PRELIMINARY REPORT

SOUTHERN GRID SURVEY NO. 17

15-18 July 1968

Prepared  
by

Richard S. Crossin

SOUTHERN GRID  
15-18 July 1968

During the period 15-18 July 1968 Smithsonian personnel Richard S. Crossin, Roger B. Clapp, and C. Douglas Hackman made observations in portions of the Southern Grid in conjunction with Howland and Baker Island surveys on SIC 19. Observation hours amounting to 11.1 and covering 120 miles were conducted during the three-day period. The small portion of the grid covered does not permit for an overall comparison by separate areas; hence no breakdown by square degree sections is included. The Grid was entered at 1812 on 15 July at 02°00' S, 175°11' W and departed at 1636 on 18 July at 02°00' N, 176°11' W.

Numerous flocks were encountered along the entire track from ca. 20 miles south of Baker to ca. 20 miles north of Howland. These were primarily Sooty Terns with associated frigates and Blue-faced Boobies. Direction of movement of most traveling flocks taken in conjunction with time of day and flight behavior leave little doubt that Howland was the origin of the vast majority of birds. All three groups are currently nesting on Howland. The present populations of Sooty Terns and Lesser Frigatebirds are among the highest recorded for the island, and they attest to the abundance of food in the vicinity of both Howland and Baker. The area about Baker has previously been the focus of heavy feeding activities, especially during the extended 1966 Sooty Tern breeding cycle. During the present cruise, however, huge mixed flocks of terns, boobies, and frigates were feeding directly offshore Howland. These could be readily seen from the island. No comparable activity has ever been noted on previous trips. Coast Guard personnel aboard the PLANETREE informed me that variable numbers of schooling tuna were in sight almost continuously during the two days the ship was anchored offshore Howland. The entire vegetation on Howland (as well as on Baker) attests to long periods of drought since the last surveys made in early 1967. [Whether or not this factor has any correlation with increased water productivity is unknown.] Recent rainfall has not yet produced noticeable changes in the vegetation.

Species Accounts

Only those species with additional information are discussed below; for total avifauna encountered in the Grid, see Table 2.

Wedge-tailed Shearwater (Puffinus pacificus)

26

All birds were dark phase. Although a small colony of Wedge-tails was found nesting on Howland during the present cruise, it is doubtful whether the colony is large enough to account for the at-sea numbers recorded. What is more likely is that pre- or post-breeding birds from the neighboring Phoenix Islands are being attracted to the rich feeding areas about Howland and Baker. Practically all birds were recorded on

16 July between the two islands. Other than a few scattered sightings of small Pterodroma, Wedge-tails were the only Procellarids recorded in the Grid.

Blue-faced Booby (Sula dactylatra)

44

This species was commonly observed both between Howland and Baker and to the north of Howland. Although commonly associated with feeding flocks, Blue-faced Boobies often feed solitarily or in pairs. During the present cruise, birds on Howland were noted to regurgitate a considerable number of fish species other than the usual flying fish. The increased tuna activity in the area possibly is allowing the boobies to take advantage of small bait fish being driven to the surface.

Frigatebirds

Greater	0
Lesser	1
Unidentified	15

The Lesser Frigatebird colony presently breeding on Howland is apparently the largest yet recorded. Despite great numbers of birds in the area, at-sea frigate sightings are surprisingly low. As has been suggested in the at-sea report, the reason for this is the widely scattered, high-altitude mode of feeding, of members of this group.

Sooty Tern (Sterna fuscata)

909

The breeding colony presently situated on Howland is primarily in the fresh-to-advanced incubated egg stage, but new subcolonies are still in the swirling stage. The long extended breeding cycle which occurred through most of 1966 and early 1967 is apparently to be repeated, and large numbers of terns can be expected in the Howland-Baker area for at least the next three to five months. The birds have switched nesting grounds to the end of the island opposite from that occupied during 1966, but streamered birds and band returns from the present colony indicate that only formerly Howland-based birds are currently utilizing the island. During the present cruise band returns on this species represent bandings from previous cruises for practically every month of the year. We are still far short of demonstrating any definite breeding period for this species on Howland, if one exists.

Preliminary Report

Northern Grid Survey No. 38  
21 July 1968

Northern Grid

During 21 July 1968, Smithsonian personnel (R. S. Crossin, R. B. Clapp, and C. D. Hackman) conducted at-sea observations through the Northern Grid on the U.S.C.G.C. PLANETREE.

Observations were somewhat hindered by rough seas and intermittent rain squalls throughout the day. No nocturnal observations were made.

Sightings consisted primarily of single individuals of the shearwater/petrel group, notably Juan Fernandez, White-necked and Black-winged Petrels. Five Wedge-tailed Shearwaters were seen, four of these dark phase. One small feeding flock of 15 Sooty Terns were recorded late in the afternoon; an immature was recorded earlier.

PRELIMINARY REPORT

PELAGIC OBSERVATIONS

SOUTHERN ISLAND CRUISE NO. 19

8 June-20 July 1968

Prepared

by

Richard S. Crossin

Preliminary Report

Pelagic Observations

SIC 19 At-Sea

During the period 8 June to 20 July 1968, 111.6 hours of diurnal at-sea observations covering 1156 miles were recorded. Observations were conducted from Oahu to Fanning Island by Smithsonian personnel Roger B. Clapp and C. Douglas Hackman. No observations were made from Fanning to Samoa. At Samoa Richard S. Crossin joined the cruise. Observations were continuous from Samoa to Sand-Johnston except when island landings were being made.

The cruise was made aboard the U.S.C.G.C. PLANETREE. Both officers and enlisted men aboard the vessel lent support at island landings and during other phases of the operation. However, the vessel was fully staffed and working quarters were at a premium. Since the Coast Guard personnel had their own services to perform and were on a fairly rigid schedule, I did not attempt any at-sea collecting. At any rate, we had no small skiff aboard and the ship's crew was not equipped to make at-sea pick-ups.

No exceptionally large concentrations of birds were found anywhere. Medium densities (primarily Sooty Terns) were found near the Hawaiian Islands and throughout the Phoenix Islands. Breeding colonies now present on many of the Phoenix group easily account for higher surrounding at-sea densities. Sooty Terns accounted for roughly 60 percent of total birds.

In the following species accounts, only the major forms are discussed; for total avifauna, see Table 2.

SPECIES ACCOUNTS

Wedge-tailed Shearwater (Puffinus pacificus) 166

Light phase individuals were encountered on 8 June, the first day south of Oahu (to 20° N); thereafter practically all were dark phase south to Samoa and north to Johnston Atoll. Wedge-tails were common between Oahu and the Line Islands and between the Northern and Southern Grids.

Newell's Shearwater (Puffinus puffinus newelli) 5

Three were noted near the Hawaiian Islands and singles noted on 11 and 12 June in the Line Islands.

Audubon's Shearwater (Puffinus lherminieri)

15

All 15 birds were encountered in a large mixed feeding flock about 11 miles north of McKean on 15 July. These most likely were birds of that island.

Juan Fernandez Petrel ( <u>Pterodroma externa externa</u> )	26
White-necked Petrel ( <u>P. e. cervicalis</u> )	8
unidentified	2

Practically all sightings of these two races were from ca. 6-7°N and northward. Both subspecies were encountered together over much of the occupied range, but White-necks were only about one third as abundant as Juan Fernandez.

Black-winged Petrel (Pterodroma hypoleuca nigripennis) 59

Distribution of this species roughly paralleled that of the large Pterodroma externa forms, with greatest numbers north of 6°N. The majority of 42 unidentified Pterodroma are most likely referable to this race.

Bulwer's Petrel (Bulweria bulwerii) 22

Seventy-seven percent of the birds seen were recorded just south of Oahu on 8 June.

## Storm Petrels 3

One White-throated Storm Petrel (Nesofregatta albicularis) was seen just north of McKean, one of the breeding islands. Two Leach's (Oceanodroma leucorhoa) were recorded between McKean and the Southern Grid. Although the bulk of the population of Leach's would be expected to be on the Alaskan breeding grounds at this time, past summer cruises through the equatorial belt have recorded low densities of non-breeders.

Tropicbirds	Red-tailed	6
	White-tailed	19

Both species in low numbers throughout the cruise. The only high density was the expected White-tail just north of Samoa, one of the major breeding grounds in the south.

Boobies	Blue-faced	9
	Brown	2
	Red-footed	19

Low numbers of all three species throughout. Most of the Red-foots recorded off Fanning Island on 12 June.

Frigatebirds	Greater	1
	Lesser	2
	Unidentified	12

A few singles encountered with mixed feeding flocks, usually near breeding islands. Our at-sea observations never reflect the numbers present, not even near islands with immense breeding populations as on McKean during the present trip. I believe this can be mainly attributed to the frigatebird's mode of foraging in that individuals space themselves over a wide area and usually remain at high altitudes until a ready source of food is apparent on the surface.

Sooty Tern (Sterna fuscata) 984

Sooty Terns comprised 62 percent of total birds recorded. There were no real concentrations; the expected higher densities existed around islands with breeding populations. Medium to large feeding flocks were noted north of the Southern Grid on 18 July; these presumably were from the large population now present on Howland Island. This particular area has usually been quite devoid of terns during past seasons even when large concentrations were breeding on Howland. A few small feeding flocks were encountered at 5° N on 19 July. These presumably marked the area of rich waters along the current boundary where huge concentrations of both Sooty Terns and Wedge-tailed Shearwaters have periodically been noted on previous cruises. On 22 July, offshore Johnston Island, Hackman and I observed several Sooty Terns being savagely pursued by Great Frigatebirds. The terns were noted finally disgorging food which the frigates deftly scooped up. This is the first time that either of us have seen Great Frigates pursuing Sooty Terns, although Lesser Frigates do so commonly in the south.

Common Noddy ( <u>Anous stolidus</u> )	15
Hawaiian Noddy ( <u>Anous tenuirostris</u> )	7
Blue-gray Noddy ( <u>Procelsterna cerulea</u> )	25

Practically all noddies were recorded in a large mixed feeding flock about 11 miles north of McKean. All three species are abundant residents of that island.

Fairy Tern (Gygis alba) 109

Several concentrations were noted: near Fanning Island on 12 June, throughout the Tokelau Islands, and just north of McKean. These appear to represent respective local populations.

0635	Fairy Tern	1	N		First seen plunging; flew toward ship, then parallel to the north about 100 yds out
0703	Fairy Tern	1	NE		25'
0705	Wedgetail	1	SE		light phase
0712	Sooty Tern	3	E		ad.
0713	Fairy Tern	2	E		
0714	W.T.T.B.	1	E		seen flying, then sat on water, very pale yellow bill
0715	R.F. Booby	1	NE		int. phase adult
0716	Sooty Tern	2	E		ad.
0720	Newells S	1	W		close to ship - would not question identification except so close to Puffin area. Back appeared black with white patch above tail. Excellent
0730	Fairy Tern	1	S		observed
0731	Fairy Tern	1	W		
0735	Bl-w. Petrel	1	E		low
0736	Sooty Tern	2	N		50'
0739	Fairy Tern	1	E		25'
0740	Fairy Tern	1	E		low, distant
0800	Red-f. Booby	1	E		Ad.
0803	Sooty Tern	1	N		50'
0804	Wedge-tail	1	E		low, dark phase
0805	Fairy Tern	1	N		25'
0806	Petrel sp	1	NE		low, in rain squall, poor vis
					Large heavy rain squall 0748-0815, vis about $\frac{1}{8}$ - $\frac{1}{4}$ mile
0809	Fairy Tern	1	W		low, eastern
0811	Fairy Tern	1	E		crossing bow, $\frac{1}{4}$ mile
0812	Fairy Tern	3	S		Running w/ship: eastern, one starboard 100 yds ast; other $\frac{1}{4}$ mile off starboard
0814	Fairy T	1	E		$\frac{1}{4}$ mile ahead

TF 0819	Fairy Tern	5	S	Came in from west, flew in front of ship - 100' high, then flew toward E
	Sooty Tern	1	S	
	Black Noddy	1	S	
0822	Wedge-tail	1	N	Dash, ph., low
0826	Bl.-w. Petrel	1	SW	On water, flushed by ship
0834	Fairy Tern	2	E	Crossing bow, 200 yds out
				Sea becoming choppy, wind freshening - 20 knots
0844	Bl.-w. Petrel	1	E	low
0845	Wedge-tail	1	E	Crossed bow, flight feathers did not appear worn
0846	Fairy Tern	4	S	These appear to be the same birds seen at 0819. Flying around ship in a great arc. They break up, fall behind, regroup and pull ahead and then disperse again. No more than 5 have been visible at one time. Still w/ship at 0859 3 GL present (B around ship at 0910)
0849	Red-f. Booby	4	SE	Adults, low
0858	R-f. Booby	1	SE	distort, looked brown backed
0904	R.R. Booby	1	SE	ad. inter. phase
0910	Sooty Tern	1	N	
0910	Additional notes Fairy Tern's See 0846 entry			One Fairy Tern flying over ship at 400 or so feet. Birds were either accompanying ship or following ship route to Fanning Is 0923-5 FT still w/ship. Last seen well ahead of ship moving S 0927
0922	Sooty Tern	3	S	ad. - about 100-150 Feet above water
0928	Shearwater	1	S	
0932	Wedge-tail	1	E	Dash, low
0938	Fairy Tern	1	SE	Frist seen on horizon, flew steadily toward SE
0939	Bl.-w. Petrel	1	SW	low
