Staffordshire.

**HAM HILL STONE,** Quarry Owners, Stone, Staffordshire.

**BLUE LIAS LIME** and Lime Merchants, Stoke-under-Ham, (Ground or Lump), Ilminster. [Adv.]

**Asphalte.**—The Seyssel and Metallo Lava Asphalte Company (Mr. H. Glenn), Office, 88, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tun-rooms, and terraces. [Adv.]

**Asphalte.** Seyssel, Patent Metallo Lava, and White Asphaltes.

M. STODART & CO.  
Office: No. 80, Cannon-street, E.O. [Adv.]

**DRAIN TESTING.**

For convenience and efficiency in making what is known as the Scent or Peppermint Test, the Banner Sanitation Company have introduced a new appliance,

**THE**

**BANNER PATENT DRAIN GRENADE OR DRAIN FERRET.**

This Appliance is made, preferably, of thin Glass, and is charged with powerful pungent and volatile chemicals, the smell caused by which is not likely to be mistaken, nor distributed in such a way as to either mislead or render the test worthless through mismanagement or the careless handling of the necessary chemicals.

When one of the "Grenades" is dropped down any pipe it breaks, and the effect produced by its contents is distributed only as intended.

One "Grenade" is often sufficient for testing an ordinary house drain. The Banner Patent Drain Grenades or Drain Ferrets can be obtained in Boxes of One Dozen each from the Banner Sanitation Company, their Agents, and most Dealers in Sanitary Goods.

PRICES.—With Peppermint Filling ..... 5/- per box of one doz. With Assafoetida Filling ..... 5/6 per box of one doz.

With Compound Filling, extra strong ..... 6/- per box of one doz. Soluble Gelatine "Grenades," with same fillings, 2/- per doz. extra.

**BANNER SANITATION COMPANY,**

WESSEX HOUSE, NORTHUMBERLAND AVENUE, CHARING CROSS, LONDON, W.G.

(Opposite entrance to Hotel Métropole.) Telegraphic Address:—"Banners, London."

### Applied Mechanics and the Resistance of Materials.

THE stability of structures depends upon that branch of applied mechanics which deals with the resistance of materials. The majority of writers upon this subject treat it in too

abstract a manner for ordinary use, and illustrate it by conventional examples simplified to suit the formula, so that a reader unfamiliar with the higher mathematics finds that either the reasoning is beyond him or the examples are not sufficiently practical to guide him in the actual cases arising in his daily routine. The writer of the portly volume before us\* endeavours to place himself in the position of the average professional man, and, while simplifying as much as possible the statement of the principal theories, he shows various methods of application, chiefly graphic, and then takes as illustrations numerous examples borrowed from every-day practice. The general method of the book has our warmest approbation; though lacking somewhat of the preciseness of allied works, the deficiency is more than compensated for by the extensive range of information and the lucid manner in which it is put before the reader. An English translation would, we think, be very acceptable, as the only work of the kind we have now is Col. Wray's "Some Applications of Theory to Construction," which partakes more of the character of a student's note-book than a compendium of the mechanics of construction. The author's remarks upon his mode of dealing with the subject are suggestive. He says that when one endeavours, not to establish formulae more or less ingenious, but to arrive at simple conclusions, clear and practical, he quickly perceives how much the theories are actually obscure on certain points, incomplete upon others, and too often remain mute upon questions which particularly interest the practitioner, who is then obliged to fall back upon empirical formulae, which are only reliable within very narrow limits. While keeping the practical requirements ever in view, M. Planat has introduced just sufficient theory to justify his conclusions, and his work therefore appeals to that class of professional men who like to know something of the "why" as

\* *Pratique de la Mécanique Appliquée à la Résistance des Matériaux.* Par P. Planat, Directeur de la *Construction Moderne*. Première édition. En vente: aux Bureaux de la *Construction Moderne*, 8, Place Boisdeau, Paris, 1887.

well as the "how." Its general scope includes fundamental principles, moments of inertia, simple beams under various conditions, columns and pillars, compound beams, trusses of wood and iron, arched trusses, pressure of earth, and equilibrium of walls and arches. Each section is amplified by division into subsections, and these latter, so far as possible, are individually treated under the heads of experimental data, formulae, graphic diagrams, and examples of application.

Commencing with the alteration which a body undergoes when subjected to stress, it is shown that all the various strains are reducible to the six elementary displacements, and these again may be classified under the ordinary deformations of *allongement*, or lengthening; *raccourcissement*, or shortening; *glissement*, or sliding; *torsion*, or twisting; *flexion*, or bending. These deformations are accompanied by reciprocal internal efforts or stresses, classified as *extension*, or tension; *compression*, or compression; *cisaillement*, or shear; *torsion*, or torsion; and *flexion*, or bending; the last two being measurable by moments instead of by direct effort. The action of external forces is then analysed, particularly in relation to the internal forces engendered by them. In the next chapter we have some useful information upon the phenomena of experiments, and the author reminds us that in practical work we do not so much want to know the ultimate limit of strength as the internal state of the material under ordinary stresses which do not surpass the elastic limit, and he refers to this later on in greater detail. We then have diagrams showing "*la marche des phénomènes*" for various qualities of iron and steel, the extension produced by the load until rupture occurs being graphically delineated.

An interesting illustration is a Creuzot experiment: a test piece of wrought-iron plate of the usual form, with a hole at each end for applying the load, and the sides cut away from the middle portion, is ruled all over with lines making small equal squares, and is shown after rupture by tension, the alteration in shape of the squares presenting a self-evident picture of the nature of the internal strains throughout the piece. Following this are some comparative curve diagrams of the lengthening and shortening of wrought and cast iron under tension and compression, which are most instructive, although their character is now pretty well known. An account of experiments upon steel and wrought iron at temperatures ranging from 25° C. to 100° C. shows that steel is rather stronger at the lower temperatures, while iron is slightly weaker. The experiments upon timber, as is usually the case, are very meagre; there is certainly scope at the present time for a new series of investigations

upon this material, and we trust that before long some one will take the matter up.

The next chapter, upon stone, is of some importance to the architect, the more so as in what little has hitherto been written it has been treated without much detail. A long course of experiments was undertaken by M. Michelot, in connexion with the new Opera House of Paris, to determine the strength of various building stones. The first point established was a confirmation of Rondelet's statement that the resistance was proportional to the sectional area; secondly, that the safe load should be rigorously limited to one-tenth of the crushing weight of ordinary stone, while the limit may be raised to one-sixth for hard homogeneous stone, well proportioned and carefully bedded. Then it was proved that non-stratified stone might be placed in any position "*de lit ou de champ*," with equal effect, but stratified stone must always be placed on its natural bed, or so that the pressure is perpendicular to the stratification. Testing stone when wet, as against the same stone dry, it was found that in some cases it lost one-third to one-fourth of its resistance, and some freshly-quarried stone only gave half the resistance which was obtained after it had become dry and seasoned. With stone belonging to the same general class the strength was found to vary with the density, and the results for limestones being plotted gave a very definite hyperbolic curve.

It is shown that this curve may be used for ascertaining approximately the resistance of any limestone from the weight of a small cube, and a similar curve laid down from experiments upon other stones would give a like result in their case. Rondelet's experiments upon superposed stones are recapitulated in a useful form, and the reduction of strength from a monolithic pillar is shown to vary with the number of joints. For sandstone, the graphic diagram of strength compared with density is an undulating curve, but the examples given are not sufficiently numerous to settle this definitely for other varieties. In testing grit stone and schists, the great variation of strength due to the presence of fissures and cracks is noticed. In the chapter upon limes, cements, mortars, and concrete, no mention is made of any of the English engineers,—Fasley, Reid, Grant, and others,—who have experimented and written upon the subject, although the results they obtained appear to be adopted. The ultimate tensile strength of lime mortar with sand in proportion of 3 to 1 is about 14 lb. per square inch as a minimum, and the compression strength 72 lb. per square inch; the difference after ten days is not very notable, although to some extent age adds strength.

The author discusses at some length the relative value of experiments upon (a) the limit of elasticity, and (b) the ultimate strength of materials. In England the majority of experiments have been conducted with the view of ascertaining the latter, and the working loads are still usually calculated as bearing a certain ratio to it. Recently, however, since autographic test-recorders have been brought into use, it has been seen that the ultimate strength is more or less a matter of accident; that after a certain point is reached it is essentially a question of time, and that only up to the limit of elasticity does the material follow any exact law. In France, on the other hand, the limit of elasticity is looked upon as the only valuable criterion, and the matter has been the subject of some important discussions before the Société des Ingénieurs Civils. In Germany the chief experiments are those which fix the maximum load that ceases to produce rupture, whatever be the number of times it is applied or removed, and the working load is fixed at a certain fraction of this maximum; all consideration of the limit of elasticity, as such, is ignored, but practically the experiments fix the maximum load as coincident with it, and therefore the actual basis is the same as that of the French engineers.

The next division of the book deals with moments of inertia, showing in a simple manner how they are arrived at for all leading sections, and graphic tables are given for those most in use, enabling the moments for any section and load to be read off without calculation. Examples follow to exemplify the use of the tables in the selection of rolled girders, &c., to fulfil required conditions. The various methods of supporting beams in general and applying loads are considered, and the moments determined graphically for simple and compound beams, the funicular polygon being introduced where desirable. The use of cantilevers and pieces with overhang is well treated, and the examples are thoroughly practical. Consoles, corbels, balconies, and other forms are included under this head. Two complete sections are devoted to the elucidation of the bending moments of *encasté* and continuous beams, and this is perhaps necessary, because it is a part of the subject generally much neglected. To take a simple instance:—In the case of a beam uniformly loaded, continuous over two spans, Rankine shows that about 18½ per cent. of the total load rests on each of the outer supports, and 63½ per cent. on the centre. Other writers virtually agree with this, in dividing the load as  $\frac{1}{4}$ ,  $\frac{3}{4}$ ,  $\frac{1}{4}$ ; but the common practice is to divide the load in the proportions  $\frac{1}{4}$ ,  $\frac{3}{4}$ ,  $\frac{1}{4}$ ; hence there may be many cases in which the central support is receiving 25 per cent. more load than it was designed for.

In dealing with columns, the experiments of Hodgkinson are mentioned as those which have exercised the greatest influence upon construction, and the principal ones are detailed. The American repetition of these experiments with more powerful apparatus, and particularly the experiments upon built-up columns of wrought iron up to 14 in. diameter, are favourably criticised, and the conclusion drawn that Rankine's formula applies more exactly than that of Gordon to the observed results. "See now in what embarrassment the French constructor finds himself: we have at our disposal the formulæ of Hodgkinson, drawn directly from his experiments, the first in date; their form presents certain conveniences, in spite of many anomalies, and one often uses them; we have also the two formulæ of M. Love employed with equal constancy, of a form a little more simple; we have finally the two English and American formulæ that we exhibit, sustained, as all those which precede, by experiment." The author then goes on to show that the imperfections of the theory, giving rise to these different formulæ, are due to the ordinary assumption that the deformation of materials under stress proceeds uniformly up to the limit of elasticity, whereas the assumed straight line is actually part of a hyperbolic curve. Some of the discrepancies of the theories were pointed out nearly twenty years ago in a paper

before our Society of Engineers, but little or no progress has been made in practical adaptation.

The value of any formula is tested by plotting curves from it and comparing all known experiments; M. Planat does this in the case of columns, and a series of twenty-three of Hodgkinson's experiments show a remarkably close approximation. The graphic table, however, relating to oak and fir posts is based upon very few experiments, and hardly seems to accord with them.

We now come to the chief examples from practice, and these include a great variety and number of all kinds, forming a synopsis of the theory of construction particularly suitable for architects. It supplies a want often felt by practical men when they apply to books for assistance; they see some theory apparently suited to their purpose, but they lack either the skill or the patience to work it out. Here there are so many examples worked out that one may find almost the identical case required. Floors of brick, iron, concrete, and wood, trussed beams, trellis and lattice girders, bowstring and parallel, and other forms, are worked out, some useful notes being added upon the arrangement of the various joints. The chapter on riveting is brief and rather weak; a few general principles only are enumerated, and some examples of covers to joints worked out. Nothing is said as to general riveting, and many other points which would have to be studied before attempting to design an iron structure of any magnitude. Roof trusses, cranes, compound trusses, centres for vaults, and the carpentry of spires are among the general examples given, and many of the forms are not to be found in other books: hence the solution of these problems has an additional value; the iron trusses include many varieties, the stresses in which are worked out in detail. A matter that is often insufficiently considered is the effect of temperature upon iron construction. It is here illustrated by a trussed rafter roof of 20 metres span, where it is shown that, if the ends were fixed, an additional load, equal to one-third of the breaking-weight, would be caused by the extreme variation of temperature, and this, in addition to the ordinary load, would cause a dangerous stress. A chapter on curved beams is carefully worked out, and theory compared with practice. In the section on the thrust of earth and construction of walls the information is very clear and simple, enabling one to design retaining walls under any given conditions. The safe load in foundations upon gravel or dry sand is given as equal to  $3\frac{1}{2}$  tons per square foot, and upon virgin soil as  $1\frac{1}{2}$  ton. The friction of masonry on masonry, with fresh mortar, equals 0.5 to 0.7; masonry on earth or ordinary sand, 0.57; on dry clay, 0.51; and on tempered clay, 0.3. A *résumé* of the experiments of M. Gobin upon the thrust of earth is given, but while those experiments were sufficient to prove the general theory, they were naturally surrounded with so much difficulty of manipulation that their practical value is considerably limited. To compensate for this, we are presented with a good collection of examples of retaining walls for earth and water, and also of walls for buildings. For arches and vaults, graphic diagrams are given, from which can be measured the dimensions for given loads and spans, similar to those for girders and beams. The book closes with a section upon vaulted roofs for churches, and flying buttresses, the reasoning in which is made perfectly clear by graphic diagrams. In fact, so much use of graphic curves has not before been made in any work which has come under our notice, although the modern engineer is well aware of the value of plotting all experiments and empirical data amenable to this method, as a check upon their accuracy; and the value of the system, for all manner of purposes, cannot be over-estimated.

In various small matters we should hardly be inclined to accept the author's dictum; and some of the woodcuts, not being drawn to scale, give a false impression, but in view of the very great utility of the work as a whole, we abstain

from calling more specific attention to what, after all, are not serious faults. It is the sort of book we want to enable education to keep pace with the increasing demands made on the practical knowledge of the architect and engineer, and is a good attempt at a combination of theory and practice.

#### THE ARCHITECTURAL ASSOCIATION SKETCH-BOOK.

IN preparing for the issue of the first part of Vol. VII. (new series) of the Architectural Association Sketch-book, the Committee append to their usual circular in regard to the objects of the Sketch-book, the conditions of contributing, &c., a special note calling the attention of subscribers to the fact that by enlarging the number of members, and consequently increasing the income at the disposal of the Committee, various improvements might be introduced and the usefulness and artistic value of the work increased. From another official circular we learn that one of the contemplated improvements is to include several coloured plates in the next volume, a form of illustration which, multiplying as it does the operations of printing, of course adds materially to the cost of the volume.

It is with a desire to assist in this extension of the suffrage in regard to the Sketch-books that we devote a few lines to a special recommendation of it to the notice of those members of the profession (a very large number, as will appear) who are not subscribers to it, and are presumably more or less unacquainted with the character and contents of the collection; and that on their own account as well as on the account of the Sketch-book Committee. We are exceedingly surprised to note in the last report that the number of subscribers for the year 1885-6 was only 205. The subscription is a guinea, and for that sum the subscriber obtains twelve numbers, each containing six plates reproduced from as many original drawings: seventy-two large-sized sketches, some of them finished drawings, all well executed, some representing some of the best architectural draughtsmanship of the day, and illustrating many buildings or details which are little known, and of which no other illustration is perhaps in existence or attainable. The contents are of a nature to meet the most catholic tastes. They include measured drawings, some of them of the most careful and finished execution; sketches of picturesque architecture, all up to at least a fair standard, many admirable, some few of them remarkable; drawings of decorative work of various descriptions, also drawn in many cases from out-of-the-way and little known works. Even independently of any use which may be made of it as a "source of inspiration," or, in other words, a capital publication to "crib" from, the Sketch-book is a most pleasant and interesting collection of plates to turn over, and, if known to them, would probably be welcome even to many who are not professedly architectural students, but who are enough for architecture to value a collection of good architectural sketches. To architects it certainly ought to recommend itself as one of the most interesting publications of the day in the way of architectural illustration. The small number of subscribers to the work can only be accounted for by supposing that a great many of the profession are not acquainted with the contents and the interest of the book.

Each of the twelve parts in a volume is made up of three transfers, two photolithographs, and one ink-photo or chromo-litho. The "transfers" are tracings on lithographic tracing paper from the original sketch. We presume this method is encouraged to a certain extent for the sake of greater economy of production, as the cost of photolithographing is saved; but drawing on transfer paper can seldom have all the freedom of a drawing on ordinary drawing paper; the surface of the transfer paper is not favourable to the free working of the pen. We observe some directions are given in the notice to subscribers as to the use of tracing transfer

paper, pointing out that "the side of the paper for writing on is the one which adheres most firmly to the thumb and finger when slightly damped and the paper pressed firmly between them." This is rather a round-about test. The right side for drawing on has a thin composition on it which gives a slight glaze to the surface; the wrong side has a duller surface; no one who has once seen it can make a mistake. On most sheets of "transfer" the maker's stamp is placed on the working side of the paper, which is another safeguard against mistakes. In regard to the lithographic ink, the note is made that there is no necessity to rub it quite "black," which is true; but he who works with black ink will judge better what is the effect he is producing, as the impression will come out black anyhow, unless it is taken off in a brown or red or other tinted ink.

The larger proportion of the drawings in the Sketch-book are of the order of picturesque or freehand sketches; there are a certain number of measured drawings, however, and those which are carried out in this manner are very well and carefully executed. In the last completed volume (vi.) we may point out especially Mr. Shearman's measured drawings from Westminster Abbey, for instance, which are executed with admirable clearness and precision. Mr. Lewis's coloured drawings of hits of glass diaper from Thaxted Church are of considerable interest as out-of-the-way hits of glass detail. Ornamental subjects have been coming more to the front lately in the Sketch-book; and some of Mr. Wacher's, from old brocades, printed in white and a delicate grey, are very well executed both by draughtsman and lithographer. Mr. Amhler has too much of the ruler in his perspective sketches, which look rather hard and toneless in consequence, though careful and precise. Mr. W. Riley's "The Folly, Settle, Yorkshire," is a good example of another type of illustration, picturesque pen sketches of picturesque old houses. All sorts of delightful "hits" of this kind are to be found in turning over the Sketch-book; and if they are used as hints, and not as mere eccentricities to be reproduced in modern buildings, they may be as useful as they are pretty. Mr. W. R. Lethaby is not so well represented in this volume as in the last, where his powerful sketch of the interior of Tewkesbury was the finest thing in the volume; but his sketch of decorative details, "Roman and Renaissance," is admirably free in touch and execution, and makes a most interesting page. A drawing by the late Mr. Deshon, "St. John, Devizes," is one to be noted, as also Mr. Bidlake's drawing, a lithograph printed in red, of the pastoral staff preserved in Westminster Abbey; an excellent bit of detail sketching. The Renaissance iron-work from All Hallows, Barking, "measured and drawn out full size on the spot," by Mr. Rix and Mr. Banher, is a very careful illustration of some very curious and charming wrought-iron work. The measured drawings from various portions of St. Paul's, by Mr. R. W. Schulz, drawn out with the greatest minuteness and refinement of execution, are examples of the class of more distinctly architectural drawing,—geometrical elevation, of which, perhaps, there might be more in the book; at all events, if they were as good as these. Pencil seems rather at a discount in the sketches; of course it does not reproduce as well or as cheaply (in general) as ink line; Mr. Hardy's "Palazzo Uguccione" is a nice hit of sketching of this class, however. Mr. Cresswell's leading of Henry VII.'s tomb, reproduced in light red with a very delicate effect, deserve notice, and Mr. Bidlake's excellent and effective drawing of the Easter Sepulchre at Savenhy. And in mentioning these as among the things that attracted us most on a turning over the volume, we have omitted any other plates of great interest. Mr. Orpen is to be complimented upon his humorous and clever title-page to the volume before us. The title-page is a new one every year, settled by competitive sketches. The whole volume is an excellent guinea's worth for any architect or anyone with a cultivated taste for architectural and decorative work, and we strongly

recommend those who think it any object to collect a number of good sketches of architectural subjects, whether for study or pleasure, to turn their attention to the Architectural Association Sketch-Book.

## NOTES.

**T**HE death of M. Ruprich-Robert, the eminent French architect, is a real loss to architecture, and one to be felt on both sides of the Channel, inasmuch as his most important labour, that which he valued most, was his work illustrative of Norman architecture in Normandy and in England, a work to which the labours of thirty years had gone, and in the final correction of which he had been recently occupied. To his works and career we shall refer again.

**T**HE Friday evening lecture on "Bridging the Firth of Forth," by Mr. Baker, at the Royal Institution, was in every sense a "popular" lecture, perhaps rather more so than one expected to hear in these precincts, but it was exceedingly successful in the aim which the lecturer evidently proposed to himself, that of conveying a general idea, without going into technical details, of the magnitude of the work, the special difficulties of the task, and the means taken to overcome them. Mr. Baker had prepared a special illustration, which caused some amusement, of the cantilever principle of construction, in the shape of a photograph of a group arranged purposely at the works, showing a living cantilever construction. Two of the main piers were represented by a couple of chairs, on which two men seated represented the central truss supported on the pier; one arm of each figure, outstretched towards the central space, represented the tension member of the cantilever, and each hand grasped the end of a staff, shutting against a rail of the chair, and representing the compression member of the cantilever; a third man on a slung seat in the centre, supported by the other two, represented the intermediate portion of the bridge carried between the two cantilevers. On the outer sides of the two seated figures a rope grasped by the hand and fastened to a heap of bricks, represented the shore anchors of the cantilevers. This living construction was certainly ingenious and amusing, but we have some doubt whether it brought home the facts of the construction to those unacquainted with it better than an ordinary drawing and a simple and precisely worded description would have done. Models to scale of the Menai tubular bridge and the Forth bridge served to give an idea of the immense scale of this most remarkable of modern engineering works, but this was much better conveyed by the fine series of photographs of various portions of the work in progress, thrown on the screen by a lantern. These also gave a vivid idea of the boldness of the scheme and the unusual conditions under which the work was carried on; the photograph showing the commencement of the compression rib or tube of the cantilever, projecting out into space, and in process of being carried forward through the air, so to speak, with no point d'appui for support to the workers except the rib itself, was almost startling in its effect. Mr. Baker paid a well-deserved compliment to the courage of the workmen and the coolness with which they worked under circumstances and in positions certainly calculated to be trying to the nerves. While alluding to the lecture, we may assist Mr. Baker in dispelling one curious confusion of mind to which he alluded, in regard to the locality of the bridge. It appears that its progress is asked after as that of "the Tay Bridge," by about half the persons who make inquiries concerning it, and the suggestion that they mean "the Forth Bridge" is usually accepted merely as an example of the hypercritical accuracy of speech characteristic of engineers!

**I**T is probable that the fire risks of electric lighting were as grossly exaggerated when the new illuminant was introduced as was the

case at the time of the introduction of gas, when people feared to touch the pipes lest they should be burnt. But in the event of bad workmanship, unskilful installation, or carelessness in keeping all the wires dry, the risk of fire is a very real one, and it is most important that all proper precautions should be observed. Mr. Musgrave Heaphey, of the Phoenix Fire Office, was the first to appreciate the necessity of laying down certain rules in accordance with which installations should be carried out, and he formulated these rules five years ago. They were found to be of such value to the fire offices that the ninth edition has now been issued, with the additions and revisions which increased experience has shown to be necessary. The chief points to be attended to are—1. That the conductors be of sufficient sectional area. 2. That they be properly insulated. 3. That they be kept a sufficient distance apart. 4. That they be covered with waterproof coating. 5. That a sufficient number of automatic safety cut-outs be provided. Details as to the proper methods of ensuring that these conditions should be carried out are given in the rules, and no one should attempt to put up even a small installation without their guidance. There is one matter which we think Mr. Heaphey should alter in his next edition. He says that in passing through party-walls, provision must be made that fire cannot be communicated by the conductors. It is most undesirable that conductors should pass through a party-wall at all, and this should be absolutely forbidden. If several houses are fed with the electric current from a common source, the connexions of the branches with the main should be perfectly separate for each house.

**T**HIS present season will be marked by the more than usual number and extent of certain properties in Scotland which, in the course of two or three weeks, are to be offered for sale at auction. Chiefest amongst these are the Dee-side Estates, including the deer forest of Glentanar, together with Ahoynie Castle and its demesne, belonging to the Marquess of Huntly. Extending over 60,000 acres, and with salmon fishings along fifteen miles of the Dee, the property will, failing a purchaser for the entirety, be put up in six lots, each to give certain valuable sporting rights. Of his lordship's house were the celebrated royalist George (Gordon), sixth Earl and first Marquess of Huntly; the as famous Duchess of Gordon, who, in 1711, forwarded the "Reddite" medal to the Dean and Faculty of Advocates in Edinburgh; and George, fifth and last Duke, who was familiarly known in his own country as the "Cook of the North," and whose statue has been set up in Aberdeen. When holding a lieutenant-colonel's commission in the regiment now known as the Scots Guards he received letters of service, under date February 10th, 1794, for raising the existing 92nd Gordon Highlanders from amongst his own people in this district. It was his mother Jane, *née* Maxwell, the beautiful Duchess of Gordon, who enlisted most of the recruits with the irresistible bounty of a guinea and a kiss, holding the coin in her lips. Amongst the other estates are Dallas, in Morayshire, covering nearly thirty square miles, and yielding a rental of 3,800*l.* a year; Ballimore, in Argyllshire, of 1,200 acres, prettily situated near to the head of Loch Fyne; Glenrossal, a small but capital sporting estate of some 2,000 acres in Sutherlandshire; and that of Tarvie, in Perthshire, near to Pitlochrie, and adjoining to the Edradour Moor owned by the Duke of Atholl. Also the Glensanda deer forest, on the shores of Loch Linne, in Argyllshire, with its 12,000 acres of moor and forest land, having a sea frontage of nearly seven miles; with the neighbouring, but less extensive, estate of Kilmalcolm, in the same county, famed for its lochs full of trout, grise, and salmon; and that of Benmore (10,700 acres), by Loch Eck and its affluent the river Echaig. We should mention, too, the Farnich property, of nearly 30,000 acres, by Kinlochhichart, county Ross, and the magnificent deer forest of Applecross, in the Macraes' and Mackenzie's country, Ross-

shire, whose 75,000 acres comprise some of the best romantic scenery in Scotland. The tenants of this last-named estate were largely represented in the now 72nd and 78th (Seaforth) Highlanders when those two regiments were originally raised last century by Kenneth, seventh and last Earl of Seaforth, and his kinsman, Lord Seaforth, hereditary Chiefs of Kintail.

AT a meeting of the Sanitary Legislation Conference, on Monday last, the remaining clauses of the draft Act, which is proposed on the Sanitary Regulation of Buildings Bill, were read and agreed to, with only one addition on Clause 10, to the effect that "every certificate for a building used as a hospital shall specify the cubic contents of each ward, and set forth in detail the provision made for warming, lighting, and ventilating each ward." The Bill, however, still retains the inadvisable feature of making "Corporations" pecuniarily responsible, and levying penalties against them which will be found to be extremely harmless weapons when there is any occasion to brandish them. The Bill is to come on for second reading on the 22nd of June. It will serve as a feeler to indicate the state of public opinion on the matter of sanitary registration, but any such step requires a great deal more consideration in detail, before final effect is given to it, than appears to have been given in this case.

THE eleventh Congress of Delegates of Fine Art Societies will be held at the Sorbonne from the 31st of May to the 3rd of June. The general meeting will be held on the 4th of June in the large Amphitheatre, the Minister of Public Instruction and Fine Arts in the chair. The Society for the Protection of Ancient Buildings have been invited to send a delegate from their Society to the Congress, and the Society have, we understand, accepted the invitation. It is to be hoped that the meeting will take the statements and views of the society *cum grano*.

THE case of Jackson v. The Farnham Water Company is a warning to householders to be sure of their ground before they go to law about their water supply. The plaintiff complained of the insufficiency of the supply of water, because the supply was turned off at ten o'clock every morning. As the Company had not agreed to afford a constant supply, it is difficult to see how the plaintiff could suppose he was wronged. It was proved there was no tank or cistern in the house; but that had clearly nothing to do with the rights and duties of the water company. That an intermittent supply of water is inconvenient, and that cisterns are often the cause of disease, no one, we suppose, can doubt; but the remedy for this state of things is not in actions for breach of contract, but in bringing public pressure to bear on the Legislature, so that they should make a continuous supply imperative by an Act of Parliament.

THE Exhibition of "East London Industries," opened on Tuesday last by the Countess of Rosebery at the People's Palace, Mile End, though interesting enough in its way, hardly comes up to what we had been led to expect. As at first proposed, it was intended, as we understand, that the exhibitors should be entirely or mainly confined to handicraftsmen themselves, but at present exhibitors of this class are few in number. The exhibition was, however (like most other exhibitions), admittedly incomplete on the day of opening, and we understand that several exhibitors belonging to the artisan class have yet to occupy the spaces allotted to them. We will take another look at the exhibition a week or two later. In face of the apathy of the class for whom the exhibition was mainly intended, the Committee seem to have had no option but to allot space to large manufacturers, so that the exhibition presents no marked contrast to other shows of the kind. Among the exhibitors of the artisan class may be named Mr. H. Staines, well known in connexion with technical education in the build-

ing trade, who exhibits an instructive series of diagrams and models illustrating the principles of carpentry and joinery. A dock labourer, named James True, exhibits two or three cabinets made by him in his leisure time; they are much better in workmanship than in design. One or two looms are at work, one of them producing some excellent figured silk for well-known West End firms of upholsterers. The Thames Iron Works and Ship-building Company lend an admirable collection of models of some recent men-of-war, including the *Sans Pareil* and the *Benbow*, and the East and West India Dock Company and the London and St. Katherine's Dock Company lend a series of large models of their respective docks. The proceeds of the Exhibition, which will remain open for three months, will go in aid of the People's Palace Fund.

WE have received from the "Fireproof Cyanite Co." some specimens of paper and cotton stuffs impregnated with cyanite, accompanied by pieces of the same material untreated. The test is perfectly satisfactory as far as it goes. The untreated pieces burned freely when a lighted match was applied; the cyanised pieces, though they blackened in the flame, entirely refused to burn.

THE Exhibition of the Royal Scottish Academy was closed on Saturday, after having been kept open for a somewhat longer period than used to be the case previously to last year, when an experiment was made in that direction which proved successful. This year the experiment has met with a like success, and we are informed that sales have been good and the prices realised high.

THE building erected in Queen-street, Edinburgh, for a National Portrait Gallery and Museum of Antiquities, has been completed so far as contemplated at the outset and as the funds permitted. The unfinished portion, as designed by Dr. Rowand Anderson, consisting of projecting wings at either end of the central oblong, is now to be proceeded with, the donor of the building fund having come forward with a sufficient sum for that purpose. It is now pretty well understood that the anonymous donor is one of the Members for the city, who has displayed even greater munificence in other directions.

A PIANOFORTE, designed by Mr. Tadema, and of which a drawing hangs in the Architectural Room at the Royal Academy, has been on view recently at Messrs. Johnstone, Norman, & Co.'s, in Bond street. It forms the second portion of a commission for furniture from the designs of Mr. Tadema, given by an American gentleman, Mr. Marquand, with "no limit as to price." The pianoforte is a superb piece of workmanship, and shows a great deal of fine detail in design, of course in a character mainly Greek, or based on Greek work. The main material is ebony, which forms the groundwork of the decoration, the finest and most remarkable portion of which, perhaps, is in the scroll-work which decorates the sides of the instrument, and which is formed of various-coloured woods inlaid but left projecting in relief from the ebony ground, and carved (if we understood aright) *in situ*. The rich and solid effect of this relief inlay must be seen to be duly appreciated; and the truth of execution of the curves deserves the highest praise, especially in the portions of the instrument where the ebony is itself on a curved plan, and the delicate curves of the scroll carving, vertically, have to be adjusted also to this horizontal bend. The top of the piano is covered, unsymmetrically, with inlaid wreaths, filled with the names, in Greek capitals and decoratively arranged, of Apollo and the Nine Muses. The underside of the lid is decorated with bands of inlaid ornament, alternately ivory in cedar and cedar in ivory. The treatment of the arms at each end of the keyboard, in ivory with convex flutings, spreading fanwise as they fall over the curve of the arm, is very fine and massive, with a touch of Egyptian

taste about it. The space at the back of the keyboard, under the keyboard fall-cover, is painted by Mr. Poynter with an allegorical subject, "The Wandering Minstrels." The music-desk is of beaten and carved brass inlaid with copper and silver, and is one of the finest bits of work in the whole. Altogether, this is a quite exceptional piece of furniture both in design, material, and execution; in regard to execution, indeed, one may say that it could not be surpassed.

WE mentioned a little while since that it was intended to erect a monument in Vienna to the memory of Mozart, on the space in front of the Opera House. We understand, from a Vienna paper, that it is proposed to have an international competition for the monument, and that 6,000*l.* have already been raised towards this object. Much more than this, however, would be required to erect a monument worth an international competition.

THERE is in Coventry a fine old hall called St. Mary's Hall, and used as the Guildhall of the city. From an advertisement which has been forwarded to us, and which is signed by the Town Clerk of Coventry, it seems that this building is in danger of being evil-entreated at the hands of any one who may offer to do so at the lowest figure. The advertisement in question invites "tenders to supply a complete set of drawings of the exterior of St. Mary's Hall, in all details of mouldings, canopies, tracery, and other parts, according to the original design of the building." This, apparently, must mean a contemplated restoration. In that case the only reasonable thing to do, supposing "restoration" is necessary or desirable at all (about which we decline to speak positively without another inspection of the building), would be to select the architect most eminent for his knowledge of work of that date, and put the matter into his hands. To put the treatment of an old building up to auction, so to speak, in this way, would be a blunder of the first magnitude; and if the only object is to get a restored drawing of the building as it was at first, that is not the way to go about it. To make any such restoration even on paper requires a great deal of knowledge and study, and no architect of standing, we should imagine, would consent to give in his name in a matter of this kind, and give a tender, like a contractor, for supplying a restoration of the Hall. The idea is absurd, and shows an entire ignorance of professional proprieties. All that the municipality will obtain will probably be "tenders" from some few artful pupils or builders' clerks who want to turn a little money; at least, we should be very much surprised if their advertisement drew any one of higher standing.

THE latest "one-man" exhibition of importance is that of Mr. Henry Moore at the Society of Fine Arts; a collection of sketches in oil and water-colour under the title "Afloat and Ashore." The second half of the title indicates that Mr. Moore has gone out of his usual beat, and for once is to be seen as a painter of landscape as well as of sea pieces. Among the landscapes, "Gelli Gynan, North Wales" (2), and "Gorse Time, Thorpeness; Shower passing off" (30), are two of the best and most characteristic. The greater part of the exhibition, however, is occupied by seas in all stages of first sketch and final finish. Among these may be named especially "Evening off the Coast of Normandy" (35), an evening scene with the sunset behind the spectator and lighting up the cliffs opposite,—this is a very fine little work, a mere sketch, remarkable for its effect of light and atmosphere; "A Rough Day, Lowestoft" (11), a rapid sketch of the movement of water; "The Dingy Atern" (15); "A Short Cut to the Mussel Rocks, Wimereux" (20), a grand scene of stormy sunlight; and among the oil paintings "Thunder Shower passing off" (65); "Weymouth Bay and Portland Bill" (66); "Sunset after Storm" (71); "The Jersey Packet" (75), the packet in the distance, and in front a most spirited representation of the pleasant short seas which she

has to tumble over, and which suggest *mal de mer* at once. The large painting entitled "Wreck of an Austrian Barque, Yarmouth" (59), rather suggests questions. The rush and movement of the water is splendidly given, but what about the colour and texture? Certainly we cannot accept this as like any sea water we ever saw. The large moonlight, "Queen of the Night" (51) is a fine sketch in oil of a moonlight effect.

**MR. WALTER CRANE'S** lecture at the Society of Arts was an eloquent protest in favour of handicraft art, the poetic sentiment that could be enshrined in it, and against everything artistic, being regarded from a pictorial point of view. Mr. Crane appears to have been very desirous also to emphasise the distinction between nature and art, "so often lost sight of." Our present system of designing he described as a search after the superficial naturalism. It might be said that it would be something to know that there was any "system of designing" at all at present. We can hardly recognise that there is, and we should hardly say that the most prominent feature of decorative design at present is a search after naturalism; there is certainly a good deal of practical recognition of the fact that decorative art does not consist in the imitation of nature. Mr. Crane's complaint that industrial organisation had destroyed the art of the people is only too sadly true, for the most part; but the fact is that there is not time, in the present race for life, to give the individual thought and skill to each article produced which is necessary to make it a work of art. Things are wanted quickly and in the mass. We may regret it, but it seems a vain regret for the most part. Circumstances are too strong. It is well to continue to strive against them, for all that, and we are glad to learn in the course of the discussion which followed that the Society of Arts would give its reward and recognition to the makers and not to the sellers of articles. That is a step in the right direction, at all events; and perhaps presently we shall hear a little less of the beautiful designs turned by "— & Co.," and a little more about the men who really design them.

ARCHITECTURE AT THE ROYAL ACADEMY.—V.

1649, "SOMERVILLE HALL, Oxford," Mr. H. Wilkinson Moore. Hung too high to be well seen; a block of collegiate residences of a suitably homelike character of architecture; the portions between the gables want a little more decisive finish at the eaves, the windows run too much up into the gutter. Plans are appended, but cannot be seen to any purpose.

1651, "Design for a Stained-glass Window," Mr. C. Hardgrave. A two-light window in memory of Trevithick; the central portions of each light represent Trevithick constructing a steam-engine,—a novel subject for stained glass, and treated with more success than might have been thought possible in that medium of illustration. The deeper tones of the window are concentrated on these centre portions, which are finished with canopy work of rich design; the upper and lower portions are occupied by canopy work of fourteenth-century character, with figures of angels holding scrolls with the inscription "Peace on earth, goodwill towards men," &c., words which are appropriate enough to the commemoration of a steam-engine inventor, in spite of Mr. Ruskin. At the foot is the inscription, "In memory of Richard Trevithick, born 13 April, 1771; died 22 April, 1833." Then why commemorate him in the style of the fourteenth century? Apart from this consideration, the window is a good piece of work.

1652, "Ceiling in Black and White, for Belton Hall," Mr. John H. Pollen. A comparison of this with No. 1642 seems to imply that the author is prepared to design in all styles, for these two are certainly as opposite in taste and feeling as could well be imagined. This is a slight pencil sketch showing a pretty design of Renaissance character; a wide border is marked off by a flat rib bearing a key pattern, and the border is filled up with central and angle panels with genii supporting shields and underlined

with wreaths; a centre space is marked off by a flat rib designed on curved lines and bearing a guilloche pattern; a large shield with lion surmounters occupies the centre, and medallion heads are placed in circular wreaths at the angles. The general effect is pretty and graceful, though the detail is not of the best school, and conventional foliage is used along with natural sprigs, which never looks in keeping.

1654, "Drawing-room Ingle, Holcombe Wood, Kent," Mr. J. Belcher. A capital little water-colour sketch bearing the signature of Mr. A. B. Pite; the ingle-nook, a very spacious one, opens under a large arch flanked by coupled red marble columns; warm tones predominate; perhaps more so than is likely to be altogether the case in the actual scene; but it is admirably harmonious in colour and handled with the feeling of an artist. The rib pattern in the ceiling is not quite true in perspective.

1656, "Birds-eye View of Proposed Royal Infirmary, Liverpool," Mr. A. Waterhouse, R.A. A view in watercolour, of a very extensive group of buildings in the plain style of architecture suitable for a building of this class. Three large longitudinal ward blocks run parallel at right angles to the street on which their ends abut, and with green lawns between them; some architectural effect is obtained on the ends towards the street by flanking towers and a large open arch and balcony in the upper story and a loggia in the lower; a cross block of buildings of communication apparently connects the main blocks at their upper ends; the centre one runs on into what is evidently the administration block behind; the side blocks, continued further apart, terminate each in a circular ward. So far one can pretty well read the plan from the drawing, but no plan is appended; and we are left in doubt whether the circular wards are for special cases, or merely as experiments in that form of ward, which few builders of hospitals as yet like to commit themselves to entirely.

1657, "Design for Commemorative Schools and Clock-tower," Mr. E. Hodgkinson. A capital tinted drawing. The author of it is the draughtsman who is responsible, as mentioned before, for drawings representing the work of more than one other architect in the room. The tower has a good deal of originality, though we cannot say we like the effect of the twisted columns, with no capitals or finish of any kind, butting against a soffit; it is a whim, but not a happy one. As a clock-tower, the design rather fails in point from the fact that the clock face is the most insignificant feature in it, being merely sunk in a small square panel midway in the height of the tower, whereas a clock-tower should carry the clock stage as its most important feature. From the large amount of opening provided in the upper portion of the tower, it is perhaps intended to have an extensive carillon peal; this would be an excuse for the treatment of the design, which otherwise seems rather out of keeping with its alleged object.

1659, "Interior of proposed Church," Mr. W. Young. A large longitudinal section of a Gothic church, which claims notice as one of the very few examples of genuine architectural geometrical drawings exhibited, and is very carefully executed. It is unfortunately simply a reproduction of Gothic, not of the most refined detail.

1660, "Hôtel Bourgethrolde, Rouen," Mr. Ernest C. Lee. A good sketch in crayon, which has been reproduced in our pages. It might have claimed to be hung better than it is.

1661, "Houses at Chiswick-mall," Mr. John Belcher. A view of two or three houses in a very quiet style, suitable to the *genius loci*. Some years ago they would hardly have been called architecture, but we have changed all that.

1662, "Montreal General Hospital," Mr. Alexander Graham. A water-colour view hung too high to make anything of it, except that, for a hospital, it seems a somewhat picturesque group of buildings.

1664, "Entrance Gateway" of the hospital just named. A good massive piece of work, though we should have liked it better without the big stone spikes on the superstructure of the gateway; in fact, the whole of this structure over the gateway is rather "tracery-like," with its big scrolls, &c.; but, at all events, it is not timid. The drawing (water-colour) is a very good one.

1665, "House near Blackheath Hall," Mr. John Belcher. An interior showing a hall,

wainscoted on the lower part, and with a ceiling panelled with massive moulded beams and intermediate ribs. A good pen drawing, but presenting nothing for special comment. By the same architect is,—

1666, "Morden Grange, Garden View." A bird's-eye view, in a rather sketchy pen drawing, of a very home-like old-fashioned-looking house, with a large extent of garden laid out with precise regularity, with those thick trimmed hedges which are the delight of artists like Mr. Penleylove; a sun-dial and a fountain on the centre axis of the garden; a plot on the left laid out in walks crossing at the centre, which is marked by floral arches and a statue. The house is exceedingly simple, with a loggia with plain cylindrical columns in the middle of the ground story, forming a vestibule to the library, which opens on to the garden. The first-floor story is decorated with brick plasters. The whole thing is in keeping, but looks so old-fashioned that one is in doubt whether it is a new house or an old one added to. A plan is appended. It is a pity the whole was not treated in a water-colour. The effect of the old-fashioned garden might have been charmingly given in a good water-colour; in the pen drawing the effect is lost, and it looks rather scratchy and straggling.

1667, "Snowdenham," Mr. Ralph Novill. Two views and a plan of a picturesque house of the style which may be generally termed "Old English," though there are bits of actual Gothic in it, as a large "Tudor" window, a *porte-cochère* with buttresses and four-centred arches, and a terrace carried on a similar construction. The great merit of the building is that the picturesque arrangement of the windows arises naturally out of the features of the plan, and really expresses the arrangement of the interior. The very spacious hall, in comparison with the general scale of the house, is an instance of the growing tendency towards giving importance to this feature, even in houses of moderate size. The offices are conveniently arranged among themselves, but it is rather a long course from the kitchen to the dining-room.

1668, "Perspective View of Clyde Trust Buildings, Glasgow," Messrs. John Burnet, Son, & Campbell. This, which is a very good water-colour sketch, signed "Jules Lessore," may be taken along with No. 1681, "Proposed Extension to Clyde Trust Buildings, Glasgow, with Clock-tower to Harbours," this latter being a geometrical drawing in line, showing end and side elevations. We do not exactly make out how much of the building is new, except that the clock-tower manifestly is. The side elevation shows a building mostly of an Italian character, boldly treated, the lower half strongly rusticated. The principal entrance, under three large arches, is accentuated by an order and a pediment above. The tower is very boldly treated, somewhat Venetian in character, rising with strongly-marked vertical lines to a considerable height and there carrying a clock-stage with balconies (?) on heavy brackets under each clock-face, the object of which is not very apparent, unless we are supposed to go up into them to look at the clock. If the clock-face had been corbelled out it would have been more to the purpose. The tower is surmounted by an open octagonal lantern with a short stone spire, or rather conical roof, over it, and four bronze (apparently) seated figures occupy pedestals on the angles of the tower and fill up the line from square to octagon. The water-colour sketch, whether intentionally or not, does not quite tally with the elevations, and represents the tower with a considerable amount of batter, which is not discernible in the geometrical elevation, but which is an improvement to its effect. As shown in the perspective sketch, this appears a fine bold piece of design, solid and massive, and with no nonsense about it.

1670, "House at Elstree," Mr. E. J. May. A picturesque house of the "cottage architecture" type, with a plan appended, but hung too high to be seen. The bit stuck on at the end of the house, with two big chimneys rising from it, comes in rather awkwardly, and looks like a subsequent addition to the house.

1672, "All Saints' Vicarage, Plymouth," Mr. J. D. Sedding. A picturesque house, but rather too eccentric; it looks tumbled together; the small bays on the road-front, connected by a balcony and a roof, form a good feature. The house seems to have shaved off its eyebrows, having no projection or moulding worth the speaking of either at eaves or gables. This is

"characteristic" in a sense, but it does not add force to a building. Two small plans are appended; they cannot be well seen, however.

1673, "House at Tunbridge Wells," Mr. Jas. Neale. A beautifully-executed pen drawing, almost as soft and graduated in tints as a good engraving; the house, with an upper story of half-timber work seated on brick walls, and with strongly accentuated eaves, looks solid and at the same time picturesque; but it owes something of its effect to the well-executed background of the picture; the house and its surroundings make a good whole.

1674, "Design for a Town House," Mr. T. MacLaren. This we have already illustrated; it has been well hung and deserves its position in spite of the overpowering roofs with which the author has spoiled it (if it were a house for execution) both architecturally and practically. The centre pile of roof is as high from the main cornice to the peak as the cornice is from the plinth line, and in execution all this would be nearly wasted material and space, only available for badly-shaped and ill-lighted attics. But the lower portion of the house is dignified in design and very well drawn. The device of carrying the capitals of the upper wall columns past the architrave and frieze, and making them carry the cornice only is, however, hardly to be commended.

#### A RELIC AT AUSTIN-FRIARS.

A SUPPOSED relic of the former settlement of Mendicant Friars in Broad-street Ward has just come into view. It consists of a leaden coffin, temporarily deposited, though not for exhibition there, in the Guildhall,—which has been discovered in a vault whilst making excavations for the rebuilding (Messrs. James & J. S. Edmeston, architects) of No. 57½, Old Broad-street, and No. 7, Austin Friars. The coffin, being of full size, is slanted to the body, and is of unusual width across the shoulders, though very narrow at the feet. It was found some 15 ft. below the surface, against what is possibly the northern chancel wall of the Friars' church. The amount of present work remains turned up in course of the present works goes to show that here was the Friars' burial-ground. A church was erected here for the Augustines in 1253, by Humphrey de Bohun, Earl of Hereford and Essex, a grandson to their founder. The church's gilded spire was one of the very few for which London in those days could lay claim to distinction; and even by Stow's time, having survived St. Paul's, it had no superior. He dwells with evident delight upon the "Augustine Friars' church and churchyard," entering thereunto by a south gate to the west perch, a very large church having a most fine spired steeple,—small, high, and straight. I have not seen the like." At the Dissolution King Henry VIII. bestowed the conventual house upon Sir William Paulet, Lord St. John of Basing, one of that sovereign's executors. Paulet converted the Friars' lodgings, cloister, and garden into a suitable residence, which continued in his family for scarcely more than half a century. On January 12th, 1550, Paulet was advanced Earl of Wiltshire, and further on October 12th, 1551, Marquess of Winchester. His new home, for a while known as Paulet or Winchester House, adjoined to that of his contemporary Sir Nicholas Throckmorton. Here he lived with his wife Elizabeth, daughter of his near neighbour Sir William Capel, ancestor of the Capels, Earls of Essex. By being, in his own words, a willow and not an oak, Paulet contrived to serve the Lord Treasurership of England to Edward VI. and his two successors on the throne: he died in his 98th year, on March 10th, 1572. His son and successor, John, sold the church monuments at Austin Friars for 100l., as also the lead from the roof. His great-grandson, William, fourth Marquess, having spent more than he could afford in various ways, including a magnificent reception of Queen Elizabeth at Basing, county Hants, was in 1602 fain to part with his property here for 4500l. to Sir John Swinnerton (Lord Mayor 1612). He had for tenants Fulke Greville, Lord Brooke, and the Countess of Shrewsbury; and in Wilkinson's "Londina Illustrata" is quoted a letter under date September 23, 1602, from Greville to the Countess. He writes:—"I thought it my duty to give your ladyship notice, because both your house and my Lady of Warwick's are included in this bargain; and we, your poor neighbours,

would think our dwellings desolate without you, and conceive your ladyship would not willingly become a tenant to such a fellow." The monuments alone testify to the pristine importance and accredited sanctity of the Friary. They comprised the tombs of Richard (Fitzalan), Earl of Surrey, whom King Richard II. beheaded in 1397; Humphrey de Bohun, King Edward I.'s god-father, who fought at Evesham; Edward, infant son of the Black Prince and Joan, his wife, the Fair Maid of Kent; Edmund Guy de Meric, Earl of St. Paul, who is said to have instigated the death of Thomas, Duke of Gloucester, in 1397; the tenth Earl of Arundel, executed in West Cheap, 1397; John de Vere, twelfth Earl of Oxford, beheaded on Tower-hill in 1461; many of the barons who fell in the Lancastrian defeat at Barnet Field, 1471; William, seventh Lord and first Marquess of Berkeley, with his wife Joan,—he died 14th of February, 1492; and Edward Stafford, Duke of Buckingham, who was beheaded through Wolsey's machinations, 1521. Some remains of the old Winchester House remained standing until about forty-five years since. Of the imposing block of three houses, styled Winchester House, in Old Broad-street, the front portion was demolished (together with other premises) in September, 1883, in pursuance of a scheme referred to in our columns of the 4th of August in that same year. The back premises had been removed in 1857. The site of Pinner's Hall, which stood hard by, was that of a Venetian glass factory that had been set up within the precincts of Austin Friars. Of this factory Howell, author of the Letters, was some time manager. After the suppression, Sir Francis Walsingham succeeded to the house here owned by a branch of the fraternity of the Papey, founded (1430) in honour of St. Charity and St. John the Evangelist at St. Augustine Papey in the Wall.

Before Humphrey de Bohun's death the nave of the Friars' Church was assigned "to the Germans . . . for their church, to have their service in, for avoiding of all sects of Anabaptists, and such like,"—according to the passage in King Edward VI.'s diary, under date 1550, June 29. The "Germans" of the charter included certain Dutch and Flemish refugees, who united themselves with the original Protestant congregation of Jean à Lasco, the Polish exile, church, that migrated from Emden in East Friesland. For a period, the Dutch or Flemish community shared this their "Temple du Seigneur Jesus" with the French refugees, who, subsequently migrating to St. Mary's Chapel, Threadneedle-street (pulled down in 1841), afterwards removed to the church, designed by Owen, in St. Martin's-le-Grand, which in its turn will soon have to make way for an extension of the General Post-office. After the fire of 1862, the valuable library of the Dutch Church community in Austin Friars, rich in MSS. and letters of Calvin, Peter Martyr, and others, Continental reformers, was, we understand, entrusted to the City Corporation for its better safety, and to render it more accessible to readers. It contained a copy of the Decalogue, attributed to the hand of Rubens.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The eleventh ordinary meeting of this Institute for the present session was held on Monday evening last, Mr. E. T. Anson, F.G.S. (President), in the chair.

#### Obituary.

Mr. Macvicar Anderson announced the decease of Sir Horace Jones, City Architect, and past-President of the Institute. Mr. Anderson's remarks and those of other gentlemen on this subject, will be found in another column of this week's *Builder*.

Mr. William H. White (Sec.) announced the death at Cannes, on the 7th inst., of M. Ruprich-Robert, an Hon. Corresponding Member of great distinction, after a long and painful illness. A notice would appear in the "Journal of Proceedings." The Council last heard from the deceased member in December last in a charming letter written from Cannes, at a time when he was very ill. He had been engaged for several years upon a well-known work on Norman architecture, which included notices of a great number of edifices erected in this country. That had been almost the work of his life, but he was also known as the author of several other works. M. Ruprich-Robert was Inspector

General of Historical Monuments in France for a number of years, and was a Member of the Commission during the year 1844.

#### Drainage of the City and Palace of Westminster.

Mr. John Phillips, C.E., then read a paper on "The Drainage of the Palace and City of Westminster," of which the following is an abstract:—

Before entering upon a detailed description of the drainage of the Palace and City of Westminster, the author referred generally to the important question of town drainage,—a subject even now not so well understood and practised as it should be. One object should be, he said, in draining a house, a mansion, a village, or a town, to make the drains and sewers so that the sewage in them shall never stagnate at any part, but be constantly flowing with a self-cleansing velocity; and so that the air in them shall never stagnate at any part, but be always flowing, by fresh air passing into their lowest parts, and by foul air discharging from their highest parts into the stratum of the atmosphere above that in which we live and breathe.

Town drainage consists, first, of the comparatively clean surface and subsoil water; and, secondly, of soiled and used water containing organic matters called sewage. The combination of comparatively clean and of highly foul water in the same channels was established in London and its suburbs about the commencement of this century, at the time that water-supply by pipes to houses became general. A largely increased amount of water was used and was discharged into the old cesspools, and thence by overflow drains into the ditches, watercourses, and sewers, open and covered, which received the surface-water, and conveyed it into the natural streams and rivers. What was at first a makeshift or temporary expedient was continued, and became a system which has been extolled as the best course to pursue. The evils arising from this combination are, however, continually asserting themselves, and they become masters of the situation.

The two systems of drainage should, the author said, be kept separate by the provision of one set of drains for receiving the surface and subsoil water, and discharging it into the natural streams and rivers; and of a second set for receiving the sewage, and conveying it in self-cleansing drains as fast as it is produced to suitable and prepared agricultural land. This separate system was recommended by the author, Mr. Phillips, thirty-eight years ago, in his preliminary report on the drainage of the metropolis, and he advocated it now as the only effectual remedy for the evils arising from a combined system we have, up to the present, been pursuing. The sewage would in this system be conducted to reservoirs, and the suspended organic matters therein called sludge would be precipitated by lime and sulphates of alumina and iron. The sludge would be used by farmers, and dug or ploughed into the land the same as farm-yard manure. The liquid sewage would flow by irrigation upon, and find its way by filtration through, the land to the natural water-courses as a purified effluent, leaving its fertilising constituents in the soil on the way to be assimilated into growing crops.

The rain or surface water from the houses and streets would be carried away into the natural streams by glazed stoneware or fireclay pipes embedded in concrete, of diameters varying from 3 in. to 24 in. or more. The sewage from the houses would be carried away by glazed pipes of cast iron of 6 ft. to 9 ft. length, with inspection covers, curved junctions, and perfectly water-tight joints, laid with a proper fall on concrete, directly under the basement floors and paving, so as to be always accessible without opening the ground to get at them.

Where towns or districts are hilly or on sloping ground the necessary fall for the drains is easily obtained; but there are many towns and districts where the ground is low and flat, and where it is impossible to give the drains the necessary fall to be self-cleansing without going to excessive depths. Such districts, for instance, are Fulham, Chelsea, Pimlico, Westminster, and Poplar, on the north side of the Thames; and Battersea, Lambeth, Southwark, Bermondsey, and Deptford, on the south side. In such districts, however, the difficulty might easily be overcome by dividing the drains into sections, converging to receiving stations where the sewage might be lifted to sufficient altitudes

to ensure its flowing by gravitation to distant agricultural land, or down to the sea to be discharged therein from the level of the highest gides under low-water level. This mode of dealing with sewage is already in active operation at the Palace of Westminster, at Eastbourne, at Southampton, and at other places, where Shone's Hydro-Pneumatic system is employed in ejecting the sewage, with economical and completely successful results.

The author then proceeded to describe in detail the drainage of the Palace of Westminster as originally laid down by the architect of the building, and to point out the defects of the system employed, and the evils attendant upon the subsequent laying down of the main low-level sewer, through Westminster and Pimlico, by the Metropolitan Board of Works. The Palace stands, as is well known, beside the Thames. Its entire area, including Westminster Hall and Old Palace Yard, is about 14 acres. Its roofed, flagged, and paved surfaces, off which rain runs into the Palace drains, is about 10½ acres. The whole Palace might have been well and efficiently drained in the first instance if the simple expedient had been followed of keeping the rainwater drains separate from the sewage drains. The surface water might have been discharged direct into the Thames, and the sewage through a ventilated siphon-trap into a sewer in Bridge-street, at the south-west corner of old Westminster Bridge.

The manner in which the Palace was actually drained was as follows:—In 1838-39 the architect laid down a brick main sewer running from north to south along the centre of the Palace, into a main sewer then existing in Abingdon-street, the outlet being near the south-west corner of the Victoria Tower, and the head on the north side of the Speaker's court. The length of the sewer was about 1,000 ft.; its size was 5 ft. 6 in. high by 3 ft. wide; its shape was a segment bottom, 6 in. deep, with upright sides and semicircular crown; and its fall was 1 in 923, or 1 in 1,078 ft. Into this sewer was conveyed, by numerous 9-in. and 12-in., and 2-ft. by 1-ft. brick drains rendered inside with cement, all the sewage produced in, and the rain falling on, the Palace. This sewer, owing to its excessive size, had shape, little fall, and absence of any means of flushing it, accumulated sewage in deposit to depths varying from 6 in. to 18 in., and from the decomposing sewage noxious gases continually escaped into the Palace. The sewer was occasionally cleansed, and additional traps were provided to keep down the smells, but all to no purpose.

At last, in October, 1846, the smells were everywhere so bad, that the author, who was then Chief Surveyor to the Westminster Commission of Sewers, was consulted by the architect of the building. He found upon examination that the main sewer was little better than an extended cesspool. By levelling he discovered that the sewer in Bridge-street, already mentioned, was 5 ft. lower than that in Abingdon-street. He therefore recommended the architect to take out the invert of the Palace sewer, and to put in a narrow deeply-curved invert with a reversed fall of 1 in 215 in place of it,—then to continue the sewer northward across the Speaker's Green into the sewer in Bridge-street. This recommendation the architect adopted and carried out, and in the end the sewer as altered, and the main drains connected therewith, became self-cleansing. They continued in this improved condition for a quarter of a century, until about fourteen years ago, when the main low-level sewer was put down through Westminster and Pimlico by the Metropolitan Board of Works. Since then the discharging level of the sewage from the Palace sewer, as well as from the sewers generally in Westminster and Pimlico,—instead of being lowered and the flow accelerated,—has been materially raised and the flow retarded; and the sewers themselves have been converted into sewage and rainfall reservoirs.

The principal cause of this state of affairs is the level at which this low-level sewer has been put in, namely, at least 5 ft. higher than it should be for properly draining the low flat districts through which it passes. When rain falls on the districts draining into it, the rain and sewage together sometimes fill it, and sometimes rise to 5 ft. and even 10 ft. above its crown, thus driving out the sewage gas, generated in the sewers, into the streets and houses. At such times the sewers in Westminster and

Pimlico, as well as the basements of many houses there, are flooded to the hydraulic level; the foul drainage rises in the low-level sewer, and the sewage overflows into and pollutes the river. In dry weather the height to which the sewage formerly accumulated in the sewers, when the flap-valves on their outlets were tide-locked, has been materially and permanently raised by the height to which the sewage now flows in the low-level sewer. At the point where the Palace sewer joins the main low-level sewer, the level of the latter was so little below the former, that the 4-ft. depth of sewage flowing in the latter in dry weather formed a permanent head or dam, about 2 ft. 4 in. deep, against the outlet of the Palace sewer. This sewer for considerable length was thus converted into a permanently elongated sewage pond and sewage gas-retort; indeed, the flap-valve fixed near its outlet was recently found to be standing open and useless, and in rainy weather the accumulated drainage in the low-level sewer prevented that in the Palace sewer from discharging.

It is evident from the foregoing particulars and facts concerning the drainage of Westminster and Pimlico, that the insufficient depth and capacity of the main low-level sewer have materially injured, instead of benefited, the sewers in those districts, which, therefore, as regards their drainage, are in a far worse condition now than they were when they drained direct into the Thames. The real remedy for the evils which arise from the insufficient depth and capacity of this main sewer consists, in the author's opinion,—(1) In lowering its bottom from near the District Railway Station at Charing-cross to the western pumping-station at Chelsea, a depth of at least 5 ft., and in so doing altering its section from an 8 ft. circle to a 13 ft. by 8 ft. egg-shaped sewer; (2) In lifting the drainage near the railway station, a height of about 20 ft., by compressed air, having a pressure of about 10 lb. on the square inch above the pressure of the atmosphere, to be admitted into suitable ejectors placed underground near the low-level sewer, and discharging into the same sewer beyond; and (3) In thoroughly ventilating the sewer in sections from end to end by fresh-air down-cast and foul-air up-cast pipes, the latter discharging considerably above the house-tops. If this improvement were carried out, the main sewer would then drain the Westminster and Pimlico districts sanitarily, so far as the combined system will permit this to be done.

Mr. Phillips then stated that, in 1886, the Select Committee of the House of Commons appointed to consider the subject of the drainage of the Palace consulted him as to the best means of improving the same. His chief proposals were the following:—

Firstly.—That while the Metropolitan low-level sewer should continue to be the outfall for the Palace drains and sewers as at present, yet the arrangements for this should be such that neither rain nor flood water, nor sewage and sewage gas, should by any possibility come from the former into the latter.

Secondly.—That inside the Palace main sewer, a small egg-shaped sewer, having a fall of 1 in 212, be constructed of white glazed fire-bricks, and all existing drains be properly connected therewith.

Thirdly.—That at the lower end of the egg-shaped sewer, under the Speaker's Green, the sewage and rainfall of the Palace be continually discharged into the low-level sewer by three of Shone's pneumatic ejectors worked by compressed air produced by three gas engines,—only one ejector and one engine to be used in dry weather, and one or both of the remainder as required during wet weather.

Fourthly.—That the small egg-shaped sewer be ventilated by a fresh-air downcast pipe carried into its lower end, and a foul-air upcast pipe carried from its upper end into the ventilating shaft going to the top of the Victoria Tower.

These proposals were adopted by the Select Committee, and Mr. Isaac Shone, C.E., was appointed by the First Commissioner of Her Majesty's Office of Works the engineer to prepare the drawings and specification, and to superintend the work, and Mr. Phillips was then appointed by Mr. Shone as the resident engineer.

The work was eventually executed in the following manner:—A 12-in. cast-iron main drain, about 1,000 ft. in length, with a fall of about 1 in 212, was embedded in concrete

along the bottom of the old main brick sewer. Two branch 9-in. cast-iron drains, and about 120 separate smaller drains, conduct all the sewage of, and rain falling on, the Palace and grounds, into the 12-in. main drain, which discharges into a receiver at the bottom of a sewage manhole under the Speaker's Green. From the side of the receiver a 12-in. cast-iron inlet-pipe is carried horizontally into the adjoining ejector chamber. This chamber is 20 ft. deep from the surface of the ground, and is 38 ft. long by 13 ft. 6 in. wide in the clear. In it are placed three cast-iron ejectors, one of which is capable of discharging 480 gallons, and the other two 335 gallons each, per minute. From the 12-in. inlet-pipe the sewage is delivered by branch 6-in. cast-iron pipes into the three ejectors. From the bottom of each ejector a 6-in. cast-iron pipe passes vertically upwards into a 12-in. cast-iron horizontal outlet-pipe. This pipe is carried through a solid brick dam, 8 ft. long, built in and entirely closing the old main sewer, and discharging beyond the dam into the outlet portion of this sewer communicating with the low-level sewer, about 1 ft. above the normal sewage flow in the latter sewer.

The compressed air for ejecting the rainfall and sewage from the ejectors is produced by Atkinson's differential gas engines placed in the basement, about 650 ft. distant from the ejector chamber. There are four of these engines of four-horse power each, though one of them is capable of compressing sufficient air for ejecting not only all the sewage under ordinary circumstances in dry weather, but a large amount of rainfall in addition. The compressed air is conducted from the engines by a 6-inch cast-iron pipe to three cylindrical wrought-iron receivers placed near the engine-room, and thence it is conveyed in 6-in. cast-iron pipes along the basement to a subway leading to the ejector chamber. From this pipe a 3-in. wrought-iron pipe conveys it into a small cast-iron horizontal cylinder fixed on the top of each ejector. The ingenious automatic arrangement by which the compressed air is conducted into the cylinders and thence into the ejectors, as well as the arrangements of the ball-valves inside the pipes for admitting and expelling the sewage, were described in detail by the author. The ejectors work, slowly or fast, according to the quantity of drainage coming to them, and they require no other attention than occasionally cleaning and oiling the joints, and the slide and main valves. The moment each ejection is completed the compressed air in the ejector is discharged therefrom by a 3-in. wrought-iron pipe connected with a 6-in. cast-iron main pipe, which leads into the ventilating shaft going to the top of the Clock Tower.

The height the drainage is ejected in dry weather is 11 ft. 6 in., and in wet weather, when the main low-level sewer is in flood, 15 ft. to 20 ft. The air-pressure for ejecting the drainage is maintained at 10 lb. per square inch above the atmospheric pressure, in order to meet immediate requirements for rainfall. About 5½ lb. pressure is sufficient in dry weather to eject the sewage alone. The amount of sewage ejected in dry weather has been tested and found to average no more than 40 gallons per minute, so that a 6-in. pipe would really carry away all the sewage produced in the Palace. This, subtracted from 1,150 gallons, the total ejecting capacity of all three ejectors working together, leaves 1,110 gallons, which is, therefore, the quantity of rainfall they are capable of ejecting per minute, and which would come to them, from the ten acres and a half of roofed and paved surfaces draining from the Palace, at a rate of rainfall equal to 28 in. in depth per hour, or 672 in. in depth per twenty-four hours.

Fresh air is admitted into the subway through two grated openings let into the footway in the Speaker's Green, and is thence conducted into the ejector chamber, and thence into the sewage manhole. From the manhole the air flows up the main 12-in. drain to near its upper end, whence it is conducted by a 12 in. pipe over a furnace in the large ventilating-shaft, going from bottom to top of the Victoria Tower. The 9-in. main branch drain, which is carried under the basement along the west side of the Palace, is also completely ventilated by receiving fresh air into its top end, and discharging the foul air under the furnace at the bottom of the Clock Tower ventilating-shaft. The subway over the 12 in. main pipe receives fresh air from the surface down the old manholes, and

from an opening in the sewage manhole. The air in the subway flows along a 16-in. cast-iron pipe to the ventilating-shaft in the Clock Tower.

These new main drainage works have been in operation nearly six months, and are completely successful. They at once convey away all the sewage produced in the Palace, and the rain falling thereon. There is now no stagnant sewage or foul air in the drains, and consequently no noxious gases arise from them into the building.

The total cost of the works, including the four gas-engines, the three compressed air receivers, the pipings, and the three ejectors, has been a little over 11,500*l.*

Sir Robert Rawlinson, in opening the discussion, said he had been sorry to hear a good deal Mr. Phillips had said. Mr. Phillips laid down a theory with regard to combined drainage, which he (Sir Robert Rawlinson) protested against. He (the speaker) knew of no such system, and had never advocated such a thing. Taking London as it was now drained, there might be some ground for fault-finding, but, on the whole, there was very much to praise. London was an enormous area, and certainly if one had to sewer it *de novo* some points might be usefully considered. In an ideal system, every valley line and valley stream should be rigidly kept as a surface-water channel and as a rain-water outlet. Then the sewage proper should be intercepted from the valley lines, and carried down to some intercepting sewer. But to have laid down a system of duplicate sewers in London would have been a mischievous failure, and he was very glad it had never been carried out. In a place like London, where the river was tidal, and where the main sewers which the Metropolitan Board had carried out would not take the volume of storm water,—there was the river to resort to, and the overflows of extremely diluted foul water would thus be conveyed away harmlessly. With regard to the drainage of the Houses of Parliament, Mr. Phillips had not said one word about all the preliminary reports made on the condition of things. Mr. Phillips knew well that he (the speaker) had had to do with it from the beginning to the end; that he had given evidence before the committee; and that, when asked how the sewage should be dealt with, he had said that if they determined to treat it in the way they had treated it there were three methods that could be followed,—by using gas-engines to lift it, or a common steam-engine, or a pneumatic ejector, worked from the existing boilers below the Houses of Parliament. He had not a word to say against the method Mr. Phillips had carried out, but he had a great deal to say against the allegation that the building was in the condition described. Let the officials of the House speak for themselves, and they would say that it was in no such condition. The cause was to be found outside, in the sewers put in Old Palace-yard, Bridge-street, &c., and their outlet ventilators. The sewers beneath the House were not perfect, certainly, but they could never have caused the amount of stench they were charged with causing, and that the officials would corroborate. Again, as to the cost, he could only pronounce it as monstrous that 11,000*l.* should have been expended upon the work. That amount would have sufficed to drain a population from beginning to end of 20,000 people. He could not understand how they had managed to get rid of the money.

Mr. William H. White (Sec.) next read two letters from Sir Henry Roscoe, Chairman of the Select Committee, speaking in terms of satisfaction as to the sewerage works lately carried out at the Houses of Parliament. A communication from Lieut.-Col. Jones, V.C., who was well known as taking great interest in sewerage matters, and referring principally to the combined and separate systems, would be printed in the "Journal of Proceedings."

Mr. R. F. Grantham said he had had some experience in designing and carrying out the drainage of several towns. He had taken special interest in the separate system, and had carried it out, completely separating the sewerage from the rainfall. With regard to country and small towns, it was all very well to design on the separate system, because an opportunity was afforded of discharging the rainfall into the ditches, but where it had to be disposed of by a mechanical process it made a material difference in separating the rainfall from the sewage. He had had an opportunity of com-

paring the drainage of Romford with that of Slough, the drainage of the latter being carried out on the separate, and the former on the combined system. He found that in the case of Romford the sewage pumped was just four times as much in quantity as that pumped at Slough, showing the great advantage in such country towns of separating the rainfall from the sewage. To think of doing this, however, in a place like London was out of all reason. Mr. Phillips seemed rather to complain of the deficient fall of the Metropolitan main sewer, which he said was about 1 in 2,640 from Chelsea to Abbey Mills pumping station, and proposed to lower the sewer from Charing-cross to Chelsea. He would like to ask Mr. Phillips whether in doing that he would not very much diminish the fall, and make it worse than it now was? [Mr. Phillips: "The sewage would be lifted by ejectors."] In that case he wished to know what would be the size of the ejectors, and their capacity for lifting the sewage at Charing-cross? He agreed with Sir Robert Rawlinson that the expense of the works at the Houses of Parliament had been something tremendous, and that a population of from fifteen to twenty thousand could be sewered for the same amount.

Mr. Harry Newton said that by the method he advocated he followed a totally different principle in dealing with sewage, viz., in trying to exclude all air from it in every possible way, and thus preventing the formation of sewage gas.

Mr. Henry Dawson remarked that it appeared to him that, assuming Mr. Phillips's diagrams correctly represented the facts [Mr. Phillips: "They do"], the constantly charged sewer from the House of Commons must have been the main source of the mischief.

Mr. Edmund Woodthorpe proposed a vote of thanks to Mr. Phillips.

Mr. Henry Curry seconded the motion, adding that the Shone system had been introduced at Eastbourne with very happy effects. The great convenience of that system was that the outfall might be situated at one particular place, and the engine and machinery at another, as at Eastbourne, where it was a mile and a half away, and where it had been of the greatest possible benefit in lifting and getting rid of the sewage at all states of the tide.

After a few remarks by Mr. Atkinson on the mechanical details of the ejectors,

Professor Kerr said he was sorry that Mr. Phillips and Sir Robert Rawlinson should be of different opinions, but it must be a matter of congratulation at the same time that their friends the engineers differed as well as the architects did. The architectural profession was very much indebted to both those gentlemen. He did not wish to undervalue Sir Robert Rawlinson's labours for a moment, but Mr. Phillips deserved great credit for what he had done. They, as architects, were concerned with drainage chiefly within the walls of buildings, or not far beyond them, and they held the engineers responsible for all the mischief that occurred outside, under the streets, and so on. The sewer gas was the engineers',—it was their own penicillar and pet ammoniac (laughter), and architects looked to the engineers to get rid of it. Mr. Phillips seemed to imply that the architect of the Houses of Parliament was somewhat to blame in regard to the drainage, but it should be recollected that at that time of day architects did not know all that they now know [Sir Robert Rawlinson: "Nor did the engineers"]; and if Sir Charles Barry, whom they held in the greatest esteem, displayed some ignorance of what was now known, it was no discredit to him. It was some satisfaction to find that the engineers had at last got, in the form of the pneumatic injector, an apparatus that would enable them to get rid of the sewage whenever they happened to make a mistake, as they appeared to have done in the district of Westminster, in collecting the sewage at a level from which it could not escape. What Sir Robert Rawlinson had said was worthy of admiration as a common-sense way of dealing with the matter, viz., that if the engineers had to deal with London *de novo* they would preserve the water-courses for the water-flow, and confine their engineering to sewage proper. That could not now be done, but he supposed it was a fact that not only Westminster, but certain other districts of the metropolis, happened to lie below the level of convenient sewage disposal. Whether that could be remedied it was a matter not for the

architects, but rather for the engineers, to decide. The engineers were responsible for it, and he hoped they would proceed with a better plan for dealing with the matter.

Mr. Phillips said he must be allowed to express his surprise at the remarks of Sir Robert Rawlinson.

Sir Robert Rawlinson said that he had not in any way intended to disparage Mr. Phillips. They were like the knights of old, and had been each looking at different sides of the same shield. He believed if he and Mr. Phillips could sit down together, there would be no difference between them as to what the latter had called the "separate" system of drainage. Mr. Phillips was far in advance of him in taking up the sewage question, and he (Sir Robert) had learned from him in his early days, but Mr. Phillips had been long lying fallow. He (the speaker), on the other hand, had been in the field, working the whole time, and that under every sort of aspect. He had laid out thirty years ago a system of sewers in West Ham, a district which was as flat as a pancake, with only 3 ft. fall in a mile, and it had worked satisfactorily from that day to this. The population, which was then 36,000, had risen to close upon 200,000, and though there had been additions, not a single yard of sewer had been altered.

The President, in putting the vote of thanks, remarked that Mr. Phillips was the oldest living pioneer of the modern science of drainage. The resolution was then put and carried.

Mr. Phillips, in replying, said he was quite satisfied that if he and Sir Robert Rawlinson were to talk the matter over they would soon agree. He did not advocate that the separate system should be carried out in London, but he affirmed that it was the proper system to be adopted in all new works, a conclusion he had come to nearly half a century ago. In reply to the question about the fall of the sewer, he believed the main low-level sewer had a fall of 2 ft. in the mile. He had suggested that the main low-level sewer should be lowered say 5 ft. The sewage, instead of standing in the sewers of Westminster as it now did, would flow easily away.

The President announced that the next meeting would be held on the 13th proximo, when a paper would be read by Mr. T. G. Jackson on "The Art of Dalmatia."

#### VISIT TO ST. THOMAS'S SEMINARY AND CHISWICK CHURCH. ARCHITECTURAL ASSOCIATION.

The ninth and last Saturday afternoon visit of the Architectural Association for this session was made on Saturday, the 21st inst. The first place visited was the St. Thomas's Seminary, Hammersmith. The members were met by Mr. Bentley, the architect, and the Bishop of Amylea, and conducted over the building, which is designed to accommodate fifty to sixty students, of which number some thirty are now in residence. It is built on the site of a religious house which existed there for many years, and when completed will comprise two complete quadrangles. Only one is at present finished, and in it are placed the dining-hall and kitchens, arranged on the ordinary college plan, and approached from a wide passage, or closed corridor. The common room is fitted up as a temporary library, and the students' rooms and those of the Principal and other officials occupy the remainder of the quadrangle. The chapel forms one side of the future quadrangle, next the Hammersmith-road, and the library, when built, will occupy the other.

The next place visited was Chiswick Church, where the rector, the Rev. Lawford Dale, met the party, and showed the church, which has been almost entirely rebuilt from the designs of Mr. Pearson. The seating is of polished teak; the choir-stalls and screens are of oak.

**Surveying Class, Architectural Association.**—The preliminary meeting to form the class for the study of land surveying and levelling will be held at 9, Conduit-street at 6:30 p.m. upon Tuesday next, May 31. Owing to the annual dinner being fixed for Thursday, June 9th, the field lesson announced in the Brown Book to be held that evening will in consequence be transferred to Friday, June 10.

THE LATE SIR HORACE JONES.

WE announce with much regret the death of Sir Horace Jones, the City Architect, which took place on Saturday last, May 21, at his residence, 30, Devonshire-place. He had only a day previously completed his sixty-eighth year, having been born on May 20, 1819. He leaves a widow and one child,—a daughter. According to the *City Press*, he was born in Sise-lane, Bucklersbury, where his father was a solicitor in practice, which was carried on after the father's death by the elder son, Alfred, who died about ten or eleven years ago. According to the same authority, Horace Jones was articled to Mr. John Wallen, architect and surveyor, in Aldermanbury. Subsequently he spent some time in studying the works of ancient architecture in Italy and Greece, the late Mr. George Vulliamy (Architect to the Metropolitan Board of Works), Professor Hayter Lewis, Mr. G. R. Burcell, and others being his companions. In the year 1846 he commenced practice as an architect at 16, Furnival's-inn, Holborn, and during a period of eighteen years designed and carried out numerous buildings of importance, such as the British and Irish Magnetic Telegraph Company's offices in Threadneedle-street, the Sovereign Assurance office in Piccadilly, the Royal Surrey Music Hall in the Surrey Zoological Gardens [both hall and gardens are now things of the past], Messrs. Marshall & Snelgrove's premises in Oxford-street, completed by Mr. Octavius Hansard after Mr. Jones's appointment to the City Architectship; Messrs. Hyam's premises in Oxford-street, Cardiff Town Hall, Caversham Park, and many other buildings, warehouses, schools, gentlemen's residences, &c. He also held the offices of Surveyor to the Tuffnell Park Estate, the Duke of Buckingham's, the Barnard Estate, Bethnal Green, and others. A vacancy occurred in November, 1863, by the death of Mr. James B. Bunning, in the office of City Architect, and although it was then strongly felt by a large number of the Corporation that the office should not be continued as that of an Architect, and although the Officers and Clerks' Committee in the report adopted that view, and recommended that a "City Surveyor" should be appointed to advise on all matters relating to the City's Estates and public buildings,—architects to be obtained by competition or otherwise for new buildings,—yet it was finally decided by a narrow majority to re-establish the office on its former extensive footing, a right, however, being reserved to the Corporation to employ other architects if they saw fit; and accordingly on February 26th, 1864, out of eleven candidates Mr. Horace Jones was elected Architect and Surveyor to the Corporation of London.\* During the twenty-three years he held the office he designed and carried out a very large number of buildings, amongst the number being the Central Meat Market, in 1868. This was followed in 1875 by the adjoining Poultry and Provision Market, and in 1883 by the Fruit and Vegetable Market, subsequently turned into a fish market; and now a fourth market in Snow-hill is in course of construction. In the year 1871 the old Government Dockyard at Deptford was converted into a Foreign Cattle Market at a very considerable cost, and works are still going on there; in 1877, Billingsgate Market was entirely reconstructed and enlarged; in 1882, the new Leadenhall Market was built, and subsequent additions have been made, and are in course of execution. This makes a total of seven markets which have been carried out from designs of the late City Architect, besides extensive alterations and additions to the Battle Market at Islington. In 1864 Mr. Jones completed the City Lunatic Asylum, Dartford, built from the designs of the late Mr. Bunning, and has since added several other buildings. In this year the design by Mr. Bunning for the new roof of the Guildhall was set aside, and that by the new Architect adopted as being more in accordance with archaeological concavity. Mr. Bunning's design was not without merit. The subsequent restorations of the masonry, windows, &c., were also carried out by Mr. Jones in 1872; the Library and Museum were added to Guildhall from his designs, and in 1884 the new Council Chamber. He also made several designs for remodelling other portions of the premises comprehended under the general head of Guildhall, but these have not reached the dignity of bricks and mortar.

\* See *Builder* for that year, pp. 115, 157, 177.

He designed several police stations in the City,—Bishopsgate-street, with the hospital, in 1867; Seething-lane, 1870; Snow-hill, in 1875; Bridewell, in 1879; Cloak-lane, in 1886; besides police dwellings in Rose-alley, Bishopsgate-street. He also carried out, in 1867, upon a plan designed by Mr. Alfred Allen, chief assistant to Mr. Bunning, but with his own elevation, some artisans' dwellings in Farringdon-road, and, a few years later, the dwellings to the rear of Charterhouse-street, facing Safron-hill. In conjunction with Sir Charles H. Gregory he designed a widening of London Bridge, but the scheme did not meet with the approval of Parliament, and so fell through. In 1887 he conceived the idea of a bascule bridge, to be erected below the Tower, and persistently advocated this idea, until at last, in 1885, the Corporation obtained powers to put the idea into execution, the result being the bridge now in course of construction, Mr. John Wolfe Barry being associated with the architect as engineer. Mr. Jones's last important work was the Guildhall School of Music on the Embankment, and one of his smallest the Keeper's Lodge, in Highgate Wood. So far we have been mainly indebted to the *City Press*, but to this list of works we must add the much-criticised "Temple Bar Memorial."

In 1882, Sir (then Mr.) Horace Jones was elected President of the Royal Institute of British Architects, and held that office for two years; but he was not knighted "on his retirement from that office," as the *Times* erroneously states in its short obituary notice. He was not knighted until last year, the honour being accorded (as we stated at the time\*), "for his distinguished services to the City of London as Architect to the Corporation." Some years ago he read a paper before the Royal Institute of British Architects describing some of his market buildings.

We append a list of those of his buildings which have been illustrated in our pages:—Concert Hall, Surrey-gardens, vol. for 1856, p. 395; Sovereign Life Office, Piccadilly (corner of St. James's-street), 1857, p. 219; New Roof of the Guildhall, 1864, p. 829; Corporation Buildings, Farringdon-road (artisans' dwellings), 1865, p. 485; Smithfield Meat Market, 1867, p. 261; City Library and Museum, Guildhall, 1870, pp. 686-687; New Billingsgate Market (river front), 1874, p. 866; ditto interior view, 1875, p. 188; New London Central Poultry Market, 1875, p. 823; New Fruit and Vegetable Market (since used as a fish-market), Farringdon-road, 1880 (January to June), pp. 70-73; New Council Chamber, Guildhall (interior), 1883 (July to December), p. 728; the Guildhall School of Music, 1885 (July to December), pp. 323, 328; and the Tower Bridge, 1886 (July to December), pp. 24, 25.

Sir Horace Jones had for the past few years held high office in the Masonic body as Grand Superintendent of Works.

At the meeting of the Royal Institute of British Architects on Monday evening, the President (Mr. E. P. Anson) in the chair,

Mr. J. Macvicar Anderson (Hon. Sec.) addressing the meeting, said:—We cannot pass through life without occasionally having painful as well as agreeable duties to discharge. It falls to my lot to-night to discharge the painful duty of intimating to you officially the loss of one who has occupied the position of President of this Institute, and who was one of our most distinguished members. The official intimation of the loss we have sustained is contained in the following letter we have received from Mr. Octavius Hansard:—

"30, Devonshire-place, W., May 22, 1887.  
Dear Mr. White,—With deep regret, at the request of Lady Jones, I have to inform you that my old friend, Sir Horace Jones, the City Architect, and Past President of the Royal Institute of British Architects, departed this life last evening. Will you please to lay this before the Council to-morrow evening, and to announce the same to the General Meeting?—I am, yours truly,  
OCTAVIUS HANSARD.  
W. H. White, Esq., Sec., R.I.B.A."

The familiar presence and genial face of Sir Horace Jones are too fresh, I think, in the memories of all present for us to realise that so recently as on Saturday last the silver cord was broken, and that within the next day or two the mourners will go about the streets. Yet so it is; a career of great public usefulness and utility has thus been cut short. This is not the time, nor the occasion, to enter on a

\* See *Builder*, August 7, 1886, p. 190.  
† See *Builder*, vol. for 1878, pp. 34, 89.

historical notice of his life or works; it will fall to abler hands than mine to do that,—but I should be sorry, if on this the first occasion on which we are met after the death of our friend, we did not express our appreciation of the character of him who has gone, and our deep regret at the loss the Institute has thus sustained. The Council, at their meeting to-day, passed a vote of condolence with Lady Jones, which will be duly communicated to her, and no doubt it will be the wish of the Institute to pass a similar vote that it may go not simply from the Council, but from the general body of the members. The career of Sir Horace Jones, especially to the younger members of the profession, offers the opportunity of drawing lessons of great utility. He was an example of determined perseverance and industry, showing what these accomplishments will produce without external aid. Commencing life at twenty-two he devoted the small patrimony to which he had succeeded to improving his professional knowledge by travelling abroad, in conjunction, I think, with Mr. Ewan Christian and Professor Hayter Lewis. I have often heard both these gentlemen speak of the great pleasure they experienced in the company of Sir Horace Jones on that occasion. On the completion of his travels, and on returning home, he entered for the competition for Cardiff Town-hall, which he won. That was his first work, and while engaged at Cardiff he made the acquaintance of Mr. Crawshaw, the great ironmaster, who, his house near Reading happening to be burnt shortly afterwards, applied to young Jones (as he then was) to meet him on the spot. He did so, and Mr. Crawshaw desired him to rebuild his mansion on an entirely new site. There and then Mr. Jones advised him to do nothing of the kind, but showed Mr. Crawshaw how he could save many thousands of pounds by rebuilding the house on its old foundations. He was appointed architect to carry on the work, which he did successfully, and this was the beginning of a career which to all of us has been so familiar. It is not necessary to refer to his later works. They are works of great utility, and it is much to be feared that the anxiety connected with some of his more recent works may have tended in some degree to expedite his death. I was favoured to-day with the sight of a letter addressed by an old friend of Sir Horace Jones to Mr. Octavius Hansard, another old friend, and by his permission I am allowed to make use of it, because it struck me as being so remarkably well expressed that I would venture to read it to you. The writer says:—

"His professional ability, his strong common sense, his humour, his social geniality, and his varied information, made him a charming companion. His high honour and manly character commanded entire respect, while his warm and loyal heart engaged the affection of those whom he honoured with his friendship. . . . He will leave a worthy monument of his professional honour in the public works he had designed and constructed, and of his personal character in the affectionate regrets of many friends. Personally, I incur most heartily in the expressions contained in that letter, and I am quite sure they will be reciprocated by every member of the Institute (hear, hear).  
Mr. Charles Fowler, who spoke with considerable emotion, said:—As a very old friend of Sir Horace Jones, I venture to propose that a letter of condolence be addressed not only from the Council, but from the Institute generally, to Lady Jones on this sad occasion. I do not wish to add much, for it is quite unnecessary that I should do so, to what the Hon. Secretary has said; indeed, I cannot trust myself to say anything further. I am quite sure that all the members of the Institute who had the pleasure of knowing our old friend appreciated thoroughly his straightforward, honourable, and honest character, his good nature, and his warm kindness in endeavouring to help forward the interests of any of the younger members of the profession who might apply to him. His death has created a vacancy which will not be very soon filled.  
Mr. Henry Dawson.—I think perhaps it may be considered appropriate that I should take the opportunity of seconding the proposition, as I was a strong competitor of our old friend at the time when he applied for the post of Architect to the Corporation of the City of London, inasmuch as I had the privilege of being third on the final list. I have always felt a very considerable satisfaction in my own mind that I did what I could,—seeing that I was not going to be the successful candidate,—to aid in the election of

the successful candidate,—to aid in the election of

our late friend to the post. Since that date, as an old practitioner in the City, and having on many occasions had the happiness of transacting business with Sir Horace Jones, I had the means of knowing him very intimately indeed, and I can therefore agree with what Mr. Anderson has said that his career is eminently one that is fitted to teach good lessons both to the old and young members of the profession, and more especially, of course, to the latter. Of all the energetic and industrious men I have known, I do not think any could surpass Sir Horace Jones, and I can say, from my own experience, that a more straightforward and honourable man I certainly never had had the privilege of knowing. Even when opposed to one, which on some questions he was to me, he was ever determined to do that which was right to both friend and opponent. I think he was a most estimable example, and I have had to express the feeling to many clients, who thought I was very partial towards my opponent, that their case would never be damaged by the admirable manner in which he treated it, always meeting, as he did, with a due regard to the real merits of the question, any representations on the part of the other side. I should like to second the vote of condolence with Lady Jones, and I take it that we shall record our sense of the estimable character of the man whom it has pleased God to take from us, and I trust that those who remain behind will strive to imitate the qualities which he so well displayed.

The President, in putting the vote to the meeting, intimated that he, with the Vice-presidents and members of the Council, had decided to attend the funeral, which was arranged to take place on Friday at Norwood Cemetery, at half-past eleven (leaving 30, Devonshire-place, W., at ten o'clock). The vote was then passed by the meeting.

#### OBITUARY.

*Mr. John Green Hall, F.R.I.B.A.*—We bear with much regret of the death of this gentleman, who had filled the office of City Surveyor of Canterbury for the last twenty-one years. He was about 52 years of age. According to the *Canterbury Press*, he recently underwent an operation for fistula, which was successfully performed, and, although it was followed by extreme prostration, it was thought that the patient was likely to recover. Subsequent complications, however, arose, and resulted finally in blood poisoning, from which, on the 17th inst., death ensued. Mr. Hall was a native of Hampshire, and went to Canterbury on receiving the appointment of City Surveyor in 1866, when he was elected out of over sixty candidates. He was a Fellow of the Royal Institute of British Architects and a Civil Engineer. His chief architectural works in Canterbury were the cemetery buildings, the Roman Catholic Chapel, the Presbyterian Chapel, and the London and County Bank. The new bank buildings now being erected for Messrs. Hammond & Co. from his designs and plans are spoken of as being probably his most important architectural effort in the neighbourhood of Canterbury. He had, however, been architect of churches and other buildings in Yorkshire and elsewhere. His plans for the sewage works at Canterbury, and the system of filtration which he adopted possessed marked originality; and although the site of the works presented many difficulties, the sewage farm has more than realised the expectations formed of it. Mr. Hall always looked upon this as his best professional achievement. He was incessant in his attention to the works until the experience of the first years had proved the success of the system. In his private capacity he was respected and esteemed by a wide circle of friends. The interment took place in the Canterbury Cemetery on the 20th inst., the funeral being attended by the members of the Corporation and a large number of the leading citizens.

*Mr. John Davis.*—One of the oldest of the Birmingham architects, Mr. John Davis, departed this life on the 15th inst., after a somewhat protracted illness. Mr. Davis was articles to Messrs. Drury & Bateman, of Birmingham, and commenced practice at Chester at an early age. For some time he was in partnership with Mr. Hornblower—now of Liverpool. Not meeting with much encouragement at Chester he settled in Birmingham, where at one period he had a somewhat

extensive practice. He was architect of several churches and schools at Birmingham and Kidderminster, several mansions near Birmingham, and numerous smaller works. He was enthusiastically fond of Gothic architecture. Many years ago he made, for publication, some beautiful measured drawings of Temple-Balsall Chapel, Warwickshire. Mr. Davis was verging on his seventieth year. He leaves a widow and large family, and was highly esteemed by all who knew him. Two of his sons are established as architects, viz. Mr. J. Statham Davis and Mr. James Davis, at Birmingham and Walsall respectively.

#### THE ARTISTS' BENEVOLENT FUND.

The twenty-eighth anniversary festival of this Fund was held at the Freemasons' Tavern on Wednesday night, Mr. L. Alma-Tadema, R.A., presiding. The Fund was established in 1810, received in 1827 a charter of incorporation from George IV., and now enjoys the patronage and support of the Queen. It consists of two divisions,—the Artists' Annuity Fund, raised and wholly supported by the contributions of its members, for their own relief in sickness and old age, and which neither asks for nor receives public support; and secondly the Artists' Benevolent Fund, which is purely charitable, having for its object exclusively the relief of the widows and orphans of members of the Annuity Fund who are left in need. The latter branch is supported by the donations and subscriptions of patrons of the fine arts, and annual subscriptions of the members of the Annuity Fund. During the past year forty-eight widows and seventeen orphans have received annuities amounting in the whole to 1,076*l.* Amongst the company, which included ladies, were:—Sir F. Leighton, P.R.A., Sir J. D. Linton, P.R.I., Sir Rutherford Alcock, Mr. Lumb Stocks, R.A., Mr. Marcus Stone, R.A., Mr. C. B. Birch, A.R.A., Mr. John Collier, Mr. John Absolom, R.I., Mr. W. Cave Thomas, Mr. Geo. Godwin, F.R.S., and Mr. C. Cattermole, R.I.

The Chairman, in proposing "Prosperity to the Artists' Benevolent Fund," said that it was the duty of those in a position to do so to help their poor and distressed brethren in art, and then made an appeal to all who had the interest of the Fund at heart to avail themselves of this annual opportunity of helping it and maintaining its prosperity.

Mr. George Godwin, F.R.S., Vice-President, who responded, said it was a mistake to suppose that this was merely a benefit society, for it assisted widows and orphans, and enabled young artists starting on a most precarious profession to provide for a rainy day. In conclusion, Mr. Godwin proposed the health of the Chairman.

The Chairman briefly replied, and next proposed "The Royal Academy," coupled with the name of the President.

Sir F. Leighton, in responding, said that he fully appreciated the excellent work done by Artists' Benevolent Fund. It was impossible that an artist should fail to regard with respect and esteem the work of a body which, while it administered to wants of which only an artist could measure the full extent and the bitterness, at the same time succoured only the provident and the survivors of the provident, and by that means offered an incentive to prudence and thrift. A distinctive feature of the Artists' Benevolent Fund was that in dispensing aid to widows and orphans it recognised only the survivors of those who, during their life time, had, in however small a degree, contributed to the fund; so that it might be said that a moral influence as well as material aid emanated from the Institution (hear).

The Hon. John Collier proposed "The Royal Society of Painters in Water-Colours and the Royal Institute of Painters in Water-Colours," the toast being acknowledged by Sir J. D. Linton, who, in return, gave "The President and Members of the Artists' Annuity Fund," for which Mr. T. H. Maguire responded.

Other toasts followed, and subscriptions and donations amounting to about 500*l.* were announced.

**The National Liberal Club.**—Referring to our description of the new Clubhouse for the National Liberal Club in last week's *Builder*, we are asked to mention that the Westmoreland Green slates used were supplied from the Tilberthwaite Green Slate Quarries, Coniston.

## Illustrations.

### AMERICAN HOUSE ARCHITECTURE.

**M**E give three examples from photographs of modern street and house architecture in the States. The residence, designed by Messrs. Cobb & Frost, for the lake shore at Chicago, is a house that in regard to its general style and architectural treatment might as well have been met with in England, and perhaps is not what would command very great admiration on whichever side of the water it was met with; the style is rather coarse and heavy, but it is a large and important dwelling-house, with a certain dignity and massiveness about it. The front of the Club-house at St. Louis, by Messrs. Peabody & Stearns, is an example of the Richardsonian order of architecture, Mr. Richardson having apparently succeeded in creating a style which others are willing to follow, just as Mr. Norman Shaw has done in England. The business premises designed by Messrs. Cabot & Chandler show something resembling recent architectural fashion in England, in the treatment of the projecting bays, but with a difference of detail.

### SUNNINGDALE CHURCH.

This church seems to have been built about fifty years ago. It consisted of a plain oblong with some excrescence at the east end. A new chancel was added by Mr. Street some time since, together with a north chancel aisle and a vestry.

The church is now to be completed by the erection of a nave, aisles, and transepts, with a central tower and spire, at a cost of about 7,000*l.*

Mr. J. Oldrid Scott, F.S.A., is the architect, and Messrs. Norris & Son, of Sunningdale, the contractors. The work has just been begun, and it is expected that the first stone will be laid by the Prince of Wales early in June.

### SKETCHES IN SHROPSHIRE.

For the seeker after English Domestic work in all its developments, from Norman Border keeps to fantastic timber houses of the sixteenth century, there is no happier hunting-ground than Shropshire. Remoteness from any of the busy centres has kept it out of reach of the tide of "modern improvements." The examples illustrated this week are all from the Welsh Border district.

Stokesay Castle, of which a north-west view and the interior of the great hall are given, is the most complete thirteenth-century dwelling-house left in England. Originally simply a moated residence, it was later on made more defensible by the addition of two towers, one still remaining, the other pulled down and replaced by the projecting half-timber solar room seen at the further end on the sketch. The tracery windows, with gables over, light the great hall. Those on the courtyard side are similar. One of the rooms has a beautiful oak chimney-piece and wall panelling of the sixteenth century. At that time the lodge also was added, and a sketch is given of its central gateway on the side next the courtyard. Another similar gateway, from the Guildhall at Shrewsbury, illustrated, is interesting as showing the different treatment of the same subject, evidently, from the likeness of detail, by the same designer.

Park Hall, near Oswestry, is a fine example of a late sixteenth-century manor-house. It is U-shaped on plan, the porch and gables shown occupying the centre. The end wings have wider gables of the same pitch, and similarly treated to those at the porch, and the same ornamental pilasters and diapering are continuous along the whole front.

HENRY D. WALTON.

**Cart Horse Parade.**—This year the parade of cart horses, which was very successful last year, will be held at Olympia, Kensington, on Whit-Monday. In the great arena all the selected teams will march past in procession, and eventually receive their prizes at the hands of the Baroness Burdett-Coutts, together with diplomas from the Royal Society for the Prevention of Cruelty to Animals. There will also be a show of tradesmen's horses. Shows such as these no doubt tend to make carters and vanmen take a kind and intelligent interest in their animals.

## CHAINS.

At a recent meeting of the Civil and Mechanical Engineers' Society, Mr. Henry Adams, M. Inst. C. E., read a paper, of some interest to builders and contractors, on "The Use and Care of Chains for Lifting and Hauling." He divided chains into two classes, those with oval links and those formed of flat bars or plates; the former were again subdivided into "common" and "short-linked" chains. The latter, being of the most importance, received the principal attention; it was pointed out that the links being well rounded, each one acts as a spring when the load surges, and hence their universal adoption for lifting purposes. The dimensions of the links are for the extreme length and breadth  $\frac{1}{2}$ " and  $3\frac{1}{2}$ " times respectively the diameter of the iron of which the link is made. In repairing or joining a chain the new link has to be made a little longer, to give room for welding, as there are two others in it instead of one, as in making a new chain. The various modes of welding were then described, and the peculiar tendency of some chains to twist while in use. The different heaves in use according to circumstances were shown upon the diagrams, the diameter in any case being not less than thirty times that of the chain-iron. The loose end of the chain should have a swivel, either separate or as part of the hook, and all cranes, except coal cranes, should have counterweights. In these cases, as the tubs have to be pulled from under the hatchway coamings, no counterweight is admissible. Several illustrations of chain-fastenings were shown and described, and the modern forms of hooks and shackles were contrasted with those thought to be "nice" some years ago. Lookeye sheaves and other supports, chain oxes for cylinder ends, and the best position of the machinery for cranes and hoists, were described, and reference was made to Mr. Vestmacott's patent cupped drum-gearing for ranes, captains, and gate engines. Turning hains next came under review, and the various methods of connecting them to the rane. Stud-link chains, being used only on ships' cables and mooring purposes, were passed over with only one remark, that as the nose of the stud was to prevent the chain getting kinked, and that it added slightly to the strength for a steady pull by keeping the link in shape. The strength of chains received very little notice. It was shown that with Crown C iron of B B quality, equal to an average tensile stress of 26 tons per square inch, an elongation of 15 per cent., and a contraction of 20 per cent., the chain would have a strength of double this, because two sides are acting, or one side with a leverage 2 to 1; but there is usually a loss of 25 per cent. from imperfect welding and other causes. Several defects in welding were explained, and specimens of an interesting collection of defective links were handed round. From a large table of results we select the following,  $d$  being the diameter of iron in  $\frac{1}{2}$  in.—Breaking weight in tons short-linked crane chain =  $\frac{1}{2}d^2$ ; Admiralty roof strain in tons =  $\frac{1}{2}d^2$ ; safe load for ordinary cranes in cwts. =  $\frac{1}{2}d^2$ ; safe load for all cranes in cwts. =  $\frac{1}{2}d^2$ ; weight in lb. per fathom =  $d^2$ . The proof test is made upon lengths of 15 fathoms each, the breaking stress upon 4 ft. lengths. The author then described in detail the system adopted for the care and maintenance of the chains at Messrs. Cory & Son's coaling establishments, where he has been responsible for chains which have lifted upwards of 15 million tons of coal in the last ten years, and during that period only one fatal accident occurred on a chain breaking, although the machinery is at work day and night, and the men necessarily work under the cranes. The inspection and lubrication are very thorough, and the chain will make about 100,000 lifts before it is worn out for lifting purposes, it is then cut into sling chains, large moorings, &c., as there are still many years of useful life in it. In hotels, warehouses, and large offices, much damage is done by the servants sweeping the dirt off each floor into the hoistway, the dirting the chain like emery. Coal dust is very detrimental to chains, but coke dust is ideally bad. Sling and fall chains used in the erection of machinery and buildings are always used dry, for various reasons. They should be put through a wood fire, and annealed on every large contract, or, say, every two or three, and carefully examined by a skilled man

before being taken into use again. In summarizing the points of economy in the maintenance of chains, the author said the testing should be moderate, the annealing frequent, the lubrication thorough, and when the wearing is not uniform throughout the length, the chains should be cut and pieced when partially worn, so that when finally discarded, each link shall have done its full share of work without overstepping the limits of perfect safety.

An animated discussion took place, in which the President and several members and visitors joined, and the proceedings closed with a vote of thanks to the author for his excellent paper, and for the large collection of diagrams and specimens by which it was illustrated.

## CIRCULAR AND BAND SAWS.

In a very interesting paper read at a recent meeting of the Institution of Civil Engineers by Mr. Lewis H. Ransome, of the firm of Allan Ransome & Co., the author gave the results of his observations during a recent visit to the chief timber-producing districts of the United States. He dealt chiefly with the pine-growing forests of the Saginaw Valley in Michigan, and after describing the general arrangement of the saw-mills, went on to consider the merits of hand-saws as against circular saws for the conversion of timber.

Mr. Ransome discussed the question from four points of view, viz.—1. Rapidity of Production. 2. Quality of Work. 3. Power Consumed. 4. Waste of Wood.

In rapidity of production the circular saw has at present a decided advantage, producing on an average in white pine 50,000 square feet of lumber, 1 in. thick, in a day of ten hours, while the hand-saw in the same time turns out on an average about 35,000 ft. It should, however, be borne in mind that the circular saw, having been in use for so many years, has probably reached its utmost limit of production, while, on the other hand, the band-saw, having been but recently introduced for this purpose, is capable of considerable further development. This assumption is confirmed by the fact that a band-saw mill of the most improved construction has been known to produce as much as 52,000 ft. in a day of ten hours, the produce of 102 logs.

As regards quality of work, this advantage is undoubtedly on the side of the hand-saw, for whereas it is practically impossible to run a large circular saw at a high velocity without a certain amount of vibration, which naturally produces a somewhat rough surface, a hand-saw, being packed immediately above and below the cut, passes through the log in a straight line; and, moreover, as the teeth of a band-saw are considerably finer than those of a circular saw, they produce a smoother surface.

Owing to the question of power being so little considered in America, and to the fact that the application of the hand-saw for logs is comparatively new, no authentic tests as to the power required by the latter machine have as yet been made with the indicator; but by comparing the engines usually employed to drive both the hand and circular mills, an approximate idea on this point may be arrived at. To drive a circular-mill with a 6-ft. saw, an engine with a cylinder 18 in. in diameter, an engine-travel of 500 ft. per minute, and an average pressure on the piston of 40 lb. to the square inch, is generally employed. Such an engine develops 154 indicated h.p. To drive a full-sized band-mill, an engine with a cylinder 12 in. in diameter, working under similar conditions as to piston-speed and average pressure, is recommended. This would develop about 68 indicated h.p., or considerably less than one-half that required to drive a circular-mill.

The last, but certainly not the least, important point, is the question of waste of wood; and here again the band-saw gives by far the best results. The amount of wood lost in saw-dust per cut by a circular saw is  $\frac{1}{8}$  in.; therefore when producing boards 1 in. thick the waste is 24 per cent. A band-saw at most wastes  $\frac{1}{16}$  in. per cut, or, when cutting 1-in. boards, 11 per cent. Again, to make a board, cut by a circular saw, when planed on both sides, hold up to  $\frac{1}{8}$  in., it must be cut 1 in. thick; i.e.,  $\frac{1}{8}$  in. must be allowed on each side for planing; while, on the other hand, owing to the superior cutting of the band-saw, it is only necessary to allow  $\frac{1}{16}$  in. on each side for planing, showing an additional saving of  $\frac{1}{16}$  inch

per cent. This gives a total saving of  $\frac{1}{4}$  in. per cut by the use of the band-saw.

The foregoing calculations apply to timber of such a size as can be converted by a circular saw 6 ft. in diameter; but for larger logs it is necessary to employ an overhead-saw, and as the tracks of the two blades never exactly coincide, the hoards thus sawn show a joint, which necessitates a still further waste of wood. This objection does not apply to the hand-mill, which will saw through logs of any diameter.

From the above considerations the author concludes that for the conversion of pine logs "the balance of advantages lies distinctly with the hand-saw"; but in the case of harder, smaller, and more valuable timber, the benefits to be derived from its use would be very much increased, and he considers it to be the machine which will supersede the circular saw.

## BRITISH ARCHEOLOGICAL ASSOCIATION.

At the meeting of this Association on Wednesday, May 18th, Mr. W. H. Cops in the chair, it was announced that the President of the approaching Congress at Liverpool, Sir J. A. Picton, had fixed the date for commencement on August 15th.

Mr. Loftus Brock, F.S.A., reported the discovery of a portion of Old London wall, which had served partly as a foundation for the houses on the east side of Wormwood-street, Aldgate, now removed. The wall is of fine Roman work, having a chamfered plinth of dark brown ironstone, various bonding courses of bright red brick, and facework of squared Kentish rag-stone. Nearly opposite the Synagogue in Bovis Marks, the foundations of a circular bastion have been met with. It is not bonded into the wall, showing that it is of later date. It is formed almost entirely of worked freestone, evidently taken from other buildings, as if for its erection in haste. In the discussion which ensued, Mr. Thos. Blashill referred to other examples of additional defensive works being added to earlier Roman works, for strength in a military sense.

Mr. Howlett exhibited several fine heraldic paving tiles, bought at Croydon, and probably obtained from either the old Palace or the Church. One bears the date 1303, in Latin numerals.

A paper was read by Mr. Loftus Brock on certain sculptured stones of Pre-Norman date, in various churches which were inspected during the recent Durham Congress. After detailing the efforts made by the Association to direct attention to the remarkable class of monuments referred to, which have now been met with throughout Great Britain and Ireland, the lecturer passed in review the various examples inspected on the occasion referred to. Apart from the fine collection at Durham, the principal objects were seen at Gainford, Dinsdale, and at the neighbouring ruined church at Sockburn, although almost every church in the district appears to have some relic of the same kind. They consist of fragments of crosses, shafts, and panels filled with elaborate interlaced work of a class which was but little understood a few years ago, except to a few investigators. Some of the examples at Auckland resemble thirteenth-century work in the beauty of their elaborations, and many examples must have been executed by a chisel.

In the discussion which followed, Mr. de Gray Birch referred to the resemblance of their patterns to those of the Saxon MSS.

**Association of Municipal and Sanitary Engineers and Surveyors.**—A Home Counties District Meeting of this Association is to be held at Portsmouth on Saturday next, June 4th. Arriving at Portsmouth (Town Station), the members will proceed to the Council Chamber, High-street, kindly placed at the disposal of the Association by the Mayor, where, at 12½, Mr. Boulnois will read a short paper descriptive of the drainage works of Portsmouth recently carried out by Sir Frederick Bramwell. At 1-0, a visit will be made to the works, where the members will be entertained at luncheon by Messrs. Mowlem, the contractors. They will subsequently visit the Town-hall works, to be shortly described by Mr. Boulnois.

"A STUDENT'S NOTES ON GLOUCESTERSHIRE."\*

In these days, when the opportunities for travel are generally limited to a matter of a few weeks, it becomes an important question how the time can be used to the greatest advantage. It is no longer possible in most cases to do as our architectural predecessors used to do,—go abroad for two or three years after they had finished their time in an office, and so get an extended knowledge of the world before settling down finally; and so we have to be contented with shorter trips, and are forced, very fortunately I venture to think, to turn more to our own country. No doubt the Continent possesses great attractions, especially as regards colour, but some of our own architectural districts, although they may be surpassed in scale, are not to be equalled in many respects by the more pretentious foreign examples.

Of the many portions of England which are worthy of a visit, some are well known, such as Northamptonshire, Lincolnshire, Yorkshire, &c. Others are comparatively unknown, and the county of Gloucester is, I think, one of these. I say "county" advisedly, because no one will deny that Tewkesbury Abbey and Gloucester Cathedral are quite household words to the student. When I had the honour and good fortune to be elected the Travelling Student of the Association last year, it occurred to me that there was an opportunity to explore a fresh field. I had long had a wish to see Evesham and Pershore, and to refresh my slight knowledge of Tewkesbury Abbey, and finding in a little handbook of ecclesiology that Gloucestershire was "remarkable for the fine architectural features of its churches, and exhibits excellent specimens of every style, from Norman to Third-pointed," I came to the conclusion that I could not do better than take Gloucestershire as the field for my six weeks' study. And, looking back now at the end of a year, I feel I could not have chosen a much better place. With almost uninterrupted fine weather, some of the prettiest rural scenery in the country, and the endeavour of all whom I came across to give every facility for making my stay successful, I can truly say that it was the most delightful experience I have ever had, and my only regret is that I cannot transmit more of it to you this evening.

Having settled the part in which I was going to travel, the next thing was to find out from various sources all the particulars I could. In a comparatively short time I had brought together a sufficiently large list to make me certain that the whole could not be done in the six or seven weeks at my disposal: so, as the time could not be lengthened, the list had to be shortened. I therefore endeavoured to choose those places which would give me the best idea of the architecture, both ecclesiastical and domestic, of the county. Fortunately there was only one cathedral town, and that I decided to avoid. I say fortunately, because cathedral towns are so fascinating generally that one is tempted to spend time on them which is often better spent on places of smaller size. Gloucester, in fact, is the centre of a good district of its own, and requires almost a special trip. In the end, I settled on the scheme to be followed. I generally made use of the railway lines, only going across country in one or two places where necessary.

Leaving London, I went direct to Chipping Campden, where I made my head-quarters for a week, and found the time all too short. Under the influences of the bracing air on the spur of the Cotswold Hills on which this old town stands, and the wealth of architecture, chiefly domestic, which is to be found there, my first impression of Gloucestershire realised all my expectations. From Campden I went to Evesham, and from hence until I reached Tewkesbury, my travels were chiefly in Worcestershire, and I went over some of the ground which the Association visited in 1881. I will not dwell upon that part of my trip now, leaving one or two points which I wish to notice until later on, but will pass on to Tewkesbury, where I stayed a fortnight. From hence I visited Deerhurst, Bredon, Cleve, and other places. Then from Tewkesbury to Cheltenham, and afterwards to Stow-in-the-Wold, having completed a rough circle. My object, as I said before,

\* A paper by Mr. Roland W. Paul. Read before the Architectural Association on the 20th inst., as elsewhere mentioned.

was to avoid Gloucester; so, instead of going back to Cheltenham, I drove across the back of the Cotswolds to Northleach, and afterwards on to Cirencester. On leaving Cirencester I found that both time and money were getting short, so I left Fairford and its stained glass for a future occasion, and recrossed the county to Berkeley. After Berkeley came Chipping Sodbury, and this was my last centre, and after seeing some of the places of interest round it, I left for Bristol, and so came out of the county at the opposite end to that at which I had entered it, and having visited, I think, most of the important places, although, of course, there was a vast deal more to see if I had had time to spend over it. Such, gentlemen, is a rough outline of my tour, and I will now endeavour, as well as I am able, to describe some of the places more in detail, with the aid of the drawings and plans exhibited on the walls.

I must now ask you to go back to the beginning again, namely, to Chipping Campden. I said before that it came fully up to my expectations, and I certainly was lucky in choosing it as my first stopping-place. It has every attribute of a good centre,—a comfortable inn, a good church, a town chiefly composed of one long broad street flanked by houses dating from the fifteenth to the seventeenth century, with a few modern ones, a fine situation on high ground, many places of interest within easy reach, and last, but not least, people who are hospitality personified, including the vicar, to whom my thanks are due for lending me the embroidery I am able to show you to-night. The first thing one generally does is to inquire "Which is my nearest way to the church?"—not that it was at all necessary here, as the church stands boldly up at one end of the main street and possesses one of the finest western towers in Gloucestershire. The church is entirely of fifteenth-century date, with the exception of the inner south door and a portion of the south aisle wall, which are Early English. The only other relic of the earlier church is a portion of a very beautiful font, which at some period has been cut in two and the surviving half has been built into a pier in the south aisle. Other objects of interest are the brass lectern, dated 1618 (and a very good specimen of the kind), a Jacobean pulpit, and, what is decidedly the most interesting, some very fine embroidery, which I am able to show you. It is probably an altar frontal, and measures 12 ft. by 3 ft. 10 in., the ground being of cream brocaded silk powdered with pomegranates, and with an elaborate representation of the Assumption of the Virgin in the centre. Two other pieces having the same patterns are still at the rectory. The western tower of this church bears some slight resemblance to the tower of Gloucester Cathedral, and is chiefly remarkable for the curious way in which the centre pinnacle is hrought down and forms the finial of the western doorway.

But the student visiting Campden will probably be most interested in the Domestic work in which it is so rich. This, as I said before, includes examples dating from the fifteenth century. Of this date is a very fine old house in the main street, which possesses, almost in its original state, a very good two-storied bay-window, the whole house being very similar to many to be seen in Somersetshire. There are one or two other remains of the same date in the town, but the larger number of houses date from the seventeenth century, and seem principally to owe their existence to the building propensities of a Lord Campden. Of these there is, firstly, the manor-house, now in ruins. One or two angles of the main building remain above ground, and on its south front ran a raised terrace with a pavilion at each end. These pavilions remain in a very perfect state, and are well worth a lengthened study,—larger than I was, unfortunately, able to give them. Inside are some good plaster cornices and oak panelling. Besides these pavilions, the entrance gate to the mansion is still standing, but though the lodges are picturesque, the central part, with the entrance, cannot be called happy in design. A little distance from the lodges are twelve almshouses, making with them and the church one of the most picturesque groups I have anywhere seen. They are remarkable for their good proportion and for an entire absence of unmeaning ornament, and the details are all very good and effective. Another building of the same date,—1624,—is the old market-house, which stands in the centre of the main street. It is a rectangular building with open

arcades, and a row of octagonal pillars down the centre, supporting an open-timber roof.

We will now pass on from Campden to Evesham and Pershore. I shall not attempt to describe these places, as it would occupy too much time, and they are both known to many of you. But there are one or two places near them to which I would call attention. Firstly, in the neighbourhood of Evesham, is the village of Hampton,—only, in fact, about a quarter of an hour's walk from the town. The church here is worthy of notice, as being a perfect specimen of a small fifteenth-century church. It consists of a nave, central tower, and chancel, and its plan at first sight is very suggestive of its having been built on Norman foundations. However, nothing earlier than the Perpendicular period is visible. The south porch of the nave has a stone-ribbed ceiling of plain but effective work. Inside we find the central tower has stone vaulting, and there are traces of where the roof-screen existed on the tower piers. These piers have immense chamfer stops, about 4 ft. from the ground, and are the only features which strike one as being out of proportion to the rest of the building. There are here in the windows, and again at Wyre, near Pershore, some bits of contemporary stained glass, and it always strikes one on seeing these bits how very easy it is to get a satisfactory effect by simple means, instead of that elaboration with which we so often see the upper portion of a modern window treated, and generally with such unsatisfactory results.

Another church, a little further from Evesham, is Sedgeborough. This, like the one at Hampton, is all in one style,—in this instance that of the fourteenth century. Its plan is a simple rectangle, without any mark externally of the division between nave and chancel, and instead of a square tower it has at the west end a very elegant octagonal turret crowned with a spire. The window tracery of this church is very beautiful, and there is one piece of stained glass which is said to represent the founder, and as he is holding a church, the suggestion seems probable. Before its restoration the church possessed the lower part of a roof-screen, but this has been replaced by a modern screen, which strikes one as being much too high for the church. There is still lying in the churchyard a fine gable cross, which has been replaced by one of modern work,—a change not altogether for the better.

The only object I would draw your attention to at Pershore is a piece of screen-work now in the south transept. It consists of a piece of woodwork, having four traceried panels with elaborately-carved spandrels and cusps, and over it is a curious inscription.

Near Pershore is Besford, which possesses a curious little church entirely of wood (with the exception of the chancel, which has been rebuilt in stone). Inside is a portion of the roof-screen, the pannelled front retaining its old colouring. About three miles distant, across the river Avon, is another village, Strensham, which possesses a painted roof-screen, which should on no account be missed.

We now come into Gloucestershire again at Tewkesbury. The abbey, as I have before said, requires no description from me. I shall again draw your attention more particularly to two or three villages which you ought to see if you make Tewkesbury a centre at any time. The nearest of these places is Deerhurst, well known on account of its recently-discovered Saxon chapel. There was a priory here, of which some traces still exist near the church in a farm-house. The church itself has been mutilated, the chancel having been destroyed, but it possesses some very beautiful arcades of Transitional Early English work, with an interesting series of carved caps, illustrating very completely the gradual growth of the Early English foliage out of the Norman cushioned form. Besides the arcades are some fine decorated windows, a very fine Saxon font covered entirely with cable ornament, and some bits of stained glass, of which the St. Catherine is perhaps the best. Attached to the Saxon chapel, which is at some little distance south-west of the church, is a very elegant specimen of half-timbered work known as Abbot's Court, and as this kind of work is not very prevalent in the county, this specimen is particularly interesting.

A few miles north of Tewkesbury is Bredon Church, which is perhaps one of the most interesting of the places I visited. It is, strictly speaking, in Worcestershire, but only

just over the border. The ground-plan of this church is very curious, and at the same time is useful as showing how a church could be added to at random without affecting the ritual, as compared with the present more general use and planning for congregational purposes. We have here the old Norman central tower, and the walls of the nave, left. The side walls were pierced in the thirteenth century on the south side for a chapel, and again in the fourteenth century for a north aisle, and at the same time the chancel was reconstructed and the tower raised. This was crowned with a lofty spire in the fifteenth century. Perhaps transepts were meant to be added, but they were not built, and this has left the ground-plan of the building very much in the shape of a tadpole, excluding the people who sit in the aisles from a view of the chancel. The chancel is probably the most interesting part of the church. The first object that strikes the visitor is a large number of armorial tiles, which no doubt were formerly in the floor, but are now placed in the risers of the steps,—a very good way of preserving them from the constant wear, but rendering it rather a difficult matter to take accurate copies of them. I think these tiles are generally considered to be one of the finest collections in England, and they are interesting as dating from before the foundation of the College of Heralds. They are probably of early fourteenth-century date, and include the arms of a great number of the principal families of that time. In all I was able to find thirty-four shields, of which I exhibit a few. Besides the tiles is a curious monumental stone on the south side of the chancel, an Easter sepulchre on the north side, and a piscina with a window immediately behind it, not glazed, but only separated from it by a shutter, which still remains. The tower arches are Transitional from Norman to Early English, and there are three fine Norman doorways on the north-west and south sides of the nave. The west front is very imposing, and is flanked by large square turrets crowned with spires and arcaded. The west window is later in date. Not far from the church is a very fine tithe-barn, with a chimney worth noticing on one of the entrances.

Another church, which is, however, nearer Cheltenham, is Cleve. Going from Tewkesbury you pass Ashchurch, where there is a fine wood-screen of good preservation. I had here the first experience, and the only one, of being prevented from sketching. The clergyman was, unfortunately, away, and the man in charge offered to show me round, but declined to allow me to sketch, and, moreover, the thought that it might be "squared" had to be abandoned. However, I have no doubt that at some future time I may be able to get a drawing of the screen, which is a very fine specimen of its kind.

Cleve, or Bishop's Cleve, is an extensive village about four miles from Cheltenham, the nearest way being, however, to go to Cleve Railway Station on the Midland line, from which it is distant about two miles. The church here is considered one of the finest in the county, and is still unrestored. It is a very long church (144 ft.), and, although not at first apparent, has many points of resemblance with Bredon Church, which we noticed just now. To begin with, it has considerable remains of Norman work, its west front being, like that of Bredon, of Transitional character, but the earlier of the two, and having rich arcading on the flanking turrets. The porch, with the aisle eastward and a broad aisle opposite, and a long Decorated chancel, are all points similar to its northern neighbour. In fact, if you remove the transepts, which Bredon never seems to have had, you have an almost identical plan on a somewhat larger scale. You will, no doubt, see that the arcades of the nave are of very wide span,—20 ft. from centre to centre. The clergyman, when I was there, had a theory that at some later date the intermediate columns of the arcade had been removed. This is possible, certainly; but a far more likely thing, I think, is that when the central tower fell in the seventeenth century, it demolished a considerable part of the nave arcades, and they were rebuilt rather with a view to increase the chance of seeing the altar, than with any idea for artistic effect. The east window of the chancel has been a very fine one, but has been much pulled about. There are considerable traces of altars and reredoses, and a large number of monuments, the earliest being one

in the south transept, with a Norman pillar piscina close at hand. At the west end of the nave is a very elaborate Jacobean gallery, which will probably be removed when the church is restored. It is very worm-eaten and is considered unsafe, but the front is well worth preserving, and it is to be hoped that the architect who may have this building to restore will take proper care that it is preserved. You should also notice particularly the south porch, which is Norman, with interlacing wall arcading and a vaulted roof. The room over is of large size, and,—what I have not seen before,—extends over the south aisle as well as over the porch itself, and there is a curious piece of ceiling underneath it. There are in the village some good bits of domestic work, and a large tithe-barn was in process of demolition when I was there.

Passing on to Cheltenham, you will find that St. Mary's Church has been a good deal restored, but the church is worth a visit. I only stayed in Cheltenham one clear day. In the morning I went to Southam House, and in the afternoon to Leckhampton, both of which you should see. Southam House is a manor-house of the fifteenth century, with some interesting windows, but I was somewhat startled on arriving at the entrance to find myself confronted by a "Norman" keep. This, I need scarcely say, is modern, and is part of the extensive addition which the late Lord Ellenborough made to the house, and is more remarkable for quantity than quality. In fact, the original fifteenth-century house is so dwarfed by the Norman additions that it is some little time before one fully realises its existence at all. The owners were away when I went there, but I was allowed to make two slight sketches of the outside of the mansion. The other place of interest,—Leckhampton,—is south of Cheltenham. The church here is interesting from its possessing a chancel of two stories. The only remains of the old church are the said chancel and the tower,—the rest having been rebuilt. The tower is about 14 ft. square, and is crowned with a long tapering spire, of curious proportions. Another similar spire occurs at Shurdington, in the same district. The chancel is 14 ft. in length and 12 ft. wide. The room over the chancel is approached by the same staircase which leads to the ringing-chamber of the tower. The east window seems to have been raised, for the upper part is concealed by the vanling. There is no record saying for what purpose this room was used. There is an interesting tomb in this church, with two recumbent effigies commemorating St. John and Lady Giffard.

Stow-in-the-Wold is very finely situated on the summit of a hill, standing by itself apart from the Cotswold Hills, and is seen for many miles around. The church here is Early, and the tower is at the east end of the south aisle. It is, I think, one of the most satisfactory towers I saw during my trip. It is very plain in character, the only enrichment being an embattled and panelled parapet. Stow was connected with the abbey of Evesham, and the tower seems to have been finished by the same hand that built the famous bell-tower there.

Near Stow is Icomb or Iocomb, and here is to be seen a very picturesque Early English church, and an equally good fifteenth-century manor-house, known as Icomb place.

Northleach is one of the most inaccessible places in the county, being eleven miles from Cirencester, and nine from Stow, and lies in a very secluded valley at the back of the Cotswolds. But the church here is worth the journey from London to see. Although not covering so much ground as some of the other churches, it is very lofty, and gives one an idea of its being much larger than it really is. Its south porch is very elaborate, and inside will be found a good stone pulpit (like those to be found in Somerset), the remains of two or three altars, fine stained glass, and many other details of interest.

Again, at Cirencester is a fine church, and this is remarkable for the number of chapels which have been added. On the south side is a porch of very large dimensions,—so large, in fact, that at one time it was used as a town-hall. The bulk of this church is of fifteenth-century work, but there is in one of the south chapels a fine Early English cap, and some of the walls are also of the same date. There is another stone pulpit here, and some very fine screenwork.

There is a very interesting district between Cirencester and Stroud, round Minchinhampton, but I cannot say anything of the places in it, as I passed by them, and went on to Berkeley and Sodbury.

In Berkeley Castle you should particularly notice the interior of the chapel, with its gallery of wood at one end, richly carved. The church is a large Early English building, with a curious chapel of the Berkeleys on the south side of the chancel. There is a stone rood-screen in this church, the peculiar design being owing to a failure of the impost of the chancel arch. A second stone screen occurs in the Berkeley Chapel, and there is a curious series of squints,—one from the church to command the side altar in the chapel, and another in the chapel wall to command the high altar.

About a mile and a half from Berkeley is Wanswell Court, which is a very perfect house of fifteenth-century date, with its hall, 25 ft. by 22 ft., solar, kitchen, and bedrooms, and an addition made later by the family of Thorpe, who resided here in the time of Elizabeth. The solar has a window in each of the two front angles, one commanding the entrance, and the other the eastern approach. There are one or two fine fireplaces, and a good roof over the hall.

At Chipping Sodbury you will find a church which might have been transported from Devon or Cornwall. It is long and low, with the centre and side aisles of equal length, and a lofty tower at the west end, quite plain except the belfry windows at the top. The church was restored by the late Mr. Street. Inside is a pulpit approached by a staircase in the thickness of the wall, and there is a very elegant remnant of an altar at the east end of the north aisle, which could easily be missed, as the organ fills nearly the whole of the space in front of it. Chipping Sodbury resembles Campden in the fact that it consists chiefly of one broad street, and has a great many old houses on both sides.

About two miles east is Little Sodbury, and here is to be seen another fine old fifteenth-century house with a splendid hall, 32 ft. by 23 ft. Near Sodbury, westward, are Yate and Iron Acton. Yate has a very fine west tower, something like that of the Temple Church at Bristol, and the church itself consists of three long aisles without any chancel arch, like Chipping Sodbury. At Iron Acton is another fine church, with tombs, good stained glass, a Jacobean pulpit, and in the churchyard a curious preaching-cross. In the same district is Thornbury Castle, which, I am sorry to say, I missed, but it is no doubt well known to you in Pugin's book of "Examples."

This gentlemen, completes these rough notes on Gloucestershire, and you, perhaps, will ask which of all these places are the best worth seeing, to which I would reply "All." I feel myself that I could thoroughly enjoy going over the same ground again, as I had to bury a good deal over some of the places, but to any one who wished to see the best I should feel inclined to recommend the following, both for centres and good work in the places themselves:—

For Church-work,—Cirencester, Northleach, Berkeley, and Tewkesbury;

For Domestic-work,—Chipping Sodbury, Icomb, Chipping Campden, and Berkeley.

A report of the discussion which followed will be found on another page.

**Baths and Lavatories.**—We have received from Messrs. Steven Bros. & Co., of Upper Thames-street, a copy of their New Illustrated List of Baths and Lavatories, which contains illustrations of the various patterns of cast-iron baths manufactured by the firm, and prices of the same, either plain, japanned, or in the various degrees of enamel. The book also contains a coloured illustration of one of their baths, fitted complete, in one of the mahogany casings which they supply. A variety of cast-iron lavatories are also shown, and a number of cabinet-stands. The catalogue also gives a section of a dwelling-house, showing method of the hot-water circulation, which will, no doubt, prove useful. We commend Messrs. Steven Bros.'s New Bath List to buyers of this class of goods, of which we have often previously spoken in terms commending their uniform good quality.

**Destruction of a Paris Theatre by Fire.**—On Wednesday night the Paris Opéra Comique was destroyed by fire, with a loss of (according to the latest reports) twenty lives.

THE ANNUAL CONGRESS OF FRENCH ARCHITECTS.

The following is the text of the programme for the Congress of this year, to be held at Paris next month:—

Lundi, 6 juin.

à 3 h.—Constitution du Bureau et ordre des travaux du Congrès.—Nomination des Commissions sur les questions suivantes: *Concours publics Honoraires, Hygiène, Voirie, Industrie du Bâtiement, Propriété artistique, Responsabilité, &c.*—L'Architecture au Salon de 1887, par M. Loviot, architecte, membre de la Société.—Notice sur la vie et les œuvres de M. Ruprich-Robert, architecte du gouvernement, inspecteur-général des monuments historiques, membre de la Société.—De la circulaire de M. le Ministre de l'Instruction publique et des Beaux-Arts relative aux honoraires et à la responsabilité des architectes attachés au service des Bâtiements civils (Officiel du 2 avril, 1887).—Communications diverses.

Mardi, 7 juin.

à 9½ h.—Visite du Val-de-Grâce.  
à 3 h.—*Les Eglises et les Mosquées de Constantinople*, par M. A. Gosset, architecte à Reims, membre de la Société.  
à 4½ h.—Visite de l'atelier et des travaux de M. Victor Galland, rue Fontaine-Saint-Georges, 25.

Mercredi, 8 juin.

à 10 h.—Visite du Palais du Luxembourg.  
à 3 h.—*Les Dernières fouilles en Egypte et le déblaiement du Temple de Louqsor*, par M. Maspéro, membre de l'Académie des Inscriptions et Belles-Lettres.—*De la Décoration théâtrale*, par M. J.-B. Lavastre, peintre-décorateur de l'Opéra.

Jeudi, 9 juin.

Excursion au château de Dampierre, aux Vaux de Cernay et à Chevreuse.

Départ de Paris pour Versailles:—

Gare Saint-Lazare, à 8 h. 25. Gare Montparnasse, à 8 h. 05.

Des voitures pour l'excursion attendront à Versailles à la gare de la rive droite d'où elles partiront à 9 h. 15 m. précises.

Retour: Départ de Ver-  
{ Rive droite, 6 b. 55,  
  arrivé 7 h. 30.  
  Rive gauche, 6 b. 35,  
  arrivé 7 h. 15.

Vendredi, 10 juin.

Matinée réservée à la *Caisse de Défense Mutuelle*.  
à 3 h.—Distribution des médailles décernées par la *Société Centrale des Architectes* à l'Architecture privée, à l'École des Beaux-Arts, aux École privée, aux industries d'Art, au Cercle des Maçons, au personnel du Bâtiement, MM. PAUL SÉDILLE, Vice-Président, et PAUL WALLON, Secrétaire principal de la Société, rapporteurs.—Notice sur la vie et les œuvres de M. Le Souffache, censeur de la Société, par M. Ch. QUESTEL, membre de l'Institut, censeur de la Société.

Samedi, 11 juin.

à 9½ h.—Visite des travaux de l'Exposition universelle de 1889—Rendez-vous, pavillon Happ.  
à 3 h.—Compte rendu du Congrès des Sociétés savantes, par M. Ch. LUCAS, architecte, membre de la Société. Communications diverses, rapports des Commissions nommées le 6 juin.—Clôture du Congrès.

à 7 h. très précises.—Banquet confraternel, à l'Hôtel Continental.

NOTA.—Tout membre du Congrès devra prévenir à l'avance le Bureau pour être autorisé à traiter une question relative à l'Architecture ou à l'Archéologie, en dehors de celles indiquées ci-dessus. Pour toute demande d'invitation ou tout autre renseignement, écrire au *Secrétaire du Congrès*, au siège de la Société Centrale des Architectes, boulevard Saint-Germain, 168.

**The Recent General Conference of Architects.**—The number of the "Journal of Proceedings" of the R.I.B.A. issued this week says,—"Following the usual custom, the Royal Institute has not claimed the copyright of any of the papers read at the meetings of the recent Conference. The *Builder*, in two special supplements of sixteen pages each (issued 7th and 14th inst.), has printed them *in extenso*, giving at the same time a very full and careful report of the discussions which followed,—a work attempted by no other journal. This, undoubtedly, involved considerable extra expense, to say nothing of extra editorial labour; and the enterprise thus shown is worthy of hearty recognition from the Royal Institute. A separate pamphlet, to contain all the papers read on the Education question, with notes and appendices referring thereto, is also in course of preparation, under the charge of Mr. Arthur Cates, the Chairman of the Education Meeting, and it will be printed and privately circulated at his expense."

THE ARCHITECTURAL ASSOCIATION.

ELECTION OF OFFICERS FOR SESSION 1887-88.

The closing ordinary meeting of this Association for the present session was held at 9, Conduit-street, on the 20th inst., Mr. J. A. Gotch (President) in the chair.

Votes of thanks were passed to Mr. A. Waterhouse, R.A., for permitting the Association to visit the National Liberal Club, and to Mr. Thomas Warburton, the clerk of works, for conducting the visitors over the building.

The Chairman intimated that the judges of the Prize Committee had sent in their award with regard to the travelling studentship, which had been gained by Mr. Alfred Henry Hart. They further recommended that Mr. Henry Philip Burke Downing should receive a second prize of 5l.

Mr. H. D. Appleton (Hon. Sec.) announced that the date for sending in the drawings for the Aldwinckle Travelling Studentship had been extended to the 15th of July next.

The Chairman added that the preliminary conditions of the Aldwinckle Studentship were so simple and easily fulfilled that it would be a great pity if it were not adequately competed for. The prize consisted of 20l. for travelling in a place to be decided upon by the winner.

It was announced that the first vacation visit would take place on Saturday, the 28th inst., when the members would inspect the fine house built by Messrs. George & Peto for Mr. Henry Doulton, called "Woolpits," near Cranleigh, Surrey. A visit had also been arranged for the 11th prox. to a house by Mr. Norman Shaw, at Banstead Park; and on the 18th prox. there would be a day visit to Cambridge.

Messrs. Fleming and Paterson were appointed scrutineers to count the voting papers for the election of office bearers.

Mr. Burrell (Hon. Librarian) announced a donation by Mr. W. W. Pocock of a historical account of the Worshipful Company of Carpenters, and another by Mr. Florence, consisting of fourteen volumes of the *Builder*, from 1851 to 1864 inclusive. Votes of thanks were passed to the donors.

The following new members were elected, viz., Messrs. W. B. Parry, W. A. D. Fern, H. E. Ayling, and H. A. Saul.

Mr. R. W. Paul then read a paper entitled, "A Travelling Student's Notes in Gloucestershire," which we print on another page.

The Chairman, in opening the discussion, said he had listened with much interest to Mr. Paul's paper because he had gone to that special quarter of England with great enthusiasm, and seemed to have explored it thoroughly. It was extremely satisfactory to find that a Travelling Student of the Association should come and give the members the results of his labours. A glance round the walls showed them that Mr. Paul had made good use of his time, and when it was borne in mind that he had only been away six weeks, such a show of plans, sketches, perspective views, and full-sized details was a most creditable result. The nature of the paper precluded discussion in detail, and he (the speaker) could not throw much light on the question, as he was not thoroughly cognisant with the district. He had been to Gloucester, but the cathedral had not much interest for him with the exception of the fine Lady-chapel and the most complete cloisters, perhaps, to be found in England. Tewkesbury and Pershore had been visited by the Association, but they had not gone so far south as Mr. Paul had been. There was an interesting place north of Tewkesbury, called Severn End, a mixture of red brick and half timber. He could fully endorse Mr. Paul's suggestion that in England was to be found work of as great value and interest as any that could be found abroad.

Mr. H. O. Cresswell, in proposing a vote of thanks to Mr. Paul, complimented him on his charming set of sketches, and the good use he had made of his time. A point in the paper had struck him, as one which all the younger students of the Association would do well to note, viz., that Mr. Paul appeared to have studied the smaller buildings more than the larger ones. There was little doubt that young students, and older ones too, would often get a more complete idea of buildings by studying small ones thoroughly than by studying big ones imperfectly. He was afraid they ran too much to cathedral cities, and although Mr. Paul might have spent a great deal of his time

in Gloucester, Worcester, Hereford, and Tewkesbury, he had been wise in devoting his attention to smaller places. From the smaller churches, which could be thoroughly seen, and probably sketched, in a day, ideas could be got which were more likely to be useful to young men than the study of the grand and magnificent cathedral arrangements. He (the speaker) had seen several of the places where Mr. Paul commenced his tour, and they had struck him as containing a great deal that was interesting both from the point of view of ecclesiastical and domestic architecture.

Mr. Leonard Stokes seconded the vote of thanks, adding that Mr. Paul had shown a good example of industry and rapidity in his work. One very good point in his work was that he had taken so many plans, and especially of the churches, a course which was of great assistance in recalling the design; for all design was based upon plan, and out of it the details grew to a very great extent. It was, therefore, a most valuable thing to study plans. Mr. Paul's domestic work was also very good, and he hoped that the editor of the "A. A. Notes" might give a list of the several places visited by Mr. Paul which might be useful to the members.

The Chairman thought that Mr. Paul might add to the list of places, some of the chief features and dates for publication in "A. A. Notes."

The vote of thanks was then put and carried.

Mr. Paul, in replying, said that though most of the plans had been drawn on the spot, they had had to be enlarged for the purpose of illustrating his paper, and the labour of doing that could not, of course, be included in the six weeks' work. On visiting a church his first duty, as a rule, was to make a ground-plan. At Tewkesbury he spent the first day in walking round the building, for in dealing with such a large place one did not know at first where to turn, or to see what was best deserving of study. A good deal of time could be saved in making a plan if it were done on scale-paper. This was divided into squares, enabling the student to draw out a plan in a third of the time that would otherwise be taken. By estimating so many feet to the square, and going round with a 5 ft. rod, a big plan could be done in half an hour or three-quarters. He took with him a 10 ft. rod in two parts, the 5 ft. rod not being always sufficient, as there were certain heights that could not be easily reached, especially in out-of-the-way churches, where there were no ladders. As to the information for the "A. A. Notes," he would be only too glad to supply the editor with any additional information that might be desired, and also with a sketch map as an illustration of the route.

Election of Officers.

The scrutineers then presented their report on the voting for new officers, and the results were announced as follows:—

President.—Mr. John Slater, B.A., F.R.I.B.A. Vice-Presidents.—Messrs. H. D. Appleton, F.R.I.B.A., and L. A. S. Stokes, A.R.I.B.A.

Committee.—Messrs. Cole A. Adams, F.R.I.B.A.; F. T. Bagrallay, A.R.I.B.A.; R. L. Cox, A.R.I.B.A.; H. O. Cresswell, A.R.I.B.A.; E. Guy Dawber, Arthur J. Gale, A.R.I.B.A.; J. A. Gotch, F.R.I.B.A.; E. J. May, A.R.I.B.A.; C. R. Pink, F.R.I.B.A.; and G. G. Woodward.

Hon. Treasurer.—Mr. J. Douglas Mathews, F.R.I.B.A.

Assistant Treasurer.—Mr. H. W. Pratt, A.R.I.B.A.

Librarian.—Mr. W. Burrell.

Hon. Secs.—Messrs. Thomas Edward Pryce, A.R.I.B.A., and F. R. Farrow, A.R.I.B.A.

Auditors.—Messrs. A. C. Bulmer Booth, A.R.I.B.A., and F. E. Eales, F.R.I.B.A.

Mr. G. Richards Julian said that before the meeting closed he thought the members ought to pass a vote of thanks to the retiring President for the manner in which he had discharged the duties of his office. The Architectural Association had been very fortunate in its selection of presidents, and he believed that in Mr. Gotch the high standard attained had been well kept up (applause).

Mr. Leonard Stokes seconded the motion, adding that, although Mr. Gotch resided in the country, he had not missed a single meeting, and few if any of the committees. Mr. Gotch was hearty and soul with the Association, and would remain so, he believed, for many years to come (applause).

Mr. H. D. Appleton, in putting the resolution

to the meeting, remarked that Mr. Cotch had been elected a member of the Council of the Royal Institute of British Architects, to represent the Architectural Association during the next Session (applause).

The vote of thanks was then passed by acclamation.

The Chairman said he was exceedingly obliged for the kind and flattering way in which the proposition had been received. When he had the honour of being elected as President he made up his mind to discharge the duties as well as he could, and no special credit was due to him for attending the meetings. Living in the country did make a certain difference, and he was afraid that as he had now been elected to represent the Association on the Institute Council, which would entail a visit to London once a fortnight on the Monday, he might not be able to put in an appearance at the Association meetings on Fridays so frequently as he had done in the past. At the same time, if he were not working so much for the Association in its own rooms he would be forwarding its interests to the best of his ability upstairs (applause). It had been a matter of very great pride to him to be the President of the Association, and he should always look back with pleasure to the time when he occupied the chair and to the kind way in which he had been supported by the members (applause).

Mr. H. O. Cresswell next proposed a vote of thanks to Mr. Herbert D. Appleton, who was now retiring from his arduous duties as Hon. Secretary, and passing to the more honoured and dignified position of a Vice-President. No one who had had anything to do with the Architectural Association for a good many years could have failed to notice the extremely energetic manner in which Mr. Appleton had carried out his duties. He had been the life and soul of every thing, and on his retiring from the Secretaryship the members ought to tender him a very hearty vote of thanks (applause).

Mr. W. Burrell seconded the motion. The President, in putting the resolution, remarked that those who had not served on the Committee could have no idea of the amount of labour the Secretaries had to undertake. He had been perfectly astounded at the ease with which Mr. Appleton had attended to his multifarious duties.

The resolution was then put, and most cordially received.

Mr. Appleton, in reply, said it was with very mingled feelings that he gave up his position of Honorary Secretary that evening. At the same time, as it had been in the past, so in the future it would be his humble endeavour to do the best he could for the Association (applause).

The proceedings then terminated.

|                                               |   |   |        |

As the above particulars have been deduced from actual facts and practical experience, they may be confidently relied on as data for calculations, and the British Gas Engine Company guarantee their engines and compressors to produce the quantities of compressed air as described.

There are many towns, villages, and mansions, both inland and at the seaside, and especially in flat low-lying districts, where the sewage, as it is produced, deposits and stagnates in the drains, sewers, and water-courses. This is caused partly by their bad shape, excessive size, and insufficient fall to make them self-cleansing; and partly by their outlets being drowned in some instances, and tide-locked in others, and so prevented from freely and constantly discharging as they should do. Wherever these conditions exist, the inevitable result is that noxious gases, which often contain the germs of contagious diseases, escape from the decomposing and fermenting sewage deposit into and around the towns, the villages, and the mansions, and the infected air the inhabitants continually breathe. It is owing to these bad conditions that excessive sickness, epidemics, and high death-rates occur; and it was owing to the same conditions, only of a more intensified character than now obtains, that plagues formerly broke out and killed half the populations. Wherever there are stagnant drains and sewers of deposit, whether in a town, a village, or a mansion, facilities are now afforded for easily, economically, and effectually remedying this state of things by the adoption of one or more of Shone's automatic sewage ejectors in combination with one or more of Atkinson's differential air-compression gas engines. The first cost and working expenses of these highly effective and scientific machines are much less than, and far superior to, the old sumptuous process of steam-boilers, steam-engines, and pumps for lifting the sewage. By means of the ejectors and gas-engines as described, which may be seen in full working action at the Palace of Westminster and elsewhere, the sewage, as fast as it is produced, may be lifted to any altitude, whence it would quickly flow by gravitation on to prepared agricultural land for utilisation and purification there; or be discharged above the level of high water down into the sea below the level of low water. If local sanitary authorities would only wisely devote their attention to this subject, the sanitary improvement of their districts may be readily accomplished.

Putney. JOHN PHILLIPS, C.E.

ST. MICHAEL'S, COVENTRY.

Sir,—Will you allow me to point out, with reference to a paragraph which I have observed in the *Builder* about St. Michael's, Coventry [p. 760, May 21st, 1887], that it is not correct to say that the tower and spire have been taken down and built up again from the base? The foundations have been underpinned, the tower is being cased and otherwise strengthened, and the upper part of the spire, some 70 ft., has been taken down, and will be rebuilt. I think the drawing of the tower and spire is by Mr. Webster, the clerk of works. I. S.

\*.\* We never implied that the tower had been rebuilt; only the spire. We are obliged to our correspondent for giving the precise extent of the work done.

NELSON COLUMN.

Sir,—The information asked for by one of your correspondents, in the issue of 14th inst., may be found in the *Builder* of April, 1850; at least, a lengthy description of the column, together with one section and a few details. J. L.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

5,189, Imparting Surface Designs to Bricks, Tiles, &c. W. Benson and L. Gunning.

This invention consists in the employment of a rotating roller with the design impressed on its surface. This roller is placed near the mouth of the pugmill, whence the clay in a plastic state issues. The roller is adjustable in its bearings, and cuts as well as stamps the mass of clay as it issues from the mill before being fired.

5,969, Ventilator and Chimney Cowl. J. Rainer.

This invention relates to a cowl or chimney-top fitted with deflector plates in such wise that when the wind strikes the main shaft the air is deflected upwards, carrying with it the smoke. The greater the force of wind the stronger is the upcurrent in the shaft.

6,196, Chimney Cowl. J. B. Fryer.

The cowl which is the subject of this patent has a circular revolving head fixed at the top of the chimney shaft. This revolving head has an inner lining, and also an outer cover or jacket. These parts are so arranged that air can enter the mouth of the chimney and pass between the jacket and the lining, producing a vacuum and causing a strong updraught for the smoke.

6,476, Water Taps. E. Budge.

This invention relates to an apparatus which may be fixed over the seat of any tap, for the purpose of regrinding or refacing it, so that the valve of the tap will fit tightly thereto. Many varieties of cutters may be used, and the little machine is easy of manipulation and quick in its effect.

6,930, Fireplaces, &c. H. Heim.

The object of this invention is to obtain an almost perfect combustion, and consumption of smoke. The fireplace is fitted with a filling channel, closed by a cover, with which the fire space in the rear communicates. Over or around the fireplace, tubes are fitted for the purpose of conveying the heated air to and from the room in which the fireplace is fixed.

7,630, Sliding Window Sashes. J. H. Beteley.

The object of this invention is retaining the window-sashes in any position, and consists in fixing a rack or series of serrations at the side of the window-sash, and a catch on the window frame which fits into the notches, and will fix the window at any required height. The improvement is also applicable to screens, blinds, &c.

NEW APPLICATIONS FOR PATENTS.

May 13.—7,014, R. Russell, Water-ways Preventers for Flushing Cisterns.—7,027, G. Bateman, Attaching Knobs to Spindles.—7,036, F. Trier, Stoneworking Machines.

May 14.—7,057, T. Boothroyd and S. Brooke, Ventilator.

May 15.—7,113, J. Horne and S. Hollyman, Warming and Ventilating Houses, &c.—7,124, H. Snell, Glazing Windows, &c.

May 17.—7,178, J. Corbett and R. Hardy, Manufacture of Cement.

May 18.—7,217, J. Clarkson and S. Wilkinson, Water-closets.—7,236, J. Warwick, Construction of Water-pipes exposed to the action of frost.—7,243, L. Knemeyer, Cement for Artificial Stonework, Coating Walls, &c.—7,251, H. Lake, Window-sash Fastener.

May 19.—7,275, J. Bird, Automatic Weather-bar.—7,311, R. Livingston, Opening and Closing Casements and Ventilators.

PROVISIONAL SPECIFICATIONS ACCEPTED.

4,623, J. Frith, Opening and Closing Window Casements, Fanlights, &c., and Retaining same in any Position.—4,937, F. Pontifex, Doors and Windows for Preventing Draughts.—5,201, C. Heston, Ornamental Cloussonné Mosaic Work.—5,220, H. Waddington, Ventilation.—5,346, G. Gregory, Window Fasteners.—5,349, W. Macavitis, Window Fastenings.—5,351, G. Williamson, Window Sash Fastener.—5,374, J. Shepherd, Water tight Doors.—5,471, J. Dedicat, Fasteners for Window Sashes, &c.—5,475, D. Burns, Manufacture of Bricks and Tiles from Waste Products.—5,571, W. Roberts, Joints of Drain-pipes.—5,702, J. Armstrong, Glazing.—5,825, J. Rowland, Air, Water, and Fire-proof Doors.—6,108, J. Shoebridge, Window Sashes.—6,187, H. Longston, Step Ladders and Trestles.—4,261, J. Millar, Construction of Wood Window Sashes.—4,634, T. Fawcett, Machinery for Making and Pressing Bricks and Tiles.—6,309, E. Marston, Fittings for Baths and Lavatories.—5,432, J. Rawlinson, Increasing the Humidity of Air in Buildings.—6,605, J. Tucker, Cisterns.—6,769, G. Shephard, Timber-drying Chambers, &c.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months.

8,731, E. Abate, Stoves.—9,150, O. Gilbert, Latch Operating Devices.—9,581, J. Hannay and E. Pape, White Paint.—13,205, J. Deuny, Terracotta Building Blocks.—2,843, T. Kemp, Water-closet Apparatus.—4,701, H. Lake, Drain Traps.—4,937, A. Boul, Drain Traps.—5,048, G. Emery, Brick Machines.—5,429, F. Wallbrecht, Manufacture of Bricks, Tiles, &c.—8,613, H. Heim, Fireplaces or Stoves.—9,378, R. Guest, Combined Edging Tile and Gutter.—9,520, J. Rawlings, Exhauster for Taking away the Dust and Shavings from Wood-planing Machines, &c.—5,331, R. Haddan, Saw-setting Apparatus.

The Hotel Victoria, Northumberland-avenue.—In reference to our recent notice of this building, the Coalbrookdale Company were there mentioned only as makers of the covered way. We are informed that they also supplied the whole of the grates throughout the building.

SEWERAGE OF TOWNS, VILLAGES, AND MANSIONS.

Sir,—The following notes on the mechanical removal of sewage, which was referred to recently in connexion with the visit of the Architectural Conference to the drainage works of the Houses of Parliament, may be of use to some of your readers:—

With a consumption of 50 cubic feet of gas per hour, a 2-h.p. Atkinson's differential air-compressor engine produces per hour,—

|                                                                  |   |   |      |
|------------------------------------------------------------------|---|---|------|
| 3,510 cubic feet of compressed air at 5 lb. pressure per sq. in. |   |   |      |
| 1,596                                                            | " | " | 10 " |
| 948                                                              | " | " | 15 " |
| 690                                                              | " | " | 20 " |
| 518                                                              | " | " | 25 " |
| 360                                                              | " | " | 30 " |

With the above quantities and pressures of compressed air respectively (after deducting for friction, slip, and loss at joints) a Shone's automatic ejector discharges per hour,—

|                                               |   |   |        |
|-----------------------------------------------|---|---|--------|
| 3,475 cubic feet of sewage 11 ft. 6 in. high. |   |   |        |
| 1,480                                         | " | " | 23 0 " |
| 938                                           | " | " | 34 6 " |
| 693                                           | " | " | 46 0 " |
| 511                                           | " | " | 57 6 " |
| 356                                           | " | " | 69 0 " |

Also, with a consumption of 90 cubic feet of gas per hour, a 4-h.p. Atkinson's engine produces per hour,—

|                                                                  |   |   |      |
|------------------------------------------------------------------|---|---|------|
| 7,800 cubic feet of compressed air at 5 lb. pressure per sq. in. |   |   |      |
| 3,540                                                            | " | " | 10 " |
| 2,112                                                            | " | " | 15 " |
| 1,536                                                            | " | " | 20 " |
| 1,152                                                            | " | " | 25 " |
| 816                                                              | " | " | 30 " |

With the latter quantities and pressures of compressed air respectively (after deducting for friction, slip, and loss at joints) a Shone's ejector discharges per hour,—

The Student's Column.

FIELD WORK AND INSTRUMENTS.—XXII.

Levelling Instruments.

VI.—THE Y LEVEL.

THE telescope is reversible in its Y supports, end for end, so that it is immaterial in which Y the object-glass end or the eye-piece end is held. The accuracy of the instrument depends upon the line of collimation being coincident with the axis of the telescope and upon the collars being both vertically and horizontally parallel to the telescopic tubes. Fig. 3 illustrates an end view of the Y support, open ready to receive the telescope. Fig. 4 gives an enlarged view of the Y support, showing one of the collars which surround the outer tube of the telescope. In order to test the accuracy of the line of collimation the instrument is set up approximately level and a well-defined distant point observed. If a level staff is held at as great a distance from the instrument as may be found convenient for clearly reading the divisions upon the face of the staff, the height read with the telescope in the position shown in fig. 1 should be the same as the height read when the telescope is revolved vertically round in its bearings 180 degrees, to the position shown in fig. 2. If any difference exists the diaphragm plate must be adjusted by moving the vertical capstan-headed screws near the eye-piece marked A and B in figs. 1 and 2, until the staff reads the same with the telescope in both positions. Before revolving the telescope upon its axis from the position shown in fig. 1 to the position shown in fig. 2, the clamp-screw attached to the body of the instrument should be tightened, and while revolving the telescope let it be observed whether the centre point between the two vertical cross-hairs diverges to the right or left hand of the distant point chosen for observation. Place the telescope, as shown in fig. 4, with the single cross-hair vertical, and observe a distant point. Revolve it 180°, as before, and the total divergence horizontally will then be apparent. Half this amount must then be taken up by working the same capstan-headed screws, A and B, which are now in a horizontal position, in order to correct any error that exists in this direction. The adjustment of the parallel cross-hairs with reference to the single cross-hair is effected by the capstan-headed screws marked C and D.

Next, to make the run of the longitudinal bubble parallel to the axis of the telescope, so that when the longitudinal bubble properly reverses, the line of collimation within the telescope may be set level by it. Unfasten the Y clips and place the telescope exactly over two opposite parallel plate screws. Tighten the clamp screw and set the longitudinal bubble in the centre of its run by the parallel plate screws. Lift the telescope out of the Ys and replace it with the ends reversed, so that the object-glass end would be removed to the left-hand side, and the eye-piece end to the right-hand side in fig. 1. Then adjust any error that may appear in the level of the longitudinal bubble, half by the two parallel plate screws over which the telescope has been placed, and half by the capstan-headed nut and lock nut marked F, which raise or lower one end of the bubble tube, as required upon its vertical screw-attachment to the telescope. Having done this, we have in the third place to set the axis of the telescope at right angles to the vertical axis of the instrument, so that the line of collimation may traverse in a horizontal plane. This is effected with the telescope fixed in the Ys, as shown in fig. 1. The clamp screw is slack, and the longitudinal bubble set level with the telescope placed over two opposite parallel plate screws. The instrument is then turned half round upon its vertical axis, so that the contrary ends of the telescope and the Y supports have changed places over the same two parallel plate screws. If the bubble is not found to settle in the centre of its run after traversing half round horizontally, half the error must be corrected by the two parallel plate screws over which the telescope has been placed, and the remaining half by the capstan-headed nut marked E attached to the Y shown in the illustration under the horizontal bar next the eye-piece. This adjustment determines the relation of the bubble to the Y supports in one direction. The operation should also be performed over the other two parallel plate screws with the telescope horizontally at right

DIAPHRAGM SHOWING POSITION OF SCREW NUTS WHEN EMPLOYED FOR CORRECTING THE LINE OF COLLIMATION PLANE BY MEANS OF THE COMBES

angles to the last direction, and repeated over both directions, until the bubble remains in the centre of its run during a complete traverse of the telescope. When once in order the instrument will remain in adjustment, unless shaken by severe handling in transit by carriage from one place to another.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table listing real estate transactions with columns for property description, agent, and price. Includes entries like 'Bethnal Green-23, Patriot-square, freehold' and 'Goswell-road-18, 19, and 20, Geo-street, freehold'.

MEETINGS.

SATURDAY, MAY 28.
Architectural Association.—The first Vacation Visit will be made to Woolpit, the residence of Mr. Henry Doulton. (See Advertisement on p. xvi.)
Association of Public Sanitary Inspectors.—Meeting at Town-hall, Eastbourne. 11 a.m. During the day addresses and papers will be given by Mr. Edwin Channick, C.B., Dr. Alfred Carpenter, and others, and visits will be made to the water-works, sewage-works, &c.
WEDNESDAY, JUNE 1.
British Archaeological Association.—(1) Mr. J. Romilly Allen, F.S.A. (Sec.), on 'The Antiquity of Fountains.' (2) The Rev. Dr. Hoepffel on 'The Excavations at Vinovia.' Part II. 8 p.m.
THURSDAY, JUNE 2.
Royal Archeological Institute.—(1) Mr. G. L. Gomme, F.S.A., on 'Evidence of a one Village Community at Aston in Oxfordshire.' (2) The Rev. A. H. Sayce of 'A Hitite Cylinder and Seal.' (3) Mr. E. Peacock, F.S.A., on 'Court Rolls of the Manor of Hildbalstow.' 4 p.m.
SUNDAY, JUNE 4.
Association of Municipal and Sanitary Engineers and Surveyors.—Home Counties District Meeting at Portsmouth. Paper by Mr. Boulton on the Drainage Works of Portsmouth, recently carried out by Sir Frederick Brunwall.

Miscellaneous.

Royal Meteorological Society.—At the last monthly meeting of this Society, held last week, at the Institution of Civil Engineers, 25, Great George-street, Mr. W. Ellis, F.R.A.S., President, in the chair, Mr. W. Marriott read a paper giving the 'Results of Thermometrical Observations made at 4 ft., 170 ft., and 260 ft. above the ground at Boston, Lincolnshire, 1882-86,' by Mr. W. Marriott, F.R.Met.Soc. These observations were made on Boston Church-tower, which rises quite free from any obstructions, in a very flat country, to the height of 273 ft. A Stevenson screen, with a full set of thermometers, was placed 4 ft. above the ground in the churchyard; a similar screen and thermometers were fixed above the belfry, at 170 ft. above the ground; while a Siemens electrical thermometer was placed near the top of the tower, the cable being brought down inside, and attached to a galvanometer on the floor of the church, where the indications were read off. The results showed that the mean maximum temperature at 4 ft. exceeds that at 170 ft. in every month of the year, the difference in the summer months amounting to 3°; while the mean minimum temperature at 4 ft. differs but little from that at 170 ft.; the tendency, however, being for the former to be slightly higher in the winter and lower in the summer than the latter. As the electrical thermometer was read usually in the daytime, the results naturally showed that the temperature at 4 ft. during the day hours was considerably warmer than at 260 ft. The author, however, detailed several sets of readings which had been made during the night as well as the day, the results from which were of a very interesting character. During the evening the President made a presentation to Dr. J. W. Tripe of a silver tea and coffee service, which had been subscribed for by the Fellows in acknowledgment of the many services which he had rendered to the Society during a period of over thirty years.

A New Lunatic Asylum for Middlesex.—A limited competition has been held for the erection of a fourth lunatic asylum for the county of Middlesex, the architects invited to compete having been Messrs. Giles & Gough (London), Griffiths (Stafford), G. T. Hine (Nottingham), Littler (Manchester), and Martin & Chamberlain (Birmingham). A committee, formed from the Managing Committees of Hanwell, Colney Hatch, and Banstead Asylums, six from each committee, and presided over by Mr. Gaddesden (the Chairman of the Banstead Asylum Committee) gave full consideration to the plans, and selected that by Mr. G. T. Hine. The hospital, which is exceedingly well planned for its purpose, furnishes accommodation for patients under four main groups:—Infirmary patients, 240 males, 291 females; acute cases, 150 males, 252 females; epileptic cases, 161 males, 180 females; chronic cases, 251 males, 360 females. The buildings, as may be supposed, are of great extent; the central block includes administration chapel, recreation-room, cooking and laundry departments, the main corridors run out obliquely on either side, the wards for infirmary and acute cases opening en echelon from the outer sides of the corridors, and the wards for chronic and epileptic cases being between the outer corridors and the centre block. Each of these departments has its own airing-court.

Railway and Canal Traders' Association.

At a special meeting of the Council of the Railway and Canal Traders' Association, held at the offices of the Association, Eastcheap, on the 23rd inst., it was decided to hold the annual general meeting of the Association at the Cannon-street Hotel, on Monday, the 13th of June, at half-past two p.m. The Railway and Canal Traffic Bill as sent down from the House of Lords was considered, and it was resolved:—That the Council of this Association fully concur with Sir Bernhard Samuelson's motion, to the effect that no Bill for the better regulation of railway and canal traffic will be satisfactory which does not afford adequate protection to traders and agriculturists against undue charges for terminals, and undue preferences, and will give the same their best interest support.

**Civil and Mechanical Engineers' Society.**—The Annual Dinner of this Society was held at the Holborn Restaurant on the 18th inst. The President, Mr. E. H. G. Brewster, A.M.I.C.E., occupied the chair, and a large number of members and visitors were present, among whom were Professor Henry Robinson (President of the Society of Engineers), Mr. S. H. Terry (of the Local Government Board), and Mr. Worby Beaumont (of the Engineer). The usual loyal toasts having been duly honoured, Mr. S. H. Terry proposed "Success to the Civil and Mechanical Engineers' Society," coupled with the health of the President. The President responded, and in the course of his remarks referred to one of the main features of the Society, viz: the cultivation of the spirit of friendship amongst the members one with another, each new member being taken in hand by the older members and introduced to all those he might be unacquainted with. Other toasts followed, and a very pleasant evening was spent.

**The County Grant and Wood Paving on Main Roads.**—The Chiswick Local Board some time ago intimated to the County Authorities for Middlesex that it had passed a resolution in favour of laying the Chiswick Highway, from Young's-corner to Kew Bridge, with wood paving, and asking the Authorities to make the usual grant in aid of the expenses of maintenance and repair of the road proposed to be laid with wood paving. At a recent meeting of the Local Board it was reported that the County Authorities had declined to accede to the application of the Chiswick Board, not on the ground, it is believed, of any unfavourable opinion with regard to the character of wood paving for main road purposes, but because the Justices are of opinion that the Highways Act does not enable them to contribute to the expenses of maintenance where part of these expenses are in the shape of interest on a loan borrowed for the complete re-laying of the road with wood. Such interest, the County Authorities contend, is not "current expenses." The Chiswick Board, in order to get over this difficulty, advertised for tenders on the basis of paying to the contractor a lump sum annually for construction at the beginning of the period, and maintenance afterwards for a certain number of years, so that the Board could obviate the necessity of borrowing to meet at once the cost of construction. The County Authorities even then regard the transaction as tantamount to borrowing money, for they would be paying a grant every half-year of something like 1,000l., when for the first two or three years of the contract term the current expenses incurred on the road would be comparatively trifling. The Chiswick Board, however, have appointed a deputation to wait on the Local Government Board to protest against the decision.

**London Sewage.**—At the meeting of the Metropolitan Board of Works, on the 13th inst., some further information was vouchsafed to the public in regard to the system of sewage disposal to which the Board has at last committed itself. The proposed system cannot produce a proper purification of the river. Even if it turns out that this is the best of all possible purification schemes, that the effluent is "fairly clear," and that the sludge and cake will produce no local nuisance, it still remains a fact that the situation of the works is utterly unsuitable. It seems to us doubtful, to say the least of it, whether chemical and mechanical operations upon the sewage of four million persons can be conducted without serious local injury, or at least annoyance; and we are certain that the effluent water, although much less objectionable than raw sewage, is unfit to be thrown into the Thames at the existing outfalls. At present, according to the Royal Commissioners, who had ample evidence before them, the river is polluted with sewage almost up to Teddington. The pollution will now be of a less disgusting character, but still it will remain a disgraceful pollution, to which the people of London ought not to submit. We have always maintained that the proper place for the treatment of London sewage is in Sea Reach, where there are large tracts of land for sewage irrigation, low lands to be raised, no houses to be incommoded, a large volume of water, and close proximity to the sea. To this remedy we shall surely come sooner or later, and then it will be found that the vast expenditure for works and steamers now lightly incurred by the Metropolitan Board of Works will have been absolutely thrown away.—*Lancet.*

**Liverpool Engineering Society.**—On Saturday last the members of this Society, by permission of Mr. W. King, M.Inst.C.E., visited the United Gas Light Company's Works at Linacre. Arriving at the works at about 2:30 p.m., the party were met by Mr. King, who took them to the office, where he showed them the plans and gave a short history of the growth of the works. He then pointed out the extensions in progress, and those contemplated, and stated that the capacity of the works when completed would be equal to a supply of about 17 millions of cubic feet of gas per day. The party then proceeded, under the guidance of Mr. King, to inspect the works, where the various operations of retorting the coal and purifying and testing the gas were examined with much interest. The members then returned to the office, where they were entertained to luncheon by Mr. King. A hearty vote of thanks to Mr. King brought the visit to a close.

### Arterial Drainage in Ireland.

WHEN the Chancellor of the Exchequer explained his Budget, he said he proposed to give a grant of 50,000*l.* this year towards the development of arterial drainage in Ireland, in accordance with the recommendation of the Royal Commission on that subject. This Commission has just issued its first Report. It was appointed in October, 1886, to inquire into the measures required for the completion and maintenance of the system of arterial drainage in Ireland, especially in the districts of the Shannon, the Barrow, and the Bann, having at the same time regard to the improvement or preservation of the present means of inland navigation; and also whether, in order to carry out any works which might be recommended, it would be necessary that the amounts which could be charged upon the localities in return for the advantages derived from them should be supplemented by the Imperial Exchequer. The objects of the Commission included an inquiry into railway and tramway extension and deep-sea fisheries, but their first Report deals only with those things we have named. The Commission consists of Sir James Joseph Allport, Mr. James Ahernethy, Mr. John Wolfe Barry, and Mr. Joseph Todhunter Pim. They examined fifty-three witnesses, some on the general question of drainage, others on the results of their experience of the subject in different points of view. They inspected the most important parts of these rivers, and visited works in progress elsewhere, and altogether made themselves acquainted, as they say, with the special circumstances of the country. The physiographical features of Ireland are peculiar. The great central plain is surrounded by high ground near the coast; the climate is humid; there are few outlets through which rivers can escape to the sea. These salient features are of themselves sufficient to suggest at once the need for artificial drainage, and the probability of difficulties in carrying it out. The inclination of the beds of the rivers, especially those of the larger rivers, are sufficiently steep near their outfalls, but they are exceptionally flat along the middle portions, whilst the upper parts of the rivers are often steep. Thus, with the considerable rainfall of Ireland, large quantities of water find their way rapidly to the middle parts of a catchment basin, but cannot find an easy exit, owing to want of fall in that part of the river course. With regard

to floods, in the case of low-lying meadow lands, the winter floods are not so injurious as the summer and autumn floods, but very competent judges hold that complete relief from these should be attained if arterial drainage is to be really successful. There are, we dare say, people who would think it a far-fetched idea that drainage could influence climate in any place, but the Commissioners gave some attention to this, and say that both general considerations and the evidence of experts go to show that large tracts of wet land tend to lower the summer temperature of the districts in which they are situated and to diminish the amount of sunshine. Both these results cannot fail to be injurious to agriculture in Ireland, where, owing to its geographical position, the summer temperature is relatively low and the sky is frequently clouded. The strongest proof of the effect of damp land on temperature is that the July temperature of the middle of Ireland is lower than that of either the northern or the southern part, and the greatest amount of wet land lies in the middle part of the country. These climatic conditions, while distinctly affecting the ripening of the crops, cannot fail, in the opinion of the Commissioners, to have effects prejudicial to health, though it would be hard to prove this statistically.\* The direct effects of the drainage of lands on adjacent towns, as regards both general improvement of sanitary conditions and improved outfalls for sewage, are more tangible, and are very considerable. The present condition of arterial drainage in Ireland has led the Commissioners to the conclusion that what the Committee of the House of Lords which sat in 1877 said about the condition of the rivers of England applies with at least equal force to Ireland. It was that "the constitution of a drainage Board in any district is not compulsory, so that in many cases districts urgently in need of such bodies are without them. The principle of rating exclusively according to the benefit accrued is difficult of application, and is frequently found to work unsatisfactorily in practice. Owing to the existence of several distinct authorities for the course of a single river, conflicts have arisen which are fatal to the adoption of any uniform and comprehensive scheme for the conservancy of the river as a whole, and there is, moreover, an absence of responsibility which may be held to account, in a great measure, for the present neglected state of several important streams." Confusion of authority in the proper drainage of the country reigns in Ireland as completely as it does in England. There is no system in Ireland for the conservancy of rivers, nor any

\* We draw attention to this subject in the *Builder* of July 10, 1886.

department of Government charged with the subject; and in many cases, where the proper regulation of a river is matter of public concern, it is under the control of no one, and is often obstructed and neglected. Drainage districts are formed without any regard to the interests of the larger river basins in which they lie, and so arranged as to escape their share of what should be a common responsibility. On the other hand, the boundaries of such districts are so arranged as to impose on their promoters responsibilities which ought to be shared by others, and to force these promoters to confer benefits on their neighbours towards the cost of which they contribute nothing. Instances occur in which some physical obstruction which is, in an engineering sense, the key to the position, is left outside the boundary of a district, the Board of which has no power to deal with it; and others, in which a district has been forced to execute expensive works below its own limits, actually conferring a benefit upon its neighbours without any power of imposing a corresponding charge. Some rivers, with no marked difference in their course, are in the charge of two Boards, each of which is naturally disposed to look with suspicion on any action taken by the other; while other rivers have been dealt with in short sections, separated by unimproved reaches. The drainage of a whole district may be stopped by a mill which cannot be bought out except on prohibitive terms, and which, perhaps, is not doing any appreciable amount of work, the vested interests in it being based on encroachments which a proper system of conservancy would have prevented; or, again, the lower section of a river may be overwhelmed by the water sent down it from the upper areas, which, being exempt from taxation, pay nothing towards the damage so caused. The first step to be taken for the improvement of the existing state of things is the adoption of the proposal made for England that the catchment area of every main river should be put in the charge of a separate body of conservators, representative of the various interests concerned, who should be responsible for the maintenance and improvement of the *main watercourses*, with the necessary powers for executing works and obtaining funds. These bodies would be Conservancy Boards. The area of jurisdiction of each such Board should comprise the whole catchment area of a river, down at least to the limit of tidal water. In the case of the Shannon, however, a district formed on these principles would be for several reasons undesirable, and in this case the principal tributaries down to the point of junction with the main river should each form a separate district, and Government should

continue to maintain the Shannon itself. The number of Conservancy Boards for the whole of Ireland would probably not exceed thirty, omitting the smaller basins. It would, the Commissioners say, be proper that Government should take steps to form these main districts without being set in motion by local initiation, and preliminary surveys for this purpose might be begun in the present year, without waiting for the legislation which would be required to bring the recommendations of the Commissioners into effect. In rating the different parts of each catchment basin of a river distinction should be made between lowlands, midlands, and uplands. A limit should be put upon the rate to be levied on the uplands, say one-tenth of that charged on the lowlands, and upon these it may be expedient to fix a maximum rate which may be levied, so as to guard against indefinite taxation. But besides such works as would fall within the province of the Conservancy Board, there are many cases where local works are required in order to free from floods particular tracts of land or to regulate tributary streams. The responsibility for the construction of such works, as well as the resulting pecuniary liability, should remain with those locally interested, subject, firstly, to Government advice, and, secondly, to the condition that one district should not injure others for its own benefit. Some tributary streams form naturally separate districts, and can advantageously be dealt with apart from the main river, and there are smaller rivers which do not lie in the larger basins and would not require a Conservancy Board, while yet they may require arterial drainage. For each area of these minor districts a District Drainage Board should be formed, its jurisdiction being confined to the lands directly benefited by drainage, and its duration limited to the period of construction, the duty of subsequent maintenance falling upon the Conservancy Board along with that of the main watercourses. This being the working organisation by which improvements of the arterial drainage would be carried out, a cognisance of the whole would be placed under a Government Drainage Department, which would take the place, for this purpose, of the present Board of Works, which would be relieved of so much of its multifarious duties as relates to arterial drainage. Such a department would be mainly an engineering one, but, in addition, the financial interests of the Government must be adequately represented. With respect to finances, drainage loans are at present repaid by a fixed annuity to cover interest and sinking fund, either of 6l. 10s. for twenty-two years or of 5l. for thirty-five years, for every 100l. advanced, the rate of interest being taken at 3½ per cent. Having regard to the rate at which Government can now borrow money, and in view of the greater control of expenditure recommended by the Commissioners, they consider that the rate of interest may properly be taken at 3 per cent., and that the maximum term for the loan may be extended to forty years.

There is no definition of arterial drainage in the Irish legislation on the subject, but in the Land Improvement and Arterial Drainage Bill introduced by Government in 1885 this omission is supplied, and is as follows:—

"Cleansing, repairing, and otherwise placing and maintaining in a due state of efficiency any watercourse or outfall for water, or any wall, bank, dam, or other defence against water.

Deepening, widening, straightening, and otherwise improving any watercourse or outfall for water, and removing any milldam or other dam, weir, or other obstruction to any watercourse or outfall for water, and raising, widening, and otherwise altering any of these.

Making any new watercourse or outfall for water, and erecting any new bank, dam, &c."

With regard to the recommendations of the Commission, we should be inclined to agree in all that relates to drainage, but a very unsatisfactory part of the Report is that which relates to the inland navigation of the country. We look at the constitution of the Commission and find in Sir James Allport a representative of the

railway interest; in Mr. Abernethy a dock and harbour engineer, but one who has declared that he is "not a canal engineer"; in Mr. Barry an engineer who, however eminent and admirable as his general practice is, would not occur to us as the most eminent in navigation works; so that if there is a member of the Commission who is inclined to look favourably upon inland navigation as a means of improvement along with arterial drainage, and to devise such works as would make these two requirements compatible, it must be Mr. Pim. The instruction to the Commission was to report "What measures are required, with due regard to the improvement or preservation of any necessary facilities for inland navigation, for the completion and maintenance of the system of arterial drainage, and whether increased facilities could be afforded to trade and commerce by any changes, legislative or otherwise, in the organisation and management of the Irish railway system, or by an extension of the Acts for aiding the construction of tramways or other cheap means of communication with existing lines"; and with the view to the extension of railways, the members of the Commission seem to have been well chosen. For the questions of fisheries and harbours Mr. Abernethy probably was specially chosen, but with regard to inland navigation, equally to be inquired into with fisheries, railways, and drainage, we should say that the Report of the Commissioners is inadequate. They were to inquire into the circumstances of three navigable rivers. In one, the Barrow, they recommend twelve out of forty-three miles to be improved for navigation; in another, the Shannon, they recommend the depth of water to be reduced 2 ft.; in the other, the Bann, that the navigation be abandoned altogether.

These attempts at destruction rather than improvement are based upon the fact that the income from inland navigation in Ireland has hitherto been small; but this, surely, is a very insufficient reason. The object is a general improvement in the prosperity of the country, as far as that can be obtained by engineering works, of whatever kind, within the means at command of the Government, and the way in which this can be done is to provide such means as may in the future contribute to that end, and not merely to strike a debtor and creditor balance of what has been, and so limit the possibilities of future improvement. It is this system of government which has earned for England the not altogether undeserved renown of being incapable of governing Ireland. A country which, according to the Commissioners' own showing, is so flat for such great distances, and which has an abundance of rainfall, is one where inland navigation is easy and inexpensive, and where it needs only excavation of the ground to produce waterways sufficient for all purposes of commerce, and which same waterways will, if cut, drain the low-lying land near and far.

The weak part of the Report of the Commission is as follows:—"Another most troublesome physical characteristic [the others being those we have named, viz., humidity of climate, few outlets of the rivers to the sea, inclinations of beds of rivers exceptionally slight along the middle portions] of Irish rivers, large and small, is that there are many obstructions in their beds, and that these are frequently of rock of the hardest character. Even where not rocky, the beds of many rivers consist of very hard gravel, almost a conglomerate, or of tenacious boulder clay. These conditions suggest the embankment of rivers rather than excavation, as the most economical method of confining the rivers within proper bounds and of protecting lands from floods."

"One reason why embanking has not been adopted has been an apprehended difficulty in some localities of effectually draining the flat lands behind embankments; but another more cogent reason has no doubt been the desire, in several important instances, to associate navigation with drainage, which, with an embanked river, would involve a permanent raising of the water level" (of the navigation). But the cropping up here and there of bard rock in

the course of a waterway, or the presence of tenacious boulder clay or of very hard gravel, are difficulties which could be easily surmounted were there the will, and when done the channel would drain the land and be a waterway for all purposes; and when the land is drained, and a way made for the removal of its produce, the population might earn their bread at home.

The flatness of the great central plain of Ireland is a feature favourable to the point in question. The more level a country the fewer the locks required on any given length of navigation, and the fewness of the locks is a great set-off against the greater expense of excavating hard ground, and fully compensates for the greater expense of an excavated channel over that of an embanked one. The embanked channel would be cheaper, but it would perpetuate a mistake in engineering.

#### "ANTIKE DENKMAELER": GERMAN ARCHÆOLOGICAL INSTITUTE.

THE appearance of the new *Denkmäler*\* has been eagerly looked for by archaeologists. Of all the new series of publications by the German Institute, it is issued last, and is in many respects the most important. It takes, it will be remembered, the place of the old *Monumenti*, which, after running an honourable course since 1829, has now ceased to exist. It takes the place of the *Monumenti*, but with a marked difference, or rather, to be accurate, two marked differences, which it may be well to note at the outset. First, the *Monumenti* was issued at Rome; the *Denkmäler* appears at Berlin. The *Monumenti* necessarily, though it did not close its doors to other countries, was chiefly concerned with the antiquities of Italy,—there was a natural bias in favour of art found on Italian soil. This resulted in a preponderance of Græco-Roman statues, Pompeian wall paintings, Italian terracottas, vases, and the like. Now the centre of gravity shifts to Berlin. As the antiquities of the Museum come from all parts of the ancient world, we shall hope for a future equilibrium. Dr. Fränkel, the editor, is just the man to rightly hold the scales.

The second point of difference between the old and new régime is, to our minds, an even more marked advance. The old *Monumenti*, it will be remembered, was a series of folio plates, accompanied by the issue of the *Annali*, an octavo volume uniformly made up of dissertations on the *Monumenti*. In no case was a monument published without this corresponding explanatory treatise. With the *Denkmäler* we have quite a new departure. The plates appear, and with them the briefest possible description, which confines itself strictly to noting matters of fact, e.g., place of discovery, explanation of plate, restorations, &c.; in fact, just what we should expect from a good catalogue. This at first sight may seem loss, not gain. It is, in fact, an innovation of the highest utility. Any one who knows the ins and outs of archaeological investigation, especially any one connected with a museum, knows how the science is kept back by delay in the publication of monuments. One reason of this delay is, of course, lack of funds, but an even more important practical reason is that a false tradition has sprung up as to the right moment for publication. A monument, be it statue, vase, or gem, is published now, be it in the *Hellenic Journal* or any foreign periodical, because some one has come to understand it, has a theory about it, and wants to utter his theory,—the monument waits for the man. The right method is quite otherwise. Publish the monument in order that it may be understood. Give it to the archaeological world; let it be the common property, the material of all students, and then let them all try their hands at interpreting it. The new plan has countless advantages. On the old system a monument never appeared unless it stood committed to a theory; compromised

\* Antike Denkmäler herausgegeben vom Kaiserlichen Deutschen Archäologischen Institut, Band I, Erstes Heft (1886). Berlin: Verlag von Georg Reimer, 1887.

from the very outset, it may be, by false opinion; it was almost impossible for a student to approach it with an unbiased mind. Now he starts clear,—the monument appears unaccompanied by So-and-so's monograph, which he felt bound to read. Further, we hold it an excellent discipline for those who actually publish the monument to be compelled to hold their hand,—to let the plates appear and reserve their opinion.

So much for the general principle, which will, we believe, go far to advance archaeological science, and improve its method. It remains to say a word as to the plates. We shall briefly describe their contents; as they are unaccompanied by theory, we shall be spared the necessity of criticism. The plates are twelve, and the Direction promises the same number each year. Naturally, in a first issue, the editor has tried to make his selection a representative one. For architecture, we have a plan by Dr. Dörpfeld of the newly-discovered Athens temple on the Acropolis; for sculpture, a marble head from Berlin, and the two notable bronze statues recently found at Rome,—the boxer and the portrait statue, to both of which at the time of discovery we drew attention. For the, so to speak, literary-monumental (if we may coin the expression) evidence of art, we have a fac-simile of Carrey's drawings of the Parthenon, and also those known as the Anonymous. As we shall not return to these, it may be said at once that the Institute has conferred the greatest boon on the educated world at large by publishing these fac-similes. Every discussion on the Parthenon marbles involves their consideration, and though each archaeologist studies the originals of the drawing, which are readily accessible in the Bibliothèque Nationale at Paris, still he cannot hold them in his eye, and constant careless reproductions have made the stock illustrations in handbooks of Greek art practically worthless. We should like to see fac-similes of these drawings framed and set up in the Elgin Marble room of the British Museum.

To continue, for terra-cottas we have a unique series of Corinthian votive tablets from Berlin; for vases, a *republikation*, much needed, of the Berlin Sosias vase; for wall-paintings, a beautiful fresco fac-similed in colour from the Villa of Livia; and for jewellery, a series of gold ornaments found for the most part in Ithaca. It will be seen that though Berlin is well represented, Italy is by no means neglected. We can note in detail only a selection of the more important plates, and first the head of Athens Parthenon (Tafel 3). The head belongs to Dr. von Kaufmann,—we presume of Berlin, but this is not stated. It is matter for congratulation that the Direction concerns itself with private collections; public collections are moderately secure for posterity; monuments of interest in private possession should at all costs be promptly secured for publication. The head is of fine-grained Greek marble, and was found in the garden of Sallust, at Rome. It is reproduced with the colouring in fac-simile, and the plate is a marvel of softness and delicate finish. Nevertheless, there is about the head a certain hard mechanical air which bespeaks late work. Its great interest consists in the fact that it is, undoubtedly, an echo of the chryselephantine Parthenon, though an echo far inferior to the well-known gold medallion of the Hermitage, with which, however, it should be carefully compared. The remains of colour on the head are of great interest. It is noticeable that the flesh parts not only have no colour now, but almost certainly never had, as the skin is worked to a high polish, whereas on the coloured parts it is left rough; the lips appear to be the only exception; they are left rough and no doubt bore colour. The helmet appears to have been painted gold colour, with the cheek-pieces brownish violet, the hair and eyebrows brown, the iris of the eye dark brown. The head only is published, but a few other unimportant fragments of the statue have been discovered, among them a fragment of a foot wearing a sandal and standing on a plinth. Rumour says that a portion of the torso of the

statue was found and fell into the possession of a collector in Austria or Hungary. Possibly some day the various fragments may be brought together.

Undoubtedly the most interesting of all the plates are Nos. 7 and 8, which are devoted to the Corinthian terra-cotta tablets. It has long been well known that the Berlin Museum possessed a unique series (about 1,000) of these curious monuments. With the single exception of the Louvre, we believe, no other Museum possesses any specimens; it was, therefore, of the first importance that they should be published, and it is remarkable that a Museum so energetic as that of Berlin should have left so obvious a duty so long unperformed. The tablets were all found (in 1879) near Pente Skuphia, a village about half an hour south of the Acrocorinthos. They are painted, some on one side, some on both, in the style of early black-figured vases. From the inscriptions, which are painted for the most part, they may be dated as of the seventh century B.C. They seem to have been for the most part votive offerings to Poseidon or Amphitrite hung up in their shrines. In many of the tablets the holes for suspension remain. There must have been at Corinth a regular *fabricque* for these anathemata. Anything quaint and more curious than the drawings of the designs on the tablets it would be hard to conceive; no description could give any idea of their formal delicacy. The most frequent inscription is just the name of the god and goddess, in Doric form,—Ποσειδάων, Ἀμφιτρίται. The name of Amphitrite seems to have been a crux to the potter, as the spelling fluctuates freely. Sometimes we have the name of the worshipper, e.g., "Eurymedes dedicated me" (Εὐρυμέδης μ' ἀνέθηκε), written "Boustopheodon." The representations are not, however, confined to the sea god and goddess; we have Athens and Herakles and Trojan heroes, Hermes, Centaurs,—in fact, a whole world of mythology. Naturally sea-monsters abound, but land scenes are not absent. We have a fox looking up into a tree, after the fashion of Æsop's fable, men labouring at a quarry, a sculptor and a potter at work, a vintage,—in fact, a whole series of scenes from Corinthian daily life. For the early history, not only of ceramography, but of mythology, and also manners and customs, these tablets will have henceforth to take a high place. We may add that many of the most important analogous tablets in the Louvre have been recently published in the "*Mouvements Grecs, publiés par l'Association des Études Grecques*," Nos. 11-13, with an interesting commentary by M. Collignon.

The plate of most sensational beauty is undoubtedly "*Tafel II, Wandbild aus Prima Porta*." Prima Porta owes its modern fame to the excavations begun in 1863, which resulted in the discovery of the Villa of Livia, "*ad Gallinas albas*," "*at White Hens*." Suetonius (Galba I.) tells the story of how when Livia was on a visit to her country estate an eagle fell into her lap a white hen with a laurel branch in its beak, and how from this hen a wonderful breed of white hens was reared, which gave the villa its name. It is in the largest room of this villa that the wonderful wall paintings, in part reproduced in the *Denkmäler*, are taken. The originals are still of marvellous freshness. The piece reproduced is from the north wall. The design represents an open-air garden. Above is a sky of intense blue. The garden is surrounded by a sort of palisade, on which perch delicately-drawn birds, one apparently a stork; within are tall trees, among which oranges, palms, and quinces are conspicuous, and about them is a thick undergrowth of flowers, red, yellow, and pale purple. Birds are everywhere perched, some in impossibly delicate balance, on the extreme end of delicate sprays; some, with a fair amount of naturalism, on the trunks and twigs of trees. The whole effect is very lovely, after the fashion of Pompeian loveliness. Probably only the great expense of a coloured reproduction has left this wonderful wall painting so long unpublished. The *Monumenti* have, of late years, been famous for the sumptuousness of their coloured plates. The *Denkmäler* shows certainly no signs of falling off. We

may add, in conclusion, that the *Denkmäler* very wisely is protected by a portfolio, which renders binding superfluous. The *Monumenti* only appeared with a quite inadequate paper covering.

NOTES

THE report of Professor Carnely, Mr. Haldane, and Dr. Anderson, on the carbonic acid and organic matter in the air of dwellings and schools, published in the Transactions of the Royal Society, gives a great deal of very valuable information, the result of carefully-conducted tests, in regard to the nature and degree of the impurity of the air in inhabited buildings under various circumstances, as compared with the normal condition of the external air. The statistics given, and the illustrations from microscopic examinations, are of interest to all who wish to get further and definite information as to what kind and what proportion of impurities are to be found in the air we breathe under various circumstances; but the most significant point for the consideration of architects is that the results are, in the great majority of cases, decidedly in favour of those schools which were mechanically ventilated. Out of about sixty rooms examined, the average of carbonic acid in naturally ventilated rooms, as compared with those mechanically ventilated, was as 18.6 to 12.3, the average of organic matter as 16.2 to 10.1, while at the same time the average temperature was 6½ degrees higher (62° as against 55°6 Fahrenheit) in the mechanically ventilated rooms. These figures speak for themselves; and while we have long recommended mechanical ventilation as always more sure, effectual, and manageable than what is called natural ventilation, we find here a decisive corroboration as to its superior chemical results on the atmosphere. The species of mechanical ventilation used in the schools examined (in Dundee) is described in the report as "air blown by fans over hot pipes." To have produced the same standard of purity in the air by the ordinary methods of opening windows, &c., the authors remark, "would have reduced the temperature to a very uncomfortable and dangerous degree." We draw attention to this point as specially bearing on the question of the ventilation of buildings, but the whole report, which is full of valuable information, should be read by all who are concerned about the sanitary condition of buildings.

JUDGING from the Annual Report of the Railway and Canal Traders' Association, which has just been published, that energetic body has had no small share in keeping the railway rates question prominently before Parliament and the public. We notice in the Report several recommendations for the amendment of the Government Bill which do not seem to have been adopted at present, but which would be very useful. For instance, the insertion of a clause providing for the disclosure of all rebates, drawbacks, and similar allowances made by railway companies, is advocated. These allowances answer to the special trade discounts enjoyed by favoured customers in commercial transactions, and, as the publication of rates is important, and, seeing that such publication would be of little value if there existed at the same time a secret list of special terms, it seems to follow that it is equally important that some such provision as that indicated should be made. In other quarters proposals have been made not so intimately connected with the principles of the measure, and which, perhaps, it would be unwise to persist in. Such, for example, as the resolution passed at a Kensington Vestry meeting:—"That this Vestry will endeavour to get a clause inserted in the Railway and Canal Traffic Bill to take town refuse for any distance not exceeding ten miles for one shilling per ton; for every additional mile one halfpenny per ton beyond that distance." However desirable this arrange-

may be, the expediency of endeavouring to attain such an end by means of the Government Bill is questionable. The supporters of railway reform find that there is a great deal to do in the House of Commons before the Bill, as it at present stands, will do much to advance their views.

THE names of eighty-five firms and individuals appear in the Edinburgh Post-office Directory under the designation of "Architects." Of that number thirty-six applied for copies of the instructions to be observed in the competition (which was confined to local architects) for the new Public Library. These instructions contained a stringent clause against the divulging of anything which might lead to the identification of any design with its author, and this condition appears to have been rigidly adhered to. The designs were to be received on the 1st of June, and are to be hung in the galleries of the Royal Scottish Academy. Mr. Alfred Waterhouse, R.A., has been appointed assessor, and after he has examined the plans they will be open to the public for a week.

THE case of Wigram v. Fryer, just decided by Mr. Justice North, does not carry the law of light in regard to the point decided much further than it was before the decision of the case. The action was brought to restrain the erection of buildings in Shaftesbury-avenue which were authorised to be made by certain Acts of Parliament, and the point at issue was whether the infringement of light in such a case was a matter to be dealt with by injunction or one for compensation under the Lands Clauses Acts. The decision of Mr. Justice North is a confirmation of the law as laid down in Roscoe's "Digest of the Law of Light," p. 46, which is to the effect that "a person, the light of whose house is disturbed by works in course of execution by a public body created by the Legislature, and to whose undertaking the provisions of the Lands Clauses Consolidation Act are applicable, cannot bring an ordinary action for damages, or proceed for an injunction, but must proceed under s. 68 of the Lands Clauses Act, 1845, to obtain compensation." The case of Wigram v. Fryer seems to confirm this, and to slightly enlarge it, putting a lessee under a public body in the same position as the body itself. When the case is reported at length in the Law Reports we may again have a word to say on it.

TO the last number of the *Bulletin de Correspondance Hellénique* (xi, 3), M. Holleaux contributes an interesting paper on the series of archaic "Apollo" statues found in the recent excavations on the site of the Temple of Apollo Ptoos, in Boeotia. From a careful analysis of the several specimens he deduces the following conclusions. The "Apollo" type, though found in other parts, was undoubtedly most prevalent in Northern Greece and in Boeotia. As regards Boeotia, one sanctuary alone, that of Perdico-Vrysi, has yielded eleven replicas. Further, the chronology of the series can, M. Holleaux thinks, be determined. The earliest specimens of a style contemporary with that of the Orchomenos Apollo belong, in all probability, to the seventh century B.C. The latest specimens are not earlier than the third quarter of the sixth century. Finally, the type was, he thinks, presumably brought by Dipencis and Scyllis to the Peloponnese, but received special development in Boeotia, and bears the stamp of local taste. We can, in fact, from this series of Apollo statues, in part venture to reconstruct the early Boeotian school of sculpture.

THE *Bulletino della Commissione Archeologica Comunale di Roma* (xv, 4) publishes in phototype two Greek grave reliefs recently found at Rome, which, from style and subject respectively, are specially interesting. The first is of Pentelic marble of the finest work, the style just touched with lingering archaism. It represents a seated woman and an attendant maiden. Tombstones of this date, when found in Rome, are, of course, valuable evidence as

to the archaising taste of Roman connoisseurs. The second relief is of late date, and the interest attaching to it is rather that of subject. In the upper part of the slab a horseman on a galloping horse is represented; below is the inscription to the dead man, whose name, it appears, was Menippus (the good horseman). We have here, Professor Gatti thinks, a fresh instance of the play on words which occurs not unfrequently on gravestones,—a sort of sculptured pun, in fact. Of these he collects a long and amusing list; for instance, a man of the name of Aper has on his tombstone a bear, with the inscription, "Innocuus Aper ecce jaces." Decimus Mus has two small moles; Felicia has a cat; and so on.

A GREAT deal has been written and said as to the restoration of the right arm of the Hermes of Praxiteles, and new evidence,—unhappily never decisive,—is always turning up. In the *Jahrbuch of the Russian Archaeological Institute* (1887, ii, 1), a Pompeian wall-painting is published, which is worth noting in connexion with the question. It represents a satyr holding the infant Dionysos in Praxitelean fashion, on the left arm; the right is upraised, and holds a bunch of grapes. A general analogy to the Hermes no one will deny; but we cannot agree with Dr. von Rohden that the question of the restoration of the statue is in any way settled by the Pompeian painting. What is appropriate in an Alexandrian pictorial translation might be quite unimaginable in a sculptured original. We do not deny the interest of the fresco, but we object to its evidence being regarded as conclusive. Why more conclusive than the seventeen instances (collected by Mr. A. H. Smith, "Journal Hell. Studies," iii, 90), in which the Hermes holds a caduceus? The Pompeian child carried is not even a Hermes.

UNDER direction of the late Mr. Octavius E. Coope's executors, the freehold Berechurch Hall estate, Essex, is to be put up for sale at auction on the 13th of June. This property includes a park, woods, and land both arable and pasture, with good shooting, covering in all about 3,300 acres, situated two miles southwards of Colchester. The total rent-roll, comprising the annual value of the house, is estimated to yield 3,700*l.* per annum. To this property appertain the advowsons of Berechurch and of Layer-de-la-Hay, together with the Blind Knights' manor or lordship in the latter parish. The land lies in sundry parishes about the port of Wyvenhoe, on the Colne estuary, whose names testify to the early settlements of the Danes in that locality.

AT eight o'clock in the morning of Whitsun Day last the Pitt dote of sixty loaves was duly distributed in the schoolroom, St. Botolph's, Bishopsgate Without. Before the building of the North London Railway terminus, at the end of Broad-street, the recipients of the bequest used to attend in a private garden which had been an ancient graveyard, being, as is not commonly known, the burial-ground appertaining to Bethlehem Hospital. A priory of canons, with brethren and sisters, was founded here in 1246, by Symon Fitz-Mary, who was a sheriff for that year, and endowed it with all his lands in the parish. Within 100 years of its establishment the priory, dedicated to St. Mary, of Bethlehem, is named as a hospital (1330); in 1346 it passed under Civic protection; and in 1546 the Corporation bought the patronage, property, and buildings, with money left, *ad hoc*, by Stephen Gennings, citizen and Merchant Taylor. At what epoch the hospital first became appropriated to that particular use with which its style is most generally connected cannot be easily determined. This, however, is known: the canons (distinguished by the star of Bethlehem on their gowns) were required to supply lodging and entertainment for the Bishop of Bethlehem whenever he visited London. Moreover, we read in Butler's "Lives of the Saints" that to the monastery which St. Theodosius set up near to Bethlehem in Judæa, circa 520 A.D., were

annexed three infirmaries: one for the sick, another for the aged and feeble, and a third for the mentally afflicted. It was certainly known as an asylum for lunatics by the beginning of the fifteenth century, when, as Stow tells us, "a King of England not liking such a kind of people to remain so near his palace," had caused certain lunatics to be removed from Charing-cross to Bethlehem in Bishopsgate Without. The original site, indeed, in St. Martin-in-the-Fields parish, continued to belong to the Hospital until 1830, when it was exchanged with the Crown and thrown into the ground which was required for improvements at Charing-cross and in West Strand. But after the Dissolution, when Henry VIII. confirmed the City's purchase, Bethlehem became the "Bedlam" which it has been ever since. In 1675-6 a new hospital was erected in Coleman-street Ward, outside of the wall, on a plot of two acres and a half that was leased to the Governors by the Corporation for 999 years at a rent of 1*l.* per annum. Designed by Robert Hooke, the celebrated mathematician, in his capacity of City Surveyor, and having cost 17,000*l.*, the new buildings, being 540 ft. by 40 ft., abutted against the northern side of the London-wall. The open ground which appears in the views by White, J. Bowles, T. Maurer, and others, is Moorfields, now covered by Finsbury-circus. The two wings for incurable patients were added in 1733. A good picture of the entrance-gates, bearing Cibber's two sculptured figures, may be seen at the Foundling Hospital; it was painted by Hayley in 1746. Cibber's handiwork, as restored by Bacon, we last saw in the South Kensington Museum. Despite Pope's oft-quoted couplet, these "brazen brainless brothers" are carved in Portland stone, stained and painted. This is the hospital delineated by Hogarth in his closing scene of his "Rake's Progress." The present site of 11 acres in St. George's-Fields, Southwark, which includes the once famous Dog and Duck Gardens, was taken in 1810, and the hospital built in 1812-5 at a cost of 122,572*l.* 8*s.*, most of which was provided by grants of public money and subscriptions made by various public bodies and private individuals. The wings and rear premises were added fifty years ago by Sydney Smirke; the dome in 1845. We should add that in 1866 the Great Eastern Railway Company paid to the Hospital Governors a sum of 61,000*l.* for their property in Bishopsgate Ward Without whereon to build their Liverpool-street terminus.

A BUILDING fund is opened for the projected new premises in Shaftesbury-avenue of the French Hospital and Dispensary. Her Majesty has consented to become patron of this charity, and has sent a donation of 50*l.* to the fund. Mainly by the exertions of the chief physician, Dr. Vintras, and the late M. Eugene Rimmel, the existing hospital in Leicester-place was established twenty years ago for the benefit of all foreigners speaking the French tongue. With room for but thirty-five inmates, it has relieved, since 1867, as many as 4,400 in-patients, and over 100,000 out-patients, representing some thirty diverse nationalities. Shaftesbury-avenue is being rapidly appropriated for institutions of a public or quasi-public character. To the inevitable new theatre, for Mr. Hollingshead, we have already adverted. On the afternoon of Tuesday, May 23rd, were laid three memorial-stones for the Baptist chapel which, at a total cost of 5,600*l.*, is designed to accommodate, on the floor and in the galleries, 500 persons.

THE ancient palace of the Archbishops of Canterbury at Maidstone has been purchased by the town for the very moderate sum of 2,000*l.*, and will be devoted to some purpose in connexion with the town; but what that purpose shall be is not yet decided, but it will be in all probability a public library. Maidstone already possesses a museum and a respectable collection of antiquities. The palace was begun, it is said, in 1348 by Archbishop Uford, and completed by Simon Islip. The present structure is late

fifteenth-century work, and bears a remarkable resemblance, as regards style, to some of the Scottish baronial castles. The plan and general features are Gothic, but there are Italian details in some parts which show the influence of the Renaissance; these Italian details are used sparingly, and with an evident preference for the older style. The palace, which is at present empty, is divided into two portions, which were until recently used as dwelling-houses. Some additions have been made to adapt the building to modern uses, but its main characteristics remain unimpaired, and it will not be difficult to restore it to something like its original condition. There is a fine central hall, measuring 36 ft. by 24 ft., with the original fireplace and fine oak panelling, and a Jacobean staircase of unusual design.

**F**ORMING a conspicuous feature on the left hand of one walking along the main road from Brixton to Streatham Hill, stand the buildings recently vacated by the Royal Asylum of St. Ann's Society. The Society, having removed to their new schools by the Junction Station at Redhill, Surrey, have put these premises up for sale. The entire property, which is freehold, covers more than 2½ acres, and includes the principal block, a master's house, an entrance-lodge, gardens, and playground. There is room here for a college, or the like thereto, of nearly 400 inmates.

**T**HE opening of the Terrace Gardens at Richmond by H.R.H. the Duchess of Teck the other day was an event fully justifying the local rejoicings,—rejoicings which were no doubt shared by some of those "economical" ratepayers who were at first opposed to the purchase of the property by the Vestry. To have allowed so lovely a spot, commanding such charming views, to be sacrificed to bricks and mortar would have been a sad blunder. With all that has been done in adapting them to the purposes of a pleasure-garden there is little to express disapproval, if we except the very commonplace, we may even say ugly, east-iron fountain on the upper plateau. This fountain, we hear, is only a temporary one. The *Thames Valley Times* of the 25th ult. gave an admirable illustrated account of the gardens. We wish we had good grounds for hoping that the example of the Richmond Vestry in saving these gardens would be emulated by the Corporation of London and the Metropolitan Board of Works in securing such valuable breathing spaces as Clissold Park (Stoke Newington) in the North of London, Brockwell Park (Herne Hill) in the South, and Ravenscourt Park (Hammersmith) in the West. If anything could justify the retention of the Coal and Wine Dues for a few years longer, the acquisition of these large and finely-wooded spaces, fast becoming hemmed in by bricks and mortar, would do so.

**A** COMMITTEE, whereof Mr. H. R. Williams, of Hornsey, is chairman, has been appointed for effecting the purchase of Alexandra Park and Palace as a Jubilee Memorial for the public benefit. We hear that there is fair expectation of the project being accomplished. Meanwhile the Palace, having remained closed for a period of nearly two years, will, until the end of July next, form the scene of a series of popular fêtes and exhibitions, under the management of Mr. H. W. Hayward.

**T**HE exhibition of paintings at the Albert Hall contains, among a good deal of uninteresting matter, some clever paintings which are new to us, and some, such as Mr. H. Moore's "Outside the Harbour," which are none the less welcome for not being new. One bay is occupied entirely by landscapes by Mr. A. MacCallum, a painter whose style of landscape is hard and artificial, but whose works when seen together produce an impression of more ability and originality than has always been credited to them; the "Pass of St. Gothard after a Storm" is a fine and effective work, and "Golden Moments," though very artificial, is, at all events, a powerful scenic

effect. One bay is devoted to architectural drawings, and the quality of these is certainly high. The selection includes eight of the best of Mr. Aitchison's designs for coloured decoration which have been seen in the Academy in various years, and which students of this kind of work will find worth studying collectively.

**I**N referring last week to the report of Mr. Walter Crane's lecture at the Society of Arts, we expressed a doubt whether there were really any such thing as a "system of designing" among us at present. From a letter of Mr. Crane's in the *Times* of May 30, it appears that he is of the same mind, and that the condensed report of his lecture misinterpreted his meaning in representing otherwise.

ARCHITECTURE AT THE ROYAL ACADEMY.—VI.

1677, "Design for Stained Glass: Presentation of Infant Saviour in the Temple," Mr. G. Parlbey. A small design for a Renaissance stained-glass window, with an architectural canopy of the kind unfortunately usual in modern windows designed in Renaissance style, viz., a kind of tradition of Renaissance details into a shape suitable for decorative treatment,—very elongated wavy columns, &c.; but otherwise this is a very good design, harmonious in colour except for the yellows (also apparently inevitable in design of this class) in which part of the architecture is shown, and the figure of the Virgin is a very pleasing one, above the usual average of stained-glass figures.

1678, "The High School, Stirling: New Wing," Mr. J. M. MacLaren. A bold application of Scotch castellated architecture to an educational building; the massive square tower, with its circular attached turret, is, at all events, very picturesque; and the drawing should be noted as a good specimen of architectural pen sketching, broad in effect and with plenty of whites left in it, but marked by precision of line where required.

1684, "Lower Luce Church, Wigan," Messrs. Paley & Austin. A careful pen interior of a church in pure Early English style. A plan is wanted to make it quite intelligible. The two lofty arches on the left, rising nearly to the roof-springing, convey the idea that there is a double transept; at all events, there is apparently ample space given in floor area and in height for the organ, which is partly shown, and this is in itself a good point: we are always glad to see a practical protest against organ-chambers. The church is of very solid construction, as everything of the kind by its architects usually is; the heavy and unadorned collar-beam, however, cuts very awkwardly across the lines of the wooden wagon ceiling; the two, in fact, seem in no way to belong to each other, and the impression is as if the collar-beam were an old piece of work, and a new ceiling had been put irrespective of it.

1685, "Constitutional Club, Northumberland-avenue," Mr. R. W. Edis. The drawing is by Mr. Raffles Davison, and shows the whole of the long lines of cornice moldings, &c., conscientiously lined in by hand. The general effect of the drawing is very satisfactory; there is a fine texture about it, but a little want of force and finish in the details, and a little too much of hatching and scratching of shading in the lower portion, which always, to our thinking, takes away from the firmness and solidity which ought to characterise an architectural drawing as a representation of a new building. The drawing is a picture in pen and ink, in fact, rather than an architectural draughtsman's drawing: all the better, some will say; but we confess we like to see detail thoroughly shown in an architectural drawing. Of the building itself we have spoken before, and it is familiar enough to every one as one of the finest and most picturesque of the recent great blocks of building which have been erected as clubs, and which, in matter of size at all events, quite throw the old-established London clubs into the shade; and certainly such a building as this has more of colour and interest than the cold and correct fronts of the "Reform" and the "Conservative."

1688, "Design for an Entrance to a Public Park," Mr. E. H. Sedding. This was a design in competition for one of the Royal Academy prizes, and we commented on it when it was

exhibited with the other designs sent for the various medals and prizes; it is a highly original design, and deserved a place here, though we cannot say we think it very beautiful. It is consoling, however, to look at a design which is not a copy of something else.

1687, "Rheims Cathedral," Mr. Arnold B. Mitchell. A careful and very refined drawing of the front, in line, and with shadows put in with washes of Indian ink tone. The effect is very delicate, but a little artificial. It is neither an architectural drawing pure and simple, nor is it a representation of the actual effect of the building. It looks very nice, however, which is its best defence.

1689, "Braenose College, Oxford; new Front and Gateway Tower in High-street," Mr. T. G. Jackson. Published, as it happens, among our illustrations of this week, though not by any deliberate purpose. The fact, however, saves the trouble of description, and we may refer the reader to the lithograph on another page. The style of drawing employed does not do the best for the design. It is a sepia drawing, rather flat in effect; the brush has been used too heavily and uniformly over the shadowed portions, and the whole, consequently, wants surface and relief. The style is a hard type of Late Gothic, which we love not; the tower, with its lantern carried on flying buttresses, is an effective feature. We must confess, however, that its architect has exhibited in this gallery a good many things that we have liked better than this.

1692, "St. Bride's Vicarage," Mr. Basil Champneys: a sepia drawing of this new vicarage in the old London eighteenth-century style, with the steeple of St. Bride's rising in the background. We should have thought Wren's steeple might have suggested a little more varied and picturesque treatment of the vicarage attached to it. The latter is, however, an exceedingly good house of its kind, and very well planned in its limited space; plans will be found in the *Builder* of May 22, 1886 (p. 759), together with a reproduction of this same drawing, which was, in fact, a drawing made for this journal from a photograph, the photograph having distorted the stages of the steeple in the background too much to be available as an illustration.

1695, "Proposed Church of St. Michael," Mr. P. J. Marvin. Where? We suspect this is a church in the air; but it is an excellent pen-drawing, at all events, showing an exterior view of a large and lofty church of Early Decorated type, with transepts and Lady-chapel, and a lofty tower and spire at the crossing. The design looks out of date with recent ideas and tastes. It is the kind of church Sir Gilbert Scott liked to build when funds were forthcoming.

1698, "House at Palace Court, Kensington," Messrs. Harvey & Bernard Smith. The entrance is effectively managed, under a large and deep archway. The strongly-marked rustication and quoins are too pronouncedly "Classical" for the general style of the building, just as the strong-ruled shadow-lines on them are out of keeping with the freer touch of some of the other portions. They look as if they had been filled in by a pupil preparatory to the completion of the drawing by another hand.

1697, "Chimney-corner in Dining-room, Stonelands, Sussex," Mr. E. W. Mountford. An artistic little pen-drawing, though there is certainly not very much in the design.

1699, "Graythwaite Hall, Windermerer," Mr. R. Knill Freeman. A well-executed pen perspective of a Jacobean house of some extent, shown with a very high sight-line, almost a bird's-eye view. A plan would have added greatly to the interest of the drawing. In many points this seems an exceptionally pleasing and picturesque design of its kind, especially in the broad treatment of the spaces of wall between the pilasters on the garden front, where windows and wall panellings together form a combined design extending over the whole wall-area, framed in by the pilasters running from plinth to cornice. It is a kind of treatment not uncommon in old houses of the date of this architecture; but it has been very happily applied here.

1702, "Lodge at Flete, Devon," Mr. J. D. Sedding. Charming. A very nice pen drawing, and the lodge is quite a little bit of the poetry of building; it is a kind of thing one would certainly sketch if one came across it as an old bit of building; but there is no affectation of looking old about it; and the plan, shown in

the corner, shows that the picturesque outline of the house arises naturally from the picturesque disposition of the plan. The deep shadowed recess for the bench is very effective, and at the same time a useful feature in a lodge, where people may have to wait occasionally.

1703, "House at Tunbridge Wells," Mr. Jas. Neale. Another view of the house shown in No. 1673, already noticed; both are very good drawings, but considering the limited space at disposal for architectural designs, it might be thought that one illustration of this house would have been adequate; and our conclusion from finding both hung, would be that whoever selected the drawings did not look at them with sufficient care to see that these two represented the same building, and that favour simply goes by the general execution of the drawing, with little reference to the design.

1704, "Board School, Woodland-road, Lower Norwood," Mr. M. S. Bailey. Hung high; a boldly-designed block of building, and the architect has made the most of the now prevalent practice of building the ground-story of a Board school as an open arcade; the piers are deep and massive, and the arcaded-ground story gives a great deal of picturesque and effective expression to the whole. The contrast of windowed walls and blank walls is, we presume, the architectural expression of the practical duty of lighting from the side; it gives additional effect to the structure, at any rate; a good instance of effect growing out of the mere observance of practical conditions.

1705, "Memorial Window for St. James's Church, Piccadilly," Messrs Ward & Hughes. Hung too high to see the detail well, it looks a good window of average Renaissance pattern; the wide decorative border has a good effect in itself, but it wants something to stop it,—or, rather, to commence it,—at the foot.

1706, "Stonelands, Sussex," Mr. E. W. Mountford. A nice pen drawing of a very pretty, homelike house, with low, mullioned windows; it looks, however, much more like a drawing of an old house than a design for a new one; but it suits the country it is in, at all events.

1707, "St. John's Church, Hampstead: new stalls, organ-case, and painted decoration on walls and ceiling," Mr. T. G. Jackson. The "painted decoration" can hardly be shown in a pen-line drawing; the general effect, the disposition and style of the decoration are shown, and we can imagine that, as executed in colour, it would be rich and effective; the methods of covering the various surfaces seem to be well balanced and contrasted. The organ-case has some richly-carved open-work brackets; the usual mistake is made, which nearly all designers of organ-cases make, of placing the larger front pipes in the centre and the smaller ones at the sides, thereby contradicting the necessary arrangement of the pipes on the sound-board. The drawing is a very clean, precise, and well-executed piece of pen-and-ink perspective.

1708, "St. Mary Star of the Sea Church, Hastings," Mr. Basil Champneys. The principal drawing shows an interior of a Gothic vaulted church, shown in the old fashion, with bare stone floor, leaving the piers all visible clear of seating. The work aims apparently at being simply a correct piece of Gothic, and calls for no special remark; the reredos, with its double tier of open work, is unusual and effective. The drawing, a pen line one, is signed by Mr. Raffles Davison, who, we fear, must have suffered from want of time to do himself justice; it is far too scribbly in execution, and nothing like the way he used to draw. The two small exterior perspectives show both architect and draughtsman to better advantage. The exterior north-east view, with the small circular turret and open lantern at the top, is decidedly original, and so is the treatment of the west end in the other exterior view, with a broad tripartite window divided up the centre by a solid compartment with niches and statues. A plan of the church is added.

1710, "Mansfield College, Oxford: Corner of Quadrangle," by the same architect as the last-named. A pleasant bit of Collegiate Gothic; without a plan and section it is not easy to understand the meaning of the expanse of blank wall between the lower windows and the dormers, on the right; it is picturesque in effect, and let us hope it has a reference to the practical arrangement of the building.

1712, "Decorative Painting for Ceiling of Drawing-room," and 1713, "Decorative Paint-

ing for Cove of Concert-room," both by Mr. J. M. Boekbinder. Clever work in a very faulty and vulgar style. The ceiling decoration is *di sotto in su*, showing, as we look up, a painted balustrade rising up above the modelled cornice of the room, over which is the open sky, with clouds and a number of pink genii kicking about in it with all the correggiosity of Correggio. It is well enough done, and (to parody a celebrated literary criticism) "for those who like this sort of thing, it is just the sort of thing they would like." The concert-room cove is in a more orthodox decorative style, being a flat composition representing a series of classical players on the sackbut, psaltery, dulcimer, and all kinds of music, in various degrees of nudity. In the centre is a winged Apollo (?) enthroned, and beneath him a draped seated female figure, fine in action and somewhat recalling the manner and feeling of Delacroix in this type of work. There are other good figures in the composition, which is bright in colour effect, and has a good deal of spirit; but somehow we cannot look at it without thinking what piquant variations Mr. Harry Furniss could play on it.

#### LETTER FROM PARIS.

PARIS is still in a kind of stupefaction from the shock caused by the Opéra Comique disaster, which has had the effect of again bringing under consideration the various precautionary measures, often before discussed, against such disasters in theatres.

It is melancholy to reflect, now that it is too late, that the disaster was foreseen and almost predicted. It is barely a month since a Deputy called attention in Parliament to the defective construction of the building, the insufficiency of its exits, and the absolutely abnormal accommodation for the actors and *employés* in two blocks of buildings seven stories high, and connected above the proscenium by narrow wooden bridges. On his side, the Minister of Fine Arts declared that, according to statistical precedent, the Opéra Comique was bound to be burned, and that if the fire took place during a performance there would be a dreadful catastrophe. This plain statement was received with laughter by a Chamber which attached no importance to it, and preferred turning the ministerial prophecy into a joke rather than voting funds to enlarge and alter the theatre.

A heavy responsibility rests with the Government for not having insisted on the regulations called for by public opinion, after the disastrous fires at the theatres of Vienna and Nice, and which should have been strictly observed everywhere without paying any attention to the complaints made on the score of expense; and the neglect of the Government is the more culpable in the case of a theatre which enjoys a State subvention, and is thus to some degree an official establishment.

It is not sufficient, however, to insist on a fireproof iron curtain to cut off the stage from the house, which, in the confusion accompanying an alarm of fire, always somehow fails to act; nor to open some new doors, or establish oil-lamps in the corridors. Security must lie in the construction itself, and it is to the architect that appeal must be made to build with un-inflammable materials, to multiply the means of access and render them easily accessible, to replace gas by electricity, isolating the engines in vaulted cellars.

This is not the first time that the Opéra Comique has been burned. It was first built from the designs of Heurtier, architect also of the theatre of Versailles. The works were commenced in 1781 and completed in 1783. This house having been burned down in 1838, M. Carpentier was commissioned to rebuild it, and the new theatre was inaugurated on May 16th, 1840, by the first representation of the "Pré aux Clercs." This house, which seated about 2,000 persons, was esteemed one of the most elegant in Paris internally. The exterior façades, which the fire has spared, are very sober in regard to decorative treatment. Towards the Place Boieldieu there is an Ionic portico.

The Opéra Comique, it is expected, will rise from its ashes completely transformed in its arrangements, in accordance with the demands of modern science. But what is to be done to safeguard the other Paris theatres which present the same dangers? Some of these, too, as the Bouffes Parisiens and the Palais Royal,

are so closely hemmed round by other buildings that a fire in them would be a danger to their whole neighbourhood also.

We have another misfortune to lament in the death, at Cannes, of Ruprich-Robert, one of the most active and learned members of the Commission des Monuments Historiques, of which he was Inspector-General. It was for the Commission that he made the splendid drawings so justly admired in the *Salons* of 1844, 1855, 1858, and 1878, among which we may specially mention that of the Templars' Church at Montsaunès, the Cathedral of Séz, the Church of St. Saurant at Dinan, the Church of Bemères, and that of Fresno-Camilly.

Victor Marie Charles Ruprich-Robert was born at Paris on February 18th, 1820, and, after studying in the *atelier* of Constant Dufeux, he entered the École des Beaux Arts in 1838. Appointed first as architect to the dioceses of L'Orne and Calvados, he became successively professor of ornament in the École Nationale de Dessin, and subsequently was appointed "Dessinateur du Mobilier" to the Crown, and designed for Napoleon III, among other things, the corona chandelier given by him to the Abbey of Einsiedlen in Switzerland. He obtained successively a "seconde médaille" in 1855, a Chevalier's cross in 1861, a "première médaille" in 1878, and the cross of Officer of the Legion of Honour in 1879. The Government had appointed him to direct the excavations of the "Arènes de Lutèce." An assiduous worker, and with a facile pen, he contributed extensively to the *Revue Générale de l'Architecture*, and in spite of his multiplicity of occupations, found time to bring out numerous publications, among the most important of which were the "Flore Monumentale," published in 1866, and the interesting monograph of the Church and Monastery of Val de Grâce, published in 1875. To his great work on Norman architecture in Normandy and England, which was hardly complete at the time of his death, reference has already been made. Among his practical works may be mentioned the construction of the Church of Flers, the important work for the restoration of the Château d'Amboise, the Church of Ste. Trinité at Caen, and the Church of Oustréham in the Calvados diocese. Ruprich-Robert was what might be termed an *archéologue passionné*. As a man, he was much liked, and has been generally regretted.

We hear also of the death of M. Emile Vernier, a landscape-painter of great merit, who received medals in the *Salons* of 1869, '70, '79, and '81. He made a long stay in England in recent years. He had exhibited in the *Salon* of 1853 a view on the Thames; in 1855 a view on the coast of Cornwall; and last year a view at St. Ives. The present *Salon* includes two works by him: "L'Île Bouin, Vendée," and "Vieux Maisons au Croisic." Vernier died at the age of fifty-eight.

While the *Salon* continues to attract its crowds, three other exhibitions have opened during the month of May. There is first, in the Galerie Petit, the sixth "International" exhibition of painting and sculpture, in which Impressionist art takes a very prominent place. Why do MM. Sisley, Pissaro, Claude Monet, &c., always see nature through a violet veil? Trees, houses, sea, and mountains are all informed with that colour, apparently a symptom of that peculiar malady of the vision called Daltonism. M. Besnard's "Panneaux Décoratifs," again, are really too eccentric. M. J. Lewis Brown exhibits some clever works, and M. Casin some splendid landscapes; but then M. Casin is a good deal more than an impressionist. Among other things to be mentioned are a scene in a cabaret by M. Kroyer, a pretty picture of the Luxembourg Gardens by M. Edelfeld, two good portraits by M. Eguisquiza, and the cattle of M. Vervé.

The second exhibition referred to is that of the works of Théodule Ribot, works in black and white, etchings, effects of light and shadow, &c. The exhibition in Rue Laflitte includes about 100 pictures and sketches, figures, portraits, still life, all showing the same marked originality, and the same search after truth and nature.

Most interesting of all, however, is certainly the exhibition of the works of Millet at the École des Beaux Arts. Millet, whose life was nothing but a hard struggle defiantly endured, is now, after his death, universally hailed with a full recognition of the greatness of his genius. There are only sixty-seven pictures, 175 drawings, and a few etchings, but this small

exhibition reveals at every step the powerful genius of this great painter of rustic life, who had not always bread for his children, and whose paintings command showers of gold now. Among those exhibited is the celebrated "Angelus," which at a recent sale brought 228,000 francs, having been sold by the artist for 500. Among others are the "Gardense de Montons," the "Vanneur," the "Dénichers d'Oiseaux," the "Glaneuses," exhibited in 1857, and popularised by engraving; the "Baigneuse Rustique," the "Tonte des Montons," &c. Among the pastels, the "Récolte des Foins" is admirable in movement and life. Space alone forbids us to notice in detail this splendid collection, the proceeds from which are to go towards the erection of a monument which the town of Cherbourg is to erect to her great citizen, unrecognised while with her.

We mentioned lately that M. François Bonvin, the painter, had fallen under the calamity of blindness, and that a sale of his works had been organised to assist him. The sale has produced 35,000 francs, and thanks to the generous confraternity of painters, the aged artist, more fortunate than Miller, can end his days free from the cares of poverty.

The voting at the Palais d'Industrie for the "Médailles d'Honneur" has rather surprised the public. In the section of painting it was expected that M. Roll would obtain the majority of votes, but the medal has been decreed to 122 votes to the "Vanqueurs de Salamine" of M. Cornon, as against only 57 votes to M. Roll. M. Tattetgrain has obtained 36 votes, M. Henner 29, M. Benjamin Constant 27, M. Vollon 19, and M. Harpignies 10. In sculpture, M. Fremiet, whose "Héran d'Armes" was illustrated in the *Builder* some time ago, has obtained the medal by fifty-six votes for his group, "Gorille important une Femme" (a pleasant subject, truly! though the talent shown in the work cannot be denied). In the section of engraving M. Courty, a pupil of M. Gauchard and M. Flameng, has obtained the medal. His exhibits this year are "La Famille du Menuisier," after Rembrandt, and a portrait after Vandyck. In architecture M. Wable has obtained the medal for his design for an "Algerian Palace" or pavilion, prepared with a view to the Great Exhibition, and second medals have been given to MM. Devienne, Deglaue, Bonnier, Esquié, and Monnier; while MM. Louzier, Joannis, Debric, Contier, Touzet, and Balleynier have obtained each a third medal.

The work for the Great Exhibition goes on slowly but steadily, without interruption so far from Ministerial changes. The long-talked-of construction of a museum of decorative arts seems to have entered on a new phase. The State is to abandon any claim to the ruins of the Cour des Comptes; and the Union Centrale des Arts Décoratifs is to engage to devote a sum of 2,500,000 francs to the immediate construction of a museum on the site of the said ruins, on the condition that at the end of thirty years the buildings and the collection they contain are to become the property of the State. If this scheme is adopted by the Chambers the works will be commenced at once. On the Quai d'Orsay will be disposed a gallery surmounted by an upper story lighted from the roof. The inner court of the palace will be covered in and surrounded by other buildings on the existing foundations, and the remainder of the site will be temporarily formed into gardens. If this is agreed upon, it will be certainly a change for the better in the aspect of this now desolate-looking corner of Paris. It is desirable also that the Government should come to some decision in regard to the Tuileries. As the actual Chamber of Deputies is now quite insufficient for the number to be accommodated, and the Palace of the Senate much too far from it, there is serious talk of creating a great legislative palace stretching along the Rue de Tuileries and uniting the Pavillon Marsan with the Pavillon de Flore. All the services of Parliament and of the Ministry of the Interior would be concentrated in this Pavilion, to which the Monument to the Revolution would serve as a façade. So far the idea is good; but unfortunately the plan submitted to the Chambers would include, apparently, the demolition of the Palais Bourbon, of which the materials and site would be sold for the benefit of the new structure. It is difficult to believe that such a piece of barbarism could be carried out as to destroy this building with its bas-reliefs of Cortot, Rude, and Pradier, which forms such

an important part of the architectural decoration of the Place de la Concorde, the design of which would be completely unaltered by such a step, against which it is to be hoped there will be an energetic public protest raised.

It may be noted that the famous Ministry of Arts instituted by Gambetta, and which had only an existence of a few weeks, seems to have come to life again; at least, there is an effort in favour of such an institution, emanating from the Société des Artistes Français, on the ground that the arts require to be more efficaciously supported and protected; and it is reported that there are petitions or demonstrations forthcoming, in the same direction, from a number of other artistic and literary societies, and even from the syndicates of the *ouvriers*. We see very little good likely to arise to art from any such institution, or, indeed, to any except the holders of some possible sinecures with large salaries attached to them.

NOTES AT THE AMERICAN EXHIBITION EARL'S COURT.

This Exhibition, which is sometimes spoken of as the "Yankeries," was opened on the 9th ult., but is still in a somewhat incomplete state. Pleasure has had the main attention: "The Wild West" and Tobogganning are ready and appreciated; so also is the "Switchback Railway," which is recommended to adventurous pleasure-seekers as affording "most fun to the square inch on earth."

There is an exhibit by the International Terra Cotta Lumber Company of Chicago, U.S.A., of porous earthenware, which can be moulded to any shape, and used for building purposes; these are called under the several names of terra-cotta lumber, brickwood, cellular pottery, and wood-stone. They are formed from the burned products of earthy and vegetable matters, such as clays, clayey loams, saw-dust, and cut straw, first made plastic by the addition of water in machine-mixing processes, subsequently pressed into any desired form by heavy power, and finally dried and burned as bricks are dried and burned. The vegetable matters in the dried compound, proportioned with clay in equal or greater parts, serve as fuel for burning the clay, none other being needed after ignition is effected, and when eliminated from the compound by combustion leave a brick-like residue so porous that its weight is from half to one-third the weight of common bricks, and the material can be nailed and worked with carpenters' tools; the specimens we saw seemed to cut readily with a saw, and were of a pale red terra-cotta in colour, and were only plain slabs similar in size and look to ashlar facing. It is claimed that this material is incombustible and adapted for the fireproofing of the interiors of brick and wooden houses, and can be used for the lining of chimneys, though we should have thought their porous formation would certainly require to be covered with cement or plastering of some kind, which would adhere remarkably well to such a material. It is further claimed that the insulating properties of the material against sound, heat, cold, and electricity are not to be excelled, and this we should think to be the case.

There is a wonderfully cheap and effective filter, called "The Boss Filter," the price being only 5s. It is easily attached to any moderate sized tap, say from  $\frac{1}{2}$  in. base to  $\frac{1}{4}$  in.; it is made of metal, and is cylindrical, being about 2 $\frac{1}{2}$  in. in diameter, with opening at the top for the nose of the tap to enter, and one at the bottom for the filtered water to pass out at. The tap passes into the opening at the top, and the filter is pressed tightly home to the tap, which then is compressed into or against a perforated rubber collar inside and secured by side screws. The water, passing at the top from a  $\frac{1}{2}$  in. hihook, comes from the filter very clear and very quickly, in about the same body as it would from a  $\frac{1}{2}$  in. bib (common way). We could not penetrate the confidence of the inventor, who showed it personally, far enough to find out the composition which formed its wondrous interior. He calls it "a special preparation or well-considered combination of the best known filtering media." Such a lengthy and mysterious compound could scarcely stand for charcoal and sand, we should think. If it but keeps away a few of the dire troubles that come from bad water, it is welcome and cheap. Messrs. Eaton & Co. are the London agents

There is shown some door furniture, "Pike's," that has an alarm concealed in the collar of the inner handle. Any one turning the outside handle to enter or open the door turns a little catch in the inside handle which strikes an alarm, and this alarm can be set so as not to sound if required. The same patentee is the inventor of the self-threading needle, which is already known in London. One side of the eye of the needle is cut through, and admits of the upper part bending in on the cotton being pressed against it, and the cotton at once enters the eye. The action is similar to that of the snaffle of a watch-chain.

Several (so-called) self-lighting gas-burners are exhibited, very similar in their construction, each having a small sentinel jet beside the larger one, and this small jet protected; no doubt jets of this kind are already familiar to some of our readers; and there are some with levers and chains, for hall-lights or public buildings. Mr. H. Fabrig, of Maskegon, Mich., U.S.A., and Hackney, has a series of these jets.

Mr. Pike, of New York and London, has another series. One of his is to be had for as small a sum as 2s. 6d. He is the patentee of the alarm door furniture and needle already referred to.

An improved plumbers' stove is exhibited by the Doane and Wellington Manufacturing Company, of New York and London. It is called the automatic cold-air pressure furnace. Naphtha or benzoline is used. The same patentees have what they call an automatic torch. This is a lamp for burning off paint. It produces a larger flame and greater heat than those now in use.

OBITUARY.

Mr. Henry Hill.—We regret to announce the death of Mr. Henry Hill, of Cork, who, during a long life, practised as an architect in that city. In 1839 his design for the Corn Exchange, Cork, was adopted, and about the same period he built the "Queen's Old Castle," a business establishment that is still a model of lofty proportions and good lighting. From that time he designed many churches, mansions, and other buildings, and was well known and highly esteemed throughout the South of Ireland. In recent years he was assisted by his son, Mr. Arthur Hill, B.E., but down to the last day of his life he took an active part in his profession. He died in his 81st year, and was interred in Cloyne Cathedral on the 30th ult.

Mr. W. Jacobm.—We regret to have to record the death of Mr. William Jacobm, the Engineer to the London and South-Western Railway Company, which occurred very suddenly on the 26th ult., at his offices, Waterloo Station.

Mr. W. B. Moffatt.—The death is announced at Summercourt, St. Enoder, Cornwall, on the 24th of May, of Mr. William Bonyngham Moffatt, for many years partner with the late Sir G. Gilbert Scott, R.A. Mr. Moffatt, who had been long ill, was 75 years of age.

THE DECORATIVE WORK OF VIRGILIUS SOLIS.

"Virgilius Solis was my name;  
Through all the world extends my fame;  
For artists many, formed by me,  
Acknowledge my paternity,  
And call me father. I did ever  
To serve them use my best endeavour:  
I painted; graved with the burin;  
Illumined, to make art alluring;  
Design'd, to waken their ability;  
And stud'd, to teach their hands facility;  
And subjects traced on blocks of wood:  
So no one as my equal stood  
In executing works of art.  
With skill, refined in every part.  
In justice, then, the voice of fame  
Has given me Solis for my name;  
For that imports that, like the sun,  
I stand alone,—the only one.  
When fifteen hundred sixty-two,  
As Christians reckon, onward drew,  
And years I counted forty-eight,  
God pleas'd to call me from the state  
Of mortal life; and His behest  
Has number'd me among the blest."

In this grandiloquent, but not very eloquent nor elegant, language, the versatile Virgilius Solis is popularly supposed to have written his own epitaph. The voice of Fame has hardly, we fear, assigned to him precisely the same niche in the temple which he would have selected for himself; in this respect, however, he has not been treated more rigorously than the rest of us,—perhaps even with more leniency, for a

full measure of appreciation has always been accorded to his work; fame has ranked him, if not the greatest, certainly not the least, of that group of early German engravers known as "The Little Masters." In our issue of December 12th, 1885, Part II. of "The Decorative Work of the Early German Engravers," the short paragraph in which we referred to his work did Solis but scant justice. We were working at that time from the collection of prints in the Fitzwilliam Museum at Cambridge, and that collection is, unfortunately, somewhat deficient in examples of his decorative designs; but the continuation of our work in the Print Room of the British Museum has brought under our notice numerous specimens of it, and it is from these and from Regnard's invaluable but little known "Album" that the sketches illustrating our present article are taken.

Virgilius Solis was born at Nuremberg in 1514, and, according to his own account,—which, in this respect, may be taken to be accurate,—practised and taught almost every form of art; he died at the age of forty-eight, having executed an enormous quantity of work of every description. His decorative work is very interesting, and, apart from a number of cups which, in common with all other engravers, he designed for the goldsmiths, may be classified under three distinct heads: first, pure Renaissance ornament, in which he was not always very successful; secondly, Arabesque, in which he excelled; and, thirdly, a peculiar species of ornament, which, borrowing the word from Mr. Ruskin, we may call "hlottesque."

Figs. 1, 2, and 3 are the best specimens we have been able to find of his pure Renaissance work, and they will serve to show how uncertain and variable his powers of designing in this style were.

Fig. 1 is one of a considerable number of similarly-shaped panels, which are the merest *pot-pourris* of Renaissance "items." Most of them bear the well-known signature,—the intertwined V and S; otherwise they might be passed by as the feeble attempts of some of his pupils. On the other hand, the little piece of flat jewelled metal-work (fig. 2) is gracefully conceived and well carried out. Fig. 3 is a more ambitious piece of design. The flow of the structural lines in the ornamental border are equal to the finest work of the best masters; but the charm of the design is sadly marred by the menagerie and one or two very badly-drawn flowers. Of his work in Arabesque, however, it is impossible to speak except in the terms of highest praise. Scattered through Regnard's Album there are innumerable first-rate examples of it, from which we have selected one (fig. 4). Solis acquired an astonishing facility of designing this graceful form of ornament, and though he was apparently able to produce any quantity of it, the merest fragment is marked by great originality. The sword-hilt (fig. 5) is a combination of rather weak Renaissance and graceful Arabesque. The outline, however, is exceedingly good, and the general effect is of considerable beauty, though it cannot compare with the elaborate hilt of Woeriot (figured Jan. 22, 1887), nor with either of the simple or elaborate ones of Holbein (figured Nov. 6, 1886).

The group of sketches given in fig. 6, contains three examples from a number of curious designs,—the purpose of which is not very apparent,—treated in Arabesque and pure line.

We now turn to Solis's third style of ornament,—the "hlottesque." It is always pleasant to devise ingenious theories accounting for successive steps in the growth of any art or science; there is a theory which we must confess has always appealed to us as a very plausible one, which accounts in a simple way for the stride forward which decorative art took from the use of lines of uniform thickness to those of varying thickness and leaf-like form. The suggestion is that the step was unpremeditated, but resulted from the resemblance which strokes made with a brush full of paint bore in outline to leaf and flower forms; and that the famous honeysuckle pattern owes its origin entirely to this. Be this as it may, it must be admitted that very charming forms are obtainable from the use of the swelling curves which slight pressure on a full brush produces, and that they may be obtained in an almost endless variety. Our readers may possibly remember what we called the "quill-pen curves," which Le Blond introduced into many of his designs (figured Jan. 15). Virgil Solis made use of brush-strokes of a kindred nature to a remarkable extent, and produced a charming effect

Fig. 1.

Fig. 6.

Fig. 8.

Fig. 9.

Fig. 4.

with them. In three plates, which we believe are well known to all students of early engravings, and of which fig. 7 is a copy of the most striking, a small surface (not much more than 2 in. by 3 in.) is closely packed with a scroll, the leaves and flowers springing from which are composed of nothing but these irregular and ever-varying brush-strokes. The main lines of the scroll are themselves exceedingly graceful and well balanced, but the undoubted charm of the design lies in the vigour and dash with which these strokes are drawn, concealing the art with which they are devised, and giving a general appearance of want of premeditation to the whole. In fig. 8 are three other little scraps, which we have selected as noteworthy examples of the same style from another series of Solis's designs.

In fig. 9, we have also sketched three designs, which are even still more worthy of the name "blottesque," by Pierre Floetner, who flourished about the middle of the sixteenth century.

#### MACHINERY AT THE MANCHESTER EXHIBITION.

MANCHESTER, as the head of one of the great centres of English engineering industry, has well exemplified its position by bringing together what may be fairly termed a really splendid collection of engineering plant and machinery. At Old Trafford the visitor may see in active operation and be initiated into the mysteries of spinning, weaving, wool-washing, wood-working, printing, &c., all carried out by machines of the most improved and advanced types. Instructive and interesting as these processes are, we confine our remarks to those exhibits which are more nearly allied to the interests of our readers.

*Prime Movers.*—Steam is supplied to the Machinery in Motion department by a battery of ten Lancashire boilers, made by W. & J. Galloway & Sons, Knott Mill Iron Works, Manchester. Each of these boilers measures 30 ft. by 8 ft., is fitted with thirty-eight coned tubes, and is capable of supplying steam for 400 indicated horse-power. They are made of steel and designed for an ordinary working pressure of 100 lb. to the square inch. They are each arranged with a back flue, and are complete with all usual fittings. The workmanship in them appears to be of the highest order. We may add that the exhaust steam from the various engines is carried into one main chimney.

Some fine specimens of locomotives are contributed by the London and North-Western Railway Company, Lancashire and Yorkshire Railway Company; Manchester, Sheffield, and Lincolnshire Railway Company; Beyer, Peacock, & Co.; Sharp, Stewart, & Co.; and Naemth, Wilson, & Co.

The machinery in motion is driven by engines supplied by Messrs. Hicks, Hargreaves, & Co., of Bolton; Messrs. J. & E. Wood, of Bolton; Messrs. Adamson & Co., of Hyde; and Messrs. Musgrave & Son, of Bolton.

Messrs. Hicks, Hargreaves, & Co.'s engine is a horizontal trunk engine of the Corliss type, and is a fine specimen of its class. The cylinder is 18 in. diameter by 4 ft. stroke. The valve gear used is a modification of the ordinary Corliss gear (Ingle's patent), and is fitted with double wrist plates, which control the steam and exhaust valves independently. The crank shaft bearings are made adjustable for wear horizontally and vertically. The engine is complete with high-speed and supplemental governor gear, and a Moscrop recorder is attached. Power is transmitted by rope gear from a driving pulley 20 ft. diameter, which acts also as a fly-wheel. For starting a small steam-barring engine is used,—this gears into teeth formed on the inside periphery of the driving-wheel, and is arranged to fall in and out of gear automatically.

Messrs. J. & E. Wood's engine is a high-pressure horizontal cylinder, 25 in. diameter by 5 ft. stroke. It is fitted with Corliss valve gear and quick-speed governor. The power in this case is transmitted by a rope pulley of 24 ft. diameter, grooved for fifteen ropes.

Messrs. Adamson's exhibit consists of a pair of coupled compound horizontal condensing engines, with 16 in. and 23 in. cylinders and 3 ft. stroke, to give off 200-h.p. These engines are of the trunk-girdle type and fitted with the Wheelock patent automatic cut-off gear, which is of very simple construction and appeared

sensitive and efficient in action. Both the high and low pressure cylinders are fitted with circular steam valves arranged with a reciprocating movement. A condenser and air-pump worked by oscillating gear are fitted, but are not in work. All the valves are placed below the cylinders, thus enabling any water arising from condensation to be readily got rid of. With the object, we presume, of reducing the friction of working, the cut-off valve is made concave on the face, with a double opening.

Messrs. Musgrave & Sons (Limited) show a strongly-designed pair of horizontal compound engines mounted on box framing. The high-pressure cylinder is fitted with a modification of the Corliss valve gear, and an automatic tripping gear is also fitted; a condenser is attached. These engines are started by one of Musgrave's patent barring engines, and must be pronounced fine examples of their type.

Messrs. Mather & Platt, of Salford, supply a pair of inverted cylinder engines, for driving part of the electric light installation. The cylinders are 20 in. diameter by 30 in. stroke, and two heavy fly-wheels are used. A convenient and somewhat novel form of automatic expansion valve gear is fitted. The dynamos are driven direct by means of leather chain belt made of double concave section to suit the convexity of the driving wheels. We noticed that these engines were driving at very short centres; the reason for this we are at a loss to conceive, as the slip and wear on the belt and bearings are thus considerably aggravated. The workmanship in these engines is everything that can be desired. Adjoining these engines is a pair of vertical high-speed compound engines, by Messrs. Davy, Paxman, & Co., of Colchester, of similar construction to those exhibited by the same firm at the recent Colonial Exhibition. Engines by Messrs. Robey & Co. and Messrs. Hornsby & Sons (Lim.), are also exhibited.

Seven Brush dynamos are driven by a fine pair of compound engines, constructed by Messrs. W. & J. Yates, of Blackburn, cylinders 14-in. and 25-in. diameter. The crank shaft, piston-rod, pins, &c., are constructed of Whitworth's compressed steel. A supplementary governor is fitted, arranged so that, in case of break-down or racing, steam is immediately shut off by means of an equilibrium valve.

Messrs. Rnston, Proctor, & Co., of Lincoln, drive some of the electric lighting plant with a highly-finished 14-in. and 24-in. compound engine. This is mounted on substantial box framing, in favour of which much is to be said, although some makers have abandoned it in favour of the girder type of frame. An extremely neat form of expansion gear, controlled by a high-speed Porter governor, is fitted. The valves are made treble ported, and the length of the steam passages has been reduced as much as possible. The feed-pump is worked by a separate eccentric. A condenser is fitted, but is not in use. The crank shaft bearings are made in three pieces, and are adjustable for wear in each direction.

An air-compressing and blowing engine is shown by Messrs. Walker Bros., Wigan. This is adapted for transmitting power in the form of compressed air in mines, tunnels, driving rock-drills, &c.; it is also used for compressing ether and ammonia for freezing purposes. The air is compressed by the action of a piston in an air cylinder, alternately drawing in the free air through valves, and expelling it afterwards through other valves, until by accumulation the air attains the desired pressure. The design and workmanship of this engine is very satisfactory.

Some specimens of vertical engines are exhibited by Messrs. Browett, Lindley, & Co., of Salford. They are of the simplest possible construction; the main frame is cast in one piece, and the slide bars are bored out true with the cylinder. The connecting-rod is made somewhat longer than usual for this class of engine, five times the crank. We noticed all the bearings were of anti-friction metal, a somewhat fresh departure for English-made engines, and one we do not altogether approve. The friction in using white metal may be somewhat less than with gun-metal, and also the first cost, but, unless the bearings are very carefully renewed, they often give much trouble and the shaft gets out of line.

Lindley's Patent Frictional Driving Gear for Dynamos is also shown. In this arrangement the engine and dynamo are placed on a bed-plate side by side. The crank-shaft of the

engine passes through the dynamo frame, and the face of the fly-wheel is used to drive a friction pulley on the dynamo shaft. The dynamo can readily be thrown out of gear, and for limited space and moderate powers this combination should prove useful.

A simple form of horizontal high-pressure compound engine is shown by Messrs. Westray, Copeland, & Co., Barrow-in-Furness. The apparent object in designing this engine was to reduce the cost of manufacture to as low a point as possible. Both the high and low pressure pistons are worked by one valve, and the piston-rods are coupled on to one cross-head, consequently only one connecting-rod is needed. The feed-pump is worked by the same eccentric and rod as the valve,—an awkward arrangement, to say the least, in case of a breakdown. The engine is mounted on a cast-iron foundation, which forms a water-tank. The workmanship displayed is satisfactory.

Gas-engines are well represented by the exhibits of Messrs. Crossley Bros., Messrs. Andrew & Co., Messrs. Dempster & Co., and Messrs. Wallworth & Co.

Messrs. Crossley Bros. exhibit, amongst other things, one of their 4-h.p. horizontal engines combined with a Crompton dynamo. The dynamo is mounted on the cylinder, and driven by a link leather belt from the fly-wheel. The arrangement is compact, but it necessitates the use of a short driving-belt, and the use of a jockey pulley to prevent undue slipping. A sensitive form of pendulum governor, especially adapted to the requirements of electric lighting, is fitted to this engine. A 7-h.p. engine, combined with force-pumps, and a 4-h.p. engine, with Lightfoot's patent dry-air refrigerator, are amongst the other exhibits.

Messrs. Andrew & Co., Limited, show one of their "Stockport" horizontal gas-engines in motion; and "Elland" gas-engines (Campbell's patent) are shown by Messrs. Dempster & Sons.

Messrs. Henry Wallworth & Co., of Manchester, exhibit Sturgeon's patent gas engine. It is claimed for this engine that the mixed charge of gas and air being ignited, its expansive force is received equally and simultaneously on two pistons. Each of these pistons moves up and down in a vertical cylinder, and imparts independently force to one pair of cranks on a double-crank shaft, to which it is connected by a sway-beam and connecting-rod. One impulse is given in every revolution of the crank shaft, and the working parts are balanced. The expansion of the charge is carried down almost to atmospheric pressure before the exhaust-pipe is opened.

In the grounds one of Spiel's patent petroleum engines is shown at work by Messrs. Shirlaw & Co., Birmingham. In this engine small charges of petroleum in its fluid state are used instead of steam or gas, the charge is ignited through the medium of a spirit-lamp and igniting-valve placed at the back of the cylinder. The petroleum is kept in a tank and drawn to a reservoir on the engine by means of a small centrifugal pump. The governor gear appeared to have the engine well under control, and the running was uniform. As coal or gas are dispensed with, this engine under certain conditions should prove itself useful.

Woodworking Machinery is represented by Messrs. Thomas Robinson & Son, of Rochdale, and Messrs. Pickles & Son, of Hebdon Bridge. Messrs. Robinson exhibit some ten machines, which include a centre-fed four-cutter planing and moulding machine. The main frame of this machine is cast in one piece, and the wood is fed through the machine by four feed rollers,—two plain and two fluted,—all of which are geared to prevent slipping. The bottom rollers are adjustable for wear, which is an improvement over the old plan of mounting them in fixed bushes. The top feed rollers are carried on swings hinged from a centro, and are readily raised or lowered by means of a hand-wheel to suit different thicknesses of wood.

The side-cutter spindles are mounted between the top and bottom cutter-blocks, which is preferable to placing them at the end of the machine, as is sometimes done. For working large mouldings, the top cutter-block is arranged to angle, so that the cutters working the thin part of the moulding need not project further from the block than the others, and it is less likely to be damaged. Altogether this is a compact and well-designed machine, but we notice that the countershaft is attached directly on to the machine; this may pass for small machines, but is distinctly objectionable on

large ones, as the belts have to run at short centres, which means more rapid deterioration of both belts and bearings.

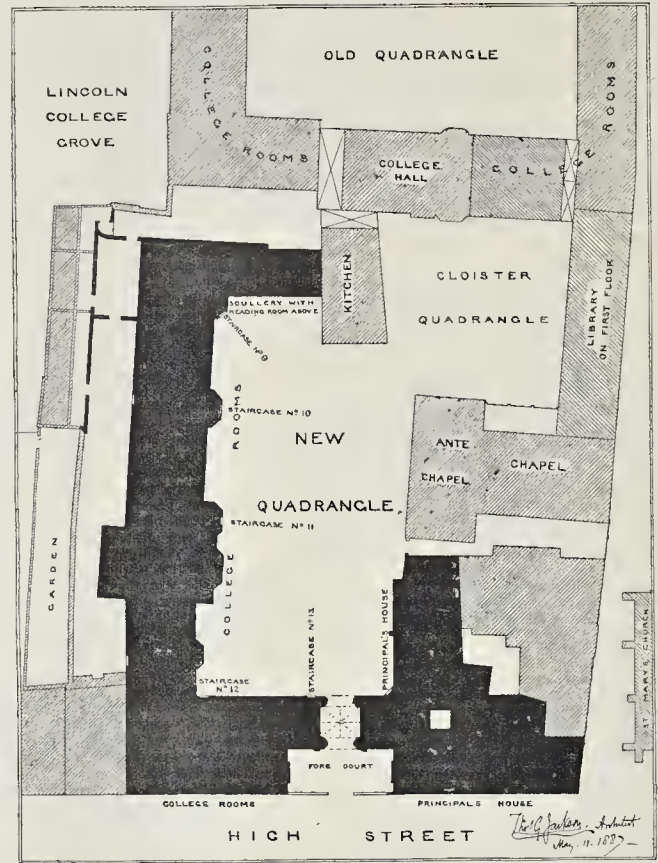

A somewhat new combination in the shape of a combined hand-feed planer and moulder is also shown here. This consists briefly of an ordinary surface-planer with the cutter-block spindle extended, and carrying an extra cutter-block for moulding at its outer end. An additional rising and falling table is fitted, and so arranged that the extra block can be worked either above the table,—the wood being fed under it for straight moulding, thickening, &c.,—or below the table,—the wood being fed over it for tonguing, grooving, &c. A fence and pressure spring for guiding and holding the wood are fitted. The outer end of the cutter-block spindle can also be arranged for carrying boring tools.

A sample of Armstrong's well-known patent machine adapted for cutting ordinary dovetails, angle dovetails, and blind dovetails, especially adapted for the requirements of box and packing-case makers, is also shown here. Amongst the other exhibits is a continuous feed circular saw-hench, a combined hand and power feed planing-machine, a tenoning-machine, steam mortising-machine, and band saw. The wood is fed through the saw-hench by means of fluted rollers mounted vertically on a spindle carried at the end of an adjustable radial arm. The radial arm swings on a pillar bracket in the front of the machine, and can be adjusted to suit saws of varying diameter. The front of the fence is fitted with friction rollers, and the bench can be used either for deepening or flattening as may be required.

Amongst other machines Messrs. Pickles & Son exhibit one for planing and thickening, fitted with Rawling's spiral cutters. For working curly or cross-grained woods these cutters possess advantages, as they give a gradual shearing cut to the wood instead of a more or less chopping cut, as given by ordinary straight cutters. The cutter-block is of spiral form and the steel cutters are screwed to it. The use of these cutters necessitates the employment of a special grinding apparatus to make them perfectly true on the cutting edge. The wood is fed through the machine by means of geared rollers in the usual way. The main frame is cast in one piece and is arranged with an extended base. An ordinary hand-feed surfacing and jointing machine fitted with these cutters is also shown, and a self-feeding cutter grinding machine for grinding long plane-irons to one exact level. This consists briefly of a horizontal spindle carrying a cylinder or cup emery wheel. The iron to be sharpened is bolted on to an adjustable face-plate mounted on a slide arranged with a horizontal traverse past the edges of the emery wheel. Adjustable stops regulate the traverse of the slide carrying the iron and reverse a rack and pinion motion till the right amount of level is produced on the iron, when it stops grinding. For planing very wide pieces, and to do clean and accurate work, a machine of this class is almost a necessity.

A combined continuous and drag feed circular saw-bench has one or two fresh features, the drag feed and continuous feed being driven from the same motion. The continuous-feed roller is readily adjustable to different sizes of saws or thicknesses of wood, and can be easily removed when it is required to use the drag feed. A useful form of saw-guard is fitted on one of the saw-benches, the guard is of hollow section to cover the top of the saw. It is hinged to a horizontal stand, arranged to adjust vertically by means of a hand wheel and screw. The guard may be swung back out of the way to allow of the saw being sharpened, and it is so placed at the back end of the bench that it does not interfere with cross-cutting.

Brick and Tile Making Machinery is represented by Mr. Wm. Johnson, of Leeds, and Mr. Thomas Fawcett, of Leeds. Amongst other things Mr. Johnson shows one of Kennedy's semi-dry brick, tile, cement, and concrete block making machines. This machine presents several features of interest, and its operation may be briefly described as follows:—The clay to be formed into bricks is fed into a hopper, in either a semi-dry or semi-plastic state, and is received by a hotbottom box or charger, which works in a slide on the face of the table and over the face of moulds formed in the table. The moulds are thus filled, and to ensure a dense feed a pressing-head drops on the material, whilst the charger is over the moulds, the pressing-head is then raised

Plan of New Buildings, Brasenose College, Oxford.

to allow the charger to return again under the hopper to be refilled, and in its passage it strikes off the surplus clay level with the top of the moulds. The pressing head then drops a second time, and two distinct additional pressures are given to the clay or brick. The presser then leaves the moulds, and the bricks are raised for delivery. A regulating apparatus is fitted, by which the thickness of the brick may be varied as required whilst the machine is running. The pressing plates and moulds are heated by steam, and require no further lubrication.

Four distinct pressures are given by this machine, and the bricks produced are of good form and very dense. For working difficult materials, it should be particularly useful. Hand lever brick and tile pressing and other machines are also shown here.

Amongst Mr. Thomas Fawcett's collection of brickmaking machinery, we noticed a very workmanlike duplex lever hand-power brick and tile press. In this press the pressure is obtained by means of double levers working from a crank shaft with a fly-wheel on, and it is claimed that a leverage of 5 to 1 over the ordinary lever or crank press is thus obtained. The brick, when pressed, is lifted out of the mould automatically at the same time the bottom plate is dropped down ready for the next brick. Mr. Fawcett also makes a wrought-iron perforated bottom clay grinding-pan, especially adapted for grinding shale, blind, marl, &c. It is driven from below, and is fitted with an arrangement for taking the weight of the rollers off the pan when not grinding.

**Penance.**—A new Reclabite Hall has lately been opened here. Besides the large hall, which will seat 700 persons, there is a smaller hall. The building is chiefly built of granite. Mr. J. W. Trounson is the architect.

## Illustrations.

### BRASENOSE COLLEGE, OXFORD.

THE new quadrangle which is being built from Mr. Jackson's designs, at Brasenose College, Oxford, has been formed by the removal of several cottages in Amsterdam-court (whose name has preserved the memory of an ancient University hall which has long disappeared), and some buildings of timber and plaster of no antiquity, which contained rooms for undergraduates.

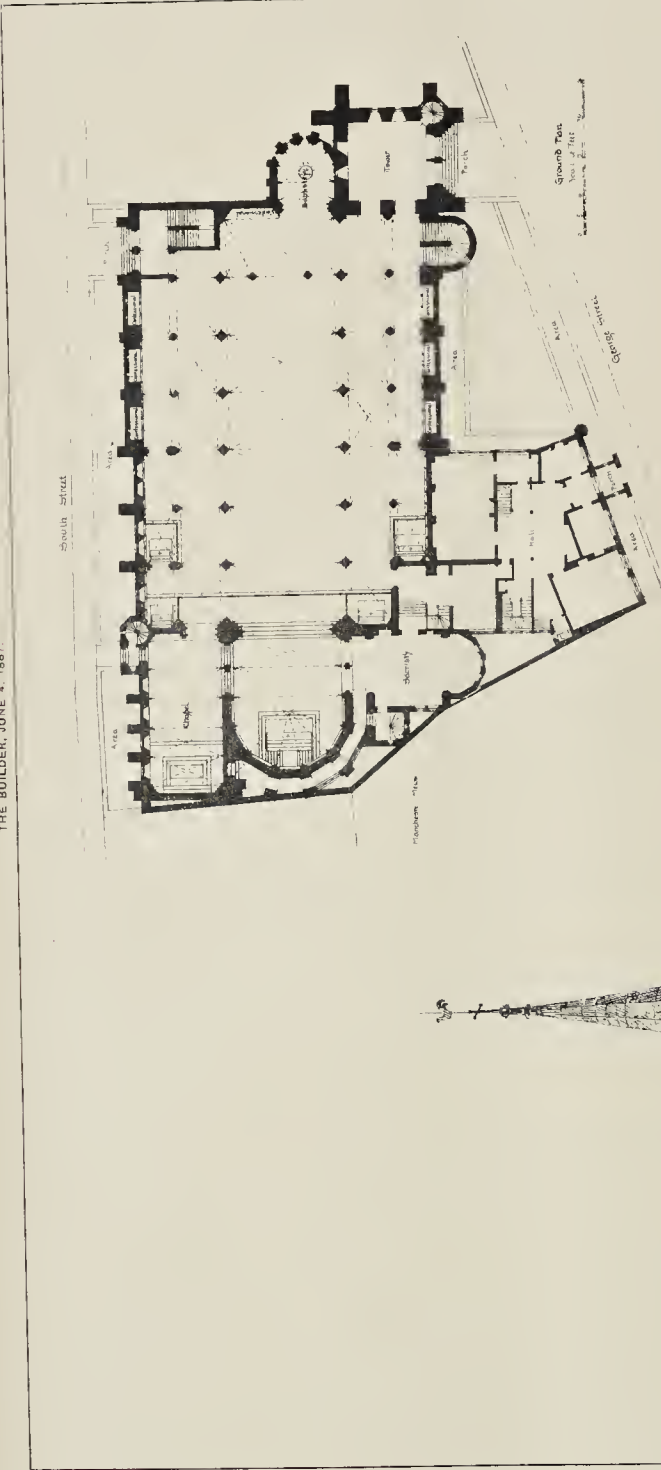

The wing which forms the west side of the new quadrangle was begun in 1882, and has just been completed, together with the return wing on the north. These buildings contain twenty-two sets of rooms for undergraduates, one large set for a Fellow, and two large lecture-rooms, as well as a reading-room for undergraduates, and some additional offices connected with the college kitchen.

It is now proposed to complete the quadrangle by a south wing, with a frontage to High-street, extending westward from the corner next St. Mary's Church, with a gateway and entrance-tower in the middle. In order to place this tower so as to group well with the steeples of St. Mary's and All Saints' churches, which form the principal features of the well-known view of the High-street of Oxford, the new tower is set back from the street frontage, as the block plan will explain, so that a small forecourt will intervene between it and the street, enclosed at the sides by the other parts of the new building.

The introduction of a third important object into so famous a picture is naturally a difficult matter, and one that requires grave consideration. A square tower, such as is usual over collegiate gateways, would be discordant with the two steeples between which it would appear, while a steeple would be too ecclesiastical in

character for its purpose. An open crown steeple surmounting a massive square tower was adopted by the architect as the form which would best reconcile these difficulties.

Of the two blocks of buildings fronting the street, the nearer one will contain a new house for the Principal, and the farther one rooms for undergraduates.

The drawing from which the illustration is taken is hung this year at the Royal Academy.

THE SALOONS OF THE ORMUZ.

We give this week two drawings, one of the dining-saloon, the other of the drawing-room and library, of the new royal mail steamer *Ormuz*, the latest addition of the Orient Company, trading to Australia.

The Drawing-room and Library are on the main deck, beside the sleeping cabins, occupying together the breadth of the ship,—a dimension of 52 ft.; the total length of the ship being 480 ft. Their walls are lined throughout with satinwood, its rich yellow colour enhanced by gilding. In the panels of the drawing-room are pictures by Pettie, MacWhirter, Colin Hunter, Heny, O'Connor, Wylie, and Dudley. The furniture in this room is covered with blue Utrecht velvet from Morris's, and that of the library with dark green morocco. The floors are laid with Morris carpets. There is ample light from the reflection from the water from the white painted ceiling, and through the oval opening in the dining-room with its skylight above.

The Dining-room is placed on the upper deck, an innovation from the arrangement hitherto usual of placing it on the main deck, in the position occupied in this ship by the drawing-room and library. This avoids the necessity of going below for meals, which in rough weather prevents many passengers from taking them; while a passage outside the saloon, between its wall and the ship's side, allows the windows to be kept open in all weathers.

In the dining-room the floor is the teak deck of the ship; the walls are in Spanish mahogany, relieved by carved columns and inlay of satinwood patterns in rosewood stiles, with ebony mouldings round bevelled mirrors.

These rooms are all in the fore part of the ship, before the engines, instead of as formerly at the stern, for, since the introduction of crew-propellers, the forepart is found to be the pleasantest part of the vessel, especially in a voyage through the Red Sea and the Tropics, and is consequently devoted to the first-class passengers. On the deck above the dining-room is a second drawing-room, with a broad promenade on each side measuring an eighth of a mile round. There are thus four saloons besides the smoking-room for the first-class passengers instead of the single dining saloon devoted to their use in older ships.

The *Ormuz* has just returned from her first trip to Australia, having made the fastest passage on record by one day and nine hours, including stoppages and detention. She was built by the Fairfield Company at their works in the Clyde in nine months from receiving the order, the workmanship throughout being of the most excellent description. The fittings of the saloons were executed at Fairfield from drawings by Mr. J. J. Stevenson, architect, of London; the carving and inlay were done by Messrs. Knox and Walter Smith, of Lambeth.

R.C. CHURCH, SPANISH-PLACE.

We give the revised design of the exterior of this church, by Messrs. Coldie, Child, & Coldie. The design has been somewhat modified since we published a view of it at the time of the competition. (See *Builder*, August 1st, 1885).

A HOUSE AT GRIMSBY.

This house occupies a good site in the outskirts of the town, and is built of best red local bricks with Red Mansfield stone dressings. The ring-courses and gables, &c., are of the northern Company's bricks, as are also the balustrade and wall to the garden in front of the house. The roofs are slated.

The plan is specially made to suit the owner's requirements, and consists of drawing and dining-rooms in the front, with library in rear, spacious hall, and staircase. There are six bedrooms and dressing rooms. All the principal

rooms have mahogany doors. The hall is marble mosaic, by De Crelle & Co., of London.

The glazing to the staircase window is of special design, introducing conventionally-treated sea fish, &c., and in the centre is a fishing smack. Mr. Alderman Smethurst, J.P., Mayor of Grimsby, the owner of the house, is one of the largest smack-owners in the town. The architect is Mr. Charles Bell, of London, and the builder is Mr. T. H. Smith, of Grimsby.

SUMMER-HOUSE AND SMOKING-ROOM, BOLTON ROYD.

The exterior of this room is treated in Japanese character, whilst the interior is of Moorish design.

The plan shows two recesses, one for a fireplace, the other a divan; a lavatory or pantry adjoins, and arrangements are provided for serving afternoon tea or other light refreshments.

The windows in the elevation facing the lawn-tennis ground are glazed with patent plate in leading lights, the remainder of the glazing being richly coloured.

The walls are constructed of timber and concrete on a stone base, and are covered internally above the dado with Lincrusta-Walton, and effectively decorated with Moorish symbols.

The furniture, hanging lamps, and other details were specially designed by the architect, Messrs. H. & E. Marten, of London.

NOTES FROM DENMARK AND SWEDEN.

WITH regard to the decision of the Danish Parliament, recently referred to in the *Builder*, of rebuilding the Castle of Christiansborg, the royal residence at Copenhagen, which was destroyed by fire a few years ago, and also to erecting a new House of Parliament, it now appears that the committee appointed to report on the details of these plans have recommended that the future castle shall serve both as a residence for the royal family and seat of the Assemblies. The latter are, however, to be located in a wing of the palace entirely separated from the rest. Designs will be invited for this plan, the number of premiums being seven, of 115*l.* each.

The Danish Parliament decided, in the session just closed, to devote a sum of 350,000*l.* of State funds for the purpose of pulling down certain "rookeries" in Copenhagen, and to build on their sites modern dwellings for labourers and artisans. The amount will be advanced by the city authorities, in the manner they may decide, at a very low rate of interest to builders.

A little while ago the first stone was laid of the Exhibition building in Copenhagen, to be opened next year. The frontage of the main building will be about 1,000 ft., and it will be surmounted by an enormous glass cupola and four towers at the corners. There will be three entrances. This building will be devoted to home and foreign art exhibits, whilst a number of small buildings will be occupied by the various other courts. There will also be gardens, &c., as at the last exhibitions at South Kensington. It seems that the exhibition has a very good prospect of success, as a large number of applications for space has been received from abroad, as well, of course, as from Scandinavia.

During last year the chief of the Copenhagen fire brigade paid a visit to several European capitals in order to study the system of fire-extinguishing adopted in those cities, the result of which visits is that the whole fire brigade in the Danish capital is to be reformed. Thus, the numerous little fire-stations all over the city, equipped with a manual engine and some ten men, are to be replaced by one central and a few hand stations, replete with steam-engines, life-saving apparatus, &c. The wages of the men are also to be increased, and they will have the right of retiring on a pension after fifteen years' service. A complete system of telegraph and telephone service will also be established. The outlay in the new scheme will be 35,000*l.*, and the annual cost 18,000*l.*

In Sweden the restoration of the ancient cathedral of Upsala is now in full progress,—a work chiefly carried out by State aid. During

the cold months only internal work could be carried on, but now the restoration of the exterior has been resumed. The architect carrying out the restoration is Herr F. Langlet.

It appears from the Stockholm journals that during the present spring the building industry in the suburbs of Stockholm has been very depressed,—in fact, it seems that the demand for small modern villa-like residences and artisans' dwellings, which gave such an impetus to the industry some years ago, has now been fully satisfied. On the other hand, speculators have turned their attention to the more central parts of the city, where so-called "eligible" sites for mansions are in great request, although difficult of obtaining. It is chiefly with the disposal of such sites that the principal estate agencies are now engaged.

The Queen of Sweden has appointed a committee for inviting and selecting a design, subject to her majesty's approval, for the new institute for the training of nurses, to be built in the celebrated Stockholm Park Djurgården, at the expense of the king and queen, the cost being estimated at 10,000*l.*

An institute, somewhat on the plan of the Imperial Institute, is to be founded in Stockholm, the President being the Crown Prince of Sweden. The object of the scheme is to develop the sale in foreign markets of articles of Swedish manufacture and industry, arranged exhibitions of the same, &c., with a central export exhibition depot in Stockholm. Some 500 members have already joined the association.

From the latest statistics published relating to the timber industry of Sweden, we learn that at the beginning of 1886, the total area of forest land in the country was 17,150,000 hectares, and that in course of the year 1,776,000 cubic metres of timber were felled, the price varying from 3*s.* 3*d.* to 6*s.* 6*d.* per cubic metre. At the end of the year, the value of the State forests was estimated at 2,250,000*l.* The revenue from the same amounted to 100,000*l.*, and the expenses to 40,000*l.*

A Swedish engineer, Herr Wellin, has constructed skates of glass instead of iron, which are said to have been found very suitable for their purpose.

THE LATE SIR HORACE JONES.

At the meeting of the Court of Common Council, on the 26th ult., the Town Clerk having read a letter announcing the death of Sir Horace,

Mr. Hicks, Chairman of the City Lands Committee, said he was quite certain that every member of the Court would receive the intimation of the City Architect's death with the deepest sympathy and respect (hear, hear). It was about twenty-three years since the then Mr. Horace Jones entered the service of the Corporation. He had been one of the high officers, and a more honest and faithful officer had never served the Corporation (hear, hear). He would content himself by saying that a large portion of the genius of Sir Horace Jones was written in stone in the City of London (hear, hear). He moved,—

"That this Court has heard with sincere regret the death of Sir Horace Jones, City Architect, and desires to offer its condolences to the widow and family on the irreparable loss they have sustained, and further to place on record its high appreciation of his ability as an architect, and of the faithfulness and integrity with which he always discharged the duties of his office."

Alderman Sir F. W. Truscott seconded the motion, which was agreed to in silence. The resolution was ordered to be signed by the Town Clerk and sent to the family.

Mr. Hicks subsequently moved "That it be referred to the Officers and Clerks' Committee to consider the nature, duties, and emoluments of the office, reporting thereon to the Court." He said he did this entirely on his own responsibility, because he felt there was a somewhat general feeling in the Court that the Committee should consider whether it would be more satisfactory to appoint a Surveyor rather than a City Architect (hear, hear).

Mr. Shaw seconded the motion, which was agreed to.

Mr. Hicks moved that Mr. Murray, the Principal Clerk in the Architect's Office, be authorised to carry on the duties of the office till the further orders of the Court. This was also agreed to *sem. con.*

The funeral took place on Friday, the 27th ult., at Norwood Cemetery, where the interment took place in the family vault. The *cortège* (consisting of a four-horse hearse and seven pair-horse mourning coaches, besides a number of private carriages) left the residence of the deceased, 30, Devonshire-place, W., about ten o'clock, and arrived at Norwood Cemetery shortly before half-past eleven. The burial service was read by the Rev. J. Hawes, (vicar of St. Paul's, Mill Hill, Hendon) and the Rev. Henry Patch (rector of Winchelsea, Sussex), brother-in-law of the deceased. The outer coffin, which consisted of polished oak, bore upon a knight's shield brass plate the following inscription:—"Sir Horace Jones, Knight, born May 20th, 1819. Died May 21st, 1887."

Among the chief mourners were Lady Jones (widow of the deceased), Mrs. Billing, Miss Wallick, Mr. Octavius Hansard, F.R.I.B.A., Sir J. B. Monckton (Town Clerk), Mr. H. H. Crawford (City Solicitor), Mr. G. P. Goldney (City Remembrancer), Mr. A. J. Brand (City Comptroller), Mr. Roderick (Secondary), Mr. W. Payne (City Chamberlain's Office), Col. Haywood (Engineer to the Commissioners of Sewers), Sir Charles Hutton Gregory, K.C.M.G., Mr. John Wolfe Barry, Hon. Associate R.I.B.A., Engineer of Tower Bridge; Mr. H. M. Brunel, Hon. Associate R.I.B.A.; Mr. James Patch, Mr. A. Great-Rex (medical attendant), Mr. E. H. Burnell, F.R.I.B.A.; Mr. A. H. Ewer, Mr. R. W. Edis, F.R.I.B.A.; and Mr. W. W. Onless, R.A.

The following gentlemen attended from the City Architect's Office, viz.: Mr. Andrew Murray, A.R.I.B.A. (Principal), Mr. Thomas Baker, Mr. A. L. Gosling, Mr. F. H. Williams, Mr. G. D. Stevenson, Mr. J. Pyhus, Mr. J. Hambling, Mr. P. Rees, Mr. J. Ellwood, Mr. G. Jackson, and Mr. W. J. Liberty.

There were also present at the grave the following representatives of the Royal Institute of British Architects, viz.: Mr. E. P. Anson (President), Mr. Ewan Christian (Past-President), Mr. Chas. Barry, F.S.A. (Past President), Mr. G. Aitchison, A.R.A., Mr. Alexander Graham, Mr. Arthur Cates, Mr. James Brooks, Mr. Henry Currey, and Mr. E. A. Gruning, Mr. Octavius Hansard, Mr. R. W. Edis, Professor T. Hayter Lewis, F.S.A. (Past Vice-President), Professor T. Roger Smith, Mr. Robert W. Mylne, F.R.S., Mr. Harry Oliver, Mr. Wyatt Papworth, Mr. John Norton, Mr. J. J. Stevenson, F.S.A., Mr. J. G. Turner, Mr. Andrew Oliver, Mr. Thomas Wells, Mr. C. E. Barry, Mr. W. E. Clifton (representing his father, Mr. E. A. Clifton), Mr. Thomas Henry Wyatt (Hon. Associate), Mr. W. H. Atkin Berry, Mr. F. T. Reads, A.M.I.C.E. (Hon. Associate), Mr. Pearson, jun., Mr. Charles Fowler, Mr. Thomas H. Watson, Mr. Henry Stock, Mr. H. H. Collins, and Mr. W. H. White (Secretary). Mr. Waterhouse, R.A. (who was on the Continent), Mr. J. Macvicar Anderson, Hon. Sec. (who was in Scotland), and Mr. C. L. Eastlake, Keeper of the National Gallery, and formerly Secretary, R.I.B.A., were unavoidably absent from the funeral.

The following gentlemen attended from the "Jerusalem Lodge" (197) of Freemasons, of which Lodge the late City Architect was a P.M. (having served that office in 1869; he was initiated in 1864), and treasurer at the time of his decease, viz.: Mr. R. F. Grantham (Hon. Associate R.I.B.A.), G.S. (Worshipful Master); Mr. G. L. Eyles (Senior Warden); Mr. C. E. Hollingsworth, P.G.S.; Mr. E. Letchworth, P.G.D.; and Mr. T. G. Bullen (Secretary).

From the Turners' Company, of which the deceased was a member, there were present Dr. R. Turtle Piggott, D.C.L. (Master), Mr. John Jones (Past-Master), Mr. E. Sydney (Past-Master), Mr. Brackstone Baker (Past-Master), Mr. R. Loveland (Past-Master), and Mr. W. M. Shirreff (Clerk). The Upper Warden, W. L. A. B. Burdett-Contts, M.P., sent the regrets of Lady Burdett-Contts.

There were also present at the grave Mr. Edward Woods, President of the Institution of Civil Engineers (Hon. Associate R.I.B.A.); Mr. Frederick Dadswell, C.C.; Mr. G. E. Wood, C.C.; Mr. P. de Lande Long, Mr. W. Miller

(clerk of works), Mr. T. Arnold, Mr. W. P. Padmore, Mr. C. Thwaites, Mr. John Mowlem Burt (Mowlem & Co.), Mr. C. H. Mabey (sculptor), Mr. Keavill, Mr. W. Read, Mr. Mills, Mr. H. Baily, Mr. F. Farwell, Mr. R. G. Glover (War Office), Col. Charles Harding, and Mr. G. de Maid.

Among the carriages which followed was that of Mr. Ex-Sheriff George Burt. Among the wreaths sent may be mentioned those from the Lord Mayor (Sir R. Hanson, Bart.), Lady Monckton, Mr. and Mrs. A. Murray, Mr. T. Baker, Mr. H. Oliver, the Staff of the City Architect's Office, the Officers of the Corporation, and the members of the Jerusalem Lodge. In all about 150 persons were present at the cemetery.

We may add that a portrait of the deceased, by Mr. W. W. Onless, R.A., is exhibited in this year's Royal Academy Exhibition.

#### BUILDERS' BENEVOLENT INSTITUTION.

##### ELECTION OF PENSIONERS.

An election of three pensioners on the funds of this Institution was held at Willis's Rooms, St. James's, on Thursday, May 26th, Mr. Basil E. Peto, the President, in the chair. There were six candidates for the three vacancies, viz., four men and two women. The poll was open from two to four p.m.

Shortly after the close of the poll the scrutineers, Messrs. Thomas Stirling and T. F. Rider, announced the results of the polling to be as follows, viz.:—James Picking, 25, Shillington-street, Clapham Junction, aged 61, builder (third application), 463 votes; Edward T. Roberts, 33, Broomwood-road, Wandsworth-common, aged 68, builder (second application), 1,685 votes (including sixty votes in respect of his former contributions); George N. Cott, 10, Mordaunt-street, Brixton, aged 69, builder (second application), 505 votes; James A. Abbott, 63, Stowe-road, Shepherd's Bush, aged 61, builder, 1,751 votes (including 210 added in respect of former contributions); Sarah A. Stableford, 366, York-road, Camden Town, aged 71, widow of Wm. Stableford, builder, 586 votes; and Ann Winter, 47, Maygrove-road, Bromdesbury, aged 62, widow of Benjamin Winter, builder, 488 votes (including 290 votes added for her late husband's contributions). The successful candidates were therefore declared to be E. T. Roberts, J. A. Abbott, and Sarah A. Stableford.

Among the friends of the Institution (other than those already named) who took part in the proceedings, were Messrs. George Plucknett, J.P. (Treasurer); C. Busnell, T. G. Smith, T. Hall, W. Scrivener, H. Colls, and R. Richardson. A vote of thanks to the chairman terminated the proceedings.

#### COMPETITIONS.

*The McArthur Hall, Belfast.*—The designs submitted in public competition for the McArthur Hall, Belfast, have been submitted to Mr. Alfred Waterhouse, R.A., for adjudication. Those of Messrs. Newenham Deane (R.H.A.) & Son, 3, Upper Merriion-street, Dublin, have been selected.

*Wesleyan Chapel, Newcastle-on-Tyne.*—The designs of Mr. J. W. Taylor, architect, of Newcastle-on-Tyne, have been accepted for the new Wesleyan chapel, lecture-hall, class-rooms, and caretaker's house, to be erected in Dilston-road, Newcastle. The chapel, which is of Gothic design, will accommodate 850 persons, and the lecture-hall 400. The estimated cost of the building is 5,000*l.*, exclusive of site.

#### ARCHITECTURAL ASSOCIATION VISITS

The first Saturday afternoon vacation visit of the Architectural Association was made on the 28th of May to Woolpits, Ewhurst, the house now being built for Mr. Henry Doulton, from the designs of Messrs. Ernest George & Peto.

From the site of the house magnificent views of the Weald of Surrey can be had, and the house has been designed with charming loggia, balconies, and belvedere, from which they can be seen.

The house is built of red bricks, which rise six courses to the foot, and huff terra-cotta dressings, the treatment of the detail being rather Flamboyant in character. The terra-cotta, which was made by Messrs. Donlton, is the most perfect work of its kind, the traceries

of the lines in the mouldings being particularly noticeable.

Over the entrance doorway a panel by G. Tinworth has been inserted, the subject being Abraham and the Three Angels, symbolising welcome; and over two of the mantel-pieces large panels by G. Tinworth are placed. All the mantelpieces are of terra-cotta.

The stables and coachman's house, and the entrance lodge, are picturesque buildings with tile hanging and half-timber work.

The drainage and sanitary work are very perfect. A double system of water-pipes is arranged in the house, so that the service can be continued even if any of the pipes are under repair.

#### WATER SUPPLY.

*Bristol.*—Dr. D. S. Davies, Medical Officer of Health for Bristol, has recently issued his first annual report, in which he explains that he has endeavoured to put before the Committee the present position of the district in regard to those details which more especially go to make up the sum of "sanitary condition." Referring to the water supply, he says:—

"The water supply is in the hands of a private company. Water is obtained by gravitation from springs at Barrow Gurney (Goldbath Spring), five miles, at Watery Combe, and at Chelston Meads (Chew Hill Head), sixteen miles from Bristol, on the side of the Mendips, from springs in the Triassic conglomerates and in the Carboniferous limestone. A recent additional supply is also obtained from springs in the Carboniferous limestone at Sherborne. The water from the Sherborne and Goldbath Springs is brought direct into the city; that from Chew Hill Head and Watery Combe is intercepted by the reservoir at Barrow Gurney, 310 ft. above Ordnance datum, with an extreme holding capacity of 350,000 gallons; whence it is brought to the city, joining the direct supplies at Redcliff. The combined waters supply the lower parts of the city en route, and also rise by gravitation to the pumping station and reservoir at Oakfield-road, 200 ft. above Ordnance datum, from which they are pumped up to the Durham Downs service reservoir, 320 feet above Ordnance datum, for the supply of Clifton and the higher parts of the district. The gravitation works were completed in 1851. After the dry winters of 1891-93, it was found necessary to provide permanent pumping works for a supplementary supply in years from wells at Chelvey, eight miles from Bristol, sunk in the New Red Sandstone (Triassic) 200 yards from any inhabited place. Two of these wells are 40 ft. deep, and a third 195 ft. The water is supplied to the city at constant pressure, except when turned off for necessary repairs. The present supply per head is calculated at about twenty-two gallons per day. A third reservoir is now in course of construction at Barrow, with a holding capacity of 500,000 gallons, which will practically double the available supply. As to any risk of excremental contamination, the water appears to be above suspicion; and no case of disease has, within my knowledge, ever been traced to its use. In the older parts of the city, many private wells still exist, the water from which is often preferred to the company's supply, on the ground of coolness. It is difficult in most cases to convince consumers of the ever-present danger that must always attend the use of water drawn from wells in the midst of a large city, where the subsoil from which the water is collected is necessarily loaded with the filth resulting from the life-conditions of 223,000 persons."

*Olney.*—Major-General C. Phipps Carey, R.E., one of the Inspectors of the Local Government Board, recently held an inquiry at the Mechanics' Hall, Olney, respecting the Board's application for a Provisional Order to amend the Olney Local Board's Act of 1885, so as to give additional powers to acquire twenty-five acres of land, instead of seven acres, and to borrow 20,000*l.* instead of 7,500*l.*, as sanctioned in the original Act. Mr. C. S. Rooke, the Board's Engineer, went into details of his scheme, and said the reservoir would hold a fifty-three days' supply, allowing twenty gallons per head per day for the population, which was now some 7,000. Mr. Jas. A. Paskin, Water Engineer to the Halifax Corporation, and Mr. Arthur Guyfield, of Olney, gave evidence for the Board. Mr. Gladstone, who opposed the application on behalf of a number of ratepayers, said that the scheme had not been sufficiently considered by the Board, who had first bought the land and then consulted an engineer as to its suitability for water storage. He submitted that the supply gained by the proposed outlay would be quite out of all proportion to the cost, and would not meet the demands for any length of time. Evidence on behalf of the opponents was given by Dr. W. H. Cheetlam, Mr. Alfred Preston, C.E., and Mr. B. Woodhead, C.E.

*Egg Buckland (Devon).*—Two new stained-glass windows have just been placed in the south side of the chancel of St. Erasmus's Church, Egg Buckland. They are the work of Messrs. Fournier & Watson, of Stonehouse. One of them contains a representation of the Blessed Virgin, whilst the other represents the patron saint of the parish, St. Erasmus.

ARBITRATION CASE.

THE GREAT NORTHERN RAILWAY COMPANY v. HER MAJESTY'S POSTMASTER GENERAL.

THIS arbitration, in which Sir Henry James, Q.C., Mr. Littler, Q.C., and Mr. Jeune appeared for the claimants, and the Attorney-General, Mr. Bidder, Q.C., and Mr. Casserley for the Postmaster-General, involving the question of compensation consequent upon the railway company's Bill and Mouth Depot, Aldersgate-street, being required for the extension of the General Post-office, has been concluded. The hearing extended over a period of twelve days, and the umpire, Mr. Charles J. Shoppee, has awarded the sum of 31,350*l.* as the compensation to be paid to the railway company.

THE IMPERIAL INSTITUTE.

SIR,—The Organising Committee of the Imperial Institute have published an outline of their scheme for the government of that Institute, and they propose to appoint a General Council for the purpose.

Certain of the members of this Council are to be nominated by some of the learned and scientific societies, including no less than four societies devoted to the promotion of Engineering, but not one connected with Architecture.

It is stated in the opening paragraphs of the scheme that "the details are open to further consideration." It is to be hoped that the result of such further consideration will be to add the Royal Institute of British Architects to the list, especially as, if I am not misinformed, a Vice-President of that Institute is a member of the Organising Committee.

F. R. I. B. A.

May 30, 1887.

SIR,—Those of your readers who are interested in this new organisation will have noticed, possibly, from experience, without surprise,—that Architecture has no representative on the General Council of Management. Amongst the forty-five members nominated on behalf of the United Kingdom are representatives from such societies as the Royal Irish Academy, the Society of Arts, the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Iron and Steel Institute, the Chemical Society, the Society of Telegraph Engineers and Electricians, the City and Guilds Institute of Technical Education, the Royal Academy, the Mining Association of Great Britain, the Trades Union Congress, and the National Miners' Union; but not on behalf of the Royal Institute of British Architects.

Few, if any, of the societies I have enumerated are as widely interested in the questions with which the Imperial Institute will have to deal as the profession of architecture is; and it must be considered a signal instance of unintentional, or marked, neglect, that a body so intimately mixed up with Colonial interests as our own should have been omitted from a list so comprehensive as to include all those mentioned above.

I do not know whether the Council of our own Institute has moved in this matter. If not, it has again shown a supineness with regard to passing events which, if characteristic, is none the less reprehensible.

It may not be too late to have this slight on the profession of architecture condoned, but this will certainly not be attained by the continuance of apathy on the part of our leaders.

J. WREGHITT CONNOR.

Leeds, May 30th, 1887.

"A STUDENT'S NOTES ON GLOUCESTERSHIRE."

SIR,—I thank you and Mr. Paul for the very interesting paper. [See p. 814, ante.]

Allow me to say, if any student is taking the same ground, that I would advise him to come *via* Oxford and Chipping Norton, to Bourton-on-the-Water, as he is then only six miles from Northleach, and about ten from the Roman villa at Cbedworth. The latter will teach him more of architecture than a cartload of books (if he has eyes to see), and no student should miss it.

Tisbury and Dursley are worth a visit; and near Gloucester there is the ruined Abbey of Llanthony waiting for some one to measure and draw it, and properly write its architectural history before it is finally carted away.

Upleadon Church, with its early sculpture, Churchdown, Burnwood, Bulley, and Newent churches are all worth a visit.

ROBERT PHILLIPS,  
Clerk of County Works for Gloucestershire.

Chiswick Church.—In reference to a note of the visit of the Architectural Association to this church last week (see p. 798, ante), Mr. Griffiths, the clerk of works, writes to say that the teak and oak seats, &c., are not "polished," but only dry-rubbed.

PROVINCIAL NEWS.

**Birkenhead.**—The new Sessions and Police Courts at Birkenhead have lately been opened. The new courts, which are situate in Chester-street, adjoining the Town-hall, form part of a large scheme launched some years ago by the Birkenhead Corporation, involving altogether an outlay of about 100,000*l.* The foundation stone was laid on January 6th, 1885. The architects are Messrs. T. D. Barry & Son, of Liverpool, whose designs were selected in competition. The amount named by the architects as the probable cost of the complete structure was 32,500*l.*, and the tender of Messrs. A. Bleakley & Son, of Birkenhead, who offered to execute the building for 28,890*l.*, was accepted. The style of architecture adopted is Classical. The stone used in all the elevation of the buildings is from the Storeton Hill quarries. The system of ventilation adopted is that known as the "Plenum" system, which consists in the admission of the warmed or cooled air to such parts of the building as are to be treated, the air being admitted at the lowest level of the rooms. The Chester-street front, above the principal entrance, is arranged to form an open colonnade, recessed about 5 ft., containing columns with richly-carved caps. Above these on the two principal angles are square turrets, about 5 ft. square and rising to a height of about 15 ft., terminating in pediments supported by pilasters with carved caps. The space between these turrets is filled in by a mask wall about 10 ft. high, and immediately in front of this, though standing considerably above it, is a large sculptural group representing "Justice." This group, which is about 15 ft. high, including its base, represents the figure of the "Law Giver," which is itself 9 ft. 6 in. high, standing on a pedestal between the half-reclining figures of "Justice" and "Mercy." The two principal windows on the Chester-street front are surmounted by carved figures of emblematic design, whilst the tympana are filled in with very fine floriated carving. The principal windows facing north and south are crowned with circular-headed pediments, the tympana containing carvings representing Hope, Penitence, Justice, and Retribution. The whole system of speaking tubes, as well as of the fire-extinguishing apparatus, pipes, hydrants, and also the copper-plate lightning conductor, were executed by Mr. A. Bucknall, of Renshaw-street, Liverpool; the other sub-contractors being as follows:—Glazing, Messrs. Lachland & Son, Birkenhead; ironfounders' work, Edward Jones, Conway Foundry, Birkenhead; carving, R. L. Boulton, Cheltenham; heating and ventilation, Messrs. Haden & Son, Trowbridge; wood block and fire-proof flooring, Mr. R. L. Lowe, Farnworth; ceramic mosaic, Mr. G. Swift, The Temple, Liverpool; marble lining to walls, Messrs. John Stubbs & Son; grates and mantels, Mr. James Roy; blinds, Messrs. Price & Patterson, Birkenhead; gasfittings, Messrs. R. Hamilton & Son, Conway-street, Birkenhead. The whole of the works were carried out under the superintendence of the architects, the clerk of works being Mr. Peter Thomas, of Liverpool.

**Buxton.**—The Local Government Board have lately given their sanction to an application by the Buxton Local Board for a loan of 6,000*l.* for providing offices for the proposed Free Library and Reading Room, subject to sanction being given for the appropriation of a plot of land for the library, as required by Act of Parliament. This, with the previous sanction of 2,000*l.* for a Town-hall, and 1,900*l.* from the insurance companies for the loss of the Market-hall by fire, makes up the 10,000*l.* necessary to complete the scheme for the erection of a Town-hall, Free Library, public offices, and market shops. It is stated that the Duke of Devonshire has promised a site of land free for a portion, if not the whole, of the buildings.

**Iseworth.**—Mr. S. Woodbridge, jnn., of Brentford, has been appointed architect for the public hall to be erected at Iseworth to commemorate the Queen's Jubilee.

**Leeds.**—By the munificence of Mr. John North, of Leeds, a Semi-Convallescent Home is being erected at Cookridge, the institution being intended as an adjunct of the Leeds Infirmary. The architects are Messrs. Chorley & Connor, Park-row, Leeds. It is expected that the building will be ready for occupation about the beginning of 1888. According to the *Leeds Mercury*, the institution will afford accommodation for forty-two beds, and should it be necessary to increase this number, some un-

appropriated rooms may be devoted to the purpose. The site is a portion of the grounds of the existing Convalescent Home at Cookridge, which have been extended for the purpose. The frontage is 230 ft. long, and the depth 120 ft. The structure will be faced with brick, the doors and windows having stone dressings. Picturesqueness will be imparted by the erection on each side of deep verandahs, which will afford shelter to the patients when out of doors, as well as by the elevated central administrative block. The general plan internally is intersected by a T-shaped corridor, the central arm forming the approach, and the head of the T leading right and left to the male and female sides. There are two large wards, 63 ft. by 24 ft., two 20 ft. square, and two 14 ft. by 12 ft. There are two day-rooms, each 27 ft. by 20 ft., with nurses' rooms, medical officers' rooms, servants' and nurses' bedrooms, cloak-rooms, kitchen, store-rooms, collarage, &c. There is also a small detached mortuary. The cubical area allowed to each patient is somewhat in excess of that usually found in such institutions. It amounts to 1,300 ft. per patient. The well-known firegrates designed by Mr. Pridgin Teale will be used throughout the building. The bath-rooms, lavatories, &c., are to be in detached pavilions, one on each side of the main block, communication between these and the wards being intercepted by isolation lobbies. The whole of the house will be heated by steam, the cooking apparatus to be arranged in connexion with the same boiler. The estimated cost of the building, exclusive of furnishing, is 5,600*l.*, and Mr. North has already contributed 5,000*l.* The contracts for the new building have been let as follows:—Mason and brick work, Mr. Chas. Myers; joiner's work, Mr. Banks Mawson; plumber's work, Mr. George Lazenby; slater's work, Messrs. Sharp & Harper; plasterer's work, Mr. J. P. Mountain; and painting, Mr. Joseph Walker.

**Newcastle-on-Tyne.**—The foundation-stone of the Fleming Memorial Hospital was recently laid by Lady Armstrong. The architects are Messrs. Quilter and Wheelhouse, of London, whose design was selected in competition. The contract was given to Messrs. John and William Lowry, of Newcastle. The site of the building is a piece of open land, about three acres in extent, facing the Town Moor, and adjoining the Philipson Memorial Institution. The building is arranged with all the wards on the upper floor, having windows on both sides, ensuring a thorough circulation of fresh air and sunshine (when any of the latter is to be had). The grounds are surrounded by an iron railing, with entrance gates and lodge at the south-west corner. At the right of the entrance-hall is the committee-room, and on the left a waiting room, adjoining which is the separate entrance for out-patients and the porter's room. The surgery, dispensary, and drug store occupy a position in the north wing, beyond which is the residence of the medical officer, and the south wing is occupied by the matron's residence, with store-room, linen and work-room. Beyond the principal staircase eastward is the dining-hall, with passages and serving lobbies on each side. A paved playground is formed on each side of the dining-hall, in addition to a large grass playground, which occupies the east portion of the site. The whole of the upper floor is occupied by the wards and rooms for patients and nurses. In the centre of the west front, over the entrance, is a day-room for convalescents. On the east side of the principal staircase, over the dining-hall, are the surgical ward, operating-room, and a small dark room for special cases. Isolation wards for four boys and four girls are arranged over the kitchen buildings, with a separate entrance, and provided with nurses' room, bath-room, scullery, and w.c. These have no internal communication with any other part of the building. The materials employed externally are dark red-pressed bricks with stone dressings for the walls, and green slates with red tile-ridges for the roof. The internal fittings and the heating and sanitary arrangements are all of the most improved character. The general style of the building has been adapted from that employed during the sixteenth century in English domestic buildings, of which so many fine examples are to be found in various parts of the country. The entire cost of the work, including purchase of site, furnishing, &c., is 20,000*l.*, and is the gift of Mr. John Fleming, of Newcastle, in memory of his wife, Mary Fleming.

Norwich.—The ceremony of opening the new premises of the Church of England Young Men's Society took place on Wednesday, the 25th of May. The following accommodation has been added to the premises which were erected about ten years since:—In the basement, a large gymnasium, 65 ft. by 25 ft., and 19 ft. high; on the ground-floor (in addition to the existing reading-room, which will be used as a general reading-room and library), a room, 25 ft. by 30 ft., devoted to study and quietreading, Secretaries' room, two class-rooms, and a refreshment-room; the lavatories have also been rebuilt and greatly enlarged; on the first floor, a large class-room, members' sitting-room, small class-room, and lavatories. The lecture-hall has also been enlarged. On the second floor two class-rooms and the resident superintendent's apartments; and two storage rooms on the third floor. The total area of the rooms as they now stand is about 7,050 square feet against the 2,500 square feet obtained in the old building exclusive of staircases and passages. The contract for the building was 2,720*l.*; extra expenses 350*l.*; and furniture and fittings 400*l.* The building was carried out by Mr. G. E. Hawes from the designs of Mr. Arthur J. Lacey, architect, Norwich.

Sculcoates.—The new Sculcoates parochial offices, which have been recently erected in Bond-street, were lately formally opened. The building is an adaptation of fifteenth-century Gothic architecture, in local red bricks, with stone dressings and shafts of polished shap granite to the ground-floor windows. The ground-floor provides a large rating office, with a strong room attached, and opening from it is the private office for the assistant-overseer. From the porch access is obtained by double doors to the stone staircase leading to the overseers'

committee-room, which will also be available for other parochial purposes. The building has been erected in a substantial manner, the wood-work for the internal fittings, and also for the doors and windows, being of Stettin oak, which has been simply oiled and wax-polished. The fittings of the public office, supplied by Messrs. Audas & Leggott, are also in oak and wax polished, and executed from the architect's designs. The building has been erected by Mr. John Drury, of Beverley-road, who has had associated with him as sub-contractors, Mr. Jordan, mason; Mr. Kendall, carpenter and joiner; Messrs. Wright & Son, ironmongers; Mr. Taylor, plumber; Mr. Hunter, slater; and Mr. Drewery, painter. The gas-fittings were supplied by Messrs. Stones, Settle, & Wilkinson, and Messrs. Jones & Willis, of Birmingham. The whole of the works have been carried out from the designs and under the superintendence of Mr. Samuel Masgrave, F.R.I.B.A., Hull.

Warrington.—Large new warehouses have just been completed at the Bank Quay Soap Works, for Messrs. Joseph Crossfield & Sons. They adjoin the other buildings belonging to the firm, and each floor contains an area of about 5,700 superficial feet. All the walls are built of the best Wigan bricks, and the elevations are relieved with Cefn stone and pressed bricks. A special feature of the building is the roof, which has a span of about 60 ft., and is constructed of wrought iron and covered with Velenheli slates. On each side of the roof a skylight is formed, about 5 ft. deep, and the full length of the building. In elevation the treatment is of a plain but substantial character, with bases, copings, labels, and pediment of Cefn stone, and the openings in the main gable are filled with louvre boards and have mionided labels. The ground-floor is to be used for tablet-

stamping and cutting soap, and the buildings are so arranged that five waggons can be loaded at the same time. The second-floor is to be used for a packing-room, and two hoists are fixed for loading the waggons below. A bridge has been constructed on the second floor so as to give access from old warehouse to the new buildings. The top floor is constructed of flitched beams resting on cast-iron columns and joists and covered with rebated boards. The ironwork has been executed by The Pearson and Knowles Coal and Iron Company, Warrington. The contract for the whole of the works has been successfully carried out by Mr. William Taylor, builder, Warrington, from plans and under the superintendence of Mr. William Perry, architect, Warrington.

### The Student's Column.

FIELD WORK AND INSTRUMENTS.—XXIII.

Levelling Instruments.

VII.—JAHN'S LEVEL.

THIS instrument is illustrated by figs. 1 and 2, and consists of a levelling telescope mounted upon the ends of a horizontal bar, which is supported upon a tripod head, the details of which are shown in figs. 4 and 5. The telescope is set level by being placed alternately in the positions shown in figs. 1 and 2. These positions are at right angles to one another. The adjustment of the longitudinal bubble in fig. 1 is effected by means of the wedge-shaped connexion marked B, which is turned horizontally by the milled edge marked A, and the adjustment in fig. 2 is effected by means of the vertical screw marked

Fig. 1

Fig. 2.

Fig. 3.

3. The comparative tightness of the adjustment may be effected by regulating the screws below the wedge-piece plate and of that fixed to the main body of the vertical axis cone. When attention is paid to this, the revolution of the telescope may be effected without disturbing the wedge-piece plate. Otherwise it must be held in position as stated upon the note in the diagram.

VIII.—STEVENSON'S LEVEL.

Figs. 1 and 2 of the annexed illustration show levelling instrument invented by the late Mr. David Stevenson, M. Inst. C.E., in 1844. It consists of a 10-in. telescope, arranged to unscrew at A, so as to pack conveniently in two parts. B C represents the longitudinal level, D a circular, or, more correctly speaking, spherical level, E a compass, F the screw for adjusting the focus when viewing an object, and G the eye-piece. The telescope rests in a support marked M, which is attached to the body of the instrument by a screw at N, and is secured to the tripod by a ball-and-socket joint, indicated by dotted lines in fig. 1. This joint is constructed to be clamped and unclamped by means of a screw, worked upon the inner circle of the piece marked S T. The telescope is clamped at M by the spring K L, and is acted upon by the elevating screw marked H. To

set the instrument level the screw-plate S T is first unclamped and the telescope is carefully moved by the hand until the circular bubble at D appears central. The screw-plate S T is then moved by the hand so as to clamp the ball-and-socket joint, and the telescope being directed to the point of observation required, the final adjustment is effected by setting the longitudinal bubble B C in the centre of its run by turning the milled head of the screw H. It will be observed that in this instrument no preliminary setting of the level by the tripod legs is required, but that any movement of the telescope would necessitate the longitudinal bubble requiring to be re-adjusted to the centre of its run, in order to make the line of collimation horizontal.

IX.—SANG'S LEVEL.

One of the earliest forms of gimbal action employed to aid the setting-up of a level is shown in fig. 3, which illustrates the arrangement contrived by the late Mr. John Sang, of Kirkcaldy in Fifeshire. The lower portion, marked A, is secured to the head of the tripod, and the vertical axis of the telescope is supported in the central socket, which is connected by a horizontal axis, marked I, to socket-bearing at F F. These bearings are rigidly attached to the middle piece, marked D, which has an axis, E, working

in the sockets B B. The axis B B is at right angles to the axis F F, and the trunnions of these two axes are formed by a double cone fitted into the socket-bearing and clamped by screws, marked k and h. The milled-headed screws, marked K and H, work each in a nut, which by a revolving-joint are connected in each case to a crank arm, so that by their means the upper portion, marked I, is adjusted in one direction, and the central portion, marked D, is adjusted in the other direction, as required.

DISSENTING CHURCH-BUILDING NEWS

**Carlisle.**—The Warwick-road Presbyterian Church, Carlisle, has lately been reopened, after extensive alteration and improvement. The church was erected about twenty-five years ago, to meet the wants of the increasing congregation of Presbyterians in Carlisle. When the site was selected it was close upon the outskirts of the east end of the city, but since then numerous streets have been formed, and the church now occupies a site almost in the centre of the best part of the town. After the site had been purchased from the Earl of Lonsdale the services of an Edinburgh architect were obtained, and as the congregation at that time was small, and not very wealthy, it is recorded (says the *Carlisle Journal*) that the following very brief instructions were given, viz. "Make it as plain as ye can, and be canny wi' the bawbees." The architect faithfully carried out their instructions, and the church has always ranked as one of the plainest internally in the town. Mr. T. Taylor-Scott, architect, of Carlisle, having been consulted, prepared plans for remodelling the whole of the interior, and the contract for carrying out the whole of the work was let to Mr. William Latimer, joiner, Victoria Viaduct. The most critical portion of the work was the roof scheme, as the whole of the interior construction of the large span roof, covering an area of 4,000 superficial feet, had to be removed and a new roof constructed without interfering with the alates and roof boarding.

**Fovey.**—A new Congregational chapel is being erected at Fovey, in place of the old one, which is not only dilapidated, but is in an obscure and out-of-the-way position. It is reached by two paths, one involving an ascent of seventy steps and the other forty-five steps, and was inaccessible to the aged and infirm, and even dangerous. The site for the new chapel is at the beginning of Lostwithiel-street. The building, which is of red brick, and Gothic in style, consists of a chapel and organ-chamber, with schoolroom and class-rooms behind. The architect is Mr. J. Wills, of Derby, the builders being Messrs. Penter & Cossentine, Polruan; and Mr. W. J. Sambell is clerk of the works. The cost is expected to be about 1,200l.

**Glasgow.**—The memorial stone of a new United Presbyterian church, in course of erection in Lancefield-street, Glasgow, for the Cranstonhill U.P. congregation, was recently laid by ex-Preceptor Mathieson. The church, which has a frontage to Lancefield-street of 70 ft., is flanked right and left by small towers rising to a height of 55 ft. The wall between these is rusticated, and built to the circle, concentric with the seating inside. Access is had from woman entrances placed in the towers. The church inside is seated entirely to the circle, to accommodate about 900 persons. Behind, and having a frontage to Oak-street of 70 ft., is placed a building in which are constructed hall, session-house, vestry, &c. The hall is seated to accommodate about 300 persons, and has passages on each side for exit from church and hall into Oak-street. On either side of the passages are placed the vestry, retiring-rooms, session-house, and stair to hall gallery and meeting-room, also stair down to kitchen, &c. From the south vestibule in Lancefield-street a stair communicates to an underground passage and the lavatories. This passage leads across the basement to a large kitchen, heating-chamber, store, &c. The church is being built by Messrs. McKissock & Co., from designs by Messrs. H. B. W. Steel & Balfour, architects, and is Classic in style.

**Mepal (near Cambridge).**—A Munich window, by Mayor & Co., has lately been erected in Mepal Church, near Cambridge, representing "The Angel at the Tomb." The window is the gift of Mr. George Borwick Mead, M.D., of Newmarket, and is erected in memory of his wife, Elizabeth Bessie Owen, died December 6th, 1885, aged fifty-three years.

## Books.

*Circular Work in Carpentry and Joinery: a Practical Treatise on Circular Work of Single and Double Curvature.* By GEORGE COLLINGS. London: Crossly Lockwood & Co.

THIS is one of "Weale's Rudimentary Series," and is an excellent example of what a book of this kind should be. Cheap in price, clear in definition, and practical in the examples selected, it will be a help to those who carry out work of the nature treated upon. The scarcity of hands who can undertake curved work, compared to those who can do straight work, is often a trouble to smaller employers when they have a job out of the common run. Mr. Collings's book gives simple and sufficient instructions for accurately setting out most of the forms that the carpenter and joiner is likely to meet with in ordinary practice. If, therefore, the employer has men of sufficient manual skill, there should, with this book to refer to, be no difficulty in compassing any forms within reasonable limits of single and double curvature. The work is divided into two parts, the first treating of simple curvature, and the second of complex circular work. In the former the more general forms are dealt with, such as solid-headed frames, elliptical heads, bulls-eye frames, Gothic forms, circular frames, &c. The way in which these should be set out is described and illustrated by suitable diagrams. The diagrams are based on geometrical principles, but nothing is introduced not necessary for the practical application of the instructions laid down. The second division of the book is naturally more complicated than the first, but here again the author's chief aim has been towards simplicity, and practical methods are used throughout. The author states that he has either himself executed, or seen executed by others, examples of all the work set forth in the book according to the rules laid down. We see no reason to doubt the accuracy of the various methods, although in some instances they may differ from the ordinary procedure of architects. It may be said, however, that where such differences arise Mr. Collings can claim the merit of greater simplicity. Altogether, the book is one to be recommended, and forms a most appropriate volume in Weale's series; none the less welcome because its principles will endure, and it is not likely to become valueless, even after twenty or thirty years' service.

*St. Wandrille's Abbey: a Lecture, with Historical Preface.* By ALFRED GATTY, D.D., Sub-Dean of York. London: G. Bell & Sons. Sheffield: Thomas Rodgers.

THIS is a pleasant, chatty, and amusingly naïve account of the author's one journey across the Channel, to visit the ruins of the Abbey of St. Wandrille, not far from Rouen, with which abbey his own parish of Ecclesfield had formerly been connected, the Church of Ecclesfield having been served in early days from the Abbey of St. Wandrille, which also (*temp.* Henry I.) held property at Ecclesfield. The ancient priory, the original foundation of which is assigned by Mr. Hadfield to the date of circa 1250, now remains apparently in the form of a late Gothic building, which is in course of repair and conservative restoration, under the care of Mr. Hadfield. One or two sketches of the remains of the French mother-church are given, not very well, it must be admitted, at the hands of an amateur sketcher.

One cannot but sympathise with the wish of the author to see whatever was left of the French abbey church, which was the original mother-church to his own parish: he gives an account, brief and rather crude, but picturesque, of some bits of architectural remains known to few persons at present; and the simplicity of the narrative is amusing, even where it conveys no special instruction.

*K. Baedeker Mittel-Italien und Rom. Achte verbesserte Auflage.* Mit einem Panorama von Rom einer Ansicht des Forum Romanum. 8 Karten und 31 Plänen. Leipzig. 1886.

THE eighth edition of Baedeker's Central Italy and Rome has just appeared. If the volume were a mere guide-book for the use of the tourist, to notice it would be superfluous; but the present edition should serve a wider purpose. The full details given as regards classical antiquities, sites, and excavations make it a practical hand-book of high utility, both for

student and teacher. Any one who is reading Roman history will do well to have before him such a plan as, for example, that of the excavations between the Capitol and the Arch of Titus, and any one who is teaching Horace will find his work the livelier for occasional reference to the excellent Panorama of Rome and its surroundings, with Mount Soracte and the Sabine range. The book cannot claim to rank as quite equal with the "Rom und die Campagna" of Gaelfels, but it runs it close.

*The Geology of England and Wales: with Notes on the Physical Features of the Country.* By HORACE B. WOODWARD, F.G.S., of the Geological Survey. Second edition. London: George Philip & Son. 1887.

THE appearance of the second edition of this very useful work will be welcomed by all who take an interest in geology, whether they study the subject from a purely scientific or from a practical point of view. It differs in its construction from any other geological treatise with which we are acquainted. The professional duties of the author have unquestionably given him peculiar advantages in prosecuting his researches. The book is divided into three parts, has two appendices, a copious index, and a coloured geological map of England and Wales. The introduction to the work is occupied by an abstract of the elements of the science, given in a clear and suggestive manner.

The first part deals with the chief divisions, from the Archaean to the Carboniferous inclusive, and these are classed together under the term Palaeozoic. In spite of the fact that the author takes up a more or less independent position with regard to controversial matters, he believes that there is no great break between the Archaean and Cambrian rocks; yet, it has frequently been demonstrated, that metamorphosed portions of the former are often found as a basal conglomerate in the latter! We observe with much satisfaction, however, that the Cambro-Silurian difficulty is bridged over by the adoption of the term Ordovician for the upper Cambrian of Professor Sedgwick. The extension of the Devonian and Carboniferous beds under the London basin are most admirably treated, and good practical suggestions are here and there thrown out in regard to undiscovered coal-fields.

The second part of the book describes the beds from the Permian to the Cretaceous inclusive. It has been customary in the more prominent of our recent text-books to class the Permian with the Palaeozoic rocks, and we see no reason why this course should have been departed from. The one given by the author,—that they should be associated with the Triassic rocks on account of the similarity in their characters and methods of formation,—does not seem to us to be sufficient. Palaeontological evidence is against it, especially so on the Continent. The Jurassic and Cretaceous series are handled in a masterly manner, particularly that portion describing the Lias.

The third part embraces the Tertiary and recent periods, volcanic phenomena, mineral veins, denudation, and scenery. We are pleased to notice that the necessity of classifying the Bovey Tracey beds with the Bagshots has been felt. Some of the subdivisions of the Tertiaries have, however, been very summarily disposed of. Surely the description of the highly fossiliferous Barton Clay ought to occupy more than a dozen lines. Each important section throughout the book concludes with a brief description of the economic products of the rocks comprised therein, and it is these portions of the work which would probably be most interesting to the majority of our readers, dealing, as they especially do, with building stones. The information under this heading, however, is not given in a connected manner. The book, as a whole, is a standard work of reference, and thus it is principally useful to us in referring to the stone quarries of particular districts. Here and there the author ventures to point out the better kinds of building stones, and sundry observations occur on the causes of the decay of stone.

The first appendix shows the relative thicknesses of strata passed through in several deep wells. The second,—by Mr. E. T. Newton, F.G.S., F.Z.S.,—is a synopsis of the animal kingdom, with especial reference to the fossil forms, which is exceedingly useful; we believe that a reprint of it is issued as a separate pamphlet. The coloured map, drawn by Mr. J. G. Goodchild, F.G.S., might have been

executed on better paper, and its scale should have permitted a more minute sub-division of the formations. We must take exception also to the colour of the Archaean and Metamorphic rocks being identical, as certain portions of the map are thereby rendered inaccurate. For instance, there are many areas in which the Palaeozoic rocks are metamorphic in every sense of the term, but the map does not show them.

Speaking generally, there can be no question as to the high value of the work as a book of reference. Its author has apparently left no stone unturned to render it complete, and we can therefore confidently recommend it to those who are interested in the subject.

*School Hygiene: The Laws of Health in Relation to School Life.* By ARTHUR NEWSHOLME, M.D. London: Swan, Sonnenschein, & Co. 1887.

THIS is a most admirable and practical little book, containing in a small compass a great deal of sound information put in a concentrated and at the same time intelligible form. A certain portion of the book is purely medical, having relation to diet, diseases, school accidents, &c.; but more than half of it is occupied with the construction, drainage, and ventilation of the buildings; and while we do not always find that medical men, in spite of their diatribes against architects, are really very well up in the mechanism of sanitary construction, we must say that as far as Mr. Newsholme goes into the subject he shows a thorough and workmanlike knowledge of it, and his sections of lavatory and closet drainage, &c., are careful and correct in showing the main outline and principle of the objects to be aimed at, and he is alive to some little details sometimes overlooked by even those who would be considered sanitarians, such as the necessity for a trap in a sink waste to prevent any foulness on the inside of the pipe from contaminating the air of the house. The remarks on warming and ventilation are also to be commended, and one point is drawn attention to in the chapter on this subject, which is often overlooked, viz., that when a furnace is employed to supply a current of warmed air, the source of the air supply to this furnace is a matter of great practical importance; "the furnace-room may contain decomposing vegetables or an empty bell-trap leading to a defective drain or a water-closet, none of which increase the purity of the school atmosphere." People are too apt, especially in the case of buildings in crowded neighbourhoods, to look only to the means of supplying and circulating air in the building, and to forget the important question, "Where does the air come from?"

Dr. Newsholme's book is mainly written for the guidance of teachers in schools, that they may know the proper conditions of health in a school, and be competent to see that these are kept up. The brief and clear wording of the book, and its moderate size and scope, render it particularly suitable for such readers, who require to obtain a general but sound knowledge within a small compass, and without too many technicalities.

*Practical Electric Lighting.* By A. BROMLEY HOLMES. Third Edition. London: Spon. This little book is well got up, and gives in a concise form a résumé of the information on the subject which can be gathered from such writers as Thompson, Gordon, Dredge, Clerk-Maxwell, and others. To any one who knows nothing of the subject, and who wishes to obtain a popular knowledge of it, such a book will be fairly interesting; but we should not recommend it to a student who wishes to master the principles of electric lighting, as he will get them far better from the larger and more scientific treatises of the authors above mentioned. Indeed, we are disposed to question the advisability of multiplying the number of professedly non-scientific treatises on scientific subjects.

*Levelling and its General Application.* By THOMAS HOLLOWAY, of Chippingham, Wilts. London: E. & F. N. Spon, 125, Strand.

IN this work the author has fulfilled in a very able manner the task which (as stated in the preface) it was his intention to undertake, namely, to provide a book solely for the guidance of the uninitiated. The experienced-practitioner will, however, find nothing new with respect to instruments, and, as regards

the portion of the book devoted to the general application of levelling, it would not be difficult to give many hints upon omissions, as invited by the author at the conclusion of the work. We are glad, however, to note some valuable remarks upon contouring, a subject generally omitted or very imperfectly alluded to in similar existing treatises, but described by the author in a very practical manner. We are sorry to find that the introduction of a column for "intermediate sights" in a level book is not recommended, as it facilitates the reduction of the levels that have been booked in the field to a common datum when checking the figures page by page. The author gives some important advice upon holding a level staff, but omits the all-important consideration of waving a staff in a vertical plane in order to obtain the shortest reading. We think also that he has shown rather too much partiality to one maker, although he has been fortunate in obtaining the loan of engravings of instruments from so eminent a maker as Mr. Stanley. There are other makers, such as Messrs. Adie, Cooke, Elliott, and Troughton & Simms, equally well known to surveyors generally. At the same time, we can heartily recommend the careful perusal of the pages of this book to young beginners. The print and binding of the book are attractive, and almost invite a study of the contents. A comprehensive index and a very practical list of questions for examination is added at the end of the book.

*Elementary Plane Co-ordinate Geometry, as applied to the Straight Line.* By W. E. ROBERTS, Architect and Government Surveyor, Durban, Port Natal. London: White, Holmes, & Stephens, Coleman-street.

The author has in this work arranged and compiled in an intelligible form about one hundred pages of useful information connected with co-ordinate geometry. His chapters deal with the co-ordinates of points, areas of rectilinear figures, equations to straight lines referred to both rectangular and oblique axes, and polar equations to straight lines, together with several valuable explanatory problems. A knowledge of Algebra, Euclid, and Plane Trigonometry is assumed to have been acquired by the student, and the reader is then presented with the above subjects in a form which the author has found eminently successful with his own pupils, and which, if not so complete as furnished by many higher mathematical works, cannot fail to be of great assistance to the student in leading him through the most essential and practical portions in as simple a manner as the subject will permit. At the end of the book are added some remarks upon the application of the subject to survey calculations, the determination of co-ordinates and area of plots of land. We doubt the general usefulness of the application to surveys which the author would assign to it, but as an example of the principles laid down in the book this chapter is well placed. The subject has a wide range, and the information which the author has dealt with in his book places very clearly before mathematical students many practical methods. We are glad to see so reliable an authority upon conic sections as Todhunter quoted. The answers given at the end of the book to the problems contained within its pages will also be welcomed by those who desire to study the subject in the only way in which it can be properly learned, namely, with pen or pencil in hand, working out the examples.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

7,797, Glazing. C. F. Elliott.  
In this invention, putty or cement is dispensed with, and the improvement consists in the particular form of, and connexion between, the sash-bar and cap, which is such as to allow for expansion and contraction. The sash-bar is provided with wings, the edges of which are turned up, and provided with grooves or channels to receive packing strips. These turned-up flanges and packing strips form the seat or bed for the glass sheets. The sash-bar is sometimes provided with a wooden core. The form of the sash-bar or astragal is claimed by the patentee, and also dies for stamping out the metal in this particular form.

7,884, Outlets for Ventilators. T. G. Norman and S. E. Major.

This invention relates to a chimney cap of rather elaborate construction, which expands the air in the shaft by creating a vacuum in the cap when the air impinges on the exterior of an air-chamber con-

structed therein. The intensity of the force of the up-current may be augmented by placing a shield or plate in the interior of the cap, which is made of metal, and is designed for terra cotta or earthenware chimney or ventilating tops.

8,120, Portland Cement. S. Lowden.  
The object of this invention is to manufacture a nucleus of cement which may be transported from place to place; so that the cement may be cheapened by reducing the cost of transport, and by the use of this nucleus to make the cement on the ground where it is to be used, whenever chalk or limestone is found in the vicinity.

8,145, Improvements in Water-closets. W. Smeaton, sen.

This invention consists mainly in the introduction of an intermediate turret or cover placed between the bottom of the closet-pan on the top of the siphon or other trap. The turret may be turned in any position, and thus a connexion of the closet and soil-pipe may be effected independently of the situation of either.

8,152, Lead Glazing. H. M. Keene.  
According to this invention, a strip of metal, lead preferably, with a ridge in the centre of the strip, is fastened down the centre of the rafters. The thin portion of the strip is then turned well back against the narrower portion (the ridge), the glass is laid on the rafters, and the thin edges are flattened to the glass and smoothed with an ordinary putty-knife.

8,175, Window-sashes and Sash-frames. T. Howdill.

This is claimed as an improvement chiefly designed to avoid the risks of cleaning windows from the outside, and also to improve the ventilation of the rooms. The sashes are hinged and secured to the sliding stile at their lower ends by means of centre hinges, in such a manner that the sashes can be tilted or drawn inward, leaving the outside uppermost. When desired, one or both sashes may be tilted so as to form a kind of hopper ventilator.

NEW APPLICATIONS FOR PATENTS.

May 20.—7,387, S. Oldershaw and D. Butt, Machines for Cutting or Stamping Holes in Slates, &c.—7,356, J. Armstrong, Lead Glazing.—7,378, W. Mosley and J. Lewis, Electric Indicators and Bells.—7,351, J. Dudley and J. Hamilton, Concrete and Artificial Stone Mantelpieces.—7,359, R. Fladgate, Securing Double Doors, Panels, &c.

Pitt, Manufacture of Building Materials from Glass.

**Restoration of a Roman Aqueduct.**—The *Kölnische Zeitung* states that, by order of the German Government, the Roman aqueduct near Ars, on the Moselle, one of the greatest Roman works north of the Alps, is to undergo thorough repair in the course of this summer. Of this structure, which dates from the time of Augustus, and originally spanned the whole valley of the Moselle, there remain on the left bank of the river nine, on the right bank seventeen piers, some of them to a height of 18 metres. The work of restoration, which is superintended by Dombaumeister Tornow, will be confined to the preservation of the existing remains.

## MEETINGS.

SATURDAY, JUNE 4.

Association of Municipal and Sanitary Engineers and Surveyors.—Home Counties District Meeting at Portsmouth. Paper by Mr. Boulnois on the Drainage Works of Portsmouth, recently carried out by Sir Frederick Bramwell.

St. Paul's Ecclesiastical Society.—Visit to Cobham. Train from Holborn, 8.16 p.m.

MONDAY, JUNE 6.

Surveyors' Institution.—(1) Annual General Meeting to receive the Report of the Council and to elect officers for the ensuing year. (2) Distribution of Prizes. 3 p.m.

Society of Biblical Archaeology.—3 p.m.

Institution of Civil Engineers.—Annual Meeting of Corporate Members only, to receive the report of the Council and to elect the Council and Officers for the ensuing year. 8 p.m.

THURSDAY, JUNE 9.

Architectural Association.—Annual Dinner, Holborn Restaurant.

Society for the Encouragement of the Fine Arts.—Third Concertations at the Galleries of the Royal Institute of Painters in Water Colours, Piccadilly. 8 p.m.

FRIDAY, JUNE 10.

Royal Institution.—Mr. Thomas Hodgkin on "Aquilaia the Precursor of Venice." 9 p.m.

SATURDAY, JUNE 11.

Architectural Association.—Visit to Banstead Park, the residence of the Hon. Francis Baring. (See advertisement on p. xvi.)

## Miscellaneous.

**The Iron Process for Sewage.**—In the course of a recent report to the Health and Drainage Committee of Windsor, by the Chairman of the Committee and Mr. Alderman Lundy, in referring to the treatment of the sewage at Chichester Barracks by the iron process, says:—"The application of sulphate of iron is very simple, and the precipitate, occurring below the outfall, was perfectly free from offensive smell. A careful examination of the sewage resultant shows it to be a true chemical precipitate, which soon desiccates, when it may be handled with impunity. The effluent possesses a high degree of purity. The sewage discharge, which is weak, as thirty-four gallons of water are daily supplied per head, amounts to 15,000 gallons in twenty-four hours. Mr. Conder's scheme is that the crushed dissolved sulphate of iron must be applied continuously; that the gentle flow and the absence of light, such as occur in every sewer, render the chemical operations of sulphate of iron on sewage most effectual, that its darkness and agitation are essential to make the experiment effectual. . . . It yields a deposit free from associated water, unlike lime and other reagents, which do not destroy sewage matters, but aggregate them into sludge—a resultant most difficult to get rid of and expensive to deal with."

**Cremation.**—During the past eight months there has been carried on upon a large scale, in the midst of a populous part of London, a system of cremation the results of which have, after severe trials, proved highly satisfactory. In the summer of last year a serious difficulty arose at the Temporary Home for Lost and Starving Dogs, in Battersea, in consequence of the local authorities of the district, where the dead bodies had hitherto been disposed of, having refused to allow of their being received there any longer. At a public meeting of the supporters of the Institution, it was

decided that the bodies should be destroyed by cremation. A furnace has been erected in a small yard at the extremity of the Society's premises near to the Battersea Park-road, and consisting of a close-chamber (capable of containing about 120 dead dogs) constructed with bottom, sides, and arched tops, of Stourbridge fire tiles, specially made and supplied for this purpose by Messrs. Cull & Son, of Palmerston-buildings, London. Underneath the chamber is placed the furnace, from which a series of cells or flues, after conveying the flames round the sides and top of the chamber for its whole length, are led by a longitudinal flue along the top, into a shaft, about 70 ft. high, built over the entrance to the furnace. The bodies of the dogs which have been destroyed in the lethal chamber on the previous night are placed in the morning in layers on the floor of the chamber until it is nearly full, leaving a space all round between the bodies and sides and top of the chamber, after which the opening is closed by a heavy cast-iron door (which is raised or lowered at pleasure) and hermetically sealed. The fire, which has previously been lighted in the furnace beneath, is then actively increased until the bottom, sides, and top of the chamber become red-hot. The gases which are created in the chamber are led back, by openings specially arranged for the purpose, into the furnace beneath, where they ignite, and, together with the contents of the chamber, become a mass of flame, thus rapidly and effectually completing the process of cremation. After the products of combustion in the close chamber have passed through the fire, they are then conducted (together with any smoke from the fire itself) through the series of super-heated flues before entering into the shaft, with the result that the whole is consumed, nothing being left but a small quantity of incinerated bones and ashes, which are eventually disposed of for manure. The furnace was designed by Mr. E. Crutchlow, the architect to the Committee, and carried out by Mr. W. Neil.

**Opening of the New Windsor Lines of the London and South-Western Railway.** The additional double lines of rails, between Clapham and Barnes, for the purpose of giving increased facilities for the traffic on the London and South-Western Company's Windsor system, were opened on Wednesday. The works, which have been in course of construction for upwards of three years, have involved a very large outlay in actual works, in addition to the heavy expenditure which has had to be incurred in the purchase of the necessary land along the line of route. All the bridges crossing over the several roads between Clapham and Barnes have been rebuilt and widened, and the stations at Wandsworth, Putney, and Barnes have all been reconstructed and very much enlarged. The most costly portion of the undertaking has been at Wandsworth, where the new and widened lines are carried over York-road by massive iron girder bridges. The former old station, which was one of the most inconvenient on the company's system, has been replaced by a large and very commodious new station, about 1,000 ft. in length and 200 ft. wide, with spacious station buildings on the north and south platforms, and also on a central platform, upwards of 50 ft. in width, all these several platform buildings being supplied with numerous waiting-rooms and station-masters' and other offices. All the platforms are about 700 ft. in length, the greater portion being roofed over. The booking-offices are on the north side, being reached through a spacious booking-hall, 60 ft. long and 30 ft. wide.

From the booking-hall the railway platforms above are approached along a subway extending entirely under the railway from the north to the south side. From this subway the platforms are reached by a central and north and south staircases. The subway is 12 ft. wide, and faced on each side with white enamelled brick, and well-lighted from the railway level above. A large open area in front of the approach to the booking-hall will be appropriated as a cab-stand. The works have been carried out from the designs of the late Mr. W. Jacob, the company's engineer-in-chief, whose painfully sudden death took place on Thursday week, as elsewhere mentioned, and who was interred at Wimbleton Cemetery on Tuesday last in the presence of several of the directors and large numbers of the company's officers and employés. Messrs. Perry & Co., of the Tredegar Works, Bow, are the contractors.

**Electric Lighting.**—The Gülcher Electric Light and Power Company, Limited, have completed the lighting of a house at Elsted, near Petersfield, for Mr. E. A. Nevill. An engine-room has been built between two stone buildings specially roofed over and paved; the total distance from the house being about twenty-five yards. The plant consists of a two-horse power Spiela's petroleum engine made by Messrs. Shirlaw & Co., of Birmingham, which drives a No. 1 Gülcher shunt-wound dynamo machine. The dynamo charges a battery consisting of twenty-seven Elwell-Parker 15-plate cells which are used to store the electricity for use during the night. A Mountain's improved switch board is placed by the dynamo machine and is used for charging and discharging, running the dynamo and accumulators together in case of emergency or running the lamps direct from the dynamo. A five-contact switch is also provided on the same slate slab for adding extra cells as the E.M.F. falls, and the volt and ammeters, with measuring-plugs, are arranged so that by inserting or withdrawing a plug the E.M.F. can be measured. The current from the dynamo room is led to the house by a pair of 7-15 cables made by Messrs. Callender & Co., supplying thirty-eight lights. In the hall special hammered iron brackets have been used in order to lend themselves to the old character of the house. In the bedrooms special rising and falling pendants, designed by Mr. Mountain, have been placed, either one on each side of the toilet table or over the centre of the looking-glass, and as these fittings are made to swing from side to side the light can be brought into any desired position. Throughout the house the shades are of cut glass. This installation is one of the first where a Spiel Petroleum Engine has been used for private house lighting.

**The Registration of Plumbers.**—The movement for the registration of plumbers, inaugurated by the Plumbers' Company of London, has, we are glad to see, extended to Scotland, and on the 24th ult. a successful meeting was held in the Town-hall, Dundee, presided over by Provost Bellingall, and addressed by Mr. W. R. E. Coles, C.E., and Mr. G. Young. In the course of the proceedings, the Provost said that they in Dundee had in prospect the foundation of a Technical Institute in connexion with University College, and he had no doubt that the Institute would give young men who were desirous of being educated practically and scientifically in the plumbing trade every opportunity of being so. Professor Ewing, Professor of Engineering in the University College, took a great interest in the Dundee and District Sanitary Association, and his connexion with the late Professor Fleeming Jenkin gave him the assurance that if a class for the technical education of plumbers was to be set up in connexion with the Institute very great good would result to Dundee and district. Eight practical plumbers from different parts of Scotland, including Broughty Ferry, Aberdeen, Cupar Fife, Inverness, Duns, and Oban, were present at this meeting, and received certificates of registration, their signatures being attested by the Provost.

**The South-Western Railway Company's New Locomotive Works at Nine Elms.**—The new departure which the London and South-Western Railway Company are about to take in the construction of their own locomotives will, it is stated, shortly give employment to about 2,000 working engineers and other artisans at the new locomotive works at Nine Elms, now in course of preparation. The company's engines have hitherto been supplied by private engineering firms, but the increasing extent and magnitude of the undertaking has determined the company to be the builders of their own engines, thus following in the footsteps of the London and North-Western and other leading companies. A considerable portion of the extensive depot at Nine Elms, occupying several acres on the south side of the line, is being set apart for carrying on the locomotive works, and new buildings and machinery are at present being erected preparatory to commencing the manufacture of the Company's engineering plant. In the meantime the first engine has for some time past been in course of construction, and is intended to be placed on the line for working the traffic on the day of the Queen's Jubilee, the designation given to the engine being the "Jubilee."

\* That is, "electro-motive force."

Monument to the Marquis of Montrose.

We mentioned a little while ago that a monument was to be erected in St. Giles's, Edinburgh, to the memory of the celebrated Marquis of Montrose. This has been designed by Dr. Rowand Anderson, and is to be executed by Mr. Rhind. We take the following particulars from the Scotsman:—"The monument will be erected on the east wall of the Montrose aisle. It is in the Renaissance style of the seventeenth century, and is suggestive of the form the monument would probably have taken had it been erected at the time Montrose was hurried. The principal feature in the design is a semi-circular arch deeply recessed, having in the recess a sarcophagus, with black marble hieroglyphs carrying the recumbent figure of the Marquis. The archway is flanked by two Corinthian pillars in black and gold marble, with caps and bases of alabaster. In the centre of each of the pillars is an alabaster wreath. These pillars are surrounded by a frieze, entablature, and cornice, with ornamented pinnacles. The frieze is decorated with floral wreaths and panels. The latter contains one of the Montrose mottoes, 'N'ouhiez,' while the rose of Montrose and the clam shell of the Grahams are also worked into the design. In the frieze immediately above the pillars is a panel with the favourite device of the Marquis,—a lion leaping from one rock to another, with the motto 'Nil Medium.' Rising over the cornice, and between the pinnacles, is a large ornamental panel, in which is quartered the full coat of arms of 'The Graham,' flanked by richly-carved pillars and dolphins, and surmounted by a pediment. In this pediment is another of the Montrose crests,—a gloved hand grasping a porcupine, with the motto, 'Col Senno a son Lamano.' The monument is finished off by another panel, which rises over the pediment, containing yet another crest,—an eagle displaying a stork. The work will be carried out in coloured marbles and alabaster. The cost will be about 1,000."

"The Stones of London": Temple Bar. "An Architect" writes to the Pall Mall Gazette:—"I hear indirectly, but on substantial authority, that Temple Bar, notwithstanding all promises, has been sold, and will be erected in private grounds. If this had been the Bridge of Sighs! And yet the 'stones of London' are fewer than those of Venice. . . . I cannot think that the gentleman who has bought it would not on public and historic grounds consent to forego his purchase if there were a desire to preserve it in London. In one of the parks, with the colonnade of Old Burlington House,—another example of exactly harmonious style,—to lead up to it or make a portico-like shelter, a fine composition might be made, and the future averted."

Distressingly Healthy.—At the first meeting of the New Blayden (Northumberland) Local Board, the medical officer of health created considerable amusement by his congratulatory report, in which he said:—"Since last meeting nothing whatever has occurred of medical interest in your district. The high state of health extending over so lengthened a period is still fully maintained. It is really altogether remarkable. Personally I may fairly claim to join in the doleful and all too general cry, 'Ah, yes, indeed; trade is very slack!' Could I pay a higher compliment to the good officers of your Board?"—The Sanitary Record.

**STOKE NEWINGTON.**—For the erection of St. Michael's Vicarage. Messrs. J. E. K. and J. P. Cutts, architects:—  
 James Holloway (accepted) ..... £1,749 0 0  
 [No competition.]

**SUTTON MADDOCK (Shropshire).**—For taking down and rebuilding Sutton Maddock Church. Messrs. Nicholson & Sons, architects, Hereford:—  
 J. Inwood\* (Worcester and Malvern) £1,840 0 0  
 \* Accepted.

[Twelve other tenders submitted, ranging from 3,397l. (highest) to 1,595l. (lowest). Names of senders of these not forwarded to us.]

**TURNFORD (Herts).**—For the erection of dwelling-houses for Mr. Rochford:—  
 Bentley, Waltham ..... £1,384 0 0  
 Boswell, Enfield ..... 1,310 0 0  
 Saunders, Chesbunt ..... 1,247 0 0  
 Brown, Hoddeston ..... 1,243 0 0  
 Hampton, Hoddeston ..... 1,227 0 0  
 Pavey, Winchmore Hill ..... 1,153 0 0  
 Farley & Maycock,\* Waltham Cross 1,095 0 0  
 \* Accepted.

\*\* SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 49, Catherine-street, W.C., not later than 12 Noon on THURSDAYS.

**FIRE BRICKS.**

BEST STOURBRIDGE FIRE BRICKS, and Cement Fire Clay, Gas Retorts, Mullers, &c. Fire Bricks and Bricks for the Highest Fires, for Iron Blast Furnaces, Forge, Rolling, Founding, and Steel Furnaces, Flint Glass Furnaces, Roasting and Refining Furnaces, Chemical Works, Coke Ovens, &c. Boiler Setting Blocks, Flue Covers, Locomotive Bricks, Tugers, Steel Runners, Grate Bricks. Special Sizes and Shapes made to Engineers' Drawings. Prices quoted to any Port or Railway Station.  
 London Agents:—

R. CULL & SON, Palmerston-buildings, E.C.

**GLAZED BRICKS.**

GATES & GREEN, HALIFAX.  
 GLAZED BRICKS (White and Coloured), Special Salt-glazed Bricks, Sanitary Pipes, Glazed Earthenware Slates, Gutter, Sheep, and Pig Troughs, Horse Mangers, Patent Automatic Trough Closets, Patent Fish Tanks, Ventilating Bricks, Patent Ventilating Gullies and Traps, Patent Chimney Pots for Down Draughts, Six Prize Medals. Copies of Testimonials sent if required.  
 London Agents:—

R. CULL & SON, Palmerston-buildings, E.C.

**BLUE BRICKS.**

THE KETLEY BRICK COMPANY, KINGWINDFORD Staffordshire, Manufacturers of Blue Bricks.  
 London Agents:—

R. CULL & SON, Palmerston-buildings, E.C.

**DRAIN PIPES.**

Blue, Cement, Bricks, Slates, Laths, Hair, Plaster, Wall Copings, Channel Bricks, Blue and Red Tiles, Red Plain Tiles and Pan Tiles, Closets, Pans and Traps, Bouds, Junctions, &c. all sizes, Chimney Pots, Red and White. PRICES on APPLICATION.  
 R. CULL & SON'S Stores, Railway Arches, London-street, Bethnal Green Station, E.  
 Chief Office:—72, Palmerston-buildings, Old Broad-street, E.C.

**TO CORRESPONDENTS.**

Registered Telegraphic Address, "THE BUILDER, LONDON.

R.R. (should send names and amounts).—W. F. P.—A. F.—C. S. (not quite in our style).—T. R. S.—H. D. A.—E. C.—D. N.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications.

Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

**Doubling Freestone.**

THE CHELYNCH STONE.  
 The stone from these quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England. It is of the same crystalline nature as the Chelnych Stone, but finer in texture, and more suitable for firewood-work.

THE BRAMBLEDITCH STONE.

**HAM HILL STONE.**

Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice.

Prices, and every information given, on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [Advr.]

Doubling Free Stone For prices, &c., address S. & J. STAPLE,

HAM HILL STONE, Quarry Owners, Stone

and Lime Merchants,

BLUE LIAS LIME Stoke - under - Ham,

(Ground or Lump), Ilminster. [Advr.]

Asphalte.—The Seyssel and Metallo Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tun-rooms, and terraces. [Advr.]

**Asphalte.**

Seyssel, Patent Metallo Lava, and

White Asphaltes.

M. STODART & CO.

Office:

No. 90, Cannon-street, E.O. [Advr.]

**DRAIN TESTING.**

For convenience and efficiency in making what is known as the Scent or Peppermint Test, the Banner Sanitation Company have introduced a new appliance,

**THE BANNER PATENT DRAIN GRENADE OR DRAIN FERRET.**

This Appliance is made, preferably, of thin Glass, and is charged with powerful pungent and volatile chemicals, the smell caused by which is not likely to be mistaken, nor distributed in such a way as to either mislead or render the test worthless through mismanagement or the careless handling of the necessary chemicals.

When one of the "Grenades" is dropped down any pipe it breaks, and the effect produced by its contents is distributed only as intended.

One "Grenade" is often sufficient for testing an ordinary house drain.

The Banner Patent Drain Grenades or Drain Ferrets can be obtained in Boxes of One Dozen each from the Banner Sanitation Company, their Agents, and most Dealers in Sanitary Goods.

PRICES.—With Peppermint Filling ..... 5/- per box of one doz. With Assafoetida Filling ..... 5/6 per box of one doz.

With Compound Filling, extra strong ..... 6/- per box of one doz. Soluble Gelatine "Grenades," with same fillings, 2/- per doz. extra

**BANNER SANITATION COMPANY,**  
 WESSEX HOUSE, NORTHUMBERLAND AVENUE, CHARING CROSS, LONDON, W.C.  
 (Opposite entrance to Hotel Métropole.) Telegraphic Address:—"Banners, London."

### Preservation of Stone.

ALTHOUGH "durable as a stone" has become an almost proverbial expression, it is hardly necessary to point out to practical men how perishable and unreliable many varieties are. A mere change of position or climate will often cause the rapid disintegration of stones which may have withstood atmospheric influences for ages in a situation favourable to their nature.

The causes of the decay of many stones have been several times the subject of inquiry, notably by the Commissioners appointed to investigate the cause of the serious destruction of the stone used in building the Houses of Parliament, and to suggest the best means of preventing further mischief. Their Report, published in 1839, was the most complete summary of the question up to that time, and contains much valuable information, and some questionable conclusions. Numerous articles have appeared since then in various technical and other journals, and several papers on the subject have been read before learned societies interested in the matter, but for the most part these have either been *résumés* of the Parliamentary Report, or else have been written in the interests of some one or another of the many patented protectives. It will be instructive to indicate the present condition of our knowledge on this subject, and may suggest some fruitful ideas to those whose interests may be with stone and stonework.

The chief conditions which affect the life of a stone are porosity, chemical nature, the atmosphere, soil or water that it may be in contact with, and the temperature to which it may be constantly or intermittently exposed. Vibration, great pressure, and position in a building also in some cases have their influences.

Porosity is a well-understood property of certain stones, although not always taken into full account. It is measured by the amount of weight gained by immersing the dried stone in water for a given time, say twenty-four hours. The degree of absorption varies widely from a scarcely appreciable trace in the case of hard crystalline blocks of dense structure to more than 20 per cent. in the case of common soft stones, such as certain sandstones, &c. The writer of a valuable, albeit popular, article\* in 1860 brings this fact home to the mind in a striking form by the

statement that "one square yard of building stone after being long exposed to dry warm air is capable of absorbing from nine to fourteen gallons of water, according to the nature of the stone, before being saturated to a depth of one foot, and in the earth each ton of stone never contains less than a pint, and may contain twenty-five gallons of water."

This porosity of stone is a matter to be carefully considered, but need not under all circumstances be regarded as a disadvantage. Where exposed to great alternations of temperature the destruction of a water-laden stone must obviously be rapid. Such a stone, moreover, would draw up by capillary attraction the ground moisture if by inconceivable ignorance, gross carelessness, or dishonesty, an efficient damp-course had not been interposed. On the other hand, in a building constructed of porous stone or brickwork more efficient ventilation and a more equable temperature can generally be maintained than is possible if the constructive material be of a hard, non-cellular nature. Pettenkofer's well-known ventilation experiment, in which a candle is blown out by a puff of air which has passed through two thicknesses of brick or porous stone (like sandstone, &c.), is a striking illustration of this porosity. When soaked in water such materials lose their perviousness to air almost entirely, but, inasmuch as such a condition seldom practically obtains, we may confidently assert that porous building materials containing only such water as they may have absorbed from the atmosphere are factors of some importance in helping to secure the healthy condition of the interior of buildings. "But the ubiquitous microbe may get through, as well as any foul gases that may result from insanitary external conditions," cries some one. As to the first objection, it has been proved by convincing experiments that finely-divided and porous materials will filter out most effectually the germs of fermentation, decay, disease, &c., from both air and water, if indeed such filtration be necessary in the vast majority of cases. As regards the second, the oxygen occluded in the pores of the stone would have some influence in modifying the character of many offensive gases; but still more to the point is the retort that it is self-evident that if external sanitary conditions are bad it would be practically impossible to maintain a pure atmosphere in a structure built of no matter how non-porous a material. If their strength, accessibility, and other conditions are favourable, the porosity of a stone need not be looked upon, sanitariously at any rate, as a drawback. The chemical nature of a stone is also to be taken into consideration in determining its suitability for specific purposes. Although chemical

analysis will not always by itself indicate the best quality of stone, the mechanical condition of the aggregate particles being frequently of at least as much importance, there can be no reasonable doubt that it is of service, and will frequently prevent the employment of certain stone for obviously unsuitable purposes.

The chief building stones are the following: The sandstones which consist of particles of hard silica or sand bound together with more or less force with some cementing materials which may be of a ferruginous, clayey, siliceous, or calcareous nature, and the density of the stone will largely depend on the pressure to which it has been subjected during formation, and the amount of the cementing material present. In some cases the grains of silica are so loosely held together that the stone quickly disintegrates, and in other cases they are cemented by a substance quickly acted on by acid atmospheres of towns, &c., so that the cohesion is rapidly destroyed.

In 1873 Dr. Angus Smith, in a paper read before the Manchester Literary and Philosophical Society, proposed a plan for measuring the value of stones for resisting the air of towns, which consisted in the immersion of 1 in. cubes of the stones in solutions of hydrochloric or sulphuric acids and noting the deterioration of strength which resulted. Some sandstones under such treatment give way at once, while others, the cementing material being of a more resistant nature, will stand prolonged action of the acid.

The limestones, which contain as their main ingredient carbonate of calcium, are the most important and varied of the building stones used in this country. Some varieties, such as dolomite or magnesian limestone, contain, in addition to the carbonate of calcium, carbonate of magnesium, and are not regarded as so readily decomposable by acids as the ordinary limestones. All carbonates are, however, decomposed ultimately by even weak acids, so that they are far from imperishable, especially in large towns, although the physical conditions of some qualities will frequently enable them to resist disintegration far longer than another variety having precisely the same chemical composition.

Slate, shales, &c., are mainly composed of clayey material (impure silicate of alumina) that has been hardened by enormous pressures acting in particular directions.

Granites, which are crystalline rocks of the old formations, as a rule consist of irregular mixtures of three minerals, felspar, quartz, and mica. A variety, known as syenite or syenitic granite, contains, instead of mica, hornblende. The granites are largely used, many sorts being very ornamental, hard, and durable. Even

\* Cornhill, vol. ii., p. 709.

this variety of stone undergoes decomposition in some circumstances: thus, although in a favourable climate like that of Egypt, granite obelisks have weathered successfully the storms of 2,000 years, the same rapidly show signs of deterioration in the atmospheres of New York and London.

The variety of felspar found in granite is orthoclase, a compound containing potash, alumina, and silica, and this is probably the weak point in the composition of the stone. Moreover, in moist climates granite surfaces are apt to become, according to M. Robert, the *habitat* of a minute cryptogamic plant, which decomposes the stones in order probably to obtain the supply of mineral matter necessary for its own nourishment.

It has, at various times, been more or less authoritatively stated that lichens which form frequently on stone surfaces in country places help to preserve such stone, but this idea is not supported by any reasonable argument. The lichens do not thrive in acid town atmospheres, which are likewise destructive to stonework, but it by no means follows that when lichens do cover the stone they conduce to its preservation. The greater probability is that the stone would last better if kept free from such growths, which requiring, as they do, mineral matter for their sustenance, obtain such matter chiefly by the decomposition of the surfaces upon which they reside; especially is this true of the lichen, *Lepra antiquitatis*, which has been described as "one of the worst enemies of stone."

This subject, however, requires and deserves further investigation, and if any readers of this summary of an important question are inclined to place at the author's disposal specimens of stone upon which may be growing lichens, mosses, fungi, or other cryptogamic plants, together with all possible information as to the position, circumstances, &c., in which the specimens were found, he will be glad to examine the same and to point out appearances, &c., that may tend to prove or disprove the theory that such growths are harmless to stone on which they develop.

Position in a building often has much to do with the longevity of stonework. The harder material should, so far as possible, be placed on the most exposed sides, in this country generally south, south west, and west. The wind and driving rain are the chief causes of the mischief, though a strong wind laden with sharp, gritty dust will also in time obliterate inscriptions, tracery, &c., in the hardest stone.

The following are the devices, patented and otherwise, good, bad, and for the most part indifferent, or, at any rate, imperfect, which have been brought before public notice with the idea of securing the object that forms the title of this article.

To obtain immunity from the growth of lichens, &c., numerous sterilising concoctions, such as those containing copper compounds, have been suggested; but these are of little importance.

A large proportion of the patented preparations consist of varieties of more or less perishable paints and varnishes, which protect the stone for just so long as they themselves remain perfect and impervious. Disregarding ordinary paints and similar preparations, we will briefly enumerate the various compounds which have been patented, and which contain some proportion of animal or vegetable material,—of course, all such substances, and nearly all other paint-like compositions, are inadmissible for most stonework, especially of an ornamental character, hiding as they do the natural colour of the stone, and clogging and destroying the sharpness of designs, &c. Still, there are conditions where such substances as some of the following may be usefully employed.

In 1847 W. Hutchison patented a mixture of rosin, pitch, and similar matters, mixed with oil and powdered stone, slate, or chalk.

B. Barrett suggested, in 1853, a process which he deemed specially applicable to the more porous stones and cements. The stone was to be placed in a chamber from which the air was exhausted, and one or another of the following indurating mixtures allowed to flow

in; or, in some cases, where exhaustion was not practicable, the mixtures might be applied like ordinary paint. No. 1 contains resin dissolved in turpentine, naphtha, or spirits of wine, mixed with gutta-percha dissolved in coal-tar naphtha, and while still warm, oil of some sort is added. No. 2 consists of gutta-percha dissolved in coal-tar. No. 3 contains shellac, Venice turpentine, &c., dissolved in spirits of wine or turpentine. No. 4 is made up of unslaked lime and soft soap; Russian tallow is added while the lime is slaking, and the whole is subsequently placed in a copper with alum, water, sulphate of iron, and "solution made from potatoes and beer settlings"! Other mixtures are also mentioned in the specification, containing sulphur, gutta-percha, &c. The latter seems to be regarded by some patentees as the *best* ideal of an imperishable substance, but the author's experience by no means bears this idea out. A few years ago he was handed some ornamental mouldings made from pure gutta-percha about thirty years since, and which were riddled through and through with minute holes, apparently the work of some insect, the holes being filled with a fine, dry, brownish powder. It is well known, too, that, in hot climates especially, the gum oxidises after a time and becomes useless.

Assanti (1854, pat. 427) uses gutta-percha dissolved in carbon disulphide. Another patentee uses the same substance, as well as other gums, dissolved in naphtha. An attempt was made in 1853 to obtain a patent for impregnating natural and artificial stone by immersion in cauldrons of melted resinous and bituminous substances; the idea being to utilise the pressure of the superatant fluid for forcing the same into the pores of the stones, a depth of at least 12 ft. of the melted substance was recommended.

G. Winspear in the same year patented the application of varnish and pulverised mineral matter to protect metallic and stone surfaces, which were first to be coated with any ordinary varnish, and while yet moist, Roman cement was to be applied by means of a blast of air. The cement might be combined with calcined oyster-shells or other preparation of lime, and the coatings of cement and varnish might be several times repeated. For interiors, pounded glass, ground flints, and even borax might be employed.

More recently (1886, No. 4,872) a plan has been patented somewhat similar to Winspear's apparently, except that the powders used are of greater variety, and include powdered sandstone, freestone, brick, terra-cotta, granite, onyx, marble, &c. These are made to adhere to the surface with paint or varnish.

In 1856, another inventor recommended that the stone should be just coated with a solution of gelatine, glue or similar matters, and then when dry the gelatinous matter was to be rendered insoluble with tannic acid; or silicate of soda or potash might be applied. So-called "anti-nitrous cements" were patented in 1858 by Candelot, which were also applicable for rendering damp surfaces impervious and for the preservation of stone. They consisted essentially of a liquid containing boiled oil, rosin, turpentine, wax, stearine, and liquid india-rubber, and of a powder containing glass or silica, chalk, oxide of zinc, sulphur, or talc and pulverised slaked lime. The powders are well mixed and sifted and when added to the liquid for use form a hard and quickly-drying cement, which can, while still semi-fluid, be applied with a brush to walls, stonework, &c. Another patent in the same year, which obtained provisional protection only, was for the special purpose of rendering plaster of Paris harder, and for the prevention of efflorescence on walls, to which such plaster was to be applied. For the first purpose the plaster was mixed with water containing hydrochloric acid and American potashes (which would result in the production of a solution of chloride of potassium); this causes the plaster to set slower, but harder. To prevent efflorescence the following mixture was to be applied to the walls:—Arsenic (which is presumably meant the oxide, commonly termed arsenious acid), half a pound; hydrochloric acid, half a pint; sulphuric acid, one

gill, mixed with one quart of milk, and three or four gallons of water. In 1861 a protective paint for stone was patented by W. Smith, which was made up of powdered flint, or other silica, with alum or sulphate of alumina, the mixture being formed into a paint with dissolved glue, bituminous substances or linseed oil and turpentine. About the same time another paint, which was also to be used with linseed oil, was brought out as being specially applicable to plaster surfaces. The dry basis of the mixture was made up of powdered slag, borax, white lead, sulphate of alumina, acetate of lead, sulphate of zinc, silicates of soda and potash, and kaolin; sufficient water was first added, and then the linseed oil. An oily compound, patented in 1863, for preserving stone, was made up of one gallon "of any oil," and one gallon of water, to which was added two pounds of nitre, salt, or soda, mixed or separate, and two pounds of dissolved sulphur. Another patent of doubtful utility obtained in the same year was for a mixture made up of animal gall, lime-water, and "liquid from boiling potatoes": this was called No. 1 solution. No. 2 consisted of a solution of sulphur and camphor obtained by the use of a combination of mineral and linseed oils. Before applying the mixtures it is directed that the stone should be cleaned first with an alkali, and then with an acid, and after being well washed with clean water, No. 1 solution is applied, to be followed by No. 2.

We will refer to some other preservative processes in a second article.

#### MILAN CATHEDRAL.

COMPETITION FOR NEW WEST FRONT.

It will be remembered that the Administration of the Duomo at Milan issued in the early part of last year a programme inviting architects to send in designs for a new west front. It was intended to do so in consequence of a considerable sum of money having been left it for this purpose by a citizen of Milan under certain conditions.

The problem of improving the west front seems to have excited the greatest interest amongst Italian architects for many generations, and numerous projects with this object in view have been from time to time prepared, and are now in the hands of the Administration.

The question has lately assumed increased importance in the opinion of the Milanese, from the fact that the new buildings surrounding the Piazza have considerably dwarfed the Duomo.

The competition has resulted in the exhibition of 126 designs, five or six of them, at any rate, being English; the rest for the most part, German and Italian. Some of the latter are drawn to an immense scale, and are illustrated in a lavish manner unknown to English competitions. They have been on view for some weeks in the galleries of the Brera, and have attracted great attention. On Tuesday, the 24th ultimo, the exhibition closed, and the day following the jury held its first meeting, presided over by the Marchese Carlo E. Visconti. Amongst the members of the jury Baron Schmidt represented German architects and Professor de Dartien the French. After many conferences, the jury reduced the number of designs to twenty-six, and finally (after bringing the twenty-six into juxtaposition for more critical comparison) to fifteen, the authors of which are the following:—

Daniel Brade, 5, Bridge-street, Kendal.  
Ludwig Becker, Mainz.  
Morelli Gaetano, Milan.  
Antonio Weber, Vienna.  
Hartel-Neckelmann, Leipzig.  
Rodolph Dick, Vienna.  
Giuseppe Brentano, Milan.  
E. Depertbes, Paris.  
Teodoro Ciagbin, St. Petersburg.  
Luca Beltrami, Milan.  
Tito Arolino, Bologna.  
Enrico Nordio, Trieste.  
Carlo Ferrario, Milan.  
Paolo Casebianche, Milan.  
Giuseppe Locati, Milan.

These names are given, not necessarily in the order of merit, but in the order in which they were hung in the galleries.

The authors of the fifteen designs will now proceed to compete again, the prize adjudged to the victor being no less than 40,000 francs, smaller sums being distributed to the other fourteen, three of 5,000 francs, three of 3,000 francs, and the rest of 2,000 francs.

The designs for the most part suggest the heightening and accentuation of the front. Some of the designs have lateral towers and spires. Of these, probably the best are those which are kept decidedly subordinate to the existing central spire, though there are others which are carried to a much higher elevation than it, so as to change entirely the character of the structure.

Several designs afford interesting examples of an open porch of the Peterborough type.

The nationality of the architects is very marked, both in the character of their designs and their draftsmanship; the French and German drawings being, as a rule, very carefully delineated and shaded with the pen, and show excellent knowledge of detail in many cases. The Italian designs are full of chiaroscuro and dash, with less care for detail. One Italian design, that of Luca Beltrami, attracted great attention. In it the author has collected the admirable Renaissance portals and windows of the present west front, and introduced them into a campanile in a design of great merit. This campanile he proposes to erect in an isolated position on the south-west of the Duomo, immediately opposite the central arcade of the great Galleria. The difficulty of disposing of these beautiful cinque-cento features seems to be found the great crux in any attempt to improve the west front of the Duomo.

A. WATERHOUSE.

NOTES.

It appears that M. Bouquet de la Grye, in his report to the French Academy of Sciences in regard to the Panama Canal, has expressed the opinion that the construction of locks on the canal would be quite useless, and that it is impossible that there can be any difference of level between the Atlantic and Pacific. So most of us would suppose; but it seems odd that there should be any conflict of opinion about such an easily-demonstrable matter as the sea-level at either end of a canal route, if there has been anything like a proper survey. There remains the further question, however, whether the raising of the canal level by locks is not a necessary condition of carrying out the work at all; a matter on which it would be impossible to come to a decided conclusion without seeing the section of the route.

WE have received a copy of a lecture given at the Hôtel Continental at Paris two or three weeks ago by M. Custavo Cuzman, in favour of a scheme for a canal from the Atlantic to the Pacific through the Nicaragua State, and by utilising the Nicaragua Lake as part of the passage. M. Cuzman avers that the river San Juan, with a little treatment, will afford the passage from the Atlantic to the lake, leaving only a short canal to be cut from the lake to the Pacific at the port of Brito. According to his report the rise of the ground is only 14 metres, and the canal can be worked with four locks. It is rather amusing to find that while, as observed in the foregoing note, it has just been reported that locks on the proposed Panama Canal are all a mistake and quite unnecessary, we have here another report, from a writer professing to know the ground, to the effect that there is hardly a place in America where a canal is possible without locks. As to the Panama Canal, no words of scorn, pity, and contempt seem sufficient to express M. Cuzman's feelings in regard to that project, of which his own is an intended rival, which he refers to as the "pretendu Canal du Panama," with defiant italics, and against which he quotes the opinion of an eminent engineer, "sir John Hawkshaw," whose name is not familiar to us. However, says M.

Cuzman, "La France, heureusement, est assez riche pour payer au prix de milliards l'erreur d'un de ses plus illustres enfants," and she will be rewarded for her disappointment and disbursements by the achievement of the Nicaragua Canal when the requisite funds are raised.

"A WOULD-BE COMPETITOR," who is now apparently "a won't-be competitor," has sent us a copy of the instructions issued to architects who may wish to compete for laying out a new cemetery, with mortuaries and other buildings, for the borough of Oldham, accompanied by much stringent and indignant criticism. Some of the points objected to by our correspondent are unfortunately common to nearly all competitors, e.g., that the premiated designs are to remain the absolute property of the Corporation. This generally-accepted condition is most unfair to the Profession, when (as is usually the case) the highest premium only amounts to a sum far below the usual 2½ per cent. commission on buildings designed, but not carried out, by the architect; but in this respect the Oldham Corporation are no worse than their neighbours, and their premium,—60s. for work to cost 5,500l., is higher in proportion to the work than in many cases. But one point about the "conditions" is open to strong objection. The competitor is to "state what commission he will charge if engaged to supervise the works": a request which is very much at variance with any proper idea of the dignity of the profession, and which in reality amounts only to a kind of premium to inferior people to cut in and do the work cheap. What would be thought by lawyers (or indeed by the general public) of a Corporation which sent round invitations to solicitors to say for what charge each of them would undertake the legal business of the Corporation? It would be considered an almost disreputable thing to do. And why are architects to be treated worse?

AFTER long years of consideration, the borough of Ramsgate has resolved to attempt to carry out the formation of a roadway to unite the East and West cliffs. This roadway will start at the Royal Hotel, facing the harbour, and will rise by a uniform gradient to the Smack Boys' Home, in front of Prospect-place. The roadway will be formed on a viaduct, and the arches beneath the road will be utilised as stores. A portion of the inner harbour, and some unimportant property in the neighbourhood of the harbour, are proposed to be taken, and eventually it is intended to acquire the Alhion Hotel at the foot of Harbour-street, so as to afford a continuous roadway to the East Cliff by way of Alhion-place and Wellington-crescent, but this latter proposal, we believe, forms no part of the present scheme. The cost of the works is estimated at 15,000l., exclusive of compensation. Most of the property likely to be affected belongs to the Board of Trade, and the Town Council are sanguine that they will be able to effect a satisfactory arrangement with the Board with regard to their property. The proposed improvement will go far to destroy the picturesque appearance of Ramsgate from the sea, and appears to offer but few compensating advantages. The elevation of the viaduct towards the harbour is a monumental example of the misapplication of design, and it is to be hoped that it will not be carried out.

A PAPER on "The Signs of old Lombard-street," originally read by Mr. F. G. Hilton Price before the Institute of Bankers, has now been published\* in an edition *de luxe*, making a thick and handsome volume mainly occupied with illustrations of the old signs, taken from authentic sources, and shown with wrought-iron supports, which, although not the actual supports of the sign-boards in question, are copied from work of the period or from drawings. In some cases wooden supports or brackets are shown. A comparison of these with the wrought-iron open ornament which surrounds some of the other sign-boards shows

\* London: Field & Tuer, and Stimpkin & Marshall, New York: Scribner & Welford.

very clearly how the apparently rather unmeaning curves of the wrought-iron work, in some cases, arose from the attempt to line out in outline, in thin iron, the curves of the features carved in other cases in solid wood. This will be quite evident on comparing the iron framework of the "Blew Anchor" sign with the wooden framework of the "Black Lyon" sign which immediately follows it. Among the more characteristic of the signs figured are the "Three Feathers," not treated as in the present Prince of Wales emblem, as springing from a central point and the outer ones falling over to right and left, but three parallel feathers, very conventionally cut, and each with a bend to the right at the top; the "Royal Oak," with a head and three crowns grouped around the foliage of a tree (this house, a tavern, is mentioned by Pepps): the "Three Crowns," artistic in effect, and with a curiously designed suspending bracket; and the "Royal Exchange," with a picture of the Old Exchange on the signboard. After the Great Fire, Mr. Price observes, many of the signs were carved in stone, and hilted into the fronts of the houses; but the habit of hanging them or planting them in front was gradually renewed, and between 1760 and 1770 most of them were removed by order. It is curious to find the fashion of signs coming in again to some extent, though it is for the most part only among those who have special artistic or archaeological tastes, and is not likely to become so general as to be an inconvenience. Those who have an inclination in that direction will find a great many models for the (archeologically) correct thing in Mr. Price's book, which, in other respects, is a truly desirable volume, with thick paper and wide margins, and altogether a handsome addition to an archaeological library.

ON the 15th of June next will be offered for sale, at the Auction Mart, one of the most beautifully-situated residences in Ireland. It is Rostellan Castle, the seat of the last Marquess of Thomond, and occupied since his lordship's decease by the late Mr. Wise. Overlooking the Cove of Cork, a favourite yachting station, and with some finely-wooded country to the north, the castle was rebuilt in the early part of the seventeenth century. The park extends over 1,200 acres. The property furnishes good trout-fishing and wild shooting, and includes some farm buildings, together with residences for keepers and halliffs, and other outdoor servants. The land is reputed to contain some seams of silicious clay, and productive veins of hæmatite ore. A ridge of limestone rock traverses the park.

AMONGST other properties also for sale, in England, we may instance the Barcombe House estate, on the Ouse, near to Lewes; the Oakeley estate, Shropshire; and the Franks property, in the Vale of Darenth, within a mile of Farningham railway station, in Kent. The last named carries with it an historic mansion, of whose antiquarian features an illustrated catalogue is being prepared. The Shropshire property has been held by the Oakeley family for several generations past. It lies by Bishop's Castle, to the north-west of Ludlow, and is not far from Hay Wood Forest, in which were benighted the children of Lord Bridgewater, President of Wales, who afterwards, on Michaelmas night, 1634, performed at Ludlow Castle Milton's "Masque of Comus." The mansion-house, and another residence known as the Toveries, together with thirteen farms and 3,000 acres of cultivated and preserved land, are estimated to yield a rental, in all, of 4,000l. a year. The freehold comprises the advowson of Lydham, which is worth about 400l. per annum.

A HIGHLY-PRACTICAL and solid memorial to the late Earl of Shaftesbury has just been established in Charles-street, Westminster Bridge-road. It is in shape of a new ragged school, designed to carry on the functions of one in Jurston-street, wherein that great philanthropist is said to have first entered upon his conspicuous share in ragged school work. The foundation stone was laid

by the Rev. Newman Hall on the 1st of June current. The schoolrooms, with two classrooms, having accommodation for 350 children in all, will cost not more than 1,000l. Rowland Hill laid the memorial stone of the original Jurston-street school in 1817. That building, however, was taken down some years later, and the school, augmented by another one, was removed into premises that had been popularly known as the "Penny Gaff" in the New-cut, Lambeth.

THE recent decision of Mr. Justice Stephen in the case of *Blake v. The Land and House Property Corporation (Limited)* appears to be scarcely legally sound. A cistern of the defendants, who were the owners of the premises above those of the plaintiff, overflowed, and by this overflow the plaintiff's property was damaged. The cause of the overflow was that the lid of the cistern was so arranged that the half-cock would not act properly, and that the tap being left turned on the water could not flow away in its proper channel because the escape pipe was stopped up by a piece of rag, a piece of earthenware, and two small cinders. Mr. Justice Stephen decided that there was no evidence that there was negligence on the part of any one for whom the owner of the premises was responsible,—in one word, that there was no negligence on the part of the defendant. Greater negligence than was disclosed in the management of the cistern could hardly be proved, for there were three distinct acts of negligence. If this decision is sound, what becomes of the elementary legal maxim that a man is to manage his property so as not to injure that of his neighbour? There is hardly any act of negligence which may not be the work of a malicious person, but until the person responsible for that negligence proves that it is caused by such a third party, who is not his servant, in every principle of law he is liable for the consequences. We hope this decision will be reversed by the Court of Appeal.

THE Edinburgh Architectural Association have collected into one handsome volume the contents of their Sketch-book from 1883 to 1886. The contributors of the various sketches have added some notes, which add to the interest of the work. A large proportion of the plates consist of measured drawings, and many of these are of a very high order, both in regard to execution and to the interest and beauty of the work illustrated. In the preface Mr. Gordon, the editor, mentions that the attention of members was some time ago directed to the fine plaster ceilings which remain in a few of the old Scottish mansion-houses, and a good many of these are carefully illustrated in the plates, and are well worth it; those from Pinkie House, and from Baillie MacMorran's house in the Lawnmarket, are especially noticeable. The latter is a panelled ceiling of rather unusual design (sixteenth century), and with some charming floral ornament in the centre of the panels, of which larger-sized details are given: the drawing is by Mr. J. H. Cooper. The drawings from Elgin Cathedral, and from the tomb of Bishop Dunbar in St. Machar's, Aberdeen, by Mr. Jas. C. Watt, are exceedingly good; these were placed first in the competition for prizes offered by the committee. Mr. Watt's admirable illustrations of the chapel and tower of King's College, Aberdeen University, we had the pleasure of publishing some time since. The decorative details from the ceiling of the Roman Eagle Hall, Lawnmarket, are very singular and graceful, and well worth attention (no signature is appended to the drawing). The ceiling of the drawing-room at Winton Castle, by Mr. Baillie, is another very fine example; this is a panelled ceiling of very rich design, and here, as in other examples, the decorative details are very curious and interesting, and different from anything of the same date that is usually found in England, showing a type of floral ornament which combines conventional arrangement of sprays with a great deal of realism in detail. Mr. J. N. Scott's drawings of the massive architecture of Jedburgh Abbey are equally good in the measured geometrical

drawing and in the small but beautifully-executed perspective sketch of two bays of the arcade, which is about the best bit of free sketching in the book. In general, the perspective sketching, of which there is not a very large proportion, is not the strongest part of the publication, being, in some cases, rather too scribbly in style, and in others, as in "Dunning Castle" and "Midcaldor Church," rather too tame and mechanical. That of the gallery in the transept of Pitsligo Church, again, is overloaded with line-shading. The entrance doorway and details from Huntly Castle, by Mr. F. W. Troup, are very interesting, containing very singular details, and a curious mixture of Gothic and Renaissance feeling. Altogether, the Edinburgh Association is to be congratulated on the general merit and interest of the volume, and the exceedingly good work in not a few of the plates. The details of the old ceilings alone would make the book worth possessing; they are full of hints which might be worked out further when opportunities present themselves.\*

IN the last number of the *Jahrbuch des Kaiserlichen Deutschen Archäologischen Instituts*, ii, 1 (1887), Dr. F. Dummmler, of Halle, publishes the fragment of a vase which, if his view be correct, casts an interesting light of a Homeric epithet. In the catalogue of the ships ("Iliad II," 542) we are told there came to Troy "Elephenor . . . captain of the proud Abantes, and with him followed the fleet Abantes with hair flowing behind (*ἰσθητὴν κομῶσάωντες*). Helbig ("Homeric Epos," 163) takes this simply to mean that the hair flowed abundantly behind, and as no nation, at least, no warlike nation, in their senses, would be likely to endure the inconvenience of their hair flowing freely in front, this amounts to little more than the usual epithet *κῆρ κομῶσάωντες*, with flowing hair, applied to all the Achæans,—such an arrangement as is frequent on the so-called "Apollo" statues. The scholiast takes the phrase as having a much more precise intention. Hair flowing behind means flowing behind and behind only. The source of this particular tradition seems to be Archemachus, of Euhæa. He, according to Strabo (book x., 465) says that "the Curetes had their settlement at Chalcis, but, being continually at war about the Lelantian Plain, and finding that the enemy used to seize and drag them by the hair of the forehead, they wore their hair long behind and cut the hair short in front, whence they had the name of Curetes, from *κομῶσάωντες*, the shearing they had undergone. This has the air of an aetiological myth, but possibly some one learned in savage lore may be able to parallel the precaution. Plutarch confirms the early interpretation, and adds that Theseus, when he came to manhood, shaved only the fore part of his head, after the manner of the Abantes, and, he adds, this form of tonsure was called after him Theseis. Dr. Dummmler's vase fragment gives a good monumental instance of the Theseis. On it is painted in very archaic style the head of a man. He is beardless; the front of the head is carefully shaved while behind falls a thick mass of hair gathered behind the ears into a spreading mass. This form of tonsure, if safe, is not becoming; hut, after all, then as now, "il faut souffrir pour être beau."

THE *Gazette Archéologique* (1887, 1, 2) publishes an interesting vase from the Campana collection of the Louvre, with the rare subject of the blinding of the giant Polyphemus by Ulysses. Polyphemus is recumbent in his cave. Two men approach him with a burning stake which they are about to thrust into his eyes; the flames at the end of the stake are carefully pointed red. A third man, distinguished by a sword, and probably Ulysses, is heating a second stake at a fire. The vase is a black figured oinochoë. Only four other instances of this subject are known, of which, perhaps, the most interesting, and certainly the most barbarous, is that in the *Bibliothèque Nationale* at Paris, in which Ulysses

\* The present volume, we should observe, forms Vol. I. of a "New Series."

presents a cup of wine to the Cyclops at the same moment that the blinding is about to take place. A second instance is in the Capitoline Museum, and is signed with the name of the potter Aristonophos. A third and fourth, of less interest, are in the Berlin and the British Museums. The newly-published vase is decidedly the finest work of all.

THE *Times* of Friday last week published a description of the micro-telephone patented by Dr. Cornelius Herz, a small but highly sensitive instrument, calculated to serve short distances at less cost than the ordinary telephone. As described, the visible portion of the instrument does not occupy much more space in a room than the shield of an electric bell. "There is a button to be pressed which causes a bell to ring. When the person at the other end touches the button there, the two are prepared to converse. In order to do this, the shield, which forms the receiver, and is attached to the instrument by a wire of any desired length, is removed from the wall and applied to the ear; the part exposed is a disc of carbon, and any sound uttered at or near it is conveyed to the opposite extremity. There is no need to remain close to the disc; on the contrary, one may remain a yard away from it, and speak in an ordinary tone of voice at that distance." It is remarked that this will be a very suitable instrument for household purposes, giving orders to servants from one room to another, &c.; but it appears to us that it will do nothing in that case that a speaking-tube will not do better, and at less cost. In speaking over rather longer distances, as from a house to the lodge or the stables, such an instrument may, no doubt, be very useful.

IN the *Asclepiad*, Dr. Richardson publishes an essay on "Winter Palaces of Health," suggesting the idea of having blocks of residences in various suitable localities built around a glass-covered winter-garden:—

"Each of these houses should be divided into an upper and lower flat 30 ft. deep from the front, 25 ft. wide, and fitted with every convenience for the residence of an invalid, and with every room and part at equable and adjustable temperature. The two sets of flats, upper and lower, numbering say one hundred altogether, would accommodate comfortably and luxuriously that number at least of sick people, with all necessary attendants and friends. On the roofs of these flats would be four galleries or terraces, covered in glass and laid out with flowers, each gallery twenty yards wide and upwards of one hundred long, in all a promenade round of nearly a quarter of a mile. The square, covered at a grand height with an arch of glass, like the Crystal Palace, would be the inner garden, kept always at an equable temperature."

This is for the benefit of those who are ordered to winter in a warmer climate, and for one reason or another cannot go. We fear, however, that to make these Palaces of Health remunerative, a rent would have to be charged which would make the expense nearly as great as that of going abroad, and we should very much doubt finding people very forward to embark money in the speculation; though it is, no doubt, a perfectly possible expedient, apart from the financial question. We should imagine, however, that a winter would be rather dull in a "Palace of Health."

#### ARCHITECTURE AT THE ROYAL ACADEMY.—VII.

1714. "DESIGN for a Pianoforte Case." Mr. L. Alma Tadema, R.A. A sheet of beautifully-executed coloured geometrical drawings of the pianoforte case designed by the artist for an American client, and which we have already described from the original when shown at the makers', Messrs. Johnstone, Norman, & Co. Careful as the drawings are, however, they do not convey an adequate idea of the effect of the work itself. It may be observed, in addition to our former remarks, that the inlaid wreaths on the lid, enclosing the names of the Muses, are all varied in design, and show some charming bits of decorative detail. The employment of two mimic Doric columns for the pedal rest is the only detail we should be disposed to criticise; it is hardly in place, and looks thin and hard in comparison with the

remainder of the work; but painters do not feel this, of course, in the same way that architects do.

1715, "Alterations and Additions to a Cottage, Haslemere," Mr. W. A. Pitt. A small geometrical elevation of a pretty and picturesque cottage, shaded in Indian ink, with a semi-pictorial effect, very successfully.

1716, "Design for a Stained-glass Window: Woman healed by Touching our Lord's Garment," Mr. Ion Pace. An upright circular-headed compartment, with a well-designed and effective border; the arch-head is filled up with armorial bearings on a diaper ground, of small quarries. The centre portion is occupied by the figures of Christ and the woman and bystanders,—a well-designed and expressive group. The upper portion is occupied by rather too realistic trees, and part of a hill and castle, with a deep blue ground representing the sky; this is too pictorial for glass. If the trees had been conventionalised into a decorative form, and the "hill" omitted, it would have been more satisfactory from this point of view. Two angels on either side of a tomb or altar, with a background of cinque-foiled semicircular arches, form a predella, graceful in effect, but of which the meaning is not very apparent. Altogether, however, this is a very refined little design.

1717, "Speldhurst Lodge, Kent," Mr. Mervyn Macartney. An effective monochrome sketch, representing a long run of half-timber walling, interrupted by a massive brick chimney-stack, and butting against a square block of stone building: very picturesque in effect, but, like some other drawings in the room, suggesting the question whether this is a sketch of an ancient house or a design for a modern one. If the latter, a good deal of pains has been taken to make it look grim and dilapidated.

1718, "Alternative Design, Newcastle Cathedral West Window," Mr. E. Frampton. This is not, we believe, quite correctly called "alternative design"; it should be "design submitted for," &c., as another artist has the commission. It consists of two lights, each with a single figure. St. Nicholas in the one, and the Venerable Bede in the other; the figures are treated with true feeling for decorative effect; the lower portion has a light diaper background, the heads stand out against a dark crimson ground, with a label with the name forming a semicircle, aureole-wise, round the head. The rest of the space is filled up with tabernacle work of a kind commonly employed in Gothic windows, ancient and modern.

1720, "Enlargement of Kew Church, Exterior, looking West," Mr. Henry Stock. A good water-colour drawing, hung high. There is nothing, however, to show in what the "enlargement" consists, and we have not at the moment a sufficient recollection of the church to appreciate the treatment of it shown here. A small plan, with the added portion coloured, would have rendered this plain.

1722, "Church for Rogerstone, Monmouthshire," Mr. T. M. Lockwood. Another view of the church, shown in No. 1690. A good-enough simple Gothic church, but with nothing whatever in it to justify its being illustrated twice over. It is obviously hung simply for the drawing. That is not the principle on which drawings ought to be hung in the architectural room at the Academy. The conclusion to be drawn is that if an architect can only succeed in catching a particular draughtsman who has evolved an effective method of tinting he may get as many illustrations of a commonplace design hung as he likes to send. This is capital for the draughtsman, who ought to make a good market out of it, but it is not in the best interests of architects or architecture.

1723, "Dovenby Hall, Smoking-room," Mr. C. J. Ferguson. A water-colour drawing of a pleasing wainscoted Jacobean interior with a panelled plaster ceiling. To speak correctly, it is not so much a water-colour drawing in the proper sense of the words, as a fine perspective subsequently tinted. The curves in the niches, by the way, are not all true in perspective.

1724, "The Pavilion, Charterhouse School," Mr. Ralph Nevill. A cricket-field pavilion of considerable dimensions, a single-timber construction, chiefly noticeable for the entire absence of the gimcrack kind of ornamentation which such structures too generally display.

1725, "Mansfield College, Oxford: South View," Mr. Basil Champneys. A view showing the square gate-tower, with a range of residential buildings, we presume, on either hand

shutting against it, and the chapel on the right. The chapel has the ante-chapel, forming a kind of transept across the end of it, which is recognised as the orthodox accompaniment of a college chapel; an octagonal turret is effectively placed at the re-entering angle of the chapel and ante-chapel. The buildings are of late Gothic style, and exhibit a traditional collegiate cast of architecture. It is impossible to judge without a plan, but we should imagine that some of the rooms must be insufficiently lighted, however picturesque may be the effect of these small windows in a wide expanse of wall.

1726, "New Houses, the Beach, Walmer," Mr. James Neale. A large and effective pen drawing; the houses, while preserving a certain similarity of general ideas, are effectively varied, but they still retain a little too much of the "watering-place villa" style, which is, in fact, the most unsuitable style for buildings by the seaside. A shore house should above all things appear solid, strong, impervious to wind and weather. These are lake houses rather than seaside houses.

1727, "Redesdale Hall, Moreton-in-Marsh," Messrs. Ernest George & Peto. This is apparently a public hall or market hall for a small town, with an open ground-story carried on massive piers and three centred arches for the walls, and with thick wooden story-posts and brackets under the floor-beams. The style is of very late, or what in the orthodox days used to be called "debased" Gothic (nothing is "debased" now!). The humour of making the lower lights of the two end windows very short, with two tiers of long lights over them, is noteworthy, and adds a good deal to the character of the design. We may notice at this juncture the other drawings exhibited by the same architects. No. 1731, "Glencot Wells" is a specimen of an Elizabethan house of the quietest type, with no decorative expression but what is derived from the placing of the mullioned windows and the string-courses, with a terrace in front showing a balustrade of later tendencies, with ball finials; one or two deep recesses give a strong shadow here and there. No. 1737, "Dunley Hill, Dorset," is an imitation of the architecture of a later date, and what would once have been called "debased Classic." A plan is appended to this. Both these are very picturesque in general, particularly so,—and the admirable brown ink drawings in which they are shown add very much to their charm; drawings which are touched with an artist's hand, not overworked or over-shaded. One cannot but remark, however, that in both cases the charm is mainly due to the revival of the features and manner of the architecture of a past generation; they look exactly like old houses of the seventeenth and eighteenth centuries, and whatever may be the charm of this, it is based on a false sentiment, which will not be permanent, and when the taste for this type has passed away, the charm will be dissolved. A real eighteenth-century house is one thing; a nineteenth-century imitation is another. This remark applies less, however, to No. 1741, "Alhambra Hotel, Piccadilly," for though the details here are all old, the combination of them shows so much effect and originality of grouping as to give a novel interest to the old features: the separate range of windows close under the cornice, for instance, with its little order of halaster-pilasters, is a very pretty incident in the design. This, like the others, however, owes something to the drawing, which gives it the effect and texture of an old building in keeping with the old details; and this source of charm also must vanish when the building is seen as a new structure. Mr. Ernest George has so much faculty for picturesque grouping and treatment of building, that it is to be regretted he should not employ this more in giving interest to buildings of more modern and more original detail, instead of producing what appear to the eye to be charming sketches of old town and country buildings of various dates.

1732, "Warehouses over the former Site of St. Paul's Schools, St. Paul's Churchyard," Mr. F. Hemmings and Mr. Delissa Joseph. This is a large and well-executed pen drawing of the range of buildings opposite the east end of St. Paul's, about the building of which there was a good deal of correspondence in the papers some time ago as to the advisability of setting back the street line and leaving more space around the Cathedral, instead of crowding it up anew with buildings after the demolition of the old St. Paul's Schools. The architects seem to be of the same mind, as they have sent in a view which is entirely illusory, and represents their own buildings as they never can be seen, and the angle of the Cathedral on the left a great deal further west of them than it really is. The semicircular sweep of the buildings is effective in the drawing, but they are entirely without interest architecturally.

1734, "University College, Aberystwith," Mr. J. P. Seddon. This is a large drawing of Mr. Seddon's picturesque and poetic building, erected many years ago, but there is nothing said as to the reason for exhibiting it now, nor whether it represents any addition to or reconstruction of the building, which was not long since to a great extent destroyed by fire: so we presume we are to take it merely as a representation of the building as it existed. In that sense it is of value.

THE ANNUAL REPORT OF THE METROPOLITAN BOARD OF WORKS.

The Report of the Metropolitan Board of Works for the year 1886 has just been issued, although it is dated "Spring Gardens, 31st December, 1886." Why a document of so much interest to the long-suffering metropolitan ratepayer should make so heated an appearance we are not told, nor can we conceive a sufficient reason for the delay. It is true that there are several appendices to the Report, containing statistical and other information, but there is nothing to show why this information should have taken about five months to prepare. Two of the appendices, Nos. 2 and 3, consist of the Reports of the Engineer and Superintending Architect\* respectively, but both these documents are dated "31st December, 1886."

Under the head of "Sewerage and Drainage," the Report of the Board alludes to the progress made in the construction of relief sewers supplementary to those of the existing main drainage system. These include new sewers from Putney to Chapham (cost 151,995*l.*), the Holloway and Northern High Level Relief Sewers (cost 75,500*l.*), the Queen's-road, Dalston, sewer (cost 19,850*l.*), and a small pumping-station in the Isle of Dogs (cost 6,100*l.*). Some of these works were completed, and others well advanced towards completion, at the date of the Report. The next section of the Report deals with "The Sewage of the River Thames," but it does not contain any particulars with which our readers are unacquainted. The subject is, however, more fully treated of in the Engineer's Report.

From another section of the Report we learn that the operations of the Board under the Metropolis Management (Thames River Prevention of Floods) Amendment Act, are practically completed. The Act, it will be remembered, empowers the Board to require the wharf-walls and banks of the River Thames within the metropolis to be so raised as to prevent the overflow of the river within the limits of the Board's jurisdiction.

Under the head of "Metropolitan Improvements" the completion or progress of several important new Metropolitan thoroughfares is reported. Among the completed works of this description the most important are the new street from Tottenham-court-road to Charing-cross, and the new street from Oxford-street to Piccadilly-circus. One of the most important street improvements now in progress is the new street from Gray's Inn-road to St. John-street-road, which will afford a long, needed and greatly improved line of communication between Holborn and Islington. The new street, starting from the junction of Gray's Inn-road with Clerkenwell-road, will run in a north-easterly direction, and, for the purpose of avoiding the hottle-necked and declivitous Elm-street and the wider though not less declivitous "Mount Pleasant" and Coldbath Fields, it will, for a distance of about 120 yards, be carried on a viaduct, crossing Great Warner-street with a headway of 18 ft. The new street will then cross Tysoe-street and Garnault-

\* The Superintending Architect's Report, signed by Mr. John Hebb, the Assistant Architect to the Board (who was, at the date mentioned, the temporary incumbent of the office of Superintending Architect), is, unfortunately enough, makes no mention of the death of so old and valued an officer of the Board as the late Mr. George Valliant; nor does the Report of the Board itself make the slightest allusion to that event.

Place, and, passing the "New River Head," near Sadler's Wells, will terminate in St. John-street-road. The execution of this improvement will involve the removal of dwellings occupied by no fewer than 3,416 "persons of the labouring class," to accommodate whom the Board is to clear sites for the erection of artisans' dwellings, and only when these dwellings are completed will the Home Secretary give his sanction to the completion of the improvements.

The Report next details the numerous operations of the Board under the Artisans' and Labourers' Dwellings Acts, with the object of remedying the evils arising from overcrowding in large towns. The "schemes" with which the Board has had to deal under those Acts are very numerous.

Other sections of the Report deal with the operations of the Board as the Bridge Authority for the metropolis (save and except the City proper); with "Parks, Commons, and Open Spaces"; with "Bills in Parliament"; with the Fire Brigade; with Gas and Water Supply; and with, among other subjects, the London Coal and Wine Dues. With regard to this subject the Report says that "the Board's share of the proceeds of the duties, which have been continually increasing, amounts at the present time to about 325,000l. a year; and if the duties are allowed to cease in 1889, the date to which they are at present authorised, the Board will have to make good the resulting deficiency in its income by an increase of the Metropolitan Consolidated Rate of about two-pence halfpenny in the pound." The opponents of the continuance of the dues may retort that there is a *per contra* account; but without entering into the *pros* and *cons.* of the discussion, we may here, perhaps, be allowed to repeat what we said last week in one of our "Notes," namely, that if anything could justify the retention of the Coal and Wine Dues, it would be the application of their proceeds to the purchase of such open spaces as Clissold Park, Brockwell Park, and Ravenscourt Park. The preservation of such oases and breathing-spaces in the ever-increasing desert of bricks and mortar yecept "the Metropolis" would amply repay the necessary outlay on utilitarian and sanitary grounds alone.

The Board's financial transactions are on a scale commensurate with the size of the Metropolis. The Board's expenditure during the year 1886, including 976,781l. advanced on loan to other local authorities, 1,144,952l. invested in Treasury Bills, and 325,533l. applied to repayment of temporary loans and reduction of debt, amounted to 4,619,473l., of which 1,128,108l. was defrayed out of money raised by the issue of Metropolitan Consolidated Stock. The total expenditure of the Board for the present year, 1887, is estimated at 1,794,624l.

The Report of the Superintending Architect, which forms Appendix No. 3 to the Board's Report, gives a mass of statistics as to the building operations of the metropolis, but the returns are only made up to the end of the year 1885. In that year the number of new building operations within the Board's jurisdiction (which, under the Metropolitan Building Act, includes the City proper) was 7,669, while additions and alterations and other works numbered 10,530. The Report also details the operations of the Architect's Department in regard to the construction of and means of exit from theatres and music-halls, a subject the importance of which has just been once more disastrously emphasised. The Report also shows the vast amount of work done in the Architect's Department in the valuation of property required by the Board in connexion with its various improvement schemes.

The Report of the Board, including the appendices, extends over just 201 pages, and it presents a mass of information of so much interest to the inhabitants of the Metropolis that its tardy appearance, already referred to, is only the more to be regretted.

**Machinery at the Manchester Exhibition.**—In reference to our article on this subject last week, Messrs. Browett, Lindley, & Co. write to say that "anti-friction metal" is not used for the bearings of the engines exhibited by them there, as erroneously stated in our report. Their own description of their "Australian engine," however, mentions anti-friction metal as a special excellence of their engine. It appears they have abandoned this, probably for the better.

The late Sir Horace Jones, Architect to the Corporation of London.

#### PORTRAIT OF THE LATE SIR HORACE JONES.

WE had intended to give a portrait of the late Sir Horace Jones last week by a reproducing process from a photograph, but the result (as sometimes happens with the various processes which have so much pushed engraving on one side of late years) was not such as would have been satisfactory to ourselves or to the late City Architect's friends.

Not wishing to abandon our original intention, we give a week later, rather than not at all, a portrait engraved from the same photograph,\* by Mr. J. D. Cooper, who has succeeded in producing, in a very short time, what we think will be admitted by those who knew Sir Horace Jones to be a good likeness.

#### THE INSTITUTION OF CIVIL ENGINEERS. ANNUAL REPORT.

THE Annual General Meeting of this Institution, to receive and deliberate upon the Report of the Council on the condition of the Institution, with the annual Statement of the Accounts, and to elect the Council and Officers for the ensuing year, was held on Tuesday last, June 7th, Mr. Woods, the President, being in the chair.

As the history of the Institution had been fully given in the Report submitted by the Council twelve months ago, it was remarked that on the present occasion it would suffice to deal mainly with matters which had transpired since.

The number of members on the roll of the Institution, on the 31st of March, 1887, was 4,347, of whom 20 were Honorary Members, 1,568 Members, 2,275 Associate Members, and 484 Associates. This was a net increase of 173, or 4.19 per cent., on the 4,174 members of all classes recorded last year. The elections had included 34 Members, 234 Associate Members, and 6 Associates, while the deaths, resignations, and erasures were 106. Many deaths had occurred among the older members of the Institution during the past twelve months, chief among whom must be placed Sir Joseph Whitworth, whose world-wide renown as a mechanician it was unnecessary to dwell upon. By his will he bequeathed to the Institution eighty shares, of 25l. each, in the firm of Sir Joseph Whitworth & Co., Limited.

During the twelve months under review, 211 candidates were admitted as Students. On the other hand, 82 were elected into the Corporation as Associate Members, and 106 ceased, from various causes, to belong to the class. The total number of Students on the 31st of March last was 949, as against 926 at the same date in 1886.

Soon after their election, the Council endeavoured to negotiate with Sir Joseph Whitworth for the purchase of No. 24, Great George-

street; but having failed in this, and No. 26, Great George-street, being in the market, that house was acquired for 13,000l. It was then deemed desirable to revive the option (which had lapsed) for the purchase of the freehold of No. 25, Great George-street, and this purchase was effected for 12,000l. The Council had then two designs prepared,—one for the rebuilding of No. 26, and incorporating it with the existing premises, and another for an entirely new building on the combined sites of Nos. 25, 26, and 27, Great George-street, it having been suggested that it might be desirable to acquire the latter house. After due consideration, the Council came to the conclusion that it was not expedient, at present, to enter into any large building operation, nor further to contemplate the purchase of No. 27. The intention then arrived at was to utilise the ground and first-floors of No. 26 by opening communications through the party-wall between Nos. 25 and 26, and to make these alterations during the coming recess. After the death of Sir Joseph Whitworth, on the 22nd of January last, his executors,—acting on directions given in his will,—offered the freehold of No. 24, Great George-street to the Institution for 15,000l., being about the same rate per square foot of ground as had been given for No. 26 under the hammer. This offer the Council accepted. Thereupon, the tenants in No. 26 were informed that they might remain in occupation of their several offices on short terms of tenancy. It had been decided temporarily to open communications during the ensuing recess between the basements and ground and first floors of Nos. 24 and 25, at the lowest cost, and with the least structural disturbance. By these means increased accommodation would be provided for offices on the ground-floor, and for the library on the first and second floors, as well as for other purposes.

**Sunderland Cemetery Extension.**—Dr. Hoffman, from the Home Office Burials Department, has just inspected 18½ acres of land proposed to be added to the Bishopwearmouth Cemetery, making, with the present burial-ground, 52 acres. The estimated cost for subsoil and surface drainage, roads, and boundary-walls, with an additional entrance-lodge, and inclusive of the land purchased, is 17,500l., per plans prepared by Mr. D. Balfour, C.E. Dr. Hoffman expressed his satisfaction with the proposed works, and particularly the subsoil drainage, which comprises 12-in., 9-in., 6-in., and 4-in. glazed fireclay socket-pipes laid with open joints in a stratum of gravel, the drains being 22 ft. apart regularly, or at one end of each grave, and at a depth of 10 ft. to 11 ft.

**Newgate Prison and the Old Bailey Sessions House.**—The Corporation of London are considering the question of the rebuilding of the Sessions House, but the decision they come to will turn upon the future of Newgate Prison, as to which the intentions of the Government are not yet known.

\* The photograph is by Mr. S. A. Walker.

Staple Inn, Holborn. Roof of the Hall.

Drawings of the repairs effected for the Prudential

visible timbers after May 1887. Assurance Co.

The Roof of Staple Inn Hall.—Measured and Drawn by Mr. Paul Waterhouse.

THE HALL OF STAPLE INN, HOLBORN.

The drawings of the roof over the hall at Staple Inn, which are published in this issue, consist of sections (longitudinal and transverse) through the bay in which the lantern is placed. These drawings are based upon measurements carefully taken on the spot, and represent the roof in its present condition.

The Prudential Assurance Company, who are now the proprietors of the Inn, have entrusted the necessary repairs of the Hall to Messrs. Holland & Hannen, under the direction of Mr. Alfred Waterhouse, R.A., and great care has been taken that the sixteenth-century work should remain, as far as possible, in its original state. The paint has been carefully removed from the oak-panelling of the hall.

As regards the roof the only important measure of restoration has been the insertion of highly necessary tie-rods, one to each of the principals.

The Hall was the scene on Wednesday afternoon last of the tenth annual meeting of the Society for the Protection of Ancient Buildings, Mr. William Morris in the chair. The report (to which we may return) was adopted, and Mr. Frederic Harrison read a paper on "The Sacredness of Ancient Buildings." It was incidentally stated in the course of the proceedings, on behalf of the owners of the property, that the Hall is about to enter into the occupancy of the Institute of Actuaries, who will use it, we presume, for their meetings, and the Hall might perhaps be even more largely used as a convenient meeting-place for some of the learned and professional societies. It was further stated that the other buildings of the Inn, including the picturesque gabled buildings facing Holborn, are about to be very carefully repaired. The Hall will be open to the inspection of the public until the 24th inst.

NOTES ON CRESTS.

The word "crest" is apparently derived from the Latin *crista*, a comb or ridge such as grows upon the heads of various species of birds; and Lower is of opinion that the idea (as well as the name) comes from this source.

The antiquity of crests is very great, and carries us back to the Classic ages for examples, such as the owl on the helmet of Minerva, perhaps one of the best known. Alexander the Great adopted the ram's head, the crest of Jupiter Ammon, from whom he claimed descent. Phœdrus, in his account of the battle of the mice and weasels, represents the heads of the generals belonging to the mice as wearing horns for their crests.

Military commanders added to their stature, and also to their awe-inspiring aspect, by the use of a crest, in the form, generally, of some fierce animal or imaginary monster; and at the same time this distinction served for their own followers as a rallying point in the heat of the battle. In fact, the crest is otherwise known as the cognisance, from *cognosco*, because by it the wearer was known even in the thick of the fight.

Amongst the earliest devices adopted for the adornment of the helmet, the tall plumes of birds were used, and the heads of human beings; the eagle was also a favourite.

With regard to the material that composed the actual crest, Lower gives us his experience, and that is, that iron or wood were often used for the purpose; he gives as examples a demilion rampart of the latter material, in Etchingam Church, Sussex; and "a peacock in his pride" of iron at Laughton, being the well-known cognisance of the Pelham family. In both these instances the helmets themselves are preserved, and the crests are therefore of undoubted authority.

Although crests are of such great antiquity,

they were not adopted in heraldry for some time after the introduction of shields or coats of arms, and Edward III. was the first monarch to wear one, as it appears on his great seal, taking the form of the lion statant guardant, which has ever since done duty as the crest of England. Edmund Crouchback, Earl of Lancaster, was one of the earliest users of an heraldic crest, his seal being nearly half a century earlier than that of our warlike Edward.

Originally considered of even greater honour than coats of arms, and permitted to be worn by commanders or chieftains alone, in our own day the crest has, to a great extent, been adopted to the exclusion of the more elaborate shield for the adornment of writing-paper, &c., by modern families wishing for some distinction of this nature.

Towards the close of the thirteenth century (according to Cassans) the practice arose of affixing a crest to the head of the charger, as well as to the helmet of its rider, which would doubtless add to the imposing appearance of both man and horse.

A remarkable crest was borne by the Bulstrodes of Buckingham, viz.—"A hull's head, crased gules, attired argent, between two wings of the same," said to be derived from an ancestor, who, mounting his followers on bulls, attacked a camp of the Norman invaders, and carried all before him through the terror created amongst the enemy by this unaccustomed display of cavalry. Lower, who tells the tale, thinks it a fine cock-and-bull story.

To the Crusades we are indebted for some most interesting and historic examples of crests. The Newtons of Barr's Court, Gloucestershire, bore "a King of the Moors, habited in a robe and crowned, kneeling and surrendering with his dexter hand his sword, all proper." This dates from Richard I., and was adopted by his follower, Sir Ansel Gornay, who took prisoner

a Moorish king at the siege of Ascalon. The Newtons inherited this crest through marriage.

The Minshalls, of Cheshire, have a somewhat similar crest, with a like derivation, and many instances could be given of the same nature.

The crest borne by the very ancient De la Bere family is one of exceeding historic interest. It represents a ducal coronet or, therefrom issuing a plume of five ostrich feathers per pale argent and azure," and was conferred by Edward the Black Prince upon Sir Richard de la Bere, a knight-banneret, after the battle of Cressy, in recognition of his bravery in rescuing the prince at a moment of imminent danger. In the whole range of heraldry it would be hard to find a more honourable bearing, or one in which its possessors could take more pride.

The crest of the Luttrells of Somerset is a white bear charged with a red rose,—a notable instance of the happy blending of the rival houses of York and Lancaster.

Sir Palmes Fairborne, who was knighted by Charles II. for his gallant defence of Tangiers against the Moors, was granted the following crest, "An arm in armour, couped at the elbow, lying on a wreath sustaining a sword; on the point thereof a Turk's head, turbaned, all proper." This commander lies in Westminster Abbey, and his epitaph was written by Dryden.

Sir John Lyon, having married a daughter of King Robert II. of Scotland, was allowed to bear the following as a crest:—"On a wreath vert and or, a lady couped below the girdle, enclosed within an arch of laurel, and holding in her right hand the royal thistle, all proper," a picturesque and most appropriate device, and afterwards borne by his descendants, the Earls of Strathmore.

The crest of the poet Drayton,—“Mercury's winged cap amidst sun beams proper,”—although opposed to the true spirit of heraldry, seems peculiarly appropriate for its bearer.

The crest of the Earls of Kildare is “an ape proper, girt about the middle, and chained or.” It is recorded of Thomas FitzGerald, the father of the first Earl, that when an infant he was taken out of his cradle by a tame baboon that carried him up to the top of a neighbouring steep, but brought him safely down again: hence this most singular bearing.

The Davenport of Cheshire rejoice in the crest of “A man's head couped below the shoulders in profile, hair brown, a halter about his neck, proper.” A family tradition says a Davenport was vanquished at a conflict of the rival Roses, and was spared his life on condition that he and his descendants should bear this humiliating device.

Sir John Hawkins, on being made Paymaster of the Navy by Queen Elizabeth, had granted him for a crest, “A demi-negro proper, manacled with a rope,” in allusion to his distinguished services in the slave trade. It was considered in those days as a grant of honour.

The crest of John, Lord Lysle, one of the founders of the Order of the Garter, is of extraordinary character,—“A millstone argent pecked sable, the inner circle and the rim of the second, the fer-de-moline or.” Boutell gives a sketch of this in his popular work on heraldry.

The hereditary wardens of the Scotch Marches had for crest, “a horse's head, bridled.” Another was “a spur erect between a pair of wings,” both denoting a readiness to issue forth and pursue at any moment.

The celebrated Admiral Drake had a grant of a very fanciful though appropriate crest: “Out of a wreath a ship drawn round a globe with a cable rope by a hand issuing out of clouds, all proper” in chief, the motto “Divino auxilio.”

The family of Hope may claim for themselves an equally appropriate if fanciful cognisance or crest: “Out of a wreath a broken globe surmounted by a rainbow issuing out of a cloud at each end, all proper.”

The “Iron Duke” had as crest: “Out of a ducal coronet or a demi-lion rampant, gules, holding a swallow-tailed pennon of the last, the fly to the sinister, and at the head charged with the ensign of St. George.”

The crest of the Viscount Downe is one of the most remarkable ones derived from that fruitful source the Crusades. It is thus blazoned: “A demi-Saracen in armour, holding in the dexter hand a ring, gold stoned azure, and in the sinister a lion's gamb erased or.” It was granted to an ancestor, Sir William d'Aunay, who slew a Saracen prince and afterwards a lion, and then cut off the paw and gave it to the king, who gave the hero his ring in return

and ordered him to bear the above device as a record thereof. The ring is said to be still in the possession of the family.

The dun bull's head of the Nevilles and the Percy lion are associated with our country's annals, as is also the lion of the Howard family.

As examples of punning crests, we may quote the Bacon family, who wear the boar; the Wolseleys, with their wolf's head; and the Warrenders, who display the rabbit in their helm.

According to Ellen J. Millington, Richard III. adopted six crests, but none of them of any particular interest. The Colonna family (Italian) bore a siren, according to the same authority. In the cathedral church at Manchester a curious oak carving exists on the stall of James Stanley, bishop of Ely, representing the tree, the eagle, and the infant, the well-known crest of the Stanleys that is said to record the carrying away of a child by the king of birds, and its marvellous rescue from the very nest of the depredator. An old Scotch ballad on Flodden Field alludes to the “swaddling child,” and the *avoc* that was there wrought by one of its race.

Some of our modern crests are absurd in the extreme. The one borne by the Tetlows, of Lancaster, is of this class: “On a hook erect gules, clasped and ornamented or, a silver penny on which is written the Lord's Prayer; on the top of the book, a dove proper, holding in the beak a crowquill pen sable.” It is said that this strange conglomeration was the reward to one of the family for writing the Lord's Prayer on the space of a silver penny.

The Tongue family crest is another heraldic curiosity. “On an oak tree, a nest with three young ravens fed with the dew of Heaven, all proper.”

The national crest of England is a crown surmounted by a lion statant guardant crowned or. That of Scotland is an imperial crown surmounted by a lion sejant guardant, displaying two sceptres or. The Irish crest is an ancient diadem surmounted by an embattled tower, a crest conant issuing from the portal. The crest of Wales is a dragon passant guardant gules.

Ruskin says the crest represents personal character and valour, as distinguished from the shield, the indication of race or family. It is only in the later days of heraldry that crests have been considered hereditary.

#### THE REGISTRATION OF PLUMBERS.

The fourth meeting of the General Council for the Registration of Plumbers was held on Monday afternoon at the Mansion House, the Lord Mayor (Sir Reginald Hanson) in the chair, supported by Alderman Stuart Knill (Master of the Plumbers' Company), Mr. George Shaw, C.C. (Chairman of the Registration Committee), Mr. F. Machin (Warden of the Plumbers' Company), Mr. W. H. Bishop (Renter-Warden), Messrs. W. Digby Seymour, Q.C., C. Hudson, and W. Dent (Past-Masters of the Company); Mr. George Gowin, F.R.S., Sir Philip Magnus, F.R.S., Mr. H. Phillips, Mr. W. Braithwaite (Leeds), Mr. J. Sanders (Newport, Mon.), Mr. G. Evans (Shrewsbury), Mr. S. C. G. Fairchild, Mr. J. Underwood, Mr. F. Scott (Manchester), Mr. W. Titmas, Mr. C. T. Mills, Mr. John Smeaton, Mr. Geo. Davis, Mr. R. A. Narse, and others.

The minutes of the previous meeting having been read and confirmed.

Alderman Knill, the Master of the Company, presented a report on behalf of the Court of the Company. That document stated that since the last meeting of the General Council was held progress had been generally satisfactory. Further evidences of public confidence in, and sympathy with, the movement had been manifested, and the movement had received increased assistance and support from the several interests which were specially represented on the General Council. Support from the side of Municipal Authority had been rendered in a conspicuous manner since the Council's last meeting, by the hearty co-operation of the present Lord Mayor (Alderman Sir Reginald Hanson), following his predecessors (Alderman Sir John Staples and Sir Robert Fowler). The Company had also received the support of the Mayors of Oxford, Bedford, Cardiff, Worcester, Brighton, Scarborough, Southampton, Rochdale, and West Ham; and the Provost of Dmde

had recently lent valuable assistance in promoting the registration of plumbers in Scotland. Since the last meeting of the Council the support of the medical profession had been accorded by persons no less distinguished than Sir James Paget and Sir Andrew Clarke; while other medical practitioners, specially conversant with sanitary matters, had given their cordial encouragement to the efforts of the Plumbers' Company. The co-operation of architects had been expressed in the very practical form of their making it a condition that new works should be executed by registered plumbers. On the side of technical education, the City and Guilds Institute had given further aid to the movement by the establishment of additional plumbing classes, and the extension of technological examination of plumbers. The Durham College of Science had also established plumbing classes; and from the communications which the Plumbers' Company had had with Sir Philip Magnus, there was every reason to expect, that through the provincial organisations of the City and Guilds Institute, working in harmony with affiliated institutions and with local organisations of plumbers, an efficient system of plumbing classes would be provided throughout the kingdom, and facilities would at the same time be secured for holding local examinations, to decide upon the qualification of plumbers, whose admission to the Company's register would be hereafter dependent upon their passing a satisfactory examination in the theory and practice of their craft. The communications which had been received by the Company since the last meeting of the Council had been sufficient to prove that strong and increasing support was accorded to the movement by both master plumbers and journeymen throughout the kingdom. But while the progress of the registration movement has been thus generally successful, the financial burden of it has been very onerous upon the Plumbers' Company, which was by no means a rich one, and it had other claims upon its funds besides those connected with the registration of plumbers. He had, therefore, to recommend, on behalf of the Company, that the Council should now fix the amount of annual fee which should be payable by plumbers enrolled upon the register, as contemplated by the resolution of the Council of 27th January, 1886. The Court of the Company desired that the fees should be moderate, but it is necessary that the annual expenditure should be in part, at any rate, provided for by annual fees, in order that the system of registration might be efficiently developed, and the names and addresses of registered plumbers made readily accessible to the public by means of advertisement and otherwise. On behalf of the Plumbers' Company, he had the pleasure to nominate the following gentlemen as Members of the General Council:—The Lord Mayor, and Messrs. S. Jennings, A. Common, J. Smith, J. C. Asbdown, George Davis, and R. A. Narse, the latter representing the United Operative Plumbers' Association of Great Britain and Ireland, whose members number upwards of 4,000, distributed over the whole of the United Kingdom.

Mr. George Shaw, C.C., Chairman of the Registration Committee, next presented a statement showing that since the last meeting of the Council the number of plumbers registered had reached 776, divided as follows:—125 masters in the London district, 353 journeymen in the London district; 155 masters in the provinces, 142 journeymen in the provinces; 308 further applications had been considered by the Committee, and there was a considerable number of applications still to be dealt with. The applications received showed that the system of registration was growing in favour with plumbers in all districts. The system of dealing with applications and examining applicants for registration was now in fair working order in London. But some of the applications came from parts of the kingdom where it was difficult to obtain satisfactory information; and, pending the establishment of local organisations of plumbers to deal with examinations and obtain other evidences of applicants' qualifications, delay in dealing with those applications unavoidably arose. Negotiations were now in progress and action was in contemplation which would, he hoped, eventually secure adequate management of the registration system throughout the provinces. In cases where applicants for registration were unable to produce satisfactory evidence of their experience in the

trade, they were required to pass an examination by a Board of Examiners (composed of practical plumbers, one-half the number being masters and the other half journeymen); and those examinations had disclosed the fact that men engaged in the trade and desirous of being registered as qualified plumbers were actually unable to pass the most simple test in any branch of the craft. The examination returns were not yet complete, and he could not, therefore, state the precise proportion of successful to unsuccessful candidates examined. The numbers had varied considerably. At some examinations nearly every applicant had passed; at others, 5, 10, and in one case 50 per cent. of the applicants failed, although the examinations were purposely made so moderate as to prevent the exclusion of any man of average ability fairly entitled to be considered a plumber. The examination of plumbers in the provinces would, he anticipated, be considerably facilitated by the development of the City and Guilds Institute system of plumbing classes and examinations. In order to bring the development of this system as far as possible into harmony with the Company's system of registration, it had been decided that plumbers passing both the theoretical and practical examinations of the City and Guilds Institute should be qualified for registration upon compliance with the Company's regulations.

Mr. W. H. Bishop, Renter-Warden, next made a financial statement to the General Council. From this it appears that the gross expenditure incurred by the Plumbers' Company up to May 31st, in connexion with the movement which has resulted in the establishment of the system of registration of plumbers, amounts to 2,017. 8s. 8d. Against this expenditure, 849. 19s. 6d. has been received by the Company as the registration fees payable by plumbers upon enrolment on the register. The net balance of expenditure incurred by the Company up to May 31st is 1,167. 9s. 2d. The estimated expenditure in connexion with registration for the year 1887-8 is 866l. If annual fees were paid to the Company by the plumbers now registered, at the rate of 10s. 6d. from masters and 2s. 6d. from journeymen, the total amount would equal 209l. 8s., leaving a deficiency of 656l. 12s. to be provided by the Company. The cost of publishing lists and advertising the names and addresses of registered plumbers must, of necessity, be exceptionally heavy in the early stages of the system.

The Master, Mr. Alderman Stuart Knill, next formally moved, "That the Reports of the Master and Chairman of the Registration Committee now presented to the meeting be adopted."

Mr. George Godwin, having been invited to second the motion, said he did so with great pleasure. He had taken much interest in the subject, as the Committee knew, for many years. He was sorry that he could not find so much satisfaction in the Reports as others did. The progress was terribly slow, and it was obvious that something more must be done to enlist, not merely the masters and the men, but the public. After all this time, expenditure, and effort to have registered only 495 of the army of journeyman plumbers existing in the country was almost disheartening. It was most difficult to make a thing known in London, and advertising was costly. But it must be done, nevertheless, if they wished to succeed. He was not casting the slightest slur on the work of the Worshipful Company of Plumbers: their proceedings had been most praiseworthy, and they had already disbursed a considerable sum of money. It seemed to him that the public should now aid in the matter. It was a subject of national concern. The lives that had been lost through had plumbers' work were uncountable; and had work continued to be done in every direction. He was not surprised to hear that so small a proportion of those who came up for examination had been unable to pass. Knowledge of the way in which work was being done showed that this inability must exist. As to the examining body, he was not quite sure that it should consist wholly of plumbers, unless they were exceptional men. He thought it should include a couple of scientists; doubtless, however, the Committee had given this consideration. He said he would make only one other observation, and that was to express his regret that any fee, however small, should be asked from the journeymen on registration. He

thought no obstacle should be opposed to it, at any rate, at present.

It was moved by the Master of the Company, seconded by Mr. George Shaw (Chairman of the Registration Committee):—"That the annual fees payable by master plumbers be 10s. 6d., and by journeymen plumbers 2s. 6d., upon renewal of the lists of Registered Plumbers, on the 21st of July in each year." This was carried, and the proceedings terminated.

Illustrations.

NEW MAIRIE, ARCEUIL-CACHAN, FRANCE.

WE give this week a view of another of the new Mairies or local town-halls which are springing up in the environs of Paris. The architect is M. Ulysses Gravigny. The style of the building is described as that of the Louis XIII. period; it is an example of the semi-playful manner in which the modern French architect makes use of the material of Renaissance detail. The general grouping of the building is such as to suit the nature of the site, which, from its triangular shape, is an awkward one to deal with. The stone dressings are of the "pierre de pays" in the lower part of the building and of Châtillon stone above, the hard stone used for the steps, &c., being "Roche de Bagnenx." The carving has been executed by M. Damé.

The chief feature of the interior is the grand staircase of iron, with treads of "roche de Chassignelles." The council-chamber, the library, and the Mayor's private room occupy the first floor, leaving the rest of the building for the remaining offices.

All the floors are of iron construction, and the principal timbers of the roof, as well as the dormers, &c., are of oak. The cost of the building has been about 300,000 fr., or 12,000l.

CHAPEL AT THE ROYAL HOLLOWAY COLLEGE.

THE chapel, of which we give an illustration in the present number, is 125 ft. from east to west, 30 ft. wide, and 30 ft. high. The ceiling, which is elliptical, is decorated with alto-relievo of the prophets and evangelists, and attendants. These groups are placed in the spandrels between the six semicircular-headed windows.

The half-domed ceiling of the apse contains the "Creation of Eve," the central figure being "God the Father descending from Heaven," supported by angels. The whole of this work, together with the sculptured panels in the pilasters, keystones, &c., in the chapel, was designed by Signor Facigna, who also designed all the carving for the college. His death occurring before the completion of the building, the small portion remaining to be done was executed by Signor Boldini, his assistant.

The whole of the interior has been decorated in oil colour and gold, by Messrs. Clayton & Bell, the warm-tinted freestone used in the construction forming the ground. The key of the colour is high, after the manner of the Sistine Chapel in Rome, the lower part of the walls being the strongest in colour, and forming a rich dado from the floor to the window-sills. The flat wall spaces above this are of a soft green, broken by deep red in the niches between the windows.

The wagon-vault of the ceiling is treated with gold as a groundwork, but this is divided into panels by longitudinal and transverse belts, corresponding to the architectural lines below, and the panels thus formed contain figures in medallions of the six Archangels, with their attributes. These, like the subject in the semi-dome of the apse, are on blue grounds.

The groups on the ceiling already mentioned in alto-relievo, are delicate in colour, somewhat in the manner of old ivories, folds and hollows being emphasised and the colour rubbed off the prominent parts, thus avoiding heaviness.

Chapels are provided at both ends. Those at the east end being for invalid students, and those at the west end being intended for visitors.

The grilles and balcony in the chapel, which are of wrought and welded iron, without rivets or screws, and gilt, together with a wrought-iron gate at the door of the chapel, have been carried out by Mr. Barford, of Maidenhead.

The baldachino and organ-case, in low polished oak and walnut, which were specially

designed by the architect, were executed, together with the oak seating and stalls, by Mr. Thompson, the contractor for the College. The floor of the chapel is of black and white marble. The lamps and brackets of brass, from the architect's design, were made by Messrs. Verity & Son.

GRAYTHWAITE HALL.

GRAYTHWAITE HALL, proposed to be rebuilt for Lt.-Col. Myles Sandys, M.P., is situated at Windermere, midway between the Ferry and Lakeside.

The present Hall, which does not possess any special points of architectural interest, is placed at so low a level in the park as to lose much of the beauty of the surrounding scenery.

To remedy this, the new building will be erected on a terrace raised some 10 ft. above the present floor-line. The internal arrangements comprise the usual requirements of a country mansion. The materials proposed to be used are, blue local stone quarried on the estate for the walls, with red sandstone for the dressed work; red tile roofs, and red brick chimneys. By this combination warmth of colouring is secured, in which the buildings of this district are generally very deficient.

The woodwork in the more important parts will be of English oak, felled on the estate. Alterations in the park will involve the erection of new gate-lodges, &c., which, with the stables, have been designed to harmonise in character with the Hall.

The architect for the work is Mr. R. Knill Freeman, F.R.I.B.A., of Manchester and Bolton, the illustration published being from a drawing in this year's Royal Academy Exhibition.

THE NEW (R.C.) CHURCH OF ST. JAMES, SPANISH-PLACE.

We this week give an interior view of Messrs. Goldie, Child, & Goldie's revised design for this fine church. We gave the exterior view of it last week.

ABERDEEN ROYAL INFIRMARY.

THE proposed alterations and additions to the Aberdeen Royal Infirmary buildings are the result of long and careful consideration given to the question by the Committee of Management during the last two years. Various schemes have been discussed and plans prepared with a view to avoid, as far as possible, interfering with the present structures, while at the same time preserving the essentials of good hospital construction as laid down by the most eminent modern authorities. Ultimately it was determined that the truest economy would be to adopt the design of Mr. Saxon Snell for converting the present front main building to administrative and clinical purposes only, and removing all patients into new pavilions to be erected at the rear of the ground facing respectively Spa-street and Woolmanhill. The plan, which will be carried out under the superintendence of Mr. Saxon Snell and Messrs. W. & J. Smith, have been so arranged as to preserve (as a portion of the wards for ordinary patients), the building erected some few years since for the purposes of a typhus fever ward, it having been determined that all patients suffering from diseases of a contagious or infectious nature shall in future be treated at the buildings expressly erected for their reception in another part of the city. No alteration whatever will be made on the exterior of the present front main building, but the interior will be entirely rearranged.

The sick-wards are distributed in such manner that the surgical patients will occupy the southern portion of the west rear block, running parallel to Spa-street, whilst the northern portion of this block will provide accommodation for eye and lock patients, as also a ward to be specially devoted to the diseases of women. The medical patients will be located in the east rear block, running parallel to Woolmanhill.

The space allowed for each bed is 90 superficial feet and 1,400 cubic feet. There will be 108 beds for surgical cases, 12 for eye patients, 13 for lock patients, 7 for diseases of women, 8 for erysipelas cases, and 84 for medical cases. The medical cases will be located in the east block.

Adjoining the wards are w.c.'s, lavatories, sinks, bath-rooms, sister's and surgeons' rooms, and linen-closets.

By the arrangement proposed, in the West

Block, each of the three surgeons, with one sister, will have under their charge on one floor 20 male and 14 female patients, or 34 patients each in all, except on first floor, where there are six extra male patients. In the East Block each of the three medical officers, with one sister, will have under their charge, on one floor, 14 male and 14 female patients, or 28 patients each in all.

Accommodation has been provided for 233 patients.

With regard to the clinical department, the accompanying plans show the main building as it at present exists, the design for its re-arrangement, which will be the last part of the work to be carried out, not having yet been fully determined upon.

It is estimated that the cost of carrying out the building works, including the clinical and administrative departments, will amount to the sum of 30,900*l.*, or about 130*l.* per bed.

#### KING'S CROSS STATION ROOF.

SOCIETY OF ENGINEERS.

At a meeting of this society, held on Monday evening last at the Westminster Town-hall, Professor Henry Robinson, President, in the chair, a paper was read on the "Renewal of Roof over Departure Platform at King's Cross Terminus, G.N.R.," by Mr. R. M. Bancroft.

A brief history and description was given of the construction of the old laminated timber roof, erected in 1851-2, according to the system introduced by Colonel Emy, a French military engineer.\* After pointing out the entire absence of ventilation in the old roof and other causes of decay, the author described the movable staging now being employed in the erection of the ribs for the new iron roof, the way in which it is moved from bay to bay as the work proceeds, and the means adopted for supporting the superstructure of staging so as to give a clear bendway for locomotives, &c., and not to interfere with the departure passenger traffic. Reference was then made to a similar roof over the old G.N.R. passenger station at Bradford, its span, distance apart of main ribs, the weight per bay of 20 ft. being given. The construction, hoisting, and fixing in place of the new wrought-iron ribs were described; and it was pointed out that they have to be made to fit the existing cast-iron spandrels and stanchions built into station walls. The construction and fixing of the lattice and trussed purlins, and the gangways adopted to give greater facilities for workmen in repairing and cleaning the glass covering, were also described. The author remarked on the absence of wind-bracing, and gave the reasons for not using it. He also described the method of glazing, both with putty for the roof generally and with Helliwell's patent puttyless glazing at the louvre. Diagrams were exhibited showing the general form of the roof and the movable staging, and the working drawings were also laid upon the table for reference by the kind permission of Mr. Richard Johnson, M. Inst. C.E., Chief Engineer of the G.N.R., under whose instructions the work is being carried out by Messrs. A. Handyside & Co., contractors, of Derby and London.

#### THE SURVEYORS' INSTITUTION.

ANNUAL REPORT OF THE COUNCIL.

The nineteenth annual report of the Council of the Institution, presented to the general meeting, held on Monday last, June 6th, states that

"The steady progress which has so happily characterised the career of the Institution from its earliest days has never been more apparent than during the past year. There have been elected during the last twelve months 1 Honorary Member, 32 Fellows, 31 Professional Associates, 7 Associates, and 40 Students, or 111 in all; from which have to be deducted 1 Honorary Member, 8 Fellows, 2 Professional Associates, and 1 Associate who have died; 3 Fellows, 2 Professional Associates, and 1 Associate who have ceased to be members; and 12 Students who have passed out of the class by effluxion of time, leaving, as shown by the subjoined statement, a net increase of

\* Its construction was illustrated in the *Builder* at the time.

81 of all classes since the date of the last Report.

|              | Hon. Members | Fel. lows | Prof. Assoc. members | Students | Totals |
|--------------|--------------|-----------|----------------------|----------|--------|
| May, 1887... | 16           | 725       | 339                  | 89       | 1,277  |
| May, 1886... | 16           | 700       | 316                  | 84       | 1,196  |
|              |              | 25        | 23                   | 5        | 23     |

It is gratifying to observe that out of the 111 of all classes enrolled during the year, upwards of seventy are a direct result of the system of professional examinations. . . .

An opportunity having offered itself of purchasing the residue of the lease (expiring in 1892) of a house in Little George-street, abutting on the eastern side of the Institution premises, it was thought that the chance should not be lost of providing for that extension of the Lecture Hall and adjoining rooms which will, before long, be necessary for the convenience of members. The purchase of the existing leasehold interests, which was effected for the sum of 1,300*l.*, placed the Council in a position to negotiate for a new lease of the premises continuous with the lease under which the Institution premises are held, at a ground-rent of 135*l.* per annum, the corporation undertaking to expend the sum of 200*l.* in improvements to the premises as a condition precedent to the granting of the new lease. It is not proposed for the present to utilise the new premises for the contemplated extension of the Lecture Hall; but alterations necessary for adapting them for use in other ways will be set about immediately after Michaelmas, when the last of the tenancies granted by the late lessee will expire.

The success which has attended the system of examinations may fairly be called remarkable. The number of candidates has been larger each successive year, as will be seen by the subjoined statistics. It is satisfactory to note that the increase has been perfectly spontaneous, the conditions of candidature being designed to limit rather than augment the number offering themselves for examination.

The following table shows the results of the examinations for the seven years since their establishment:—

| Year.       | Preliminary Examination. |         | Professional Examinations. |         |
|-------------|--------------------------|---------|----------------------------|---------|
|             | Candidates.              | Passed. | Candidates.                | Passed. |
| 1881        | 13                       | 6       | 2                          | 1       |
| 1882        | 30                       | 17      | 0                          | 2       |
| 1883        | 44                       | 22      | 23                         | 22      |
| 1884        | 61                       | 30      | 36                         | 23      |
| 1885        | 46                       | 37      | 43                         | 31      |
| 1886        | 46                       | 34      | 59                         | 33      |
| 1887        | 63                       | 39      | 68                         | 45      |
| Totals..... | 283                      | 185     | 220                        | 160     |

The standard reached by the candidates in the recent Professional Examination was, on the whole, distinctly higher than on any previous occasion. An analysis of the results shows that the fifty-eight candidates of all classes obtained among them upwards of sixty-one per cent. of the possible marks."

#### THE DRAINAGE OF PORTSMOUTH.

On Saturday last, at Portsmouth, there was a large and very successful meeting of the Home Counties District members of the Association of Municipal and Sanitary Engineers and Surveyors, who were received in the Council Chamber by the Mayor, Mr. King. The visitors included the President, Mr. Lobley (Hanley), Mr. Lewis Angell (Borough Engineer of West Ham, and formerly Borough Engineer of Portsmouth), Mr. Charles Jones (Ealing), Mr. J. Gordon (Leicester), and other well-known members of the Association, with Mr. Thomas Cole, the Secretary.

The Mayor, in welcoming the visitors to Portsmouth, said he was glad to see amongst the members present that day the former Borough Engineer of Portsmouth, Mr. Lewis Angell, to whom was due the credit of having initiated the system of sewerage now amplified and extended so as to meet the wants of an increasing population and to be abreast of the more advanced requirements of the present day.

Mr. Bouinso, the present Borough Engineer of Portsmouth, then read the following paper:—

There have been already two papers presented to this Association upon the subject of the drainage of Portsmouth. One of these papers was contributed by Mr. Lewis Angell, M.I.C.E., our first President, and the other by

Mr. Greatorex, who was then the Borough Engineer of Portsmouth, but who has since died. These papers will be found in the fourth volume of our "Proceedings."

It might, therefore, appear almost unnecessary to present a third paper upon this subject for the consideration of the Association, were it not for the fact that considerable additions and alterations to the original works have been recently carried out; and it is these works which I shall now endeavour to describe to you, and ask you presently to inspect.

If you refer to Mr. Angell's paper, to which allusion has been made, you will find that the Borough of Portsmouth is there described as being situated on an island, that its formation is of the Tertiary period, and that it is nearly a dead level all over. "The highest, huest, and most densely populated portion of the borough is elevated only about 12 ft. above the tidal range, while about one-third of the borough is very little above the level of ordinary spring tides, and includes a large extent of marsh."

These are Mr. Angell's exact words, and under such conditions we all know the difficulties and obstacles there are to a gravitation system of drainage.

Mr. Angell, however, made the best of a most difficult task, and laid out a scheme of drainage which was submitted to and approved by Sir John Hawkshaw, the Admiralty and War Departments, the Secretary of State for the Home Department, was adopted by the Corporation of Portsmouth, and eventually carried out the works, being commenced in the spring of 1865.

This scheme was shortly as follows:—a high-level sewer commencing at what is known as North-end, passing through the Commercial-road, part of Somers-road, and Elm-grove, into Albert-road, Highland-road, and Henderson-road, to the pumping-station at Eastney. There is now a further branch, a portion of which I have myself recently extended, commencing at Copnor, and also at Inebland, passing along the Copnor and Milton roads, and joining the main high-level sewer close to the pumping-station. The total length of the high-level main sewer is about eight miles. The low-level commenced in Portsea, passing through Portsmouth, across Southsea Common, along Lump's-lane and Henderson-road to the pumping-station. A branch commencing in the Commercial-road, at Landport, connected with it near the Pier Hotel, Southsea. The total length of the low-level sewer is about six miles. In the Henderson-road the high and low level sewers were constructed one above the other in the same trench, for a distance of 800 yards, before entering the pumping-station. Here the sewage in the low-level was lifted by a pair of 25-h.p. rotative, condensing beam engines into the high-level sewer, and from the pumping-station both sewers discharged by gravitation to a point most judiciously selected by Mr. Angell, near the entrance to Langstone Harbour, the only point upon the seaboard of the island of Portsea where sewage could be discharged with the least nuisance.

On account of the levels of the outfall sewer the sewage of the borough could only commence to discharge at about one hour after high water, at which time the high-level sewer commenced to discharge by gravitation, and the pumps were put into operation to lift the sewage from the low-level sewer; thus, during some five or six hours out of every twelve the low-level sewer was tide-locked, and for a slightly shorter period the sewage in the high-level sewer was also pushed back.

When it is added to these drawbacks that the gradients of the sewers were necessarily very flat, some of the mains being only 1 in 5,280, whilst the arterial drains only 1 in 650, it is scarcely to be wondered at that deposits took place in the sewers throughout the borough. In the year 1882 the state of the sewers had become so bad that the Corporation, after inviting competition schemes for the effectual dealing with the system, called in the aid of Sir Frederick Bramwell, M.I.C.E., F.R.S., &c., who, with the assistance of Mr. Harris, M.I.C.E., his chief assistant, prepared and presented to the Corporation an exhaustive report upon the condition of the sewers, and advised certain works being carried out with regard to them and also a scheme for ensuring a constant flow through the outfall, at the same time securing that the flow of the sewage into the sea should be on the ebb tide only. These are the works which are now just completed, and which I shall presently

ask you to inspect, but before doing so it will be well to give you the following description of them, this description being partly taken from a report presented to the Town Council at the recent ceremony of opening the works.

The new works consist of a sewage-collecting tank, constructed on a piece of ground which the Corporation obtained from the Governmental authorities near Fort Cumberland. This tank, or rather series of three tanks, is competent to contain all the sewage produced in the district during any one tide, not only from the present population of about 138,000 inhabitants, but also from the population of twenty years hence, estimated to increase at the rate of the last decennial period from 1871 to 1881, and competent also to contain (with the same increase) the sewage of that portion of the borough, i.e., Stanshaw, lately drained, the sewage of the Government establishments, and a proportion of the surface-water from those districts where the surface-water is not separated from the sewage proper. The tank has, therefore, been made capable of containing, when full, as much as four and a half millions of gallons, and it covers an area of nearly three acres and a quarter.

In this tank the sewage will be stored during those hours when the tide is rising, and also during those hours when it has fallen so low as to render it inexpedient to discharge into the harbour,—that is to say, for about eleven hours out of every tide. With the object of allowing the outflow to begin at such early period after high water as may be found best in practice, the sloping bottom of the tank has been placed only 1 ft. below ordinary high water.

The tank is divided into three distinct and practically equal compartments, any one of which can, if necessary, be thrown out of use for repair. Advantage has been taken of this construction to make the tank self-flushing, that is to say, it has been so arranged that the contents of any full compartment can be used to flush an empty compartment, and although, as the tank is filled by pumping, and not by gravitation, there should not be any sewage in excess of its capacity pumped into it, yet each compartment of the tank is provided with an overflow into the outlet culvert.

At the request of the military authorities, a provision has been made for ventilating the tank by means of a chimney having in it a furnace kept continually burning, so as to cause an efficient draught, the inlet of the air for this ventilation is at the shallowest end of the tank, the chimney through which the air is carried being 90 ft. in height.

In order to ensure the rapid discharge of sewage, which is essential in this scheme, the outlet culvert has been made 7 ft. by 6 ft., from which proceed three lines of cast-iron pipes, each 3 ft. 6 in. in bore, standing out from the shore into the entrance to Langstone Harbour a distance of nearly 600 ft., and have their open ends placed slightly below low-water mark and delivering well into the tidal stream. The laying of these pipes has been a work of great difficulty and of some danger, owing to the swiftness of the tidal current and to the exposed nature of the shore at this point.

The arrangement for lifting the discharge valves in the tanks is of an ingenious kind, it is effected by the action of the sewage itself upon turbines which raise the valves. Thus considerable time and labour are saved, and I hope when we inspect you will direct particular attention to this point.

A long series of experiments were made under Sir Frederick Bramwell's directions during the winter and spring of 1883 and 1884 in all states of the tides, and during all sorts of weather, to determine, by means of floats, to what points the sewage would be taken, if delivered at the proper time from the new outfall pipes, and in every case in these experiments the floats were carried many miles to sea,—never approaching the shore: thus confirming Mr. Angell's selection of this point as the best in the borough.

The tank has been constructed with Portland cement concrete walls lined with brick set in Portland cement mortar, there being a straight, thick water-tight joint between the face of the concrete and the brick lining. The floor is in Portland cement concrete, worked to parallel inverted slopes towards the outlet culvert and "rendered." The roof is composed of brick arches carried on brick piers, and on the lining walls, with concrete backing to the haunches, the whole earthed over and sown with grass

and clover seed. The discharge-culvert, and the flushing-culvert and the discharge-chamber, are of Portland cement concrete similarly lined with brickwork.

The height at which the tank is placed is such that the supply connexion to it from the pumping-station is under pressure, and thus the connexion between the two is made by a cast-iron main or pipe. In order to allow for the irregular flow of the sewage and of rain water, and so as not to sacrifice power by undue friction, this main, which is nearly 1,500 yards in length, has been made as much as 3 ft. 6 in. diameter of bore. The load on the new pumping engine is equalised, and accidents are guarded against by providing a standpipe in the engine-house premises, into which the sewage is pumped, and from which it passes into the cast-iron main. This is carried underground, generally parallel with the present brick outfall sewer, until a point is reached about 500 yards from the engine-house, when it runs to the N.E., so as to approach the tank at its N.W. angle, and is then extended along its west wall, being connected to the tank so as to fill all three compartments.

Having regard to the elevation of the tank, the whole of the sewage will have to be pumped, and having regard to the fact before stated that the sewage comes down in unequal quantities, and not by an average flow, and also that surface water has, to some extent, to be allowed for, the pumping power is very considerably in excess of that previously in use.

The two new pumping engines are each capable of developing 150 indicated horsepower. They are compound condensing beam engines, with cranks and fly-wheels, the pumps (two to each engine) being worked direct from the beam.

The pumps are double-acting plunger pumps, and draw from two sumps outside the engine-house. Into these sumps the main high-level and main low-level sewers fall, the invert of the high-level sewer at this point being about 15 ft., and the invert of the low-level sewer about 20 ft. below the surface of the ground. By an arrangement of sluice-valves on the suction-pipes it is possible for each pump of each engine to draw either from the high-level sump or from the low-level sump, or from both sumps together. The deliveries of the pumps lead to a stand-pipe, 24 ft. high from ground-level, and from this stand-pipe a cast-iron main, 3 ft. 6 in. in diameter, conveys the sewage to the collecting tank.

The general dimensions of the engines are,—high-pressure cylinders, 20 in. diameter, 4 ft. 6 in. stroke; low-pressure cylinders, 30 in. diameter, 6 ft. stroke; length of beams, 23 ft.; stroke of cranks, 6 ft.; diameter of fly-wheels, 15 ft. The diameter of the pump plungers is 2 ft. 6 in., and the stroke, 3 ft. 3 in. The total displacement of the pumps of each engine, when running at twenty revolutions per minute, is about 500,000 gallons per hour, but a much less quantity than this only is pumped with the ordinary flow of sewage. The pump-valves are rectangular leather-faced clack valves on inclined seats. There are three suction and three delivery valves for each end of each pump.

The boilers, which are in a house adjoining the engine-house, are four in number. They are double-fueled boilers, each 7 ft. in diameter, and 27 ft. long, set in the usual manner, the flues being connected to a circular chimney-shaft, 120 ft. in height.

The engines and boilers are by Messrs. James Watt & Co., of Soho, Birmingham.

The principal dimensions of the engine-houses are,—length inside, 40 ft.; width inside, 30 ft.; total height from basement to ridge of roof, 72 ft., of which 23 ft. is below floor-level. The roof, which is high-pitched, is partly supported on the two lattice "lifting girders," one of which is over each engine. On the lower flange of each of these girders is a small lifting carriage, which may be fixed in any position in the length of the girder by a brake-block taking against the bottom of the girder; to these lifting carriages may be attached blocks or other lifting tackle.

The existing engines have yet to be altered so as similarly to receive their pumping supply from the high and low level sewers, and to deliver into the new outflow main. When the whole scheme is completed the two new engines, or one of the new engines in conjunction with the existing engine, will suffice for the work, thus giving a stand-by engine to go to work when needed.

The engines, or one of them, will be kept continually at work, night and day, from one year's end to the other, so that the sewage will be taken away to the collecting-tank as it arrives at the pumping-station, and will not be allowed to "back" up in the sewers of the town, as it now does for hours together; thus all evils attendant upon the present state of things will, it is believed, gradually disappear.

A large amount of reparation and renewal of the sewers in the borough has also been done during this last four years, but much has yet to be performed, and there is no doubt but what, as soon as the new scheme is put into operation, a systematic flushing of the sewers and drains will have to be commenced in order to put them into a satisfactory condition.

To convey some idea of the magnitude of the works which have been performed, it may be stated that about two hundred thousand cube yards of earth have been excavated, over of which has, of course, been refilled in some of the work; nearly six million bricks have been used; seven thousand tons of Portland cement, for the making of concrete and mortar, with about thirty thousand tons of gravel and eight thousand tons of sand; altogether also there will be something like three thousand tons of iron, of which about 350 tons, more or less, will be in the engines and boilers, and pipes, &c., in connexion with these, the remainder being in the cast-iron main from the pumping-station to the tank, in the outlet pipes into Langstone Harbour, and in the screw pipes, &c., for securing these, and in the valves, covers, and plates, &c., throughout the works.

In conclusion, I need scarcely tell you that this is only a mere sketch of the large works which have been carried out. I hope to be able to furnish a more detailed account of them to be entered in our Minutes of Proceedings, but I felt that a longer paper would only have detained you from the inspection, and my intention was to give you only a short outline of the principal points of the work, so that you should more clearly understand them when you visit them, which I now ask you to do.

The members subsequently visited the pumping-station and outfall works, and after being entertained at luncheon by Mr. John Mowlam Bart (of the firm of John Mowlam & Co., the contractors for the works), inspected the Corporation stables, the new public baths, and the new Town-hall now in course of erection. As to the latter we will say something in our next.

### New Underground Railway at New York.

In view of the ever-increasing railway traffic, but more especially the demands for further facilities for local travelling in New York and its suburbs, it is stated that the New York Central Railway Company has determined to undertake an enterprise almost as great as the construction of the Fourth Avenue line to Harlem a few years back,—a work which cost something like 7,000,000 dollars, or 1,400,000. The new project is that of an underground railway, about three miles and a half in length, from the Grand Central Depot, in Forty-Second-street, to Brooklyn Bridge. The course of the tunnel will be under Elm-street, which in consequence will have to be considerably widened and extended at one end to the bridge, while the other end will be lengthened to Lafayette-place and Fourth-avenue, and no pains or money will be spared to accomplish the undertaking as soon as possible. It is calculated that the railway will be completed and opened for public traffic a year next autumn, or about sixteen months from the present date. There will be four lines, two of which will be employed for through travelling. The company has not stated how or when they obtained from the city or the Legislature the authority to appropriate the streets for the purpose of a railway, and on this account it is presumed in New York that the authorities are acting in accordance with the New York Central original charter (known to be a very elastic one), allowing the company the right to extend their lines in almost any direction, and to any distance at any moment. Under any circumstances, however, the new line cannot fail to be a very appreciable acquisition to the general public.

**Obituary.**—We regret to hear of the death of Mr. Caleb Holden (of the firm of Holden & Co., contractors for zinc roofing, &c.), which took place very suddenly at Wood-street, Westminster, on the 13th ult. Deceased was in his seventy-third year.

### CASE UNDER THE METROPOLITAN BUILDING ACT.

At the Lambeth Police Court a few days since, Mr. W. A. Smees, of 89, Finsbury-pavement, builder, was summoned by Mr. George Elkington, jun., the District Surveyor for Fenge, for not giving notice of his intention to build a tobogganing slide, erected by him at the Crystal Palace, contrary to 18 and 19 Vic., c. 122, sec. 38. Mr. Thomas Burton, solicitor, instructed by the Metropolitan Board of Works, appeared for the District Surveyor, and Mr. Willey Wright for the defendant.

Mr. Burton stated the defendant had erected a slide 458 ft. long, and attached thereto was an engine-house for bringing up the unused sleights, a store-room, and a ticket-office, and these being considered formed a building within the meaning of the Act, and, therefore, required notice to be given to the District Surveyor, and that he relied upon the case of *Stevens v. Gourly* in support, and called Mr. Elkington, who proved the dimensions of the various buildings.

Mr. Willey Wright contended that the slide was not a building, and that if it was it was exempted under the Special Act of the Crystal Palace, 44 Vic., c. 36, sec. 21, which enacted that the main buildings, conservatories, and waterworks, and the conveniences and other works immediately connected therewith, were to be exempted from the operation of Part I. of the Building Act.

Mr. Byron said he should find that the slide was a building, but was exempted under the Crystal Palace Act, and dismissed the summons.

Notice of appeal was given.

### RECONSTRUCTION OF THE STRATFORD RAILWAY STATION.

AMONGST the several costly new works which the Great Eastern Railway Company are at present carrying out at several points of their system is the entire reconstruction and enlargement of the station at Stratford. One of the most difficult portions of the engineering connected with the undertaking has been the designing and construction of the underground approaches to the different platforms above from which the trains are dispatched from Stratford to the many suburban and other localities embraced in the Company's system. In consequence of the peculiar conformation and levels of the station area, these platforms are, in several instances, only reached by underground subways. The reconstruction of the whole of these subways, together with staircases leading up from them to the platforms above, has been accomplished without any interruption to the traffic on the line. The subways are all about 12 ft. in width, and are light and airy, the walls being faced with white enamelled brick, and covered in with wrought-iron roofs immediately under the railway metals above. A feature in the carrying out of the works is an improvement which is being made in the approaches to the station from different parts of the town. In place of the former inconvenient approach from the Broadway, on the south-east side of the town, a new block of booking-offices and waiting-rooms has been erected at this point, approached direct along one of the main thoroughfares from Broadway, from which the platforms are reached along the subways and staircases already referred to. At the north-west side of the town, from the locality known as Stratford New Town, a carriage-way, about 40 ft. in width and upwards of 900 ft. long, is being formed on the street level. This carriage-way leads to a spacious open area immediately in front of an extensive block of new booking-offices, waiting, and refreshment-rooms, station-master's offices, and other apartments, which are at present in course of construction. Several of the platforms approached from these new booking hall and offices are reached without the aid of the subways, the floor of the offices being on the railway level. All the platforms are from 800 ft. to 900 ft. in length, and are intended to be covered with iron roofs. Immediately opposite to the booking-office block, another block is also in progress of construction, intended as general offices for the clerks and other employes of the company. The works are in the main being executed by the company's own workmen under the superintendence of Mr. Wilson, engineer-in-chief, and his assistants; the brick-work of the several new blocks of office and other buildings being in the hands of Messrs. Atherton & Latta, builders, of Poplar. It is stated that the works when completed will have cost from 200,000l. to 250,000l.

### IMPROVEMENTS IN RAIN-WATER SEPARATORS.

We have on two or three previous occasions noticed the ingenious rain-water separators invented by Mr. C. G. Roberts, of Haslemere, and we return to the subject in order to mention some material improvements lately made in those appliances.

Fig. 1.

In order to insure a thorough washing of the roof, it is deemed desirable by the inventors that in a smoky town no water should be stored before two gallons of rain have fallen on each 100 square feet of the roof; in other localities, one gallon or 1½ gallon of rain on each

light rains that took an hour to yield the requisite quantity, and until recently all the water that came in still lighter rains was of necessity allowed to run to waste. By the recent improvement it is claimed that perfect regularity of action is obtained in much lighter rains, and that in a town the separator with the slide marked "2" will be certain to run water to storage as soon as two gallons have fallen upon each 100 ft. of roof, even if it has occupied two hours' time in descending. This improvement is effected by the introduction of the funnel-shaped chamber, H, shown in the two accompanying illustrations. Fig. 1 gives a section of the horizontal separator, and fig. 2 a section of the vertical separator. While the inlet and outlet boxes differ, it will be seen that the centre part, or center, which turns upon the pivot M, is the same in construction in each drawing, but different in position. Fig. 1 shows it before it has canted and while it is still running foul water to waste. Fig. 2 shows it after it has canted and is running the clean water to storage. In the earlier form of separator (see illustration in *Builder* for April 10, 1886) the water that came through the slide B fell direct into a large chamber, with a hole at the bottom of it rather smaller than the hole at B, and as soon as this chamber filled to a certain height the centre canted. In the new form of separator, the water from B falls into the funnel F, and only a small proportion passes thence by the holes H into the chamber J. There is no aperture at the bottom of this chamber, but when the rain has ceased it is emptied by the action of the siphon L. It will be noticed that the longer leg of the siphon has been enlarged; by this very simple and, as it is believed, original contrivance, the air in the top of the siphon is prevented from interfering with its action, being made to take the shape of a short and broad instead of a long and narrow bubble.

### ARTERIAL DRAINAGE.

SIR,—As my grandfather, the late Mr. John Grantham, sen., reported to the late Mr. John Rennie in 1822, on the condition and improvement of the river Shannon, and his report was printed by the then Government, and as my father, Mr. R. B. Grantham, and I have since carried out many works of arterial and agricultural drainage in this country, perhaps you will kindly allow me space for a few remarks on the subject of your leading article on "Arterial Drainage in Ireland."

In the first place, the opinion of the Royal Commissioners appointed in October, 1886, that the climatic conditions arising from large tracts of wet land cannot fail to have effects prejudicial to health, will be supported by all who have had experience of lands liable to frequent inundation. In 1873, a report made by my father, and presented to the House of Commons by the Inclosure (now the Land) Commissioners, upon the floods in certain valleys in Somersetshire, which were very severe at that time, contained the following passage:—"The results of my inquiries among the medical men of the country show that during the wet weather of last winter the public health was generally good, but that ague set in early in the spring, and is now very prevalent on the verge of the moors. Neuralgia in various forms prevails, and is attributed to the malarious exhalations of the moors. These diseases cause a decided vital depression and diminution of energy for work, and are a source of affliction to the poor, preventing men from working and driving them to seek parochial relief. Rheumatism is generally prevalent in the neighbourhood at all times of the year." The floods in the districts referred to extended over an area of 69,000 acres in the valleys of the Rivers Parrett, Brue, Axe, Tone, and Carey, the aggregate watershed of which amounted to 609,000 acres.

I cannot but think that the recommendation by the Royal Commissioners of the adoption of the principle of a Conservancy Board for the control of the main river (in the case of the Shannon, represented by the Government), with District Boards for the management of the tributary rivers, will be hailed with satisfaction by all those interested in the conservancy of rivers; and that their apportionment of the rating powers over the lowlands, midlands, and uplands of a watershed will be regarded by many people with approval.

It is perhaps not very generally known that

Fig. 2.

100 square feet will be enough to wash it. By the insertion of a slide marked "1," "1½," or "2," the requisite amount of washing for each locality was secured in the old form of the appliance, and the separator was canted as soon as that amount of rain had fallen, whether it came in five minutes of storm or in sixty minutes of steady rain. There was comparatively little difficulty in securing the automatic action with heavy rain, but it was more difficult to ensure an unfauling action in

the principle of Conservancy Boards has to a limited extent been already established in the upper Thames Valley, and in the Somersetshire valleys already mentioned.

In 1871, the Thames Valley Drainage Act was passed, and this Act appointed a body of Commissioners, with jurisdiction over the valleys of the river Thames and its tributaries above Oxford. The area under their control was divided into seven districts, each, or a combination of them, having its separate District Board. The operations of the Commissioners themselves were confined to the beds, soil, and banks of the River Thames, and its tributaries, while the District Boards were to maintain and improve the internal drainage of their own districts, always, however, submitting their plans to the Commissioners. After the appointment of the first Commissioners the District Boards could elect Commissioners from their own body. The first Commissioners were directed to ascertain all lands which would derive benefit from the exercise of their powers, and those subsequently elected were to levy rates according to the probable or actual improved value of the lands within their jurisdiction.

The flooded areas in the Thames valleys previous to 1871 amounted to 71,100 acres from an aggregate watershed area of 826,900 acres.

An Act similar to the Thames Valley Drainage Act was passed in 1877 having for its object "the more effectual drainage and irrigation of lands in the county of Somerset and for other purposes." This Act referred to the valleys in Somersetshire previously alluded to.

Both Acts were initiated by those interested in the land in their respective valleys, and under both of them considerable works of improvement have been carried out. It will be seen that they embody the principle of Conservancy Boards, although their methods of rating are not those proposed by the Royal Commissioners.

As the report of the Royal Commissioners refers to the Fens in Lincolnshire, and as I am acquainted with the system of rating in one of the districts there, a short description may be of interest.

The jurisdiction of the Black Sluice Commissioners extends from Boston up to the river Glen, over an area of about 70,000 acres, drained by what is known as the South Forty-foot River. The district does not extend beyond the fen lands, and therefore does not include any uplands, and it is upon the fen lands within the district that the rate is levied, and this rate provides for the maintenance of the South Forty-foot River and of all streams bringing down water from the high lands so far as those streams lie within the Black Sluice District. Those streams generally have straight courses, and discharge at right angles into the South Forty-foot River. Between those streams lie the fens, each within its own parish, and discharging its drainage by what are called "interior" drains, through sluices, into the Forty-foot. For the proper drainage of each fen "interior" officers are annually appointed by the Black Sluice Commissioners, and have the power of rating for that purpose; so that, besides the Black Sluice rate, there is also the "interior" rate, on each fen. The system appears to work fairly well, although there is difficulty sometimes in getting the "interior" officers to maintain the "interior" drains in proper condition.

I fear I have made this letter too long already, but I would add that, with regard to the question of embanking, as compared with deepening the channels of rivers, it appears to me impossible to form a judgment without a close investigation of every case, although, no doubt, the deepening of the channel, as a question of principle, is the method to be preferred.

RICHARD F. GRANTHAM, M.Inst.C.E.

Northumberland-avenue, June 4.

**Temple Bar.**—The *City Press* says that the statement which we quoted last week from the *Pall Mall Gazette* to the effect that the Corporation are about to sell the stones of Old Temple Bar, to be erected in private grounds, is a *canard*. As a matter of fact, no decision has been come to with regard to the disposal of the stones. The subject is still under the consideration of the City Lands Committee, and nothing can be done without the sanction of the Court of Common Council.

LIFTS.

SIR,—In your issue of May 21st there is a communication from Messrs. Archibald Smith & Stevens which has escaped my attention until now, and which requires a word of reply. With much of that which is written by Messrs. Smith & Stevens I fully agree, but they have fallen into an error. They express a wish to show Mr. Slater "Lifts of English manufacture which comprise all the precautions by which the Otis lift is absent." The English lift, being absolutely controlled by its valve, cannot run down if overloaded; in it overwinding must be carried to the fracturing point before danger can arise."

Mr. Slater did not ascribe any danger to the Otis lift. On the contrary, not only in the course of his remarks, but in the discussion after his paper had been read, absolute safety was in the most explicit terms conceded by him. The statement that "the English lift, being absolutely controlled by its valve, cannot run down if overloaded," might be taken by the unwary reader as meaning by implication that the Otis lift could run down if overloaded. Such an idea needs no words from us with any who understand the matter. If all our readers were engineers and acquainted with lift machinery, we should not deem it necessary to trouble you, but for the benefit of such of your readers as have not gone into a critical investigation of this matter, we desire simply to correct the wrong impression calculated to be produced by Messrs. Smith & Stevens's letter. Wm. Arct. Gussow, President American Elevator Co.

\* \* \* Our correspondent is not quite correct: Mr. Slater did say that a lift on the Otis principle was exposed to three dangers. He then went on to point out that these possible dangers had been completely guarded against. The expression used by Messrs. Smith & Stevens was verbally accurate; but it was, no doubt, liable to be misunderstood.

THE JUBILEE HOLIDAYS.

SIR,—Perhaps it may not be out of place to ask what the jubilee holiday will be in the building trades as regards us clerks. I am afraid some of our firms, not knowing other firms' intentions, may only give us the day, and a lot of us will lose the chance of an extra day or two entirely through our principals' ignorance as to what is to be the general rule.

I think, myself, that we ought to have the three days, viz., Monday, Tuesday, and Wednesday, and those clerks who are not entitled to any regular summer holiday should have the week.

I hope that some of our leading firms will take this matter up and let us know their intention in your next issue. A BUILDER'S CLERK.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

7,069, Flushing Water-closets, &c. W. Smeaton, sen.

The object of this invention is principally to limit the quantity of water used for flushing the closets. The apparatus is actuated by the movement of the seat, or in the case of lavatories or urinals by a foot-plate.

8,081, Casement Fasteners. F. A. Morgan. By this invention the casement is secured to the frame by a screw, the plate affixed to the casement two legs are formed; between these is a joint with one end of a screw. On the other part of the screw is placed a thumb nut, and on one side of this thumb nut is formed a boss. A slotted plate fixed on the casement-frame is jointed so that it can be folded like an ordinary hutt hinge. The action is such that when closing the casement the jointed screw of the plate fixed on the casement is brought into the slot of the plate which is fixed on the casement-frame.

8,593, Wall Paper, &c. John Luke.

According to this invention the paper is treated in a special manner in order to render it more durable and suitable for use as a covering for walls, floors, &c. A duplex paper prepared after a formula given in a previous specification is passed before finishing through a sizing machine, in order to give it a coat of size, after which the paper is made waterproof by means of paint or oil. It is then printed with any impressed pattern and dried by heated air or some such like process.

12,331, Firegrates. C. Swindell.

Instead of the ordinary horizontal bars, wire of zigzag pattern is, according to this invention, passed from the top to the bottom bar, and laced so as to prevent the fuel from falling out.

15,904, Wood Block Flooring. R. Davison and W. T. Creed.

According to this invention, the blocks are bonded on all sides. What are called by the inventors "wood-keys" are used. The blocks have dovetail joints worked on two or more sides, and have recesses into which the aforesaid "wood keys" are inserted. The bed is made in the method common

to wood-block flooring, and it is claimed that the block flooring gives a perfectly level and well-bounded floor.

3,850, Shop Fronts. J. Gooch.

By this invention a wheeled or movable arrangement is made so that goods may be better displayed, and so also that the frontage between side and party walls may be better utilised for the display of goods.

**The Sunday Society.**—On Saturday afternoon the twelfth public annual meeting of the supporters of the Sunday Society was held in the Freemasons' Hall, Great Queen-street. Sir George A. Macfarren, Mns. Doc. (President of the Society), took the chair. There were about 200 persons present. Mr. Mark H. Judge (the Hon. Sec.) read the annual report. Mr. Judge, in the course of his statement, said that it was twelve years since the society had been inaugurated, and each year some progress had been made. The Society of British Artists, the Institute of Painters in Oil-Colour, and the Grosvenor Gallery had all been opened on one or two Sundays during the past year. The Chairman then proceeded to deliver his presidential address, after which the Rev. Septimus Hansard (Rector of Bethnal-green) moved the first resolution, accepting the report as eminently satisfactory, and authorising the Chairman to sign a petition to Parliament in favour of Sir Henry Roscoe's motion for the opening of public museums. Mr. Oscar Wilde seconded the resolution, which was then unanimously carried. Mr. George Godwin, F.R.S., proposed the second resolution, expressing gratification that Her Majesty had signified the jubilee year of her reign by opening the People's Palace,—the first great institution in the metropolis to be opened on Sundays,—and urging that in further commemoration of the event a memorial should be presented to the President and Council of the Royal Academy requesting them to solicit the sanction of the Queen to the opening of Burlington House on Sundays before the close of the present exhibition. He said that the Sunday opening of public institutions was now merely a matter of locality, for the principle had been conceded in many of the large provincial towns. It was stated that Sunday opening would be an unfair call upon the curators and officials of the museums and galleries, but it was a fact that many of the curators themselves were earnestly in favour of the change. Mr. Thomas Powell (of the London Trades Council) seconded the resolution, which was carried unanimously.

**Ecole des Beaux Arts.**—Some American architects, to mark their sense of gratitude for the training they have received at the Ecole des Beaux Arts at Paris, have presented a sum of 35,000 francs to found a prize, for French students exclusively, of architecture at the school.—*Athenæum*.

## DOERING'S GIBBAL JOINT TRIPOD HEAD

## The Student's Column.

FIELD WORK AND INSTRUMENTS.—XXIV.  
Levelling Instruments.  
X.—DOERING'S LEVEL.

ANOTHER form of gimbal-joint action in a tripod head is that shown in figures 1, 2, and 5, illustrating Doering's level. This method of supporting a levelling telescope is similar to the system adopted for a ship's compass, with the addition of vertical arcs at right-angles to one another respectively, which are clamped to each other by the thumb-screw marked L, and by the thumb-screw marked F to the frame which is fastened upon an ordinary tripod stand. In the field when setting up the instrument, should the ground be very uneven, the legs of the tripod can be put down anywhere in the most convenient manner, irrespective of level, and the telescope afterwards adjusted by moving the vertical arcs which connect it with the tripod stand. Fig. 3 illustrates the telescope, the vertical axis of which is connected at C in the socket bearing shown in elevation in figs. 1 and 5. As shown in fig. 4, a central circular bubble is substituted for the ordinary transverse bubble. Figs. 3 and 4 are here drawn to half the size to which figs. 1, 2, and 5 are drawn: hence the socket-bearing marked C in figs. 1, 2, and 5 appears double the diameter indicated by figs. 3 and 4. Fig. 2 shows in plan the relative positions of the elevations illustrated by figs. 1 and 5.

In setting up the instrument upon irregular ground, the clamps marked F and L which hold the telescope rigidly to the tripod stand are first slackened and the longitudinal bubble is set approximately level by hand. The clamps F and L are then tightened and the final adjustment made by the two milled-beaded tangent screws marked H and K working in directions at right angles to one another. These screws are connected respectively to each arc at the clamps, as shown in figs. 1 and 5. Should the ground be moderately level and firm, it is unnecessary to unclamp the vertical axis of the joint. The instrument is first set up approximately level in the ordinary manner by the legs and brought to a perfect adjustment for taking levels by means of the tangent screws.

The substitution of the gimbal joint tripod head for parallel plates enables the telescope to be rapidly set level in rough country, but it has a greater area exposed to the action of the wind, and more wearing surfaces. In adjusting the telescope by the gimbal joint, telescope should be held round the body beneath the compass-box, before the clamps are slackened. One of the arcs may be divided into degrees for measuring vertical angles, if desired.

It is stated that Huygens, in the seventeenth century, was the first to apply a telescope to an instrument which was set up level by means of a plummet, and that Dr. Hooke was the first to apply an air-bubble to an instrument for setting up a line of sight in a horizontal direction. Later on, M. Le Bion combined the telescope of Huygens with the air-bubble of Dr. Hooke. The introduction of parallel plate-screws was the invention of Sisson, prior to which all instruments were adjusted by a ball-and-socket joint. The clamp and tangent screw movement for traversing small distances was originally suggested by Ramsden. The inventor of the circular bubble is not known, but it is certain that it was employed in the early part of the eighteenth century, upon surveying instruments known as plane tables. The transverse bubble used to facilitate the approximate setting up of the instrument was the idea of Mr. Gravatt. Messrs. Troughton & Simms, Messrs. Elliott, and other well-known makers have also made several improvements in the detail arrangement of the various parts of the instrument. The annexed illustration is taken from one of Messrs. Elliott's patterns, at whose works in London several different forms of instruments are kept in stock.

**Association of Municipal and Sanitary Engineers and Surveyors.**—A Midland Counties District Meeting of this Association is to be held at Kidderminster this Saturday, June 11. Members will assemble in the Council Chamber, Town Hall (by kind permission of the Mayor), at 11 a.m., when several papers on the sanitary works of Kidderminster will be read and discussed.

## CHURCH-BUILDING NEWS.

**Coventry.**—St. Michael's Church, Coventry, was lately re-opened, after partial restoration (a work still in progress), under the direction of Mr. John Oldrid Scott. It seems that in 1833 a fruitless effort was made to induce the Coventry Corporation, as lay proprietors, to repair the chancel. In June, 1884, a scheme of restoration was launched, the estimated cost of which was 35,000l. Mr. George Woodcock started the subscription list with a donation of 10,000l., and a formal appeal to the public was made. On Christmas Day the same year, the Vicar announced that the restoration fund amounted to 30,335l. Early in the following year Mr. Scott was instructed to prepare the necessary plans, and a contract for the execution of the greater part of the work was entered into with Mr. John Thompson, of Peterborough, for 31,853l. The work was commenced in June the same year, and the portions which are completed and which were lately opened on Sunday, are the nave, chancel, sanctuary, and south aisle. The re-casing of the tower and the other departments of the work are being steadily proceeded with. A new organ has been built by Messrs. Henry Willis & Sons, London. With regard to the tower, one of the first things undertaken was the underpinning of the foundations, and since this was done no movement on the part of the steeple has been detected, and it now rests perfectly secure on the new foundations. Its symmetrical lines are hidden by the scaffolding surrounding it on every side, and the removal of 54 ft. of the upper masonry, which was exceedingly insecure, gives to it a rather stunted appearance at present. About 5,000l. more than has been yet subscribed is required to complete the work now in hand.

**Egg Buckland (Devon).**—A new reredos has just been placed in St. Erasmus's Church, Egg Buckland. It is the gift of Mr. James John Elliott, of Leigham, and is the work of Mr. Harry Hems, Exeter. It is Perpendicular in style, the architectural framework of Beer stone enclosing a sculptural representation of "The Last Supper," carved in high relief in fine-grained Caen stone. Mr. Hems has also executed a statue of St. Erasmus, which has

been placed in the niche above the south-west porch.

Failand.—The new church at Failand, an outlying district of the extensive parish of Wraxall, has been opened under licence of the Bishop of Bath and Wells. This church, which is a chapel of ease to the ancient parish church of Wraxall, has been erected, together with a residence for the curate, at the sole cost of Mr. Richard Vaughan, elder brother of the present rector of Wraxall, from designs furnished by Mr. Edward Barnes, architect, of Bristol, the builders being Messrs. Newton & Co., Wraxall. The building comprises nave, transept, chancel, and porch. The spire is 120 ft. in height. The seats are of solid oak, and there is a reredos and a pulpit of varied stone and marbles. All the windows are of stained glass. The large one at the east end, the two rose-windows, and those at the sides of the church, have been supplied by Bell & Son, of College-green, Bristol.

Guyhirn.—In excavating, a few years since, for the new church here, the foundations of the supposed original Norman church were brought to light, and numerous fragments of early Norman work, such as capitals and mouldings, were found embedded in the foundations. The Rev. W. Carpenter, the vicar, had them carefully removed, and taken care of, with the view of having a cross erected in the churchyard in commemoration of the erection of the new church and parsonage. The cross (the design of which has been entrusted to Mr. W. Adams, architect, of King's Lynn) is early Norman in character, 10 ft. high, with a base 4 ft. square, which will be surmounted with a new cross of elaborate design. The four sides of the cross will have recessed panels for inscriptions, and sun-dial with arch mouldings springing from clustered shaftings.

Leek (Staffordshire).—St. Mary's Church, Leek, which was opened on the 12th ult., is finished complete in every respect, and is erected on the local rock in the Early Decorated style of architecture, from the designs and under the superintendence of the architect, Mr. Albert Vicars, of London. It is faced with local coursed rubble, with Donlinton stone dressings, the spire being visible from nearly all parts of the town. The plan consists of nave and two aisles, sanctuary arranged for spirited choir, two side chapels, baptistry, nuns' choir, priests' sacristy, working sacristy, organ gallery, confessionals, with priests' room communicating, and heating-chamber under. The interior length of the church is 103 ft. 9 in., the width 50 ft., and the height to the apex of the nave ceiling 53 ft. 3 in., and to the gable 64 ft. The ceiling is of yellow pine, panelled, and has moulded ribs and stop-chamfered principals, every alternate one being cusped and supported on red stone wall shafts with carved caps and moulded bases. The columns in the nave and sanctuary, and the shafts to the chancel arch, are of red Scotch stone, with Portland stone carved caps and moulded bases. The spire is built of Donlinton stone, with red stone hands at intervals; its height is about 150 ft. above ground level. On the east side of the tower there is a large stone statue of the Blessed Virgin, standing under a canopy upon a moulded and carved corbel. The floor of the church has been laid by Messrs. Duffy & Son with their prepared wood block paving. The stained glass is by Messrs. Mayer & Co., of Munich and London. The vane to the spire and the wrought-iron gates and railings have been supplied by Messrs. Brown & Co., of Birmingham, and Messrs. Barker & Son, of the same town, were the contractors.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for 80 and 92, Rutland-street, 113 years, ground-rent 72, and 17 and 18, Smith-street, 26 1/2 years, ground-rent 67.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Spitalfields-38 and 39, Hanbury-street, freehold, and Bayswater-Ground-rent of 28 1/2, term 50 years.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Fitzroy-square-45, Whitfield-street, 13 years, ground-rent 17, and Bedford-square-69, Huntley-street, 38 years.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Reigate, Crescent-road, 2 1/2, plot of freehold land, and Balmesdale-road-Two freehold cottages.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Watford-Freehold residence, with armoury, and Barnaby-39 and 41, Copenhagen-street, freehold.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Chelsea-4, Halsey-street, 56 years, ground-rent 57, and 5 to 10, Wood-street, 13 years, ground-rent 15 1/2.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Beckland, near Dover-Rith Cottage, freehold, and 43, Chapel-place, freehold.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Hornsey-Ground-rents of 12 1/2, a year, reversion in 94 years, and Peckham-Ground-rents of 32 1/2, a year, reversion in 89 years.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Roxeth, London-bill-Three freehold cottages, and Greenhill-Copyhold cottage and garden.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Soho-47, Gerrard-street, freehold, and 47, Beckett-street, freehold.

Table listing real estate transactions with columns for address, years, and ground-rent. Includes entries for Bakers-street-11 and 12, Crawford-street, 17 years, ground-rent 22 1/2, 10s., and Kenish Town-1, Willow-walk, 39 years, ground-rent 32 1/2.

MEETINGS.

SATURDAY, JUNE 11. Architectural Association.—Visit to Banstead Park, the residence of the Hon. Francis Baring. (See advertisement on p. xvi.)

Association of Municipal and Sanitary Engineers and Surveyors.—Midland Counties District Meeting at Kidderminster.

Edinburgh Architectural Association.—Annual excursion to Norham Castle, Norham Church, and Ladykirk.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. T. G. Jackson, M.A., F.S.A., on "The Art of Dalmatian."

ROYAL STATISTICAL SOCIETY.—Mr. Joseph Rabino on "The Statistical Story of the Suez Canal." 7 45 p.m.

WEDNESDAY, JUNE 15. Society of Engineers.—Visit to Messrs. Aveling Porter's Works. Royal Meteorological Society.—7 p.m. Builders' Foremen and Clerks of Works' Institution.—Ordinary Meeting. 8 30 p.m. SATURDAY, JUNE 18. Architectural Association.—Visit to Cambridge. (See advertisement on p. xvi.)

Miscellaneous.

Free Library, Bethnal Green.—The Corporation of London have voted a donation of 100 guineas to the 1,000, required by the Bethnal Green Free Library Committee for the further development of the Institution.

Smethwick.—A new Primitive Methodist Chapel and schools are about to be erected in Regent-street, Smethwick, from designs by Messrs. J. P. Sharp & Co., architects, Birmingham.

A New Water-Bar for French Casements.—Mr. Samuel Elliott, of Newbury, is introducing a new water-bar for French casement sills, which is likely to prove absolutely reliable and effective.

Monument to Haydn.—A statue to Haydn, by Herr Natter, was unveiled at Vienna, in the presence of the Emperor, on the 31st of May. It is of rather more than life-size, executed in Carrara marble, with a pedestal of Tyrol faun-coloured stone, on steps of granite. The monument stands in front of the Church of the Marian-Kirche.

Frimley (Sussex).—The Rural Sanitary Authority have adopted the scheme of sewerage prepared by Mr. James Lemon, M. Inst. C.E., F.G.S., &c., and application will be made to the Local Government Board for their sanction to carry out the works. The principle adopted is that of filtration, the effluent being discharged into the river Blackwater.

The Sixth International Congress of Hygiene.—It is announced with regard to the special exhibition to be held in connexion with the sixth international congress of hygiene and demography, to which reference was made in the Builder of January 29 last, that intending exhibitors should send in applications for space not later than June 30, to the "Ausstellungs-Comité, Wieu, I., Renngrasse 20." The exhibition will be held in the rooms of the Imperial University, I., Franzensring, from September 26 to October 2.

A New Museum at Liege.—A new museum, somewhat on the plan of the proposed Imperial Institute, has just been opened at Liege, called the Musée Commercial de Liege. Its object is to promote and develop the commerce of Belgium with foreign countries by always exhibiting such wares as are in demand abroad to the manufacturer. The museum is in consequence divided into two parts, viz., one for imports and one for exports, both embracing 386 classes in forty-four sections. With the museum is connected a bureau, the function of which is to give general commercial information of every kind to those who may apply for such, and to supply books, reports, &c., connected with the subject.

A Correction.—Mr. Aldridge writes to us in reference to a letter from a German architect (Herr Honssell) which he read at the Conference Meeting on Registration, and which was printed in our Conference Supplement (p. 759, ante), to say that in the titles "Kaiserlich-Regierung's-Bauführer" and "Kaiserlich-Regierung's-Baumeister," the word "Königlicher" should have been written in each case instead of "Kaiserlicher," as the architectural regulations mentioned were confined to the Kingdom of Prussia, and do not concern the German Empire. The mistake, we should add, is in the original letter as handed to us.

Lymington Sewerage Works.—The Local Government Board and the Board of Trade have approved of the scheme of sewerage prepared by Mr. James Lemon, M. Inst. C.E., F.G.S., at an estimated cost of 13,000*l.*, and we are informed the works will be proceeded with directly the necessary details and specifications can be prepared. The principle adopted is, that of conveying the sewage to the sea by means of an iron outfall on piles across the mud for a length of about a mile and a quarter. The high-level will be drained by gravitation, and the low-level lifted by centrifugal pumps and Crossley's gas-engines above the level of the high-water spring tides. A large flushing-tank is provided to flush the outfall, and six smaller tanks are provided to flush the main sewers.

RECENT SALES OF PROPERTY.

Table listing estate exchange reports with columns for date, description, and price. Includes entries for May 23, By JOHN LEES, and May 27, 19 1/2, By RICH BEES.

Table listing estate exchange reports with columns for date, description, and price. Includes entries for May 31, By RICH BEES, and May 31, By DALE & SON.

Table listing estate exchange reports with columns for date, description, and price. Includes entries for Hackney-50 and 52, Mare-street, copyhold, and North Bow-Ground-rents of 17 1/2, reversion in 52 years.

**Sewage Sludge at Lincoln.**—The Corporation of Lincoln, having been troubled for some time about the disposal of their sewage (more particularly the sediment), last year requested their City Engineer, Mr. L. A. MacBrair Assoc-Mem. Inst. C.E., to report upon the best steps that could be taken in the matter, at a moderate cost, as in these times they felt unwilling to incur the cost of purchasing additional land several miles out of the borough, which would be necessitated if they embarked solely in farming. After visiting and carefully comparing numerous sewage works in different parts of England, Mr. MacBrair recommended precipitation and the pressing of the resultant sludge by presses of the Brentford type, made by Messrs. Manlove, Alliott, Fryer, & Co., of Nottingham. The Sewage Committee, after consideration, approved of precipitation and pressing, and also being anxious, as fresh inventions are continually being produced, of having the best machinery for the latter purpose,—pressing,—visited the works at Wimbledon, Chiswick, Maidstone, Brentford, &c., the latter two places twice, and received detailed reports thereon from Mr. MacBrair and Mr. Teagus, the latter being the Waterworks Engineer to the City. These investigations resulted in the Brentford presses being selected. Messrs. Manlove, Alliott, Fryer, & Co. have consequently received the order for the presses at a cost of 1,450l. The detailed building and other plans are nearly ready, and the machinery has been put in hand.

**The Acton Drainage Scheme.**—The Acton Local Board, at its usual meeting on Tuesday night last, resolved to adopt the magnetic ferrous carbon system of precipitation in the treatment of the Acton sewage, and to enter into a contract, under certain conditions, for five years and a half with the International Sewage Purification Company, which has been recently formed for the working of this system. The experiments conducted at Acton several weeks ago, and fully reported in the *Builder*, were so satisfactory as to induce the Board, after visiting many other works in the Thames Valley, to adopt the above-mentioned system, though the Board retains the option to cancel the agreement at the end of the first six months and end of three years. It was stated by the Chairman of the Board that in consideration of the facilities which the Board had given the company to publicly try their system at the Acton Works special terms had been offered the Acton Board, and the request was made that these terms should not be published. The company undertakes to produce an effluent which will be at all times satisfactory to the Thames Conservancy Board. It is contended for the system that, as there is no lime used, the full manurial qualities of the sludge is retained, while no smell is created during the process of clarification.

**Southampton Deep Water Dock.**—Good progress is being made with the works in connexion with the dock, for which Mr. A. Giles, M.P., is the engineer. The sea-hank, necessary to reclaim an area of about forty acres of mud-flats, has been closed, and the contractors, Messrs. S. Pearson & Son, of Westminster, are now able to proceed with the work of the dock proper, the site of which was formerly under water. Plant to a very considerable extent has been placed on the ground, and employment will be found for many hundreds of labourers and others. It is contemplated having the whole of the works completed in about eighteen months,—a very short time for works of such magnitude. Night-work will be required and used to a large extent, and artificial light employed for illuminating purposes. The dock, of which the water area is to be eighteen acres, will be an open dock, i.e., tidal, and will have a depth at low-water ordinary spring-tide of 25 ft. Nearly 4,000 ft. of concrete wall has to be erected, 51 ft. 6 in. high, from the foundations, which are to be at a depth of 6 ft. 6 in. below the dock bottom. The approaches to the dock will be dredged to the same level as the dock, so as to give every facility to the largest vessels afloat for arrival and departure at every state of the tide.

**The Coldbath Fields Prison Site.**—The City Press states that Captain Panton, M.P., has received a letter from the Lords of the Treasury, stating that "part of the site of Coldbath Fields Prison is to be reserved for Post Office purposes, and until it is decided what part is to be thus utilised no decision can be come to with regard to the remainder."

**Large Sales of Building Land in Surrey and Middlesex.**—On Thursday week, the first portion of an ancient baronial estate, situated in the county of Surrey, at Byfleet, near Weybridge, was offered for sale in building plots, by Messrs. Baker & Sons. The property, which for many centuries past has belonged to Lord Pigot's family, and is adorned with choice specimens of cedars and various other species of ornamental timber, is at present being laid out for building upon. It is known as the Dartnell Park Estate, and is bounded on the east side by the river Wey, and on the north by the London and South-Western Railway and the Basingstoke Canal. The railway company are at present erecting a new station at Byfleet, close to the estate, which is to be opened in July, bringing the estate within half an hour's run from London. New roads, intersecting the estate, are now being constructed by Mr. Neal, road contractor, of Battersea. These roads are 50 ft. in width, and are all pipe-drained and metalled. Service water-pipes are all laid on, and, in addition, the owner is willing to provide an artesian supply. The number of plots offered on Thursday week was forty-three, the several plots having frontages ranging from 110 ft. to 140 ft., and containing an area of from three-quarters of an acre to an acre each. They were all submitted for sale without reserve, the stipulations providing that not more than one residence shall be built on any one lot, and that the cost of each house, exclusive of outbuildings, shall not be less than 700l. No trades or manufactories of any kind are to be allowed on the estate. The vendor undertakes, when half the entire estate is sold, to lay out a lawn tennis court, and to construct a boat-house and baths for the public convenience of the owners. All the plots offered were sold, the first lot submitted, consisting of a corner plot an acre in extent, realised 405l., the whole of the other lots, three-quarters of an acre in extent each, averaging from 130l. to 180l. each. The total proceeds of the sale amounted to about 7,200l.—On Monday last the same auctioneers offered for sale, in sixtynine lots, the Staines Lodge Estate, occupying a central position in the town of Staines, immediately opposite the station of the South-Western Railway. The plots offered have frontages to the main Kingston road, and to intended new roads, the frontages varying from 25 ft. to 35 ft. each. They were sold at prices ranging from 60l. to 80l. each, an hotel plot having a frontage of 50 ft. to the Kingston road and a return frontage of 165 ft., realising 200l. The total sum realised by the sale was 3,460l.

**The Local Government Board and Thames Valley Drainage.**—The Local Government Board has given formal notice of its intention to issue a Provisional Order forming the urban and rural sanitary district of Richmond into a united district for the purposes of sewerage and sewage disposal, and constituting a Joint Board as the governing body for the same; and that a clause will be inserted in the confirming Bill relieving the Urban and Rural Sanitary Authorities of Richmond, for three years after the date when the order comes into operation, of any liability for penalties under the Thames Conservancy and Navigation Acts for allowing crude sewage to flow into the Thames. It is not expected that there will be any opposition to the formation of this new Joint Thames Valley Sewerage Board, as it is formed simply for carrying out a definite scheme at a cost of 100,000l., designed by Mr. Melliss, C.E., and approved by the Local Government Board, for the drainage of the five parishes of Richmond, Mortlake, Barnes, Petersham, and Kew, which were among the twenty-one parishes included in the area of the now dissolved Thames Valley Main Sewerage Board. A considerable section of the people of Shirley memorialised the authorities, urging them to close the manholes in connexion with the sewerage system of the town, where there is at present an insufficient supply of water to enable these openings to be properly flushed. An official of the Local Government Board has, after inquiry, recommended that seventeen ventilating shafts should be erected on the side of the road to replace these manholes. The Sanitary Authority had already closed many of these manholes, and it seems the result has been there as it has been in many other places, some of the sewage gas was driven into the houses of the poorer classes where disconnected sinks, waste soil-pipes, and soil-pipe ventilators are the exception rather than the rule.

Each additional line (about ten words) ..... 6s. 6d. Terms for Series of Trade Advertisements, also for special Advertisements on front pages, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

**SITUATIONS WANTED.** FOUR Lines (about THIRTY words) or under ..... 2s. 6d. Each additional line (about ten words) ..... 6s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY. \* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C.

**DOUGLAS FOURDRINIER, Publisher.** Addressed to No. 45, Catherine-street, W.C. Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

**SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS.** ADVERTISERS or OTHERS who DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY MORNINGS.

The Publisher cannot be responsible for DRAWINGS TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that the latter COPIES ONLY should be sent.

**PERSONS Advertising in "The Builder,"** may have Replies addressed to the Office, 45, Catherine-street, Covent Garden, W.C. Free of charge. Letters will be forwarded if addressed in envelopes as sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN CIRCULATION, is issued every week.

**MAP OF LONDON,** showing Boundaries of SURVIVORS Districts, The four Sheets, into which the Map is divided (issued with the numbers of August 3rd, 8th, 15th, and 22nd), if sent to the Office direct, or through any Newsgate, can be MOUNTED on the following Terms, viz.:—  
On Cloth (Bordered and Varigated), 5s. 6d. (Strainer) 5s. 6d.  
N.B.—In the case of "Strainers" if packed for rail or carrier 3s. 6d. extra.  
\* Omissions discovered since publication will be corrected before mounting.

**TERMS OF SUBSCRIPTION.** "THE BUILDER" is supplied to the Office in London in any part of the United Kingdom at the rate of 12s. per annum *PARAVAN*. To all parts of Europe, America, Australia, and New Zealand, 25s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOURDRINIER, Publisher, No. 45, Catherine-street, W.C.

FIRE BRICKS.

**BEST STOURBRIDGE FIRE BRICKS,** and Cement Fire Clay, Gas Retorts, Mullins, &c. Fire Bricks and Blocks for the Highest Heat, for Iron Blast Furnaces, Forge, Rolling, Fueling, and Steel Furnaces, Flint Glass Furnaces, Roasting and Refining Furnaces, Chemical Works, Coke Ovens, &c. Boiler Setting Blocks, Fine Covers, Locomotive Bricks, Tapers, Steel Runners, Grate Bricks. Special Sizes and Shapes made to Engineers' Drawings. Prices quoted in any Part or Railway Station. London Agents—

R. CULL & SON, Palmerston-buildings, E.C.

GLAZED BRICKS.

**OATES & GREEN, HALIFAX.** GLAZED BRICKS (White and Coloured), Special Sulphured Bricks, Sanitary Tubes, Oiled Earthenware Bins, Cattle, Sheep, and Pig Troughs, Horse Mangers, Patent Automatic Trough Closes, Patent Flush Pans, Ventilating Bricks, Patent Ventilating Gullies and Traps, Patent Chimney Pots for Down Draughts. Six Prize Medals. Copies of Testimonials sent if required. London Agents—

R. CULL & SON, Palmerston-buildings, E.C.

BLUE BRICKS.

**THE RETLEY BRICK COMPANY, BINGWINFORD** Staffordshire, Manufacturers of Blue Bricks. London Agents—

R. CULL & SON, Palmerston-buildings, E.C.

DRAIN PIPES.

Lime, Cement, Bricks, Slates, Laths, Hair, Plaster, Wall Copings, Channel Bricks, Blue and Red Tiles, Red Plain Tiles and Pav Tiles, Gullies, Fats, and Traps, Heads, Junctions, &c. all sizes. Chimney-Pots, Red and White. PRICES ON APPLICATION. R. CULL & SON'S Stores, Railway Arches, London-street, Bethnal Green, E. Chief Office:—72, Palmerston-buildings, Old Broad-street, E.C.

### The Edinburgh Library Competition.

HE exhibition of the competitive designs for the Edinburgh Public Library, in the Galleries of the Royal Scottish Academy, has been an event of some interest, both from the number and general quality of

the designs exhibited, and from the public attention which the exhibition has excited in Edinburgh.

The site is a somewhat peculiar one. It is a plot of ground to the westward of George IV. Bridge, but on the level of the Cowgate, which runs east and west under the bridge and at right angles to it. The main entrance and the main floor would almost necessarily be on the Bridge level, but the foundation of the building itself is two or three stories below this level. The site is thus a very suggestive one for bold and picturesque treatment. The natural way to treat it would seem to be as a building with more or less ornate stories at and above the level of the Bridge, with a lofty but plain basement rising from the narrower street below. A strong element of architectural effect and contrast is thus almost provided for the architects, though it is noticeable that few of the competitors have accepted this natural suggestion from the nature of the site, and hardly any of those have treated it with the boldness and thoroughness of which the site is susceptible, though there are several very fine designs among the number.

The main requirements are a lending library, a general reading-room and news-room, and a reference library, with subsidiary smaller rooms for ladies and juvenile readers, more or less separated from the main rooms, but in connexion with them. It seems an almost necessary consequence that the lending library, which is likely to have the most business, should be on the entrance level, and all but one or two competitors have treated it so; and the position of the reference library as the upper floor and the architecturally principal room has been accepted by every one. We will comment on the designs, as far as space allows, in the order of hanging; only omitting altogether some half dozen or so which are hardly worth consideration on their merits.

"Mark."—This, which comes first in the order of hanging, is one of the few Gothic designs in the room. The lending library and reference library over are placed in a block on the left; the entrance to the lending library, through a porch and vestibule and then by a

door to the left, is hardly sufficiently direct; and the whole of the public traffic to this and to the reference library above and the news-room below, passes over one not very large landing of the staircase,—not a very desirable arrangement. The design, in a heavy type of Gothic, has not much to recommend it, and the two towers on either side of the central gable do not arise out of any feature in the plan. The reference library would be deficient in light for readers.

"Progress."—Also a Gothic design, with suggestions of Scotch castellated Gothic, mingled with inspirations from Mr. Waterhouse. It is amusing to observe, since this eminent architect became so much accepted as a competition assessor, the practical appeals that are made in competition designs to what are supposed to be his architectural sympathies. This design has more refinement than the last-named, however, as far as the external architecture is concerned, but that is all. The plan is so full of absurdities as to arrangement and lighting that it is unnecessary to discuss it.

"Pro Bono Publico" shows a good deal of merit in plan. The large rooms are in a block parallel to Cowgate. The public access to the lending library is well arranged for the public, but badly for the attendants, who are too far from the books, and would be jostling each other in and out of the narrow door. The external design is of "Queen Anne" type, unpretending, and not unsuitable, and might look more attractive in a better drawing than in the hard mechanical perspective exhibited. Some supplementary light is obtained for the reference library through the side panels of the wagon ceiling; but this being a top floor, it might have been more effectively managed.

"Aldus" places the main block along George IV. Bridge, where it shows as a low block with two projecting wings, the sky-line entirely unbroken; there is some pretty treatment of the front wall in detail, but a total absence of architectural effectiveness as a mass: the section is better than the plans, and shows good arrangements for lighting the upper reading-rooms; the plan has a want of method, and is cut up with side passages and corridors in an awkward manner. The Cowgate façade is an absurd jumble.

"Triumphant Democracy."—This is one of the best of the designs. The author bestows a wider area on his library block than most of the designers, placing it at right angles to George IV. Bridge, and he has separate entrances for men and women at the opposite sides of his front, not, as in another case, two doors labelled "ladies" and "gentlemen," opening into the same small vestibule, but a completely separate door and a separate staircase for ladies. The front has two slightly

projecting wings with an area between, and the front space between these wings on the entrance-level is occupied by a large borrowers' lobby or ball, with the delivery counter along the inner side, the ladies' and gentlemen's lobbies opening into opposite ends of this hall. Above this hall, on the next floor, is the ladies' room, reached by its own staircase, which also gives them access by a separate door to the reference library on that floor. The reference library, of which one interior perspective is given, is a fine and effective room; the bookcase blocks, at right-angles to the wall, are made, so to speak, part of the architectural design, instead of being merely furniture; each block is terminated by a wide pilaster towards the room, connected longitudinally by a series of arches springing from corbels, and matching the arches of the side windows; the main cornice of the room runs along the inner edge of the projecting bays, which form a series of deep arched recesses. Ample light is provided from the large cove of the ceiling, entirely pierced with windows, with curved ribs between them, leaving a flat centre boldly treated in large panels. For the convenience of setting out the main ceiling ribs, they are made to spring from corbels on the keys of the arches, instead of from the intermediate pilasters, which are the real piers of the design; this has rather an odd effect, but it gets over the difficulty of treating the cove at the angles. For ventilation, the author proposes mechanical propulsion of warmed air by a Blackman propeller. The exterior is a dignified Italian design, in two stories, rusticated piers below and pilasters above; the wings would be much better with some kind of finish above the balustrade line, but considerations of cost probably prevented this. The lending library is a large room with a row of square piers and four-way bracket capitals forming an aisle on each side, under the piers of the reference library above; the room is left very empty in the perspective, probably to show it better, but we presume the central area is supposed to be available for bookcases.

"Bibliothèque."—This, again, is a different plan in method from the majority, the author occupying a great proportion of his area with the library rooms, arranged on a Greek cross plan, with staircases and subsidiary rooms at the angles. The main entrance is into a loggia across the front, with the main staircase occupying a large square pavilion to the right, and the staircase down to the general reading-room on the left; the public enter the lending library by a door immediately opposite the street entrance, and have the whole centre space of the Greek cross to manoeuvre in, with counter running all round, and the book-cases

in the arms of the cross. This gives very long counter space, and keeps the attendants close to the book-cases. The plan does not commend itself so much in the newspaper room below, where there is necessarily a deficiency of light in the centre space, the windows being all in the four bays of the room.\* In the reference library at the top, ample light is given by a glass dome over the central space. The ladies' room is got over the ground-floor corridor, a mezzanine between them affording a board-room, and on the same mezzanine are lavatories for the ladies' room and the librarian, cleverly got in and connected to the rooms by two small circular staircases. The style is Jacobean, or what we may most intelligibly denominate as "The prevailing style" at present. It looks as if it were meant to be carried out in terra cotta. It is shown in a very nicely sketched pen perspective, with the George IV. Bridge partly removed or cut through in section, in order to show the Cowgate elevation from ground to cornice. The interiors are not so effective nor so well drawn as in "Triumphant Democracy," nor are they so pleasing in treatment as the exterior, with which they are not entirely in keeping. For heating and ventilation, the author proposes low-pressure steam-pipes, with air passed over them, the heating being by direct radiation, and "a powerful exhaust-shaft" to remove the air, and this part of his report is somewhat vague.

"Habet."—As a bit of architecture this is one of the most pleasing designs in the room, shown in a very well executed pen perspective. It is a rather curious mixture of Gothic and Classic feeling; mullioned windows with Elizabethan ornamental pediments over them on the ground story; the upper story divided into bays by Classic pilasters, between which are circular-headed windows with geometric tracery in the heads. The projecting voussours in the archivolts of the windows would be much better omitted, and the mouldings carried round unbroken. A clock dormer, or what the French call a *fronton*, of graceful design, breaks the skyline in the centre. The lower part of the Cowgate front is treated very plainly, but still not with the marked character which the situation suggests, as aforesaid. The plan is not so satisfactory. The reading-room, not the lending library, is placed on the entrance level, on the left of a wide vestibule, and the ladies' room on the right, with no connexion with any of the rooms where books are kept except across this central corridor, or up or down the public stair at the back of it. The lending library is reached by going through the corridor and down the staircase at the back of the building; much too circuitous a route. The reference library runs in an L-shape, on the top floor, along both front and side of the plan, and is a very prettily treated room, with ample side light everywhere from large windows carried much lower than in most of the other designs, the author apparently thinking that with the long wall-space in his L-shaped room he could keep the bookcases low and yet give the necessary space. Our impression is that the shelf-room would be found deficient eventually.

"Non sibi sed Patrie."—A capital set of drawings, showing a front in what may be called a very Wren-nite manner; circular windows with square architraves in the mezzanine; circular windows without architraves in the attic; a projecting centre with rusticated ground story, and an order of pilasters above, with floral festoons between, and a segmental pediment over. The library area is square, and kept nearly unbroken as far as walls are concerned, iron columns and low partitions being used; thus, the magazine room is only a space partitioned off from the lending library

\* In reference to this question of light, we notice that Mr. Waterhouse observes in his Report:—"Which ever design is chosen, it would be as well if sections were prepared to show the amount of direct light coming through the windows of the lowest public room. It is clear that no direct light can reach the centre of a room, 60 or 70 ft. wide, the tops of the windows of which are 50 ft. below the cornice of the house opposite,—35 ft. distant. A contraction of the floor-space may therefore be wise under the circumstances, even though it involves somewhat decreased accommodation."

by a low screen between iron columns; good for light and air, but not conducive to quiet. The reference library is divided into two aisles by coupled iron columns on surbases, and carrying a semicircular arcade. There is ample top light, and the excellent interior perspective gives a most favourable idea of this room, as spacious, dignified, and well lighted. The news-room, with its large square area and side windows, must, we fear, be very deficient in light in the centre. The plan has practical merits in the way of simplicity and spaciousness, however, and the architectural treatment is exceedingly well carried out.

"R. S. A."—This has some merits of plan; the main library rooms are in a square form with an aisle and colonnade round them; a good interior sketch showing the proposed treatment of the news-room in Burmantofts faience is very pleasing, but the exterior, both in drawing and design, says but little for the artistic accomplishments of "R. S. A." The external treatment of the main central staircase is spirited in idea, but the detail and execution of the whole is poor.

"Space and Light."—The competitor under this title has shown immense diligence and energy, and sends in no less than three modifications of his design, filling quite a length of wall space. His design A 1 enters from George IV. Bridge with a large porch and vestibule in the centre of the front; the ladies' reading-room is on the right, and a staircase with an octagonal end facing to Cowgate on the left. The general reading-room is immediately behind, occupying most of the area, the ladies' reading-room having what is apparently a borrowed light from the main one,—not a good arrangement. The reference library is above, with the ladies' room in the same position, the lending library below; the public are admitted into the centre of the latter, with a counter running round, but the storage room for books seems insufficient, and the "juveniles," instead of having a separate room, have seats allotted to them in the general room; perhaps with the idea of their being better under surveillance. In connexion with the reading-room proper a special room for juveniles is provided. The reference library, the main compartment of which runs parallel to George IV. Bridge, has a paneled wagon ceiling, with skylights down the centre, which will give ample light. What is the sense of the capitals half way up the pilasters we cannot make out. It is lucky the author did not trust to his elevation, and that he had the well-executed pen line perspective to fall back upon. The elevation looks so wiry that it would be enough to condemn the whole set; but the perspective shows it in a much more favourable light. It is a curious design, mainly Gothic in feeling, though with a considerable smattering of Renaissance in detail; the large elliptical windows at the top are not very happy in effect; but the whole thing is marked by undoubted originality. A 2 shows a nearly similar plan, only with the staircase square-ended instead of octagonal, and a Classic design, which looks a great deal better in elevation than the other, and not so well in perspective; but the perspective sketch is an exceedingly rough one. A 3 is a somewhat more economical design on the same general lines, the elevation being cut down to a more level skyline. The author has shown a great many extraction-fines for vitiated air (we presume those coloured yellow are extractors), of a larger area than necessary for practical purposes; he proposes to exhaust by a fan driver, and says that "numerous openings for admission of fresh air are provided in all the rooms," but he says nothing about warming these indraughts of fresh air, only that he proposes to heat the building by means of steam-pipes placed round the rooms, &c. According to all we can gather from this, the occupants of the rooms would be exposed to overheating from a coil on one side and to a draught of cold air from another side, and the conclusion is that the author has made a show of ventilation and heating provisions in the drawings, without properly understanding how it is going to work. According to the state-

ment in the report, there are four alternative designs, not three; but these ramifications must have proved too much for us, or the committee have not hung the fourth one.

"For Health and Culture."—This is a prettily Renaissance building in front, with a back portion which does not seem the least to belong to the front, but to be another building. The library rooms run along the George IV. Bridge front, with entrance and staircase at the south-east angle; the rooms are rather small, the lending library far too small, but there is a large "well" storage apartment at the back of the building, for books, with a stair running from top to bottom of it, which is a feature in the plan; its usefulness depends very much on the way in which it is proposed to arrange and work the library. If there is supposed to be a large proportion of books to be carefully kept but only very seldom referred to, it is good; otherwise not.

"Study" deserves mention for the pretty Classic composition, with dome over the centre, shown in the brown ink perspective. The plan has nothing particular to recommend it. It is amusing to read on the corridor leading from the door marked "entrance for staff," the words also "separate entrance for ladies," the same corridor leading to the ladies' door of the lending library. If writing "separate entrance" on a plan made it separate, planning would be easy work.

"Index" is a very curious design of some ability, with some odd faults. A great deal of space is consumed on corridors and staircases, and the library rooms are somewhat limited in consequence, but generally the plan is well arranged. The front is of Roman Classic design, with a colonnaded portico on the main story, flanked by very massive blocks of rusticated masonry at the sides; but under these weighty angle masses is where the author has chosen to cut his main entrances, thus weakening the effect of the whole. Between the doorways is a rusticated arcade, and above the arches (and below the colonnade) break out three Classical bow-windows, as one may meet them, which light the ladies' room,—very inefficiently, it may be observed. At the Cowgate side appears to be another group of columns with rusticated surbases, standing apparently upon nothing; at least, there is no indication of anything on the plan. Altogether a design with a good deal of humour.

"Athenia" is to some extent an inspiration from the Bank of Scotland, which faces the end of George IV. Bridge, and may, therefore, be supposed to supply a kind of *genius loci*. The main block of the library portion is in a basilica form, running east and west, with the apse of the basilica facing George IV. Bridge, and the entrance and staircase of the right of the block. In the lending library the side counters are advanced in front of the line of the "basilica" colonnade, leaving a long, narrow alley for the public, an inconvenient shape, and we observe that in the perspective view this counter is omitted. The interiors of the lending and reference libraries look well architecturally, but the reference library would be sadly deficient in light for readers. The good point in this design is that the author has taken the hint from the circumstances of the site, and has made the whole of his building below the level of the bridge roadway one great mass of rusticated basement, with good effect.

"Supervision."—A design showing a kind of mingling of Queen Anne detail with Gothic effect; at least, the ponderous corbelled-out turret at the angle savours more of Gothic than of any other style. This feature is designed as a "well" book store, which gives a practical meaning to it. The library block is at the back, at right angles to Cowgate; the access to the rooms rather tortuous; the rooms themselves would be good ones; the reference library is both a well-arranged and (with its three glass domes in the ceiling) a light room. The author appears from the plans to have paid a good deal of attention to warming and ventilating, and to know what he is about in that respect, but his descriptive report is not attached to the drawings.

"Liber."—This is a design showing a good

deal of artistic feeling, so far as external architecture is concerned. The perspective sketches are executed in pen and ink, on a rather strong-toned tracing paper; the sketch looking from George IV. Bridge shows a solid ground-floor story of unadorned masonry, merely pierced with a few plain small mullioned windows, above which is a strongly-marked sill, forming the base to a series of rich traceried windows, with buttresses and arches and statues between them; pinnacles and an open Gothic balustrade over. A perspective from Cowgate is added. If the author had only carried all round this strong distinction between the plain basement and the rich upper story, he would have made a still better piece of work of it. The reference library is a lofty room, with a late type of hammer-beam roof over it. It would make a fine apartment. There is an alternative Classic design, which also shows good qualities, but the plan is open to a good deal of objection.

"Harmonia."—Why Harmonia? There is nothing specially harmonious about it as far as we can see. It is a design in rather commonplace Classic style, with an orthodox basement and order, and balustrade with great big flower-pots on the top of it. The point of merit in it consists in the special expression which is given by the treatment of the greater part of the upper story as unbroken wall, where the bookcases of the reference library are ranged. The plan is in the main a simple and well arranged one, at least so far as the main rooms and the access to them are concerned, except the "Juvenile Room," which is very badly placed, cut off from everything else by a passage with glass partitions, most awkwardly carried across to give access to the staircase from Cowgate level. This is a feature enough to vitiate any plan. The interiors of reference library and staircase are creditable pen drawings, showing well-worn features of Classic detail with nothing special to recommend them.

"Duomo" is noticeable for having a circular treatment of the whole library block, with an external colonnade, from which rises the domed roof of the reference library, the lower portion of the building forming a circle of larger diameter around it. The entrance is at the north end, and is marked by a graceful kind of minaret spire over it, which is not spoiled by being duplicated at the other angle. The lending library is on the entrance level, and the public are let into the centre of it, with a circular counter all round them. This does well enough, but in the rooms intended for reading and reference there is this objection to the circular form, that on a comparatively small scale it is a very noisy room, every whisper of conversation being intensified in it. This has been found to be a practical objection in similar cases, though it is not, perhaps, perceptible in a room on such a scale as the British Museum Reading-room.

"Bibliography" shows a very rich and elegant front elevation; an arcaded ground-story of a kind of Renaissance-Romanesque type, with round arched windows with mullions in them, and carved ornament in the spandrels; there is a strongly-marked architrave and cornice over this, and then a loftier range of mullioned windows between piers, relieved by statuary, and a small attic with *voiles-de-bois* and garlands over; this part of the design is stopped by solid turrets of nearly unbroken masonry at the angles. The whole shows great taste and refinement; and on the Cowgate front we observe that the first-floor architrave and cornice is carried round, and all beneath it treated as plain basement work. The portico leads from George IV. Bridge into a vestibule running across the front, terminating in a stair at each end, that on the left going down to the news-room, that on the right up to the reference library. The access to the lending library is immediately from the corridor. The plan is a very good one, and the reference library an effective room, well lighted from a sloping roof with large skylights, carried by richly-decorated semicircular ribs. There is a frieze of figures beneath the cornice on either side of the *voiles-de-bois* windows. The skylight windows are rather too bare and

bald, with their large sashes and straight bars; they require to be broken up and given more variety and richness of surface to correspond with the character of the room below. This is certainly one of the best designs here, practical and effective at the same time. The lanterns finishing the angle-turrets or pavilions of the front are a little commonplace; we should imagine the author could improve on those.

"Eliä" is a poor and commonplace design, about which we only feel bound to express any opinion because a local paper has thought proper to single it out for special admiration, and to state that the drawings are superior in execution and finish to any others in the room: a statement which can only possibly be explained on the supposition that the author has very energetic friends on the local press.

"Usui Civium."—A design with a good deal of merit. The library block is kept at the back, covering the whole width of the ground at right angles to Cowgate, the advantage of which is that the north side of the large rooms gets nearly clear of adjacent buildings and can be well lighted on three sides. To utilise the front space, however, the author has to be content with lighting the magazine-room, ladies' room, and others, from small open courts, and the access to the lending library, through a small passage between two of these courts or areas, is cramped and unsatisfactory. Once in the lending library, the pencil sketch shows it as a very commodious and well-lighted room; the reference library may claim the same praise, and has the merit which we noticed in another design, of making the bookcase blocks part of the architectural design of the room, though with a less bold and effective treatment than in the other case. The external aspect is shown in a nicely-tinted sepia sketch, the bridge being broken away to show the whole of the Cowgate side of the building; it is a Classic building with nothing remarkable about it, rusticated ground-story, and an order of coupled pilasters above; but it is graceful and suitable to its purpose.

"Regium Donum."—The two exterior alternative perspectives, one with cupolas over the angle pavilions and the other without, are elegant Classic groups, the former especially, but the details in the larger drawings, views of interiors of the libraries, are wanting in refinement, and the drawings rather showy than satisfactory. The plan is good in general idea, but with bad points in detail; for instance, the angle of the lending library jutting out into the hall opposite the entrance, looks very clumsy on plan, and would appear almost as much so in execution. The separate stair to the ladies' reading-rooms is not of much value, because they have to traverse the whole width of the hall or upper landing of the main staircase to get any books after all. Altogether the main attraction of the design is in the two small exterior perspectives.

"Desideratum."—A very fine and numerous set of drawings. The external design is of a Classic type, freely and picturesquely treated; a strong rusticated ground-story with semicircular-headed window designs, but the tympana of the arches filled in with sculpture, with an architrave window-head under; the angle portions form slightly projecting pavilions, with cupolas over them, and angle rustications, with sculptures as acroteria (N.B., the cupolas are too small and light for the substructure, and look out of scale). The centre portion has as a central feature a segmental pediment and Corinthian columns, and a high pyramidal roof rises over this portion, the whole being rather French in appearance. The plan is simple and effective, a spacious entrance vestibule giving access to staircases in the pavilions at each end and to the lending library opposite the entrance, which is very well arranged, with a horseshoe counter and plenty of space before it for the public; the two staircases give access to the reference library above, which runs down the centre of the building from George IV. Bridge to the back, subsidiary rooms, as ladies' reading, &c., opening direct out of it from each side. The room is very boldly treated internally, the cornice line runs into a semicircle, and the ceiling into a semidome at each end—an arcade is carried all

round the room, some of the tympana pierced with windows, and others being filled up with ornament in relief; a great panelled ceiling rises above the cornice, part of which is pierced by skylights. With all this the room does not seem in the drawing to be quite adequately lighted, but it is a very fine design, and the plan is admirably practical, compact, and simple.

"Lux," which is the last in order, is a Gothic design of rather florid type, and somewhat thin and wiry in treatment, but not without a certain degree of effectiveness. The best point in it is the treatment of the Cowgate elevation, which is kept very plain and solid, with a series of long buttresses rising from the lower ground-level to the upper story in strongly-marked vertical lines.

The limit of cost was 30,000l., and some few of the competitors have probably exceeded this limit, but we have avoided any special comment on individual designs in this respect, as it would be hardly possible to form a decisive judgment on this point without more detailed and protracted consideration of each design than time would have allowed.

Considering that the competition was limited to Edinburgh architects, the result gives a favourable idea of the general average of architectural talent represented beneath the smoke-breaths of "Auld Reekie."

\*\*\* Since the above remarks were written it has been announced that the first premium has been awarded (on the recommendation, as we understand, of Mr. Waterhouse, the assessor) to the design marked "Bibliothèque," by Mr. G. Washington Browne; the second to "Triumphant Democracy," by Mr. Dunn, an assistant in the Burgh Engineer's Office; and the third to "Harmonia," by Mr. J. Lumsdaine, principal assistant to Mr. Morham, Superintendent of Public Works. That two out of the three premiums should have been taken by gentlemen engaged as assistants under others is an unusual incident in the history of competitions, and argues a great deal of energy as well as architectural ability on the part of the authors, who must, we presume, have been carrying on their usual official duties at the same time. We are sorry to see that the proposition has been advanced that these gentlemen are not entitled to the awards on the ground that they are not "architects carrying on business in Edinburgh." The real object of the limitation in the instructions was obviously to restrict the competition to Edinburgh men. If the Corporation disappoint two men of the reward of their labour on the mere technical verbal objection that they are not themselves "carrying on business," they will do a very shabby thing. It is still more to be regretted that the principal mover of the objection appears to be the Superintendent of Public Works, in whose office one of the competitors is engaged. As long as the subordinate did not neglect his official duties for his competition design, we should have hoped the only feeling of his principal would have been gratification that he had so clever a man in his employ. We know nothing of the two competitors concerned, — never heard their names before; but they have given undoubted practical evidence of ability, and the proposal to deprive them of their premiums on a technical ground is not at all creditable to those who have set it up.

Mr. Waterhouse's report, we see from the *Scotsman*, has been referred to a sub-committee, who are empowered to select a plan for the Building, in consultation with the Library Committee.

#### PRESERVATION OF STONE.\*

 IMONTS composition, brought out in 1870, partakes more of the nature of a cement (like many others of the preparations that are being discussed) than of a protective fluid or paint. The material is directed to be made up of one thousand pounds of potters' earth, formed into a paste, with twenty pounds of any common

\* Continued from p. 893, ante.

oil, and four pounds of fish oil. Then a separate paste is formed from arachis (ground nut), which is spread over the previous compost, followed by the addition of eight pounds of finely-powdered charcoal and twenty-four pounds of coarse hair, which are well stirred in. There are several other similar compounds mentioned in the specification, in all of which oil of some kind seems to constitute the water-repelling ingredient.

The following are the remaining oleaginous preparations that have been patented or recommended:—

Egleston's preparation (1885, patent 9,087); so-called "fat oil" (oxidised linseed oil) is employed in conjunction with paraffin, vaseline, and sulphur. The mixture is used warm, and applied with a brush. Hibble's protective was made up of ground lime, turpentine, linseed oil, silicate of lead, and ground sulphate of iron. Another patentee suggests sulphur and linseed oil. Hardwicke's mixture contained potash, alum, fish and linseed oils. A paint to be applied hot, and which is made up of ten parts of wax, thirty parts of oil, and one part of litharge is considered worthy of mention in Knight's American Mechanical Dictionary. Provisional protection only was granted for the use of a varnish made up of shellac dissolved in naphtha or other solvent, to be applied specially to the preservation of magnesian limestone. Another suggestion was to mix any convenient resinous varnish with various metallic oxides. R. Alexander, in 1867, patented the use of mixtures of varnishes containing lime; and another patentee a few years later, the use of a varnish composed of the poisonous juice of Euphorbia plants.

Bituminous and similar preparations have also been utilised, and those which have been made the subject of patents are as follows:—Bethell's patent, chiefly available for wood, though also recommended for porous stones and cements, such as Portland, freestone, chalk, some marbles, plaster of Paris, &c., consists in the injection, under pressure, of mineral or vegetable tars, bitumens, &c., mixed or not with any suitable solvent. In some cases sulphates of iron or copper can be employed.

J. Teychenné, feather merchant, patented in 1846 improvements in treating stone to render it hard and impermeable, which improvements consist essentially in the immersion of the stone in hot melted mixtures of tar, pitch, &c., with fine sand. If the stone is not desired of so dark a colour, resin, turpentine, &c., are substituted for the tar.

In 1872, a process for saturating bricks, stones, &c., with boiled coal tar, pitch, and similar materials, was patented by G. H. Smith, of New York, who also obtained another patent which relates to the treatment of porous plasters, stones, works of art, &c., and by this process it is claimed that articles formed of plaster of Paris are rendered harder and more durable, and susceptible of a fine polish. The articles are saturated by immersion or otherwise, with materials such as coal-tar, coal-oil, melted or dissolved pitch, bitumen, &c., and subsequently heated until all volatile matters are driven off, and cooled slowly.

The use of ozocerite and paraffin wax, melted or in solution with suitable solvents, has also been patented.

In G. O. Kramer's patent, a mixture of boiled tar and sawdust is employed.

The class of expedients so far discussed are only in the most favourable cases capable of certain limited applications, and in not a few instances it is difficult to see with what object some of the ingredients are employed, yet, ineffective as a large number of them are, their consideration is instructive as showing the direction in which a large number of patentees have been working. A larger, more important, and certainly more scientific section of devices are those which have for their object the formation of some insoluble mineral compound upon the surface, either by acting upon an ingredient of the stone itself or by the reaction upon each other of the constituents of the mixture applied. Of course in every case regard must be had to the nature of the stone,

and further, the protective coating to be of any real good, should be harder (or at least as hard) and very much more resistant to atmospheric influences than the untreated stone to which it may be applied.

The silicates of soda and potash, commonly termed soluble or water-glass, may be regarded as the sheet-anchor of most seekers after a good mineral protector for stone surfaces, as in upwards of twenty patents these silicates play a more or less important part.

To M. Kuhlmann is generally ascribed the credit of having been the first to use silicate of soda for the purpose of protecting stone. This application, although it gave a good start to the employment of soluble silicates, was not so great a success as had been sanguinely expected. The river front of the Houses of Parliament was coated with the substance, but so slow was the union of the silica with the calcareous matter of the stone to form the desired insoluble and resistant silicate of lime, that a few winter months proved its inutilty.

Various attempts were next made to protect the silicate covering until union with the lime could take place. Szerelmezy, about whose method there seems to have been much unnecessary mystery, worked in this direction, and professed to cover the silicate with an asphaltum varnish; but there is little doubt, from Frankland's investigations, that various other paint-like mixtures were employed. A distinct step in advance was taken by Mr. Frederick Ransome, of Ipswich, whose indefatigable labours as the inventor of artificial stones are well known. Mr. Ransome applied alternately to the stone solutions of silicate of soda and chloride of calcium; in this way decomposition is effected at the surface of the stone, a white enamel-like silicate of lime being formed together with soluble chloride of sodium. The formation of a soluble salt in the above reaction is, of course, a serious disadvantage, and Mr. Ransome made several efforts to avoid its presence or modify its effect. One patent, applied for by this gentleman in 1860, which received provisional protection only, had for its object the decomposition of solutions of rosin, shellac, or other gums soluble in alkaline or saline solutions with soluble silicate. Further, in 1868 another patent was obtained by Ransome in which the use of objectionable alkaline salt was entirely avoided, as, in the place of an alkaline silicate, a solution of silicic acid or so-called "soluble silica" was employed; solutions of lime or baryta in water, or saccharine solutions of the same substances, were first applied to the stone and followed by the silicic acid solution.

In another process more complicated reactions were aimed at by the employment in succession of solutions of phosphate of calcium or of some aluminium compound, lime, or baryta water and solution of silicic acid.

Erichsen, Barff & Sullivan, Bartlett Bros., and other patentees give a distinct preference to silicate of potash as compared with the soda compound. In Barff & Sullivan's process the stone is treated with a mixture of alumina, carbonate of zinc, and silicate of potash. In the process of Messrs. Bartlett Bros. & Co., carefully-adjusted strengths of silicate of potash and aluminate of potash were used. If the solutions are not too concentrated the mixture hardens only after some time, forming insoluble silicate of alumina, but if too strong the mixture solidifies immediately, and before it can be applied to the desired purpose. With respect to aluminate of potash, we are reminded by its mention of an instructive incident which illustrates the value (?) of the examination made by the Patent Office of new applications. A year or two ago a chemist made application for letters patent for an improved disinfecting powder. Unusual delay in the granting of provisional protection caused inquiry to be made, when the agent in charge of the matter was informed that the delay was due to doubts on the parts of the omniscient examiner as to the existence of such a class of compounds as aluminates. The absurdity of such ignorance is evident in the face of the fact that every standard treatise mentions such compounds, which are also well known to every one having

the least pretence to chemical knowledge. Would it not be better to do away with the absurd farce of a preliminary examination which seems only to serve the purpose of providing salaries for several more or less competent individuals, and which certainly does not in the smallest degree add to the legal value of the patent.

The late Professor Barff, whose name has already been referred to, and who will be best remembered in connexion with his ingenious invention for producing rustless iron, patented a mixture containing silicate of soda, powdered pumice, and white lead, which applied as a paint forms a hard impervious coating on stone. Another patent by the same gentleman involved the use of a mixture of silicate of potash and soda, alumina and oxide of zinc. A few years later Barff recommended for the purpose of preserving and indurating cement, stone, stucco, &c., a mixture of sulphate of barium and carbonate of lime, together with silicate of potash, the object of using the sulphate of barium being to prevent the too rapid combination of the silicic acid with the lime, and so to secure the more complete impregnation of the surface of the stone with the mixture.

Professor Church in 1862 advocated a process in which a solution of silicic acid was first applied to the stone, followed by one of hydrate of barium. In 1884 M. Dennstedt obtained letters patent for a mode of preserving plaster and stone, which seems to include Church's method, as in this it is proposed to brush the surface over with various acids in aqueous solution, such as carbonic acid, sulphuric acid, silicic acid, or chromic acid; the application of any one or other of these to be followed by a solution of hydrate of barium, or less preferably hydrate of strontium, whereby the insoluble corresponding salt is produced.

A. L. Fleury preferred to use the silicic acid solution alone, taking advantage of the fact that as the water evaporates the silica becomes insoluble, and incapable of re-entering directly into solution with the water again. In the case of many calcareous stones, some formation of silicate of lime also results.

J. C. Russell's method, which secured only provisional protection, consisted in the production of a kind of artificial stone, made up of limestone mixed with soluble silicate, and then immersed in water, either pure or acidulated with hydrochloric or carbonic acid, or mixed with magnesium compounds, such as the mother liquors from salt-pans. The cement thus formed is dried, broken up, calcined, pulverised, mixed with water, and used as a paint.

Several patentees have worked in the direction of producing on the surface of the stones or bricks glazes or enamels obtained by the fusion of mixtures of silicates. The chief patents having this object are those of Summerfield, obtained in 1854; of the Viscount de Romanet, in 1876; of A. Gonault, in 1879, which applies especially to the glazing of sandstones; of C. Moreing, in 1880, also chiefly applicable to sandstones which were to be soaked in an alkaline solution, such as caustic soda and potash, dried, and then baked almost to vitrification, so that union between the silica, alkali, and any calcareous or ferruginous matter in the stone may be more or less completely effected. In another process, the stones, after being fixed, were to be brushed over with any moderately fusible enamel mixture, which was then to be melted with a hot-air blast, blow-pipe, or other means.

Hydrofluo-silicic or fluo-silicic acid, which may be regarded as a mixture of hydrofluoric acid and silicic fluoride, is an active agent in several processes. Thus, in Coombe & Wright's process, patented in 1861, this acid was used for coating stones, bricks, &c., being, of course, most useful where the substances treated contained materials capable of forming insoluble compounds with the acid.

In another process the stone was first washed with a hot solution of barium hydrate, or of bicarbonate of magnesium, and then brushed over with fluo-silicic acid.

Coombe & Wright, in a second patent, mixed

the fluo-silicic acid with lime, chalk, and other suitable materials, and used the mixture as a preservative paint, and for making artificial stone. In Sullivan's method, soluble fluo-silicates were employed, such as those of zinc and magnesium, and subsequently decomposed by application of alkaline silicates or aluminates. Faure & Kessler's patent (1883) refers chiefly to the use of fluorides and fluo-silicates of various metals.

Bernays also recommended fluo-silicic acid, the surface to be subsequently washed with a solution of a potassium salt so as to produce the insoluble fluo-silicate. Rust & Mossop's plan was to coat the surface first with a solution of hydrate of barium, and then with fluo-silicic acid.

Crookes proposed the use of a mixture of fuller's earth and hydrofluoric acid, the acid uniting with the alumina to form the insoluble fluoride.

The remaining processes are of no very great importance, and may be briefly enumerated. Daine's method (1854, pat. 1,765) involves the employment of a solution of sulphate of zinc, "to fill the pores and neutralise the tendency to alkaline efflorescence," and then, with a brush or exhausted case, a solution of sulphur in linseed oil or other suitable solvent is applied.

A process for preserving and indurating marble and other stone, and rendering it less liable to chip in working, was patented by Page in 1855, and consisted, first, in brushing over the surface a mixture composed of water, lime, and pearlsh; then carefully heating until quite dry, and while still hot rubbing thoroughly over the surface white beeswax. Another patent relating particularly to the hardening of plaster, utilises solution of barium hydrate, in which the articles are to be soaked for a few days.

Paul's processes, patented in 1857, effect the preservation of the stone by the application thereto of solutions of soluble aluminates, zincates, or alkaline solutions of phosphates of aluminium or zinc, the solutions being mixed before using with finely powdered carbonate of magnesium, chalk, silica, or other suitable substances. One would-be-patentee put himself to the trouble of trying to secure the monopoly of the use of a wash made of lime and salt and water. Others identified themselves with the application of sulphates of iron or alumina, the object being doubtless, in the case of stones containing carbonate of lime, to produce the corresponding less soluble sulphate.

In Douglas & Watson's patent a suitable solution of resin is applied and then a solution of alum. Solutions of soap applied to stone which is then treated with alum solution result in the formation of an insoluble coating of stearate or oleate of alumina, which is sometimes found useful in rendering stones, cement, &c., impervious to water.

In 1873, the application of a hot solution of alum as a preservative of stone was patented, and this might conceivably be useful in the case of some calcareous stones.

"Spence's Metal" perhaps, can hardly be regarded as adapted to stone preserving purposes, yet in some situations, especially when not likely to be exposed to a high temperature, it may be found useful as a damp-proof material. The "metal" is produced by melting powdered sulphides, chiefly those of iron and copper, with sulphur.

The following is a brief description of Westmacott & Perceval's elaborate processes for the purposes of preserving, strengthening, &c., plaster casts and natural and artificial stones. In the case of plaster articles, these, when dry are immersed in a mixture of sulphate of barium, borax, and boiling water, or in the case of walls the mixture may be applied with a brush. The object is to harden the surface. A second operation follows called the "sealing process," and consists simply in the application of shellac or other varnish. A further operation is termed the "permeating process," and consists in immersion in a bath of melted paraffin wax. For surfaces other than plaster the first process is omitted.

In 1880 A. Magaud obtained a patent for

the application to stone of the sulphates of iron, copper, or zinc, together or separately.

McMurris & Chambers, in their patent process, treat the stone with a mixture of earthy or metallic sulphates, and subsequently with a solution of fatty acids, the object being to form an insoluble soap on the surface.

C. Laboré plunges the stone into a solution preferably of sulphate of zinc and alum. The process is only applicable to those stones containing lime compounds capable of being converted into sulphates.

Spiller's method was proposed for magnesium limestone only, and consisted in the treatment of the surface first with superphosphate of lime and then with ammonia solution, the idea being evidently to produce amongst other results an insoluble double phosphate of ammonium and magnesium which will be, so to speak, held on to the surface by the hydrate of lime formed at the same time.

In concluding this summary of the subject it may be well to point out that it is futile to expect that any one particular preparation will answer equally well for every kind of stone. Even to obtain a moderately satisfactory result,—and this is all that is at present obtainable,—the chemical nature of the stone to be treated must be carefully taken into account, or the result in some instances will be a positive deterioration of its quality, and in others a waste of labour and material.

NOTES.

WHEN the Irish Crimes Bill is out of the way,—which every one, whatever may be his politics, devoutly hopes will be shortly the case,—some of the numerous Bills which have been introduced into Parliament will be discussed. There is not one which in many respects is more important than that to make further provision for technical instruction, which has been introduced by Sir H. Roscoe, Sir Lyon Playfair, and others interested in the subject. We suppose that no one will deny the need for greater technical instruction, but we fear that this Bill is but a crude attempt at reform. The subjects which are included in the purview of the Bill are (a) the use of ordinary tools, (b) commercial arithmetic, (c) commercial geography, (d) bookkeeping, (e) French, German, and other languages, (f) freehand and machine drawing. The Bill gives authority to any School Board or other School Authority to provide and maintain "day technical and commercial schools and classes for the purpose of giving instruction in any of the subjects set out in the schedule," which we have already enumerated. The first criticism which occurs is that two things are here mixed up which should be kept entirely separate, namely, technical and commercial instruction. The use of ordinary tools, and hand and machine drawing, ought not to form part of the same curriculum as foreign languages. The latter form part of a higher primary instruction; the former should either be taught in technical schools, or, so far as the very elementary part is concerned, in connexion with the ordinary primary schools. But the policy of obtaining funds in the same manner as for ordinary instruction in primary schools is a subject which requires to be carefully worked out. There is difficulty enough already in obtaining money for primary schools; to obtain further sums for technical education will be very difficult. That a discussion of this Bill in the House of Commons will be useful cannot be doubted, but it is not the least likely to become law. The subject must be dealt with in a Government measure, and the scheme must be a comprehensive one for the introduction of technical schools throughout the country. The grouping of school districts for the purpose of the higher technical education seems almost absolutely necessary, but, be that as it may, we repeat that the subject is far too important to be left to the initiation of private members, and deserves the careful attention of the Government.

THE section of the proposed Panama Canal, referred to in a former number of the

Builder (p. 861, ante) shows a maximum depth of cutting of 360 ft. at La Culebra. This depth, moreover, is measured on the centre line of a cutting aligned on the side of a hill; and the depth from the top of the slope must be considerably more. The point in question is in the centre of a district of about 7½ miles in length, comprising the sections of *Obispo*, *Emperador*, *Culebra*, and *Paraiso*; the total estimated contents of which amounts to 93 million cubic yards. As the attack on this prodigious mass must furnish the limit to the time for completing the canal (supposing funds to be forthcoming), any engineer would have made it the first point on which to set to work. Accordingly it was announced that work was to be commenced at "the hard-rock mountains of Culebra" in December, 1881. Up to June, 1886, the aggregate of 12,350,000 cubic yards had been excavated in these four sections. It is to diminish this almost inconceivable cutting that it has been proposed to introduce locks. It should not be forgotten that the tidal range of the Pacific, which amounts at times to over 27 ft., renders a canal without locks, like that of Suez, physically impossible. A tidal lock at Panama has been an integral feature of the scheme, and 480,000*l.* was allowed for the cost in the first estimate. The gates of this lock cannot be less than 40 ft. in height. The extent to which it is possible to raise the summit level of the canal by means of locks, if the matter be regarded according to the ordinary rules of art, is limited, by the supply of water, to a rise of 135 ft. This would still leave 225 ft. of cutting at Culebra. It is obvious that as the construction of locks is now spoken of as a matter for consideration, no very material diminution of the block of 81 million cubic yards left in this district last June is likely to have been since effected. Lieut.-Col. Lloyd, in 1827, ran a series of levels across the Isthmus, with a view of determining the relative mean ocean levels on either side. His work, which is in the possession of the Royal Society, gives a difference of 352 ft., by which the Pacific was higher than the Atlantic. The engineers of the Panama Railway, however, regarded the mean levels as identical. It is possible that difference of opinions may exist on that point, but the question is immaterial when compared to the known fact of the higher tidal range at Panama; nor is it justifiable to speak of the canal, under any circumstances, as without locks, as all vessels passing through it must lock, either up or down, at Panama, for at least twenty hours out of the twenty-four. The tidal range at Colon is, according to Colonel Lloyd, 116 ft.

THE report of a sub-committee of the National Health Society on the proposed "Sanitary Registration of Buildings Bill," which has been forwarded to us, is a very plain-spoken document, in decided opposition to the Bill in question. The Society opposes it on the ground that it will result in the creation of a new and unnecessarily numerous class of so-called "experts"; that there is no adequate provision for securing the real *bona-fide* competency of such experts; and that it is proposed to license "Sanitary Associations incorporated by licence of the Board of Trade." On this subject the Committee remarks:—"The licence in sanitary practice which the Local Government Board is required under the Bill to give to such an Association would clothe it in its corporate capacity with power to give an unchallengeable certificate of sanitary perfection. Associations of this kind exist nominally for the mutual help and protection of their members; but they are necessarily largely dependent for their financial success upon the amount of business in the way of sanitary inspection which their professional advisers and associates can develop. Looking to the fact that the Bill is being promoted by an Association of this sort, it is not unfair to assume that a primary reason for its introduction is to be found in the desire to foster the work and encourage the operations of such bodies." This has been very much our opinion from the first. The Bill is, we believe, essentially an advertisement.

A QUESTION was asked in the House of Commons, on Monday, relating to the proposed introduction into the Railway and Canal Traffic Bill of a clause compelling the railway companies to carry town refuse at a cheap rate. In alluding to this matter on the 4th inst., we deprecated the proposal as unreasonable; and it appears from the statement made by Baron de Worms that the Government take the same view, and do not intend to import any provision of this nature into the measure. They have, as it is said, failed to make it acceptable to the agricultural interest, who confidently looked for benefit in the Bill. Sir Richard Paget, at the meeting of the Central Chamber of Agriculture last week, stated that he should oppose the Bill from beginning to end unless they could get amendments introduced to render it of more practical benefit to themselves. What they look upon as the primary object of the measure is frustrated by any justification of lower rates for imported than for home produce; and that this position does not of necessity involve the adoption of a principle of strictly equal mileage rates, was clearly shown by another speaker,—Mr. Bell, of Newcastle,—at the same meeting. He said that what the farmers asked for was that foreign goods should not be carried over a greater distance at a less rate than home goods of the same class were carried over a shorter or the same distance. This is a reasonable demand, and it is to be hoped that the House of Commons will agree to amend the measure accordingly.

THE reply given by Lord Henniker in the House of Lords on Friday last with regard to the destination of a statue of the late Lord Idlesleigh throws a curious light upon the manner in which our public buildings are decorated. Interrogated by Lord Mount-Temple as to whether it was proposed to place the statue in the Central Hall of the Houses of Parliament or upon one of the pedestals in St. Stephen's Hall, Lord Henniker replied that, as representing the Office of Works, he was unable to give an answer to the question, but that the whole matter was in the hands of the Lord Grand Chamberlain! Lord Mount-Temple submitted that the question of the position of a statue in a building was eminently one for the decision of an architect, and instanced the case of the statue of Earl Russell in the Central Hall as an example of the mistakes which are made when professional advice is not taken in the selection of a site. Lord Mount-Temple's remonstrance evoked no echo among their lordships, who are content to leave the adornment of the palace in which they meet in the same hands as those which regulate Court entertainments. It may be safely averred that in no other civilised country in the world would such a way of arranging such matters be tolerated.

THE judgment of Mr. Justice Smith in the case of Wright v. The Wallasey Local Board (Law Reports, 18, Queen's Bench Division, p. 783) is worth noting. By the statute 17 and 18 Vict., c. 128 *seq.*, "No ground not already used as, or appropriated for, a cemetery, shall be used for burials. . . . within the distance of 100 yards from any dwelling-house." It was contended by the plaintiff that the words "dwelling-house" must include the curtilage and not the house alone. But this view the Judge would not accept. As he truly remarked, why should a burial be permitted within 100 yards of a house without a pleasure-ground or yard, and yet not within, say, 200 yards if it has these appendages? Whether 100 yards is in itself a sufficient distance seems to be questionable, but the statute is clear, and is made certain by this decision. If those who are competent to form a judgment consider the distance too short it is the duty of the Legislature to increase it.

NO. XXIV., the last issue of the *Wandtafeln* of Dr. Launitz, is the most interesting of the series. It represents a restoration of the Acropolis, and gives a view not only of all the buildings still remaining, but also the hypo-

thetical site and appearance of many of the monuments mentioned by Pausanias, which have long ago perished. It is, indeed, as a help to the realisation of this class of monuments that Dr. Launitz's work has its chief value. We all know, either from memory or photographs, what the ruins of the Parthenon and the Erechtheum, the Temple of Nike, and the Propylæa, are like, and if we want to picture them as they stood, new-built in the time of Pericles, we probably prefer the image of our own fancy to that of Dr. Launitz, for somehow his restorations remind us rather of Munich than Athens. But which of us, in thinking of the Acropolis, peoples it with all the motley throng of shrines and statues and votive offerings which met the eyes of Pausanias? How many could recall off-hand, ever so roughly, where the horse of Strongylion stood or the triple Hekate EpiPyrgidia of Alcemenes? And yet if we want to realise ancient Athens these and a hundred other monuments must not be absent from the picture. These restorations are, in fact, of service, not as satisfying the artistic sense, which they rarely can, but as a stimulus to a flagging historical imagination. Dr. Launitz's "Acropolis" is accompanied by an explanatory text, much needed by those to whom the account of Pausanias is not familiar. A ground plan of the Acropolis is to follow, giving details of the building only seen here in somewhat confusing perspective.

IN attempting the restoration of the Acropolis, topographers have at least a sufficiency of fixed points to start from in restoring the Agora; in the plain below, it is far otherwise. The most recent,—and, as it seems to us, far the most satisfactory,—attempt is the sketch given by Kaupert in the *Philologische Wochenschrift* (No. 18, 1887). In the brief text which accompanies the sketch, Dr. Kaupert clearly states the conditions of the problem. In the main, this restoration coincides with that of Dr. Curtius. He believes the Agora to have been a quadrangular space broadening towards the south, and lying in the hollow between the Thesean hill and the hill on which the Athena Archegetis gate now stands, and to the south the slopes of the Areopagos and Acropolis. This quadrangular space was divided, he believes, half-way by the street of the Hermae, the line of which produced would reach the Athena Archegetis. He takes the Stoa of Attalus as the eastern boundary of the northern half, in the same direction bounding the southern half he believes the Stoa Poicile stood. Immediately opposite the Poicile,—i.e., bounding the southern Agora on the west,—he places the Stoa Basileios, the Stoa Eleutherios, and the Temple of Apollo Patroos; bounding the Agora on the south, the little complex of buildings, the Metroon, Bouleuticon, and Tholos. Where he differs from Curtius is this. Curtius neglects entirely the so-called Hall of the Giants. Kaupert takes its east end as the west boundary of the upper Agora. Whether this Hall is to be taken into account or not can only be decided by a thorough excavation of its very substantial remains. How long are we to wait for this?

THE Chapter Coffee-house, in Paternoster-row is about to succumb to the fate which overtook its neighbour and contemporary, Dolly's Chop-house, about five years ago. Concurrently with the migration of the booksellers into the Row soon after the beginning of last century,—in succession to the tire-women and milliners,—the Chapter seems to have replaced Child's, on the southern side of St. Paul's churchyard, as the resort for proctors and the clergy. Dons and other University men in town, and the booksellers, soon followed. Here assembled the Witenagemot of the Wet-Paper Club. But it is also in connexion with Chatterton, Goldsmith, Bonnell Thornton, and Churchill that the Chapter will be remembered. Chatterton speaks of it more than once in his letters to his people at Bristol:—"I am quite familiar at the Chapter-house, and know all the geniuses there: a character is now unnecessary; an author carries his character in his pen." Again he writes from the King's Bench, May 14th, 1770 (shortly before his

death), to say that a friend he meets there has undertaken to introduce him to the young Duke of Northumberland with a view that he should accompany his grace on the grand tour: "hut, alas!" he adds, "I spake no tongue but my own." The Chapter is cited in "The Connoisseur" of January 31, 1754, as the haunt of "those encouragers of literature, and not the worst judges of merit, the booksellers." Some reminiscences of its literary and political frequenters during the period 1797-1805 are given by Alexander Stephens. These comprised the two Parrys, of the Jacobin "Courier"; Patterson, Pitt's mathematical tutor; the Robinsons, and Chalmers, their foreman; Alderman Waitman; Dr. Buchan, author of "Domestic Medicine," who with Dr. Gower compounded the famous punch; Walker, the rhetorician; and John Johnson, who, at 72, St. Paul's-churchyard (since the draper's shop), published Cowper's first volume of poems, his "Table Talk," and "Task," together with Newton's Olney Hymns.

MR. JOHN NOBLE has undertaken to endow a free library in Lower Marsh (*près* New Cut), Lambeth, with a gift, in honour of Her Majesty's Jubilee, of 10,000l. We learn, too, that the same borough is offered another free library, to be known as the "Durning Library," at Kennington; together with a site, for the same object, in Norwood. The Earl of Cadogan promises to contribute books to the value of 300l. to the proposed Free Library for Chelsea. Moreover, as tenant for life, his lordship will grant a ninety-nine years lease at a nominal rent of a suitable site for the building. Lady Cadogan supplements this gift with 50l. worth of books; her husband also has offered to contribute 200l. towards the restoration of the organ in St. Luke's Church.

SIGNOR GIACOMO BONI writes to the *Riforma* complaining that the canal front of a fourteenth-century palace at the ferry of St. Maria di Zobenigo, at Venice, has been recently newly plastered, and coloured the colour of rotten strawberries, with panels in imitation of relief, and white and dark lines, such as are usually seen under shop-windows. The Ca' Foscari, on the Grand Canal, erected towards the end of the sixteenth-century, and attributed to Maestro Bartolomeo Bon, the architect of the Porta della Carta, has been painted a uniform and dark red colour. The new colour, according to Signor Boni, does not harmonise with the plaster until the oil has become decomposed, and then instead of improving the colour deteriorates. Signor Boni advocates the use of plaster made with lime and ground brick, quite red and smooth, but not shining, which acquires very beautiful brown tints with age, and quotes Goethe's lines:—

"Was glänzt ist für den Augenblick geboren  
Das Aechte bleibt der Nachwelt unverloren."  
In conclusion, Signor Boni says:—"I hope that not only a material difficulty, but rather a persuasion that such things should not be done, will dissuade people from gilding afresh our ancient buildings. I hope that the new red plastering will be real plastering of red brick, not the colour of rotten strawberries or faded poppies; and, above all, if our fourteenth-century houses have a guardian genius, as the Cippolino quarries in the island of Eubœa had their marble Apollo, I hope that he will stay the hands of those who attempt to whitewash the mouldings and foliage of the arches and capitals."

THE vicar of Herne, Kent, has reprinted in a pamphlet form from the *City Press* of April 20th an account of Herne Church, with illustrations, for the purpose of raising funds for the restoration of the north aisle and the repair of the tower, the other portions of the church having been already restored. The cost of a new roof to the north aisle and the repair of the tower is estimated at 800l., of which sum 250l. has been collected. The plea upon which the vicar appeals to the citizens of London is that the church is the last resting-place of a former Lord Mayor of London, Sir

Matthew Philip, who died in 1470, and who, with his third wife Beatrice, is buried in the chapel of St. John the Baptist, commonly called the Milles Chapel, part of the north aisle of the church. The north aisle has a low-pitched lean-to roof, which is much dilapidated, and it is proposed to remove this roof and replace it by a span roof of an elaborate Gothic design. There appears no necessity for this alteration in the character of the roof; the aisles of churches in the Decorated and Perpendicular periods were commonly covered with lean-to roofs, and to substitute a roof of an entirely different design from the original roof seems an unnecessary and indefensible proceeding.

THE High Canons Estate, at Shenley, Hertfordshire, a beautiful property of about 810 acres, in Dacorum Hundred, has just been placed in the market. The out-farms and other holdings yield an income of nearly 1,800*l.* a year. The large sheets of water in the park were constructed during the proprietorship of Mr. T. Fitzherbert. In Shenley churchyard were buried the Rev. Philip Falle, the historian of Guernsey and Jersey; and Nicholas Hawksmoor, the architect of, *inter alia*, St. Anne's, Limehouse, burnt on Good Friday, 1850; Christ Church, Spitalfields; St. George's, Bloomsbury; St. Mary Woolnoth, Lombard-street; St. George's-in-the-East, Wapping; and the new inner quadrangle of All Souls, Oxford. He died on March 25, 1736.

THE Twyford Estate, of 916 acres freehold, traversed by the Itchen river, and lying two miles out of Winchester, between the high roads to Southampton and Portsmouth, was to have been sold at auction on Tuesday last. St. Mary's Church, Twyford, has been rebuilt, in the Transition style, by Mr. A. Waterhouse, R.A. At Twyford House Franklin is said to have written the story of his life: he was then a guest of Dr. Shipley, bishop of St. Asaph. In the Catholic school at Seagers House was educated Alexander Pope.

A CORRESPONDENT writes.—“One of the most extraordinary resolutions ever arrived at by a public body was perhaps that recently passed by the Ventnor Local Board. With a view to reducing the expenditure of the town, notwithstanding the strongest opposition on the part of the chairman and leading members, the Board resolved, by a majority of one, to give the whole of the officials three months' notice to terminate their engagements, discharge the gardeners at the Park, and invite tenders for keeping the grounds by contract, reduce the wages of the workmen and other employees by sums varying from 1*s.* to 4*s.* per week, suspend the flushing of the sewers, and directed that all letters intended for circulation within the district should be delivered by hand instead of through the Post-office! The Board afterwards offered the offices to the clerk at 20*l.* less per annum, the Surveyor at 50*l.* less, the Sanitary Inspector at 14*l.* less, and the rate collector at 12*l.* A discussion subsequently arising in which doubts were expressed as to the Board being able to make any alteration in the salary of the Inspector without the consent of the Local Government Board, who refund a moiety of the amount paid, it was resolved to allow him to continue on the full amount for the present time. On the decision of the Board becoming known, a petition was immediately prepared and presented at the following meeting by the Ventnor Medical Association, and signed by all the medical men of the district, asking the Board to reconsider their decision with regard to the surveyor (Mr. R. S. Scott), whose removal, after nearly eight years' service, would, in their opinion, be prejudicial to the interests of the town, but without effect, and Mr. Scott having accepted an appointment elsewhere, has already left the town, which will probably be without a surveyor for some time to come.” Our correspondent is responsible for the statement as to facts, but if they are correctly given, we may remind the Ventnor Local Board of one consideration which seems to have escaped them, viz., that Ventnor largely subsists on

the visitors who come there for health or pleasure. If they render the town less desirable as a resort to either of those two classes they may find they are quarrelling with their own bread and butter more effectually than they at all expected.

A VERY large work by Mr. Geo. Tinworth, a subject of life-size figures in terra-cotta, extending 23 ft. in length, has been on private view at Messrs. Doulton's this week. It is called a “panel,” but the word conveys a wrong impression: it is properly not a panel in relief, but a series of detached figures arranged in an extended composition, only one or two being attached to the background, the rest standing out on a tiled floor several feet in width from the background, conveying the general idea of a section showing the upper end of a room, with figures congregated on the floor. This is quite a different art from relief sculpture, and is to our mind a very doubtful experiment. It produces a realistic effect, in one sense, which seems to take it out of the category of ideal sculpture; when we see this tiled floor and the figures standing out on it, we almost expect to see them coloured and dressed like real life also. A bas-relief, or even an alto-relief, is a far more intellectual form of sculpture than this modelling of a company of figures standing about; and the objection to it is more felt on a life-size scale than on a small scale. Apart from this, the group, which represents Christ before Herod, shows all the same qualities of vivid and spirited realisation of the story which we have been accustomed to in Mr. Tinworth's smaller scale illustrations of Scriptural incidents. Herod and Christ are seated side by side, and the key to the expression and action of the principal figures is to be found in the words “Herod questioned with him in many words, but he answered him nothing” (Luke xxiii. 9). Carrying out this idea further, a figure, a kind of “remembrancer,” is introduced behind the king, with a scroll, supposed to be prompting or reminding Herod of various points on which to question his prisoner. The face of Christ seems to us expressive of dogged resolution and contempt, rather than the orthodox Christian meekness; but perhaps Mr. Tinworth, who has often shown his indifference to conventional readings, has and intends to express that idea. The remark that Herod “hoped to have seen some miracle done by him” has been expanded, in very dramatic spirit, into an excuse for inserting groups on either side of such persons and their friends and attendants. One of the best figures in the composition is that of the woman on the left who leans against the wall looking down sadly on the invalid on a couch at her feet; and on the right the group of the paralytic man on the floor and the others bending forward from behind him is very effective, and is the only really composed portion of the work, in a sculptural sense. Vivid dramatic conception of the scene, and realistic expression in the separate characters, are Mr. Tinworth's strong faculties; and these are among the most important elements in great sculpture; but they are not everything, and we do not call this sculpture in the highest artistic sense: it is something very clever and interesting, but it is not sculpture.

THE *Figaro-Salon*, which is being brought out in numbers by MM. Boussod, Valadon, & Co., and by M. Baschet, contains a large number of very beautiful illustrations of the leading works in the *Salon* of this year. The third number, which has just reached us, contains a beautiful reproduction of Heilbut's “*Jour d'Été*” among other things. The previous number contained illustrations of two pictures which have attracted much attention, the hospital scene by M. Gervex, and the painting of a rural wedding breakfast, “*Noce d'Ouvrier*,” by M. Fourie.

AMONG the suggestions which have appeared in the *Times*' correspondence, since the Opéra Comique disaster, for rendering theatres safer, an important letter from Mr. John Percy suggested the employment of

thin mild steel or iron (properly braced) for scenery, wire gauze for the drop curtain, iron framing, with perhaps a papier-mâché finishing surface, for the stage itself; Mr. Percy aiming at making theatres “unburnable.” His suggestions are well worth consideration, but we doubt whether anything would be considered a satisfactory substitute for the time-honoured “boards” on the stage itself. A suggestion of “B. M.” that there should be many wall-openings, filled in with thin stuff that can be broken through in case of fire, is ingenious; but he forgets that, for the safety of the property in the building, such a method could not be applied for final exit through the outer walls of the building, and therefore would only let people out of the auditorium to intensify the final crush at the real outer exits.

ARCHITECTURE AT THE ROYAL ACADEMY.—VIII.

1736, “Duko-street Mansions, Grosvenor-square,” Mr. J. T. Wimperis. A well-executed pen-drawing, showing a large block of “houses in flats,” sufficiently broke up by projecting bays to have a generally picturesque effect, but not presenting anything remarkable. The plan may be very well arranged, but there is nothing to show this. The treatment of the end of the block, with two large octagonal turrets standing out from the line of wall at the angles, and balcony railing carried across flush with their outer faces, is effective.

1739, 1747, “Statues for decoration of pediment, St. Vincent-street Buildings, Glasgow,” Mr. A. W. Bowcher. Pencil sketches of a series of small cupid-like figures with musical instruments, designed with a good deal of spirit, and which have this special merit, that, while they are sufficiently conventional and symmetrical for decorative effect, they show an attempt to do something special and original, instead of putting up mere lame repetitions of classical types of architectural sculpture.

“Chaines Church, Worcester: Enlarged and Restored,” Mr. Astou Webb. Two very well-executed pen drawings, exterior and interior, showing a small and unpromising Little Gothic church, with a low square tower. A small plan is commendably added, showing what is old and what are the additions, the latter consisting of a new north aisle and vestry in keeping with the rest of the building.

1742, “Drawing-room and Library: Steamship *Ormuz*,” and 1744, “Dining Saloon,” in the same vessel, Mr. J. J. Stevenson. These represent the internal woodwork fittings designed by Mr. Stevenson for this vessel. Reproductions of the drawings, which are by Mr. H. W. Brewer, were published in the *Builder* of June 4. The fact that an eminent architect has been commissioned to make designs for the entire fittings of the ship is one of the instances of the importance now attached to the decorative fitting up of passenger steamers; and no doubt Mr. Stevenson would ensure the good execution of the work, and the employment of the best profiles for the mouldings, &c., and the tasteful execution of the furniture. It does not appear, however, that anything special beyond these desiderata has been attained. The filling in of the windows in the drawing-room is pretty; but the general details show nothing beyond commonplace devices of panelling and pilasters. One would have thought that so special and unusual a commission might have suggested some attempt at novelty and originality of treatment.

1743, “Enlargement of Kew Church: Interior looking East,” Mr. Henry Stock. This is the interior view of what is shown externally in No. 1720; the drawing appears to be a well-executed water-colour; but is hung too high to be well seen; and here, as in the other view, we are left in the dark as to how much is original and how much is addition.

1745, “Competition Design for Proposed Church of St. Paul's, Kensington,” Mr. Edwin Dalry. A very well-executed water colour of a brick church, with red-tiled roof and tracery decorated windows, apparently the tracery in stone; the clerestory is diversified by a flat stone string at the level of springing of the window-heads, with cross-stripping in the brick-work above. There is nothing out of the way in the design, but it is well carried out as far as it goes, except that the two west end

buttresses disappear very awkwardly within the roof of the return buildings, which are carried across the lower portion of the west end.

1746, "The Tower of St. Ouen, Rouen," Mr. Arnold B. Mitchell. A monochrome drawing, a kind of geometrically symmetrical perspective, executed in the telling but rather mannered black and white method illustrated in No. 1687, to which we have already referred.

1745, "St. Alban's Shrine, St. Alban's Abbey, Herts," Mr. R. W. Paul. A very good example of free pencil sketching.

1750, "Cathedral of Tours," Mr. Aston Webb. Another free pencil sketch, but slighter; the western towers of the cathedral, with their peculiarly effective contrast of rich upper stories and lofty, plain, rock-like substructure, are seen from under a partly-broken arch which flies across the foreground. Nothing could be better chosen for a picturesque architectural sketch, but we are rather inclined to suggest that sketches for exhibition should be a little more finished than this.

1752, "Part of a Series of Windows in the Rajah's new Palace at Kolapur. 1. Sivajee's surrender to Jey Sing. 2. Sivajee and Sumbajee, his son, escaping from Delhi in baskets. 3. The goddess Bhowanee, in the temple of Purwuntum, interposes to save Sivajee from sacrificing himself"; Messrs. Ward & Hughes. These would be of interest as designs by English artists for glass in an Indian palace, but, being on a small scale, and bung at the top, it would be impossible to see them without a lorgnette. They seem to be groned in a spirited manner; we can discern no special indication of stained-glass treatment. They fill three window-heads of trefoil shape, with the upper foil terminating in ogee form.

1753, "Church of St. Luke: Decoration of Interior," Mr. W. Stirling. What Church of St. Luke? We always think these vaguely-named churches and houses with no locality given are imaginary, and existing as what the author would like to carry out. The drawing, a large coloured elevation, shows a bay of a church of rather nondescript style, a kind of round-arched Gothic. Flowers are freely painted on the stone ground of the walls, decorative flowers with symmetrical arrangement, but with a certain amount of variety in detail; above the arch is a painting with gold ground of the Adoration of the Magi; over each pier is a panel painting of a Saint; St. George and St. Agnes are the two represented; we presume these are intended for mosaic. Above is a stained-glass window with subjects from the Temptation and the Expulsion. The gold backgrounds make a glare in the drawing which would not be the case to the same extent in execution, and so far the drawing is unfavourable to the effect of the design; it is, however, even apart from this, rather too patchy and scrappy in effect, and wants concentration and the contrast of a little blank surface; but there is no doubt a great deal of originality in the design, and it is very well put upon paper.

1754, "Testcombe, Fullerton, Hants," Mr. W. D. Caroe. An elevation of a much-diversified, many-gabled, red-brick house, coloured so as to convey something of a pictorial effect, the ground-line given in section: not a bad way of illustrating an architectural design. The design is a mixture of red brick and wall tiling and half-timber gables, picturesque in appearance, and the drawing very well coloured; but as there is no plan, one can form no clue to the meaning of the various projections and gables; it is a picturesque conglomeration, that is all we can tell.

1756, "St. Clement's, Oxford: Parish Buildings," Mr. H. Wilkinson Moore. This is a very pleasant, characteristic bit of building; a small plan is added, showing the arrangement of the buildings, which consist of a long block containing the "parish hall," the end of which faces the street, and an adjoining block containing coffee-room, reading-room, &c. These are treated separately in the design, the small accessory rooms being treated as a domestic building, a street house of humbler order, in fact, and the end of the hall is shown with three large pointed windows high up, giving a "public-room" character; this upper range, we find from the plan, lights the schoolroom; the parish room, on the ground-floor, is lighted by square-headed mullioned windows, with long corbels between them, assisting to carry the upper wall, which is oversailing to some extent. Without any pretensions, the

building is a very good example of quietly picturesque effect arising naturally out of the disposition of the plan.

1757, "Design for Stained-glass Window," Mr. T. W. Bladen. A two-light window with a figure in each light, one playing a band-organ (not a barrel organ, *bien entendu*, but one of the small organs called in Mediæval parlance a *portatif*, as capable of being carried in the hand), the other singing; cherubic heads fill up the upper part of each light, and below the figures are scrolls containing lines from Milton's glorious little poem "At a Solemn Musick." The idea is good and the figures are graceful and expressive, but the colouring as shown in the drawing is rather dull and heavy in effect.

1758, "West Croydon Congregational Church: One of the Three West Windows," Mr. E. Frampton. This is a lofty and narrow two-light window, the effect of which is shown in a well-executed and effective coloured sketch, rather than drawing. Mr. Frampton, unlike the author of the last-named window, is obviously not afraid of his colours, and instead of trying to tone them down into respectable dullness, he puts them in brilliant masses, but well balanced and contrasted, and with very transparent effect in the drawing. The upper portion, which is one subject (though divided by the mullion), represents the Adoration of the Magi; the upper part shows the starry sky, forming a dark blue hack-ground relieved by powderings of stars; above this is some rich Gothic tabernacle work. Two smaller subjects are given below, one in each light. The treatment of the subject is suitable to glass; the figures are expressive and well designed; altogether this is one of the best bits of stained-glass drawing in the room.

#### THE CONGRESS OF FRENCH ARCHITECTS.

A BRIGHT sun and exceptionally fine weather, succeeding to the storm of the previous week, favoured the success of the fifteenth Congress of French Architects, which commenced its sittings on Monday, June 6th, at the Ecole des Beaux Arts under the presidency of M. Bailly.

As usual, the first day was devoted to preliminary proceedings, and the consideration of certain questions which periodically recur, and have a special professional interest, and which were again relegated to various committees for consideration. The subject of public competitions, so ably treated two years ago by M. Paul Wallon, assumes more and more importance from its close connexion with the subject of the "Caisse de Défense Mutuelle," the establishment of which was first set on foot in 1884, and which equally figures in the orders of the day of the present Congress.

Perhaps, by the side of other questions, such as those relating to professional charges, amnition, roads, artistic copyright, &c., one would have wished this year to see the question of theatre construction prominently brought forward. It is one full of practical importance and affecting many different interests. The Société Centrale could hardly overlook a subject which so much concerns the public safety, and some sound practical advice from the leading professional body might have influenced the measures to be taken by the Administration for the prevention of calamities such as that which has recently taken place.

M. Loviot, this year, undertook the review of the *Salon* architectural exhibits; but as the *Builder* has already spoken at length of these, we will merely here pay a tribute to the ability of the paper read, without going further into the subject. M. Loviot, who is the son-in-law of the lamented Duc, is a young architect of great promise, who has already obtained the Cross of the Legion of Honour for his restoration of the coloured decoration of the Parthenon.

The order of the day included a notice of the life and words of M. Ruprich-Robert, but M. Just Lisch not having had time to prepare his paper, was obliged to postpone his notice of the deceased architect to another meeting. We may mention here that M. Lisch succeeds Ruprich-Robert as director of excavations at the Arènes de Lutèce.

At the close of the meeting a subject was brought forward which considerably interested the architects who hold official relations with the State and the municipality. On several occasions Parliament has had to decide in

regard to votes of money occasioned by the cost of work exceeding the approved estimates. In order to obviate this for the future, the Minister of Public Instruction and Fine Arts has instructed the Prefects and other Government officials that they are not to accept from architects any plans which have not been completely and accurately made out in regard to detail and to the method of construction employed (including furniture in cases where that forms a part of the work), and in regard to the cost of the work. Besides this, the architects' proposals must in future include a final clause by which they bind themselves, on their *personal responsibility*, to confine the work, except on a special official order, within the cost first specified and sanctioned.

This is the general tenor of the Ministerial circular which came before the Congress for consideration. It is evident that on principle the Minister is perfectly right to wish to suppress an abuse, but it appears that this code is somewhat Draconic. When an architect undertakes work for the State there is an actual signed contract between him and the Minister. But such a contract should have a character of reciprocity, and if the architect is to be made responsible for excess of cost over the estimate he ought also to be the sharer in any overplus arising from a reduction of the estimated expense in carrying out the work. Upon this delicate point the Minister of Instruction is silent.

On Tuesday, June 7, the members of the Congress repaired to the Military Hospital of Val de Grâce, the last remnant of the celebrated Abbey founded in 1621 by Anne of Austria. The church, which is one of the finest monuments of Paris, was commenced in 1645 from the designs of François Mansard and Lemercier. Long interrupted by the troubles of the Fronde, it was completed in 1665 by Lemet, assisted by Gabriel Ledru and Duval. The Abbey, suppressed at the Revolution, has become a hospital of 900 beds. The rooms are large and airy, and the buildings surrounded by fine gardens. Some of the ancient apartments of Anne of Austria have been restored to the condition and appearance they presented in her time. A large court, separated from the Rue St. Jacques by a grille, and in which there is an absurd statue of the surgeon Larrey, which does little honour to David d'Angers, precedes the principal façade of the church, the decorative treatment of which recalls that of the Italian churches of the end of the sixteenth century. It is a fine example of the Jesuit style, which has inspired so many religious buildings in France, especially St. Gervais, the Sorbonne, Notre Dame des Victoires, &c. The style is one which does not shine either in simplicity of lines or in correctness, but it is not deficient in richness and dignity; and the dome, flanked by four campaniles, which is seen from far on the horizon of Paris, between the Pantheon and the Invalides, is remarkable for its graceful design and outline. The timber construction in it, which was in a very dilapidated state, has been reconstructed in iron. Internally the church, which the unsparing revolutionary band has despoiled of its rich decoration, looks to-day bare enough. It was transformed into a magazine at the Revolution, and was only in 1826 reopened for worship. The cupola is supported by four large arches and four pendentives. François Mignard decorated it with more than 200 figures, the largest of which are considerably above life-size. This gigantic composition is a kind of glorification of Catholicism. There should be noted also the paintings of Philippe de Champaigne and the splendid bas-reliefs with which Michael Anguier, the sculptor of the Porte Saint-Denis, has decorated the pendentives and the chapel arches. Under the dome is a high altar, the baldachino of which, supported by six great twisted columns, adorned with gilt garlands and palms, recalls that of St. Peter at Rome. The group in marble at the altar, executed by Lequieu & Desprey, is a repetition of the original group by Anguier, destroyed in 1793.

Last year M. Gosset, of Rheims, read a very able paper before the Congress on the ancient Christian basilicas, in which he traced the development of the dome, interrupted in the east by the fall of the Byzantine empire, and taken up again in the west on what he considered false principles, which destroyed the unity of the composition, and introduced common and conventional architectural forms in

place of religious symbolic ornament and mosaic pictorial decoration. Continuing the same class of subject, M. Gosset has this year presented an interesting study of the churches and mosques of Constantinople, fully illustrated, and which was listened to with great interest.

On the same day the Congress repaired to the atelier of M. Calland, the able decorator, whose works were exhibited some time since at the Union Centrale des Arts Décoratifs. The atelier is quite a museum, where the members saw, among other things, some important work executed for America, the fine cartoons for tapestries (intended for Gobelins), and the designs of work for the new Hôtel de Ville (in which M. Galland has his allotted place. These latter are carried out in accordance with the intentions of Ballu, the late architect; M. Galland, in the spirit of a true decorative artist, placing his idea in subordination to that of the architect. With many French painters the theory and practice of decorating is, unfortunately, very different from this.

On Wednesday, June 8th, the Congress met at the Luxembourg. As our readers are aware, the modern museum of painting and sculpture has been recently turned into the ancient crangerie, and the Palace of Marie de Medicis is now entirely occupied by the Senate. It may be worth while, in speaking of the visit of the Congress to this well-known palace to remind the reader of its dates and architectural origin. It was commenced in 1615 by Jacques Desbrosses, nearly finished in 1620, enlarged by Chalgrin in 1804; then, from 1831 to 1844, considerably enlarged again by De Gisors, father-in-law of the present architect, M. de Gondoin, and grandfather of M. Scellier de Gisors, himself an architect of eminence, and who was kind enough to conduct the party over the building.

It was De Gisors who built the chapel called "du Sénat," situated in the left wing, and decorated with some fairly good paintings by E. Gigoux, Vanhelet, and Abel de Pujol. Near this is the "Chambre du Trésor," erroneously called "Chambre de Marie de Medicis," the decoration of which is as old as the foundation of the palace. The ceiling, attributed to Van Hoec, represents the apotheosis of Marie de Medicis; the walls, arcades, and columns are decorated with medallions, figures, and arabesques on a gold ground, painted by Jean d'Udine and Van Thulden. Here were formerly preserved the most valuable archives of the Chambre des Pairs. We next visited the first floor, consecrated to the Senate. The first room visited was a committee-room formerly reserved for the sovereign, when about to attend the sittings of the Senate. The decoration is heavy and in bad taste, like most of the work of the reign of Louis Philippe, which has been termed the mahogany epoch, and which exaggerates still further the vulgarity of the style of the Empire. In 1879 the Salle du Sénat was altered with the object of increasing the number of seats. The side bays were built up and turned into triunes, and the room is lighted now from the cupola, which was formerly a surface covered with allegorical paintings. The decoration is rich and massive in character. In the midst of a hemicycle adorned with statues of eminent law-givers rises the President's throne, surcharged with decorative work in brass. This is the room devoted to the Council of Five Hundred. The architectural motifs, the occasional groups of sculptured cherubs, the medallions with cameo heads, &c., form a rather curious decorative medley; unity and harmony of effect being decidedly wanting. Behind this room is the library, the cupola of which is painted by Eugène Delacroix, with great power and effect. The "Salle du Trône" is very rich in effect, though a little overdone with ornament; the ceilings are the work of Brune, Balze, and Lehmann. Here the Peers formerly used to sit; to-day it is divided by partitions into committee-rooms. Various other rooms attracted more or less attention. In one are paintings by Cabanel and Flandrin, in another a fine ceiling by Jadin. Lastly, the grand staircase constructed by Chalgrin brought us back to the original starting-point of our inspection, which the exigencies of Parliamentary procedure had unavoidably abbreviated.

At 3 p.m. the Congress met again in the Hemicycle of the Ecole des Beaux Arts, under the presidency of M. Marteau of Lille, to hear a description by M. Maspéro of the most recent of the excavations carried on at Luxor under

his direction. M. Maspéro, who has been devoted from an early age to the special studies with which his name is connected, is still a young man, though with a very mature reputation. Since 1874 he has been Professor of Egyptian archaeology at the College of France, and his literary work is, of course, universally known. No one could be better qualified to expound the celebrated ruin of which his son-in-law, M. Gayet, has exhibited an interesting restoration in the architectural room of the Salon.

Taking the temple from its foundation,—that is, from the date of Amenophis III. and Rhameses II.,—M. Maspéro traced the successive enlargements, which made it, like other great Egyptian temples, almost a town in itself, and the centre of an agricultural industry. Then, towards the third or fourth century of the Christian era, the temple, which had already undergone the mutilation of the Ethiopians, was transformed into a church: a convent was formed within its precincts, and Christian emblems were engrafted among the hieroglyphics. Lastly, the Mohammedans came in their turn, suppressing the church and the convent, and constructing a mosque in the "dromos" in front of the temple. An Arah village grew up on the mounds of sand which engulfed the remains of the pylons and colonnades of the ancient structure. When the excavations were commenced, the *enceinte* of the temple enclosed a population of 3,000 inhabitants distributed among about eighty houses. The eminent Egyptologist described with picturesque realism all the vicissitudes of the excavations, and the difficulties presented both by the nature of the ground and the opposition of the inhabitants. Even now the expropriated house-owners, though they have received large indemnities, persist in endeavouring to regain a footing there. However, in two years, the French expedition has accomplished a great deal of work. Unfortunately, the mosque is still standing, and the population make a set opposition to its demolition. However, adds M. Maspéro, though we are at present prevented from pulling it down ourselves, the condition and nature of the ground are such that it will very likely demolish itself before long, without any further trouble to the excavators.

At the end of this lecture, which was much applauded, the Congress hoped to have heard M. Lavastre, the decorator of the opera house, who had promised M. Sédille to treat the question of theatre decoration. But, with a delicacy of feeling perhaps a little exaggerated, M. Lavastre had thought that it was more fitting, so soon after the dreadful catastrophe at the Opéra Comique, to adjourn the subject to some future date, and M. Saladin rose instead to give some account of the archaeological mission in Tunisia, which the Government had entrusted to his direction. This young architect,—whose excellent water-colour drawings in the architectural division of the Salon we have already mentioned,—conducted his audience through the curiosities of a region still little explored, the ruins in which form a useful complement to the study of the monuments existing in France. Bon-Chateau, ancient Utica, Dougga (where was a temple consecrated to Jupiter, Juno, and Minerva), Shebita (where some splendid mosaics have been discovered), Monastir, Soussa,—all bear witness that architectural evolution here followed the same lines as in France, and was under much the same developing influence.

Thursday, the 9th, was the day reserved for excursions beyond the city, and as this year one of the most picturesque routes of the environs of Paris had been selected, more than 150 members accompanied the excursion. Chevrenx, Dampierre, and les Vaux de Cernay included a fine collection of historical monuments of great interest. The Chateau de Dampierre is the princely residence of the Duc de Laines, whose funeral chapel, decorated by the sculptor Bonassieux, is attached to the modest church of the village. The chateau was built in the sixteenth century by the Cardinal de Lorraine, and rebuilt in great part in the eighteenth century from the designs of Hardouin Mansard, by the Duc de Chevrenx. The architect Duban restored it in 1840. The principal façade, of brick with stone dressings, rises from the *cour d'honneur* closed by a very fine iron grille. On the front of the main block, which is flanked by two turreted pavilions, is a central feature with a double order of

superposed columns, and a gable over. In the grand vestibule on the ground-floor is the "Penelope" statue by Carveier, which the artist exhibited in the Salon of 1849, when he was still a *pensionnaire* at the Villa Medici. On the first story, reached by a staircase with a wrought-iron balustrade, is to be seen in the bed-chamber of Louis XIII. a silver statue of that king executed by Rude. In one of the salons may be seen also a curious "Minerva" statue, in ivory, gold, and silver. The gardens, by Le Nôtre, are large and fine, the stables curious, the library an admirable apartment.

The Vaux de Cernay are better known to the public, and the Baronne Nathaniel de Rothschild readily gave permission to visit the ancient abbey founded in 1120 by Simon de Montfort, and which still comprises the remains of the church as well as of a long building which served as the monks' parlour. To say the truth the restoration of these buildings has not been happy, nor do we care to see modern habitations installed amid the *debris* of the Middle Ages. Thus, in a room full of decorations and furniture brought from pretty nearly everywhere, one comes on capitals and a vault of the thirteenth century, which look very much out of place in the midst of all the *bric-à-brac*. There is certain character of grandeur about the place, however.

Generally, the last day of the Congress is devoted, in the morning, to the "Caisse de Défense Mutuelle," and after midday to the distribution of honours; but as the Académie des Beaux Arts holds its weekly meeting on the Saturday, there was this year an interruption in the order of proceedings of the last two days, in order to permit members of the Institute to be present at the presentation of medals. In consequence, the morning of Friday had been reserved for the Caisse de Défense, but the meeting did not give rise to anything specially worth record. The distribution of "récompenses" in the afternoon drew a very large attendance. M. Spuller, Minister of Public Instruction, who was to have presided, had to delegate his duties to M. Kaempfen, the Director of Fine Arts, who opened the sitting at three o'clock. He was supported by M. Bailly, President of the Société Centrale, M.M. Hermant, Questel, Lenoir, Gbarles Garnier, Paul Sédille, De Joly, Echernier (Lyons), Martean (Lille), Hénard, Paul Wallon, Galland the painter, Vicomte Delaborde, &c. After some words of welcome from M. Bailly, M. Kaempfen, in a short extempore speech, retraced the work of the Congress and rendered homage to the two eminent deceased architects, Le Soufflot and Ruprich-Rohert, and uttered a warm eulogy on the indefatigable energy of M. Bailly, "le cher et vénéré maître, toujours jeune de corps, d'esprit, et de cœur."

On M. Questel it devolved, in his capacity of "Censeur" to the Société Centrale, to speak of the life and works of M. Soufflot, his professor in the same post, who was a pupil and collaborateur of Duban. We have already spoken\* of the work of Soufflot, and of his success in the practice of domestic architecture, and the great influence which he exercised upon it.

Then M. Paul Sédille, in the name of the "Jury des Récompenses," proclaimed the names of the laureates of the Société Centrale. The Silver Medal, instituted by M. Soufflot for good work in domestic architecture, which, said M. Sédille, is the prose of the art, as monumental architecture is its poetry, has been awarded to M. Louis Charles Boileau, who directed the works of the Magasins du Bon Marché. This is not the sole title of M. Boileau to artistic honours, as he took the first premium in the competition for the monument to Gambetta,—for the architectural portion of it, that is to say,—the sculpture being the work of M. Aulé.

The second silver medal was decreed to M. Garros, of Bordeaux, pupil of Constant Dufrenoy, for his numerous private houses, all remarkable for the study and invention displayed in them. In addition to this, M. Garros has acquired such a reputation in the South of France, and is regarded with so much confidence, that he is never asked to make an estimate, his clients contenting themselves with indicating a sum which is not to be exceeded, and which never is. Another pupil of Constant Dufrenoy received the medal for archaeology, M. Chipiez, who is well known by

\* "Letter from Paris," Feb. 5, p. 211, ante.

Suggestion by the Institute of Architects for adding to the National Gallery and laying out the New Street behind it.

his publications on art and antiquity made in conjunction with M. Perrot. The silver medal for jurisprudence was given to M. Alfred Normand, author of some esteemed works on architectural jurisprudence. We may remark the fact also that M. Normand was the designer of the curious Pompeian house which was built for Prince Napoleon in 1860 in the Avenue Montaigne.

The silver medal offered to the École de France at Athens has been awarded, on the representation of the Académie des Descriptions et Belles Lettres, to M. Gustave Fongères, member of the École, for his important work in the excavations at Delos.

After these various awards, which the Société gives every year by way of indicating that the architect must be at once archaeologist, juriconsult, and artist, MM. Eustache and Bernard, both pupils of M. Ginain, obtained the silver medals given by the École des Beaux Arts. M. Raphael, pupil of M. Paulin, has obtained the silver medal given by M. Van der Boyen to the private schools of architecture; M. Judas, pupil of M. Ruprich-Robert, received that of the Rolland foundation in favour of the École des Arts Décoratifs; and, lastly, the silver medal founded by M. Sédille for artistic industries has been awarded, with general approval, to M. Froment Meurice, the able silversmith, who continues so admirably the artistic traditions of his father.

There is always a great interest manifested in the awards to the apprentices and to the building artisans, the "personnel du bâtiment." This year again we have seen, not without emotion, old, grey-haired labouring men coming up, at the call of M. Wallon, to receive in a trembling hand the medal awarded as a recognition of many long years of loyal service. The list of these old servitors is a long one. They have been faithful and zealous coadjutors with the architect; and one of them, already an aged man, was accompanied by his father, a venerable octogenarian, whose button-hole was adorned with a red ribbon, attesting that in that family honours were hereditary. As usual, also, M. Wallon found ready and eloquent words in which to welcome the modest heroes of labour, and to satirise the so-called humanitarian theories which, in reality, repre-

sent the negation of talent, the encouragement of ignorance, and the decline of art.

Saturday, the 11th, the last day of the Congress, was set apart for a visit to the works of the Great Exhibition. So much information as to the progress of the works has been given in these columns from month to month, as to render it unnecessary now to enter into details. The visitors were received by M. Alphand, who, after having exhibited the plans and indicated the position of the principal buildings, conducted the party over the various workshops. MM. Bonvard, Formigé, Eiffel, and Dutert successively did the honours of the particular works they are directing; the first, for the Palais des Expositions diverses, the second for the Palais des Beaux Arts, M. Eiffel for the enormous substructures of his metallic tower, and M. Dutert for the Palais des Machines, the works of which, however, are not sufficiently advanced to be of much interest to visitors at present.

In the afternoon M. Charles Lucas, who, along with MM. Merindol, Daumet, and Rolland, represented the Société Centrale des Architectes at the Congress of Sociétés Savantes held last month at the Sorbonne, presented, as in former years, an account of the proceedings at that meeting.

Among the subjects treated at this Congress may be mentioned especially a short paper by M. Daumet on the necessity of introducing some ideas upon art into the course of primary and secondary education in France, and a dissertation by M. Lucas on the origin of the plans of the round and polygonal churches still existing in France.

After a very well filled week, the members of the Congress, as usual, dined together at the Hôtel Continental, thus closing the Congress of this year.

**The Simplon Tunnel**—The Swiss Cantons of Vaud, Valais, and Freiburg, have signified their intention of contributing respectively 100,000L., 40,000L., and 80,000L., to the Simplon tunnel. Geneva and Neuchatel refuse to contribute, but it is considered that the prospects of this scheme being realised are more encouraging than was recently the case.

**PLAN FOR LAYING OUT THE STREETS AROUND THE NATIONAL GALLERY.**

The accompanying plan represents the suggestion of the Royal Institute of British Architects for laying out the new street behind the National Gallery, and making additions to the gallery. Something good might be made of the new colonnade on the east and the proposed large apse on the north side of the gallery, but it is a pity the Institute did not suggest such a remodelling of the east side of the gallery as would have enlarged the narrow neck of street between it and St. Martin's Church.

**Architectural Association Visit to Cambridge.**

The following is the programme of the Association's visit to Cambridge this Saturday, June 18th, under the guidance of W. M. Fawcett, F.S.A.:—

|                                              |            |
|----------------------------------------------|------------|
| Leave Liverpool-street.....                  | 8-45 a.m.  |
| Arrive at Cambridge.....                     | 10-3       |
| Christ's College.....                        | 10-30      |
| Round Church.....                            | 11-0       |
| St. John's College.....                      | 11-30      |
| Trinity College.....                         | 12-30 p.m. |
| Causes.....                                  | 1-30       |
| Senate House, &c.....                        | 2-0        |
| King's College.....                          | 2-15       |
| (Luncheon in Hall.)                          |            |
| Clare.....                                   | 3-45       |
| Queen's.....                                 | 4-15       |
| St. Katherine's.....                         | 5          |
| Corpus and St. Bene's.....                   | 5-20       |
| Church.....                                  | 5-20       |
| Pembroke.....                                | 6          |
| Peterhouse and Little St. Mary's Church..... | 6-30       |
| Tea.....                                     | 7          |
| Depart for London.....                       | 7-51       |
| Arrive in London.....                        | 9-10       |

Those members who have not sent in their names to Mr. Leverton must be at the station by 8-30.

**Purity of Sand.**—Herr Lieven has called attention in *Dingler's Journal* to the fact that the presence of turf or humus in sand used for the preparation of cement mortar completely prevents hardening. A mortar thus prepared has no resistance, remains quite soft, has a saponaceous touch, and displays brown exudations, resembling a kind of jelly. He calls attention to the absolute necessity of seeing that sand is free not only from clay, but also from organic substances.

**Illustrations.**

**CLOISTER BUILDINGS, STOWELL PARK.**

THE buildings illustrated are a small portion of the works now in course of erection, and consist of a vaulted cloister which will connect the old mansion with the banqueting-hall. At the end of the cloister is a staircase leading to the gallery that opens into the hall on the upper level. The view also shows the passage under the terrace communicating with the offices and kitchen, a serving-stair giving access to the transept of the hall.

**EDINBURGH MUNICIPAL BUILDINGS COMPETITION.**

We give this week illustrations of the Classic design submitted in this important competition by Mr. Brydon, under motto "Fortuna"; including the north and south elevations and two of the plans. The lofty elevation from Cockburn-street has been very boldly treated with massive rustication, and the plan has a great deal to recommend it. Whether the manner of providing light for the rooms below the ground-floor on the inner court, by areas, and keeping the main area of the court up to the High-street level, is one to be recommended may, however, be a question.

**ST. VINCENT DE PAUL, MILL HILL, HENDON.**

This chapel is in course of erection for the Sisters of Charity of St. Vincent de Paul, who have recently purchased a property at Mil

Hill, upon which is a fine old house dating from the time of Charles II., and which is now the "Mother House" for the sisters of this religious community in England.

The materials used in the church are Kentish rag stone, with Stoke-ground stone dressings for the external work, and Bath stone for the inside. Teak will be used for the floors. Mr. C. Wall, of Chelsea, is the builder; Mr. Francis W. Tasker being the architect.

**BRYANSTON CLUB.**

We give this week a perspective view of the Bryanston Working Men's Club, now in course of erection. The elevation to Broadley-street is in red brick with Bath stone dressings, the other elevations to Lisson-grove and St. John's-place are in stock brick and red brick dressings.

The hall on the ground-floor will hold between 250 and 300 people, and can, when occasion requires, be divided into two rooms by lowering a revolving shutter in the centre of the hall. The floor over the lecture-hall is entirely occupied by a billiard-room, and the remainder of the site and the upper floors are given up to the usual requirements of a club, with the exception of the plot facing St. John's-place, and here some flats are being erected. The total cost of the club, including the flats, is about 5,000*l.*, and the contract is in the hands of Messrs. A. & E. Braid, the architect being Mr. George Hubbard.

**Buildings for Applied Science Teaching.** Messrs. Whittaker & Co. will publish early next week Mr. E. C. Robins's book on "The Design and Construction of Applied Science and Art Buildings, and their Suitable Fittings and Sanitation."

**THE ARCHITECTURE OF DALMATIA.**  
ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE concluding meeting of the present session took place on Monday last, Mr. Alfred Waterhouse, R.A. (Vice-President), in the chair.

Mr. William H. White (Secretary) announced the receipt of a large number of books and "Transactions" of other societies, the titles of which would be published in the Proceedings; also the receipt of two guineas each from Mr. F. E. Jones and Mr. W. S. Weatherley, Fellows, for the Library Fund. A further donation, through Mr. Aitchison, was announced from Signor Boni, of Venice, of his pamphlet on "Santa Maria dei Miracoli," and sixty photographs of the church.

Notes of thanks were passed to the several donors, a special vote being accorded to Signor Boni, on the motion of Mr. Octavius Hansard.

Mr. J. Macvicar Anderson (Hon. Secretary) read a letter from Lady Jones, thanking the Institute for its vote of condolence with her on the occasion of the death of her husband, the late Sir Horace Jones.

The following gentlemen were balloted for and declared to be duly elected, viz., as a *Fellow*: Mr. William C. Evans, of Westminster; as *Associates*: Messrs. Herbert Winkler Mills, Hampstead; Charles Gourlay, Glasgow; Joseph Laveuder, Wolverhampton; and Thomas Locke Worthington, Hampstead.

The Secretary intimated that the name of Mr. Benjamin Ingelow had been recommended to be added to the Literature Standing Committee.

The Chairman, in introducing the lecturer for the evening, spoke of him as not only being a most distinguished architect, to whom Oxford owed many of its recent beauties, but also an explorer of a region which seemed hitherto to

Edinburgh Municipal Buildings: Design by Mr. J. M. Brydon, F.R.I.E.A.—First-Floor Plan.

have been much neglected both by the architect and archaeologist.

Mr. T. G. Jackson, M.A., F.S.A., then read a paper on "The Art of Dalmatia," of which the following is an abstract:—

Dalmatia consists of a narrow strip of rock and moorland lying between the mountains and the sea on the eastern side of the Adriatic. Its geographical position has always given it considerable maritime importance; while the interior, which is comparatively poor and unproductive, remained in a condition of neglect and semi-barbarism, the cities of the sea coast prospered commercially, and attained a high degree of civilisation. The architecture of Dalmatia is therefore entirely urban, and though under the Roman Empire there were a few flourishing cities in the interior with buildings of some pretensions to magnificence, during the Middle Ages it was only in the maritime cities that the arts and letters continued to be cultivated.

The series of Dalmatian examples may be said to begin with Diocletian's palace at Spalato, which dates from the end of the third century. The importance of this building in the history of architecture can scarcely be over estimated. It stands at the meeting-point of the styles of ancient and modern Europe, and marks the period when the strict rules of Classic architecture began to be relaxed, and the various members of the order were for the first time treated with something of the freedom of Mediaeval architecture. The proportions of the various members of the entablature were altered without scruple; some parts hitherto considered essential were left out altogether; fresh ornaments, like the zigzag of the coming Romanesque style, first appeared; entablatures were made to spring into arches; and, finally, by the omission of frieze and cornice, the architrave was left alone to spring from column to

column without any intervening entablature, thus marking the final emancipation of the arch from the traditional forms of trabeated architecture.

To balance these signs of architectural life and progress, for thus they must be considered by all who look at the matter historically, we find in Diocletian's work some signs of the coming barbarism of the succeeding centuries. The ornament is coarsely executed, the mouldings are inartistically profiled, and in more than one instance materials of older buildings are used up second-hand in the manner which became so general a few centuries later.

In plan the palace was like the Roman camp, square or nearly so, and divided by two cross streets into quarters, except that on the south side the street did not run through, being intercepted by the Imperial apartments. Though the greater part of its area is thickly covered by houses with narrow alleys meandering among them, the outer circuit of the walls, the two temples, the peristyle court in the middle of the palace, and two of the three principal gates remain to this day; and there is no place in the world which presents a better picture of the magnificence with which the masters of the Roman world housed themselves.

The principal temple, now the Duomo of Spalato, which has by some been supposed to be the mausoleum of Diocletian, though all tradition makes it originally a temple of Jupiter, is octagonal without and round within, and is covered by a dome of brick, above which is a pyramidal roof. The cella is surrounded externally by a Corinthian peristyle, and internally by two orders of eight columns which carry projections of the entablature. Between these columns are four square recesses alternating with four semicircular niches.

The other temple, generally said to have been dedicated originally to Æsculapins, has by some

modern writers been in its turn supposed to have been the mausoleum of Diocletian. It consists of a small rectangular cell, with a portico of four columns, and is covered with a wagon ceiling, which forms also the roof, the rounded surface being exposed externally, though, strange to say, it finished at each end with the ordinary triangular pediment of a Classic temple.

These two buildings, from first to last, exercised a remarkable, though very natural, influence on the imagination of Dalmatian architects, which may often be traced in the plan and design of the buildings raised in the country during the Middle Ages.

Of Dalmatian architecture, during the following five centuries, no building has survived the disasters of the barbarian conquest, and to complete the sequence of examples we must look to the neighbouring coast-cities of Istria and Friuli, where at Parenzo and Grado may still be seen Byzantine basilicas resembling and rivaling the co-eval churches of Ravenna.

The only building in Dalmatia belonging to this period of which we have any traces is the half-excavated basilica of Salona, which suffices to show that the Byzantine style established itself as firmly in Dalmatia as in other countries which owed allegiance to the Emperor of New Rome.

In the seventh century Dalmatia was overrun by hordes of Goths, Avars, and Slavs, and one by one the ancient Roman cities were taken, sacked, and destroyed. But the Roman population was not crushed out of existence. When the shock was over the fugitive citizens came back from their island hiding-places and either rebuilt their old cities or founded new ones. Zara rose from her ashes, the fugitives from Epidaurus settled on a rock near their old home and founded the city of Ragusa, and the Salonitans, leaving their ancient city in ruins,

as it has ever since remained, crept back to the mainland and housed themselves within the deserted villa of Diocletian, which they converted into the modern Spalato.

Henceforth Dalmatia had a double population and a double history. In the rural districts were the Slavs, Croats in the northern part, and Serbs in the southern, who, with their countrymen over the old Dalmatian border, gradually were consolidated into the kingdoms of Croatia and Servia. In the maritime cities and on the principal islands of the Quarnero were the Latins or Romans, or, as they came to be called distinctively, Dalmatians, speaking their old Latin language, governing themselves by the old Roman law, electing their own magistrates and bishops, and preserving the traditions of the old Roman municipalities. The city, at first tributary to the Slavs, gradually became wealthy and powerful, and progressed in the arts of peace, while their Slavonic neighbours were left behind in semi-barbarism. To the present day the old distinction of Latin and Slav survives, and is the key to the proper intelligence of Dalmatian politics.

Dalmatian architecture during the ninth, tenth, and eleventh centuries was based on Byzantine models, but the buildings that have come down to us from that period are so humble and rude that it is impossible to fix the date of each example with precision. The most remarkable among them is the grand circular church of St. Donato at Zara, of which we know with tolerable certainty that it was built about 800. Bishop Orsini, its builder, had travelled widely for that time, and had visited both Constantinople and the Court of Charlemagne. The result of his travels may be traced in the resemblance which in a rude way his church at Zara bears to that of St. Vitale at Ravenna, and to the Cathedral of Aix-la-Chapelle. One of the most singular facts about the church of St. Donato is connected with its foundations, which consist of splendid architectural fragments of ancient Roman buildings laid confusedly on the pavement of an ancient Roman forum.

The connexion of Dalmatia with the Eastern Empire was broken by the Hungarian conquest of 1105. From that date the possession of the province was contested by Hungary and Venice, and the architecture was thenceforward based on the schools of Italy and Germany. The traces of Northern feeling which can be detected in many of the Dalmatian buildings, must be explained by the influence of Hungarian rule, which no doubt introduced architects from Austria and other countries of Central and Western Europe into the dependent provinces.

The art of Dalmatia, then, passed at this time from Byzantine to Romanesque, and the earliest examples of the new style are to be found in the Benedictine nunnery of St. Maria at Zara, and in the island city of Arhe. In point of design and execution they will compare favourably with the coeval work of any other European school.

Perhaps the most remarkable feature of the history of architecture in Dalmatia is the long duration of the Romanesque style in that country. In France and England, round-arched gave way to pointed architecture at the end of the twelfth century; in Germany, Romanesque began to give place to Gothic about the middle of the thirteenth, and Italian Gothic reached its full development about the same time; but in Dalmatia architects went on working contentedly in Romanesque well into the fourteenth century, as if they had never heard of any other style, and examples of it are wanting even as late as the fifteenth.

The finest church in the thirteenth century in Dalmatia is the Duomo of Trau, which, though dating for the most part from 1200-1250, is thoroughly Romanesque in style. It is also remarkable for its close resemblance in many points to contemporary architecture in Hungary, thus affording another instance of the influence of the trans-Alpine styles to which I have above referred. The west doorway of this church is the crowning glory of Dalmatian architecture, and the wooden doors, choir-stalls, and marble pulpit of the cathedral at Spalato, which belong to the same period, are not less beautiful in their design than they are perfect in execution.

The greatest work of Dalmatian architecture in the fourteenth century is the campanile of the Duomo of Spalato, which was built in instalments between the years 1300-1416, but is from first to last in the Romanesque style, and

has borrowed not a little of its details from the late Roman work of Diocletian's building by which it is surrounded.

At the beginning of the fifteenth century Dalmatia passed finally under Venetian rule, and the political change was marked by a corresponding transition in the architecture, though Romanesque had thus actually prolonged its existence till it met the new round-arched style of the Renaissance. The Gothic style which succeeded, and which the Venetians brought with them, never rooted itself firmly in Dalmatia except in domestic work. The only great Gothic church is the duomo of Sebenico, and of that only the lower part is in that style, the rest being finished by a Renaissance architect. But the most beautiful Gothic work in Dalmatia is to be found in the palace of the rotors of the republic of Ragusa, which was begun in 1435. The sculpture of this building is scarcely to be surpassed within the range of Gothic art.

But the reign of the Gothic style in Dalmatia was short. The Dalmatians, it would seem, had a natural liking for a round-arched style, in which we may, perhaps, trace the influence exercised on them from first to last by Diocletian's buildings at Spalato. Consequently, they welcomed with almost precocious ardour the return of the round arch when the Renaissance brought it about, and if they were behind the rest of the world in adopting Gothic, they were among the earliest to adopt the Renaissance. In 1441 the latter part of the Cathedral of Sebenico was begun by Giorgio Orsini in an eclectic style, which became less Gothic and more Classic as the work advanced. The most remarkable part of this building is the stone covering,—ceiling and roof in one,—a stupendous effort of daring construction, which makes this church one of the most remarkable in Europe.

But though the Dalmatians adopted the Renaissance style so readily, they used it throughout with a freedom that had more of the spirit of the older Gothic art than that of slavish obedience to formula which the severer masters of the Classic Renaissance exacted.

The Dalmatian Renaissance work is eclectic from first to last, and Gothic and Classic details are found strangely mixed together, though they are happily combined with a true artistic instinct, so as to produce a consistent and harmonious whole. The Renaissance art in Dalmatia continued, as it had begun, free from the shackles of a rigid formalism. It never developed, as it did in Italy, into pure Palladianism. Of the cold, severe architecture of that school there is hardly an example to be found throughout the province; something of the wild freedom and playfulness of Gothic clung to it from first to last, till in the latter part of the seventeenth century it suddenly sank into the slough of the Barocco, in which all its life and beauty was at once smothered, and architecture as a fine art ceased to exist.

Mr. William Emerson, in opening the discussion, expressed the pleasure Mr. Jackson's paper had given him. It was well in these days of going to-and-fro in the earth occasionally to bring forward specimens of the architecture of other countries, tending, as it did, to enlarge the mind, for English architects, as a rule, ran too much in a groove. Many swore simply by fourteenth-century architecture, and others by Classic, but it seemed to him that the particular style,—the transition between Classic and Gothic,—was the starting-point of what was to be the future architecture of this country. He moved a vote of thanks to Mr. Jackson.

Prof. Baldwin Brown (Edinburgh) seconded the vote of thanks, and said that the paper they had just heard was an exceedingly valuable one in the study of architecture, and for the way in which it showed the relation between the different styles that had succeeded each other since the period of the Roman Empire. It was interesting to see how very close was the contact in Dalmatia between the early round-arched architecture of the Romans and the later arched architecture of the Renaissance; how little influence the Gothic had towards the south, and how closely in many features the Renaissance was to the earlier architecture. Mr. Jackson, in his description of Diocletian's palace, had brought before them the fact that the Classical architecture of the Romans embodied more variety of plan than they had often been given credit for.

In the case of the tower, which was sometimes thought to be of Teutonic origin, the old Roman work showed a feeling in that direction, and more especially in the Roman buildings in the South of France. The early Basilica built over the cemetery, to which Mr. Jackson had referred, was extremely interesting. It looked as if the small buildings above the ground, built on the plan, were memorial chapels over the tombs of Christian saints. Possibly, also, the apsidal end in the main building was a memorial chapel built over the tomb of some saint and martyr at a later period. They were told that the old basilicas grew out of the memorial chapels, and it was curious to find what might have been the original wall cutting off the memorial chapel remaining when the nave aisles were added.

Mr. Arthur J. Evans (Keeper of the Ashmolean Museum, Oxford) said he could bear testimony to the extremely exhaustive character of the paper. In the course of his remarks Mr. Jackson had alluded to the way in which Dalmatian history had influenced the architecture of that country. It was a remarkable fact that Dalmatia was the one Roman province divided between the Eastern and Western Empires. In the palace of Diocletian was to be seen, on the one hand, the form of the Roman "Chester." In the massive architecture could be seen the influence of the West and the genius of Rome, while many details, there could be little doubt, had been borrowed from some other favoured cities of the same empire in Asia, such as Palmyra, the masons' marks being of the same character. The whole country between the Alps and the Euxine had been deluged again and again by barbaric invasions, but Dalmatia remained a flourishing province, and became one of the great strongholds of Roman civilisation. It was thus capable, not only of sheltering civilisation within its limits, but also of influencing the border countries.

In Dalmatia some of the latest of the Roman Emperors took refuge, and in the palace of Diocletian the last Western Emperor reigned after he had ceased to reign in Italy. The rocks of Dalmatia were so favourable to the practice of architecture that the country produced a race of masons who had much to do with the buildings of the opposite coast of the Adriatic, and remarkable traces were to be found of the employment of Dalmatian architects and masons in Italy. At a later date Dalmatia shared the fate of other provinces, and was subjected to the variety of influences to which Mr. Jackson had called attention,—Croatian, Carolingian, and Byzantine. Later still there were influences besides the Hungarian. In following the eastern coast of Italy, from Ancona southwards, striking parallels were to be found between the architectural details of the buildings on the opposite coasts, and in looking at the admirable drawings on the screens one was struck with a feeling of melancholy by the fact that the civilisation which was spreading over the mainland behind Dalmatia had been cut short in its development. The architecture was in its origin the work of the surviving Roman provincials, but in the Middle Ages it became to a great extent the work of the Slavonic inhabitants of Dalmatia who had received Roman culture. All that, however, was cut short, and many of the monuments, such as the Church of Ragusa, were destroyed by the great earthquake. They might congratulate Mr. Jackson on having apparently reached the termination of his great work on Dalmatian architecture, and as in the seventeenth century an Englishman was one of the first who had brought a knowledge of Dalmatian art to the West, as in the eighteenth century another Englishman executed his great work on the palace of Diocletian at Spalato, so now the most important work in Dalmatian architecture had been undertaken by an Englishman.

Mr. J. P. Seldon tendered his extreme thanks to Mr. Jackson for his most admirable paper, which had opened up new ground. He only hoped that the excellent drawings he saw around the room would be left for a few days, so that the members might examine them at their leisure. The development of Roman architecture was most interesting and instructive, and particularly as showing that when the Dalmatians found a good style, they knew how to keep it. At the same time he hoped it would be looked at in an archaeological light, and that it would not be studied with the view suggested by Mr. Emerson, as that would be deplorable. If they were

in search of a new style, as many now appeared to be, they should not go to a country which had passed through such a history as Dalmatia had, and be content with its work.

Mr. H. H. Statham said he thought the members owed a great deal to Mr. Jackson for having been a pioneer in an almost unknown district, or one, at least, which very few had an opportunity of visiting. There was one point which had struck him. In the drawing of the interior of the Duomo at Curzola he noticed the same phenomenon which was to be observed in the Yorkshire abbeys, of the pointed arch being used in the arcading of the nave and the round arch in the triforium. Was that to be accounted for in the same way as in England, viz., the employment of the pointed arch for constructional reasons, and the retention of the round arch because of its supposed better appearance? The only regret he had in listening to the paper was that it should have been written by one who was not a member of their body, a drawback, let them hope, which would soon be remedied. (Hear, hear.)

Mr. George Aitchison, A.R.A., wished to ask Mr. Jackson a few questions. He was interested in the drawings of the Temple of Jupiter belonging to the palace of Diocletian. The plaster which had only been partially stripped off the dome in Adam's time, seemed now to permit an inspection of the construction of the dome. He did not know whether Mr. Jackson had the opportunity of seeing how the dome was finished at its centre. In one of the churches at Ragusa, so charmingly vaulted with circular ribs and slabs of stone, he did not know whether Mr. Jackson had had an opportunity of knowing if the long flat stones were jointed, or whether they were entirely in the vaults. In the Temple of Diana at Nîmes, the church was vaulted in a similar manner, but the stones seemed to be rebated out like the Gothic ribs. One of Mr. Jackson's remarks was extremely true, viz., that in large and important towns, where the architects were mostly confined to the examples of that town, they were almost certain to be reproduced, and to give a strong mark to the architecture of the place.

Mr. F. Percival said they had been told that the Campanile at Spalato was covered with scaffolding. When he (the speaker) was there, it was one mass of scaffolding inside, and he would be glad to know if the main features of the building had not been in any way injured.

Mr. Ralph Nevill remarked that it was rather the fashion to ascribe every peculiar development to Teutonic influence, but in the case of Dalmatia that influence seemed to have been slight. If Mr. Emerson thought of introducing a new style of Dalmatian art it was to be hoped he would give it an English feeling, just as the Renaissance architects did when they introduced the art from abroad.

Mr. Emerson.—I did not suggest copying this exactly.

The vote of thanks was then put and carried by acclamation.

Mr. Jackson, in replying, said the drawings could remain for inspection for a few days. Professor Baldwin Brown had suggested that the apse and curious wall of the basilica at Salona might be part of an older church. The impression he had derived was that that was not the case, but that the oldest parts of the groups of buildings were some of the outside chapels. The few architectural features of the apse pointed to its belonging to a later rather than to an earlier period. Mr. Statham had referred to the mixture of pointed and round arches. In one building the nave arches were pointed, cut square through the wall without any moulding, and with a slight moulding outside. That was in a church which showed the Northern influence, because it had a triforium and distinct clear-story, the triforium arches being round. In that they saw an instance of the eclecticism which ran through the Dalmatian styles. Mr. Aitchison had raised a point about the dome. The interior of the church being entirely filled with scaffolding, he and a professor of Spalato had examined the dome, and had come to the conclusion that there was no evidence of the "eye." As to the jointing of the slabs, the construction of them was more like carpentry than anything else. Every bay and pillar had a strong marble rib spanning the church, and those being rebated received slabs of marble reaching the whole length of the nave in one piece. The restoration of the dome at

Spalato was a sad story. A great deal of the work was much decayed and broken, such as the capitals, carving, corners, and entablatures generally. All the capitals of the lower tower had been restored, but the greater part of the entablature of the lower tower, and nearly all the entablature and the eight capitals of the upper order, had been renewed. There was no doubt that a great deal more had been done than was necessary. The meeting might be congratulated on the presence of Mr. Arthur Evans, than whom no one was entitled to be listened to with more respect when dealing with Dalmatia. The point touched upon by Mr. Evans, as to the work of Slavonic artists was a very interesting one. The names of several Dalmatian architects had been preserved, and those of the architects who constructed the doors at Spalato and Ione were undoubtedly Slavonic. Those Slavonic artists were men who had been brought within range of the culture of the Latin cities, and their work had no distinctive character, but was like the work of the Latins themselves. That showed that the Serbs only required peace and tranquillity to develop the arts. With regard to the use that might be made of the study of Dalmatian art, there was nothing to be directly copied, nor did he think that was the proper way to use any style of art. But he did think that a great deal was to be learned from Dalmatian architecture in another way. In it could be seen, from first to last, the correspondence between the art and history of the country; indeed, he did not know another country in which that could be more distinctly traced. Then, again, they might notice the curiously eclectic way in which the Dalmatians had worked from the beginning, and how new forms and departures were constantly breaking in upon the purity of the existing style. Such innovations the purists of the time might call barbarisms, but, looking back on the works of those periods, people could now-a-days see how far they were from being barbaric. They were, in fact, the germs of new life, and ought to give hope in regard to the work of the present day. A great deal of work was being done now which would shock the purists, but when people looked back upon these things they would be able to trace all its singularities, as they were termed, as germs of the future life to which he hoped their art in time would attain.

#### THE SOCIETY OF ENGINEERS:

VISIT TO MESSRS. AVELING & PORTER'S WORKS,  
ROCHESTER.

On Wednesday last a party of the Members and Associates of this Society, together with a number of friends, accepted the invitation of Messrs. Aveling & Porter, of Rochester, to visit their well-known steam road-roller and traction engine works at Rochester. The party included Professor Henry Robinson (President), Mr. A. T. Walmisley (vice-President), Professor Henry Adams, Mr. Perry F. Nursey, Mr. C. Gaudon, Mr. J. Bernays, and Mr. Jabez Church (past-President), Mr. W. H. Lindsay, Mr. J. S. Tamberlin, Mr. R. L. Andrews, Mr. Philip Cbeek, Mr. R. Masefield, Mr. E. J. Heskeht-Smith, Mr. Wilfrid Airy, M.A., Mr. G. Corderoy, Mr. Parker, and Herr Gustav Kemmann, Royal Prussian State Engineer. Proceeding by the 11-42 train from Charing-cross, in a saloon carriage, the visitors reached Strood Station shortly before half-past one, and immediately proceeded to Boley Hill House, the residence of Mr. Thomas Aveling, picturesquely situated overlooking the Castle keep and pleasure-grounds. These admirably-kept and pleasant gardens are a great boon to Rochester and to the many visitors to the time-worn but grand old Norman keep, and it must be a satisfaction to Mr. Thomas Aveling, the present head of the firm of Aveling & Porter, to know that his late father, Mr. Thomas Aveling, when mayor of the borough a few years ago, was able to gratify a long-cherished wish by setting on foot a movement which speedily resulted in securing the castle keep and grounds for the use of the town. The old keep, shattered as it has been by military attacks upon it, and still more seriously as it has suffered from being long used as a convenient quarry for building stone (the steps and newels of the staircases, for instance, having been totally carried away by former generations in this way), is now carefully

guarded from injury; it is being preserved, in fact, without any attempt at "restoration," which would, of course, be entirely misplaced. With due care it is likely long to stand "four-square to all the winds that blow." Mr. Thomas Aveling and Mr. Stephen Aveling very kindly entertained the visitors to luncheon in a very pleasant apartment,—part ball-room, part meeting-room, and part play-room,—a temporary erection, in fact, half partaking of the nature of a tent, and capable of use for a variety of purposes, being cool, comfortable, and airy in the hottest weather. When not otherwise occupied, such an apartment as this, readily removable, forms an admirable music-room and play-room for children, and Mr. Thomas Aveling has, by the construction of this apartment, given a hint to occupiers of country houses which might often be found worth acting upon. Before leaving the luncheon-table, the President of the Society, Prof. Henry Robinson, expressed the indebtedness of the members and visitors to Messrs. Aveling for their entertainment.

Under the conduct of Messrs. Thomas and Stephen Aveling, the party then proceeded to inspect the extensive and very interesting workshops of the world-renowned firm of Aveling & Porter. We say "world-renowned" advisedly, for in these days of depression of trade, largely caused by foreign competition, and when lugubrious forecasts sometimes tend to make us apprehensive for the future of British industries, it is refreshing and reassuring to learn that in this one industry of the manufacture of traction engines and road-rolling engines, the productions of Messrs. Aveling & Porter hold the field everywhere. Even in the United States, where their engines are handicapped by the cost of freight (about £100 per engine) and by a protective import duty of 45 per cent., they command the market by sheer force of excellence of workmanship. That this should be the fact is no marvel to those who had the opportunity of inspecting Messrs. Aveling & Porter's busy hive of industry on Wednesday last. About 400 men are employed, and there are some hundreds of machine-tools of the most ingenious and powerful kind at work, many of them actuated by hydraulic power, on Tredwell's system. These machine-tools, which are all the latest and best of their kind, perform varied operations, such as shearing, riveting, &c., and one very ingenious machine seen at work by the visitors was a hydraulic machine for bending, while hot, the massive steel crank-shafts of the engines. Steel is also used for the frames and boilers, and the best Low Moor iron for the fire-boxes. To use a building phrase, special care is taken to "set-out" the work connected with each engine, so that when the parts are put together there shall be no rivet-holes or bolt-holes which do not precisely coincide, and therefore no inequalities of strain. In like manner means are taken to prevent unevenness of bearing, thus reducing irregularities of wear to a minimum. By prolonging the side-plates of the ireroh upwards, brackets for carrying the working parts of the engine are formed without the necessity of bolting them to the boiler, thereby relieving the boiler of external strains and, of course, conducing to the longevity of the whole machine. In the foundry the visitors were in time to witness the casting of one or two of the heavy wheels or rollers for road-rolling engines. These wheels, it may be interesting to note, are, in order to ensure good work, cast with a margin of 2 in. or 3 in. of metal on each side of the ultimate edge of the periphery, these margins being afterwards taken off by a very simple but large machine of the lathe type. The casting to be operated upon being fixed on a gigantic chuck or holder, and caused to revolve slowly, fixed cutters are brought to bear, one inside the periphery and one outside it, the superfluous and always more or less doubtful metal from the edge of the casting being thus readily though somewhat slowly removed. It was incidentally stated that the capacity of the works is equal to the turning out of one road-rolling or traction engine per day,—everything being made at Messrs. Aveling & Porter's works except the steam ganges. There are, we were informed, about 3,000 traction engines and road-rolling engines by this firm in use, and of this number about seventy are road-rolling engines used in London. It is stated that whereas a well-known firm of building contractors estimate the cost of con-

veyance of heavy materials on common roads by horse traction at 10d. per ton per mile, the cost of the haulage of such materials by traction engines is only from 2½d. to 5d. per ton per mile. Before they left the works, the visitors witnessed trials of several traction engines recently completed. One of them was a large traction engine which is about to be sent to Bordeaux to be used in pulling a deep-running plough, going from 21 in. to 24 in. deep in the soil, through some vineyards of that part of France, in which deep ploughing is a necessity. Another type of engine tested was a traction-engine with double-tired spring wheels of large diameter, this type of engine being that most favoured by the dockyard and military authorities.

After thanking Messrs. Aveling for their kindness in showing them over the works, the visitors proceeded to the top of the keep of Rochester Castle, under the guidance of Mr. Stephen Aveling, and some of them afterwards proceeded to the Cathedral. Thus the afternoon was devoted half to engineering and half to archaeology. After dining together at the Bull Hotel, Rochester, Prof. Henry Robinson in the chair, the party returned to Town by the 8-20 p.m. train from Strood Station, after spending a very pleasant and instructive afternoon.

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

In the tenth annual report of this Society, presented at the annual meeting, held last week in Staple Inn Hall, as mentioned in our last, it is stated that though, during the past year it has not had the fortune to gain any impressive triumphs in helping to preserve buildings of the first rank, the Society has yet met with much success, while its failures are a proof of how urgently its efforts are still needed. The report proceeds: "If the cases in which we are able to report definite results are not so many or so important as could be wished, it should be borne in mind that the Committee work earnestly nearly every week in the year for the cause of the Society, and that much of the good result of this labour cannot find its way into print. It is no light thing to aim at changing the sentiment of the educated part of the nation, even within the narrow limits in which we are attempting to do so. That we have to a great measure succeeded, the altered tone of some of our critics and the press generally gives us ground for believing, and we are not infrequently pleased at hearing echoes of our own arguments and our own sentiment. Our work cannot, however, be effectively continued without the hearty support of our members. The balance-sheet at the end of this report will show the pressing need there is of our funds being increased; and this increase ought to be made by the subscriptions of new members. . . . The chief work before the Society has always been to bring architects and the clergy to understand our point of view and to act accordingly. We wish them to have a full appreciation of good buildings, both old and new. In writing to the Committee, a correspondent says, towards the end of his letter,—'There is little chance for the building arts in England while architects and their organs take their present line. All they care for is their own selfish ends. They cut their own throats, for while they are so mean and sordid they cannot produce beautiful things, and it is no wonder that the public treat architecture with scorn. Men who can't treat old work with reverence, and are blind to its beauty, can't do good new work.' There is much truth underlying this statement. Architects, as a body,—and among them we must include the architect and surveyor,—are most strongly opposed to the Society. They consider that it should be discredited, and suppressed, if possible, as it is 'had for trade.' No doubt they have benefited to some extent by the 'restoration' movement, but in the long run it will be most distasteful to their disadvantage. They have had the impossible task before them of converting a good old church into a good modern one. They have made them modern certainly, but not good. The result has been that they have brought discredit upon themselves, and made a large number of people permanently disgusted with architecture. . . . Some idea may be formed of the need of this Society when it is stated that in the year 1885 the sum of 1,733,900*l.*, or nearly a million and

three-quarters sterling, were voluntarily subscribed for church building, restoration, endowments, purchase of parsonages, and burial-grounds, irrespective of grants from the Ecclesiastical Commissioners, and other sources. Between the years 1876 and 1885, no less than 2,577 churches were restored, being an average of 250 a year, and 819 churches were rebuilt. The supervision exercised by the bishops of dioceses and the Ecclesiastical Commissioners with regard to the expenditure of this large sum of money is of the slightest and most perfunctory character."

LIFTS.

STR.—With your permission we should like to say a few words in reply to Mr. Gibson's letter appearing in your issue of the 11th inst. [p. 835].

Referring first to your footnote, we had not the least intention to mislead your readers, and we think you would yourself admit that there is a broad line of distinction between one case where a specific danger is entirely absent, and another where such a danger is present, but accompanied by a more or less efficient safeguarding device, which is an additional complication.

Turning to Mr. Gibson's remarks, we would first express our gratification that that gentleman finds himself in accord with us on the vexed question of pressures. With reference to the "second danger" pointed out by Mr. Slater, Mr. Gibson writes a general denial of its existence, and appeals to those who understand the subject. Will he be a little more explicit? In all the best English lifts, the charge of pressure water, after lifting the cage, is trapped in a closed chamber from which there is no escape, except through a passage completely move till the starting valve. In case of overloading, the effect is to open it. No compressing action on the entrapped water; but no movement can occur till something positively breaks. It is our constant practice to test our lifts by suspending in the cage double the maximum weight the lift will raise, and then lower the same slowly by the ordinary valve. The maximum weight should not be confounded with the contract weight. For instance, a 10 cwt. lift will probably raise a maximum load of 12 cwt.; and our test would be 24 cwt. In actual work, this would surely be overloading.

Now, we have given careful attention to all the published descriptions of the Otis lift, and have examined several machines after completion, with this particular note in existence, and are thereupon prompted to ask Mr. Gibson the following questions:—

1. Is there in the Otis lift any positive entrapment of the charge of driving water as above described?
2. Is there not a free escape for such water back to the source of supply, restrained only by the pressure in that source?
3. In case of sufficient overloading of the cage, would not the driving water be forced back, and the cage descend?
4. Could the governor prevent all motion of the cage, or would it only act after a speed was attained greater than its normal working speed?
5. Has the attendant any power to stop the cage, should it commence to descend under the circumstances pointed out? If so, how?
6. Is there any provision against the cage being brought up with a shock at the foot of the well, under the assumed conditions?
7. Is not the speed permitted by the governor equal to 150 ft. per minute?
8. Is there any appliance in the Otis lift, other than the governor, which will prevent motion downwards when overloaded? If so, what is it, and where can it be seen at work?

We should not have presumed to so catechise Mr. Gibson, only that he has so often invited investigation and inquiry, and we feel sure he would not wish to confine such inquiry to those who have everything to learn in connexion with the subject.

ARCHIBALD SMITH & STEVENS.

June 14th, 1887.

MAIDSTONE BOROUGH ASYLUM COMPETITION.

STR.—I send you a circular received from the Clerk to the Magistrates of Maidstone, and think your readers will agree with me that it shows scant courtesy to competitors, who must have spent each about two months' hard work in preparing the unusually elaborate drawings required for this asylum,—as I did.

I shall be much obliged if some of your readers can inform me what the "terms of such resolution" were, viz., whether a design was selected at all, or whether they are all made fools of.

A COMPETITOR.

\* \* We quite share the feelings of our correspondent. The circular referred to merely announces to the competitors that their plans will be returned to them by rail, "in pursuance of the terms of a resolution" (not given), and without a word of information as to what has been done. Competitors

are entitled, in common courtesy and common fairness, to know what has been the result of their labours.

"CRESTS."

STR.—In the article upon "Crests" in your paper of June 11th [p. 865], the device of an eagle preying upon a cradled infant is described as being that of the ancient house of Stanley. It had, however, the crest of the Lathams of Latham, co. Lancaster, assuming, of course, that a particular crest can be legitimately appropriated by any one family. This device was adopted by the Stanleys upon the marriage of the great Sir John Stanley, K.G., foffeee of the Isle of Man (he died 1414), with Isabel, daughter and heir to Sir Thomas Lathom, of Latham, Kt., of Latham and Knowsley, co. Lancaster. The Stanleys (Stoneley) descended from Adam de Aldithley, of Normandy, temp. the Conqueror, and the Lathams (Fitzhenry), took surnames from their places of residence. An ancient visitation of Lancashire, deposited in Herald's College, sets forth that a child which had been found in an eagle's eyrie, upon the Latham property, was adopted by the family. The tale may account for the crest, or vice versa.

ABSTRACTS OF SPECIFICATIONS.

6,212, Compressed Blocks for Building. E. Edwards.

This patent relates to the apparatus for pressing the blocks, which are composed of slag, gravel, cement, lime, &c. It is claimed that the improved construction ensures a rapid and accurate delivery of the blocks as they pass from the rollers and the press.

7,498, Bricks. E. C. and E. Korry.

According to this invention, dovetail grooves are formed on the faces and ends of the bricks, with the object of giving a better hold for the plaster; or if the inner sides of the bricks are turned to each other in the inside of wall and grouted with cement, the bricks cannot be drawn out, and stronger and better work is claimed.

8,067, Bricks. P. J. Milligan.

The improvement which is the subject of this patent consists in the method of stacking the bricks while being haked or fired. They are so stacked as to form a natural kiln, and adjoining them is a tall chimney-shaft, which draws off the products of combustion. Fuel chambers, and all the other arrangements used in brick-burning, are also provided for, but the bricks are laid in an improved manner, differing entirely from the ordinary way.

8,339, Facing Bricks and the Manner of Setting the Same. R. Steinar.

The object of this invention is to enable the facing of the wall to be built with only one kind or form of facing brick, by which great saving of time and material is obtained. The bricks are formed hood shaped, with two shanks, being in thickness exactly half of the thickness of the back bricks (less half of the thickness of the layer of mortar). The shanks are placed at right-angles to each other, one shank serving as a facing for the wall, and the other as a means for fastening and building the facing bricks into the wall.

13,621, Metallic Lattice-work for Ventilators, &c. E. Hancock.

According to this invention, tin is first cut into strips, some of them wider than the others. The wide ones are then folded on both sides; then those that are not folded or doubled are placed the opposite way, one over and one under, those folded thus forming a woven fabric, or what, perhaps, may be better described as a basket-work pattern.

16,697, Feed Mechanism for Logs in Vertical Saw Frames. W. Buchanan.

By this invention an extra bar or rod is fitted to the feed regulator and to the feed wheel of the saw-frame. By this means, instead of the deals being fed by jerky motion on to the saw, the automatic feed is nearly continuous, and a much smoother and easier feed is obtained.

8,725, Manufacture of Pigments. J. M. Bennett.

The object of the invention is to obviate the grinding or crushing in pan mills the barytes or zinc oxides which are used for paints. A disintegrator is used instead, preferably enclosed, to prevent the escape of noxious dust and to permit currents of dried or heated air to be passed over the material under treatment.

NEW APPLICATIONS FOR PATENTS.

June 3.—8,024, J. Stevenson, Process for the Preservation of Woods.—8,031, R. Gould, Composition for Distemping.

June 4.—8,055, W. Thompson, Roofing.—8,084, F. Lees, Screws.—8,088, A. Zettler, Electric Alarm Devices.

June 6.—8,140, W. Bohm, Manufacture of Stair Treads, Flooring, &c.

**Sandwich (Kent).**—The last portion of the restoration of St. Bartholomew's Church is now being carried out. The nave was restored about six years ago. The north wall of the north chapel has been entirely taken down and rebuilt, and a new oak roof is being put on, while oak benches are to be placed in the nave. The ancient screen is to be restored and placed beneath the chancel arch, and a new screen to the north arch of the chancel. All the other chancel fittings are of English oak. Mr. John Oldrid Scott is the architect, and Mr. Wise, of Deal, is the contractor.

The Student's Column.

FIELD WORK AND INSTRUMENTS.—XXV.  
 Levelling Instruments.

XI.—PASTORELLI'S LEVEL.

Pastorelli's instrument, the horizontal bar to which the telescope is attached is either made shorter than in other patterns, or is dispensed with altogether. In the latter case, the telescope is soldered to a saddle-piece, the base of which is made parallel to the axis of the telescope, and the saddle-piece is also rigidly fitted to the gun-metal stem or pivot, which connects it with the joint at the parallel plates. In the former case, as shown in fig. 1, the telescope can be detached at the screw connexion indicated in figs. 2 and 3. By a comparison of the elevation shown in fig. 2 and of the section shown in fig. 3 with the general elevation given in fig. 1, it will be seen that the vertical axis of the instrument, marked C, terminates in a socket which rests upon a gun-metal ball formed over the centre of the lower parallel plate. This is marked B in the illustration, and the construction permits the instrument to traverse vertically about 20 degrees of inclination from the perpendicular. The underneath of the vertical axis is formed in an inverted cup shape, the curve radiating from the centre of the ball-joint. The lower parallel plate, marked A, is screwed on to a special form of tripod head, originally suggested by the late Mr. W. Froude. The three pairs of cheeks, to which the legs are here attached, are set wider apart than in the ordinary systems, and arrangements are provided for tightening the trunnions in their connexion at the cheeks, by bisecting the cylindrical bearings in which the leg-joints work, and fastening them together by means of the capstan-headed screws indicated in fig. 1. This improvement conduces to increased steadiness and freedom from vibration as wear goes on, so far as the tripod head is concerned. The wooden legs are each circular in section, and when closed up for conveying from one station to another are very uncomfortable to carry.

The level is retained in position by the upper

parallel plate marked E, which encircles the inverted cup marked D, and is clamped by the milled-headed adjustment screws marked F. The cup-piece, D, is concentric with the ball-joint, B. The parallel plate adjustment screws each have spherical projections formed under their heads, which projections work in corresponding sockets formed in the top side of the upper parallel plate. These screws work in movable hemispherical nuts marked G, which themselves are held in seats, as shown attached to the lower parallel plate. By tightening or slackening these screws, the upper parallel plate is made to clamp or to release the inverted cup attached to the vertical axis of the instrument. By loosening any two adjacent screws, F, F, the telescope can be tilted over by hand in the required direction, until the longitudinal bubble is approximately in the centre of its run, final adjustment being effected, after tightening the adjacent screws previously slackened, by turning the opposite parallel plate screws in the usual way. The tripod may be set upon the ground almost irrespective of level, and the telescope thus accurately set level without straining the parallel plates. Unlike the above arrangements, the ordinary parallel plates are very limited in their action, compelling the tripod-head to be placed within a small deviation from a horizontal plane, whereas the combination of the movable ball-joint with the parallel plate clamp, enables this form of tripod to prove of great value for work over very uneven country. It will be observed, however, that in this instrument the telescope stands higher than in ordinary instruments, and that, consequently, the vertical axis is longer. Before carrying the instrument from one station to another, care must be taken to tighten the plate-screws sufficiently to prevent the telescope from falling over in its vertical axis bearing. It will be further noticed that around the telescope are soldered two cylindrical gun-metal collars, very accurately turned and fitted to a perfect circumference. The longitudinal bubble, being fastened to these collars, can be fitted and framed parallel to the mechanical and optical axis of the telescope, with which the line of collimation should be

coincident. The centres of the movable nuts of the plate-screws are placed by the makers in the same geometrical plane as the centre of the half-joint at the foot of the vertical axis, thus insuring the most perfect action in the motion of the upper parallel plate.

RECENT SALES OF PROPERTY.

Table listing recent property sales with columns for location, agent, and price. Includes entries like 'Kensington Town-161, Prince of Wales-road, 63 years, ground-rent 7s. 6d., £430' and 'Clare Market-62 and 63, Stanhope street, freehold, 1,800'.

Table listing property sales with columns for location, agent, and price. Includes entries like '117, 118, and 119, Letchmere-grove, 87 years, ground-rent 12s., £220' and 'Malden Hill-22, Maids Hill West, 29 years, ground-rent 10s., 450'.

MEETINGS.

Table listing meetings with columns for date, organization, and location. Includes 'SATURDAY, JUNE 18. Architectural Association.-Visit to Cambridge.' and 'THURSDAY, JUNE 23. Society for the Encouragement of the Fine Arts.-A Morning Meeting.'

Miscellaneous.

Articles including 'Sale of a Building Estate at Cromer.-On Monday last a large sale of building land, in numerous plots, took place at Cromer.' and 'Abusing a Sanitary Inspector.-In a case which was heard last week by the magistrates sitting at Coventry, where the defendant, a pig-keeper, was convicted and fined for using obscene language to the Sanitary Inspector there,--insulting him whilst engaged in the performance of his duties under the Public Health Act, 1875.--Mr. T. Browett, the Town Clerk, who appeared for the complainant, remarked that the people who kept pigs, many of them honestly believed that their pig-styes, however filthy, were not a nuisance, and they resented, and occasionally they resented violently, any interference with pig-keeping.'

Registration and Technical Education of Plumbers in Scotland.

A meeting of masters and journeymen plumbers, architects, and builders, for the purpose of forming a local branch in connexion with the system of registration and technical education of plumbers established by the Company of Plumbers, London, and the City and Guilds Institute, was held on the 8th inst., in the Town-hall, Dundee. There was a large attendance, those present representing Forfarshire, Perthshire, and Fifeshire. Provost Ballingall presided. Mr. W. R. E. Coles, London, made a statement explanatory of the objects and working of the system of registration and technical education of plumbers. Dr. Anderson, medical officer for Dundee, afterwards adverted to the heavy mortality from typhoid fever and diphtheria in Dundee, resulting through escaped plumber work in many new houses erected after the passing of the Improvement Act. He stated the voluntary registration was good so far as it went, but argued that registration should be compulsory. Mr. Stewart Robertson moved that the meeting approve of the system of registration and technical training of plumbers, and in view of the important position which the plumbers' craft occupies in relation to the public health, agree to the formation of a local branch, upon condition that the executive and examiners be practically acquainted with the Scotch method of plumbing and its technicalities. Mr. Frew, Perth, seconded, and the motion was cordially adopted. Professor Ewing, of University College, Dundee, who also expressed approval of the proposal that the registration of plumbers should be compulsory, said that in a day or two ground would be broken in Dundee for the erection of a new technical school, and said that would be a consideration for the committee whether they should not institute classes, applicable to plumbers and plumbing-work. A committee, with Provost Ballingall as president, was then formed.

Abusing a Sanitary Inspector.-In a case which was heard last week by the magistrates sitting at Coventry, where the defendant, a pig-keeper, was convicted and fined for using obscene language to the Sanitary Inspector there,--insulting him whilst engaged in the performance of his duties under the Public Health Act, 1875.--Mr. T. Browett, the Town Clerk, who appeared for the complainant, remarked that the people who kept pigs, many of them honestly believed that their pig-styes, however filthy, were not a nuisance, and they resented, and occasionally they resented violently, any interference with pig-keeping. It was known to the Sanitary Committee, and he thought, to almost all intelligent people, that that was a dangerous delusion. Fevers constantly infested the city,--they were never without fevers,--and they were almost constantly traced to polluted air or polluted water. That people were struck down by these invisible foes was as plain as if they were struck down by a weapon, and yet the pig-dealers could not be brought to believe in this truth. The duties of an Inspector of Nuisances, therefore, were necessary, and his services of great importance to the public. They were also at times extremely nauseous and repulsive, and ought not to be made intolerable to the Inspector by conduct such as that of the defendant towards the complainant.

Improvements in Enamelled Bricks.-According to the Bulletin de la Ceramique, M. Laloy has patented a process for making enamelled bricks, remarkable for its simplicity. Furnace baking being relatively expensive, he bakes in moulds in the open air, as is usual in Flanders for ordinary bricks. He mixes with the clay a certain proportion of dust from coke, coal, or any other combustible substance, which is diffused throughout the mass by the kneading machine. The moulded and dried products receive the enamel colours according to the usual methods, and are laid in a pile according as the fire rises. The baking is said to be complete, and the vitrification of the coating perfectly homogeneous.

The Cement Trade in Germany.-The German cement industry (notably that of Silosia), has benefited by the re-opening of the Roumanian market, through the treaty of commerce between the two nations. The Schlesische Zeitung remarks that the English article which, on account of low sea freight, has been in a favoured position for some years, has now energetic opposition from the German product.

**Church Restoration in London.**—The Church of the Holy Trinity, Little Queen-street, Holborn, which was built about fifty years ago, has been recently re-opened, after some additions and improvements effected from the designs and superintendence of Mr. C. Forster Hayward, F.S.A., Museum-street, Bloomsbury. These include the unusual but most successful change in position of the altar from east to west, a matter which was most carefully considered, and not carried out till the sanction of all the authorities was obtained, and a faculty duly issued after inquiry, but a change of arrangement which might well be followed by many other churches where the frontage is towards the east with entrance lobbies right and left of the Communion-table, as was the case in this Little Queen-street church. The western gallery and useless enclosure beneath, and a strip of each gallery, north and south, being removed, a wide space was obtained for a raised chancel enclosure, with pierced stone parapets; the organ, formerly in this western gallery, being placed on the north, and vestry screens on the south side, the old pulpit and desks being cut down in height and refixed. The new chancel stalls in oak were carved by Robinson. The tiles for the sacarium were supplied by Messrs. Carter & Co., and those elsewhere by Messrs. Simpson (for Maw & Co.). The stained glass (the gift of Mr. Bateman) for the new window over the altar is by Messrs. Moore & Co.—On the 25th of May was laid the foundation-stone of St. James's Church, in a fast-growing suburb which is locally designated West Hampstead. Mr. A. W. Blomfield is the architect, and the contractor is Mr. J. Woodward, of Pinbury. The design is in the Early English style; the materials are red brick with Portland and Bath stone dressings; the capacity, 1,000 worshippers. A grant of 1,000l. has been made from out of the Bishop of London's Fund, and Mr. James La Fontaine subscribes 2,000l. towards the whole cost, which is estimated at 8,300l. These subscriptions bring the present contributions up to a total of nearly 6,000l.—Designs for the decoration and restoration of the chancel of St. Philip's Church, Camberwell, have been prepared by Mr. H. P. Burke Downing, architect, and the work is being carried out under his supervision as the Jubilee memorial of the parish. The decorations in all will be executed by Mr. R. Davison, of Marytebone-road.

**Leeds and Yorkshire Architectural Society.**—A general meeting of the members of the Associates' Sketching and Art Club was held on Monday evening, the 13th inst., at the Society's Rooms, Croft's-chambers, Infirmary-street. After the usual business, there was an interesting discussion on the sketches produced during the past month, amongst the most creditable of which are Mr. F. W. Bedford's "Interior, Gainsborough Manor House," Mr. J. W. Twist's "Old Font and Cover, Selby Abbey Church"; Mr. A. E. Dixon's "Lumb Hall, near Drighlington"; and Mr. W. Carley Hall's "Chapter House, Kirkstall Abbey." The drawings will remain on view to the public until Friday, the 17th inst.

**Architecture at University College, London.**—The prizes annually offered by Professor Roger Smith for the best set of sketches illustrative of the subjects of the lectures on architecture during the session have just been awarded. In the art class the first prize falls to Mr. John Borrowman, jun., the second to Mr. Harold Lander, and the third to Mr. Herbert Winny. In the science class the first prize is gained by Mr. Ernest A. Rüntz, and the second by Mr. R. S. Maynard. By the courtesy of the Directors of the Crystal Palace, the students of these classes, to the number of nearly thirty, paid a visit, on Friday, the 10th inst., to the Fine Art Courts at the Palace; some of the most remarkable of their contents were pointed out by the Professor.

**Gillingham.**—A large population having sprung up within the last few years at Gillingham, on account of its proximity to the Chatham Dockyards, it is found necessary to provide increased church accommodation. A strong committee has therefore been formed to build a new church to be called St. Barnabas, and Messrs. J. E. K. & J. P. Cnts. have been instructed to prepare plans. The church is to seat 600, and to cost about 8,000l. Gillingham is the head quarters of that curious sect the Jezzeelites, who are building a large temple there.

**British Archaeological Association.**—The closing meeting of the session was held on the 1st of June, Mr. Thos. Morgan, F.S.A., in the chair. It was announced that the Association had been invited to hold the Congress for 1888 at Glasgow, and that the invitation had been provisionally accepted. The Rev. Prebendary Scarth exhibited a board of bronze implements recently found at Penseymoor, near Neath. The articles were much worn, and appeared to be the stock-in-trade of a founder. Mr. Loftus Brock, F.S.A., exhibited a perfect example of rare Sieberg were obtained from Germany of similar pattern to what is sometimes found in excavations in London. Drawings were sent by Mr. J. T. Irvine of a small cup of green glass not unlike Roman work, but more probably of Early Saxon date. It was recently found in a coffin with an interment at Peterborough Cathedral. Mr. Walter Myers, F.S.A., described some curious bronze huckles of Etruscan date and other personal ornaments found near Ancona. A paper was then read by Mr. J. Romilly Allan, F.S.A. (Scot.), on the "Antiquity of Fonts." The existence of church fonts of earlier date than the Norman Conquest was proved by reference to many existing examples, some bearing inscriptions, as at Potterue, Wilts, or covered with interlaced ornament as at Penmon, Deorhurst, and other places. At Bingley, Yorkshire, is a curious font with a Runic inscription, and at Little Billing, Northants, and at Patrishow inscriptions in Saxon uncial characters occur. The second paper was on the "Excavations of the Site of Poughley Priory, Berks," by Mr. H. J. Reid, F.S.A., which have recently been carried out by the lecturer. The ground plan of the church has been recovered in part. It is not truly Orientated, but three interments found in the chancel are so placed. Two thigh-bones were found arranged in the form of a St. Andrew's cross over one of the interments.

|                                        |          |
|----------------------------------------|----------|
| George Shears, Maybury (accepted)..... | £990 0 0 |
|----------------------------------------|----------|

**WORKINGHAM (Berks).**—For the erection of two houses, Langborough-road, for Mrs. J. Taylor.—

|                                          |          |
|------------------------------------------|----------|
| G. S. Lewis, Castle-street, Reading..... | £490 0 0 |
|------------------------------------------|----------|

\* Accepted. [No competition.]

**Duke of York P.H., Myrtle-street.**—In the list of tenders for works here published last week (p. 859), for "J. Wessle, £1,598," read "J. Beale (accepted), £1,568."

\* **SPECIAL NOTICE.**—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 48, Catherine-street, W.C., not later than 12 Noon on THURSDAYS.

**PUBLISHER'S NOTICES.**

Registered Telegraphic Address, "THE BUILDER, LONDON."

**CHARGES FOR ADVERTISEMENTS.**

**SITUATIONS VACANT, PARTNERSHIPS, APRENTICESHIPS TRADES AND GENERAL ADVERTISEMENTS.**  
Six lines (about fifty words) or under ..... 4s. 6d.  
Each additional line (about ten words) ..... 9s. 6d.  
Terms for Service of Trade Advertisements, and other arrangements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

**FOUR LINES** (about THIRTY words) or under ..... 2s. 6d.  
Each additional line (about ten words) ..... 5s. 6d.  
PREPAYMENT IS ABSOLUTELY NECESSARY.  
\* \* \* stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to  
**DOUGLAS FOURDRINER, Publisher,**  
Addressed to No. 46, Catherine-street, W.C.  
Advertisements for the current week's issue must reach the Office before THREE o'clock P.M.

**SPECIAL.**—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY morning.  
The Publisher cannot be responsible for DRAWINGS TESTIMONIALS, &c. left at the office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

**PERSONS** Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent Garden, W.C. Free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN CIRCULATION, is issued every week.

**MAP OF LONDON** showing Boundaries of Surveyors' Jurisdictions. The four sheets, which the Map is divided (issued with the numbers of January 1st, 8th, 15th, and 22nd), if sent to the Office direct, or through any Newspaper, can be MOULDED on the following Terms, viz.—  
On Cloth (Holders) and varnished, 3s. 6d.  
" " " " (Strainer) ..... 5s. 6d.  
In 3d. extra.  
\* \* \* Omissions discovered since publication will be corrected before mounting.

**TERMS OF SUBSCRIPTION.**  
"THE BUILDER" is supplied as a matter from the Office to residents in any part of the United Kingdom at the rate of 18s. per annum. Foreign, to all parts of Europe, America, Australia, and New Zealand, 50s. per annum. To India, China, Ceylon, &c. 80s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

**FIRE BRICKS.**

**BEST STOURBRIDGE FIRE BRICKS,** and Cement Fire Clay, Gas Retorts, Mullers, &c. Fire Bricks and Blocks for the Furnaces, Chimney Flues, Hot Blast Furnaces, Fire, Boiling, Puddling, and Steel Furnaces, Flint Glass Furnaces, Roasting and Retorting Furnaces, Chemical Works, Coke Ovens, &c. Boiler-Boiling Bricks, Fire Covers, Decomotive Bricks, Turbines, Steel Furnaces, Grate Backs. Special Sizes and Shapes made to Engineers' Drawings. Prices quoted to any Port, or Railway Station.  
London Agents:—

**R. CULL & SON, Palmerston-buildings, E.C.**

**GLAZED BRICKS.**

**OATES & GREEN, HALIFAX.**  
GLAZED BRICKS (White and Coloured), Special Salt-glazed Bricks, Sanitary Tubes, Glazed Earthenware Sinks, Cattle, Sheep, and Pig Troughs, Horse Mangers, Patent Automatic Troughs, Patent Fish Tank, Ventilating Bricks, Patent Ventilating Gullies and Traps, Patent Chimney Pots for Down Draughts, six Prize Medals. Copies of Testimonials sent if required.  
London Agents:—

**B. CULL & SON, Palmerston-buildings, E.C.**

**BLUE BRICKS.**

**THE KETLEY BRICK COMPANY, KINGSWINFORD** Staffordshire, Manufacturers of Blue Bricks.  
London Agents:—

**R. CULL & SON, Palmerston-buildings, E.C.**

**DRAIN PIPES.**

Lime, Cement, Bricks, Slates, Laths, Hair, Plaster, Wall Copings, Channel Bricks, Blue and Red Ridges, Red Flank Tiles and Pan Tiles, Closest, Fare and Traps, Bricks, Junctions, &c. all sizes. Chimney-Pots, Red and White. PRICES on APPLICATION.  
**R. CULL & SON'S STORES, Railway Arches,**  
London-street, Bethnal Green Station, E.  
Chief Office—72, Palmerston-buildings, Old Broad-street, E.C.

**TO CORRESPONDENTS.**

Registered Telegraphic Address, "THE BUILDER, LONDON."

**Dooling Freestone.**

The stone from these quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England.  
It is of the same crystalline nature as the Chelney Stone, but finer in texture, and more suitable for ironmoulded work.  
**HAM HILL STONE.**  
Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice.  
Prices, and every information given, on application to **CHARLES TRASK & SONS,** Norton-sub-Hamdon, near Ilminster, Somerset.  
London Agent—Mr. E. WILLIAMS,  
16, Craven-street, Strand, W.C. [Adv.]

**Doalting Free Stone**

For prices, &c., address S. & J. STAPLE, Quarry Owners, Stone and Lims Merchants, Stokes - under - Ham, Ilminster. [Adv.]

**Asphalte.**

The Seyssel and Metallo Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tun-rooms, and terraces. [Adv.]

**Asphalte.**

White Asphaltes.  
**M. STODART & CO.**  
Office:  
No. 80, Cannon-street, E.C. [Adv.]

**DRAIN TESTING.**

For convenience and efficiency in making what is known as the Scent or Peppermint Test, the Banner Sanitation Company have introduced a new appliance,

**THE BANNER PATENT DRAIN GRENADE OR DRAIN FERRET.**

This Appliance is made, preferably, of thin Glass, and is charged with powerful pungent and volatile chemicals, the smell caused by which is not likely to be mistaken, nor distributed in such a way as to either mislead or render the test worthless through mismanagement or the careless handling of the necessary chemicals.

When one of the "Grenades" is dropped down any pipe it breaks, and the effect produced by its contents is distributed only as intended. One "Grenade" is often sufficient for testing an ordinary house drain. The Banner Patent Drain Grenades or Drain Ferrets can be obtained in Boxes of One Dozen each from the Banner Sanitation Company, their Agents, and most Dealers in Sanitary Goods.

PRICES.—With Peppermint Filling ..... 5/- per box of one doz. With Assafoetida Filling ..... 5/6 per box of one doz.  
With Compound Filling, extra strong ..... 6/- per box of one doz. Soluble Gelatine "Grenades," with same fillings, 2/- per doz. extra

**BANNER SANITATION COMPANY,**  
**WESSEX HOUSE, NORTHUMBERLAND AVENUE, CHARING CROSS, LONDON, W.C.**  
(Opposite entrance to Hotel Métropole.) Telegraphic Address:—"Banners, London."

### Architecture in the Reign of Queen Victoria.

HE reign, the fiftieth anniversary of which the whole country has this week been celebrating with so much unaffected and loyal good-will and enthusiasm, includes what has

been in many respects a most eventful period; more eventful, perhaps, than many of those who have lived through the greater part of it altogether realise. It has been a time marked by immense changes, especially in political and in scientific thought. Whether the first-named class of changes have all been in the direction of progress is a matter on which there will be various opinions and on which we, on principle, abstain from expressing any opinion in these columns, the business of which is not with politics. But as to scientific progress, there can be no question at all. The last half-century has been one of the most remarkable epochs in modern history, perhaps in history of any date, in regard to the strides taken by science and the increased predominance of the scientific spirit. In mechanical science the development of steam locomotion by land and sea, and especially the development of the railway system, is a physical fact the results of which are before every eye, and which is, therefore, the most popularly appreciated. The invention and development of the electric telegraph comes only second to this in popular appreciation; and in comparison with this the science and art of electric lighting and electric motors, destined probably to play as important a part, are really only just at their commencement. But history will place even these achievements, which concern only our material convenience, as far inferior in importance to the great changes which have taken place in what may be called the higher strata of scientific thought. The great generalisation of Darwin, one of the greatest generalisations ever made by one mind, has permeated all contemporary thought, and altered the whole course of ideas in regard to the philosophy of life. The development of the spectrum analysis has placed us in chemical relations with other worlds situated at almost inconceivable distances from the earth, so that we can investigate the chemical constituents of a body whose very disc we cannot optically define with any telescope yet made; and the spectroscope is still, probably, in the infancy of its achievements. These two facts alone,—the promulgation of the Darwinian idea, and the discovery of the

power of the spectroscope,—would suffice to stamp this last fifty years as what it essentially is,—a great scientific epoch.

It is not without a direct reference to the subject indicated at the head of this article that we commence by a reference to the scientific achievements of the present reign. It must be admitted that this has not been a great artistic epoch,—not in the same sense and with the same extent of meaning in which we call it a great scientific epoch. And it is well to remember that this admission involves no depreciation of the standard of intellect of the present day. It is only that the most eager and gifted portion of the intellect of the time has been turned in the direction of science, not in that of art.

We cannot, therefore, expect to find the same definite progress, the same well-defined aims, in looking at the art and architecture of Queen Victoria's reign, which we find marking the scientific achievements of the same epoch. Science during this period has known what she wanted; Art has not. Art has been trying one experiment after another, satisfied with each for a time; satisfied permanently with none. But the spectacle is not without its interest, nor have we been without definite progress and improvement in certain respects.

The reign has, at all events, produced one great building; and that is something to say for the architecture even of a long reign, seeing how few and far between such achievements are. But we think the Westminster Palace does merit the title of a great building, and it is interesting to note that its commencement was very nearly coincident with the commencement of the present fifty years we have been celebrating. It represented a kind of forcing forward, in one particular instance, of the architectural movement which was in progress during the earlier portion of the Victorian era, the Gothic revival. There was not at that period any such general movement in favour of Gothic as would have led naturally to the adoption of the Gothic style for a national building of that importance. Some years after the commencement of the Westminster Palace, we were discussing in the columns of this journal, in 1843, the *pros* and *cons*. of the proposed unsuitable columnar Classic façade to the British Museum; Elmes's design for his great building at Liverpool was beginning to be spoken of as a new piece of Classic architecture, which would probably throw Smirke's proposed achievement at the Museum considerably into the shade; and two years later, one of the erections about which public and professional interest was excited was the big piece of Doric architecture which still forms the entrance *pylon* to

Easton Station. The employment of the Gothic style, therefore, for our great legislative building actually forestalled the general adoption of the movement in England,—a very unusual event in architecture. Whether Barry would have produced something finer than the existing building had he been left a free hand, instead of being saddled with a style with which he did not naturally sympathise, we can only conjecture now. It is very possible that he would. But the result, as it is, is not unworthy of the occasion.

The Gothic revival, however, was the most important architectural movement operating during a great portion of the present reign, which architecturally might, perhaps, be best remembered as the epoch of the restoring of the cathedrals. It is curious, and perhaps, in a sense, rather pathetic, to look back now to the days when Gothic architecture was the obvious faith and duty of every man, or almost every man, calling himself an architect; when mouldings and capitals were sketched and measured and drawn out as if architectural salvation depended on the work, as, indeed, in the eyes of many, both architects and clients, it actually did. We now regard the matter from a very different point of view. The crisis of Gothicising energy has passed away, and the reaction has some time since set in. There was a great deal of unreason in the blind belief in the efficacy of Gothic reproducing and Gothic restoration, as we have said upon occasion during the time when the movement was still the popular one. But there is no doubt that of late years the tables have been turned too violently. The erection of Gothic churches was really, in a sense, the architectural expression of the spirit of the day. There was a spiritual church revival, and it found its outward expression in part in a material church revival. It led to the erection of a good many mere copies of Mediaeval churches, which have lost most of their interest now, but it, at all events, substituted something better and more appropriate and more artistic in church architecture than what had immediately preceded it. The restoration of the cathedrals also has been most unfairly judged by the more recent school of architectural and popular critics. To some extent, restoration,—even as carried out by its most accomplished experts,—no doubt meant the destruction or impairing of the historical and often, to some extent, of the artistic value of a building. But it also meant, in many cases, the raising up of the structure from a state of decay and neglect into one of far greater fitness and serviceableness for the purposes for which it was to be used; and in some cases restoration included an investigation and development of the history of the structure such as reflected the

highest credit on the knowledge and perception of the restoring architect, and brought out facts in connexion with the history of the building dealt with, and that of others of the same type and date, such as constituted a real addition to our critical knowledge of this type of architecture. In looking on the restoring epoch, therefore, while recognising the mistakes that were made, and the over-importance, and even finality, which was then attached to Gothic architecture, let us hear in mind also the real architectural knowledge and study which directed it, and the architectural energy which carried out such an amount of work in church building and church restoring as was done during the earlier part of the present reign, and which at least substituted order and decency and architectural fitness for a state of neglect and decay.

We are now in a second stage of the architectural development of the reign, which began absurdly enough in the mere fashion of taking up a certain later phase of English architecture, which in its original eighteenth-century form pretty nearly represented the negation of all real architecture, except one important quality in architecture, sound and solid construction. But the movement is passing out of that mere fashion phase now, and is developing in a manner which seems to indicate that the later Victorian architecture, however oddly we have come by it in the first instance, seems, as far as one can judge, to have a vitality and a promise of development such as the Gothic revival did not evince. We have, at all events, got beyond the blind faith in copying ancient architecture as the one means of architectural salvation. Most, or at any rate many, of those who copy now *know* that they are only copying, which the Gothic revivalists really, in a sense, did not know; that is, they thought doing it over again was of just the same value to the world as originating it, provided it were correctly and learnedly done. We are not without frequent evidences at present of something like architectural originality, to an extent to which it never was aimed at or thought of in the earlier part of the present reign; there is an intimation of possible further life and growth for it in a new direction, and that is a great gain to be able to register; and it must be recognised, also, that there is at the present moment a greater general interest in architecture, and a greater desire to have something like architectural beauty in our mansions and street buildings, than there has been in any earlier portion of the present reign. Even the speculating builder has caught the noble infection, and makes clumsy efforts to produce picturesque brick houses; and when we remember the general nature and beauties of the new terraces and street architecture which used to be evolved in the London suburban districts thirty years ago, to the happiness and content of all concerned, we must admit that it is a promising sign if even the desire for architectural beauty and expressiveness, the perception that it is something worth taking trouble for, has come to be more generally diffused and tacitly accepted as reasonable.

Four important competitions for great Government buildings have formed architectural events of some interest during the present reign. The first was that for the Foreign Office, the result of which presented, oddly enough, a kind of reversal of the case of the Houses of Parliament, as concerns Gothic architecture. As we have observed, the employment of the Gothic style was enforced by official authority in the case of the Houses of Parliament, before the general taste of the country or of architects would have demanded the employment of the style. In the Foreign Offices, when the Gothic revival was almost at its zenith, and when the most successful Gothic architect of the day had been commissioned to undertake the building, the then favourite style was forcibly dismissed by official authority. Both the incidents are worth noting as curious exceptions to the usual course of architectural design, which has been generally, both before and since the Renaissance, carried out in unison with the general taste of

the day, and not in opposition to it. The result of this competition is not regarded by any one, probably, as a fortunate one. The next great competition and the largest and most important in this reign, was that for the Law Courts; and here the magnitude and importance of the work, the scale of the drawings, and the genius displayed in some of them, attracted a great deal of public attention. Here the successful architect was allowed, in the earlier stages at least, rather too much of his own way, even to the extent of pushing aside the colleague who ought, according to the official decision, to have shared the responsibility and honour with him, and whose co-operation would probably have ensured a more satisfactory practical result than we can he said to have obtained. The Law Courts is not a great success; though we think its practical defects have been somewhat unduly exaggerated by critics who had a constitutional antipathy to art-architects generally, or to Mr. Street in particular. It is a building of very marked character, and character of a powerful type, but as a whole we fear it must be taken as a practical expression of the fact that revived Mediæval architecture, however genuine and admirable, was the enthusiasm which the movement evoked in the country, has not been a success as a modern style. The Houses of Parliament is a success, independently of its Mediæval detail, but then in its main plan and architectural grouping it is really not Mediæval; as Pugin said, it is "Tudor details on a Classic body." The Law Courts reflects the true Mediæval spirit more faithfully and forcibly than any other large building of its epoch, a statement which its architect would have regarded as the hest compliment that could have been paid him, as indicating that he had achieved the result he aimed at; but the opinion which we expressed from the first, that the building is an illustration of the mistake of attempting to revivify Mediævalism in modern architecture, is now a pretty generally accepted conclusion.

The next important competition was the recent one for the War Office, which, owing to the way in which it was managed, or mismanaged, has had results certainly of less architectural interest than its predecessors, and the result seems likely to be, architecturally, much the same as that of the Foreign Office,—the erection of a common-place building, which no one cares about; though there is no reasonable doubt that the practical and sanitary arrangements of the structure will be much in advance of its predecessors. But the history of the recent War Offices competition also seems to furnish evidence of the growth of the influence of official dilettantism in such matters,—an influence at variance with the production of anything great in architecture; and if we are to credit what is said in the way of rumour and *on dit*, there is a disposition on the part of the Committee concerned with this important building to cut it down to a merely utilitarian structure. It is to be hoped that public opinion will be against such a view of the matter. It is a rather melancholy reflection that at the commencement of the present reign there was both public and official interest felt in the project of receiving something great and striking in architecture for the home of the Legislature, and that after fifty years the architectural result of a great public building seems to be a point about which both politicians and public are indifferent: for this means retrogression in more senses than one. It is to be hoped that the new Imperial Institute, the competition for which has resulted in the appointment of an architect who, though he has not done any great works hitherto, has always shown a distinct artistic power in his buildings, may result in something which will be an architectural gain to the country, and perhaps do something to stimulate again the idea that it is worth while for a Government to spend money in promoting architectural beauty, as well as in merely providing shelter from the weather for its officials.

One of the architectural characteristics of the reign has been the great activity, especially during the last five-and-twenty years, in what

may be termed municipal architecture in our large towns, and the number of town-halls, municipal buildings, assize courts, and other such structures, which have been raised here, there, and everywhere. Some of the largest of these have not been great architectural successes; but a good many, both small and large ones, have been very successful and interesting additions to modern English architecture. The great activity in this class of architecture almost dates, we should be disposed to say, from the Manchester Assize Courts, designed by Mr. Waterhouse in 1862, and finished three or four years later. This was the first important building of the kind, or the first which attracted much attention, during the full tide of the Gothic revival, and it had a great deal of influence in stimulating new efforts on municipal architecture. Very recently Her Majesty laid the foundation-stone of an admirable building of a similar class at Birmingham, and the comparison of the designs of the two is a good illustration of the course which architecture has been taking in the meantime. Mr. Waterhouse's building was pure Gothic. Messrs. Webb & Bell's design (which, by the way, was selected by Mr. Waterhouse) is Gothic in feeling, but distinctly avoids the reproduction of pure Gothic, and aims at originality and at new departures in detail. So far has this tendency been carried, to modify the models we follow even while using them more or less as models, that Gothic and Classic elements now frequently seem to run into each other in recent designs, and the line of demarcation between the two opposed styles, as they were once regarded, is almost lost.

In two subjects not precisely architectural, in the common meaning of the word, but of the highest practical importance, there has been an extraordinary progress during the last fifty years. One of these is the science of sanitation, which may be said to belong to this reign. Fifty years ago the current ideas upon the subject of drainage and ventilation were comparatively of the crudest kind, and it was hardly recognised that the subject was one specially demanding an architect's attention, except so far as some general perfunctory attention to fall and brick traps was concerned. A good many of the artistic architects are much in default in this respect now, but the knowledge that they are so, and that sanitation is a subject which some one, at all events, must attend to, is forced upon them; and in general there is now a degree of study given to the sanitary requirements of buildings which was not dreamed of fifty years ago; a study which, it may be added, has resulted in the condemnation or absolute reversal of some of the sanitary beliefs and expedients of that period. The other subject we refer to is the progress in regard to the improvement in the habitations of the poorer classes, and the recognition, to some extent at least, of the responsibility resting with landlords and with the Government in regard to this subject. The part taken many years ago by this journal in urging attention to this subject is known to all who are acquainted with the history of the amelioration of artisans' dwellings; and though much remains to be done in this respect, what has been already accomplished may count among the architectural achievements of the present reign; and while we have witnessed the foundation of a new cathedral (unfortunately only a good mediæval copy and with no Victorian *cachet* about it), we may perhaps be justified in thinking that the many blocks of healthy dwellings which have been built during late years, not indeed beautiful architecturally, but representing the possibility of decent, comfortable, and healthy housing for the poor, are as important architectural works in their way as cathedrals and churches. In regard to sanitary progress, by the way, it is worth remarking that one of the most recent pieces of work for which public money was voted was the rectification and putting on a proper and efficient footing the drainage of that same great House of Legisla-

tion, the commencement of which was nearly coincident with the commencement of the present reign; the architecture was done fifty years ago, and adequate drainage supplied now; a significant indication of the progress in practical matters which has been made during the period we are considering.

One of the great works of the present reign has certainly been the embankment of the Thames, which has almost remade that portion of London which borders upon its time-honoured river. Architecturally speaking, perhaps the most has not been made of the opportunity; but still it is a great public improvement, to be numbered among important achievements of the period. The present reign has also witnessed the construction of three important new bridges over the Thames, of which that at Putney, comparatively small in scale, reproduces, however, the essential qualities which went to make London Bridge not only a great engineering, but, in its way, a great architectural work. On the larger bridges lower down the river, Westminster and Blackfriars, one looks with rather a sigh, and on looking to London and Waterloo Bridges, we are disposed to say "the old is better." Though there has been a good deal said of late as to the desirability of drawing architecture and engineering closer together, as a matter of fact the two professions are farther dissociated in the manner and aspect of their works than ever; and the greatest piece of constructional work at present going on, the greatest in some ways that has ever been attempted, is the gigantic structure at the Firth of Forth, from which everything that we generally call architectural design has been entirely eliminated, nothing being left, so to speak, but the bare poles of construction. Such a work as this is an appropriate culmination to a half-century in which the most numerous and remarkable constructional works have certainly been those of the engineers. Engineering has known what it wanted, and the public have known what they wanted from it; that is the secret. In architecture there has been doubt and experimenting on one side, and a good deal of public indifference on the other side. As to the latter drawback, we see little immediate prospect of improvement; architecture is still a kind of sealed book, and a subject of indifference to the public. But the art itself appears to be in a healthier and more promising condition than it was at the beginning of the present reign; it has more of life and originality, is less fettered by precedent, and has a sounder basis of sanitary and constructional knowledge; and these are conditions which may make us hopeful for the future achievements of English architecture during the remainder of a reign which we all trust may still be prolonged for many years.

#### THE TREATMENT AND UTILISATION OF SEWAGE.\*

**T**HIS work was originally published in 1869, after the author had taken an active part in a committee appointed on this subject by the British Association. A second edition was soon called for, and now a third edition is given to the world, with revisions and additions. The general value of the work has, therefore, been sufficiently acknowledged. It consists mainly of extracts and compilations from authoritative reports and other published statements of facts and opinions on the various topics which enter into the subject, and although this deprives the book of much claim to originality, yet it must be remembered that the selection of the matter from such an enormous mass of material involves judgment and knowledge, for which the authors are entitled to credit. The book gives, on the whole, a fair general idea of the question, pointing out its importance, the difficulties attending its solution, and the present state of knowledge and practice in regard to the

measures applied, and, so far as opinions are expressed by the authors, they seem fair and reasonable.

There are only a few points we may remark on. In the first place, it is unfortunate that the authors have not been able to make more use of the proceedings and Reports of the Royal Commission on the Metropolitan Sewage Discharge which sat from 1882 to 1884, under the Presidency of Lord Bramwell. The Commissioners, in dealing with this gigantic and most difficult problem, were obliged to extend their investigations over the whole range of subjects connected with sewage treatment and disposal, and it is allowed on all hands that, independently of their judgment and verdict on the special case before them, their published documents contain probably the most valuable and admirably arranged collection of facts and arguments on these matters that has ever appeared. Dr. Corfield's book testifies, in an Appendix, to the value of the Commissioners' Reports, and gives some extracts therefrom, but mentions that they "could not be conveniently included in the body of the work."

Dr. Corfield sets his face against all proposals for the collection of town excreta, asserting that their removal by water carriage is, on sanitary grounds, the only proper system. This is, of course, natural enough. The inhabitants of towns desire to get rid of this disagreeable stuff as quickly as possible, for "out of sight out of mind"; and if when the excreta were turned into the sewers, and carried into the nearest stream, there was an end of them, the opinion would be right enough. But when their further progress, and the mischief they subsequently do, have to be traced, as Lord Bramwell's Commission had to trace them, the case assumes another complexion, which led the Commissioners to say (II. Report, par. 138) that "considering the difficulties that attend the modern drainage system, the question [of town collection] is one that ought always to receive candid attention and fair discussion." They evidently did not think it beyond the power of engineering and chemical skill to devise, some day, a method of removal of such refuse which, while it would be unobjectionable on sanitary grounds, might prevent the destruction of our rivers and streams, and might do what water carriage probably can never do, namely, preserve to the refuse its high manurial value.

There are two systems in vogue for treating sewage,—application to land, and chemical precipitation; and unfortunately most people who have to do with the subject are strong advocates of one and strong opponents of the other. Dr. Corfield is no exception, he advocates irrigation, in which he is right; but he despises precipitation, in which he is wrong. It is true, as he says, that precipitation has not yet succeeded in drawing from the sewage any valuable product, and also that it will not effect thorough purification. But precipitation will do very great good by extracting the most offensive matters, and it will give greatly increased facility for rendering the whole innoxious and inoffensive.

Dr. Corfield is also, we think, somewhat inclined to undervalue the spontaneous natural purification which takes place by oxidation and other influences in running streams. This is a most important element in sewage considerations, and he may learn much about it from the Sewage Discharge Commission.

The book, in treating of house-drainage, says something about water-supply fittings. The authors have evidently taken their information chiefly from London practice; but they are not aware that London has been about the worst-fitted town in Europe, having been given over largely to the tender mercies of plumbers, patent jobbers, and brassfounders, whose interests are anything but consistent with effectively carrying out a constant water supply. To see how this is done, Dr. Corfield must go to Manchester, or Sheffield, or Norwich, or Nottingham.

We are tempted to say something more on the great London sewage drama, but we had better not give way to the temptation, or we shall not only exceed our space, but lose our temper.

#### NOTES.

**I**T is much to be hoped that the Bankruptcy Offices Sites Bill, now before a Committee of the House of Commons, will not be allowed to pass in the shape in which it has been presented to the House by the Government. If the measure he carried it will inflict an irreparable wrong upon that portion of central London in which it is proposed to erect the new buildings. We have previously referred to the scheme, but may here say that the Bill proposes to empower the Government to perpetuate, in a scarcely modified degree, some of the narrow and tortuous courts which lie between King's College Hospital, Clement's Inn, and Clare Market. We are glad to learn that the Hospital authorities and the Strand District Board of Works are opposing the Bill. The Hospital authorities are chiefly concerned on account of apprehended diminution of access of light and air to their premises, especially to their dissecting-rooms. The Strand District Board of Works oppose the Government scheme on the ground that the erection of the new Bankruptcy Offices on the particular site defined by the Government will effectually preclude the making of a very necessary and long-needed street from the west end of Carey-street to the Strand. That a Government should propose such an ill-conceived measure as this would be incredible did we not know what blunders have been perpetrated in regard to public works and buildings in years gone by. But the metropolis has now a strong phalanx of Members, and it behoves those gentlemen to see to it that the Bill does not pass in such a form as to stand in the way of a very necessary street improvement in Central London.

**A**LTHOUGH the Jubilee decorations and illuminations have been very general in London, there were few that were very notable. The streets which were traversed by the Royal processions naturally made a very profuse display of flags, red haize, mottoes, and flowers; while foliage, flowers, and tinsel were strung together to form festoons dependent from Venetian masts and from house-to-house across the streets. The effect of all this, as seen, for instance, at Regent-circus and Piccadilly, was very bright, though somewhat "higgledy-piggledy." The nondescript "decorations" suspended over the roadway of Waterloo-place, Regent-street were poor in design and wretched in colour, though they were, no doubt, economical substitutes for triumphal arches. In regard to the illuminations, among the most striking and successful effects were those obtained by the use of small incandescent electric lights arranged in rows along or up the main lines of the buildings. The Grand Hotel at Charing-cross was most successfully illuminated in this manner. Messrs. Defries did a great deal of successful work with gas and oil, and a brilliant display was afforded by the illumination of the three principal façades of the Royal Exchange, the Bank of England, and the Mansion House. Another notable display of light in the City was that of the North British and Mercantile Insurance Company, Threadneedle-street. The *Times* office, in Queen Victoria-street, was illuminated by coloured lamps marking the angles of the building, the pediment, and each of the windows, but the colours were not well selected. The *Daily Telegraph* office had a brilliant display of crystal devices, while the *Daily News* advertisement offices were illuminated by electric arc lights embowered in shrubs. The naked perforated iron gas pipe devices (such as stars, crowns, initials, mottoes, &c.), capable of very good effects when there is no wind, did not show to advantage in the breeze which prevailed on Tuesday and Wednesday evenings. Some of these devices of fire were at times nearly completely blown out, and were a long time in regaining their proper forms, only to lose them again very speedily. One of the most successful effects, seen far and wide along the river banks and from the northern and southern suburban heights, was

\* *The Treatment and Utilisation of Sewage.* By W. H. Corfield, M.A., M.D., &c. Third edition. Revised and enlarged by the author and Louis G. Parker, M.D. London: Macmillan, 1887.

the illumination of the tower of the new National Liberal Club on the Victoria Embankment. Just below the base of the conical roof were suspended ten or twelve powerful arc lights. As seen from the immediate vicinity they looked like a circlet of gigantic pearls; from Blackfriars Bridge they looked like a cluster of diamonds. The Junior Carlton Club, in Pall-mall and St. James's-square, had also a very brilliant effect, given by a large number of arc lights.

WE cannot altogether congratulate the country on artistic advance in its new coinage. The head of Her Majesty is a well-executed piece of work, but the additional height given to the effigy by the crown and by the addition of a portion of the bust renders the whole much less adapted to fill the circular area of the coins, the obverse of which has a very awkward appearance, the effigy cutting vertically across it and leaving a large blank space on each side; on the old coins the larger head fills up the space much better, and produces a more correctly decorative effect. The reverse of the half-crown, with its symmetrical circle of delicate alternating devices, is pretty, and shows better decorative treatment than the old one. The new florin, on the contrary, is distinctly inferior to the old one in design: the four radiating sceptres between the shields have a symbolical meaning, no doubt, but they are awkwardly fitted into the design, leaving disagreeable unfilled spaces. The reverse of the old florin is a far better and richer piece of design. The new double florin, or four-shilling piece, is merely an enlarged copy of the new florin.

THE great work on Norman architecture by the late M. Ruprich-Robert is about to be published by MM. Des Fosse & Cie., of Paris (the successors to Morel & Cie.). It will be in quarto form and will contain 100 engravings on steel, eleven in heliotype, four chromolithographs, and a map of ancient Normandy, as well as historical and descriptive text accompanied by more than 200 drawings. From the known ability of its author, the time and care which he devoted to it, and the intrinsic interest of the subject, this ought to prove one of the finest and most valuable architectural publications of modern times. According to the circular sent to us by the publishers the author has preferred, in most cases, to give, not entire buildings in his illustrations, "but portions, separate bays, drawn in plan, section, and elevation, so as to show the system of construction and decoration adopted, rather than more or less picturesque wholes. A common scale has been adopted for certain series of drawings: plans, bays in section and elevation, spires, and other details." Thus it will be gathered that the work is likely to be such as to be specially valuable to architects, and not a mere series of picturesque illustrations.

THE 'Εβδονάς (No. 15) reports the following new discoveries in the Acropolis,—a colossal marble statue which has, unfortunately, lost the head and the greater part of the feet, date not given; a life-sized also headless figure made of polished marble, a small head of very early style, several bases of statues which may possibly be fitted on to figures already found. The next find sounds almost too good to be true,—two bronze statues of Athens are reported, each of about 25 centimetres in height, of very remarkable workmanship. In what way they are remarkable is not told. One of the statues appears to have been discovered between the Erechtheion and the north wall of the Acropolis. It is said to represent Athene in her aspect of Promachos. She wears a long garment and high-crested helmet; her right hand is raised as if she were hurling a spear; her left carries a shield. After discoveries such as these and those which have preceded there will be no excuse if the future historian of Greek art fails to trace the clear sequence of early Attic art. Cannot M. Rhomaides give us a second issue of his book the "Museums of Athens," which began with such fair promise a year and a half ago?

THE death of M. Daremberg, joint-editor of the great "Dictionnaire des Antiquités Grecques et Romaines," is deeply to be deplored, not only on personal grounds, but because the issue of this invaluable work has been no doubt delayed by the fact that M. Saglio, the co-editor, has had to work single-handed. We are glad to find he has at length joined forces with a new and most able coadjutor, M. Edmond Pottier, of the Louvre. The result is the issue of the eleventh part of the work (Cup-Del), and we may now feel assured that the issues will go forward with no unnecessary delay. We sincerely hope ourselves that the next "Encyclopædia" that appears will begin at Z and work back to A. Any one who relies on a lexicon for information on mythology will find himself with a plethora of information as regards Apollo, but he must probably wait some years if he wants to be up to date on Poseidon. Among the most important articles in the new issue are "Curus," by M. Saglio, a really exhaustive treatise on Greek and Latin chariot forms; "Cyathos," by M. Pottier, which will surprise some students of vase shapes; and "Cupidon," by M. Collignon,—this last by no means the best.

SIGNOR GIUSEPPE COLBACCHINI, of Venice, has recently published a brochure of 250 pages entitled "Quattro dipinti di sommi Maestri," giving a description with critical notes of four pictures in his possession attributed to Raffaele, Titian, Leonardo da Vinci, and Andrea del Sarto respectively. The pictures are an Entombment, by Raffaele, signed and dated 1508-9; Diana and Endymion, by Titian, said to have been painted about 1528; a Madonna and Child, by Leonardo da Vinci, believed to have been painted about 1490; and the "Disciples at Emmaus," by Andrea del Sarto. The Raffaele is said to be a hitherto unknown work which is sought to be identified with the picture referred to by the painter in a letter to his uncle Simone di Ciarla dated April 21st, 1508. This picture is signed "R. S." The picture attributed to Titian is said to have been transferred from the Suracco family to the Lombardo family by a deed dated in 1690, and to have remained the property of the Lombardo family from that date until the year 1883, when it came into the possession of the present owner. The book is illustrated by some well-executed photographs of the pictures described.

IN a letter to his friend the editor of the *Berliner Philologische Wochenchrift*, Dr. Milchhöfer reports his discovery of a new dome-shaped grave at Thoricus. He has during his long stay at Athens made a special point of examining, so far as he could, every promising tumulus he came across, but until the present moment with small success. The tumulus in question lies near the high hill Viglaturri, and its circumference at the base is 150 paces. It has been pierced in three places, and it is possible to look down the borings and obtain a tolerably distinct view of the masonry of the interior. The plan of this masonry differs, Dr. Milchhöfer says, from any of the dome-shaped substructures so far known in Greece, but it has a near parallel in the well-known Regulini-Galassi grave. Dr. Milchhöfer is trying to stir up Dr. Schliemann and Dr. Kabbadias (general ephors of antiquities) to a systematic exploration of the tomb, and unless funds be lacking they are not likely to want much stirring, unless, as is possible, Dr. Schliemann prefers to unearth his own fox.

THE Church of St. Lawrence-on-Sea, near Ramsgate, was extensively restored some years ago; it is now proposed to complete the restoration in commemoration of the Queen's Jubilee. The central tower is late Norman; but the rest of the church is of later date, having been remodelled in the beginning of the fifteenth century, when the aisles and transepts were pulled down, the church lengthened, and aisles added, the central tower was raised 6 ft., and aisles added to the nave, and a porch built on the south side. Mr. J. L. Pearson, R.A., has examined the tower and reports that the

piers are substantially upright, the deviation from the perpendicular being in no case more than one inch and in some instances much less. On cutting into the north-west pier the mortar was found to be good and the work substantial. Mr. Pearson proposes, however, to expend 400l. upon the tower. It is also proposed to erect an external staircase to the ringing loft at a cost of 140l., and a further sum of 1,370l. is proposed to be spent on the repairs to the roof and south porch.

IT is now nearly ten years since we noticed\* the proceedings of the Salford Town Council in regard to the "Wilton Hospital Competition," when the designs of Mr. Stephen Salter, of London, were accepted for altering and adding to a row of houses at Cross-lane, Salford, in order to adapt them as a hospital for patients suffering from infectious fevers within the borough. Since that time the hospital has been used for the purpose with, we believe, more or less success, upwards of 4,000 patients having been admitted into its wards up to the end of 1886; but it could never be regarded as a good infectious hospital worthy of so important a borough. It now appears that the London and North-Western Railway Company, requiring to enlarge their premises adjacent to the hospital, have arranged to purchase it from the Corporation, and the latter have accordingly in contemplation the erection of a new hospital elsewhere for their district, and an opportunity is afforded for the erection of a new hospital not only adequate to the wants of the borough, but embodying all the most recent improvements in this important branch of Local Government buildings. The Corporation appear to be fully alive to the opportunity thus afforded them; for, acting under their instructions, Dr. Tatham, the Medical Officer of Health, has prepared a very instructive provisional Report upon the whole subject. Dr. Tatham has taken great pains to obtain the latest information upon infectious hospitals. He acknowledges assistance received from Dr. Thorne Thorne and Mr. Gordon Smith, of the Local Government Board; and likewise from Dr. Collie, of the Eastern Hospitals at Homerton; and likewise Mr. Shirley Murphy, late Medical Officer of Health to St. Pancras, and formerly Resident Medical Officer of the London Fever Hospital. According to this Report, it is recommended that the new hospital should be arranged for 200 patients, though it is considered that, in the first instance, accommodation for only 160 patients may be sufficient; and a site 10 acres in extent is advocated. The amount of space requisite for each patient and the most suitable sub-division of patients, and the arrangement of ward blocks, are next considered; likewise the necessary administrative arrangements and extent of staff that may be requisite for such a hospital. In all these matters the Report is of special interest and value as affording much detailed information respecting the planning and management of hospitals for the treatment of patients suffering from infectious diseases, and, as such, it will be found useful by architects and others engaged upon such works.

IN the course of this season the Hesleyside, Northumberland, and the Langton Hall, Yorkshire, estates will be offered for sale. The former is a manorial freehold of some 22,000 acres, locally famed for its picturesque situation in the North Tyne Valley, to whose scenery it largely contributes. Within the confines of this property lie portions of the quaint old town of Bellingham, site of a Roman Station. Here is excellent fishing for salmon in the North Tyne, which forms a wide stretch of water within the park, and for trout in the Irthing. The holdings on the estate comprise several stock-breeding farms, of good repute in the county. Langton Hall, of red brick, in modern Gothic style, is distant five miles from Northallerton. Approached by a stately avenue, it overlooks the Vale of Mowbray, and the Swale, renowned for its grayling. The agricultural portion of the

\* See the *Builder*, Nov. 2nd, 1878, vol. xxvii., page 1159.

estate, which is 1,230 acres in all, yields an annual rental of 1,300*l.*

WE have to mention two more memorials to the late Earl of Shaftesbury. On Friday, June 17th, Louisa, Lady Ashburton, laid the first stone of the Shaftesbury Memorial Mission Hall, in Kerbey-street, East India Dock-road, where the committee's labours will be devoted to gospel services for adults and the young, a Sunday ragged school, winter lectures, and above all, to the providing of meals for destitute children. On the same day the Prince of Wales performed the same function on behalf of the new Home in Shaftesbury-avenue, which has been established by the Society of National Refuges for Homeless and Destitute Children. The Society began their operations in 1843, with a first year's income of 180*l.*, in a cow-shed left in a now demolished St. Giles's rookery. In 1852 they opened their Ragged-Schools and Home in Broad-street, St. Giles's, and secured a lease of No. 8, Great Queen-street, where 150 boys are housed. In addition to the training-ships, *Chichester* and *Arcthusa*, they have opened industrial schools at Fortescue House, Twickenham; Bisleys, Surrey; at Sudbury; Ealing; and elsewhere. They have accommodation for 1,000 boys and girls. For twenty years past the Society's income has exceeded 20,000*l.* per annum. This new Home, to be styled "Shaftesbury House," is intended to take the place of a temporary home at 25, Great Queen-street. The architect is Mr. E. P. Loftus Brock, F.S.A.

ON Thursday, June 16th last, the President and Council of the Zoological Society celebrated the Jubilee by a reception of the Fellows and their guests in the Gardens. The Society was founded in 1826 mainly by the exertions of Sir Stamford Raffles, Sir Humphry Davy, and Lord Darnley: the first-named giving to it as a nucleus for the museum his fine collection which was originally stored at No. 33, Bruton-street. Sir Francis Chantrey and Decimus Burton laid out the ground which the Government allotted to the Society; Burton also built the animals' houses and other enclosures; and the Gardens were opened in 1828. King George IV.'s menagerie was removed hither from Sandpit-gate, Windsor, in 1830, and four years later the last of the "lions" from the Tower. The Aquarium, being the first of its kind, was constructed in 1854.

THE Crown Lease of St. John's Lodge, at the northern side of the Inner Circle, Regent's Park, together with its twelve acres of private ground, is about to be sold. This finely situated mansion, designed by Decimus Burton, was long the residence of Sir Isaac Goldsmid, and is now occupied by his widow.

THE Reform Club, which has just celebrated its fiftieth anniversary, was established by the Right Honourable Edward Ellice from out of the old Westminster Reform Club, which existed, rather than flourished, for two years. Brooks's refused to countenance the enterprise, and the members were at first fain to rent some rooms in Carlton House-terrace. Nevertheless, on the Princess Victoria's birthday their numbers had reached to 1,000 subscribers, of whom, it is said, ten are yet living. In June, 1838, certain houses were demolished in Pall-mall,—one of them being Angerstein's, No. 103, and which had held his picture gallery,—for the present building, whereof the elevations were adapted by Barry from the Farnese Palace in Rome. Here the Reform Club was installed on March 1st, 1841, removing from Gwydyr House, Whitehall, since occupied by the Local Government, or old Poor-Law, Board and now by the Charity Commission. At Gwydyr House they gave their historic Coronation feast.

IN virtue of the Medina Suhway Act, 1884, a company has been incorporated to construct a subway beneath the mouth of the Medina river, in order to connect the two towns of East and West Cowes, Isle of Wight. The existing ferry is about 140 yards

across, its traffic, being carried in boats and a steam chain vessel, is at present leased by the Commissioners of Her Majesty's Woods and Forests. Failing the ferry, a detour has to be made inland, *via* Newport, which is distant between four and five miles. The new subway will be about 430 ft. in length (with easy approaches), and high enough for the passage of a four-horse coach. A contract has just been made with Messrs. Green, Parker, & Co., of Cardiff, for the construction of the works within eighteen months, for the sum of 43,000*l.* The company's engineer is Mr. James Aher-nethy, of 4, Delahay-street, Westminster.

ON Saturday, June 11th, the Baroness Burdett-Coutts laid the foundation-stone of St. Augustine's Church, Archway-road, Highgate. It replaces the little iron church in All Saints' parish, which the congregation have, much to their credit, voluntarily supported for the past twelve years. When completed, the new buildings (Mr. J. D. Sedding, architect), including vestries and classrooms, will cost altogether 7,500*l.* The purchase-money, 500*l.*, of the site was originally met by a grant from the Bishop of London's Fund, and a loan, in 1874. All Saints' parish had then just been taken out of the ecclesiastical district of St. Michael's; and all this part of it, with a now population of 4,000, was green fields.

A FEW days ago the Marylebone Cricket Club commemorated their first centenary by giving a banquet in the Tennis Court at Lord's. The oldest recorded match of the Marylebone Club is one in which the members took part, May 27th, 1788, on the ground that is now covered by Dorset-square. They migrated to Lord's ground in 1814 or 1815. The present cricket-ground, originally about 7½ acres in extent, has been somewhat enlarged of late years along its eastern side by the florist's garden. The reshulding of the tavern, the erection of stands and turfed ranges of seats, together with the making of new entrances and carriage drives, have quite changed the pristine aspect of the ground.

A MONGST the pictures of the late Earl of Lonsdale which were sold on Saturday last [June 18th] at Christie, Manson, & Wood's, were two large views, by P. Pannini, of the exterior and the interior of St. Peter's, at Rome, together with his Forum, and composition of Roman ruins. The collection included Hogarth's portraits of Mrs. Garrick, in straw hat and pink and white dress, from the Wadmore collection; and of Peg Woffington, in a blue and white gown, and having a canary bird on her left shoulder; some "heauties" by Lely; Gainsborough's "Horses Drinking at a Spring," formerly in Mr. J. L. Parker's collection; Reynolds's laughing girl, which was exhibited, together with the last-named, at Burlington House in 1867; a Teniers; several Watteaus; Lawrence's portrait of J. Wilson Croker; and so on. Three views of London by S. Scott are worthy of record. The largest, being 36 in. by 54 in., is a perspective of the Tilt-Yard, or, as it is more commonly termed, the Horse-Guards' Parade, St. James's Park, as seen from before the now demolished Gun House. The troops are shown as exercising; in the distance stand the Treasury Chambers and the Prime Minister's Lodgings on the northern side of Downing-street. The other two, 18 in. by 36 in., delineate London and Westminster as seen from the Thames,—that is, from a point about level with the Privy stairs below Labeyle's Westminster Bridge (1747); and from what we take to be the earlier Temple Gate, near to Whitefriars. Scott's view of Blackfriars and Bridewell Dock may now be seen in the Guildhall Art Gallery. His Westminster shows Derby House, and the Bear at the bridge foot: this painting was engraved by Canot in 1758. The Lonsdale Canalettos include two paintings of the Rialto and the Grand Canal.

ONE of the best positions for viewing the procession on Jubilee Day was the stand erected by Messrs. John Mowlem & Co.

in front of the large block of buildings in course of construction on the south side of Piccadilly, at the corner of Arlington-street, belonging to Lord Walsingham. The stand was gaily decorated, and an excellent hand, hidden in the building, played at intervals. Among the company were Lord and Lady Walsingham, Hon. W. Gody (Buffalo Bill, whom Her Majesty recognised as she passed), Mr. Alfred Waterhouse, Col. Haywood, Mr. Thos. Blashill, Mr. T. Cuhitt Nicholls, Mr. W. O. Milne, Mr. Geo. Crickmay, and others.

IT appears from a paragraph in last week's *Illustrated London News*, before which, as the Laureate says,—

—"He bare  
The abyssal depths of personal(j)ty."

that the will of the late Mr. George Devey, architect, who died on the 4th November last, was proved on the 2nd inst., the value of the personal estate amounting to over 32,000*l.* This is a pretty large sum, as times go, for a man to have accumulated by his own exertions in a profession the emoluments of which are not over-liberal, and proves that if some members of the profession are scarcely remunerated there are others who must be looked upon as fully compensated for their exertions. The three richest men in the profession of late years were Sir Wm. Tite (who, as he was wont to boast, inherited one fortune, made a second himself, and married a third), Mr. J. B. Bunning, and Mr. Lewis Vulliamy. Mr. Devey leaves legacies of 100*l.* each to the Architects' Benevolent Society, the Artists' Benevolent, and other societies. The residue of his property the testator, who was unmarried, bequeaths to his brother and sister, in equal moieties.

A CORRESPONDENT writes:—"In your issue of the 4th inst., 'An Architect' is stated to have said, 'Temple Bar has been sold and will shortly be erected in private grounds,' and in your next issue the *City Press* is stated to have contradicted this. Allow me to state I had a conversation with a contractor just a month since, who stated he actually had the contract to erect this ancient relic in a gentleman's park not fifty miles from the City." Is this the case?

ARCHITECTURE AT THE ROYAL ACADEMY.—IX.

1760, "Church of St. John the Baptist, Brighton: Proposed new Façade and Tower," Mr. Samuel J. Nicholl. A good water-colour drawing (illustrated in the *Builder*, May 21) of a very clever and original design, which has the unusual merit that, while it looks well, it is impossible to pigeon-hole it under any special style. A deeply-recessed round-arched doorway between two solid masses of masonry is richly decorated with ornamental details and figures of cherubim; in the tympanum of the arch, over the square-headed doorway, is a mosaic subject on a dark blue ground. A strong dentil cornice terminates the sides of this portion of the building, and runs round across part of the front, but is interrupted over the doorway to give space for a large circular window, with mullions in the form of a cross, and a boldly-sculptured wreath surrounding the architrave. The whole front is finished with a pediment with a raking cornice. The manner in which the main architrave is broken and lifted up to form a lintel to the two windows on each side of the entrance is an eccentricity which would shock an architectural purist; but it does not look bad. The tower is not quite so effective as the façade, but harmonises with it in general treatment; the detail might be improved here. The building is one of the most distinctly original designs in the room.

1761, "New Church at Stratton, Hamp-shire," Mr. T. G. Jackson. A small and unpretending country church with a low tower at the north side of the chancel, with a slated or tiled spire; apparently built of flints or small rubble, with ashlar dressings; a chequer work of squares is formed over the east wall above the sill line by the arrangement of the two materials, and an inked wall arcading formed below the east window in the same manner; a similar arcading is repeated on the plinth of the tower. The whole is very

"country-church" looking, with a touch of novelty about it, though strictly Gothic in detail. The windows in the upper stage of the tower seem crowded rather too closely up to the eaves.

1762, "Design for Roman Catholic Church, N.B.," Mr. A. J. Gordon. An exterior of a Gothic design shown in a rather mechanical pen drawing; the only notable point about it is the curious treatment of the tower, a large square one with no buttresses, built with a considerable batter, finishing with a heavy corbel table in a castellated style, with a solid stone lantern or short spire above, and heavy angle turrets. This is apparently by way of assimilating a Scotch church to the Scotch castellated style, and the feature is effective in its way, and would have been still more so if the author had kept the stalk of his tower a more unbroken mass instead of cutting it up so much with windows of various shapes and having no particular relation to each other.

1763, Chapel, St. Chad's College, Denstone," Messrs. Carpenter & Ingelw. A simple Early Gothic interior with an open timber roof; hung too high to be well seen.

1766, "A Parsonage," Mr. John Cash. A pretty and artistic sketch in pen-and-ink of a picturesque house, but the author in his anxiety to escape from the hardness of anything like rigid lines has gone to the other extreme and been unnecessarily "shaky" in many places. There is a reaction against rulers at present in architectural drawing, — a reaction long wanted; but it does not follow that one should go to the opposite extreme and draw a building without a straight or even a clean line in it. To draw clean lines without the ruler is the desideratum.

1767, "The Old Gatehouse, Lanhydrock, Cornwall," Mr. J. M. MacLaren. A very harmonious and artistic water-colour drawing of a charming old gate-house, with octagonal turrets flanking a semi-circular archway; a curious mixture of very Late Gothic and half Classic details, with a battlemented finish and singular pinnacles with hall terminations, and apparently supported on groups of similar ball objects.

1768, "Entrance Porch, Quarrydene, Westwood, Leeds," Mr. W. H. Thorp. Apparently this is hung under the last-named as a modern comment on it, for here are seen, carefully drawn out, the same ball-supported and ball-terminated finials. The drawing is a clean well-executed pen perspective of a porch dated visibly "1885," but imitating the manner of the English Renaissance.

1769, "Byrkyte Lodge, Staffordshire, North-East View," Mr. R. W. Edis. A very good "architectural draughtsman's" water-colour of a large red brick mansion with stone dressings, mullioned windows, angle quoins, and Classic columns to the porch. The tower over the entrance, with octagonal angle turrets, is the only departure from general Elizabethan detail. The general appearance is dignified and has the proper "English gentleman's mansion" appearance, though with nothing special to remark in it. There is no plan.

1770, "Bank of England: New Fleet-street Branch," Mr. A. W. Blomfield. We may refer our readers to the illustration of this, published in the *Builder* for May 21 last. It is a powerful-looking design, with a "bank" appearance given to it by the heavy rustication up to the line of springing of the entrance-door, a less marked rustication being continued up to the first-floor cornice. The symmetrical square pavilions at the four angles increase the look of solidity characteristic of the whole. Classic style, we presume, was an imposed condition, the branch Bank of England buildings having all been erected in a style intended to connect them with the central establishment; indeed, the present design shows considerably more breaking away from Bank of England precedents than we have noticed in any other of these buildings.

1771, "New Chancel and Transepts, Dewbury Parish Church," Mr. Arthur E. Street. This is a large and rather bare-looking water-colour of an interior with a marble floor of various colours, and piers and arcades white in one portion of the drawing and brown in the other; this seems like an attempt to differentiate to the eye the new and old portions, but if so it is overdone, and the result on the drawing is not happy. The new (?) portions show arcades without any impost (at least in the chancel) of late Gothic type, carried out with

knowledge of the style, but with no feature calling for special comment.

1772, "Killesley Hall, near Scarborough," Messrs. S. E. Smith and J. Tweedale. Two exteriors and an interior of a house apparently very picturesquely treated, and which might have claimed to be hung lower than it is. The effectiveness of the building is derived in great measure from the characteristic grouping of the features; the rows of small windows in one portion, the two large mullioned windows grouped on the other front, the half-timber marking another portion. There is no plan, so we cannot tell how far these variations express the interior.

1773, "House at Bickley," Mr. Ernest Newton. Over-acted simplicity; a house that seems to say, "Observe how humble and unpretending I am." That is a kind of architectural affectation, though by no means so disagreeable as the affectation of the opposite kind.

1774, "Scheme of Decoration for a Drawing-room," Mr. John J. Shaw. This is an effective piece of work, though better suited for a dining-room than a drawing-room. There is a door and dado of dark wood, with carved panels (medallion heads of Homer and Dante in the two principal panels); a frieze over the door of gilded Cupids and seahorses with entablature over; crimson wall panels with a floral diaper; a peacock frieze at the top of the wall in long panels, and interrupted by gilded winged genii between the panels. The general effect is rich, though a little sombre, and the peacock frieze very finely and decoratively treated.

1775, "Lower Ince Church, Wigan," Messrs. Paley & Austin. This is a charming little church exterior with a good deal of character, with its double transepts and picturesque bell-gable with an octagonal spire rising from the middle of it; but why did the authors do injustice to it by so hard and mechanical a drawing? The ruler has had it all its own way here, at any rate.

1777, "New Church at Northington, Hampshire," Mr. T. G. Jackson. A church in Late Gothic style, with four-centred windows, and treated otherwise much in the same manner as No. 1761, already mentioned, with a similar inlaid wall arcade under the windows of the octagonal east end; the church is a rather larger one, and is battlemented throughout, giving a different and less rural expression. The small pinnacles springing from the buttress slopes look very feeble; they may be proper to the *genius loci*, but they have no other recommendation.

1778, "Interior of Notre Dame, Châlons-sur-Marne," Mr. Arnold B. Mitchell. A very well-drawn perspective of this fine Early Gothic interior, executed with the same white spaces and brush-shading as in the author's other drawings exhibited; it has the advantage of getting an effect very quickly, and with little labour on the drawing, and the author knows thoroughly how to use it.

1779, "Entrance Lodge, Walmer, Kent," Mr. James Neale. A study of a large tree trunk, with the lodge behind as a secondary object. The whole makes a pleasant little picture.

1780, "Club-house, Ship-ton-on-Stour," Mr. E. W. Mountford. A small drawing of a village club-house, looking like what it is intended for.

In concluding these brief notes on the architectural drawings of this year, from which we have omitted only those drawings which seemed to present nothing for remark (which were not many), we may draw attention to what we have more than once adverted to in passing, the too great prominence which seems to be given, in the choice of drawings for hanging and in the placing of them, to mere effectiveness of draughtsmanship. It seems to have now come to this, that if you can get one of two or three favoured draughtsmen to make your drawing, you are pretty sure to get her, even with an indifferent design. We never remember to have seen before such large groups of drawings with the names of various architects attached to them, but obviously all drawn by the same hand. This is just what ought not to be. It is reducing the architectural room to an exhibition of draughtsmanship. There ought to be special favour shown to those architects who make their own drawings, provided the designs are good, rather than to those who merely exhibit their capacity of appreciating and paying a popular draughtsman.

#### THE NEWCASTLE EXHIBITION.

We have not had an opportunity before this of giving any special account of the exhibition at Newcastle, which, though on a much smaller scale, and in other ways less important than the Manchester Exhibition, holds a very good place among general exhibitions of this kind, and has the merit of being well classified and arranged.

The buildings are arranged in a quadrangle extending about 600 ft. from north to south, and 500 ft. from east to west, enclosing a centre court or garden 340 ft. by 270 ft. The North Court, at the east end of which is the main entrance from the north road, is much the largest in area, being about 200 ft. in width; the South Court being only a comparatively narrow one of about 60 ft. width. Outside the North Court, and adjoining its north side, are the exterior gardens, where an artificial lake has been formed, chiefly for the purpose of giving as much of realistic effect as may be to the reproduction of the old Newcastle bridge, which is built in an oblique line stretching over the water. Various pavilions are disposed about this part of the grounds, many of them partaking rather of a "fancy fair" character, including a Paris panorama, a camera obscura building, a chalet of Swiss goods, a toboggan slide, &c., though there are also more practical exhibits to be seen in the grounds.

The North Court contains the exhibits in illustration of the great engineering industries which form the most prominent portion of the exhibition, and some of the most important of which are specially connected with the neighbourhood of the Tyne. Marine architecture, steam engines, heavy forgings, and ironwork generally, are here represented; forming a curious commentary on the history of the neighbourhood which first became notorious, and had a name, by the building of "the new castle on the Tyne," still in such excellent preservation, though now the oldest conspicuous monument in the place to which it still gives the name of "new." The material progress is extraordinary enough, as also the change from the feudal domination of the castle to the development of a great industrial centre; but possibly the moral progress in some ways is not so great, after all. The building of a castle with walls of some dozen feet or so in thickness was one way of overawing your neighbours and imposing your own will upon other people; it seems a clumsy way now, and would, at all events, be inefficient in the present day; but, after all, the scientific manufacture of guns at the Elswick works, which are very largely represented here, is only a highly-elaborated effort in the same direction.

However, the arts of peace occupy, no doubt, the larger portion of the Newcastle Exhibition. The right-hand alley of the North Court, as we enter, is mainly devoted to ship-building exhibits. We may observe that the numbering of the exhibits for cataloguing has been done in a much more systematic manner than is generally the case in such multifarious exhibitions as this; exhibits being ticketed in numerical order down the right-hand side of the first aisle, up the left-hand side, and then down the right-hand side of the next, and so on: a simple matter, it may appear, but one which is seldom properly attended to. The result is that in the Newcastle Exhibition it is in most cases possible to find an exhibit which you wish to see, from its number in the catalogue; and we have been in few such exhibitions where this was the case; certainly it was not so at the large shows held during the last few years at South Kensington, and notably not in the permanent South Kensington Museum itself, where nothing can be found except by chance. Armstrong, Mitchell, & Co. are the great exhibitors in the marine architecture department; their works being represented by a great number of beautifully-executed models, some of them sectional, and representing vessels of almost all classes and for various Governments, but fighting vessels of various types predominating. Among the specialties in the exhibits of this firm are half models of vessels built for service in the Caspian and Black seas for burning petroleum fuel; a half model of the twin screw steamer *Faraday* built in 1874 for cable laying, with how and stern-alkie, and a rudder at each end for moving either way with equal facility; and a model of the 100-ton floating crane *Atlas*, built in 1885 for the Mersey Docks and Harbour Board, five-knots speed, built to lift 100 tons at a radius of

30 ft., the counterbalancing being regulated by water ballast. The Italian Government, "per H. F. Swan, Esq., Newcastle-on-Tyne," are large exhibitors of marine models, including sectional models of some of the largest of the Italian ironclads. Among their exhibits is also a model of a Venetian galley of the fifteenth century, with three banks of oars on each side; but the accuracy of this reproduction seems doubtful; at least, if it correct the efficiency of the three tiers of oars must have been more imaginative than practical. Among various exhibits in this gallery we noticed Messrs. Dohson & Co.'s patent steam hopper vessel, as used on the Onse improvements for the construction of training walls and embankments; a vessel constructed for carrying ballast and stone in hoppers, to be dropped through the bottom for deposit in building up embankments. Messrs. Call & Davis's exhibit of steel and iron sheets shows the ductility of their mild steel by a sheet bent cold in eight folds lying one upon another,—a pretty good practical test.

The next aisle of the North Court shows some large locomotive engines, among which, exhibited by the North-Eastern Railway Company, is "Locomotion," the No. 1 engine on the Stockton and Darlington Railway, built by G. Stephenson in 1825, with two vertical cylinders rising from the top of the boiler, working with cross-heads and long connecting-rods on the wheel-cranks. A curious spectacle it must have made when in motion. The position of the cylinders seems, at all events, calculated to avoid the difficulty of cooling of the cylinder, and consequent condensation of steam at starting, which in the modern locomotive requires the provision of a special tap for blowing the water from the cylinder. Next to this, in effective contrast, is a new engine of the largest size from the Doncaster workshops of the Great Northern Railway Company. Near this is a locomotive exhibited by the North-Eastern Railway Company, designed by their locomotive superintendent, Mr. J. M. Worsdell, which is of special interest: it is a modification of the principle of Mr. Webb's three-cylinder engine for utilising waste steam at low pressure, in use on the London and North-Western Railway, and to which we have more than once referred. Mr. Worsdell's engine works with only two cylinders,—a small high-pressure (18 in. diameter), and a large low-pressure one (26 in. diameter), side by side; the high-pressure one can be used alone at starting. Whether this simplified arrangement gets rid of any of the difficulties experienced in the three-cylinder engine at starting only practical trial can prove; the engine has been running for three months on the North-Eastern Railway, but what its performances have been we have no direct means of knowing. Near this we observe in the catalogue, but did not notice it at the time, what, if it acts well, ought to be a very useful improvement in tramway cars, by the Ashbury Railway Carriage Company, namely, a reversible tram-car turning round on a hogie frame, so as to avoid the necessity of uncoupling the horses and taking them round at the end of every journey. Among the rolling stock exhibits is an engine specially made by Messrs. Hawthorn, Leslie, & Co., of Newcastle-on-Tyne, for a light 3 ft. 6 in. gauge line in Australia; and boiler and furnace arranged for wood-burning. There is also a locomotive by Stephenson & Co., of Newcastle, from the designs of Mr. Adams, of the London and South-Western Railway Company, described as fitted with Adams's patent vortex blast pipe, which has been in use on this railway since 1885, and is stated to have effected a considerable economy in fuel, but the principle of the blast pipe in question is not illustrated. The engine is on the well-known pattern in use on the London and South-Western Railway, with a front hogie carrying four leading wheels, with the wheel base far in advance of the main bulk of the engine. How does this hogie frame, pushed in advance, with the weight of the engine behind it, behave in running fast on a down gradient, is a question we should like to see put. We believe some of the drivers have opinions on the subject.

It is impossible to do more than note a few more of the principal exhibits among the mass of work to be seen in the North Court. As before mentioned, the Elswick gun manufactory is very largely represented, and the description of the work occupies some pages of the catalogue, and constitutes a kind of brief sketch of the recent history of English gunnery. A

model (full size) of the 110-ton Elswick gun is exhibited, with a lengthy description; a 30-pounder "rapid-fire gun," field guns, howitzers, and Gatlings; also projectiles, including the shell for the 110-ton gun, weighing 1,800 pounds. A statement of the cost to the country of firing each round of this gun would have been an interesting statistic. From the great guns to the surfaces for resisting them is a natural transition; and Messrs. Brown & Co., of Sheffield, exhibit, among various other specimens of forging, some steel-faced armour plates. The Darlington Forge Co. exhibit some fine work in solid and "hull" cranks and other heavy forgings; and the Leeds Forge Company show, among other things, a very large frame plate flanged at one heat from a single plate of Leeds steel. Among the specially illustrative exhibits are those of the Darlington Steel and Iron Co., who illustrate the process of rolling railway iron, giving pieces showing the forms taken by the bar after each successive roll, from the square "bloom" to the finished rail; and those of Messrs. Bell Bros., of Middlesbrough, who give a very complete set of specimens showing "what it takes to make one ton of Clarence pig-iron" in the shape of examples of the ironstone, the coal, the quantity of limestone used, and one ton of iron, and the slag resulting from the smelting of the materials. The Kirkstall Forge Company show rolled shafting in steel and iron, which boasts to be of such finish that no turning is required, and the specimens shown are certainly admirable examples of what can now be done in rolling-mills. Messrs. J. & F. Howard, of the Britannia Ironworks, Bedford, exhibit the materials for a patent portable railway, with steel sleepers, the sleeper and chair "in one piece, and the rail keyed up with a metal safety key. The Wallsend Slipway and Engineering Company send a fine specimen of boiler architecture, built up in Siemens-Martin steel, manufactured by the Steel Company of Scotland. Among the engine exhibits we should not have passed over Messrs. Hawthorn, Leslie, & Co.'s triple expansion engines, with cylinders of 20 in., 27 in., and 42 in. diameter respectively, for developing a large power with a light weight: this type of engine being specially intended for torpedo cruisers. Messrs. Taylor Bros. give a number of samples of iron and steel castings and forgings; and Messrs. Tozer & Son have a good exhibit of steel sleepers, with self-fastening cast-iron chairs, clipped on without the introduction of any bolts or other fastenings. If these are to be relied on, they ought to constitute a considerable economy in platelayers' work on railways.

Messrs. Donlon & Co., it may be mentioned here, have two elaborately decorated interior pavilions erected just within the entrance to the North Court, exhibiting both the artistic and the sanitary work of their firm.

In the East Court, to the left from the main entrance, are grouped a good many exhibits of a class coming more or less under the head of furnishing and decorative work of various types. The first object numbered in the catalogue is a "Jubilee Mining, Engineering, and Science trophy," in silver, of which the less said the better; the main portion of it is a poor model of the famous tower of St. Nicholas Church, one of the well-known architectural attractions of Newcastle. The second number is a much less pretensions item, which, however, deserves praise; an "excelsior" blind-cord and pulley, by Messrs. Hargreaves, of Stockton-on-Tees, in which the blind-cord is kept stretched by a neat looking brass weight attached to the pulley-slide; simple enough, but entirely effectual, and which cannot get out of order until the cord breaks from age. There are a set of decoratively furnished rooms here, a feature one meets with in every exhibition now, whether it be "Healtheries," "Inventories," or whatever else in "ies." There is nothing very remarkable about these for the most part; but they are well up to the usual mark. Some of them are by well-known London makers. Messrs. Jeffery & Co., and the Lincrosta Company, have stands representing the class of work for which they are so well reputed; others are by local firms; among these a very good display is made by Messrs. Robson & Sons, cabinet-makers, of Newcastle, including a lobby, morning-room, and bondoir furnished, which are very well done, with the exception of the mistake of waxing and polishing the mosaic floor of the lobby,—a complete mistake to make in the treatment of mosaic. The hono-  
 r

has a very fine wall fabric, and a good ceiling in fibrous plaster. Messrs. Bainbridge & Co. have also a good suite of rooms in what they rather freely call the Italian Renaissance style; the title may do for want of a better; the general effect of furnishing is rather out of the common way in colour, and mostly rich, and good in effect; too much blue in the dining-room upholstery. Messrs. Sopwith & Co. exhibit an "Oak Jacobean Dining-room," with some very well-excited furniture of a rather heavy type, including a black oak cabinet, made, so we are informed, from "out of part of the oak taken from the old Tyne bridge built by the Emperor Hadrian, A.D. 120,"—a respectable antiquity for any wood. Messrs. Chapman & Son's furniture is also to be commended. But the most extensive, and, in some respects, most striking native exhibits of this class are those coming from Messrs. Emly & Co., of Newcastle, Gateshead, and Glasgow. These comprise a considerable amount of furniture of various kinds, costly, and highly finished, but, to our thinking, rather handsome than artistic. Another room by this firm represents the saloon of a passenger steamer in marble; that is, a complete veneering of the bulkheads with this material. The marble work and upholstery accompanying it are in excellent taste and of the best finish, and form a curious example of the present idea of luxury in regard to the fitting of passenger vessels. But the question is, how far is this practically suitable for a ship? It must be very difficult to ensure such rigidity in the bulkheads of even the largest iron vessel, straining in a heavy sea, as would leave no chance of disturbing a veneer in a substance so rigid as marble; and, to our thinking, such a material is quite out of place on board a ship. The third exhibit by the same firm is open to no such objection. It consists chiefly of an altar and recesses of Pavonazza marble for the new Church of St. George, Jesmond. The material is a grand one, and nothing could be better in its way than the work, especially the execution of the deeply-cut floral diaper on the panels on each side of the altar. The work is from the designs of Mr. T. R. Spence, of London, and does credit both to designer and executants. Among other exhibits in the same court Messrs. Hobbs, Hart, & Co. show a steel hull safe in one piece of steel, door also in one piece; a new method for special security; besides a number of other examples of work of the highest class of its kind. Mr. J. Farthing's very elaborate inlaid walnut cabinet deserves a special word of recognition as a very fine piece of work; and, though not quite on the same grounds, we cannot pass over the enterprising manufacturers (Rolls & Son, of London, and Coxon & Co., of Newcastle) who have challenged attention to their linoleum and floor-cloth exhibit by arranging the rolls and sheets of the material "so as to represent a Byzantine arcade!" Their staff, as well as that of Messrs. Anderson & Lee, near them, shows some good and tasteful patterns, however.

In the West Court is a good exhibition of the work of the Royal School of Art Needlework. A considerable portion of this court is occupied by exhibits of which it does not come within our province to notice; but we may mention that there is a large exhibition of carriages of various kinds by Messrs. Prond (Carlisle), Lawton & Co. (Liverpool), Atkinson & Phillips (Newcastle), and the Institute of British Carriage Manufacturers (London). These latter exhibit, as we observe from the catalogue, a large number of drawings and engravings illustrating the progress of carriage manufacture, which ought to be of much interest, but which we were unable to spare time to examine. Various presentation carriages and harness suites are lent by the Queen, and among other carriage exhibitors are Messrs. Mason & Co. (Birmingham), Forder & Co. (London and Wolverhampton), Ridges & Co. (Newcastle), Angus & Co. (also of Newcastle), and Selby & Co. (Birmingham), who exhibit some "safety axles" and other improvements in various carriage accessories.

Machinery in motion, of which, however, there is not a very large exhibition, finds place in the West Court; this includes, however, a considerable amount of exhibits which we have not space just now to notice in detail. Among things we specially noticed as of interest in connexion with buildings is Walker's "Anti-Vibration Shnter" for air-driving fans, the principle of which consists in partially

closing the opening through which the air is propelled by two cheeks in the shape of long triangles, following the curve of the periphery of the fan, and leaving an opening for the air-passage in the shape of a long inverted  $\Lambda$ , the blast of air coming into play gradually by a kind of *crescendo* arrangement, with less marked pulsation than through a rectangular opening. A working Blackman propeller is also shown, with satisfactory results. Among materials exhibited, we noticed the blocks of Frosterley marble from Messrs. Pease's Weardale quarries, a remarkable-looking marble showing a diaper of fossil-vegetation marks on a black ground. The "North of England School Furnishing Company" have a good exhibit of various types of school furniture, including a "Hygienic Chair," fitted with an "adjustable spinal pad," to be moved up and down of the centre vertical rail of the chair back, as required by the special conformation of the sitter. Messrs. Armstrong, Addison, & Co. show a considerable number of examples of creosoted wood, including specimens that have been in use as railway-sleepers and in other somewhat similar situations for many years, and give a good account of the preservative influence of creosoting. Messrs. Walker & Son, of Newcastle, have a good exhibition of stoves and grates, and Messrs. Emley & Sons, of the same city, a large and multifarious exhibit, including door-springs, lock-furniture, hand-lifts, kitchen-ranges, &c. Messrs. Dinning & Cooke's (Newcastle) stable fittings are worth attention, especially their granite-concrete floor; and the Carron Company are well represented in ovens and cooking apparatus, especially designed for large establishments. Messrs. Craggs & Son's (Newcastle) chimneypieces and decorative work in British and foreign marbles, is a good exhibit, as also that of Messrs. Smith & Co., of Coalville (Leicestershire), of ornamental floor and wall tiles. Messrs. Duffy & Son exhibit their "unwearable" system of wood-block flooring, the pieces grooved at the sides and tenoned at the ends.

A series of "artisans' exhibits" in this portion of the exhibition is a good idea in itself, but it cannot be said that it shows in most cases anything beyond diligence and neatness in the construction of models of various kinds. Mr. C. Bain, of Gateshead, is to be credited with a well-executed model of artisans' dwellings for large towns, executed in wood; but there is no new suggestion in it. Models of engines and ships, many of them very well executed, are tolerably abundant. Among things that are more than mere models is the model by Mr. Macallum (of Leanington, Northumberland) of an improved accommodation ladder for ships and tidal landing-stagings, in which the steps remain level at whatever inclination the ladder has to be placed, and the ladder can be lowered to suit boats at whatever draught the ship may be. This is an ingenious, and appears a practical exhibit. Mr. E. Rowe (Chilton Moor, Durham) exhibits a model of what should be a very important idea, if practical or practicable, a "coal-getting machine," consisting of "a simple wedge" acted upon by hydraulic power; "no explosives required." The model, however, is rather a sketch than an actual model; at all events, it is not sufficiently worked out in detail to enable one to judge of the feasibility of the idea, which we should rather doubt.

The "outside lean-to" or shed adjoining one side of the buildings is chiefly devoted to materials connected with building. Messrs. W. B. Wilkinson & Co. (Newcastle) have a good exhibit here, including what they call "spectacular granite" pavements and flaggings, a good looking material, probably capable of a great deal of wear; they show a fireproof concrete floor without iron joists to carry a safe load of 2 cwt. per superficial foot, and a concrete bar with iron inserted, carrying weights, to show its resistance to transverse strain. "The rod alone will bend with 1 cwt., the concrete alone will break with 3 cwt.; the two combined carry 6 cwt." We are quite prepared to believe this, but the value of the "preparation" would have been increased if the size and position in the concrete of the iron rod, had been shown in section.

Grindstones take a considerable place among the exhibits here, being articles of great importance in a manufacturing district. The Lunley Brick Co. show some good-looking glazed bricks; Messrs. Ferens & Love (Durham) some sanitary ware. The Nor-

manby Brick and Tile Company show some good terra-cotta glazed ware and bricks, and Messrs. Harriman & Co. (Newcastle) show an excellent quality of bricks, sanitary pipes, and traps, &c. Messrs. Rimmington Bros. (Newcastle) are also well represented as producers of this same class of work. Messrs. R. Boyle & Co. exhibit their various ventilators. We may mention, while touching on the topic of sanitary exhibits, that there is, or was, or was to be, a model sanitary dwelling, the position of which is, indeed, shown on the map of the grounds, but which, as far as we could ascertain, was at the time of our visit unfinished, at all events not to be seen.

Among the exhibits in the North Gardens is to be seen a door giving access to the "model coal-mine," which, on being entered, introduces one to a whole catacomb of artificially-constructed low and dark passages, representing the working passages of a coal-mine; the total length of the passages, which form a kind of labyrinth dimly lighted by electric glow lamps of low power, being about 600 yards. Additional realism is imparted by the whole ground being strewed with coal-dust. But the exhibition is really an interesting one, showing the coal-wagons used, the means of ventilation, the system of support to the sides of the galleries, the manner of dealing with a "faul," &c. A similar but shorter catacomb near it illustrates in the same manner the working and characteristic features of a lead mine; and in another part of the grounds is a series of illustrations of various methods of haulage employed in mines; but how complete or instructive this is we had not time to observe.

The model of the old Newcastle Bridge is very well done, and looks very picturesque; but this kind of thing is not difficult to do when the idea is once started, as it was by "Old London"; and probably every exhibition of this kind will now contain an archaeological model of this kind, and the promoters of exhibitions will create an archaeology for their district even when it has none to speak of. Among other things of interest in the North Garden grounds are two temporary bridges constructed by the First Newcastle Engineer Volunteers under command of Col. Palmer; a treble sing bridge made of spars and ropes, and a floating bridge on casks. These are both made with such materials as might be found on the ground or carried with troops in the field; and they are very good specimens of temporary work of the kind, put together with rough materials, but in a perfectly workmanlike manner.

The fine art section is the least important part of the Newcastle exhibition, containing, indeed, a considerable number of drawings and paintings, but of which the average merit and interest are not very high. There are some great paintings scattered up and down among them, however, of which the most noteworthy are Cromie's grand views of Carrow Abbey (722) and "Bridges" (728), the latter a moon-light, an unusual subject with Cromie; Mr. Watts's "Creation of Eve" and a second edition of "Love and Life"; Mr. H. Moore's grand sea-shore painting, "The Beached Margin of the Sea" (758); Corot's "Dawn" (881), one of the greatest works he ever painted; Mr. Alfred Hunt's "Durham" (916), and Mark Antony's "Night Storm and Darkness" (773), the old picture of the big tree, under a new name. There are other lesser works by well-known names (Mulready's "Careless Messenger" it is interesting to meet with again); and several very good paintings bearing names not familiar to us, but not the less welcome on that account.

**Imperial Institute.**—We understand that Mr. Collett's design for the Imperial Institute is accepted; as far as we can ascertain, there appears no doubt of the fact, though we have seen no official announcement of it. The Queen is to lay the foundation-stone on the 4th of July.

**Exhibition of Mosaic Work at Venice.** Attention has been called by the Continental press to the Art Exhibition at Venice, one of the most interesting features of which is a mosaic executed by Dr. Salvati for the Loggia of the Dusseldorf Kunst-Halle.

**The New Law Courts, Birmingham.**—The contract for the Victoria Law Courts, Birmingham, of which the Queen laid the first stone some weeks since, is assigned to Mr. John Bowen, of that town. His tender was for 78,860*l.*

#### A DUTCH DESIGNER. BOLTEN VON ZWOLL.

In this, the concluding article of the series\* which we have devoted to the early engravers who worked chiefly in France and Germany, and who flourished from the fifteenth to the seventeenth centuries, we hope to serve some useful purpose by glancing rapidly through the work which we have illustrated, and by gleaming therefrom a sheaf of those elementary principles on which the art of those old designers was built, and which are too often ignored by the designers of the present day.

With the exception of those precursors of Albert Dürer noticed in our first article published on December 6th, 1885, it will probably have pleased some of our readers to adopt one broad classification for all the artists whose work we have passed under review. There are those for whom all ornament, or at least all the ornament of Central Europe, is either Gothic or Renaissance; and by far the largest proportion of the works we have sketched will by them be generalised, at the best, as interesting specimens of the Renaissance. It seems to us that mere broad generalisation can serve but little good unless we go further and dissect the work which the influence of the Renaissance called into existence. One thing this influence did was to foster a servile imitation of the classical models, to produce through all succeeding time a multitude of copyists whose work was as blemished as the models were themselves; copyists who ignorantly reproduced the faults of the Roman workmen, and in the reproductions made them infinitely more faulty. The imitators rapidly formed a school of their own, producing work characterised by the same methods, the same devices, and the same tricks as the Roman antiquaries, which served for models. It is this work specially which we have termed Renaissance work, and the faults of which we have so frequently and without hesitation pointed out. It is not to be wondered at that among the students in this school some should have been found of originality and skill sufficient to produce some very charming work, in which the blemishes of style were reduced to a minimum. Such men were Aldorfer and Aldegrever in early days, and Pierre Bourdon in the beginning of last century; but the very excellence of their work only serves to emphasize the villainies perpetrated in the name of the Renaissance by a lower order of beings who are with us even to this day. But of this lower order we feel that we have already said enough. And we may turn with a feeling of relief and satisfaction to the influence for good which may undoubtedly be attributed to the Renaissance.

That influence for good was, as has been often said, a revival of the search for principles. Many of the unthought examples may have been bad, but at least the principles on which they depended were of the highest excellence. With such of the principles as related to decorative art we are now perfectly familiar, and here it is necessary only to mention them briefly. They involve the complete ascendancy of the conventional over the realistic; the complete dependence, nevertheless, in certain cases, of the conventional on natural forms and principles of growth and structure, i.e., in the tangential flow and radiation of the lines of design; the proportion of all parts of the design to each other; and the even covering of the space or surface ornamented.

In the first and foremost of these lies the spirit of true conventional work, and from the study of the methods of conventionalising adopted by the Classic artists came the power of conventionalising other natural forms, and of breaking away from the use of the eternal acanthus-leaf on every occasion, whether appropriate or inappropriate. It must be confessed, however, that the Gothic designers, when they make use of foliage decoration, are not much freer from the charge of artistic tautology than the servile copyists of the Classic models. To many, though not to all, minds the Gothic serrated leaf possesses charms as potent as those of the Classic acanthus. It is not so

\* The following is a complete list of the series, with the dates on which they have appeared:—1883: Dec. 8, The Precursors of Albert Dürer; Dec. 12 and 19, Albert Dürer and his Followers. 1886: Oct. 30 and Nov. 6, Hans Holbein. 1887: Jan. 1, Jean Bourdant; Jan. 8, Pierre Bourdon; Jan. 15, Harist, Le Blond, and Gentsch; Jan. 22, A Cluster of Decorative Artists; Feb. 5, The Two De Brys; Feb. 19, Some Unknown Designers; April 28 and 30, Some Designers of Grotesques; June 4, Virgilius Solis; and the present one on Bolten von Zwoll.

cumbersome, and consequently lends itself more easily as an ornament to the flowing curves of a design; but there must of necessity be a feeling of monotony attending its too constant use. In the varieties and modifications of it which make Israel von Meckemur's work (created at length in our issue of December 5th, 1885) so charming, we find this Gothic leaf in its least rigid form. In many instances Von Meckemur's foliage is, as it were, the connecting link between the Gothic and the Classic styles.

In the same way that Von Meckemur broke away from the severe Gothic models and produced conventional floral designs of striking

In the monkey-panel (figured in our issue of February 19, 1887, on page 279), by an unknown German engraver, we find the leaf of the black bryony treated in a rigidly conventional manner. The quaint and irregular serration of these leaves, which, hanging from the vines, add to the countless beauties of every wayside hedge, make them in conventional form specially serviceable to the decorator. It is a wonder that they are not more used. We have seen them very effectively treated in plain gold on a delicately-tinted diapered background, with here and there a brilliant scarlet berry. Then there is the flower-scroll (fig. 6 on the same

page) sprang into existence, and was endowed with vitality by the discovery of the great antiques which lay for so many hundreds of years beneath the Italian soil.

Of the remaining principles which concern the structural formation of a design we have already spoken at sufficient length and with sufficient emphasis in our former articles; it is unnecessary to dwell on their characteristics again, though we may without fear of wearying our readers repeat that their recognition is essential to good and perfect ornament.

To-day we present our readers with a few sketches of some curious designs from the hand of an unknown Dutchman,—Bolten von Zwoll. They are taken from a large collection of the original drawings pasted into a folio scrap-book in the British Museum Print-room. Beyond the facts that the book passed into the Museum from the Earl of Arundel's collections; that the drawings, to the number of about 300, were probably got together by the Earl; and that the date impressed on the cover is 1640, nothing is known about them, nor of Bolten their producer.

We give the sketches to-day more as curiosities than as first-rate specimens of decorative art. They are essentially Dutch, and none of the designs can be said to possess any very great beauty; but, albeit somewhat grotesque, they are strikingly original, and show a most remarkable force and purity of outline. In fig. 1 are two quaint pilasters. Fig. 2 is one of a large series of lamps and tazzas, all of which are very charming in form. Fig. 3 is a very boorish grotesque, probably designed for the hoses of a cap; there are a great number of these grotesques, the faces of the men and animals being full of a Batavian grace and humour, which makes us regret that our space for sketches is but limited. In fig. 4 we have sketched the largest of three or four designs for silver cups; the outline is vigorous and well proportioned; and, if we omit the portly *frau* and the bunch of fruit, the ornament is simple and in good taste. In the chasing of the base will be seen the better half of a Batavian face much resembling that depicted in fig. 3, and pointing the noses to which these fantastic figures were put by their prolific designer, Bolten von Zwoll.

In concluding this series of articles we cannot fail to express our thanks to Professor Colvin, to Mr. Fagan, and to their many assistants in the British Museum Print-room for the unwearied attention and unfeeling courtesy which they have shown us during the pleasant hours spent in foraging among the priceless treasures committed to their care.

Illustrations.

REREDOS, LANGPORT CHURCH.

THE reredos for this church, in the neighbourhood of Tannock, has been executed by Mr. G. W. Seale, from the designs of Mr. J. D. Sedding. We gave a full description of it in the *Builder* for March 12th of this year, page 409.

MONUMENT TO THE LATE BISHOP OLLIVANT.

This fine and expressive monumental figure, which is now in the Royal Academy, has been designed by Mr. Armstrong, R.A., as a monument to the late bishop, to be placed in Llandaff Cathedral. The face is a very fine example of the sculptor's art, and ranks, to our thinking, as one of the best productions of its author. The altar tomb on which the figure is to repose, which is not shown in our illustration, has been designed by the late Mr. John Pritchard, of Llandaff.

MONUMENT TO THE LATE BISHOP FRASER.

This monument, to be placed in Manchester Cathedral, is also in the present Academy exhibition. It is designed by Mr. Jas. Forsyth, and will rest on an altar-tomb designed by Mr. Crowther, the Cathedral Architect, and executed by Messrs. Earp & Hohhs, of Manchester.

ST. ERMIN'S MANSIONS, WESTMINSTER.

The block of mansions of which we give a view and plan (half entrance-floor half first floor) in our issue of to-day is in course of erection by Mr. A. Steer on a site about three-quarters of an acre in extent, adjoining St.

originality, did many artists in later days, after imbibing the principles which the Renaissance brought prominently to the front, break away from the perpetual use of the one model with which it supplied them. The three-petalled leaf which appears so frequently in Aldorfer's and Aldegrever's panels (see our issue of December 12, 1885) is a good example of this original work. Its curves are always exceedingly graceful, and when multiplied to make the corolla of a flower give a very charming result. In Aldegrever's panels additional variety is obtained by frequent introduction of the side view of this leaf. This leaf reappears in a simpler form and with less surface modelling in some of Bourdon's work, together with some more complicated variations (see our issue of January 8, 1887, more especially the scent-bottle or handle, fig. 12).

page) on whose originality and beauty we have already dwelt.

In the best work of the younger Theodore de Bry (see our issue of Feb. 5, 1887) we noticed what great power that artist showed in conventionalising natural forms which hitherto had not been pressed into the decorator's service: notably the seed-pods of a papilionaceous plant open, half-open, or shut, and in segment. Once more we find the principle carried to its utmost limits in the charming floral designs of Herbst (see our issue of Jan. 15, 1887). But instances might be multiplied without end: those we have given are sufficient to show what the chief influence of the Renaissance really was on decorative art, and in what direction it worked: notwithstanding the bad work so often alluded to, that influence is with us as great to-day as it was when it first

MONUMENT TO THE LATE BISHOP OLLIVANT.—MR. H. H. ARMISTEAD, R.A., SCULPTOR.

James's Park Station and the Westminster Town-hall. The main frontage is to Caxton-street, parallel with Victoria-street, from which it is separated by the garden of Christ Church, the Hotel Windsor being to the right and Members' Mansions to the left.

It will be seen that the building forms three sides of a quadrangle, open on the fourth side to the south, the centre being laid out as a private garden for the use of the residents,—a feature unique in London as attached to residences "in flats."

The view was drawn from the preliminary design, and considerable alterations have been made in the actual working drawings from which the plans are copied.

The whole range is constructionally divided into four blocks, each having a spacious hall, large staircase, and hydraulic passenger and service lifts. For convenience of supervision, and as an additional means of escape in the event of fire, there are corridors for communication between all the blocks on the sixth and lower ground floors.

The buildings are divided into suites of from two to nine rooms, each having its own private entrance, bath-room, and water-closet, with store-closets, and in the larger suites its separate kitchen and larder, and servants' water-closet.

To each pair of blocks is attached a staff kitchen, 36 ft. by 19 ft. (with a complete set of offices), in close proximity to the service lifts, enabling the management to undertake, as in a hotel, for all or any of the tenants who may desire it, the entire culinary and other domestic service.

There are also public dining-rooms, billiard-rooms, &c., for the use of tenants and their friends.

Residences for housekeepers and bedrooms for a number of house servants are also provided.

The staircases and floors throughout will be of fireproof construction. Special attention will be paid to the sanitary arrangements, including the ventilation, automatic flushing, and provision of means for inspection of drains. All rain-pipes and bath and sink wastes will be disconnected from the drains. The window areas generally are large, to make the rooms bright and cheerful.

It is proposed to supply the buildings with pure water from an artesian well on the premises, sunk deep into the chalk.

The site possesses the advantage of being in the heart of Westminster, in close proximity to the Houses of Parliament, the park, clubs, &c., while it is retired from the noise of a main thoroughfare.

The estimated cost of the building, exclusive of the land, is about 80,000*l.* The architect, from whose designs and under whose superintendence the work is being carried out, is Mr. Edwin T. Hall.

**TOMB OF CARDINAL MATTEO OF ACQUASPARTA, IN THE CHURCH OF S. MARIA IN ARA COELI, ROME.**

This tomb stands in the north transept. It has no inscription upon it. The Cardinal died in 1302, and mention of him is found in Dante, where he is spoken of as the General of the Franciscan Order, wise and moderate in his rule.

The representation of the Madonna with the two monkish saints is in fresco, as well as the small head of Christ, and the underside of the arch.

The spandrels, coats of arms, &c., are in mosaic. The colour of the marble is very beautiful and delicate. On the drapery is carved diaper work. In Santa Maria Maggiore is a somewhat similar tomb, signed and dated Johannes Cosmo, 1299, but the picture of the Madonna is in mosaic. G. HORSLEY.

**WESTERN TOWERS, ABAYE AUX HOMMES, CAEN.**

The spires to these towers (*temp.* William the Conqueror) were added in the thirteenth century. G. HORSLEY.

**Truro.**—St. George's Schools are about to be considerably extended. The alterations include the erection of a new infants' school which will accommodate over 100 children. Mr. A. H. Clemens, of Truro, is the architect.

**CANONS, MIDDLESEX.**

"At Timon's villa let us pass a day,  
Where all cry out, 'What sums are thrown away!'"

Who then shall curb or who improve the soil?  
Who plants like Balthus or who builds like Boyle.  
'Tis us alone that sanctifies expense,  
And splendour borrows all her rays from esse."  
Pope, "Moral Essays," Epistle iv.

We have adverted as occasion arose to the purchase of the Jervanix Abbey Estate,\* and the projected sale of Walpole's seat at Houghton, county of Norfolk,—which latter property was withdrawn by Sir J. W. Ellis on a highest bid of 300,000*l.*, at the auction of the 27th of July last year. Next month another historic property will be put up for sale by auction, by direction of the trustees under the will of the late Dr. Begg. We speak of Hendel, Pope, and the

"magnificent" Duke of Chandos. Being now some 600 acres in area, the property lies within Whitechurch, or Little Stanmore, parish, which extends over about 1,570 acres of Gore Hundred, Middlesex. Distant eight miles and a half from the Marble Arch, the estate stands on the verge of the great northern forest, whereof we still find vestiges at Enfield Chase, Epping, and Waltham. Its eastern boundary rests against the straight high road,—Watling-street, and perhaps a former British causeway,—through London to Caswallon's fastness of Brigha's Wood (Brockley Hill), the Sullonicae of Antonine's Itinerary; and thence to Verulamium and the tracts of the Cassii. In proof of the main road's antiquity we may here observe that its middle line separates the parishes of Kingsbury and Hendon, and of Whitechurch and Edgware or Edgworth.

Lysons tells us that the manor in Stanmore Parva, which had been held by Alger, servant to Earl Harold, belonged in the Conqueror's time, as is recorded in Domesday, to one Roger de Raymes. The Raymes family owned wide lands in Essex, constituting a barony. At the marriage of King Henry III.'s sister Isabel to Frederic Emperor of Germany, "half a knight's fee was paid by Henry Bocoynne for his lands in the parish of Stanmore Parva, held of the barony of William de Raymes." This property

next passed to the prior and canons of St. Bartholomew-the-Great, West Smithfield, from which circumstance its name, like to that of Canonbury, is commonly deduced. Yet many derive it from a religious house or chantry that had been established on this spot in connexion with Bentley Priory at Stanmore. However this may be, Canons in 1544 was given to Hugh Losse,† under the style of "the Manor of Canons and Wimborogh in the Parish of Whitechurch." The Losses were succeeded, or joined, in possession by the Franklyns, *temp.* Elizabeth. Yet it was a Sir Hugh Losse who sold the estate to Sir Thomas Lake, Secretary of State to King James I., and who died here on October 19th, 1630. Sir Thomas's granddaughter and heir brought the property in marriage, on February 27th, 1697, to James (Brydges), ninth Baron Chandos of Sudley Castle, who, on April 30th, 1719, was advanced Duke of Chandos. His Grace's house derived from the Montaguerys, Earls of Arundel, and could boast descent through the Tudors and Plantagenets.

In 1712 the Grand Duke, as he was locally designated, had begun to build, and in a style seldom attempted before, a mansion whose memory chiefly lives in Pope's trenchant albeit inaccurate and ungrateful satire. Its total cost, including that of the park and gardens, amounted to nearly one million sterling of our present money. For architects he employed Gibbs, Shepherd, and James. The pleasure-ance, with its lake covering seven acres, and fishing temple, was laid out by Dr. Alexander Blackwell.† No adornment was spared for the interior. Thornhill painted the ceilings; even the door-locks and hinges were of silver or gilt. Constructed of stone, the house was square in plan, set diagonally before an avenue of elms. Each of the four front elevations had three rows of eleven windows with a sculptured head above every opening. The principal front had a row of six fluted columns, in marble, standing on a rusticated base, ascended by steps. The pediment covered heraldic achievements, trophies, and so on. The outer walls were 12 ft. thick at the base,

diminishing to 9 ft. at the ground-floor. The celebrated main staircase now owned by Lord Burton, of Chesterfield House, May Fair, is built of blocks of white marble, 22 ft. in length. The balustrade was of silver.\* Two lodges by the main road gates are of a design to correspond with that of the house. The long avenue reaching northwards from Sir Lancelot Lake's Almshouses (1656), by the church, is now a wilderness, interspersed with firs, beeches, and pines, and traversed by a winding path. Traces exist of the private road which, as the story goes, the Duke planned in London. He wanted to pass over his own land in riding between Canons and the town mansion that he proposed to build in Marylebone Fields along what is now the northern side of Cavendish-square. Of this house the eastern wing stands at the corner (north-eastwards) of the square and Chandos-street. A view of its entire elevation, after John Price's design (1720), is preserved in one national collection, British Museum. The Duke, by the way, was twice attacked by highwaymen along this same road, and on two successive days, Monday and Tuesday, February 6th and 7th, 1720, as stated in the *British Gazetteer*.

Various anecdotes survive of the Duke's precautions against imprecident profusion in his plan of living. He used to sell such garden fruit as was not required for his own table,— "It is as much my property," said he, "as the corn and hay and other produce of my fields." An aged man who had been his servant was wont to tell how his occasional bounties to the labourers never exceeded 6d. at a time. "This," he would say, "may do you good; more may make you idle and drunk." He engaged an able accountant,—one Watts,—to settle a scheme of household expenditure with totals for a year, a month, a week, and a day: the particulars being engraved on a large copper-plate. On the other hand, we have testimony by the author of a "Journey through England" to the Duke's sumptuous order of service at table; his stately progresses to and from chapel escorted by a band of pensioner sergeants equipped as Yeomen of the Guard, his regal choir of vocal and instrumental music at the parish church. The vast fortune he had amassed when Paymaster-General to the Forces under Queen Anne suffered three shocks by his concern in the African Company and the South Sea and Mississippi schemes, 1718-20. Yet he lived on in scarcely diminished splendour at Canons until his death on August 9th, 1744. His son and successor, Henry, had married, 21st of December, 1728, Mary, daughter to Charles (Bruce), third Earl of Ailesbury. Lord Ailesbury, as trustee for his son-in-law, found the estate, already encumbered, to be quite unequal to the charge of such a costly inheritance. So he determined to sell the property, and, failing a single purchaser for the whole, in separate lots. The sale (1747) did not realise more than a net amount of 11,000*l.* Relics of the house were scattered over the country. Lord Chesterfield bought the hall staircase for his new house at May Fair; its silver balustrade, and the main portico, went to Lord Tynes's seat (Wanstead House); the equestrian statue of George I. was taken to form the ornament, though in our day it became the relic, of Leicester-square; a marble mantelpiece was bought for the Goldsmiths' Hall. Some of the stained glass was removed to Witley Court. It is said that the two stone houses on the northern side of Cavendish-square were built out of one lot of materials; with the materials of another lot the purchaser, Mr. Hallet, a cabinet-maker, of Long-acre,—who also bought the land,—constructed the existing house, on a site close to that of the original residence. William Hallet, his grandson, parted with the property to Colonel O'Kelly, the wealthy owner of Eclipse, which famed racehorse and sire was buried within the grounds. A nephew of Philip O'Kelly, the colonel's brother and heir, sold the property to Sir Thomas Plumer, Vice-Chancellor of England and Master of the Rolls. Meanwhile, James (Brydges), third and last Duke of Chandos, had died leaving a daughter and sole heir, Anna, who on April 16, 1796, married Richard (Nugent-Temple-Grenville), second Marquess of Buckingham, advanced February 4, 1822, Duke of Buckingham and Chandos.

In 1715-20 the Duke of Chandos rebuilt of pale red brick the nave and chancel of the parish church, which had been dedicated to St. Lawrence, *temp.* Henry VIII. The register

\* The *Builder*, February 26th, 1887.  
† The initials R. L. (Robert Losse) above crest and coat-arms are carved on a mantel-piece that was taken from the Chandos Arms,—now, alas! "a hotel,"—the supposed manor house.  
‡ *Gentleman's Magazine*, September, 1747.

\* Vide Virtue's account in a MS. owned by Lord Orford at Strawberry Hill.

dates from 1558. In mute protest against the parishioners' greed, he left the Gothic tower. This, having battlements and a north-eastern turret, is stuccoed over, and defaced with an Italian, or Classic, doorway in stone. Taking for model a royal chapel at Versailles, the Duke engaged the labours of Bellinchi, of Laguerre and Verrio, and of Gibbons and his father-in-law, for the paintings, carvings, and ironwork with which the church's interior is so profusely decorated. Setting aside the carving and ironwork, and perhaps one or two of the coloured paintings, the general effect of the interior, enforced as it is by the fresco Evangelists, Saints, and Virtues, and the sham columns, arches, pavements, &c., on the walls, is to our mind that of a Vauxhall by daylight. The altar stands beneath a curved pediment, which is supported by a pair of coupled columns and pilasters,—the work of Gibbons, and of oak grown in the grounds. In a lighted recess behind this, and itself flanked by the "Adoration" and the "Glory," is the organ, by Father Schmidt, its case by Gibbons, also. Subject to certain enlargements of 1878, this is the instrument on which Handel played whilst resident chapel-master at Canons, 1718-21. With Handel's greater name should be cited, too, those of Dr. Randall, of Cambridge; Dr. Pepmeh, whose morning and evening services were long used; and of Savage and Beard, in the choir. In a southern window is a brass tablet to the memory of Sir Harry Smith Parkes, who died at Peking on March 22nd, 1855. The Chandos memorials are in two chambers next north of the nave. Of these, the inner one is on a higher level than the outer; it covers the vault wherein lie the remains of the Duke, some of his descendants, and other members of his house. In the outer room rest his banner and coronet, ranged over the flight of steps which cover the vault door. Around the painted walls are fixed numerous hatchments, conspicuous with the emblazoned cross saltire, *gules* on *or*, of the Bruces, and the cross *sable* with *logherhead, gules* on *argent*, with the motto "Maintien le droit" of Byrdes. Facing the steps is the great duke's large but commonplace monument. Supported by kneeling figures of Mary Lake and Cassandra Willoughby, two of his three wives, he stands in full-bottomed wig and conventional Roman attire,—an ambitious but poor performance without. Amongst his titles of honour are those of Chancellor of St. Andrew's University, High Steward of Cantremelenith, and Ranger of Enfield Chase. Much of the marble in this "Monument Room" is turning green; the ceiling is out of repair, and the stains of trickling rain-water do not improve Verrio's painted columns, arches, &c. By the doorway which opens into the rectory-garden stands a tombstone, on which are carved in relief an anvil and hammer with initials "W. P.," intertwined in a bay wreath, under a musical staff with notes B and E, being the opening notes of a well-known melody. The stone is thus inscribed:—"In Memory of /William Powell/ the Harmonious Blacksmith /Who was buried 27 February, 1780/ Aged 78 years./ He was parish clerk during the Time/ the Immortal Handel/ was organist of this church/ Erected by Subscription/ May 1868." Powell's reputed smithy, wherein Handel, taking shelter from a storm, heard him singing a German air at his work, stands on the western side of the main street; it is now the sweep's stable, and goes with the premises hard by. After some difficulty we succeeded in identifying Powell's home with the Bee Hive public-house, a few yards distant, its front defaced with stucco. The house is some 300 years old; the landlady told us she is endeavouring to re-purchase the board which formerly distinguished it as the blacksmith's residence. A few good subjects for the artist's pencil may be found in the town of Edgware, particularly some quaint little shop-fronts by the forge, the church tower, and the Old George tavern and Chandos Arms.

**Nonington, Kent.**—The church here is about to undergo restoration under the supervision of Mr. Ewan Christian. The chancel was restored some few years since, leaving the nave and north aisle yet to be done. Chiefly owing to the munificent donations of Mr. Plumpton, of Fredville Park, and Mr. W. O. Hammond, of St. Ahans, these are now to be taken in hand, which include new roof to the nave and restoration of the north aisle roof, and reseating the body of the church. Mr. Wise, of Deal, is the contractor.

### MACHINERY AT THE MANCHESTER EXHIBITION.

(SECOND NOTICE.)

A VERY fine display of electric lighting is to be seen in Manchester, the directors of the Exhibition having profited by the experience gained at previous Exhibitions in London and elsewhere. The installation of arc lights is carried out almost entirely by the Anglo-American Brush Electric Light Corporation (Limited), London, and the incandescent installation by the Manchester and District Edison Electric Light Company (Limited). The Anglo Brush Company supply no fewer than 546 arc lamps; of these 476 lamps are used inside the Exhibition buildings, or one to about every 1,254 square feet. The brush dynamos supplying the current are of three sizes, feeding 15, 25, and 35 lamps each. The current is distributed by conductors carrying 50 lamps to a circuit.

Messrs. Mather & Platt, of Salford, have in operation two 500-light Manchester dynamos and two 800-light Edison-Hopkinson dynamos. These are constructed by the exhibitors. The illumination of the fountains is undertaken by Messrs. W. & J. Galloway & Sons, of Manchester; the lights placed below the water consist of 18-arc lamps, arranged in groups of two lamps of 60 amperes each. These are fed by two Siemens B 13 dynamos.

The gardens are illuminated by arc lights, and oil or fairy lamps arranged in the shrubs and grass. The arc lamps are suspended from lofty hollow masts, and are raised or lowered by ropes and a winch placed inside each mast.

The incandescent lighting consists of some 4,000 Edison-Swan 16 c.p. lamps, and use the Swan coiled filament. They are fitted into brass sockets, and opal shades are used to reflect the light downwards.

Safety fuses are fitted at various points to get rid of any excess of current that may arise. The lighting of each room in the picture annexes is sub-divided between two different mains, so that should there be a breakdown in one circuit the rooms would not be left in darkness. Many of the lights are placed amongst foliage or softened by glass shades of different colours. The effect in some instances is extremely good.

Amongst other dynamos in use is a large 500-light one by Elwell-Parker: this is a slow-speed compound wound one.

The electric lights are generally extremely steady and good, and individually equal to any we have seen; but as a show the effect of the garden illuminations is certainly not equal to the recent Colonial Exhibition in London.

**Pumping Machinery.**—The Worthington Pumping Engine Co., 114, Queen Victoria-street, London, exhibit, amongst others, a compound steam pump. This is designed more particularly for use in countries where fuel is expensive. Two steam cylinders are fitted and are so arranged that the steam having acted for the full length of the stroke of the small piston, expands on to a larger one, which works in the opposite direction, and so the return stroke is made. A feature of all the Worthington pumps is the employment, for a steam-valve, of an ordinary slide-valve working upon a flat face over ports or openings similar to those used in most steam engines. The motion of the valve is produced by means of a vibrating arm, which swings through the whole length of the stroke. It is claimed for this arrangement that greater certainty of action than steam-moved valves is obtained, and the blow inseparable to the tappet system is done away with. The plunger works through a deep metallic packing ring. The details of these pumps have been well thought out, and all the working parts are readily accessible for adjustment or repair,—an important point sometimes lost sight of. Where high-pressure steam is available this compound pump should be worked with economy. A neat form of water-meter, a low-service steam pump, and several boiler feed pumps are also to be seen here.

Amongst others a long-stroke double-ram pump known as the "Manchester" is exhibited by Messrs. Frank Pearn & Co., Manchester. It is designed chiefly for use as a fire-engine; it is of vertical type and has its main frame with pedestals for carrying crank-shaft cast in one piece. The chief feature of this engine is the length of stroke obtained, which is considerably longer than is usually found. It appears that in a recent trial at Ashton-under-Lyne a pump

of this make with two 7 in. rams and two 10 in. steam cylinders, with a stroke of 14 in., a speed of ninety-two revolutions, and 150 lb. pressure, threw 1½ in. jet of water 190 ft. high in the face of an adverse wind. This must be pronounced a very satisfactory result, and the pump should be particularly useful as a stationary fire-engine in lofty buildings.

Messrs. W. H. Bailey & Co., of Salford, show a number of their double-acting fly-wheel steam pumps adapted for various duties. In these pumps ordinary flat slide-valves similar to those used in high-pressure steam engines are employed. The use of these valves for pumping purposes has extended considerably of late, and much can be said in their favour. The pump valve chambers are fitted with doors for adjustment or repair of working parts. The valves are considerably larger than is usual in pumps of similar construction, and are well adapted for lifting large quantities of water to a low head, such as is required in ballast or some contractors' purposes. The pump valves are made of india-rubber or gun-metal, as the condition of usage may require.

Mr. John Wolstenholme, of Radcliffe, shows a strongly-designed duplex rotary steam pump with bed-plate, front covers, and pedestals in one casing. Common flat slide-valves are employed, and the pump being double-acting on both suction and delivery is suitable for rough usage, as the concussion often found is here greatly modified, all parts in contact with the water being enclosed. The motion work is of steel.

Messrs. Holme & Lund, Manchester, exhibit samples of their patent direct-acting steam pumps, for which they claim that there are only three moving parts for the distribution of the steam, viz., one small flat slide-valve in the top valve-box, and one main flat slide-valve, which is worked by one auxiliary piston. Both main and auxiliary pistons are steam-cushioned. The chief novelty in this pump is the method of moving the main flat slide-valve. This is done by a small auxiliary cylinder placed above the main steam cylinder, and a small flat slide-valve is attached to the top valve-rod, on which rod are adjustable collars; these are moved at the end of each stroke by the crosshead-arm on the pump-rod. The collars on the middle rod,—which is a continuation of the piston-rod of the auxiliary cylinder,—are set further apart than the others, so that the crosshead-arm only comes in contact with them when the steam from any cause fails to move the auxiliary piston quick enough; in such case the crosshead-arm, by contact with these collars, assists the steam to move the main slide-valve. Although the parts are somewhat increased by this arrangement, there is little doubt it makes the pump more certain in its action, and the outlay of steam for working the small auxiliary piston should be small.

Mr. John Cameron, of Manchester, shows samples of his well-known single and double acting vertical ram-pumps. The general design and construction of these pumps well maintain their reputation.

A stationary steam fire-engine is shown by Mr. Charles Walsmsley, of Bury. It consists briefly of a three-throw pump, with air-veiled and receiver driven by steam cylinder and slide-valve of the ordinary type; this latter is worked by an eccentric. The plungers, buckets, foot-valves, and glands are made of gun-metal and the pump barrel is gun-metal lined. A treble-throw pump, with 12-in. cylinder, 10-in. pump, and 7-in. plunger, is stated to be capable of throwing 60,000 gallons of water per hour 100 ft. high, in jets ¾ in. diameter. In large establishments this pump should be useful.

Several engines and pumps are exhibited by Messrs. Tangy (Limited), Birmingham, including a vertical engine and dynamo, a 12 in. by 24 in. horizontal engine fitted with Jefferis' patent automatic expansion gear, a centrifugal pumping engine, colonial ram-pump, and a selection of their direct-acting steam-pumps.

Mr. W. Gunther, of Oldham, shows a selection of Girard turbines, including one of 102-h.p. for a fall of 200 ft. This is coupled to a 40-light dynamo. Exhaust and blowing fans are also exhibited, and several centrifugal pumps.

Mansfield's apparatus for manufacturing oil gas is shown in the grounds by Messrs. E. Mansfield & Co., Manchester. The apparatus consists of a simple form of retort and gas-holder, and is designed to produce gas from any kind of oil or grease. A special sort of oil is usually used; this is non-explosive, and will not

give off inflammable vapour under a temperature of 212° Fahr. In comparison with the Salford town gas, the light of this oil gas is much more brilliant, and, tested by Wright's photometer, the result has been given as four to one in favour of the oil gas. This is a highly satisfactory result, to say the least, and in districts where coal gas is unobtainable this gas should be of good service.

The Dowson Economic Gas and Power Company, Limited, Westminster, exhibit in the grounds their apparatus for producing fuel-gas, suitable for driving gas-engines, heating ovens, type-founding, soldering, &c. The apparatus is fitted with a governing arrangement, by means of which the production of gas is regulated automatically to suit a varying rate of consumption. The gas made is used in driving an engine. The process of making is very simple. It consists briefly in passing a jet of superheated steam, mixed with air, through red-hot anthracite, or small gas coke, contained in a generator. There is no exterior fire, and to make 1,000 cubic feet of gas, it is stated that only 15 lb. of anthracite and about seven pints of water are required, and, with fuel costing 10s. a ton, at a cost of about 2½d. per 1,000 cubic feet.

A patent cylinder filter, for the treatment of large quantities of liquids, especially water, is shown in the grounds by Messrs. Mather & Platt, of Manchester. Each filter consists of two vertical perforated metal tubes, one placed within the other, the space between them being filled with sawdust, charcoal, or other filtering material. The liquid to be filtered has to enter through the perforations in the outer cylinder or tube, and, after passing through the filtering material, is collected in the inner tube, whence it is conveyed in the service-pipes. The makers claim that it will remove from water all solid, greasy, or slimy matter, and that it is also applicable to the treatment of sewage.

Messrs. Howard, of Bedford, have a specimen of their patent portable railway, 24 in. gauge and 14 lb. rails; also an iron tipping wagon and samples of sleepers for portable and permanent railways.

Portable railway wagons and accessories are also exhibited by Messrs. Decanville, of Idolane, London. The rails used are of steel of very light section, and permanently riveted to cross sleepers. The rails are jointed in a simple way. The rail to the right hand is furnished with two fish-plates; that to the left with a small steel plate riveted underneath the rail and projecting beyond it. The lengths of rail are laid end to end, making the rail, which is fitted with the small plate, come in between the two fish-plates when the joint is made. The wagons are made chiefly of steel, and as the whole can be readily laid without skilled labour this system should be particularly useful for quarries, brick-fields, or contractors' purposes.

A self-acting cold-iron and steel circular sawing-machine is shown by Messrs. Lee & Hunt, of Nottingham. The girder or iron to be seen is placed on a table and held by a powerful clamp, the saw is traversed and set by a screw feed and is fitted with a quick return motion. The rate of traverse can be varied according to the material being cut. This machine should prove itself very useful to contractors of wrought-iron work, where many pieces have often to be reduced to one exact length.

A band-sawing machine for cutting iron is to be seen at the stand of Messrs. B. & S. Massey, Steam Hammer Works, Manchester.

The Blackmen Air-Propeller Ventilating Company, Limited, 57, Fore-street, London, show a selection of their propellers.

Windmills are represented by the Ontario Pump Company, of Toronto, who exhibit one of their 10-ft. Halliday windmills working a vertical pump; a deep-well pump, a general purpose pump, and force-pumps are also shown. These, in conjunction with a windmill, should be very useful for irrigating and similar purposes.

A simple form of water-meter is shown by Mr. T. Kennedy, Kilmarnock. The measuring parts of this meter consist of a cylinder and piston,—the former of cast-iron and the latter of vulcanite,—on which an india-rubber roller forms an elastic separation between the top and bottom of the cylinder. A four-way cock directs the water alternately above and below the piston. This is actuated by a weight. All the moving parts move round on an axial line;

friction and consequent wear are therefore considerably reduced. It is stated that this meter registers the smallest leak or ball-cock supply, yet does not sensibly reduce the pressure. For instance, the effect on pressure or delivery of fixing a 1-in. meter on a 1-in. pipe is the same as adding 3½ yards horizontally to the length of pipe, and it is also claimed that this meter cannot register against the consumer, while the facts that it works with a small flow, and that the index does not hang at the reverse, are conclusive that it is accurate.

A centrifugal pulveriser (Lucop's), and Mumford & Moodie's patent separator, are shown by Messrs. Askham Bros. & Wilson, Limited, Sheffield. The separator consists, briefly, of a tapering wrought-iron chamber with spout at the bottom; this chamber is divided, and also has an inner casing. A fan-blower is placed in the upper chamber, and as the ground material,—which is fed in from the top,—descends, a current of air circulates through it, the fine dust is thrown into the outer casing, and descends through the spouts into hags or casks. The coarse material falls down the inner casing, and passes out through a branch pipe to be returned to the pulveriser for regrinding. This apparatus is of simple construction, and will produce finished material of any degree of fineness. It should prove useful.

The Grinding and Polishing Machine Co., Birmingham, exhibit a grindstone with attachments which possess some fresh features. The stone is mounted in a trough in the usual way, but parallel guides are fitted to the trough, and the work is passed along these guides and over the top surface of the stone; consequently a true face is produced and the surface of the stone also remains true. Flat, bevel, convex or concave surfaces may be produced, and by the use of guides prepared for a required curve work may be ground to any radius. An adjusting table and parallel vice for gripping rounds, squares, and tapers is fitted, and altogether this must be pronounced an extremely useful machine.

Messrs. Clark, Bunnett, & Co., Limited, London, show one of their hand rope safety lifts, and a sample of Clark's patent self-gripping crab. In this crab the ordinary winding drum is done away with, the lifting chain being arranged to pass in and out between small rollers shaped to suit the links of the chain and to grip it as it passes. The crab is worked with a handle in the usual way, and thrown in and out of gear by a clutch. A strap break is fitted, and the whole space occupied is much less than with crabs of ordinary construction.

We must not omit to notice the 173-h.p. patent water-tube boiler erected in the grounds by the Bahcock & Wilcox Company, of Glasgow and New York. This type of boiler has met with considerable success of late, and there is little doubt it possesses advantages in making steam economically, combined with comparative safety in use. The boiler is made of lap-welded wrought-iron tubes placed in an inclined position and connected with each other, and with a horizontal steam and water drum, by vertical passages at each end. A mud-drum connects the tube at the rear and lowest point of the boiler. The end connexions are in one piece for each vertical row of tubes; and the tubes are "staggered." Openings for cleaning are provided opposite the end of each tube. The steam and water drums are made of steel or wrought iron, and the mud-drums are of cast iron, to better withstand corrosion or "pitting." The chief points claimed for this boiler are that, owing to the thinness of the heating surface-plates, heat is very rapidly transmitted from the fire to the water, consequently steam is rapidly and economically raised, and, owing to its construction, it is readily cleaned or repaired, and there is much less chance of an explosion than with boilers of the ordinary type.

A good display of steam traps and various engineering fittings is made by Mr. John Boyle, 27, King-street West, Manchester. Amongst these we noticed a steam trap for discharging air and condensed water from steam apparatus especially adapted for dirty situations or where there is dirt in the water. In this trap a ball-float in combination with a siphon is used. The cover is held on the trap by wing-bolts, to retain a slight pressure of steam within the box, sufficient to eject the water by the siphon, so long as steam continues to come to the inlet. If water accumulates behind the inlet the ejection

action ceases temporarily; the water thus accumulates in the cistern, raises the ball, and rapidly discharges the water until the pipes are again dry, when the ejection action by the siphon lowers the ball and nearly closes the inlet. The outlet is open to the atmosphere to secure a free discharge. A patent return steam trap and hot-water (212° Fahr.) boiler feeder, patent reducing valves, hydraulic test-pump, improved swivel unions and hends, &c., are also exhibited.

A self-acting gas governor is exhibited by Messrs. Jas. Stott & Co., 10, Market-place, Manchester, and although there is justly a prejudice against gas regulators, owing to many failures, the one under notice has several fresh features about it.

What appears to be a distinct improvement in fusible plugs for steam boilers is shown by the English and Scottish Boiler Insurance Co., Limited, of 58, Fountain-street, Manchester. The improvement consists in the introduction of a packing pad of asbestos between the steam and the fusible metal, in such a way that when the metal becomes melted it drops into the furnace, and the pressure in the boiler forces out a lead washer and the asbestos wad, leaving a clear opening for the steam to escape. By this arrangement, direct contact of the steam or water with the fusible metal is prevented, thus obviating partial fusion, as it is generally concluded that a flow of steam coming in contact with partially-fused metal stops further fusion. The use of the asbestos wad prevents also the cooling effect of the steam on the fusible metal, it then facilitates the melting. The fusible metal and asbestos wad are readily removable.

*Pulleys, &c.*—A large number of the pulleys used in the Exhibition are wrought iron or steel split ones, made by Messrs. Perkins, Sun, & Barrett, of Bradford. They appeared to run very true, and we were informed that all pulleys made by this firm are carefully balanced and turned in a lathe.

The Power Pulley Company, of Manchester, show some of their Shepherd's patent perforated pulleys. These contain a large number of perforations through the face of the pulley, the object being to prevent driving-belts slipping by rapidly discharging the air found between the belt and the pulley through the perforations.

With the same object, i.e., to prevent belt slipping, Messrs. Wilkinson & Co., Manchester, exhibit samples of perforated covering for pulleys.

As was to be anticipated, there are a great number of exhibits connected with steam and the steam engine, such as pistons, steam traps, boiler-fittings, economisers, &c. Some of these are well worthy of notice but the limits of our space permitted.

Altogether Manchester must be congratulated on its exhibition, as it possesses features of interest in certain departments that have rarely if ever been surpassed.

#### ARCHITECTURAL ASSOCIATION SUMMER VISITS.

The second summer visit of the Architectural Association was made on the 11th of June to a house at Banstead, Surrey, erected for the Hon. F. Baring, from the designs of Mr. Norman Shaw, R.A. The ground-floor story walls are of thin red brick, with Ham Hill stone dressings. The upper part of the house is of half-timber work, with some portions tile hung, the rain-water pipes having very elaborate lead heads. The entrance-hall and staircase are panelled with oak of a very light colour; the drawing-room is panelled with painted wood-work, which still has to be decorated.

The third visit was made on Saturday, the 18th inst., to Cambridge, under the guidance of Mr. W. M. Fawcett, M.A. The first College visited was Christ's, where the entrance gateway and the oriel over the entrance to the Master's Lodge are the only portions of the sixteenth-century work left, the clunch stone used having become so decayed that the walls were cased in the eighteenth century, and the windows inserted in the Classic taste. The Round Church was next visited, and thence the party proceeded to St. John's College, the Divinity School, by Mr. Basil Champneys, being noticed in passing. Professor Mayor conducted the party over St. John's College, which was founded by Margaret, the mother of

Henry VII, the entrance gateway, like that of Christ's, which was also founded by Margaret, having the Tudor rose and portcullis and "Marguerites" carved over the archway. The Hall was lengthened in 1863 by the addition of a large bay, and the Chapel was pulled down to make way for the sumptuous building from the design of Sir Gilbert Scott. The three arches forming the entrance to Fisher's Chapel have been built into the south wall of the ante-chapel. The Combination-Room has a handsome plaster ceiling, and beyond this is the Library, a new set of rooms now being built from the designs of Mr. Penrose, and connected with the old buildings at this point. Passing over the bridge, the "New Courts" built in 1826 from designs by Mr. Rickman were inspected.

Trinity College was next visited. The entrance-gate, which dates from 1535, was until recently covered with plaster, but this has been removed, and the original bricks and stone exposed, the latter is very much marked with holes to give a key to the plaster but otherwise is not much damaged.

The next College visited was Cains, and then King's, where the Chapel, with its magnificent fan vault, was examined, and the screen of Flemish woodwork was compared with the Jacobean stalls. The party went on the roof and examined the upper side of the vaulting, and then passed into the Hall. From this college they passed to Clare College, and subsequently to Queen's, after passing down "The Backs" and by the mill-pond. This college, founded by two queens, is an interesting example of the form of the early colleges; Prof. Willis, when he measured it, found that it corresponded closely to the plan of Haddon Hall. Additional buildings are being erected from the designs of Mr. W. M. Fawcett. St. Catherine's and Corpus were next visited. In the latter, the old ball is now used as the kitchen. The new buildings were designed by Mr. Wilkins. The Church of St. Bennet, which adjoins the College, was formerly used as the college chapel, and is connected with it by means of a gallery (now used as a vestry by the church). Pembroke college was then visited; the Chapel, designed by Wren, and the ceiling of the Combination-Room, being regarded with special interest. The new buildings are from the designs of Mr. Waterhouse and Mr. Gilbert Scott. Peterhouse was the last college visited. The Church of St. Mary-the-Less was used by the College, and connected with it by a corridor (also now used as a vestry).

#### THE SANITARY INSTITUTE.

SIR,—As a member of the Referee Committee of Council of the Sanitary Institute of Great Britain, it is my duty to make arrangements for the reception of papers to be read at the forthcoming Sanitary Congress at Bolton in September next.

Will you be so good as to allow me to call the attention of the profession to this yearly opportunity of recording the advances made in the practical application of the principles of sanitary science to civil architecture?

EDWARD C. ROBINS.

#### THE PRESERVATION OF STONE.

SIR,—With reference to your recent articles on the above subject, I trust you will permit me to point out that syenite and syenitic granite are not synonymous terms for the same rock, and that syenitic granite does contain mica as an essential constituent, with hornblende, quartz, and felspar. Syenite is not a variety of granite, but a distinct rock. In the trade, I know, several different kinds of stones are embraced under the term "granite" (some of them being limestones), but it is impossible for science to assist in the selection of these rocks for building purposes unless each kind is separately dealt with.

I quite agree with your remarks on lichens, &c. (p. 860).  
GEO. F. HARRIS, F.G.S.

SIR,—In your article on the above in your issue of the 11th inst., you state, "It has, at various times, been more or less authoritatively stated that lichens which form frequently on stone surfaces in country places help to preserve such stone, but this idea is not supported by any reasonable argument."

In this district (Isle of Portland), where lichens, &c., are abundant, it is always maintained that whilst the lichen may not preserve the stone, the very fact of its being on the face, proves the stone to be a good weathering piece, as, were it otherwise,

and constantly crumbling away, the lichens could not take root and thrive, as every rub or shower of rain removes the disintegrated parts. There is a wall near me, built of brown (exterior or weather) Portland stone, and a few pieces of white (or interior) Portland, the former, being covered with a greyish lichen, exhibiting every tool-mark, although centuries old, whereas the latter is constantly, but almost imperceptibly, wasting, and has a yellow, decomposed appearance, without any lichen on it.  
F. J. BARNES.

#### THE CONGRESS OF FRENCH ARCHITECTS.

MONSIEUR,—J'ai lu avec grand intérêt le Comptendu du Congrès des Architectes Français publié dans *The Builder* du 18 juin, mais permettez-moi d'attirer votre attention sur trois points, non à l'état de rectifications, mais seulement comme complément d'informations:—

1. *Caisse de Défense mutuelle des Architectes.*—Comme tous les ans, le compte-rendu de la séance annuelle de cette Association a été analysé devant le Congrès, qui a constaté, avec l'accroissement des membres de la Caisse, l'importance et l'intérêt des affaires dans lesquelles la Caisse de Défense est venue en aide aux associés.

2. *Propriété Artistique.*—MM. Ach. Hermant, Ch. Lucas, et Al. Normand, membres du Conseil de la Société Centrale et H. et C. M. R. I. E. A., ont soumis à la dernière séance du Congrès un vœu pour que le Gouvernement Français ratifiât la Convention signée à Berne le 9 Septembre, 1886, en vue de la création d'une Union Internationale pour la Protection des Œuvres Littéraires et Artistiques (les dessins d'architecture étant compris dans ces dernières).

3. *Droits des Architectes des Administrations publiques.*—La Commission qui a étudié cette dernière question a soumis au Congrès, qui l'a adoptée à l'unanimité, une suite de vœux en réponse à la lettre de M. le Ministre des Beaux-Arts, vœux dont le plus important est ainsi libellé: "Qu'il ne peut être accordé à un Ministre ou à tout autre fonctionnaire ayant appelé un architecte à un emploi public, de conserver à l'endroit de cet architecte le droit absolu de révocation; mais que ce droit doit être entouré, pour l'architecte, comme pour le magistrat, l'officier, le professeur, ou tout autre fonctionnaire de l'Etat, de garanties équivalentes dont les principales pourraient être une enquête, la nécessité de faire la preuve de la faute reprochée à l'architecte et l'examen de la cause par une Commission composée en partie d'architectes, devant laquelle l'architecte incriminé serait appelé à se défendre."

CHARLES LUCAS.

Paris, 19 Juin, 1887.

#### GUILDFORD SHIRE HALL RESTORATION.

SIR,—I wish to ask the question, whether town-halls built in the last quarter of the seventeenth century had, as a rule, open roofs or flat ceilings? My reason for asking is that the old Shire Hall in this town (date 1683), whose quaint facade and bell-turret are the most noticeable objects in the High-street, has been undergoing restoration, and one of the first steps taken by the architect was the removal of the flat ceiling in the hall, and the substitution of an open-timbered roof.

The plea for this alteration was that one of two tie-beams had its lower face chamfered, as if formerly exposed to view. On the other hand, there was the clearest evidence of the flat ceiling having been the original one in the state of the other timbers, which are finely striped, of unequal size, and destitute of ornament. In place of kingposts, there was an unsightly arrangement of struts rising obliquely from the centre of each tie-beam to the roof in the form of an inverted pyramid.

The question, of course, is not whether an open-timbered roof is the better architectural feature or not, but whether it is historically correct, and in its right place in a Late Jacobean hall.

And as this is a point for archaeologists to decide, I hope to elicit an opinion in the pages of your journal.

Guildford, June 19th, 1887.  
H. S. T.

**Preservation of Archaeological Remains in Prussia.**—The Prussian Minister of the Interior has issued a circular to the civic and rural authorities in Prussia requesting that careful returns be made of all archaeological remains existing within each commune. The circular also ordains that in future the vestry of every parish shall, on excavations or finds of graves being made within their boundary, superintend the same, and in case of discoveries being made of ancient remains, monuments, and archaeological objects, report such, and see that no further excavations take place unless directed by a qualified archaeologist. The sale of archaeological objects thus discovered is also strictly forbidden.

#### The Student's Column.

FIELD WORK AND INSTRUMENTS.—XXVI.  
Leveling Instruments.

XII.—HAND LEVELS.

THESE instruments are of great service in preliminary work, or for arriving at an approximate comparison of levels in places where a larger instrument would be placed off. They commend themselves chiefly on account of their portability, as they can be easily carried in the pocket when not in use. Fig. 1, which shows the longitudinal section of a reflecting level, illustrates the manner in which the detailed portions shown in fig. 2 are connected. B is an inner tube carrying half a convex lens, which magnifies a horizontal line marked across the reflecting-plate E. This plate or mirror occupies one-half of the interior of the tube to which it is attached underneath the centre of the spirit bubble A. The remaining half of the interior of the tube is left open to enable any distant point to be observed, the open and mirror portions being respectively placed upon opposite sides of a vertical diameter, as indicated in fig. 2. The object seen when the bubble is in the centre of its run is, therefore, on a level in the line of sight, A D, with the observer's eye at A. A stop-piece is introduced to aid distinct vision, and is attached to the centre of the outer tube, as shown in fig. 1. It will be noticed that as no magnifying power is employed to observe distant points, the distance at which the divisions upon a level staff can be distinctly read is very limited.

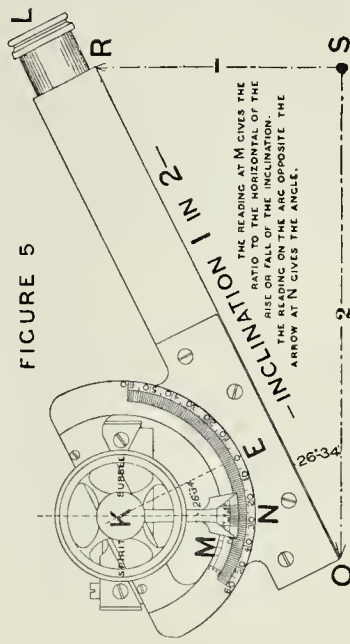

Fig. 7 illustrates a reflecting balance level hung upon gimbals. It is constructed upon the principle that a small mirror suspended vertically, when held at a short distance from an observer at the level of the eye, will reflect the pupil of his eye. As in the instrument previously described, a portion of the space is either open, or the glass is left plain, through which to view a distant object; and the eye of the surveyor is directed upon the line marked E across the silvered glass, so that when the reflection of half of the pupil of the eye is seen upon this line at the edge of the mirror, the observer is guided to read points at a distance in a horizontal plane upon a level with the eye. The height of the instrument from the ground, if required, is readily determined. In some instruments the mirror is fixed horizontally. In the illustration it is placed vertically. The instrument is held in the hand at arm's length by the ring H in fig. 7, and a level staff being held at any desired stations, such as F and G in fig. 6, first at one point, then at the other, with the instrument at the same level, the readings upon the staff can be compared in order to determine the rise or fall in the ground.

In Captain Abney's level illustrated by figs. 3 and 4 we have a reflecting level and clinometer combined. It consists of a spirit level so fixed at K to a limb carrying a vernier that by turning a milled-edged wheel at the side of the telescopic tube as shown in plan in fig. 4, the vernier arm is made to move at right angles to the run of the bubble and upon the same transverse axis. The arc traversed by the vernier is graduated to indicate certain angles of inclination together with the corresponding ratio to the horizontal of the rise or fall of the gradient. The sight tube is divided horizontally in its interior by a glass ball silvered fixed immediately below the bubble tube, in a similar manner to the detail shown in figs. 1 and 2, but the open portion in fig. 1 is in this instrument filled in with plain glass so that the central horizontal line is marked across both the silvered and unsilvered portion of the glass.

To test the accuracy of the instrument select two distant points which shall previously be determined upon the same level. Set the arrow head upon the vernier arm to the point indicating zero upon the graduated arc, as shown at E in fig. 3, and look through the sight tube at the two points under observation. The bubble should then stand in the centre of its run, and be half reflected exactly upon the dividing line of the silvered portion of the glass. To arrive at the inclination or vertical angle of any given slope the telescopic tube is held upon or placed parallel to the slope, as shown in fig. 5, and the side milled edged wheel is then turned by the hand until the bubble appears in the centre of its run. The reading upon the arc at N will give the

ABNEY'S LEVEL

FIGURE 6

NOTE THE INSTRUMENT IS HELD BY THE RING H, IN SUCH A POSITION THAT THE SURVEYOR'S EYE IS REFLECTED IN THE MIRROR-PORTION E - IN FIGURE 7 AND THEN THE LEVEL STAFF IS READ AT ANY REQUIRED STATIONS F, AND C, IN ORDER TO ASCERTAIN THE FALL IN THE GROUND.

FIGURE 6

REFLECTING LEVEL SUSPENDED ON CIMBALS --- CAPTAIN ABNEY'S LEVEL GIVING INCLINES ---

angle of the gradient. It will be seen that the angle R O S is equal to the angle E K N, and that if in fig. 5 the angle E K N equals  $26^{\circ} 34'$ , the vertical height R S will equal one unit at a distance O S of two units from the point of observation.

We have now provided our readers with an account of the principal optical instruments employed in land surveying and levelling, and such as we trust may enable the student to properly handle and use the same. Great patience must be exercised by the young beginner. He must remember that it is better to be blamed by his employer for being slow, than for being inaccurate, and he will find with the exercise of care and precision, that he will acquire speed in proportion as he is diligent in practice.

### Books.

*The Steam Engine.* By George C. V. Holmes. London: Longmans, Green, & Co. 1887.

HERE could hardly be a more ambitious title than that selected by Mr. Holmes. As we are reminded in the opening paragraph, "the complete study of the steam-engine involves an acquaintance with the sciences of heat, of chemistry, and of pure and applied mechanics, as well as a knowledge of the theory of mechanism, and the strength of materials," thus opening up an acquisition of knowledge Baconian in its immensity. The author is undismayed by the task he has set himself, and ranges through the five hundred odd small octavo pages from the "hollow cylinder of indefinite height, the bottom of which is closed while the top remains open," &c., up to the theory of strains on crank shafts and the action of governors, which cannot be adequately dealt with without the aid of the calculus. It is well to say at once, however, that whatever has been attempted has been well done, and the book proves the author to possess a mastery of the subject and a gift of lucid explanation, which must give it a high position amongst text-books of the steam-engine.

The work is one of that most excellent series of "Text-hooks of Science" which Messrs. Longmans have been publishing for some years past for "the use of artisans and students in public and science schools." We think artisans might be dropped out of the announcement; for, though there may be a few of those paragons of intelligence and industry in humble life (met with by Mr. Smiles and writers of his class) who might profit by such a work as that under review, their number must be so few as to make it unnecessary to appeal to them as a class. If for "artisan" we were, in the present instance, to substitute "practical designers of engines," the case would not be a great deal more hopeful. It is not a generally acknowledged fact, but fact it is none the less, that ninety-nine out of every hundred engines designed are plotted out by "the grand old rule of thumb." Years ago we had a vision of a simple but complete text-book on the steam-engine, compiled for those employed in the practical designing of engines for commercial purposes. Such a work was to have shown the way in which scientific principles were involved in construction, and were unconsciously applied (or misapplied) in practice. The vision has fled, along with the conviction of the usefulness of the work. When once a draughtsman attains to the head of his department in any important engineering establishment, he has little time for work other than that absolutely demanded from him; and he has a vast accumulation of proved data to work from. So science goes to the wall, and trial and error carry the day. Even those ingenious persons who devise new applications of mechanical laws do not, as a rule, call overmuch science to their aid in their inventive labours; although some of them bring a heavy battery of scientific jargon to bear on their hearers in subsequent explanation of their devices. But it does not follow on this account that text-books of science are not useful and necessary. As a matter of fact, they are becoming every day of increased utility; but it is to the second string to Messrs. Longman's bow,—the student,—that they must appeal. Rule-of-thumb designing is like learning to play the piano by ear: it precludes the hope of a more scientific method. Therefore, we must catch

our designer young, and train him early to virtuous habits. Fortunately the possibilities to this end are increasing year by year. It is to the technical students of the present day that we must turn for the hope that this country will be able to battle for that engineering supremacy which, although threatened, has happily not yet been wrested from its grasp.

To return to Mr. Holmes's hook in particular, we find it opening, as we have intimated, with the first elements of the subject, and the clear manner with which the subject-matter is treated must render it plain to the most uneducated.

The next section of the book treats of the nature of heat, and gives the reason for accepting the theory that heat is a form of energy. The subject is one that may, and, in less skilful hands, undoubtedly would, lead to the student reader being led considerably out of his depth; but here, again, Mr. Holmes's talent for simple exposition stands him and his readers in good stead, so that the phenomena by which the conversion of heat into work is accompanied are clearly set forth. The next chapter is no doubt the natural outcome of the one just referred to, but it carries the reader a long step, and is indeed a sort of *pons asinorum*, which will not be altogether a pleasant surprise for the student. There are, however, many hard nuts for the sucking engineer to crack; and, undoubtedly, he had better consider the requirements of "theoretically perfect heat engines," whilst the knowledge gleaned in the last chapter is still in his mind. But if Mr. Holmes shows, on this occasion, not overmuch mercy to his inexperienced readers, he is at least a safe guide, and those who do master the chapter will find they have acquired sound knowledge. It must not be supposed, however, that this chapter has only an academic interest. The descriptions given, especially the graphic representations of the various problems, are of very real and practical interest, and must necessarily be understood by those who would soar above rule-of-thumb designers. The laws connecting the pressure, volume, and temperature of dry steam, as laid down by the best authorities, are set forth, and the reasons why a practical working steam-engine falls so far short of the theoretically perfect engine are explained. The subject is further pursued in the next chapter, and here the necessity for higher mathematics arises in considering the applications of principles laid down by various authorities. In the succeeding chapter the student is introduced to a fresh branch of the subject in "the mechanics of the steam engine." Here, again, the author begins with those elementary principles which underlie the problems involved, taking nothing for granted, but working upwards from sure foundations of fact. The consideration of the twisting moments on crank shafts is a good example of this; the relation between those results and their source in the varying pressure of steam on the piston is well illustrated by means of the indicator. The influence of inertia of reciprocating parts is another part of this chapter well worthy of attention. It is a subject which in times past has been too much neglected in practical work, but is happily receiving more attention in the present day of high piston speeds, to which the best designed modern engines owe much of their success. In Chapter VI. the student finds himself amongst simpler details of general practice relating to various parts of the mechanism. The consideration of strains on crank shafts and the action of governors naturally require mathematical treatment of a comparatively complex nature, but there is nothing that the ordinary student will find above his powers.

The treatment of valves and valve gears occupies a large section of the book. There are simple illustrations showing the manner in which steam distribution is effected with an ordinary slide valve, and the reader, having mastered this elementary knowledge, is introduced to some of the less common arrangements met with in practical work. The theoretical aspect of the case is mainly taken up, as of necessity almost it must be, by an examination of Zeuner's well-known diagrams. We can cordially recommend to the attention of all students this part of the hook, especially those who have not the time to go through Dr. Zeuner's original work.

The next chapter is hardly so satisfactory. Probably Mr. Holmes says all that he well can in the space at his command about the steam-engine indicator, but the subject is far

too large to be treated of within the limits of a single chapter. We think it would have improved the work had the succeeding chapter on the boiler been omitted, and much that is left out have been inserted respecting indicator diagrams and the lessons they teach. We are inclined to find fault, too, with the lack of more moderate instances in this part of the book. What there is, however, appears to be sound, and the governing principles are well explained, besides some useful hints being given as to common faults revealed by some typical diagrams. A single chapter on boilers is far too little space in which to deal with the subject. Of course it is impossible to treat of one part of the most important heat engine without including to some extent the other, but to give a few illustrations of various types, to partially discuss proportions and details of construction, and to describe fittings and mountings, is, we think, expending valuable space in an unsatisfactory matter. This, however, is a question that lies between Mr. Holmes and his publisher,—as the hook is one of a series,—and we are bound to add that what is said is, so far as it goes, unexceptionable. It is a great pity, however, that the question of forced draught is not dealt with at greater length. It is a subject on which the author might have enlarged with advantage, considering its importance and the scarcity of information in existing text-books.

There is a short chapter on condensers, which leads up to the question of condensation of steam in cylinders. This subject naturally introduces super-heating and steam-jacketing, the reasons why the former has been abandoned, and why the latter is too often unsuccessful, being stated. We next find the compound engine discussed, the distribution of steam, as illustrated by indicator diagrams, theoretical and actual, being dealt with. A considerable appendix and a useful index conclude the hook.

We have not said much in criticism of this work. Indeed, there is very little to criticise, for Mr. Holmes has not attempted to advance any new theories or introduce fresh discoveries. His duty as the compiler of a text-book has been observed throughout. He has selected the best authorities on the various subjects and plainly set forth their views, combining them with those recognised facts for which there is no authority. There may be a few points in which the opinions expressed will jar with some engineering theorists of repute. This, however, was inevitable, and Mr. Holmes has generally taken his stand on the least assailable ground.

*Warm-Blast Steam Boiler Furnace.* By J. C. HOADLEY. New York: John Wiley & Sons. London: Trübner & Co.

This book is a "report of a series of trials of a warm-blast apparatus for transferring a part of the heat of escaping fire gases to the furnace." It seems rather an extensive business to devote a by no means inconsiderable volume to a record of one set of experiments; but Americans have a way of doing these things very thoroughly. The task the author had to accomplish was to test the efficiency of an economiser or heat-extractor which was then devised, and is constructed on much the same principle as a well-known economiser in use in this country. As a result we may at once state Mr. Hoadley came to the conclusion that a net saving of 10 to 18 per cent. of fuel was effected over the best attainable ordinary practice. Against this there must be considered the question how soon the apparatus will wear out, and also the increased rapidity with which fire-bars will deteriorate on account of the warm blast. The "abstractors" in question consist of 2-in. ordinary lap-welded iron tubes, expanded into cast-iron tube plates at each end. These tubes are encased within 3-in. tubes of thin iron. The escaping gases and products of combustion pass through the 2-in. tubes, and the air to feed the furnace passes through the annular space formed by the insertion of the 2-in. tubes in the 3-in. tubes. As the extraction of heat from the chimney gases by this device would check the draught, a fan was provided.

We do not think our readers will expect us to follow Mr. Hoadley through the minutiae of his trials and researches, which are so fully set forth in his book. Any experimentalist who may have to go through a similar course will undoubtedly find the work useful, although we

think that even to those most closely identified with such matters, some of the results will seem to be worked out with a minuteness little short of pedantry. To take an instance at random, on p. 49 we find an "Account of the experiment to determine by the third method the heat capacity of the calorimeter." Here we have the steam pressure given with three places of decimals (69.094 lb.), and on this the number of British thermal units in a pound of steam is further calculated to four places of decimals. Of course the British thermal unit is a small unit, and it is necessary to calculate closely, but this over-refinement in the manipulation of figures is useless, unless the data obtained are equally beyond question. Mr. Hoadley, however, only follows the practice of his compatriots.

Mensuration Made Easy; or, the Decimal System for the Million. By CHARLES HOME. Seventeenth Edition. London: Effingham Wilson & Co.

A VERY useful practical little book, giving plain explanations of the working of decimal arithmetic, with a number of "applications to the daily employments of the artisan and mechanic." That it has been found practically useful by those for whom it is intended seems to be indicated by the number of editions it has gone through.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

7,541, Transparent Material for Roofing. MM. Brophy and J. A. Archer.

This invention relates to improved machinery for manufacturing roofing material composed of wire gauze, covered or coated with some transparent mullage or substance, and the machinery described in this specification is designed to effect great economy in its manufacture.

8,576, Fastenings for Doors and Windows. H. W. Hennes.

The improvements which are the subject of this invention are designed to obviate several disadvantages in the form of fastenings of double doors or windows, in which the act of closing the second door automatically fastens the first, which has been already closed, and to cheapen the cost of manufacture. A frame is made, in which works a lever so placed that one of its ends, which is bevelled on both sides, protrudes; the other end is withdrawn into the plate. The bevelled projection is so arranged that it is under the edge of the door which is first closed. Near, or on this edge is a hole of suitable shape and size into which the bevelled projecting end rises, and holds the door when the door is closed. The second door is secured by a catch or lock, and so long as it remains closed, the first door is equally securely fastened.

8,589, Safety Fastenings for Sashes. W. Dryden.

The class of fastener which is the subject of this invention belongs to those for vertical sliding window-sashes, which, while affording security against burglars, allow also for the sashes to be lifted, say six inches or so for ventilation, and secured, whether so open or closed. The fastening is arranged by the use of a horizontal locking sliding bolt, controlled by a weight or spring retaining catch, and a vertical retaining stop slide, case or plate. This is fixed at the side of the sash and frame, with a plate notched or perforated so as to retain the windows in different positions with respect to height.

12,565, Gully for Excluding Sewer Gas. R. Atkinson.

According to this invention a hinged metallic valve, with india-rubber face, working on an inclined plane, is fitted on the end of the gully inside of the trap-box. The action of the valve is such that as soon as a sufficient head of water enters the gully the valve is automatically opened. As the pressure of water is reduced the valve shuts, and no sewer gas can enter the gully from the sewer. The cover is made airtight.

5,204, Sanitary Appliances. G. Price.

The object of this invention is to arrange receivers, &c., and their connexions with the sewer or drain, in such manner that the soil after leaving the receiver shall not come in contact with the sides or surface of the connexions, but shall have a clear fall direct into the water at the bottom of the trap. A vertical pipe is provided, and a sharp edge is formed around the outlet of the basin or receiver. The aforesaid pipe being vertical and parallel slide, it forms a full continuation from the receiver, and allows the soil to fall clear into the water without contact with the sides.

MEETINGS.

SATURDAY, JUNE 25.

St. Paul's Ecclesiastical Society.—Visit to Bishop's Stortford, &c. Train leaves Liverpool-street at 2.32 p.m.  
Glasgow Architectural Association.—Visit to Darnley line.

WEDNESDAY, JUNE 29.

Society of Arts.—Annual General Meeting. 4 p.m.

Miscellaneous.

**The New Scandinavian Sailors' Home in London.**—We understand that the building committee of the Scandinavian Sailors' Home in London some time ago succeeded in securing a site for the new building of the Home in the very heart of the locality where it operates. The patrons of the Home are H.R.H. the Princess of Wales, and their Majesties the Queens of Denmark and Sweden and Norway, whilst the building committee consists of Lord Blantyre, Mr. T. A. Denny, and Mr. David Carnegie. During the last seven years the Home has been located at Nos. 88 and 90, Leman-street, but for a long time these buildings have far from sufficed for the requirements, besides being ill adapted to the functions of such an Institution. The lease of these houses expiring in September next, the committee decided upon not renewing the same, but to attempt finding an eligible site for a new building in the same neighbourhood, a task not of the easiest in this crowded locality. They succeeded, however, beyond expectation, having acquired a piece of land from the East and West India Dock Company, close to the East and West India Dock Stations, at a cost of 1,700*l.*, the superficial area being nearly 30,000 square feet. The building will face Garford-street, but the frontage here will only be about 50 ft. in length, due to the peculiar shape of the site. This is, however, considered an advantage by the committee, as only a portion of the rooms will overlook the noisy street with its dust, &c., whilst the majority will face a handsome garden to be laid out at the back of the building. The new Home will contain bedrooms for about 200 sailors, besides some superior apartments for captains and mates, and rooms for entertainments and mission work, a library, restaurant, baths, bowling-alley, in addition to the usual offices, &c. The new Home, which, like the old, will be under the management of Miss Agnes Medenström, a Swedish lady celebrated throughout Scandinavia for her excellent mission work among the thousands of northern sailors who annually visit London, will be conducted on strictly Temperance principles. It is stated that the sum of money towards the cost of the new building, of which we hope to give an illustration on a future occasion.

**Photographs of Lightning.**—The Royal Meteorological Society is desirous of obtaining photographs of flashes of lightning, as it is believed that a great deal of research on this subject can only be pursued by means of the camera.

**A Carved Oak Pulpit.** with freestone base, has been erected in the Parish Church at Burscombe (Devon), as a Jubilee Memorial. The work has been executed by Messrs. Luscombe & Son, carvers and art-workers, of Exeter.

**The New Winchester House Buildings.**—Some interesting statements were made at the meeting of the Winchester House Company last week respecting the prospects of the extensive and costly new buildings in Broad-street in the City, which are scarcely yet completed, although several portions of them are already let and occupied. Mr. John Pender, the chairman, said that the cost of the freehold alone had amounted to no less than 405,000*l.*, but he considered that the Company had secured a most valuable property and that their new building was the finest in the City of London. The original estimate of the cost of the new building had been exceeded, owing to the necessity of acquiring other property besides old Winchester House itself, and also in consequence of their having been advised to sink down to the London clay, the additional cost in carrying out this portion of the work having been 3,000*l.*, and the total cost of the double basement alone was fully 20,000*l.* He added that the lettings already amounted to 21,658*l.* a year, and that the amount receivable from Messrs. Spiers & Pond for the letting of a portion of the halls was likely largely to increase during the present year. It appeared to him that these halls of theirs, which were now constantly occupied, were likely to become popular places for public meetings in the city. They had now completed the safe deposit system, which would utilise one portion of the building, and, as there would be 5,000 safes, it was calculated that that branch of their business would bring in from 11,000*l.* to 12,000*l.* a year, and the inlet portions of the building were estimated to produce about 15,000*l.* a year. Their expenses were estimated at 26,000*l.* a year, of which 21,000*l.* were for ground-rents and interest on mortgages.

**Sale of Building Land at Pinner.**—Amongst the numerous sales of building land which have recently taken place, both in the neighbourhood of the metropolis and more distant localities, fifty plots of this class of property were submitted to competition on Thursday week by Messrs. Baker & Sons. The property offered consisted of the first portion of the Pinner Chase Estate, adjoining the Pinner Station of the Metropolitan Railway, and also within a few minutes' walk of the London and North-Western station. The several lots have frontages to the station road, the Pinner main road, and to Took's memorial fountain. The sale took place in a marquee on the estate, and all the lots were announced to be sold without the slightest reserve. Most of the lots offered consisted of shop plots, having frontages of 18 ft. and 20 ft., and depths varying from 70 ft. to 90 ft. All the lots were readily sold at prices ranging from 15*l.* to 25*l.* each; a corner tavern site, having a frontage to the main road of 54 ft., and a return frontage to the station road of 80 ft., being sold for 65*l.*, the stipulations providing that the cost of the building to be erected on this site must not be less than 500*l.*, and on the other sites not less than 200*l.* and 300*l.* The estate has been laid out for the erection of 136 houses and shops.

**Testing Establishment for Ventilating and Heating Appliances.**—The Technical High School at Berlin is now receiving an addition in the form of an establishment for testing the calorific properties of various kinds of fuel, and thus facilitating estimates of the cost of heating state buildings. Similar experiments will be carried on as to ventilation. The necessary funds for the installation of this establishment are included in the Budget of 1887-8, and provision has also been made for the expenses of maintaining its efficiency. It will be specially advantageous, the *Centralblatt der Bauverwaltung* considers, for senior pupils of the High School and for young architects.

**Building in Berlin.**—Official statistics indicate a marked increase of activity during 1886 in the building trade at Berlin, the works executed having exceeded by 1,000 the number carried out in 1885. Accidents were reported in greater number, but this is attributed to the more complete system of registration now in force. Out of 438 casualties, 16 were fatal, 165 severe, and 257 slight in their effects. In most cases, the *Diamant* remarks, no blame was attributable to any third party, the accidents being due to the inattention or carelessness of the persons injured. The new regulations for building contain a provision for only two-thirds of any site being built over, one-third at least being reserved as a yard or open space.

**Threatened Destruction of the Blue Grotto at Capri.**—According to an Italian journal, the *Vita Napoletana*, the famous Grotto Azurra, or Blue Grotto, at Capri, will shortly be the subject of a lawsuit before the Naples Tribunal, which may result in its destruction. The facts are as follow:—For some years past that part of the island below which the world-famed grotto is situated has been owned by a rich American "gentleman," who now claims "that, as he is the owner of the soil, what is beneath it also belongs to him, viz., the Blue Grotto." But as this from time immemorial has belonged to the little fishing village of Capri, and as the civic authorities charge each visitor to the grotto a small sum, they do not intend to part with their property without a contest. In consequence, the American gentleman has begun a lawsuit against the Capri authorities before the Naples Tribunal in order to obtain the proprietorship of the grotto, and, what is worse, threatens, in the event of his losing the case, to pierce a hole in the ground into the grotto, which would, as is generally known, have the effect of at once destroying the lovely tints of colour for which the grotto is so justly famous. There is, however, some hope of satisfying the American's claim with part of the revenue derived from visitors to the grotto.

**The Sound Tunnel.**—It appears that the negotiations between a French syndicate and the Scandinavian Government for the construction of a tunnel under the Sound, to which we recently referred, were broken off in consequence of the committee appointed to consider the scheme reporting against it. The feasibility of constructing the tunnel was in no way denied, the undertaking being in fact pronounced comparatively simple, but the committee objected chiefly to certain financial proposals of the promoters. Now, however, negotiations have been resumed between the latter and the Danish Government, the promoters having modified their conditions, and it is expected that the Swedish Government will also shortly re-consider the scheme. It should, however, be mentioned that public opinion in Sweden is not in favour of the tunnel, though its advantages are fully recognised.

**The Baltic and White Sea Canal.**—The Society for Promoting Russian Trade and Industry, says the *Novoje Vremja*, has submitted a plan to the Government for the construction of a canal from the Baltic to the White Sea, *via* Lake Ladoga, an undertaking said to have been suggested by Peter the Great. Such a canal, apart from its strategical value, would open up the famous iron deposits in the Government of Olonetz, as well as develop trade in Northern Russia. The cost of the canal is only estimated at about 800,000*l.*, but it is generally believed that this sum is too low. The Emperor of Russia is stated to be much interested in the plan.

**Strikes in the United States.**—During the first five months of this year, 480 strikes were reported in the United States, involving 226,803 wage workers, against 164 strikes during the corresponding period of last year, involving 364,630. During May of the present year, 79,000 men struck, against 216,000 in May, 1886. The building trades show 44,573 men on strike; coal-miners and coke-makers, 18,650; boot and shoe makers, 5,650. The unsettled condition of the American labour-market is not extending at present; but it is stated that about 60,000 workmen will make fresh demands in various branches of trade for higher wages shortly.

**Jubilee Clocks in Kent.**—As a permanent memorial of the Queen's jubilee, the parishioners of Willesborough have placed in the parish church tower a clock specially constructed by J. W. Benson, of Ludgate-hill. Time is shown on two copper dials of 5 ft. diameter, the hours are struck on a bell of 15 cwt., and "ting tang" quarter chimes on two smaller bells. At Horsmonden a suitable turret has been erected on the Working Men's Institute, in which a clock has been fixed by the same maker. There are two copper dials of 3 ft. diameter, and the hours are struck on a bell of 1 cwt.

**Trads Outing.**—On Saturday last the office staff of Messrs. Wm. Brass & Son, of Old-street, E.C., had a most enjoyable trip to the Royal Forest Hotel, Chingford, where a cricket match was played, married & single, which ended in a victory for the latter with 18 runs, after which they sat down to a "high tea," and concluded a most enjoyable outing with a stroll in the Forest.

Improved Method of Preparing Cement.

The Thonindustrie Zeitung lately published the following details as to a recently-patented system for hastening the setting and increasing the resistance of Portland cement. There are taken 100 parts of finely-pulverised hanxite, or in its place 100 parts of any refracting argillaceous earth in powder. These are mixed with 50 parts of sulphuric acid, so as to make a firm paste. After twenty-four hours, the mass is heated in a flaming furnace until it hardens and assumes a light colour. It is then finely pulverised, and baked with water in such a way as to form a liquid paste. There is then added a solution of soda so as to render the liquid alkaline, and afterwards, by decantation, the water is separated from the precipitate, which is carefully dried, pulverised, and sifted. The hydrate of alumen, which is found in the coarsest portions, causes the rapid setting of the cement, while the soluble silicium increases its resistance. If it is desired to change a slow-setting into a quick-setting cement, it is sufficient to mix thoroughly about half to one per cent. of the powder. For making moulded objects, the proportion should be two to four per cent.

PRICES CURRENT OF MATERIALS.

Table with columns for material names (Timber, Metals, Oils, etc.), units, and prices in £, s, d. Includes items like Greenheart, Teak, Spruce, Iron, and various oils.

CONTRACTS AND PUBLIC APPOINTMENTS.

Epitome of Advertisements in this Number.

CONTRACTS.

Table of contracts with columns: Nature of Work or Materials, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, Page. Includes items like Pumping Engines, Stone Ketting, Repairs and Alterations, etc.

PUBLIC APPOINTMENTS.

Table of public appointments with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in, Page. Includes Inspector and Surveyor's Assistant, Clerk of the Works, etc.

TENDERS.

Table of tenders for various construction projects. Includes sections for ABINGDON (Berks), BIGGLESWADE, BLACKHEATH, BOXFORD (near Newbury), HINCKLEY, LEWISHAM, and MARSTON (Beds). Each section lists the project, the architect/engineer, and the tender amounts.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON."

A Query or article cannot be re-opened the subject now; nor, to say truth, can we regard the record of the printer of Solomon as quite conclusive in the matter.—H. S. T.—"Bartolice" (letters cannot be published unless the name and address of writer are enclosed).—B. F. (Baker).—T. M. H. (too late).  
All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.  
None.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.  
We cannot undertake to return rejected communications.  
Letters or communications beyond mere news items which have been duplicated for other journals, are NOT DESIRED.  
All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.
