TO THE

MOST HIGH AND MIGHTY PRINCE CHARLES By the Grace of God, K In g of Great Britain, France, and Irelands Defender of the Faish, ẹ̛.

Cray it pleafe Kour Moft Excellent Majesity; Hiftory, either defigned or yvritten, by the late Lord Vifcount S. Alban, vvas dedicated to Your Majefty, in his Book De Ventis, about Four years paft, vvhen Your Majefty vvas Prince: So as there needed no nevv Dedication of this Work, butonely in all humblenefs, tolet Your Majefty knovv, it is Yours. It is true, if that Lord had lived, Your Majefty, erelong had been invoked to the Protection of another Hiftory, vvhereof, not Natures Kingdom, as in this ; but thefe of A $_{3} \quad$ Your

Your Majefties, (during the time and Reign of King Henry the Eighth) had been the fubject; vvhich fince, it died under theDefignation meerly: There is nothing left, but YourMajefties Princely goodnefs, gracioufly to accept of the undertakers Heart and Intentions; wvho vvas vvilling to have parted for a vvhile vvith his darling Philofophy, that he might have attended Your Royal Commandment in that other VVork. Thus much I have been bold, in all lovvlinefs to reprefent unto Your Majefty, as one that vvas trufted vvith his Lordships VVritings, even tothe laft. And as this VVork affecteth theStamp of Your Majefties Royal Protection, to make it more currant to the VVorld; fo under the protection of this Work, I prefume in all humblenefs to approach Your Majefties prefence, and to offer it up into Your Sacred Hands.

Vour OMajeflies mof Loyal and Devoted Servamt

W. RAWLEY:
 Abing bad the Honor to be continually with my Lord, in compiling of this Work; and to be employed therein, I bave thought it not imi $\beta_{3}^{\prime}$ (with bis Lordfhips good leave and liking) for the better fatisfaction of tboje tbat Jball read it, to make known fomewbat of bis Lord/bips intentions, touching the ordering and publifbing of the Jame. I bave beard bis Lordflip often fay, That if befhould bave ferved the glory of bis omn o Came, be bad been better not to bavepublifhed this Natural Hiftory; for it mayjeem an indigefted beap of Particulars, and cannot bave tbat liffre which Books caft into Methods, bave: But that be refobsed to prefer the good of ©Men, and that wbich might besif ecture it, before any thing that might bave relation to bim $\int$ elf. efind; be knewo well, that there was no other way open to unloofe Mens mindes, being bound; and (as it were) OVIleficiate, by the charms of deceiving $\mathcal{N}$ (otions and Theories; and tbereby made impotent for Generation of $W$ orks: But onely no where to depart from the Seinje and clear experience, but to keep clo fe to it, efpecially in the beginning. Befides, this Natural Hiftory mas a Debt of bis, being defigned and fet down for a third Part of the Inftauration. I bave alfobeard bis Lord/hip difcourfe, That eMen (no doubt) willt tintkwany of the Experiments contained in this Collection, to beV Vil-

To the Reader.
gar and Trivial, mean and fordid, curious and fruitle $\beta$; and therefore be mifgeth, that they would bawe perpetually be. fore the cireyes, what is now in doing ; and the difference between this Natural Hintory, andotbers For thoje Natural Hittories which ave extant, being gatbered for delight and ufe, are fullof pleafant Defcriptions and Pitures; and affect and Seek after Admiration, Rarities, and Secrets. But contrarimi $\int \rho_{\text {, }}$ the Coppe, wbich bis Lord/bipintendetb, is to write fuch a Natural Hiftory, as may be fundamental to the erecting and building of a true Pbilo ophy: For the illumination of the Underfanding; the extrafting of elxioms, and the producing of many noble Worksand Effects. For he bapetb by this means, to acquit bimfelf of tbat, for whicd be taketb bimjelf inafort bound; and tbat is, the adrancement of Learning and Sciences. For baving, in this prefent W ork, collected the materials for the Building; and in bis Novum Organum (of fob hich his Loridh ip is yet to publi) a Second Part) Set down the Inflruments and Direttions for the VV ork: Men Ball now be wanting to themfelves, if they raice not knowledge to that perfection, whereof the $\mathcal{X}$ (ature of Mortal Menis capable. eAnd in this bebalf, I bave heard bis Lord/hip Reak complainingly, That bis Lord/hip (who thinketh, that he deferveth to be an A Architect in tbis Building) (Bould be forced to be a VV Vrkman, and a Laborer; and to dig the (lay, and burn the Brick; and more then tbat? (according to the bard condition of the Ifraelites, at the latter end) to gather the Straw and Stubble, aver all the Fields, - 0 burn the Bricks withal. For he knoweth, that except be do it, nothing will be done; Men are fofet to defpife the means of their omn good. And as for the bafene $\beta$ of many of the Experiments, as long as they be Gods VVorks; they are bonorable enough: And for the vulgarne $\beta$ of them, true A xioms mult be dramn from plain experience, and not from doubfful; and bis Lordhips couryeis to make VV Vonders plain, and
and not plazin ibings $V$ V onders ; and thats sxiesriences like-
 grooveth; ; and for U[e, bis Lordhip bath offen im whis OMouth, the two kindes of Experiments, Experimenta Fructifera, and Experimenta Lucifera: Experiments of Ufe; and Experiments of Light: And be reportetb bimfelf, whetber be bere not a Arange Man, that fould think that Light bath no UJe, becaule it bath no Maiter. Furiber bss Lordhbip thought good allo, to add unto many of the Experiments themjelves, Jome gloss of the Caufes; that in the fucceeding work of Interpreting Nature, and Framing Axioms, all things may be in more readine $\beta$. And for the Caufes berein by bim aßigned; bis Lordfbip perfwadetb bimjelf, they are far more certain, thain thofe that are rendred by otbers ; not for any excellency of his own wit, (as bis Lord/bip is wont to fay) but in refpect of bis continual converjation with Nature and Experience. He did confader likewife, That by this eAddition of Caufes, CMens mindes (wbich make fo much bafte to frnde out the caufes of things ; ) would not think themjelves utterly loft in a vall Wood of Experience, but fay upon tbefe Caufes (fuch as they are) a little, till true Axioms may be more fully dijcovered. I have beard bis Lord/h ip fay alfo, That one great reafon, why be would not put thefe Particulars into any exail Method, (thoughbe, that looketh attentively into them, Ball funde, that they bave a Se. cret order) mas, Becaufe be conceibed tbat other men would now think that they could do the like; and fo go on with a further Collection, wbich, if the Metbod bad been exact, many would bave depaired to attain by Imitation. eAs for bis Lord/hips love of Order, I can refer any Man to bis Lordflips Latin Book, De Augmentis Scientiarum; which, if my judgment be any tbing, is mritten in B
the

## To the Reader.

The Epistle is the fame, that should have been prefixed to this Book, if his Lordfhip had lived.
the exactef order, that $I$ know any writing to be. I will conclude, with :a usual Speech of bis Lordships. That this Work of bis Natural Hiftory, is the World; as God made it, and not as Men have made it; for that it hath nothing, if Imagination.

W. RAWLEY.

## The Life of the Right Honorable

what the Iffue, was like to be; Harving bad what foever Nacure or. Breeding could put into bim.

His first and cbildiß years were not witbout fomie Mark of Eminency; At which timé be was indued with ibat Pregnancy, and Towardliness; of wit ; As they were Prefages; of that Deep, and Univerfal Apprehenfion, which was manifeft in bim, afterward: And caufed bim to be taken notice of, by feveral Perfons, of Worth and Tlace; And efpecially, by the Queen; 2bho (as I bave been informed) deliglted much, then, to confer with bim; And to prove bim wit's Queftions; unto mbom, be delivered Himfelf, with that Gravity, and Macurity, above bis years; That Her Majefty mould often term bim, The young Lord Keeper. Being asked by the Queen, how old he was? He anfwered nith much difcretion, being then but a Boy; That he was two years younger than her Majefties happy Reign; with which anfwer the Queen was mucbtaken.

At the ordinary years, of Ripenefs, for the univerfity; or ratber, fomething earlier; bewas fent by bis Eather, to Trinity Colledge, in Cambridge ; To be educated, and bred under the Tuition of Dočor John White-Gift, then Mafter of the Colledge; Afterwards the renowned Arch Biffiop if Canterbury; a Prelate of the firft Magnitude of Sanctity, Learning, Patience, and Humility; Tuder ubom, He wasobServed, to bave been more, than an Ordinary Proficient, in the ferveral Arts and Sciences. Whilfo be was commorant, in the Vniverfity, about 16 years of age, (as bis Lordifhip batb been pleafed to impart unto my felf; ) be firlt fell .into the Dijilike, of the Philofophy of Arifotle; Not for the Worthleffenefs of the Author, to nobom be would ereval cribe all High Attributes; But for the Vnfruitfulnefs; of the way; Being a Philofophy, (as bis Lordfhip ufed to fay) only frrong, for Difputations, and Contentions; But Barren, of the production of Works, for the Benefit of the Life of Man. In which Mind be continued to bis Dying Day.

After loe bid palfed, the Circle of the Liberal Arts; His Farher thought fit, to frame, and mould bim for the Arts of State; and, for that end, fent bim orver into. France, with

Sir Amyas Paulet, then Employed Ambaffadour Lieger, into France: By wobom, be was, after awhile, beld fit to be entrufied, with fome Melfage, or Advertifement, to the Queen; which baving performed with grcat Approbation, be returned back into France again; witb intention to continue, for fome years, there. In bis abjence, in France, bis Father, the Lord Keeper, died; Having collectsd, (as I bave heard, of Knowing Perfons) a contderable Jum of Money, wobich hebad Separated, with Intention, to bave made a competent Purchale of Land, for the Lively bood of this bis youngeft Son; (who was onely unpravided for; and though hs was theyoungeft in years, yet be was not the lowe ft, in bis Fathers affection; ) But the faid Purchale, being unaccomplifbed, at bis Fathers Death, there came no greater /bare to bim, than bis fingle. Part, and Portion, of the Money, diridable among $f$ t firve Brethren; 'By which means, be lived', in fome ftreits, and Neceffities, in bis younger years. For as for tbat pleaf anst Scite, and Mannor of Gorhambury, be came not to it, till many years after, by the Death, of bis Deareft Brother, Mr. Anthony Bacen; a Gentleman, equal to bim, in Height of Wit; Though inferiour to bim, in the Endowments of Learning and Knowledge; $\because$ noto whom be was, molt nearly conjoyned in affection; They troo being the fole Male-iffue of a fem cond Venter.

Being returned from Travail, be applied bimjelf, to the Study of the Common-Law; sobich be took upon bim to be bis Profeffion. In robich, be obtained to great Excellency. Though be madethat, (as bimSelffaid.) but as an acceffary, and not as his Principal ftudy. He wrote feveral Tractates, upon that Subject.: Wherein, thougb jome great Mafters, of the Law did out-go bim in Bulk, and Particularities of Cales; yet, in the Science, of the Grounds; and Myfteries, of the Law, be was exceeded by none. In this way, bewas af. ter a while, fiworn, of the Queens Counfel Learned, Extraordinary; agrace, (if I erre not) fcarce known before. He jeated himfelf for the commodity of bis fludies, arid Practije; amongf.tbe Honourable Society, of Greyes-Inn; Of whica Houle; be vas: Member ; where be Erecteds

| 4 | The Life of the Right Honorable |
| :---: | :---: |
|  | that Elegant Pile, or Structure, commonly known by the Name of the Lord Bacons Lodgings; which be Inbabited by Turns, the moft part of his Life, ( Jome few years onely excepted, ) unto bis Dying Day. In robick Houfe be carried himfelf, with fuch Sweetnefs, Comity, and Generofty; That be was much rervered, and beloved, by the Readers and Gentlemen of the Houfe. <br> Not witblfanding, that be profeffed the Law for bis Livelybood, and Subfifence; yet bis Heart and Affection was more carried after the Affairs and Places of Eftate; for which, if tbe Majefty Royal then, bad been pleafed, be was most fit. In bis youngeryears, be ftudiedtibe Service, and Fortunes, (as they call them, ) of that iNoble, but unfortunate Earl, the Earl of Effex; unto whom be was, in a fort, a Private and free Counfeller, and gave bim Safe and Honourable Adrice, till, in the end, the Earl inclined too much, to the riololent and precitate Counjell of otbers, bis Adberents, and Followers; which was bis Fate and Ruine. <br> His Birth and otber Capacities qualified bim, above o. thers of bis Profeffion, tohave ordinary acceffes at Court; and to come frequentiy into the Queens Eye; who would of ten grace bim with private and free Communication; Not onely about Matters of his Profeffion, or Bulinefs in Law ; But alfo, about the arduous Affairs of Eftate; Froms whomphe received, from time to time, great Satisfaction. Nevertbelefs though fle cheered bim much, with the Bounty of her Countenance; yet Sbe never cheered bim with the Bounty of ber Hand : Having nerver conferred uponbim, any Ordinary Place or Means of Honour or Profit, Sarve onely one dry Reverfion of the Regifters Office, in the StarChamber; worth about 1600 I. per Annum; For which be waited in Expectation, either fully or near twenty years; Of which bis Lordhhip would $a y$, in Queen Elizabeths Time; That it was like anorher mans Ground, buttalling upon his Houfe; which might mend his Profpect, but it did not fill his Barn. (Nevertbelefs in the time of King James, it fell unto bim, which might be imputed; not . $o$ much to ber Majefties averfenefs and Difaffection, towards him; |

as the Arts and Policy of a Great Statefman, then; pobola- boured by all induftrious, and fecret Means, to Jupprefs, and keep him down; left, if be bad rijen, be might bave obfcured his Glory:

But tbougb; be food long at aftay, in the Dajes of bis Miftrefs Queen Elizabeth; $\mathrm{ret}_{\text {et }}$, after the change, and Coming in of bis New Mafter, King James, be made a great progrefs; by whom be was much comforted, in Places of Truft, Honour, and Revenue, Ibarve feen, a Letter of bis LordThips, to King James, wherein be makes Acknowledgement; That he was that Mafter to him, that had raifed and advanced him nine times; Thrice in Dignity, and six times in Office, His Offices (as I conceire) were Counfel learned extraordinary, to bis Majefty, as be bal been, to Queen Elizabeth; Kings Solliciter General; His Majefties Atturney General; Counfellor of Eftate, being yet bxt Atturney : Lord Keeper of the Great Seal of England; Lafly, Lord Chancellor: which tyo laft Places,thougbt they be the Jame, in Autbority and Power; yet they differ in Patent, Height, and Favour of the Prince. Since mbole time, none of bis Succeffors, until this prefent Honourable Lord; didever bear the Title of Lord Chancellor. His Dignities कere firf Knight, then Baron of Verulam; Lafly, Vifcount Saint Alban : Befides otber good Gifts and Bouncies of the Hand, which bis Majesty garue bim, Both, oust of the Broad-Seal, and out of the Aleniation-Office, To the pg lue, in both of eighteen bundred poonds per annum : whicb whith bis Mannour of Gorhambury; and otber Lands and Poffelfions, wear thereunto adjoyning, aupounting to a tbird part more, be retained to bis Dying Day.

To wards bis Rifing years, not before, be entered into a mar: ried Eflate, and took to Wife, Alice, one of the Daughters, and Co-heirs of Benedict Barnham, Elquile, and Alderman of London, with wbem be received, ofuffciently annsple, and liberal Portion, in Marriage. Children be pasd none : whicb, thougb they be tbe means, to perpertate our Names', afterour Deaths; yet be bad otber Iffues to perpetuate bis Name; The Iffues of bis Brain; in mbich be was e-

## The Life of the Right Honorable

reer bappy, and admired; as Jupiter was, in the produttion of Pallas. Neitber did the soant of Children, detrest from bis goodujage of bis Confort, during the Intermarriage: whom be profecuted, with much Conjugal Love, end ReJpect ; with many Ricb Gifts, and Endowments; Befdes a Robe of Honours which be invefted ber xithal; which the woreuntill her Dying Day; being twenty years and more;' ofter bis Death:

Tbe lalt five years of bis Life, being with drawn from C vil affaires, and from an Active Life, be employed molly in Contemplation and Studies. A thing, wheriof bis Lordhip would often Speak, during bis Active Life $\boldsymbol{a}^{3}$ as if be affected to dy in the Shadow, and not in the Light; which alfomay befound in ferveral PajJages of bis Wirksol In mish time be compofed, the greateSt part of bis Books, and Writings; 'Both in Englifh and Latine; Which I will enu. merate, (as near as I can) in tbe jull order, wherein they were written. The Hiftory of the Reign of King Henry the Seventh; Abcedarium Naturx; or a Metaphyfical piece; pbich is lof: Hiftoria Ventorum; Hiftoria Vita \& Mortis; Hiftoria Denfi \& Rari, not yet printed; Hiftoria Gravis \& Levis's which is aljo tof ; A Difcourfe of a War mith Spain; A Dialogue, toncbing an Holy War. The Fable of the New Atlantis. A Prefase to a Digeft of the Lawes of England. The Beginning; of the Hiftory of tbe Reign of King Henry tbe Eighth. De Augmentis Scientiarum, Or the Advancement of Learning, put into Latin, with Soverat Enrichments and Enlargements. Counfels Civil, and Moral. Or bis Book of Effayes, Likewife Enriched and Enlarged. The Converfion of certain Pfalms, into Englifh Verfe. The Tranflation into Latin of the Hifory of King Henry the Seventh. Of the Counfels (ivil and Moral. Of the Dialogue of the Holy War. Of the Fable of the New Atlantis, For the Benefit of otber Nations. His Rervijug of his Book, De sapientia Veterum. Inquifitio de Magnete, Topica Inquifitionis, de Lüce \& Lumine; Botb thefe not yet Printed, LaftlyrSylva sylvarum, or the Natural Hiftory. - Theje were: the

Fruits,
fruits and Productions, of his laft five years. His Lordflip allo defgned upon the Motion and Inruitation of his late Majefty;-To bave roritten the Reign of King Henry the Eighth; But that Work Perifhed in the Defignation meerly; God not lending bim Life, to proceed further upon it, then only in una Mornings Work:- rrbereof tbere is Extant, An, Ex Ungue Leonem, already Printed, in bis Lordfhips Mifcellany Works.

Tbere is a Commessoration due; As well, to bis abilities, and Frertues, as to the Courfe of bis Life. Thofe Abilities, whicb conimonly go fingle in other Mer, though of prime, and obferrueable, Parts, were all conjoynéds and mot in Him. Thoje are, Sharpnefs of Wit, Memory, Judgment, and Elocution. For the Former Tbree, bis Books do abanndantly Speak them; wobich, with wbat Sufficiency be wrote, let the World judge; But with what Celerity be wrote them, I can befiteftifie. But for the Fourth, his Elocution; I will only fet down, what I beards Sir Walter Rawleigh, once /peak of bim; by may of Comparijon; (moofe fudgment may woll be trufted; ) That the Earl of Salifbury, was an excellent Speaker, but no good Pen-man; That the Earl of Nortbampton, (the Lord Henry Howard,) was an excellent Pen-man, but no good speaker; But that Sir Francis Bacon, was Eminent in both.
I barve been enduced to think ; That if there were, a Beam of Knowledge derirved from God upon any Man, in thefe Modern Times, it was upon Hims. For though be seas a great Reader of Books; yet be bad not bis Knowledoe from Buoks'; sut from Jome Grounds, and Notions from within Himfelf. Which notwitbftanding, be vented mith great Caution and Circumfpection. His Book, of Inftauration Magna, (wobich, in bis own Account, was the chiefefl of bis Works,) was no Slight Imagination, ar Fancy, of bis brain; but a setled, and Concoeted Notion; The Production of many years, Labour, and Travel. I my Self, bave feen, at the lest, Twelve Coppies, of the Inftauration; Revifed, year by jear sone after another; And every year altered, aind amended,

The Life of the Right Honorable
in the Frame thereof; Till, at laft, it came totbat Model, in whichit was committed to the Prels; As many Living Creatures, do lick their young ones, till they bring them, to their ftrength of Limbs.

In the Compofing of his Books, be did ratber drive at a Mafculine and clear Exprefsion, than at any Finenefs, or Affectation of Phrafes, and rould often ask, if the Meaning were expreffed plainly enough : as being one that accounted words to be but fubfervent, or Minifterial, to Matter; and not the principal. And if bis Scile mere Polite, it roas becaure be could do no otherwife. Neitber mas be given, to any Light Conceits; Or Defcanting uponWords; 'But did ever, purpofely, and induftrioufly, avoid them ; For be beld fucb Things, to be but Digrefsions, or Diverfions, from tbe Scope intended; and to derogate, from the Weight and Dignity of the Stile.

He was no Plodder upon Books; Thoughbe read much, and that with great fudgement and Rejection of Impertinences; incident to many Authors ; For be vould ever interlace a Moderate Relaxation of His Minde with bis Studies; As Walking, Or Taking the Air abroad in bis Coach; or fome otber befitting Recreation; and yet, be would loofe no Time, In as much, as upon bis Firft, and Immediate Return, he would fall to Reading again, and so fuffer no Moment of Time to Slip from bim without Some prefent Improvement.

His Meales were Refections of the Eare as well as of tbe Stomack : Like the Noctes Atticx; or Convivia Deip-no-Sophiftarum ; Wherein a Man might be refre/bed in his Mind and underftanding, no lefs then in bis Body. And 1 barve knowon fome, of no mean Parts, that baroe profeffed to make ufe of their Note-Books, when they have rifen from bis Table. In mbicb Converfations, and otherwife, be mas no Dajbing Man, as fome men are; "But erver a Countenancer, and Fofterer, of another Mans Parts. Neither was be one, that would appropriate the Speech, wholy to Himjelf; or delight to out-vie others; But leave a Liberty, to the Co-Affeffours, to take their Turns. Wherein bt would draw
a Man on, and allure bim, to fpeak wpon fucb a jubject, as wherein be was peculiarly. Skilful, and would delight to /peak. Aind, for Himfelf, be contemned no Wans Obfervations, but would light bis Torch at every mans Candle.

His Opinions and Affertions were, for the mof part, Binding, ant not contradicted by any; Ratber like Oracles, than Difcourfes. Which may be imputed, either to the woll weighing of his sentence, by tbe Skales of Truth, and Reafon; Or elfe to the Reverence and Eftimation, wherein be was commonly bad, that no Man would sjconteft with him: So that tbere was no. Argumentation, or Pro and Con (as they termit) at bis Table : Or if tbere chanced to be any it was carried with muccl Submiffion and Moderation,
$I$ bave often obserroed, and fo barve otber Men of great accounnt, That ifbebad occafon to repeat anotber Mans Words after bim, be bad an ufe and facultg to drefs thens in, better Veftments, and Apparel than they had before: So tbat the Authour bould find bis own speech much amended; and yet the fubftance of it fill retained : As if it bad been Na . tural to bim to ufe good Forms; As Ovid Jpake of bis Faculty of Verfifying.

Et quod rentabam frribere, Verfus erat,

Wben bis Office called bim , as be was of the Kings Counfel Learned, to charge any Offenders', either in Criminals, or Capitals; He was never of an Infulting, or Domineering Natureover them; But alwayes tender Hearted, and carry:ing bimfelf dee ently towards the Parties; (Though it was his Duty, tocharge them bonse:) But yet, as one, that looked upon the Example miththe Eye of Severity, But upon the Perfon, moth the Eve of Pitty, and Compaffion. And in Civil Bufinefs, as be was Counfellor of Eftate', be bad the beft way of advifing ; Not engaging bis Mafter, in any Precipitate or grievous Courfes; but in Moderate and Fair Proceedings: Tibe King, whom be Jerved, girving bim this Teftimony; That be ever dealt, in Bufineffe, Suavibus

## The Life of the Right Honorable

Modis; Which wasthe way that was moft according to his own heart.

Neither woas He in bis time leffe gracious woith tbe Subject than with bis Soveraign. He was ever acceptable to the Houfe of Commons, wher be was a Member thereof. Being the Kings Atturney, and chofen to aplace in Parliament; be rpas allowed and difpenfed witb to fit in the Houfe; which wors not permitted to other Atturneys.
$\Delta n d$ as be was a good Servant to his Mafter; Being never, in nineteen years fervice (as be bimself arverred, ) rebuked by the King for any Thing relating to his Majefty; So be was a good Mafter to bis Servants; And revoarded their long attendance with good Places, freely when they fell into bis Power. Which was the Caufe that fo many young Gentlemen of Blood and Quality, fought to list themfelres in bis Retinue. Andif be were abujed by any of them in their Places, In was onely the Errour, of the Goodnels, of bis Nature; but the Badges of tbeir Indifcretions, and Intempérances.

This Lord was Religious; For though the World be apt tolu/pect, and prejudice, Great Wits, and Politicks to bave romewbat of the Atheift; ret be was converfant with God: as appeareth, by feveral Taffages, throughout the mbole Cur: rent of bis Writings. Otberwije be 乃ould barve croffed his ornn Principles; which were, That a little Philofophy, makerh Men apt to forget God; As attributing too much to fecond Caufes; But Depth of Philofophy, bringeth Men back to God again. Noso 1 am fure tbere ix no Man that will deny bim, or accownt otherwife of him, but to bave bim bees a deep Philofopher. And not only $f 0$, But be wasable to render a Reafon of the Hope which was in him; Whichthat Writing of his, of the Confeffion of the Faith, doth abumdantly testific. He repaired frequently, mben bis Healds mould permit bim, to the Service of the Church, To bear Sermons, To the Adminiftration of the Sacrament of the Bleffed Body and Bloud of Chrift; and died in the true Faith eflablifibed in the Church of England.

I bis is moft true; He moas free from Malice; which, (as be faid Himelf,) He never bred nor fed. He spas no Kevenger of Injuries; which, ifhe badminded, be bad both Opportunity and Place High enough, to barve done it. Hexras no Heaver of Men out of their Places, as delighting in their Ruine and undoing. He was no diefamer of any Man to bis Prince. One Day, when a great States-Man was newly Dead, Ihat bad not been bis Friend; The King asked bim, What he thought of that Lord, which was gone? He anwrered, That he would never have made his Majelties Eftate better; But he was fure he would have kept it from being worle. Which was the worlf, be would jay of bim. WWich 1 reckon, not among his Moral, biot his Chriftian Vertues.

His Fame is greater, and Sounds lowder in Forraign Parts abroad, than at home in bis ovon Ndtion. Thereby rverify ing that Divine Sentence, A Prophet is not without honour, fave in his own Country, and in his own houfe. Concerning which 1 will give yous a Tafte onely, out of a Letter, seritten from Italy (Tbe Store-houfe of Refined Wits) to the late Earl of Devonfhire, Then, the Lord Candifh. I will expeet the Nero Effayes of my Lord Chancellor Bacon, as alfo his Hiftory, with a great deal of De. fire, and whatfoever elfe he thall compole. But in Particular of his Hiftory, I promife my felfa thing perfect and Singular ; efpecially in Henry the Seventh; Where be may exercife the Talent of his Divine Underftanding. This Lord is more and more known, and his Books here, more and more delighted in ; And thole Men that have more than ordinary Knowledge in Humane affairs, efteem him one of the moft capable Spirits of this Age; and he is truely fuch. Now his Fame dutb not decree with Dayes fince, but ratber increafe. Divers of his Works bave been anciently, and yet lately, tranתated into otber Tongus, botb Learned aind Modèrn, 6y Eorraign Pens. Several Perfons of Quality, during bis Lordfhips Life, croffed the Seas on purpofe togais an Opportunity of feeing him, and Difcourfing with him : wher of one,

But yet, in this Matter of bis Fame, I (peak, in the Comparative, onely; and not in the Exclufive. For his Reputation is great, in bis oron Nation , alfo; Efpecially amongft thofe, that are of a more Acute, and Sarper Fudgement : Which I will exemplifie, but with two Teftımonies, and no more. The Former; When his Hiftory of King Henry the Seventh was to come forth; It was delipered to the old Lord Brook, to be periufed by bim; who, when be bad dijpatched it, returned it to the Author, with tbis Eulogy:Commend me to my Lord; and bid him take care, to get good Paper and Inke, for the Work is incomparable. The otber fall be that, of Doctor Samuel Collins, late Provoft, of Kings. Colledge, in Cambridge, A Man of no vuilgar Wit, wobo affirmed unto me, That when he had read, the Book of the Advancement of Learning, He found himfelf in a cafe to begin his Studies a new, and that he had loft all the Time of his Itudying before.

It $b$ at been defined; That jometbing would be fignified, touching bis Diet; and the Regiment of bis Health: Of whicb,in regard; of $b_{i s}$ Univerfal Infight into Nature, be may (perhaps,) be to Come, an Example. For bis Diet; It was rather a plentiful, and liberal, Diet, as bis Stamack roould bear it, then a Reftrained; Which be alpo commended in bis Book of the Hiftory of Life and Death. In bis younger years, beaus mucks given to the Finer and Lightter fort of Meats, As of Fowles'; and Such like: 'But afterward, when he gre io more judicious; He preferred the tronger Meats; Juch as the Shambles afforded; As thole Meats, robich bred the more firm and fubjtantial Juyces of the Body, and less Diffipable: upon which, be would often make bis Meal; Though be bad other Meats, upon the Table. Yow may be fire; He would not neglect that Himself, which He So much extolled in bis Writings; And that was the r) Se of Niter: Whereof be took in the Quantity of about three Grains, in thin rearm Broath, every Morning, for thirty years' togeter, next before bis Death. And for Pbyfick, be did, indeed, live Pbyfically, but not miserably; For be took only a Maceration of Rhubarb; InfuFed into a Draught of White Wine, and Beer, mingled together, for the Space of half an Hour; Once in fa or Seven Dayes; Immediately before his Wheal, (whether Dinner, or Supper, ) that it might dry, the Body, leffe: whicb(as be (aid, ) did carry away frequently, the Groffer Humours of the Body, and not diminifb, or car ry away, any of the Spirits, as Sweating doth. And this was no Grievous Ibing to take. As for other Pbyfick, in an ordinary way, (what Soever bath been rullgarly/poken; ) be took not. His Receit, for the Gout; which did, constantly, ease bim of his Pain, within two Hours, Is already Jet down in the End, of the Natural Hiftory.

It may Seem, the Moon, bad rome Principal Place, in the Figure of his Nativity. For the Moon, wasnerver in her Passion or Eclipsed, but be was furprized, with a sudden Fit, of Fainting: And that, though be observed not, nor took any presrious Knowledge, of the Eclipfe thereof; and affoon as the Ecliple ceafed, be was reftored, to bis former ftrength again.

Hedied, on the $9^{\text {th. }}$. Day of A pril, in the yedr 1620 ; In the early Morning, of the Day then celebrated for our §aviours Refurrection, In the $66^{\text {th. }}$ year of bis Age; at the Earle of Arundells Houle in High-gate, near London; To ishich Place, be cafually repaired, about a neek befors, Godfoordaining, that be fould dye tbere, Of a Gentle Feaver, accidentally accompanied, woith agreat Cold; whereby the Defluxion of Rheume, fell fo plentifully upon his Breaft, tbat be died by Suffocation: and wos buried, in Saint Michaels Church; at Saint Albans; Being the Place, defigned for bis Burial, by bis laft Will, and Teftament; Both becauje the Body of bis Mother was interredthere; And because, it was the only Church, then remaining, Within the Precincts of old Verulam: Where be bath a Monument, erected for bim of White Marble; ( $B y$ the Care, and Gratitude, of Sir Thomas Meautys, Knight, formerly bis Lordlhips Secretary; Afterwards Clark of the Kings Honourable Privy Gounfel, under two Kings: ) Reprefenting bos full Pourtraiture in the Pofture of fudying; with an Infcription compored by that Accomplifbt Gentleman, and Rare Wit, Sir Henry Wotton.

But bowfoever bis Body pan Mortal; yet no doubt bis Memory and Works will live ; And will in all probability, last as long as the World lafteth. In order to which, I bave endeavoured, (after my poor Ability,) to do tbis Honour to bis LordChip by way, of enducing to the fame.

SPEECHES

# NE W <br> ATLANTIS. 

A VVork unfinished.

Written by the Right Honorable,
FRANCIS
Lord Verulam, Vifcount St. eAlbans:

(an

TO THE
READER.

His Fable my Lord devifed, to the end that he might exhibit therein a Model or Defription of a College, inftituted for the Interpreting of Nature, and the producing of great and marvellous Works for the benefit of Men, under the name of Solomons Houfe, or, The College of the Six days Works. And even fo far his Lordship hath proceeded as to finish that Part. Certainly, the Model is more vaft and high, than can poffibly be imitated in all things, notwithflanding moft things therein are within Mens power to effect. His Lordship thought alfo in this prefent Fable to have compofed a Frame of Laws, or of the beft State or Mould of a Commonmentlis; but fore-feeing it would be a long Work, his defire of Collecting the $\mathcal{X}$ (atural Hiftory diverted him, which he preferred many degrees before it.

This Work of the $\mathcal{X}$ (ew eftlantis (as much as concerneth the English Edition) his Lordship defigned for this place, in regard it hath fo near affinity (in one part of it) with the preceding Natural Hitory.
W. Ramley.

# NEW ATLANTIS. 

E failed from Peru (where we had continued by the fpace of one whole year) for Claina and fapan by the South Sea, taking with us Victuals for Twelve Moneths, and had good Winds from the Enft; though foft anid weak, for Five Moneths fpace and more; but then the Wind came about, and fetled in the Welt for many days; fo as we could make little or no way, and were fometimes in purpofe to turn back : But then again, there arofe frong and great Winds from the South, with a Roint Eaft, which carried us up (for all that we coulddo) towards the North; by which time our Victuals failed us, though we had made good fpare of them: So that finding our felves in the midft of the greatent Wildernefs of Waters in the World, without Victual, we gave ourfelves for loftmen, and prepared for death. Yet we did lift up our hearts and voices to God above, Who Serweth bis moonders in the deep; befeeching him of his mercy, That as in the Beginning he difcovered the Face of the deep, and brought forth dry. land; fo he would now difcover Land to us, that we might not perifh. And it came to pafs, that the next day about Evening, we faw within a Kenning before us, towards the North, as it were thicker Clouds, which did put us in fome hope of Land ; knowing how that part of the South-Sea was utterly unknown, and might have Inands or Continents that hitherto were not come to light. Wherefore we bent our courfe thither, where we faw the appearance of Land all that night; and in the dawning of the next day, we might plainly difcern thatit was a Land flat to ourfight, and full of Bofcage, which made it thew the more dark; and afrer an hour and a halfs failing, we entred into a good Haven, being the Port of a fair City, not great indeed, but well built, and that gave a pleafant view from the Sea: And we thinking every minute long, till we were on Land, came clofe to the Shore and offered to land; but ftraight-ways we faw divers of the people with Battons in their hands, (as it were) forbidding us to land, yet without any cries or fiercenels, but onely as warning us off by figns that they made. Whereupon being not a little difcomforted, we were advifing with our felves, what we fhould do. During which time, there made forth to us a fmall Boat with about eight perfons in it, whereof one of them had in his hand a Tip-ftaff of a Yellow Cane, tipped at both ends with Blew, who madde aboard our Ship without any thew of diftruft at all : And when he faw one of our number prefent himfelf fomewhat afore the reft, he drew forth a little Scroul of Parchment (fomewhat yellower then our Parchment;
and fhining like the Leaves of Writing-Tables, but otherwife foft and flexible) and delivered it to our foremont man. In which Scroul were writen in ancient Hebrepo, andin ancient Greek, and ingood Latine of the School, and in Spanifh, thefe words, "Landyenor, none of you, and provide tobc "gone from this Coait within fixteen days, except you have further time "given you: Mean while, if you want Frefh-water or Victual, or help for "your Sick, or that your Ship reedech repair, write down your wants, and "you fhall have that which belongeth to Mercy. This Scroul was figned with a ftamp of Cherubinas IVings, not spred, but hanging downwards, and by them a Croß. This being delivered, the Officer returned, and left onely a Servant with us to receive ouranfwer. Confulting hereupon amongt our felves, we were much perplexed. The denial of Landing, and hafty warning us away, troubled us much." On the other fide, to finde that the people had Languages, and were fo full of Humanity, did comfort us not a lite ; and above all, the Sign of the Croß to that Inftrunient, was to us a great rejoycing, and, as it were, a certain prefage of good. Our anfwer was in the Spaniß Tongue, "Thar for our Ship it was well, for we had rather " met with Calms and contrary Winds then any Tempelts. For our Sick, " they were many and in very ill cafe; fo that if they were not permitted to " land, they ran in danger of their lives. Our other wants we fet down in particular," adding, "That we had fome little ftore of Merchandize, which "if it pleafed them'to deal for, it might fupply our wants without being "chargeable unto them. W.e offered fome reward in Piftolets unto the Servant, and a piece of Crimfon Velvet to be prefented to the Officer; but the Servant took them not, nor would fcarce look upon them, and to left us, and went back in another little Boat which was fent for him.

About three hours after we had difpatched our Anfwer, there came towards us a perfon (as it feemed) of place: He had on him a Gown with wide Sleeves of a kinde of Water-Chamolet, of an excellent Azure coloúr, far more gloffie then ours; his under apparel was green, and fo was his Har, being in the form of a Turbant, daintily madel, and not fotuge as the Tarki弓a. Turbants; and the Locks of his Hair cane down below the brims of it: AReverend Man' was he to behold. He came in a Boat gilt in fome part of ir, with four perfons more onely in that Boat, and was followed by another Boat whercin were fome twenty. When he was come within'a flight: fhot of our Ship, figns were made to us, that we fhould fend forth fome to meet him upon the Water'; which ave prefently did in out Shipboar, fending the principal Man amongtt us fave one, and four of our number with him. When we were come within fix yards of their Boat, they called to us to ftay, and not to approach further; which we did: And thereupon the Man whom I before dercribed food up, and with a loud voice in Spanif, asked, Alveye Khrifians? We ancwered, VVe mere; feáring thelefs, becaufe of the Crof we had feen in the Subfcription. At whict anfver, the faid perfon lift up his right handtovvards Heaven, and drevvit foftly to his mouth, (vvhich is the gefture they ufe vihen they thank God) and then faid, "If you vvill Ivvear (all of you') by the Merits of the Saviour that ye areno "Pirates, nor have fhed blood, davvfully nor anlavvfully", vivithin forty "days, paft, you may have Licenfe to come onLand. TVe faid, "VVe vvere "allready to take that Oath. VVhereupon one of thofe that vvere vvith him, being (as it feemed) a सoraiy made an Entry of this A At. VVhich done another of the attendants of the Great Perlon, waich vas vivith
hum in the fame Boat, alfer his Lord had ipoken a little to him, faid aloud, "My Lord, would have you know, that ic is not of Pride or (ireatnels hat "he cometh not aboard your Ship ; but for that, in yout Anfwer, y'cu de"clare, That you have manylick amongit you, he was warned bv the Con. "Servator of Health of the City, that he hould keep a diftance. VVe bowed our felves rowards him, and anhwered, "VVe were his humble Servants, " and accounted for great Honor and fingular Humanity towards us, that " which was already done ; but hoped well, that the nature of the ficknefs "of our Men was not infectious. So he returned, and a while after came the Notary to us aboard our Ship, holding in his hand a Fruit of that Countrey like an Orenge, but of colour between Orengeotamay and Scarlet, which caft a moft excellent Odor: He ufed it (as it feemeth) for a Prefervative againtt Infection. He gaveus our Oath, By she Name of Fefus, and bis Merits; and after told us, that the next day by fix of the clock in the morning we fhould befentto, and brought to the Strangers Houfe, (fo he called it) vohere vee Thould be accommodated of things both for our vvhole and for our fick. So he left us; and vvhen vve offered him fome Piftolets, he fmiling, faid, He muf not be twice paid for one labor, meaning (as I take it) that he had falary fufficient of the State for his fervice; for (as I after learned) they call an Officer that taketh revvards, $T_{\text {rice }}$ prid.

Thenext morning early, there came to us the fame Officer that came to us at firt veith his Cane, and told us, "He came to conduct us to the Strangers " $H$ onfe, and that he had prevented the hour, becaufe we might have the whole "day before us for our bufinefs: For ( $\mathrm{f}_{\mathrm{ai}} \mathrm{d}$ he) if you vvill follovv my ad. "vice, there fhall firft go vvith me fome fevv of you, and lee the place, and " hovv it may be made convenient for you; and then you may fend for your "fick, and the reft of y our number which ye will bring on Land. VVe thanked him, and Said, "That this care vvhich he took of defolate Strangers, God "vpould revvard. And ro fix of us vvent on Land vvith him ; and vven vve vvere on Land, he veent before us, and turned to us, and faid, He was but our Servant, and our Guide. He led us through three fair Screets, and all the waywe went there were gathered fome people on both fides, ftanding in a row, but in fo civil a fafhion, as if it had been not to wonder at us, but to welcome us; and divers of them, as we paffed by them, put their arms a little abroad, which is their gefture when they bid any welcome. The Strangers House is a fair and fpacious Houfe, built of Brick; of fomewhat a bluer colour then our Brick, and with handfome Windows, fome of Glafs, fome of a kinde of Cambrick oiled. He brought us firft into a fair Parlor above-ftairs, and then asked us, "What number of perfons "we were, and how many fick. VVe anf wered, "We Were in all (fick and "'whole) One and fifty perfons, whereof our fick were feventeen. He defired us to have patience a little, and to ftay till he came back to us, which was about an hour after ; and then he led us to fee the Chambers which were provided forus, being in numberNineteen. They having caft it (as it feemeth) that four of thofe Chambers, vuich vvere better then the relt, might receive four of the principal men of our company, and lodge them alone by themfelves; and the otherfifteen Chambers vvere to lodge us, tvvo. and tvvo together ; the Chambers vvere handfome and chearful Chambers, and furnifhed civilly. Then he led usto a long Gallery, like a Dorture, vvhere he fhevved usallalong the one fide (for the other fide vvas but Wall and Windovv) feventeen Cells, very nearones, having Partitions of Cedar-vvood. VVhich Gallery and Cells, being in
all forty, (many more then we needed) were inftituted as an Infirmary for fick perfons. And he told us withal, that as any of our fick waxed well; he might be removed from his Cell to a Chamber; for which purpofe, there were fet forth ten fpare Chambers, befides the number we fpake of befure. This done, he brought us back to the Parlor, and lifting uphis Cane a little (as they do when they give any charge or command) faid to us, "Ye are to know, that the Cuftom of the Land requireth, that afterthis "day and to morrow (which we give you for removing your People from "your Ship) you are to keep within doors for three days: But let it not "trouble you, nor do not think your felves reftrained, but rather left to "your Reft and Eafe. You fhall want nothing, and there arc fix of our "people appointed to attend you for any bufinefs you may have abroad. We gave him thanks with all affection and refpect, and faid; God furely is maniffefed in this Land. We offered him alfo twenty Piftolets; but he fniled, and oncly faid, $V$ Vhat, twice paid? and fo he left us. Soon after our Dinner was ferved in, which was right good Viands, both for Bread and Meat, better then any Collegiate Diet, that I have known in Europe. VVe had alfodrink of three forts, all wholefome and good; VVine of the Grape, a Drink of Grain, fuch as is with us our Ale, but more clear; and a kinde of Sider made of a Fruit of that Countrey, a wonderful pleafing and refrelhing drink. Befides, there were brought in to us great flore of thofe Scarler Orenges for our fick, which (they faid) were an affured remedy for ficknefs taken at Sea. There was given us alfo a Box of fmall gray or whitifh Pills, which they wifhed our fick fhould take, one of the Pills every night before fleep, which (they faid) would haften their recovery. The next day, after that our trouble of carriage and removing of our Men and Goods out of ourShip, was fome what fetled and quiet, I thought good to call our company together, and when they were affembled, faid unto them, "My dear Friends, let us know our felves, and how it ftandeth "with us. VVe are Men caft on Land, as fones was out of the VVhales "Belly, when we were as buried in the deep; and now we are on Land, "we are but between Death and Life, for we are beyond both the Old "VVorld and the New, and whether ever we thall fee Europe, God onely "knoweth : It is a kinde of miracle hath brought us hither, and it muft be "little lefs that thall bring us hence. Therefore in regard of our deliver"ance paft, and our danger prefent and to come, let us look up to God, "and every man reform his own ways. Befides, we are come here amongft "'a Clrififian People, full of Piety and Humanity; let us not bring that con"fufion of face uponour felves, as to fhew our vices or unworthinefs be"fore them. Yec there is more ; for they have by commandment (though " in form of courtefie) cloiftered us within thefe VValls for three days?'
" wwho knovveth vwhether it be not to take fome tafte of our manners and "conditions; and if they finde them bad, to banifh us ftraight-vvays; if "good, to give us further time? For thefe men that they have given us for " attendance, may vvithal have an eye upon us. Therefore for Gods love, 's and as vve love the vveal of our Souls and Bodies, let us fo behave our "felves as vee may be at peace vith God, and may finde grace in the cyes "of this people. Our Company vvith one voice thanked me for my good admonition, and promifed me to live foberly and civilly, and vvithout giving any the lealt occafion of offence. So vve fpent our three days joyfully and vvichout care, in expectation vwhat voould be done vvith us vvhen they vere expired: During vvhich time, vve had every hour joy
of the amendment of our fick, who rhoughe themelves calt into fome divine Pool of Healing, they mended fo kindly and fo fait.

The morrow after our three days were pait, there came to us a nein Man that we had not feen before; cloathed in blew as the former was, fave that his Iurbant was white with a fmall Red Crols on the top; he had airo a Tipper of fine Linnen. At his coming in he did bend to us a little, and put his arms abroad. We of our parts faluted him in a very lowly and fubmuffive manner, as looking, that from him we thould receive fentence of Life or Death. He defired to fpak with fome few of us ; whercupon fix of us onely ftaid, and the reft avoided theroom. He faid, "I am by office Go"vernor of this Houfe of Strangers, and by Vocation 1 am a Chriftian Prief; " and therefore am come to you to offer you my fervice, both as Strangers, " and chiefly as Chrifians. Some things I may tell you, which I think you " will not be unwilling to hear. The State hath given you licence to ftay on "Land forthe fpace of fix weeks; and let it not trouble you, if your occa. " fions ask further time, for the Law in this Point is not precife; and I do "not doubr, but my relf fhall beable to obrain for you fuch fuether time as "Thall be convenient. Ye fhall alfo underftand, that the Strangers House is at "this timerich and much aforehand, for it hath laid up Revenue thefe Thir"ty feven years; for fo long it is fince any Stranger arrived in this part: And "therefore take ye no care, the State will defray youall the time youftay, "neither fhall you ftay one day lefs for that. As for any Merchandize you 'save bought, ye fhall be well uled, and have your Return, either in Mere "chandize, or in Goldand Silver; for to us it is all one. And if youhave " any other riqueft to make, hide it not, for ye fhall finde we will not make "your countenance to fali by the anfwer ye fhall receive. Onely, this I muft "tellyou, that none of you muft go above a Karan (that is Doiththema mile and "an ba'f) from the W alls of the City without fpecial leave. Weaniwered, after we had looked a while upon one another, admiring this gracious and parent-like ufage, " That we could not tell what to fay, for we wanted "words to exprefs our thanks, and his noble free offers left us nothing to "ask. It feemed to us, that we had before us a Picture of our Salvation in "Heaven; for we that were a while fince in the Jaws of Death, were now " brought into a place where we found nothing but Confolations. For the "Commandment laid upon us, we would not fail to obey it, though it "was impoffible but our hearts fhould be inflamed to tread further upon "this happy and holy Ground. We added, "That our Tongues thould firft "cleave to the Roofs of our Mouths, ere we fhould forget either this Re"verend Perfon, or this whole Nation, in our Prayers. We allo moft bumbly befought him to accept of us as his true Servants, by as juft a right as everMen on Eath were bounden, laying and prefenting both our perfons and all we had at his feet. He faid, He was a Prieft, and looked for a Priefts repard, which was our Brotherly love, and the good of our Souls and Bodies. So he went from us, not without tears of tendernefs in his eyes; and left usallo confufed with joy and kindnels, faying amongt our felves, I hat vee veree come into a Land of Angels, which did appear 10 usdaily, and prevent with comforts which ne thought not of, much leß expected.

The next day about ten of the clock the Governor came to us again, and after falutations, faid familiarly, I bat he voas come to vifit us, and called for a Chair, and late him down; and we beirg cometen ot us (the reft were of the meaner fort, or elfe gone abroad) fire down with him: And when we were fet, he began thus, "We of this IAland of Bensalems (for So they call it in
"their Language, ) have this, That by means of cur rolieary ficustion, and of "the Laws of Secrecy which we have for our Travellers, and our rare " admiffion of ftrangers, we know well mof part of the Habitabe World, 's and are our felves unkrown. Therefore, becaute he that knoweth leaft, "c is fitteft to ask Queftions, it is more reafon, for the entertainment of the "time, that ye askme Quetions, than that I ask you. We anfvpered, T.at "we humbly thanked him, that he would give us leave fo to do, and that "we conceived by the tafte we had already, that there was no worldly thing
"on Earth, more worthy to be known, then the ftate of that happy Land.
"But above all (vve (aid) fince that vve vvere met from the feveral Ends of
"the World; and hoped affuredly, that vve fhould meet one day in the
"Kingdom of Heaven, (for that vive vvere both parts Chrifians) vve defired "to knovv (inreipect that Land vvas fo remote, and fo divided by valt and
"unknovvn Seas, from the Land vvhere our Saviosr vvalked on Earth)
"vvho vvas the Apoflle of that Nation, and hovvit vvas converted to the
"Faith. It appeared in bisface, that he took great contentrsent in thisonr quefion. He said, "Ye knit my heart to you by asking this Queftion in the firft place, "forit Thevveth that you firft feek the Kingdom of Heaven; and I fhall gladly and "briefly fatisfie your demand.
"About twventy years after the Afcenfion of our Saviour, it came to "pafs, that there voas feen by the people of Renfufa (a City upon the "Eaftern Coaft of our Inand) vvithin night (the night vvas (lon'y and "calm) as it might be fome mile in the Sea, a great Pillar of Light, not fh rp , "but in form of a Column or Cylinder, rifing from the Sea a great vvay up " tovvards Heaven, and on the top of it was feen a large Croß of Light, more "bright and refplendent then the Body of the Pillar: Upon which to "ftrange a fectacle the people of the City gathered apace together upon so the Sands to wonder, and fo after put themfelves into a number of imall «Boats to go nearer to this marvellous fight. But when the Boats were scome within (about) fixty yards of the Pillar, they found themfelves all "c bound, and could go no further, yet fo as'they might move to go abour, "but might not approach nearer; fo as the Boats ftood all as in a Thearre, "ebeholding this Light as an Heavenly Sign. It fo fell out, that there was in " one of the Boats, one of the wife Men of the Society of Solomons. Houfe, "(which House or College (my good Brethren) is the very Eye of this King"dom) who having a while attentively and devoutly viewed and contem. "plated this Pillar and Cröfs, fell down upon his face, and then raifed him"felf upon his knees, and lifting up his hands to Heaven made his Prayers «inthis manner.

## [. Ord God of Heaven and Earth, thou baft vouchSafed of thy Grace to thofe of our Order, to know thy

 Works of Creation, and true Sccrets of them, and to difcern (as far as appertainetb to the Generations of $M e n$ ) between Divine Miracles, VVorks of $\mathcal{N}$ (ature, VVorks of Art, and Impoftures and Illufions of all forts. I do bere acknomledge and teftifie before this People, that the Tbingwe now See before oureyes is thy Finger, and airue Mi macle. And forafmuch as we learn in our Books, that thou never worked E TI iracles but to a Divine and excellent End, (For the Lams of $\mathcal{N}$ (nature, are thine own Laws, and thou exceedeft them not but upon good cause) me mo ? Dumbly beSech the to proper this great Sign, and to give us the Inter. predation, and use of it in mercy, which thou do ft infome part Secretly promiSe, by fending it untous.
"When he had made his Prayer, he prefently found the Boat he was is in, moveable and unbound, whereas all the reft remained fill fat; and "taking that for an affiance of leave to approach, he caufed the Boat to be "Softly, and with filence, rowed towards the Pillar; but ere he camenearit; "s the Pillar and Croß of Light brake up, and cat ir elf abroad, as it were, into "a Firmament of many Sars; which alpo vanifhed foo after, and there was "nothing left to be cen but a mall $\mathcal{L}_{i v}$ or Chef of. Ce lar, dry, and nor wet " at all with Water, though it $\left\{\begin{array}{l}\text { wan } \\ \text {; and in the fore end of it, which was }\end{array}\right.$ "towards him, grew a fall green Branch of Palm. Aid when the Wile"s man had taken it with all reverence into his Boar, it opened of ic elf, and "there was found in it a Book and a Letter, both written infine Parchment, "and wrapped in Siddons of Linnen. The Book contained all the Canonical "B Books of the Old and New Teflament, according as you have them, (for we "know well what the Churches with you receive;) and the (Apocalypse it elf, "and fame other Books of the New Teftament, which were not at that time "s written, were neverthelefs in the Book. And for the Letter, it was in thee " words.

1Bartholomew, a Servant of the Higheft, and Apoftle of $\mathcal{F} E S U S$ CHRIST, waswarned by an Angel that appeared to me in a Vifion of Glory, that I should commit this e Ark to the Flours of the Sea. Therefore I do teftifie and declare unto that People, where GOD shall ordain this Ark to come to Land, that in the fame day is come unto them Saivacion, and Peace, and Good Will from the $F A T H E R$, and from the $L O R D \mathcal{F} E S V S$.
"There was alto in both the fe Writings, as well the Book as the "Letter, wrought a great Miracle, conform to that of the $A$ pofles in the "Original Gift of Tongues.' For there being at that time in this Land Hebrews, "Perrfinns, and Indians, befides the Natives, every one read upon the Book
"and Letter, as if they had been written in his own Language. And thus "was this Land faved from Infidelity (as the Remain of the old World "was from Water) by an Ark, through the Apoftolical and Miraculous "Evangelifm of S. Bartholomevv. And here he paured, and a Meffenger came and called him forth from us. So this was all that paffed in that Conference.

The next day the fame Governor came again to us immediarcly after Dinner, and exculed himfelf, faying, "That the day before he was called from us "fomewhat abruptly, but now he would make us amends, and fpend time "with us, if we held his Company and Conference agreeable. We anfwered; "That we held it fo agreeable and pleafing to us, as we forgot both dangers "paft and fears to come, for the time we heard him fpeak, and that we " thought anhour fpent with him, was worth years of our former life. He bo veed bimfelf alittle to us, and after vvevvere fet again, befaid," Well, the Quefti"ons are on your part. One of our number faid, afier a little paufe, "That there "was a matter we were no lefs deffrous to know then fearfulto ask, left we " might prefume too far; but encouraged by his rare Humanity towards us, " (that could fearce think our felves ftrangers, being his vowed and proffffed "s Servan's) we would take the hardinels to propound it: Humbly befeech"ing him, if hethought it not fir to be anfwered, that he, would pardon it, "though he rejected it. VVE faid, We well obferved thofe his words "s which he formerly fpake, That thishappy Inland where we now ftood "vvas knoven to fevv, and yet knevv molt of the Nations of the World; "vvhich vve found to be true, confidering they had the Languages of "Europe, and knevv much of our ftate and bufinefs; and yet vve in Europe " (notvvithltanding all the remote Difcoveries and Navigations of this laft "Age) never heard any of the leaft inkling or glimpfe of this Ifland. This "vve found vvonderful ftrange, for that all Nations have interknovvledge "one of another, either by Voyage into Forein Parts, or by Strangers "that come to them : And though the Traveller into a Forcin Countrey, "doth commonly know more by the Eye, then he that ftaid at home can "s by relation of the Traveller ; yet both ways fuffice to make a mutual "knowledge in fome degree on both parts: Butforthis Ifland, we never "heard tell of any Ship of theirs that had been feen to arrive uponany " fhore of Europe, no nor of either the Eaft or $V$ Veft-Indies, nor yet of any "Ship of any other part of the World that had made return for them. And "yet the marvel refted not in this ; for the fituation of it (as his Lordfhip "faid) in the fecret Conclave of fuch a vaft Sea might caufe it: But then, «s that they thould have knowledge of the Languages, Books, Affairs of "thore that lie fuch a diftance from them, it was a thing we could not tell "what to make of ; for that it feemed to us a condition and propriety of "Divine Powers and Beings, to be hidden and unfeen to others, and yet "to have others open, and as in a light to them. At this Speech the Go. vernor gave a gracious fmile, and faid, "That we did well to ask pardon "for this Queltion we now asked, for that it imported as if we thought "s this Land, a Land of Magicians, that fent forth Spirits of the Air into all "s parts to bring then news, and intelligence of other Countreys. It was anfwered by us all, in all poffible humblenefs, but yet with a countenance taking knowledge, that we knew, that he fpake it but merrily, "That we "s were apt enough to think, there was fomewhat fupernatural in this "Inand, but yet rather as Angelical then Magical. But to let his Lord. " hip know truly what it was that made us tender and doubtful to ask this
"Queftion; it was not any fuch conceit, but becaufe we remembred he " had given atouch in his former Speech, that this Land had Laws of Sc" crecy, touching Strangers. To this be faid, "You remember it right; and "therefore in that, Ifhall fay to you, I muft referve fome particulirs which "it is not lawful for me to reveal, butthere will be enoughleft to give you " Fatisfaction.
"You fhall underftand (that which perliaps you will fcarce think cre" dible) that about Three thoufand years ago, or fomewhat more, the Na" vig tivn of the VVorld (fpecially for remote Voyages) was greate then " at this day. Do not think with your felves, that I knownothow much " it is increaled with you within thefe threefore years, I know it well; and " yet I fay, greater then then now. VVhether it was, thate the example of - the Ark that faved the remnant of Men from the Univerfal Delige. gave - men confidence to adventure uponthe VVaters, or what it was, but fuch ' is the rruch. The Pbonicisns, and fpecially the Tyrians, had great Fleets; - fo had the Carthaginians their Colony, which is yet further VVeft: To" ward the Eaft the Shipping of Egypt and of Paleftina was like wife great; - Chine alfo, and the Grear Atlants (that you call A merica) which have no w ". but junks and Canoaes, abounded then in tall Ships. Ihis Illand (as ": appeareth by faithful Regifters of thofe times) had then Fiftecn hundred " ftrong Ships of great content. Of all this, therc is with you fparing memory " or none, but we havelarge kno ledge théreof.
"At that time this Land"was known, and frequented by the Ships and - Veffels of all the Nations beforenamed and (as it comerh to pals) they "had many times Men of othet Countreys that were no Sailers, that came "with them, as Perfians, Chaldeans, Arabians;" fo as almoft all Nations of "might and fame reforted hither, of whom we have fome Stirps and little - Tribes with us at this day. And for our own Ships, they went fundry "Voyages, as well to your streights, which you call the 'Pillars of Hercues, "as to orher parts in the Atlantick and Meditterranean Sens ; as to feguin (whici " is the (ame with Cambalu) and Quinfay upon the Oriental Sers, as far asto "the Borders of the Eaft Tartary.
"At the fame time, and an Age after or more, the lnhabitants of the "Great Aclantis did flourifh. For though the Natration and Defcription "which is made by a great Man with you, of the Defeendents of Neptune "planted there, and of the magnificent Temple, Palace, City, and Hill, "and the manifold ftreams of goodly Navigable Rivers, which (as fo many "Chains) invir ned the fame Site and Femple, and the feveral degrees of " afcent, whereby men did climb up to the fame, as if it had been a Scala "Cali, be all Poetical and Fabulous; yet 'o much is true That the faid "Countrey of $\mathcal{A}$ tlantix, as well that of Pers then called $C_{1}$. $a$, as that of "CMexico then named Tyrambel; were mighty and proud King foms in "Arms, Shipping, and Riches; fo mighty, as ac one time (or a leaft with"in the fpace of ten years) they both made two great expeditions, they of "Tyrambel through the Atlantick to the Meditarranean Sea, and they of Coy, "through the South-fea upon this our Illand. And for the former of thefe, " which was into Europe, the fame Author amongft you (as it feemeth) had " fome relation from the Egyptian Prief whom he citeth for affuredly fuch "a thing there was. But whether it were the ancient $\mathcal{A}$,benians that had "the glory of the repulfe and refift ince of thofe Forces, I can fay nothing; "but certain it is, there never came back either Ship or Man from that Voy" age. Neither had the other Voyage of thofe of Coya, upon us, had better
" fortune, if they had nor met with enemies of greater clemency. For the
"King of this Illand (by name Altabin) a wife Man, and a great Warrior; "knowing well both his own ftrengib, and that of his enemies, handled the "matter fo, as he cut off their Land forces from their Ships, and entoiled "both their Navy and their Camp, with a greater power than theirs, both "by Sea and Lanid, and compelled them to render themfelves withour "ftriking ftroke; and after they were at his mercy, contenting himfelf one"ly with their Oath, that they fhould no more bear Arms againft him, dif" miffed them all in fafety. But the Divine revenge overtook not long "e after thofe proud enterprifes; for within lefs then the fpace of One hun"dred years the Great Atlantis was utcerly loft and deftroyed, not by a great "Earthquake, as your CMan faith, (for that whole Tract is little fubject to "Earthquakes) but by a particular Deluge or Inundation, thofe Countreys "having at this day far greater Rivers; and far higher Mountains to pour "down Waters, than any part of the Old World. But it is true, that the " fame Inundation was not deep, not paft forty foot in moft places from "the ground; fo that although it deftroyed Man and Beaft generally, " yet fome few wilde Inhabitants of the Wood elcaped: Birds alfo were "faved by flying to the high Trees and Woods. For as forMen, a!though " they had Buildings in many places higher then the depth of the VVater; "yet that Inundation, though it were fhallow, had a long continuance, "whereby they of the Vale, that were not drowned, perifhed for want of "food, and other things neceffary. So as marvel you not at the thin Popu"lation of America, nor at the Rudenefs and Ignorance of the People; for "you mult account your Inhabitants of 1 merica as a young People, "younger a thoufand years at the leaft than the reft of the VVorld, for "that there was fo much time between the Univeríal Flood, and their par"t ticular Inundation. For the poor remnant of Humane Seed which re"mained in their Mountzins peopled the Countrey again flowly, by little " and little: And being fimple and a favage people (not like Noab and his "Sons, which was the chicf Family of the Earth) they were not able to "leave Letters, Arts, and Civility to their Pofterity. And having likewife "in their Mountainous Habitations been ufed (in refpect of the extream "Cold of thofe Regions) to cloath themfelvss with the skins of Tigers, "Bears, and great Hairy Goats, that they have in thofe parts; when after "they came down into the Valley, and found the intolcrable Heats which " are there, and knew no means of lighter Apparel, they were forced to "begin the cuftom of going naked, which continuethat this day; onely "they take great pride and delight in the Feathers of Birds: And this alfo "they took from thofe their Ancefitors of the Mountains, who were in"vited unto it by the infinite flight of Birds that came up to the high "Grounds, while the Waters flood below. So you fee by this main "accident of time, we loft our Traffick with the Awericans, with whom, "of allothers, in regard they lay neareft to us, we had moft commerce. "As for the other parts of the World, it is moft manifet, that in the "Ages following (whether it were in refped of VVars, or by a Natural "revolution of time.) Navigation did every where greatly decay, and "efpecially far voyages. (the rather by theufe of Gallies, and fuch Veffels "' as could hardly brook the Ocean) were altogether left and omitted. "So then, that part of entercourle which could be from other Nations "to fail to us, you fee how it hath long fince ceafed, except it were by "fome rare accident, as this of yours. But now of the ceffation of that "other
"otner pars of entercourie, which mignt be by our failing to o ther Nations: "I muft yield you fome other cau'e: For I cannor fay (if I hould fay truly) "but our fhipping for number, ftrength, Mariners, Pilor:, and all things that "apperrain to Navigation, is as great as ever; and therctore why we.thould "fit at home, 1 fhall now give yon an account by it felf, and it will dra w nearer "to give you latisfaction to your principal Queftion.
"There reigned inthis Ifland about One thoufand nine handred years "ago, a King, whofe memory of all orhers we moft adore, not luperfitioully, "but as a Divine Intrument, though a Mottal Man; his name was Saloomona; "and we efteem him as the Law-giver of our Nation. This King had alarge "heart infcrutable for good, and was wholly bent to make his Kingdom and "People happy: He therefore taking into confideration, how tufficient and " (fubtantive this Laid was to maintain it felf without any aid (at all) of the "Foreigner, being Five thoufand fix hundred miles in circuit, and of rare "fertility of foil in the greateft part thereof; and finding alfo the fhipping of "this Countrey might be plentifully fer on work, both by Fifhing, and by "Tranfportations from Port to Port, and likewife by failing unto ome fmall "Illands that are not far from us, and are under the Crown and Laws of this "State; and recalling into his memory the happy and flourifhing eftate "wherein this Land then was, fo as it might be a thoufand ways altered to "the worfe, but fearce any one way to the better; thought nothing wanted "to his Noble and Heroical Intentions, but onely (as far as Humane fore"fight mighr reach) to give perperuity to that which wasin histiue fo happily "eftablifhed; therefore amongt his other Fundamental Laws of this King"dom, he did ordain che Interdicts and Prohibitions which we have touch"ing entrance of ftrangers, which at that time (though it was after the, cala" mity of $A$ merica) was frequent, doubting novelties and commixture of " manners. It is true, the like Law againt the admiffion of ftrangers; with" out licence, is an ancient Law in theKingdom of Cbina; and yet continued "c in ufe; but there it is a poor thing, and hath made them a curious, igno"rant, tearful, foolifh Nation. But our Law-giver made his Law of another "temper. For firft, he hath preferved all points of humanity, intaking or"der and making provifion for the relief of ftrangers diftreffed, whereof you "have tafted. At whbicl Speech (as reafor . Tous) we all rofe up and bowed our felves. Ho werit on. "That King alloftill defiring to joyn Humanity and Policy to" gether, and thinking it againf Humanity to detain Strangers here againtt "e their Wills, and againf Policy, that they fhould return and difcover their " knowledge of this State, he took this courfe. He did ordain, that of the "S Strangers that fhould be permitted to Land, as many (at all times) might "departas would, but as many as would ftay, fhould have very good con"ditions and means to live from the State. Wherein hefaw lo far, that - now in fo many Ages, fince the Probibition, we have memory not of one "Ship that ever returned, and but of thirteen perfons onely at feveral times ac that chole to return in our Bottoms. What thofe few that returned; may sh have reported abroad, I know not; but you muft think, whatfoever they co have faid, could be taken where they came, but for a dream. Now for "our travelling from hence into parts abroad, our Law-giver thought fit al"together to reftrain it. So is it not in China, for the Chiniefos fail where they "will, or can; which fhewerh, that their Law of keeping our Strangers"' is "a Law of pufillanimity and fear. But this reftraint of ours hath one onely "exception, which is admirable, preferving the good which comech by "communicating with ftrangers, and avoiding the hurt; and I will now
"open it to your. And here 1 thall feem a litele to digrels, but you will by "and by finde it pertinent. Ye fhall underftand (my dear Eriends) that " amongft the excellent acts of that. King, one above all hath the preemi"nence : It wasthe erection and inftitution of an Order or Society which " we call Solomoss Houfe, the nobleft Foundation (as we think) that ever " was upon the Earth, and the Lanthorn of this Kingdom. It is dedicated " to the ftudy of the W orks and creatures of Gor. Some think it beareth ${ }^{\text {c }}$ c the Founders name a little corrupted, as if it hould be Solomons Houfe; "but the Records write it as it is fpoken, fo as I take it to be denomi" nate of the King of the Hebrews, which is famous with you, and no ftranger "to us; for we have fome parts of his Works which with you are loft; " namely, that Natural Hiffory which he wrote of all Plants, from the Cedar " of Libanzs to the $\mathcal{M}$ Moß that grovveth out of the $W$ all, and of all things that bave "Life and Motion. This maketh me think thatour King findinghimfelf to "fymbolize in many things with that King of the Hebreves (which lived " many years beforehim) honored him with the Title of this Foundation. "And I am the rather induced to be of this opinion, for that I finde in an"cient Records this Order or Society is fometimes called Solomons Houfe, " and fometimes The Colledge of the Six days VVorks; whereby I am fatisfied, "that our Excellent King had learned from the Hebrevvs, that God had "created the World, and all that therein is withia Six days; and therefore " he inftituting that Houfe for the finding out of the true Nature of all "things (whereby God might have the more glory in the workmanfhip of "them, and Men the more Fruit in their ufe of them) did give italfo that "fec ond name. But now to come to our prefent purpole.
"When the King had forbidden to all his People Navigation in any "pare that was not under his Crown, he made neverthelefs this Ordinance, " That every twelve years there fhould be fet forth out of this Kingdom "two Ships appointed to feveral Voyages; that in either of thefe Ships, "there hould be a Miffion of three of the Fellows or Brethren of Solomans " Houfe, whofe errand was onely togive us knowledge of the affairs and "ftate of thofe Countreys, to which they were defigned, and efpecially of the "Sciences, Arts, Manufactures and Inventions of all the W orld; and withal "to bring unto us Books, Inftruments, and Patterns in every kinde. That " the Ships after they had landed the Brethren thould return, and that the "Brethren hould ftay abroad till the new Miflion. The Ships sne not other"wife fraught than with fore of Victuals, and good quantity of:Treafure, "s to remain with the Brethren for thebuying of fuch things, and rewarding " of fuch perlons as they fhould think fit. Now for me to tell you hows the "vulgar fort of Mariners are contained from being difcovered at Lands "and how they that mult be put on thore for any time colour themfelves "under the names of other Nations, and to what places thefe Voyages have " been defigned, and what places of Rendezvous are appointed for the new, "Miffions, and the like circumftances of the practick, I may not do it, neither ${ }^{\text {a }}$ " is it much to your defire. But thus you fee"we maintain a Trade, not for "Gold, Silver, or Jewels, nor for Silks, nor for Spices, nor any other com. ' $c$ modity of Matter, but onely for Gods firft Creature, which was Light; to "have Light (I fay): of the growth of all parts of the World. And when he. had faid this, he was filent; and lo were we all; forindeed, we were all aftonifh. ed to hear fo ftrange things fo probably told. And he perceiving, thatwe werc willing to fay fomewhat, but had it not ready, in lgreat courtefie, took us off, and defcended to ask us Queftions of our Voyage and Fortunes;
$\mathcal{N}$ em Atlantis:
and in the end concluded, that we might do well to thank with our felves what time of fay we would demand of the State; and bad us not to cant our felves, for he would procure furn time as we defied. Whereupon we all role up and prefented our felves to skiffs the skirt of his Tippet ; but he would not fuffer us, and to took his leave. But when it cane once among ft our people, that the State ufed to offer conditions to ftrangets that would flay; we had work enough to get any of our men to look to our Ships and to keep them from going presently to the Governor to crave conditions; but with much ado; we refrained them till we might agree what course to take.

We took our felves now for Freemcii, freeing there was no danger of our utter perdition, and lived molt joyfully, going abroad; and feeing what was to befeen in the City and places adjacent within our Tedder, and obtaining acquaintance with many of the City, not of the meaneft quahits, at whiofe hands we found fuck humanity; and fuch a freedom and defire to take ftrangers, as it were into their boom, as was enough to make us forget all that was dear to us in our own Countreys, and continually we met with many things right worthy of obfervation and relacion: As indeed, if there be a Mirror in the World, worthy fo hold means eyes, it is that Country. One day there were two of our company bidden to a Feaft of the Family, as they call it; amoft natural, pious and reverend cuftom it is, Chewing that Nation to be compounded of all goodnets. This is the manner of ic. It is granted to any man that hall live to fee thirty perloris defended of his body alive together, and all above three years old, to make this Feaft, which is done at the colt of the State: The Father of the Family, whom they call the Iitfani, two days before the, Feint taketh to him three of foch Friends as hie liketh to chute, and is affined also by the Governor of the City or place where the Feaft is coleGrated ; and all the Perfons of the Family of both Sexes arefummoned to attend him. The fe two days the $T_{i v} f_{n i n}$ fittecth in conflation concern. ing the goodeftue of the Family; there, if there be any Difcord or Suits between any of the Family; they are compounded and appeared; there, if any of the Family be difteffed or decayed; order is taken for their relief and competent means to live; there, if any be fubject to vice or take ill courfes, they are reproved and cenfured. So likewife; direction is g. ven touching Marriages, and the courfes of life which any of them mould rake, with divers other the like orders and advices. The Goo veznor afiliteth to the end; to put in execution by his publick Authority, the Decrees and Orders of the $\mathscr{I}_{i r} f_{a n}$; if they fhould be difobeyed, though that feldon needeth; foch reverence and obedience they give to the order of Nature. The Tirfand dothalfo then ever chafe one man from amongst his Sons to live in Houfe with him; who is called ever after the Son of the Vine; the eaton will hereafter appear. On the Fearday, the Tatter or $\mathcal{T i r f}_{\text {an }}$ cometh forth after Divine Service into a large Room where the Feat is celebrated; which Room hath an Half. puce at the upper end. Againft the Wall; in the middle of the Half. pace, is a Chair placed for him; with a Table and Carpet before it : Over the Chair is a State made round or oval, and it is of Ivy'; an Ivy rome what whiter then ours, like the Leaf of a Silver $\mathbb{A}_{f}$; but more frining, for it is Green all Winter: And the State is curiously wrought with S IVCF and Silk of divers colours, brooding or binding in the Ivy; and is ever of the work of tome of the Daughters of the Family, and veiled

## $\mathcal{N}$ (ew Atlantis.

over at the rop with a fine Net of Silk and Silver: But the fubftance of it is true Ivy, whereof, after it is taken down, the Friends of the Family are defirous to have fome Leaf or Sprig to keep. The Tirfan cometh forth with all his Generation or Lineage, the Males before him, and the Females fol. lowing him. And if there be a Mother, from whofe body the whole Lineage is defcended, there is a Traverfe placed in a Loft above on the right hand of the Chair, with a Privy Door, and a carved Window of Glats, leaded with Gold and Blew, where fhe fitteth, but is not feen. When the Tirfan is come forth, he fitteth down in the Chair, and all the. Lineage place themfelves againtt the Wall, both at his back, and upon the return of the Half-pace, in order of their years, without difference of Sex, and Itand upon their Feer. When he is fer, the room being always full of company, but well kept, and without diforder, after (ome paule there cometh in from the lower end of the room a Taratan, (which is as much as an Herauld) and on either fide of him two young Lads, whereof one carrieth a Scroul of their fhining yellow Parchment, and the orher a clufter of Grapes of Goid, with a long foot or Gtalk : The Herauld and Children areclothed with Mantles of Sea-water-green Sattin, but the Heraulds Mantle is ftreamed with Gold, and hath a Train. Then the Herauld, with itree Courtefies, or rather Inclinations, cometh up as far as the Half pace, and there firft taketh into his hand the Scroul. This Scoul is the Kings Charter, containing Gift of Revenue, and many Priviledges, Exemptions, and Points of Honor granted to the Father of the Family; and it is ever ftiled and directed, To fuch an one, Our melbeloved Friend and Creditor, which is a Title proper onely to thiṣ cafe: For they lay, the King is Debior to no Man, but for propagation of his Subjects. The Seal fet to the Kings Charter, is the Kings Image imbofled or moulded in Gold. And though fuch Charters be expedited of coutfe, and as of right, yet they are varied by difcretion, according to the number and dignity of the Family. This Clatter the Herauld readeth aloud; and while it is read, the Father or Tir $\int_{a n}$ Itandeth up, fupported by wo of his Sons, fuch as he chufcth. Then the Herauld mounteth the Half. pace, and delivereth the Charter into his hand, and with that there is an acclamation by all that are prelent in their Language, which is thus much, Happy are the People of Benfalem. Then the Herauld taketh into his hand from the other Childe the clutter of Grapes, which is of Gold, both the $S$ :a!k and the Grapes; but the Grapes are daintily enamelled: And if the Males of the Family be the greater number, the Grapes are enamelled Purple, with a littie Sun fet on the top; if the Females, then they are enamelled into a greenifh yellow, with a Crefcent on the top. The Grapes are in number as many as there are Defcendants of the Family. This Golden Clutter the Herauld delivereth alfo to the Firfan, who prefenty delivereth ir over to that Son thathe had formerly chofen to be in houle with him; who beareth it before his Father as an Enfign of Honor when he goeth in publick ever aiter, and is thereupon called The Son of the Vine. After this Cermony ended, the Fatber or Tirfan retireth, and after tome time cometh forth again to Dinner, where he fitteth alone under the State as before ; and none of his Defcendants fit with him; of what degree or dignity foever, except he hap to be of Solomons Houfe. He is lerved onely by his own Children, fuch as are Male, who perform unto him all fervice of the Table upon the knee; and the Women onely ftand about him, leaning againft the Wall. The Room below his Half-pace
hath Tables on the fides for the Guefts that are bidden, who are ferved with grear and comely order ; and toward the end of Dinner (which in the greateft Feafts with them, lafteth never above an hour and a half) there is an Hynus fung, varted according to the Invention of him that compofed it, (for they have excellent Poefie ; ) but the fubject of it is (always) the praifcs of Adam, and Noab, and Cabrabam; whereof the formertwo peopied the W orld, and the lait was the Fatlier of the Faitbful; concluaing ever with a Thankfiving for the Nativity of our Saviour, in whofe Bitt the Births of allareoncly Bleffed. Dinner being done, the Tirfan retireth again, and having withdrawn himfelf alone into a place, where he maketh lome private Praycr, he cometh forth the third time to give the Bleffing, with all his Defceńdants, whoftand about him as at the firit. Then he calleth them forth; by one and by one, by name, as he pleafeth, though feldomthe order of age be inverted. The perion that is called (the Table being beforeremoved) kneeleth down beforethe Chair, and the Father lay eih his hand upon his head, or hur head, and giveth the Bleffing in thefe words ; Son of Benfalem (or. Daughter of Benfalem) thy Fatier faith it, the CMan by rhom thou baft breath andlife geaketb the wrord: The Blefing of the Everlafting Father, the Prince of Peace, and the Holy Dove be upoo thee, anil make the days of thy Pilgrimage good and many. This be faith to every of them; and that done, if there be aly of his sons of eminent Merit and Vertue, (fo they be not abovetwo) he callech for them again, and faith, laying his arm over their fhouldere, they ftanding, Sons, it is well you are born; give God the praife, and perfevere to the ent. And withal delivereth to eicher of them a ]ewel, made in the figure of an Ear of Wheat, which they ever after wear in the front of their Turbant or Hat. This done, they fall to Mufick and Dances and other Recreations after their manner for thereft of the day. This is the full order of that Feaft.

By that time fix or feven days were fperit, I was fain into ftraight acquaintance with a Merchant of that City, whofe name was Foabin; he was a Few, and circumcifed: For they have fome few Atirps of fems yet remairing among thicm, whom they leave to their own Religion; which they may the better do, becaule they are of a far differing difpofition from the jexs in other parts. For whereast cy hate the Name of CHRIST, and have a fecret inbred rancor againft the people, among whom they live: Thefe (contrariwife) give uno our SAVIO UR many high Attribuer, and love the Nation of Benfalem extreamly. Surely this Man, of whom Ifpeak, would ever acknowledge that CHKIS T was born of a Virgin, and that he was more then a Man; and he would tell how GOD made him fuler of the Scraphims which guard his Throne ; and they call him alfo the crilken may, and the Eliab of the CMeßiah, and many other h:ghNames; which though they $b$ : inferior to his Divine Mujefty, yet they arefar from the Langunge of other forws. And for the Countrey of Benfalem, this Man wouid make no end of commending it, being defirous; by Tradition among the jews there, to have it believed, that the people thereof were of the Generations of Abrabam by another Son, whom they call Nachoran; and that Mojes by a fecret Cabala ordained the Laws of Benfalem, which they now ufe; and that when the Mefiab fhould cone and fit in his Throne at Ferufalem, the K!ng of Benfalem thould fit at his Feer, whereas other Kings Chould keep agreat diftance. Bur yet fetting afide thefe Jewifh Dreams, the Man was a wife man and learned, and of grest policy, and excellently feen in the Laws and Cultoms of that

Nation: Amongft other difcourfes, one day I told him, I was much affected with the Relation 1 had from lome of the companys of their Cuftom in holding the Feaft of the Family, for that (me thought) I had never heard of a Solemnity wherein Nature did fo much prefide. And becaufe Propagation of Families proceedeth from the Nuptial Copulation, I defired to know of him what Laws and Cuftoms they had concerning Marriage, and whether they kept Marriage well, and whether they were tied to one Wife. For that where Population is fo much affected and fuch as with them it feemed to be, there is commonly permiflion of Plurality of Wives. To this he faid, "You have reafon forto commend "that excellent Inftitution of the Fèaft of the Family; and indeed wc "have experience, that thofe Pamilies that are partakers of the Dieflings "of that Feaft do flourifh and profper ever after in an extraordinary man"ner. But hear me now, and I will tell you what I know. You fhall un"derftand, that there is not under the Heavens, fo chafte a Nation as this "of Benfalen, nor fo free from all pollution or foulnefs; it is the Virgin " of the World. I remember I have read in one of your European Books " of an holy Hermit amongft you, that defired to fee the Spirit of Fornication, "and thère appeared to him a little foul ugly cetbiope: Bur if he had "defired to fee the Spirit of Cbaffity of Benfalen, it would have appeared to "him in the likenefs of a fair beautiful Cherubin; for there is nothing "amongf Mortal Men more fair and admirable, then the chafte Mindes "of this People. Know therefore, that with them there are no Stews ${ }_{z}$ "nodifloluteidHoufes, no Courtefans; nor any thing of that kinde; nay "they wonder (with deteftation) at you in Europe which permit fuck "things. They fay you have put Marriage out of office; for Marriage " is orḍained a remedy for unlawful concupifcence, and natural concu"pifcence feemeth as a fpur to Marriage : But when Men have at hand "a remedy more agreeable to their corrupt will, Marriage is almoft ex"pulfed. And therefore, there are with yout feen. infinite Men that mar"ry not, but chufe rather a Libertine, and impure fingle life, then to be
"" yoaked in Marriage; and many that do marry, marry late, when the "prime and ftrength of their years is paft; and when they do marry, " what is Marriage to them, but a very Bargain, wherein is fought Alli"ance, or Portion, or Reputation, with fome deffre (almoft indifferent) " of iffue, and not the faithful Nuptial Union of Man and Wife that was "f firft inflituted? Neither is it polfible, that ihofe that have caft away fo "b bafely fo much of their ftrength, fhould greatly efteem Children (be"ing of the fame matter) as chaft Men do. So likewife during Marriage, "s is the cafe much amended, as it ought to be, if thofe things were tole"rated onely for neceffity? No, but they remain ftill as a very affront to "c Marriage ; the hunting of thofe diffolute places, or refort to Courtefans, "are no more punifhed in Married men, then in Batchelors: And the de" praved cuffom of change, and the delight in meretricious embrace"ments, (where Sin is turned into Art) maketh Marriage a dull thing, and "sa kinde of Impofition or Tax. They hear you defend thefe things as "s done to avoid greater evils, as Advowtries, Deflouring of Virgins, "Unnatural Luft, aud the like: But they fay this is a prepofterous Wif "dom; and they call it Lots offer, who to fave his Guefts fromabufing "offered his Daughters: Nay, they fay further, that there is little gained "in this, for that the fame Vices and Appetites do ftill remain and abound, «Unlawful Luft being like a Furnace, that if you ftop the Flames alto-
"gether, it will quench but if yougive it any vent, it will rage. As fo "Mafculine Love, shey have no touch of it, and yet there are not fo furb, "ful and inviolate. Friendhips in the World again as are there; and to "Speak generally (as I faid before) I have not read of any fuch Chaltity in " any Peopleas theirs. And their ufual faying is, That wholoever is unchatie, "cannot reverence himfelf. And they fay, That the reverence of a Mans felf " is', next Religion, the chiefet Bridle of all Vices. And when he had faid this, the good Jeve paufed a little. Whereupon, I far more willing to hear him fpeak on, than to fpeak my felf; yet thinking it decent, that upon his paule of Speech I Thould not be altogether filent, faid onely this. "That "t would fay to him, as the Widow of Sarepia faid to Elias, That he was "come to bring to momory ourfins; and that I confefs the righteoufnefs of "Benfalem. was greater than the righteoufnefs of Europe. At vobich Speeth, lie bovved his Head, and veent on in this manner. "They have alfo many wife and "excellent Laws touching Mariage; they allow no Polygamy; they have "ordaired, that none do intermarry or contract until a moneth be patt from ", heir firft interview. Marriage without confent of Parents, rhey do not "m ke void, but they mulct it in the Inheritors; for the Children of fuch "Marrages are not admited to inheric above a third part of their Parents "Inheritance. I have read in a Book of one of your Men, of a Feigned sCommonwealth, where the married couple are permitted before they "contract tofee one another naked. This they diflike, for they think it a " forn to give a refufal after fo familiar knowledge; bur becaufe of many "nidden defects in Men and Womens Bodies, they have a more civil way; ©品 they have near every Town, a couple of Pools (which they call ©c adam and Eves Pools) where it is permitted to one of the Friends of the " $M_{3 n}$, and another of the Friends of the Woman to fee them leverally "bith naked.

And as we were thus in Conference, there came one that $f$ emed to be a Meffenger, in a rich Huke, that Spake with the Jevv; whereupon he turned tome, and faid, Tou voill pardon me, for I am commanded apray in hafte. The nexe morning he came to me again, joyful, as it feemed, and faid, e There is word come to the Governor of the City, that one of the Fathers "c of Solomons Hufe will be here this day feven-oight; we have feen none of ef $t$ em this dezen years. His coming is in ftate, but the caufe of bis coming "is fecre. I will provide you and your Fellows of a good itanding to fee "his entry. 'I thanked him, and told him, I was neft glad of the nevvs. The day be ng come, he made his entry. He was a Man of middle ftarure and oge, comely of perfon, and had an alpect as if he pitied men: He was cloathed in a lobe of fine black Cloth, with wide Sleeves, and a Cape; his under Garment was of excellent white Linnen down to the Foot, girt with a Girdle of the fame, and a Sindon or Tippet of she fame about his Ncck ; he had Gloves that were curious, and fet with Stone, and Shooes of Peach-cc.loured Velvet ; his Neck was bare to the Shoulders; his Hat was like a Helmet or Spani/b Montera, and his Locks curled below it decently, they were of colour brown; his Beard was cut round, and of the fame colour with his Hair, fomewhat lighter. He was carried in a rich Chariot without Wheels, Litter-wife, with two Horfes at either end, richly trapped in blew Velvet embroidered, and two Footmen on each fide in the like atrire. The Chariot was all of Cedar, gilt and adorned with Cryftal, fave that the fore-end had Pannels of Saphiresfer in borders of Guld, ar.d the hinder-end the like of Emeralds of the $\mathcal{P}$ ers colour.

Therewas allo a Sun of Gold; radiant upon the top in the midit; and on the top before a farall Cherith of Gold, with Wings diplayed. The Chariot was covered with Cloth of Gold tiffued upon bicw. He had before him fitty attendants, young men all, in white Sutten loofe Coats, tip to the mid-leg. and Stockins of white Silk, and Shooes of blew Velver, and Hats of blew Velvet, with fine Plumes of divers colours fet round like Hatbands. Next before the Chariot, went two men bare-headed, in Lidnen Garments down to the Foot, girt, and Shooes of blew Velvet, who carried, the one a Crofier, the orher a Paftoral Staff like a Sheephook, neither of them of Metal, but the Crofier of Balm-wood, the Paftoral.Stáff of Cedar. Horfemen he hadnone, neither before, nor behinde his Chariot, as it feemeth; to avoid all tumult and trouble. BChinde his Chariot went all the Officers and Principals of the Companies of the City. He fate alone upon Cufhions, of a kinde of excellent Plufh, blew, and under his Foor curious Carpets of Silk of divers colouirs, like the Perfian, but far finer. He held up his barehand as he went, as blefsing the People, but in filence. The Sireet was wonderfally well kept, to that there was never any Army had their Men ftand in better battelarray, then the peopic flood. The Windowslikewife were not crouded, but every one ftood in them, as if they had been placed. When the fhow was paft, the fevv faid to me," I hall not be able to attend you as I " would, in regard of fome charge the City hath laid upon me for the en"tertaining of this great Petfon. Tbree days afore the Jew came zo me again, and dsid, " Yearc happy men, for the Father of Solomons Houle taketh knowledge of "your being here, and commanded me to tell you, that he will admit all "yout company to his prefence, and have private conference with one of "you that ye fhall chufe; and for this, hath appointed the next day after to " morrow. And becaule he meaneth to give you his Bleffing, he hath "appointed it in the forenoon. We came at our day and hour, and I was chofen by my fellows for the private accefs. We found him ina fair Chamber richly hanged, and carpeted under Foot, without any degrees to theState: He was fet upon alow Throne, richly adorned, anda rich Cloth of State over his head of blew Sattin embroidered. He was alone, fave that he had two Pages of Honor on either hand one, finely attired in white. His under Garments were the like, that we faw him wear in the Chatiot ; but inflead of his Gown, he had onhim a Mantle with a Cape of the fame fine Black, faftned about him. When we came in, 'as we were taught, we bowed low at our firte entrance; and when we were come ncar his Chair, he ftood up, holding forth his hand ungloved, and in pofture of Bleffing; and we every one of us tooped down and kiffed the hem of his Tippet. That done, the reft departed, and I remained. Then he warned the Pages forth of the Room, and caufed me to fit down befide him, and fpake to me thus in the Spanif? Tongue.

## $\mathcal{N}$ (em Atlantis.

GOD Blefs thee, my Son, I will give thee the, greateft Jewel I have; for I will impart unto thee, for the love of God and Men; "The Preparations and Inftruments we have for our Works. Thirdly, "The feveral Employments and Functions whereto our Fellows are affign"ed : And fourthly, The Ordinances and Rites which we obferve.
"The End of our Foundation, is the Knowledge of Caules and Secret "Motions of things, and the enlarging of the Bounds of Humane Empire, "to the effecting of all things poffible.
"The Preparations and Inftruments, are thefe. Wo have large and "deep Caves of feveral depths; the deepett are funk Six hundred fathom, " and fome of them are digged and made under great Hills and Mountains ; " © o that if you reckon together the depth of the Hill, and the depth of the "Cave, they are (fome of them) above three miles deep: For we finde that "the depth of an Hill, and the depth of a Cave from the Flar; is the fame "thing, both remote alike from theSun and Heavens Beams, and from the "open Air. Thefe Caves we call the Lower Region, and we ufethem for "all Coagulations, Indurations, Refrigerations, and Confervations of "Bodies. We ufe them likewife for the Imitation of Natural Mines, and "the producing alfo of new Artificial Metals, by Compofitions and Mate"rials which we ufe and lay there for many years. We ufe them alfo fome"times (which may feem frange) for curing of fome Difeales; and for pro"longation of life in fome Hermits that chufe to live there, well accommo"dated of all things neceffary, andindeedlive very long; by whom alfo we "learn many things.
"We have Burials in feveral Earths, where we put divers Cements "as the Chinefes do their Porcellane; but we have them in greater variety " and fome of them more fine. We allo have great variety of Componts "and Soils for the making of the Earth fruitful.
"We have high Towers, the higheft about half a mile in height, and "fome of them likewife fet upon bigh Mountains, fo that the vantage of the "Hill with the Tower, is in the higheft of them, three miles at leatt: And "cthefe places we call the Upper Region, accounting the Air between the "high places, and the Low as a!Middle Region. We ufe thefe Towers, "according to their feveral heights and fituations, for Infolation, Refrige"ration, Confervation, and for the view of divers Metcors, as Winds, Rain, «Snow, Hail, and fome of the Fiery Meteors alfo. And upon them, in fome "places, are dwellings of Hermits, whom we vifit fometimes, and inftruct "s what to obferve.
"We have great Lakes; both falt and frefh, whercof we have ufe for "the Fith and Fowl. We ufe them alfo for Burials of fome Natural Bodies; "for we finde a differencein things buried in Earth, or in Air below the Earth, "and things buried in Water. We have allo Pools, of which fome do ftrain "Frefh Water out of Salt, and others by Art do turn Frefh Waterinto Salt. se We have alfo fome Rocks in the midit of the Sea, and fome Bays upon "the Shore for fome Works, whercin is required the Air and Vapor of the "Sea. We have likewife violent ftreams and cataracts, which ferve us for "many Motions; and likewife Engins for multiplying and enforcing of «Winds, to fet alfo ongoing divers Motions.
" We have alfo a number of artificial Wells and Fountains, made in "imitation of the Natural Sources and Baths; as tincted upon Vitriol, Sul"phur, Steel, Brafs, Lead; Nitre, and other Minerals. And again we have "clittle Wells for Infufions of many things, where the Waters take the viro "t tue quicker and better then in Veffels or Bafins: And amongft them we have " a Warer which we call $W$ ater of $P$ aradife, being by that we do to it; made "very fovereign for Health, and Prolongation of Life.
"We aifo great and fpacious Houres, where we imitate and demon"ftrate Meteors; as Snow, Hail, Rain, fome Artificial Rains of Bodies, and "not of Warer, Thunders, Lightnings; alfo Generations of Bodiesin Air; "as Fogs, Flies, and divers others.
"We have alfo certain Chambers which we call Chambers of Healrh, "where we qualifie the Air, as we think good and proper for the sure of di"v vers Difeales, and prefervation of Health.
" We have alfo fair and large Baths of teveral mixtures, for the cure of "Difeales, and the reftoring of Mans Body from Arefation; and orhcr,' fot "the confirming of it in firength of Sinews, Vital Parts, and the very Juice " and Subt nce of the Body.
"Wc have alfo large and vatious Orchards and Gardens, wherein we "do not fo much reffect Beauty, as variety of ground and foyl, proper for "divers'Trees and Herbs; and fome very fpacious, where Trees and Berries " are fer, whereof we make divers kindes of Drinks, bcfides the Vineyards. "In thefe we practife likewife all conclufions of Grafing and Inoculating, as " well of Wild-trees ay Fruit-trees, which produceth many effects. And we " make (by Art) in the lame Orchards and Gardens, Treés and Fow ers to "come earlier or later then their feafons, and to come up and bear more "fpeedily then by the $r$ natural courfe they do. We make them alfo (by A") " much greater hen their nature, and their Fruit greater and fiveeter, and of "differing tafte, fmell colcur and fgure from therf nature; and many of them "wefo order, that they become of Medicinal ufe.
"VVe have alfo means to make divers Plants rife, by mixtures of "Earths without Seeds, and likewife to make divers new Plants differing - from the Vulgar, and to make one Tree or Flant turn into anoticer.
"V Ve have alfo Parks and Enclofures of all forts of Eeafts and Birds; "which we ufe not ondly for view or rarenefs, but likewife for Diffections "and rryals, that thereby we may take light, what may be wrought upon "the Body of Man, wherein we finde many ftrange effects; as continuing "life in them, though divers parts, which you account vital, be perifhed " and taken forth; Refufcitating of fome that feem dead in appearance, " and the like. VVe try alfo all poyfons and other medicines upon them, " as well of Chirurgery as Phy fick. By Art likewife we make them greater " or taller then their kind is, and contrariwife dwarf them, and ftay their "growth: VVc make them more fruitful and bearing, then their kind "is, and contrariwife barren, and not generative. Alfo we make them "differ in colour, flape, activity, many ways. VVe finde means to make "commixtures and copulations of divers kinds, which have produced " many new kinds, and them not barren, as the general opinion is. VVe " make a number of kindes of Serpents, VVorms, Flies, lifhes, of Putre"faction"; whereof fome are advanced (in effect) to be perfect Creatures, " like Beäfts or Bird's, and have Sexes, and do propagate. Neither do we "this by chance, but we know beforehand of what matter and commixture "what kind of thofe Creatures will atife.
"Wehave alfo particular Pools where we make tryals upon Fifles, "as we have faid before of Bcalts and Birds.
"We have alfo places for Breed and Generation of thofe Kinds of "W Wrms and Fties which are of fpecial ufe, fuch as are with you, your "Silk-worms and Bees.
"I will not hold you long with recounting of our Brcw-houfcs, Bakc" houfes and Kitchins, where are made divers Drinks, Breads, and Meats, " rare and of fpecial cffcets. Wines we have of Grapcs, and Drinks of "other Juice, of Fruits, of Grains, and of Roots; and of mixturcs with "Honey, Sugar, Manna, and Fruits dried and decocted"; alío of the Tears " or Woundings of Trees, and of the Pulp of Canes; and thefe Drinks are " of fevcral Ages, fome to the age or laftof forty years. VVe have Drinks "alfo brewed with feveral Herbs, and Roots, and Spices, yea, with feveral "Flefhes, and VVhite-meats; whercof fome of the Drinks are fuch as they "are in effect Meat and Drink boch; fo that divers, efpecially in Age; do "defire to live with them with little or no Meat or Bread. And above all, we - ftrive to have Drinks of cxtream chin parts, to infinuate into the Body, " and yet without all biting, fharpnefs, or fretting ; infomuch, as fome of "them put upon the back of your hand, will, with a little ftay,pafs through "to the palm, and yer tafte milde to the mouth. VVe have alfo VVaters " which we ripen in that fanion as they become nourifhing; fo that they "are indeed excellent Drink, and many will ule no other. Breads we have ¿ of feveral Grains, Roots and Kernels, yea, and fome of Flefh and Fifh "dried, with divers kinds of Levenings and Seafonings; fo that fome do - extreamly move Appetites; fome do nourifh fo, as divers do live of them " without any other Meat, who live very long. Sofor Meats, we have fome "of them fo beaten, and made tender and mortified, yet without all cor"rupting, as a weak heat of the Stomach will turn them into good Chylus, "as well as a froing heat would meatotherwife prepared. VVehave fome " Meats alfo, and Breads, and Drinks, whichtaken by men, enable them to - faft long after; and fome other that ufed, make the very Flefh of Mens "Bodies Icnfibly more hard and tough, and their ftrength far greater then : otherwife it would be.
c. V Ve have Difpenfatories or Shops of Medicines; wherein you may " eafily think, if we have fuch variety of Plants and Living Creatures, more "then you have in Etrope, (for we know what you have) the Simples, Drugs, " and lngredients of Medicines, muft likewife be in fo much the geater "variety. VVe have them likewife of divers Ages, and long Fermenta"tions. And for their Preparations, we have not onely all manner of ex"quifit Diftillations and Scparations, and efpecially by gentle Heats, and "Percolationsthrough divers Strainers, yea, and Subitances ; but alfo exact "Forms of Compofition, whereby they incorporate almoft as they were "Natural Simplcs.
"VVe have alfo divers Mechanical Arts, which youhave not, and "Siuffis made by them; as Papers, Linnen, Silks, Tilfues, dainey works of "Feathers of wonderful lufte, excellent Dies, and many others; and Shops " likewife as well for fuch as are not brought into vulgar ufe amonglt us, " as for thofe that are. For you mult know, that of the things before re"cited, many are grown into ufe throughout the Kingdom ; but yet, if "they did flow from our Invention, we have of them alfo for Patternis and "Principals.
"VVe have aifo Furnaces of great diverficies, and that keep great di"ve:fity of heats, ferce and quick frong and conftant, foft and mikie; "blown, quiet; dry", moift, and the like. But above all we have heats, in "imitation of the Suns and Heavenly Bedics heats, that pars divers Inequa" lities, and (as it "ere) Orbs, Progrelies and Returns, whereby we maty "produce admirable cffects Befides, we have heats of Dungs, and of Bcl. " lics and Maws of Living Creatures, and of their Bloods and Fodies; and " of Hays and Herbs laid up moif"; of Lime unquenched, and fuch like. "Inftruments alfo which generate heat onely by motion; and further, places "for ftrong Infolations; and again, places und cr the Earth, which by Na"turc or Art yield Hear. The fe divers heats we ufe, as the nature of the ope"ration which we intend, requiretio.
"V̇Ve have alfo Perfpective Houfes where we make Demonftration "of 'all Lights and Radiations, and of all Colours; and out of things un"coloured and tranfjarent, we can reprefent unto you all feveral colours, " not in Rainbows. (as it is in Gems and Prifms) but of thenfelves fingle. "VVe reprefent alfo all Multiplications of Light, which we carry to great "diftance, and make fo fharp as to difcern fmall Points and Lines; allo all "colourations of Light, all delufions anddeceits of the Sig't, in Figures, " Magnitudes, Motions, Colours : all demonftrations of Shadows. VVe "finde alfo divers means yet unknown to you of producing of Light origi "nally from divers Bodies. VVe procure means of feeing objects afar off, "as in the Heaven, and remote places; and reprefent things near as afar off, "and thingsafar off as near, making fcigned diftances. VVe have allo helps "for the Sight, far above Spectacles and Glafles in ufe. VVe have alio "Glaffes and Means to fee fmall and minute Bodies perfectly and diftinctly, "c as the flapes and colours of fmallFlics and VVorms, grains and flaws in "Gems, which cannot otherwife be feen, obfervations in Urine and Blood, " not otherwife to be feen. VVe make Artificial Rainbows, Halo's, and * Circles about Light. VVe reprefent alio all manner of Reflexions, Re" fractions, and Multiplication of Vifual Beams of Objects.
"، V.Ve have alfo PreciousStones of all kindes, many of them of great "beauty, and to you unknown ; Cry fals likewife, and Glafes of divers " kindes, and amongft them fome of Mctals vitrificated, and other Materi"als, befide thofe of which you make Glafs: Alfo a number of Foffiles "and imperfectMinerals, which youtave not; likewife Loadtones of pro"digious virtue, and other rare Stones, boch Natural and Artificial.
" VVe have alfo Sound-houfes, where we'practife and démonftrate all "Sounds and their Generation. We have Harmonies which you have not, "of Quarter-founds, and leffer Slides of Sounds; divers Inftruments of "Muficklikewifc to you unknown, fome fweeter then any you have, with "Bells and Rings that are d inty and fweet. We reprefent fmall Sounds as "great and deep, like wifc great Sounds extenuate and harp. We make "divers tremblings and warblings of Sounds, which in their original are "entire. We reprcfent and imitate all articulate Sounds and Letters, and "the Voices and Notes of Beafts and Birds. VVe ave certain helps, which "fet to the Ear; do further the hearing greatly. We have alfo divers ftrange "and artificial Echo's reflecting the voice many times, and as it were tof ng "it $j$ - and fome that give back the voice louder then it came, fome foriller, "iand fóme deeper, yea, fome rendring the voice differing in the Letters or "articulate Sound from that they reccive. We have all means to convey ". Sounds in Trunks and Pipes in ifrange lines and diftances.

## New Allantis.

"We have aifo Perfume-houfes; wherewith we joyn alfo practices of "Tafte ; we multiply Snells, whichmay feem trange; we imitate Smalls, "making allSmells to breath out of other mixtures then thofe that give them.
"Wemake divers imitations of Tafte likewife, fo that they will deceive any "Mans talte. And inthis Houfe we centain alfo a Confi.ure houf'; where "we makeall Sweet-mears, dry and moift, and divers pleafint Wines, Milks, "Broths, and Sallers, far in greater variety then you have.
"Wehave alfo Engine-houfes, where are prepared Ergines and Inftu "ments for all forts of motions. There we imitate and practife to make " (Wifter motions then any you have, either out of your Muskers or any En"gine that you have; and to make them, and multiply them more eafily, and " with fmall force, by wheels and other means; and to make them ftronger " and more violent then yours are, exceeding your greatef Cannors and "Bafilisks. We repretent alfo Ordnance and Inftruments of War, andEr. " gines of all kindes; and likewife new mixtures and compofitions of Gun"powder, Wildefires burning in Warer and unquenchable; alfo Fireworks " of all variety, both for pleafure and ule. We imitatealfo fights of Birds; ¿s we have fome degrees of flying in the Air ; we have Ships and B ats for "going under Water, and brooking of Seas; allo Swimming-girdles and «Supporters. We have divers curious Clocks, and orher like motions of "Return, and fome perpetual motions. We imitate alfo motions of Living "Creatures by Images of Men, Bealts, Birds, Fifhes,'and Serpents; we have " alfo a grear number of other various motions, Atrange for quality, finenefs «s and fubtilty.
"We have allo a Mathematical-houfe, where are reprefented all Inftru. "s ments, as well of Geometry as Aftronomy, exquifitelymade.
"We have alfo Houfes of Deceits of the Senfes, where we reprefent $\leftrightarrow$ all manner of feats of Jugling, falfe Apparitions, Impoftures and Illufions, $\leftrightarrow$ and their Fallacies. And furely, you will eafily believethat we that have fo ' many things truly Natural, which induce admiration, could in a world of separticulars deceive the Senfes, if we would difguife thofe thing", and labor "to make them more miraculous: But we do hate all Impontures and Lies "infomuch, as we have fevercly forbidden it to all our Fellows, under pain " of Ignominy and Fines, that they do not fhew any natural work or thing, " adorned or fwelling, but onely pure as it is, and without allaffectation of «f ftrangenefs.
"Thefe are (my Son) the riches of Solomons Houre.
"For the feveral employments and offices of our Fellows; we have «twelve that fail into Foreign Countreys under the names of other Nations, " (for our own we conceal) who bring us the Books, and Abftracts, and Pat${ }^{6} c$ terns of Experiments of all other Parts. Thefe we call CMerchants of © Light.
"We have three that collect the Experiments, which are in all Books. "Thele we call Depredators.
"We have three that collect the Experiments of all Mechanical Arts, st and alfo of Liberal Sciences, and alló of Practices which are not brought " into Arts. Thefe we call Myfery-men.
"We have three that try new Experiments; fuch as themfelves think "good. Thefe wecall Pioneers or Miners.
"We have three that draw the Experiments of the formerfour into "Titles and Tables, to give the better light for the drawing of Oblervations "and Axioms out of them. Thefe we call Compilers.
"Wc have three that bend themfelver, looking into the Experiments " of their Fellows, and caft about how todraw out of them things of ufe "a and practice for Mans life and knowledge, as well for Works, as for plain "demonftration of Caufes, means of Natural Divinations, and the cafie "and clear difcovery of tie Virtues and Paris of Bodies. Thefe we call "Dowry-men or Benefactors.
" Ihen after divers Meetings and Coniults of our whole number, to "confider of the former Labors and Colle Ctions , we have three that take "care out of them to direct new Experiments of a higher Light, morepene" rrating into Naturethen the former. Thefe we call Lamps.
"VVe have three others that do execute the Experiment fodirected, "and report them. Thefe we call Inoculators.
"Lafty, VVe have three that raife the former Difcoveries by Experi" ments into greater Obfervations, Axiome, and Aphorifms. Thefe we call "Interpreters of Nature.
"VVe have alfo; as you mult think, Novices and Apprentices, that "the fucceffion of the former employed Men do not fail; befides a great "number of Servants and Attendants, Men and VVomen. Andthis we do "alfo, VVe bave Confultations which of the Inventions and Experiences, " which we have difcovered hallbe publifhed, and which not ; and take all "as Oath of Sccrecy for the concealing of thofe which we think meet to keep "fecret; though fome of thofe we do reveal fometime to the State, and "fome not.
"For our Ordinances and Rites; we have two very long and fair Gal"leries. In one of thefe we place Patterns and Samples of all manner of the "more rare and excellent Inventions; in the other we place the Statues of " all principal Inventors. There we have the Statue of your Columbur, that "difcovered the Wef-Indies, alfo the Inventor of Ships; your Monk that "was the Inventor of Ordnance, and of Gun-powder; the Inventor of "Mufick; the Inventor of Letters; the Inventor of Printing; the Inventor " of Oblervations of Aftronomy; the Inventor of Works in Metal; the " Inventor of Glafs; the Inventor of Silk of the Worm ; the Inventor of "Wine; the Inventor of Corn and Bread; the Inventor of Sugars: And "all thefe by more certain Tradition, then ycu have. Then we have divers "Inventors of our own of excellent W orks, which fince you have not feen, "it were tcolong to make Defcriptions of them ; and befides, in the right " underflanding of thofe Defcriptions, you might eafily err. For upon every "Invention of value we erect a Statue to the Inventor, and give him a libe"cral and honorable reward. Thefe Statues are fome of Brafs, fome of Marble "s and Touch-ftone, fome of Cedar, and other fpecial Woods gilt and adorn"ed, fome of Iron, lome of Silver, fome of Gold.
"We have certain Hymns and Seivices which we fay daily, of Laxd and "and 7hanks to God for his marvellous Works; and Forms of Prayers, im"ploring his aid and blcfling for the Illumination of our Labors, and the "t curning them into good and holy ufes.

- "Lanty, We bave Circuits or Vifits of divers principal Cities of the "Kingdom, wher', as it cometh to pafs, we do publifh fuch new profitable "Inventions, as we think good. And we do alfodeclare Natural Divinati"ons of Difeafer, Plagues, Swarms of hurtful Creatures, Scarcity, Tempeft, "Earih quakes, great Inundations, Comets, Temperature of the Year, and "divets other things; and we give countel thereupon, what the People fhall ‘do for the prevention and remedy of them.

# NATURAL HISTORY 

Century I.

Ig a Pit upon the Sea-fhore, fomewhat above the High-water Mark, and fink it as deep as the Lowwater Mark ; And as the Tide conicth in, it will fill with Water, Frefh and Potable. This is commonlv practifed upon the Coaft of Barbary, where other Frefh Water is wanting. And Cafar knew this well, when he was befieged in Alexandria; forby digging of Pits in the Sea-hore, he did fruttrate the laborious Works of the Enemies, which had turned the Sea-water upon the Wells of Alexandria, and fo faved his Army, being then in Defperation. But Cafar miftook the caufe; for he thought that all Sea-fands had Natural Springsof Frefh-water. But it is plain, that it is the Sea-water, becaufe the Pit filleth according to the Meafure of the Tide : And the Sea-water paffing or ftraining through the Sands, leaveth the Saltnefs.

I remember to have read, that Tryal hath been made of Salt-water

## I.

 Experiments in Confort, touching the Straining and Pafing of Bodies une thorow another; which they call Per. colation. paffed through Earth; through ten Veflels, one within another, and yet it hath not loft his Saltnefs, as to become potable: But the fame Man faith, that (by the relation of another) Salt-water drained through twenty Veffels, hath become frefh. This Experiment feemeth to crofs that other of Pits, made by the Sea-fide ; and yet but in part, if it be true, that twenty Repetitions do the effect. But it is worth the note, how poorthe Imitations of Nature are, in common courfe of Experiments, except they be led by great Judgment, and fome good Light of $A x i o m s$. For firft there is no fmall difference between a Paffage of Water through twenty fmall Veffels, and through fuch a diftance, as between the Low-water and High-water Mark. Secondly, there is a great difference between Earth and Sand; for all Earth hath in it a kin Je of Nitrous Salt, from which, Sand is more free: And befides, Earth doth not ftrain the Water fo finely as Sand doth. But there is a third point, that 1 fufpeet as much, or more than the othertwo; and that is, that in the Experiment of TranfmiPion of the Sea-water into the Pits, the Water rifeth ; butin the Experiment of Tranfinision of the Water, through the Veffels, it falleth : Now certainit is, that the Salter part of Water (oncefalted throughout) goeth to the bottom. And therefore no marvel if the draining of Water by defcent, doth make it freflh: Befides; 1 do fomewhat doubt, that the very dafhing of the Water that cometh from the Sea, is more proper to ftrike off the falt part, than where the Water fideth of her own motion.

It feenerh Percolation or Transmifion ( which is commonly called Straining) is a good kinde of Separation, not onely of thick from thin, and grofs from fine, but of more fubtile Natures; and varieth according to the Body, through which the Tranfmifion is made. As if through a Woollen-bag, the liquor leaveth the fatnefs; if through Sand, the faltnefs, \&c. They fecak of fevering Wine from Water, paffing it through lvy-wood, or through other' the like porous body, but Noin conftat:

The Gum of Trees (which we feeto be commonly Chining and clear) is but a fine paffage, or ftraining of the Juice of the Tree, through the Wood and Bark. And in like manner, Cornish Diamonds, and Rock Rubies, (which are yet more refplendent than Gums) are the finc Exudations of Stóne.

Arifote giveth the caufe vainly, Why the Featbers of Birds are of more lively colours than the Hairs of Beafts; for no Beaft hath any fine Azure, or Carnation, or Green Hair. He faith it is, becaufe Birds aremore in the Beams of the Sun than Beafts, but that is manifeflly untrue ; for Cattle are more in the Sun than Birds, that live commonly in the Woods, or in fome Covert. The true caufe is, that the excrementicious moifture of living Creatures, which makech as well the Feathers in Birds as the Hair in Bealts, palseth in Birds through a finer and moredelicate Strainer, than itdoth in Beafts: For Feathers pafs through Quills, and Hair through Skin.

The clarifing of Liquors by Adhefion, is an inward Percolation, and is effected, when fome cleaving Body is mixed and agitated with the Liquors; whereby the groffer part of the Liquor flicks to that cleaving Body; and fo the finer parts are freed from the groffer. So the $A$ pothecaries clarifie their Syrups by Whires of Eggs, beaten withthe Juices which they would clarifie; which whites of Eggs, gather all the dregs and groffer parts of the Juice to them ; and after the Syrup being fet on the fire, the whites of Eggsthemfelves harden, and are taken forth. So Ippocraß is clarified by mixing with Milk, and ftirring it about, and then paffing it through a Woollen-bag, which they call Hippocrates Sleeve; and the cleaving Nature of the Milk, draveth the Powder of the Spices, and grofler parts of the Liquor to it, and in the paffage they ftick upon the Woollen-bag.

The clarifying of Water, is an experiment tending to Health, befides the pleafure of the Eye, when Water is Cryftaline. It is effeeted by cafting in, and placing Pebbles at the head of a Current, that the Water may ftrain through them.

It may be $\mathcal{P e r c o l a t i o n ~}^{\text {doth not onely caufe clearnefs and fplendor, but }}$ fweetnefs of favor; for that alfo followeth, as well as clearnefs, when the finer parts are fevered from the groffer. So it is found, that the fweats of men thathave much heat, and exercife much, and bave clean Bodies and fine Skins, do fmell fiveet, as was faid of Alexander; and we fee commonly,

TAke a Glafs, and put Water into it, and wet yourfinger, and draw it round about the lip.of the Glafs, preffing it fomewhat hard ; and after you have drawn it fome few times about, it will make the Water frisk
and fprinkle up in a fine Dew: This inftance doth excellently demonftrate the force of Comprefion in a folid Body. For whenfoever a folid Body (as Wood, Stone, Metal, \&c.) is preffed, there is aninward tumult in the parts thereof, feeking todelivec themfelves from the Compreffion: And this is the caufe of all Violent Motion. Wherein it is itrange in the higheft degree; that this Motion hath never been obferved, nor enquired; it being of all Motions, the moft common, and the chief root of all CMechanical Operations. This Motion worketh in round at firft, by way of Proof and Search, which way to deliver it felf, and then worketh in Progrefs, where it findeth the deliverance eafieft. In Liquors this Motion is vifible ; for all Liquors ftrucken, make round circles, and withal dafh, but in Solids (whichbreaknot) it is fo fubtile, as it is invififle ; but neverthelefs bewrayeth it felf by many effects, as in this inftance whereof we fpeak. For the Prefure of the Finger furthered by the wetting (becaufe it fticketh fo much the better unto thre Lip of the Glafs) aftertome continuance, putteth all the fmall parts of the Glafs into work, that they frike the Water flarply; from which Percufion, that fprinkling cometh.

If you frike or pierce a Solid Body that is brittle, as Glafs or Sugar; it breaketh not onely where the immediate force is, but breaketh all about into fhivers and firters; the Motion upon the Preffure fearching all ways, and breaking where it findeth the Body wcakeft.

The Powder in Shot being dilated into fuch a Flame, as endureth not Compreffion, moveth likewife in round (the Flame being in the nature of a Liquid Body ) fometimes recoyling, fometimes breaking the Peece; but generally difcharging the Bullet, becaufe there it findeth eafieft deliverance.

This Motion upon Preffure, and the Reciprocal thereof, which is Motion upon Tenfure; we ufe to call (by one common name) Moton of Liberty ; which is, when any Body being forced to a Preetrnatural Extent or Dimenfion, delivereth and reftoreth it felf to the natural: As when a blown Bladder (preffed) rifeth again ; or when Leather or Cloth tentured, fpring back. Thefe two Motions (of which there be infinite inftances) we fhall handle indue place.

This Motion upon Prefure is excellently alfo demonftrated in Sounds: As when one chimeth upon a Bell, it foundeth; but as foon as he layeth his hand upon it, the Sonnd ceafecth: And fo, the lound of a Virginal Siring, as foom as the Quill of the Jack falleth from it, ftoppeth. For thefe founds are produced by the fubtile Percuffion of the Minute parts of the Bell or String upon the Air; All onc, as the $W_{\text {ater }}$ is cauted to leap by the fubrile Percuffion of the Minute parts of the Glafs upon the $W_{\text {ater }}$, whereof we fpake a little beforc in the Ninst Experiment. For you muft not take is to be the local Thaking of the Bell or String that doth it. As we fhall fully declare when we come hereafter to handle Sounds.

TAke a Glaß with a Belly, and a long Neb, fill the Belly (in part) with Water: Takeallo another Cla $\beta$, whereinto put Claret $W_{\text {ine }}$ and $W$ ater mingled. Reverfe the firf Glafs, with the Belly upwards, ftopping the Neb with your Finger; then dip the mouth of it within the fecond Glafs, and remove your Finger. Continue it in that pofture for a time, and it will unmingle the Wine from the Water; the Wine afcending and feelling in the top of the upper Glafs, and the $W$ ater defcending and fetling in the buttom of the lower Glafs. The paffage is apparent to the Eye ; for For handfomnefs fake (becaufe the working requireth fome fmall time) it were good you hang the upper Glaßupon a Nail. But as foon as there is gathered o much pure and unmixed Water in the bottom of the lower Gla $\beta$, as that the Mouth of the upper Glajß dippeth into it, the Motion ceafeth.
15. Motion at all. Letthe upper Glaßbe Water pure,the lower Water coloured; or contrariwife there followeth no Motion at all. But it hath been tryed, that though thémixture of Wine and Water, in the lower Gla $\beta$, be three parts Water, and but one Wine; yet it doth not dead the Motion. This fes paration of Water and Wine appearcth to be made by weight ; for it mutt be of Bodies of unequal weight, or elfe it worketh not ; and the heavier Body nuftever be in the upper Glaf. But then note withal, that the watcr being made penfible, and there being agreat weight of Water in the Belly of the Glaß,. fuftained by a fmall Pillar of Water in the neck of the Glap; ; it is that which fettech the Motion on work: For Water and Wine in one Gl/ $\beta$, with long ftanding, will hardly fever.

This Experiment would be extended from mixtures of feveral Liquors to Simple Bodics, which confift of feveral fimiliar parts: Try it therefore with Broynor Salt-vvater and Fresh-vvater, placing the Salt-vvater (which is the heavier) in the upper Glaß, and fee whetherthe freh will come above. Try it allo with Water thick Sugred, and pure Water; and fee whether the: Water which cometh above, will lofe his fu eetnefs: For which purpole, it were good there were a little Cock made in the Belly of the upper Glaß.
17.

Experiments in Conlort, touching Iudicieus and Accurate Infuffons, both in Liquors,and Air.

IN. Bodies containing fine Spirits, which do eafily diffipate when you make infufions; the Rule is, A fhort flay of the Body in the Liquor receiveth the Spirit, and a longer ftay confoundeth it ; becaufe it draweth forth the Earthy part withal, which embafeth the finer. And therefore it is an Error in Pbyfitians, to reft fimply upon the length of fay for encreafing the vertue. But if you will have the Infufion ftrong, in thofe kinde of Bodies, which have fine Spirits,' your way is not to give longer time, but to repeat the Infufion of the Body oftner. Take Fiolets, and infufe a good Pugil of them in a Quart of Vinegar, let them flay three quarters of an hour, and take them forth, and refrefh the Infiffon with like quantity of new Violets feven times, and it will make a vinegar fo frefh of the Flovver, as if a Twelvemoneth after it be brought you in Saucer, you fhall fmellit béfore it come at you. Note, that it fmelleth more períectly of the Flowera good while after, then at firft.

This Rule which we havegiven, is of fingular ufe for the preparations of Medicines, and other Infuffons. As for example, the Leaf of Burrege hath an excellent Spirit, to reprefs the fuliginous vapor of Dusky Melancholy, and fo to cure Madnefs: : But neverthelefs, it the Leaf be infufed long it yeildeth forth but a raw fubftance of no vertue : Therefore I fuppofe, that if in the Muft of Wine or Wort of Beer, while it worketh before it be Tunned, the Burrage ftay a fmall time, and be often charged with frefh, it vvill make a foveraign Drink for Melancholy Paßions. And the like I conceive of Orange Flovvers.

Ribarb hath manifeftly in it Parts of contrary Operations: Parts that purge, and partsthat binde the Body; and the firfllay loofer, and thelatter lay
deeper; So that if you infute Rubarb foran hour, and crufh it well, it will purge better, and binde the Body lefs after the purging, than if it food Twenty our hours: This is tried, but I conceive likewife, that by repeating the Infufion of lizuarb, feveral times (as was faid of Violets) letting cach flay in but a fmall tine, you may make it as ftrong a Purging Medicinc, as Scairmony. And it is not a fmall thing won in phyjick, if you can make Rubarb, and other Medicines that are Benedity, as ftrong Purgers, as thofe that are not without fome malignity.

Purging Medicines, for the moft part, have their Purgative Vertue in a fine Spirit, as appearech by that they indure not boiling, without much lofs of vertue. And therefore it is of good ufe in Pbyjich, it you can retain the Purging of Vertue, and takeaway the unpleafant tafte of the Purger; which it is like you may do, by this courfe of infufing oft with litele fay. For it is probable, that the horrible and odious tafte is in the groffer part.

Generally, the working by Infufions is grols and blind, except you firft try the uffuing of the feveral parts of the Body, which of them iffue more fpeedily, and uhich more flowly ; and fo by apportioning thetime, can take and leave that quality which you defire. Thisto know, therebe two ways; the one to try whatlong ftay, and what fhort tay worketh, as hath been faid; the other to try, in order, the fucceeding Infufions, of one and the fame Body, fucceffively, in feveral Liquors. As for example, Take Orange-Pills, or Rofeniary, or Cinnaman, or what you will; and let them infufe half an hour in Water ; then take themout, and infufe them again in ocher Water ; and fo the third time; and then tafte and confider the firft Water, the fecond, and the third, and you will finde them differing, not onely in ftrength and weaknefs, but ot:crwife in talte, or odor ; for it may be the.firt W ater will have more of the fent, as more fragrant; and the fecond more of the tafte, as more bitter or biting, \&c.

Infufions in Air (for fo we may call Odors) have the fame diverfities: with Infufions in Water; in that the feveral Odors (Wnich are in one Flower; or other Body) iffue at feveral times, lome earlier, lome later: So we finde; that $V_{i v}$ lets, Woodbines, strawbervies, yield a pleafing fent, that cometh forth firt ; but foonafter an ill fent quite differing from the former. Which is caufed not fo much by mellowing; as by the late iffuing of the groffer Spirit.

As we mar defire to extrat the fineft Spirits in fome cales; fo we may defirealfo'to difcharge them (as hurfful) in fome other. So. Wine burnt, by reafon of the evaporating of the finet Spirit, inflamech lefs, and is beft in: Agues: Opium lecferh fome of his por fonous quality, if itbe vapored out, mingled with Spirit of Wine, orthe like. Seun leefert fomewhat of his windinefs b decocting; and (generally) fubtilc or windy Spirits are taken off by Incenfion, or Evaporation. And even in Infufions in things that are of too high a ipirit, you.were better pour off the firt Infufion, after a fimall time, and ufe the latter.

BUbbles are in the form of an Hemifphere; Air within, and a little Skin of Water without : And it feemeth fome what ftrange, that the Air Chould rife fofwiftly, while it is in the Water; and when it cometh to the top, fhould be ftaid by fo weak a cover, as that of the Bubble is. But as for the 1 wift afcent of the $\mathcal{A}$ ir, while it is under the Water, that is a motion of Percuffion from the Water, which it felf defcending, driveth up the Air; and no motion of Levity in the Air. And this Democritus
called Motus Plaga. In this common Experiment, the caufe of the enclofure of the Bubble is for that the Appetite to refift Scparation, or Difcontinuance (which in folid Bedies is frong) is alfo in Liquors, though fainter and weaker : As we fee in this of the Bubble; we fee it alfo in little Glaffes of Spittle that Children make of Rufhes; and in Caftles of Bubbles, which they make by blowing into. Water, having obtained a little degree of Tenacity by Mixture of Soap: We fee it alfo in the Stillicides of $W$ ater, which, if there be $W_{\text {ater enough to follow, will draw themfelves into a }}$ fmall Thred, becaufe they will difcontinue; but if there be no remedy, then they caft themfelves into round Drops; which is the Figure, that faveth the Body moft from Difcontinuance: The fame reafon is of the Roundnefs of the Bublle, as well for the Skin of $W_{\text {ater, }}$ as for the Air within: For the Air likewife avordeth $\mathcal{D i}$ isontinuanie'; and therefore cafteth it felf into a round Figure. And for the ftop and arreft of the Air a little while, it fheweth, that the Air of it felf hath little, or no Appetite of Afcending.

THe Rejection, which I continually ufe, of Experiments (though it appearech not) is infinite ; but yet if an Experiment be probable in the Work, and of great ufe, I receive it, but deliverit as doubtful. It was reported by a fober man, that an Artificial spring may be made thus: Finde out a hanging Ground, where there is a good quickFall of Rain-water. Lay a Half-Trough of Stone, of a good length, three or four foot deep within the fame Ground;: with one end upon the high Ground; the other upon the low: Cover the Trough with Brakes agood thicknefs, and caft Sand upon the top of the Brakes: You hall fee (faith he) that after fome fhowres are paft, the lower end of the Trough will be likea. Spring of Water; which is no marvel, if it hold, while the Rain-water lafteth; but he faid it would continue long time after the Rain is paft: As if the Water did multiply it felf upon the Air, by the help of the Coldnefs and Condenfation of the Earth, and the Confort of the firf W ater.

THe French: (which put off the name of the Frenich $\mathcal{D}$ ifenfe, unto the name of the Difeafe of Naples) doreport, That atthe fiege of Naples, there were certain wicked Merchants that barrelled up Mans Flesh (of fome that had been lately flain in Barbary) and fold it for $T_{\text {unney ; and that, upon }}$ that foul and high Nourifhment, was the Original of that Difeafe. Which may well be; For that it is certain; that the Canibals, in the $V V_{\text {g }}$-I-Indies, eat $C H_{\text {ans }}$ Flesh; and the $V$ Vef--ndies were full of the Pox when they were firt difcovered: And at this day the Mortaleft poyfons, practifed by the VVef-Initin ans, have fome mixture of the Blood, or Fat; or Flefh of Man: And divers Witches, and Sorcereffes, as well amongft the Heathen, as amongft the c brifisms, have fed upon Mans flefh, to aid (as it feemeth) their Imaginations with high and foul Vapors.

IT feemeth that there be thefe ways (in likelihood) of Verfion of Vapors or elair, into Watcer and Moifture. The firftis cold, which doth maniteflly Condenfe; asi we. fee in the contra\&ting of the Air in the WeatherGlafs; whereby it is a degree nearerto Water:: We fee italfo in the Genes ratioi of Springs, whichthe Ancientsthought (viery probably) to be made by the Wefion of Aix into KEater, holpen by the: Reft, which the UA ir hath in thofe parts, whereby it cannor diffipate. And by the coldnel's of Rocks; for billes there

#### Abstract

there Springs are chicfly generated. We fee it alfo in the Effects of the Cold of the Middle Region (as thcy call it) of the Air; which produceth Deins and Rains. And the Experiment of turning Water into lce, by Snow, Nitre, and Salt (whereof we fhall fpeak hereafter) would be transferred to the turning of Air into Water. The fecond way is by Comprefion; as in Stillazories, , here the Vapor is turned back, upon it felf, by, the Encounter of the Sides of the Stillatory; and in the Dew upon thic Covers of Boiling Pots; and in the Dewi towards Eain, upon Maible, and $V$ Vainfoot. But this is like to do no great effect ; except it be upon Vapors, and grofs Air, that are already very near in Degree to Water. The third is that, which may be fearched into, but doth not yet appear ; which is, by Mingling of moift Vapors with Air; and trying if they will not bring a Return of more Water, than the Water was at firf: For if fo, That Increafe is a Verfion of the Air: Therefore put VVater into the bottom of a stillatory, with the Neb ftopped; weightheVVater firft ; hang in the Middle of the stillatory a large Spunge ; and fee what quantity of $V$ Vater you can crufh out of it; and what it is, more, or lefs, compared with the VVater fpent; for you muft underftand, that if any Verfion can be wrought, it will be eafily done in fmall Pores: And that is the reafon why we prefcribe a Spunge. The fourth way is probable alfo, though not appearing; 'which is, by receiving the Airinto the fmatl Pores of Bodies; For (as hath been faid) every thing in fmall quantity is more eafie for Verfion; and Tangible Bodies have no plealure in the confort of Air, but endeavor tofubact it into a more Denfe Body: But in Entire Bodies it is checked; becaufe, if the Air hould Condenfe, there is nothing tofucceed: Therefore it muft be in loofe Bodies, as Sand, and Powder, which we fee, if they lie clofe, of themfelves gather Moifture.

IT is reported by fome of the Anciepts, That Whelps, or other Creatures, if they be putyoung into fuch a Cage, or Box, as they cannot rife to their Scature, but may increafe in breadth or length, will grow accordingly,' as they can get room; which, if it be true, and feafible, and that the young Creature lo preffed, and Itreightned, doth not thereupon die; it is a means to produce $\mathcal{D}$ warf Creatures, and in a very frange Figure. This is certain, and noted long fince, That the Preflure, or Forming of Parts of Creatures, when they are very young, doth alter the fhape not a little: As the ftroaking of the Heads of Infants, between the Hands, was noted of old, to make Mactocephali; which fhape of the Head, at that time, was efteemed. And the raifing gently of the Bridge of the Nofe, doth prevent the Deformity of a Saddle Nofe. Which oblervation well weighed, may teach a means, to make the Perfons of Men and Women, in many kindes, more comely and better featured, than otherwife they would be; by the Forming and Shaping of them in their Infancy: As by Stroaking up the Calves of the Legs, to keep them from falling down too low; and by Stroaking up the Forchead, to keep them from being low Foreheaded. And it is a common practice to $f$ athe $\operatorname{lnf}$ fants, that they may grow more Araight, and better fhaped; and we fee young Women, by wearing ftraight Bodies,keep themfelves from being Grofs and Corpulent.

oNions, as they hang, will many of them fhoot forth; and fo will pennyroyal; and fo willan Herb called Orpin; with which they ufe, in the Countrey, to trim their Houfes, binding, it to a Lath,: or Stick, and fetting it againft a Wall. VVe fee it likewife, more efpecially, in the greater

> Semper-
28. Experiment Solitary, touching the Felps towards the Beauty and good Features of Perfons.
29. Experiments Solitary, touching the Condex/ing of Air in fuck fort as it may put on Weight, and yicld $N_{0}$ urijhment.

Sempervive, which will putout Branches, two or threc years: But it is true, that commonly they wrap the Root in a cloth befmeared with Oyl ; and renew it once in a half year. The like is reported by fome of the Ancients of the ftalks of Lillies. The caufe is, for that the Pe Plants have a ftrong denfe, and fucculent moifture, which is not aptto exhale; and fo is able, from the old fore, without drawing help from the Earth, to fuffice the fprouting of the Plant: And this fprouting is chiefly in the late Spring, or early Summer ; which are the times of putting forth. We fee alfo, that ftumps of Trees, lying out of the Ground, will put forth Sproutsfor a time. But it is a noble tryal, and of very great confequence, to try whether thefe things, in the fprouting, do encreafe weight; which muft be tryed, by weighing them before they behanged up ; and afterwards again, when they are fprouted. For if they increafe not in weight, then it is no more but this, That what they fend forth in the fprout, they leefe in fome other part ; but if they gather weight, then is is CMagnale Natura: For it fheweth, that Air may be made fo to be condenfed, as to be converted into a denfe Body; whereas the race and period of all things, here above the Earth, is to extenuate and turn things to be more pncumatical, and rare; and not to be retrograde, from pneumatical to that which is denic. It Theweth alfo, that Air can nourifh; which is another great matter of confequence. Note, that to try this, the Experiment of the Semper-vive, muft be made without oyling the cloth; for clfe, it may be, the Plant receiveth nourifhment from the $\mathbf{O y l}$,

F Lame and Air do not mingle, except it be in an inftant; or in the Vital, Spirits of vegetables, and living Creatures. In Gurpouder, the force of it hath been afcribed to raretaction of the carthly fubftance into flame. And thus far it is true; and then (forfooth) it is become another Element; the form whereof occupiethmore place; and fo, of Neceffity, followech a Dilatation: And therefore, left two Bodies fhould be in one place, there muft needs allo follow in Expulfion of the Pellet, or blowing up of the Minc. But thefe are crude and ignorant feculations: For Flame, if there were nothing elfe, except,it were in a very great quantity, will be fuftocate with any hard body, fuch as a Pellet is,' or the Baricel of a Gun; fo as the fame would not expel the hard body, but the hard body would kill the flame, and not fuffer it to kindle, or fpred. But the caufe of this fo potent a motion is the Nitre (which we call otherwife Salt-I eter) which having in it a notable crude and windy Spirit, firft by the heat of the Fire fuddenly dilateth it fclf; (and we know that fimple Air, being preternaturally attenuated by heat, will make it felf room, and break, and blow up that which refifteth it.) And fecondly, when the Nitre hath dilated it felf, it bloweth abroad the flame as an int ard Bellows. And therefore we fee that Brimfone, Pitch, campbire, $W$ ildfire, and divers other inflamable matters; though they burn cruelly, and are hard to quench, yet they make no fuch fiery wind, as Gunpenvider doth : And on the other fice, we fee that Quick-fliver (which is a moft crude and watry Body) heated, and pent in, hath the like force with Gunporider. As for living Creatures. it is certain, their Vital Spirits are a fubftance compounded of an airy and flany matter; and though Air and Flame, being free, will not well mingle ; yet bound in by a Body that hath fome fixing, they will. For that you may beft fee in thofe two Bodies (which are their Aliments) Water and Ogl; for they likewife will not well mingle of themfelves, but in the Bodies of Plants,

## Century I.

and Living Creatures, they will. It is no marvel therefore, that a fmall 2 uantity of Spirits, in the Célls of the Brain, and Cannals of the Sinc ws, are able to move a whole Body (which is of fo great mals) both with fo great force, as in Wreftling, Leaping; and with fo great fwiftnefs, as in playing Divifion upon the Lute: Such is the force of thefe two Jatures, Nir and Flame when they incorporate.

TAke a fmall Wax-Candle, and put it in a Socket of Brafs or Iron, then fet it upright in a Porringer full of Spirit of Wine, heated; then fet both the Candle, and Spirit of Wine on fire, and you fhall fee the flame of the Candle open it felf, and become four or five times bigger then otherwife it would have been, and appear in figure Globular, and not in Pyramis. You fhall fee alfo, that the inward flame of the Candle keepeth colour, and doth not wax any whit blew towards the colour of the outward flame of the Spirit of Wine. This is a noble inftance, wherein tivo things are moft remarkable; the one, that one flame within another quencheth not, but is a fixed Body, and continueth as Air or VVater do; and therefore flame would fill afcend upwards in one greatnefs, if it were not quenched on the fides; and the greater the flame is at the bottom, the higher is the rife. The other, that Flame doth not mingle with Flame, as Air doth with Air, or Water with Water, but onely remaineth contiguous ; as it cometh to pafs betwixt Confjfing Bodies. It appeareth alfo, that the form of a Pyramis in Flame, which we ufually fee, is meerly by accident, and that the Air about, by quenching the fides of the Flame, crufheth it, and extenuateth it into that form ; for of it felf, it would be round: And therefore Smoak is in the figure of a Pyramis reverfed; for the Air quencheth the Flame, and receiveth the Snook. Note alfo, that the flame of the Candle, within the flame of the Spirit of Wine, is troubled; and doth not onely open and move upivards, but moveth waving, and to and fro: As if Flame of his own Nature (if it were not quenched) would roul and turn as well as move upwards. By all which it thould feem, that the Celefitial Bodies (moft of them) are true Fires or Flames, as the Stoicks held ; more fine (perhaps) and rarified, than our flame is. For they are all Globular and Deternate, they have Rotation, and they have the colour and filendor of Flame: So that Flame above, is durable and confiftent, and inhis natural place; but with us, it is a franger, and momentany and impure, like Vullean that halted with his fall.

TAke an Arroov, and hold it in Flame for the fpace of ten Pulfes; and when it cometh forth, you fhall finde thofe parts of the Arrow which Were one the outfides of the Flame, more burned, blacked, and turned almoftinto a Coal; whereas that in the midf of the flame, will be as of the fire had fcarce touched it.. This is an inftance of great confequence for the difcovery of the nature of Flame, and fhewerh manifeftly, that Flame burneth more violently towards thefodes, then inthe midft: And; which is more, that Heat or $F$ ire is not violent or furiouc, but where it is checked and pent. And therefore the Peripateticks (howfoever their opinion of an Element of Fire, above the Air, is juftly exploded) in that point they acquit themfelves well. For being oppoled, that if there were a fphere of Fire, that incompaffed the Earth fo near hand, it were impoffible, but all things fhould be burnt up; they anfiver, that the pure Elemental Fire, in his own place, and not ircitate, is but of a moderate heat.

3 ri. Experiment Solitary; touching the Secret Natsre of Flame. Solitary, touching the Decreale of she Natural Mo. sisn of Gravi. $t y$ in great diftance from the Earth; or within fome depsh of the Earth.
34. Experiment Solitary, touchingthe Contraction of bodies in bulk. by the mixuture of the morc Liquid Body, with the more Solid.
35. Experiment Solirary, touching the Making Vines more frwitful.
36. Experiments in Confort, touching Purging Medicines.

IT is aftirmed conitantly by many, as an ufual Experiment, Thata lump of Vre, in the bottom of a Mine, will becumbled and firred by two Mens ftrength; which it you bring it to the top of the Earth, will ask fix Mens ftrengrh atthe leaft to fir it. It is a noble inflance, and is fit to be tryed to the full : For it is very probable, that the Morion of Gravity worketh weakly, both far from the Earth, and alfo within the Earth: The former, becaufe the appetite of Union of Denfe Bodies with the Earth, in refpect of the diftance is more dull. The latter, becaufe the Body hath in part attained his nature, when it is fome depth in the Earth. For as for the moving to a point or place (which was the opinion of the Antients) it is a meer vanity.

IT is Arange, how the Antients took up Experiments upon credit, and yet did build great Matters upon them. The obfervation of fome of the beft of them, delivered confidently, is, T hat a Veffel filled with A/kes, will receive the like quantity of Water, that it would have done if it had been empty. But this is utterly untruc, for the Water will not go in by a fifth part; and Ifuppofe, that that fifth part is the difference of the lying clofe, or open of the Ahes; as we fee, that Afhes alone, if they behard preffed, will lie in lefs room ; and fo the Alhes with Air between, lie loofer, and with Water clofer. For I have not yet found certainly, that the Water it felf, by mixture of Ahtes or Duft, will fhrink or draw into lefs room.

IT is reported of credit, That if you lay good ftore of - Kernels of $G$ Grapes, about the Root of a Vine, it will make the Vine come earlier, and profper better. It may be tried with other Kernels, laid about the Root of a Plans of the fame kinde; as Figs; Kernels of Apples, íc. The caufe may be, for that the Kernels draw out of the Earth Juice fit to nourifh the Tree, as thofe that would be Trees of themfelves, though there were no Root; but the Root being of greater ftrength, robbeth and devourech the nourilhment, when they have drawnit; as great Fifhes devour little.
$T$ He operation of $\mathcal{P}_{\text {urging }}$ Medicines, and the caufes thereof, have been thought to be a great Secret; and fo according to the flothful manner of Men, it is referred to a Hidden Propricty, a Specifcal Veriue, and a Fourib Quality, and the like fhifts of Ignorance. The Caufes of Purging, are divers, Allplain and perfpicuous, and throughly maintained by experience. The firf is, That whatfoever cannot be overcome and digefted by the Stomack, is by the Stomack, either put up by Vomit, or putdown to the Guts; and by that Motion of Expulfion in the Stomack and Guts, other Parts of the Body (asthe Oriffes of the Veins, and the like) are moved to expel by Confent: For nothing is more frequent then Motion of Confent in the Body of CMan. This Surcharge of the Stomack, is caufed either by the Quality of the Medicine, or by the Quantity. The Qualities are three, Exiream Bitter, as in Aloes, Coloquintida, ©'r. Loatbfome, and of horrible tafte, as in Agarik, Black Hellebore, Goc. And of fecret CMalignity, and difagreement towards CMans Body, many timestnot appearing much in the tafte, as in Scammony, CMachoacham, Ansimiony, © ©. And note well, that if there be any Medicize that purgeth, and hath neither of the firft two CManifeß Qualities, is to be held fufpected asa kinde of Poyfon ; Fort that it worketh either by Corrofion, or by a fecret Malignity, and Enmisy to Nasure ; and therelore fuch Medicines are warly to be prepared ani ufed. The quantity of that which is taken, doth alfo caufe Purging, as we fec in a great quantity of new Milk from the Cow, yea, and a great quantity of Meat: For

Surfeits many times turn to Purges, both upwards and downwards. Therefore we fee generally, that the working of $\mathcal{P}$ urging Medicines cometh two or three hours after the Melicines taken : For that the Somark firft maketh a proof, whetherit can concoct them. And the like happeneth after Surfeits, or Milk in too great quantity.

A fecond caufe is CMordication of the Orijices of the Parts, elpecially of the evefentery Veins; as it isfeen; that Salt, or any fuch thing that is finarp and biting, put into the Fundament, doth provoke the part to expel, and Mufard provoketh fneezing ; and any fharp thing to the cyes provoketh tears. And therefore wefee, that almof all $P_{u r g e r s}$ have akinde of twitching and vellication, befides the griping which cometh of wind. And if this CMordication be in an over-high degree, it is little better than the Corofion of Poyfors; and it cometh to pafs fometimes in Antimony, efpecially if it be given to Bodies not repleat with humors; for where humors abound, the humors fave the parts.

The third caufe is Attration: For I do not deny, bus that Purging Medicines have in them a direct force of $A_{\text {ttration }}$; as Drawing-Plaifters have in Surgery: And we fee Sage, or Bituny bruifed, SneeZZing-powder, and other Fowders or Liquors (Wiich the Pbyjitians call Errbines) put into the Nole, draw Flegm and Water from the Head; and fo it is in Apopblegmatifms and Gargarifms that draw the Rheume down by the Palat. And by this vertue, no doubt, fume $\mathcal{P}$ urgers draw more one humor, and fome another, according to the opinion received: As Rubarb draweth Choler, Sean Melancholy, Agarack Flegm, \&c. butyet (more orlefs) they draw promilcuoufly. And note alfo, that befides Sympathy betw cent the Purger and the Humor, there is alfo another caufe, why fome Medicines draw fome humor more than another; and it is, forthat fome CMedicines work quicker than others; and they that deaw quick, draw onely the lighter, and more fluid humors; they that draw flow, work upon the more tough, and vifcuoushumors. And therefore, men muft beware how they take Ruburb, and the like, alone, familiarly; for it taketh onely the lighteft part of the humor away, and leaveth the Mafs of Humors nzore obftinate. And the like may be faid of Worm-mood, which is fo much magnified.

The fourch caufe is Flatuofity : For wind ftirred, moveth to expel; and we finde that (in effect) all Purgers have in them a raw Spirit or $W$ ind, which is the principal caufe of Tortion in the Stomack and Belly. And therefore $\mathcal{P}_{\text {urgers lecfe ( }}$ (moft of them) the virtue, by decoction upon the fire; and for that caufe are chiefly given in Infufion, Juyce, or Powder.

The fifth caufe is Compreßiois or Cru/bing: Aswhen Water is cruflhed out of a Spunge : So we fee that taking cold moveth loofnefs by contraction of the Skin, andoutward patts; and fodoth Cold likewife caufe Rheums and Defluctions's from the Head, and fome ciffringent Plaifers crufh outpurulent Matter. This kinde of operation is not found inmany Medicines : OWirabolanes have it, and it may be the Barks of Peaches; for this vertue requireth an Afriction, but fuch an Aftrition, as is not grateful to the Body (for a pleafing Afrition doth rather binde in the humors, than expel them :) And therefore fuch Afrition is found in things of an harrifh tafte.

The fixth caufe is Lubrefation and Relaxation: As we fee in Medicines Emollient, fuch as are CWilk, Honey, Mallows, Lettuce, Mercuriad, Pellitory of the Wall, and others. There is alfo a fecret vertue of Relaxation of Cold ; for the heat of the Body bindeth the Parts and Humors together, which

Cold, relaxeth : As it is feen in Vrine, Blood, Pottage, or the like; which, if they be cold, break and diffolve. And by thiskinde of Relaxation, Fcar loofneth the Belly; becaufe the heat retiring inwards towards the Heart, the Guts, and other parts are relaxed ; in the fame manner as Fear alfo caufech trembling in the Sinews. And of this kinde of Purgers are fome CMedicines made of Mercury.

The féventh caule is 1 afferfion, which is plainly a fouring off, or incifion of the more vifcuous buinors, and making the bumors more fluid, and cutting between them, and the part ; as is found in Nitrous $W$ ater, which fcoureth Linnen-Cloth (fpeedily) from the foulnefs. But this Incifion muft be by a Sharpneß, without Afrition; which we finde in Salt, Wormwood, Oxymel, and the like.

There be Medicines that move Stools, and not Vrine; fome other Vrine, and not Stools. Thofe that $\mathcal{P}_{\text {urge }}$ by Stool, a are fuch as enter not at all, or little into the CMefentery Veins; but either at the firft, are not digeftible by the Stomack; and therefore move immediately downwards to the Guts; or elfe are afterwards rejected by the cNefentery Veins, and fo turn likewife downwards to the Guts; and of thefe two kindes, are moft Purgers. But thofe that move $V$ rine, are fuch as are well digefted of the Stomack, and well received alfo of the Mefentery Veins; fo they comeas far as the Liver, which fendeth Vrine to the Bladder, as the Whey of Blood: And thofe cMelicines, being opening and piercing, do fortific the operation of the Liver, in fending down the Wheyey part of the Blood to the Reins. For Medicines Vrinative do not work by rejection and indigeftion, as Solutive do.

There be divers Melicines, which in greater quantity move Stool, and in fmaller, Urine ; and fo contrariwife, fome that in greater quantity move Urine, and in fmaller Stool. Of the former fortis Rubarb, and fome others. The caufe is, forthat Rubarb is a Medicine, which the Stomack in a fmall quantity doth digeft, and overcome (being not Flatuous nor Loathfome, ) and fo fendeth it to the Mefentery Veins; and Io being opening, it helpeth down Urine: But in agreater quantity; the Stomack cannot overcome it, and fo it goeth to the Guts. Pepper, by fome of the Ancients, is noted to be of the fecond fort; which being in fmall quantity, moveth wind in the Stomack or Guts, and fo expelled by Stool; but being in greater quantity, diffipatech the wind, and it felf getteth to the Mefentery Veins, and fo to the Liver and Reins ; where, by Heating and Opening, it fendeth down Urine more plentifully.

WE have fpoken of Evacuating of the Body, we will now fpeak fomething of the filling of it by Reforatives in Confumptions and Emaciating Difeafes. In Vetegables, there is one part that is morenourifhing than another ; as Grains and Roots nourifh more than the Leaves, infomuch as the Order of the Foliatans was put down by the $P_{\text {ope }}$, as finding Leaves unable to nourifh Mans Body. Whether there be that difference in the Flehn of Living Creatures, is not well enquired ; as whether Livers, and other Entrails, be not more nourifhing than the outward Flefh. We finde that amongft the Romans, a Goofes Liver was a great delicacy; infomuch, as they had artificial means to make it fair, and great ; but whether it were more nourifhing, appeareth not. It is certain, that CWarrow is more nourifhing than Fat. And I conceive, that fome decottion of Bones and Sinens, ftamped and wellftrained, would be a very nourifhing Broth: We finde alfo, that Scotch Skinck (which is a Pottage of ftrong nourifhment) is

## Century I.

made with the Kinees and Sinews of Beef, but long boiled: Felly allo, which they ufe for a Reftorative, is chiefly made of Knuckles of Veal. The Pulp; that is within the Crafifh or Crab, which they fpice and butter, is more nourithing then the flefh of the Crab, or Crafifh. The Yolks of Eggs are clearly more noutifhing than the Whites. So that it fhould feem; that the parts of $L$ iving $C$ reatures that lie more inwards, ncurifh more than the out. Ward fleflh; except it be the Brain, which the Spirits prey too much upen, to leave it any great vertue of nourifhing. It feemeth for the nourifhing of aged Men, or Men in Confumptions, fome fuch thing thould be devifed, as fhould be half Chylu, before it be put into the Itomach.

Take two large Capons, perboil them upon a foft fire, by the fpace of an hour or more, till in effect all the Blood be gone. Add in the decoction the Pill of a Sweet-Lemmon, or agood part of the Pill of a Citton, and a little Mace. Cus off the Shanks, and throw them away; then with a good ftrong Chopping-knife, mince the two Capons, Bones and all, as fmail as ordinary minced Meat ; put them into a large neat Boulter, then take a Kilderkin, Iweet, and well feafoned, of four Gallons of Beer of Eight fhillings ftrength, new as it cometh from the Tunning; make in the Kilderkin a great Bung-hole of purpofe, then thruft into it, the Boulter (in which the Capons are) drawn out in length; let it fteep in it three days and three nights, the Bung-hole open to work, then clofe the Bung hole, and fo let it continue a day and a half, then draw it into Bottles, and you may drink is well after three days Botling, and it will laft fix weeks (approved). It drinketh frefla, flowrech, and mantlerh exceedingly, it drinkerh not newifh at all, it is an excellent drink for a Confumption to bedrunk cither alone, or carded with fome other Beer. It quencheth thirft, and hath no whit of windinefs. Note, that it is not poflible, that Meat and Bread, either in Broths, or taken with Drink, as is ufed, Chould get forth into the Veins, and outward Parts, fo finely, and eafily, as when it is thus incorporate, and made almoft a Chylus aforehand.

Tryal would be made of the like Brew with Potado-Roots, or Bwr-Roots, or the Pith of Artichoaks, which are nourifhing Meats: It may betryed alfo, with other flefh; as Pbefant, Patridge, Young Pork, Pig, Venifon, efpecially of Young Deet, doc.

A cMortreß made with the Bramiz of Capons, Itamped, and ftrained, and mingled (after it is made) with like quantity, atthe leaft, of Almond Butter; is an excellent Meat to nourifh thofe that are weak, better than Black-Manger or Jelly: And fo is the Cullice of Cocks, boiled thick with the like mixture of Almond Butter : For the Mortrefs or Cullice of it felf, is more favory and ftrong, and not io fit for nour: fhing of weak Bodies, but the Almonds that are not of fo high a tafte as flefh, do excellently qualifie it.

Indian Maiz hath (ot certain) an excellent Spirit of Nourifhment; but it mult be throughly boiled, and made into a Maiz-Cream like a Barley-Cream. I judge the fame of Rice, made into a Cream; for Rice is in Turky, and other Countreys of the Eaft, moft fed upon, bat it muft be throughly boiled in refpect of the hardnefs of it ; and alfo, becaufe orherwife it bindeth the Body too much.

Piftachees, fo they be good and not mufty, joyned with Almonds in Almond Milk, or made into a Milk of themeelves, like unto Almond Milk, but more green, are an excellent nourifher. But you hall do well, to add a little Ginger fcraped, becaufe they are not wichour fome fubtil windinels.

Whilk warm from the Cons, is found to be a great nourifher, and a good remedy in Confumptions: But then you muft putintoit, when you Milk the Cow, two little Bags; the one of Powder of Mint, the other of Powder of Red Rofes; for they keep the Milk fomewhat from turning, or crudling in the Stomack; and put in Sugar alfo for the fame caufe, and partly for the taftes fake : But you muft drink a good draught, thát it may fay lefs time in the Stomack, left it cruddle: And let the Cup, into which you milk the Cow, befet in a greater Cup of hot Water, that you may take'it warm. And Cow-milkthus prepared, I judge to be betcer for a Confumption, than Aß-milk, which (it is true) turneth not fo eafily, but it is a little harfh : Marty it is more proper for fharpnefs of Urine, and Exulceration of the Bladder, and all manner of Lenifyings. Womens-milk likewilc is prefcribèd, whemallfail; but I commend it nor, as being alittle too near the Juyce of Mans Body, to be a good nourifher; except it be in Infants, to whom it is natural.

Oyl of freet Almonds newly drawn, with Sugar and a little Spice, fpred upon Bread tofted, is an excellent nourifher; but then to keep the Oyl from frying in the Stomack, you mult drink a good draught of Milde-Beer after it; and to keep it from relaxing the Stomack too much, you muft put in a little $P$ erder of Cimnamon.
 rifhment, as (fo they be Potched, or Rearboyled) they need no other preparation or mixture ; yet they may be taken allo raw, when they are new laid, with CMalmfey or sweet Wine. You fhall do well to put in fome few flices of Eriagium Roots, and a little A Amber-greece: For by this means, befidesthe immediate faculty of nourifhment, fuch drink will ftengthen the Back; fo that it will not draw down the Urine toofafe. For too much Urine doth always hinder nourifhment.

CMincing of 'Meat, as in Pies, and Buttered minced Meat, faveth the grinding of the Teeth; and therefore (no doubr) it is more nourifhing, efpecially in Age, or to them that have weak Teeth; but the Butter is not fo proper for weak Bodies, and therefore it were good to moiften it with a little Claret Wine, Pill of Lemmon or Orenge cur fmall, Sugar, and a very little Cinnamon, or Nutmeg. As for Cbuets, which are likewife Minced-meat; inftead of Butter, and Fat, it were good to moiften them, partly with Cream, or Almond, or Piftachomilk, or Barley, or Maiz Cream ; adding a little Co-riander-feed, and Carraway-feed, and a very little Saffron. The more full handling of Alimentation, we referve to the due place.

> We have bitberto bandled the Particulars, which yield heft, and eafief, and plentifulleft,
> Nourishment; and nowo re will $p e a k$ of the bef Means of conveying, and converting the Nourishment.

The firf Means is to procure, that the Nourifhment may not be robbed and drawn away; wherein that which we have already faid, is yery matetial, to provide, that the Reins draw not too ftrengly an over-great part of the Blood into Urine. Tothis add that Preccpt of Ariffote, That Wine be forborn in all Confumptions; for that the Spirits of the Wine do prey upon the Rofcide Juyce of the Body, andinter-common with the Spirits of the Body, and fo deceive and rob them of their Nourifhment. And therefore if the Confumption, growing from the weaknels of the Stomack, do force you to ufe Wine; let it always be burnt, that the quicker Spirits may evaporate, or (at the leaft) quenched with two little Wedges of Gold, fix or feven times repeated. Add alfo this Provifion, that there be not too much expence

## Century 1.

of the nourihment, by Exhaling and Sweating: And tierefore if the Patient be apt to freat; it muft be gendly reftrained. But chiefly Hipocrates Rule is to befollowed, who advifeth quite contrary to that which is in ufe: Namely, That the Linnen or Garment next the Flefh, be in Winter dry and oft changed ; and in Summer feldom changed, and fmeared over with Oyl : For certainit is; that any fubftance that is fat, doth a little fill the Pores of the Body and ftay Sweat in fome degree. But the more cleanly way is to have the Linnen fimeared lightly over with Oylof fiveet Almonds, and not to forbear fhifting as oft as is fit.

The fecond Means is to fend forth the nourifhment into the parts more ftrongly, for which, the working muft be by ftrengthning of the Stonack; and in this, becaufe the Stomack is chiefly comforted by Wine and hot things, which otherw ife hurt, it is good to refort to outward applications to the Stomack: Wherein it bath beentryed, that the Quilts of Rofes, Spices, Maftick, Wormwood, Mint, \&c. are not fohelpful, as to take a Cake of New Bread; and to bedew it with a little Sack or Alegant, and todry it; and after it be dryed alittle before the Fire, to pur it within a clean Napkin, and to lay it to the Stomack: For it is certain, that all Flower hath a potent Vertue of Afrition, infomnch, as it hardneth a piece of Fleth, or a Flower that is laid in it: And therefore a Bag quilted with Bran;' is like wife very good, but itdryeth fomerwhat too much, and therefore it muftnot lie long.

The thicd Means (which may be a branch of the former) is to fend forth the nourifhment the better by fleep. For we fee, that Bears and other Creatures that flecp in the Winter; was exceeding fat: And certain itis, (as it is commonly believed) that Sleep doth nourifh much, both for that the Spirits do lefs fpend the nourihment in Sleep, than whenliving Creatures are a wake: And becaufe (that which is to the prefent purpofe) it helpeth to thruft out the nourilhment into the parts. Therefore in aged-men, and weak Bodies, andluch as abound not with Choler, a fhort fleep after dinner doth help to nouriith; forinfuch Bodies there is no fear of an over-hafty digeftion, which is the inconvenience of Poft-meriditn Sleeps. Sleepalfo in the morning, after the taking of fomewhat of eafie digeftion; as Milk fron the Cow, nourifhing Broth, or the like, doth further nourifhment: But this would be done fitting upright, that the Milk or Broth may pafs the more fpeedily to the bottom of the Stomack.

The fourth Means is to provide, that the parts themfelves may draw to them the nourihmentitrongly: There is an excellent obfervation of Arifoole, that a great reafon why Plants (fome of them) are of greater age than Living Creatures is, for that they yearly put forth new Leaves and Boughs; whereas Living Creatures put forth (after their period of growth) nothing that is young; but Hair and Nails, which are Excrements, and no Parts. And it is moft certain, that whatfoever is young; doth draw nourifhment better, than that which is old ; and then (that which is the myftery of that obfervation) young Boughs and Leaves, calling the Sap up to them, the fame nourihech the Body in the paffage. And this we feenotably proved alfo, in that the oft cutting or polling of Feedges, Trees, and Herbs, doth conduce much to their lafting. Transfer therefore this oblervation to the helping of nourifhment in Living Creatures: The Nobleft and Principal Ufe whereof is, for the Prolongation of Life; Reltauration of fome degree of Youth,' and Inteneration of the Parts: For certain it is, that there are in Living Creatures Parts that nourih and repair eafily; and parts that
noutifh and repair hardly; and you muft refrefh, and renew thofe that are eafie to nourifh, that the other may be refrefhed, and (asit were) drink in nourifhment in the paffage. Now we fee that Draught Oxen putinto good Pafture, recoverthe Fleh of young Beef; and Men after longemaciating Diets, wax plump and fat, and almolt new: So that you may furely conclude, that the frequentand wife ufe of thofe emaciating Diets, and of Purgings; and perhaps of fome kinde of Bleeding, is a principal means of prolong ation of life, and reftoring fome degree of Youth: For as we have often faid, Death cometh upon Living Creatures like the Torment of Mezentius,

> chortua quinetiam jungebat corpora vivis,
> Component Manibufque Manus, atque oribusora.

For the parts in Mans body eafily repairable (as Spirits, Blood, and Flefh) die in the embracement of the parts hardly repairable. as Bones, Nerves; and Membranes) and likewife fome Entrails (which they yeckon amongtt the Spermatical Parts) are hard to repair: Though that divifion of Spermatical and Menftrual Parts, be but a conceit. And this fame obfervation alfo may be drawn to the prefent purpofe of nourifhing emaciated Bodics : And therefore Gentle Frication drawerh forth the nourifhment, by making the parts a little hungry and heating them, whereby they call forth nourifhment the better. This Frication I wifh to be done in the morning. It is alfo beft done by the Hand, or a piece of Scarlet-W ool, wet a little with O, 1 of Almonds, mingled with a fmall quantity of Bay-Salt, or Saffron: We fee that the very Currying of Horles doth make them fat, and in good liking.

1 he fifth means is, to further the very act of Aißimilation of $N$ ourishment; which is done by fome outward emollents, that make the parts more apt to Affimilate. For whichI have compounded an ointment of excellent odor, which I call Roman ointment, vide the Receit. The ule of it would be betwien fleeps; forin the latter feep, the parts affimulate chiefly.

THere be many CMedicines, which by themfelves would do no cure, but perhaps hurt, but being applied in a certain order, one atter another, dogreat cures. I have tried (my felf) a Remedy for the Gout, which hath feloom failed, but driven it away in Twenty four hours ipace: It is firft to apply a Pultaf, of which, vide the Receit, and then a Bath or Fomentation, of which, vide the Recert, and then a Plaifter, vide the Receit. The Pultaß relaxed the Pores, and maketh the humor apt to exhale. The Fomencation calleth forth the Humor by Vapors; but yet in regard of the way made by the 'Pultaf, draweth gently ; and thercfore draweth the Humors out, and doth notdraw more to it: For it is a Gentle Fomentation, andhath withal a mixture (though very little) of fome ftupefacive. The Plaiter is a moderate Aftringent Plaifter, which repellect new humor from falling. The Pultaß alone would make the pare more foft and weak, and apter to take the defluxion and impreflion of the Humor. The Fomentation alone, if it were too weak, without way made by the Pultaf, would draw forth little'; if too ftrong, it would draw to the part, as well as draw from it. The Plaifter alone would pen the Humor already contained in the part, and fo exalperate it, as well as forbid new Humor; therefore they muft be all taken in order, as is faid: The Pultaß is to bo laid to for two or three hours; the Fomentation fora quarter of an hour, orfomewhat better, being ufed hot, and feven or eight times repeated; the Plailter to continue on fill, till the part be well confirmed.

THere is a fecret way of Cure, unpractifed by Afuetude of that which in itfel: hurtech: 'Poy ons have been made by fome Familiar, as hath been faid. Ordinary Kcepers of the fick of the plague, are feldom infected. Enduring of Tortures, by cuftom harh been made more eafic: The brooking of enormousquantity of Meats, and fo of Wine, or ftrong drink, hath been by cuitom made to be without Surfeit or Drunkennefs. And generally Dileafes that are Chronical, as Coughs, Pbrbijicks, fome , kinde of Palfies, Lunacies, w'c. are moft dangerous at the firt: Therefore a wife $P$ byjpitian will confider, whether a Difeafe be incurable, or whether the juft curc of it be not full of peril; and if he finde it to be fuch, let him refort to Pallation, and alleviate the Symptom without bufying himfelf too much with the perfect cure: And many times (if the Patient be indeed patient) that courfe will exceed all expectation. Likewife the Patient himflf may frive, by little and little to overcome the Symptom in the Exacerbation, and fo by time turn fuffering into Nature.

DIvers Difeafes, efpecially Chronical, (fuch as Ourtan Agues) are fometimes cure: by Surfeit and Exceffes; as excels of Meat, excefs of Drink, extraordmary Fafting, extraordinary ftirring, or Laflitude, and the like. The caufe is, for that Difeafes of continuance, get an adventitious ftrength from Cultom, befides their material caufe from the Humors: So that the breaking of the Cuftom doth leave them onely to their firtt cate; which, if it be any thing weak, will fall off. Befides, fuch Exceffes do excite and fpur $N_{\text {ature, }}$ which thercupon rifeth more forcibly againt the Difeafe,

THere is in the Body of Man, a great confent in the Motion of the feveral parts : We fee it is Childrens fport, to prove whether they can rub upon their-Breft with one hand, and patupon their Forehead with another; and itraight ways they'fhall fometimes rub with both hands, or pat with both hands. We fee, that when the Spirits that come to the Noftrils, expel a bad fent, the Stomack is ready to expel by vonit. We finde chat in Confunptions of the Lungs, when Nature cannot expel by Cough, Men fall into Fluxes of the Belly, and then thes die. So in Pefilent $\mathcal{D}$ ifeafes, if they cannot be expelled by Sweat, they fall like wife into Loofneß, and that is commonly Mortal. Therefore Plyyfitiass fhould ingenioully contrive, how by Motions that are in their power, they nay excite inward Motions that are not in their power, by confent; as by the ftench of Feathers; or the like, they, cure the rifing of the Mother.

HIppocrates Aphorifm, in Morbis Minus, is a good profound Uphorifn: It importech, that Difeafes contrary to the Complexion, Age, Sex, こeafon of the year, Diet, \&c. are more dangerous than thofe that are concurrent. A Man would think it fhould be otherwife ; For that when the Accident of Sicknefs, and the Natural difpofition, do fecond the one the orher; the Difeafe fhould be more forcible. And (fo no doubt) it is, if you fuppofe like quantity of Matter. But that which maketh good the esphorism, is, becaufe fuch Difeafes do thew a greater collection of Matter, by that they are able to overcome thofe Natural inclinations tothe conerary. And therefore in Difeafes of that kinde, let the phyfirian apply himfelf mure to $P$ urgation, than to Alteration; becaule the offence is in the quantity, and the qualities are reatified of themfelves.
65. Experiment Solitary, touching Preparations before Purg. ing, and fet. ling of the Body aftcr. ward.
66. Experiment Solitary, rouching Stanching of Blood.
67. Experiment Solitary, touching change of $\mathcal{A}$ liments and Medicines.

PHyptians do wifely preferibe, thatchere be Preparatives ufed before Juft Purgations; for certainit is, that $\mathcal{P}$ urreers do many times great hurt, if the Body be not accommodated, both before and atter the Purging. T he hurt that they do, for want of Preparation before Purging, is by the fticking of the Humors, and thcir not coming fair away; which cauteth in the Body great perturbations, and ill accidents, during the Purging; and alfo the diminifhing and dulling of the working of the Medicine it felf, that it purgeth not fufficiently: Therefore the work of $\mathcal{P}_{\text {reparation }}$ is double, to make thé Humors fluide and mature, and to make che paffages more open; For thofe both help to make the Humors pafs readily: And for the former of thefe, Syrups are moftprofitable; and for the latter, Apozums or Preparing Evoths; Clyfersallo help left the CMedicineftop in the Guts, and work gripingly. 'But it is true, that Bodies aboundıng with Humors, and fat Bodies, and open Weather, are Preparatives in themfelves; becaufe they make the Humors more fluid: But let a Pbyjfian beware how he purge after hard Frofty Weather, and in a lean Body, without Preparation. For the hurt that they may do after furging, it is caufed by the lodging of fome Humors in ill places; for it is certain, that there be Humors which fomewhere placed in the Body, are quiet, and do little hurt; in other places (efpecially Paffages) do much mifchief. Therefore it is good after Purging, to ufe Apozums and Broths, not fo much opening as thofe ufed before Purging, but Abfturfive and Mundifying Clyfters alfo are good to conclude with, to drav away the relicks of the Humors that may have defcended to the lower region of the Body.

1 Lood is ftanched divers ways: Firft, by Aftringents and Repercuffive Wenedicines. Secondly, by drawing of the Spirits and Blood inwards, which is done by cold; as Iron or a Stone laid to the Neck doth ftanch the Bleeding of the Nofe ; allo it hath been tried, that the Teficles being put into fharp Vinegar,' hath made a fudden recefs of the Spirits, and ftanched Blood. Thirdly, by the Recefs of the Blood by Sympathy; fo it hath been tried, that the part that bleedeth, being thruit into the body of a Capon, Sheep, new ript and bleeding, hath ftanched Blood; the Blood, as it feemcth, fucking and drawing up, by fimilitude of fubftance, the Blood it meeteth with, and fo it felf going back. Fourchly, by Cuftomand Time; fo the Prince of Aurange, in his firfthurt by the Spanifh Boy, could finde no means to ftanch the Blood, either by CMedicine or Ligament, but was fain to have the Orifice of the Wound fopped by Mens Thumbs, fucceeding one another for the fpace at the leaft of two days; and at the laft the Blood by cuftom onely retired. There is afffh way alfo in ufe, to let Blood in an adverfe part for a Revulfion.

Thelpeth, both in Medicine and Aliment, to change and not to continne It the fame $\wedge_{\text {sedicine }}$ and Aliment fill. The caufe is, for that Nature by continual ufe of any thing, groweth to a fatiety and dulnefs, either of Appetite or Working. And we fee that Affuetude of things hurtful, doth make. them leefe tncir force to hurt; As Poyfon, whichwith ufe fome have brought themfelves to brook. And therefore it is no marvel, though things helpful by cuftom, leefe their force to help, I count intermiffion almoft the fame thing with change; for that, that hathbeen intermitted, is after a fort new.

IT is found by Experience, that in Diets of Guineuma Sarza; and the like; (efpecially, if they beftriat) the $\mathbf{P}$ atient is more troubled in the beginning than a ter continuance ; which hath madecfome of the more delicate fort of Patients, give them over in the midft; Suppoling, that if thofe Dists trouble them fo much at firf, they flall not be able to cndure them to the end. But the caufe is, for that all thole Diets, to dry up Humors, Rheums, and the like; and they cannot dry up uncil they have firft attenuated: And while the Humor is attenuated, it is more fluid, than it was before, and troubleth the Body a great deal more, until it be dryed up, and confumed. And therefore $\mathscr{P}$ atients muft: expect a due time, and not check at them at the firf.

THe producing of Cold is a thing very worthy the. Inquifition, both for ufe and difclofure of caufes. For Heat and Cold are $N$ atures two hands, whereby the chicfly worketh; and Heat we have in readinefs, in refpect of the Fire: But for Cold, we muft flay tillit cometh, or feek it in deep Caves, orhigh Mountains ; and when all is done, we cannot obtain it in any great degree : For Furnaces of Fire are far hotter than a Summers Sun, but Vaulss or Hills are not much colder than a Winters Froft.

The firt menns of producing Cold $x$ is that which $N_{\text {ature }}$ prefentech us withal; namely, the expiring of Cold out of the inivard parts of the Earth in Winter, when the Sun hath no power to overgome it; the Earth being (ashath been noted by fome (Primum Frigidiun.) This hath been afferted, as well by Ancient, as by Modern Philofopbers: It was the tenet of Parmenites it was the opinion of the Author of the Difcourfe in Plutarch, (for I take it, that Book was not Plutarchs own) $\mathcal{D}_{\text {e primo }}$ Figito. It was the opinion of Telefrus, who hath renewed the Philofophy of Parmenides, and is the beft of the Novelifis.

Thefecond caufe of Cold is, the contact of cold Bodies; for Cold is Aative and I ranfitive into Bodies adjacent, as well as Heat; which is feen in thofe things that are touched with Snow or cold Water. And therefore, whofocver will be an Enquizer into Nattre, let him refort to a Confervatory of Snow and lce; fuch as they ufe of delicacy, to cool Wine in Summer: Which is a poor and contemptible ufe, in refpect of other ufes that may be made of fuch Confervatories.

The chird caufe is the Primary Nature of all Tangible Bodies; for is is well to be noted, That all things whatfoever (Tangibleare of themfelves) Cold ; except they have an acceffory heat by Fire, Life, or Motion: For even the spirit of Wine, o: Chymical Oyls, which are fo hot in operation, are to the firfeteuch, Cold; and Air it felf comprefled, and condenfed a little br blowing, is Cold.

The fourth caufe is, the Denfity of the Body; for alldenfe Bodies are colder than moft other Bodies, as Mettals, Stone, Glaß, and they are longer in heating than fafter Bodics. And it is certain, that Eartb, Denfe, Tangable, hold all.f the Nature of Cold : The caufe is, for that all Mareers Tangible being Cold, it muft needs follow, that where the Matter is moft congregate the Cold is thegreater.

The ch caufe of Cold, or rather of increafe and vehemency of Cold, is Experiments in Confort, touching the Production of Coldo.-
is coldèr than Oyl , becaufe ithath a quicker Spirit; for all Oyl, though it hath the tangible parts better digefted than W ater, yet hathita duller Spirit : So Snow is colder than Water, becaufe it hath more Spirit uithin it : So we fee that Salt put to ice (as in the producing of the Arificial Ice) encreafeth the activity of cold : So fome Infecta which have Spirit of Life, as Snakes and Silkworms, are to the touch, Cold. So Quick-filver is the coldeft of Metals, becaufe it is fulleft of Spirit.

WE have formerly fet down the Means of turning Air into Water, in the Experiment27. But becaufe it is CMagnale Natura, and tendeth to the fubduing of a very great effect, and is alfo of manifold ufe: We wil adde fome inftances in Confort that give light thercunto.

It is teported by fume of the Ancients, that Sailers have ufed every night, to hang Fleeces of Wool on the fides of their ships, the W ool towards the Water; and that they have crufhed frefh water out of them, in the Morning, for their ufe. And thus much we have tried, that a quantity of Wool tied loofe together, being let down into a deep Weil ; and hanging in the middle, fome three Fathom from the Water for a night, in the Winter time, increafed in weight, (as I now remember) to a fifth Part.
77.

It is reported by one of the Ancients, that in Lydia, near Pergamus, there were certain Workmen in time of Wars, fled into Caves; and the Mouth of the Caves being fopped by the Enemies, they were famihed. But long time after, the dead Bodies were found, and fome Veffels which they had carried with them, and the Veffels full of Water ; and that $\mathrm{W}_{2}$ ter thicker, and more towards lee, than common Water; which is a notable inftance of Condenfation and Induration by Burial under Earth (in Caves) for long time; and of Verfion alfo (as it fhould feem) of the Air into Water; if any of thofe Veffels were emptv. Try therefore a fmall Bladder hung in Snow, and the like in Nitre, and thelike in Quick-filver: And if you finde the Bladders faln or hrunk, you may be fure the Air is condenfed by the Cold of thofe Bodies, as it would be in a Cave under Earth.
(entury I. Y.

It is reposted of very good credit, that in the Eaft-Indies if you fet a Tub of Water open in a Room where Cloves are kept, it will be drawn dry in Twenty four hours, though it fand at fome diftani from the Cloves. In the Countrey, they ufe many times in deceit, when their Wooll is new fhorn, to fet fome Pails of Water by in the fame Room, to encreafe the weight of the Wooll : But it may be, that the Heat of the Wool remaining from the Body of the Sheep, or the heat gathered by the lying clofe of the Wool, helpethto draw the watey vapor; "but that is foothing to the Verfion.

It is reported alfo credibly, that Wool new fhorn, being laid calually upona Veffel of Verjuice, after fome time hath drunk up a great part of the $V$ erjuice, though the Velfel were wh le without any Gaw, and had not the Bung-hole open. In this infance there is (upon the by) to be noted, the Percolation or suing of the Verjuice thorow the Wood; for verjuice of it felf would never have paffed through the Wood: So, asit feemeth, it muft be firft in akinde of vaporbefore it pafs.

It is elpecially to be noted, that the caufe that doth facilitate the Verfion of Air into Water, when the Air is not in grofs, but fubtilly mingle 1 with tangible Bodies, is, (at hath been partly touched before) for that tangible Bodies have an antipathy with Air; and if they finde any Liquid Body that is more denfe nearthem, they will draw it ; and after they have drawn it, they will condenie itmore, and in effect incorporateit: For yefee that a Spunge, or Wooll, or Sugar, ora Woollen-cloth, being put but in part, in Water or Wine, will draw the Liquorhigher, and beyond the place, where the Water or Wine cometh: Wefee allo, that Wood, Late-frings, and the like, do fwell in moift feafons; as appeareth by the breaking of the Atrings, the hard turning of the Pegs, and the hard drawing furth of Boxes, and opening of Wainfcot doors, which is a kinde of infufion; and is much like to aninfufion in Water, which will make VVood to fwell; as we fee in the filling of the Chops of Bowls by laying them in VVater. But for that part of thele Experiments, which concerneth $A$ ttraction we will referveinto the proper Title of Atraction.

There is alfo a Verfion of Airinto Water, feeing in the fiweating of Marbles, and other Stones; and of V Vainfcot before, and in moift weather. This muft be, either by fome moifture the Body yieldeth, or elfe by the moift Air thickned againft the hard Body. But it is plain, that it is the latter; for that we fee Wood painted with Oyl-colour, will fooner gather drops in a moift night, than Wood alone; which is caufed by the fmoothnefs and clofenefs, which letech in no part of the vapor, and fo turneth it back and thickneth it into Dew. We fee allo, that breathing upona Glafs, or fmooth Body, givech a Dew; and in Frofty mornings ( firch as we call Rime Frofts) you thali finde drops of Dew upon the infide of Glaf -windows: And the Froft it felf upon the ground, is but a Verfion or Condenfation of the moift vapots of the night, into a watry fubitance: Dews likewife, and Rain, are but tive antum of moift vapors condenfed; the Dew, by the cold onely of the nesdeparture, which is the gentler cold; Rains, by the cold of that which they call the coiddle Region of the Air, which is the more violent Cold.

It is very probable (as hath been touched) that that which will turn Water into Ice, will likewife turn Air fome degree nearer unto Water. Iherefore try the Experiment of the Artificial curning Water into Ice (wherecf we hall feak in another place) with Air in place of Water, and
the Ice aboutit. And although it be a greater alteration to turn Air into Water, than Waterintolce; yet there is shis hope, that by continuing the Air longer time, the effect will follow ; for that artificial converfion of Water into Ice, is the work of afew hours; and this of Air may be tried by a moneths fpace, or the like.

Experiments in Contort, touching Induration of Bodiesa

INduration or Lapidification of Subitances more foft, is likew ife another degree of Condenfation, and is a great alteration in Nature. The effecting and accelerating thereof, is very worthy to be enquired it is effected by three means.

The firftis by Cold, whofe property is to condenfe, and conftipate; as hath been faid.

The fecond is by Heat, which is not proper but by confequence ; for the heat doth attenuate, and by attenuation doth fend forth the Spirit, and moifter part of a Body ; and upon that, the more grofs of the tangible parts do contrait and ferve themelelvestogether; both to avoid Vacuim (asthey call it) and alfo to munite themfelves againft the force of the Fire, which they have fuffered.

And the third is by Affimilation, when a hard Body affimilateth a foft; being contiguous to it.

The examples of Induration taking them promifcuoufly, are many: As the Generation of Stones within the Earth, which at the firft are but Rude Earth or Clay ; and fo of CWinerals; which come (no doubt) at firft of Juyces Concrete, which afterward indurate: And fo of Porcellane, which is an Artificial Cement, buried in the Earth a long time ; and fo the making of Brick and Tile; alfo the making of Glaß, of a certain Sand an'd Brake-Roots, and fome other matters ; alfo the Exuldations of Rock Diamonds and Chryfal, which harden with time ; alfo the Induration of Bead-Amber, which at firftis a foft fubftance, as appeareth by the Flies and Spiders, which are found in it, and many more. But we will fpeak of them diftinctly.

For Indurations by Cold, there betew Trials of it ; for we have no tirong or intenfe cold here on the furface of the Earth, fo near the Beams of the Sun and the Heavens, the likelieft tryal is by Snow and Ice; for as Snow and Ice, efpecially being holpen, and their cold activated by Nitre or Sale, will turn Water into Ice, and that in a few hours: So it may be it will turn Wood orftiff Clay into Stone in longertime. Put therefore into a Confeiving Pit of Snow and Ice, (adding fome quantity of Salt and Nitre) a piece of Wood, or a piece of tough Clay, and let ie lie a moneth or more.

Anothertryal is by CMetuline VVaters, which have virtual Cold in them. Put therefore Wood or Clay into Smiths water; or other CMeralline water,' and try whether it will not harden in fome reafonable time. But I underftand it of chetaline waters, that come by wafhing or quenching, and not of Strong Waters that come by diffolution ; for they are too Corrofive to confolidate.

It is already found, that there are fome Natural Spring-waters that will inlapidate Wood; fo as you fhall fee one piece of Wood, ahereof the part above the Water fhalf continue Wood; and the part under the Water, fhall beturned into a kinde of Gravelly Stone. It is likely thofe Waters are of fome Metalline Mixture; but there would be more particular inquiry made of them. It is certain, that an Egg was found, having lain many years in the
bortom of a Moat, where the Earth had fomewhat overgrown it: And this Egg was come to the hardnefs of a ftone, and had the colours of the White and Yolk perfect ; and the Shell fhining in fmall Grains, like Sugar or Alabla?

Another Experience there is of Induration by Cold, which is already found, which is, That Metals themfelves are hardned by ofren heating, and querich ing in Cold-water : For Cold ever worketh moft potently upon Heat pre. cedent.

For Induration by Heat, it mult be confidered, That Heat, by the exha ling of the moitter parts, doth either harden the Body; as in Bricks, Tiles, \&e. Or if the Heat be morefierce, maketh the groffer part of it felf, run and melt; as in the making of ordinary Glafs, and in the Vitrification of Earth, (as we fee in the inner parts of Furnaces) andinthe Vitrification of Bick; and of Metals. And in the former of thele, which is the hardning by Baking, without Melting, the Heat hath thefe degrees: Firlt, It Indurateth, and then maketh Fragile; and laftly, It doth Incinerate and Calcinate.

But if youdefire to make an Induration with Toushne $\beta$, and lefs Fragility, a middle way would be taken, which is that which Arifotle hath well noted, but would be throughly verified. It is, to decoct Bodies in Water for two or three days; but they mult be fuch Bodies, into which the Water will notenter; as Stone and Metal. For if they be Bodies; into which the Water will enter, then lotig feething will rather foften than in durate them, as hath been tricd in Eggs, \&c. J bercfore, fofter Bodies mult be put into Bottcs, and the Botlles bung into Water feething, with the Mouths open above the Water, that no Water may get in: For by this Means; the Virtual Heat of the Water will enter ; anduch a Hest, as will not make the Body adult or fragile: But the Subftance of the Water will be fhut out. This Experiment we made, and it forted thus, It was tryed with a piece of Free-ftone, and with Pewter, put into the Water at large, the Free-itone we found received in fome Water; forit was fofter and eafier to fcrape, than a piece of the fame fone kept dry. But the Pewter, into which no Water could enter, became more whice, and likerto Silver, and lifs:flexible by much. There were alfo put into an Earthen Bottle, placed as before, a good pellet of Clay, a piece of Cheefe, a piece of Chalk, and a piece of Freeftone. The Clay came forth almoft of the hardnefs of Stone: The Cheefe likewife very hard, and not well to becut : The Chalk and the Free ftone much harder then they were. The colour of the Clay inclined not a whit to the colour of Brick, but rather to white, asin ordinary drying by the Sun. Note, that allthe formertryals were made by a boyling upon a good hot fire, renewing the Water as it confumed, with other hot Water ; but the boyling was bur for Twelve hours onely : And it is like, that the Experiment would have been more effectual, if the boyling had been for two or three days, as we prefcribed before.

As touching Aßimilation (for there is a degree of Aßimilation, even in Inanimate Bodies) we fee examples of it in fome Sroner, in Clay.grounds; lying near to the top of the Earth where Pebble is; in which you may manifeftly ree divers Pcbbles gathered together, and a crutt of Cement or Stone between them, as hard as the Pebbles themfelves. And it were good to make a tryal of purpore, by taking Clay, and purting in it divers Pebble-fones, thick fet, to fee wherher in continuance of time, it will norbeharder than other Clay of the famelump, in which no Pebblesarefet. We fee alfo in Ruins

## $\mathcal{X}$ (atural Hifory;

of old Walls, efpecially towards the bottom, the Morter will becomeas hard as the Brick: We fee allo, that the Wood on the fides of Veffels of Wine, gatherech a ciult of Tartar harder than the Wood ir telf; and Scales likewife grow to the Teeth, harder than the Teeth themfelves.

Moft of all, Induration by Afimilation appeareth in the bodies of Trees, and Living Creatures: For no nourifhment that the Tree receivcth, or that the Living Creature receiveth, is fo hard as Wood, Bone, or Horn, \&ce. but is indurated after by Affimilation.

9 I.
Experiment Solitary,

THe Eyeof the Undertanding, is like the Eye of the Senfe: For as you may fee great obje Cts through fmallCranies, or Levels; fo you may fee great Axioms of Nature, through fmall and contemptible inftances. The fpeedy depredation of Air upon Watry moifture, and verfion of the fame into Air, appeareth in nothing more vifible than in the fudden difcharge, or vanifhing of a little Cloud of Breath, or Vapor, from Glafs or the Blade of a Sword, or any fuch polifhed Body; fuch as doth not at all detain or imbibe the moifture: For the miftineis fcatereth and bre:kech up fuddenly. But the like Cloud, if it were oily or fatty, will not difch arge; not becaule it fticketh fatter, but, becaufe Air preycth upon Water, and Flame, and Fire, upon Oyl; and therefore, to take cut a pot of Greafe, they ufe a Coal upon brown Paper, becaufe fire worketh upon Greafe or Oyl, as Air doth upon Water. And we fee Paper oiled, or Wood oiled, or the like, laft long moift ; but wet with Water, dry or putrific fooner. The ciufe is, for that Air meddleth little with the moifture of oyl.

THere is an admirable demonfration in the fame trifling inflance of the little Cloud upon Glafs, or Gems, or Blades of Swords of the force of Union, even in the leaft quantities, and weakef Bodies, how much it conduceth to prefervation of the prefent form, and the rcfifting of a new. For mark well the difcharge of that Cloud, and you fhall fee ir everbreak up, firt in the skirts, and laft in the midf. We fee likewife, that much Water draweth forth the Juyce of the Body infufed, but little Water is imbibed by the Body : And this is a principal caufe, why, in operation upon Bodies, for the ir Verfion or Alteration, the tryal in great quantities doth not aniwer the tiyal in fmall, and fo deceiverh many; for that (I fay) the greater Body refifteth more any alteration of Form, and requireth far greater ftrength in the Active Body that fhould fubdue ir.

TX ${ }^{\text {E have fpoken before in the Fiff Infance; of the caufe of Orient }}$ Colours in Birds; which is by the finenefs of the Scrainer, we will now endeavor to reduce the fame Axiom to a Work. For this Writing of our Sylpa Sylvarum, is (to (peak properly) not Natural Hiffory, but a high kinde of Natural Magick., For it is not a difcription onely of Nature, but a breaking of Narure, into great and ftrange Works. Try therefore the anointing over of Pigeons, or other Birds, when they are but in their Down, or of Whelps, cutting their Hair as fhort as may be, or of fome other Beaft ; with fome oyntment, that is not hurtful to the flefh, and that will harden and ftick very clofe, and fee whether it will not alter the colours of the Feathers, or Hair. It is, received, that the pulling off the firf Feathers of Birds clean, will make the new come forth White: And it is certain, that White is a penurious colour, and where moifture is feant. So Blew Violets, and other Flowers, if they beflatved, turn pale and white.
$\frac{\text { Century } I \text {. }}{\text { Birds, and Horfes, by age or fcars, turn white ; and the hoar Hairs of }}$ Men, come by the fame reafon. And therefore in Birds, it is very likely, that the Feathers that come firft, will be many times of divers colours, according, to the nature of the Birds; for that the skin is more porous, but when the skin is more fhut and clofe, the Feathers will come white. This is a good Experiment, not onely for the producing of Birds and Beafts of itrange colours, but alfo, for the difclofure of the nature of colours themfelves; which of them require a finer porofity, and which a groffer.

IT is a work of providence that hath been truly oblerved by fome; that the Yolk of the Egg coilduceth little to the Generation of the Bird, but onely to the nourifloment of the fame: For if a Chickon be opened when it is new hatched, you fhall finde much of the Yolk remaining. And it is needful, that Birds that are fhaped without the Females Womb, have in the Egg, as well matter of nourifhment, as matter of generation for the Body. For after the Egg is laid, and fevered from the body of the Hen, it hath no more nourifhment from the Hen, but onely 2 quickning heat when fhe fittech. But Beafts and Men need not the matter of nourifhment within themfelves; becaufe they are fhaped withinthe Womb of the Female, and are nourifhed continually from her body.

IT is an inveterate and received opinion, That Cantharides applied to any part of the Body, touch the Bladder, and exulcerate it, if they flay on long. It is likewife received, that akinde of Stone, which they bring out of the Wef-Indies, hath a peculiar force to move Gravel, and to diffolve the Stone ; infomuch, as laid but to the Wrelt ; it hath fo forcibly fent down Gravel, as Men have been glad to remove it,' it was fo violenr.

It is received and confirmed by daily experience, that the Soals of the Feet, have great affinity with the Head, and the Mouth of the Stomack: As we fee, Going wethod, to thofe that ufe it not, affecteth both; Applications of hor Powders to the Feet, attenuate firtt, and after dry the Rheume. And therefore a Phyfician that would be myftical, prefcribeth for the cure of the Rheume, That 2 Man fhould walk continually upon a CamomilAlley; meaning, that he fhould put Camomil within his Socks. Likewife, Pigeons bleeding, applied to the Soals of the Feet, eafe the Head; and Soporiferous Medicines applied unto them, provoke fleep.

It feemeth, that as the Feet have a fympathy with the Head; fo the Wrefts and Hands have a fynmpathy with the Heart. We fee the affects and Paffions of the Heart, and Spirits, are notably difclofed by the Pulfe: And it is often trged, that Juyces of Stock-gilly-fowers, Rofe-iampion, Garlick, and other things, applied to the Wrefts, and renewed, have cured long Agues. And I conceive, that wafhing with certain Liquors the Palms of the Hands, doth much good: And they do well in Heats of Agues to hold in the Hands, Eggs of Alablafter, and Balls of Cryital.

Of thefe things we shall Jpeak more, when we handle the Title of Sympathy and Antipathy, in the proper place.

THe knowledge of Man (hitherto) hath been determined by the view or fight; fo that whatfoever is invifible', either in refpest of the finenefs of the Body it felf,or the fmallnefs of the Parts,or of the fubtilty of the

Motion, is little inquired. And yet thefe be the chings that govern Nature principally, and without which, you cannot make any true © Analyfis and Indications of the proceedings of Nature. The Spirits or Pencematicals that are in all Tangible Bodies, are fcarce known: Sometimes thry take them for Vacuum, whereas they are the moft adive of Bodies: Sometimes they take them for Air, from which they differ exceedingly, as much as Wine from Water, and as Wood from Earth: Sometimes they will have them to be Natural Heat, or a Portion of the Element of Fire, whereas fome of them are crude and cold: And fometimes they will have them to be the Vertues and Qualities of the Tangible Parts which they fee, whereas they are things by themfelves: And then, when they come to Plants and Living Creatures; they edll them Souls. And fuch fuperficial fpeculations they have ; like Profpectives that fhew things inward, when they are but Paintings. Neither is this a queftion of words, but infinitely material in Nature: For Spirits are nothing elfe but a Na tural Body, rarified to a Proportion, and included in the Tangible Parts of Bodies, as in an lntegument : And they be no. lefs differingone from the other, then the Denle or Tangible Parts: And they are in all Tangible Bodies what oever, more or lefs, and they are never (almoft) at reft: And fromthem, and their Motions, principally proceed earefation, Colliquation, Concoction, Maturation, Putrefation, Vivification, ard moft of the effects of $2 \mathbb{2 a}$ ture. For, as we have figured them in our Sapientia Veterum, in the Fable of Proferpina, you Chall in the Infernal Regiment hear little doirgs of $\mathcal{P}$ luto, but moft of $P_{\text {roferpina }}$ : For Tangible Parts in Podies, are fupid things, and the Spirits do (in effeat) all. As for the differences of Tangible Parts in Bodies, the induftry of the Chymifts hath given fome light in difcerning by their leparations, the Oily, Crude, Pure, Impure, Five, Grof, Partis of Bodies, and the like. And the Phyfitians are content to acknowledge, that Herbs and Drugs have divers parts; as that $O$ pium hath a fupefacting part, anda heating part; the one moving Slecp, the other a Sweat following; and that Ruburb hath Purging parts, and Aftringing parts, \&c. But this whole In quijition is weakly and negligently handled. And for the more fubtil differences of the Minute parts, and the pofture of them in the Body, (which alfo bath great effects) they are not at all touched: As for the Motions of the Minute Parts of Bodies, which do fo great effects, they have not been obferved at all! becaufe they are invifible, and incur not to the eye ; but yet they are to bedeprehended by experience. As Democritus faid well, when they charged him to hold, that the World was made of fuch little Moats, as were feen in the Sun. ©tomus (faith he) neceSitate Rationis of Experientia effe convincitar: Atomum enim nemo nunquam vidit. And therefore the tumult in the parts of folid Bodies, when they are compreffed, which is the caufe of all flights of Bodies thorow the Air, and of other Me hanical Motions, (as hath been partly touched before, and thall be throughly handled in due place,) is not feen at all, but neverthelefs, if you know it not, or inquire it not attentively and diligently, you fhall never be able to difcern, and muchlefs to produce, a number of Mechanical Motions. Again, as to the Motions Corporal, within the Enclofures of Bodies, whereby the effects (which were mentioned before) pafs between she pirits and the Tangible parts (which are Arefation, Colliquation, Concoction, CMaturation, © $c$.) they are not at all handled; but they are put off by the names of $V$ ertues, and Natures, and Ations, and Pafions, and fuch other Logical zords.

IT is certain, that of all Powers in Nature, Heat is the chief; both in the Frame of Nature; and in the Works of Art. Certain it is likewilc, that the effeas of Heat, are moft advanced, when it worketh upon a Body withiout lofs or dillipation of the matter; for that ever betrayed the account. And therefore it is true, that the power of Heat is beft perceived in Diftillations, which are performed in clofe Veffels and Receptacles. But yet there is a higher degree ; For howfoever Diftillations dokeep the Body in Cells and Cloyfters, without going abroad, yetthey give fpace into Bodies to turn into Vapor, to return into Liquor, and to feparate one part from another. So as Nature doth expatiate, although it hath not full liberty; whereby the true and ultime operations of Heat, are not attained: But if Bodies may be altered by Heat, and yet no fuch Reciprocation of Rarefaction, and of Condenfation, and of Separation, admitted; then it is like that this Proteus of Matter, being held by the Sleeves, will turn and change into many Metamorpholes. Take cherefore a fquare Veffel of Iron, in form of a Cubs, andlet it have good thick and ftrong fides; put it into a Cube of Wood, that niay fill it as clofe as mav be, and let it have a cover of Iron as ftrong (at leaft) as the fides, and let it be well Luted, after the manner of the Cbymifts; then place the Veffel within burning Coals kept quick kindl ed, for fome few hoursfpace; then take the Veffel from the Fire, and take off the Cover, and fee what is become of the Wood, I conceive, that fince all Inflamation and Evaporation are utterly prohibited, and the Body till turned upon it felf, that one of thefe two Effects will follow, Either that the Body of the Wood will be turned into a kinde of Cumagma, (as the Chymiffs call $i t$,) or, that the finer part will be turned into Air, and the groffer ftick as it were baked, and incruftate upon the fides of the Veffel, being become of a denfer matter, than the Wood it felf, crunde. And for another tryal, take alfo Water, and put it in the hike Veffel, fopped as before; but ufe agentler Heat, and remove the Veffel fometimes from the fire; and again, after fome fmall time, when it is cold, renew the heating of it, and repeat this alteration fome few times; and if you can once bring to pafs, that the Water which is one of the fimpleft of Bodies, be changed in Colour, Odor, or Tafte, after the manner of Compound Bodies, you may be fure that there is a great work wrought in Nature, and a notable entrance made in ftrange changes of Bodies, and productions; and alfo a way made to do that by Fire, in frmall time, which the Sun and Age do in long time. But if the admirable effeets of this $\mathcal{D}$ ifililation in clofe, (for fo we callit) which is like the Wombs and Matrices of Living Creatures, where nothing expireth nor feparateth: We will fpeak fully, in the due place. Not that we aim at the making of $\mathcal{P e r e r a c e l} /$ fus Pigmeys, or any fuch prodigious follies; but that we know the effects of Heat will be fuch, as will fearce fall under the conceit of Man, if the force of it be altogether kept inf.

THere is nothing more certain in $\dot{N}_{\text {atture, }}$ thati that it is impoffible for any Body to be utterly annihilated; but that as it was the work of the Omnipotency of God, to make Somewhat of 2Xothing: So it requireth the like omnipotency, to turn Somewbat into Notbing. And therefore it is well faid by an obfcure Writer of the Sect of the Chymifts, That there is no fuch way to effect the frrange $T_{\text {ran }}$ mutations of Bodies, as to cadeavor and urge by all means, the reducing of them to Nothing. And hercin is contained al-
fo a great fecret of Prefervation of Bodies from change; for if you can prohibit, that they neither turn into Air, becaufe no sir cometh to them, nor go into the Bodies Adjacent, becaufe they are utterly Heterogeneal, nor make a round and circulation within themfelves; they will never change; though they be in theirNature never fo perifhablc or mutable. We fee how Flies and Spiders, and the like, get a Sepulchre in Amber, more durable than the cMonument and Embalming of the Body of any King. And Iconceive the like will be of Bodies put into Quick-filver. Burthen they muft be butchin, as a leaf or a peece of Paper or Parchment; for if they have a greater craffitude, they will alter in their own Body, though they fpend not. But of this, we thall fpeak more when we handle the Title of Conservation of Bodiess

create Tones; Percuffion of Metals (comprehending Glaß, and the like) Percuffions of Air, and Percuffions of Water.

The Diapafon or Eight in CMufick, is the fiweetef Concord; in iomuch, as it is in effect an Vnijon; as we fee in Lutes that are ftrung in the bafe ftrings with two ftrings, one an Eighth above another, which make but as one found; and every Eighth Note in Afcent, (as from Eight to Fifteen, from Fiftecn to Twenty two, and fo in infinitum) are but scales of $\mathcal{D}$ iapafor. The caufe is dark, and hath not been rendred by any, and therefore would be better contemplated. It feemeth that Air (which is the fubject of Sounds) in Sounds that are not Tones (which are all unequal as hath been faid) admitteth much variety; as we fee in the Voices of Living Creatures, and likewife in the Voices of feveral Men : for we are capable to difcern feveral Men by their Voices) and in the Conjugation of Letters, whence $A r$ ticulate Sounds procced; which of all others, are moft various. But in the Sounds which we call Tones (that are ever equal) the Air is not able to caft it felf into any fuch variety; but is forced to recur into one and the fame Pofture or Figure, onely differing in greatnefs and fmallnefs. So we fee Figures may be made of Lines, crooked and ftraight, in infinite variety, where there is inequality; but Circles or Squares, or Triangles Equilateral, (which are all Figures of equal Lines) can differbutit in greater or leffer.

It is to be noted (the rather, left any Man fhould think that there is any thing in this number of Eight, to create the Diapafon) that this computation of Eight, is a thing rather received than any true computation. For a true computation ought ever to be, by diftribution into equal Portions. Now there be intervenient in the rife of Eight (in Tones) two Beemols or Half-Notes; fo as if you divide the Tones equally, the Eighth is but Seven whole and equal Notes: And if you fubdivide that into Half-Notes, (as it is in the ftops of a Lute) it nuaketh the number of Thirteen. Man (not meafuring the Tone by whole Notes and Half Notes, which is the equal Meafure) there fall out to be tivo Beemols (as hath been faid) between the Vnifon and the Diapafon; and this varying is natural. For if a Man would endeavor to raife or fall his Voiceftill by Half-Notes, like the ftops of a Lute, or by whole Notes alone, without Halfs as far as an Eighth; he will notbeable to frame his Voice unto it, which fheweth, that after every three whole Notes, Nature fequireth, for all Harmonical ufe, one HalfNote to be interpofed.

It is to be confidered, That whatfoever vertue is in Numbers, for conducing to concent of Notes, is rather to be afcribed to the Ante-number, than to the Enite-number; as namely, that the Sound returneth after Six, or after Twelve: So that the Seventh or the Thirteenth is not the Matter, but the Sixth, or the Twelfth; and the Seventh and the Thirteenth, are but the Limits and Boundaries of the Return.

The Concords in Mufick which are Perfett, or Semiperfett, between the viifon and the Diapafon, are the Fifth, which is the moft Perfect; the Third next, and the Sixth which is more harfh : And as the Ancients efteemed, and fo do my felt, and fome other yet, the Fourth which they call Diateßeron; as for the Tenth, Twelfth, Thirteenth, and fo in infinitum, they be but Recurrences of the former ; viz. of the Third, the Fifth, and the Sixth, being an Eighth refpectively from them.

For $\mathcal{D}$ ifords, theSecond and the Seventh, are of all others, the moft odious in Harmony to the Senfe; whereof, the one is next above the Vnifon, the other next under the Diapafon; which may fhew, that Harmony requireth a competent dittance of Notes.

In Harmony, if there be nota Dif cord to the Bafe, it doth not difurb the Harmony, though there be a $\mathcal{D} i f$ ford to the higher parts ; fo the $\mathcal{D i f c o r d}$ be not of the Two that are odious: And therefore the ordinary Concent of Four parts confiftech of an Eighth, a Fifth, and a Third to the Bafe; but that Fifth is a Fourch to the Trebble, and the Third is a Sixth. Andthe caufe is, for that the Bafe ftriking more Air, doth overcome and drown the Trebble (unlefs the Difcord be very odious) and fo hideth a fmall imperfection For we fee, that in one of the lower ftrings of a Lute, there foundeth not the found of the Trebble, nor any mixt found, but onely the found of the Bafe.
 able of Harmony; for wefee the Half-Notes themfelves do but interpofe fometimes. Neverthelefs, we have fome Slides or Reli/bes of the Voice or Strings, as is werc, continued without Notes, from one Tone to another, rifing or falling, which are delightful.

The caures of that which is $\mathbf{P}$ leafing or ingrate to the Hearing, may receive light by that which is Pleafing or ingrate to the Sight. Fhere be two things pleafing to the fight (leaving Pitiures and Sbapes afide, which are but Sicondary Objects , and pleafe or difpleafe but in Me. mory; ) thefe two are Colours and Order.. The pleafing of Colour fymbolizeth with the Plafing of any Single Tone to the Eir; but the pleafing of Order doth fymbolize with Harmony. And therefore we fee in Garden-knots, and the Frets of Houfes, and all equal and well anfwering Figures, (as Globes, Pyramides, Cones, Cylinders, © ©.) how they pleafe; whereas unequal Figures are but Diformities. And borh there pleafures, that of the Eye, and that of the Ear, are but the effects of equality, good proportion, or correfpondence: So that (out of queftion) Equality and Correfpondence are the caufes of Harmony. But to finde the Proportions of that Correfpondence, is moreabltrufe ; whereof, notwithftanding we fhall fpeak fomewhat (when we handle Tones, in the general enquiry of Sounds.

Tones are not fo apt altogether to procure Sleep, as fome other founds: As the Wind, the Purling of Water, Humming of Becs, a fweet Voice of one that readeth, \&e. The caufe whereof is, for that Tones, becaufe they are equal and flide not, do miore ftrike and ereet the Senfe, than the other: And overmuch attention hindereth fleep.

There be in $M_{w j}$ ch. certain Figures or $T$ ropes, almoft agreeing with the Figures of Rherorick, and with the Affetions of the Minde, and other Senfes. Firf, The Divifon and ouvering, which pleafe fo much in CMufick: have an agreement with the Glittering of Light ; Asthe CMoon-Beann playing upous a Wave. Ag in, the Falling from a Diford to a Coniord, which maketh grear Iweernefs in Mufick. hath an agreement with the Affections, which are reintegrated to the better, afeer fome diflikes; it agreeth alfo with the tafte, which is foon glutted with that which is fweet alone. The giding from the Clofe or Cadence, hath an agreement with the Figure in Rhetorick, which they call Prater Expettatum; for there is a pleafure, even in being deceived. The Reports and Fuges have an agreement with the Figxyes in Rbetorick of Reperition and Traduction. The Tripla's and Changing of Times, have an: agreement with

Experiments in Confort, touching Sounds; and firft touching the Nullity, and Entity of Sounds.

II5.
the changes of Motions; as when Galliardtime, and Meafure time, are in the Medly of one Dance.

Ithath been anciently held, and obferved. That the Senfe of Hearing, and the Kindes of Muybck, have moft operation upon Manners; as to incourage Men, and make them warlike; to make them foft and effeminate ; to make them grave ; to make them light; to make them gentle and inclined to pity, \&c. The caufe is, for that the Senfe of Hearing ftriketh the Spirits more immediately, than the othicr Senjes; and more incorporeally than the Smelling: For the Sight, Tafe, and Feeling, have their Organs, not of fo prefent and imniediate accefs to the Spirits, as the Hearing hath. And as for the Smelling (which indeed worketh alfo immediately upon the Spirits, and is forcible while the object remaineth) it is with a communication of the Breath or Vapor of the objeft oderate: But Harmony entring eafily, and mingling not at all, and coming with a manifeft motion; doth by cuftom of often affectung the Spirits, and putting them into one kinde of pofture, alter not a little the nature of the Spirits, even when the object is removed. And therefore we fee, that Tunes and Airs, even in their own nature, have in themfelves fome aftinity with the Affedions: As there be Merry Tunes, Doleful Tuncs, Solemn Tunes; Tunesinclining Mens mindes to Pity, Warlike Tunes, \&c. So as it is no marvel, if they alter the Spirits, confidering that Tunes bave a predifpofition to the Motion of the Spirits in themfelves. But yet it hathbeen noted, that though this variety of Tunes, doth difpofe the Spirits to variety of Paffions, conform unto them; yet generally; COufjck feedeth that difpofition of the Spirits which it findeth. We fee alfo, that feveral Airs and Tunes, do pleafe feveral Nations, and Perfons according to the fympathy they liaveswith their Spirits.

PErfertive hath been with fome diligence inquired ; and fo hath the Nature of Sounds, in fome fort, as far as concerneth $M u f / c k$, but the Na ture of Sounds in general, hath been fuperficially obferved. It is one of the fubtilleft pieces of Nature. And befi les, I practife, as I do advife: Which is after long inquiry of things, immerfe in matter, to enterpofe fome fubject which is immateriate or lefs materiate ; fuch as this of Sounds: To the end, that the intellet may be redified, and become not partial.
It is firf to beconfidered, what great motions there are in Nature which pafs without found or noife. The Heavens turn about in a moft rapide motion, without noife to us perceived, though in fome dreams they have been faid to make an excellent Mufick. So the motions of the Comets, and Fiery Meteors (as Stella. Cadens, ©ic.) yield no noife. And if it be thought, that it is the greatnefs of diftance from us, whereby the found cannot, be heard; we fee that Lightnings and Corufcations, which are nearathand, yield no found neither; and yet in all thefe, there is a percuflion and divifsion of the Air.! The Winds in the Upper Region (which move the Clouds above (which we call the Rack): and are notperceived below) pafs without noile. The lower Winds in a Plain, except they be ftrong, make no noife; but amongft Irees, the noife of fuch Winds will be perceived. And the Winds (generally) when they make a noife, do ever make it unequally, rifing and falling, and fometimes (when they are vehement) trembling at the height of their blaft. Rain or Hail falling, though vehemently, yieldeth no noife, in pafsing through the Air, till it fall upon the Ground, Water, Houfes, or the like. Water in a River (though a fwift ftream, is not heard in the Channel,
butrunnech in filence, if it be of any depth; but the very Stream upon Shal lows, or Gravel, or Pebble, will be heard. And Waters, when they beat up on the Shore, or are ftraitned, (as in the falls of Bridges) or are dahted againtt themfelves by Winds, give a roaring noife. Any peece of Timber, or hard Body, being thrult forwards by another Body continguous, without knocking givech no noife. And fo Bodies in weighing, one upon another, though the upper Body prefs the lower Body down, make no noifc. So the motion of the Minute parts of any folid Body, (which is the principal caufe of violent Motion, though unobferved) paffeth without found: For chat found, that is heard fometimes, is produced onely by the breaking of the Air, and not by the impulfion of the parts. So it is manifeft, that where the anterior Body giveth way as faft as the pofterior cometh on, it maketh no noife, be the motion never fogreat or fwift.

Air open and at large, maketh no noife, exceptit be Charply percuffed : as in the found of a ftring, where Air is purcuffed by a hard and ftiff Body, and with a fharploofe : For it the ftring be not ftrained, it maketh no noile; but where the $A$ ir is pent and ftraitned, there breath or other blowing (which carry but a gentle percuffion) fuffice to create found; as in Pipes and Wind Inftruments. But then you mu't note, that in Recorders which go with a gentle breath, the Concave of the Pipe (were it not for the Fipple that ftraitneth the Air muich more then the fimple Concave) would yield no found. For, as for other Wind-Infruments, they require a forcible breath, as Trumpets, Cornets, Hunters, Horns, ©c. Which appearech by the blown Cheeks of him that windeth them. Organs alfo are blown with a frong wind by the Bellows. And note again, that fome kinde of Wind Inftraments are blown at a fmall hole in the fide, which fitraineth the breath at the firt entrance; the rather, in refpect of their traverfe, and ftop aboveshe hole which performeth the Fipples part ; as it is feen in Flutes and $F$ Fifes, which will not give found by a blaft at the end, as Recorders do, \&c. Likewife in ail Whiftling, you contract the Mouth; and to make it more fharp, Men fometimes ule their finger.

But in open Air, if youthrow aStone or a Dart, they give no found : No more do Bullets, excepethey happen to be a little hollowed in the carting ; which hollownets pennech the Air: Nor yet Arrows, except they be ruffled in their Feathers, which likewile penneth the Air. As for Imall Whi. ftles or Shepherds Oaten-Pipes, they give a found, becaufe of their extream flendertefs, whereby the Air is more pent than in a wider Pipe. Again, the voices of Men and Living Creaures, pafs through the Throat, which pen. neth the breath. As for the jems-Harp, it is a fharp percuffion, and befides hath the vantzge of penning the Air in the Mouth.

Solid Bodies, if they be very foftly percuffed, give no found; as when a Man treadeth very foftly upon Boards. So Chefts or Doors in fair weather, when they open eafily, give no found. And Cart-wheels fqueek not when they are liquored.

The Flame of Tapers or Candles; though it be a fwift motion and breaketh the Air, yer paffert without found. Air in Ovens, though (no doubt) it doth (as it were) boil, and dilate it felf, and is repercuffed, yet it is without noife.

Flame percufed by Air, giveth a noife; As in blowing of the Fire by Bellows, greater than if the Bellows fhould blow upon the Air it felf. And fo likewife Flame percuffing the Air Atrongly (as when Flame fuddenly takech and openeth) givech a noife: So great Flames, whiles the one impelleth the other, give a bellowing found.

There is a conceit runneth abroad, that there fhould be a White Powder, which will difcharge a piece without noife, which is a dargerous experiment, if it thould be true: For it may caufe fecret Murthers, but it feemeth to me unpoffible; for if the Air pent, be driven forth and frike the Air open, it will certainly make a noife. As for the White Powder, (if any luch thing be that may extinguifh or dead the noife) it is like to be a nixixture of Petre and Sulphure, without Coal. For Petre alone will not takeFire. And if any Man think, that the found may be extinguified or deaded, by difcharging the pent Air, before it cometh to the Mouth of the Peece, and to the open Air, that is not probable; for it will make more divided founds: Ás if you hould make a Crofs-barrel hollow, thorow the Barrel of a Peece, it may be it would give feveral founds, both at the Nofe and the fides. But I conceive, that if it were poffible to bring to pafs, that there thould be no Air pent at the Mourh of the Peece, the Buliet might fie with fmatl or no noife. For firft it is certain; there is no noife in the Per. cuffion of the Flame upon the Bullet. Next the Buller, in piercing thorow the Air, maketh no noile, as hath been faid; and then, if there beno pent Air, that ftriketh upon open Air, there is no caufe of noife, and yer the llying of the Bullet will not be ftaid. For that motion (as hath been oft faid) is in the parts of the Bullet, and not in the Air. So astryal muft be made by taking fomefmall Concave of chinal, no more than you mean to fill with Powder, and laying the Bullet in the Mouth of it half our in the open Air.

I heard it affirmed by a Manthat was a great dealerin Secrets, but he was but vain; That there was a Confpiracy (which himfelf hindred) to have killed Queen Mayy, Sifterto Queen Elizabeth, by a Burning-Glaß, when the walked in St. Fames Park,from the Leads of the Houre. Bus thus much, no doubr, is true, That if Burning-Glaffes could be brought to a great ftrength, (as they talk generally of Burning-Glaffes, that are able to burn a Navy) the percuffion of the Air alone, by fuch a Burning-Glaß, would make no noife; no more than is found in Corrufcations, and Ligbenings without 7 hunders.

I fuppofe that Impreßion of the $\mathcal{A}$ ir with Sounds, asketh a time to be conveighed to the Senfe, as well as the Imprefion of Speciesvifolle, or elfe they will not be heard. And thereforc, as the Bullet moveth ro 1 wiff, that it is invifible, To the fame fwiftnefs of motion makech it inaudible; for we fee that the apprehenfion of the Eyc, is quicker then that of the Ear.

All Eruptions of Air, though fmall and flight, give an entiy of found, which we call Crackling, Puffing, Spiting, ơc. As in Bay- Galr, and Bay-kaves caft into the fire; fo in Cbefnuts, when they leap forth of the Afles, fo in green wood laid upon the fire, efpecially Roots; fo in Candles that fpit flame, if they be wet ; foin Rafping, Sneezing, \&c. Soin a Rofe leaf gathered together into the fathion of a Purf, and broken upon the Forchead, or Back of the Hand, as Children ufe.

THe caufe given of Sound, that it thould be an Elifon of: the C Air (whereby, if they mean any thing, they mean Cutting or Dividing, or elfe an Attenuating of the Air)" is but a term of Ignorance; and the motion is but a catch of the Wit upon a few Infances, as the manner is in the Philosophy received. And it is common with Men, that if they have gotten a pretty expreffion by a word of $A v$ t, that expreflion goeth curranr, though it be empty of matter. This conceit of Elifion, appeareth moot manifeflly
to be falfe, in that the Souind of a Bell-ftring, or the like, continueth melting, fometime after the Percuffion; but ceateth ftraight-ways, if the Bell or String be touched and ftayed; whereas, if it were the Elifion of the $\mathcal{A}$ ir, that made the Sound, it could not be that the touch of the Bell or String, fhould extinguifh fo fuddenly that motion, caufed by the Elifion of the Air. This appeareth yet more manifeftly, by Chiming with a Hammer upon the outfide of a Bell; for the Sound will be according to the inward Concave of the Bell : Whereas the Elifion or Attenmation of the Lir cannot be, but onely between the Hammer, and the outfide of the Bell. So again, if it were an Elifion, a broad Hammer, and a Bodkin, ftruck upon Metal, would give a diverfe Tone, as well as a diverfe Loudnefs: But they do not fo ; for though the Sound of the onebe louder, and of the other fofter, yet the Tone is the fame. Befides, in Eccho's (wher eof fome are as loud as the Original Voice) there is no new Elyfion, but a Repercuffion onely. But that, which convinceth it moft of all, is, That Sounds aregenerated, where there is no Air atall. But thefe, and the like conceits, when Men have cleared their Underttanding, by the light of Experience, will fcatter and break up likea Mift.

It is certain, that Sounds is not produced at the firft, but with fome Local Motion of the Air or Flame, or fome other Medium; nor yet without fome refiftance, either in the Air, or the Body percuffed. For if there be a meer ytelding or ceffion, it produceth no Sound, as hath been faid. And therein Sounds differ from Light or Colours which pafs through the Air; or other Bodies, without any Local Motion of the Air, either at the firf, or after. But you mult attentively diftinguifh between the Local Motion of the Air (which is but $V$ ebicitlum cauf $f_{a}, A$ Carrier of the Sounds,) and theSounds themeelves conveighed in the Air. For as to the former, we fee manifeftly; that no Sound is produced (no not by Air it felf againft other Air, as in Organs, \&cc.) but with a perceptible Blaft of the Air, and with fome refiftance of the Air ftrucken. For, even all Speech, (which is one of the gentlef Motions of Air,) is with expulfion of a little Brcath. And all Pipes have a blaft, as well as a Sound. We fee allo manifefty, that Sounds are carried with Wind : And therefore Sounds will be hard further with the Wind, than againft the Wind; and likewife, do rile and fall with the intenfion or remiffron of the Wind: But for the Impreflion of the Sound, it is quite another thing, and is utterly without Local Motion of the Air, perceptible; and in that refembleth the fpecies vifible: For after a Man hath lured, or a Bell is rung, we cannot difcern any Perceptible Motion (atall) in the Air, as long as the found goeth, but onely at the firt. Neither doth the Wind (as far as it carrieth a Voice) with the Motion thereof, confound any of the delicate, and Articulate Figurations of the Air, in varicty of Words. And if a Manfpeak a good loudnefs againft the flame of a Candle, it will not make it tremble much; though moft, when thofe Letters are pronounced, which contract the mouth, as F, S, V, and fome others. But gentle breathing, or blowing withour fpeaking, will move the Candle farmore. And it is the more probable, that Sound is without any Local Motion of the Air, becaure as it differech from the fight, in that it neederh a Local Motion of the Air at firft: So it parallelech in fo many other things with the fight, and radiation of things invifible, which (without all queftion) induce no Local Motion in the Air, as hath been faid.

Neverthelefs it is true, that upon the noife of Thunder, and great Ord-
the Motion, caufed by noife upon the Water. But thefe effects arefrom the local motion of the Air, which is a concomitant of the Sound (as hath been faid) and not from the Sound.

In Delation of Sounds, the enclofure of them preferveth them, and caufeth them to be heard further. And we finde in Rowls of Farchment, or Truncks, the Mouth being laid to the one end of the Rowl of Parchment, or Trunck, and the Ear to the other, the Sound is heard much further then in the open Air. The caufe is, for that the Sound fpendeth, and is diffipated in the open Air; but in fuch Concaves, it is conferved and contracted. So alfo in a Piece of Ordnarice, if you fpeak in the Touch-hole, and another lay his Ear to the Mouth of the Piece, the Sound pafleth, and is farbetter heard than in the open Air.

It is further to be confidered, how it proveth and worketh when the Sound is not enclofed, all the length of his way, but paffeth partly through open Air ; as where you fpeak fome diftance from a Trunck, or where the Ear is fome diftance from the Trunck, at the other end; or where both Mouth and Ear are diftant from the Trunck. And it is tryed, that in a long Trunck of fome Eight or ten foot, the found is holpen, though both the Mouth, and the Earbe a handful ormore, from the ends of the Trunck; and fomewhatmore holpen, when the Ear of the Hearer is near, than when the Mouth of the Speaker. And it iscertain, that the Voice is better heard in a Chamber from abroad, than abroad from withinthe Chamber.

As the Enclofure, that is round about and entire, preferveth the Sound ; fo doth 2 Semi-con caye, though in a lefs degree. And therefore, if you divide a Trunck, or a Cane intotwo, and one fpeak at the one end, and you lay your Ear at the other, it will carry the Voice further, than in the Ait at large. Nay further, if it be not a full Semi-concave; but if you do the like upon the Maft of a Ship, or a long Pole, or a Piece of Ordnance (though one fpeak upon Surface of the Ordnance, and not at any of the Bores) the Voice will be heard further then in the Air at large.

It would be tryed, how, and with what proportion of difadvantage, the Voice will be carried in an Horn, which is a Line Arched; or in a Trumpet, which is a Line Retorted; or in fome Pipe that were Sinuous.

It is certain, (howfoever it crofs the received opinion) that Sounds may becreated without Air, though' Air be the moft favorable different of Sounds. Take a Veffel of Water, and knap a pair of Tongs fome depth within the Water, and you fhall hear the Sound of the Tongs' ' ell; and not much diminifhed, and yet there is no Airatall prefent.

Take one Veffel of Silver, and another of Wood, and fill each of them fullof water, and then knap the Tongs together as before, about an handful from the bottom, and you thall finde the Sound much more refounding from the Veffel of Silver, than from that of Wood; and yet if there be no Water in the Veffel, fo thac you knap the Tongs in the Air, you fhall finde no difference between the Silver, and the Wooden Veffel, whereby befide the main point of creating found without Air, you may collect two things; the one, that the found communicateth with the bottom of the.Veffel; the other, that fuch a communication paffeth far better thorow Water than Air.

Serike any hatd Bodies together' in the midft of a flame, and youthall hear the found with litele difference, from the found in the Air.

The TPeumatical part, which is in all Tangible Bodies, and hath fome affinity with the Air, pesformethin lome degree, the parts of the Air; as when you knock upon an empty Barrel, the found is (in part) created by the Air on the outfide, and (in part) by the Air in the infide; for the found will be greater or leffer, as the Earrel is more empty, or nore full; but yet the found participateth alfo with the Spiritin the Wood, thorow which it pafseth from the outhide to the infide; and fo it cometh to pafs in che chiming of Bellison the outfide, where alfo the found paffeth to the infice; and a number of other like inftances, whereof we thall feak more when we handle the Communication of Sounds.

It were extrean grofnefs to think (as we have partly touched before) that the found in Strings is made, or produced between the Hand and the String, or the Quill and the String, ot the Bow and the String: For thofe are but Vehicula motus, paffages to the Creation of the founds, the found being produced between the String and the Air; and that not by anyimpulfion of the Air, from the fift Motion of the String; but by the return orrefult of the String, which was ftrained by the touch to his former place; which Motion of Refult is quick and Marp, whereas the firt Motion is fofe and dull. So the Bow tortureth the String continually, and thereby holdeth it in a continual $\Gamma$ repidation.

TAve a Trunk, and let one whiftle at the one end, and hold your ear at the other and you fhall finde the found frike fo fharp, as you can fcarce endure it. The caufe is, for that found diffufeth ic felf in round, and fo fpendeth it felf: But if the found, which would fcatter in open Air, be made to go all into a $C_{\text {analo }}$ : if mult needs give grearer force to the foond. And to you may note; that inclofures do not onely preferve found; butalfo en: creafe and harpen it:

A Hunters Horn, being greater at one end, than at the other, doth enscreafe the fourd more, than if the Horn were all of an equal bore. The caule is, for that the Air and Sound, being firft contracted at the leffer end, and afectiards having more room to fpred at the greater end, do dilate chemfelves, and in coming out, ftrike more Air, whereby the found is the greater, and bafer. And even Hunters Horns, which are fometmes
madeftraight；，and not oblick，are ever greater at the lower end．It would be tryed alfo in Pipes，being made far larger at the lower end，or being made with a Belly towards the lower end，and then iffuing into a ftraight con． cave again．

There is in St．Famefes Fields，a Conduit of Brick，unto which joyneth a low Vault；and at the end of that，a round Houfe of Stone；and in the Brick Conduit there is a Window，and in the round Houle a Slit or Rift of fome little breadth；if you cryout inthe Rift；it will make a fearful roaring at the Window．The caufe is the fame with the former：Forthat all Con－ caves that proceed from more narrow to more broad，do amplifie theSound at the coming out．

Hawks Bells that haveholes in the fides，give a greater ring，than if the Pellet did ftrike upon Brafs in the open Air．The caufe is the fame with the firft inftance of the Trunck：Namely，for that the Sound，enclofed with the fides of the Bell，cometh forth at the holes unfent and more ftrong．
In Prams，the clofenefs round about，that preferveth the Sound
from difperfing，maketh the noife come forth ar the Dium．hole，far more loud and Arong，than if you fhould frike upon the like skin，ex－ tended in the open Air．The caufe is the fame with the two prece． dent．

Sounds are better heard，and further off in an Evening，or in the Night， than at the Noon or in the Day．The caufe is，for that in the Day，when the Air is more thin（no doubt）the Sound pierceth better；but when the Air is more thick（as in the Night）the Sound（pendeth and fpredeth abroad lefs； and $f 0$ it is a degree of Enclofure．As for the night，it is true alfo，that the general filence helpeth．

There be two kindes of Reflections of Sounds；the one at Diftance，which is the Eccho；wherein the original is heard diftinctly，and the Reflexion alfo diftinctly ；of which，wefhall fpeak hereafter．The other in Concur－ rence；when the Sound reflecting（the Reflexion being near at hand）re－ turneth immediately upon the original，and fo iterateth it not，but am－ plifieth it．Therefore we fee，that Mufick upon the Water foundeth more ；and fo likewife，Mufick is better in Chambers Wainfcotted than Hanged．

The Strings of a Lute，or Viols or Virginals，do give a far greater Sound， by reaton of the Knot，and Board，and Concave underneath，than if there were nothing but onely the Flat of a Board，without that Hollow and Knot， to let in the upper Air into the lower．The caufe is，the Communication of the upper Air with thelower，and penning of both tromexpence or difper－ fing．

An Irifh Harp hath open Air on both fides of the Strings；and it hath the Concave or Belly，not a long the Strings，but at the end of the Strings． It maketh a more refounding Sound，than a Bandora，Orpharion，or Cittern， which have likewife Wire－ftrings．I judge the caufe to be，for that open Air on both fides helpeth，fo that there be a Concave；which is therefore beft placed at the end．

In a Virginal，when the Lid is down，it maketh a more exile Sound than when the Lid is open．The caufe is，for that all fhutting in of Air，where there is no competent Vent，dampeth the Sound；which maintaineth like－ wife the former inftance：For the Belly of the Lute，or Viol，doth pen the Air（omewhat．

There.is a Churchat Glocefter, (and as I have heard, the like is in fome other places) where if you feeak againft a Wall foftly, another thall hear your voicebetter a good way off, than near hand. Inquire more paricularly of the fame of that place. I fupp fe there is fome Vault, or Hollow, or llle, behinde the Wall, and fome paffage to it, to wards the further end of that Wall againft which you fjeak: So as the voice of him that fpeaketh flideth along the Wall, and then entreth at fome paffage, and communicateth with the Air of the Hollow ; for it is prelerved fomewhat by the plain Wall; but that is too weak to give a Sound audible; tillit hath comnunicated with the back Air.

Strike upon a Bow=ftring, and lay the Horn of the Bow near your Ear, and it will increafe the Sound, and make a degree of a Tone. The caufe is for that the fenfory, by reafon of the clofe holding is percuffed, before the Air difperfeth. Thelike is, if you hold the Horn betwixt your Teeth. But that is a plain Dilation of the Sound, from the Teeth to the inftrument of Hearing ; for there is a greatentercourfe between thofe two parts, as appeareth by this, that a harth grating Tunefetteth the Teeth one edge. The like fallethout, if the Horn of the Buw be put uponthe Temples; but that is but the flide of the Sound from thence to the ear.

If you take a Rod of Iron or Brafs, and hold the one end to your ear and ftrike upon the other, it maketh a far greater Sound, han the like flroke upon the Rod, not made fo contiguous to the Ear., By which, and by fone other inflances that have been partly touched, it fhould appear; that Sounds do not onely flide upon the furface of a fmooth Body, but do alfo communicate 1 ith the Spirts th:r are in the Pores of the Body.

I remember in Trinity-Colledge in Cambridge, there was an upper Chamber, which being thought weak in the Roof of it, was fupported by a Pillar of Irch, of the bignefs of ones arm, in the midft of the Chamber, which, if you had ftruck, iswould make a little flat noife in the Room whereit was ftuck; but it would make a great bomb in the Chamber beneath.

The found which is made by Buckets in a Well, when they touch upon the Water, or when they ftrike upon the fide of the Well; or when two Buckets dafh the one againft the other. Thefe Sounds are deeper and fuller, than if the like Percultion were made in the open Air. The caufe is the penning and enclofure of the Air in the Concave of the Well,

Barrels placed in a Room under the Floor of a Chamber, makeall noifesin the lame Chamber more full and refounding.

So that there be five ways (ingeneral) of CMajoration of Sounds, Enclofure Simpie, anclofure in the Dilatation, Communication, Reflexion, Concurrent, and Approach to the Senfory.

For Exility of the Voice, or other Sounds: It is certain, that the Voice doth pats thorow folid and hard Bodies, if they be not too thick; and thorow Water, which is likewife a very clofe Body, and fuch an one as letteth not in Air. Butchen the Voice or other Sound is reduced, by fuch paffage to a great weaknefs or exility, If therefore you ftop the Holes of a Hapks Bell, it will makeno ring, but aflat noife or rattle. And fo doth the $\mathcal{E}$ Itities or Eagles Sone, which hath a little ftone withinit.

And a. for Water, it is a certain Tryal: Let a man gointo a Bath, and take a Pail and turn the bottom upward; and carry the mouth of it (even) down to the level of the Water, and fo prefs it down under the Water fome handful and an half, fill keeping it even, that it may not tile on either fide, and fo the Airgetout: Thenlethim that is in the Bath, dive

| 40 | Jatural Hiftory; |
| :---: | :---: |
|  | with his head fo far under Water, as he may put his head into the Pail, and there will come as much Air bubbling forth, as will make room for his head. Then let him fpeak, and any that fhall ftand without, fhall hear his voice plainly, but yet made extream tharp and exile, like the voice of Puppets: But yet the Articulate Sounds of the words will not be confound. ed. Note, thar it may be much more handfomly done, if the Pail be put over the Mans head above Water, and then he cowre down, and the Pail be prefied down with him. Note, that a man mult kneel or $\left(1 t,{ }^{\circ}\right.$ that he may be lower than the Water. A man would think, that the Sicilian Poet had knowledge of this Experiment; for he faith, that Hercules's Page Hylas went with a Water-pot, to fill it at a pleafant Fountain that was near the fhore, and that the Nymphs of the Fountain fell in love with the Boy, and pulled him under the Water, kecping him alive; and that Hercules miffing his Page, called him byhis name aloud, that all the fhore rang of it ; and that Hylas from within the Water anfwered his Mafter; but (that which is to the prefent purpofe) with fo fmall and exile a voice, as Hercules thought he had been three miles off, when the Fountain (indeed) was falt by. |
| 156. | In Lutes and Inftruments of Strings, if you ftop a ftring high, whereby it hathlefs fcope to tremble, the Sound is more Trebble, but yet more dead. |
| 157. | Taketwo Sawcers, and ftrike the edge of the one againft the bottom of the other, within a Pail of Water, and you fhall finde that as you put the Saweers lower and lower, the Sound groweth more flat, even while part of the Sawcer isabove the Water; but that flatnefs of Sound is joyned with a harfhnefs of Sound, which, no doubt, is caufed bythe inequality of the Sound, which cometh from the part of the Sawcer under the Water, and from the part above. But when the Saweer is wholly under the Water, the found becometh more clear, but far more low, and as if the found came from a far off. |
| 158. | A foft body dampeth the found, much more than a hard; and if a Bell hath cloth or filk wrapped about it, it deadeth the found more than if it were Wood. And therefore in Clericals, the Keyesare lined, and in Colledges they ufe to line the Table-men. |
| 159. | Tryal was made in a Recorder after thefe feveral manners. The bottom of it was fet againft the Palm of the Hand, ftopped with Wax round about, fet againtt a Damask Cuthion, thruit into Sand, into Afhes, into Water, (half an inch under the Water) clofe to the bottom of a Silver Bafin, and ftill the Tone remained: But the bottom of it was fet againt a Woollen Carpet, a Lining of Pluth, a Lock of Wool, (chough loofly |
| +1 | put in, againft Snow, and the found of it was quite deaded, and but breath. |
| 160. | Iron hot produceth not fo full a found, as when it is cold, for while it is hot, it appeareth to be more foft, and lefs refounding. Solikewife warm Water, when it faileth maketh not fo full a found as cold; and I conceive it is fofter, and nearer the nature of Oyl ; for it is more flippery, as may be perceived, in that it fowreth better. |
| $16 \%$. | Let there be a Recorder made with two Fipples at each end one ; the Trunck of it of the length of iwo Recorders, and the holes anfwerable towards each end, and let 'two play the fame Leflom upon' it; at an Unifon'; and let it be noted; "whether the faund be contounded, or amplified; or dulled. So likewife let a Crofs be made of two Truncks (thorowour) |
|  |  |

hollow; and let two ipeak or fing, the one long ways the other traverfe. And let two hear at the oppofite ends; and note, whether the Sound be confounded, amplified, or dulled. Which,two inftances will alfo givclight to the mixture of Sounds, whereof we fhatlf feak hereateer.

A Bellow, blown into the hole of a Drum, and the Drum then ftucken, maketh the Sound a little flater, but no other afparent alteration. The caule is manifeft; partly for that it hindreth the iffuc of the Sound; and partly for that it maketh the Air being blown together, lefs moveable.

THe Loudnefs and Sofnuefs of Sounds, is a thing diftinct from the Magnitude and Exility of Sounds; for a Bafe-fring, though foftly frucken, giveth the grearer Sound; but a Trelble. ffing, if hard ftrucken, will be heard much further off. And the caufe is, for that the Bafe-fring frikech more Air ; and the Trebble lefs Air, but with a fharper percuffion.

It is therefore the ftrength of the Percuffion, that is a principal caufe of the loudnefs or foftnefs of Sounds: As in knocking, harder or fofer ; Windirg of a Horn, ftronger or weaker ; Ringing of an Hand bcil, harder or fofter, \&c. And the ftrength of this Percuffion confifterh, as much or more, in the hardnefs of the Body percuffed, as in the force of the Boody percuffing: For if you ftrike againtt a Clorh, it will give a lefs found; it againft Wood, a greater ; if againft a Metal, yet agreater ; and in Merals, it you ftrike againft Gold, (which is the more pliant) it giveth the flatter found; if againft Silver or Brafs, the more ringing found. As for Air, where it is ftrongly pent, it matchech a hard Body. And therefore we fee in dif. charging of a piece, what a great noile it maketh. We lee allo, that the Charge with Bullet, or with Papet wet, and hard fopped; or with Powder alone rammed in hard, maketh no great difference in the loudnefs of the report.

The fharpnefs or quicknefs of the Percuffion, is a great caufe of the loudnef., as well as the ftrength : As in a Whip or Wand, if you Atrike the Air with it, the fharper and quicker you frike it, the louder found it giveth. Andin playing upon the Lute or Virginals, the quick ftroke or touch is a great life to the Sound. The caufe is, for that the quick ftrking cutterh the Air fpeedily, whereas the foft friking, doth rather beat than cut.

THe Cammunication of Soands (as in Bellies of Lutes, empty Veffels, \&c.) hath been touched obiter, in the Majoration of Sounds: But it is fitalfo to make a Title of it apart.

The Experiment, for greatef Dimoniftration of Communication of Sounds, is the Chiming of Bells; where, if you ftrike with a Hammar upon the upper part, and then upon the midft, and then upon the lower, you thail finde the found to be more Trebble, and more Bafe, according unto the Concave on the infide, though the Percufion be onely on the outfide.

When the Sound is created between the Blaft of the Mouth, and the Air of the Pipe, it hath neverthelefs fome communication with the matter of the fides of the Pipe, and the firits in them contained: For in a Pipe of Trumpet of Wood and Brafe, the found will be diverfe; fo if the Pipe be covered E 3 with

Experiments in Confort, touching the Communicat:on of Sounds.
with Cloth or Silk, it will give a diverfe Sound from that it would do of it felf; fo if the Pipe be a little wet on the infide, it will make a differi:g Sound, from the fame Pipedry.
168.

Experiments in Confort, touching Equalityand Inequality of Sounds.

Ihat Sound made within Water,doth communicate better witfi a hard Body thorow Water, than made in Air, it doth with Air. Vide Experimentum, I 34.

WE have fpoken before (in the Inquifition touching (riuffck) of $M u$. fical Sounds, whereunto there may be a Concord or Ditcord in two Parts; which Sounds we call Tones, and likewife of Immufical Sounds; and have given the caufe, that the Tone proceedeth of Equality, and the other of Inequality. And we have alfo expreffed there, what are the Equal Bodies that give Tones, and what are the Unequal that give none. Butnow we fhall fpeak of fuch Inequality of Sounds, as proccedeth not from the Nature of the Bodiesthemfelves, but is accidental, Either from the Roughnefs or Obliquity of the Paffage, or from the Doubling of the Percutient, or from the Trepidation of the Motion.
169. A Bell if it have a Rift in it, whereby the found hath not a clear paffage, giveth a hoarfe and jarring found; fo the Voice of Man, when by cold taken, the Wefil groweth rugged, and (as we call it) furred, becometh hoarfe. And in thefe two inftances, the Sounds are ingrate, becaufe they are meerly unequal; but if they be unequal in equality, then the Sound is Grateful, but Purling.

All Infruments that have cither Returns, as Trumpets; orFlexions, as Cornets; or are drawn up, and putfrom, as Sackbuts, have a Purling Sound ; But the Recorder orFlute that have none of thefe Inequalities, give a clear Sound. Neverthelefs, the Recorderit felf or Pipe, moiftened a little in the infide, foundeth more folemnly, and with a little Purling or Hiffing. Again, 2 Wreathed String, fuch as arc in the Bafe Strings of Bandoraes, giveth alfo ${ }^{2}$ Purling Sound.
171. and untuncable Sound, which frings we call falle, being bigger in one place, than in another ; and therefore Wire-ftrings are never falie. We fee alfo, that when we try a falfe Lute-ftring, we ufe to extend it hard between the Fingers, and to fillip it; and if it giveth a double fpecies, it is true; but if it giveth a trebble or more, it is falle. trembling noife ; and in Regals (where they have a Pipe, they call the Nigbtingale-Pipe, which containeth Water) the Sound hath a continual trembling. And Children have allo little things they callCocks, which have water in them; and when they blow, or whiftle in them, they yield a trembling noife; which Trembling of Water, hath an affinity with the Letter L. All which Inequalitics of 1 repidation, are rather pleafant, than otherwife.

All Bafe Notes, or very Trebble Notes, give an Afper Sound; for that the Bafe friketh more Air, than it can well frike equally; and the Trebble cutteth the Air fo Tharp, as it returneth too fwift, to make the Sound equal; and therefore a Mean or Tenor is the fivecteft part.
174.

We know nothing, that can at pleafure make a Mufcal or Immufical Sound: by voluntary Motion, butthe Voice of Man and Birds. The caufe is (no doubt) in the Wefil or Wind-Pipe, (which we call ABerin Arteria,)

## Century II.

which being well extended, gathered equality ; as a Bladder that is wrinckled, if it be extended,becometh fmooth. The cxtenfion is always, more in Tones, than in Speech; therefore the inward voice or whifper, can never give a Tone. And in finging, there is (manifefly) a greater working and labor of the Throat, than in fpeaking; as appeareth in the thrufting out, ordrawing in of the Chin, when we fing:

The Humming of Bees is an unequal buzzing, and is conceived by fome of the Ancients, not to come forth at their'Mourh, but to bean inward Sound; but (it may be) it is neither, but from the motion of their Wings; tor it is not heard, but when they fir.

All Metals quenched in Water, give a fibillation or hiffing found (which hath an affinity with the Leter Z.) notwith(tanding the Sound be created between the Water or Vapor, and the Air. Seethingallo, if there be but fmall ftore of Water in a Vefiel, giveth 2 hiffing found; but boyling in a full Veffel, giveth a bubbling found, drawing fomewhat near to the Cocks ufed by Children.

Tryal would be made, whether the Inequality, or interchange of the Medium, will not produce an Inequality of Sound; as if three Bells were made one within another, and Air betwixt each; and then the outermoft Eell were chimed with a Hammer, how the Sound would differ from a fimple Bell. So likewifetake a Plate of Brafs, and a Plank of Wood, and joyn them clofe together, and knock upon one of them, and fee if theydo not give an unequal Sound. So make two or three Partitions of Wood in a Hoghthead, witth holes or knots in' them ; and mark the difference of their found, from the found of an Hog fhead; without fuch partitions.

I$T$ is evident, that the Percuffion of the greater quantity of Air, caufeth the bafer Sound; and the lefs quantity, the more trebble Sound. The Percuffion of the greater quantity of Air, is produced by the greatnefs of the Body percuffing; by the Latitude of the Concave, by which the Sound pafferh, and by the Longitude of the fame Concave: Thereforewefee, that a Bafe-fring is greater than a Trebble; a Bafe-pipehath agreater borethan a Trebble: And in Pipes, and the like, the lower the Note holes be, and the furtheroff from the Mouth of the Pipe, the more Bafe found they yield; and the nearer the Mouth, the more Trebble. Nay more, it you ftrike an entire Body, as an Andiron of Brafs, at the top it maketh a more Trebble found, and at the bottom a Bafer.

It is alfo evident, that the fharperor quicker Percuffion of Air, "caufeth the more Trebble found; and the flower or heavier, the more Bafe found. Sowe fee inStrings, the more they are wound up and ftrained (and thereby give a more quick tart back) he more Trebble is the found ; and the flacker they are, or lefs wound up, the Bafer is the found. And therefore a bigger String more ftrained, and a leffer String lefs ftrained, may fall into the fame Tone.

Cbildren, Women, Eunuchs, have more fmall and fhrill Voices than Men. The reafon is, not for that Men have greater heat, which may make the voice ftronger, (for the ftrength of a Voice or Sound, doth make a difference in the loudnefs orfoftnefs, but not in the Tone) but from the dilatation of the Organ, which (it is true) is likewife caufed by heat ; but the caufe of changing the voice at the years of puberty is moft obfcure. It feemerh to be for that, when much of the moifture of the Body, which did before irregate
the Parts, is drawn down to the Spermatical Vefiels, it leaveth the Body more hot than it was; whence cometh the dilatation of the Pipes: For we fee plainly all effects of Heat do then come on; as Pilofity, more roughnets of the skin, hardnefs of the flefh, \&c.

The induftry of the CMuftiian, hath produced two other means of Straining, or Intenfon of Strings, befides their $W$ inding up. The one is the Stopping of the String with the Finger; as in the Necks of Lates, Viols, \&c. The other is the Shortneß of the String; as in Harps, Virginals, \&c. Both thefe have one and the fame realon, for they caufe the String to give a quicker ftart.

In the ftraining of a String, the further it is ftrained, the lefs fuperitraining goeth to a Note: For it requireth good winding of a Sering, before it will make any Note at all. And in the ftops of Lutes, \&c. the higher they go, the lefs diftance is between the Frets.

If you fill a Drinking Glaß with Water, (efpecially one fharp below, and wide above) and fillip upon the Brim, or outfide; and after, empty patt of the Water, and fo more and more, and ftill try the Tone by fillip. ing; you fhall finde the Tone fall, and be more Bale as the Glafs is more empty.

Experimests in Confort, touching the Proporiign of Trebble and Bafe Tones.

THe juft and meafured Proportion of the Air percuffed, towards the Bafenefs or Trebblencfs of Tones, is one of the greateft fecrets in the Contemplation of Sounds. For it difcovereth the true Coincidence of Tones into Diapafons, which is the return of the fame Sound. And fo of the Concords and Difcords, between the Unifon and Diapafon; which we have touched before in the Experiments of Mufick, but think fit to refume it here as a principal pattof our Inquiry, touching the Nature of Sounds. It may be found out in the Proportion of the Winding of Strings, in the Proportion of the Diftance of Frets, and in the Proportion of the Concave of Pipes, \&c. But molt commodicufly in the laft of there.

Try therefore the Winding of a Sring once abour, as foon as it is brought to that extenfion as will give a Tone, and then of twice about, and thrice about, \&e. And mark the feale or difference of the Rice of the Tone, whereby you fhall difcover in one, two effects; bothithe proportion of the Sound to wards the Dimenfion of the Winding, and the proportion likewife of the Sound towards the String, as it is more or lefs frained. But note chat to meafure Wis, the way will be to take the length in a right line of the String, upon any. Winding about of the Peg. As for the Stops, you are to take the number of Frets, and principally the length of the Line, from the firt ftop of the String, unto fuch aitop as Thall produce a $\mathcal{D}$ iapafon to the former ftop, upon the lameString.

But it will beft (as it is faid) appear in the Bores of Wind-Inftruments; and therefore caufe fome half dozen Pipes to be made in length, and all shings elfe like, with a fingle double, and fo one to a fextuple Bore; and fo mark what fall of Tone every one giveth. But fill in thefe three laft inftances you muft diligently obferve, what length of String, or diftance of Stop, or concave of Air, maketh what rife of Jound. As in the laft of there (which, as we faid, is that which giveth the aptef demonfration) you mult fet down what increafe of Concave goeth to the making of a Note higher, and what of two Notes; and what of three Notes, and fo up to the Diapafon: For then the great fecret of Numbers and Proportions will appear. It is not
unlikelv,
unlikely, that thore that make Recorders, \&c. know this already, for that they make them in Sets. And likewife Bell-Founders in fitting the une of their Bells: So that enquiry may fave tryal. Surely, it hath be obferved by one of the Ancients, that anempty Barrel knocked upon wi h the finger, giveth a Diapafon to the Sound of the like Barrel full: But how that hould be, I do not well underftand, for that the knocking of a Barrel full or empty, doth fcarce give any Tone.

There is required rome fenfible difference in the Proportion of creat ing a Note towards the Sound it felf, which is the Paffive; and that it be not toonear, but at a diftance : For in a Recorder; the three uppermoft holes yield one Tone, which is a Note lower than the Tone of the firt three. And the like (no doubt) is requirea in the winding or fopping of Strings.

THerc is another difference of Sounds, which we will cail Exterior and Interior. It is not Soft nor Loud; nor it is not Bafe, nor Trebble; nor it is not Mufical, nor Immuffical. Though it be true, that there can be no Tone in an Interior Sound; but on the other fide, in an Extecior Sound, there may be both $M$ Mufcal and 1 mmufical. We fhall therefore enumerate them, rather than precifely diftinguifh them; though to make fome adumbration of (that we mean) the Interior, is rather an Impulfion or Contufion of the Air, than an Elyfion or Section of the lame; fo as the Percuffion of the one towards the other, differeth as a Blow differerh from a Cut.

In Speech of Man, the Whilpering, (which they call Sufurrus in La tin,) whether it be louder or fofter, is an Incerior Sound; , but the Speaking out, is an Exterior Sound: And therefore you can never make a Tone, nor fing in Whifpering; but in Speech you may. So Breathing, or Blowing by the Mouth, Bellows, or Wind (though loud) is an Interior Sound; but the blowing thorow a Pipe, or Concave (though foft) is an Exterior. So likewife, the greateft Winds, if they have no coarctation, or blow not hollow, give any Interior Sound; the whiftling or hollow Wind, yieldeth a finging, or Exterior Sound; the former being pent by fome other Body, the latter being pent in by his own Denfity: And therefore we fee, That when the Wind bloweth hollow, it is a fign of Rain; the flame, as it moveth withinit felf, or is blown by a Bellows, givech a murmur or Interior Sound.

There is no hard Body, but ftruck againtt another hard Body, will yield an Exterior Sound, greater or leffer; infomich, as if the Percuifion be overfof, it may induce a nullity of found, but never an Interiot Sound, as when! one tr adeth fo foftly, that he is not heard.

Where the Air is the Percutient, pent or not pent, againfta hard Body, it never giveth an Exterior Sound; as if you blow Arongly witha Bellows againft a Wall.

Sounds (bonth Exterioù and Interior) may be made as well by Sưtiofif as by emiffion of the Breath ; as in Whitting, or Breathing.

I$T$ is evident, and it is one of the ftrangeft fecrets in Sounds; that the whole Sound is not in the whole Air onely, but the whole Sound is alfo in every fmall part of the Air. So that all the curious diverfiry of Arti= culate

## $\mathcal{N}$ atural Hifory;

culate founds of the voice of Man or Birds, will enter into a fmall crany, inconfuled.

The motions of the Tongue, Lips, Throat, Palate, \&rc. which go to the making of the feveral Alpbabetical Letters are worthy inquiry, and pertinent to the prefent Inquifition of Sounds: But becaufe tney are fubtil and long to delcribe, we will refer them over, and place them amongtt the Experinents of Speech. The Hebrens have been diligent in it, and have affigned which Letters are Labiall, which Dental, which Guttural, © co. As for the Lasins and Grecians, they have diftinguifhed between Semi-voviets and Mutes; and in chutes, between Mure Tenkes, Media and Afirate, not amifs, but yet not diligently enough. For the fpecial ftrokes and motitions that create thofe Sounds, they have little enquired; as that the Letters, B. P.F. M. are not expreffed, but with the contrating, or hutting of the Mouth; that the Letters N. and B. cannotbe pronounced, but that the Letter N. will turn in:o M.. as Hecatonbon will be Hecatomba. That M. and T. cannot be pronounced together, but P. will come betw een ; as Emtus, is pronounced Emptus, and a number of the like : So that if you enquire to the full, you will finde, that to the making of the whole Alphaber, there will be fewer fimple Motions required, than there are Letters.

The Lungs are the moft fongy part of the Body, and therefore ableft to contract and dilate it felf; and where it contractech it felf, it expelleth the Air, which thorow the Antire, Throat, and Mouth, maketh the Voice: But yet Arciculation is not made, but with the help of the Tongue, Pallate, and the reft of thofe they call Infrimments of Voice.

There is found a Similitude between the Sound that is made by Inanimate Bodies, or by Animate Bodies, that have no Voice Articulate; and divers Letters of Articulate Voices; and commonly Menhave given fuch names to thofe Sounds as do allude unto the Articulate Letters. As Trembling of Water hath refemblance with the Letter L. Quenching of Hot Metals with the Letter Z. Snarling of $\mathcal{D}$ ogs with the LetterR. The $\mathcal{K}$ oife of Scritch. Oyls with the Letters Sh. Voice of Cats with the Dipthong Eu. Voige of Chucko s with the Dipthong Ou. Sounds of Strings with the Letters Ng. So thatif a Man (for curiofity or ftrangenefs fake) would make a Puppet, or other dead Body, to pronounce a word: Lethim confider on the one part, the Motion of the Inftruments of Voice ; and on the other part, the like Sounds made in Inanimate Bodies; and what Conformity there is, that caufeth the Similitude of Sounds; and by that he may minifter light to that effect.

LL Sounds (whatfoever) move round, thar is to fay, On allfides, Upwards, Downwards, Forewards, and Backwards: This appeareth in all Intances.

Sounds do not require to be conveighed to the senfe in a right Line, as $V$ ifibles do, but may be arched, though it be true they move ftrongeft in a right Line; which neverthelels is not cauled bythe rightnefs of the Line, but by the flortnefs of the diftance. Linearectea bre vijim. And the refore, we fee if a Wall be between, and you fpeak on the one fide, rouhear it on theother; which is not $b$ caufe the found paffeth thorow the Wall, but arched over the Wall:

If the Sound be ftopped and repercuffed, it cometh about on the other fide, in an oblick Line: So, if in a Coach, one fide of the Boot be down, and the other up, and a Begger beg on the clofe fide, you would think that he were on the open fide. So likewife, if a Bell or Clock, be (for example) on the North-fide of a Chamber, and the Window of that Chamber be upon the south; he that is in the Chamber, will think the found came from the South.

Sounts, though they fpred round, fo that (there is an orb, or fpherical
201. Experiments in Confors, touchingthe Motions of Sounds, in zphat Lines they are Circular, oblick. Straight, Vpzuardis Downd wards, ForJvards, Backwards. Area of the Sound) yet they move ftrongeft, and go furtheft in the ForeLines, from thefirit Local Impulfion of the Air. And therefore in Preaching, you fhall hear the Preachers voice better before the Pulpit than behinde it, or on the fides, though it ltand open. So a Harquebuz or Ordnanie will be further heard forwards, from the mouth of the Piece, than backwards or on thefides.

It may bedoubted, that Sounds domovebetter downuards, than upwards. I tuptus are placed high above the people: And when the Ancient

Generals fpake to their-Armies, they häd ever a Mount of Turff caft up, where upon they food. But this may be impured tothe fops and obltacles which the voice meeteth with, when one fpeaketh upon the level. But there feemeth to be more in it; for it may be, that Spiritual Species, both of things vifible, and Sounds, do move better downwards than upwards.. It is a ft range thing, that to Men flanding below on the ground, thofe that be on the top of Pauls, fecm much lef thanthéy are, and cannot be known: But to Men above thofe below, feem nothing fo much leffened, and may be known; yet it is true, That all things to them above, feem alfo fome what contracted and better collected into figure ; as Knots in Gardens fhew beft from an upper Window or Tarras.

AFter that Sound is created (which is in a moment) we finde it continueth fome fmall time, melting by little and little. In this there is a wonderful error amongt Men, who take this to be a continuance of the firt Sound; whereas (in truth) it is a Renovation, and not a Continuance: For the Body percuffed, hath by reafon of the Percuffion, a Tripidation wrought in the minute parts, and foreneweth the Percuffion of the Air. This appeareth manifeftly, becaufe that the Melcing found of a Bell, or of a ftring ftrucken, which is thought to bea Continuance, ceafeth as foon as the Bell or ftring are touched. As in a Virginal, as foon as ever the Jack falieth, and toucheth the Atring, the found ceafeth; and in a Bell; after you have chimed upon it, if you touch the Bell, the found ceafeth. And in this you muft diftinguifh, that there are two Trepidations, The one Manifeft and Local; as of the Bell, when it is Penfile ; the other Secret, of the Minute parts, fuch as is deferibed in the ninth Inftance. But it is true, that the Local helpeth the Secret greatly. We lee likewife, that in Pipes, and other Wind Inftruments, the found lafterh no longer than the breath blo weth. It is true, that in Organs there is a confuled mutmur for a while, after you have played, but that is but while the Bellows arcin falling.

It is certain, that in the noife of great Ordnance, where many are fhot off together, the found will be carried (at the leaft) twenty miles upon the Land, and much further upon the Water, but then it will come to the Ear; not in the inflant of the fhooting off, but it will come an hour, or more later: This muft needs be a Continuance of the firft Sound; forthere is no Trepidation which fhould renew it. And the touching of the Ordnance would not extinguifh the found the fooner : So that in great Sounds, the Continuance is more than Momentany.

To try exactly the time wherein Sound is delated, Let a Man ftand in a Steeple, and have with him a Taper, and let fome Veil be put before the Taper, and let another Man fland in the Field a mile off; then let him in the Steeple frike the Bell, and in the fame inftant withdraw the Veil, and fo let him in the Field tell by his Pulfe, what diftance of time there is between the Light feen, and the Sound heard: For it is certain, That the Delation of

Light is in an inftant. This may betried in far greater ditances, allowing greater Lights and Sounds.

It is generally known and obferved, that Light and the object of ighte, move fwifter than Sound ; for we fee the flafh of a piece is lecer fooner, than the noife is heard. And in hewing Wood, if one fome diftance off, he fhall fee the Arm lifted up for a fecond ftroke, beforc he hear the noilc of the firf ; and the greater the diftance,the greater is the prevention: As we fecin Thunder, which is far off, where the Lightring precedeth the crack a good fipace.

Colours, when they reprefent themfelves to the Eye, fade rio nor melt not by degrees, but appear ftill in the fame ftrength; but Sounds melt, and vanifh, by little and little. The caufe is, for that Colours participate nothing with the motion of the Air, but Sounds do: Anditis a plain argu nent tha: Sound participateth of fome Local Motion of the Air, (as a caufe Sine quat non) in that it perifhech fo fuddenly : For in every Section, or Impulfion of the Air, the Air doth fuddenly reftore and reunite it Celf, which the Water alfo doth, but nothing fo fiviftly.

IN the Tryals of the Paffage, or not Paffage of Sounds, you muft take heed you miftake not the paffing by the fides of a Body, for the paffing thorow a Body; aid thérefore you muft make the Intercepting Bodỳ very clofe; for Sound will pafs thorow a fmall chinck.

Where Sound paffeth thorow a hard, or clofe Body (as thorow Water, thorow a Wall, thorow Metal, as in Hawks Bells ftopped, \&c.) the hard or clofe Body, mult be but thin and fmall; for elfe it deadeth and extinguilheth the Sound utterly. And therefore, in the Experiment of Speaking in Air under Water, the voice mult not be very deep within the Water, for then the Sound pierceth not. So if you fpeak on the further fide of a clofe Wall, if the Wall be very thick, you fhall not be heard; and if there were an Hogshead empty, whereof the fides were fome two footthick, and the Bunghole ftopped. I conceive, the refounding found by the Conimunication of the outward Air with the Air within, would be little or none, but onely you fhall hear the noife of the outward knock, asif the Veffeliwere full.
lc is certain, that in the paffage of Sounds thorow hard Bodies, the Spirit or Pneumatical part of the hard Body it felf doth co-operate ; but much better, when the fides of that hard Body are fruck, than when the percuffion is onely within, withouttouch of the fides. Take therefore a Hawks-Bell, the holes Itopped up, and hang it by a thred within a Bottle-Glafs, and flop the Mouth of the Glafs very clofe with Wax, and then fhake the Glafs, and fee whether the Bellgive any found at all, or how weak? But note, that you muft inftead of Thred take a Wire, or elfe let the Glats have a great Belly, left when you fhake the Bell, itdafh upon the fidès of the Glars.

It is plain that a verylong and down right arch for the Sound to pafs, will extinguifh the Sound quite, fo that chat Sound, which would be heard over a Wall, will not be heard over a Church ; nor that Sound, which will bo heard, if you ftand fome diftance from the VVall, will be heard if you fland clofe under the VVall.

So 'tand Foraninous Bodies in the firft creation of the Sound, will dead

Experiments in Confort, onuching the Paffase and Incerceptions of Sounds. it; for the ftrikingagaint Cloth or Fur, will make little found, as ha h been faid: But in the paffage of the found, they will admit it better than harder Bodies, as we fee, thar Cuirtains and Hangings will not ftay the found much; but Glafs windows, if they be very clofe, will check a found more, than the like thickiefs of Cloth. VVe fee alfo in the rumbling of the Belly, how cafily the Sound paffeth thorow the Guts and Skin.

Experiments in Confort, what the Figures of the Pipes or Coneaves, or the Bodies different, conduce so the Sounds.

It is worthy the inquiry, whether great \$ounds (as of Ordnance or Bells) become not more Weak and Exile; when they pafs thorow fmall Cranies. For the Subtilties of Articulate Sounds, (it may be) may pals thorow (mall Cranies, not confured; but the magnitude of the Sound (perhaps) not fo well.

THe CNediums of Sounds, are Air, foft and porous Bodies; alfo Water, and hard Bodies refufe not altogether to be Mediums of Sounds. But all ot them are dull and unapt differents, except the Air.

In Air, the thinner or drier Air, carrieth not the Sound fo well,' as the more denfe; as appearech in Night Sounds, and Evening Sounds, andSounds in moif Weather, and Southern Winds. The reafon is already' mentioned in the Title of cMajoration of Sounds; being, for that thin Air is better pierced, but thick Air preferveth the Sound better from watte: Let further Tryal be made by hollowing in Mifts, and gentle Showers; for (it may be) that will fomewhat dead the Sound.

How far forth Flame may be a Medium of Sounds, (efpecially of fuch Sounds as are created by Air, and not betwixt hard Bodies) let it betried in rpeaking, wherea Bonefire is between; but then you muft allow for fome difturbance, the noife that the Flame it felf maketh.

Whether any other Liquors being made CHediums, cauce a diverfity of Sound from Water, it may be tryed: As by the knapping of the Tongs, or Atriking the bottom of a Veffel filled either with Milk or with Oyl; which though they be more light, yet are they more unequal Bodies than Air.
of the Natures of the Mediums, we have now poken; as for the Difpofition of the faid Mediums, it doth confff in the Penning, or not Penning of the Air; of which, we bave fooken before in the Title of Delation of Sounds. It comffeth alfo in the Figure of the Concave, through which it paffeth. of which, we will lpeak wext.

HOw the Figures of Pipes or Concaves, through which Sounds pals, of of other Bodies different; conduce to the variety and alteration of the Sounds, either in refped of the greater quantity, or lefs quantity of Air, which the Concaves receive; or in refped of the carrying of Soundslonger or Thorter way ; or in refpect of many other Circumdances, they have been touched, as falling into other Titles. Bur thofe Figures which we now are to fpeak of, we intend to be, as they concern the Lines, through which Sound paffeih: As Straight, Crooked, Angular, Circular, \&'c. dilating more fuddenly. The Figare of a Husters Horn, and Cornet, is oblick, yet they have likewife ftraight Horns; which if they be of the fame bore with the oblick, differ little in Sound, fave that the ftraight require fomewhat a ftronger blaft. The Figsure of Recoriers, and Flutes, and Pipes, are ftraight; but the Recorder hath a lefs bore, and a greater, above and below. The Trmppse hath the Figure of the Letter $\mathcal{S}$. which maketh that Purling Sound; \&c. Generally, the ftraight Line harh the cleaneft and roundeft Sound, and the crooked the more Hoarte, and Jarring.
Of a Sinuous Pipe that may have fome four Flexions, tryal would be made. Likewife of a Pipe made like a Crofs, open in the midf; and fo

|  |
| :---: |
| likewile of an Angilar $\mathcal{P}_{i p e}$; and fee what will be the effects of thefe feveral Sounds. And fo again of a Circular Pipe: As if you take a Pipe perfeet round, and make a hole whercinto you fhall blow, and anotherhole not far from that; but with a traverfe or ftop between them : So that your breath may go the Round of the Circle, and come forth at the fecond hole. You may try likewife Percuffions of folid Bodies of feveral Figures : As Globes, Flats, Cubes, Croffes, Triangles, ©́r. And their Combinations; as Flat againft Flat, and Convex againft Convex, and Convex againft Flat, Ưc. And mark well the diverfities of theSounds. Try alfo the difference in iound of feveral Craffitudes of hard Bodies percuffed, and take knowledge of the diverfities of the founds. I my felf have tried, That a Bell of Gold yieldeth an excellent lound, not inferior to that of Silver or Braß, but rather better. Yet we fee that a piece of money of Gold, foundeth far more flat than a piece of money of Silver. <br> The Harp hath the concave, not along the ftrings, but acrofs the ffrings; and no Infrumrent hath the found fo meling and prolonged, as the Irißh Harp. So as I fuppoie, that if a Virginal were made with a double Concave; the one all the length as the $V$ irginal hath, the other at the end of the frings, as the Harp hath; it muft needs make the found perfecter, and not fo fhallow, and jarring. You may try it without any Sound board along, but onely Harp. wite, at one end of the ftrings; or laftly, with a double concave, at each end of the'trings one. |

THere is an apparent diverfity between the Species vifible and Aulible, in this. That the Vifille doth not mingle in the CNedium, but the Audible doth. For if we look abroad, we fee Heaven, a number of Stars, Trees, Hills, Men, Beafts, at once; and the Species of the one, doth not confound the orher: Bur if fo many Sounds come from feveral parts, one of them would utterly confound the other. So we fee, That Voices or Conforts of CMufich do make harmony by mixture, which Colours do not. It is true neverthelefs, that a great light dtowncth a fmaller, that it cannot be feen; as the Sun that of a Gloworm, as well as a great found drowneth a leffer. And I fuppofe likewife, that if there were two Lanthorns of Glafs, the one a Crimfin, and the other an Azure; and a Candle within either of them, thofe coloured lights, would mingle and caft upon a White Paper, a Purple colour. And even in colours, they yield a faint and weak mixture; for White Walls make rooms more lightfome, than Black, \&c. But the caufe of the Confufion in Sounds, and the Inconfufion in Species Vifible, is, For that the Sight worketh in rightLines, and maketh feveralCones; and fo'there can be no Coincidence in the Eye, or Vifual Point: But Sounds that move in oblick and arcuate Lines, muft needs encounter, and difturb the one the other.

The fweeteft and beft Harmony is, when every Pact or Inftrument is not heard by if felf, but a conflation of them all, which requireth to ftand rome diftance off. Even as it is in the mixture of perfumes, or the taking of the fmells of feveral Flowers in the Air.

The difpofition of the Air, in orher qualities; except it be joyned with
But Sounds do difturb and alter the one the other: Sometimes the one drowning the other, and making it notheard; fometimes the one jarring and difcording with the other, and making a confufion; fometimes the one ming. ling and compounding with the other, and making an harmony.
228.
229. Experiments in Confort, touching Meluration of sounds.
230.
231.

ALLReflexions Concurrent, do make Sounds greater; but if the Body that createth, either the original Sound, or the Reflexion, be clean and fmooth, it maketh themfweeter. Tryal may be made of a Lute or Vial, with the Belly of polifhed Brafs inftead of Wood. We fee, that even in the open Air, the Wire-fting is fweeter than the fring of Guts. And we fee, that for Reflexion, Water excelleth; as in Muficknear the Water, or in Eccho's. Two Voices of like loudnets, will not be heard twice as far, as one of
them alone; and two Candles of like light, will not make things feent twice as far off, as one. Thecaufe is profound, but it feemeth, that the Impreffions from the objects of the Senles, do mingle refpectively, every one with his kinde ; but not in proportion, as is before demonftrated: And the reafon may be, becaufe the firft impreflion, which is from Privative to Active, (as from Silence to Noife, or from Darknefs to Light;) is a greater degree, than from lefs noife, to more noife, or from lefs light, to more light. And the reafon of that again may be, For that the Air, after it hath received a charge, doth not receive a furcharge, or greater charge, with like appetite, as it doth the firt charge. As for the increafe of Vertue generally, what proportion it beareth to the inereafe of the Matter, it is a large Field, and to be handled by it felf.

It hath been tryed, that a $\mathscr{P}$ ipe, a little moitned on the infide, but yet fo as there be nodrops left, maketh a more folemn found, than if the Pipe were dry ; but yet with a fweet degree of sibilation or $p_{\text {urling, }}$ as we touched it before in the Title of Equality. The caufe is, for that all things porous, being fuperficially wet, and (as it were) between dry and wer, become a little more even and fmooth; but the Purling (which muft needs proceed of Inequality) I take to be bred between the fmoothnefs of the inward Surface of the Pipe which is wet, and thereft of the Wood of the Pipe, unto which the wet cometh not, but it remaineth dry.
In Frofty weather, CWufick within doors foundeth better; which may be, by reafon not of the difpofition of the Air, but of the Wood or String of the Inftument, which is made more crifp, and fo more porous and hollow; and we fee that Oid Lutes found better than Nem, for the famereafon: And fo do Lute-frings that have been kept long.

Sound is likewife meliorated by the mingling of open Air with pent Air : Therefore tryal may be made of a Lute or Vial with a double Belly, making another Belly with a knot over the ftring; yet fo, as there be room enough for the flrings, and room enough to play below that Belly. Tryal may be alfo made ot an Irish Harp; with a concave on both fides, whereas it ufeth to have it but on one fide. The doubt may be, left it fhould make too much refounding, whereby one Note would overtake another.
233.

If you fing in the hole of a $\mathcal{D r u m}$, it makeththe finging more iweet. And Io I conceive it would, if it were a Song in Parts fung into feveral Drums; and for handfomnefs and frangenefs fake, it would not be amifs to have a Curtain between the place where the Drums are, and the hearers.

When a found is created in the $W$ ind-Inftrument, between the Breath and Air, ye: if the found be communicate with a more equal Body of the Pipe,
it meliorateth the found. For (no dobut) there would be a differing found in a Trumpet or Pipe of Wood, and again, in a Trumpet or Pipe of Brafs. It were good to try Recorders and Hunters Horns of Braß, what the found would be.

Sounds are meliorated by the Intenfion of the Senfe, where the common Senfe is collected moft to the particular Senfe of Hearing, and the Sight furpended: And cherefore Sounds are'/weeter, as well as greater, in the Night than in the Day ; and I fuppofe, they are fweeter to blinde men, than to others: And it is manifelt, that between fleeping and waking, (when all the Senfes are bound and fu(pended) chujick isfar fiweeter than when one is fully waking.

IT is a thing ftrange in Nature, when it is attentively confidered, How Children and tome Birds learn to imitate Speech. They take no mark'at all of the Motion of the Mouth of him that fpeaketh, for Birds are as well taught in the dark, as by light. The founds of Speech are very curious and exquifite; fo one would think it were a Leffon hard to learn. It is true, that it is done with time, and by little and little, and with many effays and proffers: But all this difchargeth not the wonder. It would make a Man think (though this, which we fhall fay, may feem exceeding ftrange) that there is fome tranfmifion of Spirits, and that the Spirit of the Teacher put in motion, fhould work with the Spirits of the Learner, a predifpofition to offer to imitate, and fo to perfect the imitation by degrees. But touching Operations by Tranimiffions of Spirits (which is one of the higheft fecrets in Nature) we fhall (peak in due place, chiefly when we come to inquire of Imagination. But as for Imitation, it is certain, That there is in Mer, and other Creatures, a predifoofition to imitate. We fee how ready Apes and Monkies are to imitate all motions of Man: And in the catching of Dottrels, 'we fee how the foolifh Bird playeth the Ape in geftures: And no Man (in effect) doth accompany with others, but he learneth (ere he is aware) fome Gefture, or Voice, or Fathion of the other.

In Imitation of Sounds, that Man fhould be the Teacher, is no part of the matter : For Birds will learn one of another, and there is no reward by feeding, or the like, given them for the imitation: And befides, you hall have Parrets that will not onely imitate Voices, but Laughing, Knocking, Squeaking of a Door upon the Hinges, or of a Cart wheel, and (in effect) any other noife they hear.

No Beaft ean imitate the Speech of Man, but Birds onely: For the Ape it fell, that is foready to imitate otherwife, attaineth not any degree of imitation of Speech. Ir istrue, that I have knowna Dog, that if one howled in his ear, he would fall a howling a great while. What fhould be the aptnefs of Birds, in comparilon of Beafts, to imitate the Speech of Man, may be further inquired. We fee that Beafts have thofe parts, which they count the Inftruments of Speech, (as Lips, $T_{\text {eeth, }}$ dec.) liker unto Manthan Birds. As for the Neck, by which the Ibroat paffeth, we fee many Beafts have it for the length, as much as Birds. What better gorge or attire Birds have, may be further inquired. The Bird shat are known to be feakers, are $\mathscr{P}_{\text {arrets, }} \mathscr{P}_{\text {yes }}$, Fays, Daws, and Ravens: Of which, Parrets have an adunck Bill, but the reft nor.

But I conceive, that the aptnefs of Birds is not fo much in the confor-

## $\mathcal{J}$ atural Hifory;

more than Beafts; becaufe naturally they are more delighted with them, and practife them more, as appeareth in their Singing. We fee alfo, that thofe that teach Birds to fing, do keep them waking, to increafe their attention. We fee allo, that Cock-Birds, amongft Singing-Birds, are ever the better fingers, which may be, becaufe they are more lively, and liften

Experiments in Confort, touching the R+fexion of Sounds.
242.
243.

Labor and Intention to imitate Voices, doth conduce muchto imitation: And therefore we fee, that there be certain $\mathcal{P}$ antomimi, that will reprefent the Voices of Players of Interludes, fo to life, as if you fee them not, you would think they were thofe Flayers themfelves, and fothe Voices of other men that they hear.

There have been fomethat could counterfeit the diftance of Voices, (which is a fecondary object of Hearing) in fuch fort; as when they ftand faft by you, you would think the Speech came from afar off, in a fearful manner. How this is done, may be further enquired; but I fee no greatufe of $\mathrm{it}_{2}$, butforImpofture, in counterfeiting ghofts or fpirits.

THere be three kindes of Refexions of Sounds; a Refexion Concurrent, a Refexion $l_{t e r a n t, ~ w h i c h ~ w e ~ c a l l ~ E c c h o, ~ a n d ~ a ~ S u p e r-r e f e x i o n, ~ o r ~ a n ~ E c c h o ~ o f ~ a n ~}^{\text {an }}$ Eccho, whereof the firtt hath been handled in the Title of CMagnitude of Sounds. The latter two we will now fpeak of.

The Refexion of Species Difible by CMirrors, you may command; becaufe paffing it Right Lines, they may be guided to any point: But the Reflexion of Sounds, is hard to mafter; becaufe the found filling great fpaces in arched Lines, cannot be fo guided. And therefore, we fee there hath not been practifed any means to make Artificial Eccho's. And no Eccho already known, returneth in a very narrow room.

The Natural Eccho's are made upon Walls, Woods, Rocks, Hills, and Banks: As for Waters being near, they make 2 Concurrent Eccho; but being furcher off, (as upon a large River) they make an Interant Eccho: Forthere is no difference between the Concurrent Eccho, and the Iterant, but the quicknefs or flownef of the return. But there is no doubr, but Water doth help the Delation of Eccho, as well as ithelpeth the Delation of Original Sounds.

It is certain (as hath been formerly touched,) that if you feak thorow a Trunck, Itopped at the further end, you fhall finde a blaft return upon your mouth, but no found at all. The caufeis, for that the clofenefs, which preferverh the original, is not able to preferve the reflected found; befides that, Eccho's are feldom created, but by loud Sounds. And therefore there is lefs hope of Artificial Eccho'sin Air, pentin a narrow concave. Neverthelefs it hath been tryed, that one leaning over a Well of Twenty five fathom deep, and fpeaking, though but foffly, (yet not fo foft as a whifper) the Water returned a good audible Eccho. It would be tryed, whether /peaking in Caves, where there is noiffue,fave where you fpeak, will not yield Eccho's as Wells do.

The Eccho cometh as the Original Sound doth in a round orb of Air: It were good to try:the creating of the Eccho,', where the Body repercuffing maketh an Angle: As againft the Return of a Wall, \&c. Alfo we fee that in Mirrors, there is the like Angle of Incidence, from the Objed to the Glafs, and from the Glafs to the Eye. Andif you ftrike a Ball fide-long, not full upon the Surface, the rebound will be as much the contrary way; - whe-
$\frac{\text { Century }}{-\quad \text { ther there be any fuch refilience in Eccio's }}$. hear better, if be ftand afide the Body repercuffing, than if he ftaind where he 〔peaketh, or any where in a right Line between) maybetried; Tryal likewife would be made, by fanding nearer the place of reperculfing, than he that fpeaketh; and again, by ftanding further off, than he that fpeakerh, and ro knowledge would be taken, whether Eccho's, as well as Original Sounds, be not ftrongeft near hand.

There be many places, where you thall hear a number of Eccho's one affer another; and it is, when there is variety of Hills or $W_{\theta o d s, ~ f o m e ~ n e a r e r, ~}^{\text {, }}$ fome further off: So that the return from the further, being lat created, will be likewife laft heard.

As the Voice goeth round, as well towards the back, as towards the front of him that fpeaketh; Colikewife doth the Eccho, for you have many Back-eccho's to the place where you ftand.

To make an Eccho that will report three; or four, or five words dinfinctly, it is requifite, that the Body repercuffing be a good diftance off : For if it be near, and yet not fonear, as to make a Concurrent Eccho, it choppeth with you upon the fudden. It is requifite likewife, that the Air be not much pent: For Air, at great diftance, pent, worketh the fame effect with Air at large, in a fmall diftance. And therefore in the Tryal of Speaking in the Well; though the Well was deep, the Voice came back fuddenly, and would bear the report but of two words.

From Eccho's upon Eccho's, there is a rare infance thereof in a place, which I will now exactly defcribe. It is fome Three or four Miles from Paris, near a Town called Pont-Caronton; and fome Bird. bolt fhot or more from the River of Sean. The Room is a Chappel, or fmall Church; the Walls ail ftanding, both at the fides, and at the ends ; two rows of Pillars after the manner of Ifles of Churches, alfo ftanding; the Roof all open, not fo much as any Embowment near any of the Walls left: There was againk every Pillar, a ftack of Billets above a Mans height, which the Watermen, that bring Wood down the Sean, in Stacks, and not in Boats, laid there (as it feemeth) for their eafe. Speaking at the one end, I did hear it return the Voice Thirteen feveral times; and I have heard of others, that it would return Sixteen times; for I was there about three of the Clock in the Afternoon; and it is beft, (as ail other Eccho's are) in the Evening. It is manifelt, that it is not Eccho's from feveral places, but a toffing of the Voice, as a Ball too and fro; like to Reflexions in Looking. Glaffes; where if you place one Glafs before, and another bebinde, you thall fee the Glafs behinde with the Image, within the Glafs before ; and again, the Glass before in thar: And divers fuch Super-Reflexions, till the Species Jeciei at laft die : For it is every return weaker, and more thady. In like manner, the Voice in that Chappel, createth Speciem 乃peciei, and maketh fucceeding Super-Reflexions; for it meiteth by degrees, and every Reflexion is weaker than the former: So rhat, if youlpeak three words, it will (perhaps) Come three times report you the whole three words; and then the two latier words for fometimes, and then the lalt word alone for fometimes, ftill fading and growing weaker. And whereas in Eccho's of one return, it' is much to hear Four or fivic words. In this Eccho of fo many Returns, upon the matter; you hear above Twenty words for three.

The
58

The like Eccho upon Eccho, but onely with two reports, hath been obferved to be, if you ftand between a Houfe and a Hill, and lure towards the Hill ; for the Houfe will give a Back Eccho: One taking it from the other, and the latter the weaker.

There are certain Letiers, that an Eccho will hardly exprefs : As S for one, efpecially being principal in a word. I remember well, that when I went to the Ecchoat Pont-Carenton, there was anold $P$ arifian that took it to be the Work of Spirits, and of good Spirits. For (faid he) call Satan, and the Eccho will not deliver back the Devils name : But will fay, Vaten, which is as much in French, as LApage, or Avoid. And thereby I did hap to finde, that an Eccho would not return S, being but a Hiffing and an Interior Sound:

Eccho's are fomemorefudden, and chapagain as foon as the Voice is delivered, as hath been partly faid; others are more deliberate, that is, give more fpace between the Voice and the Eccho, which is cauled by the Local nearnefs or diftance: Some will report a longer train of words, and fome a fhorter: Some more loud (full as loud as the Original, and tometimes more loud) and fome weaker and fainter.

Where Eccho's come from feveral parts, at the fame diftance they muft needs make (as it were) a Quire of Eccho's, and fu make the Report greater, and even a continued Eccho; which youfhall finde in fome Hills that ftand encompaffed, Theatre-like.

It doth not yet appear, that there is Refraction in Sounds, as well as in Species Vifible. For dô notthink, that if a Sound fhould pafs through divers Mediums, as Air, Cloth, Wood, it would deliver the Sound in a differing place, from that unto which it is deferred; which is the propereffect of Refraction. But Majoration, which is alfo the Work of Refraction, appeareth plainly in Sounds; (as hath been handled at full) but itis not by diverfity of Mediums.

Experimeats in Confort, touching the Confent and Difjent betreen Vifbles and Sudibles.

WE have Obiter, for Demonftrations fake, ufed indivers Inflances, the Examples of the Sight, and Things $V_{i f i b l e, ~ t o ~ i l l u f t r a t e ~ t h e ~ N a t u r e ~ o f ~}^{\text {a }}$ Sounds. But we think good now to profecute that Comparifon more fully.

## Conent of Vifibles a nd Audibles.

255. 

$B^{\circ}$Oth of them fpred themfelves in Round, and fill a whole Flore or Orb unto certainLimits; and are carried a great way, and do languih and leffen by degrees, according to the Diftance of the Objects from the Senfories.

Both of them have the whole Species in every friall portion of the Air or Medium, foas the Species do pafs through fmall Cranies, without confufion: As we fee ordinarily inLevels, as to the Eye ; and inCranies; or Chinks, as to theSound.
2.57.

Both of them are of a fudden and eafic Generation and Delation, and likewile perihh fiviftly and fuddenly; as it y ou remove the Light, or touch the Bodies that give theSound.
Century ILI.

Both of them do receive and carry exquifite, and accurate differences; as of Colours, Figures, Motions, Diftances', in Vifibles ; and of Articulate Voices, Tones, Songs, and Quaverings, in Audibles.

Botio of them in their Vertue and Working, do not appear to emit any Corporal Subftance into their vediums, or the Orb of their Vertuc; neither again to rife or ftir any evident, Local Motion in their Mediums as they pals, but onely to carry certain Spiritual Species. The perfect knowledge of the caufe whereof, being hitherto fcarcely attained, we fhall fearch and liandle in due place.

Both of them feem not to generate or produce any other effect in $\mathrm{N}_{2}$ ture, but fuch as appertaineth to their proper Objects and Senfes, and are othervife barren.

But both of them in their own proper ation, do work three manifeft effects. The firft, in that the ftronger pieces drowneth the leffer: As the light of the Sun, the light of a Gloworm, the report of an Ordnance, the Voice. The fecond, in that an Object of furcharge or excefs, deftroyeth the Senfe: Asthe light of the Sun the eye, a violent found (near the Ear) the Hearing. The third, in that both of them willbereverberate: Asin Mirrors, and in Eccho's.

Neither of them doth deftroy orhinder the Species of the other, although they encounter in the fame Mediwn : As Light or Colour hinder not found, nor à contrà.

Both of them affect the Senfe in Living Creatures, and yield Objects of Pleafure and Diliike; yet neverthelefs, the Objects of them do alfo (if it be well obferved) affect and work upon dead things ; namely fuch, as have fome conformity with the Organs of the two Senfes: As Vifbles workupon a Looking-glaß, which is like the Pupil of the Eye; and Audililes upon the places of Eccho, which refemble, in fome fort, the cavern and ftructure of the Ear.

Both of them do diverfly work, as they have their CMedium diverfly difpofed. Soa Trembiling Medium (as (moak) maketh the object feem to trem-: ble; and Rifing or Falling Medium (as Winds) maketh the Sounds to tife or fall.

To both, the CVedium, which is the moft propitious and conducible, is Air ; For Glafs or Water, \&c. are not compairable.

In both of them, where the object is fine and accurate, it conduceth much to have the Senfe intentive, and ereat ; infomuch, as you contract your eye, when you would feefharply, and ered your ear, when you would hear attentively ; which in Beafts that have ears moveable, is mof manifeft.

The Beams of Light, when they are multiplied and conglomerate, generate heat ; which is a differentaction, from the action of Sight: And the Multiplication and Conglomeration of Sounds, doth generate an extream Rarefation of the Air; which is an a ction materiate, differing from the action of Sound. If it be true (which is anciently reported) that Birds, with great fhouts, have faln down.

## Diffent of Vifibles and Audibles.

263. THe Species of Vifbles, feem to be Emissons of Beams from the Objet fien, almoft like Odors, fave that they are more incorporeal; bar rne Species of Audibles, feem to participate more with Local Motion, like Percußions. oi Innprefions made upon the $\mathcal{A}$ ir. So that whereas all Bodies do feem to work in two manners, Either by the Communication of iheir $\mathcal{Z}$ atures, or by the $/ \mathrm{m}$ prefions and Signatiares of their chotiois. The Diffufion of Species $V V_{i f i b l e, ~}^{\text {, }}$ feemeth to parricipate more of the former Operation, and the species Audible of the latter.

The Species of Audibles feem to be carried more manifeftly thorow the Air, than the Species of Vifibles:, For (I conceive) that a conirary ftrong Wind will not much hinder the fight of Vifibles, as it will do the hearing of Sounds.

There is one difference above all others, bet ween Viffbles and Audibles, that is the moft remarkable ; as that whereupon many fmitler differences do depénd; Namely, that Vifities (except Lights) are carried in Right Lines, and Audibles in Arcuate Lines. Hence it cometh to pafs, that Vifibles do not intermingle and confound one another, as hath been faid before, but Sounds do. Hence it cometh, that the folidity of Bödies doth not much hinder the fight, fo that the Bodies be clear, and the Pores in a Right Lirie, as in Glafs, Cryftal, Diamonds, Water, \&c. But a thin Scarf or Handkerchicf, though they be Bodies nothing fo folid, hinder the fight: Whereas (contratiwife) thefe Porous Bodies do not much hinder the Hearing, but folid Bodies do almoft fop it; or at leaf attenuare if. 'Hence alfo it cometh, that to the Reflexion of Vifibles, fmall Glaffes fuffice, butto the Reverberation of Audibles, are required gre ater fpaces, as fath like wife been faid before.

Vifibles are feen further off, than Sounds are heard; allowing neverticlefs the rate of their bignefs: For otherwife, a grear Sound will be heard further off, than a fmall Body feen.

Vifibles require (generally) tome diftance berweer the objea, and the Eye to be betrer feen; whereas in Audibles, the nearer the approach of the Sound is to the Senfe the better; but in this, there may be a double error. The one, becaufe to Seeing there is required Light, ano any thirg that toicheth the Pupil of the Eye (ll over) excluderh the Light. For 1 have heard of a perfon very credible, (who himfelf was cured of a Catarat in onc of his Eyes) that while the Silver- ncedle did work upon the fight of his Eye, to remove the Film of the Cataract, he never law any ihing more clear or perfeit, than that white Needle : Which (no doubt) was, becaufe the Needie was leffer than the Pupil of the Eye, and fo took not the lightit from ir. The other error may be, For that the object of Sight doth ftrike upon the Pupil of the Eye, direCly without any interception; whereas the Cave of the Ear doth hold off the Sound a little from the Organ : And fo neverthelefs there is fome diftance required in both.

Vifibles are (wiffer carried to the Senle, than Audibles; as appeareth in Thunder and Lightning; Flame, and Report of a Piece ; Motion of the Air, in hewing of Wood. All which have been fet down heretofore, but are proper for this Title.

1 conceive alfo, that the Species of Aulibles, do hang longer in the Air than shore of $V$ ifibles: For alchough even thofe of Vifibles do hang fome time, as we fee in Ringsturned, that fhew like fpheres. In Late-ftrings fillipped, a Firebrand carried a long, which leaverh a train of light behinde it, and in the Twi light, and the like: Yer I conceive that Sounds, ftay longer becaufe they are carried up and down with the Wind; and becaule of the diftance of the time in Ordnance difcharged, and heard twenty miles off

In $V$ ifibles there are not found Objects foodious and ingrate to the Senfe, as in $A$ xdibles. For foul Sights do rather difpleafe, in that they excite the memory of foul things, than in the immediate Objects. And therefore in Pittures, thofe foul Sights do nor much offend; but in Audibles, the grating of a Saw when it is harpned, doth offend fo much, as it ferterh the Tceth on edge ; and any of the harfl $\mathcal{D} i f$ cords in CWuficks, the Ear doth ftraightways refufe.

In $V_{\text {fifles, after great light, if you come fuddenly into the dark, or con- }}$ trariwife out of the dark into a glaring Light. The eye is dazled for a time, and the Sightconfufed; but whether any tuch effect be after great Sounds, or after a deeper filence may be better enquired. It is an old Tradition, that thofe that dwell near the Cararacts of $\chi$ ilus, are frucken deaf: But we finde no fuch effect in Cannoniers, nor Millers, hor thofe that dwell upon Bridges.

It feemeth, that the Impreßion of Colour is fo weak, asit worketh not, but by a Cone of direct Beams, or right Lines, whereof the Bafis is in the Object and the Vertical point in the Eye : So as there is a corradiation and conjunction of Beams; and thofe Beams fo fent forth, yet are not of any, force to beget the like borrowed or fecond Beams, except it be by Reffexion, whereof we fpeak nct. For the Beams pafs and give little tincture to that Air which is adjacent; whichif theydid, we fhould fee Colóurs out of a right line. But as this in Colours, fo otherwife it is in the Body of Light. For when there is a skreen between the Candle and the Eye; yet the light pafferh to the Paper whereon one writeth, fo that the light is feen where the body of the flame is not feen; and where any Colour (if it were placed where the body of the flame is) would not be feen. I judge: that Sound is of this later nature: For when two are placed on both fides of a Wall, and the voice is heard, I judge it is not onely the original found, which pa ffeth in an Arched line ; but the found, which paffech above the Wail in a Rigbt line, begettech thęlike Motion round about it, as the firft did, though more weak.

ALI Concords and $\mathcal{D}$ ifords of Mufck (no doubt) Sympatbies and Antipathies of Sounds, and fo (likewife) in that Mufick, which we call Broken mufcck, or Confort Mufick; fome Confortsof Inffrumests are fweeter than others, (a thing not fufficiently yer obferved;) as the Irish-Harp and Bafe. Vial agree well; the Recorder and Stringed Mufcck agree well; Organs and the Voice agree well, \&c. But the Virginals and the Lute, or the Welsh-Harp and Irish-Harp, or the Voice and Pipes alone, agrce not fo well; but for the Chelioration of Mufick, there is yet much left (in this. Point of Exquifite Conforts) to try and enquire.

There is a common oblervation, That if a Lute ot Vial be laid upon the in Confort, toushing the Sympashy or Ansipasby of Sounds, one wish another. back with a fmall traw upon one fide of the frings, and another Lute or Vialbe laid by it; and in the other Lute or Fial the Vinifon to that/fring be frucken, it will make the fring move; which will appear both to the Eye, and by the Atraws falling off. The like will Ue if the Diapafon or Eight to that fring be frucken, either in the fame Lute or Vial, or in others lying by: Bat in none of thefe there is any report of Sourd that cari be difcerned, but onely Motion.
$\frac{62}{280 .}$

It was devifed, That a Vial fhould have a Lay of Wire-ftrings below, as clofe to the Belly as a Lute, and then the Strings of riuts mounted upon a Bridge, as in ordinary Vials; to the end, that by this means, the upper Strings ftrucken, fhould make the lower refound by Sympathy, and fo make the Mufick the better; which, if it be to purpofe, than Sympathy worketh as well by report of Sound, as by Motion. But this device, I conceive, to be of no ufe, becaufe the upper Strings which are ftopped in great variety, cannot maintain a $\mathcal{D}$ iapafon or a $V$ nifon with the lower, whichare never ftopped. But if it thould be of ufe at all, it muft be in Inftruments which haveno ftops, as Virginals and Harps; wherein tryal may be made of two rows of Stringe, diftant the one from the other.

The: Experiment of Sympathy may be transferred (perhaps) fromInftruments of Strings, to other Intruments of Sound. As totry', if there wete in one Steeple rwo Bells of Unifon, whether the ftriking of the one would move the other, more thanif it were another accord: Ard fo in $\mathbf{P}$ ipes, if they be of equalbore and found,) whether a little Straw or Feather would move in the one Pipe, when the other is blown at an Vinifon.

It feemeth both in Ear and Eye, the Inftrument of Senfehath a Sympathy or Similitude with that which giveth the Reflexion (as hathbeen touched before.) For asthe Cight of the Eye is like a Chryfal, or Glafs, or Water; fo is the Ear a finuous Cave with a hard Bone, toftop and reverberate the Sound: Which is like to the places that report Eccho's. Hearing.
284.

WHen a Man yawneth, he cannot hear fo well. The caufe is, for that the Membrane of the Ear is extended; and to rather cafteth off the Sound, than draweth it to.

We hear better when we hold our Breath, than contrary, infomuch, as in all liftening to attain a Sound a far off, Men hold their Breath. The caufe is, for that in all Expiration, the mation is outwards, and therefore rather driveth away the voice than drawerh it: And befides, we fee that in all labor to do things with any ftrength, we"thold the Breath; and liftening after any Sound that is heard with difficulty, is a kinde of labor.

Let it betryed, for the help of the Hearing, (and I conceive it likely to fueceed) to make an Infrument like a Tunnel; the narrow part whereof may be of the bignels of the hold of the Ear ; and the broader end much larger; like a Bell at the skirts, and the length half a foot or more. And let the narrow end of it be fet clofecto the Ear. And mark whether any Sound abroadin the open Air, will not be heard diftinctly, from further diftance, than without that Inftrument; being (asit were) an Ear Becticle. And I have heard there is in Spain, an Inftument in ufe to be let to the Ear, that helpeth fomewhat thole that are Thick of Hearing.

If the Mouth be fhut clofe, neverthelefs there is yielded by the Roof of the Mouth, a Murmur; fuch aș is ufed by Dumib men: But if the Noftrils be likewife fopped, no fuch Murmur can be made, except it be in the bottom of the Pallate towards the Throat. Whereby it appeareth manifeftly, that a Sound in the Mouth, except fuch as aforefaid, if the Mouth be ftopped,

THe Repercußion of Sounds, (which we call Eccho) is a great Argument of the Spiritual Effence of Sounds. For if it were Corporeal, the Repercuffing thould becreatedinthe fame manner, and by like Inftruments, with
the original Sound: But we fee what a number of exquifite Inftruments mult concur in fpeaking of words, whereof there is no fuch matter in the returning of them, butonely a plain ftop, and repercuffion.

The exquifite Differences of Articulate Sounds, carried along in the Air, fhew that they cannot be Signatures or Impreffions in the Air, as hath been well refured by the Ancients. For it is true, that Seals make excellent Impreffions; and fo it may be thought of Sounds in their firf generation : But then the Delation and Continuance of them, without any new fealing, Shew apparently they cannot be Impreffions.

Ail Sounds are fuiddenly made;and do fuddenly perifh; but neither that, nor the exquifite Differences of them, is matter of fo great admiration: For the Quaverings, and Warblings of Lutes, and Pipes are as (witt ; and the Tongue (which is no very fine Infrument) doth in fpeech, make no fewer motions, than there be letters in ali the words which are uttered. But that Sounds fhould not oncly be fo fpeedily generated, but carried fo far every way, in fuch a momentany time, deferveth moreadmiration, As for example, If a man ftand in the middle of a Field, and fpeak aloud; he fhall be heard a Furlong in round, and that fhall be in articulate Sounds, and thofe fhall be entire in every little portion of the Air ; and this fhall be done in the fpace of lefs than a minute.

The fudden Generation and Perifhing of Sounds, mult be one of thefe two ways: Either, that the Air fuffereth fome force by Sound, and then reftoreth it felf as $W$ ater doth; which being divided, maketh many circles, tillit reftoreit felf to the Natural confiftence ; orotherwife, that the Air doth willingly imbibe the Sound as grateful, but cannot maintain it; for that the Air hath (as it Hould feem) a fecret and hidden Appetite of receiving the Sound at the firtt; but then other grofs and more materiate qualities of the Air Itraight ways fuffocate it, like unto Flame which is generated with alacrity, but fraight quenchea by the enmity of the Air, or other Ambient Bodies.

There be there differences (in gencral) by which Sounds are divided:

$$
\begin{aligned}
& \text { I. Mufcal, Immufical. } \\
& \text { 2. Treble, Bafe. } \\
& \text { 3. Flat, Shapp. } \\
& \text { 4. Soft, Loud. } \\
& \text { 5. Exterior, , nterior. } \\
& \text { 6. Clean, Harblo, or Purling. } \\
& \text { 7. Arviculate, Inariculate. }
\end{aligned}
$$

We have labored (as may appear) in this Inquiftion of Sounds diligenitly; both becaufe Sound is one of the moft hidden portions of Nature, (as we faid in the beginning) and becaufe it is a Vortue which may be called Incorporeal and $I_{\text {minateriate, }}$ whereof there be in Nature but few. Befides, we were willing (now in thele our firt Centuries) to make a pattern or prefident of an Exat Inquiftion; and we fhall do the like hereafter in fome other fubjects which require it. For we defire that Men fhould learn and perceive how fevere a thing the true Inquigtion of Nature is; and fhould accultom themfelves by the light of particulars, to enlarge their mindes to theamplitude of the World; and not to reduce the W orld to the narrownefs of their Mindes.
291. Experiment Solitary, touching the Orient Colours in Difolutions of Metals.

292:

MEtals give orient and fine Colours in Diffolution; as Goldgiveth an excellent Yellow, Quick-filver an excellent Green, Tingiveth an excellent Azure. Likewife in their Putrefactions, or Rufts; as Vermilion, Verdegreafe; Bile, Cirrus, \&c. And likewife in their Vitrifications. The caufe is, for that by their ftrength of Body, they are able to endure the Fire, or Strong-waters; and to be put into an equal pofture, and again, to retain part of their principal Spirit: Which two things (equal pofture, and quick Spirits) are required chiefly, to make Colours lightfome.

IT' conduceth unto longLife, and to the more placide Motion of the Spirits, which thereby do lefs prey and confume the Juyce of the Body: either that Mens actions befree and voluntary, that nothing be done invità minerva, but fecundum genium ; or, on the other fide, that the ACtions of Men be full of Regulation, and commands xitbin thempelves: For then the victory and performing of the command, givech a good difpofition to the Spirits, efpecially if there $b c$ aproceeding from degree to degree, for then the fenfe of wituory is the greater. An example of the former of thefe, is in a Countrey life; and of the latter, in CMonks and Philofophers, and fuch as do continually enjoyn themfelves.

IT is certain, that in all Bodies, there is an Appetite of Vnion, and Evitation of Solution of Continuity: And of this Appetite there be many degrees, but the moft remarkable, and fit to be diftinguifhed, are three. The firft in Liquors, the fecond in hardBodies, and the third in Bodies cleaving or tenacious.: In Liquors this Appetite is weak ; we fee in Liquors, the Threding of them in Stillicides (as hath been faid) the falling of them in round drops (which is the form of Union) and the ftaying of them for a little time in Bubbles and Froth. In the fecond degree or kinde, this Appetite is ftrong; as in Iron, in Stone, in Wood, \&c. In the chird, this Appetite is in 2 Medium between the other two: For fuch Bodies do partly follow the couch of another Body, and partly ftick and continue to themfelives; and therefore they rope anddraw themfelves in threds, as we fee in Pitch, Glew, Birdime, ofc. Buinote, that all folid Bodies are cleaving more or lefs; and that they love better the touch of fome what that is tangible, than of Air. For Water in fmall quantity cleaveth to any thing that is folid, and fo would Metal too, if the weight drew it notoff. And therefore Gold Foliate, or any Metal Foliate, cleaveth: But thofe Bodies which are noted to be clammy, and cleaving, are fuch as have a more indifferent Appetite (at once) to follow another Body, and to hold to themielves. And therefore they are commonly Bodies ill mixed, and which take more pleafurc ina Foreign Body, that in preferving there own conffiftence, and which have little predominance in Drought or Miojfare.

TIme and Heat are fellows in many effects. Heat drieth Bodies that do eafily expire ; as Parchment, Leaves, Roots, Clay, \&c. And fo doth Time or Usearefie; as in the fame Bodies, be. Heat diffolveth and melteth Bodies that keep in their Spirits, as in divers Liquefations ; and fo doth Time, in fome Bodies of a fofter confiftence: As is manifeft in Honey, which bye Age waxeth more liquid, and the like in Sugar; and fo in old Oyl, which is ever more clear and more hot in medicinable ufe. Heat caufeth the Spirits to fearch fome iffue out of the Boty, as in the Volatility
of Mecals; and fodoth Time, as in the Ruft of Mecals. But generally Heat doth that in fmall time, which Age doth in long.

SOme things which pals the Fire, are fofteft at firf, and by Time grow 295. hard, as the Crum of Bread. Some are harder when they come fronithe Fire, and afterwards give again, and grow foft as the Crult of Bread, Bi.ker, Sweet-Meats, Salt, \&c. The caufe is, for that in thofe things which wax hard with Time, the work of the Fire is a kinde of melting; and in thore that wax foft with Time, (contrariwife) the work of the Fire is a kinde of Baking; and whatlocver the Fire baketh, Time doth in fome degree diffolve.

MOtions pals from one Man to another, not fo much by exciting Ima ${ }^{-1}$ gination as by Invitation, efpecially if there be an Aptnefs or Inclination before. Therefore Gaping, or Yawning, and Stretching, do pafs from Man to Man; for that that caufeth Gaping or Stretching is, when the Spirits are a little Heavy, by any Vapor, or the like. For then they ftrive (as it were) to wring out, and expel that which loaderh them. So Men drowzy and defirous to fleep; or before the fit of an Ague, do ufe to yawn and ftretch, and do likewife yield a Voice or Sound, which is an Interjection of Expulfion: So that if another be apt and prepared to do the like, he followeth by the fight of another. So the Laughing of another maketh to laugh:

THere be fome known Difeafes that are Infectious, and others that are not. Thofe that are infectious, are firft, Such as are chiefly in the Spirits, and not fo much in the Humors, and therefore pars eafily from Body to Body; fuch are Peftilences Lippitudes, and fuch like. Secondly, fuch as taint the breath, which we fee paffeth manifefly from Man to Man, and not invifible as the affects of the Spirits do ; fuch are Confumptions of the Lungs; \&c. Thirdly, Such as come forth to the skin, and therefore taint the Air, or the Body adjacent; efpecially, if they confift in an unctuous fubftance, not apt todiffipate; fuch are Scabs, and Leprofie. Fourthly, fuch as are meerly in the Humors, and not in the Spirits, Breath, or Exhalations: And therefore they never infect, butby touch onely; and fuch touch alfo, as cometh within the Epidermis, as the venome of the French Pox, and the biting of a Mad-Dog.

MOft Powders grow more clofe and coherent by mixture of Water, than by mixture of Oyl, though Oyl be the thicker Body; as Meal, ট゙c. The reafon is the Congruity of Bodies, which if it be more, makerh aperfecter imbibition, and incorporation; which in moft Powders is more be. tween them and Water, than between them and Oyl: But Painters colours grounds and afhes, do better incorporate with Oyl .

MUch Motion and Exercife is good for fome Bodies, and fitting and lef's motion, for others. If the Body be hot, and void of fuperfluous Moiftures, too much Motion hurteth; and it is an error in $\mathbf{P}$ lyypitians, to call too much upon Exercife. Likewife, Men ought to beware, that they ufe not Exercile, and a fpare diet, both; butif much Exercife; then a plentiful diet; and if fparing diet, then little Exercile. The Benefits that come of Exercife are. Firft, thatit lendeth nourifhment into the parts more forcibly.

Experiment Solitary, touching the Differing Ope rations of Fire, and Time.
296. Experiment Solitaiyr touching Motions by Imitation,
297. Experiment Solitary, touching $1 n$ fertious dif eafes.
298. Experiment Solitary touching the Incorporation of Powders and Liquors.
299. Experiment Solitary, touching Exercife of the sody.

## Natural Hifory;

Secondly, That it belperh to excern by Sweat, and fo maketh the parts affimilate the more perfectly. Thirdly, that it maketh the fubttance of the Body more folid and compact ; and fo lels apt to be confumed and deprcdated by the Spirits. The Evils that come of Exercite, are, Firft, That it maketh the Spirits more hot and predatory. Sccondly, That it doth abforbe likewife, and attenuate too much the moifture of the Body. Thirdly, That it maketh too great Concuffion,: (efpecially, if it be violent) of the in ward parts, which delight more in reft. Butgenerally Exercife, if it be much, is no friend to prolongation of life; which is one caufe, Why Women live longer then Men, becaure they fir lefs.
300. Experiment Solitary, touching. Meatt that in" duce Satiate.

SOme Food we may ufe long, and much, without gluting; as Bread, Flefh that is not Far, or Rank; \&c, Some other (though pleafant) gluttech fooner, as Swect-Meats, Fat-Meats, \&e. The caufe is, for that Appetite con. Giltech in the emptinefs of the Mouth, of the Stomach, or poffeffing it with fomc what that is aftingent; and therefore, cold and dry: But things that are /weet and far, are more filling, and do fwim and hang more about the Mouth of the Stomach, and go nor down fo fpeedily; and again turn fooner to Choler, which is hor, and ever abateth the appetite. We fee alfo, that another caufe of Satiety, is an Over-cuftom ; and of Appetite, is Novely. And therefore Meats, if the fame be continually taken, induce Loathing. To give the reafon of the diftafte of Satiety, and of the pleafure in Novelty, and to diftinguifh not onely in Meats and Drinks, but allo in Motions, Loves, Company, Delight, Studies, what they be that Cuftom maketh more grateful; and what more tedious, were a large Field. But for Mears, the caule is Attraction, which is quicker, and more excited towards that which is new, than towards that whereof there remaineth a relifh by former ufe. And (generally) it is a rule, That whatfoever is fomewhat ingrate at firt, is made grateful by Cuftom; but whatfoever is too pleafing at firt, growerh quickly to Satiate.

## Century IV.

Cceleration of Time; in Works of Nature; may well be efteemed Inter Magnalia $N_{\text {atura. }}$. And even in Divine Miracles Accelerating of the Time, is next to the Creating of the Matter. We will now therefore proceed to the enquiry of it; and for Acceleration of Germination, we will refer it over unto the place, where wefhall handle the Subject of Plants, generally; and will now begin with other Accelerations.
Liquors are (many of them) at the firt, thick and troubled; As Muff, Wort, Fuyce of Fruits, or Herbs expreffed, \&c. And by Time, they fettle and clarifie. But to make them clear, before the Time, is a great work; for it is a Spur to Nature, and putteth her out of her pace : And befides, it is of good ufe for making Drinks, and Sauces, Potable, and Serviceable, fpeedily. But toknow the Means of Accelerating Clarification, we muft firf know the caufes of Clarification. The firlt caufe is, by the Separation of the groffer parts of the Liquor, from the finer. . The feciond, by the equal diftribution of the Spirits of the Liquor, with the tangible parts; for that ever reprefenteth Bodies clear and untroubled. The third, by the refining the Spirit it felf, which thereby giveth to the Liquor more fplendor, and more luftre.
Firf, For Separation: It is wrought by weight; as in theordinary

Experiments in Confort, touching the clarification of Liquars, and the Accelarating theresf.
302.
$302:$ refidence or lettlement of Liquors. By Heat, by Motion, by Precipitation, or Sublimation, (that is, a calling of the feveral parts, either up or down, which is a kinde of Attraction,) by Adhefion; as when a Body, more vifcous, is mingled and agitated with the Liquor; which vifcous Body (afterwards fe-

## $\mathcal{N a t u r a l}$ Hifory;

vered) draweth with it the groffer parts of the Liquor: And laftly, by Percolation or Paffage.

Secondly, For the even Diftribution of the Spirits, it is wrought by gentle heat, and by Agitation of Motion; (for of Time we (peak not, becaufeit is that we would anticipate and reprefent $:$ ) And it is wrought allo, by mixture of fome other Body, which hath a vertue to openthe Liquor, and to make the Spirits the better pass thorow. by motion a by mixure of Body which hag like wife by Hear, by motion, and by mixure of So therefore (having fhewed the caules) for the accelerating of Clarification in general, and the enducing of it; takethefe Inftances and Tryals. we call Racking) whereby it will clarifie much the fooner : For the Lees, though they keep the drink in heart, and make it lafting; yet withal they caft up fome fpiffiude ; and this Inftance is to be referred toSeparation.

On the otherfide, it were good to try, what, the adding to the Liquor, more Lees than his own, will work; for though the Lees do make the Liquor turbide, yet they refine the Spirits. Take therefore a Veffel of new Beer, and take a nother Veflel of new Beer, and rack the one Veffel from the Lees, and pour the Lees of the racked Veffel into the unracked Veffel, and lee the effect. This Inftance is referred to the Refining of the Spirits.

Take new Beer, and put in fome quantity of ftale Beer into it, and fee whether it will not accelerate the Clarification, by opening the Body of the Beer, and cutting the groffer parts, whereby they may fall down into Lees. And this Inftance again is referred to Separation.

The longer Molt or Herbs, or the like, are infufed in Liqkor, the more thick and troubled the Liquor is; but the longer they be decocted in the Liquor, the clearer it is. The reafonis plain, becaufe in Infuifon, the longer it is, the greater is the part of the grofs Body that goeth into the Liquor:: But in Decoction, though more goeth forth, yet it either purgeth at the top, or fettleth at the bottom. And therefore the moft exact way to clarifie is, firft, to Infufe, and then to take off the Liquor and decoct it; as they do in Beer, which hath Molt firt infured in the Liquor, and isafterwards boiled with the Hop. This alfo is referred to Separation.

Takehot Embers, and put them about a Bottle filled with new Beer, almoft to the very neck; let the Bottle be well ftopped, left it flie out: And continue it, renewing the Embers every day by the fpace of ten days, and then compare it with another Bottle of the fame Beerfet by. Takealfo Lime, both quenched and unquenched, and fet the Bottles in them ut fupra.. This Inftance is referred, both to the even Diftribution, and allo to the Refining of the Spirits by Heat.

Take Bottles and fiving them, or carry them in a Wheel-Barrow upon rough Ground, twice in a day :- But then you may not fill the Bottlesfull, but leave fome Air; for if the Liquor come clofe to the ftopple, it cannot play nor flower: And when you have fhaken them well either way, pour the Drink in another Bottle, Ropped clofe after the ufual manner ; for if it ftay with much Air in it, the Drink will pall, neither will it fertle foperfectly in all the parts. Let it ftand fome Twenty four hours, then take it, and putit again into a Bottle with Air, ut fuprà ; and thenceinto a Bottle ftopped, ut fuprà; and forepeat the fame operation for feven days. Note, that in the emprying of one Bottle into another, you mult do it fwiftly, left the Drink
pall. It were good alfo to try it in a Bottle with a little air below the Neck without emptying. This Inftance is referred to the even Diftribution and Refining of the Spirits by cMotion.

As for Percolation, inward, and outward (which belongeth to Separation,) Tryal would be made of Clarifying by Adhefion, with Milk put into new Beer, and ftirred with it: For it may be, that the groffer part of the Beer will cleave to the CMilk; the doubt is, whether the Milk will fever well again, which is foon tried. And it is ufual in clarifying ippocraffe to put in Milk, which after fevereth and carcieth with it the groffer parts of the Ippocraß, as hath been faid elfwhere. Alfo for the better Clarification by Percolation'; when they Tun new Beer, they ufe to let it pafs through a Strainer; and it is like the finer the Strainer is, the clearer it will be.

THe Accelerating of CMaturation, we will now enquire of, and of Maturation it felf. It is of three natures, the CMatwration of Fruits, the Maturation of Drinks, and the Maturation of Impofthumes and Vleers. This laft we refer to another place, where we fhall handle Experinemts cMedicinal. There be alfo other Maturations, as of Metals, \&rc. whereof we fpeak as occafion ferveth. But we will begin with that of Drinks, becaufe it hath fuch affinity with the Clarification of Liquors.

For the Maturation of Drinks, it is wrought by the Congregation of the Spirits together, whereby they digeft more perfectly the groffer parts; and it is effected, partly by the fame means that Clarification is phereof we fake before :) But then note, that an extream Clarification doth (pred the Spirits fo fmooth, as they become dull, and the drink dead, which ought to have a little flowring, And therefore all your clear Amberdrink is flat.

We fee the degrees of Maturation of Drinks, in Muft, in Wine, as it is druak, and in Vinegar. Wherecf Mutt hath not the Spirits well congregated, Wine hath them well united, fo as they make the parts fomewhat more Oyly. Vinegar hath them congregated, but more Jejune, and in fmaller quantity; the greateft and fineft Spirit and part being exhaled: For we fee Vinegar is made by fetting the Veffel of Wine againft the hot Sun. And therefore Vinegar will not burn, for that much of the finer part is ex. haled.

The refrefhing and quickning of Drink palled or dead, is by enforcing the motion of the Spirit. So we fee that open weather relaxeth the Spitit, and maketh it more lively in Motion. We fee alfo Bottelling of Beer or Ale, while it is new and full of Spirit, (fo that it fpirteth when the ftopple is taken forth) maketh the Drink more quick and windy. A Pan of Coals in the Cellar, doth likewife good, and maketh the Drink work again. New Drink put to Drink that is dead, provokethit to work again: Nay, which is more (as fome affirm) a Brewing of new Beer, fet by old Beer, maketh it work again : It were good alfo to enforce the Spirits by fome mixtures, that may excite and quicken them, as by the putting into the Bottles, Nitre Chalk, Lime, \&c. We fee Cream is matured, and made to rife more fpeediiv by putting in cold Water; which, as it feemeth, getteth down the Whey.

It is tryed, that the burying of Bottles of Drink wellftopped, either in dry Earth, a good depth, or in the bottom of a Well within Water; and beft

Experiments in Confort, souching Maturatiois, and tine Accelevating thereof. And firf rouching the Matsration and 2uick. ning of drinks, and nex: soucking the Maturation of Frovits.

## $\mathcal{X}$ atural Hifory;

of all, the hanging of them in adeep Well fomewhat above the Water, for fome fortnights fpace, is an oxcellent means of making Drink frefh and quick: For the cold doth not caufe any exhaling of the Spiritsat all, as heat doth, though it ratifieth the reft that remain : But cold maketh the Spirits vigorous, and irritateth them, whereby they incorporate the parts of the Liquor perfectly.

As for the Maturation of Fruits, it is wrought by the calling forth of the Spirits of the Body outward, and fo fpreading them more finoothly; and likewife by digefting, in fome degree, the groffer parts: And this is effected by Heat, Motion, Attraction, and by a Rudiment of Putrefaction: For the Inception of Putrefaction hath in it a CMareration.

There were taken Apples, and laid in Straw, in Hay, in Flower, in Chalk, in Lime, covered over with Onions, covered over with Crabs, clofed up in Wax, fhut in a Box, \&c. There was alfo an Apple hanged up in fmoak. Of all which the Experiment forted in this manner.

After a moneths fpace, the Apple, enclofed in Wax, was as Green and frefh as at the firftputting in, and the Kernels continued White. The caufe is, for that all exclufion of open Air, (which is ever predatory) maintaineth the Body in his firft frefhnefs and moilture ; butthe inconvenience is, that it tafteth a little of the Wax, which, I fuppofe, in a Pomegranate, or fome fuch thick coated fruit, it would not do.

The Apple hanged in the fmoak, turned like an old Mellow-Apple wrinkled, dry, foff, fweet, yellow within. The caufe is, for that fuch a degree of heat, which doth neither melt nor fcorch (for we fee that in a greater heat, a roaft Apple fofeneth and melteth, and Pigs feet made of quarters of Wardens, feortch and have a skin of coal) doth Mellow, and not adure: The fmoak alfo maketh the Apple (as it were) fprinkled with Soot, which helpeth to mature. Wefee, that in drying of Pears and Prunes, in the Oven, and removing of them often as they begin to fweat, there is alike operation : but chat is with a far more intenfe degree of heat.

The Apples covered in the Lime and Afhes, were well matured as appeared both in their yellownefs and fweetnefs. The caufe is, forthat that Degree of Heat, which is inLime and A.fhes, (being a fmoothering heat) is of all the reft molt proper ; for it doth neither Liquefie nor Arefie, and that is true Maturation. Note, that the tafte of thole Apples was good, and therefore it is the Experiment fittelt for ufe.

The Apples covered with Crabs and Onions, were likew ife well matured. The caufe is not any heat, but for that the Crabs and the Onions draw forth the Spirits of the Apple, and fpred them equally thorowout the Body; which takech away hardnefs. So we fee one Apple ripeneth againft another. And therefore in making of Cider, they turn the Apples firft upon a heap; fo one Clufter of Grapes, that toucheth another whileft it groweth, ripeneth fafter. Botrus contra Botrums citius matreef cit.

The Apples in Hay and the Straw, ripened apparently, though not fo much as the other, but the Apple in the Straw, more. The caufe is, for that the Hay and Straw have a very low degree of Heat, but yet clofe and fmoothering, and which dryeth not.

The Apple in the clofe Box was ripened alfo. The caufe is, for that all Air kept clofe, hath a degree of warmth ; as we fee in Wool, Fur, Plufh, scc.
$\frac{\text { Century } I V}{}$

Take an Apple, or Pear; or other like Fruit, and roul it upon'a Table hard: We fee in common experience; that the rouling doth foften and fiveeten the Fruit prefently, which is nothing but the ímooth diftribution of the Spirits into the parts; for the unequal diftribution of the Spirits maketh the harriflhefs : But this hard rouling is between Concoction, and a fimple Maturation; therefore, if you fhould roul them but gently perhaps twice a day, and continue it fome feven days, it is like they would Maturemore finely, and like unto the Natural Maturation.

Take an Apple, and cut out a piece of the top and cover it, ito fee whether that Solution of Continuity will not haften a Maturation. We fee that where a $W_{\text {ajp }}$, or a Fly, or a Worms hath bitten in a Grapeor any Fruit, it will fiveeten hattily.

Take an Apple, trc. and prick it with a Pin full of Holes, not deep, and fmear it 2 little with Sack, or Cinnamon Water, or Spirit of Wine, every day for ten days, to fee if the Virtual Heat of the Wine, or StrongWaters, will not Mature it.

In thefe Tryals alfo as was ufed in the fryt, Set another of: the Same Fruits by, to compare them, and try then by tbeir Cellowneßß', and by their Sweemeß. $_{\text {S }}$.

THe W orld hath been much abufed by théopinion of Making of Gold. The Work it felf, I judge to be poffible; butt the Means (hitherto propounded) to effect it, are in the Practice, full of Error and Impofture; and in the Theory, full of unfound Imaginations. For to fay, that Nature hath an in ention to make all Metals Gold ; and that, if fhe were delivered from Impediments, fhe would perform her own'work; and that; if the Crudities, Impurities, and Leprofies of Metals weree cured, they would become Gold; and that a little quantity of the Medicine in the Work of Projection, will turn a Sea of the bafer Metal inte Gold by multiplying. All thefe are but dreams, and fo are many other Grounds of Ellchymy. And to help the matter, the Alchymifts call in likewife many wanitics, out of Affrology, Natural Magick, Superfitious lnterpretations of Scri ptures, Auricular Traditions, Feigned Teftimonies of Ancient Authors, and the like. It is true, on the other fide they have brought to light not a few profitable Experiments, and thereby made the World fome amends: But we, when we thall come to handle the $V$ erfion and $T_{\text {ranfinutation }}$ of Bodies, and the Experiments concerning Metals and Minerals; awill lay open the true Ways and Paffages of $N$ ature, which may lead to this great effect. And we commend the wit of the Chinefes, who defpair of.making of Gold, butare mad upon the making of Silver.: Forcertain it is, That it is more difficult to make Gold, (which is the mof ponderous) and materiate amongt Metals) of other Metals, lefs ponderous and lefs materiate, than (Via versâ) to make Silver of Lead, or Quick-filiver ; both which are more ponderous than Silver: So that they need rathera further degree of Fixation, than any Coidenfation. In the mean time, by occafion of handling the axioms touching CTaturatioiza, we will direct a tryal touching the Maturing of Metals, and thereby turning fome of them into Gold; for we conceive indeed, That a perfect good Concotion, or Difseffion, or Ma. turation of fome CMetals will produce Gold. And here we call to minde, that we knew a Dutchman that had wrought himfelf into the belief of a
great perfon, by undertaking, that he could make Gold: Whofe difcourfe was; That Gold might be made, but that the Alchymifs over-fired the work: For (he faid) the making of Gold did require a very temperate Heat, as being in Nature a fubterrany work, where little Heat cometh; but yet more to the making of Gold, than of any other Metal: And therefore, that he would do it with a great Lamp, that fhould carry a temperate and cqual Heat, and thatit was the work of many Moneths. The devife of the Lamip was folly, but the overfiring now ufed, and the equal Heat to be required, and the making it a work of fome good time, are no ill difcourfes.

We refort therefore to our $A x i o m s$ of $M$ aturation, in effect touched before.

The firt is, That there be ufed a Temperate Heat ; for they are ever Temperate Heats that Difgefts, and Mature; wherein we mean Temperate; according to the Nature of the Subject : For that may be Temperate to Fruits and Liquors, which will not work at all upon Metals.

The fecond is, That the Spirit of the Metal be quickned, and the Tangible Parts opened: For without thofe two operations, the Spirit of the Metal, wrought upon, will not be able to difgeft the Parts.

The third is, That the Spirits do fpred themfelves even, and move not fubfultorily, for that will make the parts clofe and pliant. And this requireth a Heat that doth notrife and fall, butcontinue as equal as may be.

The fourth is, That no part of the Spirit be emitted but detained: For if there be Emiffion of Spirit, the Body of the Metal will be hard and churlifh. And this will be performed, partly by the temper of the Fire, and partly by the clofenels of the Veffel.

The fifth is, That there be choice made of the likelieft and beft prepared Metal for the Verfion ; for that will facilitate the Work.

The fixth is, That you give time enough for the Work, not to prolong hopes (as the Alcbymifts do, but indeed togive Nature a convenient fpace to work in.

Thefe principles moft certain and true, we will now derive a direction of Tryal out of them, which may (perhaps) by further Meditation be improved.

Let there be a fmall Furnace made of a Tcmperate Heat; let the heat be fuch as may keep the Metal perpetually molten, and no more; for that above all, importech to the Work : Forthe Material, take Silver, which is the Metal, that in Nature, fymbolizeth moft with Gold; ; put in alfo, with the Silver a tenth part of Quick-filver, and a twelfth part of Nitre by weight: Both thefe to quicken and open the Body of the Meral; and foler the Work be continued by the fpace of Six Moneths, at the leaft. I wifh alfo, That there be as fometimes an Injection of fome Oyled Subftance; fuch as they ufe in the recovering of Gold, which by vexing with Separations hath been made churlifh: And this is, to lay the parts more clofe and fmooth; which is the main work. For Gold (as we fee) is the clofeft (and therefore the heavieft) of Metals; and is likewife the moft flexible and tenfible. Note, That to think to make Gold of Quick-filver becaufe it is the heavieft, is a thing not to be hoped; for Quick-filver will not endure the mannage of the Fire: Next to Silver, I think Copper were fitteft to be the Material.
Century $I \ddot{V}$

GOld hath theefe Natures: Greatnefs of VVeight; Clofeners of Parts, Fixation, Pliantnefs or Softnefs, Immunity from Kuft, Colour or Tincture of Yellow. Therefore the fure way (though moft about ) to make Gold, is to know the caitifes of the feveral Natures before rehcarifed, and the Axioms concerning the fame. For if a Man can make a Mctal that hath all thefe Properties; let Men dilpute; whether it be Gold, or no ?

THe Enducing and Accelerating of Putrefaction, is a fubject of a very Univetfal Enquiry. For Corruption is a Reciprocal to Generation; and they two are as Natures to Terms or Boundaries; and the Guides to Life and Death, Putrefaction is the VVork of the Spirits of Bodies, which ever are unquiet to get forth and congregate with the Air, and to enjoy the Sun-Beams. The getting forth, or fpreding of the Spirits, (which is a degree of getting forth) have five differing operations. If the Spirits be detained within the Body, and move more violently, therefolloweth Colliquation; as in-Metals, \&cc. If more mildely, there followeth Digeftion or Maturation ; as in Drinks and Fruits. It the Spirits be riot meerly detained; but Protrude a little, and that Motion be confufed; and inordinate, there followeth Putrefaction; which ever diffolveth the Confiftence of the Body into much inequality; as in Flefh, Rotten Fruits, Shining VVood, \&c. and alfo in the Ruft of Metals. But if that Motion be in a certain order, there followeth Vivification and Figuration; as both in Living Creatures bred of Putrefaction, and in Living Crearures perfect. But if the Spirits iffue out of the Body, there followeth Deficcarion, Induration, Confump. tion, \&c. As in Brick, evaporation of Bodies Liquid, \&c.

The Means to enduce and accelerate Purrefaction, are, Firf, By adding lome crude or watry moifture ; as in VVetting of any Flefh, Fruit, Wood, with Water, \&c. For contrariwife, UnCtuous and Oyly Subftances preferve.

The fecond is, By Invitation or Excitation; as when a retten Apple lieth clofe to another Apple that is found; or when Dung (which is a fubftance already purrified) is added to other Bodies. And this is alfo notably feen in Church-yards, where they bury.much; where the Earth will confume the Corps, in farthorter time than other Earth will.

The third is, By Clofenefs and Stopping, which detaineth the Spirits in Prifon, more then they would, and thereby irritatech them to feek iffue; as in Corn and Cloaths which wax multy ; and therefore open Air (which they call Aer perfabilis) doth preferve : And this doth appear more evidently in Agues, which come (moft of them) of obftructions and penning the Humors, which ther eupon Putrifie.

The fourth is, By Solution of Continuity; as we'fee an Apple will tot fooner, if it be cut or pierced, and fo will Wood, \&c. And to the Flefh of Creatures alive, where they have received any wound.

The fifth is, Either by the Exhaling, or by the driving back of the principal Spirits, which preterve the confiftence of the Body; fo that when their Government is diffolved every partreturneth tohis Nature, or Homogeny. And this appeareth in Urine and Blood, when they cool and thereby break. It appeareth alfo in the Gangreen or Mortification of Flefh, either by Ofiates, or by Intenfe Colds. I conceive allo, the fame cfie tit
is in Peftilences, for that the malignity of the infecting vapor, aaunreth the principal Spirits, and maketh them flie, and leave their Regiment; and then the Humors, Flefh, and Secondary Spirits, do diffolve and break, as in an Anarchy.

The fixth is, VVhen a Forreign Spirit, ftronger and more eager than the Spirit of the Body, entreth the Body, as in the ftinging of Serpents. And this is the caufe (generally) that upon all Poyfons followern Swelling; and we fee Swelling followeth alfo, when the Spirits of the. Body it felf congregare toc much; as upon blows and bruifes, or when they are pent in too much, as in Swelling upon Cold. And we fee alfo, that the Spirits coming of Putrefaction of Humors in Agues, \&c. which may be counted as Foreign Spirits, though they be bred within the Body, do extingurfh and tuffocateithe Natural I pirits and heat.
335. The feventh is, By fuch a weak degree of heat, as feteth the Sp:rits in a little Motion, but is not able either to digeft the parts, or to ifue the ' pirits, as is feen in Flefh kept ina room that is not cool; whereas in a cool and wet Larder it will keep longer. And we fee, that Vivification (whereof Putrefaction is the Baftard Brother) is effected by fuch foft heats; as the harching of Eggs, the heat of the VVomb, \&c.

The eighth is, By the releafing of the Spirits, which before were clofe kept by the folidnefs of their coveriure, and thereby their appecite of iffuing checked; as in the artificial rufts induced by Srrong waters in Iron, Lead, \&c. And therefore wetting haftneth Ruft or Putrefaction of anyrthing, becaufe it foftneth the Crult, for the Spirits to come forth.

The ninth is, By the enterchange of heat and cold, or wet and dry; as we fee in the Mouldring of Earth in Frofts, and Sun; and in the more hafty rotting of VVood, that is fometimes wer, fometimes dry.

The tenth is, By time, and the work, and procedure of the Spirits themfelves, which cannot keep their fation ; cfpecially, if they be lefr to themfelves, and therebe not Agitation or Local Motion. As we fee in Corn not ftirred, and Mens Bodies not exercifed.

All Moulds are Inceptions of Putrefaction; as the Moulds of Pyes and Flefh the Moulds of Orenges and Lemmons, which Moulds afterwards turn into VVorms, or more odious Putrefactions: And therefore (commonly) prove to be of ill odor. And if the Body be liquid, and nor apt to putrific torally, it will caft up a Mother in the top, as the Mothers of D.tilled waters.

Mofs is a kinde of Mold of the Earth and Trees: But if may be better fortedas a Rudiment of Germination, to which we refer it.

Experiments in Confort, touching Probibicing and Preventing Putre:. factions.

ITT is an Enquiry of excellent ufe to enquire of the Means of Preventing or Staying of Putrefaction; for therein confifterh the Means of Confervation of Bodies: For Bodies have two kindes of Diffolutions, the one by Confumption and Dificcation, the other by Putrefaction. Bur as for the Putrefactions of the Bodies of Men and Living Creatures (as in Agues, VVorms, Confumptions of the Lungs, Impofthums, and Ulcers, both in wards and outwards) they are a great part of Phyfick and Surgery: And therefore we will referve the Enquiry of them to the proper place, where we fhall handle Medicinal Experiments of all forts. Of the reft, we will now enter into an En. quiry, wherein much light may be taken from that which hath been faid of the Means to enduce or accelerate Putrefaction: For the removing that which caufed Putrefaction, doth prevent and avoid Putrefaction.
Century IV.

The firlt Means of prohibiting or checking Purrefaction is cold; for fo we fee that Meat and Drink will lale longer, unputrified, or unlowred, in Winter, than in Summer : And we fee that Flowers, and Fruits; put in contervatories of Snow, keep frefh. And this worketh by the Detention of the Spirits, and conftipation of the Tangible parts.

The fecond is Aftriction: For Aftriction prohibiterh Diffolution; as we lee (generally) in Medicines, whereof fuch as are Aftringents do inhibit Putrefaction: And by the fame reafon of Aftringency; rome fmall quantity of Oyl of Vitriol, will keep frefh water long from purrifying. And this Aftriction is in a fubftance that harh a virtual cold, and it worketh (partly) by the fame means that cold doth.

The thirdis, The excluding of the Air ; and again, the expofing to the Air : For thele contrarics, (as it cometh ofren to pafs) work the fame effect; according to the nature of the Subject-matter. So we fee, that Beer or Wine in Bottles clofe ftopped, laft long; that the Garners undes Ground keep Corn longer, than thofe above Ground; and that Fruit clofed in Wax, kecpeth frefh : And likewife, Bodies put in Honcy, and Flower, keepmore frefh: And Liquors, Drinks, and Juyces, with a little Oyl caft on the top, kecp frefh. Contrariwife, we fee that Cloath and Ap: parel, not aired, do breed Moaths and Mould ; and the Diverfity is, that in Bodies that need Detention of Spirits, the Exclufion of the Air doth good; as in Drinks, and Corn: But in Bodies that need Emiffion of Spirits, to difcharge fome of the fuperfluous moifture, it doth hurt; for they require airing.

The fourth is Motion, and Stirring; for Putrefaction askethReft: For

34 I
342.
$3: 43$. heat keepeth Bodies from Putrefaction; but a tepide heat enclineth them to Putrefaction : So a ftrong Spirit likewife preferveth, and a weak ot faint Spirit difpoleth to corruption. So we finde, that Salt-water corrupteth not to foon ass frefh; and lalting of Oyfters; and powdring of Meat, keepeth them from Purrefaction. It would be tryed alro, whether Chalk, putinto Water; or Drink, doth not preferve it from Putrifying, or Ípeedy Souring. So we fee that Strong-Beer will laft longer than fmall, and all things, that are hot and aromatical, do help to preferve Liquors, or Powders, \&c. which they do, as well by ftrengthning the Spirits, as by foaking out the loofe Moiture.

The fevench is, Separation of the cruder parts, and thereby making the Body more equal ; for all unperfect mixture is apt to putrifie, and Watry fubftances are more apt to purrifie, than oily: So, we fee diftilled Waters will laft longer than raw Waters, and things that have paffed the Fire, do laft longer thàn thofe that have not paffed the Fire ; as dried Pears, sxc.

The eighth is, The drawing forth continually of that part, where the Putrefation beginneth: Which is (commonly) the looje and Datry moiffure; not onely for the reafon before given, that it provoketh the radical moifture to come forth with it ; but becaufe being datained in the Body, the Putrefaction taking hold of it, infeqeth the reft : As we fee in the Embalming of Deid Bodics. And the fame reafon is, of preferving Herbs, or Fruits, or Flowers, in Bran or Meal.
$\therefore$ The ninthis, The commixture of any thing thatis more oyly ar fweet: For fuch Bodies are leaft apt to putrifie, the Air working little upon them, and they not putrifying preferve the reft. And therefore we fee Syrrups and Oyntments will laft longer than Juyces.

The tenth is. The commixtare of fomewhat that is dy ; for Putrefaction beginneth firft from the Spirits, and then from the moifture; and that that is dry, is unapt to putrifie. And therefore fmoak preferveth flefh; as we fee in Bacon, 'and Neats-Tongues, and CTLartlemas-Beef, ơr.

The opinion of fome of the Ancients. That blown Airs do preferve Bodies longer than other Airs, feemeth to me probable ; for that the blown Airs; being over-charged and compreffed, will hardly receive the exhaling of any thing, but rather repulfe it. It was tryed in a blown Bladder, whereinto flefh was put, and likewife a Flower, and it forted not : For dry Bladders will not blow, and neiw Bladders rather further Putrefaction. The way were therefore, to blow ftrongly with a pair of Bellows; irto a Hoghead, putting into the Hoghead (before) that which you would have preferved; andin the inftant that you withdraw the Bellows, ftop the hole clofe.

THe Experiment of Wood that fhineth in the dark, we have diligently driven and purfued: The rather, for that of all things that give light here below, it is the mont durable, and hath leaft apparent motion. Fire and Flame are in continual expence; Sugar Thining onely while it is in fcraping; and Salt-water while it is in dafhing, Gloworms have their fhining while they live, or a little after; onely Scales of Fifhes (putrified) feem to be of the fame nature with fhining Wood. And it is true, that all Putrefaction hath with it an inward motion, as well as Fire or Light. The tryal forted thus.
I. The fhining is in fome pieces more bright, in fome more dim; but the moft bright of all doth not attain to the light of a Gloworm. 2. The Woods that have been tryed to fhine, are chiefly Sallow and Willow; alfo, the Ah and Hane, it may be, it holdeth in others. 3. Both Roots, and Bodies do fhine. but the Roats better. 4. The colour of the Thining part, by day-light, is in fome pieces white, in fome pieces inclining to red; which in the Country they call the White and Red Carret. 5. The part that fhincth, is (for the moft part) fomewhat foft, and moift to feel to ; bur fome was found to be firm and hard; fo as it might be figured into a Crofs, or into Beads, \&cc. But you muft not look to have an Image, or the like, in any thing that is Lightfom ; for even a Face in Iron red hot,

| Century IV. |  |
| :---: | :---: |
|  | will not be feen, the light confounding the fmall differences of lightome and darkiome, which fhew the figure. <br> 6. There was the fhining part pared off, till you came to that, that did not thine; but within two days the part contiguous began alfo to thine, being laid abroad in the Dew ; foas it reemeth the putrefaction fpredeth. <br> 7. There was other dead Wood of like kinde that was laid abroad, which fhined not at the firft; but after a nights lying abroad, begin to Chine. 8. There was other Wood that did firt Thine, and being laid dry in the Houfe, within five or fix days loft the fhining; and laid abroad again, recovered the Chining. 9. Shining Woods beinglaid in a dry room, within a feven night loft their fhining; but being laid in a Cellar, or dark room, kept the fhinıng. io. The boring of holes in that kinde of Wood, and then laying it abroad, feemeth to conduce to make it fhine; the caufe is, for that all folution of continuity, doth help on purrefaction, as was touched before. II. No Wood hath been yet tryed to fhine that was cut downalive, but fuch as was rooted both in Stock and Root while it grew. 12. Part of the Wood that thined, was fteeped in Oyl and retained the fhining a fortnight. 13. The likefucceeded in fome fteepedin Water, and much better. 14. How long the fhining will continue, if the Wood belaid abroad every night, and taken in and fprinkled with Water in the day, is not yet tryed. 16. Tryal was made of laying it abroad in frolty weather, which hutt it not. 16. There was a great piece of a Roor, which did fhine, and the fhining part was cut off, till no more fhined 3 yet after two nights, though it were kept in a dry Room, it got a thining. |

THe bringing forth of Living Creatures may be accelerated in two refpects: The one, if the Embryon ripenerh and perfecterh fooner ; the other, if there be fome caule from the Mothers Body of Expulfion or puting it down: Whereof the former is good, and argueth ftrength; the latter is ill, and cometh by accident or difeafe. And therefore the Ancient oblervation is true, that the Cbilde born in the Seventh CMoneth, doth commonly well ; but Born in the Eighth CMonth, doth (for the moft part) die. But the caufe affigned is fabulous, which is, That in the Eighth Moneth Chould be the return of the reign of the Planet Saturn; which (as they fiy) is a Planet malign; whereas in the Seventh is the reign of the CWion, which is a Planet propitious. But the true caufe is, for that where there is fo great a prevention of the ordinary time, it is the luftinefs of the Childe; but when it is lefs, it is fome indifpofition of the Mother.

TO Accelerate Growth or Stature, it muft procced; Either from the Plenty of the Nourifhment, or from the Nature of the Nourifhment, or trom the Quickning and Exciting of the Natural hear. For the firft, Excers of Nourifhment, is hurfful; for it maketh the Childe corpulent; and grow. ing in breadth, rather than in height. And youmay take an Experiment from Plarts; which if they fpred much; are feldom tall. As for the Nature of the Ncurifhnment ; Firft, it may not betoodry, and therefore Children in Dairy Countreys do wax more tall, than where they feed more upon Bread and Floth. There is allo a received tale, that boyling of Dafie-Roots in Milk (which it is certain are great dryers) will make Dogs little. But fo much is true, That an over-dry Nourifhment in Childhood putcech back Stature. Secondly, The Nourifhment mult be of an opening

Nature ; for that attenuateth the Juyce, and furthereth the Motion of the Spirits upwards. Neither is it without caufe, that Xenophon in the Nouriture of the Perfoan (bildren, doth fo much commend their feeding upon Cardamon, which (he faith) made them grow better, and be of a more active habit. Cardanow is in Latin, Nafturtium, and with us Water-creffes; which, it is certain, is an Herb, that whilft it is young, is friendly to Life. As for the quickning of Natural Heat, it muft be done chiefly with exercife; and therefore ( no doubt) much going to School, where they fit fo much, bindereth the growth of Children; whereas Countrey-People, that go not to School, are commonly of better ftature. And again, Men muift beware how they give Children any thing that is cold in operation; even long fucking doth hinder both Wit and Stature. This hath been trycd, that a Whelp that hath been fed with Nitre in cMilk, hath become very little, but extream lively: For the Spirit of Nitre is cold. And though it be an excellent Medicine in ftrength of years for Prolongation of Life; yet it is in Children and young Creatures an enemy to growth ; and all for the ame realon, For Heat is requifite to Growth. But after a Man is come to his middle age, Heat confumeth the Spirits; which the coldnefs of the Spirit of Nitre doth help to condence and correct.

Experiments in Confort, touching Sulphure and Merchry, two of Paracelfus Principles.

THere be two great Families of Things, you may term them by feveral names, Sulphureous and CMercural, which are the Cbymits, words: (For as for their Salts which is their third Principle, it is 2 Compound of the other two,) Infamable, and Not Inflamable; CWature and Crude, Oily and Warry: For we fee that in Subterranies thereare, as the Fathers of their Tribes, Brimftone and Mercury ; In Vegetables and Living Creatures, there is Water and Oyl ; in the Inferior order of Pneumaticals, there is Air and Flame; and in the Superior, there is the Body of the Star, and the Pure Skey. And thefe Pairs, though they be unlike in the Primitive Differences of Matter, yet they feem to have many confents; for Mercury and Sulphure are principal materials of Metals; Water and Oyl are principal materials of Vegetables and Animals, and feem to differ but in Maruration or Concoction. Flame (in Vulgar Opinion) is but Air incenfed, and they both have quicknets of Motion, and facility of Ceffion, much alike: And the Interftellar 5 key, (though the opinion be vain, that the Star is the Denfer Part of his Orb,) hathnotwithftanding fo much affinity with the Star, that there is a rotation of that, as w. 11 as of the Star. Therefore, it is one of the greateft Magnalia Natura, to turn Water or Watry Juyce into Oyl or Oyly Juyce: Greater in Nature, than to turn Silver or Quick-filver into Gold.

The Inftances we have wherein Crude and Watry Subftance, turneth into Fat and Oyly, are of four kindes. Firft, In the Mixture of Earth and Water, which mingled by the help of the Sun, gathered a Nitrous Fatnefs, more than either of them have feverally; As we fee, in that they put forth Plants, which need both Juyces.

The fecond is in the Affimilation of Nourifhment, made in the Bodies of Plants, and Living Creatures; whereof Plants turn the Juyce of meer Water and Earch, into a grear deal of Oyly matter: Living Creatures, though much of their Fat, and Flefh, are out of Oyly Aliments, (as Meat, and Bread,) yet they affimilate alfo in 2 meafure their Drink of Water,
 Mixture and by Affimilation) are by many Paffages, and Percolations, and by continuance of foft Heats, and by circuits of 1 ime?

The third is in the Inception of Putrefaction ; as in Water corrupted, and the Mothers of Waters diftilled, both which have a kinde of Fatnels or Oyl.

The fourth is in the Dulcoration of fome Metals; as Sacchartim SaDigeftion: For Oy 1 is almoft nothing elfe but Water digefted and this Digeftion is principally by Heat ; which Hear muft be either outward or inward. Again, It may be by Provocation or Excitation, which is caufed by the mingling of Bodies already Oyly or Digetted, for they will fomewhat communicate their Nature with the reft. Digeftion allo is ftrongly effeted by direct Affimilation of Bodies Crude into Bodies digefted ; as in Plants and Living Creatures, whofe nourifhment is far more Crude than their Bodies. Butthis Digeftion is by a great compafs as hath been faid. As for the more full handling of thefe two principles, whereof this is but a talte; (the enquiry of which, is one of the profoundeft enquiries of Na ture, we leave it to the title of Verfion of Bodies; and likewife to the title of the Firft Congregations of Matter, which like a General Affembly of Eftates, doth givc Law to all Bodics.

AChamelion is a Creature about the bignefs of an ordinary Lizaid, his Head unproportionably big, his eyes great; he moveth his Head without the writhing of his Neck (which is inflexible) as a Hog doth: His Back crooked, his Skin fpotted with little Tumors, lefs eminent nearer the Belly, his Tail flender and long; on each Foot he hath five Fingers; three on the outfide, and two on the infide; his Tongue of a marvellous length, in refpect of his Body, and hollow at the end, which he will lanch out to prey upon Flies. Of colour Green, and of a dusky Yallow, brighter and whiter towards the Belly, yet fpotted with Blew, White, and Red. If he be laid upon Green, the Green predominateth; if upon Yellow, the Yellow; not fo, if he be laid upon Blew, or Red; or White, onely the Green fpots receive a more orient luftre ; laid upon Black, he looketh all Black, though not without a mixcure of Green. He feedeth not onely upon Air, (though that be his principal fuftenance;) for fometimes he taketh Flies, as was faid; yet fome that have kept Chamelions 2 whole year together, could never perceive that ever they fed upon any thing elfe but Air, and might obferve their Bellies to fivell after they had exhaufted the Air, and clofed their Jaws, which they open commonly againft the Rayes of the Sun. They have a foolifh Tradition in Magick, that if a Chamelion be burnt upon the top of an Houfe, it will raife a Tempeft, fuppofing (according to their vain Dreams of Sympathies) becaufe he nourifheth with Air, his Body thould have great vertue to make impreffion upon the Air.

1
T is reported by one of the Ancients, that in part of Media, there are eruptions of Flames out of Plains, and that thofe Flames are clear, and calt not forth fuch fmoak, and'afhes, and pumice, as Mountain Flamesdo. The reafon (no doubr) is, becaufe the Flame is not pent, as it is in Mountains, and Earthquakes which caft Flame: There be alfo fome blinde Fires,
360. Experiment Solitary, touchifg Chamelivins:

## Natural Hifory;

underStone, which flame not out, but Oyl being poured upon them; they flame out. The caufe whereof is, for that it feemeth the Fire is fo choaked, as not able to remove the Stone, it is heat rather than flame, which neverthelefs is fufficient the enflame to $\mathbf{O y l}$.

I$T$ is reported, that in fome Lakes the Water is fo Nitrous, as if foul Cloaths be put into it, it froureth them of it felf: And if chey ftas any whit long they moulder away. And the fcouring Vertue of Nitre is the more to be noted, becaule it is a Body cold; and we fee warm Water fcoureth better than cold. But the caufe is, forthat it hath a fubtal Spirit, which fevereth and divideth any thing that is foul, and vifcous, and ficketh upona Body.
363. Experiment Solitary, touching Congealing of Sir.
364. Experiment Solitary, touching Congeating of Water into Chryfal.
$365:$ Experiment Solitary, touching Preferving of Rofe Leaves, both in Colosr and Smelb.

TAke a Bladder, the greateft you can get ; full it full of Wind, and tye it about the Neck with a Silk thred waxed ; and upon that likewife Wax very clofe; fo that when the Neck of the Bladderdrieth, no Air may poffibly get in nor out. Then bury itthree or four foot under the Earth, in a Vault, or in a Confervatory of Snow, the Snow being mad ehollow about the Bladder ; and after fome fortnights diftance, fee whether the iladder be fhrunk: Forif it be, then it is plain, that the coldnefs of the Earth or Snow, hath condenfed the Air, and brought it a degree nearer to Water : Which is an Experiment of great confequence.

IT is a report of fome good credit, that in deep Caves there are Penfile Chryftal, and degrees of Chryftal that drop from above, and in fome other (though more rarely) that rife from below. Which though it be chiefly the work of cold, yet it may be, that Water that paffeth thorow the Earth. gathereth a Nature more clammy, and fitter to congeal, and become folid than Water of it felf. Therefore tryal would be made to lay a heap of Earth in great Frofts, upon a hollow Veffel, putting a Canvafe between, that it falletio not in ; and pour Water upon it, in fuch quantity as will be fure to foak thorow, and fee whecher it will not make an harder Ice in the bottom of the Veffel, and lefs apt to diffolve than ordinarily. I fuppofe alfo, that if you make the Earth narrower at the bottom than at the top, in falhion of Sugar Loaf reverfed, it will help the Experiment. For it will make the Ice, where it iffueth, leff in bulk; and evermore fmallnefs of quantity is a help to Verfion.
T Ake Damask Rofes and pull them, then dry them upon the top of an Houle, upon a Lead or Tarras in the hot Sun, in a clear day, between the hours (onely) of Twelve and two or thereabouts. Then put them into 2 fweet dry Earthen Bottle or a Glafs with narrow mouths, fuiffing them clofe together, but without bruifing : Stop the Botte or Glafs clofe, and thefe Rofes will retain, not onely ther fmell perfeat, bur their colour frefh for a year at leale. Note, that nothing doth fo much deftroy any Plant, or other Body, either by $\mathcal{P}^{\prime}$ utrefation, or Arefaction, as the Adventitious croifure, which hangect loofe in the Body, if it be not drawn ourt. For it betrayeth and tolleth forth the Innate and Radicall Moifture along with it when it felf goeth forth. And therefore in Living Creatures, moderate fweat doth preferve the Juyce of the Body. Note, that: thefe Rofes when you take them from the drying, have little

|  | Century $V_{0}$ | 81 |
| :--- | :--- | :--- |

or no fmell; fo that the fmell is a fecond fmell that iffueth out of the Flower afterwards.

THe continuance of Flame, according unto the diverfity of the Body enflamed, and other ci cumftances; is worthy the enquiry ; chiefly, for that though Flame be (almoft) of a momentany lafting, yet it receiveth the More, and the Lefs: We will firft therefore fpeak (at large) of Bodies enflamed, wholly, and immediately, without any Wiek to help the Inflammation. A fpoonful of Spirit of Wine, a little heated, was taken, and it burnt as long as came to rit Pulfes. The fame quantity of Spirit of Wine, mixed with the fixth part of a foonful of Nitre, burnt but to the fpace of 94 Pulfes. Mixed withthe like quantity of Bay-Salt 83 Pulfes. Mixed with the like quantity of Gun-powder, which diffolved into a Black-water 110 Pulfes. A Cube or Pellet of Yellow Wax, was taken, as much as half the Spirit of Wine, and fet in the midft, and it burnt onely to the fpace of 87 Pulfes. Mixed with the fixth part of a poonful of Milk, it burnt to the fpace of roo Pulfes; andthe Milk was crudled. Mixed with the fixth part of a poonful of Water, it burnt to the fpace of 86 Pulfes; with an equal quantity of Water, onely to the fpace of four Pulles. . A fmall Pebble was laid in the midft, and the Spirit of Wine burnt to the Cpace of 94 Pulfes. A piece of Wood of the bignefs of an Arrow, and about a Fingers length, was fet up in the midid, and the Spirit of Wine burnt to the fpace of 94 Pulfes. So that the Spirit of Wine Simple, endureth the longeft, and the Spirit of Wine with the Bay-falt, and the equal quantity of Water, were the fhorteff.

Confider well, whether the more fpeedy going forth of the Flame, be caufed by the greater vigor of the Flame in burning; or by the refiftance of the Body mixed, and the averrion thereof to take Flame: Which will appear by the quantity of the Spirit of Wine, that temaineth afterthe going out of the Flame: And it feemeth clearly to be the latter, for that the mixture of things leaft apt to burn, is the fpeedieft in going out, and note by the way, that Spirit of Wine burned, till it go out of it felf, will burn no more, and tafteth nothing to hot in the mouth as it did; no nor yet four, (as if it were 2 degree to wards. Vinegar) which burntWine doth, but flat and dead.

Note, that in the Experiment of Wax aforefaid, the Wax diffolved in the burning, and yet did not incorporate it felf with the Spirit of Wine, to produce one Flame; but whereloever the Wax floated, the Flame forfook it; till at laftit fpred all over. and put the Flame quite out.

The Expcriments of the Mixtures of the Spirit of Wine enflamed, are things of difcovery, and not of ufe : But now we will fpeak of the continuance of Flames, fuch as are ufed for Candles, Lamps, or Tapers, confiting of Inflamable Matters, and of a Wiek that provoketh Inflamation. And this importeth nct onely difcovery, but alfo ufe and profit; for it is a great faving in all fuch Lights, if they can be made as fair and right as others, and yet laft longer. Wax pure made into a Candle, and Wax mixed feverally into Candle-ftuff, with the particulars that follow, (Viz. Water, © Squas-vites, CWilk, Bay-Salt, Oyl, Butter, $\mathrm{N}^{2}$ itre, Brimfoone, Sawd duft, every of thefe bearing a fixth part to the Wax; and every of thefe Candles mixed, being of the fame weight and wiek, with the Wax pure, proved thus in the burning, and lafting. The livifeeft in confuming was that with Sawduft, which firft burned fair till fome part of the Candle was confumed,
366. Experiments in Confort, touching the Continuance of Flame.
and the dult gathered bout the fnafte, ; but then it made thie fnalte big, and long, and to burn duskithly, and the Candle wafted in half tie time of the Wax pure. The next in fwiffinefs. were the Oyl and Butter, which confumed by a fifth part fwifter thian the pure Wax.. Then followed in fwiftelis the clear Wax ic felf; then the Bay-falt, which lafted about an eight part longer than the clear Wax ; then followed the e $A$ yut-vita, which lafted about a fifth part longer than the clear. Wax ; then follow the Milk and Water, with little difference from the Aquävita, but the Water floweft. And in thefe four laft, the VViek would fpie forth little (parks: For the Nitre, it would not hold lighted above fome twelve Pulfes : But all the while it would fit out portions of Flame, which afterwards would go out into a vapor. $v^{\dagger}$ For the Brimftone, it would hold lighted much aboutchefame with the Nitre; but then after a little while, it would harden and cake about the fnafte : So that the mixture of Bay-falc with VVax, will winaneighth part of the time of lafting, and the VVater 2 fifth.

After the feveral materials were tryed, Tryal was likewife made of feveral VVieks; as of ordinary cotten, sowing Thred, Ru/b, Silk, Stran, and $W_{\text {ood. }}$ The silk, Straw, and Wood, would flame alitele, till they came to the Wax, and thengo out; of the other three, the. Thred confumed fafter than the Cotten, by a fixth part of time; the Cotten next; then the Rufth confumed flower than the Cotton, by at leaft a thitd part of time. For the bignefs of the Flame, the Cotton, and Thred, caft a Flame much alike, and the Rufl much lefs and dimmer. 2uare, whether VVood and VVieks both, as in Torches confume fafter, than the VVieks Simple?
to the lafting of the Flame, it importeth alfo, not onely, what the material is, but in the fame material, whecher it be hard, foft, old, new, \&c. Good Houfwives to make their Candles burn the longer, ufe to lay them (one by one) in Bran or Flower, which make them harder, and fo they confume the flower. Infomuch, as by this means they will out-laft other Candles of the fame ftuff, almoft half in half. For Bran and Flower hive a vertue to harden, fo that both age, and lying in the Bran doth help to the lafting. And we fee that VVax Candles laft longer then Tallow-Candles, becaufe VVax is more firm and hiard:

The lafting of Flame alfo depenoeth upon the eafie drawing of the Nourifhment; as we fee in the Court of Eugland; there is a fervice which they call $A l l-N i g h_{n}$; which is (as it were) a great Cake of Wax, with the Wiek in the midit; whereby it cometh to pafs, that the Wiek fetcheth the Nourifhment further off. We fee allo, that Lamps latt longer, becaufe the Veffel is far broader than the breadth of a Taper or Candle.

Take a Turreted Lamp of Tin made in the form of a Square; the height of the Turret, being thrice as much as the length of the lower part, whereupon the Lamp ftandeth; make onely one hole in it, at the end of the remurn furtheft. from the Turret. Reverfe it, and fill it full of Oy!, by that hole; and then fet it apright again, and put a Wiek in'at the hole, and Jighten it : You fhall finde that ir will burn flow, and a long time: Which is cauled (as was faid laft before) for that the Flame fetcheth the Nourifh. ment a far off. You fhall finde alfo, that as the Oyl walteth and defcendeth, fo the top of the Turret, by little and litile filleth with Air; which is cauled by the Rarefaction of the Oyl by the heat. It were worthy the obfervation to make a hole, in the top of the Turret, and to try, when
the Oyl is almoft confumed; whether the Air made of the Oyl , if you put to it a flame of a Candle, in the letting of it forth, will enflame. It were good alfo to have the Lamp made, not of Tin, but of Glafs; that you may fec how the Vapor or Air gathereth by degrees in the top.

A fourth point, that importeth the lafting of the Flame, is the clofenefs of the Air, wherein the Flame burneth. Wefee, that if Wind bloweth upon a Candle, it watteth apace; we fee alfo, it lafteth longer in a Lanthorn, than at large. And there are Traditions of Lamps and Candles, that have burnt a verylong time in Caves and Tombs.

A fifth point, that importeth the lafting of the Flame, is the Nature
of the Air where the Flame burneth; whether it be hot or cold, moift or dry. The Air, if it be very cold, irritateth the Flame, and maketh it burn more fiercely, (as Fire fcor heth in Frofty weather) and fo furthereth the Confumption. The Air once heared; (I conceive) maketh the Flame burn more mildly, and fo helpeththecontinuance. The Air, if it be dry, is indifferent; the Air, if it be moift, doth in a degree quench the Flame, (as we fee Lights will go out in the Damps of Mines ;) and howloever maketh it burn more dully, and fohelpeth the continuance.

B
Urials in Earth Cerve fur Prefervation, and for Condenfation, and for Induration of Bodies. "And if youintend Condenfation or Induration, you may bury the Bodies fo, as Earth may touch them; as if you would make Artificial Procellane, \&xc. And the like you may do for Confervation, if the Bodies be hard and rolid, as Clay, Wood, \&c. But if you inten' Prefervation of Bodies, more foft and tender, then you muft do one of thefe two: Eicher you muft putthem in cafes, whereby they may not touch the Earth; or elfe you muft Vault the Earth, whereby ir may hang over them, and not touch them: For if the Earth touch them; it will do more hurr by the moifture, caufing them to putrifie, than good by the virtual cold, to conferve them, except the Farth be very dry and fandy.

An Orenre, Lemmon, and Apple, wràpt in a Linning Cloth, being buried for a fortnights fpace four foot deep within the Earth, though it were in a moift place, and a rainy time; yet came forth no ways mouldy or rotten, but were become a little harder than they were, otherwife frefh in their colour, buttheir Juyce fomewhat flatted. But with the Burial of a fortnight more, they become putrified.

A Bottle of Beer buried in like manner as before, became nore lively, better tafted, and clearer than it was: And a Bottle of Wine, in like manner. A. Bottle of Vinegar fo buried, came forth more lively and more odoriferous, fmelling alnoft like a Violet. And after the whole Moneths Burial, all thethree came forth as frefh and lively, if notbetter than before.

It were a profitable Fxperiment, to preferve Orenges, Lemmons, and Pomgranates, till Summer ; for then their price will be mightily encreafed. This may be done, if you put them in a Pot or Veffel well covered. that the moifture of the Earth come not at them ; or elfe by putting them in a Confervatory of Snow. And generally, whofoever will make Experiments of Cold, lethimbe provided of three things, a Confervatory of Snow, a good large Vault, twenty foot at leaft under the Ground, and 2 deep Well.

There

## $\mathcal{N a t u r a l}$ Hifory;

There hath been a Tradition, that Pearl, and Coral, Surchois-Stone, that have loft their Colours, may be recovered by burying in the Earth; which is a thing of great profit, if it would fort : Butupon tryal of fix weeks Burial, there followed no effect. It were good to try it in a deep Well, or in a Confervatory of Snow, where the cold may be more conftringent ; and fo make the Body more united, and thercby. more refplendent.
381.

MEns Bodies are heavier and lefs difpofed to Motion when Southern Winds blow, then when Northern. The caufe is, for that when the Southern Winds blow, the Humors do (in fome degree) melt, and wax fluide, and fo flow into the parts; as it is feen in Wood, and other Bodies, which when the Southern Winds blow, dofwell. Befides, the Motion and Activity of the Body confifteth chiefly in the finews, which, when the Southern Wind bloweth, are more relax.

IT is commonly feen, that more are fick in the Summer, and moredye in the Winter ; except it be in Peftilent Difeales, which commonly reign in Summer or Autumn. The reafon is, becaufe Difeafes are bred (indeed) chiefly by Heat; but thenchey are cured moft by Sweat and Purge, which in the Summer cometh on, or is provoked more eafily: As for Peftilent Difeafes, the Reafon why moft dye of them inSummer, is becaulethey are bred moft in the Summer; for otherwife, thofe that are touched are in moft danger in the Winter.

THe general opinion is, That Yearshot and moif, are moft Peftilent ; upon the fuperficial Ground, that Heat and Moifture caule Putrefaction. In England it is found not true; for, many times, there have been great Plagues in dry years. VVhereof the caule may be, for that drought in the Bodies of Inlanders, habituate to moif Airs, doth exafperate the Humors, and maketh themmore apt to Putrifie or Enflame; befides, it tainteth the VVaters (commonly) and maketh them lefs wholfome. And again in Barbary, the Plagues break up in the Summer-Moneths, when the VVeather is hot and dry.
384. Experiment Solitary,

MAny Difeafes, (both Epidemical and others) break forth at particular times. And the caufe is fally imputed to the conftitution of the Air, at that time, when they break forth or reign; whereasit proceedeth (indeed) from a Precedent Sequence, and Series of the Seafons of the Year: And therefore Hippocrates, in his Prognofticks, doth make good obfervations of the Difeafes, that enfue upon the Nature of the precedent four Seafons of the Year.

TRyal hath been made with Eartien Bottles, well ftopped, hanged in a VVell of Twenty Fathom deep, at the leaft; and come of the Bottles have been let downintothe VVater, fome others have hanged above, within abouta Fathom of the V Vater; and the Liquors fo tryed have been, Beer, (not new, but ready for drinking) and VVine, and Milk. The proof hath been, that both the Beer, and the VVine, (as well within VVater, as above) have not been palled or deaded at all; but as good, or fomewhat better than Bottles of:the fame Drinks and ftalenefs, kept in a Celler. But thofe which did hang above V Vater, were apparently the beft ; and that Beer did.
flower a litcle; whereas that under Water did nor, chough it were frefh. The Milk foured, and began to purrific. Neverthelefs it is true, that there is a Village near Blois, where in deep Caves they do thicken Milk, in fuch fort, that it becometh very pleafant; which was tome caufe of this tryal of hiang. ing Milk in the Well: But our proof was naught, neither do I know, whether that Milk in thofe Caves be firft boyled. It were good therefore to try it with Milk fodder, anid with Cream ; for that Milk of it felf, is fuch a Compound Body of Cream, Cruds, and Whey, as it is eafily turned and diffolved. It were good alfo to try the Beer, when it is in Wort, that it may be feen, whecher the hanging in the Well, will accelerate the ripening and clarifying of it.

DIvers, we fee, doStut. The caufe may be (in moth) the Refrigeration of the Tongue, whereby it is lefs apt to move; and therefore wefee, that Naurals do generally Stut: And wefee, that in thofe that Stut, if they drink Wine moderately, they Stut lefs, becaufe it heateth: And fo we fee, that they that Stat, do Sut more in the firte offer to fpeak, than in continuance; becaufe the Tonguc is, by motion, fomewhat heated. In fome allo, it may be (though rarely) the drynefs of the Tongue, which likewife maketh it lefs apt to move as well as cold; for it is an affet ihat cometh to fome wife and greatMen, as it did unco Mofes, who was Lingua Prapedita: And many Stutters (we finde) are very Choplerick Men, Choler enducing a drynefs in the Tongue.

SMells, and other Odors, are fweeter in the Air, at fome diftance, than near the Nofe; as hath been partly touched héretofore. The caufe is double, firft, The finer mixture, or incorpotation of the Smell. For we fee, that in Sounds like wife, they are fweeteft, when we cannot hear every part by it felf. The cther reafon is, For that all (weet Sméls have joyned with them fome Eatthy or Crude Odors ; and af fome diffance the Sweet, which is the more (pirilual, is perceived; and the Earthy reachech not fo far:

Sireet Smells are moft forcible in dry Subfances, when they are broken; and folike wile in Orenges or Lemmons, the nipping off thcir Rinde, giveth out their fmell more: And generally, when Bodies are moved or Airred, though not broken, they fmell more, as a Sweet-Bag waved. The caufe is double; the one, for that there is a geater emiffion of the Spirit, when way is made: And this hoidet. in the Breaking, Nipping, or Crufhing ; it holdeth alfo, (in fome degree) in the Moving. Butin this laft, there is a concurrence of the econd caufe, which is the Impulion of the Air, that bringeth the fent fafter upori us.

Tne daintieft fmells of Flowers, are our of thofe Plants whofe Leaves Imell not; as Violets. Rofes, Wall-fowers, Gilly flowers, pincks, Wood-bine, Vine. Aowers, Apple-blooms, Limetree blooms, Bean-bloons, ©̛c. The caufe is, for that where there is heat and ftrength enough in the Plant to make the Leaves odorate, there the fmell of the Flower is rather evanide and weaker, than that of the Leaves; as it is in Rofemary-fopwers, Lavender-fopmers, and Strect-Brier Rofes: But where there is lefs heat, there the Spirit of the Plant is digefted and refined, and fevered from the groffer Juyce in the Efflorefeence, and not before.

Moft Odors fmell beft, broken, or crufht, as hath been faid; but Flowers preffed or beaten, do lofe the frefhnefs and fweetnefs of their Odor. The caufe is, for that when they are crufhed, the groffer and more earthy Spirit cometh out with the Finer, and troubleth it ; whereas inftronger Odors there are no fuch degrees of the iffue of the fmell.

I$T$ is a thing of very good ufe, to difcover the goodnefs of Waters. The talte to thofe that drink Water onely doth fomewhat: But other Experiments are more fure. Firf, try Waters by weight, wherein you may. finde fome difference, though not much: And the lighter, youmay account the better.

Secondly, Try them by boiling upon an equal fire; and that which con. fumeth away falteft, you may account the beft.

Thirdly, Try them in feveral Bottles or open Veffels, matches in every thing elfe, and fee which of them laft longeft withourfench or corruption; and that which holdeth unputrified longeft, you may likewife account the beft.

Fourthly, Try them by making Drinks, ftronger or fmaller, with the fame quantity of Malt ; and you may conclude, that that Water, which maketh the ftronger Drink, is the more concocted and nourifhing; though perhaps it be not fo good for Medicinal ufe. And fuch VVater (commonly) is the VVater of large and navigable Rivers; and likewife in large and clean Ponds of fanding VVater : For upon both them, the Sun hath more power than upon Fountains, or fmall Rivers. And I conceive, that Chalk-water is next them the beft, for going furtheft in Drink. For thatalfo helpeth concoction, fo it be out of a deep VVell; for then it cureth the rawnefs of the VVater; but Chalky-water towards the top of the Earth, is too fretting, as it appeareth in Laundry of Cloaths, which wear out apace, if you ule fuch VVaters.

Fifthly, The Houkwives do finde a difference in Waters, for the bearing or not bearing of Soap; and it is likely, that the mpre fat water will beat Soap beft, for the hungry water doth kill the unctuous nature of the Soap.

Sixthly, You may make a judgment of Waters according to the place, whence they fpring or come. The Rain-water is by the Phyfitians efteemed the fineft and the beit ; but yet it is faid to putrifie fooneft, which is likely, becaufe of the fineneft of the Spirit ; and in Confervatories of Rain-water, (fuch as they have in Venice, of c) they are found not io choice Waters ; (the worfe perhaps) becaufe they are covered aloft, and kept from the Sun. Snow-water is held unwholefome, infomuch, as the people that dwell at the Foot of the Snow Mountains, or otherwife upon the afcent, (efpecially the VVomen) by drinking of Snow-water, have great bags hanging under their Throats. VVell VVater, except it be upon Chalk, or a very plentiful Springmaketh Meat red, which is an ill fign. Springs on the tops of high Hills are the beft; for both they feem to have a Lightnefs and Appetite of Mounting; and befides, they are moft pure and unmingled: And again are more percolated through a great pace of Earth. For VVaters in Valleys, joyn in effect under ground with all VVaters of the fame Level ; whereas Springs on the tops of Hills, pafs through a great deal of pure Earth with less mixture of other VVaters.

Seventhly, Judgment may be made of Waters by the Soyl whereupon the VVater runneth, as Pebble is the cleaneft and beft tafted; and next to that

Clay-water; and thirdly, Water upon Chalk ; Fourthly; that upon Sand; andworft of all, upon Mud. Neither may you truift Waters that talte fivect, for they are commonly found in Rifing.grounds of great Cities, which muft needs take in a great deal of filth.

IN $P$ Peru, and divers parts of the $W$ eft-rndies, though under the Linc, the Heats are not fo intolerable, as they be in Barbarys and the Skirts of the Torrid Zone. The caufes are, firft, the great Brizes which the motion of the Airingreat Circles (fuch as are under the Girdle of the World) produceth; which do refrigerate ; aid therefore in thofe parts, Noonis nothing fo hot when the Brizes aregreat, as about nine or ten of the clock in the Forenoon. Another caufe is, for that the length of the Night, and the Dews thereof, do compence the Heat of the day. A third caule is, the flay of the Sun ; not in re pect of day and night (for that we fpake of before) but in refpect of the Seafon: For under the Line, the Suri croffech the Line, and maketh two Summers and two Winters; but in the skirts of the Torrid Zone, it doubleth and goeth back again, and fo maketh one long Summer.

THe heat of the Sun maketh Men black in fome Countreys, asin $C \mathbb{E}$ thiopia and Guinny, dec Fire dothit not as we fee in Glafs-Men, that are continually about the Fire. The reafon may be, becaufe Fire doth lick up the Spirits and Blood of the Body, fo as they exhale ; fo that it ever maketh Men look Pale and Sallow; but the Sun which is agentler heat, doth but draw the Blood to the outward parts, and rather concocteth it, then foaketh it: And therefore, we fec that all Cethiopes are flefhly, plump, and have great Lips. All which betoken moifture retained, and not drawn out. We feealfo, that the Negroes are bred in Coun'reys that have plenty of Water, by Rivers or otherwife: For CNero, which was the Metropolis of $\subset \mathcal{E} t h$ oppia, was upon a great Lake; and Congo, where the Negroes are, is full of Rivers. And the confines of the River $N$ iger, where the Negroes alfo are, are well watered ; and the Region about Capo Verde is likewife moift, infomuch, as it is peftilent through moifture: But the Countreys of the $A$ byffenes, and Burbary, and Peru, where they are Taisney, and Olivatter, and Pale, are generally more fandy and dry. As for the $\mathcal{A}$ thiopes; as they are plump and flefhly, to (it may be) they are Sanguine and Ruddy coloured, if their Black Skin would fuffer it to te feen.

sOme Creatures do move a good while after their head is off, as Birds. Some a very little time, as Men and all Beafts. Some move, though cut in feveral pieces, as Snakes, Ecls, Worms, Flies, \&c. Firt, therefore it is certain, that the immediate caufe of Death, is therefolution or extinguifhment of the Spirits; and that the deftruction or corruption of the Organs, is but the mediate caufe. But fome Organs are fo peremptorily necelfary; that the extinguifhment of the Spirits doth fpeedily follow; but yet fo, as there is an interim of a fmall time. It is reported by one of the Ancients, of credit, That a Sacrificed Beaft hath lowed after the Heart hath been fevered; and it is a report alfo of credit, That the Head of a Pig hath been opened, and the Brain put into thé Palm of a Marrs Hand, trembling, without breaking any part of it, or fevering it from the Marrow of the Back-bone: during which time, the Pig hath been, in all appearance, flark dead, and without motion : And after a fmall time the Brain bath been replaced.
and the Skull of the Pig clofed, and the Pig hath alittle after gone abont. And certain it is, that an Eye upon Revenge, hath been thruft forth, fo asit hanged a pretty diftance by the Vifual Nerve; and during that time, the Eye hath been without any power of Sight ; and yet after (being replaced) recovered Sight. Now the Spirits are chiefly in the Head, and Cells of the Brain, which in Men and Beafts are large; and therefore, when the Head is off, they movelittle or nothing: But Birds have fmall Heads, and therefore the Spirits are a little more difperfed in the Sinews, whereby Motion remaineth in them a little longer; infomuch, as it is extant infory, that an Emperor of Rome, to fhew the certainty of his hand, did fhoot a great Forked Arrow at an Eftrich, as the ran fwiftly upon the Stage, and froke off her Head; and yet the continued the racee a little way with her Head off. As for Worms, and Flies, and Eels, the Spirits are diffufed almoft all over; and therefore they move in their \{everal pieces.

## $\mathcal{N}$ atural Hifory;

other in Urine of Man, otherin Water mixed with Chalk powdred, other in Water mixed with Soot, other in Water mixed with Afhes, other in Water mixed with Bay-Salt, other in Claret Winc, other in Malmfey, other in Spirit of Wine. The proportion of the mixture was, a fourth part of the ingredients to the Water, fave that there was not of the Salt above an cight part. The Urine, and Winds, and Spirit of Wine, were fimple withour mixture of Water; the time of fteeping was twelve hours; the time of the year Otaber. There was alfo other Wheat fo wn unfteeped, but watred twice a day with warm Water; there was alfo other Wheat fown fimple, to compare it with the reft. The event was, that thofe that were in the mixture of Dung, and Urine, Soot, Chalk, Afhes, and Salt, came up within fix days; and thofe that afterwards proved the higheft, thickeft, and moft lufty, were, firfthe Urine, and then the Dungs ; next the Chalk, next the Soot, next the Afhes, next the Salt, next the Wheat fimple of it felf unfteeped and unwatercd, next the watered twice a day with warm Water next the Claret Wine. So that thefe three laft were flower than the ordinary Wheat of it felf; and this Culture did rather retard than advance. As for thofe that were fteeped in Maimfey, and Spirit of Wine, they came not up at all. This is a rich Experiment for profit ; for the moft of the fteepings are cheap things, and the goodnefs of the crop is a great matter of gain ; if the goodnefs of the crop aniwer the earlinefs of the coming up, as it is-like it will, both being from the vigor of the Seed ; which alfo partly appeared in the former Experiment, as hath been faid. This Experiment would be tryed in other Grains, Seeds, and Kernels; for it may be fome fteeping will agree beft with fome Seeds. It would be alfo tryed with Roots ftecped as before, but for longer time; it would be tryed alfo in feveral feafons of the Year, elpecially in the Spring.

Striazberries watered now and then (as once in three days) with Water, wherein hath been fteeped Sheeps-dung, or Pigeons-dung, will prevent and come early. And it is like the fame effect would follow in other Berries, Herbs, Floxers, Grains, or Trees; and therefore it is an Experiment, though vulgarin Strawberries, yet not brought into ufe generally: For it is ufual to help the Ground with Muck, and like wife to recomfort it fometimes with Muck put to the Roots, but to water it with Muck-water, which is like to be more forcible, is not practifed.

Dung; or Chalk; or Blood, applied in fubfance (fearonabiy) to the Roots of Trees, doth fer them forwards. But to do it unto Herbs, without mixture of Water or Earth, it may be thefe helps are too hot.

The former means of helping Germination, are either by the goodnefs and ftrength of the Nourifhment, or by the comforting and exciting the Spirits in the Plant, to draw the Nourifhment better. And of this latter kinde concerning the comforting of the Spirits of the Plant, are alfo the experiments that follow; though they be not applications to the Root or Seed. The planting of Trees warm upon a Wall, againft the South or South-Ealt Sun, doth haften their coming on and ripening; and the South Eaft is found ro be better than the South-Weft, though the South-Weft be the horter Coaft. But the caufe is chiefly, for that the heat of the morning fuccecdeth the cold of the night; and partly, becaufe (many. times) the South-Went Sun is too parching. So likewife planting of them upon the Back of a Chimney where a fire iskept, doth hatten their coming on, and -ripening: Nay more, the drawing of the Boughs into the infide of a room, where a Fire is continually kept, workech the fame effect ; which
hath been tryed with Grapes; infomuch, as they will come a Moneth eaticer, then the Grapes abroad.

Befides the two Means of Accelerating Germination, formerly deferibed; that is to fay, the mending of the Nourifhment; comforting of the Spirit of the Plant; there is a third, which is the making way for the eafie coming to the Nourifhment, and drawing it. And therefore gentle digging and loolning of the Earth about the Roots of Trees, and the removing Herbs and Flowers into new Earth, once in two years (which is the fame thing, for the new Earth is ever loofer) doth greatly further the profpering and earlinefs of Plants.

But the moft admirable Acceleration by facilitating the Nourifhment, is that of Water. For a Standard of a Damask Rofe withthe Rooton, was fer in a Chamber, where no Fire was, upright in an Eatthen Part, full of fair Water, without any nixture, half a foot under the Water, the Standard being more than two foot high above the Water. Within, in the fpace of ten days, the Standard did put forth a fair green Leaf, and fome other little Buds, which ftood at a flay without any flew of decay or withering, more then feven days. But afterwards that Leaf faded, but the young Buds did fprout on; which afterward opened into fair Leaves, in the fpace of three Moneths, and continued, fo a while after, till upon removal weleft thetryal. But note, that the Leaves were fomewhat paler, and light-coloured then the Leaves ule to be abroad. Note, that the firt Büds were in the end of October, and it is likely, that if it had been in the Spring time, it would have put forth with greater ftrength, and (it may) be to have grown on to bear Flowers. By this means, you may have (as it (eemeth) Roles fet in the midft of a Pool, being fupported with fome ftay; which is matter of rarenels and pleafure, though of fmall ufe. This is the moreftrange, for that the like Rofe Stand. ard was put at the fame time, into Water mixed with Horfe=dung, the Horledung about the fourth part to the Water, and in four Moneths fpace (while it was oblerved) put not forth any Leaf, though divers Buds at the firt, as the other.

A Dutch Flowerthathad a Bulbons Root, was likewife put at the fame time all under Water, fome two or three fingers deep; and within feven days fprouted, and continued long after further growing. There were alfo put in, a Beet-root, a Borrage-root, and a Raddish-root, which had all their Leaves cut almolt clofe to the Roots; and within fix weeks had fair Leaves, and focointinued till the end of $N$ ovember.

Note, that if Roois, or Peafe, or Flowers may beaccelerated in their coming and ripening, there is a double profit; the one in the high price that thofe things bear when they comeearly; the orher in the fwiftnefs of their returns: For in fome Grounds which areftrong you fhall have a Raddifh, \&c. comein a moneth, that in other Grounds will not come in two, and fo make double returns.

Wheat alfo was put into the Water, and came not forthat all; 10 as it feemeth there mult be fome ftrength and bulk in the Body, put into the Wa. ter, as it is in Roots; for Graitis, or Seeds, the cold of the Water will mortifie. But cafuatly fome Wheat lay under the Pan, which was lomewhat moi, ftened by the fuing of the Pan; which in fix weeks (as aforcfaid) looked mouldy to the eye, but it was fprouted forth half a fingers length.

It feemeth by thefe Inftances of Ware, that for nourifhment the Water is almoft all inall; and that the Earth doth but keep the Plant upright, and fave it from over-hear, and over-cold; and therefore is a comfortable Experiment for good Drinkers. It proverh alfo that our former opinion; that

Drink incorporate with Flefh or Roots (as in Capon-Bër, b̌c.) will nourifh more eafily than Meat and Drink taken feverally.
413.

Experiments in Confort, touching the Pastring back or Retardation of Germinazion.

TO make Rofes or other Elowers come late, it is an Experiment of Pleafure. For the Ancients efteemed much of Rofa Sera, and indeed the 10vember Rofe is the fweeteft, having been lefs exhaled by the Sun. The Means are thefe, Firft, The cutting off their tops immediately after they have done bear. ing, and then they will come again the fame year about November; but they will not come juft on the tops where they were cut, but out of thofe Shoots which were (as it were) Water-boughs. The caufe is, for that the Sap, which otherwife would have fed the top, (though after bearing) will, by the difcharge of that, divert unto the Side fprouts, and they will come to bear, but later.
414. The fecond is the Tulling of the Buds of the Rofe, when they are newly knotted, for then the fide Branches will bear. The caufe is the fame with the former: For cutting of the Tops, and pulling off the Buds, work the fame effect, in Retenfion of the Sap for a time, and Diveffion of it to the Sprouts that were not foforward.

The third is the cutting off fome few of the Top-boughs in the Spring time but fuffering the lower Boughs to grow on. The caufe is, for that the Boughs do help to draw up the Sap more ftrongly; and we fee that in Pouling of Trees,' many do ufe to leave a Bough or two on the top to help to draw up the Sap. And it is reported alfo. That if you graft upon the Bough of a Tree, and cut off fome of the old Boughs; the new Cions will perifh.

The fourth is by laying the Roors bare about Chrifmas fome days. The caufe is plain, for that it dorh arreft the Sap from going upwards for a time; which arreft, is afterwards releafed by the covering of the Roor again with Earth, and then the Sap gettect up, but later.

The fifth is the removing of the Tree fome Moneth before it Buddeth. The caufe is, for that fome time will be required after the Remove, for the Refetling, before it can draw the Juyce; and that time being loft, the bloffom muff needs come forth later.

The fixth is the Grafting of Rores in May, which commonly Gardiners do not till fuly, and then they bear not till the next year; but if gou graft them in May, they will bear the fame year, but late.

The feventh is ithe Girding of the Body of the Tree about with fome Packthred-; for that alfo in a degrec reftraineth the Sap, and makech it conie up more late, and more flowly.

The eighth is the Planiting of them in a Shade or in a Hedge. The caufe is, partly the keeping out of the Sun, which haftneth the Sap torife, and partly the robbing of them of Nourifhment by the fuff in the Hedge;
Century
thefe means may be practifed upon orher, both Trees, and Flowers, mutatis
mutandis.
Men have entertained a conceit that fheweth prettily, namely, That if
you graft a Late comirg. Fruit, upon a Stock of a Fruit-tree that comethcar.
ly, the Graft willbear Fruit carly, as a Peach upon a Cherry: And contrari-
wife, if an Early coming. Fruit upcn a Stock of a Fruit-tree that cometh late,
the Graft will bear Fruirlate; as a Cherry upon a Peach. But thefe are but
imaginations, and untrue. The caufe is, for that the Cions over-ruleth the
Stock quite, and the Stock is but Paffive onely, and giveth Aliment, but no
Motion to the Graft.

W
E will fpeak now, how to make Fruits, Flowers, and Roots larger, in more plenty and fweerer than they ufe to be; and how to make the Trees themfelves more tall, more fpred, and more halty and fudden, than they ufe to be. Wherein there is no doubr, but the former Experinients of $\mathcal{A}$ cceleration will ferve much to thefe purpofes. And again, that thele Experiments which we fhall now fet down, do ferve alfo for Aceleration, becaufe both Effects proceeds from the encreafe of Vigor in the Tree; but yet to avoid confufion. And becaule fome of the Means are more proper for the one effect, and fome for the other. We will handle them aparto

It is an affured Experience, That an heap of Flint or Stone, laid about the bottom of a wilde Tree, (as in Oak, Elm, Afh, \&\&.) upon the firft planting, doth make it profer double as much as without it. The caufe is, for that it retaineth the moifture which fallech at any time upon the Tree, and fuffereth it not to be exhaled by the Sun. Again, it keepech the Tree warm from cold Blafts and Frofts, as it were in an Houle. It may be alfo, there is fomewhat in the keeping of it feady at the firt. Quere, if laying of Straw fome height abour the Body of a Tree, will not make the Tree forwards: For thoughthe Root giveth the Sap, yetit is the Body that draweth it. But you muft note, that if you lay Stones about the Stalk of Lertuce, or other Plants that are more foft, it will over-moitten the Roots, fo as the $W$ orms will eat them.

A Tree at the firle fetting, fhould not be fhaken, untilit hath taken Root fully; And therefore fome have put too little Forks about the bottom of their Trees, to keep them upright ; but after a years rooting, then fhaking doth the Tree good by loofning of the Earth, and (perhaps) by exercifing (as it were) and Atirring the Sap of the Tree.

Generally, the cutting away of Boughs and Suckers at the Root and Body, doth make Trees grow high; and contrariwife, the Poling and Cur. ting of the top, makerh them grow, fpred, and bufhy ; as we fee in Pollords, \&c.

It is reported, That to make hafty growing Coppice.wood, the way is, to take Willow, Sallow, Popler, Alder, of fome feven years growth; and to fet them, not upright, but a-llope, a reafonable depth under the Ground; and then infead of one Root they will put forth many, and fo carry more fhoots upon a Stem.

When you would have many new Roots of Fruit-Trees, take a low Tree, and bow ir, and lay all his Branches a flat uponthe ground, and calt Earth upon them, and every iwig will take Roor. And this is a very profitable Experiment for coflly Trees ; (for the Boughs will make Stocks withour charge) fuch as are Apricots, Peaches, Almonds, Cornelians, Mulberries, Figs,

Experimests in Confort, touching the Melioration of Fruit:Trces, and Plants.
\&c. The like is continually practifed with Vines, Rofes, Musk-Rofes,

It hath alfo been practifed (by fome) to pull fome Leaves from the Trees fo fpred, that the Sun may come upon the Bough and Fruit the better. There hath been practifed alfo a curiofity, to feta Tree upon the North fide of a Wall, and at a little height, to draw him through the Wall, and fpred him upon the Sourh fide ; conceiving, that the Root and lower part of the Stock fhould enjoy the frefhnefs of the fhade, and the upper Boughs and Fruit, the comfort of the Sun; but it forted not. The caufe is, for that the Root requireth fome comfort from the Sun, though under Earth, as well as the Body; and the lower part of the Body more than the upper, as we fee in compaffing a Tree below with ftraw.

The lownefs of the Bough, where the Fruit cometh, maketh the Fruit greater, and to ripen better; for you fhall ever fee in Apricotes, Peaches, or CThelo-Cotones upon a Wall, the greateft Fruits towards the botton. And in France the Grapes that make the Wine, grow upon the low Vines, bound to friall Stakes ; and the raifed Vines in Arbors, make but Verjuyce. It is true, that in Italy, and other Countreys where they have hotter Sun, they raife them upon Elnis and Trees: But I'conceive, that if the French manner of Planting low, were brought inufe, their Wines would be ftronger and fweeter: But it is more chargeable in refpect of the Props. It were good to try whether a Tree grafted fomewhat near the ground, and the lower Boughs onely maintained, and the higher continually proyned off, would not make a larger Fruit.

To have Fruit in greater Plenty, the way is to graft, not onely upon young Stocks, but upon divers Boughs of an old Tree; for they will bear
great numbers of Fruit ; whereas if you graft but upon onestock,the Tree can bear bur few.

The digging yearly about the Roots of Trees, which is a great means, both to the Acceleration and Melioration of Fruits, is practiled in nothing but in Vines; which, if it were transferred unto other Trees and Shrubs; (as Rofes, \&c.) I conceive, would advance them likewife.

It hath been known, that a Fruit-tree hath been blown up (almoif) by, the Roots, and let up again, and the next year bare exceedingly. The caufe of this was nothing but the loofening of the Earch, which comforterh any Tree, and is fit to be practifed more than it is in Fruit-rrees: For Trees cannot be fo fitly removed into new Grounds, as Flowers and Herbs may.

To revive an old Tree, the digging of it about the Koots, and applying new Mould to the Roots, is the way. We fee alfo that Draught-Oxen put into frefh Pafure, gather new and tender flefh; and in all things, better nourifhment than hath been uled, doth help to renew, efpecially, if it be not onely better but changed, and differing from the former.

If an Herb be cut off from 'the Roots in the beginning of Winter, and then the Earth be trodden and beaten down hard with the Foor and Spade, the Roots will become of very great magnitude in Summet. The reafon is, for that the moifture being forbidden to come up in the Plant, ftayeth longer in the Root, and fo dilaterh it. And Gardiners ufe to tread down any loofe Ground after they have fown Onions, or Turnips, \&c:

If $\mathcal{P}$ anicum be laid below, and about the bottom of a Root, it will caufe the Root to grow to an exceffive bignefs. The caufe is, for that being it felf of a fpungy fubftance, it draweth the moifture of the Earth to it, and fo feedeth the Root. This is of greateft ule for Onions, Turnips, Parfnips, and Caryets.
-The fhifting of Ground is a means to better the Tree and Fruit; buit with this Caution, That all things do profper belt, when they are advanced to the better. Your Nurfery of Stocks ought to be in a more barren Ground, than the Ground is whereunto you remove them. So all Grafers prefer their Cattle from meaner Paftures to better. We fee alfo, that hardnefs in youth lengthneth life, becaufe it leaveth a cherifhing to the better of the Body in Age: Nay, in exercifes it is good to begin with the hardeft, as Dancing in thick Shooes, \&c.

It hath been oblerved that hacking of Trees in their Bark, both downright, and a crofs, fo as you make them rather in flices, than in continued Hacks, doth great good to Trees, and elpecially delivereth thena from being Hide bound, and killeth their Mois.

Shadeto fome Plants conduceth to make them large and profperous more than Sun; as inStrawberries, and Bays, \&c. Therefore amongt Strawberries, fow here and there fome Boirage-Seed; and you fhall finde the Strawberries under thole Leaves, far more large than their fellows. And Bays you muft plant to the North, or defend them from the Sun by a Hedg. Row; and" when you fow the Berries, weed not the Borders for the firlt half year' for the Weed giveth them Siade.

To increafe the Crops of Plants, there would be confidered, not onely the increafing the Luft of the Earth, or of the Plant, but the faving alfo of that which is filt. So they have lately made a tryal to fet V Vheat; which neverthelefs hath been left off, becaule of the trouble and pains: yet $\mathrm{fo}^{\circ}$ much is true, that there is much faved by the Setting; in comparifon of
that which is Sown; both by keeping it from being picked up by Birds, and by avoiding the fhallow lying of it, whereby much that is fown, taketh no Roor.

It is preferibed by fome of the Ancients, that you take fmall Trees, upon which Figs or other Fruit grow, being yet unripe, and coverthe Trees in the middle of Autumn with Dung until the Spring, and then take them up in a warm day, and replant them in good Ground; and by that means, the former years Tree will be ripe, as by a new Birth, when orher Trees of the lame kinde do but bloffom. But this feemeth to have no gicat probability.

Take Seed or Kernels of Apples, Pears, Orenges; or a $P_{\text {each }}$, or a $P_{\text {lumb }}$ Stone, ©́r. And put them into à Squill, (which is like agreat Onion) and they will come up much earlier than in the Earth it felf. This I conceive to be as a kinde of Grafting in the Root; for as the Stock of a Grafy yeldert berter prepared nourifhment to the Graft, than the Cruade Earth, fo the Squill doth the like to the Seed; and, I fuppofe, the fame would be done, by putting Kernels into a Turnip, or the like, fave that the Squill is more vigorous and hot. It may be tryed alfo, with putting Onion-Seed into an Onion. Head, which thereby (perhaps) will bring forth a larger and earlier Onion.

The pricking of a Fruit in feveral places, when it is almoft at his big. nefs, and before it ripenerh, hath been prattifed with fuccefs, to ripen the Fruit more fuddenly. We lee the example of the biting of Wa'ps or Worms upon Fruit (whereby it manifefly) ripeneth the fooner.

It is reported, That Alga Marina (Sea-xecd) pur under the Roots of Colworts, and (perhaps) of other Plants, will further their growth. The verue ( no doubt) hath relation to Salt, which is a great help to Fertility.
$44^{8 .}$
It hath been practifed to cut off the Stalks of Cucumbers, immeđiately after their bearing clofe by the Earth; and then to caft a pretty quantity of Earth upon the Plant that remaineth, and they will bear the next year Fruir long before the ordinary time. The caufe may be, for that the Sap goeth down the fooner, and is not fpent in the Stalk or Leaf, which remaineth after the Fruit. Where note, that the Dying in the Winter, of the Roots or Plants that are Annual, leemeth to be partly cauled by the over-expence ol the Sap into Stalk and Leaves; which being prevented, they will fuper annuate, if they ftand warm.

The pulling off many of the Bloffomsfrom a Fruit-tree, doth make the Fruit fairer. The caufe is manifeft, for that the Sap hath the lefs to nourifh. And it is a common experience, That if you do nor pull off fome Bloffoms, the firt time a Tree bloometh, it will bloffom it felf to death.

- It were good to try what would be the effeet, if all the Bloffoms were pulled from a Fruit-tree, or the Acorns and Chefnur-buds, \&c. from a wilde Tree, for two years together. I fuppofe, that the Tree will either puit forth the third yearbigger; and more plentiful Fruit'; or elfe; the fame years; larger Leaves, becaufe of the Sap ftored up. Leaves, have his top cut off. The caule is plain, for that the Sap hath the lefs to feed, arid the lefs way to mount: Bur it may be the Fig will come fomewhat later, as was formerly touched. The fanie may betried likewife in other Trees.

It is reported, That Mulborries will be fairer, and the Tree more frnitful, if you bore the Trunk of the Tree thorow in feveralplaces, and thrult into shé places bored, Wedges of fome hot Trees; as Turpentine, Maffick-tree, Guaiaium, Funiper, \&rc. The caufe may be, for that Adventive heat doth chear up the Native Juyce of the Tree.

It isteported, That Trees will grow greater and bear better Fruit, if you pat Silt; or Lees of Wine, or Blood to the Root. The caufe may bethe en-
creafing the Luft or Spirit of the Root:- Thefe things being more forcible than ordinary compolts.

It is reported by one of the Ancients, that Artichoaks will be lefs prickly, and more tender, if the Seedshave their tops dulled or grated off upon 2 Stone:
459. Herls will be tenderer, and fairer, if you take them out of Beds when they arenewly come up, and remove them into Pots with better Earth. The remove from Bed to Bed was fpoken of before; but that was in feveral years, this is upon the fudden. The caufe is the fame with other removes, formerly mentioned: and to be better tafted, if they be fometimes watred with Salt-water, and much more with Water mixed with Nitre; the Spirit of which islefs Adu' rent than Salt.

It is reported, That Cucumbers will prove more tender and dainty, if their Seeds be fteeped (little) in Milk; the caufe may be, for that the Seed being mollified with the Milk, will be too weak to draw the groffer Juyce of the Earth, but onely the finer. The fame Experiment may be made in Artichoaks, and other Seeds, when you would take away, either their Flaminefs or Bitternefs. They fpeak alfo, that the like effect followeth of feeping in Water mixed with Honey; but that feemeth to me not fo probable, becaufe Honey hath too quick a Spirit.

It is reported, That Cucumbers will be lefs Watry, and more Melonlike, if in the Pit where you fet them, you fill it (half way up) with Chaff, or fmall Sticks, and then power Earth upon them; for Cucumlers, as it feemeth, do extreamly affect moifture, and over-drink themfelves; which this Chaff, or Chips forbiddeth. Nay it is further reported, That if when a Cucumber is grown, you fet a Pot of water about five or fix inches diftance from it, it will in Four and twenty hours fhoot fo much out as to touch the Pot; which if it be true, itis an Experiment of anhigher nature than belongeth to this Title: Foritdifcovereth Perception in Plantsto move towards that which hould help and comforthem, though it be at adiftance. The ancient Tradition of the Vine is far more ftrange: It is, that if you fet a ftake, or prop; fome diftance from it, it will grow that way, which is far ftranger (as is laid) than the other: For that Water may work by a Sympathy of Attraction: But this of the Stake feemeth to bea reafonable difcourfe.

It hath been touched before, that Terebration of Trees doth make them profper better. Butit is found alfo, that it maketh the Fruit fweeter, and better. The caufe is; for that notwithfandingthe Terebration, they may receive Aliment fufficient, and yet no more than they can well turn, and difgeft; and withal do fweat out the courfeft and unprofitableft Juyce, even as it is in Living Creatures; which, by moderatefeeding, and exercife, and fiveat, attain the foundeft habit of Body.

As Terebration dothmeliorate Fruit, fo, upon the like reafon, doth Letting of Plants Blood; as Pricking Vines, or other Trees, arter they be of fome growth, and thereby letting forth Gum or Tears, though this be notto continue, as it is in Terebration, butat fome Seafons. Andit is reported, thar bvi this artifice, Bitter Almondshave been turned into fweet.

The Ancients for the Dulcorating of Fruit, do commend Swines dung above all other Dung, which may be, becaufe of the moifture of thar Beaft, whereby the Excrenient hath lefs Acrimony, for we fee Swines and Pigs Ftefl is the moittef of fehthes.

It is obferved by fome, that all Herbs wax Iweeter, both in foll and talte, if after they be grown up fome reatonable time, they be cut," and fo you take the latter Sprout, The caile may be, for that the longer the Juyce fayeth in the Root and Stalk; the betier it concocteth.? For one of the chicf caufes, why Grains, Seeds, and Fruis, are more noúrifhing than Leaves, is the length of time, in which they grow ro Maturation: It wére not amifs'to keep back the Sap of Herbs, or the fike, |by fome fir means till the end of Summer, whereby (it may be) they will be more nourifhing.

As Grafting doth generally advance and Meliórate Fruits, above that which they would be; if they where fet of Kernels or Stones, in regard the nourifhment is betrer concocted. So (nodoubr) even in Grafting,for the fame caufe the choice of the Stock doth much; always provided, that it be fomewhat inferior to the Cions. For otherwife it dullech it. They commend -much the Grafting of Pears, or Apples, upon a Quince.

Befides the Means of Melioration of Fruits before-mentioneds it is fet down as tryed, that a mixture of Bran and Swines Dung or Chaff and SwinesDung (elpecially laid up together for a moneth to rot) isa very great nourifher and comforter to a Fruit-tree.

It is delivered, thar O:ions wax greater if they be taken out of the Earth, and laid a drying twenty days, and then fet again; and yet more, if the outermoft Pill be taken off all over.

It is delivered by fome, that if one take the Bough of a low Fruit-tree, newly budded. and draw it gendy; without hurting its into an Earthen por perforate at the bottom to let in the Plant, and then cover the Pot with Earth, it will yield a very large Fruit within the Ground. Which Experiment is nothing but potting of Plants, without removing and leaving the Fruit in the Earth. The like (they $f_{3}$ ) will be effected byan empty Por without Earch in ir, put over a Fruit, being propped up with a fake as it hangeth upon the Tree, and the better, if- Come few Pertufions be made in the Por. VVherein, befides the defending of the Fruit from extremity of Sun or VVeather, fome give a reafon that the Fruit loving and coveting the open Air and Sun, is invited by the Pertufions to fpred and approach as near the open Air as it.can, and fo inlargerh in Magnitude.

All Treesinhigli and Sandy Grounds, are to be fet deep; and in VVatry Grounds more fhallow.' And in all Trees when they be removed (efpecially Fruif-rrees) care ought to be taken, that the fides of the Trees be coalted, (North and South,\&c.) as they food before. Thefame is faid allo of Stone out of the Quarry, to make it more durable, though that feemeth to have lefs reation; becaufe the Stone lyeth not fo near the Sun, as the Tree groweth.

Timber Treesin a Coppice-wood, do grow better thian in an open Field; both, becaule they offer not tolpred fo much, but fhoot up ttill in height, and chiefly, becaure they are defended from too much Sun and Wind, which do check the growth of all Fruit ; and fo (no doubr) Fruit-trees, or Vines, fet upon a Wall, againft the Sur, between Elbows and Butriffes of Stone, ripenmore than upon a plain $W$ all.

Is is faid, that if Potado Roots be fet in a Pot filled with Earth, and then the Por with Earth be fer likewife within the Ground, fome two or three inches, the Roots will grow greater than ordinary. The caufe may be, for that having Earth enough within the Por to nourifh them; and then being topped by the bottom of the Pot from putting ftrings downward, they muft needs grow greater in breadth and thicknefs And it may be
that all Seeds, Roots, potted, and fo fet into the Earth, will profper the better.

474
The cutting off the Leaves of Raddifh, or ocher Roots, in the boginning of Winter before they wither; 1and covering again the Rout, fonecthing high with Earth, will preferve the Root all Winter, and make it bigger in the Spring following, as hath been partly touched before. So that there is a double ufe of this cutting off the Leaves: For in Plants, where the Root is the Efculent, as Raddifh, and Parfnips, it will make the Root the greater and fo it willdo to the Heads of Onions, and where the Fruit is she Effulent, by frengthning the Root, it will make the Fruit alfo the greater:
475.
476.

Experiments in Confort, touching compound Fruits and 20)

It is an Experiment of grear pleafure to make the Leaves of haddy Trees, larger than ordinary. . It hath been tryed (for certain) that a Cions of a Weech Elm, grafted upon the ftock of an ordinary Elm. will put forth Leaves, almoft as broad as the brim of ones Hat. And it is very likely that as in Fruit-Trees, the Graft maketh 2 greaterFruit ; fo in Trées that bear no Fruit, it will make the greater Leaves. It would betryed therefore in Trees of that kinde chiefly; as Birch, $A / k, W_{i l l}$ ow, and efpecially the Shining Willow, which they call Swallow-Tail, becaufe of the pleafure of the Leaf.
The Barrennefs of Trees by accident (befijes the weaknefs of the Soil Seed, or Root, and the injury of the Weather) coming either of their overgrowing with Mofs, or their being hide bound, or their planting too decp, or by iffuing of the Sap too much into the Leaves: Forall thefe three are remedies mentioned before.

WE fee that in Living Creatures that have Male and Female, there is copulation of feveral kindes, and fo Compound Creatures; as the Crule, that is generated betwixt the Horfe and $\mathcal{L} \beta$; and fome other Compounds which we call Monfters, though more rare : And it is held, that that Proverb, Africa Semper aliquid Monftri parit, cometh, for that the Fountains of.Waters there being rare, divers forts of Beafts come from feveral parts to drink, and fo being refrefled, fall to couple, andmany times with feveral kindes. The compounding or mixture of Kindes in Plant $\overline{\overline{ }}$ is not found out; which neverthelefs, if it be polfible is more at command than that of Living Creatures, for that their luft requireeth 2 voluntarymotion; wherefore it were one of the moft notable Experiments touching Plants, to finde it out, for fo you may have great variety of new Fruits, and flowers yet unknown. Grafting doth it not, that mendeth the Fruit, or doubleth the Flowers, sxc. But it hath not the power to make a new Kind. Forthe Cions ever over-ruleth the Stock.

It hath been fet down by one of the Ancient, That if you take two Twigs of feveral Fruit Trees, and flat them on the fides, and then binde them clofe together, and fet them in the ground, they will come up in one Stock ; but yet they will put forth in their feveral Fruits without any commixture in the Fruit. Wherein note (by the way) that Unity of Continuance, is eafier to procure, than Unity of Spécies. It is reported alfo, That Vines of Red and White Grapes, being fet in the Ground, and the upper parts being flatted, and bound clofe together, will put forth Grapes of the feveral colours, upon the fame Branch; and Grape-ftones of feveral colours within the fame Grape: But the more, after a year or tivo, the unity (as it feemeth) growing more perfect. And this will likewife help, if from
the firft uniting, they be often watred ; for all moifture helpeth to Union: And it is prefcribed alfo to binde the Bud, as foon as it cometh fortli,as wcll as the Stock, at the leaft for a time.

They report, that divers Seeds put into a Clout, and laid in Earth weil dunged, will put up Plants contiguous; which (afterwards) being bound in, their Shoots will incorporate. The like is faid of Kernels put into a Bottle, with a narrow mouth, filled with Earth.

It is reported, that young Trees of feveral kindes fet contiguous withoutany binding, and very often watred in a fruifful ground, with the very luxury of the Trees, will incorporate and grow together. Which feemerh to me the likelieft means that hath been propounded; for that the binding doth hinder the natural fwelling of the Tree; which, while it is in motion's doth better unite.

THere are mathy ancient and received Traditions and Obfervations, touching the Sympathy and Antipathy of Plants; for that fome will thrive beft growing nearothers, which they impute to Sympathy; and fome worfe which they impute to $A$ ntiputhy. But thefe are idle and ignorant conceits, and forfake the true indication of the caufes.; as the mofk part of $E_{x}$ periments, that concern Sympathies and Anizpathies do. For as to Plants, neither is there any fuch fecret Friendhip, or Hatred, as they imagine. And if we fould be content to call it Sympati, and Antipathy, it is utterly miftaken; for their Sympaty is an Antipatby, and their Anstipathy is a Sympathy: For it is thus, wherefoever one Plant draweth fuch a particular juyce out of the Earth, as it qualifiech the Earth, fo as that Juyce which remainech is fit for the other Plant, there the Neighborhood doth good, becaufe the nourifhments are contraty, or feveral : But where two Plants draw (much) the fame Juyce, there the Neighborhood hurteth; for the one deceiveth the other.

Firft, therefore, all Plants thiat do draw much nourifhment from the Earth, and fo foak the Earth, and exhauft it, hurt all things that grow by them; as great Trees, (efpecially $A$ bes) and fuch Trees, as ipred their Roots near the top of the ground. Sothe Colewort is not an enemiy (though that wereanciently received) to the $V$ ine onely; butit is an enemy to any other Plani , becaufe it draweth ftrongly the fatteft Juyce of the Earthr: And if it be true, that the Fine, when it creepech near the colewort, will turn away: This may be, becaufe there it findeth worfe nourifhment; for though the Root be where.it was; yet (I doubt) the Plant will bend as it nourifhert.

Where Plants are of feveral Natures; and draw feveral Juyces out of the Earth, there as hath been faid) the one fet by the other helpeth : As it is fet down by divers of the Ancients, that Rem doth profper much; and becometh ftronger, if it be fet by a Fig-Tree: Which (we conceive) is caufed not by reafori of Friendihip, but by Extration of contrary Jayces; the one drawing Juyce fit to refiult fweet, the other bitter. So they have fet down like wife, that a Rofe fet by Garlick is fweeter ; which likewife may be, becaufe the more Fetide Juyce of the Earth goeth into the. Garlick, and the more oderate into the Rofe.

This we fee manifefly, That there be certain Cirn-Flowers which come feldom or never in other places, unlefs they be fet, but onely amongft

Corn: As the blew Bottle a kinde of yellow Mary-Gold, Wilde Poppey, and Eumitory., Neither can this be by reafon of the culture of the Ground, by Ploughing or Furrowing, as tome Herbs and Flowers will gro wv but it Ditches new caft , for if the groundilye fallow and unfown, they will not come: So as it fhould feem to be the Corn that qualifieth the Earth, and preparethit dar their growth. Musk-Melons, and fee whether the Melons will hor be more winy, and better tafted. Set Cucumbers (likewife) amongt Raddifh, and fee whether the Ráddifh will not be made the more biting.

Take Sorrel and fet it amongftafps, and fee whether the Raps will not be the fweeter.

Take Commori Bryar, and fetit amongt Violets or Wall-flowers, and fee whether it will not make the Violets or Wall-flowers fwecter, and lefs carthy in their fmell. So fet Letruce or Cucumbers, amongf Rofemary or Bays, and fee whether the Rofenary or Bays, willnot be the more oderate or aromatical.

Contrariwife, you muft take heed how you fet Herbs together that draw manch the like Juyce And therefore I think Rofematy will lefe inf fweences, if it be fet with Lavender or Bays, of the like. But yer, if you will correat the Atrength of an Herb, you fhall do well to fet other like Herbis by him, to take him down; and if you would fer Tanfey. by Angelica, it may be the Angelica would be the weaker and fitter for mixture in perfume. And if you fhould fee Rew by Common Wormwood, it may be, the Wormwood would tufn to be liker Roman Wormwood.

ThisAxiom is of large extent; and therefore would be fevered, and refined by Tryal. Neither mult you expect to have agrofs difference by this kinde of Culture, but onely further Perfection.

Tgyal would be alfo made in Herbs, Poyfonous; and Purgative, whofe ill (quality (perhaps) may be difcharged or attempted; by fetting ftronger Poylons or Purgatives by them.

It is reported, That the Shrub called Our Ladies Seal, (which is a kinde of Bripny) and Coleworts, fet near together, one orboth will die. The caute is; for that they be both great Depredators of the Earth, and one of them feavech the other. The like is faid of Reeds and a Brake, both which are fucculent; and therefore the one deceiveth the other. And the like of Hemlock and Rew, both which draw frong Juyces.

Some of the Ancients, and likewife divers of the Modern Writers, that have labored in Natural Magick, have noted a Sympathy between the Sun,
 they have denominated fome Herbs Solm, and fome Lunar, and fuclivike toys putinto great words. It is manifent ithathere are fome Elewagrs that have refpect to the Sun in two kindes; the ofe by opening and fluthite and the other by bowing and inclining the Head. TFot Maty golds, Talfipplasil Pird? pernel, and indeed mot fowers do operiof fored their Leaves abroad whien the Sun fhineth ferene and fair: And again, (in foneti part) clore fhem, or gather them in ward, either toward night, or when the skyis overcint. Of this; there needeth no fuch folemn Reafon to be affigried is as to fay; That they rejoyce at the prefence of the Sun, andmoutn at the abrence thenebof. For it is nothing elfe, but litte loading of the Leaves, what avehfig anensant the bottom, with the moifture of the Air ; whereas the dry Air doth extend thent And they makeit a piece of the wonder, That Gatden Claver will hide the Stalk, when the Sun fheweth bright; which isnothing but afulp expliffion of the Leaves; for the bowing and inclinitg the Head it is foufib in the great Flower of the Sun, in Marygolds, Wartwort, Mallow flowers, and others. The caufe is fome what more obfare than the former Widit lake it to be no other, but that the part, againft which the Sun beateth, waxerh more faint and flaccide in the Stalk; and thereby lefs able to fupport the Flower.

What a little Moifture witld oin Vegetables, eventhough they bei dead, and fẹered from the Earth, lappeareth welt in the Experiment of 7 uglers They take the Beard of an Oat, which (if you mark it well) is wreathed at thebottom, and one fmoothentire ftraw at the top. They take onety the part that is wreathed, and cut of the other , leaving the Beard half the bredtry of a finger in length. Then they make alitle Crols of $\mathrm{Q} Q$ millong ways, of that part of the Quill whichshath the Pith ; and Crofsways of that piece of the Quill withour Pith, the whete Crofs being the bredtliof a finger high : Then they prick the bottom -where the Pith is, and thereinto they put the Oatien-Beard, leaving hall of it Atcking forth of the Quill: Then they take a litte white Box of Wood ro deceive men, as if lome what in the Box did work the feat ; in which, with a Pin; they mäke a litele hole, ciiough to take Beard, but not tole the Croff fink dowa, but to flick: Then like: wife, by way of Impofture, they make a queftion: As, who is the fairelt Woman in the company ? or who hath a Glove or Card ? and caure another to name divers' perfons; and upor every naming, they ftick the Erols in the Box; having firt put it towards their Mouth, as if they charmed it, and the Grofs.firreth not: :But when they come to the perfon that they would take, as they hold the Grofs to their Mouth, they touch the Beard with the tip of their Tongue, and wet it, and fo ftickihe Crofs in the Box; and then you fhallfeeit turn finely and foftly, threc or four turns, which is cauted by the untwining of the Beard by the moifture You may fee it more evidently if you ftick the Crofs between your fingers, inftead of the Box: And therefore you may fee, that this Motion, which is' effected by fo little wet, is firönger than the clofing or bending of the Head of alMaryt gold.

It is reported by fonie, That the Herb called Rofa Solw's (whereof they make Strong-maters) : will at the Noon-day; when the Sun fhineth hot anid bright, have a great Dew upon it.) And therefore, that the right name is Ros Solis ; which they impute to a delight and fympathy that it hath with the.Sun. Men favor wonders. It were good firt to be flire, That the Dew that is found upon it, ber not the Dew of the Morning prefented; $\mathcal{N}$ atural Hiftory;
when the Dew of other Herbs is breathed away: For it hath a fmooth and thick Leaf that doth notdifcharge the Dew fo foon asother Herbs, that are more Spungy and Porous. And itmay be Purflane, or fome other Herb doth the like, and is not marked. But if it befo, that it hath more Dew at Noon than in the Morning, then fure it feemeth to be an exudation of the Herb it felf. As Rlums fweat when they are fet into the Oven: For you will not ( 1 hope) think, thatit is like Gideons Fleece of Wooll, that the Dew fhould fall upon that, and no where elle.

THe altering of the Sent, Colour, or Tafte of Fruit, by Infufing, Mixing, or Letting into the Bark, or Root of the Tree, Herb, or Flower, any Coloured, Aromatical, or Medicinal Subftance, are but fancies. The caufe is, for that thofe things have paffed their period, and nourifh not; and all alteration of Vegetables, in thofe qualities, muft be by fome what that is apt to go into the nourifhment of the Plant. But this is true, that where Kine feed upen Wilde Garlick, their Milk tafted plainly of the Garlick. And the Flefh of Muttons is better tafted where the Sheep feed upon Wilde Thyme, and other wholfome Herbs. Galen alfo fpeaketh of the curing of the Scirrus of the Liver, by Milk of a Cow, that feedeth uponcertain Herbs; and Honey in Spain fmelleth (apparently) of the Rofemary, or Orenge, from whence the Bee gather it: And there is an old Tradition of a Maiden that was fed with Napellus, (which is counted the ftrongeft poyfon of all Vegetables) which with ufe, didnot hurt the Maid, but poyloned fome thathad carnal contpany with her. So it is obferved by fome; that there is a vertuous BeZoar, and another without vertue, which appear to the fhew alike ; but the vertuous is taken from the Beaft, that feedeth upon the Mountains, where
there are Theriacel Herbs; and that without vertue, from thofe that fed in the Valleys, where no fuch Herbs are. Thus far 1 am of opinion, that as fteeped Wines and Beers are very Medici al, and likewife Breadtempered with divers powders; fo of ©eat alfo, (as Fiesh, Fish, Wulk, and Eggs) that they may be made of great ufe fur Medicine and Dict, if the Beaff, Fowl, or Fish, be fed $\mathbf{u}$ ith a lpecial kinde of ford, fit for the difeafe. It were a dangerous thing alfo for fecret empoyfonments. But whether it may be applied unto Plants, and Herbs, I doubt more, becaufe the nourifhment of them is a more common Juyce; which is hardly capable of any feecial quality until the Plant do affimilate it.

But left our incredulity may prejudice any profitable operations in this kinde (efpecially fince many of the Ancients have fet them down) .we think good briefly to popound the four Means, which they have devifed of making Plants Medicinable. The firt is by flitting of the Root, and infufing into it the Medicine, as Hellebore, Opium, Scammomy, Triacle of. and then binding it up again. Thisfeemerh to me the leaft probable,becaufe the Root draweth immediately from the Earth, and fo the nourifhment is the more common and lefs qualified; and befides, it is a long time ingoing up, ere it come to the Fruit. The fecond way is, toperforate the Body of the Tree, and there to infule the Medicine, it hath the lefs way, and the lefs time to go up The third is, the fteeping of the Seed or Kernel in fome Liquor wherein the Medicine is infufed; which I have little opinion of, becaufe the Seed (I doubt) will not draw the parts of the matter which have the propriety; but it will be far the more likely, if you mingle the Medicine with Dung, for that the Seed, naturally dra wing the moifture of the Dung, may call in withal fome of the propriety. The fourth is, the Watering of the Plant oft, with an infufion of the Medicine. This, in one refpect nay have more force tharı the reft, becaufe the Medication is oft renewed, whereas the reft are applied, but at one time; and therefore the vertue may the fooner vanifh. But fill I doubt, that the Roor is fomewhat too ftubborn to receive thofe fine Impreffions ; and befides (as I have faid before) they have a great Hill to goup. I judge therefore the likelieft way to be the pesforation of the Body of the Tree, in feveral places, one above the other, and the filling of the Holes with Dung mingled with the Medicine. And the Watring of thofe Lumps of Dung, with Squirts of an Infufion of the Medicine in dunged Water, once in three or fourdays.

Ur-Experiments wetake care to be (as we have often faid,) either Experimenta Fruttfera, or Lucifera; cither of Ufe, or of Difcovery: For we hate Impoftures; and defpife Curiofities. Yet becaufe we muft apply our felvesfomewhat to others, we will fet down fome Curiofities touching Plants.

It is a Curiofitg to have feveral Fruits upon one Tree; and the more, when fome of them come early, and fome come late: So that you may have, upon the fame Tree, ripe Fruits all Summer. Thisis eafily done by Grafting of feveral Cions upon feveral Boughs of a Stock, in a good ground, plentifully fed. So you may haveall kindes of Cherries, an 1 all kindes of Plumbs, and Peaches, and Apricots upon one Tree: But, I conceive the Diverfity of Fruits muft be fuch, as will graft upon the fame Stock: And therefore, I doubt, whether you can have Apples, or Pears, or Orenges, upon the fane Stock, uponwhich you graft Plumbs.

It is a Curiofity to have Fruits of divers Shapes and Figures. 7 h 's is eafily performed by Moulding them, when the Fruit is young; with Moulds of Earth or Wood. So you may have Cucumbers, Stc. as long as a Cane, or as round as a Sphere, or formed like a Crofs. You may have allo Apples in the form of Pears or Lemmons. You may have allo Fruit in more accurateFigures ; as we faid of Men, Bealts, or Birds, according as you make the Moulds, wherein you muft underftand, that you' make the Mould big enough to contain the whole Fruit, when it is grown to the greateft ; for elfe you will choak thefpreding of the Fruit, which otherwife would fpred it felf, and fill the Concave, and fo be turned into the fliape defired; as it is in Mould-works of Liquid things. Some doubtmay be con-

Experiments in Confort, tourhing Curiofities about Fruits and Plants.
ceived.
ceived, that the keeping of the Sun from the Fruit, may hurt it : But there isordinary experience of Fruit that groweth covered. 2uare alfo, whether fome fmall holes may not be made in the Wood, to let in the Sun. And note, that it were beft to make the Moulds partible, glued, or cemented together, that you may open them when you take out the Fruit.

It is a curiofity to have infcriptions or Engravings, in Fruit or Trees. This is eafily performed, by writing with a Needle; or Bodkin, or Knife, or the like, when the Fruit or Trees are young; for as they grow, fo the Letters will grow more large, and graphical.

## Tenerif $f_{q}$ ue meos incidere Amores <br> Arboribus, crefcentilla, crefcetis Amores.

You may have Trees apparelled with Flowers or Herbs by boring holes in the Bodies of them, and putting into them Earth holpen with Muck, and fetting Seeds or Slips, of Violets, Stranberries, Wilde Tima, Camomil, and fuch like in the Earth, wherein they do butgrow in the Trec, as they do in Pots, though (perhaps) with fome feeding from the Trees. As it would be tryed alfo with Shoots of Vines, and Roors of Red-Rofes; for it may be, they being of a more Ligneous Nature, will incorporate with the Trec it felf.

It is an ordinary curiofity to form Trees and Shrubs (as Rofermary, Funiper, and the like) into fundry fhapes; which is done by moulding them within, and cutting them without. But they are but lamethings, being too fmall to keep Figure ; great Caftles made of Trees upon Frames of Timber, with Turrets and Arches, were anciently matters of magnificence.

Amongft curiofities, $\mathbf{I}$ thall place Colouration, though it be fomewhat better; for Beauty in Flowers is their pre-eminence. It is oblerved by fome, that Gilly-Fioxers, Sprect-Williams, Violets, that are coloured, if they be neglected, and neither Watered, nor new Moulded, nor Tranfplanted, will turn White. And it is probable, that the White, with much culture, may turn coloured; for this is certain, That the white colour cometh of fcarcity of Nourifhment; except in Flowers that are onely white, and admit no other colours.

It is good therefore to fee what Natures do accompany what colours ; for by that you fhall have light, how to induce colours, by producing thofe Natures. Whites are more inodorate (for the moftpart) than Flowers of the fame kinde coloured; as is found in fingle Whice Violets, White Rofes, White Gilly-Flowers, White Stock-Gilly-Flowers, \&c. We finde alfo, that Bloffoms of Trees that are White, are commonly inodorate; as Cherries, Pears, Plums, whereas thofe of Apples, Crabs, Almonds, and Peaches, are blufhy, and fnell fweet. The caufe is, for that the fubftance that maketh the Flower, is of the thinneft and fineft of the Plant; which alio maketh Flowers to be of fo dainty Colours. And if it be too fparing and thin, it attaineth no ftrength of odor, except it be in fuch Plants as are very fucculent; whereby they need rather to be fcanted in their nourifhment, than replenifhed, to have them fweet. As we fee in White Satyrion, which is of a dainty fmell; and in Bean-flowers, szc. And again, if the Plant be of Nature to put forth White Flowers onely, and thofe not thin or dry, they are commonly of rank and fulfome fanell; as May-Flowers and White Lillies.

Contrariwife, in Berries, the White is commonly more delicate and fweet in tafte, than the Coloured; as we fee in white Grapes, in white Rafpes, in white Strawberries, in white Currans, \&c. The caufe is for that
Century $V L$.
the coloured are more juyced, and courfer, juyced; and chicre force not fo
will and equally concoted, but the white are better proportioned to thic difgeftion of the Plant.

But in Friits the white commonly is meaner, as in Pear-Plumbs, Damo-
fins, wic. and the choiceft Plumbs are black; the Mulleryy, (which though they call it a Berry, is a Fruit) is better the Black, than che. White. The Havveft White-Plumb, is a bafe Plumb, and the Verdoctio and White DatePlumb, are no very good Plumbs. The caufe is, for that they are alf over-watry: Whereas an higher Concoction is required for fiveetnefs, or pleafure of tafte ; and therefore all your dainty Plumbs, are a little dry, and come from the Stone ; as the CWuskle. Plumb, the Damofin-Plumb, the Peach, the Apricot, ©́r. Yet fome Fruits which grow not to be Black, are of the Nature of Berries, fweeteffuch as are paler, as the Caur-Chery, which inclineth more to White, is fweeter than the Red; but the Egriot is more foivre.

Take Gillifowers seed, of one kinde of Gillifoners (as of the Clove-Gilliforver which is the moft common) and fow it, and there will come up Gilliflowers, fome of one colour, and fome of another, cafually, as the Seed meeteth with nourifhment in the Earth: So that the Gardiners finde, that they may have two or three Roots amongft an hundred that are rare, and of great price, as purple Carnation of feveral ftripes. The caufe is (no doubt) that in Earth, thoughit be contiguous, and in one Bed, there are very feveral Juyces; and as the Seed doth cafually, meet with them, fo it cometh forth. And it is notedefpecially, that thofe, which do come up Purple, do always come up fingle ; the fuyce, as it feemeth, notbeing able to fuffice a fucculent colour, and a double Leaf. This Experiment of feveral colours, coming up from onc Seed; would be tryed allo in Larkssfoot, Monk-bood, Poppy; and Hollioak.

Few Fruitsare coloured Red within; the 2ueen-Appleis, and another Apple, called the Rofe-Apple; Wulberries like wife, and Grapes, though moft toward the skin. There is a Peach alfo, that hath a circle of Red towards the ftone; and the Egriot.Clerry is fomewhat Red within: But no Pear, nor Warien, nor Plumb, nor Apriot; although they have (many times) Red fides, are coloured Red within. The caufe may be enquired:

The general colour of plants is Green, which is a colour thatno Flower is of. Therc is a greenif $P_{\text {rime-Rofe, }}$ butit is pale, and fcarce agreen; the Leaves of fome Trees turn alittle Murrey or Reddifh, and they be commonly young Leaves that do fo; as it is in Oaks and Vines. And HafeLeaves rotinto a Yellow; and fome Holies had part of their Leaves Yellow, that are (to all feeming) as frefh and hining as the Green. I fuppofe alfo, that Yellow is a lefs fucculent colour than Green, and a degree nearer White. For it hath been noted, that thofe Yellow Leaves of Holly, ftand ever toward the Notth or North-Eaft. Some Roots are Yellow; as Carress; and fome Plunts, Blood-red, Stalk and Leaf, and all; as caniarianthus. Some Herbs incline to Purple and Red; as a kinde of Sage doth, and a kinde of CMint, and Rofa Solis, ©ic. And fome have White Leaves, as another kinde of Sage, and another kinde of Cxint: But $\mathcal{A}$ Iure and a fair Puirple are never found in Leaves. This fheweth, that Flowers, are made of a refined Juyce of the Earth, and fo are Fruits; but Leaves of a more courfe and common.

It is a curiofity alfo to make Flowers double, which is effected by often removing them into new Earth ; as on the contrary part, double Flowers,

| 110 |
| :--- |

by neglecting, and not removing, prove fingle. And the way toda it fpeedity is to fow or fet Seeds, or Slips of Flowers; and as foon as zhey cone up, cou remove theminto new ground that is good : Enquire alfo, whether inocuit lating of Flowers, (ass stock-Gilliflowers, Rofes, Musk-Rofes, \&ic.) idurh not make them double. There is a Cherry-Tree that hath double Bloffoms, but that Tree beafeth no Fruit; and, it may be, that the fame means which applied to the Trec, doth extreamly accelerate the Sap to rife and brcak forth, would make the Tree peind it felf in Flowers, and thofe to become double, which were great pleafure to ce, efpecially in Appee-rress, Reachtrees, and Almond-trees, that have Bloffoms Blufh coloured.

The making of Fruits without Core or Stone, is likewife a curiofity, and fomewhat, better; becaure what foever maketh them fo, is like to make. them more tender and delicate. If a Cions or Shoor fit to be fet int Ground, have the Pith finely taken forth (and not altogether, but fome of it leff, the better to fave the life) it will bear a Fruit with little or no Core or Stone. And the like is laid to be of dividing a quick Tree down to the Ground, and taking out the Pith, and then binding it up again.
515. It is reported alfo, that a Citron grafted upona Quince will have fmall or no Seeds; and it is very probable, that any fowre Fruir grafted upona Stock that bearech a fweeter Fruit, may both make the Fruir fweeter, and more void of the harfh matter of Kernels or Seeds.

It is reported that not oncly the taking out of the Puth, but the fopping of the Juyce of the Pith from rifing in the midts, and turning it to rife on the outfide, will make the Fruit without Core or Stone; as if you fhould borea Tree clean thorow, and put a wedge in. It is true, there, is fome affinity bes tween the Pith and the Kernel, becaufe they ate both of a harfh fubftance, and both placed in the midat.

It is reported, that Trees watered perpetually with warm Water, will make a Fruit with little or no Core or Stone. And the rule is general, "That whatfoever will make a wilde Tree, a Garden Tree, will make a Garden Tree to have leff Core or Stone.

THe Rule is certain, That Plants for want of Culture, degenerate to be bafer in the fame kinde; and fometimes fo far, as to change into another kinde. 1. The fanding long, and not being removed, maketh them degenerate. 2. Drought, unlefs the Earith of it felf be moift; doth the like. 3. So dothremoving into worfe Earth, or forbearing to compof the Earth; as we fee, that Water-Mint turneth into Field Mint, and the Cole wort inco Kape by negleat, \&c.

Whatfoever Fruit uferh to be fer upon a Root, or a Slip, if it be fown; will degenerate; Grapes fown, Fige, Almonds, Romegranate Kernels fowni, make the Fruits degenerate, and become wilde And again, moft of thofe Fruits that ufe to be grafted, if they be fet of Kernels; or Stones degenerate. It is true, that Peaches (as hath been touched before) do better upon Stones fet, than upon grafting : And the rule of Exception fhould feem to bethis, That whatroever Plant requireth much moifture, profpereth better upon the Stone or Kernel, than upon the Giafe. For the Stock, though it givech a fincr nourifiment, yet itgiveth a fcantef, than the Earthat large.

Secds, if they be very old, and yer have ftrength enough to bring fortha, Plant, make the Plahi degenerate A tid theteforte skilful Gardiners, makerryal of the Seeds, before they buy them, whether they begood or no; by, puting.
them in Water gently boiled; and if they be good, they will fprout within half an hour.

It is Atrange which is reported, That Bafl 100 much expofed to the Sun, doth turn into Wilde Time: Although thote two Herbs feem to have fimall Affinity; but Bafil iswalmott the onely hot Herb that hath fat and fúc culent Leaves; which Oylinefs if it be drawn forth by the Sun, it is like it will make a very great change.

There is an old Tradition, that Boughs of Oak put intathe Earth, will put forth Wilde Vines; which if it be true; (no doubr) it is not the Oak that turneth into a Vine; but the Oak-bough purifying, qualifieth the Earth to put forth a Nine of it telf.

It is not impoffible, and I have heard it verified, that upon cutting down of an old Timber-Tree, the Sub hath put out fometimes a Tree of another kinde; as that Beech hath put forth Birch: Which ifit be true, the caufe may be, for that the old Sub is too feant of Juyce to put forth the former Tret;: and therefore putterh forth a Trec of fmaller kinde, that needeth lels Nourifhment.

There is an opinion in the Countrey, That if the fame Ground be oft fown with the Grain that grew upon ir, it will, in the end, grow to be of a bafer kinde.

It is cerrain, that in Sterile Years, Corn fown will grow to an orher kinde.

> Grandia Tape quibus mandiavimus Hordea Sulcis, Infalix Lolium, Ó Jeriles doxininatur Avena.

And generally it is a Rule, that Plantsthat are brought forth by Culture, as Corn, will fooner change into other Species, than thote that come of themfelves: For that Culture givech but an Adventitious Nature, which is:more cafily put off.

This work of the Tranfmstation of Plants, one into another, is inter Magnalia Natura: For the Tranfmatation of Species is, in the vulgar Philofophy, pronounced impoffible: And certainly, it is a thing of difficulty, and requireth deep fearch into Nature:: But féeing there appear fome manifeft intances of it, the opinion of impoffibility is to be rejected, and the means thereof to befound out. We fee that in Living Creatures, that come of Putrefaction, there is much Tranfmutation of one into another. As Caterpillersturn into Fiies, \&c. And it fhould feem probable, that whatfocyer Creature having life, is generated withour Secd, that Creature will change out of one Species into another; for it is the Seed, and the Nature of it, which locketh and boundeth in the Creature, that it doth not expatiate. So as we may well conclude, that feeing the Earth of it felf, doch put forth Plants without Seed ; therefore Plants may well have a Tranfmigration of Species. Wherefore wanting Inftances, which do occur, we fhall give Directions of the mof likely tryals: And generally, we would not have thole that read this work of Sylva Sylvarum, account it ftrange, or think that it is an overhafte, that we have tet down particulars untried:? For contrariwife, in our own eftimation, we account fuch particulars mote worthy than thofe that are already tryed and known. For there latter mult be taken as you finde them, but the other do level point blank at the inventing of caules, and Axioms.

Firf, therefore you mult make account, that if you will have one Plant change into another, you muft have the Nourifhment over- rule the Seed : And therefore you are to practife it by Nourifhments as contrary as may be, to the Nature of the Herb; foneverthelefs as the Herb may grow, and likewife with Seeds that are of the weakeft fort, and have leatt vigor. You thall do well therefore to take Marfh Herbs, and plant them upon tops of Hills and Champaigns; and fuch Plants as require much moilture, upon Sandy and very dry grounds. As for example, Marfh-Mallows, and Sedge upon Hills; Cucumber and Lettuce Seeds, and Coleworts upon a Sandy Plat ; fo contrariwife plant Bufhes, Heath, Ling, and Brakes upon a Wet or Marfh Ground. This I conceivealfo; that all Efculent and Garden Herbs, fec upon the tops of Hills; will prove more Medicinal, though lefs Efculent, than they were before. And it may be likewife, fome Wilde Herbs you may make Salet Herbs. This is the firf Rulefor Tranfmutation of Plants.

The fecond Rule flould be to bury fome few Seeds of the Herb you would change amongt other Seeds; and then you fhallfee whether the Juyce of thole other Seeds do not fo qualifie the Earth, as it will alter the Seed whereupon you work. As for example, Put Parlly. leed amonglt Onion-feed, or Lettuce-feed amongit Parlly.feed, or Bafil-feed amongtt Thyme-feed, and fee the change of tafte or otherwife. But you fhall do well to put the Seed you would change into a little Linnen Cloth, that it mingle not with the Foreign Seed.

The third Rule fhall be the making of fome medly, or mixture of Earth, with fome other Plants bruifed, or thaved, either in Leaf orRoot: As for examplemake Earth; with a mixture of Colew ort Leaves flamped, and fet in it Artichoaks, or Parfnips: So take Eath made with CMajoram, or Origanxum, or Wilde Thyme, bruifed, or ftamped, and fet in it Fennel-Seed; $\ddagger c$. In which operation, the Proces of Nature flill will be, (as I conceive,) not that the Herb you work upon, fhould draw the Juyce of the Foreign Herb; (for that opinion we have formerly rejected) but there will be a new confection of mould, which perhaps will alter the Seed, and yet not to the kinde of the former Herb.

The fourth Rule fhall be io mark what Herbs fome Earths do put forth of themfelves, and to take that Earth, and to Pot it, or to V.ffel it ; and into that, fet rhe Seed you would change : As for Example; take from under Walls; or the like; where Nettles put forth in abundance, the Earth which you fhall there finde, without any String or Roor of the Nettles; and pot that Earth; and fet in it Stock-Gilly-flowers, or Wall-flowers, \&e. Or fow in the Seeds of them, and fee what the event will be; ortake Earth, that you have prepared to put forth CWu/brooms of it felf, (whereof youl Thall finde fome inftances following, ) and fow it in Purflane-feed, or Lettuce.feed; for in thefe Experiments, it is likely enough, that the Earth being accuftomed to fend forth one kinde of Nourifhment, will alter the new Seed. to make Ground Herbs rife in height: As for example; Carry Camomile, or Wilde Thyme, or the Green Strawberry, upon fticks, as youdo Hops upon Poles, and fee what the event will be.

The fixth Rule fhall be to make Plants grow out of the Sun, or open Air; for that is a great mutation in Nature, and may incuce a change in the Seed: As barrel up Earth, and fow fome Seed in it, and put in the bottom of a Pond, or put it in fome great hollow Tree; try alfo the fowing
of Seeds in the bottoms of Caves; and Pors with Seeds fown; hanged up in Wells, fome diftance from the Water, and fee what the event will be.

IT is certain, that Timber-Trees in Coppice Woods, grow nore upright, and more free from under Boughs, than thofe that ftand in the Fíelds. The caufe whercof is, for that Plants have a natural motion to get to the Sun ; and befides, they are not glutted with too much nourifhment; for that the Coppice Ghareth with them, and Repletion ever hindreth ftature. Laftly, they are kept warm, and that ever in Plants helpech mounting.

Trees that are of themlelves full of Heat, (which heat appeareth by their inflamable (Gums) as Firrs, and Pines, mount of themfelves in heighth without Side-boughs, till they come towards the top. The caufe is partly heat, and partly tenuity of Juyce; both which fend the Sap upwards. As for Juniper, it is but aShrub, and groweth not big enough in Body to maintain a tall Tree.

It is reported, that a good ftrong Canvas, (pred over a Tree grafted low, foon after it puttech forth, will dwarf it, and make it fpred. The caule is plain ; for that all things that grow, will grow as they finde room.

Trees are generally fet of Roots or Kernels; but if you fet them of Slips, (as of lome Trees you may; by name the (Mulberry). fome of the Slips will take; and thofe that take, (asis reported) will be Drarf-trees. The caufe is, for that a Slip draweth nourifhment more weakly, than either a Root or Kernel.

All Plants that put forth their Sap haltily, have their Bodies not proportionable to their length, and therefore they are Winders and Creepers; as Ivy, Briony, Hops, Woolbine: Whercas Dwarfing requirech a flow putting forth, and lefs vigor of mounting.

THe Scriptüre faith, That Solomon wrote a Natural Hiftory; from the Cedar of Libanus, to the CTopgrowing upon the Wall; for fo the beft Tranflations have it. And it is true, that Mas is but the Rudiment of a Plant, and (as it were) the Mould of Earth or Bark.

CMoß groweth chiefly uponRidges of Houfes, tiled or thatched, and upon the Crefts of Walls, and that Mors is of a lightfome and pleafant Green. The growing upon Slopes is caufed for that Mofs, as on the one fide it cometh of Moiture and Water, fo on the other fide the Water mu? but flide, and not fland or pool. And the growing upon Tiles, or Walls, \&c. is caufed, for that thofe dried Earths, having not moillure fufficient to pur forth a Plast, do practice Germination by putting forth Mofs; though when by age, or orherwife, they grow to relent and refoive, they fometimes put forth Plants; as Wall flowers. And almoft all Mofs hath here and there little Stalks, befides the low Thrum:
$\mathcal{C H}_{2} \beta$ groweth upon Alleys, efpecially fuch as lye cold, and upon the

It is reported, that the Bark of white or Red Poplar, (which are of tinc moifteft of Trees) cut (mall, and caft into Furrows well dunged, will caule the ground to pur forth Mubbromes, at all leafons of the year fit tobe caten, fome add to the mixture Leaven of Bread, rcfolved in Water.

It is reported, that if a Hilly-field, where the fubble is ftanding, be fet on fire, in the fhowry featon, it will put forth great fore of Mushomes.

It is reported, that Harts-Horn fhaken, or in fmiall pieces, mixed with Dung, and watred, putteth up Mushromes. And we know that Haits-Horn is of a fat and clammy fubftance : And it may be $O_{x}$-Hori would do the like.

It hath been reported, though it be fcarce sredible, that Ivy hath grown outof a Sags-Horn ; which they tuppofe did rather come from a confrication of the Horn upon the Ivy, than from the Horn it felf. There is not known any fubftance, but Earth, and the Procedeurs of Earth, (as TileSone, © © c.) that yieldethany Mofs, or Herby fubltance. There may betryal made of fome Seeds, as that Fennel-Sced, Multard-Seed, and Rape-Seed, puit into fome little holes made in the Horns of Stag;, or Oxen, to fee if they will grow.

There is alfo another unperfect Plant, that (in fhew) is like agreat Mufh rome: And it is fometimes as broad as ones Hat, which they call a ToalsRool; but it is not Efculene, and it groweth (commonly) by a dead Stub of a Tree, and likewife about the Roots of rotren Trees; and therefore feemerh to take his Juyce from Wood putrified. Which fheweth by the way, that Wood purrified yielderh a frank moifture.

Tiere is a Cake that groweth upon the fide of a dead Tiee, that hath gotten no name, but it is large and of a Chefaut colour. and hard and pithy; whereby it fhould feem, that even dead Trees forget not their putting forth, no more than the Carcaffes of Meus Bodies that put forth Hair and Nails for a time.

There is a Cod or Bag that groweth commonly in the Fields; that at firt is hard like a Tennis-Ball, and white; and after growth of a Mufhrome colour, and full of light duft upon the breaking; and is thoughr to be dangerous for the eves, if the Powjer get into them, and to begood for Kibes. Belike it hath a Corrofive, and fretting Nature.

There is an Herb called ${ }^{\prime}$ ews-Ear, that groweth upon the Roots, and lower parts of the Bodies of Trees, efpecially of Elders, and fometimes Ahhes. It hath a ftrange propriety; for in warm Water, it fwellerh, and openeth extreamly. It is not green; but of a dasky brown colour. And it is ufed for fquinancies, and inflamations in the Throat, whereby it feemeth to have a mollifying, and lenifying vertue.

There is a kinde of Spongy excrefence, which groweth chiefly upon the Roots of the Lafer-Tree, and fometimes upon Cedar, and other Trees. It is very white, and light, and fryable;' which we call $\boldsymbol{A}$ garick. It is famous in Phyfick for the purging of tough Flegm. And it is allo an excellent openir for the Liver, but offenfive to the Stomach ; and in tafte it is, at thefinft fiweet and after bitter.

We finde no Super-Plant, that is a formed Plant, but Miffetioe. They have an idle Tradition, that there is a Bird called a criffel-Bird, that feedeth upon a Seed, which many t mes the cannot difgeft, and to expelleth is whole with her Excrement; which falling upon a Bough of a Tree, that hath fome rift, purtech fotth Miffeloee: But this is a Fable; for it is not probable, that Birds fhould teed upon that they cannor difgeft. But allow
that, yet it cannot be for other Reafons: For firt, it is found bur upon certain Trees; and thofe Trees bear no fuch Fruit; as may allure thar B rd to fit and feed upon them. It may be, that Bird feedeth upon the MiffeltoeBerries, and fo is often found there; which may have given occafion to the tale. But that which maketh an end of the queftion is; that Miffelroe hath been found to put forth under the Boughs, and not (onely) above the Boughs; fo it cannot be any thing that fallech upon the Bough. M.ffiltoe groweth chiefly upon Crab-trees, Apples. rrees, fometimes upon H Aes, and rarely upon Oaks; the Miffeltoe whereof is counted very Medicinal. It is ever green, Winter and Summer, and beareth a white gliftering Berry; and it is a Plant, utterly differing from the Plant,' upon which it groweth. Two things therefore may be certainly fer down : Firft, that Superferation mult be by abundance of Sap, in the Bough that putteth it forth. Secondly, that that Sap muft be fuch as the Tree doth excern, and cannot aflimilare, for elfe it would go into a Bough; and befides, it feemerh to be more fat and unctuous, than the ordinary Sap of the Tree; both by the Berry which is clammy, and by that it continueth green Winter and Summer, which the Trec doth not.

This Experiment of Miffeltoe may give light to other praCtices; therefore tryal would be made, by ripping of the Bough of a Crab-tree in the Bark, and watering of the Wound every day; with warm water dunged, to fee if it would bring forth Miffeltoe, or any fuch like thing. But it were yet more likely, to try it with fome other watering or anointing, that were notfonatural to the Treeas Wateris; as Oyl, or Barm of Drink, \&c. So they befuch things askill not the Boagh.

It were good to try, what $\mathcal{P l a n t s}$ would put forth, if they be forbidden to putforth their natural Boughs: Powl therefore a Tres, and cover ir, lome thicknefs with Clay on the tof, and fee what it will put forth. I uppole it will put forth Roors; for fo will a Cions, being turned down into Clay. Therefore in this Experimentallo, the Tree would be clofed with fome what that is norfo natural to the Plantas Clay is; try it with Leather, or Cloth, or Painting, foit be not hurtful to the Tree. And it is certain, that a Brake hath been known to grow out of a Pollard.

AMan may count the Prickes of Trees to be a kinde of Excrefeence, for they will never be Boughs, nor bear Leaves. The Plants that have Prickles, are Thorns, Black and White ; Bryer, Rofe, Lemmon-trees, Crab-trces, Goosberry; Berberry ; thefe have it in the Bough. The Plants that have Prickles in the Leaf are, Holly, Juniper, Whin bufh, Thiftle; Nettles alfo have a fmall venemous Prickle; to hath Borrage, but harmlefs. The caufe muft be, hafty putting forth, want of moifture, and the clorenefs of the Bark: For the hafte of the Spirit to put forth, and the want of nourifhment toput forth a Bough, and the clofenefs of the Bark, caufe Prickles in Boughs; and there fore they are everlike a $P$ yramis, for that the moifure fpendech after a litthe putting forth. And for Prickles in Leaves, they come alfo of putting forth more Juyce into the Leaf, that can fpred in the Leaf fmoo:h; and therefore the Leaves orherwife are rough, as Burrage and Nettles are. As for the Leaves of Holly, they arefmooth, bur never plain, but asit were with folds for the fame caufe.

There be alfo $P_{\text {lants , that though they have no Prickles, yer they have a }}$ kinde of Downey or Velvet Rine upon their Leafes; as Rofe-Campion, StockGillifoneres, Colss-foot Si which Down or Nap cometh of a fubtile Spirit, in a foft or fat fubftance. For it is certain, that both Stock-Gilififobers, and Rofe-

Campions, ftamped, have been applied (with fuccefs) to the Wrefts of thofe that have had Tertian or Qufrran Agues; and the Vapor or Colts-foot have 2 fanative vertue towards the Lungs, and the Leaf alfo is healing in Surgery.

Another kinde of Excrefeence is an Exudation of Plants, joyned with Putrefaction, as we fee in Oak-Apples, which are found chiefly upon the Leaves of Oaks, and the like upon Willows: And Countrcy. people have a kinde of Prediction, that if the Oak-Apple, broker, be full of Worms, it is a fign of a peftilent year; which is a likely thing, becaufe they grow of corruption.

There is alfo upon Sweet, or other Bryer, a fine Tuft, or Brufh of Mofs
of divers colours; which if you cut, you hallever finde full of little white Worms.

I
Tis certain, that Earth taken out of the Foundations of Vaults and Houfes and bottoms of $W$ ells, and then put into Pots, will put forth fundry kinde of Herbs: But fome time is required for the Germination; for if it be taken but from a Fathom deep, it will put forth the firft year, if much deeper, not till after a year or two.

The nature of the Plants growing out of the Eareh fo taken up, doth fol= low the nature of the Mould it felf, as if the Mould be loft and fine, it putteth forth foft Herls ; as Graß, Planime, and the like : If the Earth be harder and courfer, it puttech forth Herbs more rough, as Tbifles, Firs, or.

It is common Experience, that where Alleys are clofegravelled, the Earth putteth forth the firt year Knot Gräß, and after spire Graß. The caufe is, for that the hard Gravel or Pebble at the firft laying, will not fuffer the Graß to come forth upright, but turneth it to finde his way where it can ; but after that the Earth is fomewhat loofened acthe top, the ordinary Grafs comethup.

It is reported, that Earth being taken out of fhady and watry Woods, fome depth, and potted, will putforth Herbs of a fat and juycy fubftance; as Penny-wort, Purflane, Houfleek, Pemny. Royal, ớc.

The Water alfo doch fend forth Plants that have no Roots fixed in the bottom ; but they are lefsperfect Plants being almoft but Leaves, and thofe fmall ones: Such is that we call $\mathcal{D}_{\text {uck }}$. weed, which hath 2 Leaf no bigger then a Thyme Leaf, but of a frefher Green, and putteth forth a little fring into the Water, far from the bottom. As for the Water-Lilly, it hath a Root in the Ground; and fo have a number of other Herbs that grow in Ponds.

It is reported by fome of the Ancients, and fome Croders Tefimony likewife, that there be fome Plants, that grow upon the top of the Sea; being fuppofed to grow of fome concretion of Slime from the Water, where the Sur heateth hot, and where the Seaftirrethlittle. As for the e Alga CMarina, (Sea--Deed) and Erixgium (Sea-Thifle) both the Roots; but have Sea-weed under the Water, the Sea Tiffle butupon the Shore.

The Anciens have noted, that there are fome Herbs thatgrow out of Snow, laid up clofe together, and putrified; anid that they are all bitcer, and they name one efpecially, Flomus, which we call Cooth-Mollini. It is certain, that Worms are found in Swow commonly, like Earth-worms; and therefore it is not unlike, that it may likewife put forth Plants.

that come early with us, are, Prime-Kofés, Voleteri; Anemonies, Water-D affai dilies, Croous Vermuis, and fome early Tulippa's. And vhéy ate all told Plants; which therefore (as it fhould feent) have a quicker Perception of the heat of the Suntincreafing, than the hat Herbs haves as a cold hand will fooner finde a little warmth, than a hot A thd thofe thatcome next aftef ala WallFlowers, Cowflips, Hyacinths, Rofemary-flowers, \&c. And after them Pinks, Rofes, Flowerdeluces, \&c. And the lateftare, : Gillv flowers', HollyOaks, Larks-Foor, \&c. The earlieft Bloffoms are, the Bloffoms of Peaches, Almonds, Cornelians, Mezerions, \&c. And they afé of luch Trees; as have much moifture, either Watery, or Oyly. And therefore Crotus Rernisallio, being an Herb that hath an Oyly Juyce, putiech forth early. e . For thole alfo finde the Sun fooner than the dryer Trees. The Grains ate, firt Rye and Wheat, then Oats and Barley', then Peale and Béans; for though Green Peafe and Beans be eaten fooner,' yet the dry'ones that are ufed for Horfe:meat, are ripe laft ; and it feemeth, that the fatter Grain cometh fitt.l The earlieft Fruits are, Strawberries, Cherries, Goofeberries, Corran's and after them early Apples, early Pears, Apricors, Rafps ; and after them, Damofins, and moft kinde of Plumbs,Peaches, \&ci.: And the lateftare, Apples, Wardens, Grapes, Nuts; Quinces, Almonds, Sloes, Brien-berries, Heps; Medlars, Services, Cornelians, \&c.

It is to be noted, That (commonly) Trees that ripen lateft, bloffom rooneft ; as Peaches, Cornelians, Sloes; Almonds, \&c. And ir feemeth to be a work of providence that they bloffom fo foon, for otherwife they could not have the Sun long enough to ripen:

There be Fruirs (but rarely) that' come twice a year; as fome Pears; Strawberries, \&c. And it feemeth, they are fuch as abound with nourim.? ment, whereby affer one period, before the Sun waxech too weak, they can endure another. The Violet allo, amongtt Flowers, cometh twice a -year, efpecially the double White, and that alfo: is a Plant full of moifure. Rofes come twice, but it is not without cutting, as hath been formerly faid.

In CMufovia; though the Corn comenot up till late Spring; yet their Harvelt is as early as ours. The caule is, for that the ftrength of the Ground is kept in with the Snow; and we fee with us, that if it be a lotig Winter, it is commonly a more plentiful year: And after thofe kinde of Winters like wife, the Flowers and Corn which are earlier and later, do come commonly at once, and at the fame time ; which troubleth the Husbandman many times: For you fhall have Red-Rofes and Damask-Roles come togen ther, and likewife the Harveft of Wheat and Barley. Bue this hapneth ever, for that the carlier flayech the later, and not that the later cometh looner.

There be divers Fruit Trees, in the hot Countreys, which baye Blafy foms, and young fruit, and ripe fruit, almoft all the year, fucceeding one, another. And it is faid, the: Drenge ihath the like with us, for agreat part, of, Summer, and lo alfo hath the Fig. And no doubr, the Nataral Motion of Plants is to have fo: But that eitherthey want Juycet tofpend orthey meet, with the cold of the Winter. And therefore this Cirele of ripening cannot be, but in fucculent Plants iand hot Countreys. mis ziolbrael if.. (fo at 58. He lafting of Planes, is moft in thofe that are largeft of Body ss Oaks,

Some Herbs are but Annual, and die Root and all once a year ; as Bor-
 of Corn; ; fome continue many years; as Hyfope, Germander, Lavender, Fennel, oc. The caufe of the Dying is double; the firft is, the tendernefs and weaknefs of the Seed, which maketh the period in a fmall time, as it is in Borrage, Lettuce, Cucumbers, Corn, ©́c. And therefore none of thefe are hot: The other caufe is, for that fome Herbs can worle endure cold, as Bafil, Tobacico, $M u /$ fard f feed ; and thefe have (all) much heat.

Tit is often contrary; for Borrage; Coleworts. Pompions, which are Herbs of the largeft fize, are of fmall durance; whereas Hyfope, Winter-Savory, Germander, Time, Sage, will laft long. The caufe is, for that Trees lant according to the ftrength, and quantity of their Sap and Juyce, being well munited by their Bark, againft the injuries of the Air: But Herbs draw a weak Juyce, and have a foft Stalk; and therefore thofe amongf them which laft longeft, are Herbs of ftrong fmell, and with a flicky falk: 20

Trees thát bear Maft and Nuts, are commonly more lafting than thofe that bear Fruits, efpecially the moifter Fruits; as Oaks, Beeches, Chefnuts, Walnuts, Almonds Pine trees, 3xc. Iaftlonger than Apples, Pears, Plumbs, \& c. The caufe is, the fatraefs, and oylinefs of the Sap; which ever waftech lefs, than the more Watry.

Treesthat bring forth their Leaves late in the year, and caft them likewife late, are more lafting than thofe that forout their Leavesearly; or fhed them betimes. The caufe is, forthat the late coming forth, thewerh a moifture more fixed ; 'and the other loofe, and more eafily refolved. And the fame caufe is, that wilde Trees laftlonger than Garden-trees; and in the fame kinde'; thofe whofe Fruit is acide more than thofe whofe Fruit is fiweer.

Nothing procureth the lafting of Trees, Bufhes, and Herbs, fo much as often cutting; for every cutting caufeth a renovation of the Juyce of the Plant; that it neither goeth fo far, nor rifeth fofaintly, as when the Plant is not cut: Infomuch, as eAnual Planes, if you cur them feafonably, and will fpare the ufe of them, and fuffer them to come up ftill poung will laft more years than one, as hath been partly touched; fuch as is Lettuce, Purflane, Cucumber, and the like. And for great Trees, we fee almoft all overgrown Trees in Church-yards, or near ançient Building, and the like, are Pollards: or Dottards, and not Trees at their. full height. Some Experiment would be made, how by Art to make Plants more
lafting than their ordinary peri d; as to make a Stalk of Wheat, \&c. laft a whole year: You muftever prefuppofe, that you handle it $f 0$, as the Winter killeth it not, $;$ for we fpeak onely of prolonging the Natural Period. I conceive, that the Rule will hold, That whatfoever maketh the Herb come later, than at his time will make it laft longer time : It were good to try it in a Stalk of Wheat," \&ec fet in the fhade, and encompaffed with a cafe of Wood, not touching the Straws to keep out open Air.
10 As for the Prelervation of Fruits, as well upon the Tree or Stalk; as gathered, we fhall handle it underthe Tiitle of Confervation of Bodies,

THe Particular Figures of Plantsve leave to their defrriptions, but fome few things in general, we will obferic. Trees and Herbs, in che growing forth of their Boughs and Branches, are not figured, and keep no order. The caufe is, for that tne Sap, being reftrained in the Rinde and Bark, breaketh not forth at all, (as in the Bodies of Trees, and Stalks of Herbs,) till they begin to branch, and then, when they make an cruption, they break forth calually, where they finde beft way in the Bark or Rinde. It is true, that fome Trees are more fcattered in their Boughs; as Sallow trees, Wardentrees, Quisce-trees, Medlar-trees, Lemmon trees, ©r. Some are more in the form of a Pyramis, and come almoft to tod; as the Pear-trees (which the C $\cdot i$ ticks will have to borrow his name of wieg Fire) Orenge-trees, Fir- trees, Service trees, Lime--rees, \&̌r. And fome are more fpred and broad, as Beeches, Hornbeam, $6 c$. The reft are more indifferent. The caufe of fcattering the Boughs is, the hafty breaking forth of the Sap; and therefore thofe Trees rife not in a Eody of any height, but Branch near the Ground. The caufe of the Pyramis is, the keeping in of the Sap, long before it branch, and the fpending of it, when it beginneth to branch, by equal degrees: The fpreding is caufed, by the carrying up of the Sap plentifully, without expence, and then putting it forth fpeedily, and at once.

There be divers Herbs, but no Trees, that nay be faid to have fome kinde of order, in the putting forth of their Leaves: Forthey have Joynts, or Knuckles, as it were ftops in their Germination; as have Gillifowers, finks, Fennel, Corn, Reeds, and Canes. The caufe whereof is, for that the Sap afcendcth unequally, and doth (as it were) tire and fop by the way. And it feemeth, they have fome clofenefs and hardnefs in their Stalk, which hindereth the Sap from going up, until it hath gathered into a knot, and fo is more urged to put forth. And therefore, they are moft of them hollow, when the Stalk is dry; as Fennel Stalks, Stubble, and Canes.

Flowers have (all) exquifite Figures, and the Flower numbers are (chiefiy) five and four; as in Prime-Rofes, Bryer-Rofess,fingle CWubk-Rofes, fingle Finks, and Gillifoners, for. which have five Leaves; Lillies, Flower-de-luces, Borage, Bugloß. © $\sigma$. which have four Leaves. But fome put forth Leaves nor numbred, but they are ever fmall ones; as Marigolds, Trifole, ér. We fee alfo, that the Sockets, and Supporters of Flowers, are Figured; as in the five Brethren of the Rofe, Sockets of Gillifoners, ©'r. Leaves alio are all figured, fome round, fome long, none fquare, and many jagged on the fides; which Leaves of Flowers feldom are. For, I account, the jagging of Pinks, and Gil lifo oners, to be like the inequality of Oskeleaves, of Vins-leaves, or the like; bur they feldom or never have any fmall Purls.

o
F Plants fome few put forth their Bloffoms before their Leaves; as Almonds, Peaches, Cornelians, Black-Thorn, ©'r. But moft put forth fome Leaves before their Bloffoms; as Apples, Pears, Plumbs, Cherry. White-Thorn, or The caufe is for that thofe that put forth their Bloffoms firt, have either an acute and fharp firit; (and therefore commonly they all put forth early in the Spring, and ripen yery late, as moft of the particulars before mentioned) or clle an oyly Juyce, which is apter to put out Flowers than Leaves.

Of Plants fome arc Green all Winter, others caft their Leaves. There Plants.

Experimerts in Comlor: rourbing the Several Fi:gures of Plants. areGreen all Winter, Holly, Ivy, Box, Firr, Eugh, Cypreß, Funiper, Bays, Rofemary, \&rc. The caufe of the holding Green, is the clofe and compaet fub-
ftance of their Leaves, aud the Pedicles of them. And the caute of ihat again, is, either the tough and vifcous Juyce of the Plant, or the Itrength and heat thereof. Of the firf forr, is Hiolly; which is of fo vifoous a Juyce, as they make Birdlime of the Bark ot 11 . The S:aik of Ioy is tough, and not fragile, as we fee it inorher fmall T wigs dry. Firr yielderh litch. Box is a fatt and heavy Wood, as we fee it in Bowls. Eugh is a itrong and tough Wood, as we fee it in Bows. Of the fecond fort, is 'guniper, which is a Wood odorate, and maketh a hot Fire. Bays is likewifea hot and aromatical Wood, and fo is Rofemary for a Shrub. A , or the Leaves, their denfity appeareth in that; either they are fmooth and thining, as in Bays. Holly, Ivy, Box. ©rc. or in that they are hard and foiry, as in the reit. And tryal woula be made of Grafting of Rofernary, and Bays, ind Box, upon a Holly Stock, becaufe they are Plants that come all Winter. It were good to try it alio with Grafts of other Trees, either Fruit trees, or Wild-trees, to fee wherher they will not yield their Fruit, or bear their Leaves later, and longer in the Winter ; becaufe the Sap of the Holly puttech forth moft in the Winter. It may be alfo a Mezerion-treegrafted upon a Holly, will prove both an earlier, and a greater Tree.

There be fome Plants that bear no Flower, and yet bear Fruit ; there be fome that bear Flowers, and no Fruit ; there be fome that bear neither Flowers nor Fruit. Mott of the grear Timber-trees, (as Oaks, Beeches,\&c.) bearno apparent Fiowers; fome few (lkewile) ot the Fruit-trees, as Mulberry, Walnuts, \&c. And fome Snrubs, (as Juniper, Holly, \&c.) bear no Flowers. Divers Herbs alfo bear Seeds, (which is as the Fruit,) and yer bear no Flow res, as Purllane, \&c. Thofe that bear Flowers, and no Fuit, are few, as the double Cherry, the Sallow, \&c. But for the Cherr", ir is doubrful, whether it be nor by Art or Culture; for if it be by Art, then tryal would be made, wherher Apples and other Fitlirs Bloffoms may not be doubled. There are fome few, that bear neither Fruit, nor Flower; as the Elm, the Poplars, Box, Braks, \&c.

Tiere be fome Plants that fhoot ftill upwards, and can fupport themfelves, as the greaieft part of Trees and Plants: There be fome orher, that creep along the Ground, or wind about other Trees, or props, and cannot fupport themfelves; as Vines, Ivy, Bryar, Briony, Wood-bines, Hops, Climatis, Camomil, \&c. The caufe is, (as hath been partly touched) for that all Plsnts, (llaturaily) moveupwards; but if the Sap put up too faft, it maketh a A Ander Stalk, which will nor fupport the weight ; and therefore thefelatter fort are all fwift and halty comers.
595. Experiments in Confort, touching all Manner of Compofts and Help of Grannd.

THe frit and moft ordinary help is Stercoration. The Sheeps-dung is one of the beft; and next, the $\mathcal{D}$ ung of Kine; and thirdly, that of Horfes; which is held to be fome what too hot, unlefs.it be mingled; that of $\mathcal{P}$ igeons for a Garden, as a fmall quantity of Ground, excelleth. The ordering of Dung is, if the Ground be Arable, to fored it immediately before the Ploughing and Sowing, and fo to Plough it in: For if you (pred it long before, the Sun will draw out much of the fatnefs of the Dung: If the Ground be Grazing Ground, to fpred it lomewhat late towards Winter, that the Sun may have the lefs power to dry it up. As for Ipecial Coniposits for Gardens (as a Hot Bed, ©̛.c.) we have handled them before.

Thefecond kinde of Compoit is, the fpreding of divers kindes of Earth; as CTAarl, Clalk, Sea Sand, Earth upon Earth, Pond-Earth, and the mixtures of them. Warl is thought to be the beft, as having moft fatnefs. Aind not

## Century VI.

heating the Ground too much. The next is Sea-fand, which (no doubt) obtained a fecial vertue by the Salt; fot Salt is the firt rudiment of life. Chalk over-heatech the Ground a little; and therefore is beft upon cold Clay Grounds, or moift Grounds: But Iheard a great Hubband lay, thatit was a common error to think that Chalk helpeth Airable Grounds; but hidlpeth not Grazing Grounds, whereas (indeed) it helpeth Grafs as well (Corn: But that which breedeth the error is, becaufe after the chalking of the Ground, they wear it out with many Crops, without reft ; and then (indeed) afterwards it will bear little Grafs ; becaufe the Ground is tired our. It were good to try the laying of Chalk upor Airable Grounds, a little while before Ploughing, and to Plough it in, as they do the Dung'; but thenitmutt be Friable firt, by Rain or Lying: As for Earlh it compafferh it felffs for I knew a great Garden; that had a Field (in a manner) poured upon it,' and it did bear Fruit excellently the firftyear of the Planting; for the Surface of the Earth is ever the fruiffulleft: And Earth fo prepared hath a double Surface. But it is true, as I conceive, that füch Earth as häth Salt-Peter bred in it, if you can procure it without too much charge, doth excel. The way to haften the breeding of Sult-Peter, is to forbid the Suin, and the growth of Vegetables. Andtherefore, if you make alarge Hovel, thatched, over fonie quantity of Ground; nay, if youdo but planck che Ground over, it will breed Salt-Peter. As for Pond-earth or River-earth, it is 2 very good compoft, efpecially, if the $\mathcal{P}$ ond have been long uncleanfed, and fothe $W$ ater be not too hungry; and 1 judge it will be yet better; if there be! ome mixture of Chalk.

The third help of Ground is, by fome other Subftances that have vertue to make Ground Fertile, though they be not meerly Earth, wherein Afhes excel; infomuch as the Counsreys about CEtna and $V$ efuvius have akinde of amends made them, for the milchief the eruptions (many times) do, by the exceeding fruitfulncfs of the foyl, caufed by the Afhes fcattered about. Soot alfo, thoughthin, fpred in a Field or Garden, is tryed to be a very good compoft. For Salt it is too coftly; but it is tryed, that mingled with Seedcorn, and fown together, it dorh good: And I am of opinion, that Chalk in Ponder, mingled with Sced-corn, would do good; perhaps as much as Chalking the Ground all over. As forthe fteeping of the Seeds in feveral mixtures with Water, to give them vigor, or watring Grounds with Compoft-water, we have fpoken of them betore.

The fourth help of Ground is, the fuffering of Vegetables to dic into the Ground, and foto fatten it; as the Stubble of Corns, efpecially Peafe. Brakes caft upon the Ground in the beginning of Winter, will make it very fruitful. It were good (alfo) to try whether Leaves of Trees fwept together, with tome Chalk and Dung mixed, to give them more heart, would not make a good Compoft : For there is nothing loft, fomuch as Leaves of Trees, and as they lie fcattered, and without mixture, they rather make the Ground four, than otherwife.

The fth help of Ground is, Heat and Warmth. If hath been anciently practifed to burn Heath, and Ling. and Sedge, with the vantage of the Wind, upon the Ground. We fee, that Warmth of Walls and Inclofures; mendeth Ground; we fee alfo, that lying open to the Soutb, mendeth Ground ; we fee again that the Foldings of Sheep help Gound as well by their warmth, as by their compoft: Andit may be doubted, whetherthe covering of the Ground with Brakes, in the beginning of the Winter (whereof we fpake in the laft Experiment) helpech it not, by reafon of the Warmth. Nay, fome very good

Husbands do fufpect, that the gathering up of Flints in Flinty Ground, and laying them on heaps (which is much ufed) is no good Husbandry forthat they would keep the Ground warm.
600.
"The fixth help of Ground is, by Watring and Irrigation, which is in two manners; The one by Letting in, and Shutting out Waters, at feafonable times; for Water; at lome fealons, and with realonable ftay, doth good; but at fome other feafons, and with too long ftay, doth hurr. And this ferveth onely for Meadows, whichare along fome River. The other way is tobring Water from fome hanging Grounds, where there are Springs into the lower Grounds, carrying it in fome long Furrows; and from thofe Furrows, drawing it trayerfe to fpred the Water: And this makech an excellent improvement, both for Corn and Grafs. It is the richer, if thofe hanging Grounds, be fruitful, becaufe it wafheth off fome of the fatnefs of the Earth; but howfoever it profitech much. Generally where there are great overflows in Fens, or the like the drowning of them in the Winter, maketh the Summer following more fruitful: The caufe may be for, that it keepe:h the Ground warm, and nourifheth it. But the Fen men hold, that the Sewers mult be kept fo, as the Water may not ftay too long in the Spring, till the Weeds and Sedge be grown up ; for then the Ground will belike a Wood which keepeth out the Sun, and fo continueth the wet ; whereby it will never graze (to purpofe) that year. Thas much for Irrigation ; but for Avoidances, and Drainings of Water, where there is too much, and the helps of Ground in that kinde, we fhall fpeak of then in another place.

Century VII.

He differences between Animate and Inanimate Bodies, we fhall handle fully under the Title of Life, and Living Spirits, and Powers. We fhall therefore make but a brief mention of them in thisplace. The main differences are two. All Bodies have Spirits, and Pncumatical parts within them ; but the main differences between $A n i$ mate and Inamimate are two. The firft is, that the Spirits of things animate, are all contined with themfelves, and are branched in Veins, and fecret Sanales, as Blood is: And in Living Creatures, the Spirits have not onely Branches, but certain Sells or Seats, where the principal Spirits do refide, and whereunto the reft do refort: But the Spirits in things Inanimate are fhut in, and cut off by the Tangible parts; and are not pervious one to another, as Air is in Snow. The fecond main difference is, that the Spirits of Animate Bodies are all infome degree (more or lefs) kindled and inflamed, and have a fine commixture of Flame, and an Ærial fubftance : But Inanimate Bodies have their Spirits no whit inflamed or kindled. And this difference confifteth not in the Heat or Coolnefs of Spirits; for Cloves and other Spices, $N_{\text {aptha }}$ and Petroleum, haveexceeding hor Spirits (hotter a great deal than $\mathrm{Oy} l_{\text {, }} W_{a x}$, or Tallow, $\sigma c_{0}$ ) bur not inflamed. And when ary of thofe weak and temperate Bodies come to be inflamed, thanthey gather a much greater heat, than others have uninflamed, befides their light and motion, \&c.

The differences which are fecondary, and proceed from thefe two ra. dical differences are, firf, $P$ Planes are all figurate and determinate, which inanimate Bodies are not; for look how far the Spirit is able to fpred and continue it felf, to far goeth the fhape or figure, and then is determined. Secondly, plams do nourifh, inanimate Bodies do not; they have an Accretion, buṭ no Alimentation. Thirdly, Plants have a period of life, which inanimate Bodies have not. Fourthly, they have afucceffion and propagation of their kinde, which is notin Bodies inanimate.
601. Experiments in Confort, touching the Affinities and Differences, between Plants and Inanimare Bodies.

THe Affinities and Differencesbetween $P_{\text {lants }}$ and $L_{\text {iving }}$ Creatures, are thefe that follow. They have both of them Spirits continued and branched andalfo inflamed. Buefirftin Living Creatures the Spirits have a Cell or Seat, which Plants have not, as was alfo formerly faid. And fecondly, the Spirits of Living Creatures hold more of Flame, than the Spirits of Plants do; and thefe tivoare the Radical differences. For the Secondary differences, they are as follow. Firft, Plants are all fixed to the Earth; whereas all Living Creatures are fevered, and of themfelves. Secondly, Living Creatureshave Local Motion, Plants have not. Thirdly, Living Creaturesnourifh from thicir upper parts by the Mouth chiefly ; Plantsnourifh from below, namely from the Roots. Fourthly, Plants have their Seed and Seminal parts uppermoft, Living Creatures have them lowermoft ; and therefore it was faid, not Elegantly alone, but Philofophically: Homo eft Planta inverfa. CJan is like a Plast turned uprards; For the Root in Plants, is as the Head in Living Creaturcs. Fifthly, Living Creatureshave a more exad Figure than Plants. Sixthly, Living (reatures have more diverfity of Organs within their Bodies and (as it were) inward Figures than Plants have. Seventhly, Living Creatures have Senfe, which Plants havenot. Eightly, Living Creatures have Voluntary Motion, which Plants havenot:

For the difference of Sexes in $\mathcal{P}$ lants, hey are oftentimes by name diftinguifhed; as Male-Piony, Female Piony; Cxale Rofemary, Female-Rofemary; He Holly, She-Holty, ơr. But Generation by Copulation (certainly extendeth not to Plants. The neareft approach of it, is between the He-Palm, and the She-Palm, which (as they report). if they grow near, incline the one to the other: infomuch as, (that which is more ftrange) they doubtnot to report, that to keep the Treesupright frombending, they tye Ropes or Lines from the one to the other, that the contact might be enjoyned by the contact of a middle Body. But this may be feigned, or at leáftamplified. Neverthelefs, I
an apt en ugli to think, that this fame Binariuti of a fronger and a weaket, like unto Mafouline and Fiminine, doth hold in all Living Bodics. It is confounded fomecimes; as in fome Creatures of Putefaction, wherein no marks of diftinction appear; and it is doubled fometimes, as in Hermaphrodites: but generally therc is a degree of frength in moftSpecies.

The Participles or Confiners between Plants and Living Creatures, are fuch chiefly as are fixed, and have not Local Motion of remove; though they have a Motion in their parts, fuch as are Oyfters, Cockles, and fuch like, There is a fabulous Narration, That in the Nortbern Countreys there fhould be an Herb that groweth in the likencts of a Lamb, and feedeth upon the Grafs, infuch fort, as it will bear the Grafs round about. But, I fuppofe, that the Figure maketh the Fable ; for to we fee there beBee-flowers, \&c. And as for the Grafs, it feemeth the Plant, having a greatitalk and top, doth prey upon the Grafs a good way about, by drawing the Juyce of the Earth from it.

THe Indian Fig boweth his Roots downfolowin one year; as of it felf it taketh Rootagain; and fo multiplieth from Root to Root, making of one Tree a kinde of Wood. The caufe is, the plenty of the Sap, and the foftnefs of theftalk, which maketh the Bough, being over-loaten, and not ftiffly upheld, weigh down. It hath Leaves as broad as a litele Target, but the Fruitno biggerthan Beans. The caufe is, for that the continual Ihade increafeth the Leaves, and abateth the Fruit; which neverthelefs is of a pleafant tafte. And that (no doubt) is caufed, by the fupplenefs and gentlenefs of the Juyce of that Plant, being that which maketh the Boughs alfo fo flexible.

It is reported by one of the Ancients, that there is a certain Indian Tree, having few, but very great Leaves, three cubits long, and two broad shand that the Fruit being of good tafte, groweth out of the Bark. It maybe there be Plants that pour out the Sap 1 , faft, as they have no leifure, either to divide into many Leaves, or to put forth Stilks to the Fruit. With us Trees generally have fmallLeaves in comparifon: The Fig hath the greateff, and next it the Vine, Mulberry, and Sycamore, and the leaftare thofe of the Willon, Birib, and Thorn. But there be found Herbs with fargreater Leaves ihan any. Tree; as the Bur, Gourd, Cucumber, and Colewort. The caufe is, (like to that of the $I_{n}{ }^{2 r}$ dian $F_{i g}$ ) the hafty and plentiful putting forth of the Sap.-

There be three things in ufe for fweetnefs, Sugar, Honey, Nanna. For Sugar, to the ancients it was fearce known, and little ufed. It is found in Canes; Quare whether to the firft Knuckle, or furtherup? and whether the very Bark of the Cane it felf doyield Sugar, or no ? For Huney, the Bee makech it, or gathereth it ; but I have heard from one, that was induftrious in Husbandry, that thelabor of the Bee is about the Wax, anid that hehath known in the beginning of Miy, Honey-Combs empty of Honey, and within a fortnight, when the fweet Dews fall, filled like a Cellar. It is reported by fome of the Ancients, that there is a Tree called occhus, in the Valleys of figrcania, that diftilleth Honey in the Mornings. It is not unlike, that the Sap and Tears of fome Trees maybe fweet. It may bealfo, that fome fiveet Juyces, fitformany ufes, may be concocted out of Fruits, to the thicknefs of Honey, or perhaps of Sugar; the likelieft are Rafins of the Sun, Figs, and Corrans: The Means may be enquired.

The ancients report of a Tree, by the Perfian Sed, upon the shore-fands,

6 IO Experiments Psomifucus rouching Plants.

6 II.
612.

613 whic!
which is nourifhed with the Salt-water; and whenthe lide sbech, you fiall lee the koots, as it were, bare without Bark (being, as it feemeth, corroded by the Sale) and grafping the Sands like a Crab, which neverthelefs beareh a Fruit. It were good to try fome hard Trecs, as a Scrvice- Trec or Fir. Tree, by fetting them within the Sands.

There be of Plants which they ufe for Garments, thefe that follow, Hemp, Flax, Cotton, Nettles, (whereof they make $N_{\text {ettle (loth) Sericum, which }}$ is a growing Silk; they make alfo Ciables of the Bark of Lime-Trees. It is the Stalk that maketh the Filaceous matter commonly, and fometimes the Down that groweth above.

They have in fome Countreys, a Plant of a Rofie-colour, which fhurteth in the Night, openeth in the Morning, and openeth wiae at Noon; which the Inhabitants of thofe Countreys fay, is a Plant that fleepeth. There be Sleep. ers enough then; for almoft all Flowers do the like.

Some Plants there are, but rare, that have Moffie or Downy foot, and likewife that have a number of Threds like Beards, as CMandrakes; whereof Witches and Impofors make an ugly Image, giving it the form of a face at the top of the Roor, and leave thofeftrings to make abroad Beard down to the foot. Alfo there is a kinde of $N_{\text {ard in }}$ Creet (being a kinde ot $P_{b u}$ ) that hath a Roothairy, like a riough-footed Doves foot. So as you may fee, there are of Roots, Bulbous Roots, Fibrous Roots, and Hivfute Roots. And, I take it, in the Bulbous, the Sap haftneth molt to the Air and Sun: In the Fibrous, the Sap de. lighteth more in the Earth, and therefore putteth downward; and the Hirfure is a middle between both, that befides the putting forth upwards and downwards, putteth forth in round.

There are fome Tears of Trees, which are kembed from the Beards of, Goats; for when the Goats bite and crop them, efpecially in the Morninge, the Dew being on, the Tear cometh forth, and hangeth upon their Beards: Of this fort is fome kinde of Ladanum.

The irrigation of the Plane-tree by Wine, is reported by the Ancients, to make it fruitful. It would be tryed likewife with Koots; for upon Seeds it worketh no great effect. Earthen veffels; but if the $V$ cffels be not very great, you mult make fome holes in the bottom, to give fome refrefhment to the foots; which otherwife (as it feemeth) will decay, and fuffocate. and thof thing which and thole things which are known to comfort other Plants, did make that more fteril; for in fhowers it profpered worft: It grew allo amongt Bufhes of other kindes, where commonly Plants do not thrive, neitber did it love the Sun. There might be one caule of all thofe effects, namely, the fparing nourifhment, which that Plant required. Quare, how far Caßia, which is now the fubltitute of Cimamon, doth participate of thefe things.

It is reported by one of the Ancients, that Caßia, when it is gathered, is put into the Skins of Beafts newly fleyed; and that the Skins corrupting, and breeding Worms, the Worms do devour the Pith and Marrow of it, and fo make it hollow, but meddle not with the Bark, becaule to them it is bitter.

There were in ancient time, Vines of far greater Bodies, then we know
often cut; and fo muchdigged and dreffed, that their Sap fpendech into the Grapes, and fo the Stalk cannot increafe much in bulk. The Wood of Yines is very durable, without rotting. And thatwhich is itrange, though no Tree hath the Twigs, while they aregreen, fobrittle, yet tie Wood dried is extream tough, and was ufed by the Captains of Armies amorgfthe Rumans for their Cudgels.

It is reported, That in fome places, Viries are fuffered to grow like Herbs fipreding upon the Ground, and that the Grapes of thofe Vines are very great. It were good to maketryal, whether Plants that ufe to be born up by props, will putforth greater Leaves, and greater Fruics it they be laid along the Ground; as Hops, IDy; Woolline, $\mathrm{w}^{2} \mathrm{c}$.

2 ninces or $A_{p p l e s . c ̌ c . ~ i f ~ y o u ~ w i l l ~ k e e p ~ t h e m ~ l o n g, ~ d r o w n ~ t h e m ~ i n ~ H o n e y ; ~}^{\text {a }}$ but becaufe Honey (perhaps) will give them a tafte over-lufhious, it were good to make tryal in Powder of Sugar, or in Syrrup of Wine onely boiled to height. Both thefe would likewife be tried in Orenges, Lemmons, and Pomegranates; for the Powder of Sugar, and Syrrup of Winc, will ferve for times more than once.

The confervation of Frait would be alfo tried in Veffels, filled with fine Sand, or with Powder of Chalk, or in Meal and Flower, or in Duft of Oak-wood, or in Mill.

Such Fruits as you appoint for long keeping, you muft gather before thev be full ripe, and in 2 fair and dry day, towards Noon; and when the Wind bloweth not South, and when the Moon is under the Earth, and in decreafe.

Take Grapes, and hang them in an empty Veffel, well ftopped; and fet the Veffel not in a Cellar, but in fomedry place, and it is faid, they will laft long. But it is reported by fome, they will keep better in a Veffel half full of Wine, fo that the Grapes touchnot the Wine.

It is reported, that the preferving of the Stalk, helpeth to preferve the Grape; efpecially, if the Stalk be put into the Pith of Elder, the Elder not touching the Fruit.

It is reported by fome of the Ancients, that Fruit put into Bottles, and the Bottles let down into Wells under water, will keep long.

Of Herbs and Plants, fome are good to eatRaw; as Lettuce, Endive, Purflane, Tarragon, Creffes, Cucumbers,Musk-Melons, Radifh,\&c. Others onely after they are boiled, or have paffed the Fire ; as Parley, Clary,Sage, Parfnips, Turnips, Alparagus, Artichoaks, (though they alfo beingyoung are eat( $n$ ravv.) But a number of Herbs are not efculent at all; as Wormwood, Grafs Green-Corn, Centory, Hyffope, Lavender, Balm, \&c. The caufes are, for that ${ }^{2}$ Herbs that are not efculent, do want the two taftes, in which nourifl)ment refteth; which are fat and fweet, and have (contrariwife) bitter and over-ftrong taftes, or a juyce lo crude, as cannot be ripened to the degree of Nourifhment, Herbs, and Plants, that are Efculent raw, have fatnefs, or fiveetnefs (as allEfculent Fruits) fuch are Onions, Lettuce, \&c. But then it muft be fuch a fatnefs (for as for fweet things, they are in effect always effulent) as is not over-grofs, as loading of theStomack; for Parfnips and Lecks have fatnefs; but it is too grofs and heavy without boiling. It muft be alfo in a fubftance fomewhattender; for we fee Wheat, Barley, Artichoaks, are no good Nourihment, till they have paffed the Fire; but the Fire coth ripen, and maketh them foft and tender, and fo they become efculent. As for Raddifh, and Tarragon, and the like, they are for Condinients, and not for Nourifhment; and even fome of thofe Herbs, which are
not efculent, are notwithftanding pöculent; as Hopss, Broom, ऊぃ, Quate, what Herbs are good for Drink, befides the two aforenamed; for that it may (perhaps) eafe the charge of Brewing; if they make Beer to require lefs Male, or make it laft longer.
631.

Parts fit for the nourifhment of $\mathcal{C M}$ an in $\mathcal{P}_{\text {lants, are Seeds, Roots, and }}$ Fruits; but chiefly Seeds and Roots. For Leaves, they give no nourifhmentatall, or very little; no more do Flo kers, or Blofoms, or Stalks. The reafon is, for that Roots, and Seeds, and Fruits, (in as much as all Plants confift of an Oyly, and Watry fubftance commixed) have more of the Ogly fubitance, and Leaves, Fioners, ©́c.. of the Watry. And fecondly, they are more conco oted, for the Root, which continueth ever in the Earth, is fill concocted by he Earth; and Fruits and Grains (we fee) are half a year, or more in concocting; whereas Leaves are out, and perfedt in a Moneth.
632. Plants (for the moft part) are more ftrong, both in tafte and fmell in the Seed, than in the Leaf and Rooz. The caufe is, for that in Plants that are not of a fierce and eager fpirit, the vertue is increafed by Concoction and $\mathrm{M}_{2}$ turation, which is ever moft in the Seed; but in Planst that are of a fierce and eager fpirit, they are ftronger whileft the fpirit is inclofed in the Root; and the fpirits do but weaken and diffipate, when they come to the Air and Skn; as we fee in Onions, Garlick, Dragon. ©́c. Nay, there be Plants that have their Roots very hot and aromatical, and thèir Seels rather infipide as Ginger. The caufe is (as was touched before) for that the heat of thofe Plants is very diffipable; which under the Earth is contained and held in, but when it cometh to the Air, it exhaleth.

The Juyces of Fruits, are either Watry or Oyly. I reckonamongft the Watry, all the Fruits, out of which, Drink is expreffed; as the Grape, the $A p^{2}$ ple, the Peet, the Cherry, the Pomegranate © © And there arefome others, whi.h though they be not in ufe forDrink, yet they appear to be of the fame nature; as Plums, Services, Mulberries, Rafps, Orenges, Lermmons, © © c. And for thofe Juyces that are fo fefhy, as they cannot make Drink by Expreffion, yet (perhaps) they may make Drink bymixture of Water.

## Poculaque admiffis imitantur vitea Sortis.

Andit may be Heps and Brier-Berries woulddo the like. Thofe that have Oyl ly Juyces, are Olives. Almonds, Nuts of all forts, Pine-Apples, \&̛c. and their Juyces are all inflamable. And you muft obferve alfo, that fome of the Watry Juyces, after they have gathered firit, will burn and enflame, as $W$ ine. There is a third kinde of Fruit that is fiweet, without either fharpaefs or oylinefs; fuch as is the Fig and the $\mathcal{D a t e}^{2}$.
634. It hathbecn noted, that moft Trees, and efpecially thofe that bear $M_{a f f}$, are fruifful but once in two years. The caufe, no doubt, isthe expence of Sap ; for many orchard Irees well cultured, will bear divers years together.

There is no Tree, which befides the Natural Fruit, doth bear fo many Baftard Fruits as the Oak doth ; for befides the $\mathcal{A}$ corn, it bearetls Galls, Oak-Apples, and certain Oak-Nuts, which are inflamable; and certain Oak. Berriesfticking clofe tothe Body of the Tree without Stalk. It bearech alfo Mifeltee, though rarely. The caule of all thele may be, the clofenefs, and folidnefs of the Wood, and Pithe of the $O a k$; which makech feveral Juyces finde feveral Eruptions. And therefore, if you will devife to make. any Super-Plants, you muft ever give the Sap plentiful rifing, and hard iffue.

There

There are two Excrefcences which grow upon Trees, both of them in the nature of CNubsromes; the one the Liomans called Bolesus; which grow: eth upon the Roots of Oaks, and was one of the dainties of their Table: The other is Medicinal, that is called Afgarick (whereof we have fpoken before) which groweth upon the tops of Oaks; though it be affirmed by fome, that it groweth alfo at the Roots. I do conceive, that many Ex. crefences of Trees grow chiefly, where the Tree is dead or faded; for that the Natural $S_{a p}$ of the Tree, corrupteth into fome Prenatural fub. flance.

The greater part of Trees bear moft, and beft on the lower Boughs ; as Oaks, Figs, Walnuts, Pears, ${ }^{\text {Ge }}$. But fome bear beft on the top Boughs; as Crabs, 'bc. Thofe that bear belt below, ape fuch, as fhade doth more good to than hurt : For generally all Fruits bear beft loweft, becaufe the $S$ ip itreth, not having but a fhort way. And therefore in Fruits (pred upon Walls, the loweft are the greateft, as was formely faid: So it is, the fhade that hindreth the lower Boughs, except it be in fuch Trees as delight in fhade, or at leaft bear it well. And therefore they are either ftrong Trees, as the Oak or elfe they have large Leaves, as the Walnut and Fig, or elfe they grow in Pyramis as the Pear. But if they require very much Sun, they bear beft on the top; as it is Ctab=, Apples, Plumb , \&ec.

There be Trees thet bear bet when they begin to be old; as Almonds, Pears, Vines, and all Trees that giveMiff. The caule is, for that all Trees that bear Maft have an oyly Fruit ; and ycung Trees have a more watry Juyce, and lels concocted; and of the ame kindealfo is the Almond. The Pear likewife though it be not oyly, yet it requireth much Sap, and well concoted; for we fee it is a heavy Fruit and folid, much more than Apples, Plumbs, \&c. As for the Vine, it is noted that it beareth more Grapes when it is young; but Grapes that make better Wine when it is old, for that the Juyce is the better concocted: And we fee, that Wine is inflamable, fo as it hath a kinde of oylinefs. But the moft part of Trees, amongft which are Apples, Plumbs, \&c. bear beft when they are young.

There be Plants that have a Milk in them when they are cut; as Figs, Old Lettuce, Sow-thiftles, Spurge, \&cc. The caufe may be an Inception of Pu:refaction: For thofe Milks have all an Actimony, though one would think they fhould be Lenitive. For if you write upon Paper with the Milk of the Fig, the Le:ters will not be feen, until you hold the Paper before the fire, and then they wax brown; which fheweth, that it is a fharp or fretting Juyce. Let.uce is thought poyfonous, when it is to old as to have Milk: Spurge is a kinde of poyfon in it felf; and as for Sow-thiftles, though Coneys eat them, yer Sheep did Cattel will not touch them; and befides, the Milk of them, rubbed up n Warts, in thort time weareth them away: Which fheweth the Milk of them to be Corrowfive. We fee al o, that Wheat and other Corn lown, if you take them forth of the Ground, b: fore they fprout, are full of Milk; and the beginning of Germination is ever a kinde of Putretaction of the Seed. F.upiorlium alfo hath a Milk, though not very white, which is of a great Acrimong. And Saladine harh a yellow Milk, which harh likewife much Acrimony, for it cleanfeth the Eyes ; it is good alfo for Cataracts.

Musbromes are reported to grow, as well upon the Bodies of Trees as

There is hardly found a "hait thar yieldeth a red juyce in the Blade or Ear, except' it be the Tree that bearecth Sanguis 'Dracons; which gr. weth chiefly in the Illand Soquotra: the Herb Aramanthns (indecd) is red all over; and $\mathrm{Brafil} i$ is red in the Wood; and fo is Ret Sanders. The Tree ot Sanguis Dracions groweth in the form of a Sugar-Loaf; it is like the Sap of that Plant concotteth in the Body of the I ree. For ive fec, that Grapes and Pomegranatesare red in the Juyce, but are Green in the Tear. And this maketh the I ree of Sanguis Draconis leffer towards the top, becaufe the Juyce haftneth not up; and befides, it is very Aftringent, and therefore of flow motion.

It is reported, that Sweet Mofs, befides that upon the Apple-trees, groweth likewife (fometimes) upon Poplars, and yet (generally) the Poplar is a fmooth Tree of Bark, and hath little Mofs. The Mofs of the Larix.tree burneth alfo fweet, and fparkleth in the burning. शuare, of the Moffes of Odorate Trees; as Celdar, (ypref, Lignum, Aloes ơc.
$6+3$.
The Death, that is moft without pain, hath been noted to be upon the taking of the Pction of Hemlock; which in Humanity was the form of executio nof capital offenders in $A$ thens. The Poyfon of the $A \beta p e$, that Cleopatra ufed, hath fome affinity with it. The caufe is, for that the torments of Death are chiefly raifed by the frife of the Spirits; and thefe Vapors quench the Spirits by degrees; like to the death of an extream old Man. I conceive it is lefs painful then opium, becaufe opium hath parts of heat mixed.

There be Exuits that are fiweet before they ripen, as CNirabolanes; fo Fennel-Seeds are fweet before they ripen, and after grow fpicy ; and fome never ripen to be fiveet; as Tamarinds, Barberries, Crabs, Sloes, ©ّ̛. The caufe is, for that the former kinde have much and fubtile heat, which caufech early fweetnefs; the latter have a cold and acide Juyce, which no heat of the Sun can fiveeten. But as for the Mirabolane, it hath parts of contrary natures, for it is fiweet and aftringent.

There be few Herbs that have a Salt tafte; and contrariwife, all Blood of Living Creatures hath a falteffs; the caufe may be, for that Salt, though it be the Rudiment of Life, yet in Plants the original tafte remaineth not; for you fhall have them bitter, fowre, fweet, biting, but feldom falt: Butin Living Creatures, allthofe high taftes may happen to be (fometimes) in the humors, but are feldom in the flefh, or fubftance; becaufe it is of a more oy ly Nature, which is not very fufceptible of thofe taftes; and the faltnefs it felf of Blood, is but a light and fecret faltnefs: And even among Plants, fome do participate of faltnefs, as Alga Marina, Samphire, Scurvy Graß, \&rc. And they report there is in fome of the Indian Seas, a Swiming Plant, which they call Salgazus, fpredingover the Sea, in fort, as one wouldthink it were a Meadow. It is certain, that out of the Ahes of all Plants, they extrad a Salt which they ufe in Medicines.

It is reported by one of the Ancients, that there is an Herb, growing in the Water, called Lincostio, which is full of Prickles: This Herb puttech forth another fmall Herb out of the Leaf, which is imputed to fome moifture, that is gathered between the Prickles, which putrified by the Sun, germinateth. But Iremember alfo, I have feen, for a great rarity, one Rofe grow out of another, like Honey. Suckles, that they call Top and Top-gallants.

Barley (as appeareth in the Malting) being fteeped in Water three days, and afterwards the Water drained from it, and the Barley turned upon a dry Floar, will fprout half an inch long, at leaft: And if it be let alone, and
not turned, much more, until the heart be out. What will dothe fame; try it alfo with Peafe and Beans, This Experiment is not like that of the Orpin and Semper-vive; for there it is of the old ftore, for no Water is added; but here it is nourifhed from the Water. The Experiment would be further driven; for it appeareth already, by that which hath been faid, that Earth is not neceffary to the firff frouting of Plants; and we fee, that Rofe-Buds fet in Water, will blow: Therefore try whether the Sprouts of fuch Grains may nut be railed to a further degree, as to an Herb or Flower, with Water onely, or fome fmall commixture of Earth: Forif they will, it Thould feem by the Experiments before, both of the Malt, and of the Rofes, that they will come far fafter on in Water then in Earth; for the nourifhment is eafilier drawn out of Water then out of Earth. It may give fome lighealfo that Drink infufed with Flefh, as that with the Capon; \&e. will nourifh fatter and eafilier, then Meat and Drink together. Try the fame Experimene with Roots; as well as with Grains. As for example, take a Turnip and feep it a while, and then dry it, and fee whetherit will fprout.

CMaltin the Drenching will fwell, and that infuch a manner, as afeer the putting forth in fprouts, and thedrying upon the Kiln; there will be gaincd, at leaft, a Bufhel in eight, and yet the fprouts are rubbed off; and there will be a Bufhel of Duft befidesthe Malt; which I fuppofe to be, not onely by the loofe and open laying of the Parts, but by fome addition of fubftance drawn from the Water, in which it was fteeped.

CMalt gathereth a fweenefs to the tafte, which appeareth yet more in the Wort. The Dulcoration of things is worthy to betryed to the full; for that Dulcoration importeth a degree to nourifhment. And the making of things inaliniental to become alimental, may be an Experiment of great proite for making new victual.

Moft Seeds in the growing; leave their Husk or Rind about the Root ; but the Onion will carry it up, that it will be like a cap upon the top of the young Onion. The caufe may be, for that the Skin or Husk is not eafie to break; as we fee by the pilling of Onions, what a holding fubftance the Skin is.

Plants that have curled Leaves, do all abound with moifture; which cometh fo falt on, as they cannot fpred themfelves plain, butmuft needs gather together: The weakeft kinde of curling is roughnefs, as in Clary and Bur. The fecond is, curling on the fides; as in Lettuce and young Cabbage. And the third is; folding into an Head, as̀ in Cabbage full grown; and Cab. bage Lettuce.

It is reported, that Firr and Pine; efpecially if they be old and putrefied, though they fhine not as fome rotten Woodsdo, yet in the fudden breaking they will fparkle like härd Sugar.

The Roots of Treesdo (fome of themi) put downwards deep into thic Ground; as the Oak, Pine, Firr, Gc. Sonve fpred more towards the Surface of the Earth; as the ל\&sh, Cypreß-treé, Olive, of. The caufe of this latter may be, for that fuch Trees as love the Sun, do not willingly defcend far into the Earth; "and therefore they are (commonly) Trees that fhoot up much; for in theit Body their defire of approach to the Sun maketh them fpred the lets. And the fame reaforr, unider Ground, to avoid recefs from the Sun, maketh them fpred the mare, Andwe fee it cometh to pafs in fome Trees which have been planted to deep in the Groand, that for love of approach to the Sun, they forfake their firt Root " and put out another more towards the top of the Earth. And we fee alfo, that
the Olive is full of Oily Juyce, and Afh maketh the beft Fire, and Cyprefs is an hot Tree. As for the Oak, which is of the former fort, it loveth the Earth, and therefore growech flowly. And for the Pine, and Firr likewife, they have fo much heat in themfelvee, as they need lets the heat of the Sun. There be Herbs alfo, that have the fame difference; as the Herb they call CMorfus $\mathcal{D}$ iaboli, which puttech the Roor down fo low as you cannot pull it up without breaking; which gave occafion to the name and fable, for that it was faid it was fo wholefome a Roor, Thas the Devil When it गras gathered, bit it for envy. And fome of the Ancients do report, that there was a goodly Firr (which they defired to remove whole) that had a Root under ground eight cubits deep, and fo the Root came up broken.

It hath been oblerved, that a Branch of a Tree being unbarked fome ipace at the bottom, and fo fet into the Ground, hath grown even of fuch Trees, as if the Branch were fer with the Bark on, they would not grow; yet conirariwile we fee, that a Tree pared round in the Body above Ground will die. The caufe may be, for that the unbarkt part draweth the nourithment beit, but the Bark continueth it onely.

Grapes will continue trefh and moift all Winter long, if you hang them clufter by clufter in the Roof of a warm Room, efpecially, if when yougather the clufter, youtake off with the clufter fome of the ftock.

The Reed or Cane is a watry Plant, and groweth not but in the Warer. It hath thele properties, That it is hollow, that it is knuckled, both $S_{i a l k}$ and Root, that being dry it is more hard and fragile then other Wood, that it putteth forth no Boughs, though many Stalks out of one Root. It differeth much in greatnefs, the fmalleft being fit for thatching of Houfes, and ftopping the chinks of Ships better then Glew or Pitch. The fecond bignefs is uled for Angle.rods and Staves, and in Cbina for beating of offenders upon the Thigs. The differing kindes of them are, the common Reed, the Cafia Fiptula, and the Sugar-Reed. Of all Plants it boweth the eafieft, and rifech agiin. It feemeth, that amongft Plants which aie nourifhed with mixture of Earth and Water, it draweth mof nourifhment from Water ; which maketh it the fmootheft of all others in Barks and the holloweft in Body.

The Sap of Trees, when they are let Blood, is of differing Natures. Some more warry and clear, as that of Vines, of Beeches, of Pears; fome thick; as Apples; fome Gummy, as Cherries; fome frothy, as Elms; fome milky, as Figs. In Mulberries, the Sap feemeth to be (almoft) towards the Bark onely; for if you cut che Treea little into the Bark with a Stone, it will come forth, if you pierce it deeper with a tool, it will bedry. The Trees which have the moifteft Juyces in their Fruit, have commonly the moifteft Sap in their Body ; for the Vines and Pears are very moift, Apples fome what more foongy: the Milk of the Fig hath the quality of the Rennet, to gather Cheefe, and fo have certain Your Herbs wherewith they make Cheefe in Lent.

The Imber and $W_{\text {oad }}$ are in (ome Trees more clean, in fome mos e knoty'; and it is a good tryal, to try it by feaking at one end, and laying the Ear at the other: For if it be knotty, the voice will not pals well. Some have the Veins more varied and Chamloted; as oak, whereof Wainfcot is imade: Maple, whereof Trenchers are made: Some more fmooth, as Firy iand Valuüt; fome do more cafly breed Worms and Spiders; fome more hardly, as it is faid of Irib Trees. : Befides, shere be a number of
differences that concern their ufe: As Oak, Cedar, and Cheffnut, are the beft builders. Some are beft for Plough-timber, as Afh; fome for Peers; that are fometimes wet and fometimes dry, as Elm; fome for Planchers; as Deal; fome for Tables, Cupboards and Desks, as Walnuts; fome for Ship. timber, as Oaks that grow in moift Grounds, for that maketh the Timber tough, and not apt to rift with Ordnance, wherein Englifh and Irifh Timber are thought to excel) fome for Mafts of Ships, as Firr and Pine, becaufe of their length, ftraighnefs, and lightnefs; fome for Pale, as Oak; fome for Fucl, as Afh: And fo of the relt.

The coming of Trees and Plants in certain Regions, and not in others, is fometimes cafual ; for many have been tranflated, and have profpered well ; as Damask Rofes, that have not been known in England above an hundred years, and row are fo common. But the liking of Plants in certain Soyis more then in others, is meerly Natural ; as the Firr and Pine love the Mountains; the Poplar, Willow, Jallow, and Alder, love Rivers and moift places; the Ah loveth Coppices, but is bef in Standards alone; Juniper loveth Chalk, and fo do molt Fruit-trees; Sámpire growerh but upon Rocks; Reeds and Ofiers grow where they are wathed with Winter ; the Vine loveth fides of Hills turning upon the South Eaft Sun, \&c.

The putting forth of certain Herbs, difcovereth of what nature the Ground where they put forth is; as wilde Thyme Thewethgood Feeding Ground for Cattel; Bettony and Strawberries thew Grounds fit for Wood; Camomile fheweth mellow Grounds fit for Wheat ; Muftard-feed growing after the Plough, fheweth a good ftrong Ground alfo for Wheat; Burnet Theweth good Meadow, and thelike.

There are found in divers Countreys, fome other Plants that grow out of Trees and Plants, befides Miffeltoe : As in Syria there is an Herb called Cafyetds, that groweth out of tall Trees, and windeth it felf about the fanie Tree whereit groweth, and fometimes about Thorns. There is a kinde of Polypode that groweth out of Trees, though it windeth not. So likewile an Herb called Faunos upon the Wilde Olive; and an Herb called Hippopbafion upon the Fullers Thorn, which, they fay, is good for the Fallingflicknefs.

It hath been obferved by fome of the eAmients, that howfoever cold and Eaferly winds are thought to be great enemies to Fruit, yet neverthelefs South-winds are alfo found to do hurt, efpecially in the Blofloming time, and the more, if fhowers follow. It feemeth they call forth the moifture too falt. The Weft winds are the beft. It hath been oblerved allo; that green and open Winters do hurt Trees, infomuch, as if two or three fuch Winters come oogether, Almond-Trees; and fome other Trees will die. The caufe is the fame with the former, becaufe the Luft of the Earth overfpendeth it felf; howfoever fome other of the Ancientshave commended warm Winters.

Snows lying long caufe a fruitful year. For firft, they keep in theftrength of the Earth: Secondly, they water the Earth better then Rain; for in Snow the Earth doth (as it were) fuck the Water as out of the Teat: Thirdly, the moifture of Snow is the fineft moifture, for it is the Froth of the Cloudy Waters.

Showers, if they come a little before the ripening of Fruits, do good to

Small fhowers are likewife good for Corn, io as parching hears come not upon them. Gencrally, Night-fhowers are better then Day fhowers; for that the Sun followedh not to falt upon them: And we fee, even in watering by the Hand, it is beft in Summer time to water in the Eyening.

The differences of Earths, and the tryals of them, are worthy to be diligently enquired. The Earth that with fhow crs dotheafily foften, is com mended; and yet fome Earth of that kinde will be very dry and hard before the fhowers. The Earth that calteth up from the Plough a great clod, is not fo good as that which cafteth upa Imaller clod. The Earth that putterh forth Mof $f_{s}$ eafily, and may be called Mouldy, is not good. The Earth that finetleth well upon the Digging, or Ploughing, is commended; as containing the Juyce of Vegetables almoft alteady prepared. It is thought by fome, that the ends of low Rain-bows fall more upon one kinde of Earth then upon another: As it may well be, for that Earth is mott rofcide; and therefore it is commended for a fign of a good Earth. The poornefs of the Herbs (it is plain) theweth the poorsefs of the Earth, and efpeci:lly, if they be in colour more dark : Butif the Herbs fhew withered or blated at the top, it fheweth the Earth to be very cold; and fo doth the Moffir efs of Trees. The Earth whereof the Grafs is foon parched with the Sun and toafted, is commonly forced Earth, and barrenin his own nature. The tender, chefom, and mellow Earth is the bett; being meer Mould, between the two extreams of Clay and Sand, efpecially, if it be nat Loamy and Binding. The Earth that after Rain will fearce be Plougheds is commonly fruitul; for it is cleaving, and full of Juyce.

It is ftrange, which is obferved by fome of the Ancients, that Duft helpeth the fruifulnefs of Trees, and of Vines by name; infomuch, as they caft Duft upon them of purpofe. It fhould feem thatithat powdring, when Thower cometh, makech a kinde of foyling to the Tree, $b$ ing Earth and Water finely laid on. And they notes, that Countreys where the Fields and Ways are dufty, bear the beft Vines.

It is commended by the $\boldsymbol{A n c i e n t s}$ for aneexcellent help to Trees, to lay the Stalks and Leaves of Lupines about the Roots, or to Plough them into the Ground, where you will fow Corn. The burning alfo of the cuttings of Vines, and cafting them upon Land, doch much gocd. And it was gencrally received of old, that dunging of Grounds when the Weft-wind bloweth, and in the decreafe of the Moon, doth greatly help; the Earth (asit feemeth) being then more thirfy, and open to receive the Dung.

The Graffing of Vines upon Vines (as I take it) is not now inufe. The Suncients had it, and that three ways; the firf was Infition, which is the ordinary manner of Graffing: The fecond was Terebration, through the middle of the Stock, and putting in the Cions there: And the third was Paring of two Virtes that grow together to the Marrow, and binding them clofe.

The Difeales and ill Accidents of Corn, are worthy to be enquired, and would be more worthy to be enquired, if it were in Mens power to help them: whereas many of them are not to be remedied. The Mildew is one of the greateft; which (out of queftion) cometh by clofencf of Air ; and therefore in Hills, or large Champain Grounds, it feldom cometh, fuch as is with us $\mathrm{Y}_{\text {ork's }}$ Woald. . This canno: be remedied, otherwife then that, in Countreys of fmall enclofure the Grounds be turned into larger Fields: Which I have known to do good in fome Farms.

Inother Difeaceis the putting forth of Wilde Oats, whereinto Corn ofrencimes (efpecially Barley) doth degenerate. It hapneth chiefly from the weaknefs of the Grain that is fown ; for if it be either too old or mouldy, it will bring forth wilde Oats. Another difeafe is the faticty of the Ground; for if you fow one Ground ftill with the fame Corn (I mean not the fame Corn that grew upon the fame Ground, but the fame kinde of Grain, as Wheat, Barley, \&c. ) it will profper but pcorly; thercfore be fides the refting of the Gtound, you mutt vary the Seed. Another ill Accident is from the Winds, which hurt at twe times; at the flowring by thaking off the Flowers, and at the full ripening by fhaking out the Corn. Another ill Accident is Drought at the findling of the Corn, which with us is rare, but in hotter Countreys common, infomuch as the word Calamitas was firft derived from Calamus, when the Corn could not get out of the falk. Another ill Accident is Over-wet at fowing time, which with us breedeth much Dearth, infomuch asthe Corn never comerh up; and (many times) they are forced to re-fow Summer-Corn, where they fowed Winter-Corn. Another ill Accident is bitter Frofts, continued withour Snow, efpecially in the beginning of the Winter, after the Seed is new fown. Another Difeafe is Worms, which fometimes breed intheRoot, and happen upon hot Suns and fhowersimmediately after the fowing; and another Worm breedeth in the Ear it felf, efpecially when hot Suns break often out of Clouds. Another Difeafe is Weeds; and they are fuch, as eitherchoak and over-9hadow the Corn, and bear it down, or Atarve the Corn, and deceive it of nourifhment. Another Dileafe is, over ranknefs of the Corn, which they ufe to remedy by Mowing it after it is come up, or putting Sheep into it. 'Another ill Accident is, laying of Corn with great Rains near or in Harvelt. Another ill Accident is, if the Seed happen to have touched Oyl, or any thing that is fat; for thofe fubitances haye an antipathy with nourifhment of Water.

The remedies of the Difeafes of Cornhave been obferved as followeth. The Steeping of the Grain before Sowing, a little time in Wine, is thought a prefer vative; the Mingling of Seed.Corn with Afhes, is thoughe to be good; the Sowing at the wane of the Moon, is thought to make the Corn found. Ithath not been practifed, but it is thought to be of ule to make fome Miffellane in Corn; as if you fow a few Beans with Wheat, your Wheat will be the better. It hath been oblerved, that the fowing of Corn with Houfleek doth good. Though Grain that toucheth Oyl or Fat receiveth hurt; yet the feeping of it in the Dregs of Oyl, when it beginnethroputrefie; (whichthey call Amurca) is thought roaffure it againt Worms. It is reported alfo, that if Corn be moved, it will make the Grainlonger, but emptier, and having more of the Husk.

- It bath been noted, that Seed of a year old is the bett, and of two or three years is worfe; and that which is more old is quite barren; though (no doubr) fome Seed and Grain laft better then others: The Corn which in the Vanning liethloweft is the beft; and the Corn which broken or bitten, retaineth a little yellownels, is better then that which is very white.

It hath been oblerved, that of all Roots of Herbs, the Root of Sorrel goeth the furthett into the Earth, infomuch as it hath been known to go three cubits deep; and that it is the Root that continueth fit (longeft) to be fet again, of any Root that groweth. It is a cold and acide Herb, that (as it leemeth) loveth the Earth, and is not much drawn by the Sun.
670.

It hath been oblerved, that fome Herbs like beft being watered wivith Salt-water; as Radihb, Beet, Rue, Penny royal. This tryal would be extended to fome other Herbs; efpecially fuch as are ftrong, as Tarragon, cNuffardSeed, Rocket, and the like.
674. It is itrange, that it is generally reccived, how fome poyfonous Beafts affect odorate and wholrome Herbs; as, that the Snake loveth Fennel, that the Toash will be much under Sage, that Frogs will be in Cingucfoil.' It may be it is rather the Shade, or orher Coverture, that they take liking in, then the virtue of the Herb.

It were a matter of great profit, (fave that I doubt it is too conjeCtural to venture upon) if one could dijcern what Corn, Herbs, or Fruits, are like to be in Plenty or Scarcity, by fome Signs and Prognofticks in the begin: nirg of the year: For as for thofe that are like to be in Plenty, they may bc bargained for upon the Ground; as the oldrelation was of Thales, who to fhew how eafie it was for a Philofopher to be rich, when he forelaw a great plenty of. Olives, made a Monopoly of them. And for Scarcity, Men may make profit in keeping better the old fore. Long continuance of Snow is believed to make a fruitful year of Corn; an early Winter, or a very late Winter, a barren year of Corn, an open and ferene Wincer, an ill year of Fruit. Thele we have partly touched before; but other Prognofticks of like nature are diligently to be enquired:

There feem to be in fome Plants fingularities, wherein they differ from all other. The Olive hath the oyly part onely on the ouffide, whereas all other Fruits have it in the Nut or Kerncl. The Firr hath (in effet) no Sone, Nut, nor Kernel ; except you will 'count the little Grains, Kernels. The Pomegranate and Pine-Apple haye onely, amonge Früits, Grains, diftinct in Ieveral Cells. No Herbs have curled Leaves, but Cabbage and CabbageLettuce. None have double Leaves, one belonging tó the Stalk, another to the Frut or Seed, but the Artichoak. No Flower hath that kinde of fpted that the Wood-bine hath. This may be a large Field of Contemplation; for it the weth, that in the Frame of Nature there is, in the producing of fome Species, a compofition of Matter, which hapneth off, and may be much diverfified; in others, fuch as hapneth rarely, and admitteth little variery. For to it is likewife in Beafts ; Dogs have a reremblance with Wolves and Foxes, Horfes with Affes, Kine with Bufles, Hares with Concys, \&c. And foin Birds; Kites and Keftrels have a refemblance with Hawks; Common Doves with Ring-Doves and Turles; Black-Birds with Thrufhes and Maviffes; Crows with Ravens, Daws, and Choughs, \&c. But Elephants and Swine amongft Beafts, and the Bird of Paradife, and the Peacock amongft Birds, and fome few others, have fcarce any other Species that have affinity with them.

We leave the Defcription of Plants and their Virtues to Herbals, and other like Books of Natural Hifory, wherein Mens diligence bath been great, even to Curiofity. For our Experimients are onely fluch, as do ever alcend a degree to the deriving ofCaufes, and extracting of Axioms, which we are not ignorant, but that fome, both of the Ancient and Molern Vrisers have alfo labored; but their Caufes and Axioms are fo full of Imagination, and fo infected with the old received Theories, as they are meer Inquinatiobs of Experience, and concogt it nor.

II hath been obferved by fome of the Ancients, that Skins, efpecially of Rams newly pulled off, aed applied to the Wounds of Stripes; do kecp them from fwelling and exulcerating, and likewife heal them, and clole then up; and that the Whites of Eggs do the fame. The caule is, a temperate Conglutination ; for both Bodies are clammy and vifcous, and do bridle the Deflux of Humors to the hurts, withour penning them in too much.

YOu may turn (almoft) all Flefh into a fatty fubftance, if you take Flefh and cut it into pieces, and put the pieces into a Glafs covered with Parchment, and fo let the Glafs fand fix or feven hours in boyling Water. It may be an experiment of profit, for making of Fat or Greafe for many ufes: But then it mutt be of fuch Flefh as is not edible; as Horfes, Dogs, Bears; Foxes, Badgers, \& c.

IT is reported by one of the Ancients, that new Wine put into Veffels well topped, and the Veffels let down into the Sea, will accelerate very much the making of them ripe and porable; the fame would be tryed in Wort.

BEafts are more Hairy then Men; and Savage Men more then Civil; and the Plumage of Birdsexceedeth the Pilofity of Beafts. The caufe of the fmoothnefs in Men, is not any abundance of Hear and Moifture, though that indeed caufeth Pilofity; but there is requifite to Pilofity, not fo much Heat and Moifture, as Excrementitious Heat and Moifture; (for whatfoever affimilateth goeth not into the Hair) and Excrementitious Moiftureabounderh moft in Beafts, and Men that are more favage. Much the fame Reafon is there of the Plumage of Birds; for Birds affimilatelefs, and excern more then Beafts, for their Excrements are ever aliquid, and theirFlefh (generally) more dry ; beffde, they have not Inftruments for Urine, and fo all the Excrementitious Moifure goeth into the Feathers: And therefore it is no marvel though Birds be commonly betrer Meat then Beafts, becaufe their flefh doth affimilate more finely, and fe-cerneth more fubtilly. Again, the Head of Man hath Hair upon the firlt Birth, which no other part of the Body hath. The caule may be want of Perfiration; for much of the matter of Hair, in the orher parts of the Body goeth forch by infenfible Per(piration. And befides, the Skull being of a more folid fubftance, nourifheth and affimilateth lefs, and excerneth more; and fo likewife doth the Chin. We fee alfo that Hair cometh not upon the Palms of the Hands, nor Soals of the Feet, which are parts more perfpirable. And Children likewife are not Hairy, for that their Skins are more perfpirable.

BIrds are of (wifter motion then Beafts; for the flight of many Birds is fwifter then the race of any Beafts. The caufe is, for that the Spirits in Birds are in greater proportion, in comparifon of the bulk of their Body, then in Beaits. For as for the reafon that fome give, that they are partly carried, whereas-Beafts go, that is nothing ; for by that reafon, fwimming fhould be fwifrer then running: And that kinde of carriagealfo, is not withour labor of the Wing.
682. Experiment Solitaıy, touching the Different clearneß of the Sea.
683.

Experiment Solitary, touching the Differens Heats of Fire and Boiling Water.

THe Sea is clearer when theNorth-wind bloweth, then when the Southwind. The caufe is, for that Salt-water hath a little Oylinefs in the Surface thereof, as appeareth in very hot days: And again, for that the Southernwind relaxeth the Water fomewhat; as no Water boyling, is fo clear as cold Water.
$\Gamma^{I r e}$ burneth Wood, making it firt Luminous, then black and brittle, and laftly, broken and incinerate; fcalding Water doth none of thefe. The caufe is, for that by Fire the Spirit of the Body is firt refined, and then emitted; whereof the refining or attenuation caufeth the light, and the emiffion; firf the fragility, and afer the diffolution into Ahhes, neither doth any other Body enter. But in Wiater, the Spirit of the Body is not refined fo much; and befides, part of the Water entreth, which doth increafe the Spirit, and in a degree extinguifh it ; therefore we fee that hot Water will quench Fire. And again, we fee that in Bodies wherein the Water doth not much enter, but onely the heat paffeth, hot Water worketh the effects of Fire: As in Eggsboiled and roatted, (into which the Water entreth not at all) there is fcarce difference to be difcerned ; but in Fruit and Flefh, whereinto the Water entreth in fome part, there is much more difference.
684. Experiment Solitary, touching the Qualification of Heat by Moifuro.
686. Experiment Solitary, touching the Hiccough.

THe bottom of a Veffel of boyling Water (as hath been obferved) is not very much heated, fo as men may put their hand under the Veffel, and remove it. The caufe is, for that the moifture of Water, as it quencheth Coals where it entreth, fo it doth allay heat where it toucheth. And therefore note well, that moifture, although it doth not pafs through Bodies without Communication of fome fubftance (as hear and cold do) yet it worketh manifelt cffects; not by entrance of the Body, but by qualifying of the heat and cold, as we fee in this inftance. And we fee likcwife, that the water of things diftilled in water, (which they call the Bath) differeth not much from the water of things diftilled by Fire. We fee allo, that Pewter-Difhes with Water in them will not melt eafily, but without it they will. Nay, we fee more, that Buter or Oyl , which in themfelves are inflamable, yet by the virtue of their moifture will do the like.

$I^{T}$T hath been noted by the Ancients, that it is dangerous to pick ones Ear whileft he Yawneth. The caufe is, for that in Yawning, the inner Parchment of the Ear is extended by the drawing in of the Spirit and Breath; for in Yawning and Sighing both, the Spirit is firff ftrongly drawn in, and then frongly expelled.

IT hath been obferved by the Ancisms, that Sneezing doth ceafe the Hiccough. The caufe is, for that the Motion of the Hiccough is a lifting up of theStomach; which Sneezing doth fomewhat deprefs, and divert the motion another way. For firf, we fee that the Hiccough cometh of fulnefs of Mear, (efpecially in Children) which caufeth an extenfion of the Stomach: We fee alfo, it is caufed by acide Meats or Drinks, which is by the pricking of the Stomach. Andthis motion is ceafed, either by Diverfion, or by Detention of the Spirits: Diverfion, as in Sneezing; Detention, as we feeholding of the Breath doth help fomewhat toceare the Hiccough, and putting a Man into an carne? ftudy doth the like, as is commonly ufed: And Vinegar put to the Noftrils cr Gargarized doth it alfo; for that it is Aftringent, and inhibiteth the motion of the Spirit.

Looking

LOoking againft the Sun doth indice Sneezing: The caufe is, not the heating of the Noftrils; for then the liolding ijp of the Noftrils againlt the Sun, thugh one wink, would do it, but the drawing down of the moifture of the Brain: For it will make the Eyes run with water; and the draw: ing of moifture to the Eycs, doth draw it to the Noftrils by Motion of Con: fent, and fo followeth Sneezing. As contrarivife, the Tickling if the Noftrils u ithin dorh drave the moifture to the Noftrils, and to the Eyes by confent, for theyalfo will water. Bur yet it hath been obferved, that if one be about to foeeze, the rubbing of the Eyes till they run with water, will prevent it. Whereof the caule is, for that the humor which was defcending to the Noftrils, is diverted to the F yes.

THe Tecth are more by cold drink, or the like, affeded, then the other parts. The caufe is double; the one, for that the refiftance of Bone to cold, is greater then of Flefh; for that the Flefh fhrinketh, but the Bone refifteth, whereby the Cold becometh more eager. The other is, for that the Teeth are parts without Blood, whereas Blood helpeth to quali é the cold. And therefore we fee, that the Sinews are much affected with Cold, for that they are parts without Blood. So the Bones in Tharp Colds wax brittle; and therefore it bath been feen, that all contufions of Bones in hard weather ${ }_{2}$ âre more difficult to cure.

ITT hath been noted, that the Tongue rectiveth more eafily tokens of Difeafes then the other parts; as of heats within, which appear muft in the blacknefs of the Tongue. Again, Pied Cattel are fpotted in their Tongues, \&cc. The caufe is (no doubt) the tendernefs of the part, which thereby receiveth more eafily all alctiations then any other parts of the Flefh.

WHen the Mouth is out of tifte, it maketh things tafte fometimes falt, chiefly bitter, and fometimes loathfome, but never fuect. The caufe is, the corrupting of the moifture about the Tongue, which many times turneth bitter, and falt, and loathfome, but fweet never ; for the reft are degrees of corruption.

IT was oblerved in the Great Plague of the laft year, that there were feen in divers Ditches, and low Grounds about London, many Toads that had Tails two or three incheslong at the leatt, whereas Toads (ufually) have no Tails at all; which argueth a great difpofition to putrefátion in the Soil and Air. It is reported likèwife, that Roots (fuch as Carrots and parfnips) are more fiweet and lufcious in infectious years then in other yedrs.

WIfe Phyfricans fhould with all diligence inquire whiat Simples Nature yieldeth, that have extream fabtile parts without any Mordication or Acrimony; for they undermine that which is hard, they open that which is fopped and fhut, and they expel that which is offenfive gently; without too much perturbation." Of this kinde are Elder-fomers, which thetefore are proper for the Stotie; of this kinde is the Dwiarf-pine; which is proper for the laundies; of this kinde is Harts.born, which is propet or Agues and Infections; of this kinde is $\mathcal{P}$ iony, which is proper for Sioppings in the Head; of this kinde is Fumitory which is proper for the Spleen;
and a number of others. Generally, divers Creatures bred of Putrefaction, though they be fomewhat loathfome to take, are of this kinde ; as EartbHrorms, Timber-fonss, Snails, wo. And I conceive, that the Trochifs of Vipers, (uhich are fo much magnified) and the flefh of Snakes fome ways condited and corrected (which of late are grown into fome credit) are of the fame naturc. So the parts of Beafts putrefied (as Caforeum and muk, which have extream fubtil parts) are to be placed amongt them. We fee allo, that putrefaction of Plants (as $A_{g a r i c k}$ and Fens-Ear) are of greateft vertue. The caufe is, for that putrefaction is the fubtileft of all motions in the parts of Bodies, And fince we cannot take down the lives of Living Creatures (which fome of the Paracelfians fay, if they could be taken down, would make us Immortal,) the next is, for fubtilty of operation to take.Bodies putrefied, fuch as may be fafely taken.
693. Experiments in Confort, touching $\checkmark$ enus.

I hath been obferved by the Ancients, that much ufe of $V$ enis doth dim the fight, and yet Eanuchs, which are unable to generate, are (neverthelefs) alfo dim-fighted. The caufe of dimnefs of fight in the former, is the expence of Spirits; in the latter, the over-moifture of the Brain; for the overmoifture of the Brain doth thicken the Spirits vifual, and obfructeth their paffages, as we fee by the decay in the fight in Age, where alfo the diminution of the Spirits concurreth as another caufe. We fee alfo, that blindnefs cometh by Rheums and Cataracts Now in Eunuchs there are all the notes of moifture ; as the fwelling of their Thighs, the loofnefs of their Belly, the fmoothnefs of their skin, \&c.

The pleafure in the Act of Venus, is the greateft of the pleafures of the Senfes; the matching of it with Itch is improper, though that alfo be pleefing to the touch, but the caufes are profound. Firft, all the Organs of the Senfes qualifie the motions of the Spirits, and make fo many feveral fpecies of motions, and pleafures or difpleafures thereupon, as there be diverfities of Organs. The Inftruments of Sight, Hearing, Taffe, and Smell, are of feveral frame, and To are the parts for Generation; thercfore Scaliger doth well to make the pleafure of Generation a fixth Senfe. And if there were any other differing. Organs, and qualified Perforations for the Spirits to pals, there would be more then the Five Senfes: Neither do we well know, whether fome Beafts and Birds have not Senfes that we know not, and the very Sent of Dogs is almoft a fenfe by it felf. Secondly, the Pleafures of the Touch are greater and decperthen thofe of the other Senfes, as we fee in Warming upon Cold, or Refrigeration upon Heat: For as the Pains of the Touch are greater then the offences of other Senfes, fo likewife are the Pleafures. It is true, that the affecting of the Spirits immediately, and (as it were) without an Organ, is of the greareft pleafure ; which is but in two things, sweet fmells and Wine, and the like Sxeet vapers. For Smells, we fee their great and fuidden effedtin fetching Men again when they fwown; for Drink, it is certain, that the pleafure of Drunkennels is next the pleafure of Venu; and great Joyes (like ewife) make the Spirits move and touch themielves; and the pleafure of $V$ enus is fomew hat of the fame kinde.
It hath been always obferved, that Men are more inclined to Venus io the Winter, and Women in the Summer. The caufe is, for thatthe Spirits in a Body more hot and dry, (as the Spirits of Men are) by the Summer are more exhaled and diffipated, and in the Winter more condenfed and kept entire ; but in Bodies shatare cold and moift, (as Womens are) the Summer
doth cherifh the Spirits, and calleth them forth, the Winter doth dullthem. Furthermorr, the Abftinence or Intermiffion of the ule of Venus, in moiff and well habituate Bodies, breedeth a number of Diecafes'; and épecially dangerous impothumations. The reafon is evidens, for that it is a principal evacuation, efpecially of the Spirits; for of the Spirits, there is fcarce any evatuation, but in Venus and exercife. And therefore the omiffion of either of them breederh all difeafes of Repletion.

T4 He nature of Vivification is very werthy the enquiry ; and as the Nature of things is commonly better perceived in fmall then ingreat, and in unperfect then in perfect, and in pars then in whole ; fo the Nature of $V$ vification is beft enquired in Creatures bred of Purrefaction. The contemplation whereof hath many excellent Fruits. Firft, in difclofing the original of Vivificaticn. Secondly, in difelofing the original of Figuration. Thirdly, in difclofing many things in the nature of perfct Creatures, which in them lie more hidden. And fourthly, in traducing by way of operation, fome obfervations in the Infecta, to work effects upon perfect Greatures. Note, that the word Infelta agreeth not with the matter, but we ever ufe it for brevities fake, intending by it Creatures bred of Putrefaction.

The Infelta are found to breed out of feveral matters: Some breed of Mud or Dung; as the Earth-worms, Eels, Sakkes, frc: For they are both Putrefactions: For Water in Mud do purrefie, as nor able to preferve it felf; and for Dung, all Excrements are the refufe and putrefactions of nourifhment. Some breed in Wood, bothgrowing and cut down. Quare, in what Woods moft, and at what feafons. We fee that the Worms with many feer, which round themfelves into Balls, are bred chiefly under Logs of Timber, but not in the Timber, and they are faid to be found alfo (many time') in Gardens where no Logs are. But it feemeth their Generation requirerh'a coverture both from Sun, and Rain or Dew, as the Timber is; and therefore they are not venemous, but (contrariwife) are held by the Phylitiansto clarifie the Blood. It is obferved, that Cimices are found in the holes of Bedfides. Some breed in the Hair of Living Creatures; as Lice and I ikes, which are bred by the fiveat clofe kept, and fome what airified by the $\mathrm{H}_{\text {air }}$. The Excrements of Living Creatures do not onely breed Infecta whenthey are excerned, butalfo while they are in the Body; as in Worms, whereto Children are moft fubject, and are chiefly in the Guts. And it hath been lately obferved by Phyfitians, that in many Pefilent $\mathcal{D}$ ifeafes there are Wornis found in the upper parts of the Body, where Excrementsare not, but onely humors putrefied. Fleas breed principally of Straw or Mats, where there hath beena little moiture, or the Chamber and Bed ftraw kept clofe, and not aired. It is received, that they are killed by frewing Worm wood in the Rooms. And it is truly obferved, that bitter things are apt rather to kill then engender Putrefaction, and they be things that are fat or fiveet that are apteft to putcefie. Tincre is a Worm that breedeth in Meal of the fhapeof a latge white Maggot, which is given as a great dainty to Nightiogales. The Moth breedeth upon Cloth, and other Lanifices, épecially if they be laid up dankifh and wer. It delighteth to be about the flamic of a Candle...There is a Worm called a $V$ Vevil, bred under Ground, and that feedeth upon Roots, as Parfinips, Carrots, \& . S Sme breed it Waters, efpecially fhaded, but they mutueby fanding Waters; as the Water-Spider that hath fix Legs. The Fly called the Gad fie breedeth of fomewhat that fwimeth upon the top of the W ater, and
is moft about Ponds. There is a Worm that brecoeth of the Dregs of Wine decayed, whichafter wards (as is obferved by fome of the Ancients) wrnech into a Gnat. It hath been obferved by the Ancients, that there is a Worm that breederh in old Snow, and is of colour reddifh, and dull of motion, ?nd dieth foon after it cometh out of Snow; which hould hew that Snow hatlrin it a fecret warmoh, for elfe it could hardly vivifie. And the reafon of the dsping of the Worm may be the fudden exhaling of that little Spirit, as foon as ic cometh out of the cold, which had fhut it in. For as Buter files quicken with hear, whici were benummed with cold; fo Spirits may exhale with hear, which wecre preferved in cold. It is affirmed, both by the ancient and Moolern obfervation, that in Furnaces of Copper and Brafs, where Chalcites is (wisich is Virtiol) often caft in to mend the working, there rifeth fuddenly a Fly which fometimes moverh, as if it took hold on the Walls of the Furnace; fometimes is feen moving in the fire below, and dieth prefently as foonas is is our of the Furnace. Which is a nobleinftance, and worthy to be weighed, for it Cheweth that as well violent heat of fire, as the gepele heat of Living Crea: tures will vivifie, if it have matter proportionable. Now the great axiom of Vivification is, that there mufe be heat to dilate the Spirit of the Body, an Aative Spirit to be dilated, matter vilcous or tenacious to hold in the Spirit, and that matter to be put forth and figured. Now a Spirit dilated by fo ardent a fire as that of the Furnace, as loon as ever it cooleth never fo little;congealeth prefently. And (no doubr) this action is furthered by the Chalcites, which hath a $S$ pitit that will put forth and germinate, as we fee in Chymical Tryals. Briefly, moft things putrefied bring forth $I_{n j e t z a}$ of feveral names; but we will not take upon us now to enumerate them all.

The Infett have been noted by the Ancienss to feed little: Büt this hath not beem diligently oblerved; for Grafhoppers eat up the Green of whole Countreys, and Silkoworms devour Leaves fwiftly, and Ants' make great provifion. If is true, that Creatures that fleep and reft much, eat little, as Dormiceand Buts, \&c: they are all without Blood; which may be, for that the Juyce of their Bodies is almoft allone; not Blood; and Flefh, and Skin, and Bone, as in perfect Creatures: The integral parts have extream variety, but the fimilar parts little. It is true, that they have (fome of them) Diaphragm, and an inteftine; and they have all Skins, which in moft of the Infectia, are calt often. They are hot (generally) of longlife; yet Bees have been known to live feven years; and's nakes are thought, the rather for the calting of their fpoib; to live, till they be old s and Eels, which many times breed of putrefaction, will live and grow very long; and thofe that enterchange from Worms to Flies inthe Sumner, and from Flies to Worms in the Winter, have been kept in Boxes four years at he leaft ; yet there are certain Flies that are called Ephemers, that live buta day. The caufe is, the exility of the Spirit, or perhaps the abfence of the San; for that if they vere brought in, or kept clofe, they might live longer, Many of the Infetta (as Butter-flies and orher Flies) revive cafily, whenthey feem dead, being brought to the Sun or Fire. The caufe whereof is, the diffufion of the Vital Spirit, and the eafie dilating of it by a little heat. Theyftir a good while after their heads are off, or that they be cutin pieces; which is caufed alfo, for that their Vital Spirits are more diffufed throughout all their parts, and lefs confined to Organs chen in perfect Creatures.
viscThe Infecta have voluntary Motion, and:therefore imagination. And whereas fome of the Ancients have faid, that their Motion is indeterminate, and their imagination indefinite, it is negligently obferved; for Ants go right
forwards to their Hills; and Bees do (admirably) know the way from a Floury Heath, two or three miles off to th ir Hives. It may be Gnats and Flies have their Imagination more mutable and giddy, as fmall Birds likcwite have. It is faid by fome of the Ancients, that they have onely the Senfe of Feeling, which is manifertly untrue; for if they go forth right to a place, they mult needs have Sight: Befides, they delight more in one Flower or Herb, then in another, and therefore have tafte. And Bees are called with found upon Brafs, and therefore they have hearing. Which fhewech like. wife, that though their Spirits be diffufed, yet there is a Seat of their Senfis in their Head.

Other obfervations concerning the Infecta, together with the Enumeration of them, We refer to that place where De mean to hasdle the Title of Animals in general.

AMan leapeth better with weights in his hands, then without. The caufe is, for that the weight (if it be proportionable) Itrengthneth the Si news, by contracting them; fur otherwile, where no contration is needful, weight hindrech. As we fee in Horfe Races, Men are curious to forecee that there be not the leaft weight upon the one Horfe more then upon the other. In Leaping with Weights, the Arms are firft caft backwards, and then forwards, with fo much the greater force; for the hands go backward before they take their raile, Quare, if the contrary motion of the Spirits, immediarely before the Motion we intend, doth not caufe the Spirits as it were to break forth with more force; as Breath alfo orawn, and keptin, cometh forth more forcibly: And in cafting of any thing, the Arms, to make agreater fiwing, are firft caft back ward.

oF Mufical Tones and unequal Sounds, we have fpoken before, but touch. the pleature and difpleafure of the Senfes not io fully. Harfh Sounds, as ct a Samb when it is fharpned, Grimding of one Stone againft another, fqueaking orferieching noifes, make a fhivering or horror in the Body, and fet the Tecth on edge. The caufe is, for that the objects of the Ear do affect the Spirits (immediately) molt with pleafure and offence. We fee there is no colour that affecteth the Eye much with difpleafure. There be fights that are l:orrible, becaufe they excite the memory of things that areodious or fearful; butche famethings painted, do little affect. As for Smells, Taftes, and 7 ouches, they be things that do affect by a Participation or Impulfion of the body of the Object. Soit is Sound alone that doth immediately and incorporeally affcct moft. This is moft manifeft in Mufick, and Concords, and Difcords in CVufick: For all Sounds, wherher they be fharp or flat, if they befweet, have a roundnefs and equality; and if they be harif, are unequal : For a Dif cord it felf, is but a harfhnefs of divers founds meering. It is true, that inequality, not itaid upon, but paffing, is rather an increafe of fweetnefs; as in che Purling of a Wreached Suring, and in the raucity of a Trumpet, and in the 2 रightingale- $\mathcal{P}_{\text {ipe }}$ of a Regal; and in a $\mathcal{D} i f$ cord ftraight falling upon a Conscord: But it you fay upon it, it is offenfive. And therefore there be thefe three degrees of pleafing and dilpleafirg in Sounds: sweet founds, $\mathcal{D} i$ ifords, and $H a r / h$ Sounds, which we call by divers names, as Scriecbing, or Grating, fuch as we now ipcak of. As for the ferting of the Teeth on edge, we plainly fee whar an intercourfe there is ber ween the Teeth, and the Organ of the Hearing, by tne taking of the end of a Bow between the Teeth, and ftriking uponithe String.

## NA TURA: HISTORY

## Century V I I I.

Here be cuinerals and Fopiles in great variety, but of Veins of Earth Medicinal but few. The chief are, Terra Lemnia, Terra Sigiltata 'communis, and Bolus' Arminus; whereof Teira Lemnia is the chief. The Vertues of them are for Curing of Wounds, Stanching of Blood, Stopping of Fluxes and Rbeums, and Arrefting the Spreding of $\mathcal{P}_{\text {oy }}$ oin, Infection, and Putrefaction: And they have of all other Simples the perfecteft and pureft quality of $\mathcal{D}_{\text {rying, }}$ with little or no mixture of any other quality. Yet it is true, that the Bole Arminick is the moft cold of them, and that Terra Lemnia is the moft hot; for which caufe the Illand Lemnos where it is digged, was in the old Fabulows A ges confecrated to Vullcan.

ABout the Bottom of the Sereights are gathered great quantities of Sporiges, which are gathered from the fides of Rock's, being as it were a large, but tough $\mathrm{CT}_{0}$ S. It is the more to be noted, becaufe that there be but few Subftances, Plant-like, that grow deep within the Sea, for they are gathered fometime Fifteen fathom deep: And when they are laid on Shore, they feem to be of great Bulk; but crufhed together, will be tranfported in a very fmall room.

IT feemeth that Fiss that are ufed to the Salt-water, do neverthelefs delight more in frefh. We fee that Salmons and Smelts love to get into Rivers, though it be againt the Stream. At the Haven of Confantinople you fhall have great quantities of Fisl, that come from the Euxine Sea, that when they come into the Frefh-water, do inebriate and turn up their Bellies, foas you may take them with your hand. I doubt there hath notbeen fufficierit Ex-
701. Experimens Solitary, touching Veirs of Me. dicinal Earth.

702 Experimens Solitary, touching the Growith of Sponges.
703. Experiment Solitary, touching Sez-Fifs put in Frel! $\mathrm{b} \boldsymbol{x}$ zers.
periment made of putting seat fish into Frefl-water, Ponds, and Pools. It is a thing of great ufe and pleafure; for fo you may have them new at fome good diftance from the Sea : And befides, it may be the Fifl will cat the pleafanter, and may fall to breed. And it is faid, that Coltiefer Oysters, which are put into Pits, where the Sea gocth and cometh, (but yet fo that there is a Frefh-water coming alfo to them when the Sea voideth) become by that means fatter, and more grown.
704. Experiment Solitary, touching Attraction by similitude of Subfance.

705: Experinient Solitary', tourhing Certain drink, in Turkey.
706.

Experiments iis Confort, finuching spoeat.

TFic, Turkish Bom giveth a very forcible Shoot, infomuch as it hath bicen known, that the A Aroow hath pierced a Steel Target, or a piece of Brafs of two Inches thick : But that which is more Atrange, the Arron, if it be headed with Wood, hath been kñown to pietce through a piece of Wood of eight Inches thick. And it is certain, that we had in ufe at one time, for Seafight, fhort Arrops, which they called Sprights, without any otherHeads, fave Wood harpned; which were difcharged out of Muskets, and would picrce through the fides of Ships, where a Bullet would not pierce. But this dependeth upon one of the greateff fecretsin all Nature; which is, that Similitude of Subftance will caufe Attraction, where the Body is wholly freed from the Motion of Gravity: For if thatwere taken away, Lead would draw Leal, and Gold would draw Gold, and Iron would draw 1ron without the help of the Loaid.fione. But this fame Motion of Weightor Gravity (which is a meer Motion of Matter, and hath no affinity with the Form or Kinde ) doth kill the other Motion, exceptit felf be killed by a violent Motion; and in thefe inftances of Arrows, for then the Motion of Attraction by Similitude of Subftance beginneth to fhew it felf. But we fhall handle this point of Nature fully indue place.

THey have in Turky; and the Eaff, certain Confetions, which they call Servers, which are like to Candid Conferves, and are made of Sugar and Lemmons, or Sugar and Citrons, or Suigar and Violets, and fome other Flowers; and fome mixture of $\mathcal{A}$ mber for the more delicateperfons: And thofe they diffolve in Water, and thereof make their Drink, becaufe they are forbidden Wine by their Law. But I do muchmarvel, that no Englishman, or $\mathcal{D}$ uti bmann, or German, doth fet up Brewing in Confanntinople, confidering they have fuch quantity of Barley. For as forthegeneral fort of Men, frugality may be the caufe of Drinking Water; for that it is no fmall faving to pay nothing for ones drink: But the better fort might well be at the coft. Andyet I won der the lefs at it, becaufe I fee France, Italy, or Spain, have not taken into ufe Beer or Ale; which (perhaps) if they did, would better both theirHealths and their Complexions It is likely it would be matter of great gain to any that fhould b:gin it in Jurkey.

1N Bathing in hot water, fiweat (neverthelefs) cometh not in the pats unt der the Water. The caufe is, firt, forthat fweat is a kinde of Colliquation. And that kinde of Colliquation is not made either by an over-dry Heat, or an over-moift Heat. For over-moifture dothlomewhatextinguifh the Heat; as we fée, that evenhot ivaterquencheth Fires and over.dry Heat thutteth the Pores. And therefore Men will fooner fweat covered before the Sun or Fire, then if they food naked: And Earthen Bottles filled: with hot water, do provoke in Bed a $S$ weat more daintily then Brick-bats: hor: Secondly, Hot water doth caule Evaporation from the Skin; fo as it fpendeth the matter in thofe parts under the Water, before it iffueth in

Sweat. Again, Sweat cometh more plentifuliy, if the Heat beincreafed by degrees, then if it be greateft at firft, or cequal. The caufe is, for that the Pores are better opened by a gentle Heat, then by a more violent; and by their opening the Sweat, iffueth more abundantly. And. therefore Phyjficians may do well, when they provoke Sweat in Bed by Botlles, with a Decoation of Sudorifick Herbs in Hot W'ater, to make two degrees of Heat in the Bottles, and to lay in the Bed the lefs-heated firft, ahd aftec half an hour the moreheated.

Sieat is falt in tafte. The caufe is, for that that part of the Nouriflhment which is frefh and fivect, turnech into Blood and Flefh; and the Sweat is onely that part which is feparate and excerned. Blood allo raw, hath fome faltnefs more then Flefh; becaufe the Affimilation into Flefh, is not without a little and fubtile excretion from the Blood.

Sweat cometh forth more out of the upper parts of the Body then the lower. The reafon is, becaufe thofe parts are more replenifhed with Spirits, and the Spirits are they that pur forth Sweat; befides, they are lefs flefhy; and $S_{\text {weat iffueth (chiefly) out of the parts that are lefs flefhy and more dry, }}$ as the Forehead and Breft.

Men fweat more in fleep then waking, and yet fleep doth rather flay other Fluxions, then caufe them; as Rheums, Loofneß of the Body; coc. The caufe is, for that in Sleep the Heat and Spirits do naturally move inwards, and there reft. But when they are collected once within,the Heat becomech more violent and irritate, and thereby expelleth $S$ weat.

Cold Sreats are (many times) Mortal and near Death, and always ill and fufpected; as in great Fears, Hypochondriacal Paßions. ©ic. The caufe is, for that Cold Sweats come by a relaxation or forfaking of the Spirits, whereby the Moifture of the Body, which Heat did keep firm in the parts, feverech and iffuech out.

In thofe $\mathcal{D}$ ifeafes which cannot be difcharged by $S$ weat, Sweat is ill, and rather to beftayed; as in Difeafes of the Lungs, and Ftuxes of the Belly; but in thofe Difeafes which are expelled by Sweat, it eafeth and lightneth; as in Agues, peffilences, ©ic. The caufe is, for that Speat in the latter fort is partly Critical, and fendech forth the Matter that offendeth : But in the former, it either proceedech from the Labor of the Spirits, which fhe weth them oppreffed ; or from Motion of Confent, when Nature hotable to expel the Difeafe where it is feated, moveth to an Expulfion indifferent over all the Body.

THe Nature of the Glo Morm is hitherto not well obferved. Thus much we fee, that they breed chiefly in the hotteft Moneths of Suminser ; and that they breed not in Chaimpaign, but in Busbes and Hedges. Whereby it may be conecived, that the Spirit of them is very fine, and not to be refined but by Summer beats. And again, that by reafon of the finenefs, it doth cafily exhale. In Italy, and the Hotter Countreys, there is a Flie they call Lucciote, that fhineth as the Gloworm doth, and it may be isthe Flying-Gloworm: but that Flie is chiefly upon Fens and Uxaiishes. But yet the two former obfervations hold, for they are not feen but in the heat of Suinmer; and Sedge, or other Green of the Fens. give as good thade as Bufhes. It may be the $G$ lonoorms of the Cold Countreys ripen not fo far as to be wirged.

T
He Paffions of the CWinde work upon the Body the impreffions following. Fear, caurcth Paleneß, Trembling, the Standing of the Hair up-
right, Starting, and Scrieching. The Palenefs is cauled; for that the Blood runneth inward to fuccor the Heart. The Trembling is cauled, for that through the flight of the Spirits inward, the outward parts are deftituted, and not fuftained. Standing upright of the Hair is cauled, for that by fhutting of the Pores of theSkin, the Hair that lyeth afloap muft needs rife. Srarting is both an apprehenfion of the thing feared, (and in that kinde it is a motion of Chrinking;) and likewife an Inquifition in the beginning what the matter fhould be, (and in that kinde it is a motion of Ereation ;) and therefore when a Man would liften fuddenly to any thing, he farteth; for the ftarting is an Erection of the Spirits to attend. Scrieching is an appetite of expelling that which fuddenly ftriketh the Spirits. For it muft be noted, that many Motions, though they be unprofitable to expel that which hurtech, yet they are Offers of Nature, and caule Motions by Confent ; as in Groan. ing, or Crying upon Pain.

Grief and Pain, caufe Sighing, Sobbing, Groanitig,Screaming, and Roar. ing, Tears, Dıtorting of the Face, Grinding of the Teerh, Sweating. Sighing is caufed by the drawing in of a greater quantity of Breath to refrefh the Heart that laboreth; like a great draught when one is thirfty. Sobbing is the fame thing ftronger. Groaning, and Screaming, and Roaring, are caufed by an apperite of Expulfion, as hath been faid; for when the Spirits cannot expel the thing that hurteth in their ftrife to do it, by Motion of Conifent they expel the Voice. And this is when the Spirits yield, and give over to refift; for if one do conftantly refilt Pain, he will not groan. Tears are cauted by a Contraction of the Spirits of the Brain; which Contraction by confequence aftringeth the Moifture of the Brain, and thereby fendeth Tears into the Eyes. And this Contraction or Compreffion cauleth alfo Wringing of the Hands; for Wringing is a Gefture of Expreffion of Moifture. The Diftorting of the Face is cauled by a Contention, firft, to bear and refift, and then to expel ; which maketh the Partsknitfirt, and afterwards open. Grinding of the Teeth is caufed (likewife) by a Gathering and Serring of the Spirits together to refift ; which maketh the Teeth alfo to fer hard one againft another. Sweating is allo a Compound Motion by the Labor of the Spirits,firft to refift, and then to expel.

Joy caufeth a Chearfulnefsand. Vigor in the Eyes,Singing, Leaping, Dancing, and fometimes Tears. All thefe are the effects of the Dilatation and coming forth of the Spirits into the outward parts, which maketh them more lively and ftirring. We know it hath been feen, that Exceffive fudden Joy hath caufed prefent Death, while the Spirits did Ipred fo much as they could not retire again. As for Tears, they are the effeds of Compreffion of the Moifture of the Brain, upon Dilatation of the Spirits. For Compreffion of the Spirits worketh an Exprefion of theMoifture of the Brain by confent, as hath been faid in Grief : But then in Joy it workethit diverfly, viz. By Propulfion of the Moifure, when the Spirits dilate, and occupy more room.

Anger cauferh Palenefs in fome, and the going and coming of the colour in others; alfo Trembling in fome, Swelling, Foaming at the Mouth, Stamping, Bending of the Fiit. Palenels, and Going, and Coming of the Colour, are cauled by the Burning of the Spirits about the Heart ; which to refrefh themfelves, call in more Spirits from the outward parts. And if the Palenefs be alone, without lending forth the colour again, it is commonly joyned with fome fear : But in many there is no Patenefs at all, but contrariwife Rednefs about the Checks and Gils; which is by the fending forth of the

## Century VIII.

Spirits, in an appetite to Revenge. Trembling in Anger is likewife by a call ing in of the Spirits, and is commonly when Anger is joyned with Fear. Swelling is caufed both by a Dilatation of the Spirits by over-heating, and by a Liquefaction or Boiling of the Humors thereupon. Foaming at the Mourin is from the lame caufe, being an Ebullition. Stamping and Bending of the Filt are cauled by an Innagination of the Act of Revenge.

Light Difpleafure or Diflike caufeth fhaking of the Head,Frowning, and Knitting of the Brows. Thefe effects arife from the fame caufe that Trembling and Horror do.; namely, from the Retiting of the Spirits, but in a lef; degree. For the Shaking of the Head, is but aflow and definite Trembling : and is a Gefture of flighr refufal: And we fee alfo, that a dillike caufeth often that Gefture of the Hand, which we ufe when we refufe a thing, or warn it away. The Frowning and Knitting of the Brows, is a Gathering or Serring of the Spirits, to refift in fome meafure. And we fee alfo, this Knitting of the Brows will follow uponearneft Studying; or Cogitation of any thing, though it be without difike.

Shame caufeth Blufhing; and cafting down of the Eyes. Bluthing is the Kefort of Blood to the Face, whichinthe Paffion of Shame, is the part that laboreth moft. And although the Blufhing will be feen in the whole Brett, if it be naked, yet that is but in paffage to the Face. As for the cafting down of the Eyes, it proceedeth of the Reverence a Man beareth to other Men, whereby, when he is afhamed, he cannot endure to look firmly uipon others: And we fee, that Blufhing and the Cafting down of the Eyes both, are more when we come before many; Ore Pompeii quid molizus? Nunquam non coram pluribus erubuit; and likewife, when we come before Great or Reverend Perfons.

Pity caufeth fometimes Tears, and a Flexion or Caft of the Eye afide. Tears come from the caufe, that they do in Grief: For Pity is but Grief in anothers behalf. The Caft of the Eye, is a Gefture of Averfion or Lothnefs to behold the object of Pity.

Wonder caufeth Attonifhment, or an Immovable Pofture of the Body, Calting up of the Eyes to Heaven, and Lifting up of the Hands. For Aftonifhment, it is caufed by the Fixing of the Minde upon one object of Cogitation, wherebv it doth not fatiate and tranfcur asitulech: For in Wonder the Spirits flie not, as in Fear; but onely fette, and are made lefs apt to move. As for the Cafting up of the Eyes, and Lifting up of the Hands, it is a kinde of Appeal to the Deity, which is the Author, by Power and Providence of ftrange Wonders.

Laughing eaureth a Dilatation of the Mouth and Lips; a continued Ex. pulfion of the Breath, with the loud Noife, which maketh the Interjection of Laughing ; Shaking of the Breft and Sides; Running of the Eyes wihh Water, if it be violent and continued. Wherein firft it is to be underftood, that Laughing is (carce(properly) a Paffion, but hath his Source from the Intellect; for in Laughing, there ever precedeth a conceit of fomewhat ridictlous. And therefore it is proper to Man. Secondly, that the caufe of Laughing, is buta light touch of the Spirits, and not fo deep an Impreffion as in other Paffions. And therefore that which hath no Affinity with the Pafflons of the Minde) it is moved, and that in great vehemency, onely by Tickling fome parts of the Body. And we fee, that Men even in a grieved fatc of Minde, yet cannot fometimes forbear Laughing. Thirdly, it is ever joyned with tome degree of Delight: And therefore Exhilaration hath fome Affinity with Joy, though it be much Lighter Motion. Res fevera eft perati Gaudium:

Fourthly, That the object of it is Deformity, Abfurdity, Shrend turns, and the like. Now to feak of the caufes of the effects before-mentioned, whercunto thefe general-Notes give fome light. For the Dilatation of the crouth and Lips, continued Expulfion of the Breath and Voice, and Shaking of the Brefts and Sides, they proceed (all) from the Dilatation of the Spirits, efpecially beirg fudden: So likewife the Running of the Eyes with Water, (as hathbeen formerly touched, where we fake of ihe Pears of Foy and Grief) is an (ffect of Dilatation of the Spirits: And for Suddenneß; it is a great part of the Matter : For we fee that any Sbrerd turn that lighteth upon another, or any Deformity, orc. moveth Laughter in the inftant, which after a little time it doth not. So we cannot Laugh at any thing after it is ftale, but whileft it is new. And cven in Tickling, if you tickle the fides, and give warning, or give a hard or con: tinued touch, it doth not move Laughter fo much.-

Luff caufeth a Flagrancy in the Eys, and Priapism. The caufe of both thefe is, for that in Luft the Sight and the Touch, are the things defired; and therefore the Spirits refort to thofe parts which are molt affected. And note well in general, (for that great ule may be made of the oblervation) that (evermore) the Spirits inall Paßions refort moft to the parts that labor moft, or are moft affected. As in the laft, which hath been mentioned, they reforito the Eyes and Venereous parts; in Fear and Anger to the Heart; in Shame to the Fuce; and in Light diflikes to the Head.
723.

Experiments in Confort; touching Drunkemeß.
724.

IT hath been obferved by the Ancients, and is yet believed, That the Sperm Lof Drunken-men is unfruitful. The caufe is, for that it is over-moiftned, and wanteth Spiffitude. And we have a merry faying, That they that go drumk, to Bed, got ${ }^{\text {D }}$ aughters.

Drusken-men are taken with a plain Defect or Deltitution in Voluntary Motion; they reel, they tremble, they cannot fand, nor fpeak Atrongly. The caufe is, for that the Spirits of the Wine opprefs the Spirits Animal, and oc. cupate part of the place where they are, and fo make them weak to move; and therefore $\mathcal{D}$ runken-men are apt to fall afleep. And Opiates and Stupefactives (as Poppy, Henbane, Hemlock, © c.) induce a kinde of Drunkenne $\beta$ by the grofsnefs of their Vapor, as Wine doth by the quantity of the Vapor. Befides, they rob the Spirits Animal of their Matter whereby they are nourifhed; for the Spirits of the Wine, prey upon it as well as they, and fo they make the Spirits lefs fupple and apt to move.

Drunker-men imagine every thing turneth round; they imagine alfo, that things come upon them; they fee not well things afar off; thofe things that they fee near hand, they fee out of their place; and (fometimes) they feethings double. The caule of the imagination that things turn round is, for that the Spirits themfelves turn, being compreffed by the Vapor of the Wine; (for any LiquidBody upon Compreffionturneth, as we fee in Water:) And it is all one to the fight, whether the Vifual Spivits move, or the Object moveth, or the Mediam moveth; and we fee, that long turning round breedeth the fame imagination. The caufe of the imagination that things come uipon them ir, for that the Spirits Vifual themfelves draw back, which maketh the Object feem to come on; and: befides, when they fee things turn round and move, Fear maketh them think they come upon them. : The caufe that they cannot fee thing; afar off, is the weaknefs of the. Spirits; for in every CMegrim or Vertigo, there is an Obtenebration joyned with a femblance of Turningroutnd, which we fee allo in the lighter fort of Swoonings.

The caule of feeing things out of their place, is the refraction of the Spirts vilual; for the vapor is as an unequal Medium, and it is as the fight of things our of place in Water. The cauf: of feeing things double, is the fiwift and unquier motion of the Spitits (being opprefled) to and fro; for (as was fard betore) the motion of the Spirits vifual, and the motion of the object make the fame appearances; and tor the fwift motion of the object, we fec that if you fillip a Lutic Atring, it theweth double or trebble.

Men are fooner Drunk with Imall draughts then with great. And again, Wine fugared, inebriatecth lefs then Wine pure. The caufe of the tormer is, for that the Wine defcendech not fo taft to the Bottom of the Stomack; but maketh longer tlay in the upper part of the Stomack; and fendeth Vapors fatter to the Head, and therefore inebriateth fooner. And for the fame reafon, Sops in Wine (quantity for quartitif) inebriate more then Wine of it felf. The caure of the latter is, for that the Sugar doth infliffite the Spirits of the Wine, and maketh them not fo eafie to refolve into Vapor. Nay further, it is thought to be fome remedy againtt inebriating, if Wine fugared be taken after Wine pure. Ard the fame effect is wroughr; either by Oylor Milk taken upon much Drinking。

THe ufe of Wine in dry and confumed Bodies is hurffil) in moit and full Bodies it is good. The caufe is, for that the Spirits of the Wine do prey upon the Dew or radical moifture (as they term it) of the Body, and fo deceive the Animal Spirits. But where there is moifture enough; or fuperfluous, there Wine hefperh to digeft and deficcate the moifture:

THe Caterpiller is one of the moft general of Worms, and breedeth of Dew and Leaves ; for we fee infinite number of Catterpillers which breed upon Trees and Hedges; by which the Leaves of the Trees or Hedges are in great part confumed; as well by their breeding out of the Leaf, as by their feeding upon the Leaf. They breed in the Spring chiefly, becaufe then there is both Dew and Leaf. And they breed commonly when the Eaft Winds have much blown: The caufe whereof iss the drynels of that Wind; for to all Vivification upon Putrefaction; it is requifite the matter be not too moift : And therefore we fee they have Cobnebs about them; which is fign of a flimy drynefs; as we fee upon the Ground, whereupon by Dew aind Sin Cobwebs breed all over. We fee alfo the Green Catterpiller breedeth in the inward parts of Rofes, efpecially not blown where the Dew fticketh: But efpecially Catterpillers, both the greateft and the molt; breed upon Cabbages, which have a fat Leaf, and apt to putrifie. The Catterpiller toward the end of Summer waxeth volatile, and turneth to a Butterfie, or perhaps fome other Flie. There is a Catterpilure that hath a Fur or Down upon him, and feemeth to have affinity with the Silk: Borm:

THe Flies Cantharides, are bred of a Worin or Catterpiller'; but peculiar to certain Fruit-trees ; as are the Fig-tree; the Pine-tree, and the Wilde Bryar; ali which bear (weet Fruir, and Fruit that hath a kinde of fecret biting or Ghatpnefs. For the Fig hath a Milk in it that is fiweet and corrofive; the Pine-Apple hath a Kernel that is frong and abterfive ; the Fruit of the Bryar is faid to make Children, or thofe that eat them; feabbed. And therefore no marvel though Cantharides have fuch a Corrofive and Cauterizing quality; for there is not one other of the $I_{n f e t i a, i b t ~ b u t ~ i s ~ b r e d ~ o f ~ a ~}^{\text {a }}$ duller matter: The Body of the Cantharides is bright coloured; and it may
be, that the delicate coloured Dragon Flics may have likevific fome Corrofive quality.
730. Experiments in Confort, tuoching Laßitude.
732.

Experiment Solitaiy, touching the Carting of the Skin and Shell in fome Crea. tures.

LAfitude is remedied by Bathing or Ancinting with Oyl and warm Water. The caufe is, for that all Laßitude is a kinde of Contufion and Compreffion of the Parts ; and Bathing and Anointing give a Relaxion or Emollition: And the mixture of Oyl and W ater is better then either of them alone, becaufe Water entreth better into the Pores, and Oyl after entry. foftneth better. It is found alfo, that the taking of Tobacio doth help and difcharge Lafiute. The reafon whereof is partly, becaufe by chearing orcomforting of the Spirits, it openeth the Parts compreffed or contufed: Andchiefly, becaufe it refrefheth the Spirits by the Opiate Vertue thereof, and fo dilchargeth Wearinefs, as Sleep likewife doth.
731. In going up a Hill the Knees will be moof weary; in going down a Hill, Thighs. The caufe is, for that in the Lift of the Feet, when a man goeth up the Hill, the weight of the Body beareth moft upon the Knees; andin going down the Hill, upon the Thighs.

THe cafting of the Skin, is by the Ancients compared to the breaking of the Secundine or Call, but not rightly; for that were to make every cafting of the Skin a new Birth: And befides, the Secundine is but 2 gencral Cover, not fhaped according to the Parts; butthe Skin is fhaped according to the Parts. The Creatures that caft their Skin are, the Snake, the $V_{\text {ipert, }}$ the Grashopper, the Lizard, the Silk-morm, \&'c. Thole that caft their Shell are, the Lobffer, the Crab, the Cra-fsh, the Hodmandod or Dodman, the Torroife, for. The oldSkins are found, but theold Shells never: So as it is like they fcale off, and crumble away by degrees. And they are known by the extream tendernefs and fofterfs of the new Shell; and fomewhatby the frefhnefs of the colour of it. The caufe of the cafting and Skin and Shell fhould feem tobethe great quantity of matter in thofe Creatures, that is fit to make Skin or Shell: And again, the loofnefs of the Skin or Shell, that ficketh not clofe to the Flefh. For it is certain, that it is the new Skin or Shell that puttech off the old. So we fee that in $\mathcal{D e e r}$, it is the young Horn that putteth off the old. And in Birds, the young Feathers put off the old ; and fo Birds that have much matter for their Beak; caft their Beaks; the new Beakputting off the old.

L$Y_{\text {ing not }}$ nrect but Hollow, which is in the making of the Bed, or with the Legs gathered up, which is in the pofture of the Body, is the more wholefome, Thereafonis, the better comforting of theStomack, which is by that Iefs penfile; and we fee, that in weak Stomacks, thelaying up of the Legs high, andthe Knees almoft to the Mouth, helpeth and comforteth. We fee alfo, that Gally-faves, notwithftanding their mifery otherwife, are commonly fat and fleflyy; and the reafon is, becaufe the Stomack is fupported fome what in fitting, and is penfile in ftanding or going. And therefore for Prolongation of Life, it is good to chufe thofe Exercifes where the Limbs move more then the Stomack and Belly ; as in Rowing and in Sawing, being fet.

CTegrims and Giddineß are rather when we Rife, after long fitting, then while we fit. The caufe is, for that the Vapors which were gathered by fitting, by the fudden Motion flie more upintothe Head.

The caufe is, for that the Compreflion of the Parts fuffereth not the Sivirits to have freê accefs; and therefore, when we come out off itiswe feel alting. ing or pricking, which is the tee enirance of the Spiritis.

T hath been noted, That thofe Years are peftilential and untwholfomé, when there are great numbers of Frogs, Flies, Locufts, \&c. The caufe is plain; for that thofe Creatures being ingended of Putrefaction, whein they abound, fhew a general difpofition of the Year, and coniltitution of the Air to Dileales of Purrefaction. And the famie Prognoflick (as hath been fiid before) holdeth, if you finde Worms in Oak-Applés. For the Conftitution of the Air appeareth more fubtilly in any of thefe things, then to the fenfe of Man.
T is an obfervation amonglt Country people, thai Years of fore of Haids and Heps, do commonly portend cold Winter's a and they alcribe it to Gods Providence, thai (as the Scripture faiib) reacherh even to the fâling of a Sparrow; and much more is like to reach to the Prefervation of Birds in fuch Seafons. The Natural caule alfo may be the want of Heat, and abundance of Moiflure in the Summer precedent, which puttech forth thole Fruits; and mult needs leave great quantity of cold Vapors not diffipate, which caufeth the cold of the Winter following.

THey have in Turkey a Drink called Goffes, made of a Berry of the fame niame, as black as J6or, and of a frong fent, but not aromatical, which they take, beaten into powder, in Water as hot as they can drink it And they take it, and fir at it in their Coffee-Howfes, which are like our Taverns. This Drink comforteth the Braih and Heart, and helipeth Digeltion. Certainly this Berry Coffee, the Root and Leaf Betel, the Leaf Tolacico, and the Teare of $\mathcal{P}_{\text {oppy }}$, (Opium) of which, the $\mathcal{T}$ urks are great takers (luppofing it expelleth all fear ; do all coidence the Spirits, and make them itrong and aleger. But it feemeth they are taken after leveral matinèrs ; for Coffee and Opiam are taken down, Tobacco but in Smoak, and Beiele is but champed in the Mou'h with a littleLime. It is like, there are more of them, if they were well found out, and well corrected. 2uare, of Henbane-fedd, of CWandrake, of Saffoon, Root and Flower, of Folixm indum, of Ambergierce, of the Afforinn (A monnumb, if it may be had; and of the scället Porder which they call Kermez; and (generally) of all fuch things as dó inébriate and provoke fleep. Note, that Tobacro is not taken in Root er Seed, which are more forcible ever then Leaves.

THe Turks have a black Powder made of a Mineral called \&Alcobole, which with a fine long Pencil they lay under their Eye lids; which doth colour them black, whereby the White of the Eye is fer off more white. With the fame Powder they colour alfo the Hairs of their Eye.lids, and of their Eye-brows, which they draw into embowed Arches. You fhall finde that Xenophon makeih mention, that the CWedes ufed tó paint their Eyes. The Turksufe with the fame Tineture to colour the Hait of their Heads aña Beárds black: And divers with us that are grown Gray, and yet would appear young; finde means to make their Hair black, by combing it (as they (ay) with a Leaden Comb, or the like. As for the Chimefes, who are of an ill Complexions (bcing olivaffer) they paint their Cheeks Scarlet, efpecially their King and Grañitets. Generilly, Barbaroust people that go naked do not onely paint
thect.
736. Expeciment Solitaty; touching peftilentiát Tears.

Expetiments in Confort, touching sleep.
$\mathrm{T}^{\mathrm{T}}$ is ftrange that the ufe of Batbing as a part of Diet is left. With the Romans and the Grecians it was as ulual as Eating or Sleeping ; and 'ro is it amongtt the Turks at this day ; whereas with usit remaineth out as a part of Phyfick. I am of opinion, that the ufe of it as it was with the Romans, was hurfful to health ; for that it made the Body foff and eafie to wafte. For the Turks it is more proper, becaufe their drinking Water, and feeding upon Rice, and other Food of fmall nourifhment, makech their Bodies for folid and hard, as you need not fear that Batbing fhould make them frothy. Bc. fides, the Turksare great fitters, and feldom walk; whereby they fweat Iefs, and need Batbing more. But yet certain itis, that Bathing, and éfpecially " $A_{n}$. ointing, may be fo ufed, as it may be a grear help to Healch, and Prolongation of Life. But hereef we fhall fpeak in due place, when we come to handle Experiments Medicinal.

THe Turks have a pretty Att of Chamoletting of $\mathcal{P}$ aper, which is not with us in ufe. They take divers Oyled Colours, and put them feverally (in drops) upon Waters and ftir the Water lightly, and then wet their Paper (being of fome thicknefs), with it; and the Paper will be waved and veined like Chamolet or CMarble.

IT is fomewhat Arange, that the Blood of all Birds, and Beafts, and Fifhes, fhould be of a Red colour, and onely the Blood of theCutile fhould be as black as Ink. A man would think thar the caufe fhould be the high Concoction of that Blood; for we fee in ordinary Puddings, that the Boyling turneth the Blood to be black; and the Cutcle is accounted a delisate Meat, and is much in requeft.

IThis reported of credit, That if you take Earth from Land adjoyning to the River of Nile, andpreferve it in that manner, that it neither come to be wet nor watted, and weigh it daily, it will not alter weight uniil the $S e_{-}$ vententh of Fune, which is the day when the Fiver beginneth to tile; and then it will grow more and more ponderous till the River comerh to his height. Which if it be true, it cannot be caufed but' by the Air, which then beginneth to condenfe ; and fo turneth within thit fmall Mould into a degree of Moifture, which produceth weight: Soit hath been obletved, that Tobacco cut and weighed, and then dryed by the Fite, lofeth weight ; and after being laid in the open Air, recovereth weight again. And it Chould feem; that as foon as ever the River beginneth. to increafe, the whole Body of the Air thereabours fuffereth a change: For (that which is more frange) it is credibly affirmed, that upon that very day; , when che River firtt rifeth, ,great Plagues in Cairo ule fuddenly to break up.

THofe that are very cold, and efpecially in their Feet, cannot get to Sleep. The canfe may be, for that in Sleep is required a freerefpiration, which cold dothhut in and hinder: For we fee, that ingreat Colds, one can fcarce
draw his Breath. Another caufe may be, for that Cold callech the Spiritsto fuccor; and therefore they cannot fo well clofe, and go togecher in the Head, which is ever requifite to Sleep And for the lame caule, Pain and noife hinder fleep, and darknefs (contrariwife) furthereth fleep.

Some noilcs (whercof we fpake in the II 2 Experiment) help Sleep; as the blowing of the Wind, the trickling of Water, humming of Bees, foft finging, reading, \&xc. The caule is, forthat they move in the Spirits a gentle attention; and whatfocver moveth attention, without too much labor, ftilleth the natural and difcurfive motions of the Spirits.

Sleep nourihheth, or at leaft preferveth, Bodies a long time, without other nourifhment. Beafts that fleep in Winter, (as it is noted of wilde Bears) duting their fleep wax very fat, though they eat nothing. Bats have been found in Ovens, and other hollow clofe places, matted one upon another ; and therefore it is likely that they fleep in the VVinter time, and eat nothing. Quare whether Bees do not fleep all VVinter, and fpare their Honey. Butter-flies, and other Flies, do not onely fleep, but lie as deadall VVinter; and yet with a little heat of Sun or Fire revive again: A Dormoufe, both VVinter and Summer will fleep fome days together, and eat nothing.

TO reftore Teeth in Age, were cwagnale Natura; it may be thought of; but howfoever, the nature of the Teeth deferveth to be enquired of, as well as the other parts of Living Creatures Bodies.

There be five parts in the Bodies of Living Creatures that are of hard fub. ftances; the Skull, the Tectb, the Bomes, the Horns; and the Nails. The greatelt quantity of hard fibftance continued, is towards the Head; for there is the Skull of one entire Bone, there are the Teeth, there are Maxillary Bones, there is the hard Bone that is the Inftrument of Hearing, and thence iffue the Horns. So that the building of Living Creatures Bodies is like the building of a Timber-houfe; where the VValls and other parts have Columns and Beams; butthe Roof is in the betterfort of Houfes, all Tile, or Lead, or Stone. As for Birds, they have three other hard fubftances proper to them; the Bill, which is of the like matter with the Teeth,for no Birdshave Teeth; the Shell of the Egg, and their Quills; for as for their Spur, it is but a Nail. But no Living Creaturesthat have Shells very hard (as Oyfers, Cockles, Muftes, Shalops, Crabs, Lobfers, Craw.fish, Shrimps, and efpecially the Tortoife) have Bones within them, but onely little Grifles.

Bones, after full growth, continue at a ftay, and fo doth the Skull. Horns, in fome Creatures, arecaft and renewed: Teeth ftand at aftay, except their wearing. As for Nails, they grow continually, and Bills and Beaks will over. grow, and fometimes be caft, as in Eagles and Parrots.

Moit of the hard fubftances flie to the extreams of the Body; as Skull; Horns, Teeth, Nails, and Beaks; onely the Bones are more inward, and clad with Flefh. As for the Entrails, they are all without Bones, fave that a Bone is fometimes found in the Heart of a Sias, and it may be in fome other Creatures.

The Skull hath Brains, as a kinde of Marrons within it. The Back-bone hath one kinde of Marrow, which hath an affinity with the Brain ; and other Bones of the Body have another. The Fax-bones have no Marrow fevered, but a little $\mathcal{P u l p}$ of Marrond diffufed. Teeth likewife are thought to have a kinde of Marrow diffuff, which caufeth the Senfe and Pain: But it
$158 \quad \mathcal{N a t u r a l}$ Hifory;
751. None other of the hard fubttances have Senfe, but the Teeth ; and the Teeth have Senfe, not onely of Pain, but of Cold.

But we will leave the Enquiries of other Hard Subfances unto their feveral places, and now enquire onely of the Teeth.

Tne Teeth are in Men of three kindes, Sharp, as the Fore-teeth; Broad, as the Back-teeth, which we call the CMolar-teeth, or Grinders; and Pointed-teeth, or Canine, which are between both. But there have been fome Men that have had their Teeth undivided, as of one whole Bone, with fome little mark in the place of the Divifion, as ${ }^{\text {S Pyrrhus had. Some Creatures have }}$ over-long or out-growing Teeth, which we call Fangs or Tusks; as Boars, pikes, Salmons, and Dogs, though lefs. Some Living Creatures have Teetb. againft Teeth, as Men and Horfes; and fome have Tetb, efpecially their Mafferteeti; indented one within another like Sanss, as Licns; and fo again have - Dogs. Some Fistles have divers Rows of Teeth in the Roofs of their Mouths;
 Serpents have venemous Teeth, which are fometimes miltaken for their Sting.

No Bealt that hath Horns hath upper. teeth; and no Beaft that hath Teeth above, wanteth them below. But yet if they be of the fame kinde, it followeth not, that if the hard matter goeth not into upper-teeth, it will go into Horns; nor yet è converfo, for Does that have no Horns, have no upperteeth.

Horfes have, at three years old, a Tooth pur forth which they call the Colis-tooth; and at four years old, there cometh the Mark.tooth, which hath a hole fo big as you may lay a Peafe within it ; and that weareth fhorter and fhorter every year, till that at eight years old the Tooth is fmooth; and the hole gone; and then they fay, That the Markis out of the Hor fes Choust.

The Teeth of Men breed firft ; when the Childe is about a year and half old, and then they caft them, and new come about feven years old. But divershave Backward-teeth come forth attwenty, yea, fome at thirty, and forty 2uare of the manner of the coming of them forth. They tell a alale of the old Countefs of $\mathcal{D e}$ mond, who lived till fhe was Sevenfcore years old, that fhe did Dentire twice or thrice, cafting her old Teeth, and others coming in their place.

Teedh are much hurt by Sweet-meats, and by Painting with Mercury, and by things over-hot, and by things over cold, and by Rheums. And the pain of the Teeth, is one of the fharpeft of pains.

Concerning Teeth, thefe things are to be confidered. i. The preferving of them. 2. The keeping of them white. 3. The drawing of them with leaft pain. 4. The ftaying and eafing of the Tooth-ach. 5. The binding in of Artificial Teeth, where Teeth have been ftrucken out. 6. And laft of all, that great one, of rèforing Teeth in Age. The inftances that give any likelihood of reftoring Teeth in Age, are, The late coming of Teeth in rome, and the renewing of the Beaks in Birds, which are commaterial with Teeth. - 2uare therefore more particularly how that comerh. And again, the tenewing of Horns. But yet that hath not been known to have been provoked by Art; therefore let tryal be made, whether Horns may be procured to grow in Beafts that are not horned, and how; and whether they may be procured to come larger then ufual, as to make an Ox or a Deer
have a greater Head of Horns; and whether the Head of a Decr, that by age is more, fifitcd, may be brought again to be more branched. For thefe tryals and the like will fhew, Whether by art fuch hard matter can be called and provoked. It maybe tryed alfo, whecher Birds may not have fomething done to them when they are young, whereby they may be made to have greater or longer Bills, or greater and longer Talons: And whether Children may not have fome $W a / f$, or tomething to make their Teeth better and ftronger. Coral is in ule as an help to the Teeth of Children.

SOme Living Creatures generate but at certain feafons of the year; as Deer, sheep, Wilde Coneys, \&ic. and moft forts of Birds and Fishes: Others at any time of the year, as CMen; and all Domeftick Creatures, as Horfes, Hogs, Dogs, Cats, óc. The caufe of Generation at all feafons; feemeth ro be Fulnefs; for Generation is from Redundance. This Fulnefs arifeth from tivo caules, Either from the Nature of the Creature, if it be Hor, and Moift, and Sanguine, or from Plenty of Food. For the firft, Men, Horfes, Dogs, Goc. which breed at all feafons, are full of Heat and Moifture; Doves are the fulleft of Heat and Moilture amonglt Birds, and therefore breed often, the Tame Dove almoft continually. But Deer are a Mslancholick dry Creature, as appeareth by their fearfulnefs, and the hardnefs of their Flefh. Sheep are a cold Creature, as appeareth by their mildnefs, and for that they feldom drink. Moft forts of Birds are of a dry fubitance in comparifon of Beafls; Fishes are cold. For'the lecond caule, Fulnefs of Food, Men, Kine, Swine, Dogs, oc. feed fuil. And we fee, that thofe Creatures which, being Wilde, generate feldom, being tame, generate often; which is from warmth and fulnefs of food. Wefinde that the time of going to Rut of Deer is in September, for that they need the whole Summers Feed and Grafs to make them fit for Generation ; and if Rain come early about the middle of Septeriber, they go to Rut fomewhat the fooner; if Drought, fomewhat the later. So Sheep, in refpect of their fmall hear; generate about the fame time, or fomewhat before. But for the molt part, Creatures that generate at certain feafons generate in the Spring; as Birds and Fifhes: For that the end of the Winter, and the heat and comfort of the Spring prepareth them. There is alfo another reafon why fome Creatures generate at certain feafons, and that is the Relation of their time of Bearing to the time of Generation; for no Crearure goeth to generate whileft the Female is full, nor whilet the is bufie in fitting, or rearing her young; and therefore it is found by experience, that if you take the Eggs or Young:ones out of the Nefts of Birds, they will fall to gencrate again three or four times one after another.

Of Living Crcatures; fome are longer time in the Womb, and fome fhorter. Women go commonly nine Moneths; the Cow and the Ewe about fix Moneths, Docsgo about nine Moneths, Mares cleven Moneths, Bitches nine Weeks; Elephants are faid to go two years, for the received Tradition of ten years is fabulous. For Birds there is double enquiry; the difrance between the treading or coupling, and the laying of the Egg; and again, between the Egg laid, and the difclofing or hatching. And amongft Birds there is lefs diverfity of time then amongtt other Creatures, yet fome there is; forthe Hen fiteth but three weeks, the Turky-hen; Goofe and Duck, a moneth. Quare of others. The caufe of the great difference of times amongt Livirig Creatures is; either from the nature of the Kind;
or from the confitution of the Womb. For the former, thofe that are longet in coming to their maturity or growth, are longer in the Womb, as is chicfly feen in Men; and fo Elephanis, which are long in the Womb, are long time in coming to their fullgrowih. But in mioft orher Kinds, the confitution of the Womb (that is, the hardnefs or drynefs thereof) is concurrent with the former caufe. Forthe Colt hath about four years of growth, and fo the Fawn, and fo the Calf; but Wnelps, which come to their $\mathfrak{\varepsilon}$ rowch (commonly) within three quarters of a year, are but nine weeks in the Womb. Asfor Birds; as there is leis diverfity amongt them in the time of theirbringing forth, fo there is lefs diverfity in the time of their growth, mofe of them coming to their growth within a twelve-moneth.

Some Creatures bring forth many young ones at a Burthen ; as Birches, Hares, Concys, \&c. fome (ordinarily) but one; as Women; Lioncfles, \&c. This may be caufed, either by the quantity of Sperm required to the producing one of that Kind; which if lefs be required, may admit greater number; if more, fewer: Or by the Partitions and Cells of the Womb, which may fever the Sperm.

THere is no doubt but Eight by Refraction will fhew greater; as well as things coloured; for like as a fhilling in the bottom of the Water will fhew geeater, fo will a Candle in a Lanthorn in the bottom of the Water. I have heard of a practice, that Glo worms in Glaffes were put in the Waterto make the Fifh come. But I am not yet informed, whether when a Divcr diveth, having his eyes open, and fwimmeth upon his back; whether (I Iay) he feeth things in the Air, greater or lefs. For it is manifeft, that when the eye flandeth in the finer medium, and the objet is in the groffer, things fhew greater; but contrariwife, when the eye is placed in the groffer medium; and the object in the finer, how it worketh I know not.

It would be well boulted out, whether great Refractions may not be made upon Reflexions, as well as upon direat beams. For example; we fee, that take an empty Bafon, putan Angel of Gold, or what you will into it * then go fofar from the Bafon till you cannot fee the Angel, becaule it is not in a right Line; then fill the Bifon with. Water, and you fhall fee it out of his place, becaufe of the Reflexion. To proceed therefore, put a Lookingglafs into a Bafon of Water; I fuppore you fhall not fee the Image in a right Line, or at equal Angles, but afide. I know not whether this Experiment may not be extended fo, as you might fee the Image, and not the Glafs; which for beauty and ftrangenefs were afine proof, for then you fhall fee the Image like a Sitit in the Air. As for example, if there be a Cittern or Pool of Water, you fhall place over againft it a picture of the Devil, or what you will, fo as youdo norfee the Water, then put a Looking glafs in the Water: Now if you can tee the Devils pifure afide, not feeing the Water, it will look like a Devil indeed. They have an old tale in Oxford; That Fryer Basor walked between two Stceples;: which was thought to be done by Glafles, when he walked upon the Ground.

AWeighty Body put into Motion, is more cafily impelled then at firt when it refteth. The caufe is, partly becaute Motion doth ditcufs the Iorpour of folid Bodies', which befide their Motion of Gravity, have in them a Natural Appetite not to move at all; and partly; becaule a Body that refte:h doth get, by the refiltance of the Body upon which it refteth, a fronger
compreffion
compreffion of parts thenit hath of it felf, and therefore needeth morefores to be pus in motion. For if a weighty Body be penfile, and hang but by a thred, the percuffion will make an impulfion very near as cafily as if it were already in morion.

A Body over-great orover-fmall, will not be thrown fo far as a Body of a middlefize; lo that (it feemeth) there mult be a commenfuration or proportion berween the Body moved, and the force, to make it move well. The caufe is, becaufe to the Impulfion there is requifite the force of the Bo dy that moveth, and the refiftance of the Body that is moved ; and if the Body be too great, it yieldeth too little; and if it be too fmall, it refifteth too little.

It is common experience, that no weight will prefs or cut fo ftrong being laid upon a Body, as falling or ftrucken from above. It may be the Air hath fome part in furthering the percufion: But the chief caufe I take to be, for that the parts of the Body moved, have by impulfion; or by the notion of gravity continued, a compreffion in them as well downwards, as theg have when they are thrown or fhot through the Air forwards. I conceive alfo, that the quick loofe of that motion preventeth the refiftance of the Body be: low; and priority of the force (always) is of great efficacy, as appeareth in infinite inftances.

TIckling is moft in the Soles of the Feet, and under the Arm-boles, and on the Sides. The caufe is, the thinnefs of the Skin in thofeparts, joyned with the rarenefs of being touched there ; for all Tickling is a light motion of the Spirits, which the thinnefs of the Skin, and fuddennefs and rarenefs of touch do forther: For we fee a Feather or a Ruh drawn along the Lip or Cheek, doth tickle ; whereas a thing more obtufe or a touch more hard, doth not. And for fuddennefs, we fee no man can ticklehimfelf: We fee alfo, that the Palm of the Hand, though.it hath as thin a Skin as the other parts mentioned, yet is not ticklifh, becaufe it is accuftomed to betouched. Tickling allo caufeth Larghter. The caule may be the emiffion of the Spirits, and ro of the Breath, by a flight from Titillation; for upon Tickling, we fee there is ever aftarting or fhrinking away of the part to avoid it ; and we fee alfo, that if you tickle the Noftrils with a Feather or Straw, it procureth SneeZing, which is a fudden emiffion of the Spirits, that do likewife expel the moifture. And Tickling is ever painful, and not well endured.

IT isftrange, that the River of Nilus overflowing, as it doth the Countrey of Egypt, there fhould be neverthelefs little or no Rain in that Countrey. The caule mult be, either in the Nature of the Water, or in the Nature of the Air, or of both. In the Water, it may be afcribed either unto the long race of the Water; for fwift-running Waters vapor not fo much as ftanding Waters, or elfe tothe concoction of the Water; for Waters well concoeted, vapor not fo much as Waters raw, no more then Waters upon the fire do vapor fo much, after fome time of boyling, as at the firt. And it istrue, that the Water of $\mathrm{Ni} / \mathrm{lus}$ is fweeter then other Waters in tatte; and it is excellent good for the Stone, and Hypochondriacal Melancholy, which theweth it is lenifying ; and it runneth through a Countrey of a hot Climate, and flat, without Thade either of Woods or Hills, whereby the Sun mut needs have great power to concoct it. As for the Air (from whence I conceive this want of Showers cometh chicfly) the caure muft be,
for that the Arr is of it felt thin and thrity, and as fuon ascerer getecti any moifture from the Water, it imbibert, and dilipateth it in the whole Body of the Air, and luffercth it not tormann in Vapor, whereby is might breed Rain.
763. Experiment Solitary, touching clarificatisn.
769. Experiment Solitary, touching Plants tivithout Lexves.
770. Experiment Solitary, touching the Materiais of claß.

77 「. Experiment Solitany, touching Prolibition of Pstrefactiou, and the long Confervation of Bodies.

IThath been touched in the Title of Pcrlocations, (namely, fuch as are inwards) that the Whites of Eggs and Miik do clarifie; and it is certain; that in Esypt they prepare and clarifie the Water of 2eile, by putting it into great Jars of Stone, and ftirring it abour with a few ftamped Almond:, wherewith they alfo befmear the Month of the Veffel; and fo draw it off, after it hath refted fome time. It were good to try this Clarifying with Almonds in new Beer or Muft, to halten and perfect the Clarifying.

THere be farce to be found any Vegctables that have Branches and no Leaves, except you allow Coral for one. But there is alfo in the Defarts of S. Macario in Egypt, a Plant which is long, Leaflcfs, brown of colour, and branched like Coral, fave that it cloreth at the top. This being fet in Water within Houfe, fpredeth and difplayeth ftrangely $;$ and the people thereabout have a fupertitious belicf, that in the Labor of W omenit helpeth to the cafie Deliverance.

THe cryftalline Venice-Gla $\beta$ is reported to be a mixture, in equal portions, of Siones brought from Pavia, by the River Ticinum, and the fifhes of a Weed called by the Arabs, Kall, which is gathered in a Defart between Alexandria and Rofetta; and is by the Egyptians uled firft for Fuel, and then they crufh the Afhes into lumps like aStone, and fofell them to the $V$ enetians for their Glats-works.

IT is ftrange, and well to be noted, how long Carcaffes have continued uncorrupt, and in their former Dimenfions; as afpeareth in the Mummies of $E_{s} / p t$, having lafted, as is conceived (fome of them) three tisouland years. It is true, they finde means to draw forth the Brainsy and to take forth the Entrails, which are the parts aptelt to corrupt. But that is no. thing to the wonder; for we fee what a foft and corruptible fubitance the Fkelh of all the other parts of the Body is. But it fhould feem, that according to our obfervation and axiom, in our hundredth Experiments, Putre. faction, which we conceive to be fo natural a Period of Bodies, is but an accident, and that Matter maketh not that hafte to Corruption that is conceived; and therefore Bodies in fhining Amber, in Quick-filver; in Balms, (whereof we now (peak) in Wax, in Honey, in Gums, and (it may $b c$ ) in Corfervatories of Snow, \&c. are preferved very leng. It need not go for repetition, if we refume again that which we faid in the aforefaid Experiments concerning eAnilization, namely, That if you provide againft three caules of $\mathcal{P}$ utrefation, Bodies will not corrupt. The firt is, that the Air be excluded; for that undermineth the Body, and confpireth with the Spirit of the Body to diffolveit. The lecond is; that the Body adjacent and ambient be not Commaterial, but meerly Heterogeneal towards the Body that is to be preferved; for if nothing can be received by the one, nothing can iffue from the other; fuch ate Quick-filver and White Amber to Herbs and Flies, and fuch Bodies. The third is, that the Body to be preferved be not of that grofs that it may corrupt within it felf, although no part of itiffue into the Body adjacent; and therefore it mult be rather thin
and fmalletien of Buk. There is a fourth iiemedy aifo; whech is, That if the body to be preterved, be of bulk, as a Corps is, then the Body that inclofeth it muft have a virtue to draw forth and dry the moilture of the inward Body; for elfe the Purrefaction will play within, though norhing iffue forth. I remember Livy doth relate; that there were found at a time rwo Coffins of Lead in a Tomb, whercof the one contained the Body of King Numa, it being fome Four hundred years afier his death, and the other, his Books of Sacred Rites and Cererizonies; and the Difcipline of the Pontiffs: And that in the Coffin that had the Body, there was nothing (at all) to be fecm but a litte light Cinders about the fides; but in the Coffin that had the Books, they were found as frefh as if they had been but newly writren, being written in Parchment, and covered over with Watch-candles of Wax three or four fold. By this it feemeth, that the Romans in Numa's time were not fo good Embalmers as the Exyptians were; which was the caule that the Body was utterly confumed. But I finde in Plutarib and others; that when Augufus Cafar vifited the Sepulchre of Alexander the Great in Alexandria, be found the Body to keep his Dimenfion ; but withal, that notwiti)tanding all the Embalming (which no doubt was of the beft) the Body was fotender, as $C_{a}$ far touching but the Nofe of it, defaced it. Which maketh me finde is very ftrange, that the Egyptian Mummies flould be reporred to be as hard as Sone-pich : For I tinde no difference but one, which indeed may be very material ; namely, that the ancient Egyptian Mummies were fhowded in a number of folds of Linnen; befmeared with Gums, in manner of Sear-cloth; which it doth not appear, was practifed upon the Body of Alexander.
$\mathrm{N}^{\text {Ear the Caftle of Catie, and by the Wells } A \iint_{\text {dik }} \text { in the Land of Idumaa, }}$ a great part of the way, you would think the Sea were near hand, though it be a good diftance of: And it is nothing, but the fhining of the Nitre upon the Sex-fands : fuch abundance of Nitre the Shores there do pint forth.

THe Dead-Sea, which vomiteth up Bitumen, is of that Ctafficuiee, as Living Bodies, bound hand and foor, and caft into it, have beefl borne up and not funk: Which fheweth, that all finking into Water, is but an overweight of the Body put into the Water; in refpect of the Water; fo that you may make Water fo Atrong and heavy of 2 uitk-filver, (perhaps) or the like, as may bear up Iron; of which I fee no ufe, but Innpofture. We fee alfo, that all Metals, except Gold, for the fame reaton \{wim upon Quick filver:

I
T is reported; that at the Foot of a Hill neat the CNate mortuim, there is a Black Sone (whereof Pilgrims make Fires) which burneth like a Coal and diminifheth nor; but onely waxeth brighter and whiter. That it fhould do ro, is not ftrange ; for we fee Iron red hot burneth and confumeth nor. But the frangencfs is, that it fhould continue any time fo; for Iron, as foon as it is out of the Fire, deadeth ftraight-ways. Certainly, it were a thing of great ufe and profit, if you could finde out Fuel that would Burn hoi, and yet laft long: Neither am I altogether incredilous; but there may be fuch Candles as (they fay) are made of Salamanders Wool, being a kinde of Mineral which whiteneth alfo in the burning', and confumerh not. The Queition is this. Fame mult be made of fomewhat ; and commonly it
772.

IT is at this day in ufe in Gaza, to couch Pors Sherts or Deffels of Earth in their Walls, to gather the Wind from the top, and to pafs it down in Spouts into Rooms. It is a device for frefhne fs ingreat Heats. And it is faid, there are fome fooms in Italy and Spain for freflnefs, and gathering the Winds and Air in the Heats of Summer; but they be but Pennings of the Winds, and enlarging them again, and making them reverberate, and go round in Circles, rather then this device of Spouts in the Wall.

THere would be ufed much diligence in the choice of fome Bodies and Places (as it were) for the talling of Aity to difcover the wholefomenefs or unwholefomne fis as well of Seafons, as of the Seats of $D$ wellings. Itis certain, that there be fome Houfes wherein Confitures and Pies, will gather Mould more then in others; and I am perfivaded, that a piece of raw Flefh or Ff , will fooner corrupt in fome Airs then in others. They benoble Experimenss that can make this difcovery; for they ferve for a Natural Divination of Sealons, better then the Atronomers can by their Figures; and again, they teach men where to chufe their dwelling for their better health.

THere is a kinde of Stone about Betblehem which they grinde to powder, and purinto Water, whereof Cattel drink, which maketh them give more Milk. Surely, there would be fome better Tryals made of Mixtures of Water in Ponds for Cattel, to make them more Milch, or to fatten them, or to keep them from CMurrain. It may be, Chalk and $N$ itre are of the beft.

IT is reported, that in the Valley near the Mountain Carmel in fudea, there is a Sand, which of all other, hath moft affinity with Glafs, inlomuch, as other Minerals laid in it, turn to a glaffie fubftance without the fire ; and again, Glafs put into it, turneth into the Mother-fand. The thing isvery ftrange, if it be true ; and it is likelieft to be caufed by fome natural Furnace of Heat in the Earth, and yet they do not lpeak of any Eruption of Flames It were good to try in Glafs works, whether the crude Materials of Glats mingled. with Glafs, already made and remoulten, do not facilitate the making of Glals with lef? heat,

IN the Sea, upon the south-Weft of Sicily, much Corál is found. It is a Subnarine Plant, it hath no leaves, it branchech onely when it is under $\mathbb{W}$ ater; it is foff; and green of colour ; but being brought into the Air, it becomerh hard, and ilining red; as we fee. It is faid alfo to have a white Berry, but we finde it not brought over with the Coral: Belike it is caftaway as nothing worth. Idquire better of ir, for the difcovery of the Nature of the Plant.

THe crianna of Calabria is the beff, and in moft pienty. Tacy gather it from the Leaf of the CMulberry-tree; but not ot fuch CMulberry-tree's as grow in the Valleys : And Manna talleth upon the Leaves by night, as other Dews do. It fhould feem, that before thofe D iws come upon Trees in the Valleys; they diffipate and cannothold out. It fhould feem alfo, the Mulberry. leaf it felf hath fome coagulating virtue, which infpiffateth the Dew; for that it is not found upon other Trees: And we fee by the Silk worm; which feedeth upon that Leaf, what a dainty fmooth Juice it hath; and the Leaves alfo (cfpecially of the Black Muiberry) are fomewhat brittly, which may help to. preferve the Dew. Cerrainly, it were not amifs to obferve a little better the Dews that fallupon Trees or Herbs growing on Mountains; for it may be, many Dews fall that fpend bêfore they come tothe Valleys. And I fuppofe, that he that would gather the beft $M_{x} x$ Dew for Medicinc, fhould gather it from the Hills.

IT is frid, they have a mainner to prepare their Greek Wines, to keep them from Fuming and Inebriating, by adding fome Sulphur or Allum; whereof the one is Uncuous, and the other is Aftringent. And certain it is, that thofe two Natures doreprefs the Fumes. This Experiment would be tranf. ferred unto other Wine and Strong-Beer, by putting in fome like Subftances while they work; which may make them both to Fume lefs, and to influme lefs.

IT is conceived by fome, (not improbably) that the reafori why Wildfires (whereof the principal ingredient is Bitumen) do not quench with Water, is, for that the firt concretion of Bitumen, is a mixture of a fiery and watry fubitance ; fo is not Sulpbur. This appeareth, for that in the place near Putroli, which they call the Court of Vulcain, you fhall hear under the Earth a horrible thundring of Fire and Water conflicting together ; and there break forth alfo Spouts of boiling $W$ ater. Now that place yieldcth great quantities of Bitumen; whereas $C$ Etna, and $V_{c} f u v i u s$, and the like; which confift upon Sulpbur, fhoot forth Smoak, and Afhés, and Pumice; bur no Water. It is reported alfo, that Bitunen mingled with Lime, and pur under Water, will make,as it were, an artificial Rock ${ }_{j}$ the fubftance becometh fo haid.

THere is a Cement compounded of Flower, Whites of Eggs, and Stone powdred; that becometh hard as Marble, wherewith Pifinn Mirabiliss, near Cuma, is faid to have the Walls plaifered. And it is certain, and tried, that the Powder of Load.ftone and Flint, by the addition of Whites of Eggs and Gum-dtagon, made into Paftes will in a few days harden to the hardnefs of a Stonte.

Experiment Solitary, touching Woznds.
788. Experiment Solitary, touching Mortification by Cold.
789. Experiment Solirary, touching WIIGht.
790. Experiment Solitary, touching the Suppernation of Bodies.

IThath been noted by the Antients, that in full or impure Bodics, U'cers or Hurts in the Legs are hard to cure, and in the Head morecafie. The caufe is, for that Ulicers or Huris in the Legs require Dcficcation, which by the defluxion of Humors to the lower parrs is hindred, whereas Hurts and Ulcers in the Head riquire it not; bu;, contrariwife, Drynefs makech them more apt to Confolidate. And in Modern oblervation, the like difference hath been found between French men and Englifh men; whereof the ones Conftitution is more dry, and the others more moint : And therefore a Hurt of the H eld is harder to cure inaFrench-man; and of the Leg inan Englifh. man.

IT hath been noted by the Ancients, that Southern $W$ inds blowing much without Rain, do caufe a Fevorous Difpofition of the $Y_{\text {ear }}$; but with Rain, not. The caufe is, for that Soutbern Winds do of themfelves qualifie the Air to be apt to caufe Fevers; but when Showers are joyned, they do refrigerate in patt, and check the foultry Heat of the Southern Wind. Therefore this holdeth not in the Sea-coafts, becaufe the vapor of the Sea without Showers doth reffelh.

IT hath been noted by the Ancients, that Wounds which are made with Brafs, heal more eafily then Wounds made with Iron. The caufe is, for that Brass hath in it felf a Sanative virtue, and fo in the very inftant helpeth fomewhat ; but Iron is Corrofive, and not Sanative. And therefore it were good that the Inftruments which are ufed by Chirurgions abour Wounds were tather of Brafs then Iron.

$I^{\mathrm{N}}$N the cold Countreys, when Mens Nofes and Ears are mortified, and (as it were) Gangrened with cold, if they cometo a Fire, they rot off prefently. The caufe is, for that the few Spirits that remain in thofe parts are fuddenly drawn forth, and fo Purrefaction is made compleat. Bur Snow put upon them helpeth, for that it preferverh thofe Spirits that remain till they can revive; and befides, Snow hath in it a fecret warmth; as the croonk proved out of the Texr, 2 ui dat Nivem ficut Lanam, Gelu ficut Cineres Spargit; whereby he did infer, that Snow did warm like Wool, and Froft did fret like Afhes. Warm Water alfo doth good, becaure by little and little it openeth the pores, without any fudden working upon the Spirits. This Experiment may be transferred unto the cure of Gangrenes, either coming of themfelves, or induced by too much applying of Opiates; wherein you muft beware of dry Heat, and refort to things that are Refrigerant, with an inward warmth and virtue of cherifhing.

N Eigh Iron and Aqua-fortis feverally, then diffolve the Iron in the Aquafortis, and weigh the Diffolution; and you fhall finde it to bear as good weight as the Bodies did feverally, notwithftanding agood deal of wafte by a thick vapor that iffueth during the working; which fheweth; that the opening of a Body doth increare the weight. This wastryed once or twice, butl know not whether there were any Error in the Tryal.

TAke of Aqua-fortis two Ounces, of 2uick-filver two Drachms, (for that charge the $\mathcal{A}$ qua fortis will bear) the Diffolution will not bear a Flint as big as a Nutnatg ; yet ( no doubt) the increafing of the weight of

Water

Water will increate his power of bearing; as welee Broyn, when it is talt enough, will bear an Egg. And I rememberwell a Pingtian, that ufed to give fome M neral Baths for the Gout \&c. And the Body when it was pur into the Buth, could nor get down fo eafily as in ordinary Water. Bur it fermcth, the weight of the Quickfilver, morethen tine weight of a Stone, doth not compenfe the weight of a Stone, more then the weight of the Aqua-forti\%.

LEt there be a Body of unequal weight, (as of Wood and Lead, or Bone and Lead; ) it youthrow it from you with the light end forward, it will turn, and the weightier end will recover to be forwards, unlefs the Body be over.long. The caule is, for that the more Denle Body hath a more violent preffure of the parts from the firf impultion; which is the caufe (though heretofore not found out, as hath been often riid) of all Violent Motions: And when the hinder part moveth fwifter (for that it lefs endureth preffure of parts) then the for ward part can make way for it; it muft needs be that the Body urn over; for (turned) it can more eafily draw for ward the lighter part. Galilaus noteth it well, That if an open Trough, wherein Water is, be driven fafter then the Water can follow, the Water gathereth upon an heap towardsthe ninder end, where the motion began; which he fuppofeth (holding confidently the motion of the Earth) to be the caule of the Ebbing and Flowing of the Ocean, becaufethe Earth over. runneth the Water. Which Theory though it be falfe, yet the firft Experiment is true ; as for the inequality of the preffure of parts, it appeareth manifeltly in this, That if you take abody of Srone or Iron, and another of Wood, of the fame magnitude and Thape, and throw them with equal force, you cannot polfibly throw the Wood fo far as the Stone or Iron.

IT is certain (as it hath been formerly in part touched) that Water may be the Medium of Sounds. If youdafh a Storie againft a Stone in the bottom of the Water, it makes a Sound; fo a long Pole ftruck upon Gravel, in the bottom of the Water, maketh a Sound. Nay, if you fhould think that the Sound cometh upby the Pole; and not by the Water, you fhall finde that an Anchor let down by a Rope maketh a Sonnd; and yet the Rope is no folid Body; whereby the Sound can alcend.

ALl objects of the Senfes whicíare very offenfive, do caufe the Spirits to retire; and upon their flight, the parts are (in fome degree) deAtitute, and fo there is induced in them a trepidation and horror. For Sounds, we fee, that the grating of a Saw, or any very harh noife, will fet the Teeth on edge, and make all the Body fhiver. For Taftes, we fee, that in the taking of a Potion, or Pills, the Head and the Neck fhake. For odious fmells, the like effeet followeth, which is lefs perceived, becaufe there is a remedy at hand, by fopping of the Nofe. But in Horfes; that can ufe no fuch help, we fee the fmell of a Carrion, efpecially of a dead Horfe, maketh them flie away, and take on almoft, as if they were mad. For Feeling, if you come out of the Sun fuddenly into a fhade, there followeth a chilnefs or fhivering in all the Body. And even in Sight, which hath (in effect) no odious object, coming into fudden darknefs, induceth an offer to Thiver.

THere is in the City of Jicinum in $I_{t a l}$, a Church that hath Windows onely from above; it is in Lengch an hundred Feet, in Bredth twenry Feet, and in Height near fifty, having a Door in the midtt. It reporteth,
the voice twelve or thirteentimes．If you ftand by the clofe end－wall over againf the Door，the Echo fadeth and dieth by little and little，as the Echo at Pont－Charenton doth，and the voice found th as if it came from above the Door；and if you ftand at the lower end，or on cither fide of the Door，the Fcho holdeth；but if you ftand in the Door，or in the midft jult over againft the Door，not．Note，that all Echocs found better againft old Walls then new，becaufe they are more dry and hollow．
795.

Experiment Solitary， touching the force of Imags－ nation，Imi－ tating that of the Sense．
796. Experiment Solitary， rouching Prefervation of Bodies．
$\therefore 2:$

THofe cffects which are wrought by the percuffion of the Senfe，and by things in Fact，areproduced likewife in fome degrec by the Imagina． tion ：Therefore if a man fee another eat four or acide things，which fet the Teeth on edge，this object taintech the Imagination ；fo that he that feeth the thing done by another hath his own Teeth alfo fet on edge．So if a man fee another turn fwiftlyand long，or if he look upon．Whecls that turn，him－ felf waxeth Turn－fick．So if a man be upon a high place，without Rails，or good hold，except he be ufed to it，he is ready to fall；for imagining a fall， it puttech his fpirits into the very action of a fall．So many upon the feeing of others Bleed，or Strangled，or Tortured，themfelves are ready to faint， as if they bled，or were in ftrife．

TAke a Stock－Gillifover，and tie it gently upon a fick，and put them both both into a Stoop－glafs full of Quick－filver，fo that the Flower be covered；then lay a little weight upon the top of the Glafs，that may keep the ftick down；and look uponthem after four or five days，and you fhall finde the Flower frefh，and the Stalk harder and lefs flexible then itwas． If you compare it with another Flower，gathered at the fame time，it will be the more manifeft．This fheweth，that Bodies do preferve excellently in Quick－filver ；and not preferve oncly，but by the coldnefs of the Quick－filver， indurate．For the frefhnefs of the Flower may bemeerly Confervation， （which is the more to beobferved，becaufe the Quick：filver preffech the Flomer） but the ftifnefs of the Stalk cannot be without Induration from the cold（as it feemeth）of the Quick filver．

$I_{1}^{T}$T is reported by fome of the Ancients，That in Cyprus there is a kinde of Iron，that being cut into little pieces，and put into the ground，if it be well watered，will encreafe into greater pieces．This is certain，and known of old， that：Lead will multiply and encreafe；as hath been feen in old Statues of Stone，which have been pur in Cellars，the Feet of them being bound with Leaden bänds；where（after a time）there appeared，that the Lead did fivell， infomuch，as it hanged upon the Stonelike Warts．

IColl that drowning of Metals，when the bafer Metal is fo incorporate with the more rich，as it can by no means be féparated again；which is a kinde of Verfion，though falfe；as if Silver fhould be infeparably incorpo－ rated with Gold，or Copper and Lead with Silver．The Anciens Electrum had in it a fifth of Siver to the Gold，and made a Compound Metal，as fit for moft ules as Gold，and more refplendent，and more qualified in fome other properties；but then that was eafily feparated．This to do privily， or to make the Compound pafs for the rich Metal fimple，is an adulteration or counterfeciting ；but if it be done avowedly and without difguiffig，it may be a great faving of the richer Metal．I remember to have heard of a man skilful in Metals，that a fifteenth part of Silver incorporate with

Gold is the onely Subftance which liath nothing in it Volatile, ond yet meltech without much difficulty. The Melting fnciweth, that it is not icjune or fearce in Spirit. So that the fixing of it is not want of Spirix to flic out, but the equal fpreding of the Tangible parts, and the clofe coacervation of them ; whereby they have the lelis appetite, and no means (ar all) to iffue forth. It were good therefore to try whether Glafs Re-molten, do lofe ang weight; for the parts in Glafs are evenly fpred, but they are hot fo clofe as in Gold; as we fee by the eafie admiffion of Light, Hear, and Cold, and by the fmalnefs of the weight. There be other Bodies fixed, which have little or noSpirit, fo as there is nothing to flie out; as we fee in the Stuff, whereof Coppels are made, which they put into Furnaces, upon which Fire worketh not. So that there are thiree caufes of Fixation : the Even-ppreding both of the Spirits and Tangible parts; the Clofeneß of the Tangizle parts; and the $\%$ ejunesieß or Extream Comminution of Spirits: Of which three, the two fifft may be joyned witha Nature Liquefable, the laft not:

IT is a profound Contemplation in Nature, to confider of the Emptinefs (as we may callit) or Infatisfaction of feveral Bodies, and of theirappetite to take in others. Air taketh in Lights, and Sounds, and Smells, and Vapors: And it is moft manifeft, that it doth it with a kinde of Thirft, as not latisfied with hisown former Confiftence; for elfe itwould never receive them in fo fuddenly and eafily. Water and all Liquors do haftily reccive dry and more Terreftrial Bodies proportionable; and Dry Bodies, on the other fide, drink in Waters and Liquors: So thiat (as it was well faid by one of the Ancients, of Earthy and Watry Subftancés) one is a Glue to another. Parchments, Skitis, Cloth, E.c. $_{\text {c }}$ drink in Liquors; though themfelves be entire Bodies, and not comminuted, as $S$ and and $A /$ bes, ilor apparently porous. ©Metals thetmfelves do receive in readily Strong-Wiaters, and Strong-pdederslikewifédo readily piercé into Metals and Stones; and that Strong-Wpater will touch upon Gold, that will not touch upon Silver, and $\dot{e}$ converfo. And Goll, which feemeth by the weight to be the clofeft and moft folid Body, doth greedily drink in 2xick-filver. And itfeemeth, that this Reception of other Bodies is not violent; for it is (many times) reciprocal, and, as it were, with conferit. Of the caufe of this, and to what Axiom it may be referred, confider attentively ; for as for the pretty affertion, That CMater is like a Common Stremper that defireth ail Forms, it is but 2 Wandring Notion. Onely Flame doth not content it felf to take in any other Body; but either to overcome, and turn another Body into it felf; as by vitory, or itfelf to dié and go out.

Century I X.

T is certain, That all Bodies whatfoeder, though they have no Senfe, yet they have Perception: For when one Boly is applied to another, there is a kinde of Election, to embrace that which is agtecable, and to exclude or expel that which is ingrate: And whether the Body be alterant or altered, evermore a Perception precedeth Operation; for elfe all Bolies would be alike one to another. And fometimes this Perception in fome kinde of Boties is far more fubtilthen the Senfe ; fo that the Senfe is but a dull thing in comparifon of it. We fee a $W$ eather-gla $\beta$ will finde the leaft difference of the Weather in Heat or Cold, when Men finde it not. And this Perceptiof alfo is fometimes at diftance, as well asupon the touch; as when the LoadPone draweth Iron, or Flame fireth Napbtha of Babylon a great diftance off. It is therefore a fubject of a very Noble Enquiry, to enquire of the moré fubtil Perceptions; for it is another Key to open Nature, as well as the Senfe, and fometimes better : And befides, it is a principal means of Natural Divination; for that which in thefe Perceptions appeareth early, in the great effects cometh long after. It is true alfo, that it ferveth to difcoverthat which is hid, as well as to foretel that which is to come, asitisin many fubtil Tyyals: As to try whether Seeds beold or new, the Senfe cannotinform; butif you boil them in Water, the new Seeds will fprout fooner. And fo of Warer, the tafte will notdifcover the beft Water; but the fpeedy confuming of it; and many other means which we have heretofore fet down, will difcover it: So in all Phyfognomy, the Lineaments of the Body will difcoyer thofe Natural Inclinations of the Minde, which Diffimulation will conceal, or Difcipline will fupprefs. We fhall therefore now handle onely thofe two $\operatorname{CP}$ erceptivns

Experiments in Confort, touching Perception is Budies InCert fible, rending to Nathral Divinationion ór Subiii Tijali:

Percoption in other things to be difpofed elf.nhere. Now it is true, that $\mathcal{D}$ ivination is attained by other means; as if you know the caufes, if you know the Conicomitants, youmay judge of the effect to follow' ; and the like may be faid of Difcovery. But we tye our felves here to that $\mathcal{D i v i v a t i o n ~ a n d ~}^{\operatorname{D}} \mathrm{i}$ fovery chieffy, which is caufed by an early or fubtil Perception.

The aptnefs or propenfion of Air or Water to corrupt or putrefie, (no doubt) is to be found before it break forth into manifeft effécts of Difeafes, Blafting, orthe like. We will therefore fet down fome. Prognofticks of Peftilential and unwholfome years.

The Wind blowing much from the South without Rain, and Worms in the Oak-Apple, have been fpoken of before. Alfo the plenty of Frogs, Grahoppers, Flies, and the like Creatures bred of Putrefaction, doth portend Peftilential ycars.

Great and early Heats in the Spring, (and namely in CMay) without Winds, portend the fame. And generally fo do years with little Wind or Thunder.

Great Droughts in Summer, lafting till towards the end of $\mathcal{A}$ uguit, and fome gentle chowers uponthem, and then fome dry weather again, do portend a Peftilent Summer the year following: For abour the end of Ausuff, all the fweetnefs of the Earth which goeth into Plants or Trees is exhaled; (and much more if the $A u g u f t$ be dry) fo that nothing then can breath forth of the Earth but a grofs vapor, which is apt to corrupt the Air; and that vapor by the firft fhowers, if they begentle, is releafed, and cometh forth abundantly. Therefore they that come abroad foon after thofe thowers are commonly taken with ficknef 3 . And in Africk no Body will ftir out of doors after the firft fhowers. But if the firft fhowers come vehemently, then they rather wafh and fill the Earth, then give it leave to breath forth prefently. But if dry weather come again, then it fixeth and continueth the corruption of the Air upon the firft fhowers begun, and maketh it of ill influence even to the next Summer, except a very Frofty Winter difcharge it, which feldom fucceedeth fuch Droughts. mer precedent, and hovering all Winter, do portend a great Peffilence in the Summer following : For Putrefaction doth not rife to its height at once.

It were good to lay 2 piece of ralv Fleth or Fifh in the open Air ; and if it putrefie quickly, it is a fign of a difpofition in the Air to Putrefaction. And becaule you cannor be informed, whther the Putrefaction be quick or late, except you compare this Experinient with the like Experiment in another year ; it were not amifs in the fame year, and at the fame time to lay one piece of Flefh or Fifh in the open Air, and another of the fame kinde and bignefs within doors: For I judge, that if a general difofition be in the Air to putrefie, the Flefh or Fifh will fooner putrefies abroad, where the Air hath more power then in the Houfe, where ir hath lefs, being many ways corrected. And this Experiment would be made about the end of CHarch; for that feafon is likeft to difcover what the Winter hath done, and what the Summer following will do upon the Air.: And becaufe the Air (no doubt) receiveth great tincture and infufion from the Earth, it were good to try that expofing of Flefh
or Fifh both upon a Stake of Wood, come height above the Earth, and upon the flat of the Earth.

Take $\mathcal{C H}_{4} y$ Dew, and fee whether it puttefie quickly, ot no; for that likewife may diclofe the quality of alie Air, and vapor of the Earth, more or lefs corrupted.

A dry March, and a dry May, portend a wholefome Stumner, if there be a fhowring April between; but otherwife it is a fign of a Pefilentialyear.

As the dilcovery of the difpofition of the Air is good for the Prognofticks. of wholefome and unwholefome years; fo it is of much more ufe tor the choice of places to dwell in; at the leaft for Lodges and Retiring-places for Health, (for Manfion.Houf:s refpect provifions as well as health) whercin the Experiments above-mentioned may lerve.

But for the choice of Places or Seats, it is good to make tryal, not onely of aptncfs of Air to corrupt, but alfo of the moifture and drynefs of the Air, and the temper of it in heat or cold; for that may concern health diverfly. We fee that there be fome Houfis wherein Sweet Meats will relent; and Baked Meats will mould, more then in others; and $W$ ainfcots will alfo fweat more, fo that they willalmoft un with Water: All which (no doubt) are caufed chief. ly by the moifteff of the Air in thofe Seats. But becauf: it is better to know ir before a Min buildeth his Houfe, then to finde it after, take the Experimests following.

Lay Wool, or a Sponge, or Bread in the place you would try, comparing it with fome other places, and fee whether it doth not moiften, and make the Wool or Sponge, \&c. more ponderous then the other: And if it do, you may judge of that place, as fituate in agrofs and moilt Air.

Becaufe it is certain that in fome places, either by the Nature of the Earth; or by the firuation of Woods and Hills, the Air is more unequal then in others; and inequality of Air is ever an enemy to health: It were good to take two Weather. Glafes, matches in allthings, and to fet them for the fame hours of one day in feveral places where no hade is nor enclofures; and to mark when you fet them, how far the Water cometh ; and to compare them when you come again, how the Waterftandeth then. And if you finde them unequal, youmay be fure, that the place where the $W$ ater is loweft is in the warmer Air, and the otherin the Colder. And the greater the inequality is of the afeent or defient of the Water, the greater is the inequality ot the temper of the Air.

The Predictions likewife of cold and long Winters; and hot and dry Summers, are good to be known, as well for the difcovery of the cauf:s, as for divers Provifions. That of Plenty of Harbs, and Heps, and Bryar-Berries, hath been fpoken of before. If $W$ ainfeor or Stone, that have ufed to fweat, be more dry in the beginning of Winter, or the drops of the Eavs of Houfes come more flowly do wn then they uf,, it portenderh a hard and frofty Win. ter. The caufe is, for that it fheweth an inclination of the Air to dry W eather, which in Wirter is ever joyned with Froft.

Generally a moift and a cool Summer, portendeth ahard Winter. The caufe is, for that the vapors of the Earth are not diflipated in the Summer by the Sun; and fo they rebound up on the Winter.

A hot and dry Summer and Autumn, and efpecially if the heat and drought exiend fir into Siptember, portendeth an open beginning or Winter, and colds to fucceed toward the latier part of the Winter, and the beginning of the Spring. For till then the former heat and drought bear the fway, and the vapors are not fufficiently multiplied.

An open and warm Winter portendeth a hot and dry Summer: For the Vapors difperfe into the Winter Chowers; whereas Cold and Fron kecp. ech them in, and tranlporteth them into the late Spring and Summer following.
816.

Birds that ute to change Countrevs at certain Seafonc, if they come earlier, do fhew the temperature of Weather according to that Countrey whence they came: As the Winter. Birds, (namely, Woodcocks, Feldefaies. © co.) if they come earlier, and out of the 2 oorthern Countreys, witl us hew cold Winters. And if it be in the fame Countrey, then they fhew a temperature of Seafon, like unto that Seafon in which they come ; as spallioas B.tis, Cuckoes, \&'c. that come towards Summer, if they come early, hew a hor Summer to follow.

The Prognofticks more immediate of Weather to follow fôn afier, are more certain then thofe of Seafons: The Refounding of the Sea upon the Sipre, and the Murmurof Winds in the Woods, without apparent Wind, Thew Wind to follow. For fuch Winds, breathing chicfly cut of the Earth, are not at the firft perceived, except they be pent by Water or Wood. And therefore a Murmur out of Caves likewile portendeth as much.
s18. The Upper Regions of the Air, perceive the Collection of the matter of Tempeft and Winds before the Air here below, And therefore the obfcuring of the fmaller Stars, is a fign of Tcmpefts following. And of this kinde you fhall finde a number of inflances in our Inquifrion de Ventis.
sig. pefts fooner, then the Valless or Plains below. And therefore they fay in VTMVVben certain Hills bave their Night-caps on, they me, anmif bief. The caufe is, for thas Tempents which are for the moft part bred, abovec in the Middle Region, (as they call it) are fooneft perceived to collect in the places nexit.

The Air and Fire have fubtil Perceptions of Wind rifing before Men finde it. We fee the trembling of a Candle will difcover a Wind, that otherwife we do not feel; and the Flexious burning of Flames doth hew the Air beginneth to be unquiet ; and fo do Coals of fire, by calting off the ahhes more then they ufe. The caufe is, for that ino Wind at the firte, till it hath ftruck and driven the Air, is apparent to the Senfe ; but flame is eafier to move then Air. And for the Afhes, it is nomarvelthough Wind unperceived Th ske them off; for we ufually try which way the Wind bloweth, by cafling up Grafs or Chaff, or fuch light things into the Air.

When Wind expireth from under the Sca, as it cauleth fome refound ings of the Water, (whereof werpake before) fo it caufeth fome light motions of Bubbies, and white Circles of Froth. The caufe is, for that the Wind cannot be perceived by the Jenfe, until there be an Eruption of a great quantity from under the Water, and fo itgettech into a Body, whercas in the firf putting up, it cometh in little portions.

We fpake of the Afles that Coals calt off, and of Grafs and Chaff carried by the Wind ; fo any light thing that movech when we find no VVind, fheweth a VVind at hand: As when Feathers or Down of Thiftes flie to and fro inthe Air.

For $P_{r o g n o f f i c k s ~ o f ~ V V e a t h e r ~ f r o m ~ L i v i n g ~ C r e a t u r e s, ~ i t ~ i s ~ t o ~ b e ~ n o t e d, ~ T h a t ~}^{\text {a }}$ Creantires that live in the open Air (fubdio) mult needs have a quicker impreffion from the Air, then Men that live moft within doors; and efpecially Birds who live in the Air freeft and cleareft, and are apteft by their voice to tell tales what they finde, and likewile by the motion of their flight to exprefs the famé.

VVater-fonts' (at Sea-Gulls, CMoor-Hens, G̛c.) when they flock and flie together from the'Seato wards the Shares; and contrariwife Land Birds, (as Cronts Spallows, $\begin{gathered} \\ \text { c. }\end{gathered}$ the $V V_{\text {aters with their }} V V_{\text {ings, }}$ do forcflew Rain and $V V_{\text {ind }}$. The caufe is; Pleafure that both kindes take in the moitnefs and denfity of the Air, and fo defire to be in motion, and upon the VVing, whither-foever, they would orherwife go: For it is no marvel that $V$ Vder fowl do joy moft in that Air which is likeft VVaters; and Land Birds alfo (many of them) delight in Buthing and moift Air. For the fame reafon:allo, many Birds do prone their Feathers, and Geele do gaggle, and Crows feen to call upon Rain. All which is but the comfort they feem to receive in the reienting of the Air.

The Heron when fhe foarech high, (fo as fometimes fhe is feen to pafs over a Cloud) fheweth VVinds: But Kites flying alof, fhew fair and dry weather. The caufe may be, for that they both mount moft into the Air of that temper wherein they delight. And the Heron, being a VVater-fowl, taketh pleafure in the Air that is condenfed; and befides, beingbut heavy of VVing, needeth the help of the grofferAir. But the Kite affecteth not fo much the groffacf, of the Air, as the cold and frefhnefs thereof; for be: ing a Bird of Prey; and therefore bor, fhe delighteth in the frefh Air,' and (many times) fleth againft the VVind; as Trouts: and Salmons (wim againft the fream. And yet it is true alfo, that all Birds finde an eafe in the depth of the Air, as S wimmers do in a decp VVater.' And therefore when they are alfo, they can uphoid themfelves with their VVings fpred, fcarce moving them.

Fijes when they play towards the top of the VVater, do commonly foretel Rain. The caufe is, for that a Fifh nating the dry, will not approach the Air till it groweth moift ; and when it is dry will fle it, and fivim lower.

Beaifs do take comfort (gencrally) in a moift Air, and it maketh them eat their Meat better ; and therefore Sheep will get up berimes in the morning to feedagainी Rain; and Catte, and Deer, and Coneys will feed hard before Rain ; and a Heifer will put up his Nofe, and fnuff in the Air againlt Rait.

The Trifoil againt Rain, fwelleth in the Scalk, and fo fandeth more uprignt ; for by wet, Stalks do ereat, and Leaves bow down. There is a fmall Red Flower in the Stubble.fields, which Countrey people call the WVincopipe ; which, if it open in the Morning, yout may be fure of a fair day to follow.

Even in CMes, 'Aches, and Furts, and Corns, do engrieve either towards Rair, or towards Froft; for the one maketh the Hiimors more to abourd; aid the other maketh them fharper. So we fee both extreams bring the Gout.

LVorms,: Vermine, wf. do forfhew (likewile) Rain';-for Eartb-xorms will come forth, and CNoles will caft up more, and Fleas bite more againt Rain.

Solid Bodies likewife fore thew Rain: As Stones and Wainfoot when they fiveat, and Boxes and Pegs of Wood when they draw and wind hard; though the former be but from an outward caule, for that the Stone or Wainfcot turneth and beateth back the Air againft it felf; but the latter is an inward fwelling of the Body of the VVood it felf.
831. Experiment Solitary, touching the Nature of Appetize in the Stomack.

A$\mathcal{P}_{\text {petite is moved chiefly by things that are cold and dry. The caule is, }}$ for that Cold is a kinde of indigence of Nature, and callech uponfupply, and io is Drynefs: And therefore all four things (as Vinegar, Fuyce of Lemmons, oyl of Vitriol, drc.) provoke Appetite. And the Difeale wnich they call A ppetitus Caninus, confilteth in the Matter of an Acide and Glaffie Phlegn in the Mouth of the Stomack. Apperite is alfo moved by four things, for that four things induce a contraction in the Nerves, placed in the Mouch of the Stomack, which is a great caufe of Appetite. As for the caufe why Onions, and Salt, and Pepper in Baked Meats moveAppetite, it is by Vellication of thofe Nerve! ; for Motion whetteth. As for Wormmood, olives, Capers, and others of thatkinde, which participate of Bitternef, they move Appetite by Abferfion. So as there be four principal caufes of Appetite; the Reffigeration of the Stomack joyned with fome Drynefs, Contraction, Vellication, and Abtterfion; befides Hunger, which is an emptinefs; and yet overfafting doth (many times) caufe the Appetite to ceafe ; for that want of Meat maketh theStomack draw Humore, and fuch Humors as are light and Cholerick, which quench Appctite moft.
832. Experiment Solitary, touching Sweetne $\beta$ of Odor from the Rainb̄an.
833. Experiment Solitiry? toucking Sweet Smills.

TO fweet Smells, heat is requifite to concoct the Matter, and fome Moyfture to fpred the Breath of them: For heat, wefeethat Woods and Spices are more odorate in the Hot Countreys, then in the Cold. For Moifture, we fee that things too much dryed lofe their Sweetmefs; and Flowers grow. ing fmellbetter in a Morning or Evening, then at Noon. Some fweet fmells are deftroyed by approach to the Fire ; as Violets, Wall-foners, Gillifonzers, Pinks, and generally all Flowers that have cool and delicate Spirits. Some continue both on the fire, and from the fire, as Rofe-mater, of c. Some do farce come forth, or at leaft not fo pleafantly, as by means of the fire; as Funiper, sweet Gums, foc and all fmells that are enclofed in a fan Body; but (generally) thofe fmells are the mof grateful wherethe degree of heat is finall, or where the ftrength of the fmell is allayed; for thefe things do tather wo the Senfe,
 nefs that of Spices; and Gums, and the ftrongeft fort of fmells, are beft in a weft afar off.

IT is ecrain, that no fricll iffueth but with emiffion of fome corporeal fubtance; not as is is in Light, and Colours, and Sounds: For we lee plainly that fnell doth fpred nothing that diftance that the other do... It is true, that fome Woods of Orenges, and Heaths of Rofemary, will fmell a great way into the Sea, perhaps twenty Miles; but what is that, fince a peal of Ordinance will do as much, which moverh in a mall compars, whereas thore Woods and Heaths are of valt fpaces? Befides, we fee that fmells do adhere to hard Bodics; as in perfuming of Gloves, © $c$, which fheweth them corporeal; and do laft a great while, which Sounds and Light do not.

THe Excrementis of moft Creatures fmell ill, chicfly to the fame Creature that voideth them: For we fee, befides that of Man', that Pigeons and Hories thrive beft, if their Houles and Stables be kept fweer; and foof CageBirds; and the Cat burieth that which fhe voideth. And it holdeth chiefly in thofe Beafts whichfeed upon Fle fh. Dogs (almoft) onely of Beatts delight in fetide odors; which fheweth there is fomewhat in their fenfe of fmell differing from the fmells of other Beafts. But the caufe why Excrements fmell ill is manifeft, for that the Body it felf rejectech them, much more the Spirits: $^{\text {: }}$ And wefee, that thofe Excremens that are of the firft digeftion fmell the worft; as the Excrements from the Belly; thole that are from the fecond digeftion, lefs ill, as Vrine ; and thofe that are from the third, yet lefs; for Sweat is not f bad as the other two, efpecially of fome perfons that are full of heat. Like ${ }_{7}$ wife moft Putrefactions are of an odious fimell, for they fmell either fertile or mouldy. The caufe may be, for that Putrefaction doth bring forth fuch a, confiftence as is moft contrary to the confiftence of the Body whileft it is found, for it is a meer diffolution of that form. Befides, there is another reafon, which is profound: And it is, That the objects that pleale any of the fenfes, have (all) fome equality, and (as it were) order in their compofition, but where thofe are wanting the object is ever ingrate. So mixture of many difagreeing colours is never unpleafant to the Eye : Mixture of dilcordant Sounds is unpleafant to the Ear ; mixture or hotch-potch of many taftes is unpleafant to the tafte; harfhnefs and ruggednefs of Bodies is unpleafant to the touch. Now it is certain, that all Putrefaction; being adiflolution of the firft form, is a meer confufion, and unformed mixture of the part. Neverthelefs, it is itrange, and feemeth to crofsthe former obfervation, that fome Putrefactions and Excrements do yield excellent Odors ; as Civit and Mutk,and, as fome think, $A_{\text {mber-greece, }}$, for divers take it (though unprobably) to come from the Sperm of Fifh ; and the Mols we fpake of from Apple-trees is littie better then an Excretion. The reafon may be, for that there paffeth in the Excrements, and remaineth in the Putrefactions, lome good fpirits; efpecially where they proceed from Creatures that are very hor. But it may beallo joyned with a further caufe, which is morefubtul; and it is, that the Senfes love not to be over-pleafed, but to have a commixure of lomewhat that is in it felf ingrate. Certainly, we fee how Difcords in Mufick, falling upon Concords, make the fweeteft ftrains: And we fee again what ftrange taftes delight the tafte ; as Red-berrings, Caviare, Parmefan, $\dot{\text { Gec. }}$. And it may be the fame holdech in fmells. For thofe kinde of fmells that we have mentioned are all ftrong, and do pull and vellicate the Senfe. And we findeallo, that places where men Urine conmonly have fome fmell of Violets. And Uine, if one hath eaien Nutmeg, hath fotoo.

The flothful, gericral, and indefinite Contemplations and Notions of the Elements, and encir Conjugations of the Influences of Heaven, of Hot, Cold, crioifure, Droungh, 2ualities Ative, Pafive and the like, have fwallowed up the truc Paffages, and Froceefies, and Affects, and Conffifencies of Matter, and Natural Bodies. Therefore they are to be fet afide, being bue notional, and ill limited; and definite axioms are to be drawn out of meafured inftances, and fo affent to be made to the more general axioms by Scale. And of thefe kindes of Proceffes of $N_{\text {atture, and }}$ Characters of Matter, we will now fet down fome inflances.
$8,36$. Experiment Solitary, touching the Caufes of Pu trefaction.
837. Experiment Solitary, rouching Bodies unper. fectly mixt.

ALl Putrefactions come chiefly from the inward !pirits of the Body, and partly alfo from the $\mathcal{A}$ 'mbient Boay, be it Air, Liquor, or whatfoever elfe. And this laft, by two means; cither by ingrefs of the fubftance of the Ambient Body into the Body putrefied, or by excitation and folicitation of the Body putrefied, and the parts thereof, by the Body Ambient. As for the received opinion, that Putrefaction is caufed either by Cold, or Peregrine and Preternatural Heat, it is but nugation: For Cold in things inanimate, is the greatef enemy that is to Putrefation, though it extinguiheth Vivification, which ever confifteth in Spirits attenuate, which the Cold doth congeal and coagulate. And as for the Feregrine leed, it is thus far true. That it the proportion of the eAdventive heat, be greatly predominant to the Natural beat, and Spiriss of the Boty, it tendeth to diffolution, or notable alteration. But this iswrought by E miffion; or Suppreffion, or Suffocation of the Native Spirits, and allo by the Dilordination and Difcompofure of the Tangible parts, and other paflages of Nature, and not by a confiet of Heats.

IN verfions or main Alterations of Bodies, there is a Medium between the Body, as it is at firft, and the Body refulting; which Medium is Corpus imperfectè Miffum, and is tranfitory, and not darable; ascMifts Smoaks Vapors, Chylus in the Stomack, Living Creatures in the firft Vivifaction; andthe middle action which produccth fuch Imperfect Bodies, is fitly called (by fome of the (Ancients) Inquination or Inconcotion, which is a kinde of Putrefation; for the parts are in confufion till they fettle one way or other.
838. Experiment Solitary, rouching Concoction and Crudity.

THe word Concoiftion or Digefion, is chiefly taken into ufe from Living Creatures, and their Organs, and from thence extended to Liquors and Fruits,\&c. Therefore they fpeak of Meat concocted, Urine and Excrements concocted; and the Four Digeftions (in the Stomack, in the Liver, in the Arteries and Nerves, and in the feveral parts of the Body) are likewife colled Concoitions, and they are all made to be the works of Heit. All which notions are but ignorant catches of a few things, which are moft obvious to Mens obfervations. The conftanteft notion of Concoftion is, that it thould fignifie the degrees of alteration of one Body into another, from Crudity to Perfeit Concortion, which is the ultinity of that action or procefs. And while, the Body to be converted and altered is too ftrong for the efficient that fhould convert or alter it, (whereby it refiftech, and holdeth faft in fome degree the firf Form or Confiftence) it is (all that while) Crude and Inconcoat, and the Procefs is to be called crudity and Inconcoftion. It is true, that Concoction is in great part the work of Heat; but not the work of Heat alone: For all things that further the Coniverfion or Alteration (as Reff, Mixture of a Body already concoeted, sec.) arc alfo means to Concoftion. And
there are of Concoction two Periods; the one Affimilation; or abfolute Converfion and Subaction; the other Maturation: Whereof, the former is moft confpicuous in the Bodies of Living Greatures, in which there is an Abfolute Coaverfion and $\mathcal{A}$ Bimilation of the $\mathbb{2}$ ourishment into the Body, and likewife in the Bodies of Plants; and again, in Metals; where there is a full Tranfmutation. The other (which is Maturation) is feen in Liquors and Fruits; wherein there is not defired, nor pretended, an utter Converfion, but onely an Alteration to that Form which is mote fought for Mans ufe; as in Clarifying of Drinks, Ripening of Fruits, \&c. But note, that there be two kindes of $A b$ folute Converfons. The one is, when a Body is converted into another Body which was before; as when Nourifhment is turned into Flefh : That is it which we call $\mathcal{A}$ Similation. The otheris, when the Converfion is into a Body meerly new, and which was not before; as if Silver thould be turned to Gold, or Iron to Copper. And this Converfion is better called, by diftinction fake, Tranfmutation.

THere are alfo divers other great alterations of Matter and Bodies, befides thofe that tend to Conioction and CMaturation; for whatfoever doth fo alter a Body, asitreturneth not ag in to that it was, may be called cilis. ratio Mijor: As when Meat is Borled, or Rofted, or Fried, \&c. or when Bread and Meatare Baked ; or when Cheefe is made of Curds, or Butter of Cream, or Coals of Wood; or Bricks of Earth; and a number of others. But to apply Notions PbiloSophical to Plebeian Terms; or to fay, where the Aotions cannot fitly be reconciled, that there wanteth a Term or Nomenclature for it, (as the Ancients ufed) they be but Thifts of Ignorance: For Knowledge will be ever a Wandring and Indigelted thing, if it be but a commixure of a few Notions that are at hand, and oecur, and not excited from fufficient number of initances, and thofe well collated.

The Conffencies of Bodies are very divers ; Denfe, Rare, Tangible, Pnellmatical ; Volatile, Fixed; Determinate, not Determinate; Hard, Soft; Cleaving, not Cleaving ; Conselable; not Congelable; Liquefiable, not Liquefiable; Frägile, Tough ; Flexible, Inflexible; Tractile, or to be drawn forth in length, Intratile; Porous, Solide; Equal and Smooth, Vnequal; : Venous and Fibrous, and with Grains', Entive, and divers others. All which to refer to Heat and Cold, and Moiflure and Drought, is a Compendious and Inutile Speculation. But of thefe fee prin. cipally our Abecedarium Natura, and otherwife $\beta$ par $\mathrm{f}_{\mathrm{um}}$ in this our Sylua Syl. varkm. Neverthelefs, in lome good part, we thall handle divers of them now prefensly.

LIquefiable and not Liquefiable proceed from thefecaufes. Liquefation is ever cauled by the Decention of the Spirits, which play within the Body, and open it. Therefore fuch Bodies as are more Turgid of Spirit, of that have their Spirits more ftreightly imprifoned, or again, that hold them bet. ter pleafed and content, are Liquefable : For thefe three Difpofitions of Bodies co arreft the Emiffion of the Spirits. An example of the firft wo Properties is in Metals, and of the laft in Greafe, Pitch, Sulphut; Butter, Wax; \&e. The Dippofition not to Liquefie, proccedeth from the eafie Emiffion of the Spitits, whereby the groffer parts contract and therefore Bodies jejune of Spirits, or which part with their Spirits more willingly, are not Ligkefable; aș Wood, Clay, Freeftone, \&c. But yet even many of thofe Bodies that will not melt, or will hardly melt, will notwithftanding foften; as Iron in the
$839^{\circ}$ Experiment Solitary, touching Alterations which may be called Majors.

840 Experiment Solitarỳ, touching Bodies Liqué fiable, and nos Liquefiable.

Forge, and a Stick bathed in hot Afhes, which thereby becometh more Flexible. Moreover, there are fome Bodies which do Liquefie or diffolve by Fire ; as Metals, Wax, ofr. and othér Bodies which difolve in Water, as̀ Salt, Sugar, of The caufe of the former proceedeth from the Dilatation of the Spirits by Heat: The caufe of thelatter proceedeth from the opening of the Tangitle Parts, which defire to receive the Liquor. Again, there are fome Bodies that diffolve with both; as G $k m$, $\in c$. And thofe be fuch Bodies as on the one fide have good ftore of Spirit, and on the cther fide have the Tangible parts indigent of Moifture; for the former helpethto the dilating of the Spirits by the Fire, and the latter ftimulateth the parts to receive the Liquor.
$84 I$ Experiment Solitary, touching the Bodies Fragile and Toingh.
842. Experiment Solitary, touching the Troo kindes of Pnesmaticals in Bodies.
843. Experiment Solitary, tovehing. Concretion arra Diffolution of Bodiesitituzes

0F Bodies fome are Fragile, and fome are Tough and not Fragile; and in the breaking; fome Fragile Bodies break but where the force is, lome Thatter and flie in many pieces. Of Fragility, the caufe is an impotency to be extended ; andthereforeStone is more Fragile then Metal; and fo Fiate Earth is more Fragile then Crude Earth, and Dry Wood then Green. And the caufe of this unaptnefs to Extenfion, is the fmall quantity of Spirits (for it is the Spirit that furtherech the Extenfion or Dilatation of Bodies;) and it is ever concomitant with Porofity, and with Drinefs in the Tangible parts. Contrariwife, Tough Bodies have more Spirits; and fewer Pores, and Moifter Tangible parts : Therefore we fee, that Parchment or Leather will fretch, Paper will not; Woollen-Cloth will tenter, Linnen fcarcely.

ALL folid Bodies confift of Parts of two feveral Natures ; $P_{\text {neumatical, }}$ and Tangible: And it is well to be noted, that the $P_{\text {neumatical Subpanice }}$ is in fome Bodies, the Native Spirit of the Body; and in fome other, plain Air that is gotten in; as in Bodies deficcate, by Heat, or Age: For in them; when the Native Spirit goeth forth, and the Moifture with it, the Air with time gettech into the Pores. And thofe Bodies are ever the more Fragile ; for the Native Spirit is more Yielding and Extenfive (efpecially to follow the Parts) than Air. The Native Spirits alfo admit gireat diverfity : as Hot, Cold, Active, Dull, \&c. Whence proceed moft of the Vertues, and Qualities (as we call them) of Bodies: But the Air intermixts is without Vertues and maketh things infipid, and without any extimulation.

THe Coincretion of Bodies is (commonly) folved by the contrary; as Ice. which is congealed by Cold, is diffolved by Heat; Salt and Sugar, whichiare excoted by Heat, are diffolved by Cold and Moifture. The caufeils, for that thefe operations are rather returns to their former Nature; than alterations; fo that the contrary cureth. As for Oyl, it doth neither eafily congeal with Cold, nor thicken with Heat. The caufe of both Effects, though they be produced by contrary efficients, feemeth to be the fame ; and that is, becaufe the Spirit of the Oyl, by either means, exhalech little : For the Cold keepeth is in, and the Heat (except it be vehement) doth notcall it forth. As for Cold, though it take hold of the Tangible Parts,yet as to the Spirits it doth rather make them fwell, than congeal them : As when Ice is congealed in 2 Cup. the lce will (well inftead of contracting, and fometimes rift.

0F Bodies, fome (we fee) are hard, and fome foft: The hardnéfs is caufed (chiefly) by the Jejunenefs of the Spirits; and their imparity with the Tangible parts: Both which, if they be in a greater degrec, maketh them not onely hard, but fragile, and lefs enduring of preffure 3 as Steet, Stone, Glâß, Diy Wood, \&c. Softnefs cometh (contrariwife) by the greater quantity of Spirits, (which ever helpeih to induce yielding and ceffion;) and by the more equal fpreding of the Tangible parts, "which thercby are more fliding, and following; as in Goild, Lead, Wax, toc. But note, that foft Bodies (as we ufe the word) are of two kindes; the one, that eafily giveth place to another Body, but altereth not Bulk by rifing in other places; and therefore we fee that Wax, if you putany thing intoir, doth not rife in Bulk, but onely giverh place: For you may not think, that in Printing of Wax, the Wax rifech upat all ; but onely the depreffed part giveth place, and the other remaineth as it was. The other thar altereth Bulk in the Ceffion, as Water, or other Liquors, if you put a Stone, or any thing into them, they give place (indeed) eafily, but then they tife all over; which is a falfe Ceffion; for it is in place, ahd not in Body.

ALI Bodies Ductile, and Jenjile, (as Metals) that will be drawn into Wires; Wool, and Tow that will be drawn into Yarn or Thred; have in them the Appetite of Not difcontinuing, frong; which maketh them follow the force that pullech them out ; and yet fo, as not difcontinue or forfake their own Body. Vifcous Bodies (likewife) as Pitch, VVax̂, Birdlime, chéefetoafted, will draw forth and roap. But the differefice between Bodies fibrous, and Bodies vifious, is plain; For all Wooll, and Tow, and Cotton, and Silk (efpecially raw Silk) have, befioes their defire of continuance; in regard of the tenuity of their Tared, a greedinefs of Moifture, and by Moiflute to joyn and incorporate with other Thred, efpecially, if there bea litele Wreatiing, as appearech by the twitting of Thred, and the practice of Twirling about of Spindles. And wefee alfo, that Gold and Silver Thred cannot be made without Twifting.

THe differences of impreffible, and not impreffible; figurable, and not figuable ; mouldable, and not mouldable; feiffible, and not fiffible; and many other Paffions of Matrer; are Plebeian Notions, applied unto the Infruments and Ufes which Men ordinarily praciife;' but they are all but the effects of fome of thefe caufes following, which we will enumerate without applying them, becaufe that would betoo long. The firt is the Ceffion; or not Ceflion of Bodies, into a fmaller fpace; or toom, keeping the out ward Bulk, and not flying up. The fecond is; the ftronger or weaker Apperite, in Bodies, to continuity; and to flie difcontinuity. The third is, the difpofition of Bodies, to cohtract, or not contract; and again, toextend, or not extend. The fourth is, the fmall quantity, or great quantity of the Pneumatical in Bodies. Tine fifth is, the nature of the Pneumatical, whether it be Native Spirit of the Body, or common Air. The fixth is, theNature of the Native Spirits in the Body; whether they be Active, and Eagers or Dull, aind Gentle. The feventh is the emiffion or detenfion of the Spirits in Bodies.' The eighth is, the dilatation or contration of the Spirits in Bodies, while they are detained. The nineth is, the collocation of the Spirits in Bodies, vvhether the collocation be equal or unequal; and again, vvhether the Spirits be coacervate or diffufed. The tenth is, the denfity or rarity of the Tangible parts:
the eleventh is the Equality or Inequality of the Tangible parts; the twelfth is the Difgeftion or Crudity of the Tangible parts; the thirtench is the Nature of the Matter, whecherSulphureous, or Mercurial, or Watey, or Oily, Dry, and Terreftrial, or Moift and Liquid; which Natures of Sulphureous and Mercurial, feem to be Natures Radical and Principal; the fourteenth is the placing of the Tangible parts, in Length or Tranlygrfe (as it is in the Warp, and the Woof of Textiles; ) more inward ormore outward, sce. The fifteenth is the Porofity or Imporofity betwixt the Tangible parts, and the ge eatnefs or fmallnefs of the Pores; the fixteenth is the Col. location and pofture of the Pores. There may be more caufes, but thefe do occur for the prefent.

84\%. Experimeit Solitary. touching Induration by sympathy.

TAke Lead and meltit, andinthe midft of it, when it beginneth to congeal, make a little dint or hole, and put Quick-filver wrapped in : a piece of Linnen into that hole, and the Quick-filver will fix, and run no more, and endure the Hammer. This is a noble inflance of Induration, by confent of one Body with another, and Motion of Excitation toimitate; for to afcribe it onely to the vapor of the Lead, is lefs probable. Quere; whether the fixing may be in fuch a degree, as it will be figured like other Metals: For if fo, you may make Works of it for fome purpofes, fo they come iot near the Fire.

SUgar hath put down the ufe of Honey, infomuch, as we have loft thofe oblervations and preparations of Honey, which the Anciens had, when it was more in price. Firft, it feemeth, that there was in old time Tree-honey, as well as Bee-honey, which was the Year or Blood illuing from the Tree; infomuch, as one of the Ancients relaterh, that in 7 ribefond, there was Honey iffuing from the Box-trees, which made Men mad. Again, in ancient time, there was a kinde of Honey, which either of the own Nature, or byArt, would grow as hard as Sugar, and was not fo lufhious as ours; they had alfo a Wine of Honcy, which they made thus. They crufhed the Honey into a great quantity of Water, and then ftrained the liquor, after they boiled it in a Copper to the half; then they poured it into Earthen Veffels for a fmall time, and after turned it int Veffels of Wood, and kept it for many years. They have alfo, at this day in Rußia, and thofe Northern Countreys, CTead Simple, which (well made and feafoned) is a good wholeform Drink, and very clear. They ufe alfo in Wales, a Compound Drink of Meat, with Herbs and Spices. But mean while it were good, in recompence of that we have loft in Honey, there were brought inufe a Sugar-Mesd (for fo we may call it) though without any mixture at all of Honey; and to brew it, and keep it itale, as they ufe Mead; for certainly, though it would not be fo abfterfive, and opening, and folutive a Drink as Mead ; yet it will bemore grateful to the Stomack, and more lenitive, and fic to be ufed in Thatp Difeales: For we fee, that the ufe of Sugar in Beer and Ale, hath good effects infuch cafes.

T is seported by the Ancienss, that there is a kinde of $S$ teel, in fome places, I which would polith almof as white and bright as Silver. And that there was in India a kinde of Brafs, which (being polithed) could fcarce be difcerned from Gold. This was in the Natural Ure, but I am doubrful, whether Men have fufficiently refined Metals, which we count $\mathrm{Bafe}^{2}$ : As, whether Iron, Brafs, and Tin, be refined to the height? But when they
come to fuch a finenefs, as ferveth the ordinary ule; they try no furcher.

THere have been found certain Cements under Eartb, thiat are vers foft, and yet taken forth in: o the Sun; harden as hard as Marble: There are alfo ordinary Quarries in Sommerfet-sbire, which in the Quarry cut foft to any bignefs, and in the Building prove firm, and hard.

LIving Creatures (generally) do change the r Hair with Age, turning to be Gray and White ; as is feen in CTen, though fome earlier, fome later; in Horfes, that are Dappled and turn White ; in Oid Squirrels, that turn Grifly, and many others. So do fome Birds; as Cygnets from Gray turn White; Hanks from Brown turn more White: And fome Birds there be, that upon their Moulting, do turn Colour ; as Robin-Redbrefts, after their Moulting grow to be Red again by degrces ; fo do Goll-Finches upon the Head. The caufe is, for that Moifture dorh (chiefly) colour Hair, and Feathers ; and Drynefs turneth them Gray and White ; now Hairin Age waxeth Dryer, fo do Feathers. As for Feathers, after Moulting, they are young Feathers, and fo all one as the Feathers of young Birds. So the Beard is younger than the Hair of the Head, and doth (for the moft part) wax hoary later. Out of this ground, 'a Man may devife the Means of altering the colour of Birds, and the Retardation of Hoary. Hairs. But of this fee the Fift $b$ Experiment.

THe difference between Male and Female, in fome Creatures, is not to be difcerned, otherwife than in the parts of Generation; as in Horfes and CMares, Dogs and Bitches, Doves he and he, and others. But fome differ in magnitude, and that diverlly : For in moft the Male is the greater; as in Man, Pheafants, Peacocks, Turkies, and the like; and in fome few, as in Hanks, the Female. Some differ in the Hair and Feathers, both in the quantity, crifpation, and colours of them; as He-Lions are Hirfuite, and have great Mains; the She's are fmoorh like Cats. Bulls are more crifp upon the Forehead than Cows; the Peacock, and Pbefant-cock, and Goldfinch-cock, have glorious and fine coloutrs ; the Hens have not. Generally, the he's in Birds have the faireft Feathers.Some differ in divers features; as Buckshave Horns, Does none; Rams have more wreathed Horns than Evvs; Cocks have great Combs and Spurs, Hens little or none; Boars have great Fangs, Sovvs much lefs; the Turkey--ook hath great and fwelling Gills, the Hen hathlefs; Menhave generally deeper and ftronger voices than DVomen. Some differ in faculty, as the Cock amongft Singing Birds, are the beff fingers. The chief caufe of all thefe (no doubt) is, for that the Males have more Itrength of heat than the Females; which appeareth manifeftly in this, that all young Creatures Males are like Females, and foare Eunuchs, and Gelt Creatures of all kindes, liker Females. Now heat caufeth greatnefs of growth, generally, where there is moifture enough to work upon: But if there be found in any Creature (which is feen rarely) an over.great heat in proportion to the moifture, in them the Female is the greater̃; as in Havpls and Sparrovvs. And if the heat be ballanced with the moifture, then there is no difference to be feen between cuale and Fermale; as in the inftances of Horfes and $\mathcal{D}_{\text {ogs }}$. We fee alfo, that the Horns of Oxen and Covvs, for the moft part, are larger than the Buils, which is cauf:d by abundance of moifture, which in the Horns of the Bull faileth, Again, Heat cauferh Pilofity, and Crifpation; and fo likewife Beards in CMen. It alfo expellech
finer moilture, which want of heat cannot expel; and that is the caufe of the beauty and variety of Feathers: Again, Heat doth pur forth many Excrefcences; and much folid matter, which want of Heat cannot do. And this is the caufe of Horns, and of the greatnefs of them ; and of the greatnefs of the Combs; and Spurs of Cocks, Gills of Turkey-Cocks, and Fangs of Boars. Heat alfo dilateth the Pipes and Organs which cauferh the deepnefo of the Voice. Again, Heat refineth the Spırits, and that caufth the Cock finging Bird to excel the Hen.
853. Experiment Solitary, touching the Comparative Magnitude of Living Creatures.
854. Experiment Solitary, touching Exofjation of Fruits,

THere be Fifhes greater than any Beafts; as the Whale is far grearer than the Elephant. And Beaftsare (generally) greater than Birds. For Fifhes, the caufe may be, that becaufe they live not in the Air, they have not their moifture drawn, and foaked by the Air; and Sun-Beams. Alfo they reft always, in a manner, and are fupported by the Water; whereas Motion and Labor do confume. As for the grearnefs of Beafts, morethan of Birds, it is caufed, for that Beafts ftay longer time in the Wombthan Birds, and there nourifl, and grow; whereas in Birds, after the Egglaid, there is no further growith, or nourifhment from the Female ; for the fiting dorh vivifie, and not nourifh.

WE have partly touched before the Means of producing Fruits; with. out Coars, or Stones. And this we add further, that the caufe munt be abundance of moifture; for that the Coar, and Stone, are made of a dry Sap: And we fee, that it is poffible to makea Tree putforth onely in Bloffom without Fruit ; as in Cherrics with double Flowers, much more in Fruit without Stones, or Coars. It is reported, that a Cions of an Apple, grafted upon a Colewort-Atalk, fendeth forth a greatApple without a Coar. It is not unlikely, that if the inward Pith of a Tree were taken our, to that the Juyse came onely by the B ark, it would work the effect. For it haih been oblerved, that in Pollards, if the Water get in on the top, and they become hollow, they put forth the more. We add alfo, that it is delivered for certain by fome, that if the Cions be grafted, the frall ends downwards, it will make Fruit have little or no Coars, and Stones. Experiment Solitary, touching the Maelioration of Tobacco.

| 855. |
| :--- |
| $\begin{array}{l}\text { Obacco is a thing of great price, if it be in requeft. For an Acre of it } \\ \text { will be worth (as is affirmed) Two hundred pounds by the year to- }\end{array}$ | wards charge. The charge of making the Ground, and otherwife, is grear, but nothing to the profir. But the English Tolacco hath fmall credir, as being too dull and earthy: Nay, the Virginian Tobacto, though that be in a botter climate, can get no credit for the fame caufe. So that a tryal to make Tobacco more Aromatical, and better concocted here in England, were a thing of great profit. Some have gone about to do it, by drenching the English Tobacco, in a Decoction or Infofion of Indian Tobacto. But thofe are but fophiltications and toyes; for nothing that is once perfect, and hath run his race, can receive much amendment; you mult ever refort to the beginnings of things for Melioration. The way of Muturation of Tobacco mult (as in other Plants) be from the Hear, either of the Earth, or of the Sun. We fee fome leading of this in Musk-Melons; which are fown upon a hot Bed, dunged below; upon a Bank turned upon the South Sun, to give Heat by Reflection; laid upon Tiles, which increaferh the Heat; and covered with Straw, to keep them from Cold; they remove them allo, which addeth fome Life: And by thefe helps they become as good in

England, as in Iraly, or Provence. Thele and the like means may be tried in robacco. Enquire alfo of the fteeping of Roots, in loine fuch Liquor, as hasy give them Vigor to put forth ftrong.

HEat of the Sun, for the Muturition of Fruts; yca; and the heat of Vivilication of Living Creatures, are both reprefented and fupplied by the heat of Fare; and likew:fe, the hears of the Sun, and life, are reprefented one by the other. Trees, fer upon the Backs of Chimneys, do tipen Fruit fooner. Vines, that have been drawn in at the Window of a Kitchin, have fent forth Grapes, ripe a moneth (at leaft) before others. Stoves, at the Back of Walls, bring forth Orenges here with us. Eggs, as is reported by fome; have been hatched in the warmith of an Oven. It is reported by the Ancients, that the Efrichlayech her Eggs under Sand, where the heãt of the Sun difclofeth them.

BArley in the Boyling fiwelleth not miuch; Wheat fwellerh more, Rize ex. treamly; infomuch, as a quarter of a Pint (unboiled) will arife to a Pint bouled. The caufe (no doubr) is, for that the more clofe and compact the Body is, the more ic will dilate. Now Barlcy is the molt hollow, Wheat nore folid than that, and Rize moft fulid of all. It may be alfos thity forme Bodies have akinde of Lentor, and more depertible nature than others ; as we fee it evident in colouration; for a mall quantity of Saffron, will tinct more, than a very great quantity of Brefil, or Wine.

FRuit growerh (weet by Rowling or $\operatorname{Pr}$ (Ming then geitly with the Hund; as Roæling Pears, Damafins, U'c. By Rottenneß; as CMedlars, Services', Sloes, Heps, \& c. By Jime ; as Apples, Wardens, Pomegranates, Gic. By certain Special Maturations; as by laying them in Hay, Stratr, \&oc. And by Fire; as in Roafting, Steming, Baking, öc. The caute of the fweetnefs by Rowling, and Preffing is, Emollition, which they properly enduce; as in beating of Stock-fish, Flesh, Gc. By Rottenne $\beta$ is, for that the Spirits of the Fr uit, by Putrefaction, gather hear, and thereby difgeft the harder part: For in all Purrefactions there is a degree of heat. By Time and Keeping is, becaufe the Spirits of the Body, do ever feed upon the tangible parts, and attenuate them: By feveral Maturations is, by fome degree of heat. And by Fire is, becaufe it is the proper work of Heat to refine, and to incorporate; and all fournefs confiftech in fomegrofsnefs of the Body: And all incorporation doth make the mixture of the Body, more equal, in all the parts, which ever enduceth a milder tafte.

0FFlestes, fome are edible, fome except it be in Famine, not: As thofe that are not edible, the caufe is,' for that they have (commonly) too much bitternefs of tafte; and therefore thofe Creatures, which are fierce and cholerick, are not edible; as Lions, vVolves; Squirrels, Dogs, Foxes; Horfes, ouc. As for Kine; Shrep, Goats, Deer, Smine, Conneys, Hares; Oft. We feethey are milde, and fearful. Yet it is true, that Horfes which are Beafts of courage, have been and are eaten by fome Nations; as the Scythians were called Hippophagi ; and the Chinefes eat Hoifflesh at this day ; and fome Gluttons have uled to have Colts.flofh baked. In Birds, fuch as are Carnivora; and Birds of Prey, are commonly no good Meat ; but the reaCon is, rather the Cholerick Nature of thofe Birds; than their Feeding upon Flefh; for Puits, Gulls, Shovelèrs, Ducks, do feed upon Flefh; and yet are
good Meat: Andwe fee, that thofe Birds which are of Prey, or fecd upon Fleft, are good Meat, when they are very Young; as tiali:ks, Rooks, out of the Neft, Ow/s. Mans flefh is not eaten. The Reafons arcthree.

Firft, Becaufe Men iń Humanity do abhor ir.
Secondly, Becaule no Living Crcature, that diech n't it felf, is good to eat ; and thereforcthe Cannibals (themflves) eat no Mans flefh, of thofe that die of themfelves, but of fuch as are flain.

- The third is, Becaufe there muft be generally) fome difparity between the Nourifhment, and the Body nourifined; and they muft not be overnear, or like: Yet we fee, that ingreat weakneffes and Confumptions, Men have been tuftained with Womans Milk. And Picinusfondly (as I conceive) ad. vifeth, for the Prolongation of Life, that a Vein be opened in the Arm of fome wholfome young man, and the blood to be fucked. It is faid, that Witches do greedily eat Mans flefh, which if it betrue, befides a devillifh Appetite in them, it is likely to proceed; 'for that Mans flefh may fend up high and pleafing Vapors, which may ftir the Imagination, and Witches felicity is chiefly in Imagination, a shath been faid.

860. 

Experiment Solitary, touching the Salamander.
861. Experiment Solitary, touching the Contrary ope rations of Time, upon Fruits and Liquors.
862. Experiment Solitaty, touching $B$ loves and Bruifes.

THere is an ancient received Tradition of the Salamander, that it liveth in the Fire, and hath force alfo to extinguifh the fire. It muft have two things, if it be true, to this operation. The one, a very clofe skin, whereby flane, which in the midft is not fo hot, cannotenter: For we fee, that if the Palm of the Hand be anointed thick with White of Eggs, and then Aquavita be poured uponit, and enflamed, yet one may endure the flame a pretty while. The other is fome extream cold and quenching vertue, in the Body of that Creature which choaketh the fire. We fee that Milk quencheth Wildfire better than VVater, becaufe it entreth better.

TIme doth change Fruit (as Apples, Pears, Pomegranates, or.) frommore four to more fiveet; but contrariwife, Liquors (even thofe that are of the Juyce of Fruit) from more fweet to more four'; as, Wort, CNuft, New Verjayce, ơc. The caufe is, the Congregation of the Spirits together; for in both kindes, the Spirit is attenuated by Time; but in the firft kinde, it is more diffufed, and more maftered by the groffer parts, which the Spirits do but digeft: But in Drinks the Spirits do reign, and finding lefs oppofition of the parts, become themfelves more \&rong, which caufeth allo more ftrength in the Liquor; fuch, as if the Spirits be of the hotter fort, the Liquor becometh apt to burn; bur in time, it cauferh likewife, when the higher Spirits are evaporated more fournefs.

T hathbeen obferved bythe Ancients, that Plates of Metal, and efpecially of Brafs, applied prefently to a blow, will keep it down from fwelling: The caufe is Repercuffion, without Humectation, or entrance of any Body: For the Plate hath onely a virtual cold, which doth not fearch into the hurt ; whereas all Plaifers and Oynments do enter. Surely, the caule that blows and bruifes induce fivellings is, for that the Spirits reforting to fuccor the part that laboreth, draw alfo the humors with them : Forwe fee, that it is not the repulfe, and the returnof the humor in the part Atrucken that caufech it; for that Gouts, and Toothachs caufe fwelling, where there is no Percuffion ac all.

THe nature of the Orris Root, is almoft fingular, for there be few odo. riferous Roots; and in thofe that are in any degree fivect, it is but the fane fiveetnefs with the Wood or Leaf: But the Orris is notivect in the Leaf, neither is the flower any thing fo fiveeras the Roor. The Root fecmech to have a tender dainty hear, which when it cometh above ground to thic Sun, and the Air, vaniflictli: For it is a gecat Mollifier, and hath a fmell like a Violet.

T hath been obferved by the $A$ ncienis that a great Veffel full, drawn into - Bottles; and then the Liquor puragain into the Veffel, will not fill the Veffel again, fo full, as it was, but that it may take in more Liquor; and that this holdech more in Wine, than in Water. The caufe may be trivial, namely, by the expence of the Liquor, in regard fome may ftick to the fides of the Bottles: But there may be a caufe more fubtil, which is, that the Liquor in the Veffel; sis not to much compreffed, as in the Bottle; becaufe in the Veffel, the Liquor meeteth with Liquor chiefly; but in the Bottles, a fmall guantity of Liquor meeteth with the fides of the Bottles, which comprefs it fo, that it doth not open again.

WAter being contiguous with Air coolethit, but moifteneth it not, except it Vapor. The caufe is, for that Heat and Cold have a Virtual Tranfition, without Communication of fubftance, but moifture not; and to all madefation there is required an imbibition: But where the Bodies are of fuchfeveral Levity, and G-avity, as they mingle not, they can follow no imbibition. And therefore, Oyl likewife licth at the top of the Water, without commixture : And a drop of Water running fwiffly over a Straw. or fmooth Body, wetteth not.

$S$Tarligbt Nights, yea, and bright CToonshine Nights, are colder than Cloudiy Nights. The caufe is, the drinefs and Finenefs of the Air, which thereby becometh more piercing and fharp; and therefore great Continents are colder than Illands. And as for the Moon, though it felf inclineth the Air to moifture, yet when it thineth bright, it arguech the Air is dry. Allo clofe Air is warmer than open'Air, which(it may be) is, for that the true caufe of cold, is an expiration from the Globe of the Earth, which in open places is ftronger. And again, Air it felf, if it be not altered by that expiration, is not without fome fecret degree of heat; as it is not likewife without fome fecret degree of Light: For otherwife Cuts, and omls, could not fee in the Night ; but that Airhath a little Light, proportionable to the Vilual Spirits of thofe Creatures.

THe Eyes do move one and the fame way; for when one Eye moveth to the Noftril, the other moveth from the Noftril. The caufe is Motion of Confent, which in the Spirits, and Parts Spiritual, is ftrong. But yet ufe will induce the contrary; for fome can Iquint when they will. And the common Tracition is, that if Children be fet upon a Table, with a Candle behinde them, both Eyeswill move outwards, as affeting to fee the Light, and fo induce $S$ quinting.

We fee more exquifiely, with one Eye fhut, than wihb both open. The caule is, for that the Spirits. Vifual unite themfelves more, and fo become
$863^{\circ}$ Experiment Solita:y, qourhieg the Orrisilunto

Atronger. For you may fee, by looking in a Glats, that when you thut one Eye, the Pupil of the other Eye, that is open, dilateih.

The Eyes, if the fightmeet nor in one Angle, reethings double. The caufe is, for that fecing two thinge, and feeing one thingtwice, worke h the fame effeet: And therefore a little Pelles, held between wo Fingers, laid a crois, reemeth double.

Pore-blind Men, fee beft in the dimmerlight ; and likewife have their fight ftronger near hand, than thofe that are not Poreblind, and can read and write Imaller Letters. The caufe is, for that the Spirits V.fial, in thofe that are Poreblind, are thinner and rarer, than in others; and therefore the greater light difperferh them. For the fame caufe they aeed contracting; but being contracted, are moreftrong than the Vitual Spirits of ordinary eyes are; as when we fee thorow a Levèl, the fight is the fronger: And fo is it, when you gather the Eye-lids fome what clofe: And it is commonly feen in thofe that are Poreblind, that they do much gather the eye-lids together. But old Men, when they would fee toread, put the Paper fomewhat a far off. The caule is, for that old Mens Spirits Vilual; contrary to thofe of Poreblind Men unite not, but when the object is at fome good diftance from their Eyes.

Men fee better when their Eyes are over againtt the Sun or a Candle, if they put their Hand a little before their Eye. The Reafonis, for that the Glaring of the Sun, or the Candle, doth weaken the Eye ; whereas the Light circumfufed is enough for the Perception. For we fee, that an over-light maketh the Eyes dazel, infomuch as perpetual looking againft the Sun; would caufe Blindnefs. Again, if Men come out of a great light, into a dark room; and contrariwife, if they come out of a darkroom into alght room, they feem to have a Mift before their Eyes, and fee worfe than they fhall do after they have ftaid a little while, either in the light, or in the dark. The caufe is, for that the Spirits Vifual, are upon a fudden change difturbed, and put out of order; and till they be recollected, do not perform their Function well. For when they are much dilated by light, they cannot contract fuddenly; and when they are much contracted by darknefs, they cannot dilate fuddenly. And excefs of both thefe, (chat is, of the Dilatation, and Contraction of the Spirits Vifual) if it be long, deftroyeth the Eye. For as long looking againft the Sun, or Fire, hurteth the Eye by Dilatation, fo curious painting in fmall Volumes, and reading of fmall Letters, do hurt the Eye by contraction.

It hath been oblerved, that in Anger the Eyes wax red; and in Bluhhing, not the Eyes, buthe Eats, and the parts behind them. The caule is, for that in Anger, the Spitits alcend and wax eager; which is moft eafily feenin the Eyes, becaufe they are tranflucide, though withal it maketh both the Cheeks, and the Gils red; but in Blufhing, it is true, the Spirits afcend likewife to fuccor, both the Eyes and the Face; which are the parts that labor: But when they are repulfed by the Eyes, for that the Eyes, in ffiame do put, back the Spirits that afcend to them, as unwilling tolook abroad: Forno $\mathrm{M} \mathrm{n}_{3}$, in that paffion, doth look ftrongly, but dejectedly, and that repulfion from the Eyes, diverteth the Spirits and heat more to the Ears, and the parts by them.

The objects of the Sight, may caufe a great plesfure and delight in the Spirits, but nopain or great offence; except it beby Memory, as hath been faid. The Glimpfes and Beams of Diamonds that ftrike the Eye, Indian Feathers, that have glorious colours, the coming into a fair Garden, the coming

## Ceriury $I X$.

into a fair Room richly furnifhed; a beauriful perfon, and the like, do delight and exhilarate the Spirits much. The reafon, why it holdeth not in the offence is, for that the Sight is mof fpiritual of the Senfes', whereby it hath no object grofs enough to offend it. But the caule (chiefly) is, for that there be no active objects to offend the Eyc. For Harmonical Sounds, and Difcordant Sounds, are both Active and Pofitive ; foare fweet fmells, and Itinks; fo are bitter, and fweets, in taftes ; fo are over-hot, and overcold, in touch; but blacknefs, and darknefs, are indeed but privatives; and therefore have little or no Activity. Somewhat they do contriftate; but very little.

WAter of the Sea, or otherwife, looketh blacker when it is moved; and whiter when it refteth. The caufe is, for that by means of the Motion, the Beams of Light pafs not ftraight, and therefore muft be darkned; whereas when it refteth; the Beams do pafs ftraighr. Befides, iplendor hath a degree of whitenefs, efpecially, if there be alittle repercuffion; fora Look-ing-Glafs with the Sreel behinde, looketh whiter than Glafs fimple. This Experiment deferverh to be driven further, in trying by what means Motion may hinder Jight.

SHell-fs $b$ have been by fome of the Afrcients, compared and forted with the Infecta; but l fee no reafon why they fhould, for they have Male, and Female, as orher Fiflo have ; neither are they bred of Putrefaction, "efecially fuch as do meve. Neverthetefs it is certain, that Oyfters, and Cockles, and Muffels, which move not, have not difcriminate Sex. Quare; in what time, and how they are bred? It feemeth; that Shells of Oyiters are bred where none were before; and it is tryed, that the great Horle-Mufle, with the fine fhell, that breedeth in Ponds, hath bred within thirty years: But then, which is ftrange, it hath been tryed, that they do not onely gape and flut as the Oyfters do, but remove from one place to another.

THe Senfes arealike ftrong, both on the tight fide, and on the left; but the Limbs on the right fide are ftronger. The caufe may be, for that the Brain, which is the Inftrument of Senfe, is alike on both fides; but Motion, and habilities of moving, are fomewhat holpen from the Liver, which lieth on the right. fide. - It may be alfo, for that the Sentes are putin exercife, indifferently on both fides from the time of our Birth; but the Limbs are uffed moft on the right fide, whereby cuftom helpeth: For we fee, that fome are left-handed, which are fuch as have ufed the left-hand moot.

FRititions make the parts more flefhy, and full: As we fee both in Men, and in the Currying of Horfes, \&c. The caufe is, for that they draw greater quantity of Spirits and Blood to the parts; and again, becaufe they draw the Aliment more forcibly from within; and again, becaufe they relax the Pores, and fo make better paffage for the Spirits; Blood; and Aliment: Lafly, becaufe they diffipate, and difgeft any Intutile, or Excrementitious moifture, which lieth in the Fl. fh; all which help Affimulation. Fritions allo do, more fill and impinguate the Body, than Exercife. The caufe is, for that in Fritions, the inward parts are at reft which in exercife are beaten (many (imes) too much: And for the fame reafon (as we have noted heretofore) Galliflaves are fatand flefhy, becaure they atir the Limbs more, and the inward parts lefs.

$83 \%$ Experiment Solitary, touching the Dulcoration of Salt water.
882. Experiment Solitary, touching the Return: of Salineß in. Pitsupon the Sealbore.
883. Experimeat Solitary, touching Attračion by similitude of Substance.
884. Experiment Solitary, touching. Attration.
A. Ll Globes a faroff, appearfat. 'The caufe is, for that diftance, being a fecundary object of fight, is not otherwife difeerned, than by more or lefs light; which difparity, when it cannot be difcerned, all feemeth one: Asit is (generally) in objects not diftinctly difcerned; for fo Letters, if they be fo far off, as they cannot be difcerned, hew but as duskifh Paper; and all Engravings and Emboffings (a far off) appearp'ain.

THe uttermolt parts of shadopos, feemever to tremble. The caufe is, for that the little Moats which we fee in the Sun, do everltir, though there be no Wind; and therefore thofe moving, in the meeting of the Light and the Shadow, from the Light to the Shadow, and from the Shadow to the Light, do thew the fhadow to move, becau!e the Medium movech.

SHallon and Narroro Seas, break more than deep and large. The caufe is; for that the Impulfion being the fame in both; where there is a greater quantity of $W$ ater, and likewife face enough, there the $W$ ater rouleth, and moveth, both more flowly, and with a floper rife and fall: But where there is lefs Water, and lefs fpace, and the Water dafheth more againft the bottom ; there it moveth more fwiftly, and more in Precipice: For in the breaking of the Waves, there isever a Precipice.

T hath been obferved by the Ancients, that Salt-water boiled, or boiled 1 and cooled again, is more potable, than of itfelf raw; and, yet the tafte of Salt, in Diftillations by Fire, rifeth not: For the Diftilled Water will be frelh. The caule may be, for that the Salt part of the Water, doth partly rife into a kinde of Scum on the top, and partly goeth into a Sediment in the bottom; and fo is rather a feparation, than an evaporation. But it is too grofs to rife into a vapor; and fo is a bitter tafte likewife : For fimple diftilled Waters of Wormwood, and the like, are not bitter.

T hath been fetdown before, that $\mathcal{P}$ its upon the Ser-shores turn into frefh Water, by Percolation of the Salt through the Sand: But it is further noted, by fome of the Ancients, that in fome places of $\sim$ frick, after a time, the Water in fuch Pits will become brakifh again. The caufe is, for that after a time, the very Sands, thorow which the Salt-Water paffeth, become Salt; and fo the Strainer it felf is tincted with Salt. The remedy therefore is to dig ftill new Pits, when the old wax brackifh; as if you would change. your Strainer.

$I^{T}$Thath been obferved by the Ancients, that Salt-rater will diffolve Salt put into it, in lefs time, than Frefh Water will diffolve it. The caufe may be, for that the Salt in the precedent Water; doth by fimilitude of Subftance, draw the Salt new put in, unto it; whereby it diffufeth in the Liquor more fpeedily. This is a noble Experiment, if it be true; for it fheweth means of more quick and eafie Infufions; and it is likewife a good inftance of Atrracion by Similitude of Subftance. Try it with Sugar put into Water, formerly fugred, and into other VVater unfugred.

PUt Sugar into Wine, part of it above, part under the Wise; and you fhall finde (that which may feem ftrange) that the Sugar above the VVine, will Coften and diffolve fooner than that within the Wine. The caufe is, for that
Century IX.
the Wine entreth that part of the Sugar which is under the Winc, by fim-
ple Infufion or Spreding; but that part above the Wine is likewife forced
by Sucking: For all Spongy Bodies expel the Air, and draw in Liquor, if
it be contiguous; as we lee it alfo in Sponges, putpart above the Water. It
is worthy the inquiry; to fee how younay make more accurate Infufions;
by helpof Attraction.

WAter in Wells is warmer in Winter than in Summer; and fo Air in Caves. The caufe is, for that in the higher parts, under the Earth, there is a degree of fome heat (as appeareth in fulphureous Veins, \&c.) which Thut clofe in (as in Wintet) is the more ; but if it perfpire (as it doth inSummer) it is the lefs.

IT is reported, that amongft the Leucadians, in ancient time, upon a fuperftition, they did ufe to precipitate a Man from a high Cliff into the Sea; tying about him with ftrings, at fome diftance, many great Fowls; and fixing unto his Body divers Feathers fpred, to break the fall. Certainly many Birds of good Wing (asKites, and the like) would bear up a good weight as they flie ; and fpreding of Feathers thin and clofe, and in great bredth, will likewife bear up a great weight, being even laid withour tilting upon the fides. The further extenfion of this Experiment for Flying, may be thought upon.

THere is in fome places (namely, in Cepbalonia) a little Shrub, which they call Ho'y Oak, or $\mathcal{D}$ marf $\mathrm{O}_{\mathrm{a}} k$. Upon the Leaves whereof there rileth a Tumor, like a Blifter; which they gather, and rub out of it; a certain red duft, that converteth (after a while) into Worms, which they kil with Wine, (as is reported) when they begin to quicken: With this Duft they Die Scarlet.

IN Zunt, it is very ordinary, to make Men impotent, to accompany with their Wives: The like is practifed in Gafcony, whereit is called Nover $l$ Eguillete. It is practifed alvvays upon the Wedding day. And in Zant, the Mothers themfelvesdo it by vvay of prevention, becaufe thereby they hinder other Charms, and can undo their ovvn. It is a thing the Civil Law taketh knovvledge of, and therefore is of no light regard.

IT is a common Experiment, but the caule is miftaken. Take a Pot. (or better a Glafs, becaufe therein you may fee the Motion) and fet a Candle lighted in the Bottom of a Bafon of Water; and turn the Mouth of the Pot or Glafs over the Candle, and it vvill make the Water rife. They afcribe it to the dravving of heat, $q$ vhich is not true: For it appeareth plainly to be but a Motion of Nexe. vvhich they call Nedetur vachim; and it proceedeth thus; The Flame of the Cardle as foon, as it is covered; being fuffocated by the clofe Air, leffeneth by little and little: Duting vvhich time, there is fome little alcent of Water, but not much; for the Flame occupying lefs and lefs room, as it leffenet, the Water fucceedeth. Butuponthe infant of the Candles going out, there is a fudden rife of a greatdeal of Water; for that that the Body of the Flame fllech no more place, and fo the Air and Water fuc ceed. It vorketh the fame eftect, if inftead of Water, you put Flovver, or Sand, into the Bafon: Which fheviveth, that it is not the Flames dravving the Liquor, as Nourihment; as it is fuppofed; for all Badies are
alike
889.

887 Experiment Solitary, touching the Dye of Scarlet.
888. Experiment Solitary, touching Maleficiating.
alike unco it; as it is ever in motion of Nexe; inlomuch, as I have feen che Glafs, being held by the hand, hath lifted up the Bafon, and all : The motion of Nexe did fo clafp the bottom of the Bafon. That Experiment, when the Bafon was.lifted up, was made with Oyl, and not with Water. Neverthelef's this this is true, that atthe very firt fetting of the Mouth of the Glafs, upon the bottom of the Bafon, it draweth up the Water a little; and thenitandeth at aftay, almoft till the Candles going out, as was faid. This may fhew fome Attraction at firft; but of this we will fpeak more; when we handec Attragtions by Hear.

Experiments in Confort, touching the Influences of the Moono

0F the Power of the Celefial Bodies, and what more lecrer infuences they have, befides the two manifeft influences of Heat and Lighr, we Thall fpeak, when we handle Experiments touching the Celeffial Bodies: Mean while, we will give fome Directions for more certain Tryals of the Vertue and Influences of the Moon; which is our nearefe Neighbor.

The Influences of the Moon (molt oblerved) are four ; the drawing forth of Hear; the Inducing of Putrefaction; the increafe of Moifture; the exciting of the Motions of Spirits.

For the drawing forth of Heat, we have formerly preferibed to take Water warm, and to fet part of it againf the Moon-beams, and part of it with a Skreen bet ween; and to fee whether that which fandeth expored to the Beams will not cool fooner. But becaufe this is but a fmall interpofition, (though in the Sun we fee a fmall fhade doth much) it were good to try it when the Moon fhineth; and when the Moon thineth not at all; and with Water warm in a Glafs-bottle as well as in a Difh, and with Cinders, and with Iron red-hot; \&c,
891. Fifh expofed to the Moon-beams, and again expofed to the Air when the Moon fhineth not, for the liketime, to fee whether will cort:apt foorser; and try it alfo with Capon; or fome other fowl laid abroad, to lee wherher it will mortifie and become ienderfooner. Try it alfa with dead Flies or dedd Worms, having a little Water caft upon them, to fee whether will putrefie fooner Try it allo with an Apple or Orenge, having holes made in their tops, to fee whether will rot or mould fooner. Try it alfo with Helland Cheefe, having Wine put intoit, whether it will breed Mites fooner or greater.
For the increafe of Moiflure, the opinion received is, that Seeds will grow fooneft, and Hair, and Nails, and Hedges, and Herbs, cut, \&cc. will grow fooneft, if they be fet or cut in the increale of the Moon: Alfo, that Brains in Rabits, Wood-cocks, Calves, \&c. are fulleft in the Full of the Moon; and fo of Marrow in the Bones, and fo of Oyfters and Cockles; which of all the reft are the eafieft tried, if you have them in Pits.
393.

Takefome Seeds or Roots (as Onions,\&c.) and fet fome of tham im. mediately after the Change, and others of the fame kinde immediately aftet the Full: Let them be as like as can be, the Earthallo the fame as near as may be, and therefore beft in Pots: Let the Pots alfo fand where noRain or Sun may come to them, left the difference of the, Weather confound the Experiment. And then fee in what time the Seeds fer, in the increafe of the Moon, come to a ceitain height Jand how they differ from thofe that are fet in the decreafe of the Moon.

It is like, that the Brain of Man waxech moitterand fuller upon the Full of the Moon; and therefore it were good for thofe that have moit Brains, and are great Drinkers, to take fume of Lignum Aloes, Rofemary, Frankincenfes Wr. about the Full of the Moon. It is like allo, that the Humors in Mens Bodies increafe and decreafe, as the Moon doth ; and therefore it weregood to purge fome day or two after the Full, for that then the Humors will not replenilh fo foon again.

As for the exciting of the motion of the Spirits; you mult note, that the growth of Hedges, Herbs, Hair ${ }^{3}$ \&c. is cauled from the Moon, by exciting of the Spirits, as well as by increafe of the moifture. But for Spirits in particular, the great inftance is in Lumacies.

There may be other fecret effeets of the influence of the Moon, which are not yet brought into oblervation. It may be, that if it fo fall our, that the Wind be North or North-Eaft, in the Full of the Moon, it increafeth Cold; and if South o: South-W eft, it difpofeth the Air for a good while to warmth and rain; which would beoblerved.

It may be that Children and young Cattel that are brought forth in the Full of the Moon, are ftronger and larger then thofe that are brought forth in the Wane; and thofe allo which are begotten in the Full of the Moon : So that it might be good Husbandry, to put Ramsand Bulls to their Females fomewhat bifure the Full of the Moon. It may be alfo, that the Egg; laid in the Full of the Moon, breed thebetter Birds and a number of the like effeets, which may be brought into obfervation. Quare alfo, whether great Thunders ānd Earth-quakes be not molt in the Full of the Moon.

THe turning of Wine to Vinegar, is a kinde of Putrefaction; and in making of Vinegar, they ufe to fet Veffels of Wine over againft the Noon Sun, which calleth out the more Oily Spirits, and leaveth the Liquor more four and hard. We fee alfo, that Burnt- Wine is more hard and aftringent then Wine unburnf." It is faid, that Cider inNavigations under the Line ripeneth, when $W$ ine or Beer foureth. It weregood to feta Rundlet of Vers juice over againft the Sun in Summer, as they do Vinegar, to fee whether it will ripen and fwecten.

THere be divers Creatures that fleep all Winter ; as the Bear, the Hedgbog, the Bat, the Bee, ن'r. Thefe all wax fat when they feep, and egeft not. The caufe of their fattening, during their fleeping. time, may be the want of affimilating; for whatfoever affimilatech not to Flefh, turneth either to fweat or far. Thefe Creatures, for part of their Ileeping times have been obferved not to fir at all; and for the other parts to ftir, but not to remove, and they get warm and clofe places to fleep in. When the Flemmings wintred in Nova Zembla, the Bears about the middle of November went to fleep; and then the Foxes began to come forth, which durf nor before. It is noted by fome of the Ancients, that the She Bear-breedeth, and lieth in with her young during that time of Reft, and that a Bearbig with young, hath feldom been feen.

SOme Living Creatures are procreated by Copulation between Male and Female, fome by Purrefaction; and of thofe which come by Putrefaction, many do (neverthelefs) afterwards procreate by Copulation. For the caule of both Generations : Firt, it is moft certain, that the caufe of all Vivi-
fication is a gentle and proportionable hear, working upon a gluttinous and yielding fubftance ; for the heat doth bring forth Spirit in that fubtance, and the fubftance being gluttinous, produceth two effects; the one, That the Spirit is detained, and cannot break forth; the other. That the matter being gentle and yielding, is driven forwards by the motion of the Spirits, afer fome fwelling into fhape and members. Thercfore'all Spern, all Menftruous fubfance, all matter whereof Creatures are produced by Puirefaction, have evermore a Clofenef, Lentor, and Sequacity. It feemeth ihercfore that the Generation by Sperm onely, and by Putretaction, have two different caules. The firft is, for that Creatures which have a definite and exad flise (as thofe have which are procreated by Copulation) cannot be produced by a weak and cafual heat; nor out of matter, which is not exactly prepared according to the Species, The fecond is, for that there is a greater time required for Maturation of perfect Creatures; for if the time required in Vivification be of any length, then the Spirit will exhale beforc the Creature be mature ; except it be inclofed in a place wherent may have continuance of the hear, accefs of fome nourifhment to maintain it, and clofenefs that may keep it from exhaling ; and fuch places, or the Wombs and Marrices of the Females: And therefore all Creatures made of Purrefaction, are of more uncertain fhape, and are made in fhorter time, and need not fo perfect an enclofure, though fome clofenefs be commonly required. As for the Heathen opinion, which was, That upongreat mutations of the World, perfett Creatures were firt ingendred of Concretion, as well as Frogs, and Worms, and Flies, and fuch like, are now; we know it to be vain: But if any fuch thing thould beadmitted, dilcourfing according to fenfe, it cannot be, except youadmit of a Chass firft, and commixture of Heaven and Earth: for the Frame of the World once in order, cannot effeet it by any exsefs or cafualty.

## Century $X$.

He Philofophy of PPytbagoras (which was full of Superftition) did firlt plant a Monftrous Imagination, which afterwards was, by the School of Plato, and others, watred and nourifhed. It was, That the W orld mas one entire perfeet Living Creature; infomuch, as. Apollonius of 7 yana, a Fytbagorean Prophet, affirmed, That the Ebbing and Flowing of the Sea was the Refpiration of the World, drawing in Water as Breath, and putting it forth again. They went an, and inferred, That if the World were a Living Creature, it had a Soul and Spirit; which allo they held, calling it Spiritus Mundi, the Spirit or Souk of the World; by which, they did not intend God, (for they did admit of a $\mathcal{D}_{\text {eity }}$ befides) but onely the Soul, or Effential Form of the Univerfe. This Foundation being laid, they might build upon it what they would; for in a Living Greature, though never fogreat (as for example, in a great Whale) the Senfe and the Affects of any one part of the Body iriftantly make a Trantcurfion throughourthe whole Body: So that by this they did infinuate, that no diffance of place, nor want orindifpofition of Matter, could hinder Magical Operations ; but that (for example) we might here in Europe have Senfe and Feeling of that which was done in Crina; and likewife, we might work any effect without and againft Matter : And this not holden by the co-operation of Angels or Spirits, but onely by the Unity and Harmony of Nature. There were fome alfo that ftaid not here, but went further, and held, That if the Spirit of Man (whom they call the CMicrocofin) do give a fit touch to the Spirit of the W orld, by ftrong Imaginations and Beliefs, it might command Nature ; for Paracel/us, and fome darkfome Autbors of Magick, do afcribe to Inagination exalted the Power of Miracle-working Faith. With thefe vaft and bottomlefs Follies Men have been (in part) entertained.

Experiments in Confort, rouching Tranfmißion and Influx of Immateriate Virsues, and the Force of Imagination.

Butwe, that hold firm to the Works of God, and to the Senfe, which is Gods Lamp, (Lucima Dei Spiraculum Hominis) uill enquire it ith all Sobricty and Severity, whether there be to be found in the Foot-Ateps of Nature any fuch Tranfmiflion and Influx of Immateriate Virtues ; and what the force of Imagination is, either upon the Body Imaginant, or upon another Body: Wherein ir will be like that labor of Hercules in purging the Stable of Augeas, to feparate from Supertitious and Magical Artsind Obfervations, any thing that is clean and pure Natural, and not to be either contemned or condemned. And although we fhall have occafion to fpeak of this in more places tien one, yet we will now make fome entrarice thereinto.
901.

Experiments is Confort Monisory, enuching Tranpmision of Spirits, and the Farce of Ymagination。
902.

Men are tobe admonifhed on the other fide, that they do not cafily give place and credit to thefe operations, becaufethey fucceed many times: For the caufe of this fuccefs is (oft) to be truly afcribed unto the force of Affection and Imagination upon the Body Agent, and then by a fecondary means it may work upon a diverfe Body. As for example, If a man carry a Planets Seal or a Ring, or fome part of a Beaft, believing ftrongly that it will helphim to obtainhis Love, or to keep him from danger of hurt in Fight, or to prevail in a Sute, ©c. it may make him more active and induftrious; and again, more confident and perfifting, then otherwife he would be. Now the great effects that may come of Induftry and Perfeverance (efpecially in civil bufinefs) who knoweth not? For we fee audacity doth almoft binde and mate the weaker fort of Mindes; and the ftate of Humane Actions is fo rariable; that to try things oft, and neverto give over, doth wonders: Therefore it were a meer fallacy and miftaking to afcribe that to the Force of Imagination upon another Body, which is but the Force of Imagination upon the proper Body; for there is no doubt but that Imagination and vehement Affection work greatly upon the Body of the Imaginant, as we fhall thew in due place.

Men are to be admonifhed, that as they are not to miftake the caufes of thefe Operations, fo much lef反 they are to miftake the Fact or Effect, and rafbly to take that for done which is not done. And therefore, as diwers wife Judges have preferibed and cautioned, Men may not too rafhly belicve
believe the Conteffion of Witcines, nor yer the evidence againft them: Fur the Witches themfelves are Imaginative, and believeoft times they do that which they do not ; and people are credulous in that point, and ready to impute Accidents and Natural operations to Witchcraft.: It is worthy the obfer ving, that both in ancient and late times; (as in the theffalian W itches, and the meetings of Witches that have been recorded by fo manylate Confeffions) the great wonders which they tell of carrying in the Air, transforming themflves into other Bodies, \&c. are ftill reported to be wrought, not by Incantation or Ceremonies, but by Ointments and Anointing themrelves all over. This may jultly move a Man to think, that there Fables are the effects of lmagination; for it is certain, that Ointments do all fif they be laid on any thing thick) by ftopping of the Pores; Shut in the Vapors, and fend them to the head extreamly. And for the particular Ingredients of thofe Magical Ointments, it is like they are opiate and foporiferous. For Anointing of the Forehead, Neck, Feet, Back-bone, we know is ufed for procuring dead fleeps. And if any Man fay, that this effect would be ber: ter done by inward potions; anfwer may be made, that the Medicines which go to the Ointments are foltrong, that if they were ufed inwards, they would kill thole that ule them ; and therefore they work potently, though ourwards.

We will divide the feveral kindes of the operations by tranfmiffion of Spirits and Imagination, which will give no fmall light to the Experiments that follow. All operations by tranfmiffion of Spirits and Imagination have this, that they work at diftance, and notat touch; and they are thefe being diltinguifhed.

The firt is, The Tranfmiffion or Emiffion of the thinner and more airy parts of Bodies, as in Odors and Infections; and this is, of all the reft; the moft corporeal. But you mult remember withal, that there be a number of thole Emiffions, both unwholefome and wholefome, that give no fmell at all : For the Plague many times when it is taken giveth no fent at all, and there be many good and healthful Airs, as they appear by. Habitation, and other proofs, that differ not in Smell from other Airs. And under this head you may place all Imbibitions of Air, where the fub. ftance is material, odoc-like, whereof fome neverthelefs are ftrange, and very fuddenly diffufed; as the alteration which the Air receiveth in $E_{g} y p t$ almof immediately upon the rifing of the River of $N$ ilus, whereof we have fpoken.

The fecond is, the Tranimiffion or Emiffion of thofethings that we call Spiritual Species, as Vifibles and Sounds; the one whereof we have hand. led, and theother we fhall handle in due place. Thefe move fwiftly and at great diftance, but then they require accedium well difpoled, and their Tranfmiffon is eafily ftopped.

The third is, the Emiffions which caule Attraction of certain Bodies at difance; wherein though the Loadtone be commonly placed in the firtt rank, yet we think good to except it, and refer it to another Head: But the drawing of Anber, and fet, and other Eletrick Bodies, and the Attraction in Gold of the Spirit of Quick-filver at diftance, and the Attraction of Heat at diftance, and that of fire to $\mathrm{V}^{2} \mathrm{aphiba}$, and that of fome Herbs to Water, though at diftance, and divers others, we fhall handle; but yet not under this prefent title, but under the title of Attraction in general.

The fourth is; the Emiffion of Spirits, and Immateriate Powers and Virtues, in thofe things which work by the univerfal configuration and Symparhy of the World; : not by Forms, or Celeftial Influxes, (as is vainly taught and received) but by the Primitive Nature of Matter, and the feeds of things. Of this kinde is (as we yet fuppore) the working of the Loadfone, which is by content with the Globe of the Earth; of thiskinde is the motion of Gravity, which is by confent of denfe Bodies with the Globe of the Earth; Of this kinde is fome difpofition of Bodies to Rotation, and particularly from Eattio Weft; of which kinde, we conceive the Main Float and Refloar of the Sea is, which is by confent of the Univere, as part of the Diurnal Motion. Thefe Immateriate $V$ irtues have this property differing from others, that the diverfity of the Medium hindreth them not, but they pafs through all Mediums, yet at determinate diftances. And of thefe we Thall ipeak, as they are incident to feveral Titles.

The fifth is, the Emiffion of Spirits; and this is the principal in our intention to handle now in this place, namely, the operation of the Spirits of the minde of Man upon other Spirits; and this is of a doublenature; the operation of the Affections, if they be vehement ; and the operation of the Imagination, if it beftrong. But thefe two are fo coupled, as we fiall handle them together ; for when an envious or amorous afpeat doth infet the Spirits of another, there is joyned both Affection and I magination:

The fixth is, the influxes of the Hiavenly. Bodies, befides thofe two manifeft ones of Hear and Light. But thefe we will handle, where we handie the Celeffial Bodies and Motions.

The feventh is, the operations of Sympathy, which the Writers of $N_{\alpha-}$ tural CMagick have brought into an Art or Precept; and it is this, That if you defire to fuper-induce any Virtue or Difpofition upona Perfon, you Thould take the Living Creature, in which that Virtue is moft eminent and in pertection; of that Creature you muft take the parts whercin that Virtue chiefly is collocate. Again, you muft take the paits in the time, and aet when that Virtue is moft in exercife, and then you mult apply it to that part of Man, wherein that Virtue chiefly confifteth. As if you would fuperinduce Courage and Forritnde, take a Lion, or a Cock; and take the Hearr, Tooth, or Paw of the Liox; or the Heart, or Spur of the Cock: Take thofe parts im: mediately after the Lion or the Cork have been in fight, and let them be worn upon a Mans heart or writt. Of thefe and fuch like Sympathies we fhall feak under this prefent Title.

The eighth and laft is, an Emiffion of Immateriate Virtues, fuchas we are a little doubfful to propound it is fo prodigious, but that it is fo conteantly avouched by many: And we have fet it down as a Law to our felves, to examine things to the bottom; and not to receive upon credit, or reject upon improbabilities, until there hath paffed a due examination. This is the Sympathy of Individuals; for as there is a Sympathy of Species, fo (it may be) there is a Sympathy of Individuals; that is, that in things, or the parts of things that have been once contiguous or entire, there fhould remain a tranfmiffion of Virtue from the one tothe other; as between the Weapon and the Wound. Whercupon is blazed abroad the operation of Vaguentum Teliz and fo of a piece of Lard, orftick of Elder, \&c. That if part of it be confumed or purrffed, is will work upon the other parts fevered Now, we will purfue the intances themifelves.

THe Plague is many times taken without manifeft fenfe; as hath Been faid; and they report, that where it is found it hath a fent of the imall of a Mcllow Apple, and (as fome fay) of May-flowers: And it is allo re ceived, that fmelis of Flowers that are Mcllow and Luthious, are ill for the Plague; as White Lilies, Covvfips, and Eyacinsths.

The $\mathcal{P}_{\text {lagut }}$ is not eafily received by fuch as continually are about them thiat have the Plague, as Keepers of the Sick, and Phyficians ; nor again by
212.

Experiments in Confort, touching Emifion of Spirits in Va parar Exhalation Odor like
913.
314.
deal much in Refining, or orher works about Metals and Minerals, have their Brains hurt and itupeffed by the Metalline Vapors: Amongft which, it is noted, that the Spirits of Quick-filver ever flie torthe Skull, Teeth, or Bones; infomuch; as Gilders, ule to have a piece of Gold in their Mouth to diaw the Spirits of Quick-filver, which Gold aftecwards they finde tobe whitned. There are allo cerrainLakes and Pits; füch.as that of Avernus, that poylon Birds (as is faid) which flie over them, or Men that flay too long about them. many; ${ }^{\prime}$ and it is the more dangerous, becaufe it comerh without any ill fmell, but fealeth on by little and little, inducing onely fainenefs, without any manifeft ftrangling. When the $\mathcal{D u t r c h m e n}^{2}$ wintred at Nova Zembla; and that they could gather no more fticks, they fell to make fire of fome Seacoal they had, wherewith (at firft) they were much refrefhed; buta litcle after they had fat about the fire, theregrew a general filence and lothnef, to fpeak among $1 t$ them ; and immediately after, one of the weakef of the Company fell down in a fwoon: Whereupon, they doubting what it was, opened their door to let in Air, and folaved themfelves. The effict ( no doubr) is wrought by the infpiffition of the Air, and to of the Breath and Spirits. The like enfueth in Rooms newly Plaiftred, if a fire be made in them ; whereof no lefs Man then the Emperor Forinianus died.

Vide the Experimens 803. Touching the Infelious Nature of the Air upon the firlt Showers aftertorig Droughr.

It hath come to paf, that fome Apothecaries, upon ftamping of Coloquintid, have been patinto a great Scouring by the Vaporonely.

It hath been a pradice to burn a Pepper they call Guinny-Pepper, which hath fuch a ftrong Spirit, that it provoketh's continual SneeZing in thofe that are in the Room.
It is an Ancient Tradition' that Blear'Eyes infed Sound Eyes; and that a Menftroous Womail looking in : Glafs doth ruft it: Nay, they have an opinion, which feemeth fabulous, That Menfruous Women going over a Field or Garden, do Corn and Herbs good by killing the Worms:

The Tradition is no lefs ancient, that the Baflitis killeth by afpeet; and that the $W$ oolf, if be feeth a Man firt, by aipeat friketh a $M$ an hoarfe.

Perfumes convenient dodry and ftrengthen the Brain, and ftay Rheums and Defluxions; as we finde in Fume of Rofemary dried, and Lignum Aloes, and Calamus taken at the Mouth and Noftrils. And no doubr, there be other Perfarmes that do moiften and refrefh, and are fit to be ufed in Burning Agues, Confumptions, and too much wakefulneff; fuch as are Rofe-pater, Vinegar, Lemtion-pills, Violets, the Leaves of Vines fprinkled with a little Rofawaser, ob.
d. They do ufe in fudden Faintings and Swooninge, to puta Handkerchief with Rofe-water; or alittle Vinegar to the Nofe, which gathereth together again the Spirits, which are upon point to refolve and fall away. worketh, partly by opening, but chiefly by the opiate virtue, which condenferh the Spirits. It were good therefore to try the taking of Fumes by Pipes (as they do in Tobacco) of other things, as well to dry and comforr, as for other intentions. I wifh tryal be made of the drying Fume of Rofemary and Lignnm Aloss, before mentioned in Pipe; and fo of durmegs and Folium

The following of thie Plough hath been apptoved for refrefhing thic Spirits, and procuring Appetitc; but to do it in the Ploughing for Wheat or Rye is notfo good; becaufe the Earth hath fpent herfweet breath in Vegetables put forth in Summer. It is better therefore to do it when you fow Earley. But becaufe Ploughing is tied to Seafons, it is beft to take the Air of the Earth new turned up by digging with the Spade; or ftanding by him that diggeth. Gentemomen may do themfelves much good by kneeling upon a Culhion, and Weeding. And thefe things you may practile in the beft seafons; which is.ever the early Spring, before the Earth puttecth forth the Vegetables, and in the fiveeteft Earth you can chufe. It would be done alfo when the Dew is a little off the Ground, left the Vapor be too moift. I knew a great Man that lived long, who had a clean Clod of Earth brought to him every morning as he fate in his Bed; and he would hold his head over it a good preety while. I commend alfo fometimes in digging of new Earth, to pour in fome Malmfey or Greek. Wine, that the Vapor of the Earth and Wine cogether may comfort the Spirits the more ; provided always it be not taken for a Heathen Sacriaice or Libation to the Earth.

They have in Phyjeck ufe of Pomanders; and knots of Powders for drying of Rheums, comforting of the Heart, provoking of Sleep, \&c. for though
 ally in yourhand, whereas Perfumes you can take but at cimes; and befides, there be divers things that breath better of themfelves then when the come to the Fire; as Nigella Romana, the Seed of CMelanthium, Amomum, ©́c.

There be two things which (inwardly ufed) do cool and condenfe the Spirits ; and I wifh the lame to be tried outwardly in Vapors. The one is Nure; which I would have diffolved in Malmfey, or Greck Wine, and fo the fmell of the Wine taken; or, if you would have it more forcible, pour of it upon a Fire-pan well heated, as they do Rofe-mater and $V$ inegar. Thie other is, the diftilled Water of Wilde Poppey; which $\mathbf{1}$ wifh to be mingled at half with Rofe-water, and fo taken with fome mixture of a few Cloves in a Perfuming pan. The like would be done with the ditilled Water of SaffronFlowers.

Smells of CMisk, and Aimber, and Civit, are thought to further Venereous Appetite ; which they may do by the refrefhing and calling forthof the Spirits.

Incenfe and Niderous fmells (fuch as were of Sacrifices) were thought to intoxicate the Brain, and to difpofe men to devotion; which they may do by a kinde of fadnefs and contriftation of the Spirits, and partly alfo by Heating and Exalting them. We fee that amongft the Jews, the principal perfume of the Sanctuary was forbidden all common ufes.

There be fome Perfumes prefcribed by the Writers of Natural Magick, Propherical Dreams, as the Seeds of Flax, Fleanort, © 6 c.

It is certain, that Odors do in a fmall degree, nourifh, efpecially the Odor of Wine ; and we fee Men an hungred do love to fmell hot Bread. It is r lated; that Democritus when he lay a dying, heard a Woman in the Houfe complain, that fhe fhould be kept from being at a Feaft and Solemnity (which fhe much defired to fec) becaufe there would be a Corps in the Houle : Whereupon he caufed Loaves of new Bread to be fent for, and opened thetn, and poured a little Wine into them, and fo kept himfelf alive with
the Odor of them till the Feaft was paft. 1 knew a Gentleman that would faft (fometimes) three or four, yea, five days, without Mear, Bread, or Drink; but the lame Man ufed to have continually a great Wifp of Herbs that he fmelled on; and amongft thofe Herbs lome efculent Herbs of ftrong fent, as Onions, Garlick, Leeks, and the like.

T
They do ufe for the Accident of the Mother to burn Feathers, and other things of ill Odor; and by thofe ill fmells the rifing of the Mother is put down.

There be Airs which the Phyficians advife their Patients to remove unto in Confunptions, or upon recovery of long fickneffes, which (commonly) are plain Champaigns, but Grafing, and not over-grown with Heath, or the like; or elfe Timber-finades, as in Forefts, and the like. It is noted.alfo, that Groves of Bays do forbid Peftilent Airs ; which was accounted a great caufe of the wholefome Air of Antiochia. There be alfo fome Soyls that put forth Odorate Herbs of themfelves, as $V V$ ilde 7 byme, VVilde $M$ ary jorann, Penny-royal, Camomile; and in which, the Bryar-Rofes Imell almoft like Muk $k$ Rofis; which (nodoubt) are figns that do difcover an excellent Air.

It were good for men to think of having healthful Air in their Houfes; which will never be, if the Rooms be low-roofed, or full of Windows and Doors; for the one maketh the Air clofe, and not frefh; and the other, maketh it exceeding unequal, which is a great enemy to health. The Windows allo fhould not be high up to the Roof (which is in ufe for Beauty and Magnificence) but low. Alfo Stone-walls are not wholefome; but Timber is more wholefome, and efpecially Brick; nay; it hath been ufed by fome with great fuccefs, to make their Walls thick, aed to put a Lay of Chalk between the Bricks to take away all dampifhnefs. Hefe Emiffions (as we faid before) are handled, and ought to be hand-, led by themfelves, under their proper Titles; that is, Vifibles, and Audibles, each apart: In this place, it fhall fuffice to give fome general Ob . fervations common to both. Firft, they feem ta be Incorporeal. Secondly, they work fwiftly: Thirdly, they work at large diftances. Fourthly, in curious varieties. Fifthly, they are not effective of any thing, nor leave any work behinde them, but are energies meerly; for their working upon mirrors and places of Echo doth not alter any thing in thofe Bodies; but it is the fame Action with the Original, onely repercuffed. And as for the fhaking of Windows, or rarifying the Air by great noifes, and the Heat caufed by Burning. Glaffes, they are rather Concomitants of the Audible and Vifible Species, then the effects of them. Sixthly, they feem to be of fo tender and weak a Nature, as they affect onely fuch a Rare and Attenuate Subftance as is the Spirit of Living Creatures.
$T \mathrm{~T}$ is mentioned in fome Stories, that where Children have been expofed or taken away young from their Parents, and that afteriward they have approached to their Parentsprefence, the Parents (though they have not known them) have had a fecret Joy, or other Alteration thereupon:

There was an Egyptian Sootbjayer that made Antonius believe, that his genius (which otherwile was brave and confident) was, in the prefence of octavianus $C a f_{a r}$, poor and cowardly; and therefore, he advifed him to abfent himfilf (as much as he could) and remove far from him. The Soothfayer was thought to be fuborned by cleopatra, to make him live in Egypt, and other
remote places from Rome. Howloever, the conceit of a predominant or maftering Spirit of one Man over another is ancient, and received Itill, even in vulgar opinion.

There are conceits, that fome Men that are of an ill and melanctiolly nature, do incline the company into which they come, to be fad and ill difpofed; and conerariwite, that others that are of a jovial nature do difpofe the company to be merry and chearful : And again; that fome Men arelucky to bekcptcompany with, and employed, and others unlucky. Certainly it is agreeable to reafon, that there are at the leaft fome light effluxions from Spirit to Spirit when Men'are in prefence one with another, as well as from B ody to Body.

It hach been oblerved, that old Men have loved young company, and beenconverfant continually with them, have been of longlife; their Spisits (as it feemeth) being recreated by fuch company. Such were the Ancient Sophifts and Khetoricians, which ever had young Auditors and Difciple:; as Gorgict, Protagoras, Ifocrates, bc. who lived till they were an hundred ycars old; and fo likewife did many of the Grammarians and School-mafters: Such as was Orvilius, boc.

Audacity and confidence doth, in civilbufineffes; fo great effeets; as a Man may (realonably) doubt, that befides the very daring, and carneftncls, and perfiting, and importunity, there thould be fome feeret binding and ftooping of other Mens firits to fuch perlons.

The Affections (no doubt) do make the Spirits more powerful and active; and cfpecially thote Affedions which draw the Spirits into the Eyes; which aretwo, Love and Envy, which is called Oculus Malus. As for Love, the Platonifts (fome of them) go lo far, as to hoid, That the Spirit of the Lover doth pars into the Spirits of the perfon loved, which caufeth the defire of return into the Body whence it was emitted, whereupon followeth that ap. petite of contract and conjunction which is in Lovers. And this is obterved likewife, that the Alpects that procure Love, are not gazings, but fudden glances and dartings of the Eyc. As for Envy, that emitteth fome malign and poifonous Spirits, which take hold of the Spirit of another ; and is likewife of greateft force, when the Calt of the Eye is oblique. It hath been no. ted alfo, That it is moft dangerons, where the envious Eye is caft upon perfons in glory, and triumph, and joy. The reafon whereof ir, for that at fuch times the Spirits come forth moft intothe outward parts, and fo meer the percuffion of the envious eye more at hand ; and therefore it hath been nored, Thatafter great triumphe, Men have been ill difpofed for fome days following. We fee the opinion of Fafcination is ancient for both effects, of procuring Love, and ficknefs caufed by Envy; and Fafcination is ever by the Ege. Butyet if there be any fuch infection froun Spirit to Spirit, there is no doubr, but that it worketh by prefence, and not by the Eye alone, yet moft forcibly by the Eyc.

Fear and Shame are likewife infective: For we fee that the ftarting of one, will make another ready toftart, and when one man is out of countenance in a company, others do likewife bluth in his behalf.

Now we will fpeak of the Force of Imagination upon other Bodies, and of the means to exalt and ftrengthen it. Imagination, in this place, I under. ftand to be the reprefentation of an Individual Thought. Imagination is of three Rindes; the firfe, joyned with Belief of that which isto come; the fecond, joyned with Memory of that which is paft; and the third is, of 7 bings prefent, or as if they were prefent : For I comprehend inthis, Imagination feigned,
feigned, and at pleafure: As if one fhould imagine fuch a $M_{\text {an to }}$ be in the Veltments of a Pope, or to have Wings. I fingle out for this time that wiich is with Faith or Belief of that which is to come. The Inquifition of this Subject in our way (which is by Induction) is wonderful hard, for the things that are reported are full of Fables; and new Experiments can hardly be made but with extream Caution, for the Reafon which we will after declare.

The Power of Imagination is in three kindes. Tre firt, upon the Body of the imaginant, including likewife the Childe in the Morhers Womb. The fecond is, the power of it upondead bodies, as Plante, Wood, Stonc, Mctal, $\& c$. The chird is, the power of it upon the Spirits of Men and Livirg Creatures. And with this latt wewill, onely meddle.

Tne Probleme therefore is, Whether a Man con'tantly and ftrongly be. lieving that luch a thing thall be, (as that fuch an one will love him, or that fuch an one will grant him his requeft, or thar fuch an one fhall recover a ficknefs, or the like) it doth help any thing to the effeating of the thing it fef. And here again we muft warily diftinguilh ; for it is not meant (as hath been partly faid before) that it fhould help by making a man more four, or more induftrious; (in which kinde, conftant belief doth much) but mecrily by a fecret operatior, or binding, or changing the Spirit of another. And in this it is hard (as we began to fay) to make any netve experiment; for I cannot command my felf to believe what I will, and lo no tryal can be made. Nay it is worfe, for whatfoever a Man imagineth doubtingly, or with fear, muft needs do hurt, if Imagination have any power at all ; for a Man reprefenceth that ofner that he feareth, then the contrary.

The help therefore is, for a Man to work by another, in whom he may create belief, and not by himfelf, until himfelf have found by experience, thar Imagination doth prevail ; for then experience worketh in himfelf Belief, if the Belief that fuch a thing fhall be joyned with a Belief, that his Imagination may procure it.

For example, I relared one time to a Man that was curious ana vain enough in thefe things, That I fand a kinde of fugler that bad a Pair of Cards, and vould tell a main vobat Card be thought. This pretended Learned Man told me, it was a miftaking in me. For (faid he) it vvas not the knov vedge of the Mans thought ( for that is proper to God) but is vvas the inforcing of a thought upon bim, and binding his Imagination by afronger, that be could t bink no otber Card. And thereupon he asked me a Queftion or iwo, which I thought he did but cunningly, knowing before what uled to be the feats of the fugler. Sir, (laid he) do you remember vvbether he told the Card the Man thougbt bimfelf, or bad anotiter to tell it? I anfwered, (as was true) That be bad another tell it. Whereunto he faid, So Ithought: For (faid he) bimfelf could not tave pui on fof frong an Imagination, but by telling tbe orber the Card (vybobelieved, that the Jugler vvas Some frange man, and could do Arange things) that oither man caughtaftrong lmagination. I hearkned unto him, thinking for a vanity he fpake prettily. Then he asked me another Queftion : Saith he, Do your remember pubetber he bad the Man ithink the Card fry ft, and aftervvards oold the oober
 that joould tell the Card, telling, That fuch a (Wan Souild think Jutb a Card, and after bad the Man think' a Card? I told him, (as was rruc) That he did firf obhifper the Man in the Ear, that fuch a CMan Thould thinkf fuch a Cart. Upon this, the Learned Man did much exult and pleafe himfélf, raying. Lo, you may fee that my øpinion is right: For if the Man bad thougbifift, bit thought bad been fixed; bur the other innaggi. ni:g firft: looxnd bis thought. Which though it did lomewhat fink with me, yer I
made it lighter then I thought, and faid, $I_{\text {thought it was corfederacy between the }}$ Gugler, and dibe two Servants; though (indeed) I had no reafon fo to think. for they were both my Fathers fervants, and he had never plaid in the Houle before. The Fugler alfo did caufe a Garter to be held up, and took upon him to know that fuch an one fhould point in fuch a place of the Garter, as it fhould be near fo many Inches to the longer end, and fo many to the fhorter; and ftill he did it by firt telling the imaginer, and after bidding the actor think:

Having told this Relation, not for the weight thereof; but becaufe it doth handiomly open the nature of the Queftion, I return to that I aid, That Experiments of Imagination muft be practifed by others, and not by a Mans delf. For there be three means to fortifie Belief; the firt is Experience, the fecond is Reafon, and the third is Authority. And that of thefe which is far the moft potent, is Authority : For Belief upon Reafon or Experience will ftagger.

For Authority, it is of two kindes: Belief in an Art, and Belief in a Man: And for things of Belief in an Art, a Man may exercife them by himfelf; butfor Belief in a Man, it muft be by another. Therefore if a Man befieve in Aftrology, and finde a figure prolperous; or believe in Natural Magick, and that a Ring with fuch a Stone, or fuch a piece of a Living Creacure carried, willdo good, it may help his Imagination; but the Bélief in a Man is far the more active. But howfoever all Authority muft be out of a Mans filf, turned (as was faid) either upon an Art, or upon a Man; and whcre Ruthority is from one Man to ancther, there the fecond mult be Ignorant, and not learned, or full of thoughts: And fuch are (for the moft part) all Witches and fupertitious perfons, whofebeliefs, tied to their Teachers and Traditions, are no whit controlled either by Reafon or Experience: And upon the fame reafon, in Magick they ufe (for the moft part) Boys and young People, whore fpirits caflieft take Belief and Imagination.

Now to fortific Imagination, thẹre be three ways: The Authority whence the Belief is derived; Means to quicken and corroborate the Imagination; and Means to repeat it and refrefh it.

For the Authority we have already fpoken. Asfor the fecond, namely, the Meansto quicken and corroborate the Imagination, we fee what hath been ured in Magick ; (if there be in thofe practices any thing that is purely Natural) as Veftments, Characters, Words, Seals, fome parts of Plants; or Living Creatures, Stones, choice of the Hour, Geftures and Motions; alfo Incenles and Odors' choice of Society, which increafeth Imagination, Diets and Preparations for fome time before. And for Words, there have been ever ufed, either barbarous words of no fenfe, left they fhould difurb the Im'gination; or words of fimilitude, that may fecond and feed the Imagination : And this was ever as well in Heathen Charms,' as in Charms of later times.' Thereare ufed alfo Scripture words, for that the Belief that Religious Texts and Words have power, may ftrengthen the Imagination. And for the fame realon Hebrew words (which amongt us is counted the holy Tongue, and the words more myftical) are often ufed.

For the refrefhing of the Imagination (which was the third Means of Exalting it) we fee the practices of Magick; as in Images of Wax, and the like, that fhould melt by little and little, or fome other things buried in Muck,' that Chould purrefie by little and little, or the like: For fo oft as the tmaginant doth think of thofe things, fo oft doth he reprefent to his Inagina. tion the effect of that he defireth.

$$
T
$$

If there be any powet in Imagination, it is lefs credible that it fhould be fo incorporcal and immateriate a Virtue, as to workat great diftances, or through all Meditims, or upon all Bodies; but that the diftance mult be competent; the Medium not adverfe, and the Body apt and proportionate. Therefore if there be any operation upon Bodics in abfence by Nature, it is like to be conveyed from Man to Man, as Fame is: As if a Witch by Imagination fhould hurt any afar off, it cannot be naturally, but by working upon the Spirit of fome that cometh to the Witch, and from that party upon the Im ${ }^{\text {g gination of another, and fo upon another, tillit come to one that hath }}$ reiort to the party intended; and fo by him, to the party intended himfelf. And althought they fpeak, that it fufficeth to take a Point, or a picce of the Garment, or the Name of the party, or the like; yet there is lefs credit to be given to thofe things, except it be by working of evil fpirits.

The Experiments which may certainly demonftrate the power of Imagination upon other Bodies, are few or none; for the Experimenss of $W$ itcherraft are no clear proofs, for that they may be by a tacite operation of malign Spirits; we fhall therefore be forced in this lnquiry, to refort to new $E x$ periments, wherein we cangive onely Directions of Tryals, and not any Poff. tive Experiments. And if any man think that we ought to have faid till we hăd made Experiment of fome of them our felves, (as we do cominonly in other Titles) the truth is, that thefe Effects of Imagination apon other Bodies, have fo little credit with us, as we fhall try them at leifure: Bat in the mean time we will lead others the way.

When you work by the Imagination of another, it is neceffary that he by whom you work have aprecedent opinion of you that you can do ftrange things, or that you are a Man of Art, as they call it; for elfe the fimple affirmation to another, that this or that fhall be, can work but a weak impreffion in his Imagination.

It were good, becaufe you caunot difcern fully of the flength of Imáa gination in one Man, morethen another, that you did ufe the Imagination of more then one, that fo you may light upon aftrong one. As if a Phyfician fhould tell three or four of his Patients fervants that their Mafter fhall furely recover.

The Imagination of one that you fhall ufe (fuch is the variety of Mens mindes). cannot be al ways alike conftant and ftrong; and if the fuccefs follow not fpeedity, it will faint and lofe ftrength. To remedy this, you muft pretend to him whofe Imagination you ufe feveral degrees of Means by which to operate: As to prefcribe him, that every three days, if he finde not the fuccefs apparent, he do ufe another Root, or part of a Beaft, or Ring, \&́c. as being of more force ; and if that fail, another; and if that, another; till feven times. Alfo you mult prefcribe a good large time for the effect you promife; as if you fhould tell a tervant of a fick man, that his Mafter fhall recover, but it will be fourteen days cre he findechit apparently, \&c. All this to entertain the Imagination, that it waver lefs.

It is.certain, that potions or things taken into the Body, Incenfes and Perfumes taken at the Noftrils, and oyntments of fome parts, do (naturally) work upon the Imagination of him that taketh them. And therefore it mult needs greatly cooperate with the Imagination of him whom you ufe, if you prefcribe him, before he do ufe theReceit for the Work which he defireth, that he do take fach a Pill, or a fpoonful of Liquor, or burn fuchian Incenfe, or anoint his Temples, or the Soles of his Feet, with fuch an Oyntment or Oyl : And you muft chufe for the Compofition of fuch Pill, Perfume, or

Oyntment，fuch Ingredients as do make the Spirits a little more grofs or muddy，whereby the Imagination will fix the better．

The Body Paffive，and to be wrought upon，（I mean not of the Ima－ ginant）is better wrought upon（as hath been partly touched）at fome times then at others；As if you thould prefcribe a fervant about a fick perfon， （whom you have poffifed that his Malter fhall recover）when bis Malker is fatiafleep，to ule fuch a Root；or fuch a Roor：For Imagination is like to work better upon fleeping men；then men awake；as we fhall thew when we handle Dreams．

We finde in the Art of Memory，that Imazes vifible work better then other conceits：As if you would remember the word Philofophy，you fhall more furely do it by imagining that fuch a M un（for Men are belt places）is read－ ins upon Ariffotes Phyficks，then if you fhould imagine him to fay，I mill go fudy Pbilofoghy．And therefore this obfervation would be tranflared to the fubject we now fpeak of；for the more luftrous the Imagination is，it fillerh and fixeth the better．And therefore． 1 concéive，that you fhallin that Experi－ ment（whereof we（pake before）of binding of thoughts，lefs fail，if you tell one that fuch an one fhall name one of twenty men，then if it were one of twenty Cards．The Experiment of binding of thoughts would be diverffiéd and cried to the full：And you are to note，whether it hit for themoft part； though not always．

It is good to confider upon what thingsimagination hath moft force： And the rule（as I concevve）is，that it hath mode force upon thingsthat have the lighteft and eafieft motions；and therefore above all upon the Spirits of $\mathrm{M}: \mathrm{n}$ ，and in them upon fuch affections as move lighteft ：As upon procuring of Love，binding of Lult，which is eveer with Imagination upon Men in fear，or Men in irefolution，and the like $\quad$－Wharfoever is of this kinde would be throughly enquired．Tryals likewile wouldsbe made upon Plants， and that diligently：As if you fhould tell a man that fuch a Tree would die this year，and will him at thefe and thefe times to go unto it，to＇fee how it thriverh．As for inanimate things，it is true，that the motions of fhuffing of Cards，or calting of Diee，are very light motions；and there is a folly very ufeful，That Gamefters imagine，that fome that ftand by them；bring them ill luck．There would be tryal alfo made，of holding a Ring by a thred in a Glafs，and telling him that holderh it before，that it thall frike fo many times againft the fide of the Glafs，and no more；or of holdinga Key berween two Mens fingers without a charm ；and to tell thofe that hold it， that at futh a name it thill go off their fingers．For thefe two are extream light motions．And how ioever，I have no opinion of there things，yet fo much I conceive to be rrue，That flrong Imagination hath more force iupon things living，or that have been living，then things meerly inanimate；and more force likewife upon light and fubtil motions，then upon motions vehe－ mentor ponderous．

It is an ufual obfervation，That if the Body of one murthered be brought before the Murtherer，the wounds will bleed afrefh．．Some do affirm；That the dead Body，upon the prefence of the Murtherer hath opened the eyes； and that there have beenfuch like motions as well where the party murthered hath been Itrangled or drowned，as where they have been killed by wounds． It－may be that，chis participateth of a miracle，by Gods．juit judgment，who ufually brings murthers to light．Butif it be Natural，＇itmuft be referred to Imagination．

The tying of the point upon the day of Marriage，to make Men impo－
tenc towards their Wives, which (as we have formerly touched) is fo frequent in Zant and Gafcony, if it be Natitral, mult be referred to the Imagination of him that tieth the Puiner 1 - conceive it to have the lefs affinity with Wircheraft, becaufe not peculiar perfons onely, (iuch as Witches are) but any. Body may do itt?

THere be many things that work upon the Spirits of Men by Seceet Sympathy and Anitipathy. The virtues of Precious Stones worn, have been an: ciently and generally received, and curiouny affigned to work leveral efficts. So mucth is true, that Stoines have in them fine Spirits, as appeareth by their fplendor:: And thereforethey may work by confent upon the Spirits of $M e n$, to comfort and exhilarate them. Tnoffe that are the beft for that effet, are the Diamond, the Emeratd, the Facyint Oriental, and the Gold-fone, which is the yellow Toparz. As for their particular Proprieties; there is no credit to be given tô them. Bur itis manifett, that Lightabôve all things, excellerh in comforting the Spiriis of Men; ;and it is very probable, that Light vatied doth the fame offeet with more novelty. And this is one of the catres why Preciolue Stones comfort. And therefore ir were good to have Tinted Lanthorns, or Tintted Skizeens of Glaf coloured into Green, Blue, Caraation, Crimjon, Purple, OF\% anoto tufe them wieh Candles in the night. So likewifeto have round Glaffes, not onely of Glaf coloured througn, but with Colours laid betweeci Cryptals with handles to hold in ones hand: Prifulis are alfo comfortable tnngss: They have of Parinimork, Loeking. Giaffes, bardered with broad Borders of fmali $\mathrm{Cryffat}_{\text {fl, and igreat counterfeit Precious Stones of all Colours, that ate }}$ moftgorious and plealant to beholds efpecially in the night. The Piakres of : Indiant Fieathers care.likewife comfortable and ypleafant to behold. So alfo fait and cidariPoolsda greaty comfodit the Eyes Spinits's elpecially when the Sun istrotglaring but ovetcanty or when the CWoun hinech. Wherebe divers forty of Bracelets fit to comfore the Spiriss; land they be
 winh theni to be of Pearts or of Coidely as is ufed: And it hath been noted that Cotal saf the party thar wearethit be ill ditpofed, will wax pale; which I behegef to be triue lbecaufe otherwife diftemper of heat will make coral bofe collountis Leommend alfo Beads or little Plates of Lapis Lazuliz and Beads of Dispe kither alone, ot with tome Cordial mixture. 1 II

- ti bFor Gartaboratiobsand Comfortations take fuch Bodies as are of Aftringent quation weithout mailifelt cold. . I coinmend Bead. eimber, which is full of A: Atriction, buy yet is dnculuous, and nor cold, and is conceived to impinguate thof that weac fuchiBeds. 1 commend alfo Beads of Harts-Hoin and Inotys, which ase of the like mature; alfo Orenge Beads; alfo Beads of Ligntm Aloes's macesratadfirt in Refowner and dried
Berch opening, I commend Beads, or pieces of the Roots of Cuidhuth
 CAropaticasiand of Roron.
: equTbdi Cramp (noIdoubr) cometh of contraction of Sineyvs s which is
 longraguesyd for Cotdrand Drinefs dor (both of them) conerat and cor:
 the Ceamp; whichis proughituy the Dilatation of the conrracted Sinews. by heat. There are in ufe for the prevention of the Cramp, twe thingss? The ore: Rings of Scre.Eorfe Teeth woin upon the Fingers ; theortier Bands
of Green SPerminckle (the Herb) tied about the Calf of the Lcg, or the Thigh, \&c. where the Cramp ulech to come. Ido finde this the more Atrange, becaufe neither of thefe hive any Relaxing Virtue, but rather the contrary. I judge therefore that their working is rather upon the Spirits within the Nerves to make thiem frive lef, then upon the Bodily fubftance of the Nerves.

I would have tryal made of two other kindes of Bracelcts for comforting the Heart and Spirits. The one of the Trochifch of $V$ ipers madc into little pieces of Beads; for fince they do great good inwards (efpecially for peftilent Agues) it is like they will be effectual outwards, where they may be applied in greater quantity. There would be Trchifchs likewife made of Snakes, whole flefh dried is thought to have a very opening and Cordial Virtue. The other is of Beads made of theScarlet Powder, which they call Kermes, which is the principal Ingredient in their Cordial-Confetion Alkermen. The Beads would be made up with Amber-Griece, and fome Pomander.

It hath been long received, and confirmed by divers tryals, that the Root of the CMale-Peony dried, tied to the Neck, doth help the Fallingjickneß; and likewife the Incubus, which we call the Mare. The cáufe of both thele $\mathcal{D}$ ifeafes, andefpecially of the Epilepfie from the Stomack, is the grofsnefs of the Vapors which rife and enter into the Cells of the Brain: And therefore the working is by extream and fubtil Attenuation, which that Simple hath. I judgethelike to be in Caftoream, CMusk, Ren-Seed, Agnus Cafous Seed. O'c.

There is a Stone which they call the Blood. Stone, which worn, is thought to be good for them that bleed at the Nofe; which (no doubt) is by aftrition and cooling of the Spirits. 2xare, if the Stone taken out of the $I$ oads Head, be not of the like virtue, for the Toad loveth Shade and Coolnefs.

Light may be taken from the Experimest of the Horfe-tooth Ring, and the Garland of Perwinckle, how that thofe things which affwage the ftrife of the Spirits, do help difeafes, contrary to the lntention defired; for inthe curing of the Cramp, the Intention is to relax the Sinews; butthe coneraction of the Spirits, that they ftrive lefs, is the befthelp: So to procure eafie Travails of Women, the intention is to bring down the Childe ; but the help is, to ftay the coming down too faft ; whereunto they fay the Toad-fonelikewife helperh. So in Peffilent Fevers, the Intention is to expel the Infection by Sweat and Evaporation; but the beft means to do it, is by Nitre, Diafcordianm, and othercoolthings, which do for a time arrelt the Expulfion, till Nature can do it more quietly. For as one faith prettily, In the quenching of the flame of a Peftilent Ague, रुature is like People that come to quenth the Fire of an Houle; which are fobuffe, as one of them letteth another: . Surely it is an excellent Axiome, and of manifold ufe, that whatfoever appeafeth the contention of Spirits furthereth their action.

The Writers of Natural Magick commend the wearing of the Epoil of 2 Snake, for preferving of Health. I doubt it is but a conceit; for that the Snake is thought to renew her youth by cafting her fpoil. . They might as well take the Beak of an Eagle, or a piece of a Harts-horn, becaufe thofe renew.

It hath been anciently received, (for Pericles the 1 Athenian ufed it) and it is yet in ule, to wear little Bladders of Quick-filver, or Tablets of Arfenick, as prefervatives again?t the Plague : Not, asthey conceive, for any comfort they yield to the Spirits; but for that being poyfons themfelves, they draw the venome to them from the Jpirits.

| 971. |
| 973. |
| 974. |

Vide the Experiments 95, 96 , and 97 . touching the leveral Sympathies and Antipathics for Medicinal ufe.

It is faid, that the Guts or Skin of a Woolf being applied to the Belly do cure the Colick. It is truc; that the Woolf is a Beaft of great Edacity and Digeftion; and fo it may be the parts of him comfort the Bowels.

We fee Scarecrozs are fet up to keep Birds from Corn and Fruit. It is reported by fome, that the Head of a Woolf, whole, dried and hanged up in a Dove-boufe, will fcare away Vermin, fuch as are $W_{\text {rafils, Pole-cats, and the }}$ like. It may be the Head of a Dog will do as much; for thofe Vermin with us, know Dogs better then Wolves.

The Brains of fome Creatures, (when their Heads are roted) taken in Wine, are faid to ftrengthen the Memory; as the Brains of Hares, Brains of Hens, Brains of Deer, \&c. And iffeemeth to be incident to the Brain's of thofe Creatures that are fearful.

The Oyntment that Witches ule, is reported to be made of the Fat of Children digged out of their Graves; of the Juices of Smallage, W oolf. bane, and Cinquefoil, mingled with the Meal of Fine Whear. Bur I fuppore, that the Soporiferous Medicines arelikeft to do it; which are Henbane, Hemlock, Mandrake, Moonfhade, Tobacco, Opium, Saffron, Poplar-leaves, \&c.

It is reported by fome, that the affections of Beafts when they are in ftrength, do add fome virtue unto inanimate things: As that the Skin of a Sheep devoured by a Woolf moveth itching; that afone bitten by a Dog in anger, being thrown at him, drunk in Powder provoketh Choler.

It hath been oblerved, that the diet of Women with Cbilde, doth work much upon the Infant. As if the Mother eat Quinces much, and Corianderfeed the nature of both which, is to reprets and flay vapors that afcend to the Brain) it will make the Childe ingenious: And on the contrary fide, if the Mother eat (much) Onions or Beans, or fuch vaporous food, or drink Wine or ftrong drink immoderately, or faft maich, or be given to muth mafing, (all which fend or draw vapors to the Head) it indangereth the Childe to become Lunatick, or of imperfect memory: And I make-the fame judgment of Tobacco often taken by the Mother.

The Writers of $N_{\text {atural }}$ Magick report, that the Heart of an Ape worn near the Heart, comforteth the Heart, and increaferh audacity. It is true that the Ape is a merry and bold Bealt. And that the fame Heartlikewife of an Ape applied to the Neck or Head, helpeth the Wit, and is good for the Falling ficknefs. The Apealfo is a witty Beaft, and hath a dry Brain; which may be fome caufe of attenuation of Vapors in the Head. Yet it is faid to move Dreams alfo. It may be the Heart of a Man would do more, but that it is more againft Menis mindes to ufe it: except it be in fuch as wear the Reliques of Saints.

The Flefh of a Hedghog dreffed and eaten, is faid to be a great dryer. It is true, that the Juice of a Hedghog mult needs be harfh and dry, becaufe it putteith forth fo many Prickles: For Plants alfo that are fullof Prickles are generally dry; as Bryars, Thorns, Barberries. And therefore the aftes of a Hedghog are faid to bea great deficcative of Fiftula's.

- Mummy hath great force in ftanching of Blood; which as it may be alcribéd to the mixture of Balms ihar are Glutenous, fo it may alfo partake. of a fecree propriety, in that the Blood drawech Mans flefh. And it is ap. proved, thatthe Mor's which growerh upon the Scull of a Dead Man unburied will tanch Blood poiently. And fo do the dregs or powder of Blood, levered from the Water and dried.

It hath been practifed tontake White Smallaws, by anointing of the Eggs with Oyl. Which cffect may be produced by the ftopping of the Pores of the Shell, and making the Juice that putteth forth the Feathers afterwards more penurious. And it may be, the anointing of the Eggs will be as cffectu. al as the anointing of the Body. Of which, Vide ihe Experiment 93.

It is reported, that the White of an Egg or Blood mingled with Saltwater, doth gather thefaltnefs, and maketh the water fiveeter. This may be by Adhefion; as in the Sixtt Experiment of Clarification. It may bealfo, that Blood, and the White of an Egg, (which is the matter of a Living Creature) have fome Sympathy with Salt; for all Life, hath a Sympathy with Salt. We fee that Salt laid to a cut finger, healet: it; fo; as it leemeth, Salt draweth Blood, as well as Blood draweth Salt.

It hath been anciently received, that the Sea-Hare hath an antipathy with the Lungs, (if it cometh nearthe Body) and erodeth them. Whereof the caule is conceived to be a quality it hath of heating the Breath and Spirits; as Cantharides have upon the watry parts of the Body, as Urine and Hydropical Water. And it is a good rule, That whatfoever hath an operation upon certain kindes of Matters, that in Mans Body worketh molt upon thofe parts wherein that kinde of matter aboundeth.

Generally that which is Dead, or Corrupted, or Excerned, hath antipathy with the fame thing when it is alive, and when it is found, and with thofe parts which do excern: As a Carcafs of Man ismoftinfectious and odious to Man, a Carrion of an Horfe to an Horfe, \&c. Purulent matter of Wounds and Ulcers, Carbuncles, Pox, Scabs, Leprofie, to found Flefl; and the Ex́crements of every Species to that Creature that excerneth them. ${ }^{9}$ But the Excrements are lefs perricious' then the corruptions.

It is a commonexperience, That Dogs know the Dog-killer, when as in times of Infe ction fome pety fellow is fenf out to kill the Dogs ; and that though they have never feen him before. yer they will all come forth, and bark, and flie at hinit.

The Relations touching the Eorce of Imagination, and the Secret Inftincts of Nasure, are fo uncertain, as they require a great deal of Examination ere we conclude upon them. I would have it firt throughly inquired, whether there be any fecret paffages of Symparhy between Perfons of near Blood; as Parents, children, Brothers, sifters, Nurfe-children, Husbands, Wives, ©fc. There be many reports in Hifory, that upon the death of Perfons of fuch nearnefs, Men have had an inward feeling of it., I my felf remember, that being in Paris, and my Father dying in London, two or three days before my Fathers death, I had a dream; which I told to divers Englikh Gentlemen, that my Fathers Houfe in the Countrey was Plaittered allover with Black Mortar. There is an opinion abroad, (whether idle, or no I cannot fay) That loving and kinde Husbands have a fenfe of their Wives breeding Childe by fome acci. dent in their own Body.

Next to thofe that are near in Blood, there may be the like paftage and inftincts of Nature between great Friends and Enemies. And fometimes the revealing is unto another perfon, and not to the party himfelf. I remember Pbilippus Comineus (a grave Writer) reporteth, That the Arehbithop of Viesna (a Reverend Prelat) laid (one day) after-Mafs to King Lewis the Eleventh of France, Sir, Your Mortal Enemy í dead; what time, Charles Duke of Burgundy was nain at the Battel of Granfon againft the Switzers. Some tryalalfo would be made, whether Pact or Agreement do any thing; as if two Friends fhould agree, That fuch a day in every-Week, they being in far diftant places,

Thould pray orie for another, or Thould put on a Ring or Tablet one for anothers fake; whether, if one of them fhould break chicir Vow and Promife, the other thould have any feeling of it ia abfence.

If there be any force in Imaginations and Affections of fingular Pcrfons, it is probable the force is much more in the Joync-Imaginations and Affections of Multitudes; as if a victory fhould be woir or loft in remote parts, Whether is there not fome fenfe thereof in the people whom it concerneth, becaule of the great joy or grief that many nien are poffeffed with at once? Pitu Quintu, atthe very time when that memorable victory was won by the Chriftians againft the Turks, at the Naval Battel of Lepanto; being then hearing of Caules in the Confiftory, brake off fuddenly, and faid to thofe about him, It is now more then time me Bould give thanks to G od for the great Fitcory he bathgranted us againft the Turks. It is true, that Victory had a Sympathy with his Spirit, for itwas meerly his workto conclude the League: It may be that Revelation was Divine. But what thall we fay then to a number of Examples anongf the Grecians and Romans, where the People being in Theatres at Plays, liave had news of Victories and Orerthrows fome few days, before any Meffenger could come ?

It is true, that that may hold in thefe things which is the general Root of Superftition; namely, that men obferve when things hit, and not when they mifs, and commit to Memory the one, and forget and pafs over the other. But touching Divination and the mifgiving of Mindes; we hall fpeak more when we handle in general the $N_{\text {ature of }} M$ indes, and Souls, and Spirits.

We having given formerly fome Rules of Imagination, and touching the fortifying of the fame ; we have fet down alfo lome few Inftances and Directions of the force of Imagination upon Beafts, Birds, orc. upon Plants, and upon inanimate Bodies : Wherein you mutt ftill obferve, that your Tryals be upon Subtil and Light Motions, and not the contrary; for you will Cooner by Imagination bind a Eirdfrom Singing then from Eating or Flying; and I leave it to every man to chufe Experiments which himfelf thinketh moft commodious, giving now but a few Examples of every of the three kindes. binding of a Bird from finging, and the like of a Dog from barking. Try alfo the Imagination of fome, whom you fhall accommodate with things to fortifie it in Cock-fights, to make one Cock more hardy, and the orher more cowardly. It would betried alfo in flying of Hawks, or in courfing of a Deer or Hart with Grey hounds, or in Horfe-races, and the like comparative Motions; for you may fooner by Imagination, quicken or flack 2 motion, then raife orceafe it; as it is eafier tomake a Doggo flower, then to make him ftand Itill, that he may not run. fort of Motions; as upon the fudden fading or lively coming up of Herbs; or upon their bending one way or other, orupontheir clofingandopening, \&c.

For Inanimate things, you may try the force of Imagination upon ftaying the working of Beer, when the Barm is put in; or upon the coming of Butter or Cheele, after the Churning, or the Rennet be put in.
993. Proprieties and Influxec, That the Torpedo M, rina, if it be touched $u$ ith a long ftick, doth ftupefie thehand of him that touchethit. It is one degree of
working at diftance, to work by the continuarce of a fit Medium; as Sound will be conveyed to the Ear by ftriking upoa Bow-itring, if the Horn of the Bow be held to the Ear.

The Writers of Natural CMagick do attribute mach to the Virtues that comefrom the parts of Living Creatures, fo as they betaken from them, the Creatures remaining fill alive; as if the Creature filll living did infufe fome immateriate Virtue and Vigor into the part fevered. So much may betrue, that any part taken from a Living Creature newly $\mathrm{n}_{\mathrm{in}}$, may be of greater force, then if it were taken from the like Creature dying of itfelf; becaufe, it is fuller of Spirit.

Tryal would be made of the like parts of Individuals in Plants and Living Creatures; asto cut off a Stock of a Tree, and to lay that whinich you cut off to putrefie, to fee whether it will decay the reft of the Stock; or if you thould cut off part of the Tail, or Leg of a Dog, of a Cat, and lay is ro putrefie, to fee whether it wili fefter, of keep from healing; the part which remaineth.

Is is received, that it helpeth to continue love, if one wear a Ring or a- Bracelet of the Hair of the party beloved. But that may be by the exciting of the Imagination; and perhaps a Glove, or other like Favor, may as well doir.

The Sympathy of Individuals that have beenentire, or have touched, is of all others, the moft incredible; yet according unto our fuithful nanner of Examination of Nature, we will make fone littemention of it. The taking away of Warts, by rubbing them with fomewhat that afterwards is put to wafte and confume, is a common Experiment; and I do apprehend it the rather, becaufe of mine own experience. I had from my Childhood a-Wart upbn one of my Fingers; afterwards, when I was about fixteen years old, being then at Paris, there grew upon both my hands anumber of Warts (at leaft an hundred) in a moneths (pace. The Englifb Ambaffdors Lady, who was a Woman farfrom Superitition, told me one day fhe would help me az way with my Warts. Whereupon fhe got a piece of Lard with theskin on; and rubbed the Waits all over with the fat fide, and amongt the reft that Wart which I had from my Childhood; then fhe nailed the piece of LaEd, with the fat towards the Sun; upon a poft of her Chamber. window, which was to the South. The fuccefs was, that within five weeks fpace all the Warts went quite away, and that Wart which I had folong endured, for company. But at the reft I did little matvel, becaule they came in a fhort time, and might goaway in a fhott time again; but the going of that which had ftaid fo long duth yet ftick with me. They fay the like is done by rubbing of Warts with a green Elder-ftick, and then butying theftick to rotin muck. It would be tried with Corns and Wens, and fuch other Excrefeences : I would have it alfo tried with fome parts of Living Creatures that are heareft the nature of Exctefcences; as the Combs of Cocks, the Spurs of Cocks, the Horns of Bals, \& c. and I would have it tried both ways; both by rubbing thofe parts whith Latd or Elder as befores and by cutting off come piece of thofe parts; and laying it to confume, to fee whether it will work any effect to wards the Confump tion of that part which was oncec joyned with it

It is conftantly received and avouched, that the anointing of the Weapor that maketh the Wound, will heal the Wound it felfin this Experiment, upon the relation of men of credir, (though my felf, as yet, am not fully inclined to believe it) you that note the Points following.: Firft, the Oyntment wherewith this is done, is made of divers Ingredients; whereof the
ftrangelt and hardeft to come by, are the Mofs upon the Skull of a dead Man unburied, and the Fats of a Boal, anda Bear killed in the act of generation. Thefe two laft I could eafily lufpect to be preferibed as a ftartling hole, that if the Experimens proved not; it might be pretended; that the Bealts were nor killed in the due time; for as for the Mofs, it is certain there is great quantity of it in Ireland, upon flain Bodies laid on heaps unburied. The other Ingredients are the Blood-ftone in Powder, and fome other things which feem to have a virtue to ftanch blood, as allo the Mors hath. And the defcription of the whole Oyntment is to be found in the Chyrsical Dijpenfatory of Crollius. Secondly, The fame kinde of Oynment applied to the hurt it leff, worketh not the effect, but onely applied to the weapon. Thirdly, (which I like well) they do not oblerve the confecting of the Oyntment under any certain Conftellation; which commonly is the excufe of Magical Medicines when they fail, that they were not made under a fit figure of Heaven. Fourthly, it may be applied to the Weapon, though the party hurt be at great diftance. Fifthly , it feemeth the Imagination of the party to be cured is not needful to concur, for it may be done without the knowledge of the party wounded: And thus much hath been tried, that the Oyntment (for Experimemes fake) hath been wiped off the Weapon without the knowledge of the party hurt, and prefently the party hurt hath been in great rage of pain, till the weapon' was reanointed. Sixthly, it is affirmed, That if you cannot get the weapon, yet if you put an Inftrument of Iron or Wood, relembling the weapon into the Wound, whereby it bleedeth, the anointing of that Intrument will lerve and work the effect. This I doubr Should be 2 device to keep this ftrange form of Cure in requeft and ule, becaufe many times you cannor come by the Weapon it felf. Seventhly, the Wound muft be at firft wathed clean with White-wine, or the parties own Water, and then bound up clole in fine Linnen, and no more drefling renewed till it be whole. Eighthly, the Sword it felf mult be wrapped up clofe as far as the Oyntment goeth, that it take no wind. Ninthly, the Oyntment, if you wipe it off from the Sword and keepit, wil ferve again, and rather increafe in vertue then diminifh.Tenthly, it will cure in far thorter time, then Oyntments of Wounds commonly do. Lafly, it will cure a Beaft as well as a Man ; which I like belt of all che reft, becaule it fubjecteth the matter to an eafie tryal.
999.

IWould have Men know, that though Ireprehend the eafie paffing over of the eaufes of things, by afcribing them to fecret and hidden virtues and proprieties (for this hath arrefted and laid afleep all true Inquiry and Indications; 1 yet I do not underftand, but that in the practical part of knowledge much will be left to Experience and Probation, whercunto Indication cannot fo fully reach ; and this is not onely in Specie, but in Intividuo. So in Phyfick, if you willcure the faugdies, it is not enough to lay, that the Medicine mutt not be cooling, forthat will hinder the opening which the difeafe requireth; that it mult not be hor, for that will exafperate Choler; that it mult go to the Gall, for there is the obftrution which caufeth the difeafe, \&c. But you muft receive from Experience, that:Powder of Chamapytis, or the like, drunk in Beer, is good for the Faundiss. So again, a wife Phyfician doth not continue fill the fame Medicine to a Patient, but he will vary, if the firft Medicine doth not apparently fucceed; for of thofe Remedies that are good for the Jainndies, Stone, $A$ Igues, $G c$. that will do good in one Body, which will not ${ }^{\text {t }}$ dogood in another, according to the correfpondence the Medicine hath to the Individual Body.

## Century $X$.

THe delight which Men have in Popularity, Fame, Honor, Submifion; and Subjectian of other Mens Mindes, Wills, or Affections (although thefe things may be defired for other ends) (eemeth to be athing in it felf; without contemplation of confequence, grateful, and agreeable to the Nature of Man: This thing (furely) is not without fome fignification, as if all Spirits and Souls of Men came forth out of one Divine Limbus ; elfe, why be Men fo $^{\text {L }}$ much affected with that which others think or fay? The beft temper of Mindes, defireth good Name and true Honor; the lighter, Popularity and Applaufe; the more depraved, Subjection and Tyranny; as is feen in great Conquerors and Troublers of the World, and yet more in Arch-Herencks, for the introducing of new Doetrines; is likewife anaffectation of Tyranny over the Undertandings and Beliefs of Men:

## I. The Poultice.

B. Of Mancher, about three Ounces, the Crum onely, thin cut; let it be boiled in Milk till it grow to a Pulp; add in the end, a Dram and a half of the Powder of Red Rofes.
Of Saffron ten Grains.
Of Oyl of Rofes an Ounce.
Let it be fpred upon a Limen Cloth, and applied luke-warm, and continued for three hours fpace.

## 2. The Bath or Fomentation.

Bx. Of Sagc-Leaves, half an handful.
Of the Root of Hemlock fliced, fix Drams.
Of Briony Roots, half an Ouncc.
Of the Leaves of Red Rofes, two Pugils.
Let them be boiled in a Pottle of Water wherein Steel hath been quenched, till the Liquor come to a Quart ; after the ftraining, put in half an handful of Bay-Salt.
Let it be ufed with Scarlet-Cloth, or Scarlet-Wool, dipped in the Liquor hot, and fo renewed feven times; all in the face of a quarter of an hour or little more.

## 3. The Plaifer.

2. Emplaffrum Diacalcitheos, as much as is fufficient for the part you mean to cover; let it be diffolved with Oyl of Rofes in fuch a confiftence as will ftick, and fpred upon a piece of Holland, and applied.

FINTS.

## HISTOR Y

 Natural and Experimental OFLIFE\&DEATH: O R,
Of the Prolongation of LIFE.

Written in Latin by the Right Honorable Francis Lord Verulam, Vifcount St. eflbans.

LONDON,
Printed for VVilliam Lee at the Turks-head in Fleetfreet. 1669.

praifes of Cbymical CHedicines, firtt puff up with vain hopes, and then fail their admirers.

And as for that Eeath which is caufed by Suffocation, Putrefaction, and feveral Difeafes, wefpeak not of it now, for that pettains to an Hiffory of Piyfick; but onely of that Death which comes by a total decay of the Body, and the Inconcoction of old Age. Neverthelets the laft act of Death, and the very extinguifhing of $L$ ifo it fclf, vichich mar to many wars be wrought outwardly and inwardly (which notwithftanding have, as it were, one common Porch beforeit comes to the point of death) will bepertinent to beinquired of in this Treatife; but we referve that for the 1att place.

That which may be repaired by degrees, without a tetal wafte of the firt ftock, is potentially eternal, as the $V_{e f f a l}$ Fire. Therefore when $P$ byficians and Philofoplers faw that living Creatures were nourifhed and their Bodies repaired, but that this did laft onely for a time, and afterwards came old age, and in the end diffolution; they fought Death in foniew hat which could not properly be repaired, fuppofing a Radical CMoifare incapable of folid réparation, and which, frum the firt infancy, received a fipurious addition, but no true reparation, whereby it grew daily worle and worfe, and, in the end, brought the bad tonone at all. This conceit of theirs was both ignorant and vain; for all things in living Creatures are in their youth repaired entirely; nay, they are for a time increafed in quantity, bettered in quality, fo as the Matter of reparation might be eternal, if the Manner of reparation did not fail. Put this is the truth of it, There is in the declining of age an unequal reparation; fome parts are repaired eafily, others with difficulty and totheir lofs; fo as from that time the Bodies of Men begin to endure the torments of Me . zentius, That the living die in the embraces of the dead; and the parts cafily repairable, through their conjunction with the parts hardly repairable, do decay : For the Spirits, Blood, Flesh, and Fat are, even after the decline of years, eafily repaired; but the drier and more porous parts (as the CMembranes, all the Tunicles, the Sinens, Arteries, Veins, Bones, Cartilages., moft of the Bowels, in a word, almoft all the $O_{\text {rganicut }} \mathcal{P}_{\text {arts }}$ ) are hardly repairable, and to their lofs. Now thefe hardly-repairable parts, when they come to their office of repairing the other which are eafily repairable, finding themfelves deprived of their wonted ability and ftrength, ceafe to perform any longer their proper Functions: By which means it comes to pafs, that in procefs of time the whole tends to diffolution; and even thofe very parts which in their own nature are with much eafe repairable, yte through the decay of the Organs of reparation can no more receive reparation, but decline, and in the end utterly fail. And the caufe of the termination of L ife is this, for that the spirits, like a gentle flame, continually preying upon Bodies, confpiring with the outward Air, which is ever fucking and drying of them, do, in time, deftroy the whole Fabrick of the Body, as alfo the particular Engines and Organs thereof, and make them unable for the work of Reparation. Thefe are the true ways of Natural Deatb, well and faithfully to be revolved inour mindes; for he that knows not the ways of Nature, how can he fuccor her, or curn her about?

Fherefore the Inquiftion ought to be twofold; the one touching the Confumption or Depredation of the Body of Man; the other touching the Reparation and Renovation of the lame: To the end, that the former may,

## The Preface.

as much as is polfible, be forbidden and reftrained, and the latter comforted. The former of thefe pertains, efpecially to the spirits and outward Air, by which the Depredation and W afte is committed; the latter to the whole race of Alimentation or Nourishment, whereby the Renovation or Reftitution is made. And as for the former part touching Consumption, this hath many things common with Boties Inanimate, or without life. For fuch things as the Native Spirit (which is in all tangible Bodies, whether living or without life) and the ambient or external Air worketh upon Bodies Inanimate, the fame it attempteth upon Animate orLiving Bodies; alchough the Vital spirit fuperadded, doth partly break and bridle thofe operations, partly exalt and advance them wonderfully. For it is mol? manifeft that Inanimate Bodies (moft of them) will endure a long time without any Reparation ; but Bodies Animate without Food and Reparation fuddenly fall and are ektinguifhed, as the Fire is. So then, our Inyuijftion thall be double. Firft, we will confider the Body of Man as Inanimate, and not repaired by Nourisbment: Secondly, as Animate and repaired by Nourishment. Thus having Prefaced thefe things, we come now to the Topick places of Inuuifiticn.

$$
\mathcal{T} O T H \varepsilon \quad \mathcal{R} \varepsilon A \mathcal{D} \varepsilon R
$$

 Am to give Advertifement, that there came forth of late a Tranflation of this Book by an unknown Perfon, who though he wished well to the propagating of his Lordhips $W$ orks, yet he was altogether unacquainted with his Lord/bips file and manner of Expreffions, and fo published a Tranfation lame and defective in the whole. Whereupon I thought fit to recommend the fame to be tranflated anew by a more diligent and zealous Pen, which hath fince travelled in it; and though it ftill comes short of that lively and incomparable Spiritand Expreffion, which lived and died with the Author, yet I dare avouch it to be much more warrantable and agreeable then the former. It is true, this Book was not intended to have been published in Eng lif ; but feeing it hath been already made free of that Language, whatfoever benefit or delight may redound from it, I commend the fame to the Courteous and fulicious Reader.

To the prefent Age and Pofterity, Greeting.

Lthough I bad ranked the Hiftory of Life and Death as the laft among ft my Six Monethly Defignations; yet I bave thought fit, in refpect of the prime uJe thereof, (in which the leaf lo B of time ougbt to be efteemed precious) to invert that order, and to fend it forth in the econd place. For I bave bope, and wilh, that it may conduce to a common good; and that the $\mathcal{N}$ (obler fort of Phy ficians will adpance their thoughts, and not employ their times wholly in the fordidneß of Cures, neitber be bonored for Neceffity onely, but that tbey will become Coadjutors and Inftruments of the Divine Omnipotence and Clemency in Prolonging and Renewing the Life of Man; efpecially feeing I prefribe it to be done by Jafe, and convenient, and civillmays, thoughb bitberto unajayed. For thougb we Chriftians do continually afpire and pant after the Land of Promife; yet it will be a token of Gods favor tomards us, in our journeyings through this. Worlds Wildernefs, to bave our Shoes and Garments (I mean tbofe of our frail Bodies) little worn or impaired.

Fr. St. Albans.

## THE

## Particular Topick Places;

 ARTICLES of INQUISITION TOUCHING LIFE and DEATH. Irft, inquire of $\sqrt{ }$ ature durable, and Not durable, in Bodies Inanimate or without Life, asalfo in Vegetables; but that not in a large or juft Treatife, but as in a Bricf or Summary onely.

Alfo inquire diligently of Deficcation, Arefaction, and ConSumption of Bodies Inanimate, and of Vegetables; and of the ways and proccfles, by which they are done ; and further, of Inhibiting and Delaying of Deficcation, Arefaction, and Con-- fumption, and of the Confervation of Bodies, in their proper ftate; and again, of the Inteneration, Emollition, and Recovery of Bodies to their former frelhnefs; after they be once dryed and withered.

Neither need the Inquifition touching thefe things, to be full or exact, feeing they pertain rather to thcir proper Title of Nature durable; feeing alfo, they are not Principals in this Inquifition, but ferve onely to give light to the Prolonjation and Instauration of Life in Living creatures. In which (as was faid before) the fame things come to pafs, but in a particular mamncr. So from the Inguijition touching Bodies Inanimate and Vege. tables, Iet the Inquifition pals on to other Living Creatures befides Mano

Inquire touching the lengt' and Bortnefs of Lifo in Living Creaturcs, with the due circumftances which make mott for theirlong or thort lives.

But becaufe the Duration of Bodies is twofold, One in Identity, or the felf. fame fubftance, the other by a Renovation or Reparation; whereof the former hath place onely in Bodies Inanimate, the latter in Vegetables and Living Creatures, and is perfected by eAlimentation or Nouri/bment ; therefore it will be fit to inquire of Alimentation, and of the ways and progreffes thercof; yot this not exactly, (becaufe it pertains propenly to the Titles of Afimilationand Alimentation) but, as the reft; in progrefs onely,

From the inquifition touching Living Creatures, and Bodies repaired by Nourifhment, pals on to the Inquiftion touching Man. And now being come to the principal fubject of Inquifition, the Inquiftion ought to be in all points more precife and accurate.

Inquire touching the length and Boritnefs of Lifein Men; according to the Ages of
In quire touching the length and fhortnefs of Life in Men, according to their Races fitutions, and Habits of Body, their Statures, the manner and time of theirgrowth, and the making and compofition of their Members.

- Inquirc tonching the length and /hortnes of Life in Men, according to the times of their Nativity; butfo, as you omit for the prefent all Aftrological obfervations; and the Figures of Heaven, under which they were born; onely infilt upon the vulgar and
manifeft Obfervations; as whether they were born in the Seventh, Eighth, Ninth, or Tenth Moneth; alfo, whether by Night orby Day, and in what Moneth of the Year.

Inquire touching the Lenoth and Shortnefs of Life in Men, according to otheir Fare, Diet, Government of their Life, Exercifes, and the like. For as for the Air, in which Men live and make their abode, we accoint that proper to be inquired of in the abovefaid Article, touching the places of their Habitation.

Inquire touching the Lengthand stortnefs of Life in Men, according to their Stredies, their feveral Courfes of Life, the Affections of the Minde, and divers Accidents befalling them.

Inquire apart touching thofe $\mathcal{M}$ edicines which are thought to prolong Life.
Inquire touching the Signs and Prognosticks of long and jhort life; not thofe which betoken Death at hand, (for they' belong to an History of Phyjck) but thofe which arc feen and may be obferved even in Health, whether they Be Phyfiognoninical figns, or any other.

Hitherto have been propounded Inguifitions touching Lenoth and Shortnefs of Life, befides the Rules of $\mathcal{A r t}$, and in a confufed manier ; now we think to add fome, which Thall be more Art-like, and tending to practice, under the name of Intentions: Thofe Intentions are generally three: As for the particular Diftributions of them, we will propound them when we come to the Inquiftion it felf. The thtee gencral Intentions are, the Forbidding of Wafte and Confumption, the Perfecting of. Reparation; and the Renerring of Oldnefs. Arefaction and confumption, at leaft which put off and protract the inclination thercunto.

Inguire touching thofe things which pertain to the whole procefs of Alinzentation, (by which the Body of Man is repaired) that it may be good, and with the beft improvement.
14.

Inquire touching thofe things which purge out the old Matter, and fupply withnew; as alfo which do Intenerate and Moiften thofe parts which are already dried and hardried.

But becaufe it will be hard to know the Ways of Death, unlefs we fearch out and difcover the Seat, or House, or rather Den of Deaish, it will be convienient to make Inquifition of this thing; yet not of every kinde of Death, but of thofe Deaths which are caufed by want and indigence of Nourilhment, not by violence; for they are thofe Deatbs onely which pertain to a decay of Nature, and meer old Age.
15. Inquire touching the Point of Death, and the Porches of Death, leading thereunto from all parts, fo as that Death be caufed by a decay of Nature, and not by Violence.

Laftly, becaufc it is behovefulto know the Charaiter and Form of Old Aoe, which will then beft be done, if you make a collection of all the Differences, both in the State and Functions of the Body, betwixt routh and Old Age, that by them you may obferve what it is that produceth fuchmanifold $E f f e c t s$; let not this Inquiftion be omitted.'

Inquire diligently touching the $\mathcal{D}$ ifferences in the State of the Body and Faculties of the grinde in routh and Old Age; and whether there be any that remain the fame without alteration or abatement in Old Age.

## $\mathcal{N}$ ature $\mathcal{D}$ urable, andnot Durable.

The History.

To the firf Etals are of that long lafting, that Men cannot trace the beginnings of eArticle. them ; and when they do decay, they decay through $R u \notin t$, not through perfpiration into Air ; yet Gold decays neither way.

Orick-flaer, though it be an humid and fluid Body, and cafily made volatile by Fire; yet (as far as we have obferved) by Age alone, without Fire, it neither wafteth nor gathereth Ruft.
3. Stones, efpecially the harder fort of them, and many other Foffiles, are of loing

## The Hifory of Life and Death.

ing, and that though they be expofed to the open air; much more if they be buried in the earth. Notwithftanding stones gather a kind of Nitre, which is to them inftead of Ruft. Precious stones and Cryftals exceed Mctalls in long lafting; but theri they grow dimmer and Iefs Orient, if they be very old.

It is obferved, that Stones lying towards the North do fooncr decay with age than thofe that lie toward the South; and that appcars manifeftly in Pyramids, and Churches; and other ancient Buildings : contrariwife, in Iron, that expofed to the South; gathers Ruff fooner, and that to the North later; as may be feen int the Iron-bars of windows. And no marvel, fecing in all purtefaction (as Ruft is) Moifturchaftens Diffolutions; in all fimple Arefaction, Drinefs.
$\ln$ Vegetables, (we fpeak of fuch as are fell'd, not gruwing) the Stocks or Bodics of harder Trees, and the Timber made of them, laft divers ages. But then there is difference in the bodics of Trees: fome Trees are in a manner foongy, as the Elder, in which the pith in the midet is foft, and the outward part harder ; but in Timber-trecs, as he Oak, the inner part (which they call Heart of Oak) lafteth longer.

The Leaves, and Flowers, and Stalks of Plants are but of fhort lafting, but diffolve into duft, unlefs they purrefic: the Roots are more durable.

The Bones of living Creatures laft long, as we may fee it of mens bones in Charnel. houfes: Hornsalfo laft verylong; fo do zeeth, as it is feen in Ivory, and the Seankörfe Teeth.

Hides alfo and Stins endure very long, as is cvident in old Farchment-books: Paper like wifc will laft many ages, though not folong as Parchment.

Such things as have pafed the Fire laft long, as Glafs and Bricks; likewife Fiefband Fruits that have paffed the Fire laft longer than Liaw: and that not oncly becaufe the Baking in the Fire forbids putrcfaction; but alfo becaufe the watry humour being drawn forth, the oily humour fupports it felf the longer.
water of all Liquors is fooneft drunk up by Air, contrariwife oil lateft; which we may fee not oncly in the Liguorsthemfelves, but in the Liquors mixt with other Bodies: for Paper wet with water, and fo getting fome degree of tranfparency, will foon after wax white, and lofe the tranfparency again, the watry vapour exhaling ; but oiled Paper will keep the tranfparcncy long, the oil not being apt to exhale : And therefore they that counterfeit mens hands, will lay the oiled paper upon the writing they mean to counterfcit, and then affay to draw the lincs.

Gums all of them laft very long; the like do wax and Honey.
But the equal or mequal ufe of things conduccth no Iefs to long lafting or thort lafting, than the things themfelves; for Iimber, and Stones, and other Bodies, ftanding continually in the water, or continually in the atr, laft longer than if they were fometimes wet, fometimes dry : and fo Stones continue longer, if they be laid towards the fame coaft of Heaven in the Building that they lay in the Minc. The fanc is of Plants removed, if they be coafted juft as they were beforc.

## Obfervations.

LEt this be laid for a Foundation, which is moff fure, That there is in every Tangible body a Spirit, or body Pncumatical, cnclofed and covered with the Tangible parts; And that from this Spirit is the beginning of all Difolution and Confumption, $\sqrt{0}$ as the Antidote againgt them is the detaining of this Spirit.

This Spirit is detained troo mays: either by a ftrcight 'nclofure, as it mere in a PriFon: or by akind of frce and voluntary Detention Again, this voluntary flay is perfwaded troo ways: either if the Spirit it Self be not too moveable or eager to depart; or if the external Air importune it not too much to come forth. So then, two forts of Subflances are durable, Hard Subftances, and Oily: Hard Subftance binds ins the Spirits clofe; Only partly enticeth the Spirit to stay, partly is of that nature that it is not importuned by Air ; for Air is confubftantial to Watcr, and Flame to Oil. And toucheng Nature Durable and not Durable in Bodies Inanimate, thus much.

## The Hifory.

## The Hilfory of Life and Deatb.

three or four years; as the Violet, Straw-berry, Burnet, Prim-rofe, and sorrel. But Borage and Buglof:, which feem fo alike when they are alive, differ in their deaths; for Borage will laft but oric year, Buglofs will laft more.

But many hot Herbs heartheir age and years better; Hyßop, Thyme, savory, Pot-mar. joram, Ealm, wormwood, Germander, sase, and the like. Fennel dies yearly in the ftalk, buds again from the root: but tulfe and sweet-marjoram can better endure age than winter; for being fet in a very warm place and wel-fenced, they will live more than one year. It is known, that a knot of $H_{p} \int$ fop twice a year thorn hath continued forty years.

Bufhes and shrubs live threefcore years, and fome double as much. A Vine may attain to threefcore years; and continue fruitful in the old age. Refe-mary well placed will come alfo to threefcore years; but white Thorn and /vy endure above an hundred years. As for the Bramble, the age thereof is not certainly known, hecaufe bowing the head to the ground it gets new roots, fo as you cannot diftinguilh the old from the new.

Amongt great Trees the longeft livers are the Dat, the Holm, Wild afh, the Elm, the Beech-tree, the Chef-nut, the Plane.tree, Ficus Ruminalis, the Lote tree, the rild olive, the palm-tree and the Wulberry tree, Of thefe, fome have come to the age of cight hundred years; but the leaft livers of them do attain to two hundred.

But Trees Cdorate, or that have fweet woods, and Trees Rozennie, laft longer in their Woods or Timber than thofe above-faid, but they are not folong-liv"d; as the Cyprefstree, Maple, Pine, Box, Funiper. The Cedar being born out by the vaftnefs of his body, lives well near as long as the former:

The $A / b$, fertilc and forward in bearing, reacheth to an hundred years and fomewhat better; which alfo the Birch, Maple, and Sirvice tree fometimes do : but the Poplar, Lime-tree, willom, and that which they call the Sycomore, and walnut-tree, live not folong.

The expple-tree, Pear-tree, Plum-tree, Pomegranate-tree, Citron-tree, Medlar-tree, black-cherry-tree, Cherry-tree, may attain to fifty or fixty years; efpecially if they be cleanfed from the Mofs wherewith fome of them are cloathed.

Generally, greatnefs of body in trees, if other things be equal, hath fome congruity with lengt's of life; fo hath bardnefs of Subfance: and trees bearing Mafl or Nuts are commonly longer livers than trees bearing Fruit or Derries: likewife trees putting forth their leaves late, and thedding them late again, live longer than thofe that are early either in leaves or fruit : the like is $\rho f$ wild-trees in comparifon of Orchard-trees And laftly, in the fame kind, trees that bear a Sowr fruit out-live thofe that bear a fweet fruit.

## An observation.

ARiftotle noted well the difference between Plants and living Creatures, in refpect of their Nourilhment and Reparation: Tरamely, that the bodies of living Creatures are confined within certain bounds, and that after they be come to their full growth they are continued and preferved by Nourithment, but they put forth nothing new except Hair and Nails, whisb are counted for no better than Excrements; So as the juice of living creatures mult of necelfity fooner wax old: but in Trees, which put forthyearly new boughs, new hoots, new leaves, and new fruits, it comes to pafs that all thefe parts in Irees are once a year roung and renewed. Now it being fo, that whatfocver is freb and young draws the Nouriihment more lively and chearfully to it than that which is decayed andold, it happens withall, that the ftock and body of the tree, through which the fap paffeth to the branches, isrefrefbed and chearedwith a more bountiful and vigorous nourifhment in the pafage than otherwife it would have been. And this appears manifest (though Ariftotle noted it not, neither bath be expreffed thefe things fo clearly and perfpicuonfy) in Hedges, Copfes, and Pollards, when the plafhing, fhedding, or lopping comforteth the old Item or ftock, and maketh it nore fourifling and longer. liv'd.

# Deficcation, Probibuting of Deficcation, and In-teneration of that mbich is deficcated and dried. 

## The Hiftory:

FIre and frong Heats dry fome things, and melt others.

Limus ut bic durefoit, © hac ut Cera liquefcit, Uno codemque Igne?
Hows this Clay is bardned, and how this wax is melted, with one and the fame thing, Fire? It drieth Earth, Stones, wood, Cloth, and Skins, and whatfocver is not liquefiable; and it melteth Metalls, wax, Gums, Butter, Tallow, and the like.

Notwithftanding, even in thofe things whichthe firemelteth, if it be very vehement and continueth, it doth at laft dry them. For metal in a ftrong fire, (Gold oncly excepted) the volatile part being gone forth, will become lefs ponderous and more brittle ; and thofe oily and fat fubftances in the like fire will burn up, and be dried and parched.

Air, efpecially open Air, doth manifeflly dry, but not melt : as High wrays, and, the upper partof the Earch, moiftned with fhowers, are dried; linnenclothes walhed, if they be hang dout in the air, are likewife dried; herbs, and leaves, and flowers, laid forth in the thade, are dried. But much more fuddenly doth the Air this, if it be either en. lightned with the Sun-beams, (fo that they caufe no putrefaction) or if the air be ftirred, as when the windbloweth, or in roomsopen onall fides.
age moft of all, but yet floweft of all, drieth; as in all bodies which (if they be not prevented by putrefaction) are drie with Age. But age is nothing of ic felf, being onely the meafure of time; that which caufeth the effeef is the native Spirit of bodies, which fuckech up the moifture of the body, and then, together with it, flicth forth; and the air ambient, which multiplicth it felf upon the native Jpirits and jurices of the body, and preyeth upon them.

Cold of all things moft properly drieth: for drying is not caufed but by contraction; now contraction is the proper work of cold. But becaufe we Men have heat in a high degree, namely, that of Fire, but cold in a very low degree, no other than that of $V$ Vinter, or perhaps of Ice, or of snow, or of Nitre; therefore the drying caufed by cold is but weak, and cafily refolved. Notwithftanding we fee the furface of the earth to be more dried by Froft, or by March-zizeds, than by the sun, fecing the fame wind both licketh up the moifture and affecteth with coidnefs.

Smoak is a drier;as in Bacon and Neatstongues which arc hanged up in the chimncys:and Perfumes of olibanum, or Lignum Aloes, and the like, dry the Brain, and cure Catarrhs.
Salt, after fome reafonable continuance, drieth, not oncly on the out-fide, but in the infide alfo; as in $F l e / h$ and $F i / b$ falted, which if they have contmued any long time have 2 manifeft hardnefs within.

Hot Gums applied to the skin dry and wrinkle it; and fome aftringent maters alfo do the fame.

Spirit of ftrong waters imitateth the fire in drying ; for it will both potch an Eggput into it, and toaft Bread.

Poipders dry like sponges by drinking up the moifture, as it is in Sand thrown upon Lines new written : alfo fmoothne/s and politenefs of bodies, (which fuffer not the vapour of moifture to go in by the pores ) dry by accident, becaufe it expofeth it to the air; as it is feen in precious Stones, Look kng gloffes, and Blades of swords, upon which if you breath, you thall fee at firft a little mift, but foon after it vanifheth like a cloud. And thus much tor Deficeation or Drying.

They ufe at this day in the EaSt parts of Germany Garners in Vaults under gronnd, wherein they keep $V$ Vicat and orher grains, laying a good quantity of ftraw bothunder the grains and about thein, to fave them from the dampnefs of the Vianlt; by which device they keep their grains 20 or 30 years. And this doth not onely preferve them from fuftinefs, but (that which pertains more to the prefent inquifition) preferves them alfo in that greenncfsthat they arc fit and ferviccable to make bread. The fame is reported to have becn in ufe in Cappadocia and Thracia, and fome parts of spain.

The placing of Garners on the tops of houfes, with windows towards the Eaft

To the fecond Article. and North, is very commodious. Some alfo make two Sollars, an upper and a lower; and the upper sollar hath an hole it, through which the grain continually defcendeth, like fand in an bour-gla/s, and after a few dayes they throw it up again with fhovels, that fo it may be in continual motion. Now it is to be noted

## The Hiftory of Life.and Deatb.

that this doth not only prevent the Fuftinefs, but conferveth the Greenefs, and flacketh the Deficcation of it. The Caufe is that which we noted before, That the difchargeing of the VVatry hamour, which is quickned by the Motion and the VVinds, preferves the Oily bumour in his being, which otherwife would fly out together with the VVatry bumour. Alfo in fome Mountains, where the Air is very pure, dead Carkafes may be keptfor a good while without any great decay.
13. $\quad$ Fruits, as Pomegranates, Citrons, Apples, Pears, and the like; alfo Flomers, as Kofes and Lilies, may be kept a long time in Earthen Veffels clofe ftopped : howfocver; they are not free from the injuries of the outward Air, which will affect them with his unequal Temper through the fides of the Veffel, as it is manifeft in heat and cold. Therefore it will be grod to fop the mouths of the Veffels carcfully, and to bury them within the Earth; and it will be as goodnot to bury them in the Earth, but to fink them in the vVáter, fo as the place be fhady, as in vVells or Cisternsplaced within doors: bit 1 hofe that be funk in Water will do better in Glafs veflels than in Earthen.

Generally thofe things which are kept in the Earth, or in Vaults under ground, or in the bottons of a Well, will preferve their frelhnefs longer than thofe things that are keptabove ground.

They fay it hath been obferved, that in Confervatories of snow (whether they were in Mountains, in natural Pits, or in Wells made by Art for that purpofe) an Apple, or (bef-nut, or Nut, by chance falling in, after many months, when the Snow hath melted, hath been found in the snow as frefh and fair as if it had been gathered the day bcfore.

Country people keep Clufters of Grapes in Meal, which though it makes them lefs pleafant to the tafte, yet it preferves their moilture and frefhnefs. Alfo the harder fort of Fruits may be kept long, not onely in Meal, but alfo in Saw -dsff, and in beaps of Corn.

There is an opinion held, that Bodies may be preferved frefh in Liguors of their own kind, as in their proper Menfrina; as, to keep Grapes in Wine, olives in Oil.

Pomegranates and Quinces are kept long, being lightly dipped in Sea-water or Saltwater, and foon after taken out again, and then dried in the open $A$ ir, fo it be in the Shade.

Bodies put in wine, oil, or the Lees of oil, kecplong; muchmore in Hony or Spirit of Wise; bur moft of all, as fome fay, in Quick-fliver.

Fruits inclofed in Wax, Pitch, Plaifter, Pafte, or any the like Cafe or Covering, kecpgrcen very long.

It is manifeft that Flies, Spiders, Ants, or the like fmall creatures, falling by chance into Amber, or the Gams of Trees, and fo finding a burial in them, do neyer after corrupt or rot, although they be foft and tender Bodies.

Grapes are kept long by being hanged up in Punches: the fame is of other Fruits. For there is a two-fold Commodity of this thing : the one, that they are kept without preffing or bruifing, which they muft needs fuffer if they were laid upon any hard fubftance; the other, that the Air doth encompa fs them on every fide alike.

It is obferved that Putrefaction, no lefs than Deficcation in Vegetables, dotlr not begin in every part alike, but chicfly in that part where, being alive, it did attract noutiihment. Therefore fome advife to cover the falks of Apples or other Fruits, with Wax or Pitch.

Great Wieks of Candles or lamps do fooner confume the Tallow or Oil than leffer Wieks; alfo Wicks of Cotton fooner than thofe of Rush, or Straw, or fmall Tzeigs: and in Staves of Torches, thofe of Funiper or Firre fooncr than thofe of $A / h$ : likewife Flame moved and fanned with the Wind fooner than that which is fill: And therefore Candles fet in a Lanthorn will laft longer than in the open Air. There is a Tradizion, that Lamps fet in Scpulchres will laft an nocredible time.

The Naturealfo and Preparation of the $\mathcal{N}$ ourifiment conduceth no lefs to the lafting of Lamps and Candles, than the nature of the Flame; for Wax will laft longer than Tallow, and Tallow a little wet longer $t$ ' an Tallow day, and Wax candles old made longer than Wax-candies new made.

Trees, if you ftir the Earth about their Root every year, will continue lefs time; if once in four, or perhaps in ten years, much longer: alfo cutting off the Suckers and young Shoots will make than live the longer: but Danging theim, or laying of Marl about their Roots, or much Watering them, adds to their fertility, but cuts off from their long lafting. And thus much touching the Probibiting of Deficcation or ConSumption.

## The Hiftory of Life and Death.

The Inteneration or making tender of that which is dried (which is the chief Matter) affords but a fmallnumber of Experiments. And therefore fome few Experiments which are foundin Living Creatureś, and alfoin Man lhall be joyned together.

Bands of willow, wherewith thcy ufe to binde Trees, laid in Water, grow móre flexible; likewife they putBoughs of Birch (the ends of them) in Earthen Pots filled with Water, to keep them from withering ; and Bowls cleft with drynefs, fteep'd in Water, clofe again.

Boots grown hard and obftinate with age, by greafing them before the Fire with Tallow, wax foft, or being onely held before the Fire get fome fofnefs. Bladders and Parchments hardned alfo bccome tender with warm Water, mixed with Tallow or any Fat thing ; but much the better, if they be a little chafed.

Trees grown very old, that have ftood long without any culture, by digging and opening the Earth about the Roots of them, feemtogrow young again, and put forth young branches.

Old Draught Oxen worn out with labor, being taken from the yoak, and put into frefh Pafture, will ger young and tender fleth again, infomuch, that they will eat as frefh and tender as a ${ }^{\text {teecr}}$.

A frict Emaciating Diet of Guaiarum, Bisket, and the like, (wherewiththey ufe to cure the French-Pox, Old catarrbs, and fome kinde of Dropfes) doth firft bring mento great poverty and leannefs, by wafting the Juices and Humors of the Body; which after they begin to be repaired again, feem manifeftly more vigorous and young. Nay, and I am of opinion, that Emaciating Difeafes afterwards well cured, have adyanced many in the way of long life.

## Obfervations.

MEn fee clearly, like Owls, in the Night of their own Notions; but in Experience, as in the Day-light they wink and are but balf- Fighted. They speak much of the Elementary quality of Siccity or Drinefs, and of things Deficcating, anduf the Natural Periods's of Bodies, in whichthey arecorrupted end confumed: But mean while, either in tbe beginnings, or middle paffages, or lafts acts of Deficcation and Confumption, they obfervenothing that is of moment.

Deficcation or Confumption in theprocefs thereof, is fnithedby three Actions; akd all thife (as was faid before) bave their original from the Native Spirit of Bodies.

The firft Action is, the Attenuation of the Moifure into Spirit; the fecond is, the Iniuing forth or flight of the Spirit ; the third is, the Contraction of ite grofler parts of the Body insmediately afier the Spirit $2 f$ fued forth. And this laft is, that Deficcation and Induration which we chiefly bandle; the former two confume onely.

Touching Attenuation, the mater is manifeft. For the Spirit which is inclofed in every Tangible Body forgets not its nature, but whatfoever it meets witbal in the Body (in wibich it is inclofed) that it can digeft and mafter, and turn into it felf, that it plainly alters and Subdues, and multiplies it felf upon it, and begets ners Spirit. And this evicted by öne proof, inftead of many; for that thofethings which are throughly dryed are leßeried in their weight, and become hollow, porous, and refoundeng from within. Now it is moff certain, thait the inmatrd Spirit of any thing, confers nothing to she weight, but rather lig' tens it; and therefore it muft needs be, that the Same Spirit hath turned into it the mojiture and juyce of the Body which weighed before, by which means the weight is leffened. And this is the firlt Átion, the Attenuation of the Moifture, and converting it into Spirit.

Thefecond Action, which is the 1fluing forth or Flight of the Spirit, is as mannifeff a.fo. For that iffuing forth, when it is in throngs, is apparent even to the fenfe; in Vapors to the fight, in Odors to the fmelling ; but if it ifueth forth fiowly, (as wher a thing is decayed by age) then it is not apparent to the fenfe, but the matter is the fame. Again'; where the compofure of the Body is either Joftreight or fo tenacious; that the Spirit can finde nopores or. paffares by which to depart, then, in the friving to get out, it drives before it the groffer parts of the Body, and protrudes thembeyond the Superficies or furface of the Body; as it is in the ruft of Metals, and mould of all Fat things. Aind ibis is the fecond Action, the Iffuing forth or Flight of the Spirit.

The third Action is fomerihat more obfoure, but full as ceriain; that is, ihe Conrraction of the groffer parts after the Spirit iffued forth. And this appears, firf, in that Bodies after the Spirit iffued forth, do manifefly firink, and fill a lefs room ; an it is in

## The Hilfory of Life and Deatb.

the Kernels of Nuts, which after they are dried, are too little for the Shells; and in Beams and Planchers of Houfes, which at firt lay clofetogether, but after they aredried, give; and likerife in Bowls, which through drought, grows full of cranies, the parts of the Bowl con. tracting themfelves together, and after contraction muft needs be empty spaces. Secondly; It appears by the wrinkles of Bodies dryed: For the endeavor of contracting it $\int$ elf is $\int_{u c b_{3}}$ that by the contraction it brings the parts nearer together, and fo lifts them up ; for robatfoevier is contracted on the fides, is lifted up inthe midft: And ihis is to be feen in Papers and old Parchments, and in the Skins of Living Creatures, and in the Coats of Soft Cheefes, all which, with age, gatberwrinkles. Thirdly, This Contraction /herss it felf moft in thofe things, which by beat are not onely wrinkled, but ruffled, andplighted, añd, as it weere; romled together; as it is in Papers, and Parchments, and Leaves; brought nearthe fire: For Contraction by Age, which is more flow, commonly caufeth wrinkles; but Contraction by the Fire', which is more 位edys. caufeth plighting. Nowit moft things where it comes not to wrinkling or plighting, there is fimple Contraction, and anguftiation or ftreightning, and induration or hardning, and deficcation, as mas fiemed in the firft place. Bint if the iffuing forth of the Spirit, and abfumption or wafte of the Moifture be fo great, that there is not left body fufficient to unite and contrail it felf, then of neceffity Contraction muft ceafe; and the Body beconseputrid, and notbing elfe bui a little duft cleaving together, which with a light toich is disperfed and falleth afunder; as it is in Bodies that are rotten, andin Paper burnt, and Linner made into Tinder, and Carkafes embalmed after many ages. And this is the third Action, the Contraction of the groffer paris after the Spirit ifueth forth.
It is to be noted, that Fire and Heat dry onely bjaccident; for their proper work is to attenuate and dilate the Spirit and Moifture; and then it follows by accident, that the other parts Boozld contract themfelves, either for the fying of Vacuum alone, or for fomeother motion withal, whereof we now speak not.
It is certain, that Putrefaction taketh its original from the Native Spirit, nolefstheni Arefaction; but it goeth on a far different way: For in Putrefaction, the Spirit is not fimply vapored forth, but being detained in part, works frange garboils; and the groffer parts are not $\int 0$ much locally contraited, as they congregate themjelves to parts of the fainse nature.

## Length and Shortneß of Life in Living Creatures.

To the firft Article.

TThe Hiftory. their Bodies, their time of Bearing in the Womb, the number of their young ones, the time of their growth, and thereft) in regard that the fe things are intermixed, and fometimes they concur, fometimes theyfever.
Nains age (as far as can be gathered by any certain Narration) doth exceed the age of all other Living Creatures, except it be of a very few onely; and the Concomitants in him are very equally difpofed; his ftature and proportion large, his bearing in the womb nine moneth's, his fruit commonly one ata birth, hispubertyat the age of fourteenyears, his time of growing till twenty.
\% buthis bearing in the Womb the face of Ten years, is fabulous; of two years, or at leaftabove one, is certain. Now his bulk is great, his time of growth until the thirtiethyear, his teeth exceeding hard; neither hath it been obferved, that his blood is the coldeft of all Crcatures : His age hath fometimes reached to Two hundred years.
90
Lions are accounted long livers, becaufe many of them have been found Toothlefs, afgnot fô certain, for that may be caufed by their ftrong breathol
The Bear is a great Neeper, a dull beaft, and given to eafe; and yet not noted

## The Hilory of Life and Dealh.

for long life : nay, he hath this fign of thort life, that his bearing in the momb is but fhort, fcarce full forty days.

The $F$ ox fecms to be well difpofed in many things for longlife; he is well skinned, feeds on fleth, lives in Dens; and yet he is noted not to have that property. Certainly he is a kind of Dog,anc that kind is but Chort-liv'd.

The Camel is a long liver, a lean Creature, and finewy, fo that he doth ordinarily attain to fifty,and fometimes to an hundred years.

The Horfe lives bit to a moderate age, fcarce to forty years, his ordinary period is twenty years: but perhaps he is beholden for this fhortnefs of life to Man; for we have now no Hor res of the Sun, that live freely, and at pleafure, in good paftures. Notwithftanding the Horfe grows till he be fix years old, and is able for generation in his old age. Bcfides, the Frare goeth longer with her young one than a woman, and bringsforth, two at a burthen more rarely. The $A / 5$ lives commonly to the Hor $\sqrt{6}$ 's age ; but the Mule out-lives them both.

The Hart is famous amongit men for long life, yet not upon any relation that is undoubted. The tell of a certain Hart that was found with a Collar about hisneck, and that Collar hidden with Fat. The long life of the Hart is the lefs credible, becaufe ho comes to his perfection at the fifth year; and not long after his Horns (which, he theds and renews yearly) grow more narrow at the Root, and lefs branched.

The $D o g$ is but a fhort liver, he exceeds not the age of twenty years, and for the moft part lives not to fourteen years: a Creature of the hotteftemper, and living in extreams; for he is commonly cither in vehement motion, or fleeping : befides, the Bitch bringeth forth many ata Burden, and goeth nine weeks.

The $O x$ like wife, for the greatnefs of his body and ftrength, is but a fhort liver, about fome fixteen years, and the Wales live longer than the Females; notwithftanding they bear ufually but one at a burden, and go nine months: a Creature dull, flefhy, and foon fatted, and living onely upon Herby fubitances, without Grain.

The Sheep feldom lives to ten years, though he be a creature of a moderate fize, and excellently clad; and, that which may,feem a wonder, being a creature with fo little a Gall, yet he hath the moft curled Coat of any other, for the Hair of no Creature is fo much curled as wool is. The Rams generate not before the third year, and continue able for generation until the eighth. The Ews bear young as long as they live. The Sheep is a difeafed Creature, and rarely lives to his full age.

The Goat lives to the fame age with the Sheep, and is not much unlike in other things; though he be a Creature more nimble, and of fomewhat a firmer flefh, and fo ihould be longer-liv'd; but then he is much morelafcivious, and that fhortens his life.

The Sow lives to fiftecn years, fometimes to twenty : and though it be a Creature of the mgifteft fleth, yet that feems to make nothing to Length of Life. Of the Wild Boar or Sow we have nothing certain.

The Cat's age is betwixt fix and ten years: a creature nimble and full of fpirit, whofe feed (as Elian reports) burneth the Female; whereupon it is faid, That the Cat conceives with pain, and brings forth with eafe: A Creature ravenous in eating, rather fwallowing down his meat whole than feeding.

Hares and Conies attain frarce to feven years, being both Creatures generative, and with young ones of feveral conceptions in their bellies. In this they are unlike, that the Coney lives under ground ; and the Hare above ground; and again, that the Hare is of a more duskifh fleth.

Birds for the fize of their bodies are much leffer than Beafts; for an Eagle or Swan is but a fmall thing in comparifon of an $O x$ or Horfe, and fo is an Eftrich to an Elephant.

Birds are excellently well-clad : for Feathers, for warmth and clofe fitting to the body, exceed Wooll and Hairs.

Birds, though they hatch many young ones together, yet they bear them not all in their bodies at once, but lay their Eggs by turns, whereby their Fruit hath the more plentiful nourih ment whilf it is in their bodies.

Birds chew little or nothing, but their meat is found whole in their crops, notwithftanding they will break the thells of Fruits, and pick out the Kernels: they are thought to be of a very hot and ftrong concoction.

## The Hifory of Life and Death.

The motion of Birds in their flying is a mixt motion, confifting of a moving of the limbs, and of a kind of carriage ; which is the molt wholiome kind of Exercife.

Arifotle noted well touching the generation of Burds, (but he transferred it ill to other living (reatures) that the feed of the Miale confers le:s to generation than the Female, but that it rather affords Activity than Matter ; fo that fruitful Eggs and unfruitful Eggs are hardly diftinguifhed.

Birds (almoft all of them) come to their full growth the firftyear, or a little after. It is true, that their Feathers in fome kinds, and their Bills in others, fhew their years, but for the growth of their Bodies it is not fo.

The Eagle is accounted a long liver, yet his years are not fet down; and it is alledged as a fign of his longlife, that he cafts his Bill, whercby he grows young again : from whence comes that old Proverb, The old age of an Eagle. Notwithftanding perchance the matter may be thus, That the renewing of the Eagle doth not caft his bill, but the cafting of his bill is the renewing ofthe Eagle, for after that his bill is grown to a great crookednefs, the Eagle feeds with much difficulty.

Valtures are allo affirmed to be long livers, infomuch that they extend their life well near to an hundred years. Kites likewife, and fo all Birds that feed upon flefh, and sirds of prey live long. As for Hamks, becaufe they lead a degenerate and fervile life for the delight of men, the term of their natural life is not certainly known: notwithftanding amongft Mewed Hawks fome have been found to have lived thirty years, and amonglt is ild fawks forty years.

The Raven likewife is reported to live long,' fometimes to an hundred years: he feeds on Carrion, and flies not often, but rather is a fedentry and malánchollick Bird, and hath very black flefh. But the crow, like unto him in moft things, (except in greatnefs and voice ) tives not altogether folong, and yet is reckoned amongtt the long livers:

The Swan is certainly found to be a long liver, and exceeds not unfrequently an hundred years. Hc is a Bird excellently plumed, a feeder upon fifh, and is always carried, and that in running waters.

The Goofe alfo may pals amongit the long livers, though his food be commonly grafs, and fuch kind of nourifhment ; elpecially the wild-Goofe; whercupon this Proverb grew amongtt the Germans, magis Senex quam Anfer nivalis, Older thana wild Goofe.
storks muft needs be long livers, if that be true which was anciently obferved of them, that they never came to Thebes, becaufe that City was often facked. This if it were fo, then either they muft have the knowledge of more ages than one, or elfe the old ones muft tell their young the Hiftory. But there is nothing more frequent than Fables.

For Fables do fo abound touching the Pboenix, that the truth is uttenly loft if any fuch Bird there be. As for that which was fo much admired, That the was ever feen abroad with a great troop of Birds about her, it is no fuch wonder; for the fame is ufually feen about an $\mathrm{O}_{\mathrm{wl}} l$ flying in the day-time, or a Parrot letout of a Cage.

The Parro hath been certainly known to have lived threefcore years in England, how old foever he was before hewas brought over: a Bird eating almoft all kind of meats, chewing hismeat, and renewing his bill; likewife curf and mifchievous, and of a black feiti.

The Peacocklives twenty years; buthe comes not forth with hisArgus Eyes before he be three years old; a Bird flow of pace, having whitinh flew.
32. The Dung-ill-Cock is venerieus, martial, and but of a fhort life; a crank Bird, having alfo white flefh.

The Indian-Cock, commonly called the Tw-key-Cock, lives not much longer than the Dunghill. Cock: an angry Bird, and hath exceeding white flefh.

The Ring-Doves are of the longeft fort of livers, infomuch that they attain fometimes to fifty y ears of age : an arcry Bird, and both builds and fits on high. But Doves and 7 wurtles are but thort-liv"d, not exceeding eight years. not fo white of flef as the ordinary Pullen.

## The Hifory of Life and Death.

The Black bird is reported to be, amongft the leffer birds, one of the longeft livers; an unhappy bird, and a good finger.

The sparrow is noted to be of a very short life; and it is imputed in the Males to their lafcivioufnefs. But the Linnet, no bigger in body than the Sparrow, hath been obferved to have lived twenty years.

Of the Eftrich we have nothing certain: thofe that were kept here have been fo mnfortunate, that no long life appeared by them. Of the bird 16 is we find onely that he livethlong, but his years are not recorded.

The age of Fifmes is more uncertain than that of terreftrial Creatures, becaufc living under the water they are the lefs obferved: many of them breath not, by which means their vital firit is more clofed in; and therefore though they receive fome refrigeration by their Gills, yet that refrigeration is not fo continual as when it is by breathing.

They are free from the Deficcation and Depredation of the Air ambient, becaufe they live in the water: yet there is no doubt but the water ambuent, and piercing, and received into the pores of the body, doth more hurt to long life than the Air doth.

It is affirmed too that their blood isnot warm. Some of them are great devourers, even of their own kind. Their flelh is fofter and more tender than that of terreftrial creatures : they grow exceedingly fat; infomuch that an incredible quantiry of Oyl will be extracted out of one W' bale.

Dolphins are reported to live about thirty years; of which thing a trial was taken in fome of them by cutting off their tails: they grow untill ten years of age.

That which they report of fome Fi hes is Itrange, that after a certain age their bodies will wafte and grow very flender, onely their head and tail retaining their former greatnefs.

There were found in Cafar's Fifh ponds Lampreys to have lived threefore years: they were grown fo familiar with long ufe, that crafus the Orator folemnly lamented one of them.

The Pike amongft Fishes living in fresh water is found to laft longeft; fometimes to growth, for that they; anongt all other Creatures, are thought to grow diring their whole life. They are of thofe Creatures that lay Eggs, ravenous, cruel, and well-fenced againft the waters, Touching the other kinds of shell-fif, we find nothing certain ho w' long they live:

## Obfervations.

TO Find out a Rule touching Length arid Shornefs of Life in Living Creatures is very defficult, by reafon of the negligence of Obfervations, and the intermixing of Cainfes. A fers things we will fet down.

There are more kends of Birds found io be long live than of Beafts; as the Eagle, the Vulture, the Kite, the Pelican's the Raven; the Crow, the Swan, the Goofe, the Stork, the Crane, ithe Birdcalled the Ibis, the Parrot, the Ring dove, with the reff, though they comie. to their full growth woithin a jear, and are lefs of bodzes: Jurely tbeir cloathing is excellent good againft the diftemperatures of the weather; and befides, liwing for the moft part in the open CAir, they are like the Inhabitants of pure Mountains, which are long-livid. again, their Motion, wbich (as lelfe-mpere faid) is a mixt Motion, cömpounded of a mizoving of their Limbs and of a carriage in the Air, doth lefs wieary and veear them, and tis more wholfome. Neither do they fuffer any compreffion or want of nourijbmient in their mother's bellies, becaufethe Eggs are laid by turns. But the chicfeff caufc of all I take to be this', that Birds are nade more of the fubftance of the Mother thian of the Father, whereby their Spirits are not So eager and hot:

It may be a Pofition, that Creaturcs which partake more of the fubffance of ibeir Mother than of their Father are longer-liv'd, as Birds are; which was said before Alfo that thofe which have a longer time of bearing in the nomb, do partake more of the fubftance of their. Mother, lefs of the Father, and $J o$ are longer-liv'd: Infomuch that 1 am of opinion, that even amongfte Men, (which I have noted in Some) thofe that refemble ibeir Mothers moft are longejf-liv'd; andfo are the Cbildren of Oldmen begotten of young VVives, if the Fathers be found, not difeafed.

The firft breeding of Creatures is ever material, either to their buirt or benefit: And therefore it ftands with reafon, that the lefler Compreffion, and the more liberal Alimentation of the Young one in the womb, Should confer much to Long Life. Now this happens when eitber the young ones are brought forth fucceffively, as in Birds; or when they are fingle Births, as in Creatures bearing but one at a Burtben.

But long Bearing in the Womb makes for Length of Life three ways. Firft, for that the young one partakes more of the fubftance of the Mother, as bath been faid. Secondly, that it comes forth more ftrong and able. Thirdly, that it undergoes thepredatory force of the Air later, Befides, it Jhews that Nature intendeth to finifb her periods by larger Circles. 'Nows though Oxen and Sheep, which are borain the womb about fix months, are but/hort-liv'd, that happens for other caufes.

Feeders upon Grafs and mere Herbs are but fiort livers; and Creatires feeding upon Fleih, or Seeds, or Fruits, longlivers, as fome Birds are. As for Harts, mhich are longoliv'd, they take the one half of their meat (as men ufe to fay) from above their heads; and the Goofe, befides Grafs, findeth fometbing in the water, and stubble to feed upon.
$u$ e fuppofe that a good Cloathing of the Body maketh much to longlife; for it fenceth and armeth againft the intemperances of the Air, whicbdo wonderfully affail and decay the body: which benefit Birds efpecially have. Now that Sheep, which bave fo good Flecces, Bould be fo /hort-liv'd, that is to be imputed to Difeafes, whereof that Creature is full, andte the bare eating of Grafs.
7. The feat of the Spirits, without doubt, is principally the Head; which though it be wfual ly underflood of the Animal Spirits onely, yet this is all in all. A Again, it is not to be doubted but the Spirits do moft of all wafle and prey upon the Body, oo that when they are either in greater plenty, or in greater Inflamation and Acrimony, there the life is much Bortned. And therefore I conceive a great canfe of long life in Birds to be the fmalnefs of their Heads in comparifon of their Bodies; for even Neen which have very great Heads I Suppofe to be the Jhorter livers.
8. I ans of opinion that Carriage is of all other motions the moft helpfut to long life; wbich I alfo noted before. Now there are carried Water-fowls upon the water, as Swans', all Birds in their fying, but with a frong endeavour of their limbs; and Finhes, of the length of whlofe live we have no certainty.
9.

Thofe Creatures which are long. before they come to their perfection (not fpeaking of growth in ftature onely, but of other ftepsto maturity; as Man puts forth, firft, bis Teeth, next the figns of Puberty; then bis beard, and fo formard) arelong liv'd, for it Jhens that Nature fini hed her Periods by larger Circles,
10.
II. ftone and Spur to many Functions in the Body.

Creatures whofe Flefh is more duskifh are longer-liv'd than thofe tbat have white Flefh; for it Jeeweth that the juice of the body is morefirm, andlefs apt to dijfipate.
12.

In' every corruptible Body Quantity maketh much to the confervation of the whole: for a great Fire is longer in quenching, a frsall portion of water is fooner evaporated, the Body of a Tree witheretb not fo faft as a Twig,' Andtherefore generally (I Jpeak it of Species, not of Individuals) Creatures that arelarge in body are longer-liv'dtbain thofe that are fmall, rinlefs there be forme other potent caufe to binder it.

## The Hifory of Life and Death.

Alinsentation; or Nourijbiment: and the way of Nouribing.

## The History.

NOuribiment ought to be of an inferiour nature, and more fimple fubfance than the thing nourilhed. Plants are nourifhed with the Earth and Water, Living Creatures with Plants, Man with living Creatures. There are alfo certain Creatures feeding upon Fleilh, and Wanhimfelf takes Plants into a part of his Nourilhment; but Man and Creatures feeding upon Flefh are fcarccly nourilhed with Plants alone: perhaps Fruit or Greins, baked or boiled, may, with long ufe, nourih them; but Leaves or Plants or Herbs will not do it, as the Order of the Fo liatanes Thewed by Experience.

Over-great Affinity or Confubfintiality of the Nourifoment to the thing nourifhed proveth not well : Creatures feeding upon Herbs touch no Fleth; and of Creatures feeding upon Flefh, few of them eat their own kind: As for Men, which are Cannibais, they feed not ordinarily upon FWens flefh, but refervye it as a Dainty, either to ferve their reveng upon their enemies, or to fatisfic their appetite at fome times. So the Ground is beft fown with Seed growing elfewhere, and Men do not ufe to Graft or Ino culate upon the fane Stock.
By how much the more the Nourifoment is better prepared, and approacheth nearer in likenefs to the thing nourifhed, by fo much the more are Plants more fruitful, and living Creatures in better liking and plight: for a young slip or cion is not fo well nourihed if it be pricked into the groutid, as if it be grafted into a Stock agreeing with it in Nature, and where it finds the nourilhmentalready digefted and prepared: neither (as is reported, will the Seed of an Onion; or fome fuch like, fown in the bare earth, bring forth fo large a fruit as if it be put into another Onion, which is a new kind of Grafting, into the root, or under ground. Again, it hathbeen found out lately, that a Slip of a wild Tree, as of an Elm, Oak, eAJh, or fuch like, graftedinto a Stock of the fame kind, will bring forthlarger leaves then thofe that grow without grafting: Alfo Men arenot nourifhed fo well with raw fleth as with that which hath paffed the fire.

Lizing Creatures are nourithed by the Mouth, Plants by the Root, Young ones in the womb by the Navel: Birds for a while are nourifhed with the Tolkin the Egge, whereof fome is found in their Crops after they are hatched.

All Nourìhment moveth from the centre to the Circumférence, 'or from the Inward to the : utward: yet it is to be noted, that in Trees and Plants the Nourifhment paffeth rather by the Bark and Outward parts then by the Pith and Inward parts; for if the Bark be pilled off, though butfor a fmall breadth, round, they live no more : and the Bioud in the Veins of living Creatures doth no lefs nourifh the Flefh beneath it then the Fleif above it.

In all $A$ limentation or Nowiribment there is a two fold Actions, Extufion and catt tration; whereof the former proceeds from the Inward Function, the latter from the Outward.

Vegetables affimulate their Nourifhment fimply, without Excerning: For Gums and Tears of Trees are rather Exuberances then Excrements, and Knots or knobs are nothing but Difeafes. But the fubftance of living Creatures is more perceptible of the like; and therefore it is conjoyned with akind of difdain, whereby it rejecteth the bad, and affimulateth the good.
It is a ftrange thing of the fialks of Fruits, that all the Nourifhment which produceth fometimes fuch great Fruits, fhould be forced to pafs through fo narrow necks; for the Fruit is ncver joyn'd to the Stock without fome ftalk.
It is to be noted, that the Seeds of living Creatures will not be fruitfulbut when they are now ihed, but the Seeds of Plants will be fruitfula long time after they are gathered; yet the Slips or Cions of Trees will not grow unlefs they be grafted green; neither will the roots keep long frefh unlefs they be covered with earth:
In living creatures there are degrees of Nourilhment according to their Age: in the womb, the young one is nourished with the Mother's blood; when it is new-born, with Milk ; afterwards with Meatsand Drinks; and inold age the moff nourishing and favoury Meats pleafe beft.

To t!e fourth Arricle.

To the 5, 6, $7,8,9$, and II Articles.

BEfore the Floud, as the Sacred Scriptures relate," Men lived many hundred years; yet none of the Fathers attained to a full thoufand. Neither was this Length of Life peculiar onely to Grace, or the Holy Line ; for there are reckoned of the Fathers until the Floud eleven Generations; but of the fons of Adam by cain onely eight Generations; fo as the pofterity of Cain may feem the lon-ger-liv'd. But this Length of Life immediately after the Flond was reduced to a moiety, but in the Poft-nati ; for Noab, who was born before, equalled the age of his Anceftors, and Sem faw the fix handredth year of his life. Afterwards, three Generations being run from the Flouds the Life of chan was brought down to a fourth part of the primative Age, that was, to about two hundred years.

## Length and Shortnefs of Life in © Man.

Above all it maketh to the prefent Inquifition, to inquire diligently and attentively whether a manmay not receive 2 ouribment from without, at leaft fome other way befide the Mouth. We know that Baths of Milk areufed in fome Hectick Fevers, and when the body is brought extrcam low, and Phyficians do provide Nourifhing clyfters. This matter would be well ftudied; for if Nouri/bment may be made cither from without, or fome other way than by the ftomach, then the weaknefs of Concoction, which is incident to oldmen, might be recompenced by thefe helps, and Coricoction reftored to them intire.

## The Hiftory.

Abraham lived an hundred feventy and five years: a man of an high courage, and profperous in all things. Ifacc came to an hundred and cighty years of age : a chatte man, and enjoying more quietnefs than his Father. But facob, after many croffés and a numerous progeny, lafted to the hundred forty feventh year of his life: a paticnt, gentle, and wife man. Ifmael, a military man, lived an hundred thirty and feven years. Sarab (whofe years onely amongft women are recorded) died in the hundred twenty feventh year of her age : a beautifull and magnanimous woman; a fingular good Mother and Wife ; and yet no lefs famous for her Liberty than Obfequioufnefs towards her husband. fofeph alfo, a prudent and politick man, paffing his youth in affliction, afterwards advanced to the height of honour and profperity, lived an hundred and ten years. But hisbrother Levt, elder thàn himfelf, attained to an handred thirty feven years: a man impatient of contumely and revengeful. Near unto the fame age attained the fon of Levi; alfo his grand-child, the father of Aaron and $M o f e s$.

Mofes lived an hundred and twenty years : a ftout man, and yet the meekest upon the earth, and of a very flow tonguc. Howfoever Mofes in his Pfalm pronounceth that the life of man is but feventy years, and if a man have ftrength, then eighty; which term of man's life ftandeth firm in many particulars even at this'day. Aaron, who was three years the elder, died the fame year with bis Brother : a man of a readier fpeech, of a more facile difpofition, and lefs conftant. But Phineas, grandchild of Aaron, ( perhaps out of extraordinary grace) may be collected to have lived three hundred $y$ ears; if fo be the War of the Ifraelites againft the Tribe of Benjamin. (in which Expedition Phineas was confulted with) were performed in the fame order of time in which the $H_{2}$ fory hath ranked it : He was a man of a moft eminent Zeal. : 7o frua, a martial man, and an excellent Leader, and evermore victorious, lived to the hundred and tenth year of his life. Caleb was his Contemporary, and feemeth to have been of as great years. Ebud the Judge feems to have been no lefs than an hundred year's old, in regard that after the Victory over the cil onbifes the Holy Land had reft under his Government eighty years: He was a man fierce and undaunted, and one that in a fort neglected his life for the good of his People
Fob lived, after the reftauration of his happinefs, an hundred and forty years, being before his afflictions of that age that he had fons at man's eftate : a man po-
litick, eloquent, charitable, and the E.vample of Patience. Ele the Pricft lived nincty cight years; a corpulent man, calm of diffpofition, and indulgent to his children. But Elizaus the Propliet may feem tó have died when he was ahove anhundred years old; for he is found to have lived after the afumption of Elias fixty years; and at the time of that affumption he was of thofe years, that the boys mocked tim by the name of Bald-bead : a man vehement and fevere, and of an auftere life, and a contemner of riches. Alfo Ifaiab the Prophet feemeth to bave been an hundred years old: for he is found to have exercifed the Function of a Prophet feventy years together, the years hoth of his beginning to prophefie and of his death beinguncertain: a man of an admirable eloquence, an Evangelical Propbet, full of the promices of God of the New Teftament, as a Bottle with fweet W'ine.

Tobias the Elder lived an hundred fifty cight years, the Younger, an huidredtweney feven : merciful meth, and great alms-givers. It feems, in the time of the Captivity, many of the Jews who returned out of Babylon were of great years, feeing they could remember both $T$ tomples, ( there being no lefs than feventy y.cars betwixt them) and wept for the unlikene fs of them. Many ages after that, in the time of our Saviour, lived old Simeon, to the arge of ninety; a devoutman, and full both of hope and expeCtation. Into the fame time alfo fell Anna the Prophetefs, who could not poffibly be lefs than an hundred $y$ ears old; for the had been feven years a wife, about eighty fonr years a widow, befides the years of her virginity, and the time that Che lived atter her Prophecy of our Saviour : She was an holy woman, and paffed her days in faftings and prayers.

The long Lives of Mer mentioned in Heathen Authors have no great certainty in them; both for the intermixture of Fables, whereunto thofe kind of relations were very prone, and for their falfe calculation of years. Certainly of the Fegyptians we find nothing of moment in thofe works that are extant as touching long Life, for their Kings which reigned longeft did not exceed fifty or five and fifty, years, which' is no great matter, feeing many at this day attain to thofe years. But the Arcadiag Kings are fabuloufly reported to have lived very long. Surely that Country was Mountainous, full of flocks of Sheep, and brought forth moft wholfome food; notwithftanding, feeing Pan was their god, we may conceive thatall things about them were Panickand vain, and fubject to fables.

Numa King of the Komatns lived to eighty years: a man peaceable, contemplative, and much devoted to Religion. Sarcous Valerius Corvinnes faw an hundred years complete, there being betvvixt his firft and fixth Conful乃ip forty fix years: a man valorous, affable, popular, and a.l way s fortunate,

Solon of efthens, the Law giver, and one of the feven wife-men,lived above eighty years: a man of an high courage, but popular, and affected to his Country ; alfolearned, given to pleafures and a foft kind of life. Epimenides the Cretian is reported to have lived an hundred fifty feven years: the matter is mix'd with a prodigions Relation; for fifty feven of thofe years he is faid to have flept in a Cave. Half an age after Xerophoiz the Colophomian lived an hundred and two years, or rather more: for at the age of twenty five years he left his Country, feventy feven complete years he travelled, and after that returned; but how long he lived after his return appears not ; a man no lefs wandring in mind than in body, for his name was changed for the madnefs of his opinious from Xenophanes to Xeromanes : a map no doubt of a vaft conceit, and that minded nothing but Infinitum.
e Anacreon the Poet lived eighty years and fomewhat better: a manlafcivious, voluptuous, and given to drink. Pindarus the Theban lived to cighty years: a Poet of an high fancy, fingular in his conceits, and a great adorer of the gods. sophocles the Atbenian attained to the likeage : alofty Tragick Poet, given over wholly to Writing, andneglectful of his Family.

Artaxerxes King of Perfialived ninety four years: a man of a dull wit, averfe to the difpatch of bufinefs, defirous of glory, but rather of eafe. At the fame time lived Agefilaus King of sparte to eighty fout years of age : a moderate Prince, as being a P'bilooopher among Kings; but notwit ftanding ambitious, and a Warriour, and no leff ftout in war than in bufinefs.

Gorgias the sicilianwas an hundred and cight vears old : a Retwician, and a great boafter of his faculty, one that taught Youth for profit : he had feen many Countries,

Countries, and a little before his death faid, That he had done nothing worthy of blame fince he was an old man. Protagoras of abaera fa ninety years of age: this man was likewifea Rhetorician, but profeffed norfo much to teach the Liberal Arts, as the Art of Governing Common-wealths and States: notwithftanding he was a great wanderer in the world, no lefs than Gorgias. Hocrates the Athenian lived ninety eight years: he was a Rhetorician alfo, but an exceeding modeft man; one that fhunned the publicklight, and opened his School onely in his own houfc. Democritus of Abdera reached to an hundred and nine years: he was a great Pbilofopher, and, if ever any man amongft the Grecians, a true Naturalif ; a Surveyor of many Countries, but muchmore of Nature ; alfo a diligent fearcher into Experiments, and (as Ariflotle objected againft him ) one that followed Similitudet: more than the Laws of Arguments. Diogenes the Sinopean lived ninety years : a mian that ufed liberty towards others, but tyranny over himfelf : a courfe diet, and of much patience. Zeno of Cutium lacked but two years of an handred : a man of an high mind, and a contemner of other mens opinions; alfo of a great acuteriefs, but yet not troublefome, chufing rather to take mens minds than to enforce them': The like whereof afterward was in Seneca. Plato the Athenian attained to cighty one years: a man of a great courage, but yet a lover of eafe; in his Notions fublimed, and of a fancy, neat and delicate in his life, rather calm than merry, and one that carried a kind of Majefty in his countenance. Theophraftus the Ereffian arrived at eig ty five years of age; a man $f_{w e e t}$ for his cloquence, fweet for the variety of his matters, and who felected the pleafant things of Philofophy, and let the bitter and harth go. carneades of Cy rene many years after came to the like age of eighty five years: a man of a fluent eloquence, and one who by the acceptable and pleafant variety of his knowledge de. lighted both himfelf and others. But Orbilius, who lived in Cicero's time, no PbiloSopher or Rhetorician, but a Grammzarian, attained to an hundred years of age, he was firft a Souldier, then a Schoolmafter; a man by nature tart both in his Tongue and Pen, and fevere towards his Scholars.

Quintus Fabius Maximus was Augur fixty three years, which fhewed him to be above eighty years of age at his death; though it be true, that in the eAugur/b ip Nobility was more refpected then age: a wife man, and a great Deliberator, and in all his procecdings moderate, and not without affability fevere. Mafiniffa King of Nu midia lived ninety years, and being more than eighty five got a fon: a daring man, and trufting upon his fortune, who in his youth had tafted of the inconftancy of Fortune, but in his fucceeding age was conftantly happy. But Marcus Porsius C'ato lived above ninety years of age: a man of an Iron body and mind; he had a bitter tongue, and loved to cherifh factions; be was givers to Husbandry, and was to himfelf and his Family a Phy fician.
'Terentia Cicero's wife, lived an hundred and three years : 2 woman afflicted with many crofles; firft, with the banifhment of her Husband; then with the difference betwixt them ; laftly, with his laft fatal misfortune : She was alfo oftentimes vexed with the Gout. Lsceia muft needs exceed an hundred by many years; for it is faid that the acted an whole hundred ycars upon the Stage, at firt perhaps reprefenting the perfon of fome young Girl, at laft of fome decrepit old Woman. But Galeria Copiola, a Player alfo and a Dancer, was brought upon the Stage as a Novice, in what year of her age is not known; but ainety nine years after, at the Dedication of the Theatre by Pompey the Great, The was Inewn upon the Stage, not now for an Actrefs, but for a Wonder : neither was this all, for after that, in the $S_{0}$ lemnities for the health and life of Auguftus, fhe was hewn upon the Stage the third time.

There was another AAtre/s, fomewhat inferiour in age, but much fuperiour in dignity, which lived well-near ninety years, I mean Livia fulia \& Augufa, wife to Anguftus Cafar, and mother to Tiberius. For if Augufius bis life were a Play, (as himfelf would have it, whenas upon his death-bed he charged his friends they thould give him a Plaudite after he was dead) certainly this Lady was an excellent diderefs, who could carry it fo well with her husband by a diffembled obedience, and with her fon by power and authority: a womán affable, and yet of a Matronal carriage, pragmatical, and upholding her power. But Junia, the wife of Caiws Caflues, and fifter of Marcus Brutus, was alfo nincty years old; for fhe furvived the Pbilippick Battel fixty four years : 2 magnanimous woman, in her great wealth

## The Hitory of Life and Death.

happy in the calamity of her husband and near kinsfolks, and in a long widow-hood unhappy; notwithfanding much honoured of all.

The year of our Lord feventy fix, falling into the time of Vefpaffan, is memorable; in which we thall find, as it were, a calendar of long liv'd men: For that year there Was a Taxing, (now a Taxing is the moft Authentical and trueft Informer touching the ages of men;) and in that part of laly which lieth betwixt the eApernine Mountains and the River Po, there were found an hundred and four and twenty perfons that either equalled or exceeded an hundred years of age: riamely, of an hundred years juft, fifty four perfons; of an hundred and ten, fifty feven perfons; of an hundred and five and twenty, two onely; of an hundred and thirty, four men ; of an hundred and five and thircy, or feven and thirty, four more; ; of an hundred and forty, three men. Befides thefe, Parma in particular afforded five; whereof three fulfilled an hundred and twenty years, and two an hundred and thirty: bruxels afforded one of an hundred and twenty five years olds placentia one, aged an hundred thirty and one; Faventia one woman, aged one hundred thirty and two : a crrtain Town, then called Velleiatium, fituate in the Hills about Placentia, afforded ten, whercof fix fulfilled an hundred and ten years of age; four, an hundred and twenty: Laftly, Rimini one of an hundred and fifty years, whofe name was Marcus Aponius.

That our catalogue might not be extended too much in length, me bave thought fit, as well in thofe whom we have rehearfed, as in thofe whom we 'Sall rebearle, to offer none under eighty years of age. 1 Now we have affixed to every one a true and hort Character or Elogy; but of that fort wherennto; in our judoment, Length of Life (which is not a little fubject to the Marners and Fortunes of men) hath Some relation, and that in a two-fold refoect: either that fuch kind of men are for the wiost part longliv'd; or that fuch men may fomet inmes be of long life, thouragh otherinife not well difpofed for it.

Amongt the Roman and Grecian Emperors, alfo the French and EAmain, to thefe our 'dayes, which make up the number of well-ncar two huidred Princes; : there are onely four found that lived to eighity years of age : unto whom we thay adde the two firf Emperors, augufins and Tiberius; whercof the latter fulfilled the feventy and eighth year, the former the fevcity and fixth year of his age, and might both perhaps have lived to fourforre, if Livia and Cairis had been pleafed. Auguftus (as was faid) lived feventy and fix years: a man of moderate difpofition; in accomplihing his defigns vehement, but otherwife calm and ferene; in meat and drink fober, in Venery intemperate, through all his life-time happy ; and who about the thirtieth year of his life had a great and dangerons ficknefs, infomnch as they defpaired of life in him; whom Antonius Mufa the Phyfician, when ocher Phyficians had applied hot Medicines, as moft agreable to his difeafe, on the contrar cured with cold Medicines, which percliance might be fome help to the prolonging of his life. Tiberius lived to be two years older: A man with leare chaps; as Augwitus was wont to fay, for his feech ftuck within his jaws, but was weighty. He was bloudy, a drinker, and one that took Luft into a part of his diet; notwithftanding a great obferver of his health, informuch that he ufed to fay, That he was a fool that after thirty years of age took advice of a phyfician. Gordian the elder lived eighty years, and yet died a violent death when he was fcarce warm in his Empire: a man of an high firit and renowned, learned, atid a Poet, and conftantly bappy throughout the whole courfe of his life, lave onely that he ended his dayes by a violent death. Valerian the Emperour was feventy fix years of age before he was taken prifoner by Sapor King of l'erfia, after his Captivity he lived feven years in reproaches; and then died a violent death alfo : a man of a poor mind, and not valiant ; notwithtanding lifted up in his o 1 n and the opinion of men, but falling Thort in the performance. Anaftafirs, furnamed Dicorus, lived eighty eightyears: Be was of a fetled mind, but too abject, and fuperftitious; and fearful. Anicius $\mathcal{F} u / f i-$ nianus lived to eighty three ycars: a man greedy of glory, performing nothing in his own perfon, but in the valour of. his Captains happy and renowned; uxorious, and not his own man, but fuftering others to lead him. Helena of Britain, mother of Confantine the Great, was four core years old : a woman that intermedled not in matters of Staténeither in her Husband's nor foris Reign, but devoted her felf wholly to Religion;magnanimous, and perpetually Rourifhing. Theodora the Emprefs (who was fifter to Zoes,
wife of Monomachus, and reigned alone after her deceafe) lived above eighty years : a pragmatical woman, and one that took delight in Governing; fortunate in the higheft degree, and through her good fortuines credulous;

We will proceed now from thefe Secular Princes to the Princes in the Courch. St. Folbn, an Apoftle of our Saviour, and the Beloved Difciple, lived nincty three years. He was rightly denoted under the Emiblem of the Eagle, fur hís piercing fightinto the Divinity; and was a seraph amongt the Apoftes in refpect of his burning Love. St. Luke the Evangeliff fulfilled fourfcore and four years : an cloqueit man, and a Traveller, St. Taul's infeparable Companion, and a l'byfician, "simeon the fon of Cleophas, called the Brother of our Lord, and Bithop of jernfatem; lived ain hundred and twenty years though he was cut Alorit by Martyrdom: a fout man, and contant, and full of good works." Polycarpus, Difciple unto the Apofties, and Bifhop of smyrna, feemeth to have extended his age to an huindred years and more; though he were alfo cut off by Martyrdom : a man of an high mind, of an heroical patience, and unwearied with labours. Dyonifurs eAreopagitar, Contemporary to the Apoftle St. Paul, lived ninety years: he was called the Bird of Heaven for his high flying Divinity, and was famous as well for his holy life as for hís Meditations. eAquilla and Prifcilla, firft St. Paul the Apofle's Hofts, Afterward his Fellow-helpers, lived-together in a happy and famous Wedlock at leaft to an hundred years of age a piece; for they were both alive under Pope' Xiffesthe firtt: a noble Pair, and prone to all kind of charity, who amongft other their comforts (which no doubt were great unto the firft Founders of the Church) had this added, to enjoy each other folong in an happy marriage. St. Paul the Hermite lived an hundred and thirteen years: now he lived in a Cave; his diet was fo flender and ftrict, that it was thoaght almoft impoffible to fupport humane nature therewithal: he paffed his years onely in Meditations and Soliloquies; yet he was notilliterate or an Idiot, but learned. St. Anthony, the firft Founder of osonks; or (as fome will tave it) the Reftorer onely, attained to an hundred and five years of age: a man devout and contemplative, though not unfit for Civil affairs ; his lite was auftere and mortifying, notwithftanding he lived in a kind of glorious folitude; and exercifed a command, for he had his Monks under him. And befides, many Chriftuans and Pbilofophers came to vifit him as a living Image, from which they parted not without fome adoration. St. At thanafius exceeded the term of eighty years: a man of an invincible conftancy, commanding fame, and not yielding to Fortune: he was free towards the Great ones, with the People gracious and acceptable, beaten and practifed to oppofitions, and in delivering himfelf from them ftout and wife. St. Hierom, by the confent of moft Writers, exceeded nincty years of age : a man powerful in his Pen, and of a manly Eloquence, varioufly learned both in the Tongues and Sciences, alfo a Traveller, and that lived frictly towards his old age, in an eftate private, and not dignified; he bore highSpirits, and fhined far out of obfcurity.

The Popes of Rome are in number tothis day two hundred forty and one. Of fo great a number five onely have attained to the age of fourfcore years, or upwards. But in many of the firf Popes their full age was intercepted by the Prerogative and Crown of Martyrdom. Jobn the twenty third, Pope of Rome, fulfilled the nineticth year of his age : a man of an unquiet difpofition, and one that ftudied novelty: he altered many things, fome to the better, others onely to the new, a great accumulator of Riches and Treafures. Gregory, called the twelfth, created in Schifm, and not fully acknowledged pepe, died at ninety years: of him, in refpect of his hort Papacy, we fird nothing to make"a judgment upon. Taul the third lived eighty years and one: a temperate man, and of a profound wifdom: he was Lcarned, an Aftrologer, and one that tended his health carcfully ; but, after the example of old Eli the Prieft, over-indulgent to his Family. Pasl the fourthattained to the age of eighty three years: a man of an harth nature and fevere, of an haughty mind and imperious, prone to anger; his fpeech was eloquent and ready. Gregory the thirteenth fulfilled the like age of eighty tliree years: an abfolutegoodman, found in mind and body, politick, temperate, full of good works, and an alms-giver.

Thofe that follow are to be more promifcuous in their order, more doubtful in their faith, and more barren of obfervation. King Arganthenius, who reigned at Cadiz in

Spain lived an hundred and thirty, or (as fome would have it) an huadred and forty years, of which he reigned eighty. Concerning his Manners, Inftitution of his Life; and the time wherein he reigned, there is a general filence. Cyniras King of Cyprus, living in the Ifland then termed the Happy and Pleafant Ifand, is affirmed to have attained to an hundred and fifty or fixty years. Two Latin Kings in Italy, the'Father and the Son, are reported to have lived, the one eight hundred, the other fix hundred years: but this is delivered unto us by certain philologifs, who though otherwife credulous enough, yet themfelves have fufpected the truth of this matter, or rather condemned it. © Others record fome Arcadian Kings to have lived threc hundred years : the Country, no doubt, is a place apt for long life; but the Relation I fufpert to be fabulous. They tell of one Dando in Illyrium, that lived without the inconveniences of old age to five hundred years. They tell alfo of the Epians, a part of Arolia, that the whole Nation of them were exceeding long liv'd, infomuch that many of them were two hundred years old: and that one principal man amonglt them, named $L$ itorius, a man of a Giant-like ftature, could haye told three hundred years. It is recorded, that on the top of the Mountain Timolus, anciently called Tempfis, many of the Inhabitants lived to an hundred and fifty years. We read that the SeCF of the Effeans amongt the Jews did ufually extend their life to an hundred years: " Now that Sect ufed a fingle or abftemious diet, after the rule of Pyrhagoras: Apolionius Tyanens exceeded an hundred years, his face bewraying no fuch age: he was an admirable man, of the Heathens reputed to have fomething Divine in him, of the chrifians held for a Sorcerer ; in his diet Pythagorical, a great traveller, much renowned, and by fome adored as a god : notwithttanding, towards the end of his life he was fubject to many complaints againft him, and reproaches, all which he made thift to efcape. But left his long life thould be imputed to his pythagorical diet, and not rather that it was hereditary; his Graidfather before him liyed an hundred and thirty years. It is undoubted that Quintus Metellies lived above an hundred years, and that after feveral Confulbips happily adminiftred, in his old age he was made pontifex Maximis, and exerciled thole holy duties full two and twenty years; in the performance of which Rites his voice never failed, nor his hand trembled. It is moff certain that Appius cacus was yery old, but his years are not extant; the moft part wher cof he pafled after he was blind; yet this misfortune no whit foftued him, but that he was able to govern a numerous Family, a great Retinue and Dependance, yea, even the Commonwealth it felf, with great ftoutnefs: In his extream old age he was brought in a Litter into the senate-boufe, and vehemently diffwaded the Peace with Pyrrbus: the beginning of his Oration was very memorable, thewing an invincible fpirit and ffrength of mind; 1 bave mith great grief of mind (Fatiers confeript) thefe many years born my blindnefs, but now 1 could wi/h ibat I were deaf alfo, when I bear you fpeak to fuch difnonourable Treaties. Narcus Perpenna lived ninety eight ycars, furviving all thoce whofe Suffrages he had gathered in the senate-honfe, being (onful, I mean, all the Senators at that time; as alfo all thofe whom a little after, being Conful, he chofe into the Senate, feven onely being excepted. Hiero King of Sicily, in the time of the fecond Punich War, liyed almoft an hundred years : a man moderate both in his Government and in his Life; a worlhiper of the gods, and a religious conferver of Friendfhip : liberal, and conftantly fortunate. Statilia, defcended of a noble Family in the days of Claudius, lived ninety nine years. clodia, the daughter of Oflius, an hundred and fifteen. . Xe$n c p$ 'ilmes, an ancient Philofopher, of the SeCt of TPythagoras, attained to an huncred. and fix years, remaining healehful and vigorous in his old age, and famous amonglt the vulgar for his learning. The iflanders of Corcyra were anciently accounted long liv'd, but now they live after the rate of other men, Hipocrates cour; the famous $\operatorname{phyffician}$, lived an hundred and four years, and approved and credited his own. Art by fo long a life : a man that coupled Learning and Wifdom together, very convcrfant in Experience and Obfervation; one that haunted not after Words or Mcthods, but fevered the very Nerves of Science, and fo propounded them. Demonax a Philofoper, not onely in Profeffion but Practice, lived inthe dayes of adrian almoft to an hundred years : a man of an high mind, and a vanquilher of his owr mind, and that truly and without affectation ; a contemner of the world, and yet civil and courteous. When his friends fake to him about his Burial, he faid, Tuke no care for my Burial, for Stonch mill bury a Carcafe. They replied, Is it your
mind than to be caft out tö Birds and Dogs? He faid again, secing in my life-timo 1 endeavonired to my uttermoft to benefit © Men', what hurt is it if ishen, I am dead. I benefit Beafts? Certain Indian people called Pandore are exceedingly long liv'd, even to no lefs than two hundred years. They adde a thing more marvellous, That having, when they are boys, an hair formewhat whitifh, in their old age, before their gray hairs, they grow coal black, though indeed this be every where to be feen, that they which have white hair whilft they are boys, in their man's eftate change their hairs into a darker colour. The Seres, another people of lndia, with their Wine of Palms are accounted long livers, even to an hundred and thirty years. Euphranor the Grammarian grew old in his School, and taught Scholars when he was above an hundred years old: The elder $O$ vid, father to the Poet, lived ninety years, differing much from the difpofition of his Jon, for lie contemned the Mufes, and diffaded his fon from Poetry. Afinius Pollio; intinate with esuguftus, exceeded the age of an hundred ycars :a man of an unreafonable Profufenefs, Eloquent, and a lover of tearning ; but vehement, proud, crucl, and one that made his private crids the centre of his thoughts. There was an opinion, that Seneca was an extream old man, no lefs than an handred and fourteen years of age: which could not poffibly be, it being as improbable that a decrepit old man fhould be fet over Xero's Youth, as, on the contrary, it was true, that he was able to manage with great dexterity the affairs of State $\therefore$. belides, "a little before, in the midft of Claindians his Reign, he was banilhed Rome for Adulteries committed with fome Noble Ladies, which was a Crime no way contpetible with fo extreme ôld age. Fobannes de Temporibis', among all the men of our later Ages, out of a common fame and "vulgar opinion,' was reputed long liv'd, even to a miracle, or rather, even to a fable; his age hath been counted above three hundred years: He was by Nation a French-man, and followed the Wars under Charls the Great. Garcius Aretine, Great Grand-father to Petrarch, arrived at the age of an hundred and four years : he had ever enjoyed the benefit of good health'; befides, at the laft, he felt rather a decay of his ftrength, thanany ficknefs or malady, which is the true refolution by old age. Amongft the Venetzans there have been found not a few long livers, and thofe of the more eminent fort : Francifous Donatus, Duke; Thomas Contarenur, Procurator of St. TMark; Francifcus Molinus, Procurator alio of St. Mark, and others. But moft memorable is that of cornarus the Venetian, who being in his youth of a fickly body, began firft to eat and drink by meafure to a certain weight, thereby to recover his health : this Cure turned by ufe into: Diet, that Diet to an extraordinary long Life, even of an hundred ycars and better, withoat any decay in his fenfes, and with a conftant enjoying of his health. In our age william Poftel; a French-man, lived to an hundred and well-nigh twenty years, the top of his beard on the upper-lip being black, and not gray at all: a man crazed in his brain, and of a fancy not altogether founds a great Traveller, Mathematician, and fomewhat ftained with Herefie.
I fuppofe there is fearcea Village with usin England, if it be any whit populous, but it affords fome Man or Woman of fourfcore years of age ; nay, a few years fince there was in the County of Hereford a May-game or Morrice darice, confifting of eight men, whofe age computed together made up eight hundred years, infornuch that what forme of them wanted of an huindred, others exceeded as much.

In the Hofpitalof Betbleberm, corruptly called Bedlam, in the Suburbs of London, there are found from time to time many mad perfons that live to a great age.

The ages of Nymphs, Fauns, and Satyrs, whom they make to be indeed nortal, but yet exceedingly long-liv'd, (a thing which ancient Superftition and the late Credulity of forme have admitted) we account but for Fables and Dreams; efpecially being that which hath neither confent with Philofoplyy nor with Divz nity." And as touching the Hiftorv of Long Life in Man by Ludividuals, or next unto Individuals, thus much. Now 'we will pafs' on to Obfervations by certain Heads.

The Running on of Ages, and Succeffion of Generations, feem to have 110 whit abated from the length of Life; for we fee that from the time of Mofes unto thefe our dayes, the term of man's life hath food about fourfcore years of age, neither hath it declined (as a man would have thought) by little and little. No doubt there are times in every Country wherein men are longer or fhorter liv'd.

Longer, for the moft part when the times are barbarous, and men fare lefs deliciouny, and are more given to bodily exercifes : Sliorter, when the times are more civil, and men abandon themfelves to luxury and cafe. But thefe things pafs on by their turns, the fucceffion of Generations alters is not. The faine, no doubt, is in other living Creatuses ; for neither Oxen, nor Horfes, 'nor Sheep, nor any the like, are abridged of their wonted ages at this day. And thefefore the Great Abridger of Age was the Floud; and perhaps fome fuch notable accidents (as particular Inundations, long Droughts, Earthquakes, or the like) may do the fame again. And the like reafon is in the dimenfion and ftature of Bodies; for neither are they leffened by fucceffion of Generations, howfoever Virgil (following the vulgar opinion) divined, that after Ages would bring forth leffer Bodies than the then prefent : whereupon fpeaking of ploughing up the exmathian and exmonenfian Fields, he faith, Grandiág; effofis mirabitur offa sepilchris, That after-ages Bball admire the great bones digged up in ancient sepulchres. For whereas it is imanifefted that there werc heretofore men of Gigantine Statures, "(fuch as for certain have been found in sicily, and elfe-where, in ancient Sepulchres and Caves) yet within thefelaft three thoufand years, a time whereof we have fure memory, thofe very places have produced none fuch: although this thing alfo hath certain turns and changes, by the Civilizing of a Nation, no lefs than the former. And this is the rather to be noted, becaufe men are wholly carried away with an opinion, that there is a continual decay by Succeffion of Ages, as well in the term of man's Life as in the ftature and ftrength of his Body; and that all things decline and change to the worfe.

In Cold and Northern Countries men live longer commonly than in Hot: which muft needs be in refpect the skin' is more compact and clofe, and the juices of the body lefs diflipable, and the Spirits themfelves lefs eager to confume, and in better difpolition to repair, and the Air (as being little heated by the Sun-beams) lefs predatory: And yet under the efquinootial Line, where the Sun paffeth to and fro, and caufeth a double Summer and double Winter, and where the Days and Nights are more equal, (if other things be concurring) they live alfo very long; as in Pers and Taprobane.

1 Randers are, for the moftpart, longer-liv'd than thofe that live in Continenis: for thicy live not fo long in Ruflia as in the Orcades; nor fo long in Africa, though under the fame Parallel, as in the Canaries and Tercera's; and the Japonians; are longer-liv'd than the Chinefes, though the Cbinefes are made upon long life. And this thing is no marvel, fecing the Air of the Sea doth heat and cherifh in cooler Regions, and cool in hotter.

Hioh Situations do rather afford long-liversthan Low, efpecially if they be not Tops of Mountains, but Rifing Grounds, as to their general Situations ; fuch as was Arcadia in Greece, and that part of Etolia where we related them to have lived fo long. Now there would be the fame reafon for Mountains themfelves, becaufe of the purenefs and clearnefs of the Air, but that they are corrupted by accident, namely; by the Vapours rifing thither out of the Valleys, and refting there; and therefore in Snowy Morntains there is not found any notable long life, not in the Alps, not inthe Pyre. nean Mountains, not in the eApennine: yet in the tops of the Monntains running along towards Æibiopia and the exbylines, where by reafon of the Sands beneath little or no Vapour rifeth to the Mountains, they live long, even at this very day, attaining many times to an hundred and fifty years.
asarghes and Fens are propitious to the Natives, and malignant to Strangers, as touching thedengthning and thortning of their lives: and that which may feem more marvcllous, Salt-mar hes, where the Sea Ebbs and Flows, arelefs wholfome than thofe of Frefo ascter.
The Countries which have been oblerved to produce long-livers are thefe; Arcadia, Etsile, India on this fide Ganges, Brafil, Taprobane, Britain, Ireland, with the Iflands of the Circades and Hebrides : for as for Æthiopia, which by one of the Ancients is reported to bring forth long. Livers, tis but atoy,
It is a Secret; The bealthfulnefs of Air, efpecially in atiy perfection; is better
increafed; another by a piece of flesh expofed likewife, if it corrupt not over-foon; another by a Weather-glafs, if the Water interchange not too fuddenly. Of thele and the like enquire further.

Not onely the Goodnefs or Purenefs of the Air, but alfo the Equality of the EAir, is material to long life. Intermixturc of Hills arad Dales is pleafant to the fight, but fufpected for long life. A Plain, moderately drie, but yet not over-barren or fandy, nor altogether without Trees and Shade, is very convenient for length of life.

Inequality of sir (as was even now faid) in the place of our dwelling is naught; but Change of Air by travelling, after one be ufed unto it, is good; and theretore great Travellers have been long liv'd. Alfo thofe that have lived perpetually in a little Cottage, in the fame place, have been long-livers: for air accuftomed confumeth lefs; but air changed nourilheth and repaireth more.
As the continuation ald number of Succeffrons (which we faid before) makes no-
hing to the Length and Shortnefs of Life; fo the immediate condtion of the Parents, (as well the Father as the Mother) without doubt availethmuch. For forne are be gotten of old men, fome of young men, fome of men of middle age; again, fome are begotten of fathers healthful and well-difpofed, others of difeafed and languifh. iing ; again, fome of fathers immediately after repletion, or when they are drunk, others after flecping, or in the morning; again, fome after a long interinifion of Venus, others upon, the act repeated; again, fome in the fervency of the tather's love, (as it is commonly in Baftards) others after the cooling of it, as in long-marricd couples. The fame things may be coinfidered on the part of the Mother : unto which muft be,added the condition of the Mother whillt the is with child, as touching her health, as touching her diet, the time of her bearing in the womb, to the tenth month, or carlier. To reduce thefe things to a Rule, how far they may concern Long Life, is hard; and fo much the harder, for that thofe things which a man would conceive to be the beft, will fall out to the contrary: For that alacrity in the Generation whitch begets lufty and lively children, will be lefs profitable to long life, becaufe of the Acrimony and inflaming of the Spirits: We faid before, That to partake more of the mother's bloud conduceth to long life : alfo we fuppofe all things in moderation to be bett ; rather Conjugal love than Meretricious; the hour for Generation to be the morning; a fate of body not too lufty or full, and fuch like. It ought to be wéll obferved, that a frong Conffitution in the Parents is rather good for them then for the Child, efpecially in the Mother: And therefore Plato thought, ignorantly enough, that the virtue of Generations halted, becaufe the Woman ufed not the fame exercife both of mind and body with the Men. The contrary is rather true; for the difference of virtue betwixt the":Male and the Fcmale is moft profitable for the Child ; and the thinner Women yield more towards the nouriihment of the Child ; which alfo holds in Nurfes. Neither didthc Spartan Women, which married not beforetwenty two, or, as fome fay, twenty five, (and thercfore were called Man-like wamen) bring forthia more gencrous or long-liv'd Progeny than the Roman or Atbenian, or Theban nomen did, which were ripe for Marriage at twelve or fourtcen years; and if there were any thing eminent in the sparrtans, that was rather to be imputed to the Parfimony of their Diet than to the late Marriages of their Women. But this we are taught by experience, that there are fome Races which are long liv'd for a few Defcents ; fo that Life is like fome Difeafes, a thing hereditary within certain bounds.

Fair in Face, or Skin, or Hair, are fhorter livers; Black, or Red, or Freckled, longer. Alfo too frefh a colour in Youth doth lefs promife long life cinan palencrs. A bards skin is a fign of long life rather that a doft; but we underftand not this of a rugged skin, fuch as thyy call the Goofe skin, which is as it were fpongy, but of that which is hard and clofe. A Fore-bead with decp furrows and wrinkles is a better fign than a finooth and plain Forcbcad.
34. The Hairs of the Head hard and like briftlcs, To betokenlonger life than thofe that are foft and delicate. Currled Hairs betoken the fame ching, if they be hard withal; but the contrary if they be foffand fhining: the like if the curling be rather thick than in large: bunches.

Bald betimes have lived long. Alfo early gray bairs: (howfocyer thicy may feem forerunners of old age approaching) are no fure figns; for many that have grown gray betimes have lived to great ycars: nay, hafty gray hairs without Batdnefs is a token of long life ; contrarily, if they be accompanied with Baldneff.

Hairinefs of the upper parts is a fign of fhort life, and they that have extraordinary much bair on theirbrcafts live not long: but /airinefs of the lower parts, as of the Thighes and Legs, is a fign of long life.

Talnefs of Stature (if it be notimmoderate) with convenient making, and not tno fl:nder, efpecially if the body be active withal, is a fign of long life: Alfo on the contrary, men of low ftature live long, if they be not too active and ftirring.

In the proportion of the body they which are fhort to the waftes, withlong Leggs,are longer-liv'd than they which are long to the $n$ affes, and have Bort Leggs: alfo they which are large in the neather parts, and ftreight in the upper, (the making of their body riling, as it were, into a tharp figure) are longer-liv'd than they that have broad /houlders, and are fender downwards.

Leannefs, where the affections are fetled, calm, and peaceable; allo a morc fat babit of body, joyned with Choler, and a difpofition ftirring and peremptory, fignifie longlife : but Corpulency in Youth forefhews thort life, in Age it is a thing more indifferent.

To be long and flow in growing is a fign of longlife; if to a greater ftature, the greater fign, if to a leffer ftature, yet a fign though: contrarily, to grow quickly to a great ftature is an evil fign; if to a fmall ftature, the lefs evil.

Firms Flefh, a raw-bonc body, and veins lying higher than the flefh, betoken long life ; the contrary to thefe, thort life.
A Head fomewhatlefierthan to the proportion of the body; a moderate Neck, not long,nor flender, nor flat, nor too thort; wide Noftrils, whatfocver the form of the Nofe be ; a large Month; and Ear griftly,not flefhy; Teeth ftrong and contiguous, fmall, or thin-fet, fore-token Iong life; and much more if fomenew Teeth put forth in our elder years.
a broad Breaft, yet not bearing out, but rather bending inwards; Shoulders fomewhat crooked, and (as they call fuchperfons) round-back'd; a flat Belly; a Handlarge, and with few lines in the Palm; a fhortand round.Foot, Thighs not flelhy, and Calzes of the Leggs not hanging over, but neat, are figns of long life.

Eyes fomewhat large, and the Circles of them inclined to greennefs; Senfes not too quick; the Puile in youth flower, towards old age quicker; Facilty of bolding the irexth, and longer than ufual; the body inyouth inclined to be bound, in the decline of years inore laxative, are alfo figus of long life.

Concerning the Times of Nativity, as they refer tolong life, nothing hath been obferved worthy the fetting down, fave onely Aftrological Obfervations, which we rejeEted in our opicks. A Birth at the eighth month is notonely long. liv'd, but not likely to live. Alfo is inter birtbs are accounted the longer-liv ${ }^{3}$ d.

A TPythagorical or Monafical Diet, according to ftrict rules, and always exactly equal, (as that of (ornarus was) fecmeth to be very effectual for long life. Yet onthe contrary, amongtt thofe that live freely and after the common fort, fuch as have good fomachs, and feed more plentifnilly, are often the longeft- liv'd. The middie diet, which wc account the temperate, is commended, and conduceth to good health, but not to long life: for the $\overline{5}$ pare diet begets few Spirits, and dull, and fo wafteth the body lefs; and the liberaldict yieldeth more ample nourithment, and fo repaireth more : but the middle diet doth neither of both, for where the Extreams are hurtful, there the Mean is beft; but where tlic Extreams are helpful, there the Mcan is nothing worth.

Now to that $s$ pare diet there are requifite Watching, left the Spirits being few thould be oppreffed with much flecp; little Exercife, Iff they thould exhale; abfinence from Venerys left they ihould be exhaufted : but to the -liberal diet, on the other fide, are requifite much Sleep, frequent Exercifes, and a feafomable ufe of Venery. Eaths and anointings (fuch as were anciently in ufe) did rather tend to delicioufnefs than to prolonging of life. But of all thefe things we thall fpeak more exactly when we come to the Ininiftion according to Intentions. Mean while that of ceifus, who was not onely a learned Phyfician, but a wife man, is not to be omitted, who adviieth interchanging and alternation of the diet, but fill with an inclination to the more benign : as that 2 man fixould fometimes accuftom himfelf to

## © Medicines for Long Life.

$\mathcal{T}$Ho Art of Phyfick, which we now bave, looks no farther commonly than to Confervation of Health and Cure of Difcafes : ©As for thofe things which tend properly to Long Life, there is but Лight mention, and by the way onelv. Notwithftanding we will proposnd thofe Medicines which are notable in thiskind, 1 mean, thofe which are Cordials. For it is confonant to reafon, that thofe things which being taken in Cures do defend and fortife the Heart, or, more truly, the Spirits, againit poyfons and Difeafes, being tranfferred with judgment and choice into Diet, Bould bave a good effect, in Some fort, towards the Prolonging of Life. This we will do, not heaping them promifcuoufly together, (as the manner is) but felecting the beft.

Gold is given in thrce forms.; either in that which they call Aurum potabile, or in Wine wherein Gold hath been quencbed, or in Gold in the subftance, fuch as are Leaf. gold, and the Filings of Gold. As for Aurums potabile, it is ufed to be given in defperate or dangerous difeafes, and that not without good fuecefs. But we fuppofe that the Spirits of the Salt, by which the Gold is diffolved, do rather minifter that vertue which is found in it, than the Gold it felf; though this fecret be wholly fuppreffed. Now if the body of Gold could be opened with thefe Corrofive waters, or by thefe Corrofive waters ( fo the venomous quality were wanting) well walhed, we conceive it would be no unprofitable Medicine.

Pearls are taken cither in a fine Powder, or in a certain Mafs, or Diffolution by the juice of four and new Limons; and they are given fometimes in Aromatical Confections, fometimes in Liquor. The Pearl, nodoubt, hath fome affinity with the Shell in which it groweth, and may be of the fame quality with the Shels of Cra-fi/bes.

Amongft the transparent precious Stones, two onely are accounted Cordial, the Emerauld and the Facinth, which are given under the farne forms that the Pearls are; fave only that the diffolutions of them, as far as we know, are not in ufe. But we fufpect there Glafje jeivels, left they fhould be cutting.

Of thefe which we bave mentioned, bow far and in what manner they are belpful, foall be Jooken hereafter.

Bezoar. Stone is of approved vertue for refrelhing the Spirits, and procuring a gen. tle. Siweat. As for the Unicorn's Horn, it hath loft the credit with us; yet $\mathrm{f}_{\mathrm{o}}$, as it may keep rank with Hart's Horn, and the Bene in the heart of a Hart, and Ivory, and fuch like.

Amber-griece is one of the beft to appcafe and comfort the Spirits.
Hereafter follow the names only of the simple Cordials, fecing their Vertues are fufficiently known.

| Hot. | H | Cold. | Cold : |

Secing our fpeech now is of thofe things which may be transferred into Diet, all hot Waters and Chymigal Oiles, (which, as a certain Triffer faith, are sinder the Planet Mars, and bave a furious and defruttive force) as alfo all hot and. biting Spices are 20.be, rejeited, and a Confideration to be bad, how waters and Ligiors may be made of the former Simples: not thofe phlegmatick diftilled waters, nor again thofe burning waters of spirits of wine; but fuch as may bo more semperate, and yet lively, axd Sending forith a beniga Vaposr.
I make fome queftion touching the frequent letting of Bloud, whether it conduceth to long life nor no; and 1 am rather in the opinion that it doth, if it be turned into a habit, and other things be well difpofed: for it letteth out the old Juice of the body, and bringeth in new.

To the tenth 1 r itcle.

I fuppofe alfo, that fome Emaciating Difoafes well cured, do profit tolong life, for they yield new Juice, the old being confumed; and, as (as he fath) To recover a ficknefs is to renex youith: Therefore it were good to make fome Artificial Difeafes, which is done by ftrict and Emaciating Diets, of which I Thall fpeak hereafter:

## The Intextions.

To the 12,
13 , and 14 Articles.

H Aving finifbed the Inquifition according to the Subjeets, as namely, of Inaniugate Bodies, Vegetables, Living Creatures,', Man ; 1 neill now come nearer so the matter, aid order mine Inquifitions by certain Intentions, fuch as àre true and proper. (as I am wholly per(waded) and which are the very paths to Mortal Lif...For inn this pait, nothing that is of worth bith hitherto been inquired, but the contemplations of men have been buit fimple, and non proficients. "For when 1 I heari men on the oris -fide Speak of comforting Natural heat, and the Radical moifture; and of Meats witich breed good Blood, "fuct as may neititber be burntisor phlegmatick'; and of the cleering and recreating the Spitits, I fuppofe them to be no bad men which peak thefe ithings: but nöne of thefe woorketh eff cetrially. Yowidrds the end. Dat when on the other fite thear feveral difcourfes toniching Medicinestrmade of. Gold, becaufe. Gold us not fubjectito corruption; aind toviching Precious fones to refrefb the fpirits by their, bidden properties and luftre, and that if they could be taken and retained in Veffels; the Balfoms, and Quinteffences of living Creaturés's would make men conceive a prond hope of immariality : And that the Flefle of Scrperits and Harts, by a certain confent, ane pomerful to the Renovation of Life, becaufe the one cafteth his skin, the other his Horns: (iliey frould allo bave added the Fleft'of Eagles, becaufe the Eagle changes. bis Bill), And that a certain Man, "when he had found an Oyntment hidden under the ground, and had anointed bimplelf therewith from bead to foot, (excepting onely the foles of his. feet) did, by bis anointing, live three bundred years; ;withous any difeafe, . Save onely fome Tumors in the foles of his feet: and of. Artefius, wibo when be found bis Spirit ready to depart, drew into bis body tbe Jpirit of a certain young man, and thereby made bim breatblefs, but bimfelf lived many years by another mans Spirit $:$ and of Fortunatic Hours according to the Figures of Heaven, in whict Medicines are io be gathered and compounded for the piolongation of Life : ind of the Scales of Planets, $b_{p}^{\circ}$ whish vertuestmay be draion and feitched dowin from Heaven to prolong Life: and fuchlike fabulous. and fuperffitions vanities: I nonder exceedingly that men Bould so much doat, is to Suffer themeflves to be deluded with théfe things. 'And ägain, I do pity asankind that:t' ey Bould bave the Bard fortune to be bêfeged with fuch frivolous and fencelefs apprehenifions. But mine Intentions do both come home to the Matter, and are far from vain aisd csce-dulous Imaginatious; being alfo Juch, as I conceive, pofterity may adde much to the matters which fatisfie thefe Intention's; but to the Intentions themfelves, but a little. Notwithftanding thete are a fow thinds's, and thofe of wery great montent, of which 1 would have men to be forewarned

Firft, we are of that opinion, that we efteem the Offices of Life to be more worthy than Lefe it felf. Therefore if there be any thing of that kind that:may indced cxactly answer our Intentions, yet fo, that the Offices and Duties of Life be thereby biandred; whatfoever it be of this kind, we reject it. Perlaps me may make forme log ht men. tion of fome things, 'bnt we inffetiot upont tbem. For we make no ferious nor diligent dif. fourfe, eitber of leading the life in Caves, where the Sunbeams and Several changes of the Oir pierce not, like Epimenides, his Cave; or of perpetwàl bitths, made of ciquors prepared or of shirts, and Sear-cloths fo applied, viat the cody) Jionidibealways as it:wete in a box ; or of tbick paintings of the body, aftor the manner of $\backslash$ owe Barbarous Nations; or of an exall ordering of oxr Life and Dfet, which aimeth onoly at this, and mindeth nothing ${ }^{3}$ dfe but that a man live, (as inds thrit of Herodicus amongft the e Ahtients, and of Coriatus the Vêctian in our days, but with greater moderation; or of any fuch Prodigy, Tedioufnefs, or Inconvenience: but we proposnd fuch Remedies and Precepts, by wibich.the Office's of Life may neither be deferted, nor receive any great interrokptions or moilefations.

Secondly, on the other fide we denounce unto men that they will give over trifing; and not imagine that fo great a work as the ftopping and turning back the powerful courfe of nature, can be brought to pafs by fome whorning-draught, or' the caking of fome precious Drug, but that they would be afmed that it mift needs be, that this is a work of labour, and conjisteth of many Rensedies, and a fit connexion of them ansong ft themfelves; for no man can be fo ftupid as to imagine, that what was never yet done, can be done, but by fuch mays aswere never yet attempted.

1 birdly, we ingeniouly profefs, that fome of thofe things which we hall propound have not been tried by us by way of Experiment, (for our courfe of life doth not permit that) but are derived (as mee fuppofe) upon good reafon; out of our Principles and Grounds, (of which Some we fet down, others we referve in our mind) and are, is it were, cut and digged out of the |Rock and Minc of Nature ber felf. Neverthelefs we bave been cariful, and that with all providence and circumpection, (Seeing the Scripture fauth of the Body of Man, that it is more worth than Raiment ) to propound fuch Remedies, as may at leaff be fafe, if peradventure the be not fruitful.

Fourtbly, we would bave menrightly to obferve and diftinguif, that thofe things tubich are good for an Healthful Life, are not always good for a Long Lifc'; for there, are fame things whish do further the alacrity of the Spirits, and the firengith and vigonr of the Fuñtions, which, notwitbffanding, do cut off from the fum of Life"; and there are other things which are profitable to prolongation of Life, which are not without fome peril of bealth, inlefs this matter be falved by fit Remedies; of wobich, notwithffanding, as occafion 乃all be offered, we willnot omit to give fome Cautions and Monitions.

Laflly-we have thought good to propound funiry Remedics, according to the feveral Intentions; but the choice of thofe Remedies, and the order of them, to leave to Dif. cretion: for to fet down exaitly which of them agreeth beft, with which Conftitution of Body, which with the feveral courfes of Life, which with each mans particular Age, and how they are to be taken one after another, and how the whole Practique of thefe things is to be adminiftred and governed, would be too long, neither is it fit to be publifned.

In the Topicks we propunded three Intentions:. The Prohibiting of Confumption, The Perfucting of Reparation, and the Renewing of Oldnefs. But foing thofe things which foall be faid are nothing lefs than words, we will deduce thefe three Intentions io ten Operations.
The firft is, the Opcration upon the Spirits that they may renew their vigout.
The fecond Operation is upon the Exclufion of Air.
The third Operation is upon the Bloud, and the Sanguifying Heat.
The fourth Operation is upon the Juices of the Body.
The fifth Operation is upon the Bowels, for their Extrufion of Aliment.
The fixth Operation is upon the Outward Parts, for their Atrration of Aliment.
The Jeventh Operation is upon the Aliment it felf; for the Infinuation thereof.
The eighth Operation is uipon the laft Act of Affimilation.
The ninth Operation is upon the Inteneration of the Parts, after they begin to be dried.
The tenth Operation is upon the Purging away of Old Juice, and Supplying of New
Of thefe Operations, the four firft belong to the Firft Intention, ibe four next to the se. cond Intention, and the tivo laft to the Third Intention.

But becaufe this part touching the Intenfions doth tend to Practice, under the name of Hiftory, we will not onely comprife Experiments and Obfervations, but alfo Counfels, Remedies, Explications of Caufes, Affumptions, and whatfoever bath reference herewnto.

## The Operation upon the Spirits that they may remain Touthful, and renew their Vigour.

The Hiffory.

THE Spirits are the Mafter-workmen of all effects in the Body. This is ma. nifeft by Confent, and by infinite inftances.
If any man could procure that a young man's Spirit could be conveyedinto an old man's Body, it is not unlikely but this great Wheel of the Sptrus might turn about the leffer Wheel of the Parts, and fo the courfe of Nature become retrogade. the thin and prepared; for by that means the Body becomes green and folid.

The Spirits are fo. to be wrought and tempered, that they may be in Subfance Denfe, nof Rare; in Heat Strong, not Eager; in Quantity Sufficient for the oficese of LLfe, not Reedundant or Turgid; in Motion A ppeafed, not Dancing or Unequal:
11: That Vapours work powerfully upon the Spirits, it is manifeft by Sleep, by Drunkennefs, by Mclancholick Paffions, by letificant Medicincs, by Odours, calling the Spirits back again in $S$ wounings and Faintings.
The spirits are condenfed four ways; , either by putting them to fight, or by refrigeratings. and cooling them, or by froaking them, or by guieting them. And firt of their Condetsjation by putting them to fight.
13. Whatfoever putteth to flight on all parts, driveth the body into his Centre, and fo Condenjeth.
14. To the Condenfation of the spirits by flight, the moft powerful and efficetual is Opium, and next Opiates, and generally all Soporiferous things.
15.

The force of opium to the condenfation of the spirits is exceeding ftrong, whenas perhaps tiriee grains thereof will in a thort time fo coagulare the Spirits; that they re. turn no more, but are extinguifhed, and become immoveable.
16. Opium, and the like, put not the Spirtsts to flight by their coldnefs, for they have parts manifeftly hot ; but, on the contrary, cool by their putting the Spirits to flight.
17.

The Flight of the Spirits by Opium and Opiate Medicines is beft feen by applying the fame outwardly; for the Spirits Itraight with-draw themfelves, and will return no more, butethe part is mortified, and turns to a Gangrene.
18. Opiates, in grievous pains, as in the Stone, or the cutting off of a Limb, mitigatc pains moft of all, by putting the spirits to flight.
19.
opiates obtaina good effect froma bad caufe; for the Flight of the Spirits is evil, but the Condenfation of them through their flight is good.

## The Hiftory of Life and Death.

The Grecians attributed much, both for health and for prolongation of lifc, as $O$ piates: but the Arabians much more, infonuch that their grand redicines (which they called the gods Hands) : had opium for their Baffs and principal Ingredient, other things being mixed to abate and correct the noxious qualities theroof ; fuch were Treacle; Methridate, and the reft.

Whatfoever is given with good fuccefs in the curing of Pefilential and æalignant Difeafes, to fop and bridle the spirits, left they grow turbulent and tumultuate, may very happily be transferred to the prolongation of life; for one thing is cffectual unto both, namely, the condenfation of the spirits: now there is nothing better for that than Opiates.

The rurks find opium, even in a reafonable good quantity, harmlefs and comfortable, infomuch that they take it before their Battel to excite courage: but to us, unlefs it be in a very fmall quantity, and with good Correctives, it is murtal.
opinm and opiates are manifeftly found to excite Venus; which Thews them to have force to corroborate the Spirits.

Diffilled water of wilde Poppy is given with good fuccefs in Surfeits, Agues, and divers difeafes; which no doubt is a temperate kind of opiate. Neither let any man wonder at the various ufe of it; for that is familiar to opiates, in regard that the Spirits, corroborated and condenfed, will rife up againtt any difeafe.

The Turks ufe a kind of Herb which they call Caphe, which they dry and powder, and then drink in warm water; which, they fay, doth not a little fharpen them, both in their Courage, and in their Wits; notwithflanding, if it be taken in a large quantity, it affects and difturbs the mind: whereby it is manifeft, that it is of the fame nature with opiates.

Tiere is a Root much renowned in all the Eaftern parts, which they call Betel, which the Indians a nd others ufe to carry in their mouths, and to champ it, and by that champing they are wonderfully enabled both to endire labours, and to overcome ficknefles, and to the act of carnal copulation: It feems to be akind of Stupefactive, becaufe it exceedingly blacks the Teeth.

Tobacco in our age is immoderatcly grown into ufe, and it aflects men with a fecret kind of delight, infomuch that they who have once inured themfelves unto it can hardly afterwards leave it : and no doubt it hath power to lighten the body, and to Thake off wearinefs. Now the vertue of it is commonly thought to bc, becaufe it opens the paffages, and voids humors : but it may more rightly be referred to the condenfation of the $S$ pirits ; for it is a kind of Henbane, and manifefly troubles the Head, as opiates do.
There are fometimes Humors engendred in the body, which are, as it were, opiate themfelves; as it is in fome kind of Melancholies, with which if a man be affected, it is a fign of very long life.
The fimple opiates (which are allo called stupefactives) are thefe : opium it felf, which is the juice of Poppy; both the Poppies,as well in the Herb as in the Seed; Herbane, Mandrate, Hemleck, Tobscco, Night- Jhade:
The compound opiates are, Treacle, Methridate, Trifera, Ladanum, Paracelf, Diaco: nium, Diafcordium, Philonium, Pills of Hounds-tongue.

From this which hath been faid, certain Defignations or Counfels may be deduced for the prolongation of life, according to the prefent intenfion; namely, of condenfing the Spirits by Opiates.

Let there be thercfore every year, from Adult years of Youth, an oprate diet; let it be taken about the end of May, becaufe the Spirits in the Summer are more loofe and attenuated, and there are lefs dangers from cold humours; let it be fome Majigifal opiate, weaker than thofe that are commonly in ufe, both in refpect of a fmaller quantity of opium, and of a more fparing mixture of extreme hot things; let it betaken in the morning betwixt fleeps. The fare for that time would be more fimple and fparing than ordinary, without Wine, or Spices, or Vapourous things. This Medicine to be taken onely each other day, and to be continued for a fortnight. This Defignation in our judgment comes home to the intenfion.
opiates alfo may be taken, not onely by the mouth, but alfo by Frmes; but the Fumes muift be fuch as may not move the expulfive Faculty too ftrongly, not force down humours, but onely takens in a Weft, may work upon the Spirits within the brain. And therefore a Sufumigation of Tobacco, Lignum-Aloes, Tofemary-leaves
dried, aind a little Myrrhe fuuffedup in the morning at the mouth and noftrils, would be very good.

In Grand Opiates, fuch as are Treacle, Metbridate, and the reft, it would not be amifs (efpecially in youth) to take rather the diffilled waters of them than themfelves in the ir bodies; for the vapour in diftilling doth rife, but the heat of the Medicinc commonly fetleth. Now difilled waters are good in thofe vertues which are convcyed by Vapours, in other things but weak.

There are Medicines which have a certain weak and hidden degree, and therefore fafe to an Opiate vertue ; thefe fend forth a flow and copious vapour, but not malig. nant as Opiates'do, therefore they put not the Spirits to fight; notwithftanding they congregate them, and fomewhat thicken thein.

Medicines in order to Opiates are principally Saffon, next Folium Indum, © 1 m-ber-greefe, Coriander-feed prepared, Amomum, PJeuda-momum, Lignum-Rbodıum, Orenge-flower water, and much more the Infufion of the fame Flowers new gathered in the Oil of eAlmonds; $\mathcal{X}$ numegs pricked full of holes, and macerated in Rofewater.

As Opiates are to be taken very fparingly, and at certain times, as was faid, fo thefefer condaries may be taken familiarly, and in our daily diet, and they will be very effectual to prolongation of life. Certainly an Apothecary of Calecute, by the ufe of Amber, is faid to have lived an hundred and fixty years; and the Noble-men of Barbary, through the ufe thereof, are certifid to be very long. liv'd, whereas the mean people are but of fhort life. And our Anceftors, who were longer-liv'd than we, did ufe saffron much in thcir Cakes, Broths, and the like. And touching the firft way of condenfing the Spirits of opiates and the Subordinates thereto, thus much.

Now we will enquire of the fecond way of condenfing the spirits by Cold. For the proper work of Cold is Condenfation, and it is done without any, malignity, or adverfe quality; and therefore it is a fafer operation than by opiates, though fornewhat lefs powerful, if it be done by turns onely, as opiates are. But then again, becaufe it may be ufed familiarly, and in our daily diet with moderation, it is much, more powerful for the prolongation of life than by opiates.
The Refrigeration of the Spirits is cffected three ways, either by Respiration, or by Vapours, or by Aliment. The firft is the beft, but, in a fort, out of out power ; the fecond is potent, but yet ready, and at hand; the third is weak, and fomewhat about.

Air. clear and pure, and which hath no fogginefs in it, before it be received into the Lungs, and which is leaft expofed to the Sun-beams, condenfeth the Spirits beft. Such is found either on the tops of dry Mountains, or in Champagnes open to the wind, and yet not without fome thade.

As for the Refrigeration and Condenfation of the Spirits by Vapours, the Root of this operation we place in Nitre, as a Creaturepurpofely made and chofen for this end, being thereunto led, and perfwaded by thefe A rguments.

Nitre is a kind of cool Spice: this is apparent to the fenfe it felf, for it bites the Tongue and Palate with cold, as Spices do with heat, and it is the onely thing, as far as we kno ' $N$, that hath this property.
43. Almoft all cold tbings (which are cold properly, and not by accident, as Cpisms is) are poor and jejune of Spirit; contrarily, things full of spirit are alinoft all hot, onely Nitre is found amongft Vegetables, which aboundeth with Spirit, and yet is cold. As. for Camphire, which is full of Spirit, and yet performeth the actions of cold, it cooleth by accident onely; as namely, for that by the thinnefs thereof, without $\mathcal{A}$ erimony, it helpeth perfpiration in inflammations.

In congealing and freezing of Eiquors, (which is lately grown into ufe) by laying Snow and Ice on the out-fide of the Veffel, Nitre is alfo added, and no doubr it excitcth and fortifieth the Congelation. It is true, that they ufe alfo for this work ordinary Bay-Salf; which doth rather give activity to the coldnefs of the Snow, than cool by it. felf: But, as I have heard, in the hotter Regions, where Snow falls snot, the congealing is wrought by Nitre alone; but this I cannot certainly affirm.
It is affirmed that Gin powder, which confifteth principally of Nitre, being taken in drakk, doth conduce to valour, and that it is ufed oftentimes by Mariners and Souldiers before they begin their Battels, as the Turks do Opimm.

## The Hiftory of Life and Deatb.

- Nitre is giveil irith good fuccefs in burning Agues, and Peftileitial Fevers, to mitigate and bridle their pernicious heats.

It is manifeft, that Nitre in Gun-powder doth mightily abhor the Flame, from
whence is caufed that horrible Crack and puffing.
Nitre is found to bc, as it were, the Spirit of the Earth: for this is moft cer-
cain, that any Earth, though pure and unmixt with Nitrous matter, if it be fo laid up and covered, that it be free from the Sun beams, and putteth forth no Vegetable, will gather Nitre, even in good abundance. By which it is clear, that the Spirit of Nitre is not onely inferiour to the spirit of living Creatures, but alfo to the Spirit of Vegetablés.

Cattle which drink of Nitrous water do manifefly grow fat, which is a fign of the cold in Nitre.

The manuring of the Soil is chiefly by Nitrous fubfances; for all Dung is Nitrous, and this is a fign of the Spirit in Nitre.

From hence it appears, that the Spirits of Man may be cooled and condenfed
by the Spirit of $\mathcal{X}$ itre, and be made more crude, and lefs eager. And therefore, as ftrong Wines, and Spices, and the like; do burn the Spirits, and horten life; fo on the contrary'fide, Nitre doth compofe and reprefs thein, and furthereth to life:

Nitre may be ufed with meat, mixed with our Salt, to the tenth part of the Salt; in Broths taken in the morning, for three grains to ten, alfo in Beer:' but howfoever it be ufed, with moderation, it is of prime force to long life.

As opium holds the preheminence in condenfing the Spirits, by putting then to fight, and hath withal his Subordinates, lefs potent, but more fafe, which may be taken both in greater quantity, and in more frequent ufe; of which we have formerly fooken : fo alfo Netre, which condenfeth the Spirits by cold, and by a kind of Frefcour, (as we now a-days fpeak) hath alfo his Subordinates.

Subordinates to Nitre are, all thofe things which yield an' Odour fomewhat Earthy, like the finell of Earth, pure and good, ncwly digged or turned up; of this fort the chief are, Borage, Buglofs, Langue de Bucuf, Burnet', Sträaberry leaves and stränberries, Erambois or Rajpis, raw Cucumersjraw Pearmains, Vine-leaves, and Buds; alifo Violets.
in The next in order are thofe which have a certan frefhnefs of finell; but fomewhat more inclined to heat ; yet not altogether void of that vertue of refrething by coolnefs fuch as are Balm, green Citrons, green Orenges, Rofa-mater dijtillsd,riasted Wardens; alfo the Damask, Red, and "Musk Rofes.

This is to be noted, thate Subordinates to Nitre do commenly confer more to this Intenfion, Ram, then having pafied the Fire, becaufe that the Spirit of Coollng is diffipated by the Fire ; therefore they are beft taken, either infuled in fome liguor, or raw.

As the condenfation of the Spirits by Subordinatesto Opium is, in fome fort, performed by Odours, fo allo that which is by Subiodinates to Nitre ; therefore the fnell of ine $N$ and pure Earth, taken either by following the Plough, of by digging) or by weeding, cxcellently refrefheth the Spirits. Alfo the Leaves of Trees in Woods, or Hedges, falling towards the middle of Autum, yield a good refrefhing to the Spit rits, but none fo good as Strabberry-leaves dying. Likewife the finell of Violets, or Wall-flowers, or Bean-flowers, or Sweet-briar, or Hony-fuckles, taken as they grows in paffing by themoncly, is of the fame nature.

Nay, and we know a certain grcat' ord who lived long , that had every morning immediately after flecp, a Clod of freth Earth laid in a fair Napkinunder his Nofe, that he might take the fmell thereof.

There is no doubt, but the cooling and tempering of the hlood by cool things, fuch as are Endive, Surcoory, Liver 2wort, Purguin, and the like, do alfo by confequent cool the Spirits; but this is about, whereas vaponrs cool immediately.
And-as touching the condenfing of the Spirits by Cold, thus much: The third way of condcnfing the Spirits, we faid to be by that which we call froaking the Spirits: The fourth, by guieting the alacrity and wnruline's of them.

Such, things froke the spirits as are pleafing and friendly to them, yet they at-
in their own fociety, do enjoy themfelves, and betake themfelves into their proper Centre.
C. For thefe, if you recollect thofe things which were formerly fet down, as subordinates to opium and $\mathcal{N}$ itre, there will need no other Inquijtion.
As for the quieting of the usrulinefs of the Spirits, we Ihall prefently fpeak of that, when we enquire touching their Motion. Now then, feeing we have fpoken of that Condenfation of the Spirits which pertaineth to their fubftance, we will come to the temper of Heat in them.
63. The Heat of the spirits, as we faid, ought to be of that kind that it may be robuff, not eager, and may delight rather to mafter the tough and obftinate, than to carry away the thin and light humors.

We muft beware of Spices, wine, and ftrong Drinks, that our ufe of them be very temperate, and fometimes difcontinued; alfo of savory, 4 ild marjoram, Penny-royal, and all fuch as bite and heat the tongue; for they yield unto the Sparits an beac noc 0 perative, but Predatory.

Thefe yield a robuft beat, efpecially Elecampane, Garlick, Carduns Benedictus, water-cre $\beta$ es while they are young, Germander, Alngelica, Kedoary, Vervin, Valerian, myrrbe, Pepper-wort, Elder flowers, Garden-Chervile: The ufe of thefe" things with choice and judgement, fometimes in Sallads, fometimes in Medicincs, will fatisfie this operation.

It falls out well that the Grand opiates will alfo ferve excellently for this operation, in refpect that they yield fuch an beat by compoftion, which is wilhed, but not to be found, in Simples. For the mixing of thole excelfive hot things, (fuch as are Eaphorbium, Pellitory of Spain, stavis-acre, Dragonowort, Anafordi, cafforenm, Arifolochinm, opponax, Ammoniachum, Galbanum, and the like, which of themfelves cannot be taken inwardly) to qualifie and abate the stupefactive virtue of the opium, they do make fuch a conftitution of a Medicament as we now require; which is cxcellently feen in this, That Treacle and Methridate, and the reft, are not fharp, nor bite the tongué, but are onely fomewhat bitter, and of ftrong fcent, and at laft manifeft their heat when they come into the fomach, and in their fublequent operations.

There conduce alfo to the robuf beat of the Spirits Venus of en excited, rarely performed; and no lefs forme of the affections, of which Thall be fpoken hereafier. So touching the heat of the Spirits, Analogical to the prolongation of Life, -thus much.!

Touching the Quantity of the Spirits, that they be not exuberant and boiling, hut rather Sparing, and within a mean, (feeing a fmall flame doth not devour fo much as a great flame) the inquiftion will be fhort.
68. It feems to be approved by experience, that a SWare Diet, and almoft a Pytbagoricall; fich as is either prefcribed by the frict Rules of a Monastical life, or practifed by Hermsites, which have Neceffity and Poverty for their Rule, rendreth a man lon liv'd Hitherto appertain drinking of water, a hard Bed, abfinence from Fire, a fender Diet, (as namely; of Herbs, Fruits, Flefh, and Fi/h, rather pondred and fatied than frefpand hot ) an Hair, Birt, frequent Faftings, freguent watchings, fens fenfual Plea. fures and fuch like; for all thefe diminifh the Spirits, and reduce them to fuch a gsax. tity as may be fufficient onely for the Functions of Life, whereby the depredation is the lefs.

But if the Diet fhall not be altogether fo rigorous and mortifying, yet notwithftand ing thall be always equal and conftant t') it felf, it worketh the fame effect ( We fee it in Elames that a Flame fomewhat bigger (fo it be always alike and quiet) confu: meth lefs of the fuel than a leffer Flame blown with Bellows, and by Gufts fronger oriweaker: That which the Regiment and Diet of Cornaris the Venetian Onewed plainly, who did eat and drink fo many years together by a juft weight, whereby he exceeded an hundred years of age, ftrong in linbs, and intire in his fenfes.

Care alfo muft be taken, that a body plentifully nourihed, and not emaciated by any of thefe aforefaid Diets, omitteth not a feafonable ufe of Venis, left the Spirits increafe too faft, and foften and deftroy the body. So then, touchinga moderate guan. tity of Spirits, and (as we may fay, Frugal, thus much.

Motion doth manifeftly attenuate and inflame them. This bridling is done by three means: by steep; by avording of vehement Labours,immsoderate Exercife, and, in a word, all Lafitwde; and by refraining irfomee Affections. And firft, tnuching Sleep.

The Fable tells us, that Epimenides Rept many years together in a Cave, and all that time needed no meat, becaufe the Spirits wafte not much in leep.

Experience teacheth us that certain Creatures, as Dormice and Bats, Reep in fome clofe places an whole Winter together ; fuch is the force of feep to reftrain all vital Confumption. That which Bees and Drones are allo thought to do, though fometimes deftitute of Honey; and like wife Rutter-flies, and other Flies.

Sleep after Dinner (the ftomach fending up no unpleafing Vapours to the heads; as being the firft Dews of our Meat) is good for the $\int$ pirits, but derogatory and hurtful to all other points of health. Notwithftariding in extream old age there is the fame reafon of Meat and Sleep, for both our meals and our feeps fhould be then frequent, but fhort and little; nay, and towards the laft period of old age, a mere Reff, and, as it were, a perpetual repofing doth beft, efpecially in Winter-time.

But as moderate geep conferreth to long life, fo much more if it be quiet and not dijfurbed.

Thefe procure quiet feep, Violets, Lettuce, efpecially boiled; Sirrup of dried Rofes, Saffron, Balm, Apples, at our going to bed; a Sop of Bread in Malmfey, efpecially where Musk-Rofes have been firft infufed : thercfore it would not be amils to make fome Pill, or a fmall Draught of thefe things, and to ufe it familiarly. Alfo thofe things which Thut the mouth of the ftomach clofe, as Coriander-feed prepared, Quinices and Wardens roafted, do induce found fleep; but above all things in youth, and for thofe thathave fufficient ftrongfomacks, it will be beft to take a good draught of clear sold Water when they go to bed.

Touching voluntary and procured Trances, as alfo fixed and profound Thoughts, fo as they be mithout irksomnefs; I have nothing certain: no doubt they matke to this Intenfion, and condenfe the Spirits, and that more potently than: Sleep, feerng they lay afleep, and fufpend the fenfes as much or more. . Touching them, let furiber inquiry be made, so far roncbing Sleep.

As for Motion and Exercije, Laffitude hurteth, and fo doth all Motion and Exercife which is too nimble and fwift; as Running, Tennis, Fencing, and the like ; and again, when our ftrength is extended and ftrained to the uttermoft, as Dancing, Wreftling, and fuch like: for it is certain, that the fpirits being driven into freights, either by the fwifnefs of the motion, or by the ftraining of the forces, do afterward become more eager and predatory. On the other fid $\mathrm{f}_{1}$, Exercifes which ftir up a good ftrong, motion, but not over-fwift,or to our utmoft ftrength, (fuchas are Leaping, Shooting, Riding, Bowling, and the like ) do not hurt, but rather benefiti:

We mult conte now to the Affections and Pafions of the Mind; and fee which of them are hurtful to long life, which profitable.

Great 7oys:attencrate and diffufe the Spirits, and Chorten life; familiar Chearfulnefs Atrengthens the $\int$ pirizs, by calling them forth, and yet not refolving them.

Inapreffions of $70 y$ in the fenfe are naught; ruminations of $\mathcal{F} \%$ in the memory, or apprchenfions of them in hope or fancy, are good.

Foy Suppreffed or communicated fpariagly, doth more comfort the firits than foy poured forth and publifhed.

Gief and sadnefs, it it be void of Fear, and aflict not too much, doth rather proIong life; for it contracteth the $\int$ pirits, and is a kind of condenfation.

Great Fears fhorten the life : for though Grief and Fear do both ftreighten the Jpirit, yet in Grief there is a fimple contraction; but in Fear, by reafon of the cares taken; for the remed $y$, and hopes intermixed, there is a turmoil and vexing of the $\int$ pirits.

Anger fuppreffed is alfo a kind of vexation, and caufeth the Spirit to feed upon the juices of the body; but let loofe and breaking forth, it helpeth: as thofe redicines do: which induce a robuft heat.
$\varepsilon_{n v y}$ is the wortt of all Paffons, and feedeth upon the Jpirits, and they again upon the body; and fo much the more becaufe it is perpetual, and; as it is faid seepetb no bolidays.

Pity of another man's misfortune, which is not likely to befall our felves, is good:

## The Hiltory of Life and Death.

but Pity; which may reflect with fome fimilitude upon the party pitying, is naught, becaufe it exciteth Fear.

Ligbt shame hurteth not, feeing it contracteth the spirits a little, and then ftraight diffulteth them: infomuch that /bamefac'd perfons commonly live long: but Shame for fome great ignominy, and which afflicteth the mind long, contracteth the spiriss even to fuffocation, and is pernicious.
Love, if it be not unfortunate, and too deeply wounding, is a kind of $70 y$, and is fubject to the fame, Laws which we have fet down touching $70 y$.

Hope is the moft beneficial of all the Affections, and doth much to the prolonga tion of life, if it be not too often frufrated, but entertaineth the Fancy with an expectation of good : therefore they which fix and propdund to thenifelves fome end, as' the mark and fcope of their life, and continually and by:degrees go forward in the fame, are, for the moft part, long-liv'd; in fo much that when they are come to the top of their hope, and can go no higher therein, they commonly droop, and live not lng after : So that Hope is a Leaffojo which may be beaten outto a great extenfion, like Gold. d si ti siom?

Admiration and light contemplation are very powerful to the prolonging of life; for they hold the pirits in fuch things as delight them, and fuffer them not to tumultuare, or to carry themfelves unquietly and waywardly. And therefore all the Contemplators of Tatural things, which had fo many: and eminent Objects to admire, (as Democritus, Plato, Parmedides, A polloniuss) were long liv'd: alfo Rbetoricians, which tafted but lightly of things, and ftudied rather Exornation of fpecth than profundity of matters, werealfo longlivid; as Gorgiass grotagoras; Ifocrates, seneca. : And certainly, 'as old men are for themoft part talkative, fo talkative men do often grow very old; for it fhews a light contemplation, and fuch as doth not much fain the spirits, or vex then: but fubtil, andacute, and eager inquifion fhortens life; for it tireth the pirit, and wafteth it.

And-as touching the motion of the spirits by the Affections of the Mind, thus much. Now we will adde certain other general Obfervarionsitouching the Spirits, befide the former, which fall notisto the precedent diftribution.

Efpecial care muif be taken that the Spirits be not too often refolved; for attenuation goeth before refolution, and the spirit once attenuated doth not very eafily retire, or is' condenfed. Now Refolution is caufed by over-great labours,' over-vehement affeetions of the mind, over great fweats, over great evacuations, hot Baths, and an un temperate and unfeafonable ufe of Venus; ; allo by over-great cares and carpings, and, anxious expectations; laftly, by malignant difeafes, and intolerable painsand torments! of the body: all which, as mucti as may be, (which our vulgar Phyficians alfo advife): muft be avoided.

The fpirits are delighted both with wonted things, and with new. Now it maketh wonderfully to the confervation of the Spirits in vigour, that we neither ufe monted things to a fatiety and glatting ; nor nem things; before a quick and flrong appetite. And therfore both cuffoms are to be broken off with judgment and care, before they breed a fuilnèfs; and the appetite after new things to. be reftrained for a time until it grow more fharp and jocond : and moreover, the life, as much as may be, fo to be ordered, that it may have many renovations, and the fpirits by perperual converfing in the fame actions may not wax dull. For though it were no:ill faying of seneca's, The fooldoth ever-beginu to live; yet this folly, andmany more fuch, are good for long life.

- telis to be obferved touching thelpirits, (though the contrary ufed to be done) That when men perceive their fpivits to bel in good, placid, and healthful fates ( that which will be feen by the tranquility of their Mind, and chearful difpofition') that they cherifh them, and root change them: but'wheng in a turbulent and untowndd fate (which will alfo appear by their fadnefs, lumpilhnefs, and other indifpofition of their mind) that then they ftraight overwbelm them, and alter them. Now the fpirits are contained in the fame ftate, by a reftraining of the affections, temperatenefs of diet, abfinence from Venus; moderation in labour, indffterent reft and repofe : and the contrary to thefe do alter and overwhelm the pirits, as namely, vehement affections, profafe feaftings, inmoderate Venus, difficult labours, earneft ftudies, and profecution of bufinefs. Yet men are wont,

## The Hifory of Life and Death.

Venus, Labours, Endeavours, Bufineffes, whereas if they have a regard to long life, (which may feem ftrange) they Chould rather practife the contrary. For we ought to cherith and preferve good pirits, and for the evil-difpofed spirits to difcharge and alter them.

Ficinus faithnot unwifely, That old men, for the comforting of their fpirits, ought often to remember and ruminate upon the Aits of their Childhood and Youth. Certainly fuch a remembrance is a kind of peculiar Recreation to every old man : and therefore it is a delight to men to enjoy the fociety of them which have been brought up together with them, and to vifit the places of their education. Vefpafian did attribute fo much to this matter, that when he was Emperour he would by no means be perfwaded to leave his Father's houfe, though but mean, left he Ghould lofe the wonted object of his eyes, and the memory of his childhood; and befides, he would drink in a wooden Cup, tipped with filver; which. was his'Grandmsother's;' upon $\operatorname{Fef}$ fival dayes.

One thing above all is grateful to the Spirits, that there be a continutiprogrefs to the more benign; therefore we fhould lead fuch a Youth and manhood, that our Old age thould find new Solaces, whereof the chief is moderate eafe: And therefore old men in honourable places lay violent hands upoh themfelves, who retire not to their eafe : whereof may be found an eminent Example in caffodorus, who was of that reputation amongf the Gothi/b Kings of Italy, that he was as the Soul of their affiirs; afterwards, being near cighty years of age, he betook himfelfto a Monaftery; where he ended not his dayes before he was an hundred years old. But this thing doth require two Cautions: one, that they drive not off till their bodies be utterly worn out and difeafed: for in fuch bodies all mutation, though to the more benign, haftencth death : the other, that they furrender not themfelves to a fugogi/beafe, but that they embrace fomething which may entertain their thoughts and mind with contentation ; in which kind the chief delights are Reading and Contemplation; and then the defires of Building and Planting.

Lafty, the fame AEtion, Endeavour and Labour undertaken chearfunlly and with a good will doth refrefh the spirits; but with an averfation and unvoilingnefs, doth fret and deject them. And therefore it conferreth to long life, either that a man hath the art to inftitute his life fo as it may be free and fuitable to his own humour ; or elfe to lay fuch a command upon his mind, that whatfoever is impofed by Fortune, it may rather lead him than drag him.

Neither is that to be omitted towards the government of the Affections; that elpecial care be taken of the mouth of the Stomach, efpecially that it be not toomuch relaxed; for rhat part hath a greater dominion over the affections, efpecially the daily affections, than either the Heart or Brain; onely thofe things excepted which are wrought by potent vapours, as in Drunkennefs and Melancholly.

Touching the Operation upon the spirits; that they may remain youthful, and renew their vigour, thus much : which we have done the more accurately, for that there is, for the moft part, amongft Phyficians and other Aurhors touching thefe Operations a deep filence; but efpecially, becaufe the Operation upon the spirits, and the ${ }_{i}{ }^{\mathrm{r}}$ maxing green again, is the moft ready and compendious way to long life; and that for a two-told compendioufnefs: one, becaufe the Spirits work compendioufly upon the body; the other,' becaufe Vapours and the effections work compendiounly upon the spirits; fo as thefe attain the end, as it were, in a right line, other things rather in lines circular.

## The Operation upon the Exclufion of the eAir. 2.

Tke. Hijorory.

THE Exclufion of the Air arsbient tendeth to length of life two wayes: Firft for that the External Air, next unto the Native Spirit, (howfoever the eAir may be faid to animate the Spirit of Man, and conferreth not a little to health ) doth moft of all prey upon the juices of the bodys is made hard, wathing in cold water, Aftringents applied to the skin, fuch as are Maftick, Myrrhe, Myrtle.

But much more may we fatisfie this Operation by Baths, yet thofe rarely ufed, (efpecially in Summer) which are made of aftringent Mineral waters," fuch as may fafcly be ufed, as Waters participating of Steel and Coperas; for thefe do potently contract the skin.

As for filling up the Pores, Paintings and fuch like Unctrous daubings, and (which. may moft commodioufly be ufed) Oil and fat things, do no lefs conferve the fubftance of the body, than Oil-colours and Varnifh do preferve Wood.

The ancient britains painted their bodies with nooad, and were exceeding long liv'd: the Pitts alfo ufed paintings, and are thought by fome to have derived their name from thence.

The Brafliams and Virginians paint themfelves at this day, who are (efpecially the former ) very long liv'd; infomuch that five years ago the French fefuites had fpeech with fome who remembred the building of Fernambuck, which was done an hundred and twenty years fince; and they were then at Man's eftate.

Foannes de temporibus, who is reported to have extended his life to three hundred years, being asked how he preferved himfelf fo long, is faid to have anfwered, by Oyl mithout, and by Honey within.

The Irifn, efpecially the ur ild-Irifh, even at this day live very long: certainly they report, that within thefe few years the countefs of Defmond lived to an hundred and forty ycars of age; and bred Teeth three times. Now the Iri/h have à fafhion to chafe, and, as it were, to baftethemfelves with old Salt-butter againft the fire.

## The Hiftory of Life and Death:

The fame Irifb ufe to wear Saffroned Linen and Shirts: which though it were at firft devifed to prevent Vermin, yet howfoever I take it to be very'ufeful for lengthning of life ; for saffron, of all things that I know, is the beft thing for the skin, and the comforting of the flefh, feeing it is both notably Aftringent, and hath befides an Oleofity and fubtle heat, without any' Acrimony.- I remember a certain Englibman, who when he went to Sea carried a bagg of Saffron next his ftomack, that he might conccal it, and fo cfrape Cuftom ; and whereas he was wont to be alwaysexceeding Sea-fick, at that time he continued very well, and felt no provocation to vomit.

Hippocrates advifeth in Winter to wear clean Linen; and in Summer foul Linen and befmeared with Oil. The reafon may feem to be, becaufe in Summer the Spirits exhale moft, therefore the pores of the skin would be filled up.

Hereupon we are of opinion, that the ufe of Oil, either of Olives or fweet Almonds, to anoint the skin therewith, would principally conduce to long life: The anointing would be done every morning when we rife out of bed, with Oil in which a little say-fals and saffron is mixed. But this anointing muft be lightly done with Wool, or fome foft fponge, not laying it on thick, but gently touching and wetting the skin.

It is certain that Liquors, even the Oily themfelves, in great quantities draw fomewhat from the body; but contrarily, in fmall quantities are drunk in by the body: therefore the anointing would be but light, as we faid, or rather the fhirt it felf would be befmeared with Oil.

It may happily be objected, that this anointing with Oil, which we commend, ( though it were never in ufe with us, and amongft the Italians is caft off again) was anciently very familiar amongtt the Grecians and Romans, and a part of their Diet; and yet men werenot longer-liv'd in thofe dayes than now. But it may rightly be anfwered, Oil was in ufe onely after Baths, unlefs it were perhaps amongtt Champions : now hot Baths are as much contrary to our operation, as Anointings are congruous, feeing the one opens the paffages, the other ftops them up : therefore the Bath, without the anointing following, is utterly bad; the anointing without the Bath is beft of all. Befides, the anointing amongft them was ufed oncly for delicacy, or (if you take ir at the beft) for bealth, but by no means in order to long life; and therefore they ufed them with all precious Ointments, which were good for delicioufnefs, but hurtful to our intention, in regard of their heat: So that Firgil feemeth not to have faid amifs,

- Nec Cafia liquidi corrumpitur ufus Olivi,

That odoriferous Cafia bath not Jupplanted the ufe of neat. Oil-Olive.
Anointing nith oil conduceth to health, both in Winter, by the exclufion of the cold Air, and in Summer; by detaining the fpirits within, and prohibiting the Refolution of them, and keeping off the force of the air which is then moft predatory.

Seeing the anointing with Oil is one of the moft potent operations to long life, we have thought good to add fome cautions, left the health fhould be endangered: They are four, according to the four Inconveniences which may follow thereupon,

The firft Insonvienience is; that by reprefing fmeats, it may ingender difeafes from thofe excrementitious humours. To this a remedy mult be given by Purges and Clyfers; that evacuation may be duly performed. This is certain, that evacuation by fweats commonly advanceth health, and derogateth from long life; butgentle Purgers work upon the humours, not upon the firirits, as fweat doth:

The fecond Inconvenience is; that it may heat the body, and in time inflame it; for the firits thut in, and not breathing forth, acquire heat. This inconvenience may be prevented, if the Diet moft ufually incline to the colder part, and that at times fome proper cooling Medicines be taken, of, which we fhall ffraight feak in the operation upon the Bloud.

The third is, that it may annoy the bead; for all Oppletion from without ftrikes back the vapours, and fends them up unto the head. This inconvenience is remedied by Purgers, efpecially Clyfters, and by fhutting the mouth of the ftomach ftrongly with Stipticks, and by combing and rubbing the head, and by wafhing it with convenient Lies, that fomething may exhale, and by not omitting competentand good exercifes, that fomethingalfo may perfpire by the skin.

The fourth Inconvenience is a more fubtil Evil, namcly, that the Spirit being detained by the clofing up of the Pores, is likely to multiply it felf too much; for when little iffueth forth, and new Spirit is continually ingendred, the Spirit increafeth too faft, and fo preyeth upon the body more plentifully. But this is not altogether fo; for all. Spirit clofed up is dull, (for it is blown and excited with motion as Flame is) and therefore it is lefs active, and lefs generative of it felf: Indeed it is thereby increafed in Heat, (as Flame is) but flow in Motion. And therefore the remedy to this inconvenience muft be by cold things, being fometimes mixed with Ci l, fuch as are Rofes and Myrtles; for we muft altogether difclaim hot things, as we faid of Ca/fia.
Neither will it be unprofitable to wear next the body Garments that have in them fome UnEtuofty or Oleofity, not Aquofity, for they will exhauft the body lefs; fuch as are thofe of Woollen rather than thofe of Linen. Certainly it is manifeft in the Spirits of Odours', that if you lay fwect powders amongt Linen, they will much fooner lofe their fmell than amongf Woollen. And therefore Linen is to be preferred for delicacy and neatnefs, but to be fufpected for our Operation. off their beds, and to wrap themfelves in the woollen cloaths.
Some report, that they have found great benefit in the confervation of their health by wearing scarlet Wafcoats next their skin, and under their fhirts, as well down to the neather parts as on the upper.

It is alfo to be obferved; that Air accuftomed to the body doth lefs prey upon it than new Air and often changed; and therefore poor people, in fmall Cottages, who live always within the fmell of the fame chimney, and change not their feats, are commonly longeft liv'd : notwithftanding, to other operations (efpecially for them whofe Spirits are not altogether dull) we judge change of air to be very profitable; but a mean muft be ufed, which may fatisfie on both fides. This may be done by removing our habitation four times a year, at conftant and fet times, unto convenient feats, that fo the body may neither be in too much peregrination, nor in too much ftation. And touching the Operation upon the Exclufion of Air, and avoiding the predatory force thereof, thus much.

## The Operation upon the Bloud, and the Sanguifying Heat. 3.

## The Hifory.

THE following Operations anfwer to the two precedent, and are in the relation of Paffives and eAtives: for the two precedent intend this, that the Spirits and eAir in their actions may be the lefs depredatory ; and the two latter, that the bloud and $\bar{j} u i c e$ of the body may be the lefs depredable. But becaufe the Bloud is an irrigation or watering of the yuces and Members, and a preparation to them, therefore we will put the operation upon the Bloord in the firft place. Concerning this Operation we will propound certain Counfeis, few in number, but very powerful in virtue. They are three.

Firft, there is no doubt, but that if the bloud be brought to a cold temper, it will be fo much the lefs diffipable. But becaufe the cold things' which are taken by the mouth agree but ill with many other Intentions, therefore it will be beft to find out fome fuch thingsi as may be free from thefe inconveniences. They are evvo.

The frrft is this : Let there be brought into ufe, efpecially in youth, Clyfers, not purging at all, or abferging, but onely cooling, and fome what opening: thofe are approved which are made of the Juices of Lettuce, Purflane, Liver-wort, Honfesleek, and the Thucilage of the feed of Flea-mort, with fome temperate opening decoction, and a
little Camphire : but in the declining age let the Housleck and Purslane be left out, and the juices of Borrage and Endive, and the like, be put in their rooms. And let thefe Clyffers be retained; if it may bc, for an hour or more.

The other is this, Let there be in ufe, efpecially in Summer, Baths of frefh water, and but luke-warm, altogether without Emollients, as Mallows, Mercury, Nolk, and the like; rather take new whey in fome good quantity, and Rofes.

But (that which is the principal in this intention, and new) we advife that before the bathing of the body be anointed with Oil, with fome thicknefs, whereby the quality of the cooling may be received, and the water excluded: yet let not the pores of the body be fhut too clofe; for when the outward cold clofeth up the body too ftrongly, it is fo far from furthering coolnefs, that it rather forbids, and Itirs up heat.

Like unto this is the ufe of Bladders, with fome decoctions and cooling juices, ap plied to the inferiour region of the body, namely, from the ribbs to the privy parts; for this alfo is a kind of batbing, where the body of the liquor is for the moft part excluded, and the cooling quality admitted.

The third counfel remaineth, which belongeth not to the quality of the blood, but to the fubftance thereof, that it may be made more firmand lef's diffipable, and fuch, as the heat of the firit may have the lefs power over it.

And as for the ufe of Filiggs of Gold, Leaf-gold, Powder of Pearl, precious ftones, Coral, and the like, we have no opinion of them at this day, unlefs it be onely as they may fatisfie this prefent Operation. Certainly, feeing the Arabians, Grecians, and modern Phyficians have attributed fuch virtues to thefe things, it cannot be altogether Nothing which fo great men have obferved of them. And therefore omitting all fantaftical opinions about them, we do verily believe, that if there could be fome fuch thing conveyed into the whole mafs of the bloud in minute and fine portions, over which the fpirits and heat thould have little or no power, abfolutely it would not only refift Putrefaction, but eArefaction alfo, and be a moft effectual means to the prolongation of life. Neverthelefs in this thing feveral cautions are to be given. Firft, that there be a moft esact comminution. Secondly, that fuch hard and folid things be void of all inalignant qualities, left while they be difperfed and lurk in the veins, they brees fome ill convenience. Thirdly, that they be never taken together with meats, nor in any fuch manner as they may ftick long, left they beget dangerous obftructions about the Mefentery. Laftly, that they be taken very rarely, that they may not congregate and knot together in the veins.
Therefore let the manner of taking them be fasting, in $u$ bite rine, a little Oil of e Fimonds mingled therewith, Exercife ufed immediately upon the taking of them.
the simples which may fatisfie this Operation are, in ftead ofall, Gold, Pearls, and Cora!: for all Mctalls, except Gold, are not without fome malignint quality in the diffututions of tham, neither will they be beaten to that exquifite finenefs that Leaf. gold hath. As for all glaffie and tranfparent fewels, we like them not, (as we faid betore) for fear of Corrofion.

But, in our judgment, the fafer and more effectual way would be by the ufe of woods in Infufions and Decoctions; for there is in them fufficient to caufe firmnefs of bloud, and not the like danger for breeding obftructions; but efpecially, becaufe they may be taken in meat and drink, whereby they will find the more eafie entrance into the veins, and not be avoided in excrements.

The vioods fit for this purpofe are Sainders, the Oak and Vine. As for all bot woods or fomething Rofennie, we rcject them : notwithftanding you may adde the moody ftalk's of Rofemary dried, for Rofemiry is a Shrub, and exceedeth in age many Trees; alfo the woody falks of $l v y$, but in fuch quantity as they may not yield an unpleafing rafte.

Let the Woods be taken either boiled in Broths; or infufed in Muft or exle before they leave working: but in Broths (as the cuftom is for Graiacum and the like) they would be infufed a good while before the boiling, that the firmer part of the wood, and not that onely which lieth loofcly, may be drawn forth. As for $\mathcal{A} / h$, though it be ufed for Cups,yet we like itnot. And touching the Operation upon the Blondthus much.

## The Operation upon the fuices of the Body. 4.

The Hiffory.

THere are two kinds of Bodies (as was faid before in the Inquiftion touching $I_{n}$ animates) which are hardly confumed, Hard things and Fat things; as is feen in Metalls and Stones, and in Oil and wax.
It muft be ordered therefore, that the juice of the body be fomewhat bard, and that it be fatty or fubrofcid.
3. As for bardnefs, it is caufed three ways: by Aliment of a firm nature, by cold con. denfing the skin and flefh, and by Exercife, binding and compacting the juices of the body, that they be not foft and frothy.

As for the Nature of the Aliment, it ought to be fuch as is not eafily diffipable; fuch as are Beef, Swine's flefh, Dear, Goat, Kid, Swan, Goofe, Ring-dove, efpecially if they be a little powdred; Fijblikewife falted and dried, Old Cheefe, and the like.

Asfor the Bread; Oaten-bread, or bread with fome mixture of Peafe in it, or Ryebread, or Barly-bread, are more folid than wheat-bread, and in wheat-bread, the courfe $w$ heat-bread is more folid than the pure Manchet.

The Inhabitants of the Orcades, which live upon Jaited $f f h$, and gencrally all Fi $j$-eaters, are long liv'd.

The Monks and Hermites which fed Sparingly, and upon dry Aliment, attained commonly to a great age.

Allo pure water ufually drunk makes the juices of the body lefs frothy? unto which if, for the dulnefs of the fpirits, (which no doubt in VVater are but a little penetrative) you thall adde a little Nitre, we conceive it would be very good. And touching the firmaess of the Aliment thus much.

As for the Condenfation of the skin and fle $\beta$ by cold: They are longer. liv'd for the moft part that live abroad in the operiair, than they that live in Horres; and the Inhabitants of the cold conntries, than the Inhabitants of the bot.

Great fore of clothes, either upon the bed or back, do refolve the body.
Wathing the body in cold water is good for length of life; ufe of hot Bitbs is naught Touching Palths of Aftringent Mineral waters we have fpoken before.
Asfor Exercife; an idle life doth manifeftly make the flefh foft and diffipable : robuff exercife ( fo it be without over-much fweating or wearinefs) maketh it hard and compact. Alfo exercife within cold Water, as fwimming, is very good; and generally exercife abroad is better than that withinhoufes.

Touching Frications, (which are a kind of exercife) becaufe they do rather call forth the Aliment than harden thefleth, we will inquire hereafter in the due place.

Having now fpoken of hardning the juices of the body, we are to come next to the Oleofity and Eattivefs of them, which is a more perfect and potent Intention than Induration, becaufe it hath no inconvenience or evil annexed. For all thofe things which pertain to the hardning of the juices are of that nature, that while they prohibit the abfumption of the Aliment, they allo hinder the operation of the fame; whereby it happens, that the fame things are both propitious and adverfe to length of life: but thofe things which pertain to making the Juices Oily and Rofcid, help on bothfides, for they render the Aliment both lefs diffipable, and more reparable
. But whereas we fay that the Jrice of the body unght to be Rofgid and Fat, it is to ke noted that we mean it not of a vifible Fat, but of a Deminefs difperfed, or (if you will call it) Radical in the very fubftance of the body.

- Neither againlet any man think, that Oil or the Fat of Meats or Marrow do engender the like, and fatisfie our intention: for thofe things which are once perfect are not brought back again; but the Aliments ought to be fuch, which after digeftion and maturation do then in the end engender Oleofit in the $f$ uices.
鲜 Neither again let any man think, that Oil or Fat by it felf and gimple is hard of diffi- pation, but in mixture it doth not retain the fame nature: for as Oil by it felf is much more longer in confuming then VVater; fo in Paper or Linnen it fticketh longer, and is later dried, as we noted before.

To the Irroration of the body, roafted meats or baked meats are more effectual than boiled meats, and all preparation of meat with water is inconvenient: befides, Oil is more plentifully extracted out of drie bodies than out of moilt bodies.

Generally, to the Irroration of the body much ufe of fweet things is profitable, as of Sugar, Honey, fweet Almonds, Pine-Apples, 'iftachio's, Dates, Raifins of the Sun, Corañs, Figs, and the likc. Contrarily, all four, and very falt, and very biting things are oppofite to the gencration of $R$ of cid fuice.

Neither would we be thought to favaur the Manichees, or their diet,though we commend the frequent ufe of all kinds of Seeds, Kernels, and Roots, in Mcats or Sauces; confidering all Bread (and Bread is that which maketh the Meat firm) is made either of Seeds or Roots.

But there is nothing makes fo much to the Irroration of the body, as the quality of the Drink, which is the convoy of the Meat; thereforc let there be in ufe fuch Drinks as without all acrimony or fowrnefs are notwithftanding fubtil : fuch are thofe Wines which are (as the old woman faid in Plantus) vetuftate edertula, toothlefs with age, and Ale of the fame kind.

Mead (as we fuppofe) would not be ill if it were ftrong and old: but becaufe all Honey hath in it fome fharp parts, (as appears by that fharp water which the Chymists extract out of it, which will diffolve metals) it werc better to take the fame portion of Sugar, not lightly infufed in it, but fo incorporated as Honey ufeth to be in Mead, and to keep it to the age of a year, or at leaft fix months, whereby the Water may lofe the crudity, and the Sugar acquire fubtilty.

Now ancientnefs in Wine or Beer hath this in it, that it ingenders fubtilty in the parts of the Liquor, andacrimony in the Spirits, whereof the firt is profitable, and the fecond hurtful. Now to rectific this evil commixture, let there be put into the veffel, before the Wine be feparated from the Muft, Swines-fefh or Deers-fefh well boiled, that the Spirits of the Wine may have whereupon to ruminate andfeed, and fo lay afide their mordacity.
In like manner, if Ale fhould be made not only with the grains of Wheat, Barly, Oates, Peafe, and the like; but alfo fhould admit a part (fuppofe a third part to thefe grains) of fome fat roots, fuch as are Potado-roots, Pith of dirticbokes, Burre-roots, or fome other fweet and efculent roots; we fuppofe it would be a more ufeful drink Eor long lifethan Ale made of grains onely.

Alfo fuch things as have very thin parts, yet notwithfanding are without all acrimony or mordacity, are very good Sallets : which vertue we find to be in fome few of the Flowers; namely, Flowers of Ivy, which infufed in Vinegar are pleafant even to the tafte; Marigold leaves, which are ufed in Broths; and Flowers of Betony. And touching the operation upon the fuices of the Body thus much.

## The Operation upon the Bowels for their Extrufon of Aliment. 5.

The Hiftory.

WHat thofe things are which comfore the 9 rincipal Bowels, whichare the fountains of Concoctions, namely, the stomack, Liver, Heart and Brain; to perform their functions well, (whereby aliment is diftributed into the parts, Spirits are difperfed, and the Keparation of the whole body is accomplifhed) may be derived from Phyfitians, and from their Prefcripts, and Advices.

Touching the Spleen, Gall, Kidneys, Mefenteries, Guts and Lungs, we fpeak not, for thefe are members miniftring to the principal ; and whereas fpeech is made touching health, they require fomctime a moft fecial confideration, becaufe each of thefe have their difeafes, which unlefs they be cured, will have influence upon the Prinsipal Members. But as touching the prolongation of life, and reparation by aliments; and retardation of the incoction of old age; if the Concoctions and
thofe principal Borels be well difpofed, the reft will commonly follow according to oncs with.

And as for thofe things which, according to the different ftate of cvety man's body may be transferred into his Diet and the regiment of his life, he may collett them out of the Books of Phyficians, which have written of the comforting and preferving the four Principal members: For confervation of health hath commonly nced of no more than fome ihort courfes of Phyfick ; but length of life cannot be hoped without an orderly diet, and a conftant race of foveraign medicines. But we will propound fome few, and thofe the moft felect and prime direetions.

The stomach (which, as they fay, is the Mafter of the houfe, and whofe ftrength and goodnefs is fundamental to the other concoctions) ought fo to be girarded and confirmed, that it may be without intemperatenc/s hot, ncxt aftricted or bound, not loofe; furthcrmore clean, not furcharged with foul Humours, and yet (in regard it is nourifhed from it felf, not from the veins) not altogetber empty or bunory : laftly, it is to be kept ever in appetite, becaufe appetite fharpens digeftion.

I wonder much how that fame Calidum bibere, to drink warm drink, (which was in ufe amongft the Ancients) is laid down again. I knew a lhyfician that was very fa mous, who in the beginning of dinner and fupper, would ufually eat a few fpoonfulls of very warm broth with much greedinefs, and then would prefently wifh that it were out again, faying, He bad no need of the broth, but only of the raarmth.

I do vcrily conceive it good, that the firft draught either of wine, or Ale, or any other drink, ( to which a man is moft accuftomed) be taken at fupper warm.

Line in which Gold hath been quenched, I conceive, would be very good once in a meal; not that I belicve the Gold conferreth any vertue thereunto, but that I know that the quenching of all Metals in any kind of liquor doth leave a moft potent AftriEtion : Now I chufe Gold, becaufe befides that Aftrition which I defire, it leaveth nothing elfe behind it of a metalline impreffion.
1 am of opinion, that the fops of bread dipped in wine, taken at the midft of the mcal, are better than wine it felf ; efpecially if there were infufed into the wine in which the fops were dipped $\mathcal{R o f e m a r y ~}^{\text {and } C i t r o n-p i l l, ~ a n d ~ t h a t ~ w i t h ~ S u g a r, ~ t h a t ~ i t ~}$ may not flip too faft.
It is ccrtain that the ufe of Quinces is good to ftrengthen the ftomach; but we take them to be better if they be ufed in that which they call Quiddeny of $Q$ zinces, than in the bodies of the Quinces themfelves, becaufe, they lie heavy in the ftomach. But thofe Quiddenies are beft taken after meals, alone; before meals, dipped in Vinegar.

Such things as are good for the fomach above other Simples are thefe, Rofemary, Elecampane, Maffick, wormwood, Sage, Wint.
I allow Pills of Aloes, Maftick and Saffron in Winter-time, taken before dinner; but fo, as the Aloes be not only oftentimes wathed in Rofe.water, but alfo in Vinegar in which Tragacanth hath been infufed, and after that be macerated for a few hours in Oil of fweet Almonds new drawn, bctore it be made into Pills.

Wine or Ale wherein Wormwood hath been infured, with a little Elecampane and yellow sarders, will do well, taken at times, and that efpecially in Winter.

But in Summer, a draught of white-wine allayed with stramberry-water, in which Wine Powder of Pearls and of the fhells of cra-fifes exquifitely beaten and (which may perhaps feem ftrange ) a little (halh have been infufed, doth excellently refrefh and ftrengthen the ftomach.

- But generally, all Draughts in the morning (which are but too frequently ufed) of cooling things, as of Juices, Decoctions, Whey, Barly-watcrs, and the like) are to be avoided, and nothing is to be put into tle fomach fafting which is purcly cold. Thefe things are better given, if need require, either at five in the afternoon, or elfe an hourafter a light breakfaft.
15:6 mach is to be kept clean, but always moif.

16. 

Oil of Olives new and good, in which a little cletbridate hath been diffolved, anointed upon the back-bone, juft againft the mouth of the ftomach, doth wonderfully comfort the ftomach.

A fmall bag filled with locks of Scarlet-wool fteeped in Red-wine, in which

## The Hiftory of Life and Death.

Myrtle, and Citron-pill, and a hetle :affron have been infufed, may be always worn upon the ftomach. And touching thofe things wicl comfort the ftomach thus much, feeing many of thofe things alfo which ferve for other operations are hclpful to this.

The Liver, if it be preferved from Torrefaction, or Deficcation, and from obftrution, it needeth no more; for that loofenefs of it which begets eAquofitees is plainly a difcare, but the other two old age approaching induceth.
Hercunto appertain moff efpecially thofe things which are fet down in the Operation
that $A$ ir to be heft where the Country is level and plain, and that lieth open on all fides, fo that the foil be dry, and yet not barren or fandy; which puts forth

Wild Thyme, and Eye-bright, and a kind of Marjoram, and here and there ftalks of Calamint; which is not altogether void of wood, but conveniently fet with fome Trees for fhade; where the Sweet-briar-refe fmelleth fomething Musky and Aromatically. If there be Rivers, we fuppofe them rather hurtful than good, unlefs they be very fmall, and clear, and gravelly.

It is certain that the morning air is more lively and refrefhing than the evening air, though the latter be preferr'd out of delicacy.
We conceive alfo, that the air ftirred with a gentle wind is more wholefome than the air of a ferene and calm skie; but the beft is, the wind blowing from the $n$ off in the morning, and from the North in the afternoon.

Odours are efpecially profitabie for the comforting of the beart, yet not fo as thoug' ag oododour were the prerogative of a good air: for it is certain, that as there are fome Peffilential airs which finell not fo ill as others that are lefs hurtful; fo, on the contrary, there are fome airs moft wholfome and friendly to the fpirits, which either fincll not at all, or areleff pleafung and fragrant to the fenfe. And generally, where the air is good, odours fhould be taken but now and then ; for a continual odour, though never fo good, is burthenfome to the pirits.

We commend above all others (as we have touched before) odoar of Plants, growing, and not plucked, taken in the open aur: the principal of that kind are Violets, Gillifowers, Pinks, Bean-flowers, Lime-tree-bloffoms, Vine-buds, Honey-fuckles, yellow Wallflowers, Musk. Rofes, (for other Rofes growing are faft of their-finells) Stramberry-leaves, efpecially dying, sweet-briar, principally in the early Spring,wild Mint, Lavender flowered; and in the hotter Countries, Orenge-tree, Citron-tree, जyrtle, Laurel: Therefore to walk or fit near the breath of theferplants would not be neglefted.

For the comforting of the Heart, we prefer cool fmels before hot fmells: therefore the beft perfume is, either in the morning, or about the heat of the day, to take an equal portion of Vinegar, Rofe-water, and claret-wine, and to pour them upon a Fire-pan fomewhat heated.

Neither let us be thought to facrifice to our Mother the Earth, though we advife, that in digging or ploughing the Earth for health, a quantity of claret-zine be.poured thereon.

Orenge-flower-water, pure and good, with a fmall portion of Rofe-water and brisk wine, fnuffed up into the noftrils, or put into the noftrills with a syringe, after the manner of an Errbine, (but not too frequently) is very good.

But champing (though we have no Betel) or holding in the mouth onely of fuch things as cheer the Spirits, (even daily done) is exceeding comfortable. Therefore for that purpofe make Grains or little cakes of Amber-gricce, Musk, Lignum-Aloes, Lignum Rhodium, Orras Powder, and Rofes; and let thofe Grains or Cakes bemade up with Rofe-water which hath paffed through a little Indian Balfam.

The Vapours which arifing from things inwardly taken do fortifie and cherift the beart ought to have thefe threc properties, that they be Friendly, Clear, and Cooling; for hot vapours are naught, and $"$ ine it felf, which is thought to have onely an heating vapour, is not altogether void of an opiate quality, Now we call thofe vapours Clcar which have more of the vapour than of the exbalation, and which are nothoaky* or fuliginous, or unctuous, but moift and equal.

## 37.

Out of that unprofitable rabble of cordials, a few ought to betaken into daily diet : inftead of all, Amber-griece, Saffron, and the grain of Kermes, of the hotter fort; Roots of Buglo/s and Borrage, Citrons, Sweet Limnons, and Pearmains, of the colder fort. Alfo that way which we faid, both Gold and Pearls work a'good cffect, not onely within the veins, but in their paffage, and about the parts near the heart ; namely, by cooling, without any mialignant quality.
38.

Of Bezoar-ftone we believe welt, becaufe of many trials : but then the manner of taking it ought to be fuch, as the vertue thereof may more eafily be communicated to the fpirits: therefore we approve not the taking of it in Brotks or Syrups, or in Rofemater, or any fuch like; but oncly in wine, Cinnamon-mater, or the like diftilled water, but that weak or fmall, not burning or ftr ong.
39.

Of the Affections we have fpoken before; we onely adde this, That cvery Noble, and $R$ efolute, and (asthey call it) Heroical Defire, Atrengthneth and inlargeth the powers of theHeart. And touching the Heart thus much.

As for the Brain, where the Scat and Court of the Animalspirits is kept, thofe things
which were inquired before touching Opium, and Nitre, and the subordinates to them both, alfo touching the procurizg of placed fleep, may likewife be referred hither. This alfo is moft certain, that the Brain is in fome fort in the cuftody of the Stomach; and therefore thofe things which comfort and ftrengthen the stomach do help the Brain by confent, and may no lefs be transferred hither. We will adde a few Obfervations; three Outward, one Inward.

We would have bathing of the Feet to be often ufed, at leaft once in a week: and the bath to be made of Lye with Bay falt, and a little Sage, chamomile, Fennel, Sweetmarjoram, and Pepper-zort, with the leaves of Angellica green.

We commendalfo a Fume or Suffumigation every morning of dried rofemary, Bayleaves dried, and Lignum-Aloes: for all fweet Gums opprefs the head.

Efpecially care muft be taken that no bot things be applied to the Head outwardly; fuch are all kind of Spices, the very Nutmeg not excepted: for thofe hot things we debafe them to the foles of the Feet, and would have them applied there onely; but a light anointing of the Head with oil, mixed with Rofes, Myrtle, and a little Salt and saffron, we much commend.

Not forgetting thofe things which we have before delivered touching Opiates, Nitre, and the like, which fo much condenfe the spirits; we think it not impertinent to that effect, that once in fourteen days broth be taken in the morning with three or four grains of Caftoreum, and a little Angelica- $\int$ ced, and Calamus, which both fortifie the Erain, and in that aforefaid denfity of the fubftance of the fpirits, ( fo neceffary to long life) adde alfo a vivacity of metzon and vigour to them.

In handling the Comforters of the four principal bowels, we have propounded thofe things which arc both proper and choice, and may fafely and conveniently be tranfferred into Diets and Regiment of $L$ ifc : for variety of Wedicines is the Daughter of Ignorance; and it is not more true, that many Difbes havecaufed many Difeafes, as the l'rovert is, than this is true, that many Ciedicines havecaufed fer Cures. And touching the operation upon the principal Dowels for thcir Extrufion of eAliment, thus muç.

## The Operation upon the Outward Parts for their e Atraction of Aliment. 6.

The Hiftory.

ALthough a good Concoction performed by the Inward Parts be the principal towards a perfect Alimentation ; yet the Actions of the Outpard Parts ought alfo to concur ; that like as the lnward Faculty fendeth forth and extrudeth the Aliment, fo the Faculty of the Outward Parts may call forth and attract the fame : and the more weak the Faculty of Concoction thall be, the more need is there of a concurring help of the Attractive Faculty.

A frong Attraction of the outward parts is chicfly cauled by the motion of the Body, by which the parts being heated and comforted, do more chearfully call forth and attract the Aliment unto themfelves.

But this is moft of all to beforefeen and avoided, that the fame motion and heat which calls the new juice to the members, doth not again defpoil the member of that juice wherewith it had been before refrefhed.

Frications ufed in the morning ferve efpecially to this Intention: but this muft evermore accompany them, that after the Frication the part be lightly anointed with Oil, left the Attrition of the outward parts make them by Perfpiration dry and juicelefs.

The next is Exercife, (by which the parts confricate and chafe themfelves) fo it
$\qquad$

## The Hifory of Life and Deatb.

be moderate, and which (as was noted before) is not fwift, nor to the utmoft trengith, nor unto wearinefs. But in Exercife and Frication there is the fame reafon and caution, that the body may not perfpire or exhalc too much : Therefore Exercife is better in the open air than in the houle, and better in Winter than in Summer; and again, Exercife is not onely to be concluded with Unction, as Frication is, but in vehement Exercifes Unction is to be ufed both in the beginning and in the end, as it was anciently to Cbampions.

That Exercife may refolve either the fpirits or the juices as little as may be, it is neceflary that it he ufed when the ftomach is not altogether empty: and thercfore that it may not be ufed upon a full flomach, (which doth much concern health) nor yet upon an empty ftomach, (which doth nolefs concern long life) it is beft to take a breakfaft in the morning, not of any Phyfical Drugs, or of any Liquiors or of Raifins, or of Figs, or the like; but of plain Meat and Drink, yet that very light, and in moderatc quantity.

## The Operation upon the eAliment it Jelf for the Infinuation thereof.: 7 .

## The Hiftory.

THe vulgar reproof touching many Difhes doth rather become fevere Reformer than a Pbyfician: or howfoever it may be good for perfervation of health, yet it is hurtful to length of life, by reafon that a various mixture of Alments, and fomewhatheterogeneous, finds a paffage into the veins and juices of the body more lively and chearfully than a fimple and homogeneous diet doth; befides, it is more forcible to ftir up Appetite, which is the fpur of Digcftion. Theretore we allow both a full Table, and a continual changing of DiJoes, according to the Seafons of the year, or upon other occafions.

Alfo that opinion of the Simplicity of Meats without Sawces is but a fimplicity of judgment; for good and well-chofen sawces are the molt wholefome preparation of, Meats, and conduce both to health and to long life.

It muft be ordered, that with Meats hard of digeftion be conjoyned ftrong Liquors and Sawces that may penetrate and make way ; but with Meats more cafie of digeftion, fmaller Liquorsand fat Sawces.

Whereas we advifed before, that the firft Draught at Supper fhould be taken warm; now we adde, that for the preparation of the ftomach, a good draught of that Liquor (to which every man is moft accuftomed) be taken warm half an hour before ineat allo, but a little fpiced, to pleafe the tafte.

The preparation of Meats, and Bread, and Drinks, that they may be rightly handled, and in order to this Intention, is of exceeding great moment ho wfoever it may feem a Mechanical thing, and favouring of the Kitchin and Buttery; yet it is of more confequence than thofe Fables of Gold and precious Stones, and the like.

## The Hifory of Life and Death.

The moiftning of the juices of the body by a moilt preparation of the aliment, is a childifh thing ; it may be fomewhat available againft the fervours of difeafes, but it is altogether averfe to rofcid alimentation. Thercfore boiling of meats, a's concerning our Intention, is far inferiour to roafting, and baking, and the like.

Roafting ought to be with a quick fire, and foon difpatched; not with a dull fire, and in long time.

All folid flehes ought to be ferved in, not altogether frefl, but fomewhat powdered or corned; the lefs Salt may be fpent at the table with them, or none at all : for Salt incorporated with the meat before is better diftributed in the body, then caten with it at the table.
There would be brought into ufe feveral and good Macerations, and Infufions of areats in convenient Liquors, before the roafting of them: the like whercof are fometime in ufe before they bake them, and in the Pickles of fome Fifhes.
But beatings, and as it were fcourgings, of fleth-meats before they be boiled, would work no fmall matter. We fee it is confeffed that Partridges and Pheafants killed with an Hawk, alfo Bucks and stags killed in Hunting, (if they fand not out too long, eat better even to the tafte; and fome Fi/hes fcourged and beaten, become more tender and wholfome; alfo hard and four Pears, and fome other Fruits, grow fweet with rowling them. It were good to practife fome fuch beating and bruifing of the harder kinds of Flethes before they be broughtto the fire ; and this would be one of the beft preparations of all.

Bread a littic levened, and very little falted, is beft, and which is baked in an Oven throughly heated, and not with a faint hear.

The preparation of Drinks in order to long life Thail not exceed one Precept. And as touching weter-drinkers we have nothing to lay; fuch a dict (as we faid before) may prolong lite to an indifferent term, but to no eminent length : but in other Drinks, that are full of fpirit, (fuch as are sine, Ale, Mead, and the like) this one thing is to beobferved and purfued, as the fum of all, That the parts of the Liguor may be exceeding thin and fubtil, and the Spirtt exceeding mild. This is hard to be donc by Age alone, for that makes the parts a little morefubtil, but the fpirits much more fharp and eager: therefore of the infufions in the Veffels of fome fat fubftance, which may reffrain the acrimony of the fpirits, counfel hath been given beforc. There is alfo another way without $\operatorname{lnf} u f$ fon or © Mixture: this is, that the Liquormight be continually agitated, either by carriage upon the water, or by carriage by Land, or by hanging the veffcis upon lines, and daily ftirring them, or fome fuch other way: for it is certain that this local motion doth both fubtilize the parts, and doth fo incorporate and compact the fpirits with the parts, that they have no leifure to turn to fowriefs, which is a kind of pistrefaction.

But in extream old age fuch a preparation of meats is to be made as may be almoft in
 for the Nutritive part, at leaft the beft of it, doth not afcend in Vapours.

The incorporating of meat and drink before they meet in the ftomach is a degree to chylus: thercfore let Chickens, or Partridges, or Pheafants, or the like, be taken and boiled in water with a little falt, then let them be cleanfed and dried, afterward let them be infufed in Muft or Ale before it hath done working, with a little Sugar:

Alfo Grazies of meat, and the mincings of them fmall well feafon'd, are good for old perfons ; and the rather, for that they are deftituted of the office of their Teetb in chewing, which is a principal kind of preparation.

And as for the helps of that defect; (namely, of the ftrength of $T_{e e t h}$ to grind the meat) there are three things which may conduce thereunto. Firft, that new Teeth may put forth; that which feems altogether difficult, and cannot be accomplifhed without an inward and powerful reftauration of the body. Secondly, that the faws be fo confirmed by due Aftringents, that they may in fome fort fupply the office of the Teeth; which may poffibly be effected. Thirdly, that the meat be fo prepared, that there fhall be no need of chewing : which remedy is ready at hand.
We have fome thought alfo touching the Quantity of the meat and drink, that the fame taken in a larger quantity at fome times is good for the irrigation of the body: therefore both great Feaftings and free Drinkings are not altogether to be inhibited. And touching the operation upon the Aliments and the Preparation of them,' thus much.

## The Operation upon the laft eAct of Afsimilation. 8.

TOuching the laft A ct of Affimilation (unto which the three Operations immediately preceeding chiefly tend) our advice fall be brief and fingle: and the thing it felf ra. ther needs Explication, than any various Rules.

IT is certain, that all bodies are endued with fome defire of $A / f$ milating thofe things which are next them. This the rare and pneumatical bodies, as Flame, Spirit, Air, perform generoufly and with alacrity : on the contrary, thofe that carry a grofs and tangible bulk about them, do butweakly, in regard that the defire of affimilating other things is boundin by a ftronger defire of Reft, and containing themfelves from Motion.
A gain, it is certain that the defire of affimilatiag being bound, as we faid, in a Grofs body, and made uneffectual, is fomewhat freed and ftirred up by the beat and neighbouring/pirit, fo that it is then actuated: which is the onely caufe why Inamimates affimilate not, and Animates affimilate.

This alfo is certain, that the barder the Confiftence of the body is, the more doth that body ftand in need of a greater heat to prick forward the afsmilation: which falls out ill for old men, becaufe in them the partsare more obftinate, and the heat weaker ; and therefore cither the obftinacy of their parts is to be foftned, or their heat increafed. And as touching the Malacifation or mollifying of the members, we fhall fpeak afterward, having alfo formerly propounded many things which pertain to the prohibiting and preventing of this kind of hardnefs. For the other, touching the increafing of the heat, we will now deliver a fingle precept, after we have firf affumed this $A x i o m$.

The $A E T$ of difimilation (which, as we faid, is excited by the heat circumfufed) is a motion excceding accurate, fubtile, and in little; now all fuch motions do then come to their vigour, when the local Motion wholly ceafeth which difturbeth it. For the Motion of Separation into homogeneal parts, which is in Milk, that the Cream fhould fwim above, and the Whey fink to the bottom, will never work, if the Milk be never fo little agitated ; neither will any Putrefaction proceed in Water or mixt Bodies, if the fame be in continual Localmotion. So then, from this Afumption we will conclude this for the prefent Inquiftion.

The ACE it felf of A/fimilation is chiefly accomplifhed in Sleep and Reft, efpecially to wards the morning, the diftribution being finilhed. Therefore we have nothing elfe to advife, but that men keep themfelves hot in their fleep; and further, that to wards the morning there be ufed fome Anointing, or fhirt tincted with Oil, fuch as may gently ftir up heat, and after that to fall afleep again. And touching the laft aCt of affimilations thus much.

## Tbe Operation upon the Inteneration of that wobich begins to be Arefied, or the evalacijfation of the Body. 9.

VVE have inquired formerly touc bing the Intencration from witbin, which is done by many windings and Circuits, as well of Alimentation as of Detaining the Spirit from ifuing forth, and there fore is accomplijhed fowly. Now we are to inquire touching that Intencration which is from without, and is effected, as it were, fuddenly; or touching the Malacifation and Suppling of the Body.

## Tbe Hiffory.

IN the Fable of reftoring Pelias to youth again, Medea, when the feigned to do it propounded this way of accomplifhing the fame, That the Old man's body fhould be cut into feveral pieces, and then boiled in a Cauldron with certain Medicaments. There may, perhaps,fome boiling be required to thismatter, but the cutting into pieces is not needful.

Notwithftanding, this curting into pieces leems, in fome fort, to be ufful; not with a knife, but with judgment. For whereas the Confiftence of the romels and Parts is very diverfe,' it is needfull that the Inteneration of them both be not effected ti: fame way, but that there be a Cure defigned of each in particular, befides thofe things which pertain to the Inteneration of the whole mals of the Body; of which, notwithftanding, in the firft place.

This Operation (if perhaps it be within our power) is moft likely to be done by Baths, Unctions, and the like; concerning which thefe things that follow are to be obferved.
We mult not be too forward in hoping to accomplifh this matter from the Examples of thofe things which we fee done in the Imbibations and Materations of nanimates, by which they are intenerated, wheteof we intioduced fome inftances before: For this kind of operation is more eafie upon Inanimates, becaule they attract and fuck in the Liquor ; but upon the bodies of Living. creatures it is harder, becaufe in them the motion rather tendeth outward and to the Circumference.

Thcrefore the Emollient Baths which are in ufe do little good, but on the contrary hurt, becaule they rather draw forth than make entrance, and refolve the ftructure of the body rather than confolidate it.

The Baths and Unctions which may ferve to the prefent operation (namely, of Inteneratmg the body truly and really) ought to have three properties.

The firft and principal is, That they confift of thofe $t /$ ings which in their whole fubftance are like unto the body and flefb of man, and which have a feeding and nurfong virtue from without.

The fecond is, That they be mixed with fuch things as through the fubtilty of their parts may moke entrance, and fo infinuate and conveigh their nouribing virtue into the body.

The third is, That they receive fome mixture (though much inferiour to the reft) of fuch things as are Aftringent; I mean not four or tart things, but unctuous and comforting; that while the other two do operate, the exhaling out of the body, which deftroyech the virtue of the things intenerating, may (as much as is poffible) be pro. hibited; and the motion to the inward parts, by the Aftrition of the skin and clofing of the paffages, may be promoted and furthered.

That which is moft confubfantagl to the body of man is warm Bloud, cither of man, or of fome other living creature : but the device of Ficinur, touching the fucking of blond out of the arm of a wholefome young man, for the reftauration of ftrength in old men, is very frivolous; for that which nonrilheth from within ought no way to be equal or homogeneal to the body nourifhed, but in fome fort inferiour and fubordinate, that it may be converted : but in things applied outwardly, by how much the fubfance is liker, by fo much the confent is better.

It hath been anciently received, that a bath made of the bloud of Infants will cure the Leprofie, and heal the flefh already putrefid; infomuch that this thing hath begot envy towards fome Kings from the common penple.

It is reported that Heraclitus, for cure of the Dropfie, was put into the warmbelly of an ox newly flain.

They ufe the blond of Kitlins warm to cure the difedfe called St. CAntbony's Fire, and to reftore the flefh and skin.

An Arm or other Member newly cut off, or that upon fome other occafion willnot leave bleeding, is with good fuccefs put into the belly of fome creatures newly ripped up, for it worketh potently to ftanch the bloud, the" blond of the member cut off by confent fucking in, and vehemently drawing to it felf, the warm blösd of the creature flain, whereby it felf is fopped and retireth.

It is much ufed in extreme and defperate difeafes to cut in two young Pigeons, yet living, and apply them to the foles of the feet, and to hift them one after another, whereby fometime there followeth a wonderful eafe. This is imputed vulgarly as if they fhould draw down the malignity of the difeafe; but howfoever, this application goeth to the Head, and comforteth the Animal Spirits.

But thefe bloudy Batbs and Unctions feem to us fluttifh and odious: let us fearch out fome others, which perhaps have lefs loathfomenefs in them, and yet no lefs benefit.

Next unto warm Bloud, things alite in fubstance to the Body of a man are nutritives: fat fefbes of Oxen, Swine, Dear; sifters amonglt Fifhes; Milk, Butter, Yolks of Eggs, Flower of W'beat, fweet wine, cither Sugred, or before it be fince.
such things as we would have mixed to make impreffion are, inftead of all, Sales, efpecially Bay falt; alfo Wine (when it is full of Spirit) maketh entrance, and is an excellent Convoy.

Afringents of that kind which we defcribed, namely, unctuous and comfortable 'thinge, are Saffron, Maftick, Myrrbe, and Myrtle berries.

Of thefe parts, in our judgment, may very well be made fuch a Bath as we defign : Pbyficians and Pofterity will find out better things hercafter.
But the Operation will be much better and more powerful, if fuch a Batb as we have propounded (which we hold to be theprincipal matter) be attended with a fourfold Courre and order.

Firft, that there go before the Bath a Frication of the body, and an Anointing with Oil, with fome thickning fubitance, that the virtue and moiftning heat of the Bath may pierce the body, and not the watry part of the Liquor. Then let the Bath follow, for the face of fome two hours. After the Bath, let the body be Emplaiftered with Nafick, Myrrbe, Tragacanth, Diapalma, and Saffron; that the perfpiration of the body may (as much as is poffible) be inhibited, till the fupple matter be by degrees turned into folid: This to be continued for the fpace of twenty four hours or more. Laftly, the Emplaiftering being removed, let there be an anointing with oil mixed with salt and Saffron. And let this Bath, together with the Emplaistering and Unttion, (as before) be renewed every fifth day. This Malacifation or fuppling of the body be continued for one whole month.

Alfo during the time of this Malaciffation, we hold it ufeful and proper, and according to our intention, that men nourith their bodies well, and keep out of the cold air, and drink nothing but warm drink.

Now this is one of thofe things (as we warned in general in the beginning ) whereof we have made no trial by Experiment, but onely fet it down out of our aiming and levelling at the end : For having fet up the Mark, we deliver the Light to others.

Neither ought the marmtbs and cherifoings of living bodies to be neglected. Ficinses faith, and that ferioufly enough, That the laying of the joung Maid in David's bofom was wholfome for bim, but it came too late. He fhould alfo have added, That the young Maid, after the manner of the PerfianVirgins, ought to have been anointed with Myrrhe, and fuch like, not for delicioufnefs, but to increafe the virtue of this cherifhing by a living body.

Earbaroffa, in his extream old age, by the advice of a Phyfician, a few, did continually apply young Boys to his ftomach and belly, for warmth and cherifhing: alfo fome old men lay Whelps (creatures of the hotteft kind) clofe to their fomachs every night.

There hath gone a report, almoft undoubted, and that under feveral names, of certain men that had great Nofes, who being weary of the derifion of people, have cut ofi the bunches or hillocks of their Nofes, and then making a wide gafh in their arms, have held their Nofes in the place for a certain time, and fo brought forth fair and comeIy $\mathcal{N}$ ofes: Which if it be true, it thews plainly the confent of flef unto $f e \rho \mathrm{f}$, efpecially in live flefbes.
28.

Touching the particular Inteneration of the principal Bowels, the Stomach, Lungs, Liver, Heart, Brain, Sarrom of the Back-bone, Guts, Reins, Gall, Veins, Arteries, Nerves, Cartilages, Bones, the Inquiftion and Direction would be too long feeing we now fet not forth a Erattick, but certain Indications to the Practick.

## The Operation upon the Purging amay of old Fuice, and Supplying of new fuice; or of Renovation by Turns. 10.

The Hifory.

ALthough thofe things which we fhall here fet down have been, for the moft part, fpoken of before; yet becaufe this Operation is one of the principal, we will handle them over again more at large.
It is certain that Draught-Oxen which have been wornout with working, being put into frelh and rich paftures, will gather tender and young flefh again : and this will apo pear even to the tafte and palat; fo that the Inteneration of flefh is no hard matter. Now it is likely that this Inteneration of the fefb being often repeated, will in time reach to the Inteneration of the Bones and Membranes, and like parts of the body.

It is certain that Diets which are now much in ufe, principally of Guaiacum, and of Sarfaperilla, China, and Safafras, if they be continued for any time, and according to ftrict rulcs, do firf attenuate the whole juice of the body, and after confume it ard drink it up. Which is moft manifeft, becaufe that by thefe Diets the French-Pox, when it is grown even to an hardnefs, and hath eaten up and corrupted the verymarrow of the body, may be effectually cured. And further, becaufe it is manifeft that men who by thefe diets are brought to be extream lean, pale, and as it were ghofts, will foon after become fat, well-coloured, and apparently young again. Wherefore we are abfolutely of opinion, that fuch kind of diets in the decline of age, being ufed every year, would be very uffful to our Intention; like the old skin or fooil of Serpents.

We do confidently affirm, ( $n$ cither let any man reckon us among thofe Hercticks which were called Cathari ) that often Purges, and made even familiar to the body, are more available tolong life than Exercifes and Sweats: and this mult needs be fo, if that be held, which is already laid for a ground, That Unctions of the body, and Oppletion of the paffages from without, and Exclufion of air, and Detaining of the firit within the ma's of the body, do much conduce to long life. For it is moft certain, that by Swears and outward Perfirations not only the Humours and excrementitious vapours are exhaled and confumed, but together with them the juices alfo and good firits, which are not fo eafily repaired: but in Purges (unlefs they be very immoderate) it is not fo, feeing they work principally upon the Humors. But the beft Purges for this Intention are thofe which are taken immediately beforemeat, becaufe they dry the body lefs ; and therefore they mult be of thofe Purgers which do leaft trouble the belly.

Thefe Intentions of the Operations which we bave propounded (arme conceive) are moft true, the Remedies farthful to the intentions. Neither is it credible tobetold (although not a fers of thefe Remedies may feem but vulgar) witb what care and choice they have been examined by us, that they might be (the Intention not at all impeached) both Safe and effectual Experience, no doubt, will both verifie and promote thefe matters. And fuch, in all things, are the works of every prudent counfel, that they are Admirable in their Effects, Excelient alfo in their Order, but Seeming Vulgar in the Way aid Means.

## The Porches of Death.

$W^{E}$ are now to enquire touching the Porches of D cath, that is, touching thofe things wrich happen onto men at the point of Death, both a little before and after; that Seeing there are many Paths whbich lead to Death, it may be underfood in what Common
way they all end, efpecially in thofe Deaths wbich are caufed by Indigence of Nature rather than by Violence: although Jometbing of this hater alfo mufb be inforted, becausfe of the connexion of thinges.

The Hiffory.

which the defireth to expel the foggy air drawn into the Lungs, and to take in new, fcarce the third part of a minute.

Again, the beating of the Pulfe, and the motion of the Syfole and Diaftole of the
heart, are three times quicker than that of breathing : infomuch that if it were poffible that that motion of the heart could be ftopped without ftopping the breath, death would follow more fpedily thereupon than by ftrangling.
Notwithltanding, ufe and cuftom prevail inuch in this natural action of brcathing; as it is in the Delian Divers and Fithers for Pearl, who by long ufe can hold their breaths at leaft ten times longer than other men can do.
Amongt living Creatures, even of thofe that have Luags, there are fome that are fble to hold their breaths a long time, and others that cannot hold them fo long, according as they need more or lefs refrigeration.

Fibhes need lefs refrigeration than Terreftrial Creatures, yet fome they need, and take it by their Gills. And as Terreftrial Creatures cannot bear the air that is too hot or too clofe; fo Fifbes are fuffocated in waters if they be totally and long frozen.

If the Spirit be affaulted by another heat greater than it felf, it is diffipated and deferoyed : for it cannot bear the proper beat without refrigeration, much lefs can it bear another heat which is far ftronger. This is to be feerl in burning-Fevers, where the heat of the putrefied humours doth exceed the native heat, eveni to extinction or diffipation.

The want alfo and ufe of Sleep is referred to Refrigeration. For Motion doth attenuate and rarifie the firit, and doth fharpen and increafe the heat thereof; contrarily, sleep fetleth and reltraineth the motion and gadding of the fame: for though sleep doth ftrengthen and advance the actions of the parts and of the livelefs fpirits, and all that motion which is to the circumference of the body; yet it doth in great part quiet and fill the proper motion of the living Spirit. Now fleep regularly is due unto humane nature once within four and twenty hours, and that for fix or firc hours at the leaft: though there are, even in this kind, fometimes miracks of Nature; as it is recorded of Mecanas, that he flept not for a long time before his death. And as touching the want of Refrigeration for conferving of the spirit thus inuch.

As conccrning the third Indigence, namely of Aliment, it feems to pertain rather to the parts than to the living Spirit; for a man may cafly believe that the living "pirit fubfifteth in Identity, not by fuccefion or renovation. And as for the reafonable Sosl in man, it is above all queltion that it is not cugendred of the Soul of the Parents, nor is repaired, nor can die, They fpeak of the Natural spurit of living Creatures, and alfo of Vegetables, which differs from that nther Soul effentially and formally. For out of the confufion of thefe that fame tranfinigration of Souls, and innuinerable other devices of Heathens and Hereticks have procecded.

The Body of man doth regularly require Renovation by Aliment every day, and a body in health can fearce endure fafting three days together; notwithftanding ufe and cuftome will do much even in this cate : but in ficknefs fafting is lefs grievous to the body. Alfo sleep doth fupply fomewhe to nourilhment ; and on the other fide Exrecife doth require it morc abundantly. Likewife there have fome been found who fuftained themfelves (almoft to a miracle in nature) a very long time without meat or drink.

Dead Eodies if they be not intcrcepted by putrefaction, will fubfift a long time without any notable Abjumption; but Living bodies not abnve three days, (as we faid) unlefs they be repaired by nourithment: which theweth that quick Abfumption to be the work of the living spirit, which either repairs it felf, or puts the parts into a neceffity of being repaired, or both. This is teltified by that alfo which was noted a little before, namely, that living creatures may fublift fomewhat the longer without Aliment if they feep: now fleep is nothing elfe but a reception and retirement of the living ${ }^{\text {spirit into it felf. }}$

An abundant and continual effuxion of blood, which fomctimes happeneth in the Hamorrhoides, fometimes in vomitting of blood, the inward Veins being unlocked or broken, fometimes by wounds, caufcth fudden death, in regard that the bloud of the Veins miniftreth to the Arteries, and the bloud of the eArteries to the Spirit.

The quantity of meat and drink which a man, eating two meals a day, receiveth into his body is not fimall; much more than he voideth again either by ftool, or by urine, or by fweating. You will fay, No marvel, feeing the remainder goeth into the juices and fubftance of the body. It is true ; but confider then that this addition is made twice a day, and yet the body aboundeth not much. In like manner, though the firit be re. paired, yet it grows not exceffively in the quantity.
27. It doth no good to bave the Aliment ready, in a degree removed, but to have it of that kind, and fo prepared and fupplied that the fpirit may work upon it : for the ftaff of a Torchalone will not maintain the flame, unlefs it be fed with wax, neither can men live tupon herbs alone. And from thence comes the Inconcoction of old age, that though there be, flefh and bloud, yet the fpirit is become fo penurious and thin, and the juices and bloud fo heartlefs and obftinate, that they hold no proportion to Alimentation.

Let us now caft up the accounts of the Needs and Indizences, according to the ordi. nary and ufual courfe of nature. The Spirit hath need of opening and moving it felf in the Ventricles of the Brain and Nerves even continually, of the motion of the Heart every third part of a moment, of breathing every moment; of fleep and nourifhment once within three days, of the power of nourilhment commonly till cighty years be paft: Aid if any of thefe Indigences beneglected, Deathenfucth. So there are plainly three Porches of Death; Deftitution of the Spirit in the Motion, in the Refrigeration, in the Aliment.

It is an error to thinh that the Living Spirit is perpetually generated and exting ruifbed, as Flame is, and abideth not any notable time: for even Flame it felf is not thus out of its own proper nature, but because it liveth amongst enemies, for Flame wisbin Flame endureth. Now the Living Spirit liveth amongft friends, and all due obfequioufnefs. So then, as Flame is a momentany fubftance, Air is a fixed fubfance, the Living Spirit is, betwixt both.

Toucbing the extinguifhing of the Spirit by the deftruction of the Organs (which is caufed by Difeafes and Volenice) we enquire not now, as we foretold in the beginnizg, at though that alfo endeth in the fame three Porches. : And touching the Form of Death it felf thus much.

There are two great forerunners of Death, the one fent from the Head, the other from the Heart ; Convallion, and the extreme labour of the Palfe; for, as for the deadly Hiccough, it is a kind of Convulfoan.,: But the deadly labour of the Pulfe hath that unufual fwiftnefs, becaufe the Heart at the point of death doth fo tremble, that the Syfole and Diafole thereof, are almoft confounded. There is alfo conjoyned in the Pulfe a weaknefs and lownefs, and oftentimes a great intermiffion, becaufe the motion of the Heart faileth, and is not able to rife againft the affault ftoutly or conftantly.

The immediate proceeding figns of Death are, great unquietnefs and toffing in the bed, fumbling with the hands, catching and gralping hard, gnalhing with the teeth, fpeaking hollow, trembling of the neather lip, palenefs of the face, the memory confufed, fpeechlefs, cold fweats, the body thooting in length, lifting up the white of the cye, changing of the whole vifage, (as the nofe fharp, eyes hollow, cheeks fallen) contraction and doubling of the coldnefs in the extreme parts of the body; in fome, fhedding of bloud or fperm, fhrieking, breathing thick and fhort, falling of the neather chap, and fuch like.

There follow Death a privation of all fenfe and motion, as well of the Heart and Artefies as of the Nerves and Joynts, an inability of the body to fupport it felf upright, ftiffnefs of the Nerves and parts, extream coldinefs of the whole body; after a little while, putrefaction and Itinking.
Eeles, Serpents and the Infecta will move a long time in every part after they are cut afunder, infomuch that Country people think that the parts ftrive to joyn together again. Alfo birás will flutter a great while after their heads are pulled off; and the hearts of living creatures will pant a long time after they are plucked out. I remember I have feen the heart of one that was bowelled, as fuflering for High Treafon, that being caft into the fire, leaped at the firft at leaft a foot and half in height, and after by degrees lower and lower, for the fpace, as I remember, of feven or eightminutes. There is alfo an ancient and credible Tradition of an $0 x$ lowing afterhis bowels were plucked out. But there is a more certain tradition of a man, who being under the

## The Hiftory of Life and Death.

Exceutioner's hand for high Treafon, after his Heart was plucked out and in the Exccutioner's hand, was heard to utter three or four words of prayer : which therefore we faid to be more credible than that of the $0 x$ in Sacrifice, becaufe the friends of the party fuffering do ufually give a reward to the Executioncr to difpatch his office with the more fpeed, that they may the fooncr be rid of their pain; but in Sacrifices we fee no caufe why the Prieft thould be fo fpeedy in his office.

For reviving thofe again which fall into fudden swooning and Catalepfes of aftonifhments, (in which Fits many, without prefent help, would utterly expirc) thefe things are ufed; Putting into their mouths Water diftilled of Wine, which they call Hotwouters, and Cordial.waters, bending the body forwards, ftopping the mouth and noftrls hard, bending or wringing the fingers, pulling the hairs of the beard or head, rubbing of the parts, cfpecially the face and legs, fudden cafting of cold water upon the face, Thrieking out aloud and fuddenly; putting Rofe-zater to the noftrills with Vinegar in faintings; burning of Feathers or Cloth in the fuffocation of the Motber: but cfpecially a Frying-pan heated red hot is good in Apoplexies; alfo a clofe embracing of the body hath helped fome.
$T$ here have been many examples of men in thew dead, cither laid out upon the cold floor, or carried forth to burial; nay, of fome buried in the earth, which notwithftanding have lived again, which hath been found in thofe that were buried (the earth being afterwards opened ) by the bruifing and wounding of their head, through the ftrugling of the body within the Coffin; whercof the moft recent and memorable example was that of Joannes scotus, called the Subtil, and a School.man, who being digged up again by his Servant, (unfortunately abfent at his burial, and who knew his Mafters manner in fuch fits) was found in that ftate : And the like happened in our days in the perfon of a Player, buried at Cambridge. I remember to have heard of a certain Genteman, that would needs make trial in curiofity what men did feel that were hanged; Co he faftened the Cord about his neck, raifing himfelf upon a ftool, and then letting himfelf fall, thinking it thould be in his power to recover the ftool at his pleafure, which he failed in, but was helped by a friend then prefent. He was asked afterward what he felt. He faid he felt no pain, butfirt he thought he faw before his eyes a great fire and burning; then he thought he faw all black and dark; laftly it turied to a pale blew, or Sea-water green; which colour is alfo often feen by them which fall into Swoonings. I have heard alfo of a Phyfician, yet living, who recovered a man to life which had hanged himfelf, and had hanged half an hour, by Frications and hot Baths: A nd the fame Phyfician did profefs, that he made no doubt to recover any man that had hanged fo long, fo his Neck were not broken with the firft fwing.

## The Differences of Youtb and Olde Age.

THe $\uparrow$ adder of Man's Body is this, To be conceived, to be quickned in the womb, to be born, to fuck, to be wcaned, to feed upon Pap, to put forth Teeth the firft time about the fecond year of age, to begin to go, to begin to fpeak, to put forth Teeth the fecond time about feven years of age, to come to Puberty about twiclve or fourteen years of age, to be able for generation and the flowing of the $M$ Menftrua, to have hairs about the legs and arm-holes, to put forth a Beard; and thus long, and fometimes later, to grow in ftature, to come to full years of ftrength and agility, to grow gray and bald ; the Menftruaccafing, and ability to gencration, to grow decrepit and a monfter with three legs, to die. Mean-while the Mind alfo hath certain periods, but they cannut be defcribed by years, 'as to decay in the Semory, and the like; of which hereafter.

The differences of Youth and old Age are thefe: A young man's skin is fmooth and plain, an old man's dry and wrinkled, efpecially about the forehead and eycs; a young man's flefh is tender and foft, an old man's hard; a young man hath ftrength and agility, an old man feels decay in his ftrength and is flow of motion; 2 young man
bath good digeftion, an oldman bad; a young man's bowels are foft and fucculent, an old man's falt and parched : a young man's body is crect and ftreight, an old man's bowing and crooked; a young, man's limbs are fteady, an old man's weak and trembling ; the humours in a young nanare cholerick, and his bloud inclined to heat, in an old man phlegmatick and melancholick, and his bloud inclined to colinefs; a young iman ready for the act of $r^{\prime}$ enus, an old man flow unto it : in a young, man the juices of his body are more rofcid, in an old man more crude and waterifh; the fpirit in a young man plentiful and boiling, in an old man fcarce and jcjune : a young nan's firit is denfe and vigorous, an old man's eager and rare; a young man hath his fenfes quick and intire, an old man dull and decayed; a young nan's tcech are ftrong and entire, an old man's weak, worn, and faln out ; a young man's hair is coloured, an old man's (of what colour focver it were) gray; a young man hath hair, an old man baldnefs; a young man's pulfe is ftronger and quicker, an old man's more confufed and flower; the difeafes of young men are more acute and curable, of old men longer and hard to cure ; a young man's wounds foon clofe, an old man's later; a young man's cheeks are of a frefh colour, an old man's pale, or with a black bloud; a young man is lefs troubled with rheums, an old man more. Neither do we know in what things old men do improve as touching their body, fave onely fometime in fatnefs; whereof the reafon is foon given, Becaufe old men's bodies do ncither perfpire well, nor offimilate well : now Fatnefs is nothing clfe but an exuberance of nourihment above that which is voided by excrement. or which is perfectly affimilated. Alfo fome oldmen improve in the appetite of feeding by reafon of the acid humors, though old men digeft worft. And all thefe things which we have faid, Phrficians negligently enough will refer to the diminution of the Natural heat and Radical moiffure, whichare things of no worth for ufe. This is certain Drinefs in the coming on of years doth forego Cold nefs; and bodics when they come to the top and ftrength of heat do decline in Drinefs, and after that follows Coldnefs.

Now we are to conlider the eAffections of the Mind. I remember when I was a young man, at Poittiers in France I converfed familiarly with a cortain French-man, a witty young man, but fomething talkative, who afterwards grew to be a very eminent man : he was wont to inveigh againf the manners of old men, and would fay, That if their minds could be feen as their Bodies are, they would appear no lefs deformed. Befides, being in love with his own wit, he would maintain, That the vices of old men's Minds have fome correfpondence and were parallel to the putrefactions of their Bodies: For the drincfs of their skin he would bring in Impudence; for the hardnefs of their bowels, unmercifulnefs: for the lippitude of their cyes, an evil Eye and Envy:" for the cafting down of their eyes, and bowing their body towards the earth, Atheifm; (for, faith he, they look no more up to Heaven as they are wont) for the trembling of their members, Irrefolution of their decrees and light inconftancy; for the bending of their fingers, as it were to catcli, Rapacity and covetoufnefsis for the buckling of their knces, Fearjulnefs; for their wrinkles, (raftinefs and Obliguity: and other things which I have forgotten. But to be ferious, a young man is modeft and hamefac'd,' an old man's fore-head is hardned ; a young man is full of bounty and mercy, an old man's heart is brawny; a young man is affected with a laudable emulation, an old man with a malignant envy; a young man is inclined to Religion and Devotion, by reafon of his fervency and inexperience of evil, an old man cooleth in piety through the coldinefs of his charity, and long converfation in evil, and likewife through the difficulty of his belief; a young man's defires are vehement, an old man's' moderate ; a young man is light and moveable, an old man more grave and conftant; a young man is given to liberality, and bencficence; and humanity, an old man to coveroufiefs, wifdom for his own feif, and feeking his own ends; a young man is confident and full of hope, an old man diffident and given to fufpect moft things; a young man is'gcntle and obfequious, an old man froward and difdainful; a young man is fincere and open hearted, an old man cautclous and clofe; a young man is given to defire great things, an old man to regard things neceffary; a young man thinks well of the prefent tumes, an old man preferrethtimes paft betorcthem; a yourg man reverenceth his Superiours, an old man is more forward to taxthem: And many other shings, which pertain rather to Manners than to the prefentInquifition. Notwithftanding old men, as in fome things they improve in their Bodies, fo alfo in their Minds, unlefs they be altogether out of date-: namely, that as they are lefs apt for inven-
tion, fo they excel in judgment, and prefer fafe things and found things before fpecious; allo they improve in Garrulity and Oftentation, for they feck the fruit of fpeech, while they are lefs able for action : So as it was not abfurd that the Poets feigned old Tithoiz to be turned into a Graßopper.

# Moveable (anons of the Duration of Life and Form of Death. 

## Canon I.

COnfumption is not carfed, uslefs that which is departed with by one body paffeth into another.

## The Explication.

THere is in Nature no Amnibilating, or Reducing to Notking: therefore that which is confumed is cither refolved into Air, or turned into fome Body adjacent. So we fee a spider, or $F l y$, or Ant in Amber, entombed in a more ftately Monument than Kings are, to be laid up for Eternity, although they be but tender things, and foon diffipated: But the matter is this, that there is no air by, into which they flould be refolved; and the fubflance of the Amber is fo beterogeneous, that it receives nothing of them. The like we conceive would be if a Stick,orRoot, or fome fuch thing were buried in Quick-filver: alfo Wax, and Honey, and Gums have the fame Operation, but in part oncly.

## Canon II.

IGere is in every Tangible body a Spirit, covered and encompaffed with the groffer parts of the body, and from it all Confumption and Diffolution bath the beginning.

## The Explication.

1 O Body known unto us here in the upper part of the Earth is without a Spirit, either by attenuation and Concoction from the heat of the Heavenly Bodies, or by forne other way: for the Concavities of Tangible things receive not Vacuum, but either Air, or the proper Spirit of the thing. And this spirit whereof we fpeak is not fome Virtue, or Energie, or $A C$, or a Frife, but plainly a Body, rare and invifible; notwithftanding circumfribed by Place, Quantitative, Real. Neither again is that Spirit Air, (no more than Wine is Water) but a body rarefied, of kin to Air, though much different from it. Now the groffer parts of bodies (being dull things, and not apt for motion) would laft a long time ; but the Spirit is that which troubleth, and plucketh, and undermineth them, and converteth the moifture of the body, and whatfocver it is able to digeft, into new Spirit; and then as well the pre-exifting Spirit of the body as that newly made flie away together by degrees. This is beft feen by the Diminution of the meight in bodies dricd through Persfiration: for neither all that which is iffued forth was Spirit when the body was ponderous, neither was it not Spirit when it iflued forth.

## (anon III.

$T^{H}$He Spirit iffuing forth Dricth; Detaincd and working witbin either Melteth, or Putrefieth, or Vivifieth.

## The Explication.

THere are four Proceffes of the Spirit, to Arefaction, to Colliquation, Putrefaction, to Generation of bodies. Arefaction is not the proper work of the Spirit, but of the groffer parts after the Spiritiffued forth: for then they contract themfelves partly by their flight of Vacuum, partly by the union of the Homogeneals: as appears in all things which are arefied by age, and in the drier fort of bodies which have paffed the fire, as Bricks, Char coal, Bread. colliguation is the mere work of the Spirit: neither is it done but when they are excited by heat: for when the Spirits dilating themfelves, yet not getting forth, do infinuate and difperfe themfelves among the groffer parts, and fo make them foft and apt to run, as it is in Metalls and wax: for Metalls and all tenacious things are apt to inhibit the Spirit, that being
excited it iffueth not forth. Putrefaction is a mixed work of the Spirits and of the groffer parts : for the Spirit (which before reftrained and bridled the parts of the thing) being partly iffued forth and partly infeebled, all things in the body do diffolve and return to therr Homogeneities, or (if you will) to their Elements: that which was Spirit in it is congregated to it felf, whereby things putrefied begin to have an ill \{avour : the Oily parts to themfelves, whereby things putrefied have that flipperinefs and unctuofity; the watry parts alfo to themfelves: the Dregs to themfelves: whence followeth that confufion in bodies putrefied. But Generation or Vivification is a work alfo mixed of the Spirit ind groffer parts, but in a far different manner : for the Spirit is totally detained, but it fwelleth and moveth locally : and the groffer parts are not diffolved, but follow the motion of the fpirit, and are, as it were, blown out by it, and extruded into divers figures, from whence cometh that Generation and Organiza. tion: and therefore Vivification is always done in a matter tenacious and clammy, and again, yielding and foft, that there may be both a detention of the firit, and allo a gentle ceffon of the parts, according as the firitforms them. And this is leen in the matter as well of all Vegetables as of living Creatures, whether they be engendred of Putrefaction or of Sperm; for in all thefe things there is manifeftly feen a matter hard to break through, eafie to yield.

Canon IV.
IN all living Creatures there are troo kinds of Spirits:- Livelefs Spirits, fucchas are in bodies Inanimate ; and a Vital spirit fuperadded.

The Explication.
IT was faid before, that to procure long life the Body of man muft be confidered, firt, as Inantmate, and not repaired by nourifhment: fecondly, as Animate, and repaired by nourithment: for the former confideration gives Laws touching Confumption, the latter touching Reparation. Therefore we muft know that there are in humane fleth bones, Membranes, Organs: finally, in all the parts fuch fpirits diffured in the fubitance of them while they are alive, as there are in the fame things. (Flefh, Bones, Membranes, and the reft ) feparated and dead : fuch as alfo remain in a Carkafs: but the Vital Spirit, although it ruleth them, and hath fome confent with them, yet it is far differing from them, being integral, and fubfifting by it felf. Now there are two fpecial differences betwixt the Liveless Spirits and the Vital Spirits. The one, that the Livelefs spirits are not continued to themfelves, but are, as it were, cut off, and encompaffed with a grofs body which intercepts them; as Air is mixed with Snow or Froth: but the $V$ ztal spirit is all continued to it felf by certain Conduit-pipes through which it paffeth, and is not totally intercepted. And this Spirit is two-fold alfo: the one branched, onely paffing through finall pipes, and, as it were, ftrings: the other hath a Cell alfo, fo as it is not onely continued to it felf, but alfo, congregated in an hollow fpace in reafonable good quantity, according to the Analogy of the body, and in that Cell is the fountain of the Rivulets which branch from thence. That Cell is chiefly in the Ventricles of the Brain, which in the ignobler fort of creatures are but narrow, infomuch that the firits in them feem fcattered over their whole body rather than Celled; as may be feen in Serpents, Eels and Flies, wherenfevery of their parts move long after they are cut affunder. Birds alfo leap a good while after their heads are pulledoff, becaufe they have little heads and little Cells. But the nobler fort of creatures have thofe Ventricles larger, and Man the largeft of all. The other difference betwixt the Spirits is, that the Vital Spirit hath a kind of enkindling, and is like a Wind or Breath compounded of Flame and Air, as the Juices of living creatures have both Oil and water. And this enkindling miniftreth peculiar motions and faculties: for the fmoke which is inflamable, even before the flame conceived, is hot, thin and movable, and yet it is quite another thing after it is become flame: but the enkindling of the vital fpirits is by many degrees gentler than the fofteft flame, as of Spirit of wine, or otherwife; and befides, it is in great part mixed with an Acrial fubftance, that it fhould be a Mlyfery or Miracle, both of a Flammeous and Aereous nature.

## Canon V.

THe Natural Actions are proper to the feveral Parts, bat it is the Vital Spirit that excites and Jarpens them.

The Explication.

THe adtions or Fundions which are in the ceveral Members follow the nature of the Members themfulves, (Attraction, Retention, Digeffion, Afimilation, Separation, Excretion, Tersparatron, cuen Scmfe it (cif) ancording to the propricty of the feveral Organs, (the Stomachy, Liver, Heart, Spleen, Gall, Erain, Eye, Ear, and the reft:) pet none of thefe Actions wouk cver have been actuated but by the vigour and prefence of the Fital sporst and heat thereof: as one Iron would not have drawn another wom, unlefs it had been excited by the Load fone, nor an Egge would ever have brought forth a Bird, unlefs the fubftance of the fien had been actuated by the treading of the Cock.

> Cation VI.

## T

He livelefs Spirits are nex: Combubtential to Air ; the vital Spirits approac?: more to the fubtance of Elame.

## The Explication.

IHe Explication of the precedent fourth Canon is alfo a declaration of this prefent Camon: but yet further, from heace it is that all fat and oily things continue long in their Being; For neither doth the Air much plack them, neither do they much defire to joyn themfelves with sir. As for that conceit it is aleggether vain, That Flame Bould be Air fet on fire, feeing Flame and Air are no lefs heterogeneal than oil and water. But whereas it is faid in the Canon, that the vital pirits approach more to the fubfance of Flame ; it muft be underftood, that they do this more than the livelefs spirits, not that they are more Flamy than siry.

Canon VII

THe Spirit batb tmo Defres; one of multiplying it Self, the other of flying furth and songregating it feif with the Connaturals.

## The Explication.

THe Canon is underfood of the livelefs spirits; for as for the fecand Defire, the vital sprrit doth moft of all abhor flying forth of the body, for it finds no Connatural here below to joyn withal: Perhaps it may fometimes flie to the outward parts of the body, to meet that which it loveth; but the flying forth, as Ifaid, it abhorreth. But in the livelefs Jpirits cach of thefe two Defires holdeth. For to the former this belongeth, Every fpirit feated amonoft the groffer parts dwelleth subappily; and therefore when it finds not a like unto it felf, it doth fo much the more labour to create and make a like, as being in a great folitude, and endeavour earnefly to multiply it felf, and to prey upon the wolatile of the großer parts, that it may be encreafed in quantity. As for the fecond Defre of flying forth, and betaking it felf to the eAir, it is certain that allight things (which are cver movable) do willingly go unto their likes near usto theri, as a Drip of water is carried to a Drop, Flems to tlame: but much more this is done in theflying forth of forrit into the chir ambient, becaufe it is not carried to 2 particle like unto it felf, but alfo as unto the Globe of the Cannaturals. Mean-while this is to be noted, That the going forth and fligbt of the fpirit into air is a redoubled action, partly out of the appecite of the 厅pirit, partly out of the appetite of the air; for the common air is a needy thing, and receiveth all things fpeedily, as Spirits, Odowrs, eeams, sounds, and the like.

## Canon VIII.

SPirit detained, if it bave no pollibility of begerting ness fpirits, itencrateth the groffer parts.

## The Explicatioiz.

GEneration of new Spirit is not accomplifhed but upon thole things which are in fome degree near to fpirit, fuch as are humid bodies. And therefore if the groffer parts (amongtt which the Spirit converfeth) be in a remote degree, although the fpirit cannot convert them, yet ( 35 muchasit can) it weakneth, and foftneth, and fubdueth them, that fecing it cannot increafe in quantity, yet it will dwell more at large, and live amonght good neighbours and friends: Now this Aphorimm is moft ufeful to our Ead, becauce it tendeth to the Inteneration of the obftinate parts by the detention of the Epirit.

## Canon IX.

The Inteneration of the barder parts cometh to good effect, when the Spirit neither flyeth forth, zisr begetteth new spirit.
$K 2$

## The Explication.

THis Canon folveth the knot and difficulty in the Operation of Intenerating by the Detention of the Spirit: for if the spirit not flying forth wafteth all within, there is nothing gotten to the inteneration of the parts in their fubfiftence, but rather they are diffolved and corrupted. Therefore together with the Detention the Spirits ought to be cooled and reftrained, that they may not be too active.

Canon X.
The heat of the Spirit to keep the body frefb and green, ongkt to be Robuft, not Eager.

## The Explication.

ALfo this Canon pertaineth to the folving of the knot aforefaid, but it is of a much larger extent, for it fetteth down of what temperament the beat in the body ought to be for the obtaining of Long life. Now this is ufeful, whether the spirits be detained, or whether they be not. For howfoever the heat of the sperits mult be fuch, as it may rather turn it felf upon the hard parts than wafte the foft; for the one Deficcateth, the other intenerateth. Befides, the fame thing is available to the well perfecting of AJfimilation; for fuch an heat doth excellently excite the faculty of A/fimilation, and withall doth excellently prepare the matter to be Afimilated. Now the properties of this kind of teat ought to be thefe. Firf, that it be fow, and heat not fuddenly: Secondly, that it be not very intenfe, but moderate: Thirdly, that it be equal, not incompofed, namely, intending and remitting it felf: Fourthly, that if this heat mect any thing to refift it, it be not eafily fuffocated or languifh. This operation is exceeding fubtil, but feeing it is one of the moftufeful, it is not to be deferted. Now in thofe Remedies which we propounded to inveft the fpirits with a Robust heat, or that which we call operative, not Predatory, we have in fome fort fatiffied this matter.

## Canon XI.

The Condenfing of the Spirits in their Subftance is available to Long life.

## The Explication.

IHis Canon is fubordinate to the next precedent: for the Spirit condenfed receiveth all thofe four properties of heat whereof we fpeak; but the ways of Condenfing them are fet down in the firft of the Ten operations.

> Canon XII.

THe Spirit in great quantity baftieth more to flying forth, and preyeth upon the body more, than in fmall quantity.

## The Explication.

THis Canon is clear of it felf, feeing mere Quantity doth regularly increafe virtue. And it is to be feen in flames, that the bigger they are, the ftronger they break forth, and the more fpeedily they confume. And therefore over-great plenty or exuberance of the fpirits is altogether hurtful to Long life; neither need one wifh a greater ftore of fpirits than what is fufficient for the function of life, and the office of a good Re= paration.

## Canon XIII.

THe Spirit equally difperfed maketh lefs baffe to flie forth, and preyeth lefs upon the body, than unequally placed.

## The Explication.

NOt onely abundance of fpirits in refpect of the whole is hurtful to the Duration of things, but alfo the fame abundance unevenly placed is in like manner hurtful; and therefore the more the fpirit is fhred and inferted by fmall portions, the lefs it preyeth; for Diffolution ever beginneth at that part where the fpirit is loofer. And therefore both Exercife and Frications conduce much to long life, for Agitation doth finelieft diffufe and commix things by fmall portions.

Canon XIV.
7 He inordinate and fubfultory motion of the fpirits doth more baffen to going forth, and dot th prey upon the body wsore, than the conftant and equal.

## The Explication.

IN Inanimates this Canon holds for certain ; for Inequality is the Mother of Diffolution: butin $A_{\text {aimates }}$ (becaufe not onely the Confumption is confidered, but the

Reparation, and Reparation proccedeth by the Appetites of things, and Appetite is Sharpned by variety) it holdeth not rigoroufly; but it isfo far forth to be receiveci, that this variety be rather an alternation or enterchange than a confufion, and as it were conftant in inconftancy.

## Canon XV.

The Spirit in a Body of a folid compofure is detained, though masillingly.

## The Explication.

ALl things do abhor a Solution of their Continuity, but yet in proportion to their Denfity or Rearity : for the more rare the bodies be, the more do they fuffer themfelves to be thruft into fmall and narrow paffages ; for water will go into a paffage which duft will not go into, and air which water will not go into, nay, flame and spirit which air will not go into. Notwithftanding of this thing there are fome bounds : for the spirit is not fo much tranfported with the defire of going forth, that it will fuffer it felf to be too much difcontinued, or be driven into over-ftreight pores and paffages; and therefore if the firit be encompaffed with an bard body, or elfe with an unctuous and renacions, (which is not eafily divided) it is plainly bound, and, as I may fay, imprifoncd, and layeth down the apperite of going out: wherefore we fee that © Metalls and stones require alongtime for their fpirit to go forth, unlefs either the fpirit be excited by the fire, or the groffer parts be diffevered with corroding and ftrong waters. The like reafon is there of tenacions bodies, fuch as are Gums, fave onely that they aremelted by a more gentle heat : and therefore the juices of the body hard, a clofe. and compact skin, and the like, (which are procured by the drizefs of the Aliment, and by Exercife, and by the coldness of the air) are good for long life, becaufe they detain the firit in clofe prifon that it goeth not forth.

## Canon XVI.

In Oily and Fat things the Spirit is detained millingly, though they be not tenacious, The Explication.

THe firit, if it be not irritated by the antipathy of the body enclofing it, nor fed by, the over-much likeness of that body, nor follicited nor invited by the external body, it makes no great ftir to get out : all which are wanting to Oily bodies; for they are neither fo preffing upon the fpirits as bard bodies, nor fo near as watry bodies, neither have they any good agreement with the air ambient.

## Canon XVII.

THe fpeedy flying forth of the Watry humor conferves the Oily the longer in his being.

## The Explication.

$\mathbf{W}^{\text {E faid before that the Watry bumors, as being confubftantial to the Air, flie }}$ forth fooneft ; the oily later, as having fmall agreement with the Air. Now whereas thefe two bumors are in moft bodies, it comes to pafs that the watry doth in a fort betray the oily, for thatiffuing forthinfenfibly carrieth this together with it. .Therefore there is nothing more furthereth the confervation of bodies than a gentle drying of them, which caufeth the watry bumosr to expire, and inviteth not the Oily; for then the Oily enjoyeth the proper nature. And this tendeth not onely to the inhibiting of Putrefaction, (though that alfo followeth) but to the confervation of Greennefs. Hence it is, that gentle Frications and moderate Exercifes, caufing rather Perfpiration than Sweating,conduce much to long life.

## Canon XVIII.

Air excluded conferreth to Long life, if other inconveniences be avoided. The Explication.

WE faid a little before, that the flyng forth of the sfirit is a redoubled action, from the appetite of the pirit and of the air, and therefore if either of thefe be taken out of the way, there is not a little gained. Notwithftanding divers Inconvesiences follow hereupon, which how they may be prevented we have flewed in the fecond of our Operations.

Canon XIX.
YOuthful spirits inferted into an old Body might foon turn Nature's courfe back again.

## The Explication.

#### Abstract

THe nature of the spirits is as the uppermoft whel, which turnethabout the other whet/s in the body of man, and thercfore in the Intention of Long life, that ought to be firft placed. Hercunto may be added, that there is an eafier and more expedite way to altcr the Jpirits, than to other Operations. Forthe Operation upon the spirits is two-fold: the onc by fliments, which is flow, and, as it were, about; the other, (and that two fold) which is fudden, and goeth directly to the fpirits, namely, by Vaposrs, or by the Affcrions.

## Canon XX.

Juices of the Body hard and rofcid are good for Long life.

> The Explication.

THe reafon is plain, feeing we fhewed before, that bard things, and oily or rofcid are hardly diffipated : notwithftanding there is difference, (as we alfo noted in the tenthoperation ) That juice fomewhat bard is indeed lefs diffipable, but then it is withal lefs reparable: therefore a convenience is interlaeed with an Inconvenience, and for this caufe no wonderful matter will be atchieved by this. But rofcid juice will admit both operations; therefore this would be principally endeavoured.

Canon XXI.
$\sqrt{V}$ natfoever is of thin parts to penetrate, and yet bath no Acrimony to bite, begotteth Rofcid Juices.

## Tho Explicatios.

THis Cssmon is more hard to practife than to underftand. For it is manifeft, whatfoever penetratetif well, but yet with a fing or tooth, (as do all fharp and four things) it leaveth behind it wherefoever it goeth fome mark or print of drinefs and cleaving, fo that it hardneth the juices, and chappeth the parts: contrarily, whatfoever things penetrate through their shisnefo merely, as it were by ftealth, and by way of infinuation, without violence, they bedsw and wator in their paffage. Of which fort we bave recounted many in the fourth and feventh Operations.

Canon XXII.
Affinilation is bef dose mher all Local Motion in expessded.
Tho Explication.
THis Canon we have fufficiently explained in our Difcourfe upon the eighth Operation.

Canon XXIII.
A Limentation from without, at leaff fome osker may than by the Stomach, is asost profitable for Long life, if it can be done.

## The Explication.

WE fee that all things which are done by Nwerition, ask a long time, but thofe which are done by embracing of the like (as it is in Infnfrons) require no long time. And therefore Alimentation from without would be of principal ufe, and fo much the more, becaufe the Faculties of Concoettion decay in old age: fo that if there could be fome auxiliary $\mathbb{X}$ (utritions, by Bathings, Unctions, or elfe by Clyfers, thefe things in comjunction might do much, which fingle are lefs available.

## Canon XxIV.

WHere the Concoction is meak to thrult forth the Alinent, there the Outward parts fhowld be strengtbned to call forth tbe Aliment.

## Tbe Explicatios.

THat which is propounded in this Canon is not the fame thing with the former; for it is one thing for the outward Aliment to be attrasted inward, another for the inmard Aliment to be attrailed outward : yet herein they concur, that they both help the weaknefs of the inward Concoctions, though by diyers ways.

## Canon XXV.

$\mathcal{R}^{L L}$ fudden Renovation of the Eody is wrought either by the Spirit, or by Malaciffations.

## The Explication.

THere are two things in the body, Spirits and Parts: to both thefe the way by Nutrition is long and about; but it is a thort way to the Spirits by Vapours and by the Affections, and to the Parts by Malacifations. But this is diligently to be noted, that by nomeans we confound Alimentation froms withont with Malacifation; for the intention of Malacifation is not to nourifh the parts, but onely to make them more fit to be nourilhed.

# The Hiftory of Life and Death. 

 Alaciffation is wrought by Confubftantials, by Imprinters; and by Clofers up.
## The Explication.

THe reafon is manifeft, for that Confubftantials do properly fupple the body, Innprinters do carry in, Clofers up do retain and bridle the Perspiration, which is a motion oppofite to Malacifation. And therefore (as we defcribed in the ninth operation ) Malacifation cannot well be done at once, but in 2 courfe or order. Firft, by excludzng the Liguor by Thickners : for an out ward and grofs Infufion doth not well compact the body: that which entreth muft be fubtil, and a kind of vapour. Secondly, by Intenerating by the confent of Confubstantials: for bodies upon the touch of thofe things which have good agreement with them, open themfelves, and relax their pores. Thirdly, Imprinters are Convoys, and infinuate into the parts the Confubfantials, and the mixture of gentle Aftringents deth fomewhat reffrain the Persfiration. But then, in the fourth place, follows that great Aftrition and Clofure up of the body by Emplaittratiox, and then afterward by Inunction, until the supple be turned into Solid, as we faid in the proper place.

## Canon XxVII.

FiRegrent Renoration of the Parts Repairable watereth and reneweth the lefs Reparable also.

## The Explication.

 Reparation of thefe fame lefs Reparable Parts all our forces would be employed. And therefore being admonifhed by eArifotle's obfervation touching Plants, namely, That the putting forth of new hoots and branches refrefbeth the body of the Tree in the paffage; we conceive the like reafon might be, if the $f e \int h$ and $b l o n d$ in the body of man wer e often reuewed, that thereby the bones themfelves, and membranes, and other parts which in their own nature are lefs Reparable, partly by the chearful paffage of the juices, partly by that new cloathing of the young flefo and bloud, might be matered and renewed.Canon XXVIII.
R Efrigeration or Cooling of the body, which pafeth fome other ways than by the Stomach, is uffulf for Long life.

## The Explication.

IHe reafon is ar hand: for feeing a Kefrigeration not temperate, but powerful, (efpecially of the bloud) is above all things neceflary to Long life: this can by no mean's be effected from within as much as is requifite, without the deftruction of the stomach and Bowels.

Canon XXIX. Hat Intermixing or Intangling, that as well Confumption as Reparation are the works. of Heat, is the greateft obffacle to Long life.

The Explication.

ALmoft all great works are deftroyed by the $\mathcal{N}$ (atures of things Intermixied, whenas that which helpeth in one refpect hurteth in another: therefore men mult proceed herein by a found juidgement, and a difcreet practice. For our part, we have done fo as far as the matter will bear, and our memory ferveth us, by feparating benign keats from burtfuil, and the Reme dies which tend to both.

Canon XXX.

cUring of Difeafes is effected by Temporary Medicines; but Lengthning of Life requireth Obfervation of Diets.

The Explication.

THofe things which come by accident, as foon as the caufes are removed ceafe again ; but the continued courfe of nature, like a running River, requires a continual rowing and failing againft the ftream : therefore we muft work regularly by Diets. Now Diets are of two kinds : Set Diets, whichare to be obferved at certain times; and Familiar Diet, which is to be admitted into our daily repaft, But the set Diets are the more potent, that is, a courfe of Medicines for a time : for thofe things which are of fo great virtue that they are able to turn Nature back again, are, for the moft part, more itrong, and more fpeedily altering, than thofe which may without danger be received into a continual ufe. Now in the Remedies fet down in our Intextions you

Thall find onely three Set Diets, theopiate Diet, the Diet OFalaciffant or Suppling, and the Diet Emaciant and Renewing. Butamongft thofe which we prefcribed for Familiar Diet, and to beufed daily, the moft efficacious are thefe that follow; which alfo come not far fhort of the vertue of Set Diets: Nitre and the fubordinates to NXitre; the Regiment of the Affections and Courfe of our Life; Refrigeratours which pafs not by the Stomach; Drinks Rofoidating, or ingendring oily 7nices; befprinkling, of the bloud with fome firmer Matter, as Pearls, ccrrain woods, competent Vinctions to kecp out the Air, and to keep in the Spirit ; Heaters from without, during the Affimilation after fleep; avoiding of thofe things which inflame the Spirit, and put it into an eager beat, as wine and spices; laftly, a moderate and feafonable ufe of thofe things which onduc the Spirits with a robust Heat, as saffron, Crofes, Garlick, Elecampane, and compound Opiates.

Canon XXXI.
T He Living spirit is instantly extinguibled if it be deprived either of Motion, or of Re. frigeration, or of Aliment.

## The Explication.

NAmely, thefe are thofe three which before we called the Porshes of Death, and they are the proper and immediate paffions of the Spirit. For all the organs of the principal parts ferve hereunto, that thefe three offices be performed; and again, all deftruction of the Organs which is deadly brings the matter to this point, that one or more of thefe three fail. Therefore all other things are the divers ways to Death, bur they end in thefe three. Now the mhole Fabrick of the Parts is the organ of the Spirit, as the spirit is the Organ of the Reafonable Sonl, which is Incorporeous and Divine.

## Canon XXXII.

ELame is a Momentany Subftance, Air a Fixed; the Living Spirit in Creatures is of a middle Nature.

## The Explication.

THis matter ftands in need both of an higher Indagation and of a longer Explication than is pertinent, to the prefent Inquifition. Mean-while we muft know this, that Flame is almoft every moment generated and extinguifhed; fo that it is continued only by fucceffion : but Air is a fixed body, and is not diffolved; for though Air begets new Air out of watery moifture, yet notwithftanding the old Air ftill remains; whence cometh that Super-oneration of the Air whercof we have fpoken in the Title De Ventis. But Spirit is participant of both Natures, both of Flame and Air, even as the nourihments thercof are, as well Oil, which is homogeneous to Flame; as W'ater, which is homogencous to ©Air : for the Spirit is not nourifhed either of oily alone, or of watry alone, but of both together ; and though Air doth not agree well with Flame, nor Oil with water, yet in a mix'd body they agree well enough. Alfo the Spirit hath from the Air his cafie and delicate impreffions and yieldings, and from the Flame his noble and potent motions and activities. In like manner the Duration of spirit is a mixed thing, being neither fo momentany as that of Flame, nor fo fixed as that of Air: And fo much the rather it followeth not the condition of Flame, for that Flame it felf is extinguifhed by accident, namely, by Contraries and Enemies environing it ; but spirit is not fubject to the like conditions and neceffities. Now the Spirit is repaired from the lively and florid bloud of the fmall Arteries which are inferted into the Brain; but this Reparation is done by a peculiar manner, of which we speak not now.

What are the Compound Metals, which are common, and known ? And what are the Proportions of their mixtures? As

Lattin of Brafs, and the Calaminar-ftone.
Bell-metal of, \&c.
The counterfeit Plate, which they call Alchumy.
The Decompofites of three Metals, or more, are too long to enquire, except there befome Compofitions of them already obferved.

It is alfo to be obferved, Whether any two Metals which will not mingle of the felves; will mingle with the help of another ; and what?

What Compounds will be made of Metal, with Stone, and other Foffiles? As Lattin is made with Brafs, and the Calaminar-ftone. As all the Mettals with Vitriol: All with Iron poudered. All with Flint, \&c.

> Some few of thefe wookld be enywired of, so dicclofe the Nature of the reff.

W
Hether Metals, or other Foffiles, will incorporate with Molten Glafs? And what Body it makes?
The quantity in the mixture would we well confidered : For fome fmall quantity, perhaps, would incorporate ; as in the Allays of Gold, and Silver Coyn.

Upon the Compound Body, three things are chiefly to be obferved. The Colour, the Fragility or Pliantnefs, the Volatility or Faxation, compared with the Simple Bodies.

For prefent ufe or profit, this is the Rule. Confider the price of the two Simple Bodies; confider again the Dignity iof the one above the other

## Toucbing Metals and Minerals.

other, in ufe. Thenfee, if you can make a compound that will fave more in the price, then it will lofe in the dignity of the ufe. As forexample, Confider the price of Brafs Ordnance; confider again the price of Iron Ordnance; and confider, wherein the Brafs Ordnance dothexcel the Iron Ordnance in ufe. Then if you canmake 2 Compound of Brafs and Iron Ordnance, that will be near as good in ufe, and much cheaper in price, there is profit both to the private and to the Commonwealth.

So of Gold and Silver, the price is double of Twelve. The dignity of Gold above Silver is not much; the fplendor is alike, and morepleafing to fome eye, As in Cloth of Silver, Silver Lace, filvered Rapiers, \&uc. The main dignity is, that Gold bears the Fire, which Silver doth not; but that is an excellency in Nature, but it is nothing at all in ufe. For any dignity in afe, I know none, but that Silvering will fully and canker more then Gilding ; which, if it may be corrected, with a little mixture of Gold, there is profit: And I do fomewhat marvel, that the later ages have Ioft the ancient Flectrum, which was a mixture of Silver with Gold ; whereof, I conceive, there may be much ufe both in Coyn, Plate, and Gilding.

It is to be noted, that there is in the Verfion of Metals, impoffibility, or at lealtgreat difficulty; as in making of Gold, Silver, Copper : On the other fide, in the adulterating or counterfeiting of Metals there is deceit and villainy; but it fhould feem there is a middle way, and that is, by new compounds, if the ways of incorporating were well known.

What Incorporation or Imbibitior, Metals will receive from Vegetables, without being diffolved mightbe inquired. As when the Armorers make their Stecl more tough and plyant, by the alperfion of Water; or Juyce of Herbs : When Gold being grown fome what churlifh by recovering, is made more plyant by throwing in fhreds of Tanned Leather, or by Leather oyled.

Note, that in thefe, and the like fhews of Imbibition, it were good to try by the weight, whether the weight be increafed, or no? For if it be not, it is to be doubted, that there is no Imbibition of Subitance; but onely, that the Application of the other Body, deth difpofe and invite the Metal to another pofture of parts then of it felf, it would have taken.

After the Incorporation of Metals, by fimple Colliquefaction, for the better difcovery of the Nature: And Confents and Diffents of Metals by incorporating of their Diffolutions, it would be enquired.

What Metals being diffolved by Strong-waters, will incorporate well together, and what not? which is to be inquired particularly, as it was in Colliquefactions.

There is to be obferved in thofe Diffolutions, which will not incorporate what the effects are: As the Ebullition, the Precipitation to the bottom, the Ejaculation towards the top, the Sufpenfion in the midit, and the like.

Note, that the Diffents of the Menftrua, or Strong-waters, may hinder the Incorporation, as well as the Diffents of the Metals themfelves: Therefore where the Menfrua are the fame, and yer the Incarporation followeth not, you may conclude, the Diffent is in the Metals, but where the Menftrua are feveral, not fo certain.

THe Second Letter of the Crofs Row, is the Separation of Metals, and Minerals. Separation is of three forts; the firtt is, The feparating of the pure Metal from the Ure or Drofs, which we call Refining. The fecond is, The drawing one Metal or Mineral out of another, which we may call Extracting. The third, The feparating of any Metal into his Original or Elements, or call them what you will) which work we call Precipitation.

For Refining, we are to enquire of it according to the feveral Metals; As Gold, Silver, \&ce. Incidently, we are to enquire of the firf Stone, or Ure, or Spar, or Marcafite of Metals feverally; and what kinde of Bodies they are ; and of the degrees of Richnefs.

Alfo, we are to enquire of the Means of feparating, whecher by Fire, parting Waters, or otherwife.

Alfo, for the manner of Refining, you are to fee how you can multiply the Heat, or haften the Opening ; and to fave charge, in the Refining.

The means of this is in three manners'; that is to fay, In the Blari of the Fire : In the manner of the Furnace to multiply Heat, by Union and Reflexion: And by fome Additament or Medicines, which will help the Bodies to open them the fooner:

Note, the quickning of the Blaft, and the multiplying of the Heat in the Furnace, may be the fame for all Metals; but the Additaments nurt be feveral according to the natures of the Metals.

Note again, That if you think the multiplying of the Additament in the fame Proportion that you multiply the Ure, the work will follow, you may be decęived: For quantity in the Paffive willadd more refiftance, then the fame quantity in the A ctive will add force.

For Extracing, youare to enquire what Metals contain others, and likewife what not? As Lead Silver, Copper Silver, \&c.

Note, although the charge of Extraction fhould exceed the worth, yet that is not the matter; For, at leaf, it will difcover Nature and Poffibility, the other may be thought on afterwards.

We are likewife to enquire, what the differences are of thofe Metals, which contain more or lefs, other Metals; and how that agrees withtie poornefs or richnef's of the Metals, or Ure, in themfelves: As the Lead, that contains moft Silver, is accounted to be more brittle; and yet otherwife poorer in it felf.

For Principiation, I cannot affirm, whether there be any fuch thing, or no. And, I think, the Chymifts make to o muchado about it. But howfoever it be, whether Solution or Extraction, or a kinde of Converfion by the Fire, it is diligently to be enquired, What Salts, Sulphur, Vitriol, Mercury, or the like 'Simple Bodies are to be found in the feveral Metals; and in what quantity.

| Toucbing Metals and Minerals. |
| :--- |
| He third Letter of the Crofs-Row, is the variation of Metals into |
| feveral Shapes, Bodies, or Natyres ; the particulars whereof fol |
|  |
| Tincture. |
| Turning to Ruft. |
| Calcination. |
| Sublimation. |
| Precipitation. |
| Amalgamatizing, or turning into a foft Body: |
| Vitrification. |
| Opening or Diffolving into Liquor. |
| Sprouting, or Branching, orArborefcence. |
| Induration and Mollification. |
| Makingtough or brittle. |
| Volatility and Fixation. |
| Tranfmutation or Verfion. |

For Tincture, it is to be enquired how Metals may be tincted, through and through; and with what, and into what colours: As Tincting-Silver yellow, Tincting-Copper white, and Tincting red, green, blew, elpecially with keeping the luftre.

> Item, Tincture of Glafs.
> Item, Tincture of Marble, Flint, or other Stone.

For turning to Ruft, two things are chiefly to sbe énquired: By what Corrofives it isdone, and into what cólours it turns: As Lead into white, which they call Serus; Iron into yellow, which they call Crocus Martis: Quick-filver into Vermilion, Brafs into green, which they call Verdegraß, $8<$

For Calcination, to enquire how every Metal is calciped ? And into what kinde of Body? And what is the exquifiteft way of Calcination?

For Sublimation, to enquire the manner of Sublimings and what Metals endure Subliming; and what Body the Sublimate makes?

For Precipitation likewife, By what ftrong Waters every Metal will precipitate ? or with what Additaments? and in whattime ? and into what Body?

So for Amalgama, what Metals will endure it ? What are the means to do it? And what is the manner of the Body?

For. Vitrification likewife, what Metals will endure it ?' what are the means to do it? into what colour it turns ? and further, where she whole

Metal is turned into Glafs? and when the Metal doth but hang in the Glaffie part? alfo what weight the vitrified Body bears, compared with the crude Body? Allo becaufe Vitrification is accounted, a kince of death of Metals, what Vitrification will admit, of turning back again, and what not?

For Diffolution into Liquor, we are to enquire, what is the proper CWenfruum to diffolve any Metal? And in the Negative, what will touch upon the one, and not upon the other? And ishar feveral EMenfrua will diffolve any Metal? And which moft exacily ? Item, the procefs crmotion of the Diffolution? The manner of Rifing, Boiling, Vaporing? More violent or more gentle? Caufing much heat, or lefs? tem, the quantity or charge the Strong-W ater will bear, and then give over ? Item, the colour into which the Liquor will turn? Above all, it is to be enquired, whether there be any Menfruuin, to diffolve any Meral that is not freting and corroding ; but openeth the Body by fympathy, and not by mordacity or violent penetration?

For Sprouting or Branching, though it be a thing but tranfitory, and a kinde of toy or pleafure ; yet there is a more ferious ufe of it: For that it difcovers the delicatemotions of firits, when they pur forth, and cannot get forth, like unto that which is in vegetables.

For Induration or Mollification, it is to be enquired, what will make Metals harder and harder, and what will make them fofter and fofter ? : And this Enquiry tendeth to two ends;

Firft, for Ufe: As to make Iron foft by the Fire, makes it malleable.

Secondly, Becaufe Induration is a degree towards Fixation; and Mollification towardsVolatility: And therefore the Inquiry of them, will give light towards the other.

For tough and brittle, they are much of the fame kinde with the two former, but yet worthy of an Inquiry apart : Efpecially to joyn Hardnefs to 「oughnefs ; as making Glafs malleable, \&c. And making Blades, ftrong to refift, and pierce, and yet not cafie to break.

For Volatility and Fixation, it is a principal Branch to be enquircd. The utmoft degree of Fixation is, That whereupon no Fire will work, nor Strong-water joyned with Fire, if there be any fuch Fixation poffible : The next is, when Fire fimply will not work without Strong-waters: The next is, when it will endure Fire not blow ? or fuch a ftrength of Fire: The next is, when it will not endure Fire, but yet is malleable: The next is, when it is not malleable, but yet it is not fluent, but fupified. So of Volatility, the utmon degree is, when it will flee away without returning : The next is, when it will fice up; but with eafie return:I The next, when it will flee upwards, over the Helm, by a kinde of Exuflation, without Vaporing;

## Articles of Enquiry, © ©.

The next is, whenit will melt, though not rife ; And the next, when it will foften, though not melt. Of all thefe, diligent inquiry is to be made, in feveral metals; efpecially of the more extream degrees.

For Tranfmutation or Verfion, if it be real and true, it is the furtheft point of Art; and would be well diftingurfhed from Extraction, from Reflitution, and from Adulteration. I hear muchof turning Iron into Cupper; I hearalfo of the growth of Lead in weight, which cannot be without a Converfion of fome Body into Lead: But whatfoever is of this kinde, and well approved, is diligently to be inquired, and fer down.

THe fourth Letter of the Crofs Row, is Reftitution. Firft therefore, $1 t$ is to be enquired in the Negative; what Bodies will never return, either by reafon of their extream fixing, as in fome Vitrifications, or by extream Volatility.

It is alfo to be enquired of the two Means of Reduction; and firft by the Fire, which is but by Congregation of Homogeneal parts.

The fecond is, by drawing them down, by fome Body, that hath confent with them: As Iron draweth down Copper in Water; Gold draweth Quick-filver in vapor ; whatfoever is of shis kinde; is very diligently to be enquired.

Alfo it is to be enquired, what Time or Age will reduce without the help of Fire or Body?

Alfo it is to be enquired, what gives Impediment to Uaion or Reftitution, which is fometimes called Mortification ; as when Quick-filver is mortified with Turpentine, Spittle, or Butter.

Laftly, it is to be enquired how the Metal reftored, differeth in any thing from the Metal raw or crude? As whether it becometh not more churlihh, altered in colour, or the like?
