Trustees of the London Parochial Charities v. Corporation of the City of London, 75
Various Owners v. London County Council, 75, 548
Various Owners v. Torquay Corporation, 670
West v. London County Council, 18
Yates v. Leigh Urban District Council, 302
- Architectural Ironwork. Notes on the Design and Erection of, 331
- Artesian Well Supplies, 613
- Association of Birmingham Students of the Institution of Civil Engineers, 483, 584, 742, 827
- Association of Municipal Corporations, 560
- Auctioneers' Institute, 614
- Bacterial Sewage Purification. An American Engineer on, 354
- Bacterial Treatment of Sewage, 735
- Bacterio-Chemical Study of Sewage, 184
- Bacteriological Examination, 405
- Bacteriology of Crude Sewage, 353
- Barton Waterworks, Opening of, 262
- Belfast Municipal Electricity Works, 585
- Belfast New City Hall, 593
- Belper Sewerage Scheme Competition, 313
- Bilston District Meeting of the Association of Municipal and County Engineers, 355, 382, 384, 416, 583
- Birkenhead Electricity Extensions, 339
- Birmingham Congress of the Sanitary Institute, 21, 404, 424, 441, 478, 488, 508, 541, 572, 608, 639, 668
- Birmingham, Housing Problem in, 251
- Birmingham, Municipal Work in, 552, 824
- Birmingham New Underground Lavatories, 75
- Birmingham Sewerage Works, 704, 728, 760
- Birmingham Water Scheme, 696
- Bloodlet, Water Supply of, 578
- Bolton Proposed Public Baths, 3
- Burford Tramway Accident, 415, 426, 647
- Bradford Water Supply, 627
- Brentford, Municipal Work at, 338
- Bridge, Proposed New, over the Thames, 257
- Bristol Electricity Works, 383, 393
- Bristol Electric Lighting, 158
- British Association, 327, 355, 360, 392
- British Association of Waterworks Engineers:—
Annual Meeting at Southampton, 15, 58
General Meeting in London, 765
Notices, 703, 750
- Brook Hospital, 519, 559, 671
- Brussels, Electric Light at, 581
- Brynawr Water Supply Extensions, 718
- Bucklow, Sewerage and Sewage Disposal at, 738
- Building Accident at Westminster, 22, 399, 519
- Buildings, Admission of Daylight to, 340
- Bury Electric Lighting, 336
- Bury St. Edmund's. Electric Lighting at, 167
- Business Amalgamation, 764
- Camborne, Typhoid in, 271
- Cement, Testing of, 613
- Chapter in the History of Pottery, 64
- Chard, Water Supply at, 426
- Cheltenham, Sewage Disposal at, 550
- City, Electric Lighting in the, 762
- Clare Market Rehousing and Improvement Scheme, 559
- Clever Surveying Instrument, 362
- Closet Deodoriser, 404
- Colchester, Electric Lighting in, 739
- Colombo, Sanitation in, 155
- Combined Drainage, 23, 70, 190, 241, 339, 369, 522, 576, 634, 750
- Comparative Reports of General Practice:—
XXV.—Incandescent Gas Lighting (Aldershot Report), 156
XXVI.—Refuse Destructors (Tverton Report), 223, 252, 275
XXVIII.—Tramway Traction (Blackpool Report), 307, 335, 368
XXIX.—Electric Lighting (Beekingham Report), 456, 486, 577, 636
XXX.—Tramway Traction (West Bromwich Report), 636, 664, 700, 732, 763, 801
- Conditions Necessary for the Successful Purification of Sewage by Bacteria, 395
- Construction of Roads and Streets, 68, 133, 166, 196, 282, 619, 673, 707, 740, 803, 832
- Construction of Roadways in Urban Districts, Use of Tarred Macadam in the, and Comparative Considerations, 11, 43
- Cork District Meeting of the Association of Municipal and County Engineers, 211, 212, 244
- Correspondence:—
Automatic Gas Meters and Cookers, 800
British Association of Waterworks Engineers, 22
Fungoid Growth in Subsoil Drains, 254
Gas Authorities and the Flash Point of Petroleum, 254
Gas Cremators, 287
Gas Traction for Tramways: Experiment at Natch, 671
"Genesis of Street Mud," 582
Illuminating Gas from Sewage Sludge, 162, 187

Correspondence (continued):—

Late Mr. Henry Knowles, 777
Lead-lined Iron Pipes, 104
Municipal Engineers and Medical Officers of Health, 313
Municipal Officers' Association: Superannuation, 647
Professional Etiquette, 671
Purification and Sterilisation of Drinking Water: The Howatson-Burgé System, 710
Royal Commission on Sewage Treatment, 488
Sanitary Institute Congress: The Question of Papers, 488
Sewerage of Johannesburg, 800
Sewer Ventilation, 162
Shoreditch Combined Electric Light and Dust Destructor Works, 514, 551, 620, 646
Strange Doings at Erith, 187
Superannuation of Municipal Officers, 488
Suroyoyor Baiting, 551
Tramway Traction in London: Mr. Baker's Report, 646

The Surveyor

And Municipal and County Engineer.

Vol. XIV., No. 337.

LONDON, JULY 1, 1898.

Weekly, Price 3d.

Minutes of Proceedings.

**Association
of Municipal and
County
Engineers:
The
Annual Meeting.**

The march of time has brought us once more to the annual meeting of the Association of Municipal and County Engineers—the great event in the history of the organisation and of municipal engineering from year to year. This year unusual interest attaches to the gathering, by reason of the fact that the association completes the first quarter of a century of its existence. In the full vigour of early manhood, therefore, and with the prospect of a useful and bright future, the organisation assembles in the historic capital of Scotland, where the members will find much that is interesting and instructive to occupy their time in the intervals of leisure which the compact and varied programme affords. In the programme itself, in fact, liberal provision is made for sight-seeing, and it gives an opportunity of visiting scenes and structures that have played an important part in Scottish history. In our last issue we gave a brief sketch of the main features of Edinburgh of to-day, and our readers can supply for themselves the pictures that fancy may suggest of the great figures that in the centuries that have passed moved on the stage of national life. A highly-satisfactory commencement was made yesterday, when the proceedings were opened under very favourable auspices. Probably many of the members had reached Edinburgh a day or two before the actual work began, and would no doubt have caught the vitalising spirit of the northern air, which would probably give them a real zest for work that combined both pleasure and profit. First in order of business came the annual report. This was of a very gratifying character, showing that substantial and satisfactory progress had been made during the twelve months. There is one painful fact that these annual gatherings invariably bring into prominence, and that is the gaps made by death in the ranks of the profession. In the year that has closed we have to deplore the death of half a dozen members whose faces were familiar at previous gatherings; and, in addition to them, the council had to record, with deep regret, their sense of the loss sustained through Sir Robert Rawlinson, who had been an honorary member of the association since its formation. Turning to more agreeable subjects, we note that the membership is increasing slowly, it is true, but surely—and that the finances are in a flourishing condition. With reference to examinations—an important part of the work of the association—we observe with pleasure that the increase of candidates has been so great that the board of examiners have felt it incumbent upon them to make some new departures, which have been approved by the council. The new council will, we may be sure, worthily maintain the traditions of the office. The president, Mr. O. Claude Robson, the engineer to the Willesden Urban District Council, is a most acceptable and popular selection. Mr. W. Harpur, the

borough engineer of Cardiff, now joins Messrs. J. Cooper and C. H. Lowe as vice-presidents, and he will, no doubt, do credit to the position. The additions to the ordinary members of the council are Mr. A. E. Collins and Mr. J. Price. Mr. Collins is the city engineer of Norwich, and we may say with regard to him that his great popularity has been considerably enhanced by the excellent meeting which he recently organised at Norwich. Mr. Price is the city surveyor of Birmingham, and it was inevitable that, sooner or later, he should be placed upon the council, and it is well that it should be sooner rather than later. The question of superannuation, which has been dealt with in our columns from time to time, was referred to in the report, and particulars were given of the action that had been taken with regard to the three Bills now before Parliament in which superannuation schemes are embodied. With a view to increasing the interest in the association in the Antipodes, the council have appointed Mr. R. W. Richards, the city surveyor of Sydney, corresponding secretary for Australasia, and there is every reason to believe that the appointment will be advantageous to the organisation.

The chief feature of the opening day's proceedings was, of course, the address of the president, who gave a most interesting, instructive and graphic sketch of the work of the municipal engineer. The work is certainly sufficiently varied to develop the versatility of those who aspire to the office, comprising as it does road-making and maintenance with concurrent bridge and viaduct work, tramways, sea and river walls, designing of sewerage and water systems, treatment of sewage, public lighting, erection of hospitals, public offices, free libraries, mortuaries, markets and buildings of all kinds incidental to municipal administration, to say nothing of the laying-out of public parks and pleasure grounds. Here, surely, is scope sufficient for ability and energy! Passing on from the general to the particular, Mr. Robson took up the interesting question of the purification of sewage by biological processes, and spoke of the valuable assistance rendered by the micro-organisms in tank and filter. The whole matter is still in the experimental stage, and hopes are centred upon the Royal Commission on the Treatment and Disposal of Sewage, which is the subject of comment in another column. Mr. Robson insisted upon the necessity for more careful consideration as regards the system to be adopted for the treatment of sewage. Public opinion and professional practice have undergone a change in this respect. Where there was a mere perfunctory examination of a stream in former years a duly-qualified staff of inspectors is now appointed, constant analyses are made, and riparian authorities are not allowed to evade their responsibilities. In the case of towns or districts situated upon sluggish streams an exceptionally high standard of purity is demanded, and Mr. Robson emphasised this very forcibly by fore-passing on to sewer ventilation, which is still foremost

among the difficulties in the path of the sanitary administrator. Closely related to it is the question of house drainage, and with regard to this it can scarcely be denied that if house drainage were more thoroughly and more effectively carried out there would be less necessity than there now is for the ventilation of sewers. A vast amount of the trouble that arises in connection with sewers is to be attributed to defective house drains. As Mr. Robson very truly observes, a systematic and efficient method of flushing house drains is an important factor in dealing with the ventilation of sewers. The maintenance of highways received attention from the president, and the substitution of wood paving for stone in all residential localities is alluded to as a necessity "in these mephitic days." The omnipresent microbe has now appeared upon the scene in connection with this particular form of paving, and an entirely new genus of bacteria, alleged to be injurious to human organism, has recently been discovered as emanating from imperfectly cleansed wood-paved roadways. The lesson drawn from this is the necessity for constantly and efficiently cleansing the streets and for using disinfectants in the work of watering them. Some eminently practical observations were made with regard to the need for watchfulness in the case of new buildings, to see that the stability of the structure is ensured and that due precautions are taken for the maintenance of health in the houses of the people. With regard to this it is almost superfluous to point out that too much attention cannot be paid to the efficient construction of the drainage, and the provision of requisite space around the dwellings in order that a free circulation of air may be secured. There can be no question that, great as have been the improvements of recent years and valuable as have been the by-laws framed in many districts, there is still room for advancement in both directions. Of all municipal works at present in progress or in contemplation, electric lighting monopolises the largest share of attention, and we quite agree with Mr. Robson that the almost universal action now taken by local authorities in the installation of electric light themselves, to the exclusion of monopolies, brings the question largely within the scope of the municipal engineer. The advantages possessed in many respects by electric light over any other form of artificial illumination is generally admitted, and it is gratifying to know that the financial success of most undertakings of municipal authorities seems to be fairly assured after the second or third year of working. The combination of the work incidental to the combustion of house refuse, with that appertaining to the generation of electrical energy, has been of late productive of no little discussion, and what Mr. Robson had to say with regard to it was worthy of attention. Some consideration was very properly given in the address to the state of the law with regard to public health, and he suggests the desirability of legislation in the direction of securing uniformity in the by-laws adopted, so that ignorance of the law could not be pleaded as an excuse for the neglect of obvious duty. The address was listened to with marked attention, and at its close Mr. Robson was cordially thanked.

A discussion was afterwards initiated by Mr. A. H. Campbell, Canterbury, on "Tar Macadam." Subsequently the members were entertained at luncheon, at the "Royal" hotel, by the Lord Provost and Corporation of Edinburgh. Later in the day papers were read on "Experiences of Edinburgh with Refuse Destructors," by Mr. John Young, Edinburgh; the "Conversion of Edinburgh, Leith and Portobello Horse-Tramway System into Cable Traction," by Mr. W. N. Colam, Edinburgh; "Notes on Sewer Ventilation as Applied to Water of Leith Intercepting Sewer," by Mr. Alex. Stewart, Edinburgh; and the "Housing of the Working Classes Act as Worked Out in Edinburgh," by Mr. Wm. Bruce, Edinburgh. Among the numerous papers which

will be read to-day are "Notes on the Bacterial Treatment of Sewage," by Mr. D. Cameron; "Electric Lighting of Edinburgh," by Mr. F. A. Newington, resident electrical engineer; and "Recent Extensions of Leith Docks," by Mr. Peter Whyte, docks superintendent. To-morrow, the concluding day of the meeting, will be largely devoted to sight-seeing, the programme including a drive to Forth bridge.

* * *

The Royal Commission on Sewage Treatment and Disposal.

The Royal Commission for inquiry into the disposal and treatment of sewage have, we think, begun their work badly. They held two meetings last week, and at the first, at which they considered their mode of procedure, they decided that the proceedings would not be open to the public. We have no knowledge of the grounds upon which the decision was arrived at, but whatever they were they could not have been sufficient to justify the course adopted. It has ever been the policy of the Local Government Board to prefer darkness to light. Local government in its arteries, which spread their ramifications throughout the body politic of the nation, is illuminated by the transparent rays of the bright sun of public opinion, but in the main-spring of the arteries, the great heart centre at Whitehall, all is darkness. What passes within the walls of the central office we know not until it reaches the extremities of the system, where the pulse vibrates to the touch of local life. It was hoped that an exception would have been made in the case of the sewage commission, which might have been the medium by which much useful knowledge would have been disseminated upon a subject of vital importance to the health and well-being of the people, and upon which they are, we fear, woefully ignorant. The report of the commission will, no doubt, be available to the Press and the public at the close of the inquiry, but that is not enough. It will be impossible then to give more than a bare outline of the results arrived at. The exhaustive evidence will be sealed up within the lifeless pages of a Parliamentary blue-book, and available only for the industrious experts who will ponder over their discursive contents. Had the inquiry been open, how different would have been the result! From week to week, as the commission proceeded with their work, their labours would have been closely and studiously followed, stimulated by healthy and helpful opinion, and energised by critical observation which cannot now be secured. There is literally nothing to be said in favour of a hole-and-corner inquiry of the character now in progress. We cannot understand the commissioners favouring such a course. The chairman is the Earl of Iddesleigh, and the other commissioners who were present when the determination to sit with closed doors was arrived at were Sir Richard Thorne, K.C.B., Prof. Michael Foster, Prof. Wm. Ramsey, Major-General C. P. Carey, Dr. F. B. Russell, Colonel T. W. Harding, Mr. T. W. Killick and Mr. Chas. P. Cotton. The secretary is Mr. F. J. Willis. It is most unlikely that these gentlemen would have preferred a secret to an open tribunal. The strings in this matter were most likely pulled by the Local Government Board, and this is quite in harmony with their general dislike to publicity. The hearing of evidence has been commenced, for last week Mr. A. W. Adrian, C.B., assistant secretary of the Local Government Board, gave testimony as to the history and law of the subject under investigation so far as England is concerned, and he is being followed by witnesses from Scotland and Ireland. We trust that even yet it is not too late for the commission to reconsider the question of taking the public into their confidence and throwing the inquiry open to the Press. We know that many important and valuable experiments in sewage treatment and disposal have been made in recent years at a number of places, such as Exeter, Sutton, Oswestry and Winsford, and the

engineering profession and the public would have followed with great interest accounts of the results obtained from the lips of the men whose discoveries have elevated matters of sanitation to the forefront of the scientific achievements of this wonderful century. We know that the attitude adopted by the Local Government Board towards the discoveries and the discoverers has not been invariably sympathetic. We mention these things merely to show what the public will lose through the present inquiry being conducted *janis clausis*. Some of the store of useful knowledge accumulated will, no doubt, itself be filtered out after the work of the commission is done; but will it serve the useful purpose it would have done had there been no concealment in the matter of the inquiry itself? We do not believe it, and for that reason we press for a reconsideration of the question by the commission.

* * *

Local Authorities and their Contractors.

The importance of ensuring the proper superintendence of contractors as regards precautions against accidents to the public is once more brought home to local authorities by the recent case of *Penny v. Wimbledon Urban District Council and Hes* (noted on p. 23). Short of actual superintendence, the council appear to have taken every means to secure proper safeguards. The work contracted for was the making-up of a road under sec. 150 of the Public Health Act, 1875, and by the terms of the contract the contractor was to provide all necessary watching, lighting and fencing. In the course of the preliminary process of clearing up the road sundry heaps of dirt and grass were formed, and these being left unlighted and unguarded, the plaintiff (an elderly lady), in passing along the road after nightfall, fell over one of these heaps and was injured. The council rather gave themselves away by proceeding to shut the stable door after the steed was stolen—in placing lights, or giving directions for lights being placed, on some of the other heaps. This action on their part, Mr. Justice Bruce, who tried the case, regarded as evidence that they not only had the power, but that they did, in fact, during the continuance of the contract, exercise the power, of directing lights to be placed as a warning to the public; thus negating their contention that the contractor was an "independent contractor," over whom they had no control and for whose negligence they were not liable. Even apart from this, however, the case is, as the learned judge pointed out, practically indistinguishable from *Hardaker and Wife v. Ullé District Council and Another* (noted pp. 95 and 217 of vol. ix.), in which the Court of Appeal held that the local authority, acting under the powers of the Public Health Act, could not, by employing a contractor, get rid of their own duty to other people, whatever that duty might be. A curious feature of the case is that the contractor, having paid into court £75 and the jury having returned a verdict for £50 only, the whole amount paid in will be returned to him—£25 as excess of damages and £50 on account of his costs (the balance whereof will be payable by the plaintiff) while, on the other hand, the council, having denied liability and been found liable, will have to pay both their own and the plaintiff's costs, notwithstanding the superabundant payment into court by their co-defendant. This strikes us as in the highest degree inequitable, and we shall not be surprised if an attempt is made to get this portion of the judgment reviewed.

* * *

Municipal Electric Lighting at Coventry and Blackpool.

Attention may be called to the results of the municipal electric lighting system in Coventry. It will be seen from the following figures that very considerable progress has been made during the past twelve months. For the quarter ended December 31, 1897, the amount of electricity sold was 34,895 units

against 25,685 units in 1896. The number of consumers had increased by twenty-eight, and there have been considerable extensions of the mains. Bringing the results more up to date the electricity supplied during the quarter ended March 31, 1898, was 35,090 units against 21,560 units in the corresponding period of the previous year. These results are all the more satisfactory because it was considered that there were special difficulties that would retard the progress of the municipal electricity works. The lighting accounts relating to Blackpool are almost as interesting as the tramway accounts to which we have previously referred. The total revenue for the year ended March 31st last was £12,837 and the expenditure was £7,152. A sum of £3,856 has been set aside for interest and sinking fund, this being at the substantial rate of 5½ per cent., and there is then left the sum of £1,819 as representing the nett actual profit on the year's working. The profit on the previous year's working was £828, which is sufficient to show that substantial progress has been made. The units sold during that period have increased from 429,000 to 707,000, and the costs of production have been considerably decreased, being in fact 187d. against 261d. for the previous year, the total costs for the year ended 1897 being 242d. against 341d. for the previous year.

* * *

The Abuse of Power-Houses.

Mr. W. H. Preece, in the paper on this subject, which was read at the recent meeting of the Association of Municipal and County Engineers at Yarmouth, and is given in our present issue, was not a bit too strong in condemning some of the methods that have been adopted in designing and laying down electric lighting systems. There has been undoubtedly a want of foresight in predicting the growth of the electric industries, and there has been a want of economy in selecting suitable land upon which to erect electric lighting systems. While admitting these facts, however, it must not be forgotten that the supplying of electric energy was so totally different to gas and water that there was no experience whatever to guide the engineer when designing an electric system. There are many cases at the present moment in which municipal power-houses are much too small, and have been rather laid down with a view to meet the immediate demand than with any regard to future development. It would be very regrettable if, in the future expansion of electric work, municipalities did not consider the possible combination of lighting and tramway interests, and if those are kept carefully in view the previous mistakes of municipalities will be avoided. It is quite likely that the projected legislation on the subject of large power-houses for the purpose of distributing electrical energy over a large area will prove to be of great benefit to those large municipalities with such wide interests as in the case of Manchester, Glasgow and other large cities.

PROPOSED PUBLIC BATHS AT BOLTON.

The Bolton Corporation propose spending the sum of £5,250 in the erection of public baths, on a site adjoining the branch public library in High-street. The building generally has been designed to harmonise with the free library adjoining, and will be of red brick with ornamental red terra-cotta dressings. In the basement there will be a boiler-house, coal-cellars, cistern-room, and an open gangway round three sides of the bath. The ground floor will contain a plunge or swimming bath, 75 ft. by 26 ft. It will have glazed-brick sides and a tiled bottom. The dressing-boxes number thirty-nine, and there is also an attendant's-room, besides soap and shower baths and conveniences. Circular staircases will lead to the gallery, which extends round three sides of the bath. The entrances are arranged so that they are controlled from the ticket office. The men's slipper baths—nineteen in number—are on the left of the entrance, there being a waiting-room close by, as well as needle and vapour baths. On the first floor of the building are the slipper and other baths for women. A caretaker's house and a laundry have also been provided. The architect is Mr. R. Knill Freeman, of Bolton.

Association of Municipal and County Engineers.

ANNUAL MEETING AT EDINBURGH.—I.

EDINBURGH: GENERAL VIEW OF THE CITY FROM THE CASTLE HILL.

Those who guide the policy of the Incorporated Association of Municipal and County Engineers have selected a picturesque and uniquely interesting spot in which to hold the twenty-fifth annual meeting. Judging from the opening proceedings yesterday, which we report as fully as circumstances would allow, from the admirably-arranged and comprehensive programme which was drawn up and from other factors in the case, this meeting promises to be unusually successful. It will be seen from the annual report, which we print below, that the council have a record of gratifying progress to place before the members, and this record will no doubt receive the appreciation it deserves. It will also be seen that Mr. Robson inaugurated his year of office by an able and comprehensive survey of municipal engineering and its responsibilities. To these and other matters, however, we refer at greater length in our editorial columns than we need do here.

What we may appropriately attempt here, as an introduction to our report of the proceedings proper, is a brief sketch of the renowned city in which municipal engineers are assembled, with special reference naturally to municipal development, of which it is in so many respects a splendid illustration in common with the great commercial city on the banks of the Clyde, some 40 miles away. Apart from municipal work, to attempt to sketch in our columns the history of such a city as the Scottish metropolis is neither necessary nor desirable, for such a record exists in many admirable forms and is easily accessible. Nor, indeed, would it be practicable, for to trace the history of Edinburgh is to a large extent to trace the history of Scotland, a task for the patient and voluminous industry of the historian, and not for the confined conditions which bind the journalist. It is, moreover, with the modern city that we are concerned, with its municipal progress, and more especially with that department of municipal work generally described as municipal engineering.

EDINBURGH AND ITS MUNICIPAL WORK.

Whatever reasons may have influenced those who were responsible for the selection of Edinburgh as the scene of this year's annual meeting, there is no question as to the wisdom of that selection. It is true that for many the journey is somewhat long, but that is but a slight disadvantage in comparison with the attractions, professional and otherwise, which such a visit offers. The programme gives sufficient evidence of what has been found possible in regard to papers to be read and discussed, and to works and places of interest to be visited. Possibly not a few of those present may now be visiting for the first time a city which, on account of quite exceptional associations—historical, literary and architectural—is numbered among those remarkable and favoured spots to which men travel as to a shrine. In the minds of Scotsmen, again, their capital city is peculiarly associated with some of the most remarkable events—often melancholy enough—of what for long was a stormy history, in the course of which they evolved national and individual characteristics

of singular strength and persistence. For centuries the history of Scotland was a record of struggles with a powerful and warlike neighbour, of unceasing efforts to make the best of comparatively poor resources, and of internal dissensions in which monarchs, nobles and people all figured, often amid scenes of the darkest tragedy. But the story, though often so fierce and sanguinary, is one upon which Scotsmen may look back with justifiable pride, and, as we have said, so peculiarly is the Scottish metropolis associated alike with some of the proudest and some of the most melancholy incidents of the country's history, that by Scotsmen it is regarded with a feeling amounting to almost religious veneration. To them it is to a large extent their Mecca, their holy city. To Sir Walter Scott it was ever "mine own romantic town." The romance, no doubt, was clear to his discerning eye, but that it is so clear to-day to Englishmen, and even to Scotsmen, how much is due to Sir Walter's imperishable pages, in which he cast a strange glamour over the history of his country from early mediæval times to the stirring days of "forty-five." The political importance of Edinburgh naturally declined after 1603, and still more after 1707, but the great literary outburst in the end of last century and the beginning of this gave it a period of rare social splendor, and it is to be hoped that it will continue to retain to a large degree that picturesque appearance and architectural beauty, the academic culture and refinement, the literary and artistic attributes, which have earned for it the title of "The Modern Athens."

THE PAST AND THE PRESENT.

Famed alike for natural beauty and grandeur of situation, and for stately majesty of public buildings, Edinburgh has also a high reputation as a healthy and suitable place of residence for the leisured and wealthy. In the "Old Town," with its narrow streets, closes and wynds, the patriotic Scotsman and the antiquarian have almost unlimited scope for research and historical reminiscence. Every square foot of the ground may be said to be saturated with historic incident. The old Edinburgh of the historian is to a very large extent the Edinburgh of Queen Mary and her court. Round the chequered reign of that hapless queen much of the romance of the intrigue, the chivalry and the rugged greatness of those days have invested Edinburgh with surpassing interest. The union, first of Crowns and then of Parliaments, which necessarily deprived Scotland of much of her independent interest and glory, has in the course of time fostered peace and prosperity within her borders. Of these results the metropolis has possibly had the largest share, though Glasgow, the commercial capital of the west, from her favoured maritime situation and the enterprise of her citizens and civic rulers, has made, and will continue to make, enormous progress in material prosperity and municipal government.

In the fifteenth century Edinburgh consisted simply of Castle Hill, Lawnmarket and High-street, with the closes and alleys leading therefrom, all being enclosed by the city wall. As it was practically impossible to extend the buildings along the surface, the only alternative, if further extension was desired, was to raise them into the air. Hence arose

the celebrated "high lands" which still exist. The city wall, however, was extended in the beginning of the sixteenth century, as a result of the war scare associated with the disastrous Field of Flodden. The various points which form the sites of the old city gates are still designated by the name of ports—for example, Bristol Port and West Port. These old walls, protected with tanking towers and bulwarks, were erected under fear of warlike invasion; but, as they proved of little or no use, they were ultimately swept almost wholly away during the succeeding period of spirited civic extension. From time to time these city extensions have been promoted, and even during the last seventeen years the city has been twice extended, until to-day the superficial area is 8,804.38 acres. Nor is the desire for this form of civic conquest by any means quenched, for in 1896 an abortive attempt was made to include Leith, Edinburgh's sea-

paper for itself, and, after all, they are best appreciated when actually seen. To some of the most prominent features of the city we shall have an opportunity of further referring when dealing with the various points of the programme.

We may now refer more particularly to the city as it is found at the present day. As a rule the visitor is not long in Edinburgh before he finds himself in Princes-street, and there his attention is at once attracted by the irregular appearance of the buildings. Stately hotels are now occupying much of the frontage, though here and there low, antiquated buildings, not altogether swept away by the flood of "improvements," still remain to remind us of the Princes-street of the past. At the east end of this unique thoroughfare the North British Railway Company are erecting a station of unimpressive proportions, and at the west end a vast hotel is shortly to be commenced by the Caledonian Railway Company in connection with their station.

Before proceeding to refer briefly to some of the more important public and municipal works of the city we may draw attention to the beautifully picturesque view which leads our report. In the foreground, conspicuous for their Ionic and Doric columns, are the Royal Institution, with its sculpture gallery, and the National Picture Gallery. Beyond the Scott monument, with its Gothic design, will at once be distinguished. One of the tall buildings on the opposite side of the road is the "Royal" hotel, the headquarters of the municipal engineers this week. The domed building beyond is the Register House, and opposite it are the fine buildings of the General Post Office. Further in the distance is the tall obelisk erected to the memory of the Edinburgh worthies transported for life for "speaking words tending to excite discord between king and people." In the distance rises the Calton Hill, crowned by the Nelson monument, with the unfinished model of the Parthenon immediately beyond it.

PUBLIC WORKS AND INSTITUTIONS.

The public works carried out in Edinburgh in recent years have been both numerous and extensive. The north viaduct, which connects the old town to the new, and which was widened in 1873-74, has just been rebuilt in magnificent style to a width of 75 ft. The street in continuation of this viaduct southwards as far as the iron chunnel is also to be widened and rebuilt in a tasteful and handsome manner. In 1878 the old Royal infirmary was found to be inadequate for present day requirements, so it was converted into an isolation hospital, and in the following year a new Royal Infirmary was erected on a suitable site adjacent to the Meadows. This institution is not devoted exclusively to the benefit of the metropolis, but of the whole of Scotland, and is maintained by voluntary contributions. In the immediate neighbourhood the new medical school, erected some twenty years ago, forms a splendid palatial pile, to which only recently was added a stately range of buildings, the McEwan Hall, the princely gift from Mr. McEwan, M.P., to the university. The success of the isolation hospital above referred to has led to the erection of a suburban isolation hospital, which is estimated to cost £250,000, and will contain 600 beds. The Royal

THE RIGHT HON. MITCHELL THOMSON,
Lord Provost of Edinburgh.

port, which has a population of about 80,000 souls. On behalf of the city it was contended that there was ample justification for the attempt, as a large section of the mercantile population of Leith reside in Edinburgh; and that as Leith and the adjacent burghs are benefitted by the common supplies of water, gas and tramways, there is thus to that extent and in other respects a community of interests which justifies the Edinburgh civic rulers in promoting amalgamation.

To-day the population of the city has reached 292,364. It is in a very real sense the metropolis of Scotland, the embodiment of everything distinctly national that remains since the Union of the Crown and Parliament with those of England; it is the principal seat of the administration of justice for the whole country; the meeting place of the supreme courts of the various Presbyterian bodies, the centre of scientific and literary activity, the seat of the greatest of the Scottish universities, and of many schools of the first rank. Every Scotsman has in Edinburgh a common bond of sympathy.

There are naturally fewer merchant princes than can be found in large manufacturing cities, but at the present time the city benefits from the princely benefactions of three munificent givers. These are Mr. Finlay, joint proprietor of *The Scotsman*, whose magnificent gift is the National Portrait Gallery, in Queen-street; Mr. McEwan, member of Parliament for the central division of the city, who has presented the splendid McEwan Hall; and Mr. Andrew Usher, whose noble donation was one of no less than £100,000 for the erection of a public hall for the cultivation of music. The site for this hall has not yet been decided upon.

EDINBURGH TO-DAY.

From probably every point of view from which Edinburgh can be observed, the most picturesque groupings, the most pleasing and novel effects, are presented to the eye. No one feature may approach the sublime, but no suggestion of meanness is ever present. The city is divided into three well-known and well-marked divisions. There is, first, the New Town, which has long been famed for the regularity of its streets and squares. This part of the city lies to the north of the valley separating Princes-street from the castle. The second division is the Old Town, to which our previous remarks on the subject of Edinburgh's historic interest specially apply. This part of the city is found between Princes-street and the Meadows. Finally, there is the third division, which consists of the south-side suburbs. The Castle, which is now undergoing certain additions and renovations, may justly be described as the central point of interest of the city, and next may be put Parliament-square, with the ancient cathedral of St. Giles' church in front and the law courts in the rear. We can only make a passing reference to the general public buildings of this splendid city, the exchanges, banks, insurance offices, post office, monuments, hospitals, the new medical buildings, the medical schools, the Museum of Science and Art, the Royal Institution, the Merchant Company's schools, the churches and theological colleges. An account of these would require a

MR. J. COOPER,
Borough Engineer of Edinburgh.

infirmary possesses a magnificent convalescent home at Corstorphine, a village to the west of Edinburgh, where, facing the sun and sheltered from the inclement east winds, patients are restored to their wonted health and strength. In connection with the city hospital a similar convalescent home has been planted in a sheltered spot in Musselborough, to the east of Edinburgh. In 1887 the Free Libraries Act was adopted, and Mr. Carnegie came to the rescue with £50,000. As the free library is to be specially visited by the municipal engineers, we shall refer to it in greater detail in that connection. Branch free libraries are being provided in the suburbs and the outlying districts.

Though our paper has, for the purposes of this report, been considerably enlarged beyond the customary size we still suffer from the limitations of space. Owing to this fact and to the magnitude of the subject with which we

are attempting to deal, however imperfectly, in these introductory remarks, we are compelled to hold a portion of them over until next week, in order to proceed with the report of yesterday's proceedings. Next week we shall refer more particularly to municipal administration and municipal services, such as water, gas, lighting, sewerage, &c.

We have pleasure in presenting our readers this week with portraits of Lord Provost Mitchell Thomson, who presides over the municipal affairs of the city with so much ability and dignity, of Mr. Cooper, the city engineer, who has taken so active a part in organising the present meeting, and of Mr. Morham, the city architect.

THE BOROUGH ENGINEER.

Some particulars of Mr. Cooper's career will, no doubt, be acceptable to our readers. He received his education at the General Institution, Culcross, Dollar Academy and the Heriot-Watt College, Edinburgh, and after a term of practical experience in building construction entered the burgh engineer's office, Edinburgh, in 1871. This was immediately after the death of Mr. Charles Macpherson, and on the appointment of Mr. Thomas Fraser as burgh engineer.

The office staff consisted at that period of some six assistants in all. After passing through the several grades of assistantship, he became principal assistant, which position he held until Mr. Fraser's last illness and death in 1881. Mr. Cooper was then appointed *ad interim* burgh engineer, and shortly thereafter burgh engineer. To this appointment there was added, in 1886, that of master of works, the duties of which consist in advising the Dean of Guild Court and inspecting the erection and completion of all new houses and buildings. He was elected an Associate Member of the Institution of Civil Engineers in 1885. In 1889 he received the additional appointment, along with Mr. Beaton, burgh surveyor of Leith, of conjoint engineer to the Water of Leith Purification and Sewerage Commissioners, and in 1893 of corporation tramway engineer. During his term of office the following works, among others, have been carried out: 1, The main outlet sewers in the suburbs of the city, which were formerly open burns or foul streams, have all been placed in culverts. The ordinary sewers of the city, many of them old and rotely formed, have been reconstructed, re-silled and repaired. The house drainage of the city has also been taken up, and reconstruction and repairs have been carried out for many years, at a cost to the owners of at least £10,000 per annum. At the present time there are few houses in Edinburgh which have not had their drainage and sanitary arrangements overhauled and certified. To these efforts Edinburgh no doubt owes its high place as a healthy place of residence.

The slums of the city were also vigorously taken up by Mr. Cooper's department, and a system of house-to-house inspection has been carried on for many years. The city improvement scheme of Sir James Russell was minutely carried

MR. R. MORHAM.
City Architect.

through, with enormous benefit to the city. In 1884 the Powburn system of outlet sewerage was carried out, costing £40,000. In 1889 and following years a great scheme for the purification of the Water of Leith was conceived and carried out, a stretch of work, 7 miles in length, extending from Balerno to the sea, costing in all about £350,000. Edinburgh has also been forward in considering the question of the cremation of house refuse, and a destructor of ten cells has been in use for five years.

During recent years Mr. Cooper has been associated with Prof. Kennedy and the resident electrical engineer in the erection of electric lighting power stations. Their cost was £26,000. The conversion of nearly the whole of the horse tramway system to cable traction, which has been arranged by the corporation, has been entrusted to Mr. Colam, c.e., and Mr. Cooper jointly. This work will cost £756,300. His office staff (draughtsmen, inspectors, improvers and apprentices), which numbered six on his advent, is now sixty. He

has during his term of office been obliged to conduct certain sections of the work of sanitary inspection, especially in dealing with the slums of the city, and has been called upon to erect artisans' dwellings, as the city architect's hands were otherwise filled. He leads a loyal staff of assistants, several of whom have supported him throughout the last sixteen years of responsible public life. He has engineered several Parliamentary Bills through Parliament. Edinburgh has twice over extended its boundaries since his appointment. At present there is on hand the tramway cable installation, an additional electric power station, dwellings for the poor, the promotion of improvement schemes, and the ventilation of the Water of Leith system of sewerage.

YESTERDAY'S PROCEEDINGS.

RECEPTION AT THE CITY CHAMBERS.

The work of the day began as early as 10 o'clock, in the shape of a meeting of the council of the association at the Royal Hotel. Those who had made the journey no doubt congratulated themselves on the beautiful weather with which the opening of the proceedings, at all events, had been favoured. At 10.30 an adjournment was made to the City chambers, in the Council Chamber of which they were received by the Lord Provost, supported by Bailies Kinloch Anderson, Pollard, Robertson and Hay, Dean of Guild Millar, Treasurer McCrae, Judge Danlop, Councillor Forbes Mackay, the town clerk and the city chamberlain. After the members of the association had been introduced by the burgh engineer, Mr. Cooper,

The Lord Provost, on behalf of the corporation and the city, said he had pleasure in giving them a hearty welcome to Edinburgh. It was extremely appropriate that they should have chosen Edinburgh for that meeting, for the city was at the present time executing important engineering works. He referred, of course, to that splendid work of Sir John Fowler and Sir Benjamin Baker at Queensferry. The Forth Bridge, which they would have an opportunity of visiting, was a work of world-wide renown. Then during the past two years they had taken down the old North Bridge, which connected the new town with the old. That construction was looked upon as a great feat of skill, but it had served its time. They would agree that the new bridge was wide and beautiful. Like other cities, they had installed the electric light, and thought they had reason to be proud of its success, which was largely due to the fact that they had gained from the experience of others and to having an engineer of repute like Prof. Kennedy. Mr. Colam was to read a paper on the conversion of the tramways from horse to cable traction. He thought that their corporation was the first to purchase tramways from a company. They leased the tramways to the company on the principle that the company should pay a percentage on the capital expenditure of the corporation. The great beauty of the city influenced them in deciding against overhead wires. They had steep gradients, and their experience showed that the cable system would, as at San Francisco, work well in Edinburgh. The conversion would cost over £1,000,000. Municipal engineers had last visited Edinburgh in 1890, and he hoped that when they came again they would see the cable system successfully working. Mr. Cooper would take them to see the refuse destructor. He was sorry to say it had not been an unqualified success, and the visit might be beneficial by showing the mistakes that had been made. Bailie Pollard, convener of the Public Health Committee, was by his side, and that led him to say that they were at present erecting a large infectious diseases hospital on 150 acres of land in the vicinity of the city as a substitute for the old hospital in the centre of the town. Though only just begun, an inspection of the works and the plans would no doubt be of interest to them. The experience of all must be that these annual visits to centres of population had beneficial effects all over the country. The more they met the better for the general good of the people. He again bade them heartily welcome.

Mr. LEWIS ANGELL (West Inn), in the absence of Sir Alexander Binnie, the retiring president, whose public work prevented his attendance, expressed thanks for the cordial reception which had been accorded to them. The association had now been founded about a quarter of a century, and was no longer English but cosmopolitan. Its work was humanitarian.

MEETING AT THE ROYAL HOTEL.

On returning to the Yellow-room of the Royal Hotel, Mr. Angell again took the chair, and the work of the general meeting began. The chairman called upon the secretary to read, first, the minutes of the last annual meeting, held in London, and afterwards the following

ANNUAL REPORT OF THE COUNCIL.

In presenting the twenty-fifth annual report, the council are gratified to state that the progress of the association during the past year has been satisfactorily maintained.

DISTRICT MEETINGS.

Since the last annual general meeting six district meetings have been held: At Rhaynder, for the Birmingham waterworks, August 25th; Sunderlaud, November 20, 1897; Westminster, February 18, 1898; Wembleton, April 30th; Harrogate, for the Bradford waterworks, June 4th; Norwich and Great Yarmouth, June 10th and 11th.

THE ROLL OF THE ASSOCIATION.

During the financial year ending April 30th last seventy-two new members, consisting of fifty-four ordinary members and eighteen graduates, have joined the association. One new honorary member—Monsieur Bechmann, chief engineer of Ponts et Chaussées, Paris—has been elected. Six members and one graduate have resigned. Sixteen names have been written off, and the council record with regret the deaths of Messrs. D. Bland, T. Higginson, D. C. Ottley, E. Rothwell, J. C. Stuart and W. S. Tilt.

The number on the roll of the association at the close of the year was ten honorary members, 732 ordinary members and ninety-two graduates, making a total of 834, being an addition equal to 5.4 per cent. on the numbers of the preceding year.

The council have transferred Messrs. G. Ball, H. W. Corrie, T. Hayward, G. T. Lynnam and J. A. Settle from the class of graduates to that of members, these gentlemen having been elected to appointments qualifying them for this class under the articles of association.

The council have also to place on record with deep regret the death of Sir Robert Rawlinson, k.c.b., who has been an honorary member of this association since its formation. Sir Robert Rawlinson, who was chief inspector of the Local Government Board for many years, always showed a deep sympathy with, and a keen interest in, the work of this association.

THE FINANCES.

The audited balance sheet and statement of accounts which accompanies this report shows a balance in hand on April 30th last of £255. The invested capital account of the association now stands at £750 7s. 4d., £250 having been invested to purchase £260 7s. 4d. India 2½ per cent. stock during the year. The statement of assets and liabilities shows the association to be in a highly satisfactory position.

EXAMINATIONS.

A marked and gratifying increase is shown in this department of the association's work.

Since the last report two examinations have been carried out, the first of which was held at the Council House, Birmingham, on October 1st and 2nd, 1897. On this occasion twenty candidates were examined; eleven satisfied the examiners and were granted the association's certificate. The examiners were Messrs. Pritchard, Fowler, Lemon and Eayrs. The second examination was held on April the 1st and 2nd, 1898, at the Institution of Civil Engineers, Westminster, where the use of rooms was kindly granted by the council of that body.

On this occasion forty-six candidates were examined, of whom thirty satisfied the examiners and were granted the association's certificate. The examiners were Messrs. Fowler, Lemon, Loble, May and Jones.

Arising out of the great increase of candidates for examination the council have had under consideration a report from the Board of Examiners submitting certain recommendations for the conduct of future examinations and have approved such report. To give effect to the same the council recommend the alteration of By-law 18, so as to give power to the council to enlarge the Board of Examiners and the number of examinations. The required alterations are set forth in the agenda notice of this meeting.

THE NEW COUNCIL.

The ballot lists having been duly issued, the scrutineers reported the result of the voting as follows:—

PRESIDENT.—Mr. O. Claude Robson.

VICE-PRESIDENTS.—Messrs. J. Cooper, W. Harpur and C. H. Lowe.

ORDINARY MEMBERS OF COUNCIL.—Messrs. J. P. Barber, A. E. Collins, J. H. Cox, A. Creer, A. T. Davis, E. P. Hooley, E. G. Mawbey, J. Paton, S. S. Platt, J. Price, W. Weaver and T. H. Yabbicon.

GENERAL HONORARY SECRETARY.—Mr. Charles Jones.

HONORARY TREASURER.—Mr. Lewis Angell.

PREMIUMS.

The council have awarded the association's premium of books value £10 to Mr. S. S. Platt, for his paper entitled "Some of the Municipal Works at Rochdale;" and the premium of books value of £5 to Mr. Blackshaw, for his paper entitled "Particulars of Some Municipal Engineering Works designed and carried out at Stafford."

SUPERANNUATION.

A considerable amount of attention has been given by the council and its committees to the subject of superannuation, arising out of the considerations of three Bills now before Parliament. The Bills referred to are: 1, The Metropolitan Local Government Officers' Superannuation Amendment Bill; 2, the Local Authorities' Officers' Superannuation Bill; and 3, the Local Government (Ireland) Bill.

With regard to the first-mentioned Bill, the council took all available means by memorials and circulars to advance the measures and to protect the interests of the members of the association. In response to such efforts the council have received numerous promises of support from members of Parliament, and the Local Government Board have also promised to support the suggested scheme for superannuation as soon as they receive satisfactory assurance that the measures meet with the approval of the bulk of the local authorities affected by the Bills. With reference to the third of the above-named Bills, the council have had conference

With representatives of the county surveyors of Ireland and received from them a statement of their wishes as to alterations in the Bill necessary for the protection of their interests, and in the result the measure has been materially amended on the lines desired by the Irish members of the association, and the council experience considerable gratification in recording the assistance thus afforded to their brethren across the channel.

CORRESPONDING SECRETARY.

The council have appointed Mr. R. W. Richards, the city surveyor of Sydney, corresponding secretary for Australasia. Mr. Richards having evinced so strong an interest in the association, the council believe the appointment made will tend to benefit the association and to bring its advantages under the notice of many eligible officials in our Australian colonies.

LOCAL GOVERNMENT BOARD JOINT EXAMINATIONS.

With respect to the joint committee on the question of the examination of sanitary inspectors, instituted by the Local Government Board, the council are pleased to report that satisfactory arrangements have lately been made by which the difficulties met with by the committee have been surmounted, and that shortly the final steps will be taken for the incorporation of the body thus formed.

On the motion of the CHAIRMAN, seconded by Mr. W. G. LAWS (Newcastle-on-Tyne), the annual report and the minutes of the last meeting were unanimously adopted. Then came the presentation of premiums. The first premium, of £10 in books, was awarded to Mr. S. S. Platt (Rochdale) for his paper

MR. S. S. PLATT, M.E.S.T.C.E.,
Borough Engineer and Surveyor, Rochdale.
Awarded the First Premium.

on "Some of the Municipal Works of Rochdale," and the second premium, of books to the value of £5, to Mr. Blackshaw (Stafford) for his paper on "Particulars of Some Engineering Works designed and carried out at Stafford." Mr. Platt briefly replied, but Mr. Blackshaw was absent. Biographical notices of Mr. Platt and Mr. Blackshaw appeared in our issue of May 28, 1897, and July 2, 1897, respectively.

As will be seen from the programme, two notices of motion had been given, but the following motion, of which Mr. Weaver had given notice, was withdrawn:—

"That the resolution passed at the annual meeting, held at West Bromwich, July 13, 1893, directing that the attendances of the councillors at council and committee meetings be placed on the ballot lists be rescinded."

Mr. J. T. EAVIS had given notice to move:—

"That By-law 18 be altered to read as follows:— 18. Two (or more) examinations of candidates for certificates of competency in municipal engineering, surveying, building construction, sanitary science and municipal law, shall be held annually at such places and at such times as the council shall appoint.

"The board of examiners shall be (not less than) twelve in number, and shall be elected by and be members of the council, or such other members of the association as shall be leading men in their particular branch of the profession. Four (or more) of such board shall be selected by the council to carry out each examination, who, as 'acting examiners,' shall report to the council the names of those candidates who have satisfied them of their proficiency."

This motion was carried.

On the motion of Mr. ANGELL, seconded by Mr. LEMON (Southampton), the various district secretaries were all re-elected, as were the auditors, Messrs. Savage and Lewis, and the scrutineers, Messrs. Silcock, Thomas and Clarson.

Mr. ANGELL then introduced the president-elect, Mr. O. Claude Robson, mentioning that the latter had received his first training in (Mr. Angell's) office, whence he went to the post he had so long and honourably filled at Willesden.

Mr. ROBSON then took the chair amid loud and sustained applause.

Mr. ANGELL moved, and Mr. LOBLEY (Hanley) seconded, that a vote of thanks be awarded to the retiring president, both expressing regret that the onerous nature of Sir Alexander Binnie's duties had prevented his attendance.

The PRESIDENT, having explained that even that night Sir Alexander had a duty to perform, in the shape of attending the annual dinner of the London County Council, then proceeded to read his address, which was as follows:—

PRESIDENT'S ADDRESS.

GENTLEMEN,—In addressing you upon this occasion my first and pleasing duty is to extend my heartfelt thanks to the council and members of this association for the high honour that I have received at their hands in being elected to the presidential chair for the ensuing year. It is a position of which I feel justly proud, and, although I may not hope to emulate the work of the eminent men who have preceded me, it will always be my earnest endeavour to enhance the interests of the association to the utmost of my power and steadily to maintain the high reputation it has gained in the past.

WORK OF THE MUNICIPAL ENGINEER.

The duties of the municipal engineer and surveyor are so varied, and embrace so many items of administrative and constructive work, that a large amount of time would be re-

MR. W. BLACKSHAW, ASSOC. M. INST. C. E.,
Borough Engineer and Surveyor, Stafford.
Awarded the 2nd Premium.

quired to deal with them in their entirety in this address, and I much fear the patience of my audience would be sorely tried were I to attempt so bold a measure. Some idea of the magnitude of these works may be obtained by reference to the last annual report of the Local Government Board. That report shows that since 1871 the local authorities have incurred upon the strength of their borrowing powers an indebtedness of over £150,000,000 for sanitary works and other improvements. This vast sum is in addition to, and quite independent of, the annual cost of works defrayed from current expenditure. The progress of sanitation since the constitution of the Local Government Board may also be fairly gauged by the figures in this report, the amount of the loans sanctioned to sanitary authorities by the Local Government Board, in 1871, being only £267,000, whilst, in 1896, the amount was upwards of £5,500,000.

The nature of these works for which the municipal engineer is responsible is varied, comprising road making and road maintenance with concurrent bridge and viaduct work, tramways, sea and river walls, design of sewerage and water systems, treatment of sewage, public lighting, erection of isolation hospitals, public offices, free libraries, mortuaries, markets and other buildings incidental to municipal administration, the laying out of public parks and pleasure grounds, fire brigade control and supervision of new buildings. In addition, the municipal engineer must advise on all Parliamentary promotions affecting his district, and have a fairly intimate knowledge of the various Acts now relating to public health. Upon the competency, energy and zeal displayed by the officials discharging these duties the comfort, convenience and health of the community largely depend, and the responsibility thus accepted is well known by those in this room to be no light one. It is, nevertheless, I believe, one that is taken up with enthusiasm by all of us. We feel that we are members of a grand profession, which

tends to the benefit of our fellow men, and I am glad to believe that this ever-present desire of the municipal engineer to further improvement in sanitary and kindred sciences is each year becoming more recognised and more appreciated by those whom we serve.

BIOLOGICAL PURIFICATION OF SEWAGE.

In the summary of duties before mentioned there are some matters that have been especially interesting to the municipal engineer during the preceding year, to which perhaps I may be allowed a brief reference. Among these that which has taken priority and has been most discussed is the now familiar subject of the purification of sewage by biological means, as exemplified by the septic tank—Mr. Dibdin's system—Colonel Ducat's filter and other methods. This very recent discovery of the valuable assistance rendered by the micro-organisms in tanks and filters must be deemed the more extraordinary if it be remembered that the much-condemned cesspools of olden days with filter tank attached evidently were adaptable, if they did not contain these natural media, for the breaking down and after oxidation of organic matter in the sewage to be treated, but presumably the generation, and, if I may so say, the intelligent nursing, of these minute organisms pent within the walls of tanks or filters was not then understood, and it is only quite recently that this system of nature has been adapted to the hygienic laws. The absence of sludge and the accompanying difficulty of its disposal in the neighbourhood of large towns is especially an important element in the system, and will in itself greatly tend to economise the expenditure upon sewage treatment.

Should the promise given in several of the experimental works prove as successful with a varying flow and every description of sewage, or in the more comprehensive scheme for Exeter as recently sanctioned by the Local Government Board, it will, indeed, be a long stride towards the solution of that difficult problem of the efficient treatment of sewage under all conditions. Especially will it be a boon to those towns discharging into rivers with a small catchment area and where land treatment is impossible by reason of great price or unsuitability of soil. With suitable land available, however, and at a moderate cost, it is probable that the rotation of Nature, as illustrated by the land treatment, from earth to plants, plants to animals, with return from animals to earth again, will in many places retain its early pre-eminence and the economy of Nature thereby be maintained.

The whole subject is now doubtless in a somewhat experimental stage, but will in all probability receive the earnest attention of the Royal Commission just formed for the consideration of the treatment of sewage, and whose report is awaited with so much interest and anxiety by municipal engineers. At the inquiry much valuable evidence will be received upon this important question, but, with all submission, it appears that beyond this some assistance might be rendered to the commission if experimental works were provided in the near neighbourhood of the metropolis, where the several systems of biological treatment could be panelled out and practically investigated and tested for a certain period of time under exactly similar circumstances as to character of sewage, extent of flow, climatic conditions and other situations of identity. With careful and intelligent daily supervision, investigation and systematic analyses, much valuable testimony might be gained for presentation to the commission. The cost of the construction of the necessary works need be but small, and should not stand in the way of what, I believe, would eventuate in most useful results.

A STANDARD OF POLLUTION.

The necessity for more careful consideration in the system to be adopted for the treatment of sewage is becoming each year intensified by the rapid increase of population, by the addition of legislation relating to river pollution and the more drastic supervision accorded by the river authorities with regard to sources of pollution. Where a mere perfunctory examination of a stream was accorded in former years a duly qualified staff of inspectors is now appointed, constant analyses are made, and the riparian authorities are kept closely up to the mark. Unfortunately, however, for many towns this mark is not a fixed one—*i.e.*, no uniform standard is established as to the extent of impurity allowable in the effluent or filtrate discharged into the stream. A distinction in the standard as between discharges above and below water intakes upon a river is understandable, but with similar tributaries to a parent stream, but supervised by a separate body of officials, it does appear incongruous that a varying standard of purity, or rather of impurity, should exist depending only on the individual opinion of the expert advising the particular river authority. A particular standard was certainly prepared by the Rivers Pollution Commission some years since, dealing more especially with the solids in suspension and solution and the albumenoid ammonia, but this is practically a dead letter, and no known standard is now available for many towns discharging into non-tidal waters.

Exceptional standards of purity are demanded in the case of those towns or districts that are situated upon sluggish streams possessing flat declivities and shallow inclinations from the watershed, with a maximum amount of absorption and a minimum contribution of rainfall. The oxidation of the organic matter in the effluent is thus considerably diminished by the paucity of dilution from surface waters and by the sluggish character of the river's flow, casting

especial burdens upon the towns thus situated where the population may be large and the volume of sewage altogether disproportionate to the natural flow of the stream into which it is discharged. In such cases as these a highly insanitary condition of affairs occurs, and of late much expensive litigation has ensued with regard thereto. To avoid this it is a point for consideration whether a more perfect if not more economical solution of the sewage difficulty would not be arrived at in various parts of the kingdom by the extension of the system of valley sewers or effluent channels, receiving contributions from the various towns *en route* to a final discharge into the sea, tidal river or parent stream as the case may be. The treatment of the sewage by each separate township with discharge of filtrate into the main valley conduit, or the conveyance of the combined bulk of crude sewage far away from habitations for treatment at the lower end of the valley, must be determined by the physical circumstances of the valley and questions of policy between the authorities. There are, however, at the present time some isolated schemes of this description, controlled by joint sewerage boards, which might with advantage to the general health and comfort of the public be more generally adopted in some densely-populated neighbourhoods by co-operation among the riparian authorities under the clauses of the Public Health Act relating to union of districts.

SEWER VENTILATION.

Foremost still among the difficulties of sanitary administration is the ever-troublesome question of the ventilation of sewers. This matter so closely affects the comfort of the people that I feel I may be excused for again referring to a question which has been so often discussed by the members of this association. Pamphlets and reports by the hundred have been written thereon, there has been abundant controversy, and yet we have advanced but little beyond the primitive methods of discharging the foul gases generated in the sewers by the open grids level with the surface of roadways. Numerous patents have been launched forth for the combustion or disinfection of the gases, but hitherto with no material result. Like many other patents, experiments upon a small scale were eminently satisfactory, which failed from various causes when applied to a comprehensive system extending over a large district.

In many towns the open grids have been augmented by the fixture of upcast iron shafts attached to houses and elsewhere, by which all odours offensive to the olfactory nerves are removed far above their sensitive action. The method adopted is a simple and inexpensive one, and although the efficacy of the shafts is by no means universally agreed upon, my own experience of the system, I must admit, has been most satisfactory. The complaints formerly made by residents have practically ceased in those districts where a perfect system has been available, and the life of the engineer has consequently been a more agreeable one during the summer months than was formerly the case. Doubtless, the success of the system largely depends upon local conditions and the position in which the shafts may be fixed. Some difficulty may also be experienced in obtaining the assent of all persons interested in the fixing of the shafts, but the promise to close the offending grid or grids near to the premises often secures the necessary permission. The action of these shafts is doubtless largely affected by climatic influences, a greater current being registered during strong winds, but, after a series of anemometrical readings for twelve months, I have found in no single instance a downward current apparent, whilst the upward current has averaged 30 cubic feet per minute, and has upon many days during the summer months, when the utility of the shafts is most required, amounted to 70 or 80 cubic feet. With a current of this rapidity much more success has been achieved in clearing the sewers of foul gases than would have been possible with the open grids.

HOUSE DRAINAGE.

The necessity for these shafts as vents for the gases generated in the main sewers of a town would not, however, be so apparent were all the minor tributaries of a system of main sewerage laid with the same care as the public sewers under the control of the local authority. Given a carefully designed and constructed system of sewerage, it is only with the subsidence of flow in the sewers that objectionable gases will be generated, as no stagnation with putrefaction following should exist in the invert of the sewer. The main cause of the odours in sewers so much complained of is, in my opinion, the foul contribution from faulty house drains, where the flushing administered by the occupiers is not sufficient to cleanse the drain and the intercepting syphon from deposit. A systematic and efficient system of flushing to the house drains, where necessary, is, therefore, an important factor in dealing with the ventilation of sewers, as by this work the possibility of the generation of foul gases is minimised by the sewers receiving a flow free from putrefaction. The flushing of the sewer itself is at times useless, as the malodorous contributions of the house drains are left untouched and the sewer itself may have been perfectly free from deposit prior to the application of flushing. The efficacy of this system of flushing to house drains, as connected with nuisances arising from ventilation, I have practically tested in my own district by meter barrow and special hose attached to water mains, and have found the results to be favourable in every way.

It is with bated breath that one dares to suggest the

abolition of the syphons attached to the house drains, the so miniature coops through whose putrefying media all drains must now discharge. Whilst at times they are useless for the purpose for which they are fixed, I am confident that at all times they are the source of emanations from the house drains. On the other hand, without them what multiplication to the area of ventilation would be accorded by the thousands of upcast shafts attached to the rear of the houses, and at the same time the atmospheric dilution of the sewer gases would be materially increased.

MAINTENANCE OF HIGHWAYS.

The question of the maintenance of highways, although prosaic in character, is one that more closely affects the everyday life of the public than perhaps many other municipal works of a more apparently ingenious nature. During the middle ages and until well into the present century the greater part of the highways in town and country were much neglected, and it is only quite within comparatively recent years that the subject of formation and repair of all roads and footpaths has been more scientifically and intelligently administered both in the counties and boroughs of the kingdom. It is not much more than a century since that Palmer started the first mail coach, the "Fally Ho," which ran from London to Bristol. Before that time the mails were carried by post boys and were continually carried off by highwaymen. The mail coach certainly was a change, though by no means complete, security. But this change made men look to their ways, and thus the main roads began to receive more attention, and in connection with this work we remember the honoured names of Metcalf, Telford and Macadam. The improvement effected in the main roads during the past twenty years, however, is due in a great measure to the higher standard of excellence demanded by the county authorities under the Highways and Locomotive Amendment Act, 1878, and the Local Government Act of 1885 prior to any contribution being made towards the repair of these roads, and in this respect doubtless the public have benefited in the matter of comfort but somewhat suffered in the pocket by reason of the action thus taken by the county authorities. Another improving aspirant has, however, lately appeared upon the scene in the shape of the ubiquitous cyclist. The surface of a macadamised road that was considered satisfactory for ordinary vehicular traffic now proves utterly unfit for the pneumatic-tyred bicycle, and I believe it has been seriously contemplated in some localities where pleasure is perhaps more rampant than in others that an especially prepared track upon the public highway should be reserved for the cyclist. This may or may not be a necessity of the times, but should it be so by all principles of equity let "bicycles be taxed."

WOOD PAVING.

Upon the merits of flint, slag, macadam, asphalt, brick, stone paving and hard and soft timber as materials for road repair I do not propose to dwell, as it is quite without the scope of this address and is a question that has received and will in the future still further receive detailed consideration by paper and discussion in the district meetings to be convened. Upon one point, however, it appears that but little controversy is likely to ensue, and that is the substitution of wood paving of some description for the stone paving in all residential localities, where the noiselessness of the former material is of necessity in these neurotic days. Upon macadamised roads undergoing excessive wear and tear, with the inconvenience of continuous repair, wood paving has been vastly extended during recent years, and has proved a measure of economy as well as comfort. The comparative advantages of hard and soft woods have respectively their advocates among men eminently fitted to judge, and it is possible that the battle of the timbers has yet to be fought out, not only upon the matter of durability, but also upon the important questions of noiselessness, liability to contraction and expansion and antiseptic qualities. The ever-popular microbe has also now appeared upon the scene with regard to this particular form of paving, and an entirely new genus of bacteria, alleged to be injurious to human organism, has been recently discovered as emanating from imperfectly cleansed wood-paved roadways. Unlike the septic tank or the aerobic microbe of the filter, these are of no advantage to humanity and must be exterminated. Thus, the necessity for constantly and efficiently cleansing the streets is intensified by this new discovery, and the use of disinfectants in combination with the watering of streets may become much more general.

A novel feature as affecting our highways has been recently introduced by the adoption of the Light Railways Act, 1890, by which powers are given for the construction of railways alongside or over public roads, ostensibly for facilitating the carriage of agricultural produce. During the pre-ent year of Parliament, however, these railways have been promulgated in more densely-populated quarters than it appears to many was contemplated by the promoters of the Act, and that what was intended as assistance to the farming interest is now developing into the acquisition of tramway facilities without compliance with the requirements of the Tramway Acts. It is an important question, closely affecting the suburbs of large towns, where these light railways may be introduced without the statutory consent of the road authority, and without any provision as to rate of speed, protection of public roads, restoration and maintenance of the same,

purchase of undertaking by local authority and many other covecants now required by the Acts relating to the construction of tramways. The procedure for promotion is also totally distinct from that of tramway construction, although the work proposed to be carried out may be *de facto* the same. Should these promotions undertake the work hitherto associated with tramways every endeavour should be made to secure similar protection to local authorities to that provided in the Tramway Acts.

SUPERVISION OF NEW BUILDINGS.

The supervision of new buildings is possibly one of the most important of the duties of the municipal engineer in securing stability of buildings and in endeavouring to maintain health and ward off disease in the homes of the people. Provision is also made in the by-laws for the prevention from fire in all new buildings, and upon this matter it does appear that some additions are required in the present by-laws as generally adopted throughout the country, in order that better provision should be made for fireproof walls and floors in flats or buildings of the tenement class, now being so generally built in large towns. In the metropolis powers for prevention of spread of fire in these buildings already exist, but, except in private Acts, there is no authority that I am aware of outside the metropolis that can enforce this necessary provision, the corridors and staircases in many cases being of timber, thus adding enormously to the risks of the tenants in the upper floors of any high range of buildings. Endeavours should be made at least to secure powers in this direction by the construction of all corridors and staircases, with their enclosing walls, in incombustible material, as, I believe, is universal in Edinburgh, Glasgow and other large Scotch towns. To render the by-law absolutely satisfactory, fireproof floors or horizontal party walls should be rendered compulsory, being properly constructed according to a stringent specification embodied in the by-laws, so as to avoid a calamity similar to the deplorable accident that has recently occurred at Westminster. This case also seems to indicate the necessity of additional supervision as to the construction of floors and interior walls. The suggestion is possibly a matter that might be reasonably represented to the proper authorities by this association of careful deliberation.

Upon the sanitary aspect as relating to the supervision of new buildings too much attention cannot be paid to the efficient construction of the drainage, and the provision of requisite space around our dwellings in order that a free circulation of air may be secured. Upon the former question there is no doubt but that considerable improvement has been effected in recent years, and valuable additions and amendments have been made to the by-laws in some districts, ensuring additional precautionary measures where drains are laid under houses, and enforcing proper provision for inspection and testing of drains without the inconvenience caused by the disturbing of the ground as is now found necessary in cases of imperfect drainage. The water test as applied to drains, a simple thing in itself, but one largely affecting the efficiency of the house drains and consequently the health of the people, is also now almost universally adopted, although it would possibly be desirable that this description of test should be definitely fixed and ratified by reference in the by-laws. The maximum amount of air space as now provided, I think, will be agreed is but little enough, 25 ft. of ground being by no means too extensive an area for thorough ventilation in densely-inhabited neighbourhoods. Unfortunately, however, many of the smaller houses receive little more than half this extent of land in the rear of the house, so that with a rabbit-hutch and a chicken-run but little worthy of the name of garden remains. Every endeavour should therefore be made by the municipal engineer to enforce this necessary provision for sanitation to its utmost limits, as the health returns now so clearly point to the excess of sickness in crowded localities.

ELECTRIC LIGHTING.

Of all municipal works at present in progress and contemplated to a still greater extent in the future none show more general adoption in all parts of the kingdom than the installation of electric lighting plant, the provisional orders applied for during the present session being in excess of any previous year. The almost universal action now taken by local authorities in the installation of electric light themselves, to the exclusion of monopolies, brings the question largely within the scope of the duties of the municipal engineer, the highly-trained electrical engineer being an official of the corporation or town, together with his colleague the civil engineer and surveyor. In the first stages of the introduction of any scheme of electric lighting the latter officer is often actively engaged, more especially with regard to the sites for central and sub-stations, and the routes for the transmission and distribution of the electrical energy. This must be my excuse for the few remarks I may have to make upon this prominent matter of municipal engineering interest.

The advantages in many ways of electric light over any other form of artificial light must be generally admitted, and the financial success of most undertakings by municipal authorities seems to be fairly assured after the second or third year of working. Thus it is to be anticipated that in the early future this system will, like many other municipal promotions of a similar character, become a relief to the burden of rating, and that the price will compare favourably

with that of any other description of lighting. At the outset in any new venture it is expected that the cost of supply to a limited number of customers must be greater in proportion than when the undertaking has been more generally adopted. This was the case in the early stages of gas supply, but, nevertheless, the better illumination and general superiority of gas was sufficient to practically eliminate the use of oil and candles where gas was available. In the same way, even supposing the cost of electric supply may exceed that of gas during the early years of installation, still its convenience and general utility is such that it cannot fail to become the popular illuminant, and that in the near future. The steady increase in demand for electric light is abundantly exemplified in the various installations throughout the country, where in so many instances the enlargement of the stations and plant are necessitated within two years, or even less, from completion of the work. In addition, therefore, to acquiring a site with special facilities for carriage of coal by rail or water, or by both if possible, careful provision should be made by the municipal engineer for enlargement in the future and the buildings so erected as to admit of the most economical and ready means of adding thereto.

One great difficulty encountered in the general adoption of electric light in a residential neighbourhood, and especially where the property is of a small-class character, is the expense incidental to the wiring of premises. Endeavours have been made in several directions to remove the difficulty by instituting what is nominally called the free wiring of premises by companies formed for that purpose. This is a work, however, that would be better taken in hand by the municipal promoters themselves, and it does appear most desirable with this intent that borrowing powers should be accorded to local authorities similar to those now exercised for private improvement work, by which the payment of the cost of the work by the owner or occupier, as the case may be, could be spread over a term of years commensurate with the period of the loan. This would be but little felt by the owners of property, and would, I believe, conduce very largely to the extension of electric lighting in residential property tenanted by the middle and working classes.

The public lighting is at present almost entirely confined to arc lamps upon the main streets, the branch streets still being lighted by gas, an old friend that has stood us in good stead and in which considerable improvement with regard to public lighting has been effected during recent years. The introduction of the incandescent gas burner for public lighting has been introduced with great effect in some districts where the lamps are not too far apart. With long intervals, however, this description of lighting does not appear to possess the same proportionate penetrating power as the ordinary burner. In my own district 400 lamps have been fitted experimentally with this description of burner with satisfactory results, both as to illumination and annual cost.

COMBINED UNDERTAKINGS.

The combination of the work incidental to combustion of house refuse with that appertaining to the generation of electrical energy is a subject that has resulted of late in a large amount of pamphleteering and discussion, and, although a matter of supreme interest to municipal engineers, is one upon which I dare not trust myself to enlarge on this occasion. Upon all sides, however, it must be admitted that by judicious design of the combined works in the first instance the utilisation of the calorific from the refuse furnaces must figure in some proportion as an assistance towards the generation of steam in connection with the electric lighting plant, and that outside the question of the value of the clinker for municipal work and the destruction of the useless refuse by combustion, every pound of steam thus generated should represent a saving in the expenditure incidental to the electric lighting work. Care, doubtless, should be taken in the disposition of the two departments, isolating them as far as is consistent with convenience and facilities for combined working, as the refuse tip and store with its attendant dust and dirt is not a too desirable neighbour to the engine-house of the electric lighting works. That the refuse, however, is generally of value for purposes of combustion there can be no doubt, and that it has for many years past unwisely been treated as a useless waste product in large towns has only recently become apparent.

The combination of other municipal works with an electric light installation is also possible in many ways for motive power, thus utilising the day load, which at times may in a measure be running to waste. In a minor degree this power could be most advantageously applied to motor cars or vans for the removal of house refuse, slopping and watering, and other work requiring mechanical power, provision being made for charging stations for this purpose at convenient localities within the area of supply. In this direction I believe considerable economy could be effected in a district with a large amount of cartage work, the cost of which often amounts to one of the heaviest items of administration in municipal work.

A somewhat important question as affecting electric lighting undertakings is the report of the Select Committee lately appointed to consider amendments to the electric lighting Acts that may be necessary to empower the Board of Trade to grant compulsory powers. Among other items in this report, recommendations are made that compulsory powers should be given to electric lighting undertakers for the com-

pulsory acquisition of land for a generating station outside their area of supply. This, doubtless, will prove of distinct advantage to those towns where the acquisition of site would involve excessive expenditure, but the advantage to the districts outside the area of supply and whose streets are to be broken up without any commensurate benefit received may not be so apparent. The matter is, however, in report stage only, and will hereafter be further heard of.

PUBLIC HEALTH LAW.

The law relating to public health, the study of which now forms part of the training of every municipal engineer, has been considerably extended since the original Act was passed in 1875. So numerous have been the subsequent Acts added to the statute book, and so varied the nature of the measures to which they refer, that the time has now arrived when great assistance would be rendered to municipal authorities, less litigation would be involved and the statutes themselves made much more clear if the Public Health Act, 1875, and the Acts incorporated therewith were consolidated in one General Act relating to matters connected with public health. In this could be included many useful measures now contained in private Acts, and which the Police and Sanitary Committee in their report to the House of Commons in 1897 have strongly recommended for inclusion in a public Bill. Opportunity might also be taken to secure desirable amendments to the existing Acts, notably in that ill-conceived clause 19 of the Public Health Acts Amendment Act of 1890, relating to combined drainage, which tends to the relief of owners' responsibilities at the cost of the rates.

Additional powers might likewise be conferred upon local authorities to make by-laws with regard to other matters than those mentioned in sec. 157 of the Public Health Act, 1875. In the latter case no authority is given over the question of more complete construction of roadways, the separate system of sewerage for foul and rain waters respectively, internal plastering to houses, plumbers' work, water supply (more especially with regard to locality and capacity of cisterns), and other matters upon which it is essential to obtain powers in connection with the healthy development of a town by construction of roads and erection of buildings.

There are also many other desirable amendments which, I believe, are new among the archives of the association, and were forwarded to the Local Government Board when I had the honour of presiding over the deliberations of the Parliamentary Committee, but which are of too detailed a character to refer to in this address. During the present session a Bill has been introduced into the House with a similar title to the Public Health Acts Amendment Act of 1890, in which many useful clauses have been introduced from private Acts of recent years. Unfortunately, however, I understand that this Bill has been withdrawn during the past few days. Like many former Amendment Acts, the principle of permissive legislation has been adopted in many cases where compulsory measures would possibly have been more desirable. That some powers to be conferred upon local authorities should be adoptive where the public health, or comfort or convenience of the majority are not concerned, is readily to be understood, but in all sanitary questions, or those relating to salubrious dwellings and convenient means of access thereto by roads or streets, it does seem that uniform legislation throughout the length and breadth of the country is in every way desirable. Being thus uniform, it becomes better known by all whom it concerns, and consequently there is not the same opportunity for the plea of ignorance by those who contravene the law and which is now so constantly the defence where powers are possessed in one district that are wanting, perhaps, in that immediately adjoining. A clause has been recently introduced into private Acts, as well as in the Bill before mentioned, which is of intense importance to municipal engineers throughout the kingdom, but especially to those appointed to districts where a large amount of building development is in progress. I allude to the granting of certificates by the surveyor to the local authority that, prior to occupation of all new houses, the premises are in every respect in accordance with the by-laws and requirements of the district for the time being in force, a most salutary clause and one that most surveyors would gladly adopt were proper and competent assistance rendered them for the close and constant supervision of buildings to ensure strict adherence to the by-laws in every particular. But what are the facts of the case? In many instances the surveyor, in addition to the many duties of his department, which necessitate a large amount of time spent in his office upon administrative work, has himself to supervise the erection of new buildings, and that perhaps over a district several square miles in extent with work in all directions. How is it possible under these circumstances for a satisfactory certificate to be granted, and is it fair under these circumstances to free the owner and builder from all liability and practically place the same upon the shoulders of the surveyor, and through him on his employers? Should such beneficial legislation for the property owners be enacted, by all means let it be accompanied by powers conferred upon local authorities to charge the owners and builders thus benefitted for the supervision of the buildings, by which means a sufficient number of qualified inspectors may be appointed to thoroughly supervise all building operations and thus to justify the granting of a *bona-fide* certificate. The question is of such moment to

public authorities and their engineers that earnest endeavours should be made to obtain general powers throughout the country to charge for supervision, without which the operations of any clause relating to the granting of certificates will be ineffective, and result in but little benefit to the public and an entirely new liability fraught with possible litigation to the certifying authority.

CONCLUSION.

Gentlemen, I am afraid I have somewhat overtaxed your patience in the few disjointed remarks I have made with regard to the works and duties appertaining to the office of the municipal engineer, but I look to the brotherhood which I hope exists in this association to condone any of my shortcomings. Mutual support was originally, as in most associations of this character, one of the main reasons for its constitution, and I sincerely trust that it may always be to the fore, so that in addition to the spread of professional knowledge we may also be ever ready to assist those of our profession who may at any time be in trouble or in need, thus training the heart as well as the intellect for the welfare of our professional brethren.

Mr. CHARLES JONES (Ealing) proposed a vote of thanks to the president for his address. He had seldom heard one so thoroughly utilitarian in character. It had touched upon questions in regard to which they all felt deeply, and it might well be submitted to the Local Government Board not to be pigeon-holed but to be acted upon.

Mr. J. PATTEN BARBER (Ipsington), in seconding the vote of thanks, said they had expected much, and had not been disappointed. He hoped they would all work towards giving practical shape to the very high aims and ideals so ably put before them. The powers of local authorities should be enlarged, and if extended in the directions suggested by the president, it would be for the general good.

The motion was carried unanimously, and after a brief acknowledgment by the president, the following paper was read:—

USE OF TARRED MACADAM IN THE CONSTRUCTION OF ROADWAYS IN URBAN DISTRICTS, AND COMPARATIVE CONSIDERATIONS.

By A. H. CAMPBELL, A.M.I.C.E.,

City Surveyor, Canterbury.

Mr. Adam H. Campbell was elected city surveyor of Canterbury in 1885, succeeding Mr. Frank Baker, who was now borough engineer of Middleborough. He was formerly borough surveyor of Stratford-on-Avon, and antecedent to that was an assistant in the office of the borough engineer of Edinburgh; Mr. Campbell was, indeed, the first assistant appointed by Mr. Cooper on his succeeding to the borough engineer's office of Edinburgh in 1881. Receiving his professional training as a civil engineer and architect in the office of a well-known firm of private practitioners in Edinburgh, Mr. Campbell became an assistant to a land surveyor in Perthshire, where he was engaged on several large works. Returning to Edinburgh in 1882, he remained as assistant to Mr. Cooper for seven years, works of town sewerage, street widenings, city extensions, clearance of silt areas, labourers' dwellings and tramways being the chief works of a contractor's character undertaken. From the banks of the "Molten Aitches" to the quiet of "Shakespeare's town" on the banks of the soft-flowing Avon appeared a remarkable transition; but here was abundance of work to do and peculiarly knotty as it turned out to be—the extension and amendment of the Stratford waterworks, the creation of the joint infectious diseases hospitals for the urban and rural districts, the introduction of tarré asphalté pavements, and the renovation of the corporate estate properties. Besides other works of a lesser degree, kept the surveyor of that clean and picturesque little English town busy during his five years' residence there. As city surveyor of Canterbury Mr. Campbell has been kept full of work, and watching the current of municipal progress, now being in Canterbury, he has had no time to "rust." The new infectious diseases hospital—recently illustrated by us—the Bemyey Institute, a public library and museum, street improvements and repaving, have been completed, whilst the work in progress and the work which the borough engineer has committed include the installation of a combined plant of electric lighting and dust destruction, the erection of public baths, the provision of new outfall sewerage works, new municipal buildings, surface drainage and labourers' dwellings, and the taking in hand of a further instalment of street improvement works. When it is stated that the annual total of these works represents an expenditure of about £120,000, and that the erection of a lunatic asylum to cost £200,000 is also contemplated, it will be evident that this metropolitan city of England is determined to keep herself well abreast of the times.]

The committee of the last International Congress of Hygiene and Demography, held at Baden-Pesth, adopted the following resolution: "That the paving of streets should be smooth, and as far as practicable impervious, to facilitate cleansing and also to prevent contamination of the subsoil." With this resolution this association of municipal engineers and surveyors will no doubt heartily concur. It has served to suggest to the author a good text in the preparation of his paper. The text of the resolution comprehends in a sentence all the essentials of a good roadway. These may be briefly summarised under the following heads: (a) Durability; (b) the minimum of noise; and (c) the minimum of first cost (consistent with the foregoing).

The attainment of the first of these—viz., durability—is best realised by the adoption of granite sets, as may be witnessed more or less in all large cities, and nowhere to a greater proportionate extent than in the city where the association is now assembled. This kind of paving, however, is not smooth; it is most noisy, the tramping of "empty vehicles (not vessels) making the most sound" receiving abundant illustration on this form of road; further, unless laid on a bed of concrete and jointed in pitch, it is not impervious, and the facility of cleansing is much impeded, due to the numerous joints wearing open and rounding off, holding the dirt and

dust of roadways. It is moreover costly, probably nearly as costly in construction as wood pavement, and its only claim for use is its *durability*. Allied to this material for road formation is the use of blue brick setts for carriageways, which are having experimental trials in a few places. The attainment of the second head—i.e., minimum of noise—is best realised by one or other of these descriptions of materials: (1) Gutta-percha; (2) compressed asphalt and concrete macadam; (3) wood paving; (4) macadam.

The first named is mentioned only as the ideal of noiselessness, and not as entering into comparison with any of the well-known materials of road construction. It is in a very experimental stage as yet, and has hardly come within the scope of practical consideration. It is to be seen in small short sections in Glasgow and at the entrance to Easton station, London.

Compressed asphalt, also concrete macadam, is clean, impervious, durable and saving for the clatter of horses' feet. As may be described as comparatively noiseless. Involving, as asphalt does, the underlying bed of concrete, the first cost renders it prohibitory in all save large centres of population. It is, moreover, slippery and unsuited to inclined roads upon a hill.

Wood paving comes next in the fulfilment of the necessary conditions of the text. It is smooth; is probably the least noisy of any of the descriptions of hard pavement; it is of moderate durability; and if of the hard-wood description, practically impervious to moisture. Its first cost, however, and the unreasonably short periods allowed for repayment, render the general adoption of wood pavement in moderately-sized towns, or even in the suburban parts of large cities, very unlikely, if not prohibitory.

The class of town or urban district to which allusion is made is that of moderate size and limited financial resource, which are restricted therefore to the use of "macadam" in the construction of their highways.

As it is from moderately-sized towns or districts that so many members of this association come, the consideration of any *improved form of macadam paving* acquires special interest and importance; and there is no improved form of macadam which is so coming to the front, and demanding that attention which its merits unquestionably deserve, as that now going by the name of "*Tarred Macadam*." That is, a composition of any of the stones, gravel or elinters commonly used in the making of macadam roads with a mixture of *tar*. It appears a simple enough composition, but its preparation and laying, so as to turn out a success, bristle with delicate detail.

When properly made and on roads suited for it this construction of road complies most nearly—compressed asphalt perhaps excepted—with the conditions laid down in the reso-

To its preparation, storage and laying the author has had special opportunity of study, the composition, as used by him, being prepared by the workmen in his department.

In tabular form there is here submitted an epitome of particulars of several streets laid by the author during the past three years. Besides the foregoing list, a number of lanes in Canterbury have been partially laid with this composition; and at the present time St. Margaret-street, about 700 ft. long, with a carriageway of only 12 ft. and in the centre of the city, having heavy vehicular traffic, is in process of laying. The preparation and laying embrace these details: (1) The nature of aggregate and its preparation; (2) the tar, its nature and treatment; (3) the mixing of these two together; (4) the storage; (5) the laying down upon the road; (6) the cost.

As regards the nature or description of the aggregate, the author has tried Kentish ragstone, surface-picked flints, pit gravel and Guernsey granite. The stone is prepared for the tar by burning in the open. It is laid out first of all in a flat bed about 12 in. thick and of rectangular plan; on this is spread a layer of coke and breeze about 3 in. to 4 in. thick, with a little wood to assist the fire; this is then overlaid so as to form a stack of stone of about 5 ft. in height from the ground; meantime, as the last addition of height is made, the fire of wood and coke has been kindled, and the fire is allowed to penetrate the stack. About 1½ chaldrons (5½ bushels) of coke are consumed in a stack of 60 cube yards.

As regards the length and size of the stack of stone, this may be made endless by laying out the stack so as to describe a circle, thus following in the process of mixing a circular course, with certain obvious advantages. Other makers of tarred stone composition in the author's district arrange the stack in the form of a *cone*, close it up at the top, fire it in the centre, and allowing the fire to penetrate the mass leave the stack of stone untouched whilst this process of firing proceeds. This operation may take any time between seven and ten days; the stack is then opened up and the hot stone applied to the prepared tar.

In either of these methods of firing the stone a great deal of loss by disintegration occurs; the stone succumbing to the influence of fire, and tending to get reduced to a coarse-grained powder. Particularly so was this the case with a trial of granite exposed to fire, which quickly produced the condition above described. For this reason the author would much prefer the heating of the stone in an oven or kiln; the temperature would be more equable and the severe firing causing the disintegration described would be avoided.

On the subject of "heating" one or two remarks may be submitted. The author believes it to be the practice with some makers not to heat the stone at all, but, being sure that the stone is dry and free from moisture, apply it in the cold

Name of Street.	Width of Carriageway. ft. in.	Nature of Traffic.	Date when laid.	Thickness, aggregate.	Cost per Superficial Yard.	Experience.
Stour-street ...	8 2	Heavy continuous traffic, three traction trains passing daily.	July, 1895.	6-in. Kentish rag.	About 4s. 6d.	Failure; quite unable to support the constant action of the traction engine traffic.
Thornagain-lane (cul de sac)	8 2	Light van traffic ...	Nov., 1895.	4 in. of gravel on the old natural road formation.	3s.	Satisfactory.
Orange-street	17 0	Medium through traffic, carriers' waggons, carts and tradesmen's vans.	March, 1897.	4 in. of gravel underlaid by 3 in. hard broken brick.	4s. 6d.	Most satisfactory.
King-street ...	(1) 16 6 (2) 8 2	Ditto ...	May, 1897.	3 in. ditto ...	About 4s.	Moderately satisfactory; centre of way along horse track commenced to disintegrate, due to the tar being overhauled, and the material hardening or setting before using.
Guildhall-street	15 9	Heavy through traffic, omnibuses and general town traffic.	Sept. 1897.	4 in. ditto ...	4s. 6d.	Generally satisfactory; superficially softens on parts in sun heat, but otherwise is doing well.

lutions set forth at the outset of this paper. It is a smooth and noiseless road, it is non-absorbent, it is cleanly in itself and easily kept clean, and its first cost is within the capacity of the most reasonably restricted finance of small towns and districts.

With all the advantages enumerated, it appears remarkable that tarred macadam has not been adopted except as yet on the most limited scale. It is true that tarred gravel or limestone footpaths have been in use for a great number of years and have now obtained a deservedly wide adoption, but the extension of this same composition, only of a larger gauge metal, to the construction of roadways has been most limited. As accounting for this, these reasons may be suggested—viz., the failures which frequently attend a first trial; and uncertainty as to the properties and action of *tar*, and how it will unite with the aggregate which it is designed to incorporate.

The author can speak from personal experience of its failure and of its success too—failure where success was expected, and success where failure might be anticipated; and this as evidence of the fickle character of the composition,

but thoroughly dry state to the prepared tar. This condition of the stone, in the author's opinion, resembles the risk attached to laying the tarred mixture in position in cold instead of hot weather. The tar refuses to "work," the temperatures are so unequal, and when the sun (particularly the sun of the sunny South) beats upon such a road it is not improbable but that this defect will discover itself in the liquefied tar bubbling and spewing itself up over the surface. The proper or at least *best* condition of heating is to be obtained by the kiln, where the heat will be rather of the moderate *baking* than of the hot *roasting* sort.

The temperature of the stone when the tar is applied should be such as the palm of the hand can bear with comfort; if too hot the tar will be destroyed as a cohesive; if too cold the tar will go on too thickly, and under the rays of a hot sun will soften. The hot stone when ready to be mixed with the prepared tar is sifted through two gauges, graduated to 1 in. and to ½ in., giving three sizes of material—viz., 1-in. to 2-in. gauge for the body material, ½-in. to 1-in. gauge for the intermediate or finishing coat, and ¼-in. to ½-in. gauge for the skin or top dressing. These three sizes are laid in layers as

follows—viz., 3 in. to 4 in. thick of the coarse, about 1/2 in. thick of the intermediate and the top dressing in the thinnest layer possible, with a view only to filling all interstices, thereafter a dressing of fine 1/2-in. granite or limestone siftings is scattered broadcast and the traffic at once allowed on the road, working this top dressing in and assisting in the consolidation of the road formation. The weight of the roller employed by the author is nominally 10 tons, and each of the three layers is rolled separately.

Considerable importance is attached to the state of the weather at the time of laying, in the sun by preference and to assure a good result; if laid in a cold temperature and with any defects present in the composition, disappointment and possible failure will result. Weather being normal, any time between May and September (inclusive) may be regarded as suitable. One word as to wet weather—operations both of mixing and of laying should be suspended in time of "wet," where conducted in the open, as nothing so corrupts the composition as the presence of moisture.

In constructing a road of this tarred composition, the old surface is removed to a depth of 8 in. and re-made with a 4-in. thickness of dry, hard broken stone, furnace clinker or brick; this is rolled smooth and finished to the required camber of the road. The author's reasons for this underlying ballasting of dry material are two-fold: (1) To separate the tarred composition from any damp substratum; and (2) to economise in the thickness of tarred material.

Under the author's practice the tarred composition is only 4 in. thick (finished). This by itself would be an insufficient surface formation to bear the traffic and resist the damp, but underlain by the dry ballasting of hard material, well rolled and perfectly grouted with cement or brushed with well-boiled tar, appears to answer the requirements for which it is introduced.

One sentence is necessary as to having the tarred mixture all in a fresh or "live" state when being laid, otherwise cracking and disintegration of the road will rapidly occur; also in keeping off all traffic during the progress of the work, not because the traffic in itself is an injury, but because of the dirt, dust and other matter foreign to the mixture being imported and destroying the binding together of the layers in one corporate mass. This hint is one to which the author attaches considerable importance, as the effects of this occurrence have been painfully present to his sight upon portions of two roads which he has laid down.

TAR.

The quality of the tar employed is no less important than the other details of the work. Some trading firms making this material use the refined or distilled tar, and excellent results are thus obtainable; but more commonly it is the ordinary gas tar that is used, at a cost of about 2d. per gallon. This tar should be as far as possible free from water, of a stiff dense consistency, any defects of this character having to be counteracted in the boiling operation; the lighter the tar the longer it must boil, so that all light oils are driven off.

The following pertinent observations on the subject of coal tar have been submitted by the author's friend and colleague (Mr. Sidney Harvey, F.I.C., public analyst).

"Coal tar is a by-product of extremely complex constitution, containing matters volatile at various temperatures.

"The effect of heat upon coal tar would be to volatilise certain principles therein, whereby the residue would be more viscid and tenacious than the original substance, while its melting or softening point will be proportionately raised.

"As the ultimate result of the continuous application of heat is coal tar pitch, it is desirable when coal tar is used in conjunction with road-making materials that the heat in question should be applied long enough to secure the most tenacious and difficultly fusible product, but not pushed so far as to bring about a brittle nature to the pitch itself, which latter would defeat the effect aimed at, which is to agglutinate the fragments of rock material with a watertight cement, which, while protecting the mineral from 'weathering,' would not yield to the heating action of the sun's rays."

In the author's practice the tar is boiled in 50-gallon coppers; it is brought to the boil and maintained so for a period varying from three to four hours; with good conditioned tar three hours' boiling is amply sufficient. To each 50 gallons of tar is added a small proportion of pitch (about half a bucketful), and these are boiled together. The author would not assert the necessity of introducing even this small proportion of pitch, but the cost is almost infinitesimal, and as a counteractive to bad quality of tar it is good and worth introducing.

The quantity of tar employed appears to vary with different makers, just as much as do the other details of this interesting work. It also varies with the season and with the consideration whether, when mixed, the material is to be at once laid or is to be stored in a heap. If the weather is cold and if the material is to be stored the less should be the quantity of tar used. Weather being hot, and material being laid down at once, a slightly greater proportion of tar may be used than under the reverse conditions. At the present season, with the material being laid soon after mixing, although a brief storage is found necessary, the following are the quantities of tar that are used—viz.:

	Gallons per cubic yard.
With the coarse (1-in. to 2-in. gauge) material ...	8
With intermediate (1 1/2-in. to 1-in. gauge) material ...	10
With fine sifted stone (1-in. gauge) material ...	12
From a return supplied to me by the foreman of works, the author submits the following statement giving the detail cost of the material. The stack of stone operated on for test contained 45 cubic yards; and the actual cost in preparing that quantity is:—	
<i>Debit.</i>	
45 cubic yards pit gravel, at 3s. 6d. ...	£ 7 17 6
79 gallons tar and cartage, at 2 1/2d. per gallon ...	0 16 5 1/2
23 1/2 lb. of pitch, at 46s. 8d. per ton ...	0 4 10 1/2
84 bushels of coke,* at 9s. 4d. per chaldron ...	1 1 9 1/2
30 " breeze ...	0 8 0
Wages in preparing and mixing stone and tar ...	7 18 7
	£18 7 2 1/2

Credit.

Actual product from the foregoing: 40 cubic yards of mixture costing £18 7s. 2 1/2d., equal to 9s. 2d. per cubic yard. This composition as above described, laid 4 in. to 4 1/2 in. thick, finished in compressed condition, will work out at fully 1s. 6d. per super. yard for the mixture alone.

To this ...	£	s.	d.
1. Stripping road 8 in. thick ...	0	0	" "
2. Broken brick ballasting ...	0	10	" "
3. Applying the tarred material in three layers and finishing off ...	0	9	" "
4. Rolling road ...	0	3	" "
5. Add contingencies 10 per cent. ...	0	5	" "
Total ...	4	6	per super. yard

The life of this description of road paving may be taken at seven years; so that, divided up over that term, the actual cost of a road so paved will work out at 7 1/2d. During this term it may become necessary to outlay certain small amounts in repairs so as to maintain the surface smooth, whole and impervious; this, estimated at 2d. per yard per annum, will give a grand total of 9 1/2d. per super. yard per annum for this description of roadway. This rate for a good street pavement in urban districts, for heavy vehicular traffic of the ordinary sort (that is excluding traction engine traffic, for which it is unsuited), is most moderate. Compare it with any of the other descriptions of paving; even than ordinary macadam it is rather less; and side by side with any of the improved harder pavements, wood, compressed asphalt or setts on concrete bed, it is incomparably less costly.

The author does not, however, suggest that this description of pavement should enter into competition with these superior materials of road construction; each and all of them—stone setts, wood, asphalt, tarred macadam and ordinary macadam—have their respective places; all, save tar macadam have had their field and play, and it is for a fair field, devoid of any favour, that the author presents to the association a plea on behalf of tar macadam. On the leading streets of smaller provincial towns, in the secondary and suburban thoroughfares of large towns, where in many cases stone or granite setts are used, of heavy cost, tarred macadam properly prepared and laid would form a welcome, valuable and economic substitute.

When the paper had been read a discussion was opened by Mr. SMITH SAYLLE (Darwen) and continued by Messrs. C. F. WYKE (Sheffield) and F. BAKER (Middlesbrough), after which an adjournment was made for luncheon given at the Royal Hotel on the invitation of the Lord Provost, magistrates and town council of the city. After luncheon the discussion of Mr. Campbell's paper was resumed by Mr. LEMON (Southampton), after whose speech it was decided to invite any farther criticisms to be contributed in writing to the Transactions. Mr. YORNO then summarised the chief points of his paper on "The Experience of Edinburgh with Refuse Destructors," and a discussion took place. Mr. COLMAN next followed with a summary of his paper on "The Conversion of the Edinburgh, Leith and Portobello Horse Tramway System into Cable Traction," and a long discussion was closed by an admirable reply from the reader of the paper. The papers by Mr. STEWART and Mr. BRUCE, entitled respectively, "Notes on Sewer Ventilation as applied to the Water of Loth Intersecting Sewer" and "Hoisting of the Working Classes Act as worked out in Edinburgh," were also read and discussed. The paper by Mr. BRUCE was as follows:—

WORKING OF THE HOUSING OF THE WORKING CLASSES ACT (1890) IN EDINBURGH.

By WILLIAM BRUCE,

Graduate of the Association of Municipal and County Engineers and Member of the Sanitary Institute.

[Mr. Wm. Bruce was articled to a surveyor in Edinburgh, and so acquired an experience in architectural and engineering work in his capacity as assistant to various private firms in that city. His early bent being for municipal engineering work, he sought to qualify himself in all the branches of the profession, and studied engineering, mechanics and sanitary science at the Heriot-Watt College. He entered

* Includes the coke consumed in the tar boiler.

the office of the burgh engineer of Edinburgh in January, 1892, at a time when the city was entering on a period of great municipal activity, and was fortunate in having the opportunity of participating in the various schemes about to be undertaken. The work on which Mr. Bruce has been principally engaged has been the designing and superintending of the construction of underground conveniences and public lavatories, the construction of new and the widening of existing streets

with relative works, the carrying out of the provisions of the Housing of the Working Classes Act, and city improvements generally. Mr. Bruce passed the examination of the Incorporated Association of Municipal and County Engineers in April, 1896, becoming a graduate of that body, and in July, 1897, was elected a member of the Sanitary Institute.

The fair face of the city of Edinburgh has been so often extolled, its many advantages and beauties so often commented on and admired by strangers, that anyone not acquainted with the city might be led into the belief that in this favoured community there was no seamy side to life at all. Until recent years the changes and improvements ever taking place had for their object more the increasing of the beauty and convenience of the city at large than the promoting of the welfare or interest of any particular class. But as these changes and improvements were mostly effected on the older parts of the town, in our appreciation of what had been accomplished we were inclined to overlook the fact that all these clearances and street widenings must have been accompanied by a measure of inconvenience and hardship to a large number of persons.

It is claimed that by the improvement scheme promoted by Dr. Chambers, lord provost of the city some thirty years ago, that about 14,000 persons were removed from their homes. At that time many old landmarks were swept away; whole streets, closes and wynds obliterated to give place to what are now spacious and thriving thoroughfares.

The advantages and benefits of this scheme are acknowledged, and its good effects in bringing light and air into the midst of darkness and disease are visible to-day; but it is also a question if the present scarcity of small houses in Edinburgh, with the accompanying high rents, does not date from that same time. The improvements effected in more recent times, although not so extensive as the one just mentioned, have all brought with them their quota of hardship and discomfort to some poor people. The other causes—economic, social, or otherwise, which conduce to overcrowding and congestion in the poorer parts of all large cities—it is not within the province of this paper to discuss; but these causes have been active here as elsewhere, and in this city the facilities afforded by the closely-built and lofty tenements of the old town for crowding together a large number of persons on a small area are altogether exceptional, and for long have stood a constant menace to the whole city.

The clearing away of much of this old property, without making any suitable provision for those unhoused, only drove the poor into other quarters, and to meet the demand for small houses, tenements originally intended for and occupied by a class that could even lay claims to gentility, were sublet and subdivided until what was originally a house of five or six apartments became occupied by as many families. In these large blocks, with flat raised upon flat, this subdivision, as can be realised, resulted in much overcrowding, with all the attendant evils to health and morals.

A common feature, and, indeed, almost a rule in this class of tenement, is to have all the houses on one flat, to the extent sometimes of ten and more, entering from one common lobby running along the centre of the block, without any light but what is derived from one doorway communicating with the common stair, and with only the doubtful ventilation gained by the occasional opening of a house door. Into this lobby were compounded all the smells from the various houses, besides being the chosen position for the water-closet, sink and supply cistern common to several families.

Under conditions such as these, physical and moral degeneration is all that can be looked for or expected, and against this class of tenement the Public Health Committee have waged constant and unrelenting war, and have exercised their powers of compelling owners to introduce suitable sanitary accommodation and effect other improvements; but it was ultimately felt that something more drastic and

sweeping must be accomplished if the evils of this system of subdivision were to be successfully combated, and amelioration effected in the condition of the numerous class whose lot was cast in these congested and unhealthy areas.

With this object in view the Corporation of Edinburgh applied for, and obtained in the year 1893, a provisional order for a scheme under Part I of the Housing of the Working Classes Act, 1890. This scheme embraced ten areas situated in different parts of the city, ranging from about $\frac{1}{4}$ of an acre to about 2 acres in extent, the total areas scheduled amounting to about 6 $\frac{1}{2}$ acres, with a population of nearly 10,000 persons. With the exception, perhaps, of individual properties here and there, all these areas have been acquired by the corporation, at a cost of about £70,000. In some cases these areas have been entirely reconstructed; others have been wholly or partially cleared of the whole properties, while some remain untouched as when first acquired. The actual number of persons unhoused by the corporation in carrying these improvements into effect was about 2,700.

It is unfortunate that, concurrently with the undertaking of the corporation, the North British Railway Company should have entered upon a large scheme for the enlargement and reconstruction of the Waverley station and approaching lines, which embraced the destruction of a great amount of property tenanted by the very class for whose betterment the corporation were labouring to improve; and that the additional evictions by the railway company of about 400 families caused great hardship and inconvenience among the labouring classes.

So great had the demand for small houses become that the corporation had not only to stay their hand in the work of clearing out the slums, but had to reinstate many families into their homes, and rehabilitate many houses that had been partly dismantled, in order to avoid any unnecessary suffering, and until such times as better housing accommodation could be provided.

While it is often too easy a matter to be able to put one's finger on the plague spots of a city and to effect sweeping clearances, it is only when the question of rehousing the displaced population arises that the real difficulty is confronted. Knowing the number of families to be accommodated, the first question is naturally, What class of house should be provided? To settle that they ought to be on the principle of cottage houses, flatted tenements, or anything else, does not sufficiently answer the question without first deciding what class of poor it is intended to cater for. There are some poor who only wish the conditions and opportunity to enable them to lead orderly and exemplary lives; while there are others (and these, unfortunately, constitute a large factor to be reckoned with) who can only be dragged into order, and who would require that supervision be extended into the inmost arrangements and workings of their homes.

To the first may be entreated a house with all sanitary conveniences private to itself; but for the second, who might not scruple to abuse any advantage or privilege, it might be better to have all sanitary appliances and such like under the control of a vigilant caretaker; and in any case, to bring these two classes together indiscriminately would result in injury and injustice to the one, with probably no counterbalancing advantage to the other. Up to the present time it may be said that anything the Edinburgh Corporation have done is for the benefit of what may be called the respectable poor, and it is to be hoped that they will yet do something to meet the requirements of that class whom we are inclined to regard as incorrigible and thriftless.

The sites selected for the erection of the new workmen's dwellings were two in number: One in Cowgate, in the centre of the city; the other at Tynecastle Meadows, a working-class suburb. Tynecastle Meadows was not an area scheduled under the Housing of the Working Classes Act, but the land had been acquired by the corporation, and it was thought that the erection of suitable houses here might relieve congestion elsewhere. In Cowgate there have been provided twenty-four houses of one apartment and thirty-two houses of two apartments, each house having its own water-closet and sink. At Tynecastle there have been provided—twenty-four houses of one apartment, sixteen houses of kitchen and bed-closet, and twenty-four houses of two apartments; and here the water-closets are common to two families. At Cowgate the area available for the new houses, after conceding a part of the ground to street widening, was so limited that space could not be afforded for washing-houses or bath-rooms, but from the immediate proximity of the public washing-houses and baths this was not considered a serious drawback; at Tynecastle, however, there is a wash-house and bath-room common to every four tenants.

The houses erected on both sites are in flatted tenements, on the balcony principle. The staircases are under cover, but have their entire fronts open to the outside air. In the Cowgate scheme each house is through-going from front to back, with the doors opening to the balconies and as far apart as planning will permit; all walls are plastered, with the internal angles rounded to prevent lodgment of dirt and to afford facilities for cleaning. Owing to the great difference in level between the ground at back and front of these tenements, it was found necessary to construct the entire ground floor as shops, which added to the cost and rather handicapped the scheme.

The cost of the two Cowgate blocks was £10,000, and the Tynecliffe blocks about £5,700. Owing to the inequalities of level already referred to, the amount of excavation necessary and the retaining walls required before the site in Cowgate could be utilised, no charge for land is made against this scheme. At Tynecliffe the land may be valued at £500, which makes the entire cost of this scheme £9,200 for land and building. The rentals for these corporation houses are: At Cowgate, houses of one apartment, 2s. 7d. per week; houses of two apartments, 4s. week. At Tynecliffe, houses of one apartment, 2s. 4d. per week; houses of one apartment and bed-closet, 2s. 10d. per week; houses of two apartments, 3s. 3d. to 3s. 8d. per week. The tenant's proportion of local rates are included in these rentals, with the exception of poor and school rates, which ran about 6d. in the £1; and it is estimated that after paying interest on capital, burdens and maintenance, the balance put into a sinking fund would pay off capital expenditure in about thirty-three years. These results are not much in excess of what is being paid in those dilapidated and insanitary houses already referred to. It may be quite possible to provide houses at a lower rent than those charged by adopting a different principle of construction, but we must not sacrifice any sanitary advantage to the question of cost.

Among sanitary authorities back-to-back houses stand condemned, but I believe that those who have studied the question will agree that through-going houses are less economical of space, and therefore more costly than back-to-back houses. This is especially the case if one and two roomed houses are mixed in one block; either the single-room house must be entered by a long lobby, or the room must be unnecessarily large; and when, as in Cowgate, each house of one and two apartments is provided with its own water-closet and sink, the effect on the cost becomes apparent. That houses with these advantages, however, are highly appreciated and much sought after is evident from the fact that for the corporation houses in Cowgate alone there are about twenty applicants every week seeking to be accommodated.

It may be generally accepted that for any housing scheme of the nature of those under consideration, supervision more or less stringent must be exercised if the property is to be prevented from entering on a downward course of dilapidation almost as soon as occupied. The amount of evil which a few unruly and worthless tenants can work is incalculable, and in all cases where the size of a scheme will permit, a resident caretaker should be provided. Fortunately, in some respects, but unfortunately in this, the schemes so far carried out in this city are small ones—too small to be burdened with the cost of a caretaker; but recognising the necessity for supervision, the corporation have handed over the factoring of those properties to the Edinburgh Social Union—a body whose object is to promote the welfare of the labouring classes, and to provide them with suitable and healthy houses at a low figure. The rents of the properties owned and factored by the social union are collected weekly by its lady members, who in many matters pertaining to household affairs exercise a wholesome influence over the tenants, or reprove any infringement of their rules with more tact and less offence than a man might be able to do.

Among the many applicants for these corporation houses no selection is made; each is accommodated as vacancies permit, but non-conformity with the rules, especially on the score of uncleanness, is not tolerated unless amendment is made; and further, as showing the class of tenants occupying these houses, it may be of interest to state from information kindly supplied by the social union, that the weekly wages cannot run from 7s. 6d. (in one case) up to 29s., the weekly average being 18s. to 22s.

In addition to the houses built by the corporation, the North British Railway Company have erected seventy-four houses to partly accommodate the working-class population displaced by them in the extension of their station. The social union have effected great reformation in remodelling and reconstructing several old tenements in the centre and crowded parts of the city, while there have also been several excellent examples of working men's houses provided by private agency; but these isolated examples of what *can* be done only serve by comparison to bring more into prominence how much yet remains to be accomplished.

Not satisfied with what they have recently undertaken, the Edinburgh Corporation have again, this year, applied for powers to deal with other seven areas under the Housing of the Working Classes Act, embracing an area of nearly 5 acres. Three of these areas are in Portobello, recently amalgamated with Edinburgh, and other four in the Stockbridge district in the north-west of the city, and here we may shortly expect a new condition of things, and an important housing scheme for the poor of those parts.

But the field for improvement is a large one. Other areas and districts in the city are fast lapsing into a condition (if they have not already reached that stage) when only thorough and comprehensive treatment by our local authority can root out the evils hidden in their depths. The work can be surmounted if resolutely faced, and if spasmodic and intermittent efforts give place to something at once systematic and sustained; but its execution will be sufficient to tax the resources of our councillors, and will afford scope for the ingenuity of our municipal engineering department.

The remaining papers read yesterday we have been compelled to hold over, but they will be given in our next issue, together with a report of the discussions. The discussions on the papers of Mr. Campbell and Mr. Bruce will also be given, and a full account will appear of the annual dinner, which took place yesterday evening at the Royal Hotel. We may mention that ten new members and eighteen graduates were elected at the meeting yesterday morning.

THE NEW PRESIDENT.

In the form of a special supplement we present to our readers what we believe will be admitted to be an excellent likeness of the new president, whose year of office can scarcely fail to be both successful and highly popular. The following details of his career will be of interest:—

Mr. Robson was educated at Lancing, and afterwards by private tutors. In 1863 he was articled to Mr. Lewis Angell, with whom he was engaged upon the main drainage of Portsmouth and other municipal works of that thriving seaport town. Subsequently he was employed on quantity work in Westminster, in connection with the Thames embankment, the London main drainage scheme, and other works of a varied character throughout the country, including the drainage of Clapham and Camberwell. Ultimately he was appointed assistant engineer to the West Ham Local Board, by whom a large number of municipal works were being carried out under Mr. Angell, with whom Mr. Robson was also engaged in schemes of drainage for other towns. At West Ham he remained until 1875, when he was appointed engineer to the Willesden Local Board. That body then represented a district with a population of 20,000, which has now increased to 100,000; a significant illustration of the extraordinary development of Greater London. Since 1875 Mr. Robson's professional life has been practically bound up with the growth of the district which he has done so much to regulate and promote, and he has carried out many and extensive works of drainage, bridge-making, road-making, recreation grounds and sewage treatment. When the local board was established, twenty-three years ago, the district was one of fields, streams, woods and vales, of country lanes, hedgerows and old manor houses. Lighting, well-kept roads, drainage and other amenities of a well-governed district were unknown. The board, however, set to work with a will. Plans and estimates for kerbing, channelling and lighting were drawn out, and at the present day Willesden is often cited as a model of municipal administration. Willesden is still to a large extent rural, especially in the northern parts, but the rural features are rapidly giving way to trim and well-arranged streets. The district is a purely residential one, the property erected being chiefly for the lower middle classes. About 1,200 houses are now erected each year. Willesden is well provided with open spaces. At Harlesden the authorities secured 26 acres of land, which was converted into a public park and recreation ground. The whole of Queen's Park, which is supported by the City Corporation, lies within the district. Three free libraries have been provided—at Kilburn, Harlesden and Willesden Green respectively; and an infectious diseases hospital has been built. In 1885 the drainage of the Brent district was decided upon, at a cost of £33,000; two years later the erection of new offices in Dyne-road was decided upon, the cost being £5,500. From the few facts we have given of the progress of Willesden it will be seen that Mr. Robson's experience has been varied and extensive. When the association was first started, and before it was finally officered, Mr. Robson acted as hon. secretary in the correspondence that took place. After its constitution, of course, the first hon. secretary was Mr. Charles Jones, Kaling, who still holds office. In reference to the drainage of the Brent district, we should mention that during the past two years it has been extended, at a further cost of £60,000.

Belem.—The paragraph inserted in our last issue under "Foreign and Colonial" had reference to Belem in Brazil, and not to the suburb of Lisbon, which bears the same name.

Lanchester.—The contract for the construction of bacteriobeds at Grayhead has been let to Mr. S. Walker, of Cockfield, Darlington, who submitted a tender amounting to £384. The engineer's estimate for the work was £380.

British Association of Waterworks Engineers.—Owing to the pressure on our space in reporting yesterday's proceedings at the annual meeting of municipal and county engineers at Edinburgh, we have been compelled to hold over the remainder of the report of the proceeding at the recent annual meeting of the British Association of Waterworks Engineers at Southampton.

Curious Accident at Dover.—An extraordinary accident, in which loss of life was narrowly averted, occurred on the Dover harbour works, on Monday. A steam crane, weighing 45 tons, was being employed to lift a smaller one, when both toppled over, one crushing through the custom house, where a number of officers were at work. The driver of the large crane managed to jump clear and thus save his life. The engines of both cranes were smashed, and other extensive damage was done. A chair in the custom house from which one of the officers had just moved was smashed.

Association of Municipal and County Engineers.

MEETINGS AT NORWICH AND YARMOUTH.—III.

In our last issue we gave, with numerous illustrations, the interesting paper read by Mr. Cockrill at the recent Yarmouth meeting. We now conclude our report, giving the paper contributed by Mr. Preece, and also notes of the discussions and of the visits to various works.

DISCUSSION ON MR. COCKRILL'S PAPER.

Mr. E. G. MAWBEY (Leicester), in opening the discussion said that a man was known by his works, and in the splendid set of drawings exhibited on the walls there was evidence that they had a very able colleague. The town of Yarmouth was in the front rank of municipal enterprise. Mr. Cockrill seemed never to tire in giving information to his brother-engineers. The provision of sea water at the rate of 1½d. per 1,000 gallons was a great advantage. In regard to concrete footways, Mr. Cockrill was a pioneer of that form of paving. Of course, he had everything to his hand in the shingle beach, but he had utilised it in the best way, and could guarantee thirty years', if not fifty years', life, as had been mentioned.

Mr. COCKRILL remarked that some paving on the other side of the water had been laid in 1869.

Mr. MAWBEY, resuming, said that in regard to the question in Yarmouth of the destructor, he was surprised that more had not been said about the utilisation of waste heat. The refuse was, however, evidently of a very poor type. But in Leicester there was plenty of unburnt cinder left in the refuse, and they intended to utilise it to its fullest extent. Probably Mr. Cockrill would do so. He (Mr. Mawbey) had gone into the question, and proposed to utilise the waste heat for the purpose of generating energy for electric traction. There should be no difficulty in getting 3 horse-power per ton of refuse burnt per twenty-four hours. That was based on the assumption that 1 lb. of refuse evaporated 1 lb. of water, and allowing 30 lb. of water per indicated horse-power per hour. At Cambridge they obtained about 4½ horse-power per ton burnt per twenty-four hours. It was not desirable, however, to rush 10 to 20 tons of refuse a day through the destructor cell. The best plan was to thoroughly burn it, so as to avoid nuisance, and to so get the maximum amount of steam out of it. He would not allow more than 6 or 7 tons per cell per twenty-four hours; but they had adopted forced draught, and could get much more through if required. Roughly speaking, 5 cwt. of refuse per head per annum gave 25,000 tons of refuse per 100,000 of population. Before concluding he would like to call attention to a patent tile Mr. Cockrill had invented and largely used in connection with the admirable sanitary work he had carried out. He (the speaker) had a very good opinion of the invention, and would therefore like to bring it before the members. In the matter of electric lighting the town were certainly very well advised. They had acted very wisely in consulting Mr. Preece and his able son. At Leicester Mr. Cohen had advised the alternating current, and had found it very satisfactory. The Willans engines at Yarmouth were, no doubt, the ones to adopt.

Mr. LOBLEY (Hanley) said he had great pleasure in seconding the vote of thanks. He had known Mr. Cockrill for a great many years, but had not previously seen him in his own town. There were one or two points in connection with the paper to which he wished to refer, and he had one or two questions to ask. The problem of dust destruction was exercising people's minds at present. Like Mr. Cockrill, he also was troubled with bad foundations, not on account of subsoil water, but through undermining. He had four canal bridges which continually required to be raised, of course including the approaches. They found the sewers seriously interfered with, and experienced all sorts of trouble. He had been thinking of adopting a steel chimney, and he would like to have Mr. Cockrill's opinion about that. He wished to refer to one or two points in connection with the electric lighting. The number of lamps was given, but the size was not mentioned, but he understood they were of 8 candle-power. The number of arc lights, again, was given, but it was as well to have the size of the lamps mentioned. He believed that they were 11 amperes, while at Hanley they only had 8-ampere lamps. As to the Local Government Board not allowing a long period for the repayment of loans, Yarmouth was in good company. At Hanley the periods were ten, seventeen and twenty-five years. Possibly these short periods were not a bad thing. Engines and dynamos, like bicycles, became out of date. If they had not short periods they would have to put a certain sum on one side for a reserve. With short periods there was not the same reason for putting aside a reserve in addition to a sinking fund. If the ratepayers did not get an immediate profit they would do so later, when the loans were paid off, while other places would be still paying on them. He had great pleasure in seconding the vote of thanks.

Mr. E. J. SILLCOCK (King's Lynn) called the attention of the members to the extremely low cost of the work carried out by Mr. Cockrill. It was no doubt a very great advantage to have shingle material at hand for making concrete, but Mr. Cockrill had made the fullest use of those materials

with the result that Yarmouth had secured splendid works at an extremely low cost. At the beginning of the paper it was stated that the 5-ft. sewer cost 33s. per yard run and the 3-ft. sewer 20s. per yard run without digging. They could see well that the work had been done by administration, and that it had been done at an extremely cheap rate. He had previously had an opportunity of visiting the works, and had been much struck by the way in which Mr. Cockrill handled his materials. In connection with the foundations for the destructor, Mr. Cockrill had certainly shown great courage in building a chimney 200 ft. high on such a site, and he hoped that he would be completely successful. It was most interesting to see the way in which the cylinders were being sunk. He (the speaker) had had some experience of bad foundations. At Lynn they were not all on the solid rock—(Mr. MAWBEY, "Hear, hear")—as Mr. Mawbey could bear out. He would like to know if 2,300 tons represented the absolute dead weight of the chimney, or if allowance had been made for wind pressure. As wind pressure would increase the pressure on the base he would like to know if the 2,300 tons would include that. In connection with the isolation hospital they would see much to admire, and he quite endorsed what Mr. Mawbey said in regard to the tiles. They were capital things, and he (Mr. Sillcock) had himself used them. The hospital would be very much admired, especially when the cost was taken into consideration. With regard to the quantity of power from the destructor, Mr. Mawbey put the limit of the calorific value at 1 lb. of steam from 1 lb. of material. That was quite as high a result as had ever been obtained in practice, and quite as high as could be reckoned upon in going into the question of destructors. Those who talked about lighting towns from refuse destructors simply did not know anything of the subject.

Mr. HAYWARD (Sudbury) referred to the provision of sea water at 1½d. per 1,000 gallons and town water at 1s. per 1,000 gallons, and asked if sea water was conveyed to the town in the same way as other water. Having water carried 2 or 3 miles instead of 2 or 3 yards would seriously increase the cost. In his town they were able to get water from the service reservoir at 4½d. per 1,000 gallons.

Mr. BAKER (Middlesbrough) inquired as to the cost of labour per month for flushing sewers.

Mr. H. NETTLETON (Weston-super-Mare) asked if the sewers were self-cleansing, as flushing was not considered necessary in such a case unless for the purpose of cleansing the sides of the sewers.

The CHAIRMAN said there were one or two points to which he wished to refer. On page 3 of his paper Mr. Cockrill stated that he found that 3-in. and 4-in. pipes with delivery direct into the sewers will provide flush for 9-in. pipes, and that sewers up to 18-in. diameter could be kept clean with the larger sized valves. He would like to know the average head of discharge through these pipes. If there was a considerable head no doubt the flush would be sufficient, but not otherwise. Mr. Nettleton was perhaps under a misapprehension. The sewers were made self-cleansing by reason of the enormous amount of flushing done. The saving in roadway work by the use of sea water amounted to £500 per annum over a distance of 25 miles. He would like to know the exact way in which the saving was effected, whether it was due to the state in which the sea water kept the roads or to some other reason. In connection with the destructor it would be useful to know the cost of the chimney and also the length of the concrete blocks in the cylinder. The diameter of the cylinders and the thickness of the concrete blocks were given, but it would be useful also to know the length. Mr. Cockrill must have been extremely busy, and he complimented him on carrying out the work so well and so cheaply by administration. As to his paper, whatever he wrote was always practical and useful.

The vote of thanks was then unanimously awarded.

Mr. COCKRILL, in reply, said that with reference to waste heat he had for ten years been considering the question of destructors, and he had seen almost every destructor in the country and certainly the latest types. It was glad to observe Mr. Mawbey's reference to Cambridge, where the best that had yet been done in connection with destructors had been accomplished. They could not generate steam for electric lighting works, but if the company adopted a system of traways they would put in two boilers from which to generate steam for electric traction. In regard to the chimney it was quite true that he had thought of a steel chimney, but as the Local Government Board would only grant a loan for five years he had abandoned the idea. The dead weight of the chimney was about ½ tons per foot superficial, but the subsoil and gravel below would take 9 tons if not 11 tons per foot. There was then a good margin without giving the actual figures of wind pressure. Mr. Hayward had asked a question as to the distribution of sea water. The pipes were laid all over the town, but the hydrants were in such positions that the water-carts had a shorter distance to travel than in connection with the company's pipes. If the companies had reduced their charge to 6d. there would have

been no sea-water scheme, but they refused. In reply to Mr. Baker he might mention that labour was cheap in that town, but it was apt to be inefficient. In reply to Mr. Nettleton he had to explain that the sewers were self-cleansing with the aid of the flushing. Mr. Enys had raised the question of the head of water discharged, which was from 20 to 30 ft. The advantage of using sea water on the roads was that it served to keep them moist and well together, but otherwise there was very little difference between sea water and that of the company. There was a saving of 30 per cent. in the cost of maintenance, and 1½d. per 1,000 gallons covered all charges, including those of capital and interest, the total inclusive annual cost since the extensions being about £600. Mr. Enys had inquired if the length of the cylinders used in the destructor foundations was about 2½ ft. They would be built of rings of concrete and then filled up with concrete inside.

In the unavoidable absence of the author, through a business engagement, the following paper was then read by Mr. A. H. Prece.

ON THE ABUSE OF POWER-HOUSES.

By W. H. PRECEE, C.E., F.R.S.,
President of the Institution of Civil Engineers.

[Mr. William Henry Precee, C.E., F.R.S., engineer-in-chief to the General Post Office, was born in Wales in 1841. He was educated at King's College, London, and in 1862 entered the office of the late Mr. Edwin Clark, M.E.C.E. The following year he secured an appointment under the Electric and International Telegraph Company, and in 1856 was appointed superintendent of that company's southern district. In 1860 he joined the staff of the London and South-Western Railway Company, and also acted as engineer in the Channel Islands Telegraph Company. In 1870 he was appointed divisional engineer to the General Post Office, and in 1877 electrician, whilst in 1892 he was promoted to his present position. Mr. Precee is the president of the Institution of Civil Engineers, and joint author with Mr. (now Sir James) Sivewright of a "Text-Book of Telegraphy," with Dr. Maier of "The Telephone," and with Mr. Stubbs of a "Manual of Telephony."]

There is a great tendency in the present day to multiply power-houses—or central stations, as they are more frequently called—unnecessarily. This arises from various causes.

1. From want of foresight in predicating the growth of electric industries.
2. Economy in selecting land we have rather than pay money for land more suitable by position, but which we have not.
3. The restriction of legislation in confining operations to a defined area.
4. The growth of other industries side by side, especially tramways and railways, worked by electric traction.

These causes have led to the original power-houses being designed too small and on space too confined, and to the subsequent construction of other power-houses, farther afield and more extended; and even to the necessity of going to positions outside the original area secured by provisional order.

But worse than this, different industries have been promoted by rival and opposing interests. Trade competition and patent rights have led to the construction of power-houses side by side, until we see the absurdity of one installation being worked at night to supply energy for electric light, and another installation generating energy during the day for traction purposes being built practically on the same site; whereas not only can the power be generated conveniently and economically by the same plant, but the two energies can mutually assist each other, so as to reduce considerably the work cost per unit generated. This is what the author means by the abuse of power-houses. The man who causes two kinds of grass to grow where one only grew before is called a benefactor, but the local authority which deliberately allows two power-houses to be built where only one is needed is a disturber of the peace.

It is very well affirmed by experience that the greater the plant, and the larger and more continuous the output, the cheaper is the cost of generation per unit. It may be said, roughly, that if a given plant, say 10,000 kilowatts, working at its maximum load, on the average three hours a day, produces electrical energy at 1d. a unit, it will do so at ½d. per unit if it works six hours a day, ¼d. per unit if it works twelve hours per day, and less than ¼d. per unit if it works twenty-four hours the day. Hence, concentration of power is distinctly financially desirable if it has the effect of lengthening the daily maximum output of the plant. One large station, conveniently built on the waterside, where coal can be delivered alongside, by rail or sea, at its cheapest; where water is abundant and available for condensing; where ashes, clinkers and dirt are easily barged away; where we have one control and one staff, is clearly the ideal power-house for economy. And it puts a stop to any cause of nuisance. The cartage of coal and rubbish does not impede traffic. Vapour clouds do not offend the eye, and apparent rain, in the form of condensed drops of water, does not damage one's garment or need the raising of umbrellas; vibration, noise and smells cease to be causes of vexation and litigation; additional chimneys do not disfigure the view. The question of securing a site is very much simplified. Hence comfort and convenience attest the value of the concentration of power plant in one locality.

In these days of high electrical pressure, whether continuous or alternating, the position of the power-house is not a matter of serious import. In the early days of the new electrical industry it was a question of economy of distribution to place the working plant in the centre of the area to be served,

but now it is of little consequence where it is placed, within a limit of a few miles. The difficulty is a legal one, but even this has been considerably retrieved by the action of the recent joint committee of the Lords and Commons, who recommend that compulsory powers for purchase and for wayleaves for mains shall be allowed to those who find it necessary for public purposes to establish their power-house outside their own area of supply.

The whole tendency of recent legislation has been to favour local authorities, and to facilitate their acquisition or induce their acceptance of those municipal duties which include the conduct of industries which affect the whole community, like the supply of water, of light and of general locomotion. The success of the electric light industry in the hands of local authorities is beyond dispute, and some of our larger cities are now taking up vigorously and with great spirit the working of their tramways by electric traction. The ultimate success must be the same. These corporations, with their provisional orders and their electric light installations, have already the legal powers and the means to supply electrical energy. This is their right, and a valuable property it is to them. No one contests their right to do it, but there are corporations who have not yet acquired the working of the trams in their localities, but who have the right and the means to supply energy, and in these cases the right to supply energy to tramways is contested. If it were to succeed, and the tramway companies allowed in all cases to build and work their own power-houses, we should see the absurdity of two buildings existing where only one was needed, of two causes of nuisance perpetuated where none need exist, where the public would suffer from higher fares and the undertakers voluntarily accept the responsibility of generating their energy at a needless cost.

The supply of energy to work the tramways would enable the undertakers to reduce the price per unit to the electric light users by probably 1d., while they could at the same time supply the tramway company, if such exist, as cheaply as the company can make it themselves. Moreover, when the time arrives for the local authority to take over the tramways they would not be saddled with two power-houses.

There are other advantages in combining an electric light and a tramway plant. There is but one question of site, and but one management. There is only one set of boilers and one steam-pipe system, for the loss of energy by radiation from steam pipes is very large, and therefore of some consequence. There is, moreover, less reserve plant needed.

The author thinks this abuse of power-houses is a subject that well deserves the serious consideration of the Association of Municipal and County Engineers.

On concluding the reading of the paper Mr. Precee proceeded to draw attention to a few points in connection with the Yarmouth electric light installation, especially in regard to the financial results.

DISCUSSION.

Mr. MAWBEY said that he agreed that it would be unwise to allow any company to put down electric power stations for traction purposes in any town where a corporation had already a convenient central station for lighting, and that it was better for a corporation to undertake the working themselves, although it might not be in connection with lighting. With regard to the question of one station only, he had been advising a committee of the Leicester Corporation to utilise for electric traction the waste heat from several destructors, which, to save carting, had been erected in different districts, and it appeared to him that there could be no objection to using these destructors as power stations for that purpose. In supplying neighbouring manufactories from a destructor there was a considerable loss of power in transmission, consequently the horse-power generated at a destructor was of less value than the horse-power generated by the manufacturer himself at the place where it was to be used; but the power for electric traction must be transmitted under any system, therefore the power generated at the destructor would be of equal value for the work to be done to that produced by coal or any fuel at any other station. He would like to ask Mr. Precee if, provided there was one central distributing power station at one destructor or other place, he thought there was any objection to utilising other destructors in different districts, situated near the main tram lines, as supplementary power stations for electric traction by putting down simply an engine and dynamo at each place and supplying electric current into the cables at the nearest points, much in the same way as pumping water into a system of town mains at pumping stations in different parts of the town.

Mr. LOWLEY seconded the vote of thanks to Mr. Precee. He said the subject was one to which he had given a great deal of attention. He quite agreed with Mr. Precee that no authority having both traction and electric lighting should have more than one power station, excepting, of course, in very large cities. At Hanley they had first gone in for electric lighting and traction came later, the lines running through several towns. Every attempt to supply the tramways with current was met with opposition. Jealousy was aroused in the adjoining towns, and the idea had to be dropped. Since then they had another tramway company, and the corporation had been asked on what terms they would supply power, but the company would only pay a very small price,

He should like to have got 3d., as at Dover. He knew of no instance of the same engine supplying both light and tramways from the same mains at the same time. He had had opportunities of seeing combined arrangements in operation in other towns. The saving consisted in the buildings, chimney and boilers. At Dover they had separate generating plants entirely. Also at Havre, where the electric light company supplied the traction company with energy by meter. The advantage came in with respect to buildings, boilers, chimney-stack, stores of all kinds, and staff of electricians and workmen. There was also some advantage in respect to the reserve of engine power necessary, but in the above places this was not the case, as the lighting was from alternators.

The CHAIRMAN said he quite agreed that there was a considerable waste of economy and energy in the construction of separate buildings for distribution and power. He had in his mind the case of a company which had been formed to supply energy for traction, industrial and electric lighting purposes, and there was no reason why various companies should not have energy from one central company or corporation rather than generate it themselves. In the case he had referred to the company were prepared to supply energy at 1d. per unit to local authorities and companies who could not generate it for themselves at the same rate.

A vote of thanks was then unanimously awarded, and

Mr. PREECE, in briefly acknowledging, said he saw no objection to dust destructor stations in various parts of a town. They wanted to utilise waste steam. The paper did not necessarily apply to towns with over 60,000 or 80,000 inhabitants. Stations of 4,000 or 5,000 horse-power had been found by engineers to be the maximum. When it came to 8,000 or 10,000 they might just as well build two stations. There was no reason why the same plant should not be utilised one day for one object and another day for another object. The question of separate engines was not of great importance. The economy in combining lighting and power stations was in the building, the boilers and the use of one staff. Separate cables were necessary.

VISITS TO WORKS.

When the discussion of Mr. Preece's paper had concluded the members left the town hall about 3 p.m., and proceeded in brakes to visit the various works referred to in the paper. These included the foundations for the destructor and chimney, the isolation hospital, which is being considerably extended, the recreation grounds, the beach gardens, the sea-water pumping stations, the electric lighting station, the new concrete quay wall at the fish wharf and the sewage pumping station. Special attention was given to the sinking of the cylinders to form the foundations of the destructor and the chimney and to the isolation hospital, where the tiles to which Mr. Mawbey had drawn attention were examined with much interest. The time, however, which could be devoted to the examination of the works was limited, as many of the party wished to return to their respective destinations the same evening, though not a few remained overnight. There was only one opinion in regard to the double meeting at Norwich and Yarmouth, and that was that it had been an unqualified success.

We have received from Mr. W. Bond, of 53 London-street, Norwich, a photograph of the group of municipal engineers taken at the recent meeting in that city. The portraits are excellent, and every detail comes out with remarkable clearness. The size of the photograph, copies of which can be obtained from Mr. Bond, is 11 in. by 9 in.

ARBITRATIONS AND AWARDS.

In the Sheriff's Court, on Friday, Mr. West claimed from the London County Council a sum of £13,000 in respect of the compulsory purchase of a site fronting on Royal Mint-street, under the Tower bridge approach improvement scheme. In support of his claim, Sir Robert Reid called expert evidence to prove that land in the neighbourhood was worth £3 per foot. Mr. Edward Tewson, who, in 1881, sold the property under the hammer to Mr. West, estimated its value at £2 per foot, and the whole site at £12,862. Alderman Sir Whittaker Ellis, Bart., placed the total value at £13,666. It was not fair, he said, to compare the price of land now in any part of London with its value at the beginning of the eighties. Land in London had appreciated in value by reason of the increased commercial power of gold, and, further, by the extraordinary developments that had been made commercially in the metropolis. He could recollect when he sold a site for £30,000 in Cornhill. That was a few years ago, comparatively. Now half of that site had been sold for £150,000. For the council expert evidence was called, which set out the value at a lower rate. The jury awarded £11,026.

At the Newington Sessions House, Mr. Loveland-Loveland and a special jury recently had before them the case of Marshall v. Wandsworth District Board of Works. This was a claim for compensation in respect of the acquirement of the leasehold premises, 151 Upper Richmond-road, Putney, occupied by the claimant, Mr. H. L. Marshall, job master, for the purposes of street improvements. The premises in question are held for an unexpired term of forty-five years. The

carrying-out of the improvement scheme would necessitate the reconstruction of the claimant's premises, by which he would be deprived of certain accommodation. An adjoining shop, let by the claimant at 7s. per week, would be completely abolished, whilst the whole of the job master's premises would, it was alleged, be depreciated in value to a considerable extent through the loss of washing space, &c. Mr. Percy Henry Clarke, F.S.I., submitted plans, and estimated the reduction in value of the premises as a whole at £1,493; and other witnesses for the claimant were Mr. Daniel Watney, estimated loss £1,351; Mr. Samuel Walker, £1,392; and Mr. A. W. Taylor, £1,482. For the Wandsworth District Board of Works it was contended that the claim was exaggerated, and the witnesses called included Mr. Alex. R. Stenning, who estimated the fair amount of compensation at £623; Mr. W. Bennett Rogers, £638 4s.; Mr. G. H. Brougham Glasier, £634 13s. 6d.; and Mr. J. C. Radford, surveyor to the district board of works, £621. The jury awarded £1,200.

Mr. Trontbeck and a special jury, at the Guildhall, Westminster, recently heard the case of J. W. Downing v. London County Council, to determine the amount of compensation to be paid by the London County Council in respect of the leasehold interest in the premises, Nos. 1 and 3 Vincent-street, Finsbury, which are required for the Millbank Penitentiary site for working-class dwellings. Sir William Marriott, Q.C., and Mr. Lewis Coward were counsel for the claimant; and Mr. E. Morten and Mr. C. C. Fooks appeared on behalf of the county council. The jury, having viewed the premises, which were held on lease for an unexpired term of eleven years from June, 1898, at a ground rent of £10 per annum, Mr. B. I. Breach and Mr. E. F. B. Fuller gave evidence in support of the claim. Mr. Breach said he valued the property at £378. Mr. Fuller said both houses were in good repair and had modern drainage. Their productive power was 13s. per week. His valuation was £352. Sir William Marriott urged that, in addition to the value of the property, the value of the fixtures, £20, must also be given. On behalf of the council Mr. Glasier and Mr. Herbert Paber valued the property at £266 and £239 respectively. Mr. W. E. Horne also gave evidence, his figures amounting to £243. Ultimately the jury returned a verdict, including 10 per cent. for compulsory sale and the value of the fixtures, for £375. The offer under seal was for £300.

WAKEFIELD ELECTRICITY WORKS.

OPENING CEREMONY.

These new buildings, which have been erected by the Wakefield Corporation at Calder Vale, were formally opened on the 15th ult. They comprise boiler-house, engine-house, testing-room, workshop, stores and offices. The boiler-house contains two large Lancashire boilers built by Messrs. Sparr Inman, of Wakefield, each capable of evaporating 7,000 lb. of water per hour at 125 lb. pressure. They are fitted with mechanical stokers. In the engine-house there have been erected two slow-speed steam alternators made by Messrs. John Fowler & Co., of Leeds, each of 130 kilowatts maximum capacity, while a further set of plant of this size is now in the maker's shops and will be erected in due course. The engines are of the horizontal compound type, with the alternator built up on the fly-wheel. For the day-load business a small set of high-speed plant has been provided. By the aid of this plant the larger plant can be shut down during the period when the demand for electricity is small. This plant has been running since September in last year. All the switching apparatus has been fixed in a switch gallery in the engine-house, the main board being designed on the Lowrie Hall system of plug switches. The switchboard is divided into three parts, the centre portion dealing with the synchronising instruments, the left-hand portion with distributing circuits and the right-hand with the alternators. The distribution of electrical energy to all parts of the city is effected from one central point at the top of Westgate, where a large underground chamber has been built. Three high-pressure trunk mains connect this chamber with the generating works, and are here connected to the three large transformers which reduce the pressure from 2,000 to 200 volts for distribution to the surrounding streets. Branch high-tension mains are also taken from this substation to a few outlying transformers. The county buildings have already been dealt with in this way, and it is proposed to adopt a similar method for the St. John's district. The mains throughout, for both high and low pressure, are of the concentric pattern, with paper insulation between the conductors. The high-pressure mains are everywhere drawn into stoneware culverts, but the low-pressure are armored with steel tapes and laid directly in the ground. Spare ways have been provided in the culverts to permit of the drawing in of additional high-pressure mains in the future without disturbing the surface of the pavements.

Milksham.—The district council have accepted the tender of Messrs. C. Cook & Sons, Milksham, amounting to £46, for the construction of a footpath at Sandridge-lane.

Parliamentary Memoranda.

On Thursday, in the House of Lords, the Gainsborough Gas Bill and the Rhyemay and Aber Valleys Gas and Water Bill were ordered for second reading, while the Rochdale Corporation Bill and the Thanet Gas Bill (Amendments) were read a third time and passed. The Locomotives on Highways Bill was also, after a short discussion, read a second time.

In the House of Commons the Blackburn Corporation (Tramways) Bill and the Middlesex County Council Bill were read a third time and passed. The Felxestow and Walton Water Bill, the Filey Water and Gas Bill and the Newton Water Bill were read a second time and committed.

In the House of Lords, on Friday, the Matlock Urban District Council Bill was read a second time. The Todmorden Corporation Water Bill, Portsmouth Corporation Tramways Bill, Ilford Improvement Bill and the Carmarthen Improvement Bill were read a third time and passed.

In the House of Commons the following Bills were read a third time and passed: Higham and Hundred of Ito Water Bill, Malden Water Bill, Mid-Kent Water Bill, Wey Valley Water Bill, Bolton, Tinton and Westhoughton Extension Bill, Liverpool Corporation Bill and the Sheffield Corporation Bill.

In the House of Lords on Monday the following Bills were read a second time: The Coventry Corporation (Gas Bill, Plymouth Corporation Bill, Bristol Tramways (Electrical Power, &c.) Bill, Bristol Tramways (Extensions) Bill, Middlesbrough Corporation (Gas) Bill, Drogheda Gas Bill and the Norwich Electric Tramways Bill. The Forcs Water Bill, Kew Bridge and Approaches Bill and Staines Reservoirs Joint Committee Bill were read a third time. The Rochdale Corporation Water Bill was also, after a brief discussion, read a third time and passed, while the Metropolitan Management Acts Amendment (By-Laws) Bill passed through committee. The Floods Prevention Bill was read a third time and passed.

In the House of Commons the London County Council (General Powers) Bill, the Market Harborough Gas Bill, the Leyton Urban District Council and the London United Tramways Bill were read a third time and passed. The Blackpool and Fleetwood Tramroad (Tramways Extensions) Bill was ordered for a third reading, and the Hamilton Water Bill and the Kettering Water Bill were ordered for a third reading. The Bury Corporation Bill and the Carlisle Corporation Water Bill were read a second time and committed.

The London Water Companies.—The President of the Local Government Board, in reply to a question as to whether he intended to introduce early next season a Bill to ensure the supply by water companies of pure and wholesome water, and otherwise safeguard the interests of water consumers and, if so, whether the Bill would apply to all existing companies, said he was not in a position to make any statement as to the legislation the Government might propose next session or as to the scope and extent of the Bills they might introduce.

On Tuesday, in the House of Lords, the following Bills were read a second time: Blackburn Corporation (Tramways, &c.), Middlesex County Council, Windsor Dock (Cardiff), Higham and Hundred of Ito Water, Bolton, Tinton, and Westhoughton Extension, Liverpool Corporation, Sheffield Corporation, Mid-Kent Water, Wey Valley Water, Malden Water, Burnley Corporation (Tramways, &c.), Cromer Gas, Glasgow Corporation (Sewage, &c.), Clacton-on-Sea Gas and Water, Leyton Urban District Council, and the London United Tramways Bills. The Heywood Corporation Water Bill and the Newcastle and Gateshead Water Bill were read a third time.

In the House of Commons, the Newhaven Harbour Bill was ordered for second reading. The Lords' amendments to the Nottingham Corporation Bill were considered and agreed to.

In the House of Commons, on Wednesday, the Thanet Gas Bill was considered, and the Belfast Harbour Bill, the Blackpool Improvement Bill, and the Sheringham Gas and Water Bill were ordered for third reading.

PRIVATE BILLS IN COMMITTEE.

Great Northern Railway Company and the London County Council and Islington Vestry.—A House of Lords committee, presided over by Lord Henage, passed on the 21st ult., the Bill promoted by the Great Northern Railway Company, which provides for the exceptionally large issue of £3,333,333 new capital and the construction of nearly 60 miles of new line, including widenings and duplications. This enormous outlay is rendered necessary by the altered conditions under which the system will have to be worked to meet the competition of the Great Central when the London extension of the old M.S. & L. Railway is completed. It is unnecessary to particularise the various projects embraced in this omnibus Bill, for only two parts of it were opposed—the construction of a couple of bridges over the river Ouse in Northamptonshire, which was contested by the River Ouse Navigation Commissioners, and new railways at Finsbury Park, which were objected to by the London County Council, because they meant the appropriation of 23 perches of the park, and by the Vestry of Islington, because they involved the construction of an additional bridge over a thoroughly crowded with traffic. The case presented by the Ouse Navigation was soon disposed of. The committee took little time to decide that the company's proposal should be allowed to

stand. The London County Council agreed that the widening of the line at Finsbury Park was necessary, but contended that no part of the park should be taken unless there was urgent public necessity, and if any part were acquired the compensation should take the form of an equivalent area of ground, and should not be a money recompense, as provided by the Lands Clauses Act. Sir Henry Oakley, the late general manager of the railway, spoke of the congested state of the line there, stating that 850 trains passed through Finsbury Park station every day, and at busy times as many as fifty-four an hour. These were through trains which did not stop at the station. It was highly necessary that the company should increase the accommodation, and to do that they must acquire a small part of the park. There were no buildings there, and if he could take the land at night no one would miss it in the morning. The chairman, after a careful scrutiny of the plans, pointed out that the railway company had to the east a piece of land slutting on the park which they might give up in exchange. Mr. Balfour Browne, q.c., one of the counsel for the promoters, admitted that by building a retaining wall they could give up a sufficient portion of the ground; and Mr. Freeman, q.c., for the county council, accepted this proposal on the understanding that the company would plant and lay out the piece of ground so given in exchange. The committee were not favourably impressed by the representations of the Islington Vestry with regard to the bridge, so with the proviso indicated the Bill was allowed to proceed, and it was afterwards reported to the House with amendments.

West Ham Corporation Bill.—The Select Committee of the House of Commons on Police and Sanitary Regulations, under the presidency of Sir Stafford Northcote, took up on the 21st ult., the Bill promoted by the Corporation of West Ham, in which powers were sought to acquire and work the tramways within the borough, to execute works and acquire lands, to carry out street and building improvements, to obtain a reversion of powers of the Lea Conservancy with respect to certain backwaters in the town, to enlarge the hospital and work-house accommodation, &c. The Bill was opposed by the Corporation of London, the Essex County Council and the River Lea Conservancy. It appeared with respect to the tramways which were owned by the North Metropolitan Tramways Company that the date at which the council might purchase them, in accordance with the provisions of the Tramways Act of 1870, was the 10th of August of the present year, and as they had decided to purchase them it was necessary that they should come to Parliament for powers to work them and to introduce electric power. The council proposed to provide more efficient hospital accommodation for infectious diseases and to acquire further land for the purpose of a small-pox hospital. It was also deemed expedient to make additions to the workhouse at Leytonstone and the auxiliary workhouse in the parish of Leyton. With respect to the backwaters of the river Lea the council asked for authority to scour these streams, and to do so it was necessary to obtain permissive powers, because the jurisdiction really lay with the Lea Conservancy, who, for want of funds, probably, had failed in their duty in this respect. The backwaters in question were Waterworks river, Three Mills river, Back river, Three Mills Back river, Three Mills Wall river, Midge dock, Bow creek, Bow Back river, Abbey creek and a portion of the river Lea known as the River Lea Old river, and the outfall sewer. To enable them to carry out the various works they had in contemplation the corporation proposed to raise £250,000 in respect of the borough lunatic asylum at Chadwell Heath, £42,000 for town hall extensions, £105,000 for the hospital at Plaistow, £31,500 for the Dagenham hospital, £24,000 for street improvements and £27,000 for a recreation ground. The population of West Ham had grown, it was stated, from 11,580 in 1831 to 274,000 last year, the borough was a perfect hive of industry, and its financial condition was most satisfactory, the price of its stocks standing very high indeed in the market. The opposition of the Corporation of London which related to the proposed acquisition of a portion of West Ham Park was first taken up. This park was situated in the Corporation of London as trustees for the inhabitants, and the part that the West Ham Council required for the purpose of their street improvements was a wedge-shaped strip, 465 yards in length at one end and running down to nothing. The council proposed that any purchase money that might be paid by them to the Corporation of London should be expended by the corporation in the purchase of other lands in West Ham. The corporation in the first place opposed the acquisition as not being urgently necessary, and submitted that if Parliament sanctioned the purchase they (the Corporation of London) should be allowed to spend the money where they chose. After hearing formal evidence the committee, at the suggestion of Mr. Liddler, the leading counsel for the corporation, went out in the afternoon to view the locality in question, and consequently did not proceed further with the Bill that day. After inspecting the portion of the park which the corporation proposed to appropriate for the widening of the road named the Portway, and hearing evidence as to the position taken up by the Corporation of London in the matter,

the committee decided to allow the clauses relating to the acquisition to stand with a few minor amendments. The clauses relating to the acquisition of the tramways, and to the proposed borrowing powers for the buildings and improvements already indicated were approved, with modifications, to meet the views of the Local Government Board. The clauses providing for the devolution of certain powers from the River Lea Conservancy were struck out, the committee being of opinion that as regards the backwaters the Corporation of West Ham had, under the Drainage Act and under the authority transferred to them from the Dagenham Commissioners of Sewers, sufficient powers to cleanse the streams and prevent them from becoming a nuisance.

Local Authorities and the Windsor Dock Bill.—The Corporation of Cardiff and a number of local authorities have been greatly interested in the Windsor Dock Bill, which, after an inquiry which has lasted six weeks, was passed by a House of Commons committee, presided over by Mr. James Stewart, on Wednesday week. The Bill, which had the sympathy and support of the Cardiff Corporation, was the third attempt that had been made by the promoters to obtain powers to construct a new and commodious dock near the existing docks of the Taff Vale Railway Company at Penarth, Cardiff. Although not directly promoted by the Taff Vale, the Bill was advanced in the interest of that company, by whom the dock will be worked, and it was named after the chairman of that company, Lord Windsor, who was its chief supporter. It had to face most formidable opposition from the Cardiff Railway Company, formerly known as the Butte Docks Company, backed by the Marquis of Bute, the Barry Railway Company and various trading interests in South Wales. When the promoters first went to Parliament in 1896 the Bill was rejected owing to engineering difficulties and to the fact that such a large proportion of the mudlands was taken up. When they went to Parliament again in 1897 the evidence as to the necessity for the dock was stopped and the witnesses were sent away, and then the committee declared that they were not satisfied on the point and rejected the Bill. In the 1896 Bill it was proposed to take 112 acres of mudlands, in 1897 77 acres, but by the present Bill it was not proposed to acquire more than 17 acres. The part of the harbour which it was proposed to take up was the most shallow and was of little use for the anchoring of even small craft. The land required was mainly the property of Lord Windsor and the Taff Vale Company, but 63 acres of it was pasture land belonging to Lord Bute. The dock itself was to be 4½ acres in extent, with a lock 1,000 ft. long and 100 ft. wide—of such size and depth, in fact, as to accommodate the largest vessels afloat or likely to be built. About seventy witnesses altogether were examined in support of the Bill, and scores of pages of statistics were produced to show the enormous increase in the coal shipments from Cardiff, Penarth and Barry in recent years. The increase at the Butte docks since 1890 had been 11 per cent., at Barry 87 per cent. and at Penarth 93 per cent. All the docks were working at their full capacity now, and even after the extensions of the Butte and the Barry, which had been authorised by Parliament, were carried out there would, if the same rates of increase were continued, be 1,250,000 tons of coal brought annually to port seven years hence, or by the time which it would take to build the new dock, which could not be dealt with by the then existing accommodation. The new project, which was presented in a singularly complete form, had been devised by Sir Alexander Rendell, Sir Benjamin Baker and Mr. Sibbering, the engineer to the Taff Vale company. The committee were greatly aided in their deliberations by a beautifully-constructed model of the harbour, occupying on the table of the committee-room about 6 ft. square, which had been prepared in the Taff Vale offices under Mr. Sibbering's direction. The opposition to the scheme was concentrated on three points—(1) there was no necessity whatever for a fresh port at the dock of Cardiff; (2) that even if there were the Taff Vale company should not be allowed to make it, not even directly, still less indirectly, as was proposed; (3) that if the time should come when further extensions, beyond those already authorised, should become necessary not only would the extensions be made at Cardiff and Barry with greater propriety, but they could be done for a great deal less than half the money which the Windsor dock would cost. The outlay proposed on the new dock was £1,500,000, and Mr. John Aird, M.P., stated that his firm were prepared to carry out the work at that price. The committee in passing the Bill directed that clauses should be inserted giving the Cardiff Railway Company power to run their trains from the Glamorganshire collieries to the new dock.

Leyton Urban District Council Bill.—The House of Commons Committee on Police and Sanitary Regulations have concluded a lengthy inquiry into the Bill promoted by the Urban District Council of Leyton, in which they sought powers to work the tramways in their district for the time being owned by the North Metropolitan Tramways Company and the Lea Bridge, Leyton and Walthamstow Tramways Company, to transfer certain sewers from the Dagenham Commissioners of Sewers to the district council, and to carry out certain street and sanitary improvements. The counsel for the promoters were Mr. Bagshall, Q.C., Mr. Gerald Fitzgerald and Mr. Hutchinson; and the Dagenham Commissioners of Sewers, who opposed the transfer of the sewers, were represented by Mr. J. D. Fitzgerald, Q.C. From the facts laid before the committee it appeared that the gross

rateable value of Leyton was £293,000; that the area of the district, which is situate immediately north of the borough of West Ham and separated from London by the river Lea, was 2,491 acres, and that the estimated population was 90,000. It was the largest urban district of the metropolis which had not yet been converted into a borough. It contained 15,300 houses, showing an average yearly increase since 1880 of 780. The public debt of the district was £190,000 and the general district rate was 3s. 4d. in the £1. There were 53 miles of streets dedicated to the public, 10 miles of which were accounted main roads. There were two systems of tramways running through the district, one belonging to the North Metropolitan Company, entering on the West Ham side and running through the northern part and the other near the East London waterworks, going over Lea bridge and running through the north-easterly part. As far as the North Metropolitan Company's tramways were concerned, the local authority had power to acquire part of them in August of the present year and the remainder in 1901; but, as regards the Lea Bridge Company's tramways, the period did not expire until 1902 and 1910. The council had already passed the resolutions necessary under the Tramways Act to enable them to acquire the undertakings. The powers sought by the council to work the tramways were not opposed, but the provisions relating to the transfer of the sewers were strongly opposed by the Dagenham Commissioners. They were identical with the clauses effecting a similar object which were inserted in the West Ham Act of 1888, which was warmly contested between the corporation and the Dagenham commissioners. The sewers under the jurisdiction of the commissioners were not, it may be well to explain, sewers in the ordinary acceptance of the term, dealing with the drainage of factories and so forth, but upon ditches and cuts used chiefly for the purpose of carrying off surplus land waters and providing in certain cases for irrigation. The commissioners had jurisdiction over such sewers for the levels of Havering, Dagenham, Ripple Barking, East Ham, West Ham, Leyton, Walthamstow, Bromley and East Marsh, but the body was popularly known as the Dagenham Commissioners. The sewers in the Leyton district were two in number, but it was one called the Leyton Level brook with which the local authority were chiefly concerned. The district council under the Public Health and Sanitary Acts had jurisdiction over the sewages and drainage within the district, but they did not manage these sewers, which were in such a state as to be a serious danger to public health, causing much suffering, the form of illness engendered by them being ulcerated throats and so forth. It was not alleged that the commissioners were personally responsible for this; it was the result of the system, and the only remedy was the transfer of these powers to the local authority, such as had been effected in the case of West Ham. The nuisance which had been going on had been the subject of litigation for more than twenty years. The commissioners who opposed the transfer, simply because they had a public duty to perform, obtained their authority under the following Acts: 23rd Henry VIII.; 3rd and 4th Edward VI., cap. 18; 13th Elizabeth, caps. 3 and 4; 1st William IV., cap. 22; 4th and 6th Vic., cap. 45; and 13th and 14th Vic., cap. 50. Their functions were to take charge of certain areas which were liable to be flooded either from sea or land, to deal with flooded districts and to tax the people for their own good. The commissioners might be proper persons to exercise powers in an agricultural district where there were low-lying marsh lands, but they ought not to have charge of sewers in a thickly-populated urban district such as Leyton. Under their control the Leyton brook had fallen into a dreadful state, the worst feature being that it was receiving the sewage effluent of a population of between 60,000 and 70,000 persons discharged into it from Walthamstow sewage works. Mr. Justice Chitty in the Court of Chancery, when he granted an injunction to Leyton against Walthamstow, found that the sewage effluent amounted to one-third of 2,000,000 gallons per day, and that it was such as to cause an intolerable nuisance. Evidences on these points was being given when the committee rose on Wednesday afternoon. Mr. William Dawson, surveyor to the Leyton District Council, stated that if the Bill passed the local authority would stop the nuisance, because they would at once remove the polluted matter and prevent it becoming a danger to the health of the public. Mr. W. W. Fairhead, an occupier of land adjoining the Leyton Level brook, stated that just before Christmas he went with his son and Dr. King Barry to inspect the brook, and saw the sewage matter from the Walthamstow farm flowing into the stream. Sister Murphy, lady superior of the St. Agnes Orphanage, Leyton, and Doctors A. F. Peskett and A. B. Bateley (the latter medical officer of health for the Leyton district) described the brook as very offensive and prejudicial to the health of persons living in the neighbourhood; sore throats, diarrhoea and even infectious diseases arising from it. Mr. W. C. Young, consulting chemist and analyst to the Lea Conservancy, who has had long experience in connection with the analyses of the water of sewage effluents, spoke as to repeated examinations which he had made of Leyton brook, which was in an excessively foul condition on account of the pollution by sewage matter which had not been subjected to any treatment to render it innocuous. It present disgraceful condition was due to the growth of foul vegetation, commonly called sewage fungus, which developed into sewage matter. This

fungus in forty-eight hours might be fully developed, and it soon became decomposed and putrid. Mr. Lewis Angell, borough engineer of West Ham, stated that the result of the transfer of the jurisdiction of the Dagenham Commissioners of Sewers to the Corporation of West Ham had been most beneficial in that district. Things were going exceedingly smooth now. The West Ham Corporation had been able to mitigate the evil by carrying out diversions of the stream. Mr. C. G. Masgraves, a member of the district council of Leyton and of the Essex County Council, deplored the condition of the brook, and stated that the Dagenham Commissioners never did anything unless pressure was brought upon them. In his view the sanitary authority ought to have control over all the watercourses in the district. Nobody knew anything of the Dagenham Commissioners in Leyton; most of the people had never even heard of them. Why the commissioners should struggle to maintain their jurisdiction passed his comprehension. The fault for the existing state of things largely lay with the Walthamstow local authority for having laid out a sewage farm which was unsuitable to metropolitan conditions. They had tried to move the Local Government Board and the London County Council in the matter, but without success. At the close of the case for the promoters the committee consulted in private, and upon the public being readmitted the chairman announced that the majority had come to the conclusion that they were not prepared to transfer the jurisdiction of the commissioners to the Leyton District Council, and that part of the Bill would consequently be struck out. The clauses relating to the tramways were passed with certain modifications, and the remainder of the Bill was allowed to proceed with some slight amendments.

Renfrew Borough and Harbour Extension Bill.—A Select Committee of the House of Commons, presided over by Mr. Baldwin, has had under consideration for some days the Bill promoted by the Town Council of Renfrew for the extension of the limits of the burgh and the improvement of the harbour. The Bill was opposed by the Greenock Harbour Trust, the Clyde Navigation Trustees, the Corporation of Glasgow and the County Council of Renfrew. The Glasgow and South-Western Railway Company and the Glasgow and Renfrew District Railway Company had petitioned against the Bill, but no counsel appeared in support of their petitions. The inquiry is likely to prove a long one, for the promoters have in attendance a great number of witnesses interested in shipping and the coal, iron and steel industries of the Clyde, not merely from the Clyde, but from ports like Belfast, Cardiff, Hartlepool and Newcastle. The committee intimated that in accordance with the suggestion of Mr. Peuber, Q.C., the leading counsel for the promoters, they would hear the case for the extension of the borough limits first, but before coming to a decision they would have the facts relating to both objects before them. Renfrew, it appeared, was a very old burgh, and much of its area was rebuilt upon, but in recent years it had witnessed a very remarkable development. The neighbouring town on the Clyde had all developed towards the riverside, but Renfrew was at present debarr'd from development in that way by the limited extent of its river frontage, which was not more than about three-quarters of a mile. By the Bill it was proposed to incorporate the estate of Elderslie, belonging to Mr. Spiers, and thus to extend both the burgh and river frontage. By the passing of the Glasgow and Renfrew and District Bill of last year, the district would be most materially benefited. The Clyde Trustees, who were opposing the Bill, had purchased land in the district for the erection of wharves in connection with the timber trade. That only made it the more clear that the municipality ought, as a matter of precaution, to lay their hands on the territory over which the population would spread. Mr. Spiers was the owner of the whole of the riverside property proposed to be included in the burgh with the exception of a small piece of land 10 or 12 acres in extent in the possession of the Clyde Trust, which had been bought by the Corporation of Glasgow for the purpose of their sewage works. The Elderslie estate consisted of some 345 acres, more or less equally divided between the county of Renfrew and the county of Lanark; and Mr. Spiers, recognising the strength of the case for the Bill, consented to the inclusion of the estate within the burgh. The representatives of the county of Lanark had very fairly taken from the promoters a certain amount of money compensation in respect of their rights to them, but the county of Renfrew had dissented from such a settlement. The strongest opposition to the Bill came from the Clyde Navigation Trustees, who contended that there was no reason for either one part or the other of its provisions. They were hostile to the increase of the rateable value of the burgh by the incorporation of property belonging to them. Parliament, it was argued, had always recognised the great work done by the Clyde Navigation Trustees, and had steadily refused to allow that work to be hampered by the introduction of any other authority in the river. The trustees had made the Clyde what it was in its upper navigable reaches, and they ought to have the sole control of the river and its navigation. For that reason they asked Parliament to prevent the intrusion of the authority of the burgh of Renfrew into the jurisdiction of the river over the proposed extended burgh area. The Corporation of Glasgow objected to the Bill on the ground that, as they had purchased a large piece of this land for the purpose of creat-

ing upon it important works dealing with sewage it was unfair now to place it under the jurisdiction of the burgh of Renfrew instead of their co-partners in the scheme—the County Council of Renfrew. The case for the extension of the dock was that the harbour of Renfrew was antiquated and unsuitable to existing conditions of shipping or commerce. The promoters had been considerably influenced in their present action by the passing of the Glasgow and Renfrew District Railway Bill last session. There was no question as to whether the railway would be made, because it had been taken over under a joint agreement between the Glasgow and South-Western and Caledonian Railway Companies. The promoters might be relied upon as being equally in earnest about the proposed dock. The scheme involved the construction of a dock basin about 15 acres in extent, fitted up with the most modern appliances, and with 35 acres of land for railway sidings and storage. The depth would be 20 ft. at low water and 31 ft. at high water. The estimated cost of land and works was £204,615, and borrowing powers were taken to the extent of £250,000. Mr. Charles Forman, C.E., Glasgow, explained at great length the principal features of the dock, in the laying out of which he had had the advice of Sir John Wolff Barry. It was, he said, of vital importance to the success of the dock that there should be a basin to allow even the largest ships to go in without caving in the river, and the proposed basin would enable them to do this.

THE SANITARY INSTITUTE.

THE FORTHCOMING ANNUAL CONGRESS.

The preliminary programme of the sixteenth congress of the Sanitary Institute, to be held in Birmingham from September 27th to October 1st, has now been issued. The president of the congress is Sir Joseph Bayser, Bart., K.C.S.I., M.D., F.R.C.P., F.R.C.S. LL.D., Q.U.P., F.R.S. Dr. Christopher Childs, M.D., D.P.H., will deliver the lecture to the congress, and Dr. Alex. Hill, M.A., J.P., master of Downing College and Vice-Chancellor of Cambridge University, will deliver the popular lecture. Excursions to places of interest in connection with sanitation will be arranged for those attending the congress. A *conversazine* will be given by the Right Hon. the Lord Mayor (Councillor C. G. Beale), and a garden party, at the Botanical Gardens, Egbaston, will be given by members of the Sanitary Committee.

It appears from the programme that over 300 authorities, including several county councils, have already appointed delegates to the congress, and as there are also over 2,000 members and associates in the institute, there will probably be a large attendance in addition to the local members of the congress. In connection with the congress a health exhibition of apparatus and appliances relating to health and domestic use will be held as a practical illustration and carrying out of the principles and methods discussed at the meetings, which not only serves this purpose, but also an important one in diffusing sanitary knowledge among a large class who do not attend the other meetings of the congress.

The congress will include three general addresses and lectures, three sections meeting for two days each, dealing with (1) sanitary science and preventive medicine, presided over by Dr. Alfred Hill, M.D., F.R.S., EDIN., F.I.C., M.O.H., Birmingham; (2) engineering and architecture, presided over by Mr. W. Henman, F.R.S.E., and (3) physics, chemistry and biology, presided over by Dr. G. Sims Woodhead, M.D., F.R.C.P., F.R.S., EDIN. Five special conferences: Municipal representatives, presided over by Alderman W. Cook, chairman of the Health Committee, Birmingham City Council; medical officers of health, presided over by Dr. John C. McVail, M.D., D.P.H., F.R.S., EDIN.; municipal and county engineers, presided over by Mr. T. G. Courcy Meade, M.A.C.E.; sanitary inspectors, presided over by Mr. W. W. West, chief sanitary inspector, Walthamstow; domestic hygiene, presided over by Mrs. C. G. Beale (the lady mayors).

The local arrangements are in the hands of an influential local committee presided over by the Right Hon. the Lord Mayor of Birmingham, with Prof. A. Bostock Hill, M.D., D.P.H., Mr. Bayley Marshall, M.A.C.E., and Mr. J. E. Willcox, A.M.I.C.E., as honorary secretaries.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

198. Lead-lined Iron Pipes.—"Waterworks Manager" writes: Referring to Query 193 in your issue of June 24th, I may state that Messrs. Edwin Walker & Co. are patentees and makers of lined pipes, either lead or iron. Their best pipe is lined with block tin throughout, and is made either with or without conducting material between the tin and iron covering. The tin-lined pipe has now been in use for some years, and has proved to be satisfactory.

We are obliged to our correspondent for the information conveyed. If he will, however, refer to Query 193 again he will see that the querist required particulars as to a lead-lined iron pipe and not a tin-lined iron or lead pipe, of which kind of pipe there are several manufacturers.

THE "COTSWORTH" ARC LAMP.

DEMONSTRATION AT TAGG'S ISLAND.

The well-known picnic party resort, Tagg's Island, Hampton Court, was the scene of an interesting function on the 20th ult., when over seventy press men and gentlemen interested in electric lighting, together with several of the fair sex, assembled at the invitation of Mr. Arthur Ormsby, of Merton Park, Surrey, on behalf of the Cotsworth Arc Lamp and Electric Lighting Syndicate, to witness a practical demonstration of electric lighting by means of the "Cotsworth" arc lamp. This lamp, which is the invention of Mr. Haldane G. Cotsworth, claims for its *raison d'être* the overcoming of a disadvantage, common, more or less, to all arc lamps at present on the market—*viz.*, unsteady regulation and consequent flickering of the light. Another feature of the "Cotsworth" arc lamp is that the regulation is independent of the main current, so that the light can be raised without altering the adjustment of the "feed." The mechanism of the lamp is certainly simple, especially the operation of trimming. A small knob at the side of the corona is pulled out, allowing two pistons and rods to gradually slide down; the burnt-out carbons are then replaced by new ones, the globe is pushed up from the bottom and when in place it automatically locks itself. The whole of the operations require the use of one hand only, which is a great convenience should the lamp be located in an awkward position. The globe is cleaned by removing the ash tray at the bottom, but it has been found that if a steady arc is maintained little or no carbon dust is

deposited in the globe, practically the whole of the carbon being converted into CO₂.

The points in connection with the lamp were demonstrated to those present on Monday, the whole of the island after 9.30 being illuminated by it, through the medium of current supplied by the "Immisch" Electric Launch Company, Limited. Prior to the demonstration there was a garden party, followed by a cold collation. Among those present were Sir John Campbell, Bart., Colonel Garnham, Major and Mrs. Baskerville, Mr. and Mrs. Logan, the Rev. Mr. Poynter, and Mr. and Mrs. Ormsby. Various toasts were proposed and honored, among them, in addition to the usual loyal toasts, being "The 'Cotsworth' Arc Lamp," proposed by the chairman and responded to by Mr. A. Ormsby and Mr. H. G. Cotsworth; "The Press," "Mr. and Mrs. Ormsby," "The Chairman," "The Ladies," and "The Officials of the Syndicate." During the evening a selection of music was rendered.

We may mention that the syndicate has been formed with a capital of £35,000, divided into 35,000 ordinary shares of £1 each, and that a considerable amount of support is anticipated from local authorities who are carrying out electric lighting schemes.

The inventor of the "Cotsworth" arc lamp has been experimenting on different types of arc lamps for over two years at his private laboratory at Wimbledon, and claims that he has succeeded in perfecting an arc lamp for street lighting which will burn for forty hours with one trimming, and although it has two pairs of carbons has practically only one mechanism. These lamps are worked in series and work at 42 volts across the arc. When both pairs of carbons have burned out, or should the mechanism become damaged, an automatic cut-out placed in the base of the lamp-post short circuits or may be arranged to introduce an equivalent

resistance in place of the extinguished lamp. When the carbons have been replenished the lamp is automatically cut into the circuit. We give an illustration of the "Cotsworth" arc lamp.

THE TELEPHONE SERVICE.

PARLIAMENTARY INQUIRY.

Another meeting of the Select Committee on the telephone service was held on Thursday.

Mr. J. C. LAMB, C.B., second secretary of the post office, was re-examined with reference to the circumstances under which the areas of the National Telephone Company had been extended. He had not considered how far the extension of areas in the way it had been done might affect municipalities. It was not the policy at the time to entertain applications from municipalities, and that question was absent both from the mind of the Government and that of the Post Office. He was not aware that the effect of granting a large area round London for the National Telephone Company was to hamper the action both of the local authority and of the Post Office within that area.

Sir R. HUNTER, solicitor to the Post Office, was also recalled, and stated that he had carefully considered the legal aspect of the question of the National Telephone Company granting preferences. He did not think that the Postmaster-General, as the law stood, could interfere with the operations of the company in giving what might be considered undue favours or preferences. There were no statutory restrictions applicable to the company either in the licence or in the agreements which affected them. He did not think the Postmaster-General was bound by law against giving preferences, but rather by the principle which had guided the Post Office in the matter of telegraphs. On the suggestion of the chairman, Sir Robert promised to take the opinion of the law officers on the point. With regard to the agreement between the Post Office and the National Company in relation to the extension of areas, he was of opinion that the Postmaster-General was bound simply by the plain terms of the agreement and not by any assurances which might have been given outside the agreement.

Mr. LLOYD, town clerk of Huddersfield, also gave evidence in behalf of that corporation and also the Association of Municipal Associations, in favour of the municipalisation of the telephone service.

MUNICIPALITIES FOR LONDON.

The vestries of Westminster, Bermondsey, Camberwell, Chelsea, Clerkenwell, Deptford, Fulham, Hammersmith, Hampstead, Islington, Kensington, Plumstead, Rotherhithe, St. James's, Piccadilly, St. Martin-in-the-Fields, Lambeth, Marylebone, Mile End, Old Town, Paddington and St. George's, Hanover-square, were represented on Monday at a conference, held at the Westminster Town Hall, to consider Sir Blundell Maple's and Mr. Lough's Bills in reference to the proposed formation of municipalities in London. Lord Onslow presided.

In the discussion which followed Sir Blundell Maple's explanation of the provisions of his Bill, objection was taken to its permissive character, and generally to too much power being left to the London County Council, who would veto some of the powers asked for by the new boroughs. Some of the speakers desired to have an appeal to the Local Government Board or the Privy Council. Ultimately it was agreed to refer the Bills to a committee, with instructions to draft a Bill embodying the best provisions of both, and also to introduce other provisions and report to the conference.

CORRESPONDENCE.

British Association of Waterworks Engineers.—Mr. Edwd. T. Hildred, A.M.I.C.E., of Southampton, writes: In my reply to the discussion on the "Water Supply of Gosport," reported in last week's SURVEYOR, an inaccuracy has crept in, no doubt in the taking down of the shorthand notes, which I should be obliged if you will kindly correct in your next week's issue. I am reported to say "that in carrying out the Foxbury Well works, Gosport, great trouble had been occasioned by the invasion of foul water." We were troubled with foul air only during the execution of the heading works. For the above report to go uncorrected would be detrimental to the water company.

The Westminster Building Accident.—At the Old Bailey, on Thursday, before Mr. Justice Grantham, Mr. C. J. C. Pawley, the architect of Abbey Mansions, Westminster, who was found guilty of manslaughter by the coroner's jury, surrendered to his bail. Mr. Gill, for the Treasury, in the course of his remarks, said that the Treasury were not prepared to proceed with the prosecution. Mr. Justice Grantham, in summing up, said that he was of opinion that no liability attached to Mr. Pawley in any way, and that, practically, as there was no case against him, he would be acquitted. In the judge's opinion the accident was due to the striking the centring.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SCAVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

OBSTRUCTION ON HIGHWAY: PERSONAL INJURY; LIABILITY OF LOCAL AUTHORITY.—The case of *Penny v. The Wimbledon Urban District Council and Hes* (Queen's Bench Division, 15th June) affords an illustration of the principle that a local authority are liable for personal injury to individuals arising from the negligence of the contractor employed by the authority. A precedent is to be found in the case of *Hardaker and Wife v. Idle District Council and Another* (vol. ix., pp. 95, 217), where the injury was occasioned by a gas explosion which occurred in the course or the construction of a sewer. In the present case the accident was due to a heap of soil and grass left unprotected on a roadway, and over which the plaintiff, an elderly lady, fell, after dark, sustaining severe injuries. The road was being made up by the defendant Hes, as contractor for the council, under sec. 150 of the Public Health Act, 1875, and by the terms of the contract Hes was to provide all watching, lighting and fencing. A peculiarity of the case was that Hes had paid £75 into court, whereas the jury only gave the plaintiff £50 damages; so that the £75 came back to Hes again—viz., £25 the overplus of damages and the £50 towards his costs. As regards the council, therefore, the question resolved itself into one of costs only, but in order to determine this it was necessary to consider whether they were liable for Hes' negligence, and thus properly made parties to the action. Mr. Justice Bruce, in giving judgment, after referring to the *Idle* case and also to *Pickering v. Smith* (10 C.B., N.S., 470) said: "The district council employ the contractor to do the work upon the surface of a road which they know is being used by the public, and they must have known that the works which were to be executed would cause some obstruction to the traffic and some danger unless means were taken to give due warning to the public. The duty of affording protection to the public was in the circumstances incurred by the district council, and the district could not avoid the obligation of the duty by entering into a contract with Hes. The question remains—Can the defendants, the district council, avail themselves of the separate defence which is pleaded by Hes? The two defendants might, if they pleased, have joined in a defence of payment into court, which would have been available for both. But the district council have chosen to put in a separate defence. I cannot see in the circumstances that they can avail themselves of the payment into court by Hes. So far as their defence is concerned, it simply amounts to a denial of liability; but in that defence they have failed. The plaintiff is therefore entitled to judgment for £50 and costs. Of course, as the £50 has been obtained from the other defendant, Hes, the judgment against the district council will be confined to costs only."

COMBINED DRAINAGE: BY-LAW: PREMISES WITHIN THE SAME CURTLAGE: PUBLIC HEALTH ACT, 1875, SEC. 4.—An important decision bearing upon the subject of combined drainage, and involving the interpretation of a by-law, is that in *Blundell v. Prior* (Queen's Bench Division, 25th April). The by-law in question was as follows: "Every person who shall erect a new building shall provide in every main drain or other drain of such building which may directly communicate with any sewer or other means of drainage into which such drain may lawfully empty a suitable trap at a point as distant as may be practicable from such building and as near as may be practicable to the point at which such drain may be connected with such sewer or other means of drainage." The appellant had erected six houses, in two blocks of three each, in connection with which two passages were provided. One of these passages (which was closed at the ends) was at the back of the houses and parallel to the street on which they fronted; the other ran from that street to the back passage, between the third and fourth houses. The houses all belonged to the same owner, and all the tenants were entitled to use the passages; but each house had its own separate entrance, private yard, outbuildings and garden. There was a door at the end of the centre passage communicating with the street, to which each of the tenants had a key. The appellant provided for the drainage of the six houses by means of a pipe running down the centre passage and connected with the sewer in the street, with branches in the back passage, the separate drains of the several houses being connected with this pipe and its branches in the passages. In alleged compliance with the by-law he provided one trap in this pipe at the point where it came into the street and a short distance from its junction with the main sewer. The Birmingham Corporation (within whose district the property is situate) considered that the pipe fell within the definition of a "sewer," and that consequently the drain of each house ought

to have been trapped before its connection with the pipe. The magistrates adopted this view and convicted the appellant of an offence against the by-law, and the High Court have confirmed their decision. On behalf of the appellant it was contended that he had complied with the by-law, inasmuch as the common pipe in the passages was a "drain" within the meaning of the by-law. In support of this contention it was argued (a) that, even if the statutory definitions of "drain" and "sewer" were held to apply to the by-law, the houses were premises within the same curtilage, and therefore the pipe fell within the definition of a "drain"; (b) that, in any event, the pipe did not become a sewer until it began to be used as such, whereas the by-law related to something to be done anterior to such user; and (c) that, even if the pipe was a "sewer" within the Public Health Act, it might nevertheless be a "drain" within the by-law, the scope and intention of the latter being that there should be a trap above the junction of such a pipe with the main sewer. Mr. Justice Wills, in giving judgment, said: "I cannot persuade myself that there is any doubt that the justices were right in this case. The question in the case is what the expressions 'drain' and 'sewer' in the by-law mean. The definition in the Public Health Act, 1875, must govern this question. And under that definition a drain becomes a sewer as soon as it receives the drainage of two houses, unless those houses are within the same curtilage. It is argued that these six houses are within the same curtilage. On that point it is sufficient to say that the passages marked on the plan are passages and nothing else; and that whether you take the definitions referred to by Mathew J. in *St. Leonard (Shoreditch) Testry v. Pilbrow* (L.R., 1895, 1 Q.B. 33) or, any of the tests suggested by Lord Esher M.R. or Lopes L.J. in the same case in the Court of Appeal (L.R., 1895, 1 Q.B. 433), these passages do not satisfy the tests indicating what is a curtilage. Take the language of Mathew J. or of Lord Esher M.R. or of Lopes L.J. and apply it to the circumstances of this case, and it is clear that these passages do not fall within those tests. Therefore the common pipe is not within the definition of 'drain' and is within that of 'sewer.' We have to apply these definitions to the by-law, and I fail to see any difficulty in so doing. The by-law says that any person who shall erect a new building—and each of these houses is a new building—shall provide in any main drain or other drain which may directly communicate with any sewer, into which such drain may lawfully empty, a suitable trap. The pipe indicated by the dotted line is a sewer from the point at which it receives the drainage of two houses; and having regard to that I find no difficulty in applying the by-law. Mr. Lawson Walton says that the word 'sewer' in the by-law must mean the sewer in the street. But I fail to see why. True it would be impossible to make a communication between the most distant house and the sewer in the street without laying down the whole line of pipes. But that is no reason why when that line of pipes is laid down it should not be a sewer vested in the local authority. That being so the appellant must comply with the by-law."

A Correction.—We regret that, owing to a misunderstanding, it was erroneously stated in our last issue that Messrs. Joseph Place & Sons had removed from Halifax to Darwen. The announcement had reference not to the firm, but simply to a member of the firm. The works, as our readers are well aware, have always been at Darwen and never at Halifax.

St. Saviour's Public Library.—We have received the fourth annual report of the commissioners of this institution, for the year ended March 25th. The finances of the commissioners are reported to be in a highly satisfactory state, this being largely due to the careful and economical methods employed by the librarian, Mr. H. D. Roberts, in conducting their affairs.

Belfast Deputations.—A deputation from the Public Health Committee of the Belfast Corporation, consisting of Alderman Dr. Graham (chairman of the committee), Councillors Dr. Biggar, Dr. Brown, Dr. O'Connor, Gribby and John McCormick, with Mr. Munce, assistant surveyor, have been visiting dust destructors in various parts of England, including Bradford, Leeds, Leyton and Shoreditch, with a view to the adoption of a system of dust destruction which would be adapted to the needs of Belfast. Another deputation, consisting of Aldermen O'Dempsey and Wm. McCormick and Councillor Taylor, with the city surveyor, Mr. J. C. Ireland, have been visiting various technical schools in Bradford, Sheffield, London and several places in the vicinity of the metropolis, Leicester, Birmingham, Manchester and Bolton.

Municipal Work in Progress and Projected.

Some particulars of important works in progress or projected will be found in the paragraphs relating to Battersea, Bedford, Derby, Exeter, Godalming, Huddersfield, Hindley, Leigh and Lytham. Electric light activity still continues undiminished, as will be seen if one glances at the following paragraphs and notes the number of councils who have such schemes under consideration or in hand.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

The proceedings at Spring-gardens, on Tuesday, began with a somewhat hollow discussion on the report of the Finance Committee, which detailed the profits of the Works Department during the half-year ended 31st March. The matter was, however, soon disposed of, and the council were therefore able to reach the proposals of the Local Government and Taxation Committee with respect to certain by-laws as to street noises, &c. A lively debate broke out, but it was decided to receive the report and consider it in detail. This resulted in the first by-law being referred back by a vote of two to one. The rest of the proposals were then adjourned.

Loans to Local Authorities.—Upon the recommendation of the Finance Committee, it was agreed to lend the Islington Vestry £6,470 for laying-out the open space purchased from the London Corporation, at a cost of £16,000, and £15,500 for alterations and additions to the vestry office; the Lambeth vestry £5,985 for wood paving works; the St. George's (Southwark) Vestry £4,025 for pipe sewer works; and the Shoreditch Vestry £4,585 for street improvements.

The Works Department.—The Finance Committee submitted the half-yearly statement of works executed during the half-year ended March 31st last. In this statement the committee showed what works were commenced under the late management and what under the present management. There were eleven works in all. Three of these were begun under the late management and before the reorganisation of the department. The final estimate for the latter amounted to £6,102, whilst the actual cost was £6,658, showing a balance of cost above final estimates of £556. The only loss was on one work—the Pimlico river fire station—on which there was a balance of cost above final estimate of £718, the final estimate being £990 and the actual cost £1,708. The other two works which had been executed for the Housing Committee showed a saving over final estimate of £162, making the balance of cost above estimate for the three works £556, as stated above. With regard to the eight other estimated works, the result appeared to be very satisfactory indeed, the final estimate for the works amounting to £23,021, whilst they had been executed at a cost of £17,846, showing the substantial balance of cost below estimate of £5,175. On jobbing works carried out during the half-year for the various committees, the schedule value of which was £18,055, there had been a saving of £2,033. Some discussion followed, and the report was then adopted.

St. John's-street (Clerkenwell) Improvement.—The Improvement Committee departed from their usual practice in authorising the Clerkenwell Vestry to set back the "Horse and Groom" public-house in St. John-street at the council's expense, and then recommending the council to confirm their action. The present case, however, was very exceptional, they stated, and would not be taken by them as forming a precedent. If they had waited for the council's instructions the opportunity for acquiring vacant land would have been lost and a new building would have been erected, and must have been acquired at great cost whenever the widening of the road was carried out. They would point out that in arranging for the setting back of the "Horse and Groom" public-house the council did not necessarily pledge itself to continue the improvement, and they thought it should be understood that the work was undertaken without prejudice to the question whether the widening of the whole of the narrow portion of St. John-street, if eventually carried out, either by the council or the vestry, should be considered a county or a local improvement. They added that the estimated net cost of widening the whole of the narrow portion of St. John-street between Aylesbury-street and Allmarle-street was £59,000 if carried out under the ordinary conditions affecting street improvements, but they did not at present suggest that that work should be undertaken. They concluded by recommending the council to confirm their action. After discussion the report was approved.

Proposed Purchase of Spitalfields Market.—The Public Control Committee submitted a report recommending the council to include in one of the Bills in the next session of Parliament a clause empowering the council to acquire, by agreement or compulsorily, the freehold and other interests in Spitalfields market. It also recommended that the Public Control Committee should be authorised to negotiate, subject to the necessary Parliamentary power being obtained, for the purchase of the interests in the market. This report will be discussed at the next meeting of the council.

Tenders.—The following tenders were opened: For converting four beam engines at Crossness outfall into triple-expansion engines—J. Penn & Sons, Limited, Greenwich, £16,900; W. R. Renshaw & Co., Stoke, £17,900; B. Good-

fellow, Hyde, £20,684; United Ordnance and Engineering Company, Limited, Erith, £22,430; Fullerton, Hodgart & Barclay, Limited, Paisley, £25,000; Fleming & Ferguson, Limited, Paisley, £47,000. For the supply of compound pumping engines at Barking outfall—E. Chester & Co., 120 Bishopsgate-street Within, E.C., £6,134; W. R. Renshaw & Co., Stoke, £7,500; J. Cochrane, Barrhead, near Glasgow, £8,150; B. Goodfellow, Hyde, £10,216; Fullerton, Hodgart & Barclay, Limited, Paisley, £10,480; J. McNeil & Co., Govan, Glasgow, £11,525; Fleming & Ferguson, Limited, Paisley, £12,000; United Ordnance and Engineering Company, Limited, Erith, £12,840; J. Penn & Sons, Limited, Greenwich, £13,100; Clayton, Goodfellow & Co., Limited, Atlas Ironworks, Blackburn, £13,750.—The Main Drainage Committee reported that they had considered the tenders for the erection of a brick wall, with gates, along the north boundary of the Abbey Mills pumping station, and they recommended that the tender of Mr. J. Jackson, being the lowest, be accepted. The following were the tenders received: Messrs. J. Jackson, £518; G. Munday & Son, £560; and A. E. Symes, £625. The report was adopted.

COURT OF COMMON COUNCIL.

A meeting of the court was held, on Thursday, under the presidency of the Lord Mayor. The Remembrancer reported that the Bill promoted by the corporation for the construction of a light railway from Deptford market to the South-Eastern Railway Company's line had passed both Houses of Parliament, and would probably shortly receive the royal assent. He suggested that the committee should be authorised to carry out the undertaking forthwith. The court agreed.—A report was brought up from the City Lands Committee asking for authority to spend £2,500 in carrying out certain works at the entrance to the Guildhall, in Basinghall-street. The new works will include a new entrance gateway, a path and carriage way, a new window and buttresses, a new building on the site of the Chamberlain's old parlour, and a new corridor connecting the library with the council chamber. The court unanimously approved of the recommendations of the committee.—The Improvements and Finance Committee recommended that the ground rents (£850 and £700) and reversion of St. Mangus House, Monument-street, should be offered for sale; and that arrangements should be made for acquiring the freehold interest in 124 Fenchurch-street for £23,500, the freehold interest in 82 Fleet-street for £11,800, and the sub-leasehold interest in 34 Basinghall-street for £350. The committee also submitted arrangements for acquiring the ground needed to widen the public way in front of 92 Gracechurch-street, it being proposed to pay £75 for the freehold interest and £500 for the leasehold interest. The court approved of these recommendations.

VESTRIES AND DISTRICT BOARDS.

Battersea.—Last week, at a meeting of the vestry, the Baths and Wash-Houses Committee presented a report recommending the expenditure of £5,225, mainly for the purpose of sinking an artesian well for obtaining the necessary supply of water for the baths. The consideration of the matter, however, was adjourned for a week.

Bermondsey.—The vestry have resolved, on the recommendation of the Electric Lighting Committee, to erect a dust destructor in connection with the electric lighting station, subject to the passage of the Bill now before Parliament conferring power on the vestry to supply electrical energy.

Hackney.—A sum of £500 was, last week, contributed towards the cost of the construction of Carpenter's-road bridge and a proposed improvement in White Post-lane.—Representatives were appointed to attend the meetings of the Select Committee of the House of Commons and the Committee of the London County Council on the telephone service.—The Electric Light Committee were instructed to obtain from three electrical engineers their prices at which they would be prepared to advise the vestry to carry out the electric lighting undertaking.

Lambeth.—The South London Electric Supply Corporation, who some time ago acquired the Lambeth electric lighting provisional order, entered into an agreement with the Lambeth Vestry to erect a refuse destructor in conjunction with the projected electric light station, in order that at least a portion of the parish refuse might be disposed of by combustion in the destructor cells. The corporation have now submitted to the vestry for approval plans of the destructor which is proposed to be constructed by Messrs. Manlove, Alliott & Co., in Bengeworth-road, Loughborough Junction. As the agreement provided that the destructor should be "of the most approved sanitary type," the vestry were referred to that at Shoreditch, constructed by the same company. The Shoreditch destructor has been inspected by a committee appointed by the local authority, who report that it appears to be most efficient, and as a result of the examination and report the vestry have decided to approve the plans submitted on behalf of Messrs. Manlove, Alliott & Co.

Newington.—At last week's meeting of the vestry, a re-

port was received from the Electric Lighting Committee, submitting the following tenders received for the supply and fixing of engines, generators and public lighting plant at the station in course of erection in Penrose-street—viz., Messrs. Sharp & Piper, £9,575; Messrs. Siemens Brothers & Co., Limited, £9,375; the Brush Electric Company, £9,090; Messrs. Johnson & Phillips, £8,975; Messrs. Crompton & Co., £8,802; Messrs. Fowler & Co., £5,200 (one section only). The report recommended that the tender of Messrs. Johnson & Phillips be accepted and the seal of the vestry affixed to the contract. The recommendation was adopted.

Paddington.—The Works Committee, at the vestry meeting last week, reported that they had caused plans to be prepared for the construction of a new steel-girder bridge, 45 ft. span, for Westbourne-terrace. The approximate cost would be about £4,600. It was decided to submit the plan to the Loudon County Council for their approval, with an application for a contribution of two-thirds of the cost of the improvement.

Plumstead.—The Woolwich District Electric Light Company have been informed by the vestry that they intend to oppose any application for a provisional order to extend their supply to Plumstead.

Shoreditch.—Last week, at a meeting of the vestry, Mr. Kershaw moved that the charge for current to private consumers be reduced to 5d. per unit for the first two hours and 2d. per unit after, and that consumers have the option of being charged at a fixed rate of 4d. per unit. This was agreed to; and it was also resolved to abolish the meter rents. The following recommendations were also agreed to: That the charge for current for motive power be reduced to 2d. per unit for all hours; that dry runs of current for light be charged on separate meters at 3½d. per unit; and that users of 50,000 units of current for motive power be charged at the rate of 4d. per unit for current for lighting purposes; users of 75,000 units for power, 3½d. for lighting; and users of 100,000 units for power, 3d. per unit for lighting purposes.

St. Pancras.—Two or three months ago, the St. Pancras Vestry were informed by their Electricity and Public Lighting Committee that the production of 437 electrical units had been traced as being due to the utilisation of the waste steam available at the refuse destructor, and it was suggested that in this direction the destructor might eventually become a source of profit to the parish. With this object in view the vestry instructed Mr. Sydney F. Baynes, the chief electrical engineer, to make a series of tests as to the possibility of using the steam in connection with the generation of electricity. Since then a number of tests have been carried out, but in consequence of the irregularity in the supply of steam it has been found impossible to rely upon it for generating purposes, and hence the experiments have had to be abandoned. A possible explanation of the lack of a constant supply of steam may be found in the fact that in two parts of the parish the collection and disposal of the refuse is being carried out by contract, and in this manner several of the cells are deprived of fuel and cannot be worked. It is, therefore, probable that on the expiration of the contract in question the interesting tests inaugurated by the chief electrical engineer will be resumed.

Strand.—At a meeting of the board of works, the Parliamentary Committee reported, with reference to Sir Blandell Maple's Municipal Corporation Bill, that they were not at present prepared to pass an opinion upon it. They had, therefore, adjourned further consideration thereof until the Government Bill on the same subject was introduced. Tenders for barging away refuse were opened; and that of Messrs. J. Shelburne & Co., of Fenchurch-street, was accepted, at prices showing an increase of between £500 and £600 per annum in the aggregate on the present rates. The Wharf Committee were granted permission to enter into conditional contracts for the erection of a Horsfall refuse destructor on the board's Shot Tower wharf; but this course was adopted without prejudice to any negotiations between the board and the corporation. A letter was read from the Strand tradesmen asking that the streets might be more generously watered, and that, when precautions were necessary to prevent slipping, sand should be used instead of stones, on account of the damage caused by the latter to shop windows. The matter was referred to committee, as was a letter from the Holborn Board of Works asking the board to petition Parliament in favour of the appointment of a committee to inquire into the price of gas. After a short discussion on the procrastination of the Loudon County Council in dealing with what they termed the insanitary area in the district, it was decided that a letter should be sent urging the council to push on with the work of improvement, as the present uncertain state of affairs was detrimental to the interests of traders in the affected area.

**PROVINCIAL AND GREATER LONDON
AUTHORITIES.
COUNTY COUNCILS.**

Derbyshire.—Lord Waterpark, on behalf of the Derbyshire County Council, last week, conducted an inquiry at Swadlincote as to the necessity of the formation of a joint isolation hospital for the Swadlincote district, the Harleshorpe and

Seals districts, and the parishes of Drakelow, Rostiston, Walton, Camldwell, Castle Gresley, Catton, Cotton-in-the-Elms, Linton and Lullington. All the places interested were represented, and there was a large attendance. It transpired that only Swadlincote, which had made no proper provision for infectious cases generally, was in favour of the scheme, which was objected to by the other places. Lord Waterpark expressed the hope that the report would be satisfactory, and the inquiry terminated.

MUNICIPAL CORPORATIONS.

Bedford.—An inquiry was held recently, by the Local Government Board, in reference to a proposal of the council to borrow £5,400 for electric lighting extensions. Up to the present time £19,000 has been borrowed for electric lighting purposes. Sanction had been given to borrow £58,659, and therefore the corporation had still power to borrow a further sum of £6,950. The present loan was for the extension of the engine-room, with the necessary foundation, transformers, extra testing instruments, mains for public lighting, standards for lighting the market places, &c. This was necessary on account of increased demand and for the public lighting of the St. Cuthbert's glebe estate. The total number of lamps at present was 14,250 8 candle-power, exclusive of public lighting, and this scheme included sixty-five additional lamps for the St. Cuthbert's estate.

Bolton.—A change in the method of supplying electric energy in the central portion of the town is under contemplation. At present customers are supplied with alternating current; under the proposed scheme a continuous-current supply will be substituted. The matter is being considered by the General Purposes Committee as well as by the Electricity Committee.

Cardiff.—At a meeting of the Lighting Committee of the corporation, on the 21st ult., it was decided, on the recommendation of Mr. Appelbee, the electrical engineer, to reduce the charge for current for places of worship to 5½d. per unit.

Chester.—The council have authorised the laying of arc mains and distributing mains for the supply of public and private electric lighting in George-street, St. Anne-street and adjoining streets, at an estimated cost, including street lamps, &c., of £1,260.

Derby.—A Local Government Board inquiry has been held by Colonel W. R. Slack, R.E., with respect to an application of the town council for sanction to borrow £20,000 for electric lighting purposes, £5,500 for the provision of a depot, £1,000 for the construction of a six-cell destructor, £2,300 for the purchase of land for purposes of street improvement, £1,095 for electric lighting purposes, £340 for market purposes, and £120 for the erection of a convenience.

Exeter.—Mr. W. A. Ducat, R.E., inspector of the Local Government Board, held an inquiry at the Guildhall, Exeter, on Thursday, relative to the application of the city council to borrow £7,000 for purposes of electric lighting. Of the £7,000 required, £1,104 was estimated extra expenditure on a boiler and steam alternator, £2,000 for new Kilowatt steam alternator, steam and exhaust pipes, and feed-water heater, £2,800 for extension of mains, and £1,095 10s. for additional transformers, meters, &c., in connection with the above scheme of extension. Mr. Ducat subsequently inspected the electric light works.

Codrington.—The Local Government Board have refused to sanction the borrowing by the council of £15,000 for electric lighting purposes. As there was much opposition to the scheme, it is stated that the board thought it was doubtful whether it could prove remunerative, or even self-supporting, particularly in view of the smallness of the compulsory area. The council have to consider the letter, but the mayor has expressed an opinion that a poll of the residents will be taken.

Huddersfield.—Local Government Board sanction will shortly be asked for in connection with the borrowing of £14,140 for the purchase of land for cemetery purposes.

Ipswich.—The Electric Lighting Committee have been empowered to take the necessary steps to carry out the powers conferred on the council by the provisional order for the supply of electricity within the borough.

Longton.—Last week, Colonel W. R. Slack, R.E., an inspector of the Local Government Board, held a public inquiry at Longton with respect to an application of the town council for sanction to borrow a further sum of £3,500 for the purchase of property for the purpose of street improvements.

Loughborough.—It has been decided by the town council to make an application to the Local Government Board for sanction to borrow £2,500 for sewer extensions in the borough, £200 to defray the cost of the purchase of land to add to and improve the site acquired for a highway depot in Dand-land, and £550 to defray the cost of fencing and laying-out the land acquired for the purpose of a pleasure ground in the Island House Park.

Lynn.—Major-General Crozier, Local Government Board inspector, held an inquiry at Lynn, last week, into the application made by the town council to the board for sanction to a loan of £2,500 to pay the cost for setting back various properties which were affected by the fire in High-street last Christmas. After evidence and some opposition, the inspector

pointed out that the council should have taken steps to have had the inquiry held before the work was commenced. The fact of the buildings being partly put up on the new line made that inquiry rather a farce. If the board refused the loan they would throw a great burden on a lot of people who could not meet it or bear it, and who had no voice in the matter at all. The mayor said the great idea of the corporation was not to do anything to prevent the people putting up their premises as soon as possible.

Manchester.—The River Committee of the City Council met, on Monday, Sir Bosdieu Leech in the chair. The experts who have been requested to report upon the question of sewage treatment asked permission to put down two experimental filters at Darynhulme, one dealing with the system now in operation at Sutton, and the other demonstrating the septic system. The committee assented to the proposal, and referred the matter to a sub-committee to make the necessary arrangements.

Middlesbrough.—The new Cleveland borough lunatic asylum at Middlesbrough was formally opened, on Wednesday last week. It has been built at a cost, exclusive of site, of £20,000, from plans by, and under the supervision of, Mr. Alfred J. Wood, of 22 Surrey-street, Victoria Embankment, W.C.

Newport (Mon.).—The Parliamentary Committee have recommended the purchase, for £5,350, of a site belonging to the Ecclesiastical Commissioners, near Carelean, and containing 53 acres, for the new borough lunatic asylum.

Norwich.—The town council having applied to the Local Government Board for sanction to borrow £5,700 for works of street improvement, an inquiry was held, on the 22nd ult., by Major-General D. Darley Crozier, R.E. Mr. A. E. Collins, the city engineer, was present at the proceedings, and explained the plans put before the inspector, and also as to the paving proposed to be laid down. A bridge on Station-road would be paved with soft wood. There being opposition to the use of granite paving, the corporation did not avail themselves of the amount granted for the purpose by the Local Government Board four years ago.

Ripon.—The tender of Messrs. Holmes & Co., Huddersfield, amounting to £1,275, has been accepted for the supply of a set of purifiers (14 ft. square) and for the erection of a shed for the same at the gasworks.

Wakefield.—The corporation electricity works at Calder Vale, which were opened a few days ago, have been laid down under the powers accorded to the corporation by their electric lighting provisional order granted in the year 1894. Mr. Robert Hammond was appointed consulting electrical engineer, and prepared plans and specifications of the works. The buildings comprise boiler-house, engine-house, testing-room, workshop, stores and offices.

Walsall.—Local Government Board sanction will shortly be applied for to a loan of £350 for the construction of an underground convenience. The plans have already been prepared by the borough surveyor. Application will also be made for sanction to a loan of £300 to defray the cost of purchasing property for road improvement purposes.

Warrington.—A Local Government Board inquiry has been held into an application of the corporation for sanction to borrow £31,933 for purposes of street improvement, £10,000 for the purchase of slot and other meters, and £700 for the purchase of a recreation ground.

West Hartlepool.—The erection of new municipal buildings is being contemplated by the council.

URBAN DISTRICT COUNCILS.

Balby-with-Hexthorpe.—Mr. E. A. Sandford Fawcett held an inquiry, on the 17th ult., on behalf of the Local Government Board, concerning an application of the council for sanction to borrow £3,750 for works of private street improvement.

Erith.—The question of constructing a town pier has been referred to a committee for consideration.

Crays.—At the last meeting of the district council, the plans and estimates prepared by the surveyor to the council, Mr. Arthur C. James, for fencing the stoneyard site and erecting stables, cart-shed, stores, &c., at an estimated cost of £550, and for fencing and laying-out the recreation ground site, at a cost of £2,550, were approved, and it was decided to apply to the Local Government Board for permission to borrow the money.

Hindley.—Colonel C. H. Luard, R.E., Local Government Board inspector, held an inquiry, on Tuesday of last week, with reference to an application of the council for sanction to borrow £5,700 for works of private street improvements. Mr. Alfred Holden, the council's engineer, explained the plans, &c., which had been prepared by him, and also accompanied the inspector to view the various streets.

Leigh.—Mr. H. Hall, inspector of the Local Government Board, held an inquiry at Leigh, last week, into the application of the Leigh District Council for sanction to borrow £11,426 for works of street improvement and the improvement of main roads. The money would be spent in putting several main roads in the district into proper condition. The

council, it was stated, wish to commence the works as early as possible. Granite setts, grit setts and macadam are to be used for the roads. When the works are completed all the Leigh roads would, it was mentioned, be in excellent condition.

Lytham.—The Local Government Board have communicated their sanction to the expenditure of £10,000 upon a new scheme of sewerage for Lytham. It is over twelve months since the inquiry was held, and it is understood the delay has been occasioned by the opposition of the Preston Corporation, who feared the discharge from the outlet would have an injurious effect upon the Ribble channel. The Local Government Board have approved the scheme in its entirety.

Matlock.—The undertaking of the Matlock Cable Tramways Company, Limited, which has been presented to the urban district council by Sir G. Newnes, was, on Saturday, formally transferred to the council.

RURAL DISTRICT COUNCILS.

Ashford.—The district council have instructed Messrs. Bailey-Denton, Son & Lawford, of Westminster, to advise them as to an efficient system of water supply for Willesborough, a populous suburb of Ashford, where the works of the South-Eastern Railway are situated.

Billerica.—The district council have resolved to apply to the Local Government Board for sanction to borrow £5,000 for a joint sewerage scheme for the parishes of Shenfield and Hatton. The scheme has been designed by Messrs. Bailey-Denton, Son & Lawford, of Westminster, and will be carried out immediately.

Disley.—On the 21st ult., an inquiry was held by Colonel A. G. Durnford, R.E., on behalf of the Local Government Board, into an application of the council for sanction to borrow an additional sum of £1,000 for works of sewerage and sewage disposal. The application was opposed by several ratepayers on the ground that sufficient care in the estimates had not been exercised and that the scheme was incomplete. Complaint was also made that property owners were being caused extra expense through having to take steps to prevent rain water from getting into the main sewer connections.

Hatfield.—The tender of Mr. John Maden, of Hatfield, has been accepted for the erection of a mortuary, for £335.

Hunslet.—The plans for the Temple Newsum drainage scheme were under the consideration of the council last week, and it was stated that the cost was estimated at £1,556.

Nantwich.—The council recently gave their consideration to plans prepared by the surveyor, Mr. Davenport, for certain water main extensions. The plans were eventually approved, it being decided to make the usual application to the Local Government Board for their sanction to the execution of the work, which is to cost £1,830.

Woburn, Bucks.—A detailed report has been submitted to the council for a scheme of water supply for the district of Wavenden, including Woburn Sands, by the engineers for the work, Messrs. D. Balfour & Son, civil engineers, London and Newcastle. This recommends a trial shaft being sunk about 100 ft. into the Lower Greensand, after which continuous pumping tests will be made for fourteen days at the rate of 10,000 gallons per hour. The site chosen is to the south of Woburn, on land belonging to the Duke of Bedford, and sufficiently far from the escarpment of the Lower Greensand to obtain a good supply. It is probable, if the quantity of water found will allow, that several neighbouring places may be supplied, but at present the supply is got from wells which are liable to pollution. The water will be pumped into an elevated tower on high land adjoining, from which it will gravitate in mains over the district. If the scheme is successful, Woburn Sands, with its almost Highland scenery, will have an excellent water supply.

SCOTLAND AND IRELAND.

Aberdeen.—The question of the reconstruction of Regent bridge was under the consideration of the harbour board, at a meeting, on Monday of last week. On the recommendation of the Works Committee it was agreed to proceed with the erection of a new bridge, according to the plans of the harbour engineer, and approved by Mr. Wake, the consulting engineer. The estimated cost of the bridge is £49,740.—At a recent meeting of the district committee of the county council, a letter was read from Mr. William Dyack, burgh surveyor, stating that the town council were proposing to replace the existing aqueduct by cast-iron pipes along the Deeside road between Aberdeen and Banchoy. The first section they proposed laying was from Pitodola to Cullter, the pipes of which were to be 42 in. in diameter, and it was proposed to lay them on the side of the road, out of the macadamised track. He would be glad to have permission to have the road opened as soon as possible. It was remitted to the Roads Sub-Committee to consider and report.

Edinburgh.—At the meeting of the Edinburgh Town Council, on Tuesday, it was stated that it was expected all contracts for cabling the tramway would be completed in the spring of next year. The most important business transacted was, however, the decision to take no further action with the Fountainbridge improvement scheme, which would have involved an expenditure variously estimated at from

£51,000 to £100,000, after allowing for the subsequent letting of the spare land to be acquired. The settlement of the matter gave rise to a somewhat heated personal difference between the Lord Provost and Treasurer McCrae, in which charges of "subterfuges and suppression" were freely bandied. The voting showed that the opinion of the council was decidedly with the Lord Provost. Apart from personalities, the main question appeared to be whether such an improvement as that contemplated should be carried out at once or deferred to some indefinite period. The council hesitated to apply for compulsory powers to compel the North British Railway to treat for the land that would have to be acquired, and preferred to wait, Micawber like, for something to turn up which would bring the company to them. There is a lingering hope that the company may in future want concessions, and the inference is that the council will then put the screw on. The improvement was generally admitted to be desirable, and it is not easy to see the morality or the logic of waiting to apply indirect compulsion rather than at once adopting the more dignified course of seeking Parliamentary powers. In the meantime the capital value of the company's property is daily increasing, and the council's delay will make far more costly the eventual effecting of an improvement which the burgh engineer has emphatically reported upon as a necessary one.

Kirkcaldy.—Recently, at a meeting of the town council, a report of Prof. Kennedy as to the proposed introduction of electric lighting and tramways was read. The proposal was to have two routes of tramways round the burgh, the upper being from West Bridge to Gallatown and the Public Park, Victoria-road and Rosslyn-street, the lower being from West Bridge, High-street and Sands-road, while an extra line would run up Whyte's-canvasway and Wemyssfield, to join the upper route. The total length of the route is 6½ miles. It was explained that the committee who had the matter in hand were anxious to give the council an opportunity of taking over the scheme, if they desired. If the council did not wish to take over the scheme, then it would be floated by a private company who had taken up the matter. The cost, he contemplated, would be at least £100,000. It was agreed to call a special meeting of the council to consider the matter and give their decision at the July meeting.

Portsoy.—A special meeting of the burgh commissioners was held recently, when it was resolved to relay about 4,000 yards of the gas mains within the burgh, the existing main pipes having been found on examination by an expert to be either in unsatisfactory condition or too small for the district served. It is understood that the board have accepted the offer of the Manchester Acetylene, Gas and Carbide Company to supply the requisite pipes, valves, syphons, generator, gasometer and standing meter, all complete. The plant to be put in for the generation of acetylene gas is expected to produce about ten times the quantity of gas which the old coal gas plant could have supplied. The works are to be proceeded with at once.

ADVERTISEMENTS

Received too late for Classification.

COUNTY BOROUGH OF WEST HAM.

PRIVATE STREET WORKS.

TO CONTRACTORS.

The Council hereby invite tenders for making-up the following streets:—

- Freemantle-road.
- Haslemere-road.
- New-street, Plaistow.
- Old-street, Plaistow.

Plans may be seen, and specification, form of tender and further particulars obtained, at the office of Mr. Lewis Angell, Borough Engineer, Town Hall, Stratford, E., upon payment of £1, which will be returned upon receipt of a *bona-fide* tender.

Tenders, endorsed "Tender for Private Street Works," to be sent to my office not later than 4 o'clock on Tuesday, the 26th July, 1898.

The Council do not bind themselves to accept the lowest or any tender.

The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

As regards all work to be done at the site or elsewhere within a radius of 20 miles from Charing Cross, the contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

(By order of the Council)

FRED. E. HILLEARY,
Town Clerk.

Town Hall, West Ham, E.
June 29, 1898.

**COUNTY BOROUGH OF WEST HAM.
TO WHEELWRIGHTS.**

The Council hereby invite tenders for the supply of ten Slop Carts.

Form of tender, specification and further particulars obtained at the office of Mr. Lewis Angell, Borough Engineer, Town Hall, Stratford, E., upon payment of £1, which will be returned upon receipt of a *bona-fide* tender.

Tenders, endorsed "Tender for Slop Carts," to be sent to my office not later than 4 o'clock on Tuesday, July 26, 1898.

The Council do not bind themselves to accept the lowest or any tender.

The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

As regards all work to be done at the site or elsewhere within a radius of 20 miles from Charing Cross, the contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

(By order of the Council)

FRED. E. HILLEARY,
Town Clerk.

Town Hall, West Ham, E.
June 29, 1898.

Personal.

Mr. W. Cottam, surveyor to the Southwell Rural District Council, has had his salary increased by £20 per annum.

Southampton Borough Council have increased the salary of the assistant engineer, Mr. Killick, to £200 per annum.

Mr. William Walton has been appointed surveyor and inspector of nuisances to the Harpenden Urban District Council.

Mr. F. S. Whittell, surveyor to the Holmfirth Urban District Council, has been appointed surveyor to the Workseop Urban District Council.

Prof. Henry Robinson has been appointed by the town council of Hastings to prepare a report upon the local electric light company's undertaking.

Mr. Albert Nagel, B.Sc., EDINBURGH UNIVERSITY, of Newport, Dundee, has been appointed engineer and secretary to the Hartlepool Port and Harbour Commissioners.

Mr. O. T. Oldroyd, assistant in the office of Mr. S. W. Parker, engineer and surveyor to the Thornhill Urban District Council, has been appointed assistant in the city engineer's office, Hull.

Applications for the position of surveyor will shortly be invited by the Whitechapel District Board. The salary will commence at £400 and increase to £500. Six candidates will be selected for the final interview.

The Benwell and Fenham Urban District Council have instructed Mr. Harry W. Taylor, of St. Nicholas Chambers, Newcastle and Birmingham, to prepare a scheme of main sewerage for the Fenham portion of their district.

We learn that Mr. W. B. G. Bennett, the borough engineer of Southampton, has been appointed a vice-president of the municipal engineering section at the Birmingham congress of the Sanitary Institute, to be held in September next.

Mr. William Farrow, assistant in the office of the surveyor to the Kirkleatham Urban District Council, has been appointed temporary assistant in the office of Mr. James Diggle, surveyor to the Ashton-upon-Mersey Urban District Council.

About forty members of the Gloucestershire Engineering Society had a most enjoyable excursion to the Gloucester Corporation waterworks on the 18th ult. The president, Mr. R. Read (the city surveyor), gave a description of the works.

Mr. H. B. Longley, assistant in the office of Mr. G. T. Lyuan, borough surveyor of Burton-on-Trent, was at the last meeting of the Coventry City Council appointed to fill the vacancy in the city engineer's department caused by the resignation of Mr. G. E. Jenkins.

It is reported that Mr. A. J. H. Carter, late clerk of works and chief assistant engineer for the Brighton Corporation, has been appointed clerk of works for the electric light installation in course of erection at Stockport. There were fifty-four applicants for the appointment.

At a meeting of the Gloucester City Council, held on Tuesday, it was unanimously resolved that Mr. E. W. A. Carter, who has for three years been an assistant in the office of the city surveyor, be appointed assistant surveyor. Mr. Carter served his articles with Mr. J. Fletcher Trew, of Gloucester and Bristol.

Mr. J. H. Monahan, Q.C., who has for a considerable period acted as law adviser to the Local Government Board, has been appointed to a permanent office in that department, at a salary of £1,200 a year, it is supposed as fourth commissioner. This creates a vacancy in the office of revising barrister for the co. Dublin, held by Mr. Monahan since 1884.

Mr. J. P. Greenwood, assistant surveyor to the Barry District Council, was, at a meeting on Thursday evening at Cadoxton, presented with a drawing-room clock and pair of ornamental bronzes to match on his departure from the district to take up the duties of deputy borough surveyor at Barnley. Mrs. Greenwood, also, was presented with a gold bracelet.

Sir Seymour Haden will preside at the twentieth annual meeting of the Church of England Burial, Funeral and Mourning Reform Association, to be held at 32 Wimpole-street on Wednesday. Among other resolutions will be one pointing out the desirability of the clergy enforcing the Christian obligation of carrying out the burial of the dead promptly, innocuously and inexpensively.

At a meeting of the Rothwell Urban District Council, on Wednesday of last week, Mr. John Pears was unanimously appointed surveyor to the council, in the place of Mr. W. Tuley, deceased. A member of the council stated that he thought Mr. Pears would be the right man in the right place. He had received an excellent training under the late Mr. Tuley, and was quite capable of performing the duties required.

We regret to say that in our last issue we erroneously stated that Mr. E. Clark had been appointed waterworks engineer to the East Westmoreland Rural District Council. We understand that Messrs. G. Watson & Son, of 3 St. Andrew's-place, Fenrith, have for upwards of a quarter of a century been en-

gineers to the council and to their predecessors, the rural sanitary authority. Mr. Clark was only appointed manager and collector of rates.

The Portmadoc and Trefllys School Board recently adopted the report and recommendations of Mr. J. D. Lewis, surveyor to the Portmadoc Urban District Council, respecting the drainage, water supply and ventilation of Tremadoc schools. It was at first proposed that the architect of the building should be appointed to carry out the works, but it was ultimately decided to ask Mr. Lewis to prepare the necessary drawings and carry out the work at once.

Through the kindness of Mr. E. Parry, engineer to the northern section of the Great Central Railway, the city engineer's department of the Nottingham Corporation, with a number of friends, on the afternoon of Saturday, the 18th of June, went over that portion of the line between East Leake and Annesley (a distance of over 18 miles), now rapidly nearing completion. Mr. Parry personally conducted the party, and placed an engine and trucks at their disposal. Stoppages were made at the various important works in progress, and a very enjoyable afternoon was spent.

At a recent ordinary meeting of the Middlesex County Council the Highways Committee presented a lengthy report dealing with the appointment of a county surveyor. For this post sixty-two applications were received, and of these five were disqualified in consequence of being under the specified age, and five others were disqualified as not being Members nor Associates of the Institution of Civil Engineers or Fellows of the Institute of Surveyors. Finally, the committee had interviewed four of them, and now recommended that Mr. H. T. Wakelam, of Hereford, be appointed, at a salary of £700 a year, rising to £850, and in the case of new buildings and new bridges where the contract price exceeds £1,000, the surveyor, when engaged by the council on these works, to be paid a commission, exclusive of quantity surveyor's fees, of 2½ per cent. Mr. Wakelam, it was added, was forty years of age, and since April, 1892, he had been county surveyor for Herefordshire. After a protest and an amendment against the principle of giving commission, the recommendation to appoint was carried by thirty-one to twenty. The subject of commission was, however, referred back to committee for further consideration.

NEW COURT-HOUSE AND POLICE STATION AT HALIFAX.

The corner-stones have just been laid of the new court-house and police station which it is proposed to erect at Halifax. The plans show that the exterior of the building is Renaissance in style, freely treated. The court-house is in the centre of the block, and has open areas on two sides. In every department provision is made for conveniences and cloak-rooms. There is also an open parade ground, a part of which is under cover. A coach-house with four-stall stable is at the back. The magistrates will enter from Blackwall. Here, on the ground floor, are the magistrates' cloak-room, retiring-room and the lunacy-room. The entrance gives access to a wide staircase leading to the magistrates' retiring-rooms and the court-house. One of the rooms is large enough for use as a subsidiary court. The solicitors' entrance is also from Blackwall; but their rooms, as well as those for clients and witnesses, front to Ferguson-street, where will be the general public entrance. For the latter a large entrance hall is provided. The grooms' house and matron's apartments are provided on the ground floor. The police entrance is from Carlton-street, and leads into a large entrance hall. The police offices, which front to Harrison-road, are approached by a wide corridor. The charge-room and inquiry office are near the entrance hall, and the cells are placed round the parade ground, which is approached by a special corridor, with prisoners' lobby, search-room, &c. On the right of the entrance hall is a parade-room, and a staircase leads to the first floor, with policemen's lavatories and bath-rooms. The entrance to the warrant office is in Harrison-road, and this leads also to the rooms of the magistrates' clerk, the chief constable and his clerk on the first floor. The total estimated cost is between £13,000 and £14,000. The contractor is Mr. G. Charnock, and the architect is Mr. G. Buckley.

Municipal Officers and their Patents.—At a recent meeting of the Bombay Corporation, counsel's opinion as regards the legality or otherwise of municipal servants interesting themselves in patents of inventions by themselves or others utilised by the municipality was brought forward for consideration. After a short discussion the council decided that it was undesirable that municipal officers should be in any way interested in patents connected with the working of their departments.

**ASSOCIATION OF
MUNICIPAL AND COUNTY ENGINEERS.**

ANNUAL MEETING AT EDINBURGH.

The following are the arrangements for to-day and to-morrow in connection with the annual meeting which is being held at Edinburgh.

TO-DAY.

10.30 a.m.—Papers and discussions. (7) "Notes on the bacterial treatment of sewage," by D. Cameron. (8) "Two hours' test of a steam ram pumping plant," by J. B. Wilson, Cockermouth. (9) "Electric lighting of Edinburgh: The system adopted: Financial results," by Frank A. Newington, resident electrical engineer. (10) "Recent extensions of Leith docks," by Peter Whyte, docks superintendent.

1 p.m.—The members will be entertained to luncheon by Mr. W. N. Colam, engineer for the Edinburgh cable tramways.

2.50 p.m.—Brakes will be at the "Royal" hotel to convey the members to visit the following works:—

No. 1 Party.—1, Artisans' dwellings; 2, electric lighting works; 3, cable tramway power station, Tollcross; 4, McEwen Hall (organ, by Hope-Jones, will be played by Mr. J. H. Collinson, MTS.BAC., organist, St. Mary's Cathedral); 5, free library.

No. 2 Party.—1, Refuse destructor; 2, Chancelot mills; 3, cable tramway power station, Shrubhill; 4, Leith docks.

A charge of 2s. will be made to each member for brakes, &c.

TO-MORROW.

No. 1 Party.

Visit the Forth bridge. Leave the "Royal" hotel, 9.30 a.m., in brakes for Forth bridge, go on bridge and under; arriving back at 1 p.m.

No. 2 Party.

10 a.m.—Brakes will be at the "Royal" hotel to convey members to visit the following places of interest: Scott Monument (immediately opposite "Royal" hotel), St. Giles' Cathedral, the Castle, Museum of Science and Art, Holyrood Palace, Burns' Monument and Calton Hill.

1 p.m.—Arrive back at "Royal" hotel. A charge of 2s. will be made to each member for brakes.

C. JONES, M.I.C.E., THOMAS COLE, A.M.I.C.E., Secretary,
Hon. General Secretary, 11 Victoria-street,
Westminster, S.W.

(Full details of trains were given in our last issue.)

LONDON WATER SUPPLY COMMISSION.

The Royal Commission met again, on Monday, at the Westminster Town Hall, under the presidency of Lord Llandaff.

Mr. JAMES BIGWOOD, Parliamentary member for the Brentford division of Middlesex and chairman of the Parliamentary Committee of the Middlesex County Council, said the Middlesex County Council area was within the limits of supply of the New River, West Middlesex and Grand Junction companies, whilst the East London and several of the other companies had powers to supply in parts of Middlesex, but the power was not exercised. The population of Middlesex had increased from 320,000 in 1871 to 740,000 at the present moment. The general views of the county, and their desire to stand as a body separate and independent of London, both as regards rating and water supply, had been consistent throughout, and the county council had petitioned against the purchase Bills introduced by the London County Council. The council considered it inexpedient and contrary to public policy that any outside authority should acquire the powers of any of the companies with reference to the supply of water within Middlesex, so as to be in any way empowered to control or interfere with that supply. The interests of such an authority might in many respects be antagonistic with those of Middlesex. The county of Middlesex preferred to remain as it is, and protested against being made a party to the Welsh scheme and its consequences. Supposing that the scheme for the purchase of the undertakings of the metropolitan water companies were rejected, it was submitted that a power of control should be entrusted to a Government board, upon which local authorities interested should be represented in such a way as not to give any preponderating influence to one local authority over another. Witness believed that the constitution of such a board of control would probably be found to be a nearer approach to a solution of the London water question than purchase, seeing that it was very much to the interests of water consumers that efficient and economical control should be established, with a view to secure the following results: (1) Sufficient supply to all consumers, whether within or without the county of London; (2) efficient and very stringent methods of preventing waste; (3) the primary right of the inhabitants of any district from which water is abstracted to a sufficient supply to meet their requirements; (4) more economical administration of the companies' affairs; (5) the application of any dividends in excess of 10 per cent. on the paid up capital of any company to the

reduction of water rates (6) an easy and simple method by application to a tribunal or officer who could without waste of time settle questions in dispute between any company and any water consumer; (7) the restriction and ultimate extinction of back dividends; (8) the placing of the companies under regulations analogous to those under which the gas companies now carry on their undertakings. Another system of control which suggested itself was that the water companies supplying the inhabitants within the jurisdiction of county councils should be placed under some control from those councils within the districts of their jurisdiction.

Mr. E. J. HALSEY, chairman of the Surrey County Council, who also gave evidence, explained the attitude of his council upon the question of purchase. It was urged that if the water undertakings were taken away from the companies no settlement of the water question could be satisfactory which did not secure to the county of Surrey and its local authorities the control of the sources and distribution of water within the county.

Wallasey.—The district council have decided to purchase the Woodlands estate, adjoining Liscard Vale, and having a frontage to the Esplanade, for conversion into a public park. The estate contains 12,500 square yards, and the price given is £3,500.

The Smoke Nuisance.—At last week's meeting of the St. Olave's Board of Works, the clerk reported that he had, as instructed, written to the London, Brighton and South Coast Railway Company and the South-Eastern Railway Company complaining of the smoke nuisance from locomotives. The former company replied expressing some surprise that the board, in whose district trains had been running for so many years, had only now found it necessary to call attention to the fact that locomotives emitted smoke. The South-Eastern Railway Company replied that they were taking steps to prevent the nuisance.

APPOINTMENTS VACANT.

Advertisements which are re-vised too late for classification cannot be included in these summaries until the following week.

THE CORPORATION OF BIRMINGHAM.

The Public Works Committee are prepared to receive applications for the appointment of Chief Road Surveyor in the city engineer and surveyor's department. Candidates, whose age must not exceed forty years, must be thoroughly qualified persons, having had active practical experience in the construction, scavenging and maintenance of roads and streets and of the various classes of pavement used therefor. They must also have had the management of large bodies of workmen, and be able to supervise the setting out and measuring up of works and preparation of estimates.

It will be a condition that the person appointed shall subscribe to the superannuation scheme, and shall devote the whole of his time to the duties of his office.

The salary will commence at £300 per annum, and rise by annual increments of £20 to £400 per annum. A horse and trap will be provided to help him to carry out his duties efficiently.

Applications, in the candidate's own handwriting, stating age, qualifications, present and past experience, together with not more than four recent testimonials, should be sent to the undersigned not later than noon on the 13th of July next.

Canvassing either directly or indirectly will be considered a disqualification.

JOHN PRICE,
City Engineer and Surveyor.

The Council House, Birmingham.
June 25, 1898.

COUNTY BOROUGH OF HUDDERSFIELD.

The Corporation invite applications for the appointment of Assistant Building and Drainage Inspector, at a salary of £120 per annum. Candidates must be between twenty-seven and forty years of age, and have had previous similar experience. Statement of duties may be obtained on application to the Borough Engineer.

Written applications only, in candidate's handwriting, with particulars of present employment, experience, &c., and copies of not more than four recent testimonials, to be addressed to Mr. K. F. Campbell, A.M.I.N.S.T.C.E., Borough Engineer and Surveyor, Huddersfield, on or before the 12th day of July, endorsed "Building Inspector."

Canvassing will disqualify.

(By order)

F. C. LLOYD,
Town Clerk.

Town Hall, Huddersfield.
June 22, 1898.

CORPORATION OF PIETERMARITZBURG.
BOROUGH ENGINEER.

Applications are invited for the appointment of Borough Engineer for the City and Borough of Pietermaritzburg, in the Colony of Natal, South Africa.

The gentleman appointed will be required to devote his whole time to the duties of his office. He must be a thoroughly competent engineer and surveyor, and must have had practical experience in a similar position.

The salary will be £800 per annum, without extras or allowances, and will be payable monthly. Offices, assistants, instruments and stationery will be provided by the corporation.

The city contains an area of 1,000 acres and the borough 27,000 acres. The population is 24,000 and the rateable value £2,250,000. There are 33 miles of streets in the city. Sewerage works, macadamising of roads, paving of footpaths, surface-drainage works, and additional water supply are either in progress or in immediate contemplation. The lighting of the city by electricity is now being proceeded with under the Borough Electrical Engineer.

Applications, stating the age and particulars as to experience of the applicant, &c., with original testimonials (which will be returned), must reach the undersigned not later than Wednesday, the 31st August, 1898, and be endorsed "Borough Engineer."

The appointment will be subject to passing an examination by a medical officer appointed by the corporation.

The appointment will be for three years, and thereafter be terminable by three months' notice on either side.

The successful applicant will be required to take office as soon as possible after receipt of an intimation that the appointment has been conferred upon him.

Applicants residing in the United Kingdom are required to send their applications in duplicate to the London agents of the Corporation (Messrs. Ford Brothers, 14 Southampton-street, Fitzroy-square, London, W.) not later than 22nd July, 1898. A copy of the testimonials will be required in addition to the originals.

In the event of an applicant residing in the United Kingdom being selected the agent will be advised by cable, and will communicate with the gentleman appointed, who will be required to immediately proceed to Maritzburg; £50 will be allowed for passage from London; salary to commence from date of taking office in Maritzburg.

(By order)

STEPHEN STRANACK,
Town Clerk.

DOUGLAS C. BATE, Assoc.M.Inst.C.E., Manager.

ASSISTANT SURVEYOR.—There is a vacancy for an Assistant to the Surveyor of a very healthy urban district, where a thorough insight into the duties of the office can be obtained. No premium. A small salary of about 15s. weekly would be given. Applicants should be well educated and not under eighteen years of age.—Apply to "K," Town Hall, Farnborough, Hants.

THREE ASSISTANT SURVEYORS required for service in the Surveyor-General's Department, West Coast of Africa; must be good levellers and draughtsmen, competent to design and superintend the erection of buildings and construction of roads, bridges and other public works, and to prepare plans and specifications. Commencing salary, £30 to £40 per annum, with free passages out and home.—Apply, by letter only, with copies (not originals) of testimonials, to W. SHELFORD, 35A Great George-street, Westminster, S.W.

TENDERS WANTED.

MIDDLETON CORPORATION.

The Middleton Corporation are prepared to receive tenders for Sewering, Draining, Paving, Curbing and Flagging Brewster-street from Rochdale-road to Church-street, and Church-street from Cheapside to Dawson-street. Quantities: About 157 yards of 9-in., 6-in. and 4-in. drains; 1,120 yards paving, 530 yards flagging and 330 yards curbing.

Plans, sections, details and specifications may be seen, and quantities obtained, on application to Mr. Welburn, Borough Surveyor, at his office, Town Hall, Middleton, any morning between 9 and 10 o'clock.

Sealed tenders, on forms supplied, fully priced out, must be delivered at my office, addressed to the Chairman of the Health and Surveyor's Committee, and endorsed "Street Works," not later than the 6th July, 1898.

The Corporation do not bind themselves to accept the lowest or any tender.

FREDERICK ENTWISTLE,
Town Clerk.

Town Hall, Middleton,
June 22, 1898.

BOROUGH OF MAIDENHEAD.

PRIVATE STREET WORKS ACT, 1892

TO ROAD CONTRACTORS AND OTHERS

The Town Council of the Borough of Maidenhead is prepared to receive tenders for Putting in Order and Making Good a certain Street, called Ray Park-avenue, situated within the district.

The plans and specifications may be seen, and a form of tender and copy of the bill of quantities obtained, at the office of the undersigned, on the payment of the sum of £1 1s., which will be returned on receipt of a *bona-fide* tender.

Tenders, sealed and endorsed "Tender for Ray Park-avenue," must be delivered to me not later than 5 p.m. on Monday, the 11th day of July, 1898.

The Council do not undertake to accept the lowest or any tender.

(By order)
PERCY JOHNS, A.M.C.E.,
Borough Surveyor.

Appropriation of Electric Lighting Profits.

A good deal has been said in these columns at different times as to what is a proper appropriation of profits derived from a municipal electric lighting scheme. The views that have been put forward have been in favour of giving some of the profits of a successful municipal scheme to the general ratepayer, who may not always be a consumer of electricity. A paper on "Appropriation of Profits and Repayment of Loans" was communicated by Bailie Wm. Maclay, convener of the Electricity Committee of the Glasgow Corporation, to the recent meeting of the Municipal Electrical Association, and the conclusions that the worthy bailie arrives at are somewhat antagonistic to the views which we have already put forward. In Glasgow it appears to be the custom of the corporation to allow each of the commercial departments to dispose of any surpluses that may result from a successful year's business. They apparently recognise the fact that not one of these departments exists to make a profit, as is the case with a private commercial concern, but rather that it has been called into existence for the benefit of the community as a whole. In other words, whatever the profits that any of the famous Glasgow municipal departments make, it is not devoted to the relief of taxation. For example, the Electricity Committee last year in Glasgow had a profit of £18,000. In disposing of this surplus they first of all put aside £2,770 for depreciation on somewhat old plant, £1,500 was devoted to renewals of machinery, and £935 for probable renewals of ordinary plant and machinery. They also appropriated about £3,500 of the large surplus for ordinary depreciation of plant and machinery, making in all the sum of £10,705 for depreciation and renewals on the stations. It may be taken, therefore, that the ratepayers do not in any case directly benefit from the electricity works unless they are consumers, when, of course, there is an annual reduction in the charge of electricity; and there is, moreover, street lighting by electricity, which is supplied a good deal under cost price. Needless to say, the Glasgow methods are widely different from those which obtain in most parts of England, the general view taken on this side of the Border being that if, after supplying the consumer at moderate prices and providing the necessary fund for depreciation, renewals and sinking account, there is any profit it should be devoted to the reduction of rates. As we have already maintained in these columns, there is at the present moment a good deal to be urged in favour of such a course. It must not be forgotten that however much electric lighting may eventually become a universal illuminant, it is a light of luxury at the present time. In other words, the consumers of electricity, compared with the number of ratepayers, are in a very small minority. Take, for example, the case of Bristol, which was alluded to by Councillor Pearson when discussing the worthy bailie's paper. It was pointed out that the town

of Bristol has 50,000 ratepayers, and of this number only 1,000 are consumers of electricity, yet Bristol is one of the most successful electric lighting systems in the country, and has been in existence some few years. Therefore it is obvious that a considerable time must elapse before the benefits of electric light works are brought directly within the reach of the majority of the ratepayers. In starting electric light works the whole credit of the town's ratepayers is pledged, and in those towns in which the electric lighting works have not paid for two or three years it has been necessary to make a call upon the rates to meet the losses on the year's working. Consumers, as consumers, were not taxed because the works were running at a loss, and the whole of the ratepayers were called upon to find the necessary funds—a common experience in a municipality undertaking electric lighting. It is impossible that a ratepayer should be benefitted at the expense of the consumer, because the Electric Lighting Act clearly states that after a 5 per cent. profit has been made on the works the surplus shall be devoted to reducing the price of electricity, which is a sufficient safeguard against a consumer being unfairly treated. It is quite true that the matter may assume a different phase when electric lighting becomes more universal, and if it were possible to devote the surplus to carrying out extensions on a very large scale, with the ultimate idea of bringing electricity within the reach of all, then one might argue that it would be better to devote the surplus for such a purpose rather than hand it over to the ratepayers; but as things exist at the present moment it is certainly desirable that some return should be made to the ratepayer for the risk that he has undertaken. The question of repayment of loans is a very important one, and probably is much more keenly felt in the majority of English towns than it is in the case of Glasgow. The general rule is that a municipality borrowing money for electrical purposes shall repay the loan in a period of twenty-five years. There has been some variation of this in different towns. For example, Lancaster has permission to obtain a loan for a period of forty years, and Leeds Corporation have obtained their loan on similar terms; but Bailie Maclay distinctly stated in the discussion that in Glasgow the money for municipal developments is obtained by issuing stock, a good deal of which is interminable, and even if they raise money on stock which is terminable at a certain specified date when the term expires they simply obtain a fresh loan. Thus it will be seen that the conditions are very different to those which obtain in most English towns, and a comparison between Glasgow and an English city is rendered very difficult. Still, some reference was made to the case of Manchester by Bailie Maclay, who considered that the methods adopted in Manchester for appropriation of profits were distinctly inferior to those adopted in Glasgow; but an examination into the facts shows that Manchester is not only supplying

its electricity to consumers at a much lower price than the Glasgow municipal works, but it is, after putting heavy sums aside for depreciation and sinking fund, making a very considerable return to the ratepayers. Then, again, with regard to gas in Manchester, not only is the price charged a moderate one, but after paying off all the necessary charges the gas department is able to hand over no less a sum than £40,000 (per annum) to the city funds.

* * *

An
Edinburgh
Scheme.

It is a curious fact that the week which witnessed the visit of the Association of Municipal and County Engineers to the Scottish capital should have found the Edinburgh City Council occupied with the consideration of an imposing scheme of improvements upon which the "elders of the city" are not so unanimous as they were in the days of the old provost, "of ancient name and knightly fame and chivalrous degree," who roused his fellow-townsmen to guard the city after the fateful field of Flodden. The ranks of the elders are indeed very much divided, the Lord Provost being at the head of one contingent and the Treasurer the other. The present Lord Provost, unlike his grand old predecessor, who stirred the "burghers stout and true," is in this case the missionary of conciliation and peace; it is the Treasurer who calls to "fling the banner out once more." And, strange to relate, the cause of the divided counsels is a surfeit of riches. More than a year ago a local magnate, Mr. Usher, prompted by a desire to enhance the architectural beauties of the capital, and possibly by an ambition to perpetuate his name and fame in the public annals, handed over to the corporation a large sum of money to be devoted to the construction of a public hall, to be known as Usher Hall. The money was given on the condition that the corporation should find a site, and the finding of the site has been the difficulty. Even with the free gift of the structure itself, the question of site is a serious consideration. Various sites have been suggested, but at present there is a difference of opinion as to whether the hall should be erected on the canal basin at Port Hopetoun or on property at West Meadows. The first proposal was that it should be built on Castle-terrace; but that, as well as several other sites, which would have involved an expenditure of from £100,000 to £150,000, was abandoned on the ground of expense. In connection with the canal basin site there have been various difficulties. One of them was the unwillingness of the North British Railway Company to sell it. At first there was a belief that the company did not hold the property in absolute ownership, but this appears to have been ill-founded, and there is now no manner of doubt that they own the land in absolute fee. But there is another aspect of the scheme with regard to which there is diversity of opinion, and that is the utilisation of the area for the purpose of widening Fountainbridge-street and carrying out an eminently desirable public improvement in that locality. The question of application to Parliament for powers for that purpose was debated by the council at the last meeting. It is not disputed that if the canal basin could be obtained it would make an excellent site for the Usher Hall, and the other improvements contemplated would give the structure a splendid framework; but there is the refusal of the North British Railway Company to sell. The company have declared, through the voice of their general manager, that in no circumstances and on no conditions would they consent to part with the canal basin. As a matter of fact, they advance a strong argument for not parting with it. They are now making enormous additions to the Waverley station, but it becomes every day more apparent that by the time the station is completed it will be all too small for the expanding traffic, for which outlets will have to be sought in another direction. That other direction would naturally be

the site of the Port Hopetoun basin. The corporation can only obtain the basin by promoting a Bill in Parliament for powers of compulsory purchase, and while Parliament might be induced to pass the Bill for the contemplated Fountainbridge improvement scheme, it is most unlikely that it would deprive the railway company of such a valuable property for the mere erection of a hall. The Lord Provost admitted that it was not a pleasant thing to look at, to have the coal barges coming up and discharging their coal in that part of the town; neither was a railway goods station for that matter. Mr. Cooper, the burgh engineer, put the cost of the acquisition of Port Hopetoun and Port Hamilton at £150,000, and this included nothing for the closing of the canal. The Lord Provost added, in his speech at the last meeting of the council, that he would be quite pleased to acquire that ground, or any portion of it, but he was totally opposed to the city taking compulsory powers to obtain it, and he submitted a resolution to that effect. Treasurer M'Crae moved that application be made to Parliament in the ensuing session for powers to acquire the area for an improvement scheme, and that the Lord Provost's committee be instructed to enter into negotiations with that object in view. He described the Fountainbridge district as a discredit to the city, and commented upon its "lack of salubrity" and the "air of decay" which, if not actually injurious to health, was not a healthy environment. A third motion was submitted to the meeting by Mr. Waterston in favour of the views of the ratepayers being ascertained, but this was defeated by forty votes to three. When the vote was taken upon the Lord Provost's resolution and the Treasurer's proposal the former was carried by thirty votes to twelve. Victory thus, for the present, lies with the Lord Provost. The alternative site for the Usher Hall, in West Meadows, seems to be very generally favoured. It may not be in all respects an ideal one, but it has its advantages. The building would be in an open space with Burntisland Links at hand; and economy and utility will probably outweigh other considerations.

* * *

District Surveyors and their Salaries.

Under the supervision of Mr. Heslop, county surveyor of Norfolk, the highways of that shire have reached a high degree of excellence. The chief credit must necessarily be due to the county surveyor; but that gentleman would probably be the first to acknowledge that the assistance which he has received from those subordinates who act in the capacity of district surveyors has been sufficiently great to call for special recognition from the county council in the shape of some additional remuneration. It is only just to that body to say that they also recognise the fact, but we cannot add that their recognition errs on the side of generosity. Very far from it. Each district surveyor who has served for three years or upwards to the satisfaction of the county surveyor is to receive an addition of £5 a year, which represents not quite 2s. a week. This decision was arrived at in preference to an amendment in favour of granting this small increase triennially until a maximum of £150 was reached. Each district surveyor has to keep a pony and trap, for which, we observe, Mr. Councillor Sapwell considers £25 an ample allowance. It appears that he has also heard of a gentleman who keeps a four-wheel carriage, a convertible car and a pony 14 hands high, the whole annual cost of these luxuries being only £28 3s. 4d., a fractional sum which smacks of a desire for minute accuracy. It may be that our experience of luxuries is not quite so extensive as we could desire, but we are certainly driven to the conclusion that Mr. Sapwell's friend must have a pronounced genius for doing things on the cheap. From the report of the discussion we observe also a general disposition to bring in the law of supply and demand by arguing that plenty of men could be obtained for the salaries now paid.

One of the most dangerous symptoms of the little knowledge against which we are proverbially warned is a disposition to drag into the affairs of daily life some cheap and shallow political economy. Nothing is more clearly indicative of a half-educated mental attitude, for it shows a hopeless misconception of the scope and object of what are generally known as the laws of political economy, which, like the so-called but equally misunderstood "laws of Nature," have been arrived at by thinkers simply as convenient formulae or generalisations, and not as weapons to be thrown at the heads of our fellow-creatures. Only those who imagine vain things, and those whose thinking capacity is of the crudest, assume that the ordinary affairs of everyday life are or can be regulated in accordance with what they are pleased to think are "the laws of political economy"—a phrase to roll under the tongue—without reference to moral factors, which are the most powerful governing influences, no matter how much they may be hidden. We do not believe that such a view was ever taken by economists, and in any case it would scarcely be endorsed by the economists of the present day—more luminous and inspiring, if less rigid, thinkers than their predecessors. The Norfolk councillors forget that, though remuneration is generally strictly limited, service is not, for the simple reason that in its highest form it can only be regulated by the conscientiousness of the worker and the self-respect which shows him that the adequate performance of his work is a duty which he owes to himself quite as much as to his employers. It is equally his duty to see that he is properly remunerated. These, we fear, are elementary and familiar truths, but it seems impossible to get them into the heads of many county councillors, or other councillors for that part of it. But there are two sides to every question, and the other side of this question of the district highway surveyors and their salaries has been very neatly and magnanimously expressed by our contemporary, *The Eastern Daily Press*, when it remarks that the district surveyors may comfort themselves with the thought that the reputation that the main roads of Norfolk have obtained will stand them in good stead when the chance offers itself of bettering their position elsewhere.

Public Health Law.

We referred very briefly last week to that portion of the address of the president of the Incorporated Association of Municipal and County Engineers which dealt with this subject. We should like, however, to add a word or two as to one suggestion made by Mr. Robson in the course of his remarks. After pointing out how greatly the law relating to public health has been extended since the passing of the Act of 1875, the president continued: "So numerous have been the subsequent Acts added to the statute-book, and so varied the nature of the measures to which they refer, that the time has now arrived when great assistance would be rendered to municipal authorities, less litigation would be involved, and the statutes themselves made much more clear, if the Public Health Act, 1875, and the Acts incorporated therewith were consolidated in one general Act relating to matters connected with public health." We cordially endorse these remarks, and should rejoice to see added to the statute-book a thoroughly well-drawn Public Health Consolidation Act, embodying the law at present distributed heterogeneously among a number of Acts and an infinitude of cases, with such amendments and additions as might be found desirable. The principle of consolidating legislation has been accepted in many instances—among other subjects thus dealt with may be mentioned arbitration, partnership, trustees and the sale of goods—with satisfactory results; and we do not hesitate to say that the subject of public health is ripe—and over-ripe—for similar treatment. We know not whether, amid the conflict

of party politics, the legislature will in the near future find either the time or the inclination for dealing with a subject which, great as is its importance, does not, we fear, appeal very loudly to the average elector. The first step in this direction, however, is undoubtedly to promote a more vigorous and united public opinion among those more intimately connected with matters pertaining to the public health. We trust, therefore, that this portion of the address will receive the attention and consideration which it undoubtedly merits, with a view to some concerted and practical action being taken. Mr. Robson indicated a few of the many matters which might, and should, be dealt with in such a consolidation Act—e.g., many useful police and sanitary measures now contained in private Acts, amendment of the "ill-conceived" 19th sec. of the Public Health Acts Amendment Act, 1890, additional extended powers of making by-laws, and so forth. Any such general Act should, of course, be compulsory in its entirety, and thus secure uniformity of practice throughout the kingdom, in lieu of the diversity at present fostered by the prevalent practice of permissive or adoptive legislation. It should also, in our opinion, either substantively re-enact—instead of merely incorporating by reference—or include in schedules appended, those clauses of the Towns Improvement and Towns Police Clauses Acts, 1847, which are incorporated with the Public Health Act, 1875. In short, it should, as far as reasonably practicable, comprise the entire law of public health up to date. Perhaps this is a "counsel of perfection," but, nevertheless, we believe it to be attainable.

Municipalities and Electric Lighting Companies.

The recent decision of the House of Commons to grant powers to the Marylebone Vestry for the supply of electrical energy within the parochial district has fluttered the devotees of electric lighting shareholders, with the consequence that shares have been tumbling down with extraordinary rapidity. There has probably, since the commencement of the electrical industry, been no greater scare occasioned among investors than at present exists, but there is absolutely no reason why shareholders should have been so much agitated by the action of the Marylebone Vestry. We are not anxious to go into the question of the position of electric light companies in the various districts, but it might be mentioned that competition in electric light supply was clearly stated by Government officials to be desirable, and would, moreover, be encouraged. Indeed, this view has been carried out to such an extent that in most of the districts in London there is competition between electric lighting companies, but where two companies are supplying electricity in one area it is very unlikely that a vestry or a municipality would be given powers to come in and compete against the two existing companies. It is obvious that such a course would be risky, and the Board of Trade would, no doubt, with a view to protecting the interests of the ratepayers, decline to sanction any such scheme. Even in the district where only one company exists and powers are conferred upon a local authority to become suppliers of electricity, it by no means follows that the company will be starved out; it will have the benefit of a ripe experience, it will have an established business, and it ought to be able to supply electrical energy at the same price as the vestry.

PROFESSIONAL PROVERBS.

- For a Jerry Builder:* A ditch of slime saves him.
- For a Parliamentary Agent:* It is no use taking charts to Westminster.
- For a Carpenter:* Boards with a feather lock together.
- For a Road Contractor:* Those who live in work-houses should not break stones.

Association of Municipal and County Engineers.

ANNUAL MEETING AT EDINBURGH.—II.

VIEW OF EDINBURGH SHOWING NATIONAL GALLERY AND CASTLE.

Before resuming our report of the proceedings at Edinburgh we shall, as intimated in our last issue, give some further remarks in continuation of our sketch of the city and its municipal development.

GAS AND WATER SUPPLY.

The water supply of Edinburgh was at one time provided by private companies, but the inhabitants were dissatisfied with the service, and the works were transferred by compulsory sale to the corporation in 1869. The supply is derived from several sources, lying chiefly to the south of the city, but a splendid supply of spring water, which is stored in the reservoirs of Torduff and Clhbiidean, is obtained from the northern slopes of the Pentlands. A supply is also derived from the Moorfoot Hills. Public purposes, baths and ordinary domestic supplies consume something like 35 gallons per head per day, and taking into consideration the fact that not only is the city supplied, but the neighbouring villages also, it has been decided that a further supply is absolutely necessary. The head waters of the Tweed, from which a pure supply is available, are therefore being drawn upon, and at the present time a scheme which is expected to satisfy the requirements of the city for at least a quarter of a century to come, and which will be capable of further development and extension as occasion requires, is now in progress. The cost is estimated at £750,000. In connection with the water supply it might be mentioned that the public baths and wash-houses, which have been in use for several years, are so much appreciated that their extension and multiplication is demanded.

As in the case of the water supply, the gas supply for the city and neighbourhood was at first controlled by private companies, but in 1888 the corporation promoted a Bill for the acquisition of the undertakings, which have now become part of the city property. As Leith and the adjacent burghs are supplied from the works, a joint commission, consisting of twenty-three representatives of the different authorities has been appointed for their management. When the electric light was introduced into Edinburgh four years ago, it was expected that the supply of gas in the city and its neighbourhood would diminish, but so far from that being the case, the output has gone on increasing, the existing works having been filled up with plant to their fullest capacity. They are situated in a densely-populated part of the city, and that fact, together with the appointment of a new engineer, has led the commissioners to seek a new site, on which an installation of the best kind may be erected and a modern plant utilised. A site near Granton, to the west of the city, has been acquired, and no time is being lost in taking steps to provide a gas installation of the best possible kind.

ELECTRIC LIGHTING—CABLE TRAMWAYS.

We have mentioned above that four years ago a scheme of electric lighting was promoted in Edinburgh, and a large central station in the immediate neighbourhood of railway sidings, with facilities for increasing the space for many

years to come, was duly erected. So great has been the success of the scheme that to-day a new power station in a different part of the city and of greater magnitude is now in course of erection. Beginning with charges of 6d. per unit for lighting, 3½d. for power, and £20 for each public lamp, the charges to-day are 3½d. per unit for lighting, 1½d. per unit for power, and £14 for each public lamp. The splendid lighting of the streets now always attracts the attention of visitors.

As in other cities, after the passing of the Act of 1870, a system of horse tramways was inaugurated by private companies. An efficient tramway service in towns of any size or importance is, of course, a necessity, and in 1893 the corporation acquired the horse tramways within the bounds of the city. In 1897 there was also acquired a system of cable tramways which had been laid down on the north side of the city where the gradients and slopes are excessive. This system has proved remarkably successful, and the corporation are now taking steps to acquire the section leading to Portobello, which in 1896 became part of the city in virtue of the extension scheme. It is true that the authorities of many other towns—after deliberating carefully, visiting other towns both at home and abroad, and anticipating a successful future for electricity—have either wholly or to a large extent adopted the system of the overhead trolley, but the Edinburgh authorities, after similar deliberation and close examination of other towns in this country and on the Continent, have decided that cable traction is the most suitable for Edinburgh with its many slopes and gradients.

At present the system is approaching completion. There will be in all four cable-power stations for the working of the lines. The road plant has been almost entirely renewed, and numerous extensions have been added. The cost of the whole work is estimated at £750,300. A contract has been entered into with a private firm for working the system for twenty-one years, the terms being that 7 per cent. be paid on the purchase price and an additional 7 per cent. paid on the capital expenditure of cabling. The maintenance of the whole system, roadwork, power stations and machinery, rests with the lessees, so that at the close of their contract the whole of the installation is to be handed over to the corporation in full equipment and working order, free of expense.

FIRE BRIGADE.

The Edinburgh municipal fire brigade was inaugurated in 1824, and was therefore the first in the country. It was called into existence after the great fire of that year, when one side of the High-street to the Tronⁿ Church was burned down. Until about thirty years ago, however, the brigade was worked by auxiliary firemen, but since then the men have been more or less permanent, and are now almost entirely so. The present staff consists of fifty-one officers and

ⁿ We regret that, owing to a printer's error in our last issue, the word "Tron" was printed "iron."

five auxiliary men. There are five steam fire-engines, tenders, &c., and the development and expansion of the city have impelled the corporation to build a central fire station.

This will have two steam fire-engines, two tenders and one fire-ladder always ready for immediate work, and accommodation will also be provided for the housing of the thirty officers and firemen and for the "firemaster." It will, of course, be equipped with the most modern appliances, including special arrangements for a speedy "turn out," and the cost is estimated at £35,000. All plant will be constructed and repaired in the workshops attached to the station, which will be lighted by electricity and heated by steam. Electric motors will be used throughout. The horsing of the engines will be on the American system, the horses being trained to take their places themselves. On ringing the alarm all doors will be opened automatically, and the first two engines will start to a fire within thirty seconds of the first alarm, the remainder following a few seconds later. The site of the new buildings is almost exactly in the centre of the city. A watch-tower, which will also be used for hose-drying purposes, will be provided, and it is proposed to build a sub-station in the Abbeyhill district, with a steam fire-engine and a permanent staff complete.

There are at present three district stations, with two steam fire-engines, and another steamer will shortly be obtained. The old station in the High-street will soon be discontinued. Since Mr. Portage has become firemaster the brigade has been entirely remodelled, training better adapted to modern needs being given to the staff, and certain minor improvements adopted by the new firemaster, notably the use of aluminium in place of gun metal for all couplings, pipes and appliances. It will readily be gathered that nothing is being left undone to put the Edinburgh Fire Brigade on a thoroughly satisfactory and efficient basis, in conformity with the policy now consistently adopted in connection with the other departments of the municipal service.

THE CITY SLUMS.

The question of dealing with the poor, more especially in regard to the housing problem, has always been an exceedingly troublesome one in Edinburgh, the poverty and consequent depression of the poorest classes being unusually great. This is by no means ascribed wholly to any peculiarly bad tendency in themselves, or to the evil influence of the insanitary surroundings and inadequate accommodation, but is probably very largely due to the absence of industrial activity in the city, of scope for employment and thus of healthy stimulus to exertion.

The tendency to erect flatted tenements of four, five and six storeys in height has more recently, on account of the

MR. THOMAS HUNTER, W.S.,
Town Clerk of Edinburgh.

demand for dwellings, led to the subdivision of such flats into separate houses, and has largely tended to dilapidation and the increase of insanitary conditions. About thirty years ago this state of affairs had reached so extreme a point that in 1867 an improvement scheme was promoted for the clearing out of numerous rookeries and the opening up of a number of new streets and thoroughfares, and the result was an immense advantage to the Old Town. The scheme was promoted when Dr. Robert Chambers was Lord Provost, and is known as Chambers' improvement scheme. The cost was something like £350,000.

But, while opening up areas for the admission of light and air to regions in which they were imperatively required, the expulsion of so many poor people from their homes without providing a corresponding amount of fresh accommodation served only to aggravate the overcrowding and the insanitary conditions of the remaining houses. This led to a more recent improvement scheme, which was inaugurated under the provisions of the Housing of the Working Classes Act, 1890, by Sir James A. Russell, when Lord Provost. In this case the authorities confined themselves to the absolute clearing out of dense squares and dilapidated buildings. Dozens of the old narrow "closes," from which daylight was almost absent, were abolished. The benefits of the scheme have

been incalculable, and districts in which formerly police supervision was incessantly required are now highly respectable. The Earl of Rosebery, for example, has acquired and renovated the old habitat of Lady Stair, and it now stands at the head of a court in which darkness and dilapidation were wont to reign supreme. But farther improvements are still required before Edinburgh could be considered—if, indeed, such a consummation be possible—to be entirely free from slum life. Sir James Russell's scheme cost £20,000.

Some further details may be given of the work done in providing dwellings for the poor as a necessary complement of the merely negative work of clearing insanitary areas. The work has had to be done largely in co-operation with the North British Railway Company, who have made enormous clearances of working men's houses to carry out the enlargement of the Waverley Station. There are three schemes by no means commensurate to the needs of the city, but sufficient to give the authorities the experience required for more extensive work in the future. On one of the cleared sites a scheme has been completed, at a cost of £10,000. Houses of one room and two rooms have been provided, and their administration is supervised by the Social Union, a body composed of citizens of good social position who have undertaken the work of seeking to ameliorate the condition of the poor. The scheme in question, it is gratifying to note, is regarded as satisfactory, both by the Social Union and by the occupants of the houses. The provision comprises some fifty-six houses, which are let at rents varying from 2s. 6d. to 4s. 3d. per week. Such rents, of course, are beyond the reach of those who have no regular means of livelihood, and a type of house suitable for the poorest inhabitants is still required. The problem is at the present moment receiving the earnest consideration of the authorities. Another scheme, by which some sixty-four houses have been provided, has been carried out in the suburbs at a cost of £9,000, and it is pleasant to be able to record that this scheme has also been highly successful, especially in regard to what must always be regarded as the primary test of such undertakings—the appreciation of those for whom the accommodation is designed. The North British Railway Company have also carried out a scheme which has provided over seventy one-room and two-room houses, at rentals varying from £6 to £10 per annum.

SEWERAGE AND SEWAGE DISPOSAL.

Twenty years ago the sewers of Edinburgh, from the city boundaries towards the sea, were simply polluted open streams, giving off foul exhalations. One of these—the outlet from the Old Town—was, and still is, a feeder of the irrigated land known as Craigenfinny Meadows. This system of irrigation, which has existed for the last 300 years, is still carried on. The exhalations from these meadows are considered to be noxious in the extreme, but the corporation have not yet ventured to acquire them. The fact that the public health has not been appreciably affected is largely attributed to the oxygenated atmosphere which proceeds from the sea, and serves to neutralise the evil effects of the emanations from the meadows. The south-west wind, again, has a tendency to carry the evil odours seawards. The irrigation of these meadows is carried on by a private owner for his own benefit, and whether the city will one day acquire them remains to be seen. The outlet sewers, of which there are four—two at Leith, one at Newhaven and one at Portobello—are now covered in and conducted to low-water mark, some 500 yards distant from the shore. Twenty years ago the condition of the house drains was very much an unknown quantity, but during the intervening period a system of persistent inspection has had the effect that there is to-day scarcely a house in Edinburgh that has not been overhauled and certified.

MUNICIPAL ADMINISTRATION.

A very slight acquaintance with the municipal work of Edinburgh shows that, as regards some of the important services, it is governed by specially appointed commissioners, but it is once obvious that, owing to the necessity of providing for the requirements of neighbouring places, some such form of administration was to a large extent unavoidable. As we have already indicated, one result of the existing state of affairs has been the fostering of a desire to amalgamate with Leith, far and away the most important of the surrounding places, and it is rumoured that the idea of municipal unification has by no means been abandoned by many of the leading civic administrators of Edinburgh. Their aim, in short, is to bring under one central administrative body the various departments of municipal work which are at present controlled by separate commissions, consisting of members representing not only Edinburgh, but also, in proportion to size and population, the outside boroughs. If such a policy could be carried out effect the various departments in question would practically become executive committees of an expanded town council. That many important advantages would accrue can scarcely be gainsaid, but it will suffice to mention one or two of the most important. The collection of rates, which is at present carried out by several bodies, would be centralised under one management, and the same remark holds good with reference to the continual opening up of streets for the laying of mains in connection with the various services. Whatever objections may be urged and arguments advanced against the policy of unification and centralisation, the gain that would result in many directions is obvious, particularly in connection with the diminution of working expenses and the

extinction of much of the friction that must necessarily prevail under the present system. That there is at present strong opposition to amalgamation cannot, of course, be denied, but everything points to the desirability and ultimate success of the policy. Several bodies of long-standing and exceptional privileges have already been abolished, the most important probably being the City Road Trust, to which was entrusted the paving of roads and streets. When it was found, two years ago, that further enlargement of the city boundaries was desirable the Bill that was promoted provided for the annexation of Leith, Portobello and a few small suburbs. As we have already mentioned, Leith succeeded in preserving its separate municipal existence, but the extension, which, of course, included Portobello, added considerably to the area of the city and increased the population by about 10,000.

A few miscellaneous but interesting facts may be added to those we have already given. The Edinburgh and District Water Trust was constituted in 1869, and consisted of representatives from the town councils of Edinburgh, Leith and Portobello; but, of course, the annexation of Portobello slightly altered the constitution of the trust. The Gas Trust consists of representatives from Edinburgh and Leith, and these two corporations join in forming a Purification Commission for the Water of Leith, the Edinburgh Corporation also taking part in the administration of Leith Harbour and participating in the administration of many activities which are not usually included among municipal functions. Among these matters, in the control of which the Edinburgh City Council have a voice, may be mentioned the University, which was founded by the corporation in 1582, the Calton Hill Observatory, the Veterinary College, Trinity College Hospital, and numerous charitable institutions. The Lord Provost, in addition to being Lord-Lieutenant of the County of the City of Edinburgh and Lord High Admiral of the Forth, occupies many positions in connection with public bodies and philanthropic institutions. After the Lord Provost the most important office-bearer is the City Treasurer, who, like the former, is elected for a period of three years. The Dean of Guild is elected to the corporation by the guild brethren. We have said enough to prove to those who are not already aware of Edinburgh's splendid municipal record, that that record can, in many respects, compare favourably with that of any city in the world. The corporation have carried out one of the most successful electric lighting schemes in the country; they own the tramways, and an extensive system of markets—wholesale and retail of all kinds—from which a large revenue is drawn; they have established baths and wash-houses and free public libraries, and have erected artisans' dwellings. In addition to this, it should be remembered that the gas and water supplies have been virtually municipalised, though it has been found convenient to place them under the control of special trusts or commissioners, the Edinburgh City Council, however, taking the leading part in that control through the representatives nominated. Without transgressing the legitimate limits of municipal activity, the members of the Edinburgh City Council have shown themselves to be thoroughly alive to the duties and responsibilities of civic life. Special phases of municipal work in Edinburgh are dealt with in several of the papers read last week, notably in those of Mr. Young, Mr. Colan, Mr. Stewart, Mr. Bruce, Mr. Newington and Mr. Whyte.

CONCLUSION.

Our brief preliminary sketch of Edinburgh and its municipal development we must now bring to a close, though we recognise that the necessity of confining our remarks on so extensive and engrossing a subject within severe limits must render the treatment less effective than might otherwise be expected. Nevertheless, we part from the task with as much regret as the members of the Association no doubt parted from the beautiful city in which they had been sojourning. There is as little doubt that they carried away with them vivid and permanent impressions of the city and its many remarkable features—its beautiful public buildings, so placed on lofty terraces and otherwise as to give the best effect to their architectural features; the city's unique site—one of the chief causes of its peculiar characteristics—on hills separated by ravines, forming an outlying spur of the Pentlands, full of undulations and abrupt heights; and the rare beauty of the landscape, with the bold outline of the Castle as the central feature. Above all, there is the marked contrast between the New Town and the Old Town. The Edinburgh that so roused the enthusiasm of Scott was a city, the picturesque features of which were almost exclusively those associated with the Old Town, which, as we have already had occasion to mention, practically arose after Flodden. Accommodation was sought within the walls by crowding buildings on every available spot, displacing the earlier structures by lofty piles, from which often projected overhanging additions of timber. The slopes of the ridge along which the main street of the Old Town was formed were covered with picturesque alleys and closes, which contributed so much to the antique and peculiar aspect which the city still retained when Scott was in his prime, and when Sir David Wilkie, after wide experience of Continental art and cities, wrote:—

"What the tour of Europe was necessary to see elsewhere I now find congregated in this one city. Here are alike the

beauties of Prague and of Salzburg, here are the romantic sites of Orvieto and Tivoli, and here is all the magnificence of the admired bays of Geneva and Naples. Here, indeed, to the poetic fancy may be found realised the Roman Capitol and the Grecian Acropolis."

The resemblance between the distant view of Athens from the Ægean sea and that of Edinburgh from the Firth of Forth has often been admired, and in the abortive and uncompleted monument on the Calton Hill, which was intended to be at once a reproduction of the Parthenon and a memorial to Wellington and his comrades, there is a somewhat unfortunate indication of the extent to which the likeness has been present to the minds of the citizens, whose solicitude for preserving the beauty of their town is in general worthy of all respect. In two ways has that solicitude been shown in a marked degree—in a determination to discountenance industries which might injure the aspect of the city, and in a readiness to expend liberal sums of money in the erection of splendid public buildings. The Old Town is now merely the nucleus of the modern city, which has extended over the neighbouring heights northwards towards Leith, southwards and westwards towards the lower slopes of the Pentlands. On the whole, the improvements of the nineteenth century have not only retained and developed the quaint and picturesque features of the Old Town, but have added new features, in many cases equally picturesque, though of a different order, in the other parts of the city. The ridges on which it is built are connected by splendid bridges, beneath which run crowded thoroughfares; the valley between the Old and the New Town and the Castle is laid out in beautiful gardens, and on the lofty terraces stand out clearly splendid public buildings, built of the fine white freestone which abounds in the neighbourhood. In every respect the advance made by the city since the beginning of the century is, indeed, remarkable. In 1801 the population was 66,544; in 1871 it was 196,979; and to-day it is practically 300,000. But while a New Town has grown up, the Old has not been obliterated, and to-day they stand in vivid contrast, the former characterised by symmetry and careful design, and the latter by formless picturesque and by irregularity of site on the slopes of a ridge crowned by a massive and time-marked fortress. Here, indeed, we have a city which compares to advantage with the most picturesque and beautiful capitals of the world, and is even now as worthy of enthusiasm as when Sir Walter wrote:—

Such dusky grandeur clothed the height
Where the huge castle holds its state,
And all the steep slope down,
Whose ridgy back heaves to the sky,
Filed deep and massy, close and high,
Mine own romantic town.

THURSDAY'S PROCEEDINGS

(continued).

In our last issue we were successful, largely owing to a liberal employment of telegraphic facilities, in reporting with considerable fulness the proceedings of the opening day of the annual meeting of the Incorporated Association of Municipal and County Engineers, which was this year held at Edinburgh on Thursday, Friday and Saturday of last week. It will thus be seen that the proceedings reported took place on the day immediately preceding the publication of our paper. A full account was given of the reception at the City Chambers, and also a clear outline of the general business of the day. Some of the day's functions—such as the luncheon and the annual dinner—will, of course, be dealt with more fully in subsequent pages. In addition to the president's address, two papers—those of Mr. Campbell and Mr. Bruce, dealing respectively with tar macadam and the housing of the working classes in Edinburgh—were given, though for obvious reasons it was impossible to give the discussions thereon. In continuing our report this week we give as many of the papers and discussions as space will permit of. The following is the list of those who were present at the meeting:—

PRESIDENT: Mr. O. Claude Robson, Willesden.

PAST-PRESIDENTS: MESSRS. L. Angell, West Ham; J. Lemoo, Southampton; C. Jones, Ealing; and J. Holey, Hanley.

VICE-PRESIDENTS: MESSRS. J. Cooper, Edinburgh; and W. Harpur, Cardiff.

MEMBERS OF COUNCIL: MESSRS. J. Paten Barber, Islington; J. W. Cockerill, Great Yarmouth; A. E. Collins, Norwich; A. Creer, York; E. P. Hooley, Nottingham; J. Paton, Plymouth; J. S. Pickering, Nuneaton; S. S. Platt, Rochdale; J. Price, Birmingham; W. E. C. Thomas, Neath; T. W. Stainthorpe, Eston; and T. Cole, secretary.

MEMBERS: MESSRS. T. Aitken, Cupar, Fife; C. F. J. Allin, Smethwick; J. A. Angell, Beckenham; W. Atkinson, Kiveton Park; F. Baker, Middlesbrough; B. Ball, Nelson; J. I. Barton, Isle of Wight; W. Beatson, Leith; G. Bell, Swansea; W. N. Blair, St. Pancras; J. H. Brett, Belfast; F. S. Button, Burnley; T. Caink, Worcester; K. F. Campbell, Stockton; H. J. Clarson, Tanworth; J. A. Crowther, Bootle; J. P. Dalton, Ryton-on-Tyne; H. Dearden, Dewsbury; E. Evans, Carnarvon; A. D. Greatorex, West Bromwich; J. Gregson, Padham; T. Hunter, Leigh; W. W. Inghamells, Pokesdown; J. Pollard, Westminster; J. I. Landless, Brierfield; W. H. Leete, Bedford; J. L. Lumsden, Kirkealdy; R. A. MacBrair, Lincoln; H. C. Marks, Carlisle; G. S. Matthews, Dorling; R. McKillop, Perth; N. Parr, Brentford; and S. A. Pickering,

Oldham; G. H. Pickles, Burnley; H. Richardson, Aston Manor; W. H. Savage, East Ham; N. Scorgie, Rotherhithe; T. Scott, Tadcaster; J. A. Settle, Heywood; J. E. Sharpe, Clitheroe; G. H. Shipton, Oldbury; J. S. Sinclair, Widnes; R. W. Smith-Saville, Darwen; J. P. Spencer, Newcastle-on-Tyne; S. Stallard, Maidstone; J. Standfield-Brin, Oystermouth; S. Stend, Harrogate; F. Sumner, Bermondsey; T. H. Tarbit, Loftus; R. J. Thomas, Aylesbury; A. J. Turnbull, Greenock; A. Ventris, Strand; C. F. Wike, Sheffield; J. B. Williams, Davenport; J. B. Wilson, Cockermouth; and F. S. Yates, Waterloo.

VISITORS.—Messrs. C. H. W. Biggs, London; W. Brown, London; Editor THE SURVEYOR, London; A. R. Fiech, A. S. Jones, Finchampstead; O. J. Kirby, Councillor E. Mellor, Huddersfield; K. M'Kenzie; R. M. Reid, Stirling; and G. Watson, Leeds.

NEW MEMBERS AND GRADUATES.

It will be remembered that last week we briefly stated that at the meeting of the council, held at the Royal Hotel, on Thursday morning, ten new members and eighteen graduates were elected. The following is the list:—

As Members—

Percy C. Dormer, surveyor to Urban District Council, Raunds, Northamptonshire; Robert McKillop, burgh surveyor, Perth, N.B.; Francis J. Morris, borough surveyor, Grantham; Adam R. Paterson, burgh surveyor, Renfrew, N.B.; John E. Smales, surveyor to Urban District Council, Woodford, Essex; J. Standfield-Brin, surveyor to Urban District Council, Oystermouth; Acton A. Tarriff, burgh surveyor, Elgin, N.B.; H. M. Whitehead, surveyor to Rural District Council, Cannock, Staffordshire; and Archibald Wilson, county surveyor, Dumbarthonsire.

For Transfer—

William E. Y. Putman, borough surveyor, Morley.

As Graduates—

C. Adams, city surveyor's office, Birmingham; S. P. Andrews, Tottenham; H. S. B. Best, Beckenham; D. J. Bowe, borough engineer's office, Eastbourne; J. T. Briscoe, Enfield; T. O. Cudbird, Norwich; J. F. Dent, Nelson; W. A. Farnham, Westminster; E. E. Finch, town hall, Bermondsey; R. W. Fraser, town hall, Wolverhampton; R. Oakden, borough engineer's office, Stratford, E.; F. H. Parr, council offices, Mortlake; A. H. Quick, Newlands, S.E.; J. Spink, city surveyor's office, Manchester; W. F. Sutton, Birmingham; T. E. Tiffin, West Hartlepool; E. Willis, council offices, Kilburn; and F. Wilson, London.

The following is the

DISCUSSION OF MR. CAMPBELL'S PAPER.

MR. SMITH SAVILLE (Darwen) said he wished to thank Mr. Campbell for a paper which would be of very great interest to the members. Some years ago when he was using tar macadam he was accustomed to mix the hot tar with cold stone, and not heat the stone as was done by Mr. Campbell.

Mr. C. F. WIKE (Sheffield) said he had followed the paper with very great interest, as for the last ten years he had been laying a great deal of this kind of roadway. With respect to the burning of the material for the tar macadam they used in Sheffield a process used generally in the Midlands. This a good deal of time was saved, as the material could be made and dried perfectly in twenty-four hours. They had used different kinds of material for this work, but they found granite was unsatisfactory, because it was non-absorbent. Limestone and furnace slag—not clinker, which he thought would not be strong enough—had proved to be the best material. As to the life of the material, which Mr. Campbell put at seven years, he had made several tests with streets laid in Sheffield for ten years, and found the life and cost of the material to vary considerably, one costing 4d. per yard per annum, another 7½d., another 2½d., another 2d., another 9d. and another 7½d. He had also had comparisons got out of the difference in the relative cost of tar macadam and granites. The cost of granite was 102d. per yard and of tar macadam 157d. per yard in a period of twenty years, consequently there was a saving on granite of 50 per cent. He thought Mr. Campbell had made a mistake as to the cost of this kind of paving, which he had given as 4s. 6d. per yard, including the foundations and stripping. The foundations would not be required every time.

MR. CAMPBELL: Quite right, so much the better for tar macadam.

MR. F. BAKER (Middlesbrough) considered that one of the chief points in the preparation of the material was the boiling of the tar, as it was important to obtain tar of the same consistency. He was glad to say he was able to get his tar boiled for him at a chemical works, and it was delivered through pipes, so it was always kept fine and delivered on the heaps of stones as required. Another important point was to get a good foundation. It was no use putting down a good tar macadam road unless there was a good sound foundation underneath it, and for this purpose he screened all the stone and got the dirt out of it. He used broken scoria, which was not equal to whinstone, but it was much cheaper, the difference in the two materials being 4s. 6d.—the whinstone costing 7s. 6d. and the scoria 3s. With respect to the heating of the stone he did not find it necessary, provided that the stone

was perfectly dry when the tar was run over it. It was necessary to keep the traffic off it while the road was being made, and for two or three days afterwards. He had splendid ponds in Middlesbrough made in that way. The cost of material varied in every town, and, therefore, the figures given by Mr. Campbell were not of much practical value. He had laid many thousands of yards at 1s. 6d. per square yard, laid complete and rolled.

THE LUNCHEON

On the conclusion of Mr. BAKER's remarks the members adjourned to the saloon of the Royal Hotel, where they were most hospitably entertained at luncheon by the Lord Provost and the Corporation of Edinburgh. The Right Hon. Mitchell Thomson, Lord Provost, presided, and the "croupiers," as the vice-presidents are termed in Edinburgh, were Bailies Sloan and Kinloch Anderson, and Treasurer M'Crac. "The Treasurer," it may be noted, fills an honorary office, and is a member of the corporation—in Treasurer M'Crac's case an exceedingly active and able member to boot. Among other civic representatives present were Bailies Robertson, Mackenzie, Brand and Hay, Judge J. C. Danlop and the Town Clerk (Mr. Thomas Hunter).

In proposing prosperity to the Association, coupled with the name of the President.

The Lord Provost said the Victorian era had been marked very specially in many ways, but he thought, if one read the signs of the times aright, he would acknowledge that a very important fact of the last fifty years was the enormous growth of sympathy between different classes of the community, and the recognition of the fact meant to all of them a call to do what they could for the moral and social benefit of the people. He felt sure that no association was better qualified to promote those interests than this association, because he knew that many of them were connected with the different corporations of their large cities, and to their hands was entrusted important work regarding sanitation and the care of public health. Had time permitted, information might have been given them in regard to the many questions that interested them in Edinburgh. He briefly mentioned the electric lighting department, under the co-operation of Bailie Mackenzie; and the management of the roads, in charge of Judge Dunlop. Mr. Robson had told him that he thought Prince's-street would be a beautiful street if it were only all paved with wood. He agreed with that, but they must not blame them too much. They must remember that in Edinburgh they had to contend with very steep gradients, and horses had to be shod in such a manner as to enable them to protect themselves when going down the steep streets. The result was that the wood was very quickly torn up. Then, of course, he did not know whether in their cities they had a treasurer. They had one in Edinburgh, and a very good one he was. He took charge of the public purse, and naturally he had to see that they did not become extravagant. With time to save a little money, his lordship thought the result would be that they would wood-pave the other half of Prince's-street. They were Scotsmen there, and he dared say the visitors would be surprised on that account to know that, although they had expended very large sums indeed in recent years in Edinburgh, they had been putting their money on things that would pay them, and pay them well too. One of these was one to which he had alluded—the electric light—and in connection with their proceedings he could not forget that Mr. Newington was to read a paper to them. They had also had Mr. Manuelle, the representative of the tramway lessees, who were to pay them, he would not say a handsome return, but an adequate return on their money—it was 7 per cent.—and the City Treasurer was able to borrow the money at 2½ per cent. Taking everything into consideration, most of them would see that they had not made a bad bargain. In conclusion, he said it was the duty of every man connected with the profession to join the association and to do what he could for the benefit, not only of his own corporation but of the nation at large.

MR. O. CLAUDE ROBSON, the president, in reply, acknowledged the kind reception and welcome of the Lord Provost and corporation, and in turn proposed the "Health of the Lord Provost"; and His Lordship, in acknowledgment, hoped the next time the association visited Edinburgh they would be able to see the waterworks of the city. He mentioned also that they were to remove a blot on their city by moving the gasworks at the east end of the town to a site 3 or 4 miles away. They had selected a spot close by the sea-shore, where they would have accommodation for the immense amount of refuse that must necessarily come from gasworks.

MR. J. C. DANLOP also made a few remarks regarding city improvements, and pointed to the excellent drainage system which had been provided. If anything went wrong with the health of Edinburgh it would not, he said, be for the want of good sanitary provision.

RESUMED DISCUSSION OF MR. CAMPBELL'S PAPER.

On resuming, after luncheon, the discussion of Mr. Campbell's paper,

MR. J. LEMON (Southampton) said there was no doubt that the cyclist had much to do with the improvement of our highways. The members of the Works Committee at Southampton had taken to riding bicycles, and they had since made a great many complaints about the roads. Their surveyor of

highways thought these complaints were very unreasonable, but the members of the committee were equal to the occasion, and they bought the surveyor a bicycle—(laughter). Since he had taken to riding a bicycle the surveyor had come to the conclusion that the roads which he considered so good were rather lumpy, and had gone in strongly for tar macadam. He must say there was nothing particularly new about tar macadam. He had seen it in various towns, and seen a great many failures. Everything depended upon the way in which the material was prepared, and he thought it a mistake to put it on new roads, though it could be used to advantage on old roads. In that case they did not require the very costly foundation referred to by Mr. Campbell. On an existing macadamised road a good tar macadam could be put down for 3s. per yard, and if that was done they were making a great improvement on the road. He wished to utter a word of warning with respect to the making of tar macadam roads. If they had no experience of the material they had much better put the work in the hands of a contractor—(no, no)—who had experience of it and would make it a success. The quality of the tar varied considerably even from the same gasworks, and there were many other details which made either for success or failure.

On the proposition of the PRESIDENT, a hearty vote of thanks was accorded to Mr. Campbell for his paper, and it was agreed that the author's reply should be forwarded to the secretary for inclusion in the "Proceedings" of the association.

The next paper was that of Mr. Young, on dust destructors in Edinburgh. On account of its length Mr. Young summarised the chief points of the paper, which was as follows:—

EXPERIENCE OF EDINBURGH WITH REFUSE DESTRUCTORS.

By JOHN YOUNG, C.E.,
Edinburgh.

[Mr. John Young, C.E., of the burgh engineer's department, Edinburgh, was born and educated in Edinburgh, and studied the engineering sciences at Heriot-Watt College. He was trained as a surveyor with Messrs. Brown & Laurence, and Mr. R. Roberts, ordained surveyors, Edinburgh, and for six years was engaged in practical work as a surveyor and manager in the late firm of Messrs. W. & D. McGregor, contractors, London and Edinburgh. In 1886 he was appointed inspector of drainage in the burgh engineer's department, Edinburgh, and was afterwards promoted to the post of assistant engineer. Under the direction of Mr. John Cooper, Assoc. M. Inst. C.E., burgh engineer and master of works, he has carried out several drainage schemes and underground conveniences in the city; has also acted as resident engineer on (1) refuse disposal works, Powderhall; (2) central electric lighting station; (3) the conversion of Edinburgh Corporation tramways to the cable system of traction; and (4) Tollcross cable power station, which is now in course of completion. In 1893 Mr. Young was elected a Fellow of the Royal Scottish Society of Arts. He is also president of the East of Scotland Engineering Association and editor of its "Proceedings." He has contributed papers on engineering subjects to various societies, and made several tours of inquiry bearing on municipal work.]

MODE OF COLLECTION AND NATURE OF EDINBURGH REFUSE.

The population of the city of Edinburgh, with its extended boundaries and Portobello, is now 292,364, the area being 8,804.38 acres. The number of inhabited houses is about 61,622. Under the Edinburgh Municipal Acts penalties are enacted on "any person who accumulates within any enclosure, area, house, building, garret, cellar or other apartment any dung, soil, dirt, ashes, filth, or other offensive matter or thing." The ash-pit system is practically unknown here, and as the whole city is under the water-carriage system of sewage removal, and water-closets almost universal, very little faecal matter finds its way into the refuse, which is consequently of poor manurial value to the farmer. The whole refuse becomes the property of the city, and the inhabitants are fairly regular in putting it out of their premises for removal. This they do in wooden buckets or iron receptacles, placed at the street kerb at night or early in the morning, but they must not empty their refuse on the street or allow it to blow about, or they are subject to a penalty. This is, however, a difficult matter to regulate. It is found that a large proportion is, however, emptied on the streets, and the

buckets are overturned by people who make a living by picking out materials which can be sold.

The refuse carts and waggons make a daily round of the whole streets of the city in the early morning and collect all the refuse put out, together with the street sweepings which the scavengers have collected on their various beats. The carts and waggons are covered over on the top to prevent the refuse being blown about while in transit to the depot or destructors. The carts have a capacity of about 73 cubic feet, with a weight of refuse carried of from 10 cwt. to 18 cwt., and the four-wheeled waggons a capacity of about 108 cubic feet, with a weight of refuse of from 15 cwt. to 23 cwt. The total amount of all kinds of house, shop, market, trade and slaughter-house refuse, street sweepings, slurry, road mud, and the heterogeneous compound known as police manure, collected in Edinburgh in one year is about 140,000 tons, made up as follows:—

100,000 tons of general city refuse.
40,000 tons of mud and street sweepings.

There are two toms for street sweepings, road mud, &c., one being at Queensferry-road and the other at Powderhall. The refuse, which is despatched by railway to the country, is sent from the loading banks at Logie Green, Dundee-terrace, St. Leonard's and Meadowbank. A portion is also sent by canal-barge from Fountainbridge, and carted out of the city to an old quarry at Redhall. The principal tip in the country is at Clapperton Hall, 12 miles distant from Edinburgh to the west, where large natural hollows are being filled up. The portion of the Edinburgh refuse sent to the destructor is collected from that district of the city north of Queen-street, and amounts to nearly one-fourth of the total amount of refuse collected in Edinburgh. The area of the district is approximated in the different seasons, so as to yield as much refuse as the destructor will consume.

The quality of Edinburgh refuse sent to the destructor is very mixed, light in weight, bulky in measurement, very dry, and possessing a poor amount of cinders and carbonaceous substances, but contains a large amount of dusty and sandy matter. This is partly accounted for by the daily collection, the high-burning qualities of the coal used in the district, the habits of the citizens, the state of the weather and the admixture of street sweepings, which inevitably get mixed up in lifting refuse off the streets. From the following table a comparison may be drawn with ash-bin refuse as collected in London, and given in a report on "Dust Destructors" by the medical officer and engineer of the London County Council in 1893:—

	London "ash-bin" refuse.	Average Edinburgh refuse.
Breeze, cinders and ashes ...	64 per cent.	25.5 per cent.
Fine dust ...	19 "	37.0 "
Paper, straw, organic matter, bottles, bones, tins, crockery, &c.	17 "	37.5 "
	100	100

In regard to its bulky character, it is found by measurement that there are from 72 to 80 cubic feet to 1 ton, whereas it is said that there are only 40 cubic feet per ton in the ash-bin refuse of English towns. The former mode of disposal of the city refuse was by despatching to farmers as much as they could take, the surplus being carted and tipped in waste hollows, ravines and old quarries at Powderhall, Liberton dams and Redhall quarries.

RAPID DECLINE IN DEMAND BY FARMERS.

For the ten years from 1870 to 1880 the average amount of street refuse sold to farmers was 56,030 tons, and the average rate per ton obtained 2s. 0.206d. For the ten years from 1880 to 1890 the average amount sold was 63,827 tons, the average rate per ton being only 7.404d. The price per ton obtained for the refuse in 1870 was 2s. 9.661d., but this had fallen in 1890 to 3.477d., and ultimately nothing was got. The annual average revenue had decreased from £5,650 to £1,969, showing a falling away of £3,681 per year. The Cleansing Committee in the end of 1890 were thus brought face to face with an ever-decreasing demand for the refuse by farmers, and consequently a great drop in the revenue, the difficulties of finding suitable tips for the refuse, a marked diminution in its quality and manurial value, together with a considerable increase in the quantity of the refuse to be disposed of.

APPOINTMENT OF COMMITTEE OF INVESTIGATION IN 1890. THE REPORT OF SAID COMMITTEE.

The town council, on August 11, 1890, adopted a motion by Councillor Sloss: "Remitting to the Cleansing and Lighting Committee, with powers to make further inquiry as to the best mode of disposal of the town's refuse." In due course a sub-committee was appointed which visited, between September 15 and 22, 1890, the towns of Newcastle-on-Tyne, York, Leeds, Bradford, Manchester, Birmingham and London, with the view of studying on the spot the methods of refuse disposal, and generally to ascertain the best scientific methods in operation, so as to find as satisfactory and as permanent a solution as possible. After reviewing the situation of the refuse disposal question and the fall in the revenues derived therefrom, the report goes on to give important and statistical and other information bearing on the then current methods of refuse disposal as carried out by English corporations.

POWDERHALL REFUSE DESTROYER (HORSEFALL): DETAIL OF DUST CATCHER. Elevation.

Very close attention was given in the report to the question of disposal by destructors, and a large number of these were visited and described. The conclusions arrived at in the report were as follows: That the question of diminished value and falling revenues in connection with the waste matters was neither so urgent nor important a matter as getting rid of them at all. That the English towns were more or less adopting the burning process, and the working of destructors was yielding satisfaction as regards sanitary and economic considerations. That the clinker and residual products are free of smells and innocuous, and can be used for filling up hollows for conversion into building sites and other lucrative purposes. That the time had now come for Edinburgh to deal with its refuse by means of destructors, as the mode of disposing of the city refuse was a failure. That there need be no apprehension on the part of the public as to nuisance or inconvenience arising therefrom. That with the adoption of destructors a real attempt could be made to classify the city's refuse into two distinct kinds; that these should be collected separately, that portion having no manurial value being sent to destructors. That, as the city had an area of 9 square miles, three or four divisions should be formed, each with provision for dealing with its own refuse. This report of the sub-committee was submitted to the Cleaning and Lighting Committee on January 30, 1891, and it was presented to the town council on February 17, 1891. The council approved generally of the report and recommended to the Cleaning and Lighting Committee to bring up specific recommendations, and estimates for giving effect to the same. This was approved on a division on the minutes on March 3, 1891. On July 28, 1891, the Cleaning and Lighting Committee presented an interim report to the town council on the question of the disposal of city refuse, and submitted for general approval plans prepared by the burgh engineer, of a destructor and other necessary buildings for one district of the city—viz., the northern—the site which the committee had fixed upon at Powderhall being the most eligible in their opinion. The probable cost of the destructor was estimated at £3,000, and the buildings, &c., at £9,000. The committee asked power to obtain estimates and have the work started forthwith. In the report of the burgh engineer on the plans of the proposed Powderhall destructor, Mr. Cooper also recommended the dividing of the city into four districts, each district having a full equipment of destructor arrangements, with stabling and other accessories for the carting department, entailing a capital outlay of from £50,000 to £100,000. After mature consideration the town council, on September 8, 1891, approved the proposal to erect a destructor at Powderhall.

ERECTION OF DESTROYER AT POWDERHALL.

In pursuance of the town council's instructions, working plans were prepared by the burgh engineer, for a branch cleansing depot with destructor at Powderhall. Stabling and cart sheds were provided for twenty horses, with overseer's house. Accommodation was also provided in a separate suite of buildings for a refuse destructor of ten cells, fume-cremators, boiler and flues, chimney shaft, roadways, weighing office, &c. The site of the works (about 1 acre in extent) belonged to the corporation, and was originally a sand quarry, which had been filled up with city refuse for some time. It was conveniently situated for the district, and allowed of all the cartage being downhill. The levels of the ground were very suitable, and allowed of the refuse being brought to the tipping or charging house at the level of the adjoining thoroughfare, with the clinking floor on the next level some 15 ft. below, and the lowest level permitted of

tipping the clinker and residuo from a height of about 14 ft. The whole buildings were substantially built with stone in an ornate character, so as to obviate any unsightliness, and in a measure to disguise, as far as possible, their purpose. The ten cells of the destructor occupied the basement of the large building in the centre, with the tipping platform and charging floor on the floor above. The fume-cremators, boiler and flues, and engine and dynamo room adjoined on the basement level. The buildings entirely enclosed the whole plant, and it was the intention from the first to conduct all the operations of disposing of the refuse within closed doors. The buildings were ventilated by a fan with air ducts to the various apartments, the foul air being conducted to ducts discharging into the ash-pits of the cells. The whole buildings of the destructor installation, and the stabling, &c., were lighted by electricity generated on the premises. The fires were lighted in the cells of the destructor on August 14, 1893, and preliminary firing and seasoning of the brickwork of the destructor, flues and chimney went on until September 11, 1893, when the works were formally opened by Lord Provost Sir James Russell and councillors. The works, including building and destructor, plant and machinery, were finished in eighteen months, and the cost was—

For buildings and other works	£14,216
For destructor plant and machinery	3,863
Total	£18,082

It was resolved to take specific offers and plans from two of the best-known firms of contractors for destructor plant, and Messrs. Manlove, Alliott & Co., and Messrs. Goddard, Massey & Warner, both of Nottingham, were invited to tender. It was found that Messrs. Manlove, Alliott & Co. had erected over 400 cells up to this time, and apparently were the leading firm and had the largest experience in the matter. The committee recommended the acceptance of their tender, notwithstanding that it was the higher of the two submitted. The legal contract entered into with Messrs. Manlove, Alliott & Co. provided that they were to erect and maintain for one year a ten-celled refuse-destructor, plant, machinery and other appliances, at Powderhall, capable of each cell burning 8 tons per twenty-four hours, of the ordinary house refuse collected in Edinburgh. That the refuse so treated would be reduced in bulk to one-fourth of the original quantity, that the apparatus would effectually intercept all dust and consume all fumes, render these innocuous and cause no nuisance. The contractors were bound to exercise their best skill as specialists, so as to ensure the best results, to instruct the workmen in the process of burning. In default they were to forfeit the sum of £500, which was the penalty attached for any failure of their destructor appliances.

FRYER'S DESTROYER OF TEN CELLS.

This ten-cell destructor was built by Messrs. Manlove, Alliott & Co., of Nottingham, in the summer of 1893. It was of the Fryer's patent back-to-back type, with five cells on each side, and formed a block of brickwork 36 ft. by 24 ft. by 12 ft. high. Each cell had a capacity of 126 cubic feet, with a fire-grate area of 25 square feet, a drying hearth behind this of 22 square feet area, covered over with a sloping reverberatory arch.

The cell possessed two new features over those previously erected, which were claimed as improvements at the time. *First*.—Instead of the back wall of the cell being taken up with the charging hopper on one side, and the exit opening to the main flue on the other, this wall was divided into two openings in connection with two down-take flues from the

cell into the main flue. These openings were provided with flap doors, arranged so that by opening the front clinking door of the cell the two back doors of the flues were closed all but an inch. It was hoped by this arrangement to prevent an inrush of cold air into the main flue when the clinking door was opened. These flap doors were continually giving trouble by buckling up and refusing to work, so much so that they had to be done away with entirely. The second point of difference in this cell was the charging door, which was placed in the middle of the reverberatory arch, and was closed over with an iron sliding plate cover. This cover and its frame were also so affected by the heat that it frequently became red hot, and got distorted to such an extent that they would not cover the opening effectually. Many different expedients were tried without success to protect this door from the heat, but all these failed, with the result that the refuse lying on the top deck of the destructor smoldered and took fire, emitting very unpleasant smells in the charging-house. It was quite evident that the position of this charging door was badly placed, being almost immediately over the hottest part of the fire. Another cause of nuisance from bad smell in the charging-house was the extreme heat developed in the deck top of the destructor, which had the effect of communicating to the refuse lying thereon too much heat, and to such an extent that "cooking and stewing" of the refuse took place, and consequent nuisance resulted. The cells of this destructor were provided with rocking fire-bars, worked by hand levers from the front. The ash-pits were open and received the discharge from an exhausting fan, which was connected to the charging-house with the object of sucking away any noxious fumes generated therein.

At the beginning of the work a revolving screen was erected at one end of the charging-house. Attempts were made to screen some portion of the refuse, so as to obtain sufficient fuel for four of Jones' fame cremators, but the material obtained was both inadequate in quantity and quality for keeping the cremators up to anything like a proper temperature, and had to be dispensed with. Finally, gas breeze and coke had to be purchased and burned in the cremators. The cost of working the cremators was prohibitive, and quite out of proportion with any beneficial result, either in appreciable rise of temperature or cremation of the gases coming from the destructor. Beyond the cremators, placed side by side, was the bye-pass flue with large damper and the brick-seating of the multitubular boiler, 12 ft. long and 7 ft. diameter, with its damper behind. These both joined together and formed the main flue, 4 ft. by 7 ft., which curved round in a quadrant bend to the chimney. In the main flue were placed two wire screens for catching unburnt paper. These were made to slide into an underground pit for cleaning purposes, and answered their purpose very well. The chimney was built for natural draught, being 7 ft. 6 in.

diameter at the bottom and 6 ft. 6 in. diameter at the top, and 185 ft. high from ground level. It was provided with an internal lining and air-space all round for a height of 50 ft., and a dust-pit was placed in the bottom. A steam engine and shafting was also provided for driving the dynamo for electric lighting and the ventilating fan; and a mortar mill is also placed outside for grinding clinker and making mortar, but there is no demand for it in Edinburgh.

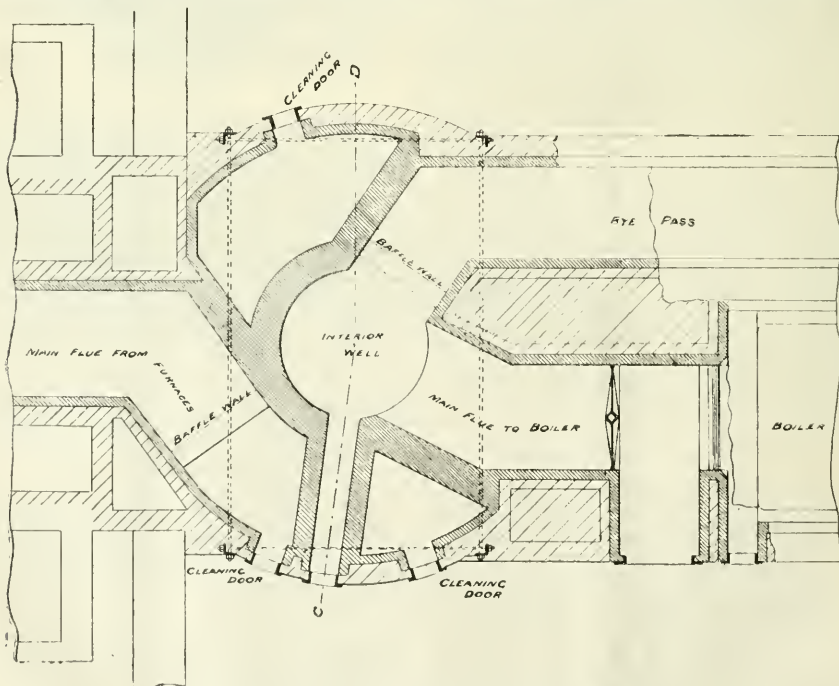

As the work of erecting the Fryer's destructor installation had been carried out under the supervision of Mr. Cooper, burgh engineer, the burning of the refuse was also continued under his charge, with the view of ascertaining the capabilities of the destructor, and in order to determine whether the terms of the maker's contract had been fully implemented. Mr. Cooper reported to the Cleaning and Lighting Committee, in March, 1894, the result of the operations at the destructor for the period from January 17 to March 24, 1894, as follows:—

"(1) That the amount of refuse burned during the period was at the rate of 64 tons 5½ cwt. per day of twenty-four hours (three shifts of labour) for ten cells.

"(2) That the cost per ton of refuse burned, including labour, oil, wick, waste, gas cinders, arc lamp carbons and other sundries, and also taking into account the interest and sinking fund at 5 per cent, on £10,000 expenditure of capital outlay, the cost per ton of refuse burned worked out at 1s. 4'723d."

Mr. Cooper's report further comments on the nature of the refuse to be burned: "As regards Edinburgh refuse, our experience is that on the whole, owing to the amount of soft ash, road sweepings and sandy matter it contains, the furnaces are seriously hampered in their work. The first delivery of refuse in the morning, which is almost wholly house refuse, is, as a rule, of good quality for burning and clinking. A large part of that delivered in the after part of the day, which is intermixed with road sweepings, is heavily charged with dust and sandy matter, which, as I have said, not only will not burn, but seriously chokes up the furnaces. It has also been found hopeless to obtain material out of the refuse for the cremator fuel. I think that were the same department and officers in charge of the burning who are in charge of the collection of the refuse, experience would speedily dictate the necessity for separating road sweepings, dust, &c., from the refuse delivered at the works, and the result would be a considerable improvement, both in the amount burned and in the nature of the clinker. As might also be expected, a number of improvements for more rapid combustion, for simplifying the labour in charging the furnaces, for fuller utilisation of waste heat, &c., have suggested themselves."

From time to time, as experience was gained, every effort was made to work the destructor up to this guaranteed efficiency, but without successful result. From several tests the following may be selected as what was accomplished:—

POWDERHALL REFUSE DESTROYER (HORSFALL): DETAIL OF DUST CATCHER.
Section through A.B. (See diagram on page 47.)

POWDERHALL REFUSE (HORSFALL) DESTROYER: DETAIL OF DUST CATCHER.
Section through CD. (See diagram on page 49.)

On October 4, 1893, 45½ tons burned in sixteen hours.
 On " 24, " 60½ " " twenty-four hours.
 For the period from January 18, 1894, to March 24, 1894, the average daily burning was at the rate of 64 tons 5½ cwt. per twenty-four hours. For the first period, from August 14, 1893, to April 17, 1894, under the charge of the burgh engineer, the total amount of refuse burned at the Powderhall destructor was 10,868 tons. The men worked in three shifts of eight hours each, there being one engineer and three furnacemen to each shift for the period from September 30, 1893, to March 31, 1894, afterwards one engineer and four furnacemen per shift. For the period from April 18, 1894, to January, 1895, by order of the Cleaning and Lighting Committee, the destructor was handed over to the responsible officer of the cleaning department, who had full charge of the staff engaged in the collection, delivery, burning, and disposal of the refuse and clinker. The quantity of refuse delivered and consumed at the destructor during this period was 12,321 tons, being an average of 61½ tons for ten cells in the twenty-four hours. The quantity of coke burned in the fume cremators was at the average rate of 2 tons per week.

SHORT HISTORY OF DESTROYER ENDING IN LAW COURTS.

On November 12, 1894, after the destructor had been working for fourteen months, the corporation received notice of an action of interdiction, at the instance of Alexander's trustees, on behalf of the proprietors of the adjoining property of Redbraes, situated on the opposite side of the North British Railway from the destructor. It was maintained that noxious fumes and gases, and offensive dust and charred paper, were disseminated over the Redbraes property from the destructor premises and the clinker bins, to the discomfort of the pursuers and their tenants, and damage to the trees and shrubs in the nursery grounds, causing them great discomfort and annoyance, and loss, injury and damage, and that the value of the property was being deteriorated. The corporation resolved to defend the action, and it was tried in the First Division of the Court of Session before Lord Stormouth Darling. The case was before the courts for ten days, between May 29 and July 24, 1895. There were thirty-four witnesses examined for the pursuers and twenty-eight for the defenders, and a large mass of very interesting and scientific evidence was given on both sides. The general purpose of the evidence went to prove that the destructor had been imperfectly worked from the beginning; that the temperatures obtained, on the whole, were too low, and the combustion defective for the peculiar nature of the refuse dealt with; that the fume cremators, although regularly in use, were inadequate for the destruction of the fumes, and the system did not sufficiently provide for the interception of the large amount of dust; and that, consequently, nuisance had resulted, and damage been occasioned to the adjoining nursery grounds of Redbraes.

The Lord Ordinary, in his interlocutor and opinion of July 31, 1895, found that the corporation had worked the destructor in such a manner as to create a nuisance, but that, as the remedial measures adopted since the raising of the action had to some extent abated the nuisance, it was reasonable that time should be allowed for making further improvements so as to remove, as far as possible, all just cause of complaint. He remitted to Mr. B. Hall Blyth, C.E., Edinburgh, to visit the premises from time to time, and, after conferring with Dr. Odling, Professor of Chemistry at Oxford, to report before the end of the year 1895 what change, if any, either in the apparatus itself or in the mode of working it, was necessary in order to prevent the escape of noxious gases or vapours, and the diffusion of noxious dust and other matters over the pursuers' said property. Finds the pursuers entitled to expenses, &c. Soon after the

notice of the action by Alexander's trustees, and pending the beginning of the action and afterwards, the management of the destructor was again placed in the hands of the burgh engineer in January, 1895, by the corporation, and, as the consequence of his recommendations, a better mode of working was introduced, whereby the cells were charged and clinkered in rotation every two hours. Two experienced foremen were brought from Braiford to superintend and instruct the day and night shifts. Finer screens were put into the main flue to intercept the paper, and proper regulating of the dampers was insisted on. To prevent any nuisance from the watering of the clinker, a specially designed box was introduced by Mr. Cooper. This box was strongly made of sheet iron mounted on wheels. It had three sides and hinged top. It was wheeled in front of the ash-pit when a fire had to be clinkered, the clinkers were raked out of the cell into the box, the lid was closed and a hose turned on to the hot clinkers through holes in the side of the box. This entirely prevented any escape of sulphurous fumes into the clinkering-house, they being sucked into the ash-pit instead. This apparatus worked very well and anticipated all objections to the watering of the clinker. With the object of increasing the temperature in the cells, one of these was fitted with the steam air blast, and better combustion and clinker was obtained.

On December 23, 1895, Mr. B. Blyth and Dr. Odling reported to the court, after making visits to Powderhall destructor, from time to time, as well as several destructors in England. In their opinion the nuisance complained of arose from three causes—viz.:

- (1) From imperfectly consumed noxious gases, and dust escaping from the chimney.
- (2) From noxious fumes and dust being blown out of the clinkering chamber.
- (3) From bad smells given off from the feeding chamber, owing to the refuse waiting for burning heating while lying on the top of the cells.

To obviate these they recommended that several alterations in the apparatus and mode of working be adopted—viz.:

- (1) That steam jets be introduced into all the cells, to assist combustion and raise temperature in main flue.
- (2) That the cells be fitted with a front exhaust.
- (3) That Bonhois and Brodie's charging trucks should be used on the top of the cells to prevent contact of refuse with heated top of destructor.
- (4) That a large dust chamber be provided in main flue.
- (5) That the clinker should not be watered, and a cooling platform be formed for laying down the hot clinker on outside the building.
- (6) That more intelligent and experienced stokers should be employed in the working.

By the time the report was published, the corporation, at Mr. Cooper's instigation, had practically anticipated several of the recommendations made in Mr. Hall Blyth's report, notably with regard to the steam jets and the dust chamber. A complete system of forced blast was applied to the cells of the destructor. This consisted of closing up the fronts of all the ash-pits with brickwork, having doors for the removal of the dust falling through the fire-bars, and the provision of two steam jets with blowing nozzles into each cell. This result was fairly satisfactory at first, and a much greater combustion was got in the cells, and better clinker was obtained for a time. The only drawbacks experienced were the choking up of the blowing jets, the unsuitability of the rocking-bars for the proper admission and distribution of the forced blast, and the blowing out of the smoke and fumes from the cells, through the badly-fitting charging doors at the top. The increased heat obtained was very destructive to the brickwork of the cells, and a large proportion of dust was deposited in the

flues. On the whole, this installation of forced blast rather emphasised than obviated the previous difficulties as to nuisance from dust, and the overheating of the refuse lying on the deck top of the destructor. Any benefit got from the forced blast in increased combustion was neutralised by the very light, sandy and dusty nature of the refuse, the greater portion of which could not be got to clinker in the fires. To prevent the dust escaping up the chimney, a pit was formed in the floor of the main flue near where it joined the chimney, and a water spray introduced for wetting the gases as they passed this point. This apparatus had the effect of arresting a fair quantity of dust and of cooling the gases before they entered the chimney. Under these somewhat improved conditions the burning of refuse was persevered in, and the amount consumed from May 15, 1895, to May 15, 1896 = 16,141 tons. The cost had, however, gone up to nearly 2s. 1d. per ton, including all charges, and this was felt to be excessive and could not be maintained.

As the recommendations of Mr. Hall Blyth involved considerable expenditure, and were calculated to make such radical changes in the construction of the destructor as regards the fitting up of charging trucks and the front exhaust from the cells, the corporation having met the rest of the proposals made, they lodged objections to these, which were duly answered by the pursuers. The reporter's recommendations being persisted in, the corporation ultimately resolved on the entire reconstruction of the Powderhall destructor on the most modern and approved system,

In August, 1896, an estimate was obtained from the Horsfall Refuse Syndicate, Leeds, and a legal contract was entered into on October 13, 1896, for the remodelling of Powderhall destructor on their improved system, with all special appliances necessary for the successful disposal of the refuse, to the entire satisfaction of Mr. Hall Blyth, C.E., or such other man of skill as the Court might appoint. The contract provided that each of the cells should consume 8 tons per twenty-four hours of the ordinary Edinburgh refuse, and that the residue would be reduced in bulk to at least one-fourth of its original quantity, and the temperature maintained would be 1,800 deg. Fahr. They were also bound to provide all other appliances for satisfying the terms of Mr. Hall Blyth's report to the Court as regards noxious fumes and dust. The work was to be entirely completed in twelve weeks, and maintained for one year after completion. In case of failure of any part of the contract a penalty of £500 was to be imposed. The work was completed in the end of January, 1897, and the burning of refuse again commenced under the new conditions, and has been in operation ever since, with the exception of a short period when sundry repairs were found necessary.

RECONSTRUCTION OF FRYER'S DESTRUCTOR BY THE HORSFALL REFUSE SYNDICATE, LIMITED, LEEDS.

Under this scheme of reconstruction the whole of the old destructor cells were taken down to the underside of the fire-grate level, and ten entirely new cells built on the old foundations by the Horsfall Refuse Furnace Company, Leeds. The new destructor is much the same in outward appearance and size as the old Fryer's destructor, but has many new features, and special arrangements were adopted to meet the conditions imposed under the contract. The new Horsfall cell has a capacity of 165 cubic feet. The sloped fire-grate has an area of 25 square feet, and a curved drying hearth an area of 324 square feet. A great change was made in the charging hole, which is in the form of a hopper, 3 ft. square and 3 ft. 8 in. deep, placed at back and common to two cells. This charging hopper has a flat bottom, and when filled up with refuse to the level of the deck top of the destructor it effectually seals up the openings at the back of the cells, but allows of the charging and moving forward of the refuse by the pokers. This form of hopper has prevented the refuse round the charging holes from taking fire as formerly. The altered position of these hoppers has also given a greater area for storage of refuse on the top of the destructor. The greatest change made, however, was in the front exhaust exit flue for the gases from the cell. This was placed at the top of the level reverberatory arch, but at the front of the cell instead of the back as formerly. This change has been entirely successful in its purpose, which was to make the gases, empyreumatic fumes and vapours from the new charge of refuse on the drying hearth pass over the hottest part of the fire on the grate-bars before going into the branch flue from the cell to the main flue. The branch flues from the cells are taken over the top of the cell arch and, being about 12 ft. in length, these present a large area of very hot brickwork, which everything coming from the cell must encounter on its way to the main flue. The main flue was also very much decreased in size, and is now 4 ft. by 7 ft. 1 in.

Another important improvement was made in the construction of the deck top, so as to prevent heating of the refuse lying thereon and to obviate any "cooking and stewing" of the material. A layer of 3-in. agricultural drain tubes was laid all over the top of the destructor deck, this was covered with Portland cement concrete 6 in. thick. One end of these tubes was left open, and the other end connected to the down-take air shafts of the forced blast apparatus. By this means a continuous stream of cold air is sucked through the pipes, the refuse on the deck top being kept comparatively cool, and the former nuisance from noxious smells in the charging-

houses from the overheating of the refuse has been overcome. From previous experience in burning, and taking into account the peculiar nature of Edinburgh refuse, it was found necessary to provide a thoroughly effective system of forced blast to all the cells. For this purpose two main air ducts, each 2 ft. 6 in. by 4 ft. 9 in., were built under the cells between the ash-pit and the main flue. These air ducts are connected to two down-take air shafts in the charging-house, so that all the air used for the forced blast is taken from the vicinity of the destructor top, and assists materially in changing the atmospheres there. In each of these down-take air shafts is placed vertically a blowing trumpet 6 ft. 9 in. long, which at first had a steam jet 18 in. wide, but these have been replaced by three separate steam jets, each 2½ in. wide in each trumpet. From the forced blast air-duct cast-iron boxes are taken along each side of the cells at the level of the fire-bars. These boxes are 13 in. high, and are covered on the faces with two movable plates to each; the object of placing the boxes in this position being to prevent the clinkers in the fire adhering to the sides of the cell. It is well-known that where only brick sides are put into destructor cells a lot of labour is expended in cutting off the clinkers from the brickwork, which consequently needs frequent renewal. From the bottoms of these two cast-iron side boxes four connecting tubes are provided for the supply of the forced blast to the ash-pit below the fire-bars. These are controlled by sliding ports operated by handles from the front of the cells, for shutting off the blast when the cell is to be clinkered or a fresh charge of refuse put on the fire. The ash-pits are closed in front, and provided with sighted doors for the removal of the very fine dust which falls through the fire-bars. The original rocking fire-bars were put into the new cells, but these have all been replaced, with the exception of one cell (which still has the old rocking-bars) with V-shaped steel fire-bars 5 in. deep, with ¼ in. spaces between, rivetted up in sections, and stretching the full length of the fire-grate. In the proper burning of refuse and the making of good clinker there is such a close relationship between the nature of the refuse burned, the form of the bar, the width of spaces between the same, and the pressure of the forced draught put on, that no satisfactory statement can be made about these without giving the records of a larger and more successful experience than has been had at Powderhall destructor. The cause for this has been largely due to several defects in various parts of the apparatus of the destructor, rather than in the type of destructor. For example, a very serious defect in the Horsfall furnace is to be found in the side boxes of the cells. The movable plates covering the faces of these boxes frequently crack, buckle up and get twisted out of shape, with the result that the leakage of the forced blast takes place directly into the cell and over the top of the fire, and the effect of the blast in the ash-pit is, to a large extent, lost, and, in some cases, entirely neutralised. It is obvious if ten side boxes for forced draught are connected to one of the air-ducts, and if even one of these has its plates defective and allows the forced blast to leak, the whole pressure in the ash-pits of the five cells on one side of the destructor is reduced. Again, these side plates are so situated and fixed that no single plate can be replaced until all the furnaces are damped down at the end of the week. The leakage of the forced blast into the cells above the fires forces fumes and smoke out at the hoppers, when the men are charging the cells, into the charging-house, frequently causing a temporary nuisance, and when clinkering the blast being cut off in the ash-pit, is only increased over the fires, a result, the entire opposite of which should be the proper condition of things.

Turning now to the forced blast itself, even under an average condition of side boxes, the experience has been that not more than ¼ in. of water column pressure is got in the ash-pits, and it need hardly be said that this pressure is entirely inadequate for the burning of refuse which has nearly double the quantity of fine, sandy, and dusty matter and street sweepings in it, than that of an ash-pit town, or even of the refuse of London. The steam jet and blowing trumpet of the forced blast apparatus in this destructor were at first worked at a steam pressure of 35 lb. per square inch, but through corrosion in the steel lips of the jets the pressure was greatly reduced. The length of lips of the two jets was 36 in. at first, and these worked for one year, but the Horsfall company, in January of this year, put in six new steam jets of a total breadth of 15 in. with brass lips to the jets, and the steam pressure had to be raised to that of boiler pressure—viz., 75 lb. per square inch. This has been very hard work for the boiler, and it now remains to be found by what means the steam pressure can be reduced or economised, and a more effective forced blast given in the ash-pits; but it is doubtful if this result can be obtained until the side boxes are put on a more satisfactory basis as regards non-leakage into the cells.

Turning now from the destructor itself, the dust catcher and heat storage chamber deserves attention. This apparatus was specially designed and erected by the Horsfall company, so as to meet the conditions specified in the contract as to the interception of all dust coming from the destructor flue, and for the provision of a large chamber, highly heated, into which all the noxious fumes generated would be effectually cremated and destroyed. It consists of a large block of brickwork, 18 ft. in diameter and 13 ft. 7 in. high, situated at

POWDERHALL REFUSE DESTROYER.

the one end and connected with the main flue of the destructor. The internal arrangement consists of a spiral flue traversing the entire circumference and winding upwards to the top of the chamber. There is an internal chamber, 6ft. diameter and 12 ft. high, having a domed top, and communicating with the outer spiral flue by four ports at the top of its walls. In the floor of the outer spiral flue several dust traps are formed. These are provided with doors in the external wall of the chamber through which the dust deposited can be easily removed. From the bottom of the internal chamber there is an opening connected to the by-pass flue, and another opening and flue to the front of the multitubular boiler, and, by arranging the dampers, the gases from the dust catcher may either be sent through the boiler tubes or passed through the by-pass flue.

Inspection holes are formed at different levels for looking into the chambers, from which the heat may be estimated and the clearness of the atmosphere inside noted. The large heat-storage capacity in this chamber, the long spiral circuit which the gases have to travel against the highly-heated brickwork, the baffling of the current and period of quiescence given to the gases, thereby relieving the pressure and promoting expansion, also favours their decomposition and provides effectually for the deposition of any dust they contain. This apparatus has given no trouble of any kind, requires no attention, except the weekly cleaning out, and has proved very successful for its purpose. The reservoir of heat, maintained at a steady temperature of from 1,500 deg. Fahr. to 1,800 deg. Fahr., is also very useful in keeping up steam in the boiler at an equable pressure for a long period. It is obvious, however, that the proper manipulation of the boiler damper and the by-pass flue damper are important elements in the successful working of this dust catcher and heat-storage chamber, so as to keep its temperature as near 1,800 deg. Fahr. as possible.

As the quality of the refuse varies from day to day, and even at different times of the day, and with the state of the weather and season of the year, difficulties are frequently experienced in keeping up the heat; but experience shows that by regulating these dampers properly, this may to a great extent be overcome. Too much care cannot be bestowed on the proper design and construction of these two dampers, so that they will at no time get out of order and always work perfectly. Cases have occurred where a by-pass damper has got twisted by excessive heat and remained standing open, resisting all attempts to close it without damping down the destructor, with the result that all the heat has leaked away, and the steam in the boiler had to be maintained by firing its furnace with coal. Again, should the damper fix itself in such a way as to close up the by-pass flue, all the

heat, and perhaps too much, must pass through the boiler on its way to the chimney. This is not unattended with serious risk which should not occur, and possibly a solution of the contingency is only to be found in providing a duplicate by-pass flue and damper.

The boiler setting and main flue were not reconstructed by the Horsfall company, with the exception of providing a coal furnace in front of the boiler and a cleaning opening for taking out dust cleaned from the tubes in front of the boiler. In the reconstruction scheme, however, another important adjunct was added by Mr. Cooper, in the form of a second dust deposition and expansion chamber in the main flue near the bottom of the chimney. It consists of an enlargement of the main flue from 4ft. by 7 ft. to 10 ft. by 7 ft., but set at right angles thereto. It is provided with two fire-brick cross walls, 3 ft. high, forming the floor into three compartments. This chamber has been found very useful for depositing the dust and allowing the gases to expand and cool down before being discharged into the chimney.

The circular chimney is 185 ft. high above ground level, and lined with fire-brick to a height of 90 ft. It was provided with steel bands from the top to near the bottom, and thoroughly overhauled, and all cracks made good internally and externally in the beginning of this year. The cost of reconstruction of the Powderhall destructor on the Horsfall principle, and other incidental work, has been £1,500. After the Horsfall destructor had been working for about six months, a proper test, extending from June 28 to July 12, 1897, or twelve working days, was made for the satisfaction of the arbiter, Mr. B. Hall Blyth, C.E. The results obtained are given in the table on page 50—viz:—

Mr. Hall Blyth's report comments on the trials as follows. "The results show that during the first three days upwards of 80 tons of refuse were daily burned in the destructor, giving a residue of clinker of about 23 per cent. The average result during the whole period gives 74 tons of refuse per day, leaving 25 per cent. of clinker. During the first three days of the trial this refuse was properly selected, and the results fully come up to the terms of the specification. During the remainder of the trial considerable quantities of sand and dust were allowed to be mixed with the refuse, hence causing the diminution in quantity of the refuse burned. If the destructor is to continue to work satisfactorily instructions should be given to the inspector of cleaning that sand and dust should be carefully excluded from the refuse sent to the destructor for consumption."

At the start of the new Horsfall destructor in February, 1897, the corporation accepted an offer by the Horsfall Refuse Syndicate to dispose of the refuse at the rate of 1s. 4d. per ton. This they continued to do until May 13, 1897, when

TABLE OF RESULTS OF TWO WEEKS' TEST OF TEN-CELL HORSFALL DESTROYER, AT POWDERHALL, EDINBURGH.

FROM JUNE 28 TO JULY 12, 1897.

FIRST WEEK.

Date.	Time.	Weather.	Number Loads.	Refuse Weighed.	Remarks.	Refuse left on deck.	Total Refuse Burned.	Clinker.	Clinker percentage by weight to refuse.	Ashes (average).	Total Residuum.	Total ashum percentage by weight to refuse.	Temperature in Dust Chamber. (Fahrénheit).	
													Max.	Average.
June 28-29	hours.	Dull, with showers	120	84 10 0	The refuse for the first three days was mainly composed of house refuse. * Lost 8 hours calculated. (50 tons 9 cwt. in 16 hours = 75 tons 13 cwt. 2 qr. in 24 hours.)
 Steam pressure on boiler, 75 lb. per square inch. On forced blast, 25 lb. per square inch.
 † 12 tons 6 cwt. 15 lb. in sixteen hours = 20 tons 1 cwt. 1 qr. in twenty-four hours.
 Steam pressure on boiler, 75 lb. per square inch. On forced blast, 25 lb. to 35 lb. per square inch.
 The average over the whole trial of total residuum by weight being, say, 28 per cent. of the weight of refuse burned, the reduction of the bulk is 28 x 40 = 14 per cent. of original bulk of refuse.
 Edinburg refuse measures 80 cubic feet to the ton. Edinburg clinker measures 40 cubic feet to the ton (before being slaked).

the rate was increased to 1s. 8d. per ton. At the beginning of October, 1897, the corporation took the burning of the refuse into their own hands, the services of the foreman of the Horsfall company being retained to superintend the work under the burgh engineer.

The staff and wages of the workmen are as follow—viz.: One manager, superintending and attending to boiler, engine and electric lighting, &c., £3 per week; one engineer, ditto, £22s. per week; seven stokers, charging the furnaces, 28s. each per week; six ditto, attending to fires and clinkering, 30s. each per week; three barrowmen, wheeling away clinker to cooling platform, 28s. each per week. There are also three men, at 25s. each per week, engaged in watering and wheeling away the cold clinker and dust from the cooling platform to the clinker bing. The men at the furnaces work in three shifts of eight hours each, disposed in the work of one shift as follows: Two men charging the cells, with the addition of one extra man on the night shift; two men attending and clinkering the fires; One barrowman wheeling clinker and ash from clinkering-hoase to cooling platform.

Work goes on continuously from 10 o'clock on Sunday night to 10 o'clock on the Saturday night following, the fires being damped down on Sunday. Flue cleaning is done weekly or fortnightly, as required, by the first shift beginning. The furnaces, until about three months ago, were charged and clinkered every one hour and twenty minutes. From the beginning of October, 1897, to the end of March, 1898, the average quantity of refuse burned per cell in twenty-four hours amounted to 7.3 tons. At this rate the average cost works out at 1s. 9.5d. per ton. With the object of burning the refuse more thoroughly, and trying to obtain a more satisfactory clinker, the furnaces are now charged and clinkered every two hours. It is found that the destructor could be worked with five men less under this arrangement, but the average amount of refuse burned is now reduced to 6 tons per cell per twenty-four hours. The average cost of burning at the present time is 1s. 9.23d. per ton. This amount only includes the wages of the manager, engineer, charging men, stokers and barrowmen, and the men employed in tipping the residue. No charge is included for maintenance, tools, repairs, &c., or for repayment of capital expenditure.

DISCUSSION OF MR. YOUNG'S PAPER.

Mr. J. PATON (Plymouth) said it appeared to him that the Edinburgh Corporation had set up a very high standard with regard to the collection of refuse. If he was not mistaken, Mr. Young said that the dust was collected daily, a system which would add enormously to the cost of collection. He must say, however, that the corporation had been somewhat unfortunate in the erection of a destructor, and the figure of 1s. 9d. per ton for burning was somewhat alarming to him, because he had been accustomed to hear figures very much lower than that. He also understood that this 1s. 9d. per ton was without allowing for interest on capital and payments to sinking fund. It would, therefore, be of interest to know what was the actual cost of burning, including all charges. When they went before their committees or local authorities the first thing they wanted to know was the actual cost of the work.

Mr. C. JONES (Ealing) considered that Mr. Paton had put a very pertinent question when he said they wanted to know not only the cost of the burning but the total cost. Another point that was raised was the destruction of the road refuse as well as of the house refuse. It did not affect his district, but in many of the larger towns it would form a serious item in connection with the destruction of the refuse. With regard to the unfortunate position in which the Edinburgh Corporation found themselves some time ago, they must bear in mind that a destructor was a novelty. They knew that things went out of date rapidly in these fast-changing days; but, at the same time, they must give credit to those who went in front and made the way straight to those who came after them. They ought to feel thankful to those who took this up in the embryo stage. There were some striking features in the paper, and, perhaps, one of the most striking was the last clause of the report of the arbiters. It was to this effect: "That more intelligent and experienced stokers should be employed in the working." To himself that assumed the most important aspect of the whole affair. It was the intelligent working of the little details that went to make up the prosperity of the whole. It was his good fortune to visit Edinburgh, and, in company with Mr. Cooper and Mr. Laws, go over the destructor works, and, singularly enough, they arrived at the very same conclusion—that the principal difficulty in the whole thing was the fact that it was not intelligently worked. He was quite prepared to admit that he did not say as much as that before the judge, or whatever they called him in Scotland. What he wanted to say was this: A destructor was a valuable adjunct to every town, whether of the low-temperature type, of which he was supposed to be a great advocate, or of the high-temperature, which was just now flooding the market—but, of whichever type, it was the intelligent working of the destructor which made it a success. The question had been raised as to the working expenses. He must say that the expenditure per ton as given by Mr. Young staggered him. He had burnt at a low temperature, and whether he burnt off 6 or 7 tons per cell a day was of no

great moment, but he did get a splendid clinker; and the cost of burning was 1s. 6.4d. as against 1s. 9d. Then at Edinburgh they had to add to the high figure the expenditure and permanent charges, which might be 5d., 6d. or 7d. per ton. That made all the difference as to the success of the thing. They might put up a high-temperature destructor, which might do a large amount of work, but if it was to be done at an excess of cost they had better fall back upon that which did not produce such startling effects, but gave them a result which was far more satisfactory so far as the Chancellor of the Exchequer was concerned. He must say that the charge put down was most extravagant. The utmost of his cost for the work was 1s. 6.6d. per ton, and by the splendid clinker which he produced, and of which he had never an ounce to spare, using it for sewage tanks, artificial snow, &c., he reduced the cost to about 3.1d. per ton. With respect to the various points that had been raised, he had only one thing to say, and, perhaps, somewhat outside the ordinary line, and that was to express his strong opinion to those who were going into this matter, to give very little heed to the destructor question beyond the fact of its being a destructor. From day to day, as his newspaper cuttings came in, he saw the tendency to mislead the economical members of their councils, and giving them the idea that they were going to get a marvellous lot of work out of nothing. In fact, they were going to light their towns by electricity out of the burning of the refuse, and the economical members of the council saw these fine things and wanted to know how it was their surveyor had not brought it before them; did not know that the things which had been put before them had gone no further; that the thing upon which a company was to be founded had never had five minutes' action. Then they must take into consideration that the house refuse of certain districts was of a class which they could not match in other parts of England. These things were lost sight of. It was not said that the calorific value was so good that no other town in England could be compared with it. Only the previous day a newspaper cutting reported that the Vestry of Bermondsey had found that their refuse was infinitely better than the refuse of another place. Probably the next cutting would be that a town in the north, beginning with E, had a refuse which was infinitely better than places in the south beginning with S and B, and that they would have the town lighted with electric light, and electric cars running about the streets all from the burning of the house refuse. A destructor was a means of destroying house and road refuse, and there they had better leave it. If they put up electric light works, let them be independent and they might succeed, but if they depended upon the intermittent power to be obtained from the destructor, and the power must be intermittent, they would make a very big mistake, whatever the patents of destructors, A, B and C, might say.

Mr. C. F. WIRK (Sheffield) said that, as he understood complaints were made in Edinburgh as to the nuisance caused by the destructor, he would say a few words as to how these things were worked up. Sheffield was not Edinburgh, neither was it rural nor very romantic, especially in the district where the destructor was constructed. Complaints had been made about certain works in the neighbourhood, and certain gentlemen, with a view to taking the wind out of the sails of the corporation, began to complain of the smoke from the destructor. The chairman allowed the complaints to go on for a time, and then the reply sent was a very simple one, that the destructor had not been working for a month (laughter). They were burning 10½ tons per cell per day to a certain extent at the expense of the fabric, and the residuum was 27 per cent.

Mr. MACKENZIE said he would like to support Mr. Jones' view that a destructor was a dust destroyer and not a wealth producer. They ought to insist, as sanitary engineers, that the refuse should be thoroughly destroyed. It was pleased that Edinburgh was prepared to pay the price to destroy its refuse thoroughly and completely.

Mr. J. PARKER (Hereford) said he could not quite agree with Mr. Jones' view as to the purpose of a destructor. There was a useful calorific value produced by the burning of the refuse, and he was of opinion that the heat should be utilised to produce steam for electric lighting or other purposes. He was struck by the high cost entailed by the burning of the refuse in Edinburgh, as the cost at Hereford was about 7d. per ton, and they obtained a large amount of clinker, which could be utilised for artificial blocks and other purposes.

Mr. JONES wished to explain that he had been utilising the heat from his destructor in the production of steam for thirteen years.

Mr. W. HARRIS (Cardiff) asked whether they attributed their success in Edinburgh in getting rid of the nuisance which formerly existed to the alteration of the cell or the construction of the dust catcher, or a combination of both.

Mr. J. COOPER (Edinburgh), explained that their reason for bringing forward this paper was that they might gather up the experience of the country. They had experienced much criticism in Edinburgh in regard to the destructor, and no doubt quite justifiably. Latterly they had adopted a method which had put an end to the nuisance from the chimney, and the dust catcher had given them further help in dealing with the refuse without causing any nuisance. The other day, when Lord Kelvin was at the destructor, he told them he be-

hired they could utilise the heat, and by converting it into steam obtain 300 horse-power. Lord Kelvin also told them that if they could utilise the steam in that way they might burn their refuse for nothing. He could only say they would be very glad to dispose of their refuse so cheaply. They were constantly being told in Edinburgh that Bermondsey and Shoreditch, and other places, were burning their refuse and lighting their districts with electric light from the power produced by the refuse. They had not investigated these things for themselves, and would be glad to hear the truth of them. There was no doubt in principle that the burning of the refuse was the right thing for large cities, and that the day would come when they would dispose of all their refuse in this way. They were getting rid of the greater part of their refuse in Edinburgh by dumping it into a big quarry, and that method of disposal was costing them 1s. 6d. per ton. That was an excessive price, and they could not tell what mischief they might be doing in poisoning the water springs in the neighbourhood. They had employed the Horsfall company to reconstruct the destructor because their specifications exactly met the requirements of the experts employed by the court of law, and they thought if the experts approved their methods they were safe in employing them. They had still to complete the year's maintenance agreed upon, and after that the corporation were left with the appliance to make the best and the worst of it. What they wanted to get at the bottom of was, how best and cheapest they could dispose of their house refuse, but they had not adopted Mr. Jones' method of making artificial stone and utilising the clinker so as to bring the cost down to 3½d. per ton. They would be happy if they could do so. Mr. Jones was brought to Edinburgh when they were in the courts of law to deliver them, and he left them hopelessly in the hands of their enemies.

Baillie MACKENZIE (Edinburgh) remarked that, as one of the members of the town council, he came there to get a great deal of light on this question, one aspect of which he had studied for some time. They read in the daily newspapers, and sometimes in the technical journals, that in London they were able to destroy the refuse and get a good deal of power out of it, even making a profit out of it. Mr. Cooper had told them what had been said by Lord Kelvin, who was a great man, and sometimes spoke a deal of nonsense—(laughter)—and when the Shoreditch destructor was opened they heard of its value for electric lighting. He saw that the Shoreditch people had published their accounts for nine months' working, but he gathered they were in such a hopeless state of confusion that nobody could make head or tail of them. Mr. Hammond, a leading electrician, who laid himself out to analyse electric light accounts, examined these accounts, and admitted that they were very wonderful but not understandable—(laughter). When they in Edinburgh consulted an expert as to utilising the heat, he told them that if they put their electric light works at the destructor they might get 150 or 200 horse-power from the destructor, but as that was only a drop in the bucket to them they did not think the game was worth the candle. He hoped they would speak their minds freely and put down the humbug which was talked about of getting so much power from destructors.

Mr. A. E. COLLINS (Norwich) remarked that sufficient note had not been made of the fact that the large bulk of the Edinburgh refuse to its weight would much increase the cost of burning it. If they had refuse half the weight to that of other places, it would probably cost double as much to burn it. With respect to the nuisance from the Horsfall cell, he was surprised to hear there was a nuisance. In Norwich they had a small installation in the middle of the city, and they got absolutely no complaints at all—(Mr. Cooper: There are no complaints since the Horsfall system started). With reference to the power from the destructor when they got their winter refuse, they could get a useful horse-power from the cells, perhaps 50 to 100 horse-power for the two cells, but in the summer time, when they got a good deal of garden refuse, the horse-power was not much. Where a town collected all the refuse they could not rely upon it.

Mr. CAMPBELL (Cantorbury) asked whether the diagram represented the cross-section of the destructor in use at Powderhall.

Mr. Young said it exactly represented the destructor, with the exception that below the grate-bar there were two tubes carried down for the forced blast. They had side boxes along each side of the cell, and above the grate-bar they had two tubes fitted with valves. These side boxes were covered with plates, which occasionally buckled and the blast leaked directly into the cell. That was one of the disadvantages.

Mr. CAMPBELL said it seemed to him that a great deal of distillation of dry refuse must take place from the discharge into the hoppers, and that a good deal of vapour and foul odour would be given off.

On the proposition of the PRESIDENT, seconded by Mr. SMITH-SAVILLE (Darwen), a vote of thanks was then accorded to the author for his paper.

When the interesting and animated discussion of Mr. Young's paper had concluded, it was arranged that Mr. Colman, whose paper was the next to be taken, should also, on account of the amount of work to be got through in a limited time, briefly summarise the points. The following is the paper:—

CONVERSION OF EDINBURGH, LEITH AND PORTOBELLO HORSE TRAMWAYS SYSTEMS INTO CABLE TRACTION.

By WILLIAM NEWBY COLMAN, M.I.C.E., M.I.M.E.

[Mr. William Newby Colman, M.I.C.E., M.I.M.E., a past-president of the Society of Engineers, served his time as civil engineer with Mr. Wilson W. Phipson, M.I.C.E., London, and as mechanical engineer with Messrs. Maudslays, Sons & Field, of Westminster. Subsequently he was for over six years with a well-known firm of shipowners, being engaged during a part of that time in connection with the construction of floating docks, slip ways, piers, &c. Mr. Colman, it seems, is not unacquainted with the trials attending shipwreck, so that his experiences with the sea have not been altogether without excitement. For the past seventeen years he has been principally engaged in tramway work, which he studied in the States, and has constructed over 40 miles of mechanically-worked lines, besides re-laying several miles of horse tramways in London. He is at present engaged upon a system of 41 miles of cable haulage in Edinburgh, as described in the following paper.]

The author regrets that the time given for the preparation of his paper has not been sufficient to enable him to deal with the subject in a more technical manner, but he hopes the practical results of working given will be of some use to the members.

On the occasion of your association's last visit to this city, in the year 1890, the author had the pleasure of submitting a paper explanatory of the construction and working of the Edinburgh Northern Cable Tramways, and on this occasion the author trusts it may be considered opportune to lay before the members the last eight years' experience in operating these lines, and to describe the conversion from horse to cable traction at present in hand within the Edinburgh boundaries, and also as about to be proceeded with in the Leith domain.

EIGHT YEARS' EXPERIENCE.

In 1890 the cable system in Edinburgh was in its infancy, as the second line built had only been opened to the public in the month of February of that year, and the first line in January, 1888. The information available at that time as to the operating costs was not reliable, because the lines had not been at work long enough to ascertain how far the working costs would be increased after the lines and machinery

EDINBURGH: GENERAL VIEW OF THE SHREBUIH CABLE POWER STATION FROM THE WEST.

had been in use for some years. This can now be given without any dubiety from the regular balance-sheets for the last ten and a half years up to the date when the Corporation of Edinburgh bought up the lines at a price which yielded a profit over the original cost of construction of about 30 per cent.

The conditions under which these lines have been compelled to operate cannot be considered conducive to the best financial results for either receipts or expenditure, for the following among other reasons:—

- (1) The maximum speed was limited to 6 miles per hour when the system was inaugurated, mainly because it was something new, and has not since been raised because in the hilly district, perhaps, slow speed is not so noticeable.
- (2) No Sunday traffic on tramways has been permitted.
- (3) The routes are most exceptionally hilly.
- (4) The ends of the routes are not built over, and lead nowhere in particular.
- (5) The engines are high-pressure non-condensing, working at low pressure of steam.
- (6) There are no economical means of utilising the gases nor feed-water heaters.
- (7) The whole managerial department was in London, which necessitated heavy travelling expenses.

Notwithstanding the unfair limitation in speed and other drawbacks, the results have been eminently satisfactory, as will be seen from the following statement (Table No. 1) made from a comparison of results in 1890 with the last year of the company's working in 1896.

TABLE No. 1.

Year.	Motive Power.	Maintenance.	Total.	Car Miles.	Passengers
1890	£1,279	£2,219	£3,498	222,822	2,582,620
1896	1,180	2,710	3,890	376,725	3,715,989
Increase per cent.)	...	22.12	11.23	69.06	43.88
Decrease per cent.)	7.74

NOTE.—The motive power includes wages, coals, oil tar, waste, water, and engine-room requirements; maintenance is for road, cars and plant.

The tabulated results of No. 1 must be somewhat puzzling to the uninitiated in cable haulage, because, when analysed, they show that although the mileage has been increased 69.05 per cent., and the number of passengers carried increased 43.88 per cent., the cost of motive power, instead of being greater, happened to be less.

The reduction in cost of motive power has been due to improvements and a slight reduction in the price of coal, and the reason for no increase is that the loads up and down balanced on an average. These figures once more prove that cable haulage is able to enormously increase its car service, and so provide for the future without appreciable increase in its working expenses.

It will be observed from the returns of working that, whereas the number of passengers only increased 43.88 per cent., the car mileage increased 69.06 per cent. This is most important to note, because it points to a factor peculiar to cable haulage. It is directly in the interests of the management to improve the service of cars beyond even the requirements of the public, because, beyond the wages of the drivers and conductors, very little extra is incurred in placing each additional car on the line.

Even more satisfactory results than are shown in Table No. 1 were recorded on one of the cable lines during a week of greatly augmented traffic, and the author now presents these figures, believing them to show the most unique results for the conditions of operating which have ever been obtained in tramway practice in Great Britain. The ordinary weekly working expenses given in the table was arrived at by a division of the yearly certified accounts of fifty-two weeks, and the increased cost of operating was carefully checked during the week, and was mostly due to wages and gratuitia given to the men and inspectors for close attention to their duties.

TABLE No. 2.

Year 1893.	No. of Cars.	Mileage of Cars.	Passengers.	Tons hauled per Mile.	Cost per Ton per Mile in Pence.	Total Receipts.	Total Expenses.
Show week, July 24th to 29th.	47	3,395	112,663	7.14	.75	£468	£75
Ordinary week. Average 4 weeks.	36	2,514	27,541	5.75	1.11	114	67
Increase per cent.)	31	35	309	24	...	311	12
Decrease per cent.)	33

Table 2 shows that with the same fares a cable tramway was able to increase its receipts 311 per cent. by a rise of working expenses of 12 per cent. only. That by quickening the service of cars by one and one-eighth minutes, when the traffic would warrant it, the working expenses per car mile run were reduced $\frac{1}{3}$, and that the tons hauled per mile increased 24 per cent., and the cost of hauling a ton mile was reduced 33 per cent. This is elasticity in the right direction, and the author is of opinion that local authorities and tramway companies too often make the mistake of not thoroughly arriving at sound conclusions as to the elasticity of a mode of traction in this direction when considering the initial cost of systems under scrutiny.

The last return of the company's workings showed that the cost per car mile, including every charge possible, excepting depreciation and interest on capital, was 5.2 pence, notwithstanding the restriction on speed and the severe hills, &c. The receipts per car mile had only been 10.13 pence, which was just about what the cost per car mile run has been on the horse system in Edinburgh. The foregoing facts conclusively prove that the lines have been a great success financially, and the fact of the Corporation of Edinburgh still favouring cable should be sufficient authority for the statement that mechanically they have met with public approval.

THE PRESENT SCHEME.

Having now brought the paper read before you in 1890 up to date, the author will lay before the members some particulars as to the big system of cable haulage which the Corporation of Edinburgh are nearing the completion of. The Corporation of Edinburgh have purchased all the tramways within the limits of the borough, and they have leased the working to a company for twenty-one years, the company agreeing as follows:—

- (1) To pay interest of 7 per cent. upon the price paid by the corporation for old lines, and the same rate of interest upon all sums of money expended by the corporation in converting to any form of mechanical traction they choose.
- (2) They also agree to set by each year a fixed sum of money sufficient to return the capital of the lessees, and to ensure the tramway lines and other works being left in a thoroughly good condition when the lease expires.
- (3) To pay the cost of maintaining the tramway tracks and other works.

EDINBURGH: TOLL-CROSS CABLE-POWER STATION, VIEW OF CHIMNEY.

- (3) To reduce the hours of workmen as desired by the corporation.
 - (4) To pay 3 per cent. upon sums expended by corporation in reconstruction until the lines are finished.
- The corporation by borrowing the necessary money for the purchase and construction of lines at 2½ per cent., and by getting 7 per cent. from the lessees, will be able to write off the cost of the tramway system within the terms of the lease. The author thinks that the corporation is to be congratulated upon the arrangement made, and suggests that those who advocate municipal working of tramways might consider the Edinburgh arrangement worthy of favourable reflection.

Before entering upon descriptive matter, it may be of primary interest to give what the author believes to have been some of the corporation's reasons for adopting cable haulage in preference to other mechanical powers which have found favour elsewhere. First of all, it must be stated that the original lines were self-contained, and were in no measure the inducement for extending the system for the preservation of continuity. Secondly, the overhead wire system of electricity, which was the only other system reported as being anything like a financial success, was not entertained in Edinburgh because of its interference with the amenities of the city. Thirdly, because the contour of the city is peculiar in being exceptionally hilly, and where so many hills exist in a city it is of paramount importance that the speed ascending hills shall not be less than that attainable on level portions of

the routes. Fourthly, the buildings limit line of the city is more markedly defined than in most cities. Fifthly, the cable system in Birmingham, London and Edinburgh had placed the fact beyond a doubt that the corporation could treat for a lessee with full knowledge of what would be an approximate working cost per car mile with the cable system, whereas by any other system which could be in any way considered no such reliable information was available, particularly from experience of operating under British Board of Trade regulations. Further, it is within the author's knowledge that eminent electrical opinion has been given that Edinburgh is not a suitable place for electrical traction in any form.

The diagram exhibited gives the tramway systems of Edinburgh, Portobello and Leith as at present cabled and being cabled, or about to be converted to cable haulage, and the subsequent table gives the miles of lines within these respective districts reduced to single track of tramway.

TABLE No. 3.

	Miles of Double Track.	Miles of Single Track.	Reduced to Single Track.	Miles of Single Track.
Edinburgh...	19'004	7'00	38'708	
Portobello ...	2'110	...	4'220	
Leith ...	2'165	1'70	4'500	
Total ...	23'279	8'70	47'428	

On the diagram the positions of power car-houses are indicated by circles. No. 1 is one of the new depots from which all the cables in the south-west and westerly districts are to be operated, and provision is here made for extensions in these districts. No. 2 depot is being constructed on a portion of the stable land of the horse tramways, and from here the whole Leith and south-east cables will be operated. No. 3 depot is to be a small depot principally for the storage of cars for the eastern district, but an engine is to be placed here to work the Portobello and Waterloo-place lines at higher speeds than would be convenient through the centre of Edinburgh. The old cable depot at Henderson-row will not be done away with, as it will be useful for extensions of the system on the northern districts.

EDINBURGH: TOLL-CROSS CABLE-POWER STATION, SOUTH FRONT OF CAR SHEDS.

The diagram also indicates to a certain extent the various directions in which the tramway traffic can be worked. Throughout the system there will exist nearly all conditions of tramway operating which are to be met with in ordinary practice. For instance, the grades are as high as 1 in 11, there are right-angle branches, "S" junctions and compound triangular junctions to be worked. Single lines of track with passing places are not common, but at places are required. Cross traffic, where cables cross each other, have also to be dealt with. Bridges and collars have already been crossed by the cable construction in Edinburgh, when clearances of 14 in. only from the surfaces of the roads have been available, and lastly, an arrangement for crossing a swing-bridge in the Leith district has been designed. Arrangements are made by which the traffic can be returned or (short circuited) through turns out when the management considers it will be advisable during parts of the day to provide an augmented service of cars short of the terminus of the route, and such provision is also made for isolating a cable section where a block may occur.

The general speed of cars throughout the Edinburgh district is to be 8 miles per hour, but passing round important corners and over congested crossings the drivers of cars will not be able to acquire a higher speed than 4 miles per hour, and they will be able to go as much slower than 4 miles as may be required. Provision is being made to increase the maximum speeds when the Board of Trade may give permission. In the outlying district of Portobello it is expected that the Board of Trade will raise no objection to 9 miles.

SOME TECHNICAL DETAILS.

The permanent way will, perhaps, interest the members as much as anything on the cable tramways at their present stage of construction. The track rails are of the usual type

now common for tramways, and are 6½ in. deep, weighing 83 lb. to the yard run. The joint adopted by the Corporation of Edinburgh was quite new, as will be seen from the specimen produced. The two objects sought to be obtained are: Firstly, that the wheel in rolling along the tread of the rail shall not, in passing from one rail to the other, be left without a support, and thereby it is hoped that all chances of concussion due to break-joint will be abolished. Secondly, that by the arrangement of recessed nuts and flat cheese-headed bolts, the paving may be brought square up to the edges of the rails, and the author submits these two improvements are of very considerable importance.

The tests of 42 to 44 tons per square inch for tensile, 15 to 20 per cent. on 8 in. for elongation, and 40 to 45 per cent. contraction called for in the specification was objected to by British manufacturers, but the engineers are pleased to report that the effort was made, and the tests were fully obtained, with the result that extremely hard and yet tough rails have been laid in the system.

The slot rails, a specimen of which is also shown, weighs 48 lb. per yard, and are made of a somewhat milder steel than the track rails, the tensile asked for being 39 tons to the square inch, with 15 per cent. elongation and a contraction of 30 per cent. The actual amount of metal appearing on the surface of the street in these slot rails is 1½ in. Against these rails also it will be observed that the paving sets can be placed right up to the edge of the rail without any chipping, and on a square bed, which is important. The Barrow Haemette Steel Company carried out one contract for rails and Messrs. Dick, Keer & Co. the other.

The points and crossings are all to be made of steel, and no facing points are used excepting when they cannot be avoided, such as at junctions. Trailing points for track and slot rails will work by springs, but where facing points are required the track points are connected underground to the slot points by levers in such a manner that, whichever way they are thrown over, there is a locking apparatus introduced to fix the slot correctly with the track points. The slot points are built up of cast and spring steel. The track points are made of cast steel, and track over slot and slot over track crossings are built up from the section of these rails, but the junctions of slot and slot are made of cast steel with renewable points.

The paving sets are granite of two qualities, as far as workmanship is concerned. Specimens of these two qualities are exhibited. Inside the track the sets are 3 in. wide by 5 in. deep, and the average length is about 6 in. Outside the track the sets are 6 in. deep by 3 in. wide. The better quality of sets are axed on top as well as square on ends and sides. The hatch covers, which are used in the track for obtaining access to the pulleys, are filled with granite sets specially dressed, and of the same size as other sets, so that in ordinary conditions they are almost imperceptible on the road surface. In the road construction a great deal of wood has been used, and this has chiefly been of the hard Australian qualities. In some cases the wood has been laid from curb to curb, including inside the tramway track.

The standard distance between the tramway tracks is 4 ft., but where the streets are narrow this has been reduced to 3 ft. At places where the streets are exceptionally wide, the tracks have been spread apart to give a distance between of 6 ft. and electric posts have been erected in the centre. The width of the slot is specified to be in no case more than ½ in.

The terminal pits for diverting the cables at the terminal of each route are not of the design described in the author's paper of 1890, but are so constructed that, regardless of whether the route ends on an incline upwards or downwards, the cars will proceed to the extreme end of the journey by means of the cable, and no gravitation whatever will be resorted to. This is attained by passing the cable around two large vertically-placed pulleys, one behind the other, and one slightly inclined. By this means, even in a heavy snowstorm, a car could proceed through the snow to its terminus and start out again without the tracks being cleared.

Where cables terminate in the middle of a route and meet other cables, the two cables are made to lap past each other by arrangement of large pulleys placed in a pit. At these places the cables are so arranged that the operation of releasing from one cable and taking the other is performed while the car is at a state of rest, and will not require more than fifteen seconds to accomplish the change over. The operation is practically automatic. The reduced maximum speeds of cables for passing round important main corners in streets is obtained by the introduction of auxiliary cables, which are worked off the axles of large pulleys kept in motion by the main cable, and the main cables are thus saved from a great deal of hard work, and their lives, consequently, will be materially lengthened.

The author feels sure that the following information as to the rate at which cable tramways have been laid in Edinburgh will be of interest to the members. There seems to be an idea existing that cable tramway tracks are very serious innovations for streets, because they require a tube construction beyond an ordinary tramway track. The following information will confute any such erroneous impression. During the first twelve months of the contract there were laid in the streets of Edinburgh a trifling over twenty miles of cable track. The greatest speed attained was during six consecutive days, when an average of 220 yards per day was

attained on one section of new lines. It will be seen that the amount of finished work during twelve months averages out to a little more than 112 yards per working day, which would be considered splendid work for an ordinary horse tramway line, where the traffic is such as in Edinburgh, and where the tramway service has to be maintained. The contract for road and pit work was secured by Messrs. Dick, Kerr & Co., Limited.

The depot for the western district, No. 1 on diagram, is the most important, and, as some of the members may be visiting it, the author will briefly describe the construction and equipment which is intended for this depot. The site is by no means an ideal one for the purpose, but by its adoption a miserable collection of houses has been removed and a great public improvement has been effected. The buildings stand one block and a street back from the main road, and the communication between it and the main tramway is through a very narrow lane. The principal materials used in the building are red stone and a fine quality of brick, the former being exclusively employed for the front elevations. The buildings include engine-room, boiler-room, chimney 180 ft. high, pump-room, ball-in water tanks to hold 40,000 gallons, tension-room, car-sheds for forty-three cars, cart-sheds and stable for three horses, stores for road work, and underground stores for oils, &c., lavatories, offices, &c. The chief station for storing, painting and repairing cars is at No. 2 station, where the sheds are divided into sections, to isolate the cars in case of fire. Total accommodation for the storing of 225 cars is being provided.

The engines are horizontal compound non-condensing, with cylinders placed side by side on separate cranks set at right angles. There are three pairs of engines attached to the one line of main shafting. Each main shaft is divided into sections, which can be connected by specially-arranged couplings forged on the shaft ends. Two 14 ft. 6 in. diameter grooved pulleys are mounted in the line of shafting, so that any two of the three engines can be geared to work the two pulleys. These pulleys are made for carrying thirty-two ropes of 1½ in. diameter, and they will revolve at forty-five revolutions per minute. The power of the engines will be transmitted to the counter shaft through pulleys 30 ft. diameter. The high-pressure cylinders are 23 in. and the low-pressure cylinders are 40 in. diameter. The stroke is 5 ft. A premium of £5 per cent. has been offered as a bonus on the contract price of the engines for every 1 lb. of water per indicated horse-power consumed per hour less than the 20 lb. specified. In like manner a deduction of £5 per cent. will be made, but should the consumption per indicated horse-power reach 23 lb. the engines may be rejected. The engine-room is provided with two cranes to lift 24 tons each. Messrs. Dick, Kerr & Co., Limited, secured the contract for this portion of the work.

THE BOILER-HOUSE.

This is placed immediately behind and considerably lower than the engine-room. The coals taken in off the road have not far to be lifted into the bunkers over the boilers. All the pipes to and from the boilers and engines pass underneath the engine-room floors without dipping, and do not appear at all in the engine-room, also the low level of boilers should also reduce the chance of priming through syphoning.

The boilers are cylindrical marine type, 10 ft. 6 in. by 12 ft., with superheater tubes on the top. The gases from the fire enter a back combustion chamber, from which they pass to the front of the boiler through tubes into the smoke-box. They are returned over the top of the boiler, passing on their way around superheater tubes into a second back chamber which directs the gases along the bottom of the boilers into the main flue.

Apparatus is provided for diverting the gases down the sides of the boilers, in case the superheater tube should require attention when the boiler is under steam. The duty of these boilers is to evaporate not less than 9,000 lb. of water per hour at a boiler pressure of 160 lb. There are four such boilers designed to work up to a pressure ultimately of 160 lb. These boilers will not be worked to anything like their full capacity, and a large reserve will always be kept in hand.

The main steam piping is welded steel, and all in duplicate. The feed pipes are in copper and are duplicated. The boilers are fitted with "Vicars, mechanical stokers," supplied with coal from an overhead bunker running the full length of the boiler-house. Coal is taken up with ropes to the bunkers in receptacles resembling contractors' steel waggons, which are so adapted that they are suitable either for use on the body of a cart through the streets or to form the tipping body of a tramway coal truck which will travel on rails over the top of the coal bunker.

There are two heaters, arranged so that they may be used together or separately. These are of the "Brown-Berryman type," and each heater is capable of passing 1,600 gallons of water per hour. The pumps are in duplicate, and are 8-in. double-vertical "Weir's type." The arrangement of pipes from the pumps is to effect the following

COMBINATION OF FEEDING:—

- (a) All the boilers may be fed with hot water.
- (b) All the boilers may be fed with cold water.
- (c) Any number of boilers may be fed with hot or cold water.

- (d) Any one boiler may be fed with hot and cold water.
 - (e) Any one boiler may be fed with hot or cold water.
- Messrs. George Sinclair are the contractors for the work in connection with the boilers, &c.

At No. 2 depot the arrangements of boilers and machinery is much the same as at No. 1, only the boiler-house is not placed exactly in the same relative position to the engine-house, but has the advantage of being at the side of a railway, so that a siding has been made by which means coils can be lifted direct up into the bunkers instead of having to be brought in carts as at No. 1 depot. At this depot all the smithy, repair, general machine, carpenter's and paint shops are placed. At both depots the cars are brought in and taken out from the main road by auxiliary cables, and they are traversed into the repair shops or ordinary sidings by tracers, also worked by auxiliary cables.

The tension races are immediately at the back of the engine-rooms, and under ear-shed floors. This apparatus is similar in some respects to that described by the author in 1890, excepting that the pulleys on the main carriages are placed horizontally instead of vertically, and all the tension weights are arranged vertically upon the wall of the engine-room, so that the man in charge can observe at any moment the fluctuation of strains taking place upon any one line being driven from each station. From No. 1 station there will be five cables driven, and the longest at present will be 24,000 ft., but these will all be capable of considerable extension. The longest cable in the system at present is 34,500 ft. The mode of driving the cables is somewhat as explained in the author's paper of 1890, but the grip pulley has the improved white metal jaw, which has given great satisfaction in the London cable tramways. Each grip pulley can be thrown out of action without interfering with any other, by means of a coil clutch of powerful construction.

EDINBURGH: TOLL-CROSS CABLE-POWER STATION, INTERIOR OF ENGINE-ROOM (ENGINES IN COURSE OF ERECTION).

Opposite each rope drive there will be an iron drum, with a spare cable for its respective route, ready at any moment to be run into the road. At the side of the engine-room an engine and drum is provided for hauling out old cables, and it is estimated that the longest cable will be taken out and a new one put in within the space of one hour.

The gripper apparatus to be placed on the cars is an important feature of the arrangements made for cabling the Edinburgh extensions. The gripper shown in the author's paper of 1890 would not meet all the requirements of the new lines where some cables have to be taken in the gripper to the left and others to the right of the direction in which the car is proceeding. The new gripper also has to be able to pass over crossing cables. The new gripper has been designed and tested on the lines of the existing cables, and can be seen by the members at the company's depot at Henderson-row. The whole machinery is enclosed with a cast-iron box standing on the platform of the car, and occupying about the same space as is taken up on the car by an electric tramway standard. The main improvements over the gripper of 1890 consists of provision by which the driver of the car standing in the front of the car can operate the gripper by his side or the one at the rear end of the car by a simple reversing of a lever. It is by this means that the driver can cross over the cable running at right angles to his path. He proceeds to a stopping point with the gripper attached to his main cable, he then by the one process lets go that cable in the front, and takes it in the rear gripper and proceeds over the crossing of the cable. The operation takes only a few seconds and should be quite safe, because there is an automatic arrangement provided for stopping the car providing the driver should be forgetful or careless. Another improvement is, that the portion of the gripper which works in the tube underground can be quickly detached from the car and dropped into the tube if anything should go wrong with it. The attachment provisionally used direct on to the axles of the car was found in practice to have several drawbacks, and the new gripper is fixed to adjustable bars on the bogies, and the moving parts are enclosed so that there will be no fear of oil, &c., injuring

wearing apparel. There are 125 cars being built on the bogie principle. The bogies are very light in construction, being made of $\frac{1}{2}$ -in. pressed steel frames. The chief feature about them is that the wheels are on the axles outside the bearings, and that the wheel base is 3 ft. 9 in. and less than the gauge of 4 ft. 8 $\frac{1}{2}$ in. This is contrary to customary practice, but the author has tried them very severely and finds them to answer admirably. The cars are designed to seat eighteen passengers inside and twenty-eight outside, and the only noticeable departure from ordinary practice is that the insides of the cars will be domed after the manner of railway carriages, instead of the type of roof common in tramway cars.

FINANCIAL CONSIDERATIONS.

In concluding, I would specially invite the members, as advisers to their respective districts, to always insist upon arriving as far as possible at: Firstly, the saving which can be effected by any particular system over the whole period in which that system is intended to operate, before allowing the initial cost to have any influence upon the minds of their committees. Secondly, to compare (at least in a common-sense way) with existing systems the cost of repairs which are likely to result upon each individual system.

With regard to the first point, it is not generally recognised what amount of expenditure is justified in converting horse tramways to mechanical traction. What expenditure is warranted upon introducing a system which can even only show a saving over the old system of 1d. per car mile run? We will take as an illustration a town system in which it is desired to have a good service of cars, such as 1,000 car miles per mile of double track per day, and experience shows this is to be quickly attained with cable haulage, which fosters, and can afford to foster, a tramway business in a way which no other system can.

One thousand car miles per mile of double track per day, with a mean car speed of 6 miles per hour (which is, of course, low), would require for a working day of seventeen

EDINBURGH: TOLL-CROSS CABLE POWER, INTERIOR OF ENGINE-ROOM (ENGINES IN COURSE OF ERECTION).

hours an average interval between the cars of, say, two minutes, ten cars thus running on the mile of street length and performing 60 car miles per hour. This would give 365,000 car miles per mile of double track per annum, and 1d. per car mile saved would be in round figures £1,500 per mile of street per annum. That sum is sufficient to pay 5 per cent. interest on a capital of £30,000 per mile of street, and yet it is only 1d. saved per car mile. Cable haulage for such a service would be about 4d., and would probably be nearer 5d., per car mile cheaper than the present expenses for horse traction. And yet there are people who still hesitate, and some even refuse, to consider mechanical form of traction where the initial cost is high, and therefore never discover the extraordinary results and savings which may be effected in the future by the expenditure of additional capital at the right time.

With regard to the second point, the author would like to draw your attention to the class of figures which you have to guard against. In a paper lately read before the Institution of Civil Engineers, the costs of maintenance and repairs on an electric tramway line were given to four places of decimals as follows: For the maintenance and repairs of cars, with motors and everything complete, 267'25d. per car mile run. The author ventures to say that nobody will dispute that the cost of maintenance and repairs for heavy cars, with heavy motors and electrical machinery, must in the future cost far more to maintain than the ordinary horse car, and yet it can be most conclusively shown that the average cost of maintaining a horse car only in Edinburgh during eleven years has been 5'1d. per car mile run, or twice the figure which is quoted for electrical maintenance.

Again, it was also stated that the cost of maintenance and repairs for lines, which would include the whole of the permanent way, rails, bonding, electric poles and wires, &c., was 1'0088d. per car mile run. Experience shows that the average expense of maintaining the horse tracks alone in Edinburgh has been during eleven years 6'1d. per car mile run,

or nearly seventy-three times the amounts given for maintaining electrical road and wires, &c. The author does not wish to infer that these figures are put forward to willfully mislead, but he cannot too strongly warn those who are seeking for information, that a few such items in the cost of maintenance would make the difference between financial success and failure. The cost of maintenance can only be properly arrived at when the fullest data of working is available over an extended period of time.

The whole of the work is from the designs of the author and your vice-president, Mr. Cooper, who are superintending the carrying out of the work with the assistance of their respective staffs.

DISCUSSION OF MR. COLAM'S PAPER.

Mr. BAKER (Middlesbrough) remarked that a private company was there putting down tramways extending for about 10 miles, on the electric trolley system. If any of the members who were seeking for information liked to visit Middlesbrough to see the system he would be only too pleased to give them any assistance and information in his possession.

Mr. COLLINS (Norwich) asked whether Mr. Colam had any experience with the cast-weld joint, and, if so, whether his experience was favourable.

Mr. PATON (Plymouth) proposed a vote of thanks to Mr. Colam. He said that the local circumstances must determine the authority as to the character and kind of tramway which would pay them best. He could quite conceive that with wide streets and a modern town a cable tramway could be laid at moderate cost; but in old towns, with narrow streets, where there was uncertainty as to the depth of drains, water and gas mains, &c., it was almost impossible to tell what would be the cost of installing a cable tramway. Personally he regarded the cable as the most perfect form of tramway haulage. It did not disfigure the streets, and with a little extra power at the central station almost any number of cars could be put on, while the proportion of expense in relation to income was not the constant figure it was with horse traction. In fact, the greater the number of cars the smaller in proportion was the cost of working. In Edinburgh it was put at 5d. a car mile. That, compared with horse traction, showed a considerable saving in working expenses. But it might so happen that in a town where they determined to lay down a cable tramway the initial cost would be such that they would never get a company to pay about 7 per cent. on the capital outlay. The return would not pay them to do so. That was a consideration, and materially affected the question of the term of repayment which would be allowed for the construction of the lines. If the Board of Trade would only allow them a term of twenty-one years, it became a serious question what would be the state of the lines on the expiration of the lease. In Plymouth the old system was horse traction, and the company made so bad a job of it that the corporation ultimately took it over. They were working it by horse traction, and a portion of it was being laid for electric traction. They considered at the time the cable, accumulator and overhead trolley, and after consideration the committee came to the conclusion that the overhead system was the best and cheapest for the town of Plymouth.

Mr. G. JONES (Ealing), in seconding the vote of thanks, said he should have liked some further information on this question, which was affecting some of their smaller towns and districts. They had been fighting a company for six days in the committee-rooms of the House of Commons, and had defeated them. An interesting point was raised by Dr. Siemens and Prof. Hopkinson in connection with the overhead and conduit systems, and if anything could have been said to those systems it would have been interesting to some of them, and perhaps have enabled them to reply to some of the questions which were sometimes asked them at their council meetings.

DALIE MACKENZIE (Edinburgh) said they had had this question of mechanical traction before the council for a considerable time. They did not enter into the cable system hastily. They looked round and found a number of companies who were very anxious to put their appliances and various systems of electric traction at the disposal of the corporation. They thought there was no question of underground electric traction worth looking at. Then, with regard to the overhead system, it was a very curious thing that, while in America they were throwing out the overhead trolley, in England they were adopting it. Was it the case that the mayor of Chicago had made an agreement with the different tramway companies that within a certain radius of the centre of the city there should be no overhead trolley? Was it the case that in Washington, Boston and New York they were throwing out the overhead trolley? It was very curious, and his own explanation was that many large syndicates with any amount of money behind them had made a raid upon the municipalities for working electric traction. With the knowledge of what had already been done in Edinburgh, and the uncertainty in connection with all forms of electric traction, they decided they would go in for cable traction, and they had seen no reason to regret it. He did not deny that the overhead trolley was a fairly good system, but they had yet to know that in a city where frequent stoppages must take place, and where the speed could not be by the Board of Trade

regulations be more than 8 miles an hour, the overhead trolley would be as successful as the cable traction had been.

Mr. J. LOBLEY (Hanley) considered the phrase car miles rather misleading, because there were cars of very different sizes. He had seen there, in Princes-street, single and double deoked cars; therefore the cost per car mile was apt to be misleading unless the number of passengers was standardised. Bailie Mackenzie was wrong in saying that New York had thrown out the overhead system, because it had from the first consistently refused to allow the system to be introduced. In Hanley they were in the throes of a reconstruction, 2½ miles of streets being up for reconstructions and extensions. They had the overhead trolley system, and after the poles and wires had been up for twelve months he did not think any one took the slightest notice of them. Notwithstanding that, he would have preferred the cable system had it been possible. The roads were crooked, the gradients were severe, which was in favour of a cable, and they had a large number of canal bridges, the crowns of which were not more than 12 in., and which required to be constantly raised owing to undermining.

The vote of thanks having been adopted,

Mr. COLAM, replying seriatim to the questions, said that the first was whether he had experience of cast-weld joints. The objections to it were two-fold. That they could not, especially on curves, get rid of a certain amount of expansion and contraction of the rails. The greater objection was that they could not bring two portions of a rail together by a weld or cast-weld without changing the nature of the metal all round where the joint was made, and the consequence was that they increased the flat pieces and the knock on the wheel. Mr. Paton made some very pertinent remarks, and he (Mr. Colam) thoroughly agreed with him that every district required to be considered upon its merits and requirements, and the proper people to discuss that point were not engineers but local authorities. Edinburgh people said what they would not have, and then began to inquire what they would have. He knew many districts in the country which could not give better results than with one-horse cars. Mr. Lobley made a point about car miles being misleading. That was one of the disadvantages of an author not having an opportunity of reading his own paper. If he had read the paper they would have found that he gave ten miles as well as car miles. As to Mr. Lobley's remark as to getting accustomed to the overhead wires, he had found that himself. Living in a district where the overhead wires existed, they could get used to it to a certain extent. The difficulty was, if they had to live in a district where four roads met, there were so many guard wires and supports that the place became a perfect eyesore. Mr. Lobley also spoke of the bridge difficulty, and referred to the fact that they had only 12 in. cover. They had four cases of that kind in Edinburgh, and had got over them all right, and two they had been working for ten years. Bailie Mackenzie pertinently put the case against the overhead system in a nutshell. It was a little derogatory on their part to be taking a back seat to Chicago, New York and other cities, which were well known never to consider the amenities of their cities. That was, however, not an engineering question, but for the town councils to discuss. In America they were actually, where they were allowing the overhead wires to go up, introducing a clause into the agreement that the moment the town council were satisfied that they could find a conduit system which was economical they should have power to make them take the wires down and put in a conduit system.

The report will be continued in our next issue, beginning with Mr. Stewart's paper on "Sewer Ventilation as Applied to Water of Leith Intercepting Sewer."

LONDON WATER SUPPLY COMMISSION.

Lord Llandoff presided, on Monday, at a meeting of the above commission, held at the Guildhall, Westminster.

Mr. HOWARD MARTIN, chairman of the Water Committee of the Croydon Corporation, first gave evidence. The water-works of Croydon were controlled by the corporation, and had involved a capital expenditure of £158,000. The corporation were now proposing to sink one or two additional wells, to provide for the growing population, which now numbered 120,000 and was increasing at the rate of 3,000 a year. The corporation supplied 94,000 and the Lambeth company supplied nearly 30,000. The corporation, as representing the inhabitants, submitted that, whatever change might be made in the present system of water supply in the metropolitan area, the borough of Croydon should not only be preserved in her present rights of water supply, but that the portion of the borough now supplied by the Lambeth company should be transferred to the corporation. The district in question could be much better supplied from Croydon than from Lambeth, and the present arrangement had many disadvantages. The acquisition of the undertakings of the water companies would not affect the borough of Croydon except with regard to the small part of the undertaking of the Lambeth company within the borough, and the corporation were of opinion that the question of the water supply of the area south of the river could be efficiently and satisfactorily dealt with by

placing it in the hands of the four county authorities exercising control over the area—namely, the county councils of London, Surrey and Kent, and the council of the county borough of Croydon, each exercising jurisdiction within their own area, and were not in favour of one authority being established for that area. The corporation were opposed to any combination of the different systems of supply now administered by the eight metropolitan water companies, in so far as this would result in either the Lambeth company or the Kent company being linked with any other company, and thus being enabled to supply water from their present sources of supply to any larger area than that already supplied by them.

Mr. T. H. WATNEY, chairman of the Water Supply Committee of the Richmond Town Council, said that, having at present control of their own water supply, all that they desired was to be let alone. The water rate in the borough was only 11d., inclusive of all charges—a condition of things which was regarded as most satisfactory.

THE HOUSING OF THE WORKING CLASSES.

A conference of the local authorities in the Parliamentary division of West Southwark, London, was held on Friday, at the Bridge House hotel, to consider the urgent necessity of providing additional workmen's dwellings in the locality. It was shown that since 1892 the number of persons displaced by demolitions and other causes was 3,650, and that fresh provision had been made for only 2,084. Other demolitions were now going on for which no adequate provision was being made. In the parish of Christ Church a few days ago there was only one house to let in the whole parish. In St. Saviour's 3,082 persons had been displaced by demolitions since 1891, and very little had been done in erecting new dwellings. In the course of the discussion which followed the overcrowding was declared to be increasing, and it was stated that the local authorities were not only powerless to deal with it under the present statutes, but even the London County Council could not be got to act, owing to their reluctance to interfere with private enterprise. The following resolution was subsequently carried: "That this meeting, being convinced of the great need of dwelling accommodation for the poorer classes in Southwark, urges the local authorities to take common action—(1) in endeavouring to obtain from the Corporation of the City of London, the railway and electric light companies, the ecclesiastical commissioners, and other landowners in the locality, facilities for the purchase of land on reasonable terms for the erection of dwellings; and (2) in impressing upon Parliament the necessity of assisting the London County Council in their efforts to provide further accommodation under the Housing of the Working Classes Acts without cost to the ratepayers, by an extension of the terms of years for repayment of loans and by the relaxation of the building conditions now imposed by the Home Office."

NEATH IMPROVEMENTS.

A DOUBLE CEREMONY.

Two interesting civic functions were performed at Neath, on Thursday, the new Victoria gardens and the new reservoir being opened with befitting ceremony. The gardens have been laid out in artistic style by Mr. Shaw, of Gowerston, at a cost of £1,400, upon plans drawn out by the borough surveyor, Mr. D. M. Jenkins. The total cost was about £2,500. The reservoir, which has been constructed by Mr. James Allan, of Cardiff, has a capacity of 25,000,000 gallons, and, in conjunction with the existing water supply, will prove more than sufficient for the inhabitants of the borough of Neath. The mayor, in his speech, submitted some interesting statistics. The reservoir, he said, was commenced in 1896, from plans and specifications drawn up by the borough surveyor, Mr. E. M. Jenkins. The site and plans were approved by experts, and the contract entrusted to Mr. James Allan, who had carried out the work most effectively. The reservoir was fed by three streams, and could supply 140,000 gallons per day in the driest weather. With the already existing reservoir they had a total storage capacity of 41,000,000 gallons, sufficient to supply 20,000 people over a drought of 200 days.

The City Streets.—Mr. D. J. Ross, the chief engineer of the Public Health Department of the Corporation of the City of London, has been giving an interviewer his opinions on the crowded state of the City streets, and has also suggested three remedies—i.e., (1) the widening of the streets, (2) the adoption of means to get the heavy traffic out of the main streets by turning it into regular routes; (3) the crawling cab, touting for fares, should be got out of the way. Mr. Ross thinks the Central London Railway will help matters for a time, but that, as the congestion is chronic, it will become as bad as ever. He doubts if people in a hurry will make much use of the subway near the Bank, because of the extra labour of descending and ascending the steps, and for the same reason he does not regard an elevated railway as likely to be popular. In his opinion this should be the last resort.

British Association of Waterworks Engineers.

ANNUAL MEETING AT SOUTHAMPTON.—VI.

In our issue of the 24th ult. we gave the valuable and interesting paper, on "The Chemical and Bacterial Examination of Water," read by Dr. Frankland on the third day of the recent meeting. It was followed by a long and interesting discussion, of which we now give the substance.

DISCUSSION ON DR. FRANKLAND'S PAPER.

The CHAIRMAN, in opening the discussion, said he was sure that it required no words of his to introduce Dr. Frankland, who was already well known to them. They had derived much valuable information from the reading of his paper, the concluding remarks of which had particularly struck him. Dr. Frankland had gone to the root of the question. He had said that practically they were hunting for the specific germs, which, however, when found, were of very doubtful value, for the mischief was then done. They would go to a chemist with samples of water, and the chemist would be able to tell them whether the samples were of a polluted character or not. But the information was useless unless it was discovered what the water was polluted with. Dr. Frankland's advice and the light he had thrown on sand filtration should, in his opinion, be acknowledged by all engineers. He himself had been very much struck by the valuable and instructive figures which had been thrown on the screen, for they had enabled them to see at a glance the results of many years of labour. But there were, said the chairman in conclusion, many gentlemen fully qualified to go into the question, and he would first call upon Dr. Kemna.

DR. KEMNA (Antwerp) remarked that he thought he had been called upon rather unexpectedly, and that it seemed to him that he was fast developing into a lecturer. The only thing he had to say was that he considered Dr. Frankland perfectly right in his opinions. But he was perhaps better qualified to testify to the efficiency of sand filtration, because he contended that they were not so well acquainted with bad water as himself. He had, in Antwerp, a bad town to deal with; the pollution was great and all the conditions were unfavourable. In Belgium, he went on, they had a very high sense of personal freedom, and would not submit to any sanitary restrictions. The sewage of Brussels and Antwerp, he would point out, discharged into a river which was a mere ditch, and in his opinion Brussels was a place where such a thing should not have been permitted. The fact was that some of the rivers of Belgium were in a most awful state, being polluted to a very great extent. The water in his own works was analysed daily. Even the river was examined at various parts, and he made over 600 analyses monthly. Microbes, he added humorously, cost him 6s. per week for beef. He had an envious feeling when examining the figures which the London companies had to deal with, for they were really good, and the companies had, he thought, nothing to complain of. The results of the action of subsidence in water had interested him; personally, he had not always been able to obtain the same results, the latter generally differing according to the water. But London waters were not always satisfactory. One cubic centimetre of water should give under twenty microbes, and at Antwerp it was always under that figure. Great care was also taken in connection with the starting of the filters, and the first delivery was never taken into the reservoirs. Another point was the importance of regularity in working. The rate of filtration should always remain constant. It should be increased slowly each day, but he thought it best to allow a rest of twelve hours, in which time the deposit would form. Then it was possible to work at a very high speed indeed, although great shocks, he reminded them, should always be avoided. Filters should be separate and under proper regulation; their running should not be stopped at night, even although the consumption varied greatly. It was better to let water overflow than to interrupt the filtration, and he was sure that if engineers adopted that method they could obtain better results. In the case of entirely new filters months often elapsed before anything like satisfactory results were obtained, while it took two or three days to get good water after cleaning out the filters. Continuing, he mentioned that he did not consider that sand filtration was sufficient to produce a completely sterile water; in his opinion it was necessary to boil the water to make it thoroughly sterile. He had never yet found a water-filter in domestic use that was not leaking. They, therefore, were of no practical use. Statistics showed that cities supplied with filtered water had the lowest death rates. Engineers, said Dr. Kemna in closing his address, must remember that they had in their hands the lives of all their fellow-citizens.

DR. A. ANGELL, county analyst of Southampton, remarked that he had felt it his duty to be present at the proceedings. He had had sufficient experience with water engineers to know that those gentlemen very often considered analysts something of a "bore." But it was necessary, he thought, that water analyses should at all times be carried out in a methodical manner. Dr. Frankland's foes had brought up his own views on water analyses. If anybody, he continued, declared to him that he had discovered a pathogenic germ,—that was to say, a germ capable of transmitting any par-

ticular form of disease—he would be inclined to quarrel with him. With regard to the difficulties attending collection, they had already been spoken of by the learned lecturer. He warned them not to place a too-high value upon the bacteriological analyses of water. If water were submitted to a chemist they must look upon his figures as a diagnosis only. He had seen the water referred to by Dr. Kemna, and did not think there was anyone in England who would dare to face it.

MR. CHARLES H. PRIESTLEY (Cardiff) said he thought he could bear out all that had been said by Dr. Frankland, and especially those remarks in regard to the subsidence of water in reservoirs. The character of the water obtained from large impounding reservoirs clearly showed the benefits to be derived from the practice. In regard to open or covered service reservoirs, he would, if it were not asking too much, like to know Dr. Frankland's opinion on that question. He himself had been told by a certain borough analyst that covered reservoirs were more preferable than open.

MR. H. ASHTON HILL (Birmingham) said he did not rise to criticise the paper, as it was, in his opinion, incapable of criticism. He desired only to say a word or two. It was he who had suggested to Dr. Frankland that he should contribute his paper. They were, he told the doctor, a young association, and it was not everybody who recognised that they had justified their existence. Dr. Frankland had hesitated for a few moments and then consented. By doing so he had conferred a great favour upon him (the speaker), and he now trusted that the doctor would not regret his appearance before the association.

MR. FRANCIS J. BANCROFT (Hull) remarked that they could not, of course, criticise a paper like Dr. Frankland's; in fact, they would have a difficulty in doing so. Water engineers, he continued, could not fail to notice how the bacteriological examination of water had lately been getting into popular demand, and it was therefore with the greatest pleasure that he had been enabled to hear the author's paper on the subject. Personally he had to deal with well water. Recently he had been making a study of the microbes which surrounded us, and when we dealt with questions of that magnitude we saw the importance of the subject. Then they asked what the value of a bacterial examination was, but that question could, he thought, be answered by the valuable figures they had seen on the screen. He held that the taking of samples of water for examination should be done by properly-qualified officials. He believed that typhoid fever could only be conveyed by faecal matter in water, which when passing through a town was, of course, liable to become polluted. Microbes were, as they knew, more numerous in summer than in winter. After a brief reference to the case of chalk waters, Mr. Bancroft then went on to say that he also would be glad to have Dr. Frankland's idea concerning the relative advantages of open and covered service reservoirs, and whether there would be any gain in constructing a covered reservoir for a chalk supply. In Cardiff it was said that the water would be better if it were exposed to the light. Mr. Bancroft then brought his remarks to a close with a question as to the frequency with which the bacteriological examination of water should be conducted.

MR. A. J. PRICE (Worcester) stated that he desired to put one question to the author. He was concerned with a river supply, but, unfortunately, was not in possession of a storage reservoir, and he wanted to know Dr. Frankland's suggestions for the elimination of the bacteria contained in the water. Everyone could not follow the examples set by the London companies. In many of the small towns the question of economy had to be taken into consideration, together with the difficulty of obtaining the necessary ground for the reception of reservoirs. Then, again, in conducting a river supply one was subject to floods. If they were going to impound water they would want something like twenty days' storage; and not only that, it meant increasing the pumping machinery.

MR. W. WATTS (Sheffield) could not help feeling that in such a discussion as the one they were engaged upon men sometimes "rushed where angels feared to tread." He thought also that many of the silent members knew as much about the subject of the discussion as those who took part in the debate. He came from a district where filtration was not introduced, for the reason that they took advantage of the gathering ground. By draining the swampy places, by ditching the streams, and by making some provision for watercourses, it was possible to exercise some control on the occasion of excessive floods, and he was sure that if they canvassed the ratepayers of their respective towns they would find that the latter were willing to pay a little more to carry out such schemes for the purification of their water. With regard to the bacteriological point of view, there were many opinions concerning it. But it was evident that filtration did a great amount of good, and he was glad that they had had such a man as Dr. Frankland to give them so much information on the subject. He had read the author's books and had argued out the matter.

MR. HAMLET ROBERTS (Ipswich), in a reference to the

taking of samples of water for the purposes of analysis, considered that the cork should be replaced in the bottle before the latter was withdrawn from the water. He suggested the adoption of a special stopper.

Mr. ARTHUR BOWKER (Mid-Kent) submitted a question respecting the reduction of microbes in a certain well water.

Mr. O. WILLIAMS (Aberdare) also added a few remarks in regard to water filtration.

Mr. JOHN SHAW (Boston, Lincs.) next made a reference to the water supply of Antwerp. The source of the water there was the filthiest he knew, and the latter when passing over the filters was something like the colour of beer. After congratulating Dr. Kemna on producing such a clear liquid he went on to speak of the effect which variations in the number of organisms in his own water had upon him—generally, as they all know, the most open-minded of men. Before starting sand filters to work his usual practice was to allow the water, after being run in, to stand for about three hours. The speed of working was then gradually increased. There was, he would mention, a limit of time at which a filter would work, because of the formation of matter upon its surface.

Dr. FRANKLAND, after thanking the members, then proceeded to reply to some of the questions raised. One of the

waters a few days after introduction, but, on the other hand in the case of well water, the bacilli were only found about thirty-three days after their introduction.

The proceedings then closed with the accordance of hearty votes of thanks to the town council of Southampton and the authorities of the Hartley College, for the facilities they had given the association to hold their meetings, and to Mr. Matthews for his duties as chairman.

VISIT TO SOUTHAMPTON WATERWORKS.

After luncheon the members left in brakes to visit the Southampton waterworks. *En route* a stoppage was made at the Red Lodge Rhododendron Nurseries, where the party were heartily welcomed by the owner, Mr. W. H. Rogers, one of Southampton's most popular ex-mayors. Perhaps the most remarkable feature of the gardens is the fact that seventy years ago their site was a mere waste of sand-pits. Now they show a wealth of colour from the blossoms of an infinite variety of rhododendrons and flowers of all hues, or are green with dense plantations of rare coniferous and other trees. A *Sequoia gigantea*—the giant tree of California—was noted with the more interest in connection with its rapid growth—70 ft. in thirty-five years; and an *auracaria* which fronts Mr. Rogers' picturesquely thatched house was conspicuous as probably the most perfectly-grown of its kind in this country. Amid the most beautiful surroundings the visitors were photographed by Messrs. Chalkley Gould & Co., of Southampton, and in one of their excellent groups—reproduced in THE SURVEYOR of June 17th—the venerable owner of this English "Momperrai" may be described modestly half-hidden in the shadow of the porch.

Not without reluctance the journey was continued to Otterbourne, where an examination was made of the wells, headings, pumping station and quarries, and especially interest was shown in the softening works with mechanical filtration. The following details of the arrangements had been prepared—

SOUTHAMPTON CORPORATION WATERWORKS, 1290-1898.

By WILLIAM MATTHEWS, M.A.S.T.C.E.

The waterworks of Southampton have a history going back to a more remote date than can probably be ascribed to any other such undertaking in this country, it being recorded that on June 16, 1290 (Edward I.), one Nicholas de Shirlee granted to the Friars Minor the right to take water from a spring at Colwell (now called Spring-hill, Hill-lane) to Aclard's bridge, and thence by the king's highway to their church in the town of Southampton. It is further recorded that upon the Feast of the Purification, 1310 (Edward II.), the friars granted the use of the water to the town. On October 3, 1420 (Henry V.), they conveyed to the mayor and community of Southampton all their rights and title in the springs, conduit and pipes, and the waterworks of the town have ever since, for a period of 478 years, remained in their possession.

The original vaulted chambers covering the Colwell spring and one of the old water-houses (adjoining St. Peter's Church), to which the water flowed, may yet be seen. On June 1, 1515 (Henry VIII.), another spring at Lobery Mead (now Grosvenor-square) was presented to the town by John Flemynge. The water was led to a water-house (which until recently could be seen in Waterhouse-lane) and thence to the still existing house, which was quite close to it. From this water-house lead pipes conveyed the water to the town, and, together with sundry wells of a purely local character, including the Houndwell well, 1490 (Henry VIII.), constituted the water supply until 1803. The first Act of Parliament was obtained in 1747, followed by others in 1803 and 1810.

About 1804 the No. 1 reservoir was constructed. It collected surface water from the common by means of earthenware pipes, and a line of elm pipes conveyed the water to the town. This reservoir has been abandoned and the banks levelled down.

About 1811 the No. 2 reservoir and about 1832 the No. 3 reservoir was made on the common. They also collected the surface water, which was conveyed to the town by a line of 10-in. cast-iron pipes. They continued in regular use until 1852, after which, and until recently, the water was used only for road watering. They have now been converted into ornamental waters.

In 1838 the deep well on the common* was commenced, and the work carried on intermittently until 1853, when it was finally abandoned at a depth of 1,317 ft. (842 ft. in chalk), having involved an expenditure of £20,000 for a yield of only 130,000 gallons per day. The water from this well was, in 1887, used to supplement the supply for road watering by pumping into the No. 3 reservoir, a hydraulic engine actuated by the pressure in the 18-in. trunk main from the upper reservoirs being used for the purpose.†

In 1851 a supply of water was obtained from the river Itchen at Mansbridge, the works comprising a brick and masonry lined subsiding reservoir (3,500,000 gallons), a pair of Cornish engines and three boilers; at the same time the two upper reservoirs, Nos. 4 and 5, on the common were constructed. The old supplies were then discontinued, and in 1865 the Mansbridge works were increased by the addition

most important points which Dr. Kemna had emphasised in his remarks was that in regard to constancy in the rate of filtration. Then, again, he had spoken of the necessity of running the water to waste before putting the filters to work. That was not the practice in this country, although it should be. Dr. Kemna was wrong when he said that he (Dr. Frankland) had had no experience of bad water, because he had analysed Antwerp water himself. It was, he admitted, abominable stuff. Referring to the bacteriological examination of water, he had no hesitation in saying that the mere statement of the number of bacteria in water was of no use whatever. It threw no light on the subject, although, of course, the information itself possessed some value. The presence or absence of suspended matter in water made no difference in the numerical results. He was afraid that he was not in a position to reply to Mr. Priestley's question concerning the merits of open and covered reservoirs. Double filtration would, he thought, be a poor substitute for the improvement of water by storage. It was a mere makeshift. Other devices had also been resorted to, but they did not meet the case. During the period of storage pathogenic bacteria usually underwent destruction. He had shown, he remarked, that typhoid bacilli could be detected in some

of a second engine and boiler house, containing a pair of coupled rotative engines and five Lancashire boilers. An additional boiler had meanwhile been added to the older plant. In 1884 the water in the river Ichen had become so liable to pollution that it was determined to abandon that source and obtain a supply from wells sunk in the chalk at Otterbourne, to accomplish which an Act of Parliament was obtained in 1885. The works were put in hand at once, and completed by June, 1888.

These works* comprised two wells 100ft. deep; a pumping station at a level of 90 ft. above ordnance datum, containing two compound steam engines and three boilers; a workshop; softening plant, consisting of two lime mills, two lime cylinders, a lime-storage tank, a mixer, a softening tank and thirteen Atkins disc filters; two limekilns; a railway siding; and roadways; and seven cottages for the working staff. A 24-in. main was laid to the covered service reservoir which was

erected on Otterbourne Hill, and thence a 16-in. main was laid to Swaythling, connecting the new to the then existing system of mains to the town and the reservoirs on the common. These works cost about £66,000.

In 1896 an additional engine-house was built, with space and foundations for two engines, and one engine was therein erected. A new shaft and well were sunk, and additions made to the softening plant by putting down two more lime cylinders and six filters; at the same time a lime store was built, the large lime-storage tank was done away with and replaced by a smaller one with mechanical agitators, and various alterations made to the softening plant generally, by which its output is increased to nearly 4,000,000 gallons per day and its efficiency and regularity much improved. The water is reduced in hardness from 18 deg. to 5 deg. or 6 deg., at a cost of about ¼d. per 1,000 gallons for working expenses, while the repayment of principal and the interest comes to just about another ¼d. per 1,000 gallons. The cost of the 1896 additional works was about £15,000.

At various times about 700 ft. of adits have been driven from the wells, at a level of about 33 ft. above ordnance datum, and a further length of 500 ft. is now being driven, as in the case of all the sub-aqueous work except the two original wells, without the aid of contractors. A contract has been let for the erection of two additional lime kilns.

In 1897 the two service reservoirs, Nos. 4 and 5, on the common were covered in, at a cost of £6,300, and an additional main, 24 in. diameter, laid from Otterbourne Hill reservoir to Swaythling, at a cost of £19,700.

Renewal of distribution mains goes on at the rate of about 3 miles per year. Deacon's waste-water meters are in use and have effected a reduction of consumption of over 30 gallons per head per day. All service pipes and outside stop-cocks are maintained by the corporation, who also hire out meters, test and keep them in repair. The present annual consumption of water to a population of 77,500 is as follows:—

Domestic supply	749,000,000
Public sanitary use, by meter	36,000,000
Softening works, cleansing reservoirs, &c.	21,000,000
Trade supply, by meter	261,000,000
Total	1,067,000,000

FOURTH DAY'S PROCEEDINGS.

VISIT TO GOSPORT AND PORTSMOUTH WATERWORKS.

Papers and discussion had been eliminated from the programme of Friday, the fourth and last day of the meeting. At 9 a.m. members and visitors left the docks railway station for Fareham, whence they proceeded in boats to the Foxbury works of the Gosport Waterworks Company. At this point an examination was made of the pumping station, well, headings and the brickwork tower, which appeared to be practically ready to receive the novel steel tank with which it is to be crowned. Full particulars of the works at Foxbury were, it will be remembered, given in Mr. Hildred's paper (THE SURVEYOR, JUNE 10th).

Thence the journey was resumed to the Havant and Bedhampton works of the Portsmouth Waterworks Company, where the remarkable feature is the extraordinary number and volume of the springs. They are briefly described in the following notes on

BOROUGH OF PORTSMOUTH WATERWORKS.

By H. R. SMITH,
Waterworks Engineer, Portsmouth.

Parliamentary powers for the supply of water to Portsmouth were first obtained in 1741, but nothing was accomplished until 1809, when the Farlington Waterworks Company constructed a pumping station and two reservoirs in Farlington Marshes, as well as the Drayton reservoir on the slope of Portsmouth Hill, and commenced to supply water to Portsmouth in 1809. At the same time the Portsea Waterworks Company constructed works and supplied water from a well sunk at Landport, within the borough.

In 1840 these companies combined, and appear to have furnished Portsmouth with an intermittent and limited supply until the year 1857, when they were bought up by the present Borough of Portsmouth Waterworks Company, who, while making use of the Farlington springs, at once set about acquiring and utilizing other and more voluminous springs at Havant, a course which had been strongly advocated in 1850 by the late Sir Robert Rawlinson.

The use of the well at Landport was abandoned and the Farlington works closed in 1860, when this company began

to supply their water from the springs at Havant, the pumping station erected there being furnished with two beam engines, each of 90 indicated horse-power, and four Lancashire boilers; and the water from such station was pumped through a 20-in. main into the Drayton reservoir. In 1865 the third engine of the same type and power and two additional boilers were put down; also two high service reservoirs were constructed on Portdown Hill. In 1878 a fourth engine of 120 horse-power, together with additional boilers working at an increased pressure, were added, and an additional rising main of 24 in. diameter was laid to the high-service reservoirs above referred to.

The company continued to purchase additional land and springs at Havant and in the neighbourhood of Bedhampton, and in 1879, having overhauled and improved the house fittings, were able to introduce a constant service of supply, which has since been maintained throughout the whole of the company's district. In 1889, the Bedhampton springs having been acquired, a pumping station was erected there, and a compound Worthington engine of 300 indicated horse-power placed therein capable of lifting 4,500,000 gallons per diem to the service reservoirs at Furlington. This engine has recently been altered to a capacity of 7,000,000 gallons per diem, and there is sufficient space in the engine-house for an additional engine of at least the same power.

The two high-service reservoirs at Furlington are 150 ft. above the town of Portsmouth, and each contain 3,500,000 gallons. The Drayton old reservoir is 76 ft. above the town of Portsmouth, and contains 2,500,000 gallons. The three reservoirs are upon the chalk of Portdown Hill, and constructed with a base of concrete upon the chalk, puddled clay upon the concrete and brickwork in cement upon the puddled clay. The Drayton reservoir is not in use, owing to its low elevation, and is kept in a state of repair for use in

Waterlooville, Parbrook and Stakes on the northern slope of Portdown Hill, a reservoir being constructed for that purpose near the "Georgo Inn" at Portsdown, at an elevation of about 300 ft. above ordnance datum.

At the works luncheon on a most generous scale was provided by the directors of the Portsmouth company, and subsequently there were some brief speeches. In the absence of Colonel Charles L. Owen, the chairman of the directors, the visitors were cordially welcomed by the secretary, and Mr. SMITH then gave a clear and interesting review of the past and present position of the undertaking; the moral to be drawn from his remarks being that the local authority of Portsmouth had neglected a splendid opportunity when, some forty years ago, they had not sufficient foresight to municipalise the then existing works. They are probably regretting to this day that they did not venture the £40,000, for which they could have secured the nucleus of an ample supply for their borough for, apparently, an indefinite time to come.

The members of the party afterwards drove to Southsea pier and returned to Southampton by boat. In the course of the various visits hearty votes of thanks were unanimously awarded for the cordial hospitality shown and for the courtesy of those who had so admirably acted as guides at the various places. These visits formed an excellent feature of a meeting, which was so eminently successful as to augur well for the future of the association.

Among those who attended the proceedings throughout was M. Victor J. Van Lint, of Brussels, the well-known civil engineer, who is prominently connected with our contemporary, *La Technologie Sanitaire*.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

199. **Hydro-Geology, Books on.**—"Aqua" writes: I should be greatly obliged if you or any of your readers would kindly give me the title, &c., of a book dealing with the subject of hydro-geology. The information that I particularly want is as to the strata in which water may usually be expected to be found, with some notes as to the quality and probable quantity to be expected.

Probably the best book on the subject of hydro-geology in relation to this country is "The Water Supply of England and Wales," price 10s., by Chas. E. De Rance, C.E., F.G.S., secretary of the British Association Underground Water Committee. Mr. De Rance is, we believe, the best authority in the kingdom on the subject, and shows what is the probable supply of water available in all the river basins of England and Wales, and what amount is required to satisfy the demands upon that supply. The book, we think, may be obtained from Mr. B. T. Batsford, engineering bookseller, &c., 94 High Holborn, London, W.C. "The Modern Practice of Sinking and Boring Wells, with Geological Considerations and Examples of Wells," by Ernest Spoon, C.E., 10s. 6d. (E. & F. N. Spon), will also be found useful. The querist should also refer to an interesting paper, "A Consideration of Some of the Conditions requisite for Obtaining Underground Water Supplies," by Mr. George Hodson, M.I.C.E., which is published in vol. xix. of the "Proceedings of the Incorporated Association of Municipal and County Engineers." Books of a more elementary nature are Hughes' "Treatise on Waterworks for the Supply of Cities and Towns, with a description of the principal geological formations of England as influencing supplies of water," price 4s. 6d. (Crosby Lockwood & Son), and Swindell and Burnell's "Well Sinking," price 2s. (Crosby Lockwood & Son).

200. **Surveying, Book on, required.**—"A.J." writes: Will you kindly inform me which are the best books on surveying and plotting to scale for a beginner? I know a little about field work, but my knowledge is very meagre.

"Sill's" "Practical Surveying," price 7s. 6d. (Crosby Lockwood & Son), and Andre's "Plan and Map Drawing," which includes instructions for the preparation of engineering, architectural and mechanical drawings, price 9s. (E. & F. N. Spon), will, we think, be found helpful. The querist is, however, advised to obtain tuition in geometry and building construction at one of the local classes in connection with the Science and Art Department if he desires to make sound progress in drawing to scale.

Exmouth District Council.—An Exmouth contemporary, in an editorial note, states: It was the habit of some persons to treat lightly Mr. Beawick's reiterated assertion that the duties of his department were more than one man could cope with. The new surveyor, Mr. Harding, had been in office just over a fortnight, when on Thursday, the 2nd ult., he stated that he should require assistance, and asked the council to allow him to take an articled pupil. This circumstance is an unexpected, and certainly a significant, corroboration of the late surveyor's oft-repeated contention as to the necessity of help being provided for him in the execution of his multifarious tasks.

BOROUGH OF PORTSMOUTH

WATER WORKS.

case of emergency. The mains from the reservoirs for the supply to the town and district consist of one 24-in., one 20-in., two 12-in. and one 10-in. The surface levels above ordnance datum throughout Portsmouth vary from 10 ft. to about 25 ft.

The springs at Havant and Bedhampton are of a remarkable character, both as to their volume, purity and permanence. Rising from the chalk, they are intercepted at their points of outbreak, and are either piped or surrounded by masonry banks, so as to form collecting basins and channels of great size; and, after being collected, the water is carried by gravitation into wells at the pumping stations. The arrangements are such that either pumping station can derive its supply from either set of springs, and any of the basins or channels could be temporarily cut out of the system for repairs or cleansing. The total yield of the company's springs at both places is estimated at about 15,000,000 gallons per diem, about 9,000,000 coming from those springs which have already been connected to the works. The average daily quantity of water pumped for the district is about 7,000,000 gallons, to an estimated population of 200,000 persons.

The company, in its anxiety to preserve the source of supply from any possible contamination, constructed a wall of puddled clay, carried down from the surface to the solid chalk or clay beds immediately over it, all round the collecting area at Havant; and the Hermitage stream, in its course from the northward, has been intercepted before it reaches the Bedhampton works and diverted through a 60-in. pipe, about three quarters of a mile in length, and made to discharge into tidal waters. Two fine cooling ponds, each holding about 350,000 gallons, have recently been erected at Havant works, and are well worthy of notice. The Furlington works were again brought into use a few years ago for the supply to the forts on Portdown Hill and villages of

Principal Features of Electric Lighting Systems.—VI.

DISTRIBUTION OF ENERGY.

The question of distributing electrical energy is probably more important than that of generation because it is the one section of an electrical supply system in which there is likely to be waste of energy. It need hardly be pointed out that any waste of energy that takes place in the distributing portion of a lighting system may mean all the difference between failure and success. It was pointed out in the first of these articles that in order to reduce waste in distributing electrical energy it is necessary to reduce the resistance of the conductors, and that in order to reduce the resistance of a conductor it is necessary to use a given size for a given current. Obviously there must be a limit to the size on the grounds of cost, and in the distribution of a given current there is a well-defined economical size of main to be adopted. In distributing electrical energy it is important that the lamps farthest from the point of generation should be as well lighted as those nearest to it, and this is a matter which calls for some care in apportioning the proper size of mains and also in regulating the electric-motive force, so that the lamps nearest the station will not be too bright and those farthest away will not be dull. The Board of Trade allow a certain variation in this respect, and a supplier may without let or hindrance supply a current of 96 volts to a lamp which is designed for 100 volts, and on the other hand it may be permitted to supply a 100-volt lamp with a current of 104 volts. When this provision was made it is more than likely that the exact results were not clearly realised, because if we examine for a moment the effects of this variation they are distinctly important from a consumer's point of view. For example, a 100-volt lamp which is being supplied with a current at 96 volts will be less bright than a lamp which is supplied with a current at a pressure of 100 volts. In other words, the consumer is not obtaining the amount of light that his lamps are designed to give. Then, again, if suppliers exercise their privilege of supplying a current at a voltage of 104 the effect is an increased brilliancy, but it cannot be said to tend to the prolonged existence of the lamp. The greatest trouble, however, from a lamp point of view, is when the variations are frequent, because it has been very conclusively proved that constant variations in the voltage have a very deleterious effect upon the life of a lamp. These, however, are matters that may be discussed in a subsequent article.

While dealing with the distribution of electrical energy, it may be interesting to point out that though the central electric lighting works provide the readiest and easiest means of supplying a great number of consumers, there are occasions when it would be better and cheaper for an establishment to have a lighting plant of its own. It is, however, only the circumstances of a particular case that can determine this point. When an establishment is depending for its lighting upon its own private plant it necessitates the employment of someone to look after that plant. In such a case it is necessary to consider the space taken up, which may vary in value according to the position of the establishment, and there is a greater danger of the supply suddenly ceasing than exists when the current is obtained from the public mains. Then, again, moving machinery is not always a desirable thing in many places. But, notwithstanding these drawbacks, there are undoubtedly cases where a supply can be obtained more cheaply from isolated plant than from public works. It was shown some time ago in the case of one well-known club in London that electricity obtained from a company at 7d. per unit would have cost £1,452 per annum, as against an annual cost of £594 for working private machinery. It is clear, however, that as the price of electricity is reduced—and this, of course, is happening on all sides—it becomes more difficult for the isolated plant to compete on the score of economy with the supply of electricity obtained from the public mains; and it is a significant fact that in Manchester, where for some years numerous small installations existed, many of these have been abandoned and electricity obtained from the corporation mains. In this case, of course, the price of electricity is very low, and can be, as a matter of fact, supplied to a consumer at a much cheaper rate than that at which he would be able to manufacture it for himself. We need scarcely enter into the why and the wherefore of its being possible, as a rule, in connection with a public supply to be able to deliver electricity at the consumer's house at a cheaper rate than he would be able to manufacture it himself. The chief factor is that a large system is able to employ larger engines and dynamos, which are vastly more economical than small ones and the cost of labour is very much minimised per unit by the fact that the labour is more constantly employed.

THE SYSTEMS OF DISTRIBUTION

vary, of course, with the system of generation. A high-pressure alternating system, for example, naturally calls for some different method of distributing electrical energy to consumers than is necessary with a low-tension continuous-current system. In the former the high-pressure alternating current is carried through feeders laid underground to what are known as sub-stations, where the high-pressure alternating current is reduced or transformed to a condition in

which it is safe to enter a consumer's house. The transformer may be said to consist of two windings of wire or other material, one of which is known as the primary and the other as the secondary. Describing it as simply and as briefly as possible, we may say that the secondary winding is interlaced or wrapped round the primary. The passage of an alternating current through the primary coil of a transformer sets up an effect in the secondary winding, and according to the amount and size of the winding so can the exact pressure of a current be regulated in the secondary winding of a transformer. Generally speaking, an alternating current station generates electricity at a pressure of 2,000 volts, and this passes to the transformer chamber or sub-station and is there transformed down to a current of 200 volts or 100 volts, and from thence distributed to the consumer. There are here and there in different parts of the country isolated instances in which the transformer is placed on the consumer's premises, but this only applies to some of the older systems, and the method has been altogether abandoned in the case of the more modern systems. A high-pressure continuous current is in some respects similar to the alternating system, in that high-pressure mains are taken to a sub-station where the current is transformed down to a condition suitable for lighting houses, but the means of transforming employed in this case differ very materially from the alternating-current transformer, and this difference is the main distinction between a high-pressure alternating and a high-pressure continuous current. The former is, by virtue of its peculiar nature, converted by means of stationary transformers, while the high-pressure continuous current needs some revolving mechanism. A high-pressure continuous converter is practically neither more nor less than a motor—which is driven by the agency of the high-pressure current—coupled direct to a low-pressure current machine, or the more modern form of a converter. The machine is provided with a double-wound armature, one end of which receives the high-pressure continuous current while the other end gives off the low-pressure current, which is then distributed.

A very important difference, however, arises in the management of these two systems, for in the case of the first it is possible to devise some automatic means of switching in and switching out the transformers, and no other attention beyond this function is necessary. In the case of the continuous-current machines, however, although there may be means of starting and stopping them automatically, it is obvious that having running machinery they should have a certain amount of supervision. As a matter of fact, the sub-stations in a high-pressure continuous current become, as it were, small generating stations, and are a great deal more inconvenient than in the high-pressure alternating sub-station system.

The simplest method of distributing an electrical current is the two-wire system, by which mains are taken from the generating station direct to the lamps, but the operation of such a system is very limited, and in dealing with a considerable area it is necessary to provide a little more complexity than is represented by a simple two-wire system. Even if a two-wire system pure and simple were adopted, which is extremely unlikely in any new installation, it would be necessary to employ what are termed "feeders," which are neither more nor less than specially heavy copper mains, designed to carry the whole of the current that is generated at the station to what are termed distributing points. The distributing points in this case may be copper or other metal bars, and from these bars distributing mains, which would be connected directly to the houses, would be taken off. This simple two-wire system was used in a good many instances in the early days of electric lighting, and, as a matter of fact, still exists in a few cases. The most notable municipal system laid down on this principle was at Bradford, and very considerable extensions were made on these lines before it was thought necessary to employ what was undoubtedly a more economical system of distributing electrical energy. The next step in the development of the two-wire system was the use of a third wire, from which the system became known as the three-wire system. The adding of another wire had a very remarkable effect on the economical distribution, and the results achieved by this have been so exceptional that in the next article it may be desirable to consider the advantages arising from the arrangement. Most low-pressure systems at present laid down are carried out on this principle, and it may be necessary before concluding this series of articles to consider one or two municipal systems in some detail.

Weston-super-Mare.—On Wednesday, the 15th ult., Mr. W. O. E. Meade-King, Local Government Board inspector, held an inquiry at the town hall in reference to an application made by the council for power to borrow £3,800 for market purposes. The clerk explained the scheme in detail, and also the estimated cost of carrying it out, the plans being produced and explained by Mr. Hans F. Price. There was no opposition, neither were there any questions forthcoming from any of those present in regard to structural matters.

Municipal Work at Darwen.

IMPORTANT LOCAL GOVERNMENT BOARD INQUIRY.

Major-General Crozier, R.E., an Inspector of the Local Government Board, recently held an inquiry at Darwen relative to the application of the town council for sanction to borrow £48,170 for the following purposes: Electricity supply scheme, £30,000; electric lighting in streets, £500; refuse destructor, £6,870; public parks, £5,500; new road at Hollins-grove, £400; land for health depot, £800; land for highways, store yard, workshops, &c., £1,600; and sewage disposal works, £2,500.

COMBINED ELECTRIC SUPPLY AND REFUSE DESTRUCTION.

This makes the fourth Local Government Board inquiry which has been held since the present borough engineer, Mr. W. R. W. Smith-Saville, A.M.I.C.E., took office less than two years ago, and shows the large amount of work which has been carried out since then. The work of the department has been rendered heavier by the desire of the corporation to proceed at once with an electricity supply scheme in conjunction with a refuse destructor. The consideration of an electrical supply scheme had been entered upon when Mr. Smith-Saville took up his duties, and a preliminary report had already been obtained from an engineer in private practice as to the desirability of carrying this out, but nothing further was done for some months. Eventually, however, a provisional order was obtained, and it became necessary to proceed with the details of the scheme, so as to have the work completed within the time allowed by the order. Acting under the advice of the borough engineer, the corporation decided to have complete control of the whole scheme at every point. To do this effectually they decided to place the matter in the hands of the borough engineer and to appoint an electrical engineer whom they would subsequently require to manage the works, to collaborate with him in designing the scheme, and to act as resident engineer during the construction of the works. W. Stanley Clegg, of Burnley, received this appointment.

With the very awkwardly-shaped and almost precipitous site which was selected as being the best available in the position required, added to the complication caused by the works having to be worked in conjunction with a refuse destructor, resulted in the designing of the works to be an anxious one, not only so as to allow for a symmetrical arrangement capable of allowing considerable extension, but also so as to give the least possible chance for friction between the future management of two plants. Finally, however, it was decided that the two plants should each be complete in themselves but at the same time run parallel to each other, so that each may be extended in the most convenient manner possible without interference with the other; whilst, at the same time, when the electricity supply works in the future require more power than possibly will be obtained from the destruction of the town's refuse independent boilers can be conveniently added, to be fired in the ordinary manner.

TYPE OF REFUSE DESTRUCTOR.

The next important matter to determine was the type of refuse destructor which should be adopted, and with a view to this a deputation from the Electricity Supply and Health Committees visited the principal places where they were informed the best of destructors was being best utilised. The committee visited Cambridge, Shore-ditch, Leyton, Rochdale, Oldham, Bury and Hereford, and were well pleased with the various systems, but did not recommend any particular one, as the quotations received and the amount of steam which the various patentees were prepared to guarantee varied so much that it became almost an impossibility to determine which really was the most efficient and economical. The borough engineer therefore advised that he should prepare proper conditions and specifications, so that each could tender upon the same basis, for the purpose of affording a fair comparison, and this was carried out. In response to the advertisement six tenders and designs were received, and the order eventually was given to Messrs. Meldrum Brothers, of Manchester, to install two units on their system. Each unit will be entirely distinct from the other, and will consist of one continuous hearth, with the grate sub-divided into four compartments, into each of which will be fitted two of Messrs. Meldrum's patent blowers, for providing the forced draught. Each grate will be fired alternately, so that the newly-charged refuse is always adjoining that which is in an incandescent state. At the end of the hearth is a combustion-chamber, for the settlement of dust and more complete destruction of any organic matter which may have escaped from the hearths, the hot gases next passing through the flues of an ordinary Lancashire boiler (30 ft. in height, and 4 ft. in diameter) in the ordinary manner, and subsequently through a regenerator, the heated air from which will be used in conjunction with the forced draught. The chimney will be 80 yards in height, and is placed in the centre between the two plants, and will be capable of being used by the electricity supply works when required.

The Darwen refuse averages about 40 tons per day, and in lieu of providing a complicated system of thermal or other

storage the engineer has deemed it better to have the cells rather in excess of the general requirements, the intention being to fire lightly during the period of light load at the electricity supply works and concentrate the bulk of the firing during the short period of heavy load, during which period it is anticipated that over 300 horse-power will be obtained from each of the two boilers. When complete it is believed that this will be the largest installation of refuse destruction, combined with Lancashire boilers for steam supply, in the kingdom, and it will be interesting to see how far the corporation have been justified in departing from the usual water-tube type of boiler used with refuse destruction.

ELECTRICITY WORKS AND PLANT.

Although space is reserved in the electricity works for boilers, it is not, of course, intended to place any therein for some time, as it is thought that sufficient steam will be obtained from the refuse for the first two or three days. The electricity works will consist of the usual offices, with testing and store rooms, accumulator-room, generating-room, &c. The generating-room is 60 ft. in width, and will allow for two rows of direct-coupled steam dynamos, one end being constructed in a temporary manner, ready for extension. This room, however, will allow for space for 2,000 horse-power as it is now being built. The system of supply will be the three-wire low-tension continuous current (160 volts, with a 230-volt supply to consumers). The various contracts have been let subject to the sanction of the Local Government Board being obtained, and the following firms are the successful contractors: Steam dynamo, Siemens Brothers (with Belliss engines); steam and exhaust piping, John Spencer, Wednesbury; switchboard and balancing apparatus, Thomas Partner, Wolverhampton; accumulators, the Tudor Accumulator Company; mains, the Callender Cable Company; arc lamps and pillars, Lucy & Co., Oxford; buildings and chimney, W. R. J. Whalley, Darwen.

The iron roof to generating-room, travelling crane, and iron buildings for refuse destructor, yet remain to be let, and will form another contract. It is anticipated that there will soon be a good demand for electricity, as many houses are already being wired in anticipation of the supply, and the corporation are acting in a very progressive manner by laying down about 4 miles of mains to commence with. A good load is also anticipated from the tramways, which will shortly be converted from steam to electricity and worked by the corporation. The town council have already, under the terms of their Act, given the local tramway company notice of their intention to purchase.

OTHER WORKS.

The item for public parks is for their completion of the laying out of one of the parks and the construction of certain adjoining streets (conditional upon which some of the land was given by the lord of the manor), works in connection with a band-stand and meteorological station (already erected), being gifts in commemoration of the Diamond Jubilee, and an entrance lodge for the caretaker. The land for which power is sought to obtain for stables and health depot, and for highways, store-yard, work-hops, sidings, &c., adjoins the electricity and destructor works, and the designs for these will next be proceeded with. It is also intended to erect public baths upon an adjoining site, and preliminary plans for these have already been got out.

The item for sewage disposal was for money overspent upon the works, and the inspector severely criticised the corporation in not having laid out the 17 acres of land for irrigation, as promised when the loan was sanctioned, in addition to the filters of polarite and coke which have been made and which are giving a very satisfactory effluent.

There was no opposition, and after the conclusion the inspector highly complimented the borough engineer upon the plans and details of the schemes which had been placed before him, and which have been carried out entirely by the regular staff in the office.

Troon.—The first annual visit of the Commissioners to the new waterworks, which were opened last year by the Duchess of Portland, took place recently. The commissioners and borough officials met at the borough buildings and walked down and inspected the new slaughter-house just erected at the north shore, at an approximate cost of £550. The building, which has all the latest sanitary appliances, was found in perfect order. It is to be opened on an early date. The party, accompanied by Mr. J. H. Turner, the Duke of Portland's factor, and Mr. Osborne, the contractor, then proceeded in brakes to the waterworks at the Glen, about 2 miles from Troon. Arrived there the reservoir, filters, &c., were minutely examined. The general opinion was that the filter from which the burgh is supplied should be covered over, thus preventing the accumulation of vegetable matter. There is at present an abundant supply of water, and the commissioners were convinced no fears need be entertained of scarcity.

A Chapter in the History of Pottery.

THE STORY OF TWYFORDS.

BIRD'S-EYE VIEW OF THE CLIFF VALE POTTERIES.

Never probably have romance and art been more beautifully woven together than in the history of pottery, the handmaid of sanitary science. During the long march of the centuries, from the days of the ancient Egyptians, the potter's art has contributed to the happiness and comfort of the peoples of every nation, and adorned the houses and palaces of their kings and governors. It is as cosmopolitan as the air we breathe, and it has ministered to the health of the humblest as well as the greatest of the human family. There is no barbarous race so rude as to know nothing of the use of earthenware, and no people so civilised as to be able to dispense with its services. The most useful ally of the pioneer of sanitary science has been the potter, who has often anticipated the want, and always responded to the call, for his best inventions to improve the health of cities, towns and villages, and given the best that ingenuity could suggest or skill accomplish.

CLIFFE VALE POTTERY AND ITS HISTORY.

From the pen of Mr. Joseph Hatton, published by the renowned firm of art publishers, J. S. Virtue & Co., comes a handsome work, superbly illustrated, tracing the development of work in clay from days anterior to Tubal Cain and the artificers in iron and brass to the present. It is a history of Twyford and of sanitary science, and he describes in graphic language the works at Cliffe Vale, which are typical of the successful application of pottery to the laws of health, which is the foundation of the solid prosperity of that firm. In days when the Wedgwoods were not, the name of Twyford was associated with Staffordshire pottery, and Mr. Hatton tells how the first Twyford and the first Astbury acquired, by assuming a guise of stupidity and imbecility, the carefully-guarded secrets of the Dutch potters, Elers, who established works at Bradwell before 1700. Two hundred years later a descendant of the first Twyford took to Staffordshire a colony of Scotchmen, and their wives and families, for the purpose of manufacturing a new variety of sanitary articles from the fire-clays of north Staffordshire. Mr. T. W. Twyford, bent upon a great extension of manufactures in a line that was new to the district, had gone to Scotland for potters already engaged in a similar class of work to that which he intended to introduce to Hanley. They had some experience of the character of the articles contemplated, but they little dreamed how far the development was destined to be carried. The material to be used for the manufacture of the new

goods was nothing better than the old potters had used for their pottingers, bread-dishes and milk-pans, but it was in the character and the size of the pieces that the innovation lay. His boldness staggered the new hands and was the despair of the old ones, but after a period of experiment which taxed his patience and perseverance to the utmost he achieved a splendid success. From his experience in the manufacture of large pieces of earthenware in connection with his sanitary pottery, Mr. Twyford realised the possibility of utilising the fire-clay of the district in the production and manufacture of specialities in the shape of sanitary and culinary vessels, sinks, cisterns and baths, of a size and strength which had never hitherto been projected. The testing of the clays was the most arduous part of the undertaking. Some having an undue proportion of alkali or alkali earths would not stand the fire; others having too great a percentage of silica, would not stand the enamel; others were so much impregnated with oxides of iron that they discoloured the enamel; and others, again, contained impurities which rendered them useless for the purpose. It was not till towards the close of 1890 that the manufacture of porcelain enamel fire-clay goods was begun in earnest. The manager of the new department more than once gave up the enterprise in despair. Like the honest man he was, he disliked the idea of taking his employer's money with such poor results. After five years of unremitting toil and anxiety, with very variable success, all difficulties were overcome, and out of the crude clays of the district were manufactured articles of enormous size and strength, with a dense, hard, vitreous surface, equal in colour and smoothness to the finest porcelain. Our space will not permit us to describe the details of the elaborate process by which fire-clay goods are made from the local fire-clays, the passage through the "pulverising" mill, the watering-pan, the "pug" mill, the forming, the pressing, the finishing, the drying and the enamelling. The firing is the most critical stage in the existence of the newly-formed pottery. It proceeds very gently at first and continues increasing in intensity for about twelve days. At the end of that time the heat has to be intense indeed to flux the glaze and finish off the goods. The time occupied from first to last is at least eight weeks, and in the case of failure in firing the work has to be done over again.

SOMETHING ABOUT THE WORKS AND PROCESSES.

What impresses the visitor first about Cliffe Vale works is the stern air of business, and this impression continues to

the last. From the unshipping of the clays until they are despatched as finished goods by rail there is unvarying regularity of method. The works are spacious, occupying about 9 acres of ground. Twyfords for many years occupied three sites, but less than a dozen years ago the present proprietor concentrated all of them at Cliff Vale, where their position is unique for purposes of transport, bounded on one side by the Bridgewater canal and on the other by the North Staffordshire Railway. The buildings are all admirably adapted for the purposes they serve. Mr. Twyford's aim has always been to bring light, air and brightness into the occupations of those in his employment, and the men are naturally proud of the splendid shops they work in. It is worth noting that since Mr. Twyford has introduced the larger and superior class of sanitary ware, notably from the epoch of the "Unitas," the wages of sanitary potters have improved at least 50 per cent. The manufacture of sanitary pottery is really an art in itself. The old principle is revolutionised, for the historic method of throwing on the "potter's wheel" cannot be employed. All the pieces of this ware are made in moulds, and the preparation of these constitutes a special branch—modelling and mould-making. First comes the modelling of the article in clay, which must be done with the greatest care; hence the art of modelling and mould-making is rightly considered one in which technical and artistic training are very requisite. Next comes the division of the clay model into separate pieces, to enable plaster casts or models to be taken. These are termed "block moulds," and the working moulds are again cast in plaster of Paris, and must be properly fitted together with snips to keep them in position after the clay has been pressed into the moulds. The moulds being ready and the clay prepared the latter is conveyed by trolleys and lifts to the various potters' shops. These shops, which are built in proximity to the slip-house and the ovens, would well merit description, but it is impossible to do more here than to indicate their character. They are so arranged that the men work on each side of the shop with a drying stove heated by steam pipes in the centre, and in each shop, as far as possible, the men are engaged in the making of the same class of goods. Thus in the first shop "Twycliffe," "Deluge," "Unitas" and other basins are made. Another shop is devoted to tip-up basins—"Ideal," "Cardinal," "C. V." and other oval and round plug-basins—and so the process goes on. The "pressing," so named from the fact that the workmen have literally to press the clay firmly down in the moulds, also requires experience and dexterity, and later on comes the "fettling," which consists of trimming the edges with a knife and sponging out the marks and finally finishing with a piece of horn until the surface is perfectly smooth and no mark of any kind is left on the ware. The placing and the fixing come still later. To describe the "Bisque" ovens would require a chapter by itself, which would tell of many a success and many a failure. The visitor to Twyfords cannot fail to realise that "peace hath her triumphs no less renowned than war."

A WATERTIGHT MANHOLE.

A manhole sewer invert which is claimed to be absolutely watertight has been patented by Mr. H. E. Stilgoe, borough engineer and surveyor of Dover. In the construction of sewers and drains in waterlogged ground it is now customary, in order to obtain watertight work with a minimum of pumping in carrying it out, to use iron pipes with turned and bored spigot and socket joints, and stoneware pipes with specially-designed joints. In this connection it has also been customary hitherto for the manhole inverts or bottoms to be constructed of brickwork, channel pipes or other materials

SECTIONAL PLAN

requiring the use of cement to make the structure watertight, so that pumping has to be resorted to when water is met with. The object aimed at by Mr. Stilgoe in his new "watertight" invert is its construction on sewers, &c., in waterlogged ground without any pumping whatever. As the cost of pumping has often been a heavy item it is obvious that if this object can be achieved a great saving must be effected. We append a few details of the invention.

The manhole as shown in the diagrams has the bottom or invert-piece constructed of cast iron, and connected to the flanged ends of cast-iron pipes with turned and bored spigot and socket joints. The flanged ends of the pipes are special

pieces which are faced for jointing, and are made either square or on the skew, according to the direction in which it is desired to lay the sewer. The pipes, having been laid up to the manhole, the invert-piece is lowered into place. A rubber ring or other suitable jointing material is placed between the facing ring on the pipe and the facing ring on the "invert"; the two are bolted together and the joint made after the same manner as the flanged joints of a water main

CROSS SECTION

valve. Pockets marked A on the diagram are constructed at the ends of the pipes and the invert-piece. The object of the pockets is that the insertion of the bolts and the bolting-up may all be done by a man standing inside the invert-piece, and in this connection it is pointed out that in the case of a very large quantity of water it would be a very difficult thing to screw up the lower bolts from the outside. When the joints are made the pockets are filled up with cement. The invert-pieces are made to any depth, according to the

LONGITUDINAL SECTION

depth of the subsoil water, and can be set in concrete or not as desired. They are also made of stoneware or other suitable material, and arranged with various forms of joints for connection to stoneware drains and in one or more pieces. The invert level of the branch sewers may be at any desirable height above that of the main sewer.

The manufacturers are Messrs. Ilam, Baker & Co., 13 Grosvenor-road, Westminster, S.W.

Billing's Gas Burner Syndicate, Limited, manufacturers of the patent non-mantle incandescent gas burner, ask us to state that, owing to the great demand for their patent burners, they have been compelled to remove from 17 Great Titchfield-street to more extensive premises, 180 Wardour-street, four doors from Oxford-street, London, W., and that with the increased facilities now at their disposal they will have no difficulty in promptly executing all orders.

Roths, Morayshire.—The foundation-stone was recently laid of the new town hall. The architect is Mr. Pratt, of Elgin, whose plans were selected in competition. The hall measures about 70 ft. long by 35 ft. wide, and will accommodate 600 people. A circular crush-lobby gives entrance to the hall and adjoining ante-rooms. There will be a supper-room and refreshment-rooms on the ground floor, and ladies' cloak and retiring rooms. At the further end of the hall a small stage will be erected for theatrical and other entertainments, with a store-room underneath and dressing-rooms in the rear. The building is estimated to cost about £2,000.

Parliamentary Memoranda.

In the House of Lords, on Thursday, the London County Council (General Powers) Bill was read a second time. The Northam Urban District Water Bill and the North Warwickshire Water Bill were read a third time and passed.

In the House of Commons, the Blackpool and Fleetwood Tramroad (Tramway Extensions) Bill, The Hamilton Water Bill and the Kettering Water Bill were read a third time and passed with amendments. The Lords' amendments to the Canals Protection (London) Bill were considered and agreed to.

Parliament-street Widening.—It was stated, in reply to questions, that it had not been possible to acquire the whole of the property between Parliament-street and King-street. It was hoped, however, that the agreement would be carried out within the next three months.

On Friday, in the House of Lords, the Norwich City Water Bill, Gainsborough Gas Bill, Southend Water Bill, East Ham Improvement Bill, and Southwark and Vauxhall Water Bill were read a third time.

In the House of Commons, the Lords' amendments to the New Bridge Approaches Bill and the Staines Reservoirs Joint Committee Bill were considered and agreed to.

On Monday, in the House of Lords, the Newcastle-upon-Tyne Corporation Bill was read a third time and passed.

In the House of Commons, the Belfast Harbour Bill, the Blackpool Improvement Bill, The Sheringham Gas and Water Bill and the West Ham Corporation Bill were read a third time. The London County Council (Money) Bill and the Yeovil Corporation Bill were considered and ordered for third reading. The Newhaven Harbour Bill was read a second time.

Petitions.—Petitions were presented by many Irish members on both sides of the House, from various public bodies, praying the House to take steps to carry out the recommendations of the Royal Commission on the Financial Relations between Great Britain and Ireland.

In the House of Lords, on Tuesday, the Wishaw Water Bill, the Cranbrook District Water Bill, the Crawley and District Water Bill, and the East Ham Improvement Bill were read a third time and passed.

In the House of Commons, the Lords' amendments to the Ilford Improvement Bill were considered and agreed to.

On Wednesday, in the House of Commons, the Portsmouth Corporation Tramways Bill was read a second time. Consideration was given to the Local Government (Ireland) Bill and several new clauses were inserted.

PRIVATE BILLS IN COMMITTEE.

Forres Water Bill.—This Bill, in which powers were sought by the Town Council of Forres to take over the local water undertaking with the consent of the water company, came before a committee of the House of Lords, presided over by Lord Henage, last week. It was opposed by several landowners, riparian owners and distillers, but when it came up it was announced that a settlement had been reached. The question at issue related to compensation water, and an agreement was arrived at by which, instead of 174,000 gallons of compensation water as proposed in the Bill, the petitioners would be allowed 250,000 gallons per day, three years being given for the construction of the necessary works. The measure afterwards went through the House unopposed.

London County Council (Acton Sewage) Bill.—The Bill promoted by the London County Council to obtain powers to compel the Acton District Council to contribute towards the expenses of the metropolitan drainage scheme was passed by a committee of the House of Lords, last week. The Bill had previously gone through the Commons, where it was strongly opposed by the district council, who renewed their opposition in the Upper House. The principal witness in support of the measure was Sir Alexander Binnie, the engineer-in-chief to the London County Council, who explained that in former times the drainage of Acton went into the Stamford brook, which ran into the Thames, but by the Metropolitan Drainage Act this brook was converted into a sewer, which formed connection with the western branch of the low-level sewer. The Metropolitan Board of Works, in 1882, obtained an injunction to restrain the Acton local authority from passing any drainage through the Stamford brook to the metropolitan main drainage, and shortly afterwards the Acton local board carried out a drainage scheme of their own. Since that time no fresh houses had been connected with the old sewers, but the Acton board had never contributed to the cost of the main drainage. This cost, which had been equally borne by the whole metropolitan drainage area, had been £7,500,000, and the annual outlay in maintenance was £200,000. To go to the Acton district and cut off the drainage could hardly be done, but the county council considered that a proportionate payment should be made, such as had been made in the case of the other urban authorities outside the metropolitan area. The contention on behalf of the Acton council was that they had a right to discharge the surface water from the land into Stamford brook, and, having been deprived of that natural drainage by the conversion of the brook into a sewer, they should not be required to contribute to the cost of a sewage scheme in the management of which they had no voice. The

committee, in passing the preamble of the Bill, suggested that the counsel representing the parties should agree upon a clause as to the contribution to be made to the London County Council. The clause was afterwards drawn up and incorporated in the Bill, which was reported to the House.

Electric Lighting Provisional Orders.—A Bill to confirm provisional orders made by the Board of Trade, under the Electric Lighting Acts of 1882 and 1888, relating to Colne, Rochdale and St. Anne's-on-the-Sea, when before a House of Lords committee, presided over by Lord Brougham, was opposed by the County Council of Lancashire, so far as the order relating to Colne was concerned. It appeared that the corporation owned the gasworks of Colne, and manufactured 120,000,000 cubic feet of gas last year, and having spent £100,000 on the works, and having the land used for them fully occupied while the town was still growing, they decided to introduce electric light; and they got a provisional order from the Board of Trade in the model form. The Lancashire County Council now wanted a special clause inserted in the Bill to this effect: "Nothing in this order shall authorise the undertakers to interfere with or make use of any county or kindred bridge vested in the Lancashire County Council, except with the consent in writing of the said county council, and subject to such terms and conditions as they may impose." The county council, as a matter of fact, desired, if the Corporation of Colne required to carry their wires along a bridge over a river under the jurisdiction of the county council, they should have an absolute veto in the matter. It was the first time the point had been raised, and the county council justified their action by stating that there were no less than fifty-four bridges which would be affected by similar orders this session, and, although this involved an alteration of the general law, it was necessary that some protection of the kind should be given. The committee passed the Bill and rejected the clause proposed by the county council.—A provisional order Bill, promoted by the Corporation of Leeds, was the subject of inquiry before the chairman of Ways and Means sitting in the Court of Referees in the House of Commons last week. The Yorkshire Hoarse-to-Hoarse Electricity Company sought to obtain a *locus standi* to be heard against the Bill on the ground, first, that it was an alteration of an Act of Parliament, and that it would be prejudicial to the company were the corporation to have power to go to individual shareholders and bargain with them in regard to giving up the right to take irredeemable stock and take redeemable stock in place of it as was proposed in the order before Parliament. The chairman intimated that the court had decided not to allow the company a *locus standi*.

General Electric Power Distributing Bill.—A very important Bill, promoted by the General Electric Power Distributing Company, has occupied for some days the attention of a committee of the House of Lords, presided over by the Earl of Northbrook. The measure, which embraced a scheme to supply electricity over a large area of the Midlands, of which Warsop was to be the centre, encountered very serious opposition, the corporations of Sheffield, Lincoln, Rotherham, Chesterfield, Doncaster, Nottingham and Ilkeston, and the urban district councils of Heanor, Long Eaton, Bakewell, Belper, Matlock Bath, Mexborough, North Darley, Swinton, Wath-upon-Dearne, Wombwell and Worksop being all arrayed against it. It appeared that from a generating station at Warsop it was intended to supply a district with an area of 2,000 square miles, and that the company intended to raise for this purpose capital amounting to £1,000,000. Seventy-two petitions were presented in favour of the scheme, by which it was hoped to supply electricity at a rate of 1½d. per unit, and sometimes at 1d. per unit. Mr. Arnold Lupton, c.e., Professor of Coal Mining at Victoria University, Leeds, Mr. Emerson Bainbridge, m.p., Mr. A. D. Williamson, electrical engineer, and Mr. Acton, vice-chairman of the Nottingham Chamber of Commerce, spoke generally in support of the project. Mr. Bainbridge expressed the belief that the introduction of electric power into the district on the plans suggested would be of great benefit in cheapening the production of coal. He used electrical power in his own collieries, and was quite sure that it was much more economical than steam power. The general position taken up by the petitions against the Bill was that, while it might possibly be advantageous in some cases to create a central supply of electrical energy which would be distributed by the authorities, it could not be publicly advantageous for a foreign body to come in and break up their streets at will. Sheffield Corporation went a little further than most of the others, arguing that they could themselves supply electricity both for lighting and power at a very much cheaper rate than the company could. It was quite an easy thing, said the Sheffield people in effect, to take a large pair of compasses, and with one part laid on at a place like Warsop and the other part at a place 26 miles distant, and draw a circle and say they were going to supply the whole of that area; but Sheffield would rather be left out. To give the company power to compete against the municipalities would, it was argued, be most unfair. It was pointed out that, in the case of companies established in municipalities for purposes of gas and water, the corporation of those boroughs were pre-

cluded from competing, and if they desired to provide either commodity for the public good they had first to buy out the existing company. If, therefore, companies were protected in that manner, why should not the municipalities be protected too? The counsel representing the various corporations opposing the Bill argued generally that they would welcome the Power Distributing Company if they could do what they suggested—supply cheaper electrical energy and deliver it at the borders of the municipalities at a less price than the corporations could do. But they had failed to produce satisfactory evidence upon this point, and the people objected to have energy thrust upon them for the purpose of distribution against their will. The mayor of Nottingham, Mr. E. H. Fraser, was very sceptical as to cheapness, but he said that if the company could produce electricity at their gates in bulk at a cheaper rate than it could be produced in Nottingham, for the corporation to distribute, they would be bound in the face of public opinion to adopt the scheme before the committee, but this the company were not prepared to do. Mr. Herbert Talbot, c.e., resident electrical engineer to the Corporation of Nottingham, and Mr. Arthur Browne, m.e.c.e., city engineer, declared that, even if coal were given to the General Power Distributing Company, they would not be able to supply electrical energy as cheaply as it could be supplied in Nottingham by the corporation. The committee, on Tuesday, passed the Bill, but considered that the local authorities should have greater power than they had now with respect to the placing of mains in their streets where the company desired to put them. It was decided that a proviso should be inserted in the Bill, to which the promoters had agreed, to the effect that the company should not supply electrical energy within the area of any borough the corporation of which should, within twelve months after notice from the company that the latter desired to supply electrical energy, undertake to receive from the company a supply of energy in bulk at a price and to a minimum amount not less than, failing agreement, should be determined by an arbitrator to be appointed by the presidents of the Institutions of Civil and Electrical Engineers. The committee thought, however, that some time limit should be inserted in the Bill, so that the price fixed by an arbitrator should be revised after the lapse of a certain period. Counsel representing the municipalities and other local authorities intimated that they would carry their opposition to the other House, and consequently would not oppose on clauses.

Newcastle Corporation Bill.—The Corporation of Newcastle had to fight very hard in the House of Lords, last week, for the Bill which they promoted in order to obtain powers to transfer about 10 acres of the town moor to the trustees of the Royal Infirmary for the purposes of the new hospital building. The Bill, which came before the Earl of Egerton's committee, was opposed by certain freemen, landowners and ratepayers, who contested the right of the corporation to sell land over which they had herbage rights without their unanimous consent. Mr. Pember and Mr. Hans B. Hamilton represented the corporation, and Mr. Halloway Browne, q.c., appeared on behalf of the petitioners. The present infirmary, it appeared, was altogether insufficient to meet the requirements of the rapidly-expanding town and district. It was built in the middle of last century, and since 1884 the corporation had been endeavouring to find a suitable site upon which to erect the new infirmary. It was most desirable that the hospital should be built according to modern ideas and in model form. A wealthy and philanthropic gentleman, Mr. John Hall, had offered to give £10,000 towards the erection of the new structure, and he had no objection to offer to the proposed site, which was described as eminently suitable. Prof. G. H. Philipson, consulting physician to the hospital, and Dr. Haliburton Blume, the senior surgeon, gave evidence in support of the scheme. Mr. Riley Lord, who had been mayor of Newcastle in 1896, stated that during his term of office it had been thought desirable that something should be done to commemorate in a fitting manner the Queen's jubilee, and he suggested that the most appropriate thing would be to build a new infirmary, which had been required for a great number of years, and as it would cost £100,000 at least, an endeavour should be made to raise that sum by jubilee day. In jubilee week the amount had reached over £10,000. The present mayor, Mr. T. B. Sanderson, said the corporation, by a large majority, were in favour of the scheme. The existing site of the infirmary was granted on a long lease by the corporation to the governors at 2s. 6d. a year so long as it was maintained as an infirmary. Part of the present scheme was that the lease should be surrendered to the corporation, and a portion of the site was to be sold in order to buy 10 acres of land to replace that taken from the town moor and to defray the expenses of the present Bill. The old site so acquired by the corporation was very valuable, and part of it might be used to extend the cattle market. It seemed from the case presented on behalf of the opponents of the Bill that there was a conflict of opinion as to whether the present site or one at Leazes was the best. The freemen most strongly protested against the corporation handing over their rights in any part of the town moor without one penny of compensation, and if such a thing were sanctioned by the committee it would be absolutely, they argued, unprecedented in the history of Parliamentary legislation. After consultation, the committee decided to pass the Bill, subject to clauses being inserted by which, while the lease of the pre-

sent site should be surrendered, sufficient land should be retained on the same terms as now—namely, a rental of 2s. 6d. a year—to provide an accident ward and an out-patient's department or dispensary. The committee further decided that land equal in area and in grazing value should be purchased by the corporation under the Lands Clauses Acts, and that compensation for loss of convenience to the cowkeepers should be provided for either by money or additional land.

Corporation Improvements at Leeds.—A House of Commons committee, presided over by Colonel Gunter, has passed a Bill for the confirmation of Local Government provisional orders relating to various corporation improvements, among them being provisions with respect to the acquisition of property and the laying-out of new streets at Leeds. These were opposed by the Committee for the Execution of Charitable Uses in the City of Leeds. It appeared from the evidence that the principal object in view was the formation of a new street from Briggate to Vicar-lane, which would enable the council to get rid of the poorer property, which was a disgrace to one of the best and busiest parts of the town. The new street would form a junction with a thoroughfare which the corporation already had power to construct. Mr. Hewson, the Leeds city and waterworks engineer, explained that at first the intention had been to widen Kirkgate, where the traffic was extremely congested, but the cost of this rendered the project practically prohibitive, so that the new street had been laid out with a view to relieving that thoroughfare. The present scheme was the best that could be devised, having regard to the projected extensions between Vicar-lane and George-street on one side and Albion-place and Briggate on the other. The main objection against the Bill was that it was a proposal to take compulsory powers for admittedly far more land than was required, in order to hand it over to a commercial company for their benefit, in return for which the company agreed to pay all the costs except the paving of the streets.

Wishaw Water Bill.—A Bill promoted by the Commissioners of the Burgh of Wishaw was passed, on Tuesday, by a committee of the House of Lords, presided over by Lord Brougham. The Bill, which empowered the commissioners to provide an additional water supply, and to make and maintain new works, was opposed by the Earl of Home, Sir Edward Colebrook, Lord Newlands, Sir Charles Ross, Sir William Anstruther, and other property owners. The Corporation of Glasgow and the County Council of Lanark had also petitioned against the Bill, but their opposition had been withdrawn. It appeared from the evidence given in support of the measure, that Wishaw was the centre of an industrial district with a large population. The present water supply, which was taken from the parish of Carluke, yielded 400,000 gallons a day, and the requirements of the burgh at the lowest computation were 570,000 gallons. The commissioners, in order to supplement the supply, had to supply carts, and adopt other means of distributing water from an old quarry, and they had to borrow water from the neighbouring burgh of Motherwell, who were good enough to help them in two dry seasons. After very careful consideration as to the proper sources of supply, they had been advised by engineers that it was prudent to go to the upper reaches of the Clyde, and they proposed to take the water from three streams running through Lord Hopetoun's property. The water they proposed to abstract could have no appreciable effect upon the Clyde, as the pipe they proposed to lay down would only be capable of carrying 1,500,000 gallons in twenty-four hours. That supply they calculated would be quite sufficient for Wishaw and the wants of its people for a considerable number of years to come. In order to meet the opposition of Lord Home, however, the commissioners proposed in the dry period, when there was less than 1,000,000 gallons flowing down from these streams, to take no water at all, but when there was an ample flow they proposed to take up to 3,000,000 gallons a day down to their reservoir at Wishaw, which would be capable of containing 45,000,000 gallons. Lord Hopetoun and Lord Belhaven spoke as to the deplorable state of Wishaw for want of water, and stated that there were numerous streams in the district from which it was proposed to take water. Engineering evidence as to the feasibility and reasonableness of the scheme was given by Mr. James Tait, c.e., Mr. W. R. Copland, c.e., Glasgow, and Mr. George Horsley, water engineer. The committee passed the Bill on condition that a clause was inserted providing water compensation for the riparian owners.

Drogheda Gas Bill.—When the Drogheda Gas Bill came before the Standing Orders Committee of the House of Lords the promoters sought powers to add to the measure a provision embodying an agreement between the company and the corporation for the purchase of the undertaking. The committee dispensed with the standing orders and allowed the new provision to be added.

Belfast Harbour Bill.—The Belfast Harbour Bill, which recently went through the Lords, has now been passed by a committee of the Commons, presided over by Mr. J. W. Lowther, chairman of Ways and Means. The Bill empowers the Belfast Harbour Commissioners to improve the Victoria channel, and to construct additional docks and works at Belfast. It was explained by the secretary to the commissioners that, in order to satisfy the Corporation of Belfast, ample provision had been made that vessels having paid their dues should not again be charged for transhipment.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XIV.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

ROAD MATERIALS AND CONSTRUCTION.

Materials.—The essential qualities of a good stone or "road metal" are hardness, toughness and power to resist the action of the weather. It should also possess strength to resist compression, and should when laid well unite with its own angles to form a compact surface not easily torn up by traffic, without the aid of much "binding material." These qualities are not always to be found together in the same class of stone, but some of the best descriptions for the purpose are found among the igneous rocks, such as granite and trap-rock, or whinstone.

Whilst there are certain general tests which are useful in selecting stones for use as a road metal, yet the only satisfactory means of judging as to its suitability for the purpose is by making an experimental trial for a sufficient length of time upon a roadway with a known amount of traffic. The following preliminary tests are suggested by Mr. Boulnois*—

1. Ascertain from local persons, such as masons, quarrymen and others, their opinion of the qualities of the stones in the neighbourhood.
2. Make a trial of the stone for toughness by setting a good stone-breaker to work upon a heap of the stone as quarried and carefully watching how much he can break in an hour.
3. Ascertain what power the stone has to resist abrasion, as by putting the broken metal into a revolving cylinder and then carefully noting by weight what the cubes lose by contact with each other, or press the stone against a grindstone with a uniform pressure and note the loss by such contact.

made use of owing to their cheapness in *first cost*, but, generally speaking, it will be better policy to obtain a superior material from a distance if there is much heavy traffic. Soft material should not be mixed with hard either for the construction or maintenance of a road, as one will obviously wear faster than the other and thus make the surface very uneven, unpleasant to ride over, and full of hollows which retain the wet and damage the road. The hard metal should be reserved for the surface coating.

A few of the most important materials will now be briefly described.

GRANITE* is a stone of a crystalline granular structure, occurring in large quantities in the older geological formations. It is an igneous rock, and probably is the product of the metamorphism of older sedimentary strata. It is found below the "primary" stratified rocks, but occurs in beds, veins and dykes, oftentimes injected from below through and over the adjacent strata; also in large masses gradually changing in character and passing into the surrounding rocks. True granite consists of crystals of quartz and felspar mixed with thin plates or scales of mica.

The quartz or silica occurs in hard glassy grey or colourless amorphous lumps.

The felspar is in the form of opaque crystals, of very irregular size, and of a white, grey, yellowish pink, red or reddish brown colour, which gives the tone to the mass.

The mica consists of small glistening scales, capable of being flaked off with the knife, and having a yellow or brownish-yellow, and sometimes dark grey or black, colour.

Name of Quarry.	Colour of Stone.	Remarks.
ENGLISH.		
Bardon Hill (Leicestershire)	Greenish	Road metal much used in Midlands.
Clee Hill (Shropshire)	—	Used for road metal.
Greoby (Leicestershire)	Pink and green	Syenite. For paving setts and road metal.
Herrn (near Guernsey)	Grey	Syenite. Fine grained, hard and durable; used chiefly for paving; apt to become slippery.
La Moye (Jersey)	Pink and grey	Syenite. For paving setts and road metal.
Markfield (Leicestershire)	Dark green	Do. Do.
Mountsorrel (Leicestershire)	Pinkish brown	Syenite. Hard and durable; used chiefly for paving and road metal.
Portmadoc (Merionethshire)	—	Syenite. For road metal.
SCOTCH.		
Dancing Cairn (Aberdeenshire)	Usually grey; sometimes red	Buildings in Aberdeen. Used in London for curbs, paving, &c.
Tillyfontie (Aberdeenshire)	Bluish grey	Much used in London for paving and setts.
Tyrebagger (Aberdeenshire)	Grey	Do. Do.
IRISH.		
Dalkey (Dublin)	Grey	A good stone for building, road metal and paving setts. Hard to work.
Newry (Down)	Grey	A hard good stone for general building purposes; very durable; one of the best granites in Ireland.

4. The power to resist compression may be easily ascertained by placing small cubes in a hydraulic press and noting under what pressures each cube will crush.

5. The effect of weather is not easily ascertained artificially, although it is suggested that a good test may be made by soaking the stones in a saturated solution of sulphate of soda, and then on exposure to the air, if soft, it is said the stone will disintegrate, as if under the action of thaw succeeding frost.

The specific gravity of a stone is no guide as to its fitness for a road metal.

Also, it is important to bear in mind that a stone should not be selected merely for its *high resistance to crushing stress*, but that *toughness* is an equally essential property for a good and durable material. This is illustrated by the following results of experiments made by Messrs. D. Kirkaldy & Sons†—

Common black flint, from chalk beds near Grays, Essex	Crushed, steel yard dropped, lb. per square inch.	32,350
Cherbourg stone (quartzite), containing about 93 per cent. of silica...		31,719
Guernsey granite (good average specimen)		28,535

From the above it will be seen that the universally admitted best material (Guernsey granite) comes out lowest, and the worst material (flints) gives the highest result—indicating clearly that a high-crushing stress alone is no evidence of the durability of a stone for macadamising purposes.

Local stones not suitable for road making are frequently

The durability of the granite depends principally upon the quantity of quartz it contains, upon the nature and regular distribution of the felspar, upon the smallness of the quantity of mica, and upon the absence of iron in any form.

Potash felspar and lime felspar are those kinds occurring most frequently in granite—both kinds being sometimes found in the same stone. The potash felspar is the more liable to decay. "All granites are not suitable for road making. When a granite becomes weathered the felspar may decompose into kaolin or china (porcelain) clay.† The commencement of this alteration is indicated under the microscope by the turbidity of the felspar. At the quarries it is often necessary to reject large quantities of stone for road purposes because of this change. All the toughness is gone out of it, and the quarrymen speak of it as 'dead.'‡§

Mica readily decomposes, and its presence is therefore a source of weakness.

The granite should be close-grained. Large, dull crystals of felspar indicate weakness.

The above list of granite quarries indicate the districts in Great Britain and Ireland from which most of the road-making material is obtained.

Granite is quarried by wedging for large blocks and by blasting for smaller pieces and road metal.

* From Latin, *granum* = grain.

† Also spell *felspar*.

‡ This is the case with the potash felspar, contained in large proportions in the Cornish and Devonshire granites.

§ "Municipal and Sanitary Engineers' Hand-Book," by Mr. H. Percy Boulnois.

|| Abstracted from "Notes on Building Construction" (Rivington), vol. iii.

* "Municipal and Sanitary Engineers' Hand-Book."

† Vide *The Contract Journal*, November 25, 1891.

The *Scotch granites*, especially those from Aberdeen (grey) and Peterhead (red), are noted for their durability and beauty.

Cornish and Devonshire granites are not so good.

Leicestershire granites, generally syenites, are tough, hard and well suited for paving setts and road metal.

Jersey and Guernsey granite (syenitic) is hard, durable, used for paving, but apt to wear shippery.

The hardest and best stones for macadam are Guernsey granite and Penmaenmawr graywacké.* The crushing resistance of the latter is greatly in excess of granite, being equal to about 7½ tons per square inch. The maximum crushing resistances of inch cubes of various granites vary from 1 to 6 tons.†

The crushing resistances of various granites are shown in the following table‡:—

Locality of Stone.	Pressure per sq. inch.	
	To fracture.	To crush.
Herm	477	634
Aberdeen (blue)	413	464
Heytor	394	619
Dartmoor	352	548
Peterhead (red)	288	488
Peterhead (bluish grey)	286	436
Penrhyn	258	345
Killinoy (grey felspathic)	—	431
Ballyknocken (coarse grey)	—	143
Hallybeg, Carlow (grey felspathic)	—	317
Aberdeen	—	516
Mountsorrel ¹	—	574
Boaw, Inverary ¹	—	487

The relative durability of granites, from experiments on stones laid down in 1830 at Limehouse so as to be exposed to the heavy traffic from the East and West India Docks, are given by Mr. Walker as follows‡:—

Name of stone.	Super. area.	Loss of weight per sq. foot.		Vertical wear.
		sq. feet.	lb.	
Guernsey granite ...	473	.95	.060	1.000
Herm granite ...	525	1.05	.075	1.190
Budle whinstone ...	634	1.22	.082	1.316
Peterhead blue granite	348	1.80	.131	2.080
Heytor granite ...	431	1.92	.141	2.238
Aberdeen red granite	538	2.14	.159	2.524
Dartmoor granite ...	450	2.78	.207	3.285
Aberdeen blue granite	482	3.06	.225	3.571

Mr. Walker has also proved that the relative wear of Guernsey and Aberdeen granite is as 1 to 6.

Gneiss is a term used in Cornwall and Devon to denote certain veins of felspathic or porphyritic rock, usually of a whitish-brown colour, consisting of quartz and orthoclase (potash felspar). It occurs in dykes and veins proceeding from the granite, but differs from true granite in that it has no mica. It varies in texture, and is sometimes of a laminated nature; it is durable and suited for road metal and building purposes.

Gneiss is "a crystalline rock, consisting like granite of quartz, felspar and mica, but having these materials, especially the mica, arranged in planes, so that it breaks rather easily into coarse slabs or flags. Hornblende sometimes takes the place of the mica, and it is then called *hornblende* or *syenitic gneiss*. Similar varieties of related rocks are also called *gneiss*." In appearance and properties *gneiss* resembles granite, but is less strong and durable; it is used for ordinary masonry in the neighbourhood where found, and, from its striated nature, makes a good material for flagstones but not suitable for road metal.

Neath.—Mr. R. A. Browning, the gas manager, in his annual report, submitted to the quarterly meeting of the town council, stated that the profit for the year was £2,645, or about £350 less than in the previous year. The falling off was attributed to exceptional causes, such as a decrease in the consumption of gas owing to the mild winter, an increase in the coal bill owing to the higher price of coal, and extra expenditure on wear and tear account. The make of gas per ton of coal carbonised had, however, been larger, the leakage had been reduced, and in certain other respects the year's working had been satisfactory. The report was favourably received by the council.

* *Graywacké* is a conglomerate of grit rock, consisting of rounded pebbles and sand firmly united together. The term, derived from the *grauwacke* of German miners, was formerly applied to gneiss, different grits and slates of the Silurian series, but it is now seldom used.—Webster's "International Dictionary."

THE TELEPHONE SERVICE.

FURTHER MEETINGS.

Mr. Hanbury presided at last week's meetings of the Select Committee dealing with the question of the telephone service.

Dr. COLQUHOUN, city treasurer of Glasgow, was called. He said that the telephone service in Glasgow was not now developed to anything like the extent which it ought to be in order to meet the needs of the community. It was practically confined to the business classes. The establishment of a municipal system would result in an immediate reduction of the charge to £5, and the service would be rendered more efficient. There would be a better staff, improved instruments, improved wires, and more attention to the wishes of the community. The number of public call-offices would be increased, they would be placed in all convenient centres, and the charge would be reduced to the lowest possible point. With this extended system there would be greater facilities for summoning the fire brigade and the police.

Mr. CHISHOLM, a member of the Glasgow Town Council, said that the service given to the corporation by the telephone company was very inefficient. One department of the corporation had presented no less than 200 complaints within eighteen months. There was great difficulty in getting connections made. The corporation, if they had a license, would at once establish a twin-wire system—the only effective system, as the telephone company admitted.

Sir JAMES A. RUSSELL, a former lord provost of Edinburgh and a member of the town council, stated that he had never met any telephone user in Edinburgh who was satisfied with the efficiency of the service. It would entail a grievous injury on the public if the present monopoly were maintained, even till 1911. The telephone was calculated to be of great general benefit, but at present it was not utilised to nearly the extent it ought to be, and would be with a proper service. While he preferred Government management to company monopoly, he believed that the municipality could and would work the telephones more efficiently and economically even than the Government. In present circumstances, with the National Company holding the field, he was of opinion that the best course was for the Postmaster-General to issue licenses to all municipalities who applied for them. This would not take away from the company any of the powers which they held under their present license.

Mr. R. CRANSTON, a member of the Edinburgh Town Council, and Mr. NICHOLSON, of Tunbridge Wells, also gave evidence.

Mr. A. C. MORTON, a member of the Court of Common Council, complained of the inefficiency and cost of the present service in London, and expressed the opinion that it was the worst in the kingdom. During the last two years, he admitted, the service in the City had improved, but, seriously enough, the complaints remained as frequent and bitter as ever.

Mr. Alderman GREEN, Norwich, also gave evidence, expressing the strong feeling in that city in favour of municipalisation. The view of the corporation was that they ought to have power either to work a service themselves or to hand it over to a responsible and accredited company under Parliamentary or municipal control.

Further evidence was taken on Tuesday, Mr. Hanbury presiding, as before.

Mr. LOYN, town clerk of Huddersfield, spoke of the nature of the complaints made in his own town against the National Telephone Company, and referred to the general inefficiency of the service there.

Mr. HARCOURT E. CLARK, town clerk of Liverpool, also described the conditions existing in the latter city, and in the course of further evidence expressed the opinion that competition between the National Company and a corporation could not last. One of them would soon throw up the cards, and that one would not be the company. If a municipal service was to be of any use the municipality must have the whole concern and oust the company, either by purchase or otherwise.

APOCRYPHAL WISDOM.

In the *Cornhill* for July appear some extracts "from an apocryphal wisdom book." Hear what the sage says to cyclists:—

"The inches of our gear are three score and ten, and though there be some so strong that they ride four score, yet is their speed but labour and sorrow at the day's end when they fetch their wind short upon a hill.

"Three things are plagues to a wheelman, yea, and a fourth is abominable: a boy which leadeth an unruly horse, and a swine which strageth in the road, and a rash woman among traffic which regardeth not the right hand or the left; but the most grievous is a county council which scattereth heaps of stone in the highway and saith it is well mended.

"Take heed unto thy riding in straws boroughs, and fall not into transgression of their by-laws, lest thou be worsted in striving with them that swear valiantly before the judgment-seat.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

BURIAL ACT, 1855, SEC. 9; SALE OF LAND FOR CEMETERY: ACTION BY VENDOR'S TENANT: DEROGATION FROM GRANT.—A curious action against a local authority was dismissed with costs on the 10th June (*Tons v. Clacton Urban District Council*, Chancery Division, Mr. Justice Romer). It appears that some short time since the council purchased certain land for the purpose of a cemetery, and the conveyance of the land contained a covenant by them not to use it for any other purpose without the vendor's consent. Upon certain adjoining land, also belonging to the vendor, and not included in the sale, stood a small cottage occupied by the plaintiff (who was the vendor's gardener) on a weekly tenancy. This cottage was within 100 yards of the proposed cemetery, and after the completion of the purchase the plaintiff commenced this action for an injunction to restrain the council from using the land purchased as a cemetery, basing his claim upon sec. 9 of the Burial Act, 1855. On the cross-examination of the plaintiff it was suggested that he was merely a dummy put forward by his employer, the vendor, with obvious motives. His preparations in the witness-box called down repeated admonitions from the judge, who ultimately ordered him to leave the box. In giving judgment, his lordship said that the vendor had granted the land in order that every part of it should be used for the purposes of a cemetery. He then placed his gardener in a cottage near it for the purpose of bringing this action and preventing in effect any of it being so used. There was no doubt that the action in substance was the vendor's, and the costs of the action would have to be provided by him. He could not derogate from his own grant in this way. Even if for the purposes of a legal argument the plaintiff could be said to be a lessee or occupier, he was so after the vendor's grant and with the fullest notice, and it was monstrous to say that the plaintiff could be in a better position than his own grantor and could acquire a right which his own grantor had not. Other grounds could be stated for dismissing the action, but on the above ground alone the action failed. On the 18th June the case again came up for judgment as to whether the council were entitled to costs as between solicitor and client under the Public Authorities Protection Act, 1893, which point was also decided in favour of the council.

PUBLIC HEALTH (BUILDINGS IN STREETS) ACT, 1888: WATERWORKS CLAUSES ACT, 1847, SEC. 93.—The recent case of *The Grand Junction Waterworks Company v. The Hampton Urban District Council* (Chancery Division, Mr. Justice Stirling, 14th June) was an outcome of certain other proceedings between the company and the council, which are still pending. The company had claimed the right under their special Act of 1852 to erect, and had partly erected, an engine-house in contravention of the Public Health (Buildings in Streets) Act, 1888, which, it will be remembered, aims at procuring uniformity of building line. The council took proceedings before the magistrate in respect of the alleged offence, and the magistrates decided against the company, who appealed to the Queen's Bench Divisional Court. Pending the hearing of the appeal the company commenced the present action, asking for a declaration that they were entitled to erect the proposed engine-house, or any other building they might think proper for the purposes of their undertaking, without the consent of the council. On behalf of the council it was argued that the Court had no jurisdiction to make such a declaration, and they also relied upon sec. 93 of the Waterworks Clauses Act, 1847, as precluding the company from any such exemption from the provisions of the Act of 1888. Mr. Justice Stirling considered that the Court had jurisdiction, but thought it ought to be exercised with the greatest care. He adopted the language of the Master of the Rolls (Sir George Jessel) in *Stannard v. Vestry of St. Giles, Camberwell* L.R., 20 ch. D. 190, "where the legislature has pointed out a mode of proceeding before a magistrate it is not, as a general rule, for another court to interfere to stop that proceeding by injunction." His lordship desired to add that in contests between local authorities and private owners that rule ought to be adhered to very strictly. The legislature had provided a mode of obtaining a decision, and it would be a matter of regret if a more expensive method were resorted to in such cases. His lordship's own experience led him to believe that vestries and other local authorities were too ready to embark in costly litigation where there was no equivalent advantage to the public whom they represented, and he would be sorry, in cases where a cheap and speedy method of procedure was pointed out by the legislature, to see a more expensive one resorted to. The Court, therefore, in the exercise of its discretion, ought to be slow to restrain proceedings before a magistrate where that method of procedure was pointed out by the legislature. A

fortiori the Court ought to be slow, in the absence of special circumstances, to make a declaration in such a case as this. That brought his lordship to the question whether there were in this case any such special circumstances, and, in his judgment, there were not. He thought he ought not to interfere either by way of injunction or by making a declaration in accordance with the claim. The matter ought to be left to the tribunal pointed out by the legislature. The action must be dismissed with costs.

NEW STREET: METROPOLIS MANAGEMENT ACT, 1855, SEC. 105; METROPOLIS MANAGEMENT ACT, 1862, SEC. 75.—"The magistrate here had found that this was a 'new street.' It was a question of fact, which the Court could not review." We quote from the judgment of Mr. Justice Day in *Allen v. Fulham Vestry* (Queen's Bench Divisional Court, June 18th). This case affords another illustration of the well-established rule, to which we so frequently have occasion to refer in our replies to queries—viz.: That if there is any evidence to justify magistrates in finding that a street is a "new street" the High Court will not inquire into the sufficiency of that evidence, the question being one of fact for the magistrates to determine. The distinction between the inquiry, "Is there any evidence to justify the magistrates' finding?" and the inquiry, "Is the evidence sufficient?" is, perhaps, rather a fine one. But the meaning of the rule is sufficiently clear—viz., that if there is evidence the Court will not attempt to appraise or weigh it, that being the magistrate's province. Although, therefore, no new principle is established by this case, it is worth while to note the facts upon which the magistrate's finding was based. The "new street" in question was a portion of Wandsworth Bridge-road, which road, together with the bridge to which it forms an approach, was made up by the Wandsworth Bridge Company in 1873, pursuant to the Wandsworth Bridge Act, 1864. The road then ran through agricultural land, and was bordered by market gardens. The Act provided that, when completed, the road should be a public highway repairable by the Fulham District Board of Works. That board, however, refused to take it over until 1876, when they received £1,750 from the company to complete it, and in the following year they made up the carriageway with flints rolled in over a hard core. From this time until 1897 the carriageway was annually repaired with granite, but no channelling or kerbing was done. There were no buildings on the land adjoining the road until 1890, when houses were erected on the east side; and in 1895 and 1896 houses were first built on the west side. In 1897 the Fulham Vestry passed a resolution that the road should be paved with wood blocks on a concrete foundation, at the expense of the frontagers. As already indicated, the magistrate decided in favour of the vestry on the main point that the street was a "new street," as well as on the minor point that wood paving was paving within the Act; and the High Court refused to interfere with his decision.

COMBINED DRAINAGE IN THE METROPOLIS: NUISANCE: RECOVERY OF COST OF REPAIR BY OWNER FROM LOCAL AUTHORITY: PUBLIC HEALTH (LONDON) ACT, 1891, SEC. 4 (SUBSECS. 1 AND 4) AND SEC. 11 (SUB-SEC. 1).—In *Andrew v. St. Olave's Board of Works* (Queen's Bench Division, 29th March) the question for decision was whether the owner of two houses drained by a combined system, constructed without an order of the vestry, who has executed works thereto required by a nuisance notice served on him by the authority, can recover the cost thereof from the latter body. It may be within the recollection of some of our readers that a similar question arose in the case of *Florence v. Paddington Vestry* (W.N., 1895, 143; THE SURVEYOR, vol. viii, p. 461), and was answered by Mr. Justice Clifft in the affirmative. In the present case a similar decision was arrived at by the Queen's Bench Division of the High Court (Lord Russell of Killowen and Mr. Justice Mathew), reversing the judgment of the county court judge. The facts were as follows: The plaintiff was the owner of two houses, Nos. 5 and 6 Vine-street, Southwark, and two notices, one in respect of each house, were served on him by the defendants, under sec. 4 of the Public Health (London) Act, 1891. Each notice was addressed to the owner or occupier of the house to which it related, alleged that the drainage of the house was defective, and ordered the owner or occupier within fourteen days to remove the defective drain and re-drain the house into the common sewer. The plaintiff, on receipt of the notices, consulted his surveyor, who, having opened the ground and found that the two houses were connected with the common sewer by a single pipe, endeavoured to find out whether the pipe

had been laid under an order for combined drainage, and for that purpose searched the records of the defendants and of the Metropolitan Commissioners of Sewers. He found among the records of the latter body a plan for the combined drainage of houses described as Nos. 5 and 6 Vino-street. He then wrote to the defendants stating that he had discovered this plan, and that he would proceed to do the work, which he did. After the work had been done it was discovered that the plan did not refer to the plaintiff's houses, the numbering of the houses in the street having been since altered, and that the pipe was therefore a "sewer," for the maintenance of which the defendants were responsible. The Lord Chief Justice, in giving judgment, characterised the question as one of considerable difficulty, turning upon the construction of secs. 4 and 11 of the Act already referred to. Under sec. 4 (sub-sec. 4) the plaintiff was compelled to comply with the notices and repair the combined drain upon pain of becoming liable to the £10 penalty imposed by the sub-section (*Debbart v. Saunders, L.R., 1892, 2 Q.B., 452*). Having thus, under stress of compulsion, done what the defendants were liable to do (viz., repaired one of their sewers), the plaintiff was, on a well-known principle of the common law, entitled to recover the expenses to which he was put. Again, under sec. 11 the plaintiff was entitled to recover—the words "expenses incurred . . . in carrying the order into effect" including the expenses of executing works in compliance with an abatement notice.

QUERIES AND REPLIES.

OBSTRUCTIONS ON HIGHWAYS.—"Constant Reader" writes: Under what section of the Public Health or other Acts have an urban district council power to order private individuals, builders and others to remove building materials, kerb laid out, &c., which are an obstruction to traffic over streets laid out by private persons, but which streets have not yet been properly made-up and dedicated under the Private Street Works Act, 1892? The streets are now well built up on both sides and subject to constant traffic.

By sec. 72 of the Highway Act, 1835, if any person shall lay any timber, stone, hay, straw, dung, manure, lime, soil, ashes, rubbish or other matter or thing whatsoever upon a highway, to the injury of such highway, or the injury, interruption or personal danger of any person travelling thereon, he shall for every such offence forfeit and pay a sum of 40s. over and above the damages occasioned thereby. By sec. 73 of the same Act if any timber, &c., &c. (as before), shall be laid upon any highway so as to be a nuisance, and shall not after notice given by the surveyor be removed, the surveyor may by order of a justice remove and dispose of it; and if it does not realise enough to pay expense the offender is liable to pay the difference. And by the Highway Act, 1864, sec. 61, if any person shall encroach by placing any dung, compost or other materials for dressing land, or any rubbish, on the side of any carriageway, within 15ft. from the centre thereof, he is liable to a penalty of 40s. and the costs of removal. By sec. 144 of the Public Health Act, 1875, the urban authority is to become and have all the powers and duties of the surveyor of highways. Under sec. 73 of the 1835 Act (quoted above) the justices have jurisdiction to inquire whether the road in question is a highway or not. A "private" street may be a highway if thrown open to and used by the public, notwithstanding that it may not have been formally taken over by the authority.

BUILDING OVER SEWERS: NEW BUILDINGS.—"Stret" writes: In laying out a large estate for building plots plans have been submitted to the urban district council showing the line of road within 3ft. of the centre line of a storm-overflow sewer, 39 in. diameter, 24ft. deep. The authority refuse to accede to this distance. What powers have the authority to compel a fixed distance that may be reasonable and able to sustain in a court of law?

Under sec. 26 of the Public Health Act, 1875, any person who without the consent of the authority (1) causes any building to be newly erected over any sewer of an urban authority or (2) causes any vault, arch or cellar to be newly built or constructed under the carriageway of any street is liable to penalties; and the authority may demolish any building, &c., erected or constructed in contravention of this section. This appears to be the only enactment bearing on the subject. It is not quite clear from the query what is meant by "the line of road," and in the absence of a plan I cannot see that there is any contemplated contravention of the section.

PRIVATE STREET WORKS: SIDE STREET: PREMISES FRONTING, ADJOINING OR ABUTTING.—"T. II." writes: I shall be glad to know what you consider to be the owner's "frontage" to the street on the annexed sketch? Whether such frontage

A—Centre of side street; B—corner of buildings.

extends to the corner of the building only or to the centre of side street on plan, it being, of course, understood that the

land to the centre of the side street belongs to the owner of the buildings?

If the side street has been irrevocably dedicated to the public the owner of the soil thereof is not chargeable in respect of making-up the street into which it leads. (*Plumstead Board of Works v. British Land Company, L.R., 10, Q.B., 203*). In that event, therefore, the "frontage" would terminate at B, the corner of the building. If, however, the side street has been determinately reserved to the owners of the soil, and there has been no public dedication (on record), it falls within the description "premises adjoining or abutting" and can be included in the frontage (*Lord Northbrook v. Plumstead Board of Works, L.R., 7, Q.B., 183*).

BY-LAWS: LAYING-OUT A NEW STREET.—"E." writes: Referring to the decision of the Appeal Court in *Smith v. Chorley Rural District Council (C.A., 1897)*, 1 Q.B., 678, am I right in assuming that a council is entitled to determine the question as to whether a builder who is erecting buildings adjoining an old road is laying-out a new street or not, and that there is no appeal against their decision if it has been come to honestly and deliberately?

The precise point decided in this case was that where a local authority have in good faith refused to pass building plans on the ground that the erection of the proposed houses would amount to the laying-out of a new street of a width which is insufficient under their by-laws no action will lie for a *mandamus* to approve the plans. The action was tried before Mr. Justice Kennedy as a surveyor, and a learned judge left the question as to whether a new street was being laid out to the jury, who answered it in the negative. Upon further consideration and argument, however, the judge dismissed the action, considering that on technical grounds it would not lie. The Court of Appeal, in confirming this decision, expressed the opinion that the question ought not to have been left to the jury, it being for the local authority to determine. This view is not altogether reconcilable with former decisions, where (in the case of proceedings for infringement of by-laws) it has been held that this question is for the magistrates to determine (*see Taylor v. Metropolitan Board of Works, L.R., 2 Q.B., 213, Regina v. Skel, 50 L.T. (N.S.), 699*), subject to review by the High Court in the event of their being of opinion that there is no evidence to justify the magistrates' finding (*Williams v. Powning, 47 J.P., 486*). It is doubtful how far *Smith v. Chorley Rural District Council* can be relied on as overruling these cases. It would, no doubt, shut out a *mandamus* where it had been disapproved of on the other side, but from bringing an action for a *mandamus*. But if he proceeded to build in defiance of the disapproval, and the authority summoned him for penalties it is questionable whether the *Chorley* case could be considered as ousting the jurisdiction of the magistrates to inquire and determine whether or not a new street is being laid out.

BUILDING BY-LAWS.—"Surveyor" writes: Has an urban authority power to require plans of additions to houses erected before the constitution of the district and the adoption of the Model By-Laws to be submitted to them? A is erecting large additions to an existing residence, and refuses to deposit plans on the grounds that the by-laws do not apply, the house having been erected before the urban district was formed, and that additions to existing buildings are not "new buildings" within the meaning of the Act.

Yes, if the additions are such as to make the house a "new building"—which is a question of fact. "The question whether a building or work has been decided over and over again to be a question of fact; it is a question of degree. For instance, if a building were nearly all taken away and then rebuilt it would be a new building; on the other hand, it is clear that by a small addition of, say, a door, the building would not thereby become a new building. Between these two extreme cases there may be thousands of cases, and it would be impossible to give a definition in each particular case as to what is or is not a new building, and it must be left to the discretion of our judges to decide for himself what is a new building." (*Per Chief Justice Coleridge in James v. Weyell, 51 L.T. (N.S.), 237*). The first sentence in the quotation means, I take it, "The question whether a given building is a new building or not has been decided, &c."

POWERS OF LOCAL AUTHORITY TO ENTER PREMISES: DANGEROUS STRUCTURES.—"Right" writes: (1) Has a surveyor or inspector any power to enter a yard which lies at the back of premises abutting a main street where there are two cottages, the whole belonging to same landlord, without asking permission of landlord or tenant? There is a door at end of passage by street which is shut at night time, but during the day is open. (2) The walls of side of passage marked dangerous are considered to be so by the surveyor. Has the surveyor power to serve notices on the owners calling upon them to take down and rebuild the walls under the Towns Improvement Clauses Act, incorporated in the Public Health Act, 1875? (3) Has a surveyor power to deal with dangerous buildings or walls on private property which endangers the lives of the occupiers or other persons?

(1) See sec. 503 of the Public Health Act, 1875, contains provisions enabling a local authority to obtain an order to enter any lands or premises for the purpose of making plans, surveying, measuring, taking levels, making, keeping in repair or examining works, ascertaining the cause of sewers or drains, or ascertaining or fixing boundaries. An entrance may also be obtained for the purpose of examining drains and privies, as to nuisances and as to unsewered man, &c., under sec. 102 and 119. (2) Notice can be given to the owners under sec. 75 of the Towns Improvement Clauses Act, 1847, to "take down, repair or secure" the walls. For form of notice see "The Municipal and Sanitary Engineers' Hand-book," by H. Percy Boulton (third edition), p. 235. (3) If dangerous to passengers or to the occupiers of neighbouring buildings the foregoing section would apply; but not apparently if merely dangerous to the occupiers of the building itself.

ERRATUM.—On page 23 ante, first column, line thirty-one from the bottom, for "Blundell v. Prior" read "Blundell v. Price."

Ramsgate.—Last week, the mayor formally opened an elaborate new pumping station at Whitehall in connection with the municipal waterworks. It has been erected under the superintendence of Mr. Valon, the borough engineer, and it is claimed to be the finest of its kind in southern England.

Municipal Work in Progress and Projected.

Several large and important improvements are contemplated by the London County Council this week, as will be seen from our report of Tuesday's meeting. Extensive undertakings continue as numerous as ever in the provinces.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

Not a very large amount of administrative work was disposed of at the meeting of the county council, on Tuesday, most of the time being spent in considering the important report of the Improvements Committee dealing chiefly with the scheme for the construction of the proposed new street from Holborn to the Strand. Naturally this elicited a large amount of discussion, but ultimately a recommendation of the committee in favour of the construction of the new street was carried, together with a number of recommendations with reference to several minor improvements.

The Holborn to Strand Improvement Scheme.—The Finance Committee presented a report dealing with the subject of the projected street improvements, and stated that, from a financial point of view, the gross cost was an important matter. The amount in the case of the new street from Holborn to the Strand was as much as £4,562,500. When the improvement had been carried out, and the surplus lands had been let, and were therefore income-producing, the charge on the rates for interest and repayment was expected to be comparatively small; but during the early years, while the property was being acquired and the land was in process of being cleared, there would be a very considerable charge without any income from ground rents to assist. Mr. Campbell criticised at length the financial aspect of the case, and proposed that the report be not received. This motion was, however, rejected by a large majority. Mr. Shaw Lefevre then moved the reception of the main report of the Improvements Committee dealing with the county improvements, for which it is proposed to seek the necessary powers in the next session of Parliament. He pointed out that the six improvements contained in the report would run to a total cost of £1,100,000. The main improvement, however, was the Holborn to Strand thoroughfare, which was estimated to cost £774,000. He also pointed out that the improvement was not a new one, for, he said, it had occupied the attention of the council for many years past, and was a necessary complement to the schemes in the neighbourhood already approved by the council—the removal of Holywell-street, the widening of Southampton-row and the clearing of the Clare Market area. From whatever point of view the scheme was regarded—as a street improvement, as a great sanitary improvement involving the improvement of the whole district, or as an architectural improvement—it would add to the dignity and beauty of London. The report was received and a long discussion followed. Eventually the following recommendation of the committee was agreed to with only one dissident: "That the council do apply to Parliament in the session of 1899 for powers to construct a new street and branch streets, 100 ft. wide, from Holborn to the Strand, and to carry out the subsidiary street improvements in general accordance with the scheme shown on the plan approved by the Improvements Committee on May 25, 1898." The following recommendations of the committee dealing with the scheme were also agreed to: "That the question of powers being sought to enable the council to lay tramways along the new streets be referred to the Highways Committee for consideration and report; that provision be made for the construction of a subway under the new streets (for mains, wires, &c.), and also for the planting of trees in the new thoroughfares; that provision be made in the Bill for part of the cost of the improvement to be dealt with on the same general principle as that embodied in the improvement charge sections of the London County Council (Tower Bridge Southern Approach) Act, 1895, but that a longer period than three years be allowed within which to judge of the effect of the improvement upon the surrounding property; that provision be made by scheme for rehousing within about a mile of their residences all the persons of the labouring class displaced who are dependent on fixed employment in the neighbourhood, and that adequate provision be made elsewhere for the remainder of the persons displaced; that provision be made as far as possible for rehousing the people previously to their being displaced; that if, on acquiring any property needed for the improvement, such property shall be proved to be insanitary, compensation shall be paid according to the rules laid down in the Housing of the Working Classes Acts, and not according to the Lands Clauses Consolidation Act, 1845."

Other Street Improvements.—The following further proposals of the Improvements Committee for street widening and improvement were also agreed to: The reconstruction of Cut and Mutton bridge, Shoreditch; the reconstruction of the swing bridge at Old Gravel lane; the widening of High-street, Kensington (estimated cost, £81,000); and the widening of Wandsworth-road between Vauxhall and Nine Elms-lane.

Proposed Extension of the Embankment.—The council approved the report of the Improvements Committee to the

effect that they proposed later on to submit a scheme for the extension of the Embankment from the Victoria Tower garden to Lambeth bridge.

METROPOLITAN ASYLUMS BOARD.

An ordinary meeting of the board was held, on Saturday, Sir E. H. Galworthy, J.P., presiding. It was decided to accept the tender of Messrs. R. Ballard, Limited, for the execution of certain work in connection with the making-up of the internal roads, &c., of the Western hospital, at the sum of £669. On March 12th last Messrs. Burstall & Monkhouse were instructed to prepare plans and specifications for placing the heating arrangements of the South-Eastern hospital in satisfactory working order. It was now reported that Messrs. Burstall & Monkhouse estimated the total cost of the scheme at £8,832, of which £3,802 was for builders' work. After conference with the Hospital Committee, the Works Committee recommended that the scheme prepared should be adopted and transmitted to the Local Government Board for their sanction. This was agreed to.

VESTRIES AND DISTRICT BOARDS.

Bermondsey.—At the vestry meeting, on Monday, seven tenders were opened for the supply of bricks, and were referred to the General Purposes Committee for consideration and report.—The Works Committee reported having had under consideration a statement as to certain of the vestry's workmen having executed private paving work on Bank Holiday and the previous Saturday afternoon. It was eventually resolved to make a rule that no workmen should be allowed to work for gain on any holiday granted by the vestry for which he is paid except he first receives permission to do so. Approval was given to a plan submitted by Messrs. Brown, Sons & Blomfield, on behalf of the Wilson Coopers Company, for the erection of new sheds and workshops in Tanner-street.—The following tenders were received for fixing balance weights to the seven shoots at the wharf, East-lane: Messrs. Crisp & Son (accepted), £30; Waterfield & Hay, £49 10s.; and Strong & Collins, £125.

Chelsea.—The following resolution has been referred to the Works Committee: "That the vestry approach the chairman of the Ecclesiastical Commissioners, and the chairman of the London and North-Western Railway Company and others, asking them if they will provide some means of crossing the London and North-Western Railway at a central point in Allington-road, Kilburn-lane, to enable the residents of Queen's Park estate to visit Queen's Park without having to journey thereto by way of Salisbury-road and Chamberlayne Wood-road, *via* Harrow-road." The Works Committee have also been requested to give their consideration to a motion recommending: "That this vestry approach the London County Council with a view to seeking their assistance and co-operation in continuing and opening up Mezz-street into Third-avenue, Queen's Park."—At a meeting of the Works Committee the surveyor presented a report upon the desirability of constructing a lavatory in the Harrow-road, in place of the one at Wedlake-street, Kensal Town. The report stated that the only suitable spot that could be found was opposite the entrance to Fifth-avenue, Queen's Park, and he was strongly of opinion that if any lavatory was erected it should be at least 9 ft. high. One of less height could be erected at Fourth-avenue, but he did not think that would be a suitable place. The cost would be about £750, and the loss on working might vary from £150 to £200. It was decided not to carry out the work, but to instruct the surveyor to bring up plans for the erection of a lavatory in Harrow-road itself.

Holborn.—At a meeting of the district board of works, on Monday week, the Works Committee recommended that an underground convenience should be erected at the junction of Clerkenwell-road and Rosebery-avenue. Mr. Jacobs, who moved the adoption of the report, said that Holborn was the only parish in London which had not adopted these conveniences. The report was adopted.

Islington.—The vestry resolved, at the meeting, on Friday, to authorise the clerk to affix the seal to the application to the Treasury for permission to raise a loan of £4,460 for the erection of a new chapel at Finchley cemetery.—The Works Committee asked for authority to instruct the vestry's solicitor to apply for an injunction to restrain the Hornsey Urban District Council from discharging water and sewage into the vestry's sewer in Stroud Green-road. It was resolved to lay two new pipe sewers, at a cost of £600.

Marylebone.—At the last meeting of the vestry, Mr. Brooke Hitching referred to the fact that the Bill to confirm the vestry's electric lighting provisional order was before a committee of the House of Commons. It was desirable that through the clerk every assistance should be given by way of evidence before the committee as to failures in the supply or as to complaints as to the quality of the light supplied by the Metropolitan Electric Supply Company, in order that the case of the vestry might be strengthened in view of the strong opposition anticipated at that stage.—The vestry referred to the Sanitary Committee a letter from the Sanitary Inspectors'

Association asking them to send their inspectors to the autumn meeting, to be held at Newcastle-on-Tyne on the 5th and 6th of August.—A motion by Mr. Down, asking a reference to the Sanitary Committee to consider as to the advisability of every house in the parish being inspected once a year by the sanitary officers, was rejected.—Messrs. Greenwell & Co., solicitors to the vestry, wrote in regard to the smoke nuisance existing in the district. They stated that in view of the result of recent cases taken into court, they were strongly of opinion that any further proceedings would be futile, and that unless the nuisance materially increased the matter should, for the time being, be allowed to remain in abeyance. It was agreed to enter the letter on the minutes.

Poplar.—The Works Committee recommended "that the East India Dock-road from the boundary of the wood paving east of Poplar hospital to the foot of the incline to Barking-road bridge be paved with hard wood blocks on concrete foundation, and that the surveyor prepare specification and estimate." This was agreed to.

Shoreditch.—The Seawogging and Dusting Committee are considering the advisability of providing motor vans for the work of the department.—The most noteworthy feature of the vestry meeting, on Tuesday, was the announcement read by the vestry clerk of the intention of the Metropolitan Electric Supply Company to seek powers to enter into competition in electric lighting matters with the vestry's undertaking. The subject was felt to be of such importance that Mr. Kershaw, the chairman of the Lighting Committee, asked for the suspension of the by-laws in order to move a special resolution on the matter. Consent having been given, the speaker moved that the clerk should be requested to take immediate steps to oppose the application to be made by the company to the Board of Trade for a provisional order, and to oppose that of the County of London and Brush Provincial Electric Lighting Company, who proposed to obtain powers to lay their mains through Shoreditch. Mr. Kershaw declared that all the trouble arose from the report of the Joint Committee on the Supply of Electrical Energy, and he said that if the House of Commons was consistent it would grant powers to the first-mentioned company to compete with Shoreditch as it had to the Vestry of Marylebone to compete with the company. The resolution was adopted.—It was resolved, on the recommendation of the Works Committee, to invite tenders for the construction of an underground convenience in Hoxton-street, at an estimated cost of £1,750.—The special committee on the Workmen's Compensation Act reported having obtained quotations from four or five of the best accident insurance companies, and by far the lowest was that received from the Ocean Accident and Guarantee Corporation, who quoted a premium of 7s. 6d. per cent. on an estimated annual amount of salaries and wages of about £29,000, covering all officials and employees of the vestry, but limiting official salaries to £100 each officer. This premium worked out at £108, and covered all risks under the Workmen's Compensation Act, 1897, the Employers' Liability Act and the Common Law. It appeared that the amount already paid in some years by the vestry in its employees on account of accidents was not largely exceeded by the amount of the above premium, the payment of which would relieve the vestry from such gratuities and at the same time protect the vestry from the risk of life pensions in respect of total disablement of £1 per week, involving a possible actuarial liability capitalised of £1,000 for each workman, which in case of an accident involving several persons would be a very heavy loss to the vestry if not covered by insurance. The committee recommended, and after some discussion the vestry resolved, to insure with the Ocean Corporation for one year, at a premium not exceeding 7s. 6d. per cent.—The vestry accepted the tender of Messrs. Pritchett & Gold for supplying a new storage battery for the electric light station, having a discharge capacity of 400 amperes for six hours, including allowance for the removal of the existing battery, at the price of £1,062; and that of Messrs. Schooley & Son, for building a stovehole and fitting hot-water apparatus to the green-houses in St. Leonard's churchyard, at the cost of £39.

St. Pancras.—At a meeting of this vestry, on Wednesday, the clerk reported the receipt of a letter from the Metropolitan Electric Supply Company intimating the intention of the company to apply to the Board of Trade for an electric lighting provisional order for the district of St. Pancras. The Baths and Wash-Houses Committee announced the receipt of a communication from the Local Government Board forwarding approval to the vestry raising a loan of £17,000 for the purchase of land in the Prince of Wales-road for the erection of baths and wash-houses. On the motion of Mr. E. M. Close, chairman of the Health Committee, it was resolved to ask the London County Council to provide for the rehousing of an additional number of persons to the 580 arranged for under the Churchway improvement scheme, since under the Act the council only intend to rehouse a little more than one-half of the population displaced. It was decided, on the recommendation of the Electricity and Public Lighting Committee, to insure the workmen in the employ of the department with the Scottish Employers' Liability and Insurance Company, at the rate of 12s. 6d. per cent. in wages for workmen and 4s. per cent. for the clerks. It was also resolved to transfer the boilers from the Regent's Park electric light works to the refuse destructor works, for the pur-

pose of raising steam by the use of the waste gases from six of the cells. The construction of two underground conveniences in Camden-road, in accordance with plans prepared by the engineer, Mr. W. N. Blair, was decided upon, the estimated cost being £2,550. It was also resolved to lay hard-wood paving in a portion of Fitzroy-street and Grafton-street, at an estimated cost of £250.

PROVINCIAL AND GREATER LONDON COUNTY COUNCILS.

Somersetshire.—The Sanitary Committee reported, at a meeting of the council on the 25th ult., that they had considered a report from the Long Ashton Rural District Council with regard to the alleged pollution of the stream at Long Ashton, and, in view of the conflicting statements in the reports of the rural district council and the medical officer of health for the city of Bristol, they recommended the county council to direct that an independent report upon the state of the stream be made. The consideration of the question was postponed till the next meeting of the council.

MUNICIPAL CORPORATIONS.

Bangor.—On Tuesday, the 28th ult., Mr. W. O. E. Meade-King, Local Government Board inspector, held an inquiry concerning the application of the city council for power to borrow the sum of £2,500 for the erection of a new gasholder, £500 for a new scrubber-washer at the gasworks, and £300 for additional gasworks, and £150 for municipal officers' purposes.

Bolton.—A Local Government Board inquiry has been held by Colonel A. G. Darnford, R.E., respecting an application of the corporation for sanction to borrow £6,000 for market purposes and £10,000 for converting dry closets into water-closets in the cottage property of the town.

Brighouse.—At a recent meeting of the town council it was reported that the expenditure on the sewage scheme had amounted to £62,089.

Bristol.—The Finance Committee of the corporation recently held a special meeting to receive plans prepared by the city engineer for the new temporary council chamber, which the council had decided should be erected at a cost not exceeding £2,500. The plans, which embodied alterations suggested by the committee at a previous meeting, were approved, instructions being given to proceed with the work.

Bury.—The contract for the erection of the new art gallery and public library has been let to Messrs. Thompson & Brierley, of Bury, the contract price being £21,259. The buildings will be erected from designs by Messrs. Woodhouse & Willoughby, of Manchester, which were selected in open competition.

Cheltenham.—On the 28th ult. Lieut.-Colonel Albert C. Smith, R.E., one of the inspectors of the Local Government Board, conducted an inquiry at the municipal offices into the matter of an application made by the town council for sanction to the raising of a loan of £283 for street improvements works in Henrietta-street.

Eastbourne.—At the monthly meeting of the town council, on Monday, the Duke of Devonshire, the mayor, announced his intention of presenting the town with a piece of land, of the value of between £5,000 and £6,000, as a memorial of his mayoralty, for the purpose of erecting upon it a technical institute and museum.

Falmouth.—On Monday last week, at a meeting of the town council, it was almost unanimously resolved to adopt the report of a committee recommending the making of an application to the Local Government Board for sanction to the borrowing of £6,500 for the carrying out of waterworks extensions.

Glossop.—The town council have adopted a resolution recommending that an application be made to the Board of Trade for a provisional order for electric lighting.

Grimsby.—Last week the Public Lighting Sub-Committee met to consider the report of Prof. Kennedy on the electric lighting of the borough. The report dealt with the many details of the scheme, and the members decided to have another interview with Prof. Kennedy respecting the matter. It is stated that the question will be shortly brought before a full meeting of the Lighting Committee, and that it will be pushed forward as quickly as possible.

Leamington.—The Free Library Committee have recommended the town council to proceed at once with the erection of a building for the free public library and technical institute, that plans and specification should be invited from architects, and that £12,000 should be expended on the building, exclusive of the amount paid for the land and furnishing.

Leeds.—Steady progress is being made with the York-street insanitary area scheme. The sub-committee have just concluded negotiations for the purchase of a number of blocks of property, including three public-houses, and their proceedings have also been confirmed by the Sanitary Committee. The licensed properties are to be acquired on the understanding that they will not be pulled down for two or three years. With reference to the Camp Field insanitary area, a Local Government Board arbitrator has held an inquiry this week and

this arbitration will, it is stated, largely determine the future policy of the corporation. Subject to the approval of the city council, the Sanitary Committee have also decided to erect a latrine near the Corn Exchange, at a cost of £1,800.—At a meeting of the Highways Committee of the corporation, on Thursday, tenders to the extent of £13,924 were accepted in connection with the extension of the electric tramway system to Headingley, Chapelton and Hunslet. The corporation had invited tenders for the supply of two engines and dynamos of about 1,000 horse-power, and for fifty new electric cars, which, it is anticipated, will be in use on the routes mentioned early next year. The committee accepted the tender of Messrs. Greenwood & Batley, of Leeds, for the engines and dynamos, at the sum of £15,586; that of Messrs. Dick, Kerr & Co., of Glasgow, for the fifty cars, at £468 10s. each; and that of Mr. Isaac Gould, of Leeds, for the work in connection with the extension of the generating station at Crown Point, at £4,082, that sum including everything except smiths' and founders' work, which has been let to Messrs. Clayton, Son & Co., Limited, Hunslet, at £830.

Norwich.—The question of rebuilding the Three Holed bridge, at Upwell, at a cost of about £500, has been referred back.

Sheffield.—The corporation propose to construct a new bridge over the river Don at Ball-street. The bridge will be of arched steel girders on stone piers, and the plans and quantities have been prepared by Mr. Charles F. Wike, city engineer. The tender of Messrs. Brithwaite & Co., of Leeds, amounting to £9,087, has been accepted for the erection of the bridge.

Widnes.—Last year, Widnes held the world's record for cheap gas, the prices being 1s. 6d. and 1s. 8d. per 1,000 cubic feet, and the make of gas increased from 181,000,000 cubic feet to 202,000,000 cubic feet, while the number of consumers increased from 4,322 to 4,884. After defraying the cost of the public lighting of the borough, £1,457 14s., the net profit on the gas undertaking was £2,078. From July 1st the price of gas will be reduced to 1s. 4d. and 1s. 6d. per 1,000 cubic feet, or about half as much as the gas consumers of Liverpool have to pay for their illumination.

URBAN DISTRICT COUNCILS.

Barking.—On the 23rd ult., the Light Railway Commissioners held an inquiry with respect to an application of the district council for powers to construct a light railway connecting the town of Barking with the works of the Gas Light and Coke Company at Beckton. There was practically no opposition, and Lord Jersey stated that the commissioners would be very glad to recommend the Board of Trade to issue an order for the construction of the railway.

Chiswick.—The district council have decided to apply to the Local Government Board for sanction to a loan of £6,000, for the purchase of Homefields recreation ground and also for fencing-in and making-up the roads.

Colwyn Bay.—On Thursday, Mr. W. O. E. Meade-King held an inquiry, on behalf of the Local Government Board, with respect to an application of the district council for sanction to borrow £5,000 for the purchase of a town yard, £500 for the old promenade and sea wall, and £600 for sewerage extensions.

Leigh, Lancs.—Last week, Mr. H. Law, Local Government Board inspector, held an inquiry at Leigh with respect to the council's application to borrow £11,428 for works of main roads and private street improvements.—The council also have in hand schemes amounting to nearly £7,000 for improving Market-street, Bridge-street and Bradshaw-gate, in addition to gasworks extensions, the provision of electricity works, &c.

Llandudno.—The 6-mile drive around the Great Orme's Head has recently become the property of the district council, who have purchased it from a company for £12,000.

Morecambe.—An inquiry was held at the council office, Morecambe, last week, before Colonel W. Langton Coke, into an application of the council to borrow £2,122 for the purpose of private street improvements. The estimated population was stated to be 10,000, as against 6,476 at the last census. Those were the figures for permanent residents. The assessable value of the township was £541,600. Application had also been made a month ago for sanction to borrow £60,000 for sewerage purposes, but nothing has been heard of the application as yet. There was no opposition to the present application.

Newton Abbot.—Mr. Walter A. Ducat, an inspector of the Local Government Board, has held an inquiry concerning an application by the council for sanction to borrow £3,450 for the purposes of sewerage and sewage disposal and £1,550 for the purposes of public walks and pleasure grounds. Mr. Lewis Stevens, the surveyor, explained to the inspector how the amount of £5,000 was apportioned, and also stated the advantages of the council making the new road.

Pudsey.—Mr. A. Duckett, an inspector of the Local Government Board, held an inquiry last week respecting an application of the council for permission to borrow £4,900 for the purchase of land at Hough Tide and Troycdale for the construction of sewerage disposal works.

Tipton.—The district council have unanimously decided not to entertain the question of purchasing the tramways in their district.

Urmston.—A Local Government Board inquiry has been held with reference to an application of the district council for sanction to a loan of £4,000 for street improvement works, including the flagging of the public footpaths. There was no opposition.

Weybridge.—The Local Government Board have sanctioned the application of the district council for a loan of £5,000 for the carrying out of a new surface-water drainage scheme and the formation of asphalt footways. The drainage scheme was designed by Mr. John T. Crawshaw, surveyor to the council, and it is proposed to carry out the whole of the works without the intervention of the contractor. It is interesting to note that only four weeks have elapsed between the holding of the inquiry and the receipt of the Local Government Board's sanction.

RURAL DISTRICT COUNCILS.

Dorchester.—Mr. W. A. Ducat, an inspector of the Local Government Board, held an inquiry in the schoolroom, on Friday, at 11 o'clock, in respect of an application made by the council for leave to borrow £1,300 for the purpose of carrying out a system of water supply for the parish of Maiden Newton.

Sleaford.—It has been resolved by the council to purchase land at Great Hale for new waterworks. In a letter to the council the Local Government Board declined to grant a loan of £900 towards the cost of the works until they received information as to whether the site was the property of the rural district council or whether any provisional agreement was being entered into for the purchase.—It was resolved, before continuing the operations for supplying the parish of Annsby with water, to ascertain whether the principal owners were prepared to contribute towards the cost.

Winchester.—Mr. W. A. Ducat, on the 24th ult., held an inquiry, on behalf of the Local Government Board, relative to an application of the district council for sanction to borrow £1,300 for water supply works. Mr. F. W. Mager, surveyor to the Walsall Rural District Council, attended and gave evidence as to the present water supply, and explained the details of the proposed scheme, for which he is the engineer.

SCOTLAND AND IRELAND.

Edinburgh.—At a meeting of the Gas Commission, held on the 27th ult., it was stated that in the consumption of gas during May there had been an increase of between 3,000,000 and 4,000,000 cubic feet, which, considering the season of the year, was regarded as quite satisfactory. The surplus for the year was £54,994, against a surplus last year of £40,570.

Glasgow.—Last week, at a meeting of the city council, it was decided by a large majority to proceed with the erection of baths in Whitevale-street, and to provide accommodation therein for Turkish baths. The cost would be between £300 and £400. The council also adopted the recommendation of a committee that the site of a proposed hall for Mount Florida, Langside and Shawlands should be at the junction of Pollokshaws-road and Langside-avenue, and that the amount to be spent in its erection should not exceed £8,000.—The Sub-Committee on Police Halls and Buildings recommended that a sum of £1,200 should be expended in reconstructing the staircase and providing improved retiring-room accommodation and additional exits for the Dixon Halls. The minutes were approved.

Limerick.—A committee of the corporation recently gave their consideration to letters from (1) Mr. H. Bickerdike, Montreal, proposing to introduce the "American electric trolley system" into the city on terms to be arranged; (2) Mr. J. E. Palmer, Ballybrack, co. Dublin, applying for a lease for 150 years of the sole right to construct, equip, maintain and work electric tramways in the city, and proposing certain routes for which the lease is asked; and (3) M. Zeitz, Hamburg, offering to supply cars, completely fitted out, for the overhead system of electric traffic.

CORRESPONDENCE.

Weardale Sewerage.—Referring to an article in our issue of the 24th ult. on "Sewage Purification at Weardale," Mr. W. M. Egglestone, surveyor to the rural district council, writes: You say "We may mention that the Wolsingham sewage farm was laid out by Mr. Egglestone over twenty years ago, £1,800 being borrowed for the purpose." The £1,800 was borrowed for the sewerage works for the town of Wolsingham, 2,000 population, and the only expense incurred at the time the town was sewered was on the field—the fence separating the 5 acres of land. The total expenditure on the field then and since for underdraining, effluent outlet, &c., is covered by the £100 mentioned. Kindly correct this. The sewerage scheme for the town was laid out by me, and £1,800 was borrowed for the purpose, not for the sewage farm.

ARBITRATIONS AND AWARDS.

On Tuesday, the 21st ult., Mr. James Green conducted an inquiry, at the Surveyors' Institution, Savoy-street, London, W.C., to determine the value of the property proposed to be included in the betterment area of the Strand improvement. The inquiry was conducted under the London County Council Improvement Act, 1897, which empowered the council to widen the Strand between the eastern end of the churchyard of the church of St. Mary-le-Strand and the western end of the churchyard of the church of St. Clement's Danes; and in connection therewith to take the lands, with the houses and the buildings thereon, situated between the two churches and Holywell-street and the Strand on the north and south respectively, and to remove the said houses and buildings to throw the site into the widened thoroughfare of the Strand. The improvement or betterment area under the Act includes the lands, all, or any part, of which fronts or abuts upon the northern side of Holywell-street. Several of the cases having been agreed upon, the case of 31 Newcastl-street, at the corner of Holywell-street, was brought forward. Mr. Bevan represented the owners, and Mr. Littleton the county council. Mr. Bevan stated that the house was at present let under a sub-lease to Mr. Russell as a refreshment-house. It was let on a lease for twenty-one years, expiring at Christmas, 1908, at £160 per year, but had been sublet for the remainder of the term, at £275 per annum. The premises were rated at £300 gross, or £250 net; and the counsel contended that when the lease fell in the value would be at least £325 per annum. Mr. Galsworthy valued the property at £6,722. If it had been in possession he considered the value would have been £8,125. Mr. W. D. Bonilla endorsed the valuation of Mr. Galsworthy; and Mr. B. J. Breach estimated the ultimate rental value at £350 and the property at £7,135. For the London County Council, Mr. Andrew Young, surveyor and valuer, was called. He considered £275 per annum was the rack-rental value of the property, and at twenty-two years' purchase he estimated the value at £6,050. Mr. Wilkinson agreed with Mr. Young's estimate. He thought £275 very full rent. The referee reserved his decision.

The Recorder, Sir Charles Hall, Q.C., M.P., and a special jury, sat at the Guildhall, on the 29th ult., to hear the case of the Trustees of the London Parochial Charities v. the Corporation of the City of London, a claim for compensation in respect of the freehold interest in premises known as No. 4, Cheap-side, which are required for the purposes of the widening of the west end of Cheap-side. Mr. Edward Boyle, Q.C., and Mr. Reginald Neville appeared for the claimants, and Sir William Marriott, Q.C., and Mr. Rose-Innes represented the corporation. The property in question was let at a ground rent of £40 per annum for sixteen years from midsummer, 1898, and it was agreed, during the hearing, to be taken on the 3 per cent. tables, £500. It was admitted that the property would be worth about £500 per annum at the expiration of the existing lease in 1914, and the question for the jury was the proper basis upon which to capitalise that reversionary value. For the claimants, it was contended by Mr. Daniel Watney and Mr. G. A. Wilkinson that the £500 per annum receivable after the year 1914 should be valued on the 4 per cent. tables (13 1/2 years' purchase), or £6,700, which, with the customary addition of 10 per cent. for compulsory sale, brought the claim to a total of £7,924. On behalf of the corporation, Mr. Robert Vigers and Mr. Alexander Ross Stenning gave evidence to the effect that the reversionary rental of £500 in 1914 should be capitalised on the 5 per cent. tables (9.25 years' purchase), £4,255, showing a total of £5,926, including the usual 10 per cent. The jury awarded the claimants the sum of £6,850.

NEW UNDERGROUND LAVATORIES AT BIRMINGHAM.

The construction of new underground lavatories, &c., in High-street (Bull Ring) and Corporation-street (Old square) has been commenced by the Public Works Committee of the Birmingham Corporation. The work will not be completed until about October. In each case there will be a department for ladies. The general plan of the subterranean areas is that of a triangle with the corners rounded off. The smaller end will be towards the upper part of the slope, and at this end will be the entrance to the ladies'-room. This department will contain six water-closets and an attendant's-room and lavatory. Hot and cold water will be provided. The men's department will communicate with the street at the wider end, with separate stairs for entrance and exit. Seven water-closets and other conveniences will be provided in this section, with two lavatories. The average depth of the floor below the street will be about 9 ft. and the area will be covered with glass prisms on the ground level, forming a "refuge." The entrances will be provided with ornamental iron railings, and upon the refuge triple street lamps. The interior of the lavatories will be faced with ivory-white glazed bricks, and the steps will be of hard York stone. The wood fittings will be of teak, and the divisions of polished rouge royal marble. The sanitary fittings will include

closets, with syphonic discharge. A water-driven air-propeller will provide ventilation for both departments. In Corporation-street the lavatory is being constructed partly under the triangular refuge round which the tramcars pass and partly under the roadway of Corporation-street. The total cost of the two buildings will be about £4,000.

NEW PUBLIC BATHS FOR EDINBURGH.

The plans of Mr. Robert Morham, the city architect of Edinburgh, for the new public baths at Saxo Coburg-place, Stockbridge, have been approved by the Dean of Guild Court. The building will be after the style of certain other baths at Dalry, and the cost is estimated at £15,000, a good part of which, however, has been swallowed up in securing the site. It occupies a vacant piece of ground on the north side of Saxo Coburg-place, between that thoroughfare and Glenogle-road. The nature of the levels and the narrowness of the site has made it a very difficult subject to treat. There is a fall of 30 ft. between the pavement at Saxo Coburg-place and the Glenogle-road level. The pond hall level will be 12 ft. above the Glenogle-road level. The swimming pond itself will measure 75 ft long by 35 ft. wide, the depth being, as usual, from 3 ft. to 7 ft. Round the pond dressing-boxes will be provided for seventy-two swimmers. At the east end of the pond will be a gymnasium, and at the west end the officials' rooms and laundry. On the gallery floor will be situated thirty-two plunge baths and a club-room, and adjoining, just over the laundry, nine first-class bath-rooms. The boiler and steam apparatus will be placed at the east end of the building. Messrs Kinnear & Moodie, the contractors of the structure, have eighteen months in which to complete their contract.

Cupar, Fife.—The purchase of the gasworks by the town council is being discussed. A committee has been formed to obtain information on the matter.

ADVERTISEMENTS

Received too late for Classification.

VESTRY OF CAMBERWELL, LONDON.
TO TAR PAVIORS AND OTHERS.

The General Purposes Committee of this Vestry will meet at the Vestry Hall, Peckham-road, Camberwell, on Monday, the 18th day of July inst., at 7 p.m., to receive tenders for laying new Tar Paving to Footways, Trenches, &c., in the various roads in the parish.

Specifications, particulars and forms of tender can be obtained from Mr. Wm. Oxtoby, Engineer and Surveyor, Vestry Hall, Camberwell, on and after Monday next, the 11th inst.

The Vestry does not bind itself to accept the lowest or any tender.

Contractors or their agents are required to be present at the time first above mentioned.
Persons tendering must comply with the conditions as regards rates of wages and hours of labour as contained in the form of contract.

(By order)

C. WILLIAM TAGG,
Vestry Clerk.

Vestry Hall, Camberwell.
July 6, 1898.

BOROUGH OF CHELTENHAM.

The Corporation of the Borough of Cheltenham hereby invite tenders for the supply of Stoneware Pipes and Cement for twelve months.

Full particulars and forms of tender may be obtained on application to the Borough Surveyor, at the Municipal Offices.

Tenders to be sent in to me, the undersigned, endorsed "Tender for Stoneware Pipes," or "Cement" (as the case may be), at or before 12 o'clock at noon on Monday, the 25th day of July, 1898.

The Corporation do not bind themselves to accept the lowest or any tender.

E. T. BRYDGES,
Town Clerk.

Municipal Offices, Cheltenham.
July 6, 1898.

BOROUGH OF CHELTENHAM.

The Corporation of the Borough of Cheltenham hereby invite tenders for the supply of 150 tons of Iron Water Pipes, and for General Road and Sewer Castings.

Full particulars and forms of tender may be obtained on application to the Borough Surveyor, at the Municipal Offices.

Tenders to be sent into me, the undersigned, endorsed "Tender for Pipes" or "Castings" (as the case may be), at or before 12 o'clock at noon on Wednesday, the 20th day of July, 1898.

The Corporation do not bind themselves to accept the lowest or any tender.

E. T. BRYDGES,
Town Clerk.

Municipal Offices, Cheltenham.
July 6, 1898.

Personal.

Mr. A. S. Darby, of Great Lever, Bolton, has been appointed engineering assistant to Mr. S. S. Platt, borough surveyor, Rochdale.

The Ramsey Urban District Council have unanimously decided to increase the salary of their surveyor, Mr. D. Bell, by £30 per annum.

Mr. J. Boulton, of the borough surveyor's office, Burslem, has been appointed building inspector to the Swindon New Town Urban District Council.

Messrs. Treadwell & Martin, of Pall Mall, S.W., have been selected by the Metropolitan Asylums Board to act as architects of the Southern hospital.

Houses are springing up so rapidly in the Ilford district that the urban district council have decided to appoint an assistant surveyor to supervise their erection.

Mr. Sydney Perks, of 13 Waterloo-place, Pall Mall, S.W., has been elected by the council of the Royal Institute of British Architects a member of the Practice Committee of that body.

Mr. William Meredith, temporary clerk of works in the office of Mr. J. W. Bradley, borough surveyor of Wolverhampton, has been appointed divisional building inspector in the same office.

Mr. A. Saxon Snell, F.R.I.B.A., has been instructed by the West Ham Corporation to prepare plans for the erection of public swimming and private baths and other buildings in Romford-road, Stratford, E.

Mr. Edward Wright, of the surveyor's offices, Wandsworth District Board of Works, has been appointed assistant draughtsman in the office of Mr. E. W. Dixon, water engineer to the Harrogate Corporation.

Mr. Walter H. Reading, chief drainage inspector in the office of Mr. J. W. Bradley, borough surveyor of Wolverhampton, has resigned, in order to enter upon private works as a contractor and sanitary expert.

Mr. James Watson, waterworks engineer to the Bradford Corporation, attended the summer excursion of the Bradford Society of Architects and Surveyors, which took place last week, to Harrogate, Pateley Bridge and Ramsgill.

Five candidates for the position of mechanical engineer at the Ponders End pumping station of the Enfield Urban District Council were interviewed on Thursday, at a meeting of that body, and Mr. A. J. Minty, of Chatham, was eventually appointed.

The London County Council, on Tuesday, decided to appoint Mr. Frederick William Hamilton, district surveyor for North Fulham, and Mr. Stanley Faithful Monier-Williams district surveyor for South Fulham. There were thirty-eight applicants.

At the parish church of Midhurst, on Thursday, a wedding was solemnised between Miss Ethel Mary Packham and Mr. Arthur Gordon Gibbs, surveyor to the Midhurst Rural District Council. Both the bride and bridegroom are well known in the town, and a large congregation of friends assembled to witness the ceremony.

Mr. Oliver E. Winter, surveyor to the Vestry of St. George-the-Martyr, Southwark, has been selected to fill the post of surveyor to the Poplar Board of Works, recently vacated by Mr. William Oxtoby on his appointment to the surveyorship of Camberwell. There were thirty-two applicants for the vacant position. The salary commences at £500 per annum.

Mr. Philip Edinger, surveyor to the Frome Urban District Council, met with a serious accident recently. Several ribs were broken on the left side, and a serious internal injury was also feared by the doctor who was summoned to attend Mr. Edinger. We are glad to be able to state that Mr. Edinger, whose condition was at one time deemed to be very critical, is now progressing very favourably.

On Saturday, at a meeting of the Metropolitan Asylums Board, Mr. William Thomas Hatch was appointed as engineer, at a salary of £600 per annum. Mr. Hatch is thirty-six years of age, and was educated at Liverpool University and at Owens College, Manchester. For the last eleven and a half years he has held the appointment of general manager to the Empire Engineering Company, Manchester.

At the last meeting of the Harrogate Town Council Mr. W. Hoffman Wood, of Leeds and London, was presented with a testimonial and honorarium in recognition of the able manner in which he had prepared the quantities for the Royal baths, at a cost of over £70,000, without any extras on the contract. The presentation was made by the mayor, who referred in his address to the satisfactory completion of the undertaking, and was suitably acknowledged by Mr. Wood.

Last week, at a meeting of the Sunbury Urban District Council, it was proposed that the surveyor should be allowed an addition to his salary, at the rate of £12 10s. per quarter,

during the period of the sewerage connections. It was stated that it was the unanimous wish of the council that Mr. Coles should superintend the connections, and it was only fair that he should be paid for the extra work he was undertaking. The motion was unanimously adopted, a member remarking that the surveyor had always given them the greatest satisfaction.

The Leicestershire, Northamptonshire and Rutland Provincial Committee of the Surveyors' Institution had their summer extension on Thursday, travelling over and inspecting the works of the new Great Central Railway. Luncheon was provided at East Leake. Mr. Woolley took the chair, and was supported by Messrs. E. K. and C. B. Fisher, H. H. Holloway and H. G. Coates (Market Harborough), G. Hodson (Loughborough), E. G. Mawbey (borough surveyor, Leicester), A. H. Walker (borough surveyor, Loughborough), A. T. Draper and J. Goodacre (Leicester), E. H. Holbeche and G. German (Ashby).

The Finance Committee of the Gloucester City Council have decided, upon the recommendation of the Improvement Committee, that in future the appointment of building inspector be distinct from that of assistant surveyor. They have unanimously recommended that Mr. E. W. A. Carter, who has for three years been an assistant in the office of the city surveyor, be appointed assistant surveyor, to discharge such of the duties of the surveyor's department as may be from time to time prescribed by the council or arranged by the city surveyor, at the salary of £125 a year, the appointment to be terminable by three calendar months' notice on either side.

Gloucester City Council last week received a letter from Mr. H. J. Weaver, stating that he had accepted an appointment as borough engineer and surveyor under the Corporation of King's Lynn, and asking if the corporation would accept one month's notice. A member, in supporting a resolution proposing the acceptance of the resignation, said he had had opportunities of seeing the work of Mr. Weaver, and he considered they were losing a capable officer who had always performed his duty. The good wishes of the council would go with him.—The Streets Committee, it might be mentioned, also passed a resolution recording their appreciation of Mr. Weaver's services during his connection with the surveyor's department and congratulating him on his new appointment.

The will of Sir Robert Rawlinson, of Lancaster Lodge, the Boltons, West Brompton, formerly chief engineering inspector of the Local Government Board, who died on May 31st, aged eighty-eight years, leaving personal estate of the value of £82,838, has been proved. The testator made various personal bequests, and left his residuary estate in trust to pay the income thereof to Lady Rawlinson during her life, with power of appointment to her of one moiety of the residuary estate, and the other moiety of the residuary estate is to be held in trust to pay a legacy of £1,000 to the Institution of Civil Engineers, and, as to the ultimate remainder of this moiety, to pay the same to the trustees of St. Thomas's hospital for the general purposes of the hospital, which will thus receive, apparently, about £35,000.

The town of Sandwich is about to lose the services of its harbour master and borough engineer. Mr. A. J. Catt, says *The Deal, Walmer and Sandwich Mercury*, was appointed in 1890, and has carried out the duties of his various offices with great success and credit. He acted as clerk of the works during the construction of the waterworks, and gave entire satisfaction both to the corporation and to the contractors. As is well-known, besides the above offices he has acted as inspector of nuisances, collector of market tolls, manager of the gasworks, and in several other capacities. To say that in carrying out his many difficult and often delicate duties he has given everybody satisfaction would be to say that he is more than human, but those who are best qualified to judge can say with positive certainty that he has done so with conspicuous zeal and ability. Besides his strictly official duties, Mr. Catt has rendered great assistance in such matters as the regatta, the flower show, the jubilee celebration, and in many other matters pertaining to the honour and prosperity of the town. He will be greatly missed by his official superiors, who have found him a most willing and faithful servant, and those who have had more personal relations with him can testify that he is a staunch friend, ever ready to give a helping hand in a time of difficulty. The regrets felt at his leaving must be outweighed by the knowledge that he goes to take up a, financially, much more valuable appointment—that of harbour master and harbour engineer at New Shoreham. He was elected to this post out of 106 applicants, and, as the Corporation of Sandwich have consented to waive part of the three months' notice due to them under the terms of his appointment, he will commence his new duties in about a month's time. No man will better deserve the many good wishes for success and happiness which he will take with him.

THE SANITARY INSTITUTE.

EXAMINATIONS AT BELFAST.

At an examination in practical sanitary science, held in Belfast, on June 24th and 25th, the following two candidates presented themselves and were granted certificates: Mr. T. A. Gailey, B.E., B.A., 324 Woodstock-road, Belfast; and Mr. W. H. Hargrave, Castle-street, Antrim. The following were the questions set for answer in writing: (1) What is meant by "specific gravity"? How is the "specific gravity" of any solid body determined? (2) Sketch and fully explain the principle of the syphon. (3) What is meant by "ground air"? How is its movement influenced? How does it affect the healthiness of a building site, and what steps may be taken to check its entry into a house? (4) State what constitutes a well-constructed open fire-grate, and of what materials it should be made. (5) Describe the manufacture of good bricks and the composition of lime mortar, cement mortar and concrete intended for drains and foundations. (6) Describe and sketch a good form of water-closet, with its fittings and connections. What should be the diameter of the supply pipe and of the soil pipe, and what quantity of water is necessary to flush it? (7) In sinking a well for the supply of a town, what conditions would determine your selection of a site? What steps would you take to ascertain the quantity of water obtainable? (8) What do you understand by the "biological" treatment of sewage? Explain its action.

At an examination for sanitary inspectors, held on the same days, four candidates presented themselves, and two were certified, as regards their sanitary knowledge, competent to discharge the duties of inspectors of nuisances. The following were the questions set for answer in writing: (1) Discuss the relative disinfectant powers of the following agents: Dry heat, superheated steam, saturated steam, Condy's fluid, carbolic acid, corrosive sublimate. (2) What is the definition of a cellar dwelling in the Public Health Act, 1875? State the conditions under which it is illegal to occupy an underground room as a dwelling, and name the penalties for breach of the provision of the above Act in this respect. (3) Explain the principles of natural and artificial ventilation, and show how you would apply each respectively in the case of (a) a cellar dwelling, and (b) an ordinary bedroom. (4) Under what circumstances are certain milk-sellers exempt from "registration"? To what points should you direct your attention when instructed to report upon dairies and upon cowsheds? State the diseases communicable to human beings by cows' milk. (5) Give a sketch plan and section of a dormitory for twenty persons, showing construction of floor and roof, thickness of walls and means of warming and ventilation. (6) How would you render the external wall of a building (south-western aspect) damp, rain and storm proof? Describe the methods usually adopted, and explain why. (7) When inspecting houses to what points would you direct your attention to ascertain whether the drainage is in proper condition. What are the methods generally employed for testing house drains? (8) What are the comparative advantages of the "dry" and "wet" method of sewage removal? Describe in detail one system of dry removal.

APPROVAL OF PLANS.

CONDITIONS ENFORCED AT GLOUCESTER.

The following are the conditions which are imposed at Gloucester in connection with plans passed by the Improvement Committee, subject to the approval of the council and to compliance with the by-laws now in force:—

1. *Notices.*—Two days' written notice must be given to me (i.e., the city engineer) before commencing the work; one day's notice to inspect the house drains before they are covered up; two days' written notice of the completion of the building before the same is sold or inhabited, or the full penalty will be enforced.

2. *Concrete.*—The whole area or site of the building must be covered with a layer of good lime or cement concrete, 6 in. thick. This concrete is in addition to, and must be put in at the same time and connected with, the concrete foundations under the walls.

3. *Drains.*—The house drains must be of best stoneware glazed socketted pipes, 6 in. diameter with 4-in. branches to gullies and soil pipes, properly connected with the city sewers, and laid with a fall of not less than 1/4 in. to each pipe. All joints must be yarned and made with the best Portland cement, and keen sand gauged one to one. All drains must be outside the building if possible and ventilated by 4-in. iron pipes, properly jointed, and carried up at least 2 ft. clear above the roof. When the house drains are obliged to be taken under the house they must take the shortest possible straight line, and be jointed in cement as above and entirely surrounded with good solid concrete, 6 in. thick. The necessity for taking drains under houses can be avoided by building in blocks of from one to eight houses each instead of in continuous rows. Not more than four small houses allowed on one drain and sewer connection. Where a block consists of less than four houses each block must have a separate

drain and sewer connection. The sewer connection and drain in the street will be laid by the corporation at the owner's expense.

4. *Sinks, Baths, Water-Closets and Rain-Water Pipes.*—All sink and bath wastes must discharge upon 6-in. glazed stoneware gullies in the open air outside the building. All inside water-closets must be built against an external wall, and the soil pipe, 4 in. diameter, fixed outside the building and carried up and ventilated the full size at least 2 ft. above the roof. Rain-water pipes, or the overflows from rain-water cisterns, must discharge upon 6-in. glazed stoneware gullies in the open air outside the building.

5. *City Water Supply.*—The city water must be laid on with proper pipes, fittings and flushing boxes to the water-closets in accordance with regulations.

6. *Party or Division Walls between Houses.*—All party or division walls between houses must be carried up, at least 9 in. thick, throughout the entire length of the houses to the underside of the roofing slates, and pointed so as to prevent the communication of fire from one house to another. All external or partly external walls must be at least 9 in. thick.

7. *Materials in Streets.*—No building materials are allowed to be deposited in streets.

DOUGLAS BREAKWATER.

The faulty construction of Douglas breakwater, which, instead of being solid like the landing portion of the Queen's Pier, has an interior of rubble in the style of construction known as "pocket," and is also built on an artificial rubble mound, has long been a source of concern to the insular authorities, owing to subsidences which involve the middle length of the work, and make it feared that any great storm may breach it and throw the inner wall into the bay. Experts have reported on the state of the breakwater, and shown that it will take an expenditure of many thousands of pounds to avert the threatened danger and make it secure. The scheme for securing it has just been completed by Mr. Neville, the insular engineer. Arrangements have been made to use diamond drills, which have been used in the coal-boring operations in the north of the island. Special iron staging will be erected on the south side of the breakwater, and on this the boring apparatus will be placed and worked to cut holes through the cross-section of the breakwater. The borings will be about 3 in. in diameter. Through these iron bars the full diameter will be run and bolted on each side. The calculation is that in this way the walls can be secured from tumbling down, and the rebuilding of the middle portion of the structure avoided.

VAUXHALL BRIDGE.

With the opening of the new temporary bridge at Vauxhall, shortly, the old structure may at once be closed and demolition commenced. According to a very interesting pamphlet written by Mr. H. W. Bridges, clerk of the Bridges Committee, and ordered to be printed by the authority of that committee, this was the first iron bridge across the Thames. It was begun in 1811, and was opened in 1816. It cost nearly £260,000. It was purchased by the Metropolitan Board of Works for £75,000, and was opened free to the public in 1879. The bridge was found to be inadequate to the traffic, it obstructed the waterway to an extent that was dangerous to navigation, and the scour of the river has had a serious effect on the foundations of the deep-water piers by washing the river bed away from them.

The new bridge will be the subject of two contracts. One will comprise the foundations and piers up to the level from which the arches spring. There is nothing to prevent this being proceeded with as soon as the old bridge has been got out of the way. But before the upper structure can be undertaken it will be necessary to obtain some modification of the Act by which the council are empowered to undertake the work. That Act requires that during the building of the bridge there shall be a clear headway of 18 ft. above high-water level. As it is to be a concrete bridge, it has been found impracticable to build it with this condition, and Parliament will next session be asked to reduce the stipulated headway to 16 ft. during the progress of the work. There will be no lowering of the arches of the bridge itself, but the alteration to be asked for is merely that the temporary staging may come down to within 16 ft. of the river level instead of 18 ft. There will be ample time to get this amended before it becomes necessary to take contracts for the building of the upper structure.

Hammersmith.—The following tenders for condensing plant have been accepted by the vestry: Ledward evaporative condenser and tanks, T. Ledward & Co., £1,345; air pump, W. H. Allen & Co., £185; circulating pumps, W. H. Allen & Co., £300. The tenders that were sent in for pipe work were considered excessive by the Electric Lighting Committee, and none was recommended for acceptance. The committee will consider the matter further and report.

PEPPERMINT OIL FROM A SEWAGE FARM.

Our contemporary, *The Chemist and Druggist*, on Saturday week published the following:—

Our news columns last week contained the curious announcement that the Sutton Urban District Council, having a quantity of peppermint oil to dispose of, had instructed their surveyor to sell it for the best price he could get. On seeing the item in print we wondered how the Sutton Council became possessed of the oil in question. We supposed they had bought a lot for testing drains, and were now wanting to realise a little profit on it. But if that were the case we thought it needed explanation that they should buy Mitcham oil for such work. So we charged them with being in possession of a certain drug—to wit, English oil of peppermint—and invited them to give any explanation in their power. We have to admit that the Sutton Urban District Council leave this court without a stain on their character. The surveyor, Mr. C. Chambers Smith, writes as follows: "It may probably be interesting to your readers to know that the Sutton Council cultivate the peppermint plant in their sewage farm, and obtain very satisfactory crops; about 4½ acres are under peppermint during the present season. The yield of oil from 2½ acres under cultivation last year was 61½ lb. The price realised from the oil just sold is 2s. 3d. per pound, the quality being considered excellent, and is of the kind known in the trade as Mitcham oil." We publish this explanation with much pleasure, and compliment the Sutton Council and their surveyor on their evident business smartness.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

TEMPORARY ASSISTANT SURVEYORS (Two).—July 8th.—Wallasey Urban District Council. £2 12s. 6d.—The Engineer and Surveyor to the Council.

CONSULTING ENGINEER AND SURVEYOR.—July 9th.—Horwich Urban District Council.—Mr. Peter Taberner, clerk to the council.

FOREMAN PAVIOR.—July 11th.—Norwich Corporation. £3.—Mr. Arthur E. Collins, A.M.I.C.E., city engineer.

SANITARY INSPECTOR.—July 11th.—Plumstead Vestry. £104.—Mr. Edwin Hughes, vestry clerk.

ROAD FOREMAN (Two).—July 12th.—County Borough of Huddersfield. £100.—Mr. K. F. Campbell, A.M.I.C.E., borough engineer and surveyor.

CHIEF ENGINEERING AND SURVEYING ASSISTANT.—July 12th.—County Borough of Huddersfield. £180.—Mr. K. F. Campbell, A.M.I.C.E., borough engineer and surveyor.

BUILDING INSPECTOR.—July 12th.—Ilford Urban District Council. £120.—Mr. H. Shaw, A.M.I.C.E., surveyor to the council.

HIGHWAY SURVEYOR, INSPECTOR OF NUISANCES, &c.—July 19th.—Newark Rural District Council. £155.—Mr. William Newton, clerk to the council.

BOROUGH ENGINEER.—July 22nd.—Corporation of Pietermaritzburg, Natal, South Africa. £800.—Messrs. Ford Brothers, 14 Southampton-street, Fitzroy-square, London, W.

CITY ENGINEER.—August 31st.—Corporation of Wellington, New Zealand. £800.—Agent-General for New Zealand, London.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

EAST RIDINGS.—July 16th.—Extension of the county offices at Beverley and the erection of a new register office, for the county council. £30, £20 and £10.—Mr. John Bickersteth, county clerk, County Hall, Beverley.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

MATHEWHEAD.—July 11th.—Making-up of Ray Park-avenue.—Mr. Percy Johns, A.M.I.C.E., borough surveyor.

HOWERS.—July 11th.—Erection of a fire engine station at Muswell Hill, for the urban district council.—Mr. E. J. Lovegrove, surveyor to the council.

LYMINGTON.—July 11th.—Erection of a small bridge near Winchelsea, in the parish of Broadburch, for the rural district council.—Mr. T. J. Fripp, surveyor to the council.

LEAMINGTON.—July 11th.—Supply of road stone for a period of twelve months.—Mr. W. de Normanville, borough engineer.

St. PANCRAS.—July 12th.—Laying of cast-iron pipes between the Record's canal and the King's-road electricity works.—Mr. C. H. F. Barrett, vestry clerk.

NANTWICH.—July 12th.—Construction of a precipitation tank, filtered and sludge strainer at the sewage outfall works, Gunnersclough, Barton, for the rural district council.—Mr. Algernon Fletcher, clerk to the council.

SOUTHAMPTON.—July 12th.—Supply and delivery of cast-iron pipes and special castings required during the ensuing twelve months, for the corporation.—Mr. W. Matthews, waterworks engineer.

REigate.—July 12th.—Laying of pipe sewers in the districts known as South Hill, Woodchurch, and the Nags Head, Farnborough.—Mr. W. H. Prescott, borough surveyor.

Huddersfield.—July 12th.—Erection of an isolation block at the sanatorium, Mill-hill.—Mr. F. C. Lloyd, town clerk.

St. HELENS.—July 12th.—Supply of various pumping plant to raise 1,500,000 gallons of water per day, for the corporation.—Mr. J. J. Lacker, borough engineer.

TRICKENHAM.—July 13th.—Various sewerage and road making works, for the urban district council.—Mr. G. B. Laffan, engineer and surveyor to the council.

Worcester.—July 14th.—Erection of about 215 yards of stone coping along Croft-road.—Mr. P. Clark, A.M.I.C.E., city engineer.

ATLETON.—July 14th.—Supply of a gas condenser, valves and connections, and the construction of a telescopic gasholder, 52ft. in diameter, for the urban district council.—Mr. Daniel Schofield, clerk to the council.

STOCKLEY.—July 14th.—Re-erection of Raisdale bridge, in the township of Bilsdale, for the rural district council.—Mr. W. H. Dixon, surveyor to the council.

SWINTON.—July 15th.—Supply of 520 yards of cast-iron socket pipes 6½ in. diameter and other pipe castings, for the urban district council.—Mr. R. Fowler, engineer and surveyor to the council.

DARTFORD.—July 15th.—Making-up, &c., of Priory-lane, for the urban district council.—Mr. W. Harston, surveyor to the council.

WOODFORD.—July 16th.—Supply of 1,400 tons to 2,000 tons of broken Quenast or Gherney granite, for the urban district council.—Mr. John A. Simpson, clerk to the council.

WATER BEINGFORD.—July 16th.—Laying of about 2,400 yards of 12-in. and 9-in. Hassell's pipe sewers, 12-in. iron pipe sewers and 9-in. surface-water drains, for the urban district council.—Mr. Wm. Pare, surveyor to the council.

MARCHESTER.—July 16th.—Construction and erection of a wrought-iron bridge for carrying 30-in. cast-iron pipes over the river Tame at Broomstall, Hyde and Denton, for the corporation.—Secretary, Waterworks Office, Town Hall, Manchester.

NELSON.—July 16th.—Construction of two storage reservoirs in Onden and Black Moss valleys about 4 miles from the town, for the corporation.—Messrs. Newton, 17 Cooper-street, Manchester.

SOUTH CROSLAND.—July 18th.—Construction of additional sewerage works, comprising the laying of over 1 mile of stoneware pipe sewers, varying in size from 6 in. to 9 in., for the urban district council.—Mr. W. H. Radford, Angel-row, Nottingham.

ILFRIST.—July 18th.—Supply of a 15-ton combined compound steam road-roller, for the urban district council.—Mr. John W. Benton, clerk to the council.

HORLEY.—July 18th.—Construction of 3½ miles of stoneware pipe sewers, varying in size from 15 in. to 7 in., for the urban district council.—Mr. W. H. Radford, Angel-row, Nottingham.

GREAT YARMOUTH.—July 19th.—Supply of one 150-horsepower high-speed engine and alternator coupled direct and auxiliary additional steam and exhaust pipes.—Mr. A. H. Miller, town clerk.

LONDON.—July 19th.—The Engineering of the bridge-way of John-street, Mile-end, with Ashmolean hard wood.—The Engineer to the Corporation.

LONDON.—July 19th.—Construction of an underground convenience in Alderman's-walk.—The Engineer to the Corporation.

CROYDON.—July 19th.—Construction of 2,230 yards of 9-in., 12-in. and 15-in. pipe sewers in the neighbourhood of London-road, Merton, and for the construction of a covered concrete storage tank, near Norbury Manor farm.—Mr. E. Mawdesley, town clerk.

CROYDON.—July 19th.—Division of a portion of Long-lane.—Mr. E. Mawdesley, town clerk.

PORTSMOUTH.—July 19th.—Supply and fixing of cast-iron valve seatings to the pumps at the Eastley pumping station.—Mr. Alexander Hellard, town clerk.

LONDON.—July 19th.—Construction of underground conveniences in Feuchurch-street.—Sir J. B. Monckton, town clerk.

Worcester.—July 20th.—Various kerbing, channelling and paving works, for the county council.—Mr. J. H. Garrett, county road surveyor, Shire Hall, Worcester.

GRANGE-OVER-SANDS.—July 21st.—Erection of a new public hall and district council offices, for the urban district council.—Mr. John Hutton, architect, Kendal.

COLNE.—July 23rd.—Erection of technical schools and a public library in Albert-road.—Mr. Alfred Valey, town clerk.

LEWIS.—July 23rd.—Supply of 500 tons of 2-in. broken blue Gherney, Cherbourg or Belgian granite, 100 tons of coarse granite screenings, 650 tons of broken surface-picked flints and 150 tons of Piddington gravel.—Mr. Montague S. Bicker, town clerk.

WEST HAM.—July 23rd.—Construction of about 1,200 lineal yards of sewers, 7 in., 6 in. and 3 in. diameter.—Mr. Lewis Angell, borough surveyor.

WEST HAM.—July 26th.—Making-up of Freeman-street, Haslemere-road, New-street (Plaiestow) and Old-street (Plaiestow).—Mr. Lewis Angell, borough surveyor.

Bucklow.—July 26th.—Construction of main sewers and outfall works for the township of Hale, for the rural district council.—Mr. Geo. Leigh, clerk to the council.

WEST HAM.—July 26th.—Erection of twenty-nine working-classes' dwellings in Hermit-road, Plaiestow.—Mr. Lewis Angell, borough surveyor.

WEST HAM.—July 26th.—Supply of ten slop-carts.—Mr. Lewis Angell, borough surveyor.

BURY.—July 26th.—Erection of a manager's house at the sewage disposal works, Lacey's Fields.—Mr. J. Cartwright, borough engineer.

BURY.—July 28th.—Erection of a model lodging-house in George-street and Foundry-street, off Rochdale-road.—Mr. J. Cartwright, borough engineer.

TENDERS.

*ACCEPTED.

APPOINTMENTS OPEN.

RURAL DISTRICT COUNCIL OF NEWARK.
APPOINTMENT OF HIGHWAY SURVEYOR, INSPECTOR OF NUISANCES, CANAL BOATS INSPECTOR AND PETROLEUM INSPECTOR.

The Rural District Council of Newark invite applications for the above appointments.

There are twenty-five parishes in the district and 100 miles of roads.

The salary for the combined offices will be £155 per annum, and the person appointed must be fully qualified and competent to perform all the duties thereof, including the preparation of plans, &c., and will be required to devote the whole of his time to such duties.

Applications, in candidate's own handwriting, stating age, previous occupation, and accompanied by copies of not more than three recent testimonials, to be sent to me not later than Tuesday, the 19th day of July instant.

Canvassing the members of the Council, whether directly or indirectly, will be a disqualification.

The appointment will be made subject to the approval of the Local Government Board.

(By order)

WM. NEWTON,
Clerk.

ADAMS' PATENT SEWAGE LIFT CO. ENGINEERS, YORK
And Old Queen St., Westminster, London.

ABSOLUTELY AUTOMATIC SEWAGE LIFTING

(i.e., NO ENGINE is required and no attention),

The **FIRST COST** of Installation being the **ONLY** Cost.

AS USED AT

Grimsby, Glasgow, Ebchester, Hoylake, Johnstone, &c., &c., and many other towns in England, on the Continent, and the United States.

WRITE FOR TESTIMONIALS.

PATENT TRUINVERT PIPE.

AA—Holes for pouring in cement or composition.
BB—Strengthened and Lengthened Socket.

CC—Inner Socket and Rest.
EE—Chamber for cement or composition.
FF—Stanford Joint in new position.

To put it shortly, this pipe secures true alignment of invert, increased strength in the socket, three gas and water-tight connections at every joint, and, while allowing for a slight settlement when first laid, forms an absolutely rigid joint directly the cement sets.

POINTS:

- 1.—Gas and Water-Tight Joints easily made under water.
- 2.—True Alignment of Invert.
- 3.—Socket the strongest part of the pipe
- 4.—No special junctions required.

OATES & GREEN, Ltd., Halifax

BOROUGH OF SANDWICH. APPOINTMENT OF SURVEYOR, &c.

The Council invite applications from competent persons for the offices of Borough Surveyor, Harbour Master, Inspector of Nuisances and Collector of Coal Dues, and Haven Dues and Cattle Market Tolls, &c.

The person appointed will be required to devote his whole time to the performance of the duties comprised within the several offices, and he will be required to give security to such amount as may be fixed by the Council.

Annual salary, £120.

Applications, in handwriting of candidate, stating age, and accompanied by testimonials of recent date, not exceeding three in number, to be sent to me on or before Wednesday, the 13th inst., endorsed "Surveyor."

Further particulars may be obtained on application to the Town Clerk's office.

(By order)

D. BAKER,
Town Clerk.

Guildhall, Sandwich.
July 1, 1898.

CORPORATION OF PIETERMARITZBURG. BOROUGH ENGINEER.

Applications are invited for the appointment of Borough Engineer for the City and Borough of Pietermaritzburg, in the Colony of Natal, South Africa.

The gentleman appointed will be required to devote his whole time to the duties of his office. He must be a thoroughly competent engineer and surveyor, and must have had practical experience in a similar position.

The salary will be £800 per annum, without extras or allowances, and will be payable monthly. Offices, assistants, instruments and stationery will be provided by the corporation.

The city contains an area of 1,000 acres and the borough 27,000 acres. The population is 24,000 and the rateable value £2,250,000. There are 33 miles of streets in the city. Sewerage works, macadamising of roads, paving of footpaths, surface-drainage works, and additional water supply are either in progress or in immediate contemplation. The lighting of the city by electricity is now being proceeded with under the Borough Electrical Engineer.

Applications, stating the age and particulars as to experience of the applicant, &c., with original testimonials (which will be returned), must reach the undersigned not

later than Wednesday, the 31st August, 1898, and be endorsed "Borough Engineer."

The appointment will be subject to passing an examination by a medical officer appointed by the corporation.

The appointment will be for three years, and thereafter be terminable by three months' notice on either side.

The successful applicant will be required to take office as soon as possible after receipt of an intimation that the appointment has been conferred upon him.

Applicants residing in the United Kingdom are required to send their applications in duplicate to the London agents of the Corporation (Messrs. Ford Brothers, 14 Southampton-street, Fitzroy-square, London, W.) not later than 22nd July, 1898. A copy of the testimonials will be required in addition to the originals.

In the event of an applicant residing in the United Kingdom being selected the agent will be advised by cable, and will communicate with the gentleman appointed, who will be required to immediately proceed to Maritzburg; £50 will be allowed for passage from London; salary to commence from date of taking office in Maritzburg.

(By order)

STEPHEN STRANACK,
Town Clerk.

Town Office, Pietermaritzburg,
May 26, 1898.

THE CORPORATION OF BIRMINGHAM.

The Public Works Committee are prepared to receive applications for the appointment of Chief Road Surveyor in the city engineer and surveyor's department. Candidates, whose age must not exceed forty years, must be thoroughly qualified persons, having had active practical experience in the construction, scavenging and maintenance of roads and streets and of the various classes of pavement used therefor. They must also have had the management of large bodies of workmen, and be able to supervise the setting out and measuring up of works and preparation of estimates.

It will be a condition that the person appointed shall subscribe to the superannuation scheme, and shall devote the whole of his time to the duties of his office.

The salary will commence at £300 per annum, and rise by annual increments of £20 to £400 per annum. A horse and trap will be provided to help him to carry out his duties efficiently.

Applications, in the candidate's own handwriting, stating age, qualifications, present and past experience, together with

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

Easily and quickly laid by unskilled workmen.
Perfect alignment of invert secured.
Joint readily made absolutely watertight.
Cheapest Patent Joint in the market.

JOHN PRICE,
City Engineer and Surveyor.

The Council House, Birmingham.
June 25, 1898.

**SPILSBY RURAL DISTRICT COUNCIL.
APPOINTMENT OF SURVEYOR OF HIGHWAYS.**

Applications are invited for the appointment of Surveyor of Highways for the above district, which comprises 500 miles of roads or thereabouts, at a salary of £200 a year, inclusive of means of locomotion and all other expenses excepting office accommodation, stationery and stamps.

The Council will provide a clerk.
The person elected must reside at Spilsby, be a good accountant, have a thorough knowledge of the management of roads and must devote his whole time to the work.

He will be required to enter into a written agreement and find a guarantee in the sum of £300 for the faithful discharge of his duties, which will commence on the 1st day of October next.

Application, in the handwriting of the candidate, with copies of not more than three testimonials of recent date, must be delivered at my office not later than Wednesday, the 13th day of July next, endorsed "Surveyor of Highways."

Preference will be given to candidates who are associate members of the Institution of Civil Engineers or who have obtained the certificate of competency granted by the Incorporated Association of Municipal and County Engineers. All canvassing prohibited, and any attempt to evade this prohibition will disqualify.

(By order)
G. BEAUMONT WALKER,
Clerk to the Council.

Spilsby.
June 27, 1898.

CIVIL ENGINEER requires Junior Assistant or Improver. Must be accurate leveller and neat draughtsman; knowledge of building plans a recommendation. Commencing salary, 20s. to 30s. per week. Excellent opportunity of gaining experience in sewerage and water schemes, of which eight are now in hand.—Apply, enclosing copies of testimonials, to HARRY W. TAYLOR, A.M.I.C.E., St. Nicholas Chambers, Newcastle-on-Tyne.

TENDERS WANTED.

COUNTY BOROUGH OF BURY.

The Sewage Committee of the Corporation of Bury are prepared to receive tenders for

- (1) Brickwork,
- (2) Stonework,
- (3) Carpenter and Joiners' Work,
- (4) Slaters' Work,
- (5) Plumber and Glaziers' Work,
- (6) Plasterer and Painters' Work,

required in the Erection of Manager's House at the Sewage Disposal Works, situated at Livesey Fields, within the borough.

On and after the 7th proximo, drawings may be seen and specification and bill of quantities, with form of tender, obtained on application at the office of Mr. J. Cartwright, the Borough Engineer, on payment of 20s. each for Nos. 1 and 3, and 10s. each for Nos. 2, 4, 5 and 6 specifications, which sum will be returned on receipt of a *bonâ-fidâ* tender.

Tenders, endorsed with the name of the work tendered for, must be delivered at my office on or before Thursday, the 25th prox.

JOHN HASLAM,
Town Clerk.

Corporation Offices, Bury.
June 29, 1898.

**SWINTON URBAN DISTRICT COUNCIL.
TO PIPEFOUNDERS.**

The above Council are prepared to receive tenders for making and delivering about 520 yards of Cast-Iron Socket Pipes of 6-in. diameter, and for other Pipe Castings.

Full particulars may be obtained on application to the undersigned.

Scaled tenders, endorsed "Tender for Pipes," must be delivered, free of charge, not later than 9 a.m., Friday, July 15, 1898.

The Council do not pledge themselves to accept the lowest or any tender.

(By order)
R. FOWLER,
Engineer and Surveyor to the Council

Swinton (near Rotherham).

JANDUS PATENT ELECTRIC ARC LAMP.

Gold Medal, Hull Exhibition, 1898.

It is claimed that the Master Patents held by the Jandus Arc Lamp and Electric Company, control the arrangements which are essential in every successful enclosed arc lamp.

The Only Lamp that is trimmed without moving the Globe.
Cannot get Out of Order, as it has Only One Working Part.
No other Carbons should be used in the Jandus Lamp except those supplied by the Firm,
for which the Lamps sent out are adjusted.

JANDUS ENCLOSED ARC LAMP.

Burns 150 to 200 Hours without re-trimming.

No hissing. No danger from falling particles of Carbon.
No skilled labor required. A steady light. A great saving in cost of Carbons.
Gives the same useful light as the open arc lamp for the same expenditure of power.

Burns singly on 100 volt circuit, or 2 in series on 200 volts. When more than 200 volts exist each lamp must be supplied with automatic cutout.

**THE ENCLOSED ARC LAMP. THE ENCLOSED ARC LAMP
THE ENCLOSED ARC LAMP. THE ENCLOSED ARC LAMP**

The phenomenal success of the Jandus Lamp, which was the Pioneer in enclosed Arc Lamps, has brought a host of imitations. Users should not be put off with the cheaper lamps.

ILFORD URBAN DISTRICT COUNCIL.
TO ENGINEERS.

The Urban District Council of Ilford are prepared to receive tenders for a new 15-ton combined Compound Steam Road-Roller Tractor and Hauling Engine, and a Portable Hand-Motion Stone-Breaker. State how soon delivery can be made.

Sealed tenders, endorsed "Tender for Steam Road-Roller," addressed to the Chairman, must be delivered to me here, on or before noon, on Tuesday, the 12th inst.

The Council do not bind themselves to accept the lowest or any tender.

JOHN W. BENTON,
Clerk to the Council.

Council Offices, Ilford.
July 1, 1898.

COUNTY BOROUGH OF WEST HAM.

PRIVATE STREET WORKS.

TO CONTRACTORS.

The Council hereby invite tenders for making-up the following streets:—

- Freemantle-road.
- Haslemere-road.
- New-street, Plaistow.
- Old-street, Plaistow.

Plans may be seen, and specification, form of tender and further particulars obtained, at the office of Mr. Lewis Angell, Borough Engineer, Town Hall, Stratford, E., upon payment of £1, which will be returned upon receipt of a *bona-fide* tender.

Tenders, endorsed "Tender for Private Street Works," to be sent to my office not later than 4 o'clock on Tuesday, the 26th July, 1898.

The Council do not bind themselves to accept the lowest or any tender.

The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

As regards all work to be done at the site or elsewhere within a radius of 20 miles from Charing Cross, the contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

(By order of the Council)
FRED. E. HILLEARY,
Town Clerk.

Town Hall, West Ham, E.
June 29, 1898.

URBAN DISTRICT COUNCIL OF DARTFORD.

TO CONTRACTORS AND OTHERS.

The Council invite tenders for the execution of the necessary works in connection with the Making-up of a certain street within their district, known as Priory-lane, and for laying Artificial Stone Footways in the said street, in accordance with plans, sections and specification, prepared by their surveyor, Mr. W. Harston, and which may be seen at his office, High-street, Dartford.

Tenders, endorsed "Tender for Works—Priory-lane," must be delivered to me, the undersigned, at the address named below, not later than 12 o'clock noon, on Friday, July 15th inst.

Forms of tender may be obtained of the said surveyor on payment of £5, which will be returned to the person whose tender is accepted on execution of a contract and bond for ensuring the due carrying out of the works, and to the persons whose tenders are not accepted upon acceptance of the successful tender.

The person whose tender is accepted will also be required to provide two sureties to the bond to the satisfaction of the Council.

The contract will contain a clause providing that the wages paid to workmen employed in the execution of the works shall be those generally accepted as current for competent workmen for similar work in the district.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
J. C. HAYWARD,
Clerk to the Council.

Sessions House, Dartford, Kent.
July 4, 1898.

COUNTY BOROUGH OF WEST HAM.
TO SEWER CONTRACTORS.

The Council hereby invite tenders for the construction of about 1,200 lineal yards of Sewers, 7 ft., 6 ft. and 3 ft. 6 in. diameter, together with Penstock Chambers, Manholes and other works.

Plans may be seen, and specification, form of tender and further particulars obtained, at the office of Mr. Lewis Angell, Borough Engineer, Town Hall, Stratford, E., on the deposit of a £5 Bank of England note, which will be returned on receipt of a *bona-fide* tender.

Tenders, endorsed "Tender for Sewers," to be sent to my office not later than 4 o'clock on Tuesday, 26th July, 1898.

The Council do not bind themselves to accept the lowest or any tender.

The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

IMPROVED DRAIN CLINOMETER.

THIS Drain Clinometer, which is a thoroughly well-made and reliable instrument, is intended for the use of Builders, Medical Officers of Health, Sanitary Inspectors and others for testing the slope of drain pipes. The arc is fixed at the extreme end of the Clinometer so as to allow of a close reading and distinct graduation, and is divided on one edge to degrees and quarter degrees, and on the other edge to gradings of 1 in 20, 1 in 30, 1 in 40, 1 in 50, 1 in 60, 1 in 70 and 1 in 80. The adjustment is by means of a nut and bolt, working against a spiral spring. The "Bubble" is ground and divided. The Clinometer is made of teak and nicely finished, and measures 12 1/2 x 2 1/2 x 1 ins.

PRICE: With Electro-um Fittings, £1 7s. 6d.; With Brass Fittings, £1 2s. 6d.; With Magnetic Compass extra 2s. 6d.

A Complete Illustrated Catalogue of Drawings and Surveying Instruments will be sent post free on application. Sole Maker—W. H. HARLING, Mathematical Drawing & Surveying Instrument Manufacturer, 47 Finsbury Pavement, London, E.C.

By-Laws and the Liberty of the Subject.

By-laws made by a local authority under the Public Health Act, 1875, and by-laws made by the council of a borough under the Municipal Corporations Act, 1882, for the prevention and suppression of nuisances, are void if repugnant to the laws of England. This is expressly provided, as to the former category, by sec. 182 of the first-mentioned Act, and as to the latter category, all the provisions of that Act are rendered applicable by sec. 187 thereof as amended by sec. 23 of the latter Act. The same rule would doubtless be applied in practice to by-laws made by a borough council for the good rule and government of the borough. But are by-laws void if unreasonable? Heretofore this has been supposed to be the case, and the courts have frequently disallowed them on that ground. From the recent decision in *Kruse v. Johnson* (noted this week under "Law Notes"), however, and from some remarks of the Lord Chief Justice in the course of his somewhat voluminous judgment in that case, it would appear that this principle is in danger. According to Lord Russell, if we understand him aright, just as the sovereign can do no wrong, so it is impossible for a by-law made by a local authority to be unreasonable. In support of this proposition the learned judge referred to the safeguards imposed by the procedure necessary to the passing of by-laws under sec. 23 of the Municipal Corporations Act, 1882—viz., the presence of two-thirds of the council on their being made, and the suspension of their operation until forty days after a copy has been fixed on the town hall and a sealed copy sent to the Secretary of State, her Majesty, with the advice of the Privy Council, having power to disallow them during that period. So far as the last requirement is concerned, it is to be observed that it has no application to by-laws for the prevention and suppression of nuisances, these being expressly excepted by sec. 187 of the Public Health Act, 1875, the operation of which is preserved by and rendered applicable to the section of the Act of 1882 above mentioned. This, however, by the way. In another part of his judgment Lord Russell admits that if by-laws "were found to be partial and unequal in their operation as between different classes, if they were manifestly unjust, if they disclosed bad faith, if they involved such oppressive or gratuitous interference with the rights of those subject to them as could find no justification in the minds of reasonable men, the Court might well say . . . 'they are unreasonable and *ultra vires*.'" There may be much virtue in these "ifs," but it is rather difficult to reconcile the admission that by-laws may be thus outrageously unreasonable with the assertion that the safeguards imposed are amply sufficient to secure their reasonableness.

The particular by-law under consideration in this case, we may remind our readers, was directed against street noises, and provided that "no person

shall sound . . . any musical instrument . . . within 50 yards of any dwelling-house after being required by any constable, or by an inmate of such house, or by his or her servant, to desist." It will be observed that in order to constitute an offence under this by-law it is not necessary that any nuisance or annoyance shall have been caused. Now, there are not lacking precedents for holding that the absence of what we may call a "nuisance clause" from such a by-law makes it unreasonable and *ultra vires*, as being too wide. Not to multiply instances, it will suffice to refer to two cases. In *Munro v. Watson* (57 L.T. [N.S.], 366) the by-law was very similar in terms, providing that "every person who in any street shall sound or play upon any musical or noisy instrument, . . . without having previously obtained a license in writing from the mayor, . . ." should be liable to a penalty; and it was held to be unreasonable and invalid. Mr. Justice Cave said that "the town council have unfortunately gone far beyond the suppression of nuisances, and extended their by-law to all kinds of noises, whether nuisances or not, no discretion being given to the justices hearing the case, who must, if the by-law is good, inflict a fine . . . however musical the sound may be." The clause providing for the mayor's license was regarded by the Court rather as an aggravation than as an extenuation of the unreasonableness, because it gave him "power to legalise a nuisance and stop a thing which is perfectly innocent." Again, in a more recent case, and one noted in our columns (vol. ix., p. 217), *Strickland v. Harper*, the by-law was as follows: "No person shall in any street or public place, or on land adjacent thereto, sing or recite any profane or obscene song or ballad, or use any profane or obscene language." This was held void, both for lack of the additional words "to the annoyance of the public," and also on account of the prohibition extending to land adjacent to a street, so that an offence would have been committed if a man sang a rowdy song on his own land with nobody within earshot to be scandalised. It is true that under such circumstances it would be impossible for him to be summoned, or if summoned to be convicted. But this consideration was not taken into account by the Court, which only shows how jealously even the slightest attempted infringement of the liberty of the subject has hitherto been guarded in the consideration of by-laws. Measured by the standard applied in these two cases (not to mention others), we think it will be admitted that the by-law in *Kruse v. Johnson* must be pronounced unreasonable. Nevertheless, a specially-constituted court of seven judges have by a majority of six to one upheld it. The dissenting judge, Mr. Justice Mathew, was of opinion that it is the duty of the Court to disallow any by-law which seeks to impose a restriction on personal liberty. Of course, in a sense, all by-laws, and all laws of any kind, impose a restriction on personal liberty. But we take it that the learned

judge meant such a restriction as is not required for the protection of the liberty of others or the rights of the community, and we think it is to be regretted that his views did not prevail.

* * *

**Municipal
Engineers at
Edinburgh.**

In spite of the fact that in our last issue no fewer than eighteen pages were devoted to our report of the proceedings at the recent annual meeting of the Association of Municipal and County Engineers at Edinburgh, several papers and discussions had necessarily to be held over. These are now given in the present issue. Last week we reported the long and interesting discussion arising out of Mr. Young's paper on dust destructors. The most animated part of that discussion centred round the question of combining refuse destruction and electric lighting. Our own views on the subject have been repeatedly expressed. No one need object to utilising the heat from a destructor for the production of steam, but until the possibilities of combined schemes have been thoroughly tested exaggerated prophecies and assumptions as to what can be accomplished in this direction are certainly to be deprecated. As Mr. Jones pointed out, there is some danger at times of losing sight of what the primary purpose of a destructor must always be. Bailie Mackenzie did not mince matters either, and treated both Lord Kelvin and the famous Shore-ditch experiments with an amount of daring irreverence which evoked equal laughter and admiration. It will be seen that the bailie also took a prominent part in the discussion which followed Mr. Colam's contribution to the proceedings—another instructive paper which served the purpose of bringing a much-debated question before the meeting. Bailie MacKenzie's remarks consisted of a vigorous defence of the cable system as opposed to the overhead trolley methods. Mr. Stewart's paper elicited a brief but interesting discussion, in the course of which Mr. Greatorex testified, from practical experience, to the same favourable results of the Reeves system which have been obtained at Edinburgh. The discussion of Mr. Bruce's paper on the housing of the working classes was characterised by practical unanimity on the part of the speakers in condemning one-room tenements, and certainly they would be difficult to justify in any circumstances or for any class of population. Mr. Hooley, as reported, seems to have made a remark which must have grated rather harshly on the feelings of those of his hearers who were on their native heath and whose guests the municipal engineers were for the time being. The remark in question appears to convey the opinion that Scotsmen generally are accustomed to herding together in one room. On the other hand, it is probable that Mr. Hooley merely expressed himself rather inadequately and meant to convey something much more restricted in its application. We take it, in short, that his remark had reference merely to the particular class of people—practically confined to the towns—who are accustomed to herd together in single rooms. We have accordingly punctuated the passage so as to convey this meaning, but it will be observed that the mere insertion of a comma after the word Scotsmen would give the sentence the very widest application. But surely the herding of families in single rooms is not confined to Scottish cities. Does Mr. Hooley maintain that such a state of affairs is unknown in English cities and towns? He is on safe ground, however, in protesting against any official encouragement being given to the tendency by the erection of one-room tenements by local authorities. In the case of Edinburgh the step may have been justified by special reasons of which we are not cognisant, but on general grounds we can only regard the erection of such tenements as a grave mistake and as constituting a domestic feature almost as objectionable as the so-called "concealed" beds, which, not many years ago, were so

prevalent in Scottish dwellings. They were simply unhealthy closets or recesses, which, we are glad to know, are now being severely discouraged. The longest, the most animated, and in many respects the most interesting, discussion of the meeting was that which arose out of Mr. Cameron's paper, but we refer to this separately in another paragraph. Brief discussions took place on the instructive papers read by Mr. Wilson and Mr. Whyte. Exceptional interest attached to Mr. Newington's able paper, on account of the remarkable success which has been achieved in Edinburgh in connection with municipal electric lighting, and appreciation of the fact was not absent in the discussion that followed. Next week we shall conclude our report with some notes and illustrations referring to the works and other places of interest visited on the Friday and Saturday.

* * *

**Mr.
Cameron's
Paper.**

It is a common assertion that a discussion is frequently more interesting than the paper on which it is based. There is often some truth in such a statement, but just as often a qualification is required. The probability is against the discussion being so useful or instructive as the paper, but it is certainly more likely to be lively and entertaining. A paper is generally prepared carefully beforehand; contributions to the discussions sometimes are—and sometimes are not. Several of the contributions to the discussion of Mr. Cameron's paper bear some evidence of having been carefully thought-out beforehand. The speeches of Mr. Lemon and Lieut.-Colonel Jones may be taken as representative of the views of those who regard with little favour the claims of the new "bacterial" systems of sewage purification. A critical discussion is useful in drawing attention to the weak points of a system, but the opposition to the new methods of sewage treatment err at times in being too extreme, and open even to the charge of prejudice. Nor can we attach so much importance as Mr. Lemon does to the question of patents, or make any hard-and-fast distinction between those bearing on the public health and any others. What encouragement is there for the inventor unless he derives some benefit, and if he happens to be an official surely his claim to benefit is as valid as that of any other patentee? Our report of the discussion shows that the new methods have plenty of defenders. We are frequently told that there is nothing new about them, but Mr. Campbell very neatly disposed of this assertion. Admitting that the main principles have long been familiar, it can scarcely be asserted that they were utilised or developed as they have been in recent years, or that they were so clearly described and explained. It is by no means certain, however, that the principles in question were formerly so well understood as they are at the present day, and the bacteriologists may reasonably protest against the somewhat unfair style of argument adopted by Lieut.-Colonel Jones and others, who systematically speak as if the former claimed to have *invented* bacteria. They do, however, claim, with some justice, to have *discovered* a great deal about them. It is not necessary to go very far back in the history of sewage disposal to learn that certain effects were formerly attributed to the operation of processes very different to those which are now accepted as a rational explanation. The recent decision of the Local Government Board was undoubtedly, to a certain extent, a triumph for the "septic" system and for bacterial methods generally. The insisting upon the passing of the effluent over land, at the rate of 1 acre for every 2,000 of the population, simply implies that the time is not considered to be ripe for dispensing with such a condition, and that bacteriology is not yet considered to be sufficiently definite in its conclusions or sufficiently reliable in the examination tests available either for sewage effluents or for water supplies. But there are many indications

that bacteriologists, as Henry VIII. said of Cranmer on a certain occasion, have got "the right sow by the ear."

**Footpaths
on
Main Roads.**

Probably the Derbyshire County Council little dreamt of discovering a hornets' nest when they began to tamper with the question of the payment for improvements in respect of footpaths on main roads. The question on the surface seems small, but little things are often fraught with very troublesome results. This has been the experience of the Derbyshire County Council. The county council are responsible for the maintenance of main roads and for permanent improvements to the footpaths. The work has hitherto been done by each of the urban authorities in its own district and then charged to the county council. That authority some time ago sent out a form of contract, to be signed by the urban councils, providing that when the sum expended on the improvement of footpaths, as distinct from the cost of maintenance, exceeds £50 the repayment by the county council shall be spread over a period of ten years. A number of the local authorities flatly refused to sign the document, which became a subject of indignant protest throughout the county. The authorities met in conference last week at the County Hall, Derby, where they swarmed about the ears of the county council in a way that must have been anything but pleasant. We gather from the proceedings that up to the present time the county council have given the urban authorities 60 per cent. of the money agreed to be expended upon main roads immediately the expenditure was incurred and the balance after the audit of the accounts of the various authorities. The effect of the new proposal is that when the sum expended exceeds £50 the whole of the repayments will be spread over the ten years. This seems a hard and arbitrary line to take. Parliament imposes upon county councils the duty and burden of paying for the footpaths upon main roads, but the urban authorities do the work and pay cash down for it. Upon what principle of justice should they have to wait ten years before getting their money back again? A resolution was submitted by Mr. Fitz-Herbert Wright, the chairman of the Alfreton Urban District Council, to the effect that the county council should be asked to increase the limit of £50 to £100, below which repayments should be made forthwith, and that where the expenditure is more than £100 the repayments should be made within three years instead of ten. It is reasonable that there should be some limit to the outlay in a matter of this kind, otherwise the county council might find themselves committed to a considerable expenditure, the extent of which they might not foresee, but Mr. Wright's compromise appears on the face of it to be fair. The resolution was agreed to, and a copy of it is to be sent to the county council. The assenting authorities were Alfreton, Ashbourne, Clay Cross, New Mills, Heage, Alvaston, Brampton and Walton, Long Eaton and Wirksworth, all of which were represented at the conference, in some cases by as many as three and four members. Several authorities have agreed to accept the contract proposed by the county council for one year. These are Ripley, Matlock Bridge, Swadlincote, Darley and Fairfield.

**Rural
Sanitation
in
Lincolnshire.**

When recently investigating the causes of the prevalence of diphtheria in the rural district of Claypole, Dr. S. W. Wheaton, in accordance with the custom of the Local Government Board in conducting such inquiries, made an examination of the sanitary condition of the district. The result was to disclose a liberal share of those sanitary defects which may almost

invariably be looked for, to a greater or less extent, in rural districts. A brief summary of the sanitary requirements will be a sufficient indication of the state of affairs. Sewers are practically non-existent, and thus, if liquid refuse from dwellings is to be disposed of without nuisance or danger to health, a proper system of sewers is necessary. The greater part of the sewage from the villages discharges into water-courses, ultimately finding its way into the river Witham. These highway "drains" frequently contain almost stagnant sewage and other offensive filth, and one discharges into the Witham at a point at which many of the inhabitants fetch water for drinking and cooking purposes. Something should obviously be done to prevent such a pollution of the water-courses. Connected with the latter by drains constructed of rubble or of agricultural pipes are catchpits, made of loose stones and not cemented, and into these catchpits slop-water is for the most part discharged. No time should be lost in having these removed and properly-trapped gullies substituted. There might also be considerable improvement in the system of excrement disposal, which is at present effected by means of vault privies so constructed and situated that they endanger the purity of the water furnished by many of the existing wells, which also leave a good deal to be desired in regard to construction. A supply of pure and wholesome water is another urgent requirement, the present sources being of very doubtful purity indeed. There is, as might be expected, a plentiful absence of facilities for isolation and disinfection, and the inspector suggests that for the purpose a combination might be effected with some neighbouring district council or councils. Probably the grossly unwholesome conditions, particularly as to house drainage, revealed in connection with many of the dwellings invaded by the disease go far to explain its prevalence. Liquid refuse was found accumulated in the neighbourhood of dwellings and escaping into the surrounding soil, untrapped pipes from catchpits were found communicating directly with the interiors of dwellings, and in other cases foul water-courses were in proximity to or actually passed under dwellings. An attempt was evidently made to attach some responsibility to the Grantham sewage farm, the effluent from which passes into the river Witham, but Dr. Wheaton could find nothing to substantiate the charge.

**A Municipal
Electric Lighting
and Tramway
Scheme.**

Halifax Corporation have just completed one of the most important electrical systems in the country. The inhabitants of the town have had the advantage of a municipal lighting system for some three years, but the municipality have now completed a system of electric tramways which is operated by electricity obtained from the lighting works. It has, of course, been necessary to re-arrange the electric plant to some extent, but the alterations have consisted only in erecting continuous-current plant for supplying current to the tramway system and a battery of accumulators. The line is under 4 miles in length, but is remarkable in that the heaviest gradients in any town in this country are found there. It was said by cable experts that the only method of operating tramways in the steep streets of Halifax would be by cable, but the successful initiation and inauguration of an electrically-propelled system has falsified these views. It will be interesting to watch the future developments of the tramway and lighting system in Halifax, and to examine how far one operation will benefit the other. It is clear that the Electric Lighting Committee will obtain some immediate advantage, inasmuch as they have found a very large consumer of electricity in the Tramway Committee, but how far this will affect the future price of electricity in the borough remains to be seen.

Association of Municipal and County Engineers.

ANNUAL MEETING AT EDINBURGH.—III.

EDINBURGH: THE FORTH BRIDGE.

Last week we carried our report of the proceedings to the end of the discussion of Mr. Colam's paper on the Edinburgh tramways. Of the first day's proceedings, which so far as papers and discussions were concerned were naturally much heavier than those of the two following days, there remain only Mr. Stewart's paper and the discussion thereof, the discussion of Mr. Bruce's paper (that paper having been given in our issue of July 1st), and the annual dinner. These we now proceed to give, continuing with the report of the second day's proceeding on Friday, July 1st.

FIRST DAY'S PROCEEDINGS (continued), (Thursday, June 30th).

After the discussion of Mr. Colam's paper the President called upon the reader of the following paper, which deals with a difficult and interesting problem in municipal engineering:—

NOTES ON SEWER VENTILATION AS APPLIED TO WATER OF LEITH INTERCEPTING SEWER.

By ALEX. STEWART, A.M.I.C.E.

Mr. Alexander Stewart, ASSOC. M. INST. C. E., was educated at High School, Arbroath, and University College, Dundee. He commenced his professional training under Mr. W. G. Lamont, architect and surveyor, Arbroath, and after one year's service was attached to Mr. Alexander McCulloch, ASSOC. M. INST. C. E., Dundee, who retained him as an assistant on the expiry of his articles. While with Mr. McCulloch he gained much experience in the design of sewerage and waterworks and extensive warehouse buildings. He left Mr. McCulloch on receiving an engagement from Mr. Duncan Menzies, of Edinburgh, but was only a short period with the latter when he was appointed assistant to Mr. Cooper, burgh engineer of Edinburgh. This was in 1866. He has had a varied experience of the work of the department, and during the past seven years

has been principally engaged in designing and superintending the execution of large schemes of sewerage, road and bridge construction, and the carrying out of other city improvements under Mr. Cooper's supervision. He also holds the appointment, under the Edinburgh School Board, in Leith-walk Advanced Evening School of teacher of building construction, machine construction, and mechanical drawing, geometry, and the various art subjects. He was admitted a student of the Institution of Civil Engineers in 1866, and was elected an associate member in 1891.]

For a long series of years prior to 1889 the local authorities of Edinburgh had been extremely solicitous about the polluted condition of the river of Water of Leith. Forty or fifty years ago this river was full of fish life, but by the increase of population and dwelling-houses along its banks it had gradually become converted into an offensive and noxious stream. In addition to this, seven or eight paper and other mills along the banks in the landward district had gradually added the noxious and soda-ley washings and other offensive matters from their several works. This resulted in the accumulation of high masses of froth at the several weirs, and indeed, in certain states of the weather over the whole length of the river, which caused the stream to be unsightly and noxious to a degree. The public authority first thought of repressive legal measures, but engineering forethought came to the rescue and devised a scheme which has been carried out to the letter, and which, while it has practically restored the stream to its former pristine purity, has also obviated any diminution of water supply to the several mills and works along the stream.

This scheme, which may be of interest to certain towns in England, consisted in the catching up by an intercepting sewer of the various sewage discharges on the way. It also intercepted the mill discharges, where these could safely be put into a conduit, where caustic soda was in use. Certain depositing ponds were constructed for eliminating the material, which had a tendency to collect in the inside of the pipes and so to obstruct the sewer. In order to supply a corresponding amount of water put into the sewer, two reservoirs were increased in storage capacity to the exact equivalent to the waste liquid abstracted from the sewer. This sewer extends from low-water mark at the Black Rocks, Leith, up for some 7 miles. Its total cost was about £350,000.

It has given general satisfaction, however, and fishes are again sporting themselves in the waters of the river. In the construction of this sewer street surface ventilators were introduced. Very soon, however, the hot discharges from distilleries and breweries, commingling with the sewage, gave off such noxious smells that ventilator after ventilator had to be closed.

Instructions were given to the engineers to report on the best means of ventilating this sewer, because it was held that, although offensive smells were removed from the streets by the closing of the ventilators, there was still risk of sewer gases finding their way into the houses in the neighbourhood. The erection of tall shafts was considered, but on account of

the undulating nature of Edinburgh, which would have necessitated the tops of the shafts being under the neighbouring houses, this scheme was abandoned. The engineers thereafter considered the use of chemical agency in the destruction of these smells and gases. They opened communication with Reeves' Chemical Sanitation Company, Limited, formed three experimental manholes fitted for the introduction of their chemical apparatus, and watched the result. These manholes were situated in populous districts. They had, as explained, been closed because of the complaints of smells.

The opening of the manholes and the application of the chemical apparatus was set going. During the months the experiment lasted frequent observations were taken of the results, and as no complaints were received and the experiment was so successful the engineers recommended the adoption of the system, and the commissioners entered into a contract for the supply and fixing of other fifty of these apparatus. The manholes have been altered, as shown on the accompanying diagram, so as to allow the apparatus to be placed in a recess clear of the manhole shaft. This arrangement gives free access to men entering or leaving the sewer. These apparatus have been fitted up and have been in operation during the past month, and from careful observations they seem to answer as successfully as the three experimental ones started last year.

It is probable that many of you are unacquainted with the details of this system, and a description may be interesting. Two chemical-ware vessels are placed in a recess formed in the manhole. The larger vessel contains a chemical mixture called by the proprietors "Reevozone," and the smaller vessel contains strong clear sulphuric acid. These chemicals are caused to mix continuously, meeting on the ware drip, the result of their mutual reaction being the formation of sulphurous acid gas, oxygen gas, permanganic acid and soda sulphate. These gases purify the foul air they come in contact with, whilst the oxidising solution falls into the sewer and has a beneficial effect on the sewage. The water supply for mixing the Reevozone is taken from the water main. Where it enters the manhole a drop stop-valve is fixed to the pipe, which when the pressure from the main ceases closes, and so entirely prevents air being sucked into the main. There is also another valve and a syphon of water about 3 ft. deep, which completely locks the pipes against any back pressure. Beyond the syphon a branch pipe with valve and spray is fitted, the discharge of the spray being thrown on to the three pots on which the chemicals fall after the gases are given off. The result of the water striking against the pots is that a fine spray or mist of the chemicals is produced, which in falling into the sewer purifies the gases coming up the shaft.

When the apparatus were first started a number of tests were made at the various manholes to determine the amount of air leaving or entering the sewer. The dates on which these tests were made were 30th and 31st May, 1898, and from the following table it will be noticed that the results give a curious condition of ventilation:—

Observations and Readings of the Ventilation of the Sewers of Edinburgh and Leith on May 30 and 31, 1898.

Name of Street	Inlet, feet per minute.	Outlet, feet per minute.	Weight of Air at Road Surface, grains per cubic foot.	Weight of Air per cubic foot.
London-street, East End	—	62	542.06	542.06
London-street, Cochran-terrace	—	448	511.09	512.06
Mansfield-place	—	496	544.06	512.06
Comely-bank	—	186	551.36	545.53
Great King-street	—	837	536.16	542.06
Donno-terrace	—	3425	536.16	542.06
Moray-place	—	415	536.16	538.60
Nelson-street	—	739	532.84	536.33
Dundonald-street	—	310	537.45	537.45
Great Stuart-street	—	1317	535.16	534.00
Randolph-crescent	—	310	535.16	539.75
Molville-street	—	992	535.16	538.66
Walker-street, opposite William-street	—	372	532.84	538.66
Walker-street	—	930	535.16	538.66
Chester-street	—	992	535.16	536.30
Rothsay-terrace	—	744	535.16	536.30
Palmerston-place	—	186	535.16	536.30
Eglinton-crescent	—	372	535.16	532.80
Comely-bank (West)	—	186	551.36	545.53
Raeburn-place	—	737	549.89	545.53
Deanhaugh-street	—	446	544.36	539.75
Ann-street	—	1320	539.75	537.45

The lowest record is in East London-street (east end), which showed 62 cubic feet per minute leaving grating; and the highest is from the grating in Donno-terrace, which registered an outlet of 3,425 ft. per minute, pointing to the necessity for further ventilation of the adjoining sewer. At this time a slight smell was observed, which showed that the volume of gases was greater than the chemicals, as applied, were able to purify. Provision, however, has since been made to meet this extreme case also, as explained below. Undoubtedly the temperature of the trade refuse discharged into the sewers is one of the chief factors in producing this

extraordinary movement of air. Some time ago experiments were made on the temperature of the trade refuse discharged into the sewers, and the highest temperature reached was 135 deg. Fahr. When operations were being carried on in the intercepting sewer in James-place, Leith Links, which is 925 yards or thereby from mouth of outfall, on the 14th June, it was found that the temperature of the air in the sewer was as high as 75 deg., whilst that on the surface was only 60 deg. This shows the difficulties met with in dealing with sewer ventilation in a district where trade refuse is allowed to freely enter the sewers.

From the results given in the table above, and from other observations, Mr. Reeves suggested to the engineers that these results were produced by the wind and tidal action at the outfall, and proposed to cut off the gases at the highest point to which the tide rises in the sewer—viz., James-place, his idea being to purify and wash the whole of the gases in

THE REEVES APPARATUS.

this length of sewer and prevent the gases above the tidal level being forced up into the city by the action of the tides. The process suggested is as follows: A chamber would be built at the highest point to which the tide rises. The air space above the sewage would be shut off by a floating trap, and the sewer air, displaced by the rising of the tide, washed through the chemicals as shown on the diagram, the purified air escaping through the gratings. Whilst the tide was ebbing and the sewage returning to its normal flow the air space would be filled with fresh air at each tide. He also suggested that a second purifying apparatus should be fixed at the base of the shaft nearest Leith Links. An experimental trap has been placed at the point suggested, and the tidal action on the air of the sewer is entirely removed, and the result of observation taken at the grating where the trap is situated shows that the inlet exactly corresponds to the vacuum caused by the lowering of the sewage.

The following is a statement of the cost of introducing the fifty-three apparatus:—

Three experimental apparatus at £15	£ 45	0	0
Fifty apparatus, as per contract, at £10	500	0	0
Altering fifty-three manholes to suit apparatus, at £7	371	0	0
Total cost	496	0	0

The company have contracted to provide the necessary chemicals for manholes in series at the rate of £2 each per annum, and for detached manholes the charge is not to exceed £3 per annum. The company are under obligation to deliver chemicals here and maintain constantly a sufficient supply for three months in advance. Facilities will be afforded any gentlemen desirous of seeing the system in operation, and comparison may be made between manholes fitted up with apparatus and those which are not.

DISCUSSION OF MR. STEWART'S PAPER.

Mr. J. LEMON (Southampton), in proposing a vote of thanks, said the paper raised a very important question as to how far manufacturers and others were to be allowed to discharge any noxious refuse into the public sewers. He had to deal with a case where the liquid refuse from breweries was about one-third of the total sewage, and he need not tell them that under such circumstances the sewage was very difficult to deal with. He was of opinion, and they took legal advice upon it, that the brewers and others who committed this

the whole time. Following those experiments he was induced to make some experiments with ventilation by means of shafts, and the results of his experience, which were published in THE SURVEYOR, showed that the system was a great mistake, the majority of the columns not acting at all. He persuaded the corporation to take down two of the columns and put in a similar apparatus to that on the low-level sewers, and they had no further complaints, thus proving that the system was a success.

Mr. BAKER (Middlesbrough) remarked that this question was of much importance to those of them who lived on tidal rivers. In Middlesbrough they were much troubled with complaints of smells from the sewers. He wished to know whether they had any galvanising works, the refuse of which passed into the sewers, and also whether, now they had adopted this arrangement, they kept the grids on the manholes closed or opened.

Mr. PICKERING (Nuneaton) said he noticed that it was necessary to utilise water from the water mains for the sewers. As a rule he thought those processes of ventilation

THE REEVES APPARATUS.

nuisance should be compelled to purify their refuse at their own works before sending it into the sewers. In Edinburgh the local authority had been put to the expense of £350,000 for the intercepting sewer which had been rendered necessary by paper mills and other manufactories, and he could not see the justice of the expenditure. With regard to smells from manholes, they sometimes had complaints of smells which only existed in the imagination of those who made the complaints. He had a case of a gentleman who made complaints about the manhole opposite his house, and who 'gammoned' the Health Committee into putting in some charcoal trays. The charcoal trays were put in, but the charcoal did not arrive, and on the first opportunity he mentioned that the charcoal answered admirably, though there was not an ounce of charcoal in the manhole.

Mr. GREATORIX (West Bromwich) referred to a similar experiment which he was the first to carry out on the same system at Edinburgh. About five years ago he introduced a system for the entire area of the low-level sewers, and, watching it continuously, he never had any complaints during

which required mechanical aid were not to be preferred if something could be got more simple and requiring less attention. At Nuneaton they were compelling the owners of all new streets to put up ventilating shafts, and found them very useful. They had a very offensive sewage to deal with, and by allowing the street grids to act as inlets and the shafts as outlets the nuisance was done away with. Another process which had been brought before them was the destruction of sewer gas by the consumption of coal gas. They had some of these gas destructors at work as an experiment, but they found that if the gas light went out the system of ventilation was made very much worse. He did not think there was an engineer who had put up these gas destructors who did not find them go out and leave the sewers unventilated.

Mr. PLATT (Rochdale) regarded it as somewhat strange that they had no power in Scotland to prevent refuse water being put into the sewers at so high a temperature. In England the highest temperature at which it could be discharged into the sewers was 110 deg. Sewer ventilation required human agency to adapt it to the climatic conditions, and on that

account he did not think it possible to devise any automatic system which would be satisfactory.

Mr. SMITH-SAVILE (Darwen) said he was once connected with a town where they had six times the ordinary flow of sewage, owing to brewery refuse. Consequently their complaints were very excessive, and they had to reconstruct their sewers and get a farm of 500 acres, at a cost of £250,000. Wherever they had a staple trade they could not rigidly enforce the law, and they frequently had water discharged into the sewers at 212 deg. He might say they had one of these sewer gas destructors, and it frequently went out, but they never had any complaints afterwards, though it was not working.

The PRESIDENT said that, without entering into the discussion, he could not help making some remarks as to ventilating by means of upcast shafts. He had ventilated upwards of 50 miles of sewers on that system with absolute and complete success. With respect to Keeling's gas destructor, he might say he had obtained a better velocity with an ordinary shaft. It was very expensive and altogether unsatisfactory.

It was agreed that Mr. Stewart's reply to the points raised should be forwarded to the secretary for inclusion in the "Proceedings."

The first day's proceedings, so far as regards papers and discussions, concluded with Mr. Bruce's instructive paper on "Housing of the Working Classes Act as worked out in Edinburgh." The paper was given in our issue of July 1st. The following is the

DISCUSSION OF MR. BRUCE'S PAPER.

Mr. C. JONES (Ealing), in proposing a vote of thanks to Mr. Bruce, said that as the question of the housing of the poor was a permanent one, the information contained in the paper was of importance to them. Mr. Bruce had done good service in bringing the question in so explicit a manner before them.

Mr. CAMPBELL (Canterbury), who remarked that he knew something of the social conditions of Edinburgh, wished to know if there were any restrictions as to the number of persons who should occupy these one and two room dwellings. He noticed that the cost worked out at £180 for the one-room tenement and £217 for the two-room tenement, which seemed a very high price for houses of such a small character. They were accustomed to get a three, four or five room dwelling for £200, ending out at a cost of 4½d. per foot.

Mr. W. H. SAVAGE (East Ham) considered that it would be interesting to know how this scheme worked out financially, taking into consideration the cost of the area cleared, interest and sinking fund, &c., and whether the corporation were making the 7 per cent. interest of which they heard so much that morning. He objected to the one-room dwellings, as it did not seem a proper thing to have a family living and sleeping in a single room.

Mr. WIKE (Sheffield) wished to know whether these dwellings were approved by the working men. In Sheffield he was clearing 5 acres for artisans' dwellings, and they were spending £80,000 or £90,000 on a scheme to house 700. The fear was that if they put up these model dwellings they would not be occupied. Yorkshire men, and Lancashire men too, were averse to having a number of families under one roof, and preferred to have their own houses. Some time ago they built a number of cottages, which they were letting to pay 3½ to 4 per cent. When the plans were sent to the Local Government Board they were sent back because the Board said that the people in the bed-room would smell what was being cooked in the kitchens, and the answer they returned was that the people living in those houses would be very pleased to smell anything.

Mr. YARBICOM (Bristol) asked whether the author of the paper had included the whole of the expenses in connection with the purchase of the land or merely the building, as he considered the cost given rather high.

Mr. E. P. BOOLEY (Nottingham) said he would like the advocates for the erection of huge flats to go to Nottingham and look round there, as he believed the beautiful and artistic buildings put up there would serve as an example and warning to all of them. About twenty years ago the town, at a cost of £78,000, erected certain buildings. Two of the blocks had never had a single soul in them, and one of them had now been pulled down. These buildings might do for Scotsmen who were accustomed to living in one room, but they would not do for England, where the people would not be herded together in this fashion. When they considered that the Local Government Board were spending £200 a bed on inmates, they ought not to object to their spending £200 to £300 on houses for sensible people to live in.

Mr. McBRAIR (Lincoln) said they had had a scheme before the Local Government Board for six months. After it had been in possession of the board for three months they returned it, saying that unless they made certain alterations they would not consider it. They insisted, among other things, on a fireplace in every bed-room, upon the dividing walls between the two houses being 9 in., that the street should be widened a further 5 ft., and the staircases of the houses ventilated. He objected to a good many of their requirements, and the local papers had taken the matter up

and criticised the Local Government Board's demands. He altered the plans to meet some of the requirements, though by no means all of them, and at last they sent down to say they would hold an inquiry, but it had not yet been held. There did not seem to be any disposition at the Local Government Board to help on the scheme, and he informed the Board that if all their requirements were insisted upon no doubt the corporation would reconsider their decision and not build the cottages at all.

Mr. PATON (Plymouth) said he considered the Local Government Board were perfectly right in insisting upon local authorities showing regard to and carrying out their own by-laws. The local authority should set an example in that respect, and they had no reason to object to the Local Government Board taking up that position. In Plymouth they were going to displace 800 or 1,000 people, and the Local Government Board compelled them to buy land in the outskirts of the town to build houses to accommodate these people. That did appear to act harshly upon the local authority if it was insisted upon to the letter. People were displaced from the densely-populated portion of the town, but they found artisans going to occupy the houses which were intended for the displaced population. In Plymouth they were clearing 3½ acres, with a population of 1,000 people. It was an old part of the town, with streets 18 ft. wide, and after pulling down the houses and widening the streets they could only provide for 500 people, so there would be nothing unreasonable in asking them to provide houses for the remaining 500 people in the suburbs. The houses were on two floors, and each floor was a separate tenement; and the only difference was that the tenant of the ground floor had access to the yard. For all practical purposes they were separate houses, and the price had cubed out at 4½d. per foot. The rentals they were getting were not sufficient to pay interest on loans and sinking fund, and if that took place with a scheme on land purchased at £500 per acre, what was going to happen with property in the centre of the town bought at very much higher than its real value? With the 3½ acres the purchase of the property cost them £30,000, and they estimated that the scheme altogether would cost £70,000, and in that case there was bound to be a very considerable charge upon the rates. That presented a very awkward problem to a local authority. Why should corporations build houses and compete with the builders out of the pockets of the rate-payers? There was another question which affected the local authority. Where they had a considerable area dealt with in that way the tenants had a very considerable influence at municipal elections, and when candidates were canvassing for municipal honours they extorted all kinds of promises as to reduced rentals, &c.

Mr. TERRELL (Greenock) said that they were the first authority in Scotland to adopt the Act. They had actually to pay for 3½ acres of land £126,000, and a further £75,000 in the erection of dwellings. They began with a rate on the owners of 3d. in the £1, and they found that, even at the present day, they were compelled to raise a rate of 5d. in the £1, notwithstanding the rentals they were receiving from the property.

The vote of thanks was then accorded to the author, and the meeting adjourned.

THE ANNUAL DINNER.

In the evening the members of the association dined together in the Royal Hotel, under the chairmanship of Mr. O. Claude Robson, the president. The "croppers" were Mr. John Cooper, the burgh engineer, and Mr. W. H. Harpur, Cardiff; and the company also included Bailies Pollard and Sloan, Dean of Guild Miller, Mr. Thomas Hunter (town clerk), and Mr. F. A. Newington, electrical engineer.

After the loyal toasts had been proposed by the PRESIDENT, Bailie SLOAN gave the toast of "Prosperity to the Association of Municipal and County Engineers." He thought they would be highly gratified, he said, to find with them that evening the father of the association—Mr. Louis Angell, West Ham—and it must be equally gratifying to him to find that the child which was born in 1873 had come into its manhood and was flourishing so well. He understood the association was making progress year by year. He was old enough, however, to remember when the questions of ventilation, drainage and water supply did not bulk so largely as they did now in the minds of the community; but he was afraid that the community had hardly realised their indebtedness to an association such as this for pressing on these matters, which had so much to do with reducing the sickness and death rate of their cities. In Edinburgh they were fortunate, indeed, in having such an esteemed burgh engineer as Mr. Cooper. As magistrates they were very pleased to meet with this association, and to know that they were not going to confine themselves only to England, but had come to Scotland, and also were trying to renovate Ireland.

The PRESIDENT, whose uprising was greeted with unanimous and continued applause, in responding to the toast said he could scarcely credit that it was only twenty-five years ago when he assisted in a very humble manner in the formation of the association. It then had a nucleus of some ten or twelve members, and he little thought that he should have had conferred upon him the distinguished position of

president of an association with a roll of 900 members, many of whom represented important towns in the United Kingdom.

It was increasing in numbers, and, he was glad to say, in prosperity, usefulness and influence. They were especially glad to find accessions to their ranks by the election, at the council meeting that morning, of several Scottish members. He hoped that after the Edinburgh meeting they should have a strong Scottish contingent to advance the fortunes of the association. Another subject of congratulation was the large number of graduates that had been admitted during the year. He thought that showed the ever-increasing popularity of the examinations, which were perhaps the most useful work performed by the association. He thought, also, it gave evidence of the extraordinarily rapid strides that had been made in the education of the municipal engineer during the last thirty years. At the present time there was scarcely an office in the country that did not possess one or more graduates of the association who had passed the qualifying examination entitling them to practice as municipal engineers. What a different state of affairs from thirty years ago. In those days it was no uncommon thing when reference was made to a surveyor to hear asked what was his trade. He believed even an ex-policeman was in those days considered eminently qualified for the office. (Laughter.) Recent legislation and the efforts of the association enabled him to say that there were now very few towns that did not possess a duly-qualified surveyor. He trusted that the association's examination, so important to the profession generally, would extend, and that the day might come when no municipal engineer would be appointed without holding a qualifying certificate from the association. He hoped by that time they would possess a royal charter. (Applause.) On the importance of organising district meetings, he remarked that some of the most interesting and instructive meetings were held in small towns, and it was not necessary to have particularly technical or abstruse papers read at them to ensure their success. In small towns there could be such works which were most interesting and instructive to members, and in this connection he recalled the statement made by the late Joseph Gordon, chief engineer to the London County Council—one of the best of men and ablest of engineers—that he never attended any single district meeting, however small, without coming away with some useful information which he had not possessed before.

Mr. J. PATTEN BARBER (Islington) gave the toast of "The Municipal Institutions of the Country," remarking that perhaps he had been selected to propose it on the ground that those who looked on saw most of the game. It might be supposed that he, as one who looked on, was in the best position for passing an opinion on the municipal institutions of the country. Probably that which was dearest to a subject, next to the national government, was the government of the particular locality in which he lived. He thought the principle upon which this was founded was distinctly a good one. It had brought out some of the best men, and, as a proof that it had worked well, he noted that increasing powers were being given by the legislature to local authorities. The time was when their energies were chiefly devoted to the making of roads and of sewers and drains, and their now devised wider schemes, whereby the intellectual and moral parts of men were improved. He believed that our municipal institutions were better to-day than ten years ago. They were not yet perfect, perhaps, but they were increasing in ability, morality and straightforwardness. It was to be regretted that politics should be brought into municipal elections and that sometimes local boards were arenas for political gerrymandering. He could not help thinking it would be far better to select men who were noted for their integrity, ability and fairness, apart from whatever political party they might belong to. In Edinburgh they had on the council some of the citizens of whom they might feel proudest. He coupled the toast with the name of Bailie Pollard, convener of the Public Health Committee. If he were a type of the Edinburgh citizen, that city must be a delightful place to live in (Applause).

Bailie POLLARD, whose name was already familiar to municipal engineers in connection with his admirable monograph on the municipal government of Berlin, said he had felt particular pleasure in being introduced to Mr. Barber, as that gentleman came from a district where they once had a bailie's daughter. All who could throw their memories back would agree that within the last thirty years enormous strides had been made in the condition of municipalities in this country. If they, for example, took Edinburgh, they would find that within that period very great improvements had been made. Thirty years ago the mortality of Edinburgh was 26 per 1,000. They were satisfied now with a mortality of 17 per 1,000, and they would be more satisfied if it were 14 per 1,000. A reduction like that in the death rate of a city with a population of 300,000 meant an enormous saving of life in the course of a year, and, if it was due to one thing more than another, it was due in Edinburgh, as elsewhere, to sound sanitary engineering and to the work and brain of the men who were represented by the Association of Municipal Engineers. He agreed with Mr. Barber in his remarks about the introduction of party politics in municipal affairs, and he hoped that the elimination of the political element in municipal elections throughout Scotland would spread. He thought also it had more need to spread throughout England. He favoured the

sending more frequently of deputations from municipal departments. He would like to see introduced the practice of departments of sanitary and public health, of streets and buildings, or of street cleansing and lighting, sending forth on voyages of discovery to other cities and countries representative members, together with the permanent officials. That was a practice liberally followed on the Continent, and with immensely satisfactory results. He thought it was incumbent upon all of them, whether in the position of members of the corporation or of permanent officials, to have before them the ideal municipality, a municipality—if they were to take, for example, the one in which they were then situated—in which there would be no slaughter-houses within the municipal bounds; in which there would be no cattle markets, and consequently no cattle driven through the streets; in which there would be no cow byres or sheds; in which the milk supply would be all not town-fed milk, but country-fed; in which the scavengers would not be allowed to go about on wet days without overalls; a municipality in which there would be no houses for the poorest people that the sunlight could not reach and that had not enough cubic space to provide a sufficient quantity of pure air for each individual; and a municipality in which every citizen, if he observed the ordinary laws of health, would have an equal chance with every other of living the whole length of his days. All the work which they would do, if they kept such an ideal before their eyes, would tend towards that end (Applause).

Mr. CHARLES JONES (Ealing) proposed the toast of "The Visitors," to which Mr. HUNTER, the town clerk, replied, referring in his speech to the energy and ability of Mr. Cooper, the burgh engineer, who constantly helped them out of difficulties by his wonderful fertility of resource. Knowing, as he did, the work which Mr. Cooper was carrying out in Edinburgh, he rejoiced to think Mr. Cooper met at these municipal engineers' meetings others who occupied similar positions in other towns and who were able to interchange experiences with him.

Mr. YARBICOM (Bristol) having proposed the toast of "The Press," which was responded to by the editor of THE SURVEYOR,

Mr. ANGELL (West Ham) submitted "The Secretary." Mr. Cole, he said, had worked so devotedly in the interests of the association that they had come to regard him as one of themselves. They now had members in all parts of the world—at Cape Town, Johannesburg, Hong Kong, Kurrachee, Penang, Sydney, Shanghai and other places abroad. In addition to their corresponding secretaries, they had honorary district secretaries, and to all these gentlemen their cordial thanks were due.

Mr. COLE, who was warmly welcomed, responded. He had been struck, he said, with the words of Bailie Pollard as to the value of visits of members of the association to one another's works, learning as they went from place to place, to the great benefit of the authorities they served. In his travels in Sydney, Melbourne and elsewhere the association, as represented by him, was, he could assure them, most warmly received and welcomed. Sydney, as an example, had actually sent their surveyor home to England to acquire facts of use to his municipality, and he thought this had not been altogether unconnected with his (the speaker's) visit to Sydney. He could not sit down without offering his congratulations to the President, in whom he had had for many years a personal friend. He hoped the association would go on and prosper, and would take its place among the foremost scientific societies of the day.

Mr. PICKERING (Nuneaton) also briefly replied, explaining that he imagined he had been called upon as the youngest of the honorary district secretaries. He had attended every meeting of the council, and would continue to do all he could for the association.

It should be added that there were connected with the dinner some local features which lent the charm of variety to the usual attractions of these annual functions. On assembling the President and guests were played into the dining-room by a stalwart piper of the Royal Scots. Hotch potch, Tay salmon and Scots' haggis were among the dishes included in the menu, the entry of the last also being honoured by the weird music of the pibroch. Picturesque, too, was the perambulation of the room by the same stalwart piper, his halt by the President's chair, the ceremonious presentation to him by the President of a draught of "the wine of the country"—and the celerity with which the barley brew was disposed of. By special request, "Cook o' the North" was one of the tunes which delighted the ears of those who love the pipes. Mr. James Galloway, the vocalist, was also an appreciated feature of the musical arrangements.

SECOND DAY'S PROCEEDINGS

(Friday, July 1st).

On the resumption of the proceedings on the second day the business of the meeting commenced with the reading by the secretary, in the absence of the author, of the following paper:—

NOTES ON BACTERIAL TREATMENT OF SEWAGE.
By DONALD CAMERON,
City Surveyor, Exeter.

It is but little more than a decade since Dr. Dupré predicted that the future methods of sewage disposal would be mainly biological. The statement received little attention at

the time, except from those who thought fit to ridicule the opinion, and it must now be gratifying to the genial doctor to find the measure of success that has already attended this mode of rendering sewage innocuous, especially now that this form of treatment has obtained a nodding acquaintance with the Local Government Board, and that a Royal Commission has been appointed to inquire into the whole question. The appointment of this commission has, no doubt, been brought about by the advances in bacterial treatment and the study of the subject, particularly by medical men, in whose domain bacteriology properly lies.

In Britain the work done in gaining a knowledge of the best methods for the disposing of sewage has been confined to individual effort by individuals who could not be expected to combine all the experience or training necessary for providing the conditions required for the solution of the problem, and, with us, the law of the division of labour has not been prominent hitherto in dealing with this question. The American experiments have, the author thinks, shown nothing clearer than the necessity of combined qualified whole-time work in attacking a question of such extreme complexity. The published contributions to the subject in this country are very much like the oft-mentioned map of Africa of our school-days: each contribution forming, no doubt, a survey of part of the whole, but in each case very independent, extremely disconnected, and incomparable; and whether the blank spaces are marked "unknown" or not, they are there all the same, and this, in the author's opinion, is true of the work of each department into which the sewage question could be divided.

It has already, however, been demonstrated beyond a doubt that by bacterial treatment (a) domestic sewage can be rendered perfectly innocuous and as clear as spring water without the necessity for using a grain of chemicals, (b) that some of the foulest trade sewages in the country are equally amenable to this treatment. To gain any desired degree of purification, in both cases, is only a question of filtration, after the sewage has been dealt with so as to render filtration practicable. To gain this result the economy of the system, both in capital and revenue expenditure, is, after the experience of recent years, almost incredible, but more especially in the revenue expenditure. In the first place the cost of precipitation or use of chemicals is removed, and in the second this purification can be accomplished by a filtering material frequently to be obtained for the cost of removal.

Not the least of the advantages of the bacterial system is practically the removal of the sludge difficult and the attendant expense. After one year and ten months' working at Exeter, and dealing with a flow averaging 54,000 gallons per day, the tank shows no sign of requiring the removal of the deposit, and the author is watching with interest how long it will be before any of it has to be removed, as he proposes to work it to its utmost limit. This tank deposit gives the same characteristics now that it showed from the first, that most peculiar to it being its finely divided condition.

For one year and eight months of working there was no provision for arresting the minute particles of the deposit coming away in the tank effluent, and which were deposited on the filter surfaces. There is now provided, at the end of the tank, a channel for the deposit of these particles, and, although not sufficiently long under observation, there is an apparent reduction in the number in the effluent. Obviously the freer from suspended matter the effluent is the more independent of attention the filter surfaces will be, and that is a condition worth attaining. It is a point gained if works require no attention for days, still more so when they can take care of themselves for weeks, and the author has no doubt it is possible to design works that will require no attention for years.

One of the most notable points observed in the Exeter tank has been the hitherto unrecognised energy stored in sewage, as evidenced by the production of marsh gas. With even the limited decomposition which the sewage undergoes the amount of gas evolved has not, the author thinks, been suspected. The large quantity of matter that must be converted into this condition explains some of the discrepancy shown by analysis.

The permeating power of the gas is another, to the author, new feature. The concrete arch of the tank is at no place less than 6 in. thick, that being again covered with 9 in. of soil; but the most delicate instruments failed to show any pressure in the tank, and it would appear as if it passed as easily through the concrete and soil as through an open pipe. Attempts to estimate the quantity evolved by drawing off into gasholders had therefore to be abandoned. Another way of estimating was tried. A metal cone of nit area, provided with an aspirating arrangement, was immersed in the liquid, and it was thought that absolute results could be obtained; but with quick variations, ranging from 130 c.c.s. to 4,140 c.c.s., it soon became apparent that only extended tests would give an estimate of the amount produced. We have thus continued in its products the only constant characteristic of sewage—viz., its variableness.

The works and public path adjoining at Exeter have been lit with the gas and incandescent mantles. The author has not had more than ten such lights burning at one time, but it was apparent, even under the conditions of leakage already mentioned, that more than twice this number could be kept constantly alight, and this estimate was made during the cold,

wet weather of last winter. The gas is innocuous, and can only be detected ordinarily by applying a light.

The filters at Exeter have undergone another winter's work without any diminution in their powers of purification. As already mentioned, there were no means provided for preventing the humus from passing on to the filter surfaces, but, notwithstanding this, the depth of filtrant that has been scraped off since the filters were set to work is less than an average of 2 in. The greatest accumulation of humus takes place near the distributing channels or in the immediate vicinity of the outlet of supply pipes, and, curiously enough, the filters with the finest top layer have had less removed than those with coarser surfaces. While the life of a clinker filter must be a very long one, common sense tells us that the less straining it has to perform the longer that life will be and the less attention the filter will require.

The automatic gear upon which the efficiency of the filters depends has worked without a hitch, entirely dispensing with manual labour. Although the work of filtration at Exeter is apparently less than at other works, the costly washing of the filtrant is entirely dispensed with, and it is but false economy to provide works entailing heavy annual charges. When it is understood by local authorities that an engineer is justified in expending in capital outlay thirty times any maintenance charge that can thereby be saved present ideas will undergo a change.

The importance of having complete data of the sewage discharge of any district to be sewered—in which work may be included the disposal works—cannot be too strongly insisted upon. The engineer should have in graphic form the characteristic flows during dry weather and during different rates of rainfall. This is as necessary for setting that Cinderella of sewage schemes—the storm overflow, so essential and so much kept in the background—as it is for designing the works for disposal. The collection of the necessary data is a tedious operation, but without this one is working in the dark.

In concluding, the author would claim indulgence for these notes, thrown together, as they have been, when it was impossible to give them the thought and time that a paper for your attention deserves.

DISCUSSION OF MR. CAMERON'S PAPER.

MR. GREATORIX (West Bromwich), in proposing a vote of thanks to Mr. Cameron for his paper, expressed regret that he was not present to take part in the discussion, because no doubt there were many members who would like to ask questions upon it. He was afraid he could not add anything new to what had already been brought out on the question, but he was in a position to tell them that he had prepared a scheme for dealing with the sewage of West Bromwich at the rate of about 2,000,000 gallons a day on the identical lines of those at Sutton. The scheme had been adopted by the council, who decided to have a portion of it put down and give it a trial for six months. Application was made to the Local Government Board about seven or eight months ago, and on the morning he left West Bromwich a letter was received from the Local Government Board sanctioning the scheme on certain conditions. The conditions were similar to those at Exeter, and provided that the effluent must be run over a certain area of land. The Board gave them seven years for the repayment of the loan, but if in the next three or four years the scheme was a success they would be prepared to increase the period for the repayment of the loan to the ordinary length of time granted for loans on sewage works. That decision appeared to be in the right direction, because it showed that the Local Government Board was taking up the question, and he thought the result of the inquiry by the Royal Commission would be to adopt biological treatment to a large extent. One very distinct point laid down by the Local Government Board was that there should be no outlet to the stream from the proposed filter-beds; and to make certain that there were no outlets he had to send a detailed drawing showing how the effluent would be taken from the filter. They could congratulate Mr. Cameron on having his large scheme sanctioned by the Local Government Board, even though the effluent had to be run on to the land. To his mind (Mr. Greatorix's) it did not matter if they had to run the effluent on the land, because it made the system doubly sure in its work. He hoped to be starting his works presently, and as soon as they were in a condition to make it worth while for the members to visit West Bromwich and see the system in operation, and dealing with sewage largely mixed with manufacturers' refuse, he would be pleased to arrange a visit.

MR. J. LEMON (Southampton), who seconded the vote of thanks, said he should have much preferred that Mr. Cameron had been present, so that they might have discussed it more fully. The paper only gave a brief outline of what was being done at Exeter, and he did not think anyone could understand the working of the process unless he had seen the works in operation. He visited Exeter with the medical officer of his town, and by the kindness of Mr. Cameron they took samples of the effluent from the septic tank and there was from the filter; and the analyses showed that there was a very little improvement from the septic tank, in fact, the sewage was rather worse than before, but there was a very decided improvement from the filters. Mr. Cameron stated that domestic sewage could be rendered perfectly innocuous and as clear as spring water without the necessity for using

a grain of chemical. They all agreed with that statement; he thought they knew that years ago. He put in a filter in 1878 for dealing with domestic sewage, and after the sewage had passed through that filter it was put on to about 6 acres of land. That 6 acres of land was leased by the corporation to a man at so much an acre. He wrote a letter to the council complaining that he had contracted for sewage to be delivered on the land, and they were sending nothing but pure water. The result of the letter was that the corporation abandoned the filter and put the crude sewage on the land. There was no difficulty whatever with the proper treatment of domestic sewage in producing a clear effluent. When they came to the second statement, that some of the foulest trade sewages of the country were equally amenable to this treatment, he disputed it altogether. It was all very well to deal with domestic sewage, but if they had to deal with some of the trade refuse which their friends in the Midlands had to deal with it was a very different matter altogether. Trade refuse meant the use of chemicals, and the right sort of chemicals. He was pleased to hear that one town had appointed a chemist to be constantly on the works, to deal with the varying qualities of the sewage as it came down to the works. He hoped to see the day when there would be a chemist at every large sewage works which had to deal with difficult trade refuse, as he was certain that such an appointment would mean the saving of his salary in a very short period of time. Then there was the statement as to the saving of capital expenditure. He was not quite convinced about that. It appeared to him it was a question of area. If they worked out what was proposed to be done by that system they would find they could not do with less than an acre of land on which to filter 1,000,000 gallons of sewage. Well, in a large town that was a big order and demanded a considerable expenditure of money. Then, again, if they had to pay Mr. Cameron or his syndicate 30 per cent, it still further increased the expenditure. The opinion he formed of Exeter was this—that to a certain extent it was a very small experiment, from which no definite results could be obtained. The septic tank was really their old friend the cesspool in another form. As regarded the filters, he thought they were beautifully designed, but he did not agree with the way in which they were working, because a filter required more rest if they were to get a good effluent. There was another point to which he wished to draw attention. Mr. Cameron stated that after a year and ten months' working, and dealing with a flow averaging 54,600 gallons a day, the tank showed no signs of requiring the removal of deposit, and he was watching with interest how long it would be before any of it had to be removed, as he proposed to work it to the utmost limit. Some of them had seen cesspools which had been in use for many years. He drained the oldest city in England—Winchester—and he found these cesspools which had been in existence for centuries, and which had never been emptied, thus showing that cesspools under these circumstances would go on for a very long period of time. He explained that in this way. When decomposition came on in these cesspools the particles of excreta were broken up into minute particles and passed away in the effluent by way of the overflow. Mr. Cameron himself seemed to have answered the question, for he said that for one year and eight months there was no provision for arresting the minute particles of the deposit which came away in the tank effluent and were deposited on the filter surfaces. This was now provided for. If the minute particles passed away in the effluent, as he had no doubt they would, this septic tank would go on for a long time and not require emptying. Then as regarded the production of marsh gas. Was it a desirable thing that a sanitary engineer should manufacture marsh gas? He was afraid the days of electric lighting were going into the dim and distant future if the councils were going to light their towns with marsh gas. Mr. Cameron said he had put up ten lights. Well, if he could put up ten lights from those small works there was no reason why he should not light the city of Exeter with marsh gas. He had some discussion there, and one gentleman was unkind enough to call it the Exeter gas-holder. He was not calling it that, but he was not impressed with this manufacture of gas. It would be within recollection that one engineer went there and met with a serious accident. It all came to this, that unless they put the sewage on the land it was a question of area for filters. If they could have a very large area of filters they would not want the chemicals they had now. What they did as engineers in the precipitation processes was this. They wanted to deal with the sewage in a small cubic capacity in a very short space of time, and in order to do that they used chemicals to accelerate deposit. If they had time enough to allow it sewage would deposit itself, and they simply used chemicals to increase the rate at which it would deposit. That showed it was all a question of the area of the tank or the filter. He did not think the qualified assent of the Local Government Board proved anything. There were 20 acres of very suitable land at Exeter, and after the sewage was passed through the filters and the septic tank it was distributed on the 20 acres of land. It appeared to him, looking at the surroundings, that the same result could be obtained by the land without the septic tank at all. He looked upon the system with very much doubt. He had spent very much time in travelling about the country and investigating these different sewage schemes from time to time. There had been hun-

dreds of patents taken out for dealing with the sewage problem, and they had all settled the question. Speaking with an experience of thirty years, he asserted that the practical effect of many of these inventions had been to retard the proper solution of the disposal of sewage. They must look upon this matter with a certain amount of suspicion, especially when they knew it was a case of making money and £ s. d., for the inventor (Cries of "Oh!") He would like to make it illegal for any man to take out a patent for anything affecting the public health, and then they would soon stop all these fads. He had been asked over and over again to be connected with these things, and had refused, because he thought what was done should be done without any self-interest whatever.

Mr. McBRAIR (Lincoln) expressed himself sorry that the paper did not give any figures as to cost, and all through confused the septic tank with the bacterial treatment of sewage. As a matter of fact, sewage could be treated bacterially without the septic tank at all. Some months ago he laid down two bacterial filters, and they had been working for two months. In the working of these filters one serious point he had discovered was that the first quantity of sewage which came from the first or settling tank was bad, always discoloured and very foul. He had a theory of his own to account for this. It was the custom to put pipes for underdrainage at the bottom of the tanks, and these pipes got full of sewage which never received any treatment, but lay there and decomposed. With his tanks it was so bad that when his committee visited the works he had to run the sewage in the settling tank away, as it would never do to show them. It seemed to him that the only way to prevent that difficulty was by not underdraining the filter, or at least only underdraining 3 ft. or 4 ft. radiating from the valve, so that the whole of the sewage which went down must percolate through a large amount of coke before it went away. Then they were told they could obtain refuse ashes for these filters, but in his case he had to buy coke from the gas manager at 10s. per ton. Then they were told that the filters should have a rest on one day a week, and that they should make that rest day Sunday. But if they were to do that where was their sewage to go on Sunday? It meant that they must have additional tanks other than those used for the ordinary flow of the sewage.

Mr. J. S. PICKERING (Nuneaton) thought it a step in the right direction that the Local Government Board had sanctioned the loan, though conditionally, for the West Bromwich works. He did not think it was clearly understood that the West Bromwich loan was for a large experiment; so the number of years for which it was granted was not a great matter. If it was a success the corporation would adopt the system, and then the Local Government Board would give the full term for the repayment of the loan. He could bear out what Mr. Cameron said as to foul trade sewage being amenable to the biological treatment. Notwithstanding that Mr. Lemon was sceptical, and he admitted he was sceptical six months ago, there was evidence that trade sewages could be treated in this way. He had one of the foulest trade sewages in the country to deal with, and some four or five months ago he laid down a filter of 100 yards square, composed of coke breeze, and every day since had been pouring crude sewage on the filter, without the use of any chemicals whatever, and he was quite sure that the results from that filter had greatly improved, and now were undoubtedly better than they were at the commencement. That was proof that manufacturers' refuses were to some degree amenable to this bacterial treatment. He was so satisfied with the result that he was going to try it on a larger scale. The conditions imposed by the Local Government Board might be necessary, but the absurdity of the thing was that whatever conditions they made they took no steps whatever to see that they were carried out. He wished to say he had an artificial filter composed of coke dust. He did not know what material was used in other towns, but he certainly did not think it necessary to go to the trouble and expense of getting coke breeze. He was convinced that the treatment could be equally well done with coke dust, a material which they were able to buy for 1s. a ton, as compared with the 7s. to 10s. charged for coke breeze. He had had filter-beds going for two years, and they were in as clean a condition as when first put in. Mr. McBair spoke of the underdrainage of the filters. It had always struck him that it was a weak point in these filters if they had a certain amount of underdrainage where no purification could take place. He had come to the conclusion that if coarse material was put at the bottom of the filter it was not necessary to underdrain the filter. He formerly had the filter underdrained with 4-in. land pipes, and the invert pipe slightly below the floor of the filter was for half an inch a putrid mass and above it was quite clear, showing that the under material got no treatment whatever. The system at West Bromwich was not patented in any way, and all of them could try an experiment for themselves at very little cost indeed.

Colonel JONES, V. C., expressed his regret at Mr. Cameron's absence, because he was disappointed with the paper which he had put before the meeting. There was some truth in it, but that was all old, and what was not old was not true. They all knew that domestic sewage could be treated by filtration; they had always known it. And in the case of cesspools, they had always known that they produced the

results put forward—marsh gas. They had always been accustomed to consider that it was very offensive, and the object of taking sewage away from the towns was that the marsh gas should not get into the houses. He would like to say something about the automatic process at Exeter, upon which alone it was patented, though it was true that Mr. Wynns Roberts, of Oswestry, had another plan of automatic transfer of the sewage from one filter-bed to another. The thing he complained of was that it was not justifiable to say there was a great saving in this automatic arrangement, because he preferred good, intelligent hand-labour in anything that had to do with sewage. Sewage had a way of clogging and choking up which upset all kinds of mechanical arrangement. He thought that would be found in time to be a bad arrangement in connection with this system, and at any rate it would not save much. As to the employing of these filters, Mr. Lemon very truly said they all knew of cesspools which did not require emptying, because they had overflows, or were in chalk or some other porous material, by which the matter got away unobserved. He had been waiting all along for this Exeter tank to be emptied. It was a matter of regret that the inspector of the Local Government Board did not say, "Kindly empty that tank and let me see it to-morrow morning." But instead of that the Local Government Board were content with the evidence given. At the sanitary congress at Leeds they were told that the tank, after a year's use, was a quarter full of sludge—the amount of humus was so many inches and the floating scum amounted to so many more inches. He put the two together, and made them 2 ft., while the tank was 8 ft. He was waiting to know how much more there was now, and when it was to be emptied. If the tank was calculated to dispose of one day's sewage, and it was a necessary part of the process that it should hold a day's sewage, when it was a quarter full of sludge there was only space for three-quarters of a day's sewage. His explanation was that if the tank was calculated to take the dry-weather sewage, whenever there was half an inch of rain in the twenty-four hours the particles of solid matter were carried away in the effluent and disposed of somehow or other, but they had not heard how. It was evident that these filter-beds could not dispose of the flood water. It might run off the surface of the filter-beds, and in some way the whole contents of the filter-beds might be washed out. He was sorry Mr. Cameron was not present, as he did not like to find fault with the paper in his absence. He must say he looked upon Mr. Cameron as a most honourable and upright man, and he had the highest opinion of the man, but he had the greatest suspicion when anything to do with sewage got into the hands of a company to make money of. He was sorry that they could not get public opinion sufficiently interested in any matters affecting sewage. They wanted their rivers purified and to watch the results as practical men, but instead of that they said it was nothing to them. They left it to the chemists and the engineers. The public ought to take more pains, for the results of their apathy was that they were the victims of these speculative syndicates and money-making people. He was afraid of the effect of the paper being put before the association. In 1877 he was present at the annual meeting, when Mr. Webster brought forward the electrical system. He was never more astonished in his life than to find that a body of trained borough engineers, whose attention had been given to the treatment of sewage for years, received that as a message from Heaven and the solution of the whole thing. There was a kind of feeling going about now that this was something new, whereas bacteria had been working upon the sewage for millions of years. There was nothing new in it, not even the number of the bacteria, though they were to be cultivated, increased in numbers, and bred to it. The only thing the advocates of this system put forward were the conditions which the late Mr. Bailey Denton and everybody insisted upon—that they should provide the most porous possible material as a filtering medium, and that the sewage should pass through it at a reasonable rate of speed, and that it should be intermittent in flow. The whole thing depended upon the flow of the sewage being intermittent.

Mr. CAMPBELL (Canterbury) said that in his innocence he went to Exeter to see the system, and he regretted that in Mr. Cameron's absence aspersions and suggestions of that kind had been brought forward. They might be correct, they might not be correct, but he had a more innocent mind than to suggest such things in connection with that paper. He went to Exeter with an unprejudiced mind, as a learner, and not as one who from thirty years' experience had learned to trust to land as the be-all and end-all of sewage purification. There were, no doubt, conditions in which Mr. Lemon's large experience of land had fulfilled all that was desired. Land was all right when they could get it sufficiently removed and isolated, but everyone had to meet the conditions of the towns where they work, and even admitting land was all Mr. Lemon had claimed it to be.

Mr. LEMON: I did not say a word against filtration. I am an advocate of filtration.

Mr. CAMPBELL, continuing, remarked that Colonel Jones had said so. His point was this, that the Local Government Board had made a great concession as to the amount of land in allowing 1 acre for every 2,000 of population. He returned from Exeter and constructed a tank at Canterbury similar to those Mr. Cameron had, and it had worked satis-

factorily for four months. If the Exeter tank and the Canterbury tank on the Exeter lines did produce a wonderfully clarified effluent from a very bad putrid sewage, then he claims that Mr. Cameron had done something. There might be not so much under the sun, but there were the developments of the practice, there was the reducing to a science, as Mr. Cameron and Mr. Dibdin were doing, of what on the land was an unknown, uncertain and an indefinite amount of purification of sewage. By these tanks they were able to define it and reduce it to the principles of a science.

Mr. SMITH-SAVILE (Darwen) said that he had constructed a bacterial tank, as his authority was anxious to be free from sludge. They had never had any marsh gas from the tank, though the manager at the sewage works thought he was going to light his residence in that way. Although the tank had been going for three months, he found there was not much sludge in it, and, indeed, he was in a position to say it had reduced the sludge to one-fourth. Previously they produced 32 tons of sludge per 1,000,000 gallons; now he should put it at 8 tons of sludge per 1,000,000 gallons. The effluent from the tank had never been so good as to justify him in having it analysed. It was of a milky consistency, and there were slight particles in it. He allowed a fifteen hours' flow through the tank to enable it to clarify, and they then passed it through two coke filters. The filter took an hour to fill, rested two hours, then ran off and aerated for two hours. The effluent from the two filters was not very good—not so good as with the ordinary coke and sand filters. He had anticipated that the first lot of sewage would scarcely get treated; therefore he filled the bottom portion with 9 in. of coke dust, so as to aerate better. Though they had the fine coke at the bottom, they did not get an effluent such as he would be justified in sending into the river or that the Rivers Board would accept. The septic tank system was one which required very careful watching and could not be looked upon with too much caution. Whatever might be the case at Exeter, it did not appear suitable to their sewage at Darwen.

Mr. WIFE (Sheffield) said he had not been to Exeter, but he had been to Sutton, and, with the consent of Mr. Smith, brought away their sewage works manager, and he was now at Sheffield. It might therefore interest them to have the result of the few experiments he had been making. The works consisted of thirty tanks, each holding 500,000 gallons. They had been for ten years using lime, and they make 1,000 tons of sludge a week. He took three of these tanks and filled one with slack and two with coals. He passed through the slack and coke tanks the crude sewage, and through the coke tank the sewage treated with lime. For a long time they got no good results whatever. He might say their sewage was very much mixed up with trade refuse, acids and vitriols. For several months they thought they were going to have a failure, but he was pleased to say now they were beginning to have a good effluent. They had abandoned the slack, which did not act, and as they were rather cramped for room, because the works were designed for a flow of 10,000,000 gallons and by the admission of surface water they often got 20,000,000 gallons, he had abandoned the use of two tanks, and was now using one, and by passing the effluent through a coke filter was getting very good results indeed.

The PRESIDENT thought it very gratifying that they should have had some record of this interesting process of sewage treatment and that it had provoked so interesting a discussion. Without wishing to enter into discussion, he considered there was one very important point they ought to get from Mr. Cameron, though it affected their councils more than anyone else—that was the cost. He did not wish to associate Mr. Cameron with £ s. d., but in reporting to their councils they would be required to say what it did mean over and above the actual construction of works. He did not himself perfectly understand what the 30 per cent. royalty commission meant. He had heard it stated that it meant 30 per cent. upon the whole of the constructive works, tanks and filters included. He could hardly credit that. He presumed it was not possible to patent an ordinary settling tank. The ironwork attaching to it might be patented, but the ordinary settling tank could not be patented any more than the microbes. Without insinuating any commercial interests, it would be very interesting if Mr. Cameron could give them the information which was essential in reporting to their councils on the matter.

On the close of the unusually animated discussion which Mr. Cameron's paper had evoked the following contribution—of less general interest, perhaps, but full of the results of careful observation and sound reasoning—was read by the author:—

A TWO HOURS' TEST OF A STEAM RAM PUMPING PLANT.

By J. B. WILSON, A.M.I.C.E.,
Corkermouth.

[Mr. J. B. Wilson commenced his career in the office of Mr. Kendall, a civil engineer practising in Whitehaven, and was appointed, on the termination of his four years' apprenticeship, as chief assistant to that gentleman. He continued in this capacity for a further term of four years, after which he accepted the appointment of surveyor and water engineer to the Arlecdon and Frimlington Urban District Council, with whom he remained three years. Mr. Wilson has held his present appointment under the Corkermouth Rural District Council since 1888,

He holds the surveyor's certificate and diploma of the Sanitary Institute, together with the certificate of the Association of Municipal and County Engineers, and is an Associate Member of the Institution of Civil Engineers.]

The writer has repeatedly met during his professional practice with both manufacturers and users of steam rams whose views on the economical principles which govern the design and proportion of these important adjuncts to public water supply appeared to him to be at variance with well-known laws of hydraulics.

In order, therefore, to try and elucidate the difficulties involved he has taken the liberty of bringing this subject before the association, with a hope that discussion thereon may lead to more improved methods of construction in the future in country districts, where the experienced engineer is not always available.

The two chief failings to which he would draw attention are: (1) The adoption of a large-sized ram to a comparatively small-sized main and suction pipe; (2) the laying of undulating rising mains without air valves or ventilation of any kind.

Taking these questions in the order given: (1) The reason assigned for this procedure is—"there is nothing like having plenty of size and weight." If weight is needed why not increase the size of steam cylinder, that being the source from whence the power is derived and not from the ram? But if size is wanted, what may be termed the "double" capacity of the ram should be obtained by extending its length and not by increasing its diameter, as by so doing, if the capacity is doubled, the load of resistance is also doubled, which is not the case if it is extended, as the sectional area remains the same.

The following tables give the results of a two hours' test of a vertical pumping engine with two single-acting rams. Table I. gives the load at seventeen revolutions per minute, which is equal to a velocity of 1.41 ft. per second in the main. Table II. gives the load at twenty-eight revolutions per minute, equal to a velocity of 2.33 ft. per second. This test could only be tried for about five minutes, as the 9-in. suction pipe could not keep the two 12-in. rams supplied with water, and the impact was so great that the speed had to be reduced to seventeen revolutions, which was found to be the maximum speed that the engine could be run with safety. The proportions of the engine are as follows:—

Steam cylinder, 12 in. diameter, 15 in. stroke.
Rams, 12 in. diameter, 15 in. stroke.
Suction pipe, 9 in. diameter, 12 ft. lift from bottom of tank.
Rising main, very undulating, no air valves, 1 mile in length,
8 in. diameter, 155 ft. rise to reservoir.

The suggested proportions of engine, given by way of comparison, are as follows:—

Cylinders and rams, 2 ft. 6 in. stroke, 8 in. diameter.
Suction pipe and rising main, 8 in. diameter.

All other proportions same as in the first case: Delivery, Table I., 180 gallons; Table II., 300 gallons per minute.

TABLE I.

Particulars and items of load.	12-in. rams, lb.	8-in. rams, lb.
Weight of column of water to be lifted = $62.4 \times ND^2H = W$	7596.38	3253.78
Friction on piston = $W \times .06$	455.78	200.22
Friction of the water in the rising main excluding rams = $\frac{G^2 \times L}{(3d)^5} =$	71.30	71.30
Resistance due to contraction and friction in suction pipe = $\left(\frac{G}{a^2 \times 13}\right)^2 =$	4.34	7.15
Resistance due to valve, say	4.00	4.00
Total load of resistance	8131.80	3536.45
Which = per square inch of sectional area of ram	71.12	71.27

The actual pressures registered by the gauge on the rising main were, at rest 64 lb., working 78 lb. per square inch.

NOTE.— $n=7,854$, D =diameter of main in feet, H head in feet.

d =diameter of main in inches, W =weight in lb.

G =number of gallons per minute.

L =length of pipe in feet.

TABLE II.

Particulars and items of load.	12-in. rams, lb.	8-in. rams, lb.
Weight of column of water to be lifted	7596.38	3253.78
Friction on piston	455.78	200.22
Friction of the water in the rising main, excluding rams	195.93	195.93
Resistance due to contraction and friction in suction pipe	12.15	14.06
Resistance due to valve, say	4.00	4.00
Total load of resistance	8264.24	3667.99

Which = per square inch of sectional area of rams 73.13 73.36

The total pressure registered by the gauge on the rising main was 100 lb. per square inch—to a load of 11,300 lb. on the 12-in. rams. The 26 lb. excess pressure recorded, the writer considers, is caused by "air lock" in the rising main from want of proper air valves on the summits of the several undulations.

This air lock is still further amplified by a continuous series of blown joints, which take place usually on the up side of the summits, rarely more than a few feet down on the rise side and never in the bottom of the hollows. On summing up the foregoing facts the writer is of opinion that they prove beyond doubt that no ram should exceed in diameter the suction and rising main to which it is connected, otherwise an economical loss takes place, which in the case before us amounts to 125 per cent., or, inclusive of "air lock" 208 per cent. of waste over and above the necessary requirements to raise the water specified.

(2) As to the ventilation of rising mains on undulating ground, no main should be laid, in such case, without suitable air valves, as an air lock ensues, causing an unnecessary excess of pressure in the mains and reducing the flow. The reason given for this arrangement was—"the main works solid, and therefore must be right"—but the solidity is not always experienced or there would be no blown joints.

The air valve recommended is a small air receiver cast on the top of the main of the full diameter of the main, on the summit of which a small brass air valve (ball valve) is fixed, similar to the valves used on hot-water cylinders. Through this valve the air is forced out under a slight pressure, which steadies the upward flow of the water and prevents waste. He has used these valves in barns filled with hay with success. They were fitted on pressure tanks.

DISCUSSION OF MR. WILSON'S PAPER.

Mr. A. E. COLLINS (Norwich) said he would like to propose a vote of thanks to Mr. Wilson for these interesting records of tests. They were as interesting as anything they had, because they were actual records of facts. He did not quite agree with all the deductions drawn by Mr. Wilson from his tests. He agreed with Mr. Wilson as to increasing the suction pipes when running at high speeds. He was article to a firm of engineers who made their suction pipes the same diameter as the plunger, but there seemed to be a rule of thumb with some of the smaller manufacturers to make them only half the size. If they were running at high speeds they must have plenty of space in the suction pipe. He scarcely knew how Mr. Wilson had arrived at the friction on 12-in. and 8-in. rams. It was all a question of the manner in which the pistons were jacketed. He made it, instead of a difference as between 455.78 lb. and 202.22 lb., a difference of two-thirds. If they were going to reduce the size of the plunger and get the displacement by increasing the speed, they would increase the amount of friction by the amount of speed, and thus get more friction with the smaller than the larger ones.

The PRESIDENT, in seconding the vote of thanks, expressed his own personal thanks to Mr. Wilson for having given them so interesting and useful a paper. It would, as Mr. Collins said, serve as a valuable means of reference.

THE ELECTRIC LIGHTING OF EDINBURGH.

By FRANK A. NEWINGTON,
Resident Electrical Engineer.

The Corporation of Edinburgh obtained, in 1891, a provisional order from the Board of Trade for the electric lighting of the city. The building of the station and the work of laying the mains in the streets was commenced in May, 1894, and the supply of electric energy was first commenced on April 11, 1895. Prof. Kennedy is the consulting engineer to the corporation.

GENERATING STATION.

The building is situated in Dewar-place and Torphichen-street. It consists of the boiler-house and engine-room on the ground floor, the coal store over the boiler-house and the battery-room, meter testing-room and store over the engine-room, the offices being at the south corner of the building.

BOILER-HOUSE.

The boiler-house is 152 ft. long by 46 ft. wide. This at

present contains thirteen boilers; four others will be erected within the next three months. The boilers are of the dry-back type, 10 ft. 3 in. diameter by 12 ft. long, with two Curves flues 3 ft. 3 in. diameter, and 168 tubes of 2 1/2 in. internal diameter. They are designed to evaporate 10,000 lb. of water per hour, the working pressure being 160 lb. per square inch.

The boilers are fitted with mechanical stokers of the coking type. Directly above the shells of the boilers superheaters are fixed, each of these consisting of two nests of zigzag tubes or coils 1 1/2 in. diameter; there are twenty-six of these coils to each superheater. The coils are connected at both the back and front of the boiler to a cast-iron pipe, the steam from the boiler enters at the back pipe, then passes through the coils and leaves by the front pipe.

The gases, after leaving the furnace flues, enter a brick combustion chamber, pass through the tubes to the front of the boiler, over the top of the boiler around the superheater

EDINBURGH: NORTH FRONT AND END OF BOILER-HOUSE AND COAL STORE AT THE CENTRAL ELECTRIC LIGHTING STATION.

tubes, and then down each side of the boiler to the main flue. By these means the steam is superheated 40 deg. to 60 deg. Fahr.

FEED PUMPS.

There are two duplex steam pumps, having a maximum capacity of about 6,000 gallons per hour each, and three three-throw pumps driven through gearing by electric motors, each with a capacity of 4,500 gallons per hour. There are two ranges of feed-water pipes, and each boiler is fitted with two check valves. The feed water is measured by Kennedy water meters, and is heated by exhaust steam feed heaters. There are three electric motors in the pump-room for driving the shafting for the mechanical stokers.

The coal is delivered in railway trucks by a siding from the Caledonian Railway. At the east entrance to the boiler-house there is a hoist driven by an electric motor, which lifts the truck to the coal store level; railway lines are fixed the whole length of the coal store, 8 ft. 6 in. above the floor level, and the trucks are drawn along these by means of an endless rope also driven by an electric motor. The coal is unloaded on to the coal store floor, and runs into hoppers fixed to the ceiling of the boiler-house, there being one hopper to each pair of boilers. Immediately below the hopper there is a measuring-box, holding 4 cwt. of coal, having slides at the top and bottom; below this box are the shoots for leading the coal into the hoppers of the mechanical stokers. The slides in the measuring-box are arranged so that on opening the top one the measuring-box is filled with coal, this is then shut and the bottom one opened, a measured quantity of coal being delivered to the boiler each time. Ordinary counters are connected to the slides to indicate the number of times the slides are opened. This arrangement works admirably, saving a large amount of labour.

ENGINE-ROOM.

The engine-room consists of a building 102 ft. long by 95 ft. wide, divided down the centre by a row of columns, these carry the roof, which is in two spans. The machinery at present erected consists of:—

- Two 100 h.p. engines coupled to two 60 kw. dynamos.
- Two 250 h.p. " " " two 155 kw. " "
- Ten 360 h.p. " " " ten 225 kw. " "
- Two 150 h.p. " " " two 84 kw. alternators.
- Two 240 h.p. " " " two 150 kw. " "

The engines are Willans' central valve type, running from 350 to 450 revolutions per minute, and are direct coupled to the dynamos and alternators. Both high and low tension systems of distribution are in use, the high-tension mains supplying the outlying parts of the city and the low-tension mains the more central part. The dynamos are two pole shunt-wound machines. The ten large machines are wound for a pressure of 460 volts, the four smaller machines for 230 volts. The four alternators are designed for 2,100 volts.

The engines and dynamos are bolted down to a solid block of concrete about 7 ft. thick. This is not in contact with the walls of the building, there being a space of about 3 ft. be-

tween them. The steam pipes form complete rings both in the boiler-house and engine-room, and the stop valves are so arranged that any section can be shut off without stopping more than one engine or boiler. The main steam pipes are 8 in. in diameter, the straight lengths are of steel, with the flanges screwed and brazed on, the bends are of copper with steel flanges. The pipes are carried by rods from brackets fixed to the walls, thus allowing for expansion. The branch pipes to the engines are of copper. Four direct-coupled sets, of 300 kilowatt capacity, two for the low tension and two for the high, will be erected in about three months time. This new plant will fit up the station. The engines for these sets will be of the Belliss high-speed type.

SWITCHBOARDS.

The switchboards are arranged on a raised platform at the west end of the engine-room.

LOW-TENSION SWITCHBOARDS.

This is arranged for eighteen dynamos and nineteen feeders. The current from the dynamos is carried by cables laid in trenches under the engine-room floor to the switchboard, passing through fuses, automatic switches and ampero-gauges to a common bar, to which the feeders are also connected. The feeders on leaving the switchboard are carried into a cellar below, and then run to various parts of the city. On starting an engine it is run up to its proper speed, which is regulated by the governor, the stop valve is opened out full, and all the regulation is done by the switchboard attendant by means of a resistance in the shunt winding of the dynamo.

HIGH-TENSION SWITCHBOARD.

This is arranged for seven alternators and seven circuits. Each alternator and circuit has a fuse and ammeter and two single pole switches. There are two omnibus bars, either of which can be connected to the inner conductor of the concentric mains by means of the circuit switches. The outer conductor is permanently connected to the machines, and is also connected to an earth plate in the station. There are seven Ferranti rectifiers for changing alternating currents to rectified currents for arc lamps, with the necessary switchboard for six circuits of arc lamps. Each rectifier is capable of lighting thirty-five to forty 12 ampere arc lamps in series. The rectified circuits are used to supply the outlying street lamps.

BATTERY-ROOM.

There are two batteries, one for the positive, the other for the negative side of the system; each consists of 128 cells,

EDINBURGH: EAST END OF BOILER-HOUSE AT THE CENTRAL ELECTRIC LIGHTING STATION, SHOWING ELEVATED COAL HOIST AND AUTOMATIC WEIGHING MACHINERY FOR RAILWAY TRUCKS.

having a capacity of 850 ampere hours, at a discharge rate of 180 amperes. The batteries are always connected to the omnibus bars on the switchboard, but, as the pressure of the dynamo is not sufficient to charge all the cells at once, motor generators or boosters are used, these are put in series with the dynamos, and are capable of increasing the pressure of the battery circuit 100 volts or so above the pressure of the dynamo. By this means the batteries are very conveniently worked, it being possible to charge them at any

time. The cells are of the Crompton Howell and Todor types.

DISTRIBUTION: LOW-TENSION SYSTEM.

The system used is a three-wire network, with feeders at various points supplying it direct from the generation station.

FEEDERS.

There are at present sixteen pairs of conductors going out of the station. The points at which these feed into the distributing network are arranged according to the demand for energy in different parts of the city, the section of the conductors also varies for the same reason. From these feeding points pilot wires are brought back to the station and connected to voltmeters, which show the pressure of the supply at these points.

The feeders chiefly consist of bare copper strip, carried on insulators in concrete culverts; where it has not been possible to use this on account of there not being sufficient room between the pavements and the cellars of the houses, Siemens armoured cable has been laid down. One of the chief advantages of using culvert and copper strip lies in the ease with which the section of the conductor of any feeder can be increased as the load on that feeder increases. All that it is necessary to do is to add one or more extra strips of copper. The usual section of the copper strip is 1 in. wide by 1/4 in. thick, and any number of these up to about six (or 1 1/2 square inch section) can be used.

DISTRIBUTING MAINS.

The distributing mains in use are insulated with india-rubber, bitumen or paper. They are drawn into Doulton stoneware casing when laid under the pavement, or into cast-iron pipes under the roadway. The pressure between the two outer mains is 460 volts, or between either outer main and the middle wire 230 volts—that is, the pressure at the consumers' lamps is 230 volts. The distributing network of one district is connected to that of another district as much as possible, in order to insure an even pressure throughout the system.

HIGH-TENSION SYSTEM.

This is used for the outlying and scattered parts of the city. The conductors in all cases are concentric cables, insulated with paper impregnated with oil, and lead sheathed. These are laid in Doulton stoneware casing or in iron pipes. Armoured cable laid directly in the ground is also in use. The pressure of the high-tension mains is 2,100 volts, this is reduced to either 230 or 115 volts before entering the consumers' premises. The transformers for this purpose are contained in cast-iron watertight boxes, which are sunk under the pathway. The size of the transformers varies according to the number of consumers supplied by them. An extension of the high-tension mains is now being made to Portobello, about 5 miles distant from the generating station. Transformer sub-stations, with a low-tension distributing network, will be used.

PUBLIC LIGHTING.

There are now 608 arc lamps in use in the city, 441 of which are lighted from the low-tension mains and the remainder by the rectified circuits. The lamp-posts are placed 60 or 70 yards apart, except those in Prince's-street and Leith-walk, which are only about 45 yards apart. The lamps hang from a bracket projecting from the top of the posts, the centre of the lamps being 23 ft. from the pavement. The circuits for the arc lamps have been arranged so that alternate lamps are on different circuits, this allowing every other lamp to be switched out at midnight. The low-tension lamps are connected to the distributing mains, but the rectified lamps require separate conductors laid from the station for each circuit. These lamps are switched on and off at the station, but in the case of the low-tension lamps, the lamp trimmers go round to switch them on and off.

The public arc lighting is now being extended by the addition of 130 lamps. A site of about 3 1/2 acres has recently been acquired by the corporation at the north-east end of the city, on which another generating station will be erected. Only a part of the ground will be built on at present, the buildings being designed for about 10,000 horse-power of machinery. The station when completed, however, will contain machinery of 40,000 to 50,000 horse-power.

FINANCIAL RESULTS.

When the supply was commenced on April 11, 1895, there were about twenty consumers connected to the mains, having an equivalent of 2,500 8 candle-power lamps and forty-six street arc lamps. At the completion of the first year's working on May 15, 1896, there were 507 consumers connected, having 53,250 8 candle-power lamps and 245 street arc lamps. On May 15, 1897, there were 900 consumers connected with 91,980 8 candle-power lamps and 471 street arc lamps, and on May 15, 1898, there were 1,620 consumers with 149,480 8 candle-power lamps and 556 street arc lamps.

During the last twelve months, therefore, an average of more than 1,100 8 candle-power lamps have been connected to the mains each week, and applications for a further 15,000 8 candle-power lamps have been received. The price per Board of Trade unit at first was 6d. for lighting, with discounts amounting to 25 per cent., according to the quantity used, and 3d. for power and heating. This has been reduced each year as follows:—

Year 1895-6, lighting 6d. per unit, power 3 1/2d. per unit.
" 1896-7, " 5d. " " 3d. "
" 1897-8, " 4d. " " 2d. "
" 1898-9, " 3 1/2d. " " 1 1/2d. "

The public arc lamps, arc lamp-posts, and all cables, connections, &c., are supplied and erected by the Electric Lighting Department, who also trim the lamps and keep them in repair, for which the following charges have been made:—

Year 1895-6	£20 per lamp per annum.
" 1896-7	£18
" 1897-8	£16
" 1898-9	£14

The following are the units sold during each year:—

	1895-6.	1896-7.	1897-8.
Private lighting	556,744	1,052,570	1,973,315
Power	13,914	47,727	86,654
Public lighting	331,043	621,276	834,060
Total	901,701	1,721,573	2,894,629

The capital expended on the undertaking now amounts to about £282,000.

A reserve fund has been commenced, £1,050 having been put aside for this purpose for the year ending May 15, 1897, and £4,000 for the year ending May 15, 1898. A consider-

EDINBURGH: INTERIOR OF ENGINE-ROOM AT THE CENTRAL ELECTRIC LIGHTING STATION (LOW-TENSION SIDE).

able net profit has been made each year, after paying all charges, including interest and sinking fund on the capital expenditure and the contributions to the reserve fund, in spite of the reduction in the price of energy.

	Year.	Nett Profit.
1895-6	£2,976	
1896-7	£3,374	
1897-8	£2,000 to £3,000 (estimated, as the figures are not yet completed).	

The following table gives the works cost and total costs per unit sold, for the years 1895-6 and 1896-7. The figures for the year 1897-8 are not quite ready yet. Works costs include fuel, oil, water, stores, wages and maintenance. Total costs include works costs, salaries, management, rent, taxes and insurance.

	Year	1895-6	1896-7	1897-8
Works Costs.	...	92d.	63d.	113d.
Total Costs.	...	167d.	113d.	

The growth of the undertaking has been extremely rapid and the results very satisfactory. This, I think, has been largely due to the policy which the corporation has adopted—namely, of extending the supply mains wherever there has been a demand for electric energy, and in reducing the price per unit as quickly as possible.

DISCUSSION OF MR. NEWINGTON'S PAPER.

Mr. J. PATTEN BARBER (Islington), in proposing a vote of thanks to Mr. Newington for his paper, said he wished they could show the same result in Islington as they did at Edinburgh. But he hoped before long they would be able to show a much better result than they did now. He thought the policy which Edinburgh had adopted, of laying mains wherever the demand justified it and reducing the price wherever they could, had brought about the excellent financial results which had been obtained. It distinctly showed the advantage of these undertakings being in the hands of the municipality. They were certainly hoping in Islington, which was not a rich parish by any means, that they would be able to show good sound financial results. At the present time they were not losing money, but were making a little money, and they would do much better if they were to make a plunge, as a company would do, and reduce the price of current at once. They could not do that at Islington, because they were dealing with money which was the money of the ratepayers, and the members of the board would not like to incur what would probably be a present loss. Anyway they had solved this problem—that the work of electric lighting could be done well by the muni-

city and done without losing money. He wished they could also say, as at Edinburgh, that it could not only be done economically but at a profit. It was very encouraging to come to Edinburgh and learn that the electric lighting was being so economically and well done by the municipality.

Mr. LEMON (Southampton), in seconding the vote of thanks, said he did not know that he had ever read a paper which gave so much information in a small space. He had had some experience in connection with electric lighting. He advocated that they should purchase the license of the then company, which they could have obtained for £500, and the council in their wisdom would not do so. The company went on and spent £21,000, and he again pressed that the council should purchase their works. They succeeded in purchasing them at par, and when he told them that the company were then paying 5 per cent. on their capital he considered they made a good bargain. They had had the works in hand two years, and were now laying out £60,000 in extensions. They were able to show a return of 7 per cent. upon the capital they had expended; but, of course, they were not able to show a return upon the capital during construction. They had also made considerable reduction in the price of the current to consumers. The company used to charge 7d. per unit. They had reduced it to 6d., with a heavy discount after a certain consumption, and they only charged 3d. per unit for power. The results of that reduction had been curious. There had been a great increase in the number of consumers and a large increase of revenue, which showed it was the right principle. Whenever there was any desire to take the electric light they had extended the mains in all directions. Mr. Barber had alluded to the difficulties which a local authority were met with in carrying out works of that description. They, of course, in their council had reactionaries and obstructionists, as most other authorities, and only the previous week they made a fierce attack upon the Electric Lighting Committee because they could not show a return upon the capital during construction. Then there was that bugbear the Local Government Board. When they had made an excellent purchase they applied to the Local Government Board for a loan, and they would not allow more than fifteen years for the repayment of the £21,000. He need not tell them that was a very heavy charge upon the undertaking, and he considered, too heavy a charge. Notwithstanding that fact, they were able to pay that very heavy sinking fund, and interest upon capital and all expenses, and show a balance at the end of last year, though they had reduced the price of the current. That was a satisfactory result, but the results they had obtained were nothing compared to Edinburgh, and he congratulated them upon their energy and success in this matter.

Mr. C. JONES (Ealing) supported the vote of thanks, as he was much interested in this problem of electric lighting. There were one or two points which ought to be given in all these papers, for purposes of comparison. Mr. Lemon had told them that the Local Government Board allowed fifteen years for their loans; in Ealing they were allowed twenty-five years; and Mr. Barber would tell them that in Islington they were allowed forty-two years. When they attempted to make a comparison as to the probable success of an undertaking, it was important they should know how many years the loan was allowed for. Then it also affected them in another way. They would like to know the rate of interest or basis on which the loans were raised. In the case of Edinburgh they would probably have the information. In the case of Southampton they might be told the rate of interest which was being paid there. (Mr. Lemon: 2½ per cent.) In Islington he thought it was 2½ per cent. (Mr. Barber: Under 3 per cent.) In Ealing it was 3½ per cent. This information was necessary in order to get at a comparison of the success of these schemes. He had felt this very much. A gentleman got up in the council meeting and said, "Look at what they are doing somewhere or other," and it became necessary to explain the difference in the interest on capital and the difference in the term of years for the loan, whereas, if they had a table drawn out in which this information was given, it would very much assist them. Another point he wished to raise was the cost of material. For instance, when in Manchester a short time ago, he was informed that the cost of coal was 6s. 9d. per ton. If he had been asked the price of coal he would have said 12s. 9d. per ton. Of course, this made a very material difference, and it would assist them very much if they could have this information and put a stop to the gentlemen who were so anxious to prove that the officers were making a fearful mistake, because in some other place where the expenses were 50 per cent. less they were making a profit. He would also like to ask if anyone had any experience of free wiring. They did it in connection with the installation in their churches, and the money was repaid in five or seven years at 4 per cent. interest. They charged the churches 4½d. per unit instead of 6d., and they were conveniencing their works and doing good to the community at large.

Mr. PARKER (Hereford) added his testimony as to the value of the paper. He came from a town which had got a provisional order, and, pending the appointment of an electrical engineer, it naturally fell upon the surveyor to do some portion of the preliminary work. He had availed himself of the knowledge of Mr. Lobley. He was certainly much struck with the great difference in the works cost at Edinburgh,

which was positively the lowest of any installation conducted by any corporation in the United Kingdom. Whereas the total works cost at Belfast was £104, and Salford 12,574, the total cost at Edinburgh was only 1134; and while the actual works cost at Edinburgh, exclusive of management, &c., was only 042d., it ran up to 935d. at Salford. That was a very extraordinary difference in favour of Edinburgh.

Mr. LOBLEY (Hanley) remarked that the conductors of all electric lighting works looked with feelings of mingled envy and encouragement on Edinburgh. They could not help feeling some envy of the very good results that had been obtained, but at the same time they also felt very great encouragement. He proceeded in Hanley on the same lines as at Edinburgh, of extending the mains and reducing the price wherever possible. They had extended the mains in Hanley to a very considerable extent for a small town. He had not the statistics at hand, but he believed they had more miles of mains and fewer customers than anywhere else, showing that they had increased the mains perhaps ardently, and they had reduced the price to such an extent that they made a small deficit. Mr. Lemon alluded to the period for loans granted by the Local Government Board. There seemed to be no rule. At Hanley their last application was only granted for seventeen years. Their first loan was for twenty-five years, another loan for ten years and the last for seventeen years. The question of a reserve mentioned in the paper, he took it, was in addition to the sinking fund. (Mr. Newington: Yes.) The question of a reserve fund depended entirely upon the period granted for the repayment of the loan. To say that Southampton, with a loan for fifteen years, must put on one side a reserve of 3 per cent. in addition to the sinking fund, and that Islington, with forty-two years loan, must only make the same reserve did not seem right or reasonable. There was no doubt that the charge of £14 per annum for the arc lamps, including trimming, carbon and all attendance was an exceedingly low charge. He saw that the customers' lamps in the centre of the city were supplied at 230 volts pressure, and he would like to have Mr. Newington's opinion as to these high-voltage lamps as compared with the ordinary low-voltage lamps.

Mr. KERR also asked if there were any disadvantages in the use of 230-voltage circuits as compared with the usual 110 volts, and also whether the lamps could be maintained with an economical efficiency.

Mr. COLLINS (Norwich) asked whether Mr. Newington had any experience of explosions of gas. They had had such an explosion in Norwich, but it did not do any serious damage.

Mr. SMITH-SAVILLE (Darwen) asked how long the india-rubber insulation had been in use. They found in the town he was in last that it broke down within five years. He noticed that the india-rubber insulation was on the low-tension wires, and that the high-tension had a paper insulation.

The PRESIDENT said he thought their thanks were due to Mr. Newington for the valuable paper he had contributed. He had seen many papers, but, as Mr. Lemon had said, he had never seen a paper with so much valuable information in so small a space.

Mr. NEWINGTON, in reply, said they had to repay the loan in thirty years, and the interest on capital, he believed, was from 2½ per cent. to 3 per cent., but he was not quite sure. The cost of the coal was 7s. 8d. per ton; it was small, and not of very high heating value. As to free wiring, they had not done anything of the kind. They had not required it. The applications had been so numerous that they could hardly get along as it was. The reserve fund was over and above the sinking fund. It was limited by Act of Parliament to 10 per cent. The continuous-current lamps were 10 amperes, except in Princes-street, where they were 15 amperes. In other parts the rectified lamps were 15 amperes. The rectifiers were not thoroughly satisfactory—they wanted a lot of attention and care. The efficiency of the lamps were about 3½ watts per candle. Some lasted very well indeed, quite as well as the 110-volt lamps. There has not been any explosions of gas there, except when they were putting in the system, and then they had a case of gas accumulating and being lighted in a cellar, or something of that kind. As to repairs of the india-rubber insulated cable, they had had a good deal of trouble with it, and were now using bitumen. For the high-tension mains they had paper insulation, and it answered very well indeed.

We are compelled to hold over Mr. Whyte's paper, which will be given next week, together with notes and illustrations in connection with the various municipal works and other places of interest visited on the Friday and Saturday of the meeting. We also wish to note that the name of Mr. T. H. Yabbieon, Bristol, should have been included among the members of the Council of the Association who attended the meeting.

Rugby.—Mr. W. G. Willocks, Local Government Board inspector, held an inquiry at Rugby recently with reference to the application of the urban district council to borrow £2,650 for the purchase of land for sewage disposal purposes, £1,920 for a new fire engine station, £770 for an improved outfall sewer, and £2,500 towards the cost of erecting new public offices on the site of the "Shoulder of Mutton" inn, in the High-street, recently bequeathed to the council.

LONDON WATER SUPPLY COMMISSION.

The Commission dealing with the question of the water supply of London sat again on Monday, Lord Llandaff presiding.

Mr. ANDREW JOHNSTON, chairman of the Essex County Council and member of the Staines Reservoir Committee, said that his council would prefer not to become a water authority at all if they could possibly avoid it; but in the event of the purchase by the London Council of the undertaking of the East London Company the only chance of efficient management would lie in the constitution of a metropolitan water authority for Essex under an Act of Parliament. This was provided for to some extent in the agreement between the London Council and the Essex Council, who desired to have as much of the wells and intakes of the East London Company as would afford a sufficient supply of water, not only for the present population of 295,000, but for the future population of the district. As a water consumer he was perfectly content with the present supply, and he felt certain that as the result of any change the consumers would have to pay more for their water in some shape or other.

Mr. WILLIAM IVEY, mayor of West Ham, stated that the question of the water supply of the county borough had been one of considerable anxiety to the corporation for some years past, and the various schemes which had been brought forward from time to time for dealing with the question of the future water supply for London and the suburbs had had the careful attention of the corporation and their officers. If the East London Waterworks Company's property were to be compulsorily acquired, looking to the magnitude of the area, the number of the population, and the vastness of their interest in the question, it would be most desirable that the Government itself should deal with the matter; but, failing that, if the interests of the water companies were acquired in any other way, the corporation considered that they ought to have conferred upon them similar powers and privileges to those contained in the proposed agreement between the London County Council and the Essex County Council. If the water companies were to be acquired by any local or municipal authority similar to the London County Council, steps would have to be taken for the protection of the outside authorities against any increase in the water rate. Speaking generally, the Corporation of West Ham were quite willing to consider the advisability of joining with any other outside authority in purchasing such parts of the sources of supply, reservoirs, pipes, mains, &c., as would be necessary for supplying West Ham or the adjoining districts.

Mr. W. K. MARRIOT, chairman of the Barking Urban District Council, said that, in the event of its being decided to allow local authorities to obtain a supply sufficient for their own requirements, his council would be prepared to acquire such supply or to purchase water in bulk at cost price and distribute it in the event of the London County Council buying out the East London Company.

Sir JOHN EVANS, vice-chairman of the Hertfordshire County Council, gave it as his opinion that the existing local authorities were the proper persons in whom the control of the water companies should be vested, and that the creation of any new board controlling the whole metropolitan water area would be a far less satisfactory solution of the question than the strengthening of the control which the local authorities of the districts supplied by the companies and the consumers of water already possess.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made, separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

201. Ordnance Maps and Scales : Meaning of Ordnance Datum.—"Student" writes: Will you please state what are the scales of the Ordnance maps in general use in this country? What is meant by Ordnance datum, and where is it taken from? What is meant by a reduced level?

The following table shows the scales of the Ordnance maps in general use in this country:—

Natural Scale.	Inches to 1 Statute Mile.	Statute Miles to 1 in.	Chains to 1 in.	Remarks.
$\frac{1}{1000}$	126.72	0.0079	0.631	Town maps.
$\frac{1}{2500}$	60.00	0.016	1.3	
$\frac{1}{2500}$	25.344	0.0395	3.156	Parish maps of the United Kingdom.
$\frac{1}{10000}$	6.00	0.16	13.3	County maps of the United Kingdom.
$\frac{1}{62500}$	1.00	1.00	80.0	General map of the United Kingdom.
$\frac{1}{250000}$	0.05	20.00	1600.0	Principal triangulation of United Kingdom.

Datum is an imaginary line parallel with the horizon and equally with the lines of collimation. The Ordnance datum

of this country is the approximate mean water at Liverpool. A reduced level is a calculated height above datum.

202. Paint for Iron Cisterns: Kind Required.—"Waterworks" writes: I shall be much obliged if you will kindly inform me the best and most suitable paint for using on the interior of large iron service reservoirs. I have a circular iron service reservoir of 100,000 gallons capacity, the sides of which are built up of wrought-iron sheets and the bottom of cast-iron plates, which need repainting. The paint used must be quick drying, and enable the work to be done expeditiously, non-poisonous and tasteless, so that no danger or nuisance is caused to consumers through the lack of either of these qualities.

For painting a service reservoir used for domestic water supply an oxide of iron paint must be used (as lead paints in any form will be dangerous). We advise the querist to write the Torbay Paint Company, 26 to 28 Billiter-street, London, E.C., or to Messrs. Young & Marten, Caledonian Works, Stratford, London, E., for prices of oxide of iron paints and inform them of the special requirements, which, we have no doubt, will be readily met.

A NON-MANTLE INCANDESCENT GAS BURNER.

We give an illustration of what is described as a "non-mantle" incandescent gas burner (Billing's patent). For this invention it is claimed that, unlike the mantle system of gas lighting, the highest candle-power obtainable is extracted from the constituents of the gas itself without the use of any mantle, and we are told that the principle by which this result is achieved is the heating of the air so as to secure that the whole of the carbon of the gas is brought to the highest state of incandescence. To secure this result an Argand burner with two chimneys and a small expansion and heating chamber just below the burner proper are used. The air supply in being drawn down between the two chimneys is heated, and the expansion chamber, which is filled with filtering material, aids in heating the gas, which then combines rapidly with the heated air. The advantages claimed for this burner are that it provides an absolutely pure white light, without a greenish tint; that it effects a considerable saving in the consumption of gas; that it is not troublesome or difficult to manage; the illuminating power is considerably increased; that it gives a light of about 30 candle-power with a consumption of 5 cubic feet of gas per hour. The burner is provided by Billing's Burner Syndicate, Limited, 180 Wardour-street, W., where it can be seen in operation.

WATER GAS.

The Public Control Committee of the London County Council have received a letter from the departmental committee of the Home Office which is considering the questions of the manufacture and supply of water gas, asking for the opinion of the council on the subject. The Public Control Committee now report that, having carefully considered the matter, they have come to the following conclusions, which they have communicated to the departmental committee:—

- (1) That considerable danger arises from the introduction of water gas in the process of the enrichment of water gas;
- (2) that non-carburetted and non-odorized water gas should not be allowed to be used under any conditions, since it is devoid of smell which would give warning of any escape of the gas;
- (3) that 25 per cent. should be the maximum amount of water gas allowed to be introduced in the enrichment of coal gas, the proportion of water gas being ascertained by determining the amount of carbonic oxide in the enriched coal gas (coal gas enriched to this extent would correspond in poisonous character to the Dowson gas which is already in use for heating purposes and for gas engines, and would exclude the use of carburetted water gas);
- (4) that when it is proposed to supply poisonous enriched gas to houses and the interior of buildings a proper inspection be made of the service pipes by a responsible officer appointed by the local or other suitable authority, who should certify that the pipes are in a sound condition and that there is no escape of gas, and that the cost of such inspection be borne by the gas company.

Tunnel Explosion.—Ten persons were killed on Monday evening by an explosion of gas in one of the tunnels in process of construction under Lake Erie in connection with the Cleveland city waterworks. The bodies are lying about 6,000 ft. inside the tunnel. A rescue party penetrated to a distance of about 5,000 ft., but were compelled to return.

Parliamentary Memoranda.

On Thursday, in the House of Lords, the Sealam Harbour Bill, the Norwich Electric Tramways Bill and the Cardiff Corporation Bill were read a third time and passed.

In the House of Commons the London County Council (Money) Bill, the St. Thomas, Southwark, and St. Saviour, Southwark, Bill, the Yeovil Corporation Bill, and the Devon, Plymouth and Stoke Tramways Bill were read a third time. The Lords' amendments to the Southend Water Bill were agreed to.

In the House of Lords, on Friday, the Drogheda Gas Bill, the Cromer Gas Bill and the Wigan Corporation Bill were read a third time and passed.

In the House of Commons the Dundee Corporation Tramways Bill, as amended, was considered and ordered for third reading.

In the House of Lords, on Monday, the West Ham Corporation Bill was read a second time. The Chelsea Electricity Supply Bill, the Sheffield Corporation Bill and the Plymouth Corporation Bill were read a third time.

In the House of Commons the Lords' amendments to the following Bills were agreed to: Cranbrook District Water Bill, Crawley and District Water Bill, East Ham Improvement Bill and Wislaw Water Bill. The Liskeard Corporation Water Bill was read a third time, as were also the St. Helens Corporation Bill and the Kenfrew Burgh and Harbours Extension Bill. The following Bills were read a second time: Newcastle and Gateshead Water Bill, Ruchdale Corporation Water Bill and Todmorden Corporation Water Bill.

On Tuesday, in the House of Lords, the Higham and Hindred of Ho Water Bill was read a third time.

In the House of Commons the Lords' amendments to the Norwich Electric Tramways Bill and the Cardiff Corporation Bill were agreed to. The Dundee Corporation Tramways Bill and the Keighley Corporation Bill were read a third time and passed.

On Wednesday, in the House of Commons, the Hleywood Corporation Bill was ordered for second reading. The order for the second reading of the Saperannation (Metropolis) Bill was read and discharged and the Bill withdrawn.

Local Government (Ireland) Bill.—The House, sitting as a committee, have given further consideration to this measure during the past week. The debate was again adjourned on Wednesday.

PRIVATE BILLS IN COMMITTEE.

Stirling Gas Bill.—The Bill promoted by the Stirling Gas Company for the purpose of obtaining statutory powers to supply gas in the burgh has for some days been under the consideration of a committee of the House of Commons presided over by Colonel Gunter. The Bill had been opposed in the Lords by the Corporation of Stirling, but, notwithstanding that opposition, the committee, who were presided over by the Duke of Richmond, passed it, and the corporation now removed their opposition in the Commons. It was the second Bill on the subject of gas legislation for Stirling which had occupied the attention of Parliament. The first Bill was introduced by the corporation to acquire the gas undertaking under an agreement with the gas company. That was opposed by certain ratepayers, and failed to pass the Lords. The question of purchase having been thus disposed of, the company wished to place themselves under Parliamentary control and to become a statutory company. The corporation were in the position of rival traders, as they had taken up and were pushing the supply of electric light. The effect of the new powers sought would be this: A statutory company conducted their business subject to penalties if the statutory conditions were not complied with. A non-statutory company had more freedom, no restrictions in price or quality of gas, and liberty as to expenditure; but, on the other hand, they have no power to break up the streets. That power existed only on sufferance. The capital powers taken under the Bill amounted to £10,000, and of that amount £30,000 was taken as bearing interest at 10 per cent., and the balance of £10,000 at 5 per cent. The corporation contended that all the capital should be put on the 5 per cent. basis. The advantages to the public under the Bill, as stated by the witnesses called in support of it, were that they would be secured of gas of not less than 22-candle illuminating power, and as to price, it had been worked down to 3s. 4d. per 1,000 cubic feet, and from that the company did not propose to depart, but to provide against strikes and other emergencies. It was originally proposed to fix the standard price under the Bill at 3s. 8d., and in the other House, as the result of the evidence of one of the experts, they agreed to reduce the figure to 3s. 6d. It was further proposed that there should be a sliding scale, which would give the public an interest with the company in the success of the undertaking. The contention of Mr. Blenöerhasset, on behalf of the corporation, was that the Bill should be amended in three particulars. First, with reference to capital, the corporation regarded it as excessive; second, with reference to the standard price, it ought to be reduced; and third, the corporation were anxious to preserve the rights of the ratepayers under the Burgh Gas (Scotland) Act until November next, so that the ratepayers, if they wished to do so, might decide as to putting

the Act into force and buying up the gas company, or, if the gas company refused to be bought up, of starting a gas undertaking themselves. Where the gas company had not statutory powers the ratepayers had the powers of buying existing gasworks or of establishing gasworks of their own. There had been negotiations with regard to the acquisition and arbitration before Sheriff Lees as to the terms, and the question at issue was between a minimum of £61,000 odd and a maximum of £69,000 claimed by the company. A good deal of discussion took place on Monday, with a view to a settlement, and ultimately the Bill was passed with some modifications. Clauses were inserted providing that the capital should be £24,000 at 10 per cent., and £16,000 at 5 per cent., the expenditure on repairs to come out of the revenue. The standard price of gas was fixed at 3s. 4d., instead of 3s. 6d., as proposed, and the illuminating power at 25 candles.

Keighley Corporation Bill.—A Bill promoted by the Corporation of Keighley for powers to construct additional waterworks, to purchase land for the protection of the water, to make new streets, to carry out an important scheme of street improvements, and to extend the authority of the corporation in relation to various matters connected with the public health, was under the consideration of the committee of the House of Commons on Streets and Sanitary Regulations, on Tuesday. It appeared that under their Waterworks Extension and Improvement Act of 1869 the corporation were empowered to construct certain waterworks, and it was now considered expedient that the time limit of some of the works not yet completed should be extended, and that the corporation should be empowered to construct a reservoir in substitution for the Bally Trees reservoir, authorised by the Act of 1869. It was also deemed necessary to acquire lands within appropriated areas, for the purpose of preventing the pollution of the water. The new reservoir which it was now proposed to construct to be known as the New Bally Trees reservoir, situated in the parish of Ilaworth in the West Riding, was to be formed by means of an embankment, 196 yards in length, across Sladen brook at a point near South Bank bridge. The scheme embraced embankments, ways, wells, settling and other tanks, basins, gauges, filter-beds and so forth. Mr. W. H. Hopkinson, the borough engineer, and Mr. Fox, M.L.C., explained the nature of the works, stating that the difference between the scheme as now submitted and that of 1869 simply lay in the raising of the embankment 4ft. or 5ft., in order that the reservoir might hold more water. Some discussion took place in reference to what was known as the Jarrigate clause, in which the county council were authorised to test the water in the reservoir in order to ascertain whether it was free from pollution by lead, but this was objected to by Alderman Brigg, on the ground that it was useless to test the water in the reservoir, seeing that the filtration process which purified the water took place after it left the reservoir. Every precaution was being taken that the water supplied to the consumer should be absolutely free from impurity. The committee passed the waterworks clauses. With regard to the street improvements within the borough, it was explained that they were urgently required in the interest of the public. The improvements included a new street commencing in Church Green and terminating at the entrance to Springfield mills in Oakworth-road, an alteration of the gradient of Westgate, and widenings in South-street, Cook-lane, Spring-street, Berry-lane, Marlow-street, Skipton-road, Lawksholme-lane, Brown-lane, Aireworth-street and Cornmill Bridge-street and a footbridge across the Midland railway to East-avenue. These improvements were sanctioned by the committee, who also approved clauses enabling the council to work the tramways by electric power, and the construction and maintenance of dynamos for the purpose of generating electricity. Provisions were also agreed to constituting the corporation the burial board of the borough, and empowering them to make better provision with reference to the sewers and drains in the borough, and to borrow £45,000 in respect of the additional waterworks and £205,000 for the purchase of land and the carrying out of the street improvements already described.

St. Helens Corporation Bill.—The House of Commons Committee on Police and Sanitary Regulations have passed the Omnibus Bill promoted by the Corporation of St. Helens for the acquisition of the tramways and for powers to carry out a number of improvements in the borough. With reference to the tramways, powers were sought to construct various new lines in or near the borough, to work them by electric power, to construct electric works, and to purchase the tramways within and without the borough owned by private companies. Very little difficulty was experienced in getting through the tramway clauses. The mayor of St. Helens stated that the corporation proposed to supply electric traction and to arrange for the carriage of goods as well as passengers at reasonable rates on the cars. The Bill contained provisions relating to extensions of time for street improvements and the compulsory acquisition of land. The improvements, he said, had long been necessary, but they had been postponed owing to depressed times. It was, however, intended to carry them out as soon as possible. Clauses were inserted in the measure allowing the corporation to lay mains outside

the borough area for the purpose of supplying the outside districts with water, and for establishing a reserve fund in the place of the present depreciation fund. An important part of the Bill related to sanitary matters. It was explained on behalf of the corporation that it was proposed to establish a water-carriage system of closets. To this the Corporation of Warrington objected, on the ground that the sewage would flow into a certain brook through the borough of Warrington, and would be injurious to the health of the inhabitants of Warrington. The question of sewage had been one of much difficulty in St. Helens. Sir Edward Frankland having given evidence in support of the scheme, the committee sanctioned the clauses, but suspended their operation until the certificate of the Local Government Board was passed. The committee passed the Bill, which was afterwards reported to the House.

Dundee and Aberdeen Corporations Tramway Bills.—When the tramway Bills promoted by the Corporations of Dundee and Aberdeen, which had previously been passed by the House of Lords, came before a Commons committee, presided over by Mr. De Tatton Egerton, a serious blow was struck at the municipalisation of tramways. The two Scottish corporations, seeing the success which had attended the efforts of other corporations by the acquisition and working of tramways, entered into an arrangement with the existing companies to purchase the undertakings. The Bills to give effect to the purchase were opposed in the case of Dundee by the Caledonian and North British Railway companies and in the case of Aberdeen by the Great North of Scotland and Caledonian. The grounds of the opposition were that the tramway systems might become a burden upon the rates, and that it was unfair to allow corporations to use public funds to compete with private companies. To the surprise of the Corporation of Dundee, whose Bill was first considered, the committee decided to pass it on condition that the corporation maintained the fares at such a figure as would ensure the tramways showing a surplus on the balance-sheet to be annually prepared. In the event of a loss arising in the working in any year the amount was to be carried to a suspense debit balance to be met by an increase in the fares sufficient to cover the deficiency. The railway companies, as the largest ratepayers in the two towns, had strongly objected to being taxed to support a competition which would in certain parts enter into their carrying trade. The corporations contended that in consequence of this new proviso they would be unable to borrow money for tramway extension on such favourable terms as they would otherwise have been able to do. Sir James Thompson, the general manager of the Caledonian company, estimated that were the tramways taken over by the corporation there would be an annual deficit of £1,500, which, with £3,000 for renewals, would give a total deficiency of £4,500, which would have to be made up from the rates unless the receipts were increased. With regard to the Aberdeen case, Mr. Alexander Copland, manager of the Aberdeen Commercial Company, considered that the bargain proposed was most improvident, that it had been based upon a fool's valuation, and that it was altogether intolerable. Mr. John Fleming, chairman of the Tramway Committee of the Aberdeen Town Council, thought different, however. He held that the result of the acquisition would be accelerated speed, cheaper fares and extensions. Both Bills were passed with the stipulation with regard to fares already specified, and, as regards the Aberdeen Bill, some additional provisions were incorporated to meet the local circumstances.

Manchester Carriage Tramways Company's Bill and the corporation opposition.—A House of Lords committee, sitting under the presidency of the Earl of Northbrook, have had under consideration the Bill promoted by the Manchester Carriage and Tramway Company to obtain powers to work the tramways by electricity. The Bill provoked much opposition, among the petitioners against it being the Corporations of Manchester, Salford, Oldham and Eccles, and the district councils of Levenshulme, Heaton Norris, Moss-side, Stretford, Withington and Denton and Gorton. The company sought power to enable them to work their tramways by electricity, with the consent of the local authorities through whose areas they passed. The Manchester Carriage Company was a powerful body founded some years ago with the assent of all parties, and the characteristic feature of its operations was that there was a common service converging on the centre of Manchester from all the surrounding districts. In some parts the company were the owners of the tramways; in others they were simply the lessees. The leases expired at different times, and inasmuch as portions of the tramways were constructed at different dates, the period when the right of purchase could be exercised by the local authorities varied in different districts. Hence, unless something could be devised by which the common application of electrical traction to the whole system could be arranged, the public must suffer because there were, for example, tramways owned by the Corporation of Manchester and leased to the company, and the corporation had determined to adopt electric traction in regard to their lines, though they had sought the power to work by this method within their own area only. The Corporation of Manchester regarded the proposal as an interference with the city, which should not be sanctioned by Parliament. They had resisted successfully all attempts to give Parliamentary powers to companies to interfere with the streets of the city, and an electric supply

for tramway traction in the hands of a company would be particularly objectionable. Some of the tramway lines within the city belonged to the corporation and some to the company, but this anomaly would be put an end to by the corporation exercising their statutory powers of purchase which accrued as to a portion of the tramways on the 23rd July next, and as to the residue, with the exception of two short lengths, in Bradford and Crumpsall, in the year 1899. The corporation were authorised by provisional orders to supply electricity within the city, and they strongly objected to the introduction of a second electrical undertaking. They were also authorised to enter into agreements with local authorities adjacent to the city for the supply of electricity. Other district councils in the vicinity of Manchester had obtained provisional orders, which were confirmed by Parliament in the same session, for the supply of electricity within their respective districts. Moreover, the city council, at a meeting held on the 1st December, 1897, determined themselves to work, demand and take tolls upon the tramways of the city at the expiration of the existing leases and to use electricity from their own electrical undertaking as the motive power. The objections of the other local authorities concerned were of a like character. As there was no evidence to show that either Manchester or Salford would give the company power to work these lines when the present arrangements expired, the committee found that the preamble, so far as the broad scheme was concerned, had not been proved. On the application of the agents of the Bill the committee made an exception in favour of clauses relating to the consolidation of the company's capital. To this part of the measure there was no opposition, so that unlike the rest of the Bill it went through.

Folkestone Water Bill.—The Bill promoted by the Folkestone Waterworks Company for powers to extend the limits of their supply, to construct additional waterworks, and to raise £250,000 additional capital, was passed by a House of Commons committee, presided over by Colonel Gunter, on Wednesday. The Bill, when before a committee of the House of Lords earlier in the session, had to face enormous opposition. The Corporations of Folkestone and Dover were arrayed against it, and quite a number of other petitioners. The Corporation of Folkestone opposed it, because for the purpose of acquiring the undertaking they were promoting a Bill of their own, which the Lords rejected. The Corporation of Dover were antagonistic because they feared that the new works which the company proposed to carry out would interfere with their supply, but as to this overwhelming expert evidence was adduced to show that there would be no interference. The Folkestone Corporation had threatened to continue their opposition in the Commons, but they had withdrawn their petition before the Bill came up for hearing. Several councillors opposed the measure, however, in their capacity as consumers of water, and some half-a-dozen other private petitioners, their principal objection being that the powers sought by the company were too extensive as regards the works they contemplated and the capital they proposed to raise. The chairman of the Folkestone Waterworks Company stated that the works proposed were sufficient to give Folkestone a constant supply of pure and wholesome water for the next fifteen or twenty years. Mr. C. J. Hawkesley, M.A.E., consulting engineer to the company, described the nature of the works by which the water was to be obtained from the chalk wells and pumped into the reservoir. He admitted, in cross-examination, that at certain periods of the year there had been some justification for complaints as to the purity of the water on account of there being a certain amount of vegetable growth through the supply being interrupted, but this would be obviated by the cementing of the reservoir and by the supply being made constant. While the water might have been short in quantity, and at times discoloured, it had never been unwholesome.

Halifax Corporation Bill.—The Bill promoted by the Corporation of Halifax for powers to construct additional water works, tramways and street widenings and to amend certain provisions of the local Acts within the borough, was passed by a committee of the House of Commons, under the presidency of Colonel Gunter, on Thursday last. The principal object of the Bill, which had gone through the House of Lords earlier in the session, was to obtain an additional supply of water for the town, which had increased very considerably of late years, and was still increasing. The continuous growth of the population rendered the tramway extensions desirable. The committee found the preamble of the Bill proved.

Compulsory Ventilation in Bombay.—Under the Epidemic Diseases Act the Municipal Commissioner for the city of Bombay is now empowered to interfere in the constructive details of any house the use of which as a dwelling has been or may be prohibited under Clause 1 of a Government notification dated February 10 and March 5, 1897. He may require the owner thereof within not less than forty-eight hours to put in hand and diligently complete such structural alterations as may be prescribed. If within the stipulated time the order is not complied with the commissioner may have the work done and paid for out of the municipal fund, and shall recover the outlay in the same manner as is followed under the provisions of the City of Bombay Municipal Act, 1888.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a *nom de plume*.

PUBLIC HEALTH ACT, 1875, SECS. 216 AND 269: LOCAL IMPROVEMENT ACT: EXTENSION OF DISTRICT: HIGHWAY RATE.—In framing an order for the extension of the boundary of an urban district under the powers of the Local Government Act, 1894, a county council should carefully consider the provisions of any local Act affecting the district, and should take care that the order contains clauses either repealing or modifying any of such provisions which may be unworkable or inconvenient in the altered state of circumstances. For lack of such precautions with respect to an order of the Devonshire County Council, a complicated problem had to be unravelled by the Queen's Bench Divisional Court in *Hill v. Crediton Urban District Council*. The material facts were as follows: By the Crediton Improvement Act, 1836, provision was made for paving, lighting, watching, cleansing and otherwise improving the town of Crediton; the limits of the town for the purposes of the Act were defined; the commissioners appointed under the Act were empowered to assess a rate, under the name of the "Crediton Improvement Rate"; and the ratepayers within the limits of the Act were exonerated from contributing towards the repairs of the highways in the part of the parish beyond the limits of the Act, and the owners and occupiers of property in the latter part of the parish were exonerated from contributing towards the repair of highways within the limits of the Act. An appeal to quarter sessions was given against rates made under the Act, and it was provided that the quarter sessions might amend the same. Under the Public Health Act, 1875, the district within the limits of the Improvement Act became an urban district, and the commissioners under that Act became the urban authority for that district. At the time of the passing of the Local Government Act, 1894, the parish of Crediton was situate partly within the urban district of Crediton and partly within a rural sanitary district, and the several parts of the parish would (apart from any order under that Act) have become separate parishes under that Act. By an order, 1894, made by the Devonshire County Council and confirmed by the Local Government Board, under sec. 36 of the Local Government Act, 1894, and sec. 57 of the Local Government Act, 1888, the urban district of Crediton was, however, extended by the addition thereto of the part of the parish of Crediton formerly within the rural sanitary district, but the order did not repeal, extend or amend the Act of 1836. On September 22, 1896, the Crediton Urban District Council made a rate, which they termed "The Crediton Improvement Rate," on the tenants and occupiers of land and tithes in the town and parish of Crediton, within the limits of the Act of 1836. The appellant was rated in respect of property within the limits of that Act. The rate was levied to defray expenses to be incurred for the purposes of the Public Health Act, 1875, including the purposes for which rates were leviable under the Improvement Act; and in part for the repairs of highways both within the limits of that Act and within the added portion of the district. The appellant appealed to quarter sessions, contending that the rate was bad. The quarter sessions held that they had power to amend the heading of the rate by expressing that it was made not only under the Crediton Improvement Act, but also under the Public Health Act, 1875, and they ordered it to be so amended, and held that, so amended, it was good. The High Court, however, while upholding the power of the quarter sessions to amend the rule, came to the conclusion that notwithstanding such amendment the rate was still bad. The judgment is too lengthy for reproduction, but it will suffice to give in outline the reasoning on which it was based. Within the area of the old local Act the council can, in exercise of the powers of that Act, make one rate for general purposes similar to those of the Public Health Acts, plus watching. Within the added area there is no such power, and no power to make any rate confined to that area. The only rate that can be made for expenses incurred within that area is a general rate, which must cover the whole of the enlarged district. Any expenses incurred for highways in the added area therefore must be paid for out of the rate for the whole district. But by the local Act the ratepayers of the old area are exempted from contributing to repair of highways in the added area, and *vice versa*. Therefore, in making the rate, the highway expenses of the two areas should have been dealt with separately, and the rate in the pound of such respective areas modified accordingly. This, however, had not been done, and therefore the rate was bad. Such a mode of dealing with the rate would probably be found difficult, or at least inconvenient. But, as Mr. Justice Wills pointed out, the remedy for this state of things is to be found in a fresh order, either repealing or amending those sections of the local Act which clash with the present altered state of things

SALE OF LAND BY LOCAL AUTHORITY: RESTRICTIVE COVENANT: CONDITION OF PURCHASE.—An interesting point arose in the recent case of *Holford v. Urban District Council of Acton* (Chancery Division, Mr. Justice Stirling, June 18th). The council (or their predecessors) having acquired certain land, under their compulsory powers, for the purpose of street improvements, offered a portion thereof for sale by auction in lots in 1894. One of the conditions of sale provided that the purchasers of certain specified lots should in their conveyances enter into covenants with the vendors to erect within two years from the day of sale upon each of the lots bought by them a shop and dwelling-house of not less value than £650. One of these lots was bought by the plaintiff, who erected a shop and dwelling-house in compliance with the condition. Certain of the lots, however, were not sold, and the council had recently determined to erect upon these lots a fire-engine station, which was required for the purposes of their district; and the sanction of the Local Government Board had been obtained to the issue of a loan for the purpose of providing the necessary funds. The plaintiff asked for an injunction to restrain the council from erecting the proposed fire-engine station or any buildings other than shops and dwelling-houses of the value prescribed by the condition, his contention being that the council were themselves bound by the conditions subject to which the land was put up to auction. For the council it was argued, first, that the covenant was affirmative in form, and there was no negative stipulation not to erect upon the land any buildings other than shops or dwelling-houses, and, as no such negative stipulation could be implied, the defendants could not be restrained by injunction. Secondly, they contended that even if the covenant could be enforced as between the respective purchasers, it was not binding as against the defendants, inasmuch as it would be beyond their powers to subject the land in their hands to a restrictive condition which would have the effect of preventing them from dealing with it for the purposes of the requirements of their district. Mr. Justice Stirling came to the conclusion that, having regard to the authorities, no negative stipulation could be implied in the condition. That being so, the restrictive covenant could not be enforced against the defendants, and the action failed and must be dismissed, and (except as to a special direction on one point) with costs as between solicitor and client, pursuant to the powers of the Public Authorities Protection Act, 1893.

PUBLIC HEALTH ACT, 1875, SEC. 132: EXPENSES INCURRED BY AUTHORITY IN MAINTAINING CHILD IN HOSPITAL: LIABILITY OF PARENT.—The above section, it will be remembered, provides as follows: "Any expense incurred by a local authority in maintaining in a hospital, or in a temporary place for the reception of the sick (whether or not belonging to such authority), a patient who is not a pauper, shall be deemed to be a debt due from such patient to the local authority, and may be recovered from him at any time within six months after his discharge from such hospital or place of reception, or from his estate in the event of his dying in such hospital or place." In the case of a child patient, is his parent liable under this enactment to pay to the authority the expenses incurred by them in maintaining the child in the hospital? One would have thought that it scarcely needed an appeal to the law to determine this question. Yet, in the recent case of *Hill Corporation v. MacLaren* (Queen's Bench Divisional Court, 20th May), the county court judge had given judgment against the father of a child who had been treated at a hospital belonging to the corporation for 26 7s. in respect of the child's maintenance. That judgment, however, has been reversed by the High Court. Mr. Justice Ridley said: "I am of opinion that the decision of the learned county court judge cannot be upheld. It is clear from the note which the learned judge has supplied to us that he was under the impression that the liability for the maintenance of the child was cast on the father by the Public Health Act, 1875. But, from a perusal of sec. 132, on which the corporation relied, it is evident that such liability is cast on the "patient" only. The real question which should have been considered below was whether, apart from the statute, the parent had contracted, either expressly or by implication, to pay for the maintenance of his child in the hospital. But that question was not considered by the learned judge, nor are we entitled to consider it here, though I think it is clear that the parent did not agree to pay for the maintenance of the child. The real point was not considered; under the statute no such liability is cast on the parent. The appeal must succeed."

BY-LAW: VALIDITY: REASONABLENESS: RESTRICTION ON PERSONAL LIBERTY.—An important case in connection with the subject of by-laws is *Kruse v. Johnson* (Queen's Bench Divisional Court, 14th May), in which a specially-constituted court of seven judges pronounced the following by-law to be valid (Mr. Justice Mathew dissenting)—*viz.*: "No person shall sound any musical instrument within 50 yards of any dwelling-house after being required by any constable, or by an inmate of such house, or by his or her servant, to desist." The appellant, who had persisted in conducting an open-air religious service after having been required by a constable to desist, was convicted by the magistrates of an offence against the by-law. The appellant contended that the by-law was unreasonable and bad, because it made the mere fact of sounding an instrument an offence—without adding "to the annoyance of the public," or words to a similar effect. The Court, however, upheld the conviction on the somewhat novel ground that the by-laws of a public body cannot be other than reasonable, owing to the safeguards provided by statute law—*viz.*, the presence of two-thirds of the council to pass them, their exhibition for forty days at the town hall, and the postponement of their operation for forty days after the sending of a sealed copy to the Secretary of State—within which time the Queen, on the advice of the Privy Council, may disallow them. The dissenting judge thought, nevertheless, that it was the duty of the Court to disallow any by-law which seeks to impose a restriction on personal liberty (like the one in question), and there are undoubtedly precedents for this view (see, as instances, *Munro v. Watson*, 57 L.T. [N.S.], 366; *Strickland v. Hayes*, *THE SURVEYOR*, vol. ix., p. 217). From the point of view of local authorities the decision is a satisfactory one, establishing as it does more firmly than ever their *imperium in imperio* in matters regulated by by-laws. Whether it will be equally welcome to the general public is somewhat doubtful.

QUERIES AND REPLIES.

COMBINED DRAIN: ALLEGED NUISANCE: LIABILITIES OF OWNER.—"H. M. F." writes: A row of labourers' houses are drained by a sewer which runs through the yards in the rear, and in each yard there is a gully trap and connection with this sewer. The houses all belong to the same owner, who has been served with a notice by the sanitary authority that a "nuisance exists by reason of defective drains, traps and connections," and requiring him "to provide proper drainage and ventilation to same, with suitable gully traps and disconnecting traps where necessary." The gully traps and connections were put down a few years since under the direction and supervision of the sanitary authority, and all appears to be working well, but it seems that the object of the sanitary authority is to try and force the owner to make a new "sewer" in the rear, as they call the present "sewer" a "drain," and allege that it is defective. They have not mentioned the word "sewer" in their notice, but they have verbally ordered the owner to open the present sewer for their inspection and testing. The owner has declined to do so, or to remake or repair the "sewer," but undertakes to do that part of it only which he states is a "drain"—*viz.*, from the commencement at the first house up to the point at which the drainage of the second house enters it—and he states that the remainder is a "sewer" to be repaired and maintained by the sanitary authorities from the above point onwards to its junction with the street sewer, which it joins by passing under a passage across the end of the row out to the street. The owner has also consented to make good any defective gully traps and connections with the "sewer" from the yards. The sanitary authorities are not satisfied with the proposals of the owner, and are proceeding against him by way of alleging "a nuisance by defective drains, traps and connections." (1) Is the owner bound to do anything more than he has consented to do, as above stated? (2) Is he bound to open any part of the "sewer" for inspection and testing? (3) In case of opening, repairing or remaking the "sewer," who would be responsible for restoring the yards and premises disturbed in the work? (4) If the owner is summoned for "the existence of a nuisance," and an order made against him (so as to endeavour in this way to force him to reconstruct the "sewer"), what course should he adopt supposing he is right in his contention?

(1) and (2) In my opinion he is not bound either to repair or to open any portion of the combined drain beyond the point where it becomes a "sewer." (3) The combined drain being (from the point where the drainage of the second house enters it) a "sewer" vested in the local authority, it is for them (not the owner) to open and repair it from that point. Any drainage occasioned would be a matter for compensation under sec. 308 of the Public Health Act, 1875; or, in the event of damage arising by reason of the work being negligently done, an action would lie against the authority (*Brise v. Great Western Railway Company*, 31 L.J., Q.B. 101). (4) He should oppose the summons before the magistrate on the ground that the "sewer" is repairable by the authority, and in the event of the decision going against him should apply to the magistrate to state a case for the opinion of the High Court. If the magistrate refuses, application should be made to the High Court for a *mandamus*.

BUILDING OPERATIONS: RESTORATION OF FOOTPATH.—"Municipal Surveyor" writes: I shall be obliged if you will allow your legal editor to give his opinion upon the following case: A builder applied for permission to erect a hoarding and occupy part of the footpath in a dedicated street in connection with repairs to a building, expressly stating that the

footpath would not be interfered with. An undertaking was signed by the builder that if the paving was interfered with he would reinstate it to the satisfaction of the local authority and maintain it for twelve months, or, in default, authorising the local authority to do the work at his expense. A fee of 10s. was paid for the permit, this being returnable when the hoarding was removed, provided no damage had been done to the paving. When the return of the fee was applied for the path was examined, and it was found the flagging round a gantry door had been taken up, the gantry removed and a larger one fixed in a new position 2 ft. from the old, this being done without any notice or permission whatever. The builder gave the authority an order to reinstate the flagging round the new gantry frame, but they were not satisfied with this, and desired to proceed against the responsible party for enlarging and altering the position of the gantry without their consent. It is, however, stated that proceedings cannot be taken against either the owner, his architect, the contractor for the alterations or the sub-contractor who undertook the work connected with the gantry, but only against the man who actually did the work, as the offence is against the criminal law. The name of this man is certainly known, but the only evidence is that of his master, the sub-contractor, who told him to do the work and knows it was done, but did not actually see the man do it. An opinion is desired as to whether the corporation has any remedy against any person in this rather important case, and as to whether they would be justified in regarding the altered gantry as a new one, filling it up and flagging over it, and whether they could recover the expense of so doing from any of the parties.

There would, no doubt, be considerable difficulty in proving the criminal offence. The authority could, however, proceed against the builder for specific performance of his undertaking.

THE TELEPHONE SERVICE.

At Tuesday's meeting of the Select Committee of the House of Commons dealing with this subject Mr. Hanbury again presided.

Mr. W. A. PREECE resumed his evidence and supplied statistics comparing the extent of the telephone service in Glasgow, Cologne, Liverpool and Hamburg. He found that Glasgow, with a population of 656,000, had 7,612 telephone instruments; Cologne, with a population of 292,887, had 4,113 instruments; Liverpool, with a population of 860,000, had 10,935 instruments; and Hamburg, with a population of 573,792, had 13,561 instruments. As to London and Berlin, the population of London within the municipal area was 4,200,000, and there were 25,724 instruments, while in Berlin, with a population of 1,578,794, there were 36,620 instruments. In the course of further evidence he said that, however cheaply a municipality could establish a telephone system, the Post Office could always establish a cheaper one. The Post Office already had the powers, they had a monopoly, they had the buildings, the administration, the organisation and the experience, and they had a technical staff of the very highest skill and better fitted for looking after a telephone system than any staff in the world. The desire to hand over the telephone service to the municipalities was based on three assumptions. First, that the Post Office could not do the work properly and cheaply; secondly, that the telephone company did not do the work properly; and, thirdly, that the municipalities could do the work better and cheaply. All those three assumptions were wrong.

CORRESPONDENCE.

Lead-lined Iron Pipes.—Mr. Edwin C. Hiscox, secretary of the Sanitary Lead-lining and Pipe-bending Company, Limited, 55 Chancery-lane, writes: Referring to queries 193 and 198 in your issues of June 24th and July 1st, I beg to inform you that the whole of Messrs. Brighton & Jennings' interests in the lead-lined iron soil pipes and other patents have been acquired by this company, who have put down a very extensive plant at their works as above, and will, within the next fortnight, be prepared to execute orders, several being in hand already. With reference to your remark that you think the lead-lined pipes would have a very limited use, the members of this company have every reason to believe otherwise, as, in addition to the fact that the lead-lined pipes and patent joints are admittedly superior to any at present in use, work can be carried out with them at a cost of about 10 per cent. less than it would be if lead only was used.

Municipal Opera Houses.—In connection with the recent petition to the London County Council in favour of a municipal opera house, a deputation of musicians waited, on Monday, upon the General Purposes Committee of the council. Sir Alexander Mackenzie, principal of the Royal Academy of Music, who acted as spokesman, delivered an interesting address, in which he strongly advocated the scheme of an opera house partly owned by the municipality as an incentive to native talent and as a means of bringing the refining influence of operatic music within the reach of the masses.

Municipal Work in Progress and Projected.

Considerable activity prevails among municipal authorities, both in the metropolis and in the provinces. The most important works mooted this week will be found under the paragraphs relating to Battersea, Bolton, Burnley, Leicester, Maldon, North Berwick and Warrington.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

The most notable feature of Tuesday's meeting of the council was the decision come to with respect to the purchase of the tramways. The matter has been under consideration for some time, and, on Tuesday, after some discussion, the council decided to buy up the undertaking and work it themselves. Mr. Benn, chairman of the Highways Committee, stated that the net profit of the company was £85,000, and he believed that the council could work the lines as well as the company. The council also decided to insert a clause in one of their Bills to be promoted in the next session of Parliament for the purchase of the freehold and leasehold interests in Spitalfields market.

Loans for Local Works.—Upon the recommendation of the Finance Committee, it was agreed to lend the Hammermith Vestry £15,500 for electric lighting purposes; the Islington Vestry £16,700 for similar purposes and £2,200 for street improvements; the Poplar District Board of Works £9,200 for paving works; the Stoke Newington Vestry £3,000 for wood paving; and the St. Pancras Vestry £21,590 for the purchase of a site for baths and the erection of conveniences.

The Purchase of the Tramways.—The Highways Committee presented a report recommending that the offer of the London Tramways Company to take a lease of their undertakings after they had been purchased by the council should not be entertained. The committee proposed at a later date to present a report with regard to the arrangements to be made for the efficient working of the lines after they had come into the possession of the council. The date named for the transfer was December 31st, and in the meantime the committee reported that they were negotiating the terms of the purchase. They recommended the council to authorise them to continue on the lines indicated in the report. Mr. Benn, chairman of the committee, in moving the adoption of the report said the company had expressed their willingness to pay £10,000 a year as rent for the lines if the council would agree to the present hours of labour being retained. For the buildings a rental of £17,000 was offered, and it was computed that the net profit to the council for leasing would be £35,000 a year. He found that the net profit of the company was £85,000 a year, which with £10,000 a year for incidental expenses, which were incurred by the company and would not be by the council, made £95,000. They had to assume that the council could work as well as the company, and that would mean that the working showed a gain of £60,000 over leasing. Some discussion followed, in the course of which Mr. B. L. Cohen, M.P., moved as an amendment to the proposal "that the committee should be authorised to negotiate for purchase, so that the council would become possessed of the whole of the lines on the last day of the present year; that the negotiations should be suspended; and that the Finance Committee should be, in the meantime, instructed to report on the financial part of the question." The amendment was, however, rejected and the report and recommendation finally approved.

Light Railways Virtually Tramways.—The Parliamentary Committee recommended that they should be authorised to take the necessary steps for supporting the objections to the London, Barnet, Edgware and Enfield Light Railways order, the committee contending that the so-called "light railway" was virtually a tramway, and that therefore it was necessary in the interests of the ratepayers that the provisions of the Tramways Act should apply. This was agreed to.

Electric Lighting on the Embankment.—Lord Russell asked whether tenders had been invited for the electric lighting of the Embankment; and, if not, whether the chairman of the committee could hold out any hope of the work being undertaken at an early date. Mr. Benn said that tenders had not yet been invited, but he would call the attention of the Highways Committee to the matter.

Proposed Purchase of Spitalfields Market.—The Public Control Committee again submitted their report recommending the council to suspend the standing order which refuses to allow legislative proposals to be considered after the first meeting in June, the object being to enable a clause to be inserted in a Bill providing for the purchase of the leasehold and freehold interests in Spitalfields market. The recommendation of the committee was carried without opposition. The council then adopted another recommendation of the committee, to the effect that the Parliamentary committee be instructed to include in one of the Bills to be promoted by the council in the next session of Parliament a clause empowering the council to acquire by agreement or compulsorily the freehold and other interests in Spitalfields market.

Proposed Clerkenwell Improvement.—The Improvements Committee asked the council to approve their action in instructing the Clerkenwell Vestry, at the cost of the coun-

cil, to set back the "Horse and Groom" public-house in St. John-street, on the understanding that the work was undertaken without prejudice as to whether the contemplated widening of St. John-street should be considered a metropolitan or a local improvement. Mr. Shaw-Lefevre asked to be allowed to withdraw the report, stating that a complicated legal question had arisen, and the council might perhaps be called upon by the proprietors of the house to buy the whole property. Colonel and Sheriff-Elect Probyn opposed, and moved that it should be referred back until after the committee had met the deputation from Clerkenwell Vestry. The recommendation of the committee was, however, rejected.

COURT OF COMMON COUNCIL.

A meeting of the corporation was held, on Thursday, the lord mayor presiding. The town clerk read a petition soliciting the assistance of the lord mayor and corporation in the purchase as an open space of the estate at Hampstead formerly belonging to the late Sir Spencer Wells. It was believed that, if the assistance of the City could be invoked, the balance required towards the purchase money of £38,500 would soon be made up. The communication was referred to the Coal, Corn and Finance Committee for consideration.

—The following resolution was approved: "That it be referred to the Central Markets Committee to consider and report to this court as to the practicability and advisability of so covering over, partially or otherwise, the northern end of the circular roadway to the Great Western goods station as to increase the existing accommodation for vehicles without interfering with the present accommodation for railway access to the underground."—The town clerk laid before the court a letter which had been received by the lord mayor from the burgomaster of Cologne, who recently headed a deputation of German burgomasters to this country on a tour of inspection of our methods of dealing with street refuse. The burgomaster, who was entertained at luncheon at the Mansion House during the sojourn in London, thanked the lord mayor for the "complaisance" and readiness which the corporation had shown in facilitating their investigations.

—It was decided to adopt a report from the Central Markets Committee recommending that the old fish market in Farringdon-street should be adapted for the purposes of the colonial and other meat trade, at an estimated cost of from £8,000 to £8,500.—Authority was given the Bridge House Estates Committee to carry out an improvement of Queen Elizabeth-street, at the southern approach to the Tower bridge, by giving up a portion of the vacant land to the St. Olave's District Board for widening the street and constructing a public convenience. The corporation would undertake the necessary repaving of the street and the maintenance of the southern approach to the bridge to the end of the parapet walls by the anchorage chains of the bridge. The court gave the necessary authority.—The court authorised the same committee to purchase the freehold of a block of premises at the rear of 25 and 26 Wood-street, belonging to the trustees of the Oxford University Chest, for £21,000.—Authority was given for the spending of £2,500 on the new entrance to the Guildhall in Basinghall-street.—The Port Sanitary Committee submitted a copy of an order issued by the Local Government Board assigning certain powers to the Port of London Sanitary Authority in respect of the docks and wharves in the port. The committee recommended that it should be referred to the committee to carry the order into execution. Authority was given.

VESTRIES AND DISTRICT BOARDS.

Battersea.—At the vestry meeting, on Wednesday evening, the Finance Committee reported that the County of London and Brush Provincial Electric Lighting Company had given notice of appeal against the decision of Mr. Justice Jeno in the action of the vestry against the company for an injunction to restrain the latter from using pipes laid in Trinity-road without the permission of the vestry and for the removal of the pipes. It may be remembered that the injunction was granted, but was suspended for three months, with liberty to apply for a further suspension if required, to enable the company to make arrangements for carrying the wires in some other way than under the road. On the recommendation of the committee the vestry decided that in the event of an application being made to the Court for an extension of the suspension the solicitor should be instructed to take steps to oppose the application. It was resolved to apply to the Local Government Board for permission to borrow £5,300 for the sinking of two artesian wells at the baths, Latchmere-road, for which the tender of Messrs. Isler & Co., was recently accepted. On the proposal of the Baths Committee the vestry resolved to purchase land having a frontage in Battersea Park-road for the purpose of enlarging the public laundry and extending the public baths.—Mr. W. Lethbridge, on behalf of the Special Committee on Municipal Dwellings, moved that the county council should be asked to insert a clause in their General Powers Bill to authorise vestries and district boards to erect dwellings for the working classes under Part III. of the Housing of the Working

Classes Act. This was agreed to.—The Lighting Committee recommended the approval of provisional contracts for the acquisition of additional land for the erection of the proposed electric lighting station in accordance with the suggestions made by Prof. Kennedy and Mr. Samuel Peach. The recommendation was adopted. At the suggestion of the same committee the vestry decided to oppose notice given by the County of London and Brnsh Provincial Electric Lighting Company of intention to apply to the Board of Trade for an electric lighting provisional order. The Lighting Committee reported having had under consideration Bills promoted by companies in the present sessions of Parliament for the supply of electrical energy in bulk over large areas in parts of which provisional orders have already been granted to local authorities. The Bills also provide for the compulsory acquisition of land for the purpose of generating stations and the usual powers of a provisional order under the Electric Lighting Acts. The committee were of opinion that action should be taken by local authorities in opposition to the Bills. On the recommendation of the committee it was resolved (a) that communications be addressed to the borough members, urging them to strongly oppose the Bill of the General Power Distributing Company when before the House of Commons, and similar Bills, and, endeavour to secure the co-operation of other members of Parliament; and (b) that a communication be addressed to the metropolitan vestries and district boards requesting them to ask their local members to oppose the Bills.

Camberwell.—At the vestry meeting on Wednesday the Plant and Scavenging Committee submitted a report by Mr. C. W. Tagg, clerk to the vestry, embodying a new scheme for the collection of house refuse in the parish. The proposal led to considerable discussion, and it was eventually decided not to receive the report, on the ground that it was the duty of Mr. W. Oxtoby, the recently-appointed surveyor, to devise a scheme for effectually dealing with the problem of collecting and disposing of the house refuse of the parish.—On the recommendation of the Finance Committee the vestry resolved to support the Metropolitan Management Acts Amendment (By-Laws) Bill introduced by Lord Monkswell. The object of the Bill is to authorise the London County Council to make by-laws, under sec. 202 of the Metropolitan Management Act, 1855, for the following purpose: "Requiring persons about to construct, reconstruct or alter drains in connection with buildings, to deposit with the sanitary authority of the district such plans, sections and particulars as may be necessary for the purpose of ascertaining whether such construction, or reconstruction or alteration, is in accordance with the statutory provisions relative thereto and with any by-laws made under the said section except as to alteration of drains in case of emergency."—The General Purposes Committee announced the receipt of notice from the Crystal Palace Electric Supply Company of intention to open Crystal Palace-parade for the purpose of laying electric light mains.—On the motion of Messrs. Ayers and Scott-Scott it was resolved to rescind a resolution, previously passed, for paving with granite pitching Hill-street and Peckham Park-road and to substitute wood-paving in place thereof, at a cost of £11,800. It was referred to the Finance Committee to make arrangements for obtaining a loan to that extent for the purpose of carrying out the work.—A letter was received from the Vestry of Battersea stating that it had been decided to take action with a view to the water supply being vested in the people of London, and asking for the views of the vestry on the subject.—The General Purposes Committee reported having had under consideration a reference from the vestry as to the schedule of wages and hours of labour attached to the forms of tender issued by the vestry, and had given instructions to the officers that this schedule of wages and hours of labour was to be revised from time to time, as might be rendered necessary, by any mutual agreement between employers and workmen. The committee, however, decided to take the paragraph back.

Hampstead.—On Thursday a tender was received from Messrs. Yerbury & Son for the construction of boiler and engine beds and for other works at the electric lighting station for £1,641. This, the only tender received, was referred to the Lighting Committee.

Lambeth.—On Thursday, a letter was received from the London County Council asking if the vestry were prepared to assist in defraying the cost of widening Camberwell New-road between Warner-road and Denmark-hill. Camberwell Vestry had offered to contribute £5,000. The General Purposes Committee, who had considered the matter, reported that, having regard to the fact that the vestry had already contributed one-half of the cost of Coldharbour-lane, they were of opinion that Lambeth should not again contribute towards the cost of another widening in the same portion of the parish boundary. The vestry concurred in the recommendation, declining to contribute to the scheme.—Messrs. A. & F. Manuelle had written to the General Purposes Committee announcing the completion of the vestry's orders for the supply of York stone, and asking whether they should continue to prepare stone in anticipation of the vestry's future requirements. In the opinion of the committee it was desirable that a certain quantity should be kept in stock, and on their recommendation the vestry decided to place an order

with Messrs. Manuelle for the supply of 20,000 ft. of stone, to be delivered as soon as ready.—The Wharf Committee reported that the Thames Conservancy were unable to consent to either of the amended embankment schemes submitted by the committee, and they had appointed a sub-committee to wait upon the commissioners in regard to the matter.—The County of London and Brush and Provincial Electric Lighting Company notified their intention to apply for an electric lighting provisional order to supply electricity in that part of Lambeth which lies to the north of Westminster Bridge-road. A second notice was given by the same company, stating that they intended to apply for powers to take their mains through Lambeth so as to connect the detached portion of Wandsworth with the main portion.—The following quotations at per van were received by the Wharf and Cleansing Committee for the supply of twelve new slop vans: Bristol Waggon Company, £39; Mr. Anstin Rendell, Little Duke-street, S.E., £40; and Messrs. Glover & Sons, Eagle Works, Warwick, £42. The offer of the first-mentioned company was accepted.

Limehouse.—The Metropolitan Electric Supply Company intend to apply to the Board of Trade for an electric lighting provisional order.

Newington.—The following resolution has been adopted by the vestry: "That the tender of Messrs. Babcock & Wilcox, Limited, for the construction, supply and erection of boilers, pumps, steam and water mains, water tank, surface condenser, fuel economiser, ironwork, mechanical stokers, conveyer and elevator, for the sum of £9,348, be accepted, and the seal of the vestry affixed to the contract."

Paddington.—Last week the Works Committee reported that they, in conjunction with the surveyor, had further considered the subject of street cleansing, and, whilst admitting that the work in the parish is not perfect, they were, nevertheless, not prepared to recommend the vestry to make any material change in the system and method in force in carrying out such work. They had, however, instructed the surveyor to exercise the greatest diligence in the control of the sweepers and others, and to do everything in his power to cause the various thoroughfares in the parish to be maintained in a clean and decent condition.

Strand.—At a meeting of the board of works, held last week, attention was drawn to the nuisance caused on windy days by the vast quantities of loose paper constantly scattered about the streets, and it was suggested that some effort should be made to have this refuse collected and placed in receptacles, which might be cleared at stated periods. The matter was referred to committee.

St. James, Westminster.—The vestry last week considered letters from telephone subscribers calling attention to the inconvenience caused them owing to having been deprived of the use of the telephone in consequence of the Heddon-street fire, and stating that the company had informed them such disturbance could not possibly have arisen if the vestry would consent to the wires being placed underground, and asking the vestry to consider the subject favourably. As the attitude of the vestry in regard to the question has been either misunderstood or misrepresented, it was unanimously resolved to issue a pamphlet to the Press and the public setting forth clearly the exact position of affairs.—Mr. Watson, chairman of the Baths Committee, mentioned that it was intended to effect a great improvement at the baths. It was proposed, he said, either to remodel the existing buildings or to construct new baths that would be a credit to the parish.—Mr. T. Hensman Munsey, vestry clerk, read a letter from the county council stating in regard to the prevailing smoke nuisance, of which specified instances were cited, that if the vestry did not take effective measures to abate the evil the council would consider the question of taking proceedings in the matter, the expenses of which would have to be borne by the vestry. After discussion the letter was referred to the Health Committee with power to act.

St. Marylebone.—The vestry recently resolved to take no action in regard to the numerous applications received in response to advertisements for positions in the surveyor's department, leaving to the Works Committee, in conjunction with Mr. Waddington, the recently-appointed surveyor, the question of elaborating a further and improved scheme for dealing effectively with the requirements of the parish. As a result the vestry, last week, adopted a proposal to appoint a superintendent of cleansing, at a salary of £180 per annum rising to £230; a superintendent of sewers and drains, at £150 advancing to £200; and three district superintendents, at £150 each rising to £200 per annum. These positions, which will be advertised for, will be probationary for twelve months.—Mr. W. H. Garbutt, vestry clerk, read a petition drawing attention to the condition of the macadam roadway between Castle-street and Godgee-street, and asking for the substitution of wood paving. It was decided to inform the memorialists that the question would receive consideration later in the year when other streets were brought forward for discussion on the same subject.—On the motion of Dr. Snape it was resolved to adopt the report of the Sanitary and Sewers Committee recommending the construction of an underground convenienco for both sexes in East-street, Marylebone-road, the cost being estimated at £2,000.—The secretary to the

Marylebone Cricket Club wrote asking what proportion of the cost the vestry would be prepared to contribute towards the urinal proposed to be erected on the new plot of ground adjoining Lord's cricket ground. The letter was referred to the Sanitary Committee.—It was resolved, on the recommendation of the Sanitary Committee, to inform Messrs. Bastin & Merryfield that the public urinal in Market-place would shortly be removed and replaced by a modern structure.

Whitechapel.—Letters have been received by the board from two electric lighting companies announcing their intention of applying for provisional orders to enable them to supply the district with electrical energy.

MUNICIPAL CORPORATIONS.

Bolton.—The council have received Local Government Board sanction to the borrowing of £100,000 for gasworks purposes.

Brighton.—A meeting of the council was held, on Thursday, when the final arrangements were made in connection with the holding of an arbitration to assess the compensation to be paid in respect of certain lands required for the purposes of waterworks.

Burnley.—It is proposed to apply to the Local Government Board for sanction to borrow £10,000 for extensions of the electric supply undertaking.

Bury.—At a meeting of the town council, on Thursday, a sub-committee recommended the erection of public abattoirs, at a cost of £13,740, and that application be made to the Local Government Board for sanction to borrow the money. A long discussion ensued. The present slaughter-houses in Bury were stated to be in good sanitary condition, and the report was referred back for farther consideration, the recommendation to be submitted to the council again in two months.

Colchester.—Colonel C. H. Luard, R.E., one of the Local Government Board inspectors, held an inquiry, on Tuesday of last week, as to the application of the Colchester Corporation for sanction to a loan of £500 for the improvement and widening of Maldon-road at its junction with Crouch-street. The borough surveyor, Mr. H. Godey, produced the plans and explained them.

Croydon.—The Local Government Board have refused to sanction a loan to cover the £1,000 payable under agreement to the British Thomson-Houston Company upon the taking over of the electric supply station by the corporation.

Gateshead.—It was last week reported that the Local Government Board had written to say they were glad to find that the questions, both of providing an efficient apparatus for disinfection and providing further suitable hospital accommodation, were under the consideration of the council. They requested to be informed of the decisions come to.

Gloucester.—A motion suggesting the appointment of a committee to consider the question of municipalising the tramways was brought up recently, but lost.

Leamington.—The tender of Mr. R. Bowen, of Leamington, at £897, has been accepted for the erection of a new engine-house at the Lillington pumping station.

Leicester.—An inquiry was conducted on Tuesday of last week, by Major-General H. Darley Crozier, R.E., into an application of the corporation for sanction to borrow £2,770 for the purchase of certain property for the purposes of public walks and pleasure grounds, and £26,077 to enable them to convert a portion of land, known as the Gilroes estate, into a cemetery.

Longton.—A deputation, appointed to inspect the coal filtration process now in use at the Wolverhampton sewage works, last week, reported that the filter effluent was clear and bright and apparently perfectly satisfactory, and the result, from a chemical point of view, was also most satisfactory. The analysis indicated 80 per cent. of purification upon the tank effluent. The approximate estimate of Mr. Garfield, the inventor of the process, of a coal filter to deal with 1,000,000 gallons of tank effluent per day was: Excavation, £630; coal, drains, carriers and valves, £2,200; and a royalty at 1s. per cubic yard, £417; total £3,247. It would probably be necessary to have brick walls for a permanent filter, and in that case this estimate would be very considerably increased. The Sewage Committee, having considered this report, recommended that the consideration of the adoption of any further system than that already decided upon be deferred until after the issue of the report of the Royal Commission on Sewage Disposal. This recommendation was confirmed.

Ludlow.—On Thursday, it was moved that application be made to the Board of Trade for a provisional order, under the Electric Lighting Acts of 1882 and 1888, to authorise the corporation to supply electricity for public and private purposes within the borough, and that the town clerk be authorised to instruct Parliamentary agents to take the necessary steps. It was stated that the council had endeavoured to obtain better terms from the gas company for the public lighting of the borough, but they still had to pay the same amount as individual consumers. The company had refused to sell the undertaking to the corporation. A letter was received from the Birmingham Installation Company saying they would be pleased to lease powers from the corporation

for a period of seven years, or to themselves apply for the order and carry out the work, making an agreement to sell the undertaking to the council as a going concern in a certain time. The motion was unanimously agreed to.

Newcastle.—At last week's meeting of the town council, a member moved the adoption of the report of a special committee appointed to consider the desirability of the corporation undertaking the provision of electricity, recommending that the committee be authorised to negotiate as to terms upon which the electric lighting companies would transfer their undertakings to the corporation. In one case twenty-four years, and in the other case twenty-five years, had to elapse before the corporation could exercise their power of buying up the two companies compulsorily. If the companies were not agreeable the committee would have another scheme very shortly to put before the council. The adoption of the report would commit the council to nothing.

North Berwick.—At a recent meeting of this body a report on electric lighting for the town was submitted from Messrs. Baratt & Monkhouse, Westminster. The report showed the inadvisability of placing the electric light station at the present gasworks, and dealt with the extra capital and annual cost involved in putting it down at the site proposed for the new gasworks, and the minimum number of lamps required to make the scheme self-supporting. The system proposed was the low-tension current one. The capital cost for an installation of the size required was estimated at £7,600. It was agreed to have an early special meeting of the board to deal with the matter.

Plymouth.—The Finance Committee have held a special meeting to receive plans prepared by the city engineer for the new temporary council chamber, which the council had decided should be erected at a cost not exceeding £2,500. The plans, which embodied alterations suggested by the committee at a previous meeting, were approved, and instructions were given to proceed with the work.

URBAN DISTRICT COUNCILS.

Bedlington.—At a recent conference between members of the council and the Tynemouth rural authorities it was decided to have a plan of a new stone bridge prepared, the structure at Bedlington being considered dangerous. A second plan, of an iron bridge to cost £2,700, will also be considered.

Cowes, I.W.—At last week's meeting of the council the following resolution of the Water Committee was approved: "That the committee having considered a report from the surveyor (Mr. John W. Webster) for improving the distribution of water and for providing a water tower, recommend the council to adopt the report and to apply to the Local Government Board to sanction a loan of £2,100 to carry out the work." The surveyor has also been instructed to prepare the necessary plans for a landing and pleasure pier on a site near the Prince's Green.

East Ham.—Central Park, the second public recreation ground which has been acquired by the council, was formally opened, on Tuesday of last week, by Mr. Thomas Leonan Knight, chairman, in the presence of several thousand local residents. The park comprises 25 acres, which have been purchased for £12,500.

Enfield.—A sub-committee appointed to consider the question of erecting public conveniences in Enfield Town on Thursday reported that they had had three schemes before them—one an underground one, costing £400; one for a convenience at the rear of the Market Cross, costing £80; and another, dealing with the north side of the Market-place costing £80.

RURAL DISTRICT COUNCILS.

Haltwhistle.—The district council have engaged Mr. Harry W. Taylor, of St. Nicholas Chambers, Newcastle-on-Tyne, as their engineer for the preparation of a scheme of sewerage and sewage disposal for the west end of Haltwhistle.

Hawarden.—The council, at a meeting on Friday, received a report from a committee recommending the adoption of a scheme for dealing with the sewage of the district. The recommendation was adopted, and an engineer is to be called in to formulate a scheme. A communication was read from the inhabitants of Penyford calling attention to the need of a water supply for the village, and it was resolved that a deputation should wait on the Wrexham Waterworks Company in regard to the matter.

Newport (Mon.)—At a meeting last week a letter was read from the Local Government Board asking what was being done about the Edgmond drainage, and the clerk was instructed to reply that it would shortly be commenced, according to the surveyor's report.

Received too late for Classification.

SURVEYORS ASSISTANT, or Improver (eighteen), requires appointment; good experience, surveying, levelling, draughtsmen. Small salary.—Address, "Improver," Office of THE SURVEYOR, 21 Bride-lane, Fleet-street, E.C.

Personal.

Mr. W. Walden has been successful in obtaining the position of surveyor to the Christchurch Rural District Council.

Mr. G. E. Vint, of Sheffield, has been appointed surveyor and waterworks engineer to the Holmfirth Urban District Council.

Mr. Macdonald, resident waterworks engineer to the Newport Borough Council, has had his salary increased to £300 per annum.

At the last monthly meeting of the Aston Manor Urban District Council the salary of Mr. G. H. Jack, assistant surveyor, was raised to £120 per annum.

By a large majority Wolverhampton Town Council, on Monday, decided to increase the salary of Mr. Woodward, the water engineer, from £350 to £450 per annum.

We have much pleasure in stating that Mr. T. B. Farrington, the borough surveyor of Conway, who has lately suffered from a severe illness, is now rapidly recovering.

Mr. W. S. Shell, of Consett, has been selected by the local authority to fill the post of surveyor, in succession to Mr. William Rippon, resigned. There were over 100 applicants.

Mr. Frederic Thomas Elliott, of Birkenshaw, near Leeds, has been appointed surveyor, waterworks manager and inspector of nuisances to the Eccleshill Urban District Council.

A marriage took place recently, at the parish church of Edenfield, between Miss Emily Chattwood, of Edenfield, and Mr. Edwin Percy Richards, son of Mr. E. Melville Richards, borough engineer and surveyor of Warwick.

Mr. F. C. Keene, building inspector to the Bournemouth Corporation, has had his salary increased to £160 per annum. An assistant is also to be advertised for, at a salary of £2 per week, to assist him in the work of his office.

Sixty applications were received for the position of borough surveyor of Bæcup. The General Works Committee have reduced the candidates to the following six: Mr. Benson, Salford; Mr. Bradley, Hull; Mr. J. S. Green, Haslingden; Mr. W. Holt, Heywood; Mr. Vickers, Blackburn; and Mr. Wood, Wakefield.

On Thursday, at a meeting of the Ealing Urban District Council, it was reported that nearly thirty applications for the post of principal assistant in the office of the surveyor had been received. Three candidates had been selected, and of these, Mr. Lobleby, of Aberdeer, was recommended for appointment. This recommendation, after a short discussion, was adopted.

At the last monthly meeting of the Wednesbury Town Council the mayor moved that the salary of Mr. Scott, the borough surveyor, should be increased from £275 to £300 per annum. He spoke of the efficient manner in which Mr. Scott had performed his duties, and remarked that since he received the appointment the work had increased tremendously. The resolution was eventually adopted.

Mr. J. E. Jackson has lately severed his connection with the Horwich Urban District Council, with whom he has served as surveyor for the past nine years. He received his training with Messrs. Settle & Farmer, architects and surveyors, Ulverston, and subsequently was in the service of the Ulverston Local Board and the Ormskirk Board of Health. He has carried out a number of large and important works, including main road improvements and the formation of new streets.

Mr. Arthur Rhodes, deputy-manager at the Gaythorn gasworks of the Manchester Corporation, was the recipient of a handsome case of cutlery last week, on the occasion of his marriage with Miss Edith Cox, daughter of Mr. William Cox, contractor, Moss Side. The presentation, says a contemporary, which was from the officials and workmen, was made by the manager, Mr. John Merrell, who spoke in eulogistic terms of Mr. Rhodes, and wished him joy and happiness. Mr. Rhodes suitably replied.

We hear with regret of the death of Mr. John Mallinson, surveyor to the Skipton Urban District Council, which took place somewhat suddenly on Sunday night, at his residence. Mr. Mallinson had been ailing for some months, but so late as Friday last he was present in the council chamber and gave evidence at a Local Government Board inquiry there. The immediate cause of death was the breaking of a blood vessel. Mr. Mallinson, who had occupied the post of town surveyor at Skipton for nearly six years, was in his fiftieth year. He leaves a widow and large family to mourn his loss.

The Housing of the Working Classes Committee of the London County Council, on Tuesday, presented a report intimating that they had selected the following firms to submit competitive designs for the erection of dwellings on a portion of certain land known as the Millbank estate: Messrs. F. Armett, T. G. Bushell, H. H. Collins, H. F. T. Cooper, C. E. Cronk, H. W. Dobb, Ellison & Son, Gibson & Russell, G. S. Hill, F. Hooper, Howgate, Leeds & Keith, Joseph, Son & Smithem, Newman & Jacques, Rowland Plumble, W.

H. Seth-Smith, Spalding & Cross, Waring & Nicholson, and R. Williams.

The officials of the Derby Corporation, accompanied by the mayor and a number of councillors, paid a visit to Castleton recently. Reserved carriages were provided for the party, and excellent arrangements were made for their comfort and enjoyment. A well-served dinner was provided, and the post-prandial proceedings were rendered interesting by the presentation to Mr. W. A. H. Clarry, late assistant surveyor, of a gold watch, the gift of his late fellow-officials. The present was made by his worship the mayor, who expressed the hope that Mr. Clarry would give the same satisfaction to Sutton Coldfield as he had at Derby. The recipient suitably responded.

Mr. William Thomas Hatch, who, as we briefly announced last week, has been appointed engineer to the Metropolitan Asylums Board, is thirty-six years of age, and was educated at Liverpool University and at Owens College, Manchester. From 1876 to 1881 he was pupil to the Mersey Dock estate, of which Mr. G. F. Lyster was engineer. From 1882 to 1833 he was a Whitworth scholar and pupil to Sir W. Armstrong, Whitworth & Co., Manchester. In 1883 he was appointed works manager to Messrs. Follows & Bate, Limited, Gorton, and four years later he was appointed to his present position—viz., general manager to the Empire Engineering Company, Manchester.

At a dinner given, last week, to Mr. R. Read, the city surveyor of Gloucester, and his staff and others by Mr. H. J. Weaver, Mr. Read, after a reference to the latter gentleman's valuable assistance in his capacity of assistant surveyor, concluded a very eloquent speech by wishing him an easy struggle in life, coupled with health, and great success in his new undertaking. Mr. Weaver, who, as we have already announced, has accepted the post of borough engineer and surveyor under the King's Lynn Corporation, expressed his regret at having to leave Mr. Read, for whom it had always been a great pleasure to work, and said he hoped that he (Mr. Read) would continue to enjoy good health and prosperity and be enabled to fill the position of city surveyor of Gloucester for many years to come.

The following members of the Society of Engineers were among those who, on Wednesday, visited the London, Brighton and South Coast Railway locomotive works, the Brighton marine palace and pier works, Volk's electric railway and Rottingdean seashore electric tramroad: Mr. W. Worby Beaumont, president; Mr. A. T. Walmisley, past-president; Messrs. J. C. Fell and Charles Mason, vice-presidents; Messrs. George Burt, D. B. Butler, Percy Griffith and R. St. George Moore, members of council; F. W. Barclay, S. O. Cowper-Coles, T. F. Craddock, John Jones, N. Harker, Fred. Hovenden, E. Hulburd, R. J. G. Read, J. Waddington, W. G. Wales and Weatherburn; and Mr. G. A. Pryce Cuxson, secretary. Illustrated descriptions of the works inspected were, except in the case of those of the railway, given in our report of the annual meeting in July, 1896, of the Association of Municipal and County Engineers.

We recently announced the resignation by Mr. E. J. Silcock of his appointment as borough engineer of King's Lynn in order to enter upon private practice. He has now opened offices at 10 Park-row, Leeds, as well as at King's-street, King's Lynn, and is therefore prepared to place himself at the disposal of those who wish to avail themselves of his services. Mr. Silcock still retains his appointment of engineer to the Lynn Harbour Conservators and the Lynn Corporation have retained him for the completion of the water supply and sewerage schemes now in hand, and he has also been entrusted with the designing and carrying out of a number of other schemes. Mr. Silcock has had twenty years' experience in Leeds and elsewhere in all the varied work of a municipal engineer and surveyor, and this, coupled with the ability and energy he is known to possess, will no doubt stand him in good stead in his future work.

Some time ago the Camnock Rural District Council appointed Mr. H. M. Whitehead to the dual offices of surveyor and sanitary inspector, at a salary of £300 per annum, subject to the sanction of the Local Government Board. At a recent meeting the board expressed themselves opposed to the appointment of one man to the two offices, and asked for the reason of the increase of salary paid to the sanitary officer, and for other information. The clerk was instructed to reply to these queries, and, on Friday, a letter was read from the Local Government Board to the effect that before further considering the appointment they would like to know how far the officer would be able to do the work over such an area, having regard to his work as surveyor. It was agreed that it should be pointed out that Mr. Whitehead had to cover the ground in carrying out his duties of surveyor, and that the combination of the offices had worked efficiently for the last three months.

Warrington.—Local Government Board sanction has been received to a proposal to borrow £4,750 for the purchase of gas meters.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

CLERK OF WORKS.—July 16th.—Barnet Urban District Council.—Mr. H. W. Pool, clerk to the council.

WATERWORKS ENGINEER.—July 16th.—Lincoln Corporation. £250.—Mr. H. K. Heib, deputy town clerk.

INSPECTOR OF MAIN ROADS.—July 15th.—Glamorgan County Council. £85.—Mr. T. Manuel Franklin, county clerk, County Offices, Westgate-street, Cardiff.

HIGHWAY SURVEYOR, INSPECTOR OF NUISANCES, &c.—July 19th.—Newark Rural District Council. £155.—Mr. William Newton, clerk to the council.

ASSISTANT INSPECTOR OF NUISANCES AND BUILDING INSPECTOR.—July 20th.—Clacton Urban District Council. 50s.—Mr. A. R. Robinson, clerk to the council.

INSPECTOR OF NUISANCES.—July 21st.—Aberdare Urban District Council. £91.—Mr. Thomas Phillips, clerk to the council.

SURVEYOR, INSPECTOR OF NUISANCES, SANITARY INSPECTOR AND WATER INSPECTOR.—July 21st.—Ashburton Urban District Council. £100.—Mr. R. E. Tucker, clerk to the council.

JUNIOR ENGINEERING ASSISTANT.—July 22nd.—Hull Corporation. £60.—Mr. F. J. Baneroff, water and gas engineer, Town Hall, Hull.

BOROUGH ENGINEER.—July 22nd.—Corporation of Pietermaritzburg, Natal, South Africa. £800.—Messrs. Ford Brothers, 14 Southampton-street, Fitzroy-square, London, W.

CHIEF SURVEYOR.—July 22nd.—Vestry of St. George-the-Martyr, Southwark. £300.—Mr. J. A. Johnson, vestry clerk.

ASSISTANT BUILDINGS INSPECTOR.—July 23rd.—Corporation of Bournemouth. £104.—Mr. F. W. Lacey, M.I.C.E., borough engineer and surveyor.

BOROUGH ENGINEER AND SURVEYOR'S ASSISTANT.—July 23rd.—Corporation of Warrington. £100.—Mr. Thomas Longdin, borough engineer and surveyor.

ASSISTANT SURVEYOR AND INSPECTOR OF NUISANCES.—July 26th.—Uxbridge Rural District Council. £75.—Mr. Charles Woodbridge, clerk to the council.

JUNIOR ASSISTANT SURVEYOR.—July 27th.—County Borough of Middlesbrough. £80.—Mr. Frank Baker, borough engineer.

BUILDING INSPECTOR.—July 27th.—County Borough of Middlesbrough.—Mr. Frank Baker, borough engineer.

CITY ENGINEER.—August 31st.—Corporation of Wellington, New Zealand. £800.—Agent-General for New Zealand, London.

ENGINEERING ASSISTANT.—City of Canterbury. £2.—Mr. A. H. Campbell, city surveyor.

DISTRICT SURVEYOR.—Corporation of Sheffield.—Mr. Chas. F. Wike, M.I.C.E., city surveyor.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

EAST RIDING.—July 16th.—Extension of the county offices at Beverley and the erection of a new register office, for the county council. £30, £20 and £10.—Mr. John Bickerseth, county clerk, County Hall, Beverley.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

SWINTON.—July 16th.—Supply of 520 yards of cast-iron socket pipes of 6-in. diameter and other pipe castings, for the urban district council.—Mr. R. Fowler, engineer and surveyor to the council.

DARTFORD.—July 15th.—Making-up, &c., of Plover-lane, for the urban district council.—Mr. W. Harston, surveyor to the council.

WEST BROMFORD.—July 16th.—Laying of about 2,460 yards of 12-in. and 9-in. Hassell's pipe sewers, 12-in. iron pipe sewers and 8-in. surface-water drains, for the urban district council.—Mr. Wm. Pate, surveyor to the council.

MANCHESTER.—July 16th.—Construction and erection of a wrought-iron bridge for carrying 30-in. cast-iron pipes over the river Tame at Broomfield, Hyde and Denton, for the corporation.—Secretary, Waterworks Office, Town Hall, Manchester.

WOODROSE.—July 16th.—Supply of 1,460 tons to 2,000 tons of broken Quabast or Guebery granite, for the urban district council.—Mr. John A. Shipson, clerk to the council.

NELSON.—July 16th.—Construction of two storage reservoirs in Ogden and Black Moss valleys about 1 miles from the town, for the corporation.—Messrs. Newton, 17 Cooper-street, Manchester.

SOUTH CROSLAND.—July 18th.—Construction of additional sewerage works, comprising the laying of over 1 mile of stoneware pipe sewers, varying in size from 6 in. to 9 in., for the urban district council.—Mr. W. H. Radford, Angel-row, Nottingham.

IFORD.—July 18th.—Supply of a 16-ton combined compound steam roller-roller, for the urban district council.—Mr. John W. Benton, clerk to the council.

HOMBY.—July 18th.—Construction of 81 miles of stoneware pipe sewers, varying in size from 15 in. to 7 in., for the urban district council.—Mr. W. H. Radford, Angel-row, Nottingham.

GREAT YARMOUTH.—July 19th.—Supply of one 150-kilowatt high-speed engine and alternator coupled direct and sundry additional steam and exhaust pipes.—Mr. A. H. Miller, town clerk.

LONDON.—July 19th.—Paving of the entranceway off John-street, Minories, with Australian hard wood.—The Engineer to the Corporation,

APPOINTMENTS OPEN.

RURAL DISTRICT COUNCIL OF NEWARK. APPOINTMENT OF HIGHWAY SURVEYOR, INSPECTOR OF NUISANCES, CANAL BOATS INSPECTOR AND PETROLEUM INSPECTOR.

The Rural District Council of Newark invite applications for the above appointments.

There are twenty-five parishes in the district and 109 miles of roads.

The salary for the combined offices will be £155 per annum, and the person appointed must be fully qualified and competent to perform all the duties thereof, including the preparation of plans, &c., and will be required to devote the whole of his time to such duties.

Applications, in candidate's own handwriting, stating age, previous occupation, and accompanied by copies of not more than three recent testimonials, to be sent to me not later than Tuesday, the 19th day of July instant.

Canvassing the members of the Council, whether directly or indirectly, will be a disqualification.

The appointment will be made subject to the approval of the Local Government Board.

(By order)

WM. NEWTON,
Clerk.

Local Government Offices,
Middlegate, Newark.
July 6, 1898.

COUNTY BOROUGH OF MIDDLESBROUGH.

The Streets Committee are prepared to receive applications for the position of Junior Assistant in the Borough Surveyor's department.

Applicants must have had some experience in surveying, levelling, architectural drawing and the working of the Model By-Laws. Salary, £80 per annum.

Also for the position of Building Inspector.

Applicants must have had some experience in the carrying out of the Model By-Laws of the Local Government Board.

Applications for each appointment, stating age, experience, and accompanied by copies of three recent testimonials, to be sent to the undersigned not later than the 27th day of July, 1898.

Applicants for the office of Building Inspector are to state the salary required.

Canvassing any member of the Corporation will be deemed a disqualification.

Sealed tenders, endorsed "Reddicap Hill Sewer," must be deposited with the Town Clerk, T. V. Holbeche, Esq., at his offices in Coleshill-street, on or before Thursday, 21st inst. The Corporation do not bind themselves to accept the lowest or any tender.

W. A. H. CLARRY,
Borough Engineer and Surveyor.

Town Hall, Sutton Coldfield.
July 8, 1898.

TO CONTRACTORS.**SEA DEFENCE WORKS AT RHYL.**

The Rhyl Urban District Council invite tenders for Works of Sea Defence on the East Foreshore.

Plans and description of the works may be seen at the Town Surveyor's office.

The Council do not bind themselves to accept the lowest or any tender.

The tenders, sealed and endorsed "Sea Defence," may be delivered to me on or before 10 a.m. on Tuesday, the 26th instant, at the Council Offices, Clwyd-street.

Approved security will be required.

ARTHUR ROWLANDS,
Clerk to the Council.

VESTRY OF ST. MARY, ISLINGTON.

The Vestry is prepared to receive tenders for the supply of eleven Water-Vans, four Water-Carts, forty-five sets of Trunks and Distributors for Water-Vans, thirty-five Dust-Vans and five Sweeping Machines.

Conditions and specifications can be seen, and forms of tender obtained, upon application to the Chief Surveyor, Mr. J. Patten Barber, at the Vestry Hall, Upper-street, Islington, N., between the hours of 10 and 12 noon, and the deposit of 2 guineas, which amount will be returned upon the receipt of a *bona-fide* tender which is not withdrawn, and the return of the whole of the documents issued.

Tenders, endorsed "Tender for the Supply of Water-Vans,

&c.," must be delivered at the Vestry Hall not later than 4 p.m. on the 25th inst.

WM. F. DEWEY,
Vestry Clerk.

Vestry Hall, Upper-street, Islington, N.
July 13, 1898.

BOROUGH OF SHOREDITCH.**PROPOSED UNDERGROUND CONVENIENCE.****TO SANITARY ENGINEERS.**

The Shoreditch Vestry invite tenders for the whole of the works required in the Construction and Completion of an Underground Public Convenience in Hexton-street, opposite the workhouse infirmary.

The plans and specification can be seen at the offices of Mr. J. Rush Dixon, A.M.I.N.S.T.C.E., Engineer and Surveyor, or to the Vestry Town Hall, Old-street, E.C., from whom also tender forms and a copy of the instructions to contractors may be obtained on payment of a deposit of £5, which will be returned after the contract has been decided by the Vestry in the case of *bona-fide* tenders having been received.

Tenders, sealed and endorsed "Underground Convenience," must be sent to the undersigned by 4 p.m. on Wednesday, August 3rd next.

Security must be given to enter into a bond for £500 for the due performance of the contract, and the contractor whose tender is accepted must be prepared to pay the trade union rate of wages and observe the hours of labour in force at the time of tendering.

The Vestry do not undertake to accept the lowest or any tender.

(By order)

H. MANSFIELD ROBINSON,
Solicitor and Clerk.

Town Hall, Old-street, E.C.
July, 1898.

BOROUGH OF LEWES.**TO STONE MERCHANTS, FARMERS, &c.**

The Town Council of this Borough invite tenders for the supply of 500 tons of 2-in. Broken Blue Guernsey, Cherbourg or Belgian Granite, 100 tons of Coarse Granite Screenings, 650 tons of Broken Surface-Picked Flints and 150 tons of Piddinghoe Gravel.

DOUGLAS G. BATE, Assoc.M.Inst.C.E., Manager.

Forms of tender and specification may be had, and any further information obtained, at the Borough Surveyor's office, Town Hall, Lewes.

Sealed tenders, endorsed "Tender for ———," must be left at my office on or before the 23rd July, 1898.

Power is reserved to reject the lowest or any tender.

(By order)

MONTAGUE S. BLAKER,
Town Clerk.

Town Clerk's Office, Lewes.
June 2, 1898.

COUNTY BOROUGH OF WEST HAM.
TO SEWER CONTRACTORS.

The Council hereby invite tenders for the construction of about 1,200 lineal yards of Sewers, 7 ft., 6 ft. and 3 ft. 6 in. diameter, together with Penstock Chambers, Manholes and other works.

Plans may be seen, and specification, form of tender and further particulars obtained, at the office of Mr. Lewis Angell, Borough Engineer, Town Hall, Stratford, E., on the deposit of a £5 Bank of England note, which will be returned on receipt of a *bond-fide* tender.

Tenders, endorsed "Tender for Sewers," to be sent to my office not later than 4 o'clock on Tuesday, 26th July, 1898.

The Council do not bind themselves to accept the lowest or any tender.

The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

As regards all work to be done at the site or elsewhere within a radius of 20 miles from Charing Cross, the contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

(By order of the Council)

FRED. E. HILLEARY,
Town Clerk.

Minutes of Proceedings.

Professional Qualifications.

In the United States the evil of insufficient professional qualifications is probably more troublesome than it is in this country, where, indeed, there is reason to believe that cases at all serious are becoming fewer and fewer every day. After all, it must in the long run be a question of the survival of the fittest. Even the smaller local authorities seem now to realise the importance—we might even say necessity—of appointing thoroughly efficient men to official posts. It is to be regretted that they do not always see equally well the importance of paying adequate salaries. Unfortunately, it is in connection with municipal work that the evil is most acutely felt in the United States, and no one requires to be told that this state of affairs is distinctly traceable to the vicious system of making official appointments the spoil of unscrupulous office-seekers and party politicians, instead of appointing capable permanent officials. One wonders how long such a pernicious practice will be tolerated in a country so advanced and enlightened in other respects. Our able American contemporary, *Municipal Engineering*, which recently discussed this question in its different bearings, cited the case of a thoroughly efficient city engineer, of education and experience, who had to make way for a successor with no training or experience as an engineer, and with only a little experience in surveying, picked up in the intervals of other occupations. The displaced official has been the chief factor in securing for the city a comprehensive scheme of sewerage, which has already been partly carried out under his supervision, and has carried out other municipal works in a thoroughly satisfactory way. It has been pertinently pointed out that, though no one imagines that the new official can possibly do the work as intelligently as his predecessor, the fact is not sufficiently realised that his lack of training and experience may entail upon the city in the future practically unlimited loss and inconvenience through bad designs, defective construction and inadequate precautions. This is what is meant by the oft-repeated remark that in certain positions some men would be dear at any price. People are apt to overlook or minimise the responsible nature of certain duties, and the potentiality of vast losses which one man would incur and another avert. To no profession do such considerations apply more forcibly than to that of the municipal engineer. Many kinds of work can be carried out satisfactorily by people of no special capacity or training, but municipal engineering is emphatically one of the professions which can be efficiently followed only by the expert few, if the ratepayers are to be saved from great and needless expense arising directly out of neglect, bad work or misdirected effort. Our transatlantic contemporary is undoubtedly right in demanding the restriction of such offices to those whose competence has been proved by the adoption of some valid test. The prominent qualifications which go to the making

of a successful engineer are much the same as those necessary in all the other higher professions—natural aptitude and intelligence, education, training and experience, with, of course, the requisite energy and perseverance. It is frequently asserted that thoroughly competent and even eminent engineers may exist on the strength of natural aptitude alone, and we are triumphantly referred to certain great names of the past, when applied science was in its infancy. In those days the argument may have possessed considerable force, but circumstances alter cases. The vast developments of engineering involve the necessity of mastering so extensive a preliminary groundwork that a certain amount of systematic training and instruction is absolutely imperative. In addition, some test is required to indicate, more or less accurately, whether the instruction has been intelligently assimilated. Apart from the actual execution of work, the test which suggests itself is that of examination—by no means a perfect test, but probably the most convenient and practicable to be had. It is admittedly easy to exaggerate the utility and function of written examinations, and to make them the sole test of fitness for public appointments, irrespective of other considerations, would, in our opinion, be a policy of questionable judgment. Within reasonable limits, however, the examination test, written and oral, is not only justifiable, but commendable and necessary, especially for young members of a difficult and responsible profession. Many men of sound and even brilliant parts would not distinguish themselves greatly under examination, but no fairly-educated man who really understands his work should have any difficulty in passing a reasonable examination with tolerable credit. This is the test which our contemporary advocates as a remedy, to some extent, for the evils which are at present found in connection with municipal life in the United States. In support of the argument the work of the Incorporated Association of Municipal and County Engineers in this country is referred to in terms of commendation, as the following passage will show:—

The British Association of Municipal and County Engineers inaugurated some time ago a series of voluntary pass examinations, which have developed into an institution of considerable value, notwithstanding the pronounced opinions of many prominent men that the work would be useless in elevating the standard of this branch of the profession. The examination is now styled one of "candidates for the offices of municipal engineers and surveyors to district councils," is carried out by the association, and is entirely voluntary. An evidence of its popularity is the fact that the twenty-fifth of the series, held April 1st and 2nd, was taken by forty-nine men. The examination consisted of one day of written work and one day of oral, and was conducted by five members of the Institution of Civil Engineers. It included engineering as applied to municipal work, building construction, sanitary science, and municipal and local government law. Some cities and county councils in Great Britain and Ireland conduct elaborate examinations of candidates for such positions, but most of them, including all the smaller corporations, do not take the trouble or incur the expense. The tendency

in favour of such examinations, however. The corporation officers are rapidly gaining confidence in the examination as conducted by the association, and a candidate for a position who has passed them in many cases has a long lead over his competitors. The tendency is strongly in favour of the method of procedure described, and, while the whole scheme is entirely voluntary, public opinion is rapidly raising it to the authority of law.

* * *

**Electrical
Competition:
Companies
and
Local Authorities.**

The principle of municipal ownership has recently received a somewhat rude shock. A Parliamentary committee have declared in favour of what we may term the revolutionary doctrine of competition in municipal boroughs. The matter has arisen more directly in connection with electric lighting, and, carried to its logical issue, the result of the committee's decision is that where a municipal electric lighting scheme already exists it is open to an electric lighting company to enter into the district and without the sanction of the local authority undertake the supply of electricity. It need hardly be pointed out that if such a principle is accepted by the House of Commons it will seriously jeopardise the security of capital. It is true that it cuts two ways, and it is as unfair for an electric lighting company to be permitted to go into a district where a municipal scheme exists as it is for a local authority to enter into competition with an electric lighting company already existing, assuming always that the service is organised and worked in the interests of the consumer. It cannot be seriously maintained that any local authorities owning electric lighting works have been neglectful of the consumer's interests. On the contrary, we have frequently pointed out that the consumer has been generally well treated, even if the ratepayer has suffered. The new principle laid down by the Parliamentary committee arose out of the scheme that had been brought forward by the General Power Distributing Company and the Midland Power Distributing Company. The objects of these companies' Bills were to obtain powers to generate electricity on a large scale and distribute it to the various towns within their area of supply.

In considering these matters on a former occasion we concluded that, if certain provisions were made to safeguard the interests of municipalities, it might under some circumstances be to the advantage of a local authority to work in conjunction with the power-distributing companies. We sketched an arrangement by which a municipality might extend its supply of electricity by buying from the large companies in bulk and distributing to the consumers as required, but the clauses suggested by the committee go very materially beyond that. Not only are powers given to supply local authorities in bulk, but, in addition, this company may enter into a district and compete with the local authority in supplying electrical energy to the larger consumers—that is, to those taking 10,000 Board of Trade units and upwards. In other words, if these measures are passed by Parliament as they stand the large power companies will be able to enter a borough and compete in supplying electricity to everybody, with the exception of the small consumer; and in order that a municipality may retain the power of supplying to the small consumer it must engage itself to purchase electricity in bulk from the company, otherwise it will be open to this company to compete in supplying electricity to everybody. The matter is of the utmost importance so far as municipalities are concerned, and, although only a few of the large towns are concerned at the moment, it is absolutely necessary that they should take immediate steps to combine in order to resist the principle of the measure when it comes before the House of Commons in complete form. The property of ratepayers is threatened, and unless vigorous measures are taken the whole future of municipal electric supply is jeopardised.

Although we have thus been compelled to make

some severe remarks on the question of competition in those towns affected by the large power-distributing companies' Bills, certain proposals have originated in London which are just as much opposed to the principle of fair trading as those already alluded to. The Marylebone Vestry sought powers to supply electricity in their district, although the Metropolitan Company had had powers for some time. In this case the matter is probably not very serious so far as it affects the Metropolitan Company, because Marylebone forms only one small portion of the area over which this company have powers, but, at the same time, the principle involved is one of the utmost importance, and after due consideration it is not surprising that the Bill of the Marylebone Vestry should have been rejected. The Electric Lighting Act clearly states that "the grant of authority to any undertakers to supply electricity within any area, whether granted by license or by means of a provisional order, shall not in any way restrict granting of a license to any other local authority or to any other person within the same area." That practically means that under some circumstances competition may be permitted in districts; but up to the present, with the exception of two or three London districts, competition has not been expressly encouraged by the Board of Trade. If a company in a provincial town had spent a large sum of money upon establishing a system of electric light, and the local authority after business had been established for some years were to undertake a similar supply, it is clear that the interests of the company would be very seriously interfered with. The same may be said of a corporation undertaking a supply. Hitherto, if local authorities have not undertaken a supply themselves but have left it to a company to carry out, the recognised policy has been for the former to purchase outright the business and plant of the company; and we must confess that such a course savours more of equity than does the decision to grant competitive powers.

* * *

**The Sewage
Disposal
Commission.**

We are informed that the Royal Commission on Sewage Treatment and Disposal have given much consideration to the question of throwing the sittings open to the Press, but they have come to the conclusion that the purpose of the inquiry would be obstructed and retarded rather than fostered and quickened by the publication of the proceedings during its progress. The Commission think that outside criticism upon sections of the evidence before the whole is presented in a complete form would be embarrassing and not helpful. Another reason which has influenced them in their decision in favour of "closed doors" is the fact that undue publicity would possibly be given to the projects and nostrums of certain theorists before their value had been tested. If these are the best arguments that can be advanced in support of a secret investigation their weakness is transparent, for, supposing the evidence were criticised, what possible harm can healthy criticism do? Its effect would, on the contrary, be beneficial, because it would bring to light before it was too late new facts which would probably otherwise escape consideration. The Commission need not be afraid of any advertisement that might be given to crude and imperfectly-developed theories, inasmuch as their defects as well as their virtues would become manifest, and no public authorities would be likely to take them up before the result of the inquiry became known. It is pointed out, on behalf of the Commission, that in excluding the Press they are acting in accordance with precedent which was only departed from in the case of the Water Commission on account of the exceptional circumstances that were under investigation. Even so, but if the precedent is bad why should it be perpetuated? We still think that the Commission have made a great mistake, and that much of the good that would have attended their labours will be lost.

Last week the Commission held three sittings. The members present on each occasion were Lord Iddeleigh (chairman), Sir Richard Thorne, General Carey, Prof. Ramsay, Prof. Michael Foster, Mr. Cotton, Dr. Russell, Colonel Hardy and Mr. Killick. Mr. F. J. Willis, the secretary, was also in attendance. Evidence was given with regard to public health legislation in Ireland and Scotland and to the existing state of the law in those countries by Mr. Dean, who represented the Irish Local Government Board, and Mr. Murray, on behalf of the Local Government Board for Scotland. Then came testimony from the three rivers boards which have been endowed with exceptional powers to cope with river pollution in the populous manufacturing districts of Lancashire and Yorkshire. These are the Mersey and Irwell, the Ribble and the West Riding Joint Committees, which during their brief history—they are essentially modern authorities, the Mersey and Irwell having only been established about seven years—have done a great work in the purification of the streams under their jurisdiction. The witnesses examined with reference to that work were Mr. Tatton, the chief inspector for the Mersey and Irwell, and Mr. Scudder, assistant to Sir Henry Roscoe; Mr. Naylor, inspector for the Ribble Joint Committee; and Dr. Maclean Wilson and Mr. Trevor Edwards for the West Riding Rivers Joint Committee. Their testimony related to the steps that had been taken to compel manufacturers to deal with their refuse in such a manner that it would not pollute the rivers upon which their works are situated. Before the boards were constituted the rivers were so polluted as to be a constant and serious danger to health in thickly-populated districts, and while much remains to be done many of the more flagrant nuisances have been abated. Practically the same course is followed in each case. The inspectors examine the condition of the streams and recommend to the boards what works they consider necessary. Their reports are considered, and offenders against the public health are served with notices; but before compulsory steps are taken manufacturers are allowed an opportunity of stating their case and of appealing to the Local Government Board, whose decision has to be given within three months. After hearing this evidence the Commission adjourned till the autumn. They came to the conclusion that it would be useless to hold further sittings until then, owing to the difficulty of getting witnesses to attend during the months of August and September.

Yellow Fever and Sanitation.

The operations in Cuba have naturally drawn increased attention to the question of yellow fever and the close connection which, in common with plague, cholera and typhoid fever, can be found between its prevalence and insanitary conditions. Its origin has been traced, with some plausibility, to the slave trade, the accompanying filth of which was not the least of its horrors. Apart from that theory, the endemic influence to which the disease can undoubtedly be attributed is effluvial or miasmatic, from the harbour mud or from the bilge-water of a ship that had lain in the harbour or from the alluvial foundations of houses nearest to the beach. It is rarely found beyond a certain range of latitude, or to any extent in ports which are in a satisfactory sanitary condition. On shore the disease seems to follow much the same laws as cholera and typhoid fever, in that it is an exogenous or soil infection, a fermentation of filth in the ground, with a seasonal activity closely following the movements of the sub-soil water. When imported to Spain, for example, it has clung to alluvial soil, and has spread after the fashion of a soil-borne infection rather than by personal contagion; and it has been clear that no epidemic is likely to be established in a distant port unless a material quantity of the specially-poisonous harbour filth should be carried in ships' bilges,

and unless the conditions favourable to its increase and diffusion by fermentation should exist in the new soil. Where harbours are most tideless, the soil most alluvial, and the movements of the subsoil water most extensive, the specific putrefaction or fermentation, when introduced into the harbour, will spread furthest on shore, being aided or encouraged always by the abundance of other organic matter met with at particular spots, such as the foundations of houses. Like typhus, now practically extirpated in this country, yellow fever is essentially a filth disease. Herein comes in its close connection with sanitation and with sanitary engineering in the endemic seats of the disease in the West Indies, Guiana, Brazil, Central America and the United States ports on the Gulf of Mexico. The disease has practically vanished from the Atlantic ports of the Union, and has become rare in such harbours as Port Royal, Jamaica. The Brazilian ports, where it was last developed, are now the most active centres of the fever. The case is so far peculiar that the harbour bottom, the adjoining mudbanks and mangrove swamps, and even the sea-water itself, are apt to retain the specific taint, especially where the cleansing action of the tides is slight. But there is reason to believe that the specific taint in the soil is everywhere slowly disappearing, now that it is no longer reinforced by fresh supplies year after year. The great object, indeed, is to secure a clean soil, and thus the bearing of proper sewerage and drainage upon a satisfactory solution of the question will be obvious to our readers. Such paltry matters have never received much attention from the Spaniard or the Cuban, and the island has in a liberal degree all the conditions, natural and acquired, for the propagation of the scourge. There will be a splendid field in Havana, and in Cuba generally, when affairs are more settled for many forms of activity, and sanitary engineering should certainly be one of them. But what about the sanitary condition of New Orleans, Mobile and other Gulf cities of the United States, where people might be expected to know better?

Electric Lighting in Bethnal Green.

Although the company which applied to the Bethnal Green Vestry for permission to introduce electric lighting into the district would have carried out the work satisfactorily, it is, nevertheless, a matter for congratulation that the vestry have resolved to keep the power in their own hands; and to show that immediate action is intended the vestry have sought the advice of Prof. Henry Robinson, who recommends the putting down of plant which will supply 5,000 lamps of 16 candle-power. This will entail a capital expenditure of £33,000, exclusive of land; £4,000 will be spent upon buildings, £10,500 on mains, £2,400 on house connections and £11,500 for machinery. We must frankly confess that we should have been better pleased if Prof. Robinson had recommended a larger scheme. It is true that a larger system would not have shown an immediate profit, upon which considerable stress is laid in the report, but it cannot be too widely known that some of the most successful municipal schemes in the country are those which showed a loss during the first two or three years, this loss being occasioned by the large capital expended with a view to meet future requirements. Prof. Robinson expresses an opinion that the Bethnal Green undertaking will be at once remunerative, and he estimates the profit at £200 at the end of the first year, at £300 at the end of the second, and at £1,010 at the end of the third year. The price to private consumers will be 6d. for the first year and 5d. afterwards. Some system of street lighting is contemplated in the report, and there is no reason to think that the scheme will not be completely successful, but it is to be regretted that more consideration has not been paid to the future development of lighting in the district.

Association of Municipal and County Engineers.

ANNUAL MEETING AT EDINBURGH.—IV.

EDINBURGH: HOLYROOD PALACE.

Last week we were compelled to hold over the instructive paper read by Mr. Whyte at the recent meeting on the subject of the Leith docks. This completed the series of papers and discussions, the remainder of the time being devoted to visits to various municipal works and other places of interest which are so plentiful in the Scottish metropolis. These visits we are describing at such length as may seem necessary, but it will, of course, be remembered that many of the works visited have been described in considerable detail in some of the papers read and discussed before the meeting.

SECOND DAY'S PROCEEDINGS (continued), (Friday, July 1st).

Mr. Whyte's paper was as follows:—

NOTES ON LEITH DOCKS AND NEW WORKS NOW IN PROGRESS.

By PETER WHYTE, M.INST.C.E.

[Mr. Peter Whyte was born about half a century ago at Invermay, near Perth. He received his education at Perth Academy, and was subsequently apprenticed to a firm of surveyors in the city. In this employment he acquired the rudiments of the profession of his adoption. Having attracted the notice of Mr. Hugh H. MacLure, a leading civil engineer of Glasgow, he was induced to join the staff under that gentleman. With him he remained two years and acquired most valuable experience. On the initiation of the Butts docks scheme at Cardiff, in 1866, Mr. Whyte received an appointment, and for eight years was actively engaged on work connected with the construction of wet and graving docks and their equipment, with warehouse accommodation, and with hydraulic machinery and other requisite appliances. In 1875 he was appointed chief assistant to the general manager of the docks, and thus, in addition to being acting engineer, he had extensive exper-

ience in matters relating to the management of docks, including the maintenance and working of machinery, the working of local traffic, discharging and loading cargoes, &c. Mr. Whyte was elected to the combined office of superintendent of harbour and docks and acting engineer to the Dock Commission of Leith in 1883. He has, in the course of his experience, designed and carried out several large works of sewerage and gas and water supply, and laid out some miles of streets. He is a Member of the Institution of Civil Engineers and a Fellow of the Royal Scottish Society of Arts, to which he recently contributed a paper on "Hydraulic Machinery."]'

Leith is one of the oldest seaports in Scotland, and, notwithstanding the tendency of all old things to decay, it still remains one of the most flourishing ports in the empire. It is first mentioned in historical records in the year 1128, but its authentic history as a port dates from 1329, in which year King Robert the Bruce granted a charter of the harbour and mills of Leith to the City of Edinburgh. This charter and other royal charters granted in subsequent centuries, and Acts of Parliament too numerous to mention from 1788 onwards, have constituted from time to time the authority and the limits of the jurisdiction of the commissioners for the harbour and docks of Leith, and define the port as extending from Wardie on the west to "Figgate Burn" on the east, a distance of 3½ miles along the south shore and extending northwards to the middle of the Firth of Forth.

It would be, doubtless, interesting to follow the history of the port from the time of its first being granted to the City of Edinburgh to the present time, to follow its course during the five centuries under which it remained as a vassal of Edinburgh, and to consider the somewhat intemperate and interminable series of conflicts which subsisted between the "City of Palaces and Towers" and their plucky little vassal by the sea. This would not be quite within the line of thought of a body of men of the engineering profession, whose associations and occupation are more concerned with matter-of-fact everyday work, so the author will come to times not yet remote and more practical, if less interesting.

Until the beginning of the present century the whole accommodation for shipping at Leith consisted of the harbour, formed in the bed of the Water of Leith, a small stream rising in the Pentlands, and which, after a course of some 12 or 14 miles, here joins the Firth of Forth. Along the banks of this water for nearly half a mile quay walls have been constructed, at which the vessels were discharged, the depth of water alongside these quays being about 12 ft. at high-water neap tides and 16 ft. at high-water spring tides. The harbour was dry at low water, the bottom of it at its lowest part being about the level of low water of ordinary spring tides. The entrance to this harbour was not then protected by piers, and great difficulty was experienced by navigators in reaching the harbour owing to the long stretch of sands and the continued shifting of the outlet of the river towards low-water line outside. Like many other ports there was a bar at Leith, respecting which Lord Jeffrey

gave vent to his pent-up feelings when delayed for want of water:—

In deep profound surpassing far
I blast the Edinburgh bar;
But, muttering oaths between my teeth,
I cursed the shallow bar at Leith.

This was the position of the harbour at the close of the last century. The trade being then considerable, and the accommodation admittedly inadequate, the Lord Provost, magistrates and council of Edinburgh (in whom the harbour was then vested), after having discussed a number of engineering (fortunately all of which were rejected), wisely agreed to consult the eminent engineer John Rennie, and on his advice in the year 1799 obtained Parliamentary powers for, and subsequently carried out from his designs and under his direction, the first docks at Leith, now known as the East and West Old Docks.

These docks the former opened in 1806 and the latter in 1817, cost, with their adjoining quays, graving dock and other works incidental to their completion, upwards of £300,000, a very large sum, having regard to the trade at that date. Each dock is 750 ft. long, 300 ft. wide, and they are entered by a lock 150 ft. long, 35 ft. wide and with a depth on the sill of 17½ ft. at high-water springs. At the time of their construction they were able to accommodate 180 vessels of the class then frequenting the port. The docks are still in excellent condition and still largely used for the smaller class of vessels.

Having regard to the trade at that period and to the size of vessel, these docks were a gigantic undertaking, and here the author would like to say what he had said elsewhere before, that notwithstanding the severe criticism and comments which have been made regarding the management of the harbour by the City of Edinburgh in the past, that the corporation of that time deserves the very greatest credit for having initiated and undertaken works of such magnitude at that period, works which remain a tribute to their enterprise and sagacity, and also may be said to have laid the foundation of the prosperity and the future development of the port.

About the year 1835 the finances of the City of Edinburgh became embarrassed. The corporation had borrowed large sums of money, applied, among other purposes, to the construction of the docks, of which sums about £260,000 was due to the Government practically on the security of the dock rates. The trade had considerably increased. Continued allegations were made that surplus revenues were being applied for civic and municipal purposes, and not for the improvement of the harbour as required by the Acts of 1799 and 1826.

An inquiry was instituted by the Government, and a result of this inquiry and of certain negotiations was that the municipal and the mercantile and maritime affairs of Edinburgh and Leith were wholly separated and dissevered. By an Act of Parliament passed in 1838 the harbour and docks were vested in eleven commissioners, of whom three were appointed by the Town Council of Edinburgh, three by the Town Council of Leith, and five by the Lords of the Treasury; and it was specially enacted that no member of either town council could be elected a commissioner for the harbour and docks, restrictions which exists at the present time, having been confirmed in successive Acts of Parliament. The commissioners as incorporated took over the whole property and revenues of the harbour and docks, subject to an annual payment of £7,680 per annum, of which £2,000 was due to the ministers of the city, and which was commuted in 1871 by a payment of £40,000. Of the remaining sum £3,180 was due to the "creditors of the City of Edinburgh," £2,500 to the University of Edinburgh, and these were commuted in 1896 by a payment of £190,000, so that the financial tie which bound the docks to the city for the sixty years since the municipal tie was broken is now also dissolved.

Shortly after the constitution of the commission in 1838 the question of the improvement of the harbour and docks was again under consideration, and the commissioners resolved to consult some of the leading civil engineers of the day. They accordingly obtained reports from Sir William Cubitt and Mr. James Walker, the latter of whom in 1839 recommended the extension of the pier to points very near their present limits, and proposed to dredge the entrance channel so as to give a depth of 12 ft. at low-water spring tides. Only within recent years this depth has been obtained and a further depth of 5 ft. will shortly be inaugurated.

Several years elapsed before any practical steps were taken to extend the accommodation, but ultimately the consent of the Treasury was obtained in 1847 to a plan by Mr. James Meadows Rendel, C.E., London, being adopted. This led to the construction of the Victoria dock and the extension of the piers now existing, the dock being opened for traffic in July, 1852. This dock is 750 ft. long, 300 ft. wide and 33 ft. deep. The entrance is 60 ft. wide, and the sill is 6 ft. lower than the sill of the old dock, so that it will be seen that a great advance was made in the character of the accommodation due to the development of steamer tonnage in the previous years.

The trade of the port continued to augment after the opening of the Victoria dock, and the commissioners resolved to provide still further accommodation. Hitherto the docks were all on the west side of the entrance channel and har-

bour. Acting on the advice of Sir Alexander Meadows Rendel, the commissioners now resolved to construct a new dock on the east sands. The works were commenced in 1859 and in 1865 the Albert dock was opened. This dock is 1,100 ft. long, 450 ft. wide and 35 ft. deep, and is entered through a lock 350 ft. long and 60 ft. wide, with the sill 2 ft. lower than the Victoria dock and 8 ft. lower than the old docks. The available depth of water on the sill is at springs about 26 ft. and at neaps about 22 ft. It may be interesting here to note that it was at this dock that hydraulic appliances were first used in Scotland in working the dock gates and machinery.

The dock gates are constructed of yellow pine trussed beams, 21 in. square, with greenheart heel and mitre posts, and greenheart planking below the water-line and pine planking above. They are moved by chains working on barrels fixed in the masonry and actuated by hydraulic engines, fixed in pits under the coping.

No sooner was the Albert dock opened than it became apparent that further dock accommodation would be required, and the construction of the Edinburgh dock was therefore undertaken. This dock lies to the east of the Albert dock, with which it is in communication and from which it is entered by a passage 65 ft. wide at coping level. The dock is 1,500 ft. long, 650 ft. wide, with a jetty 1,000 ft. long and 250 ft. wide in the centre. The dock is 35 ft. deep, the same as the Albert dock, and was opened in July, 1881. The cost of these two docks was upwards of £650,000.

The docks are well equipped with sheds, cranes, rails, &c. For the protection of goods when discharged there are sheds varying from 60 ft. to 80 ft. in width, and some are being extended to a width of 120 ft. at the present time. The sheds cover an area of over 13 acres, and they are all floored with whinstone setts or granolithic pavement. There are altogether forty-six hand, hydraulic and steam cranes, fixed and movable cranes varying from 1 ton to 65 tons power, the latter being a steam crane for lifting boilers and heavy machinery on board vessels. On the top of the jib of this crane an auxiliary jib was recently constructed rising considerably higher, with a power of 18 tons, worked from the intermediate shaft of the machinery, for masting vessels.

COAL SHIPMENT.

The facilities for coal shipping consist of one steam coal crane, two hydraulic coaling cranes and three hydraulic coil hoists, all of modern type and construction. A peculiarity of the coal hoist is that there is only one cylinder and ram, the tipping of the wagon, usually done by a separate ram, being in this case effected by a chain fixed to the front of the cradle, which holds it at the required level for the shoot, and the wagon being tipped up by the lifting ram being raised to the height necessary to give the angle to discharge the coal from the wagon. The tipping cradle is hinged at the centre, and consequently when tipped a space is left between the front of the cradle and the butt end of the shoot. This space would allow the coal to fall between the cradle and the shoot, but this is prevented by an ingenious arrangement in which by a parallel motion a small subsidiary shoot, level with the floor of the wagon, is projected forward as the cradle rises and thus effectively "bridges over the gulf."

BRIDGES.

Communication between the two systems of docks on the east and west sides of the harbour is maintained by four bridges, two of which are swing bridges and two bascule bridges. The largest of the swing bridges is 120 ft. clear span, and was erected in 1874, at a cost of over £32,000. The bridge is constructed of main braced girders, and carries two lines of railway and roadway, with a footway on each side. The bridge is 215 ft. long and weighs upwards of 700 tons. It turns on a central hydraulic ram, 69 in. diameter, and is swung by two rams, each 14 in. diameter, with multiplying sheaves and chains. At the time of its construction it was the largest swing bridge in the kingdom, but it is now surpassed by two or three others, notably by the bridge at Connaught's quay, which is 140 ft. span, and by the Manchester canal bridge at Trafford-road, which, although less span, weighs over 1,800 tons.

GRAVING DOCKS.

The accommodation for the repairs of vessels consists of six graving docks, respectively 382 ft., 335 ft., 300 ft., 266 ft., 180 ft., and 174 ft. in length. The latter has been in existence since the old docks were opened, is still in excellent condition and is very useful for the repairs of small vessels and steam trawlers. The largest graving dock, known as the Prince of Wales dock, was opened in 1860 and cost £60,000. The water is pumped from all these graving docks by turbine or centrifugal pumps of such power that the docks can be emptied in about two hours.

SHIPBUILDING AND SHIP REPAIRS.

Shipbuilding has a history at Leith. It was inaugurated by James IV., who formed a dockyard at Newhaven (then called "Our Lady's Port of Grace"), and in 1511 ordered the building of the *Great Michael*, a war vessel 210 ft. long, 33 ft. beam, and which "within the walls" was 10 ft. thick, with massive sides of oak. The building of this vessel is said to have "wasted all the woods in Fifeshire (except Falkland Wood), besides timber that came from Norway." This vessel had 300 mariners, six score gunners, 1,000 men of war, besides

captain, skippers and quartermasters." The *Great Michael* was afterwards sold or presented to Louis XIII.

The patent slip for the repair of vessels was invented at Leith by Messrs Morton & Co., a firm still in existence; and Messrs. Menzies & Co., who built the renowned *Sirius*, the pioneer of Atlantic steam navigation, in 1837, have occupied premises at the harbour for over 100 years. There are several other shipbuilding and repairing yards, the largest being that of Messrs. Ramage & Ferguson, who have acquired distinction as the builders of some of the finest steam yachts afloat.

TRADE AND FINANCE.

The cost of the harbour and docks up to the present time has been over £2,000,000, and the amount of the existing debt is £436,000. The revenue last year was £106,000, of which over £10,000 was derived from rents of ground, warehouses, feu duties, &c. The number of vessels arriving at the port during the year was 6,046, with an aggregate tonnage of 1,814,435 net register tons, of which 5,215 vessels of 1,678,784 tons were steamers. The total imports and exports were over 2,500,000 tons, of which fully one-half arrived at or was despatched from the ship's side direct in railway waggons, rails being laid on every quay in direct communication with the Caledonian and North British Railways, thus affording rapid and efficient means of transit to all parts of the country.

Goods imported and exported are of great number and variety, there being upwards of 400 classified articles and probably an equal number unclassified. The rates on vessels vary from 2d. per register ton on all coasting vessels to 5d. for Continental, 7d. for Baltic and 10d. for American and eastern vessels. But there are important concessions in all cases after two or three voyages of a vessel in any one year, and all vessels pay only 2d. per ton after eight voyages. The rates on goods vary from 1d. per ton on coal to 8d. per ton on grain, flour, timber, hemp, flax, &c.

LIGHTING AND WATER SUPPLY.

Water is supplied to the vessels and works by the Edinburgh and district water trust, by arrangements with the commissioners. The latter body obtain the water in "bulk" and distribute it to the vessels and collect the charges thereof. The commissioners have water mains on every quay, the aggregate length of mains over 3 in. diameter being about 6 miles. The quantity of water used is about 55,000,000 gallons per annum. There are also about 6 miles of gas mains, and the lighting by gas necessitates the use of about 430 large Bray and other lamps, and the consumption of about 7,000,000 cubic feet of gas per annum in addition to 60 electric 10 ampere arc lamps. The plant supplying the current for the electric light is situated at the west end of Victoria dock, and of it there will probably be a considerable extension in the near future, in view of the completion of the new dock works now in progress.

NEW WORKS.

The new dock works now in course of construction necessitated the reclamation of an area of about 80 acres of the foreshore lying to the north or seaward side of the Albert dock. This reclamation was effected by a sea wall of somewhat unusual design. It consists of a mound of hand-packed rubble stone, 30 ft. wide at the base and 9 ft. at the top, the sea face of which is covered with large concrete blocks, each 6 ft long and 4 ft wide. The whole of the wall is laid on the surface of the sand, which is dry at low water of spring tides, and the face of the wall has a slope of about $\frac{3}{4}$ to 1. A row of pine sheet piling was driven down to the clay along the back of the wall, and a row of greenheart sheet piling was driven to a depth of 8 ft. into the sand at the toe of the wall. The result was that the sand between these rows of piling became quite firm, and some small stone being spread over it made it resemble a road. The laying of the large concrete toe blocks, each weighing about 14 tons, was thus easily and expeditiously accomplished. Above the sheet piling the wall is backed with clay puddle up to high-water line, to make the sea wall "watertight," so that it became a cofferdam to exclude the water from the reclaimed area. It has in all respects proved satisfactory. The clay puddle was kept in position by a backing of dry stone, earth, sand, &c. The wall is surmounted by a parapet constructed of six to one cement concrete *in situ*, carried up to 15 ft. above high-water ordinary springs. The wall was completed in 1896 and has stood through the gales of two winters quite satisfactorily.

The dock now being constructed within the reclaimed area, from which the water was excluded in June, 1896, is 1,100 ft. long, 550 ft. wide and 40 ft. deep. The length can easily be increased to 2,000 ft. at small expense in the future. The dock is being surrounded with walls of solid masonry, set in cement mortar and carried down into the boulder clay 4 ft. below the bottom of the dock. The walls are 20 ft. thick at the base and 9 ft. at the top. The face is formed of squared stones close-jointed and with a batter of $\frac{1}{4}$ in. per foot. The back sets off 3 ft. at 11 ft. from the top, and again 4 ft. at 19 ft. below coping. From this point to the bottom the back of the wall is vertical. The walls are all finished with granite coping, 3 ft. wide in the dock and 4 ft. wide in the lock and basin, and all 1 ft. 6 in. thick. The dock will be entered by a lock 350 ft. long between the sills, 70 ft. wide and 35 ft. deep from coping to sill. This will give a depth of water over the sill at ordinary springs of 30 ft. 6 in., and at neaps of about

25 ft. 6 in.; at equinoctial springs the depth over the sill will rise to about 33 ft.

The lock walls are being constructed of masonry similar to the dock walls. The invert is of cement concrete, gauged six to one, and is to be covered with squared whinstone, 12 in. thick. All the hollow quoins, sills, roller-path stones and sluice stones are of Aberdeen granite. The culverts are each 6 ft. high and 4 ft. wide, and the sluices are to be of greenheart timber and to be raised and lowered by direct-acting hydraulic rams fixed to the masonry of the wall. A stop groove of granite is constructed on each side of the sluices, so that by inserting dummy paddles temporarily the sluices can easily be examined or repaired if necessary. The dock gates are being constructed on the flotation principle, wholly of steel and fine Yorkshire iron, with greenheart sills and heel and mitre posts. Each pair of gates, with the regular pivots and roller paths, will weigh about 292 tons. The gates will be opened and closed by direct-acting pistons, with a piston rod attached to a horizontal lever on the top of the gate. This lever is hinged to the anchor block of the gate at one end and the other end is fixed to a bracket on the top of the gate.

A passage, 60 ft. wide and 36 ft. deep, will form a communication between the new dock and the Albert dock. The construction is similar to the entrance lock. It will be fitted with a single pair of gates also of the flotation type, but the machines for opening and closing will be fixed on the back of the walls, and will actuate the gates by means of chains passing over pulleys at the heel post. The value of this passage will be obvious, as, besides enabling vessels to pass from one dock to another, it provides practically a duplicate entrance from the harbour to the whole system of the docks on the east side of the harbour, a point of manifest importance in the working of the traffic.

Across this passage a swing bridge has been constructed. The bridge is on the skew, and is 132 ft. long over all, 28 ft. wide, and has two lines of roadway and rails and a footpath on each side. This bridge is formed of two mild steel plate main girders with cross girders, and with the roadway of timber. It weighs 350 tons and is carried on a central hydraulic pivot. The tail end is carried on two rollers travelling on a segment laid in the masonry. The turning of the bridge is effected by a pair of hydraulic rams with multiplying sheaves, with chains attached to a quadrant under the bridge, one for opening and one for closing the bridge. A similar bridge is now under contract to be placed across the entrance lock, Albert dock, so as to afford an additional means of communication to the south side of the new dock.

It is expected that the dock will be opened for traffic by the end of the year 1900. The equipment is not yet decided upon, but it may be assumed that the sheds, cranes and other appliances will be of the best construction and highest efficiency, so as to place Leith in the front rank of modern, as it was for many years in the front rank of ancient ports.

DISCUSSION OF MR. WHYTE'S PAPER.

MR. W. H. HARPUR (Cardiff) said he had pleasure in proposing a vote of thanks to Mr. Whyte, who, many years ago, was at Cardiff. Most of them were not interested in the construction of docks, but it did come within the purview of many municipal engineers to erect sea walls, and the illustration given in the paper would be of very great value to them.

MR. J. PATTEN BARBER (Islington), who seconded the vote of thanks, said the portion of the paper which interested him was the wall which had been constructed for the purpose of reclaiming some of the foreshore. He thought they might fairly describe that wall as of novel construction. It was ingenious and daring. He used the word advisedly, and he hoped its meaning would not be misunderstood. He did not say reckless—it was daring, it was bold. He should like to know with what Mr. Whyte had protected the sheet piling. It looked somewhat like concrete bag work. He should also like to know whether there had been any indication of these stones, or whatever they might be, being rolled away by the flood tides. And were the concrete blocks, forming the toe of the wall, constructed in the open? The boldest part of the construction seemed to be the formation of the heart of the wall in dry rubble. With this clay puddle being put in at the back any excess of water in the heart of the wall with a full tide might have had a tendency to break up the concrete face with hydrostatic pressure. It was a bold piece of work, but, as Mr. Whyte had told them, the result had been successful, and they need not criticise a bold piece of work when the result had been absolutely successful. It was a very ingenious piece of work, and he felt perfectly confident that no one but a man who knew what he was doing would have had the courage to adopt that method of construction. He particularly wished to draw attention to the way in which the foundation of the wall was prepared for laying the toe of the wall upon the sand. He once had occasion to design a retaining wall which was to be 60 ft. high, and the foundation was somewhat similar to the sands on which this embankment or wall had been constructed, and he intended, had the wall been constructed, to have placed hard-burnt clinker on the soft foundation to have made it somewhat harder than it was, and to have assisted in consolidating the clay and prevent spewing by the weight of the wall upon it.

The vote of thanks having been accorded.

MR. WHYTE, in reply, said he wished to say a word in

reference to the question raised by Mr. Barber. They were rough stones laid at the toe of the wall, and not one of them had shown the slightest sign of movement at any time. The object was to prevent the backwash washing away the sand. As to the boldness of the design, it was not arrived at in one day. A smaller wall was built on the same design, and as they got on perhaps they got bolder. The object of the sheet piling was to keep the sand in place, without that they could not get the sand firm enough to have the blocks laid. Then he recommended sheet piling, and that overcame all their difficulties, and the foundations became so strong that they could drive trucks along it.

LUNCHEON.

At the close of the indoor business of the meeting the members were entertained to luncheon by Mr. W. N. Colam, the engineer for the Edinburgh cable tramways.

After the toast of "The Queen" had been submitted by Mr. Colam, who occupied the chair,

Mr. JAMES LAW (Edinburgh) gave "The Lord Provost and Magistrates of the City." He did not know, he said, a body of men more able or more disinterested than those who composed the Corporation of Edinburgh. For his own part he wondered how busy men found time to do so much public work. He noticed that in connection with all the leading departments of municipal work in Edinburgh the conveners of committees always placed the greatest reliance on the wisdom and judgment of their skilled advisers. He was speaking to a company of skilled engineers, who were the advisers to municipal corporations, and when they went back to their own spheres of work they would, he hoped, impress upon their councils the great advantage which the City of Edinburgh derived from, and the implicit faith it placed in, the wisdom and skill of its trained engineers and specialists (Applause).

Baillie ROBERTSON, in replying, after commenting upon the beauties of Edinburgh, alluded to its industries, and remarked upon the fact that a good deal of the printing trade had recently gone from Edinburgh to London. He was very pleased to know, however, that one of their leading and most important newspapers in the country had acquired a site for new printing premises, which he was sure, from all he had heard, would be second to none in the kingdom. He had no doubt that, should any of the gentlemen present be back in Edinburgh in a year or two, they could do better than visit these printing premises, which, he felt sure, would be superior to anything in the country.

Mr. COLAM, in proposing the toast of "The Association," said municipal engineers had to be a great deal more than engineers—they had to be diplomats, and if they were not he was afraid they would not have a very happy time. They had in Edinburgh, in charge of a department in which municipal engineers were interested, a gentleman who was almost aggressive in his desire to get information. He referred to Baillie Mackenzie, convener of the Electric Lighting Committee. They wanted more Baillie Mackenzies in their municipal life. If they had more bailies and aldermen at these meetings they would find that these gentlemen, instead of grumbling at the absence of their officials, would be the first to propose that the expenses of the members should be paid. He was convinced that what he was saying was correct, and he hoped that members of the association would use their persuasive powers to bring this desirable state of matters to pass (Applause). They had just been speaking about that powerful organ, *The Scotsman*, which represented the Press power of the country, and he would like to say that Mr. Law, in making the great changes he was about to carry out, had recognised the importance of picking up all the information he could, and at the present moment he had even spared his right hand to go to America, in order to bring back the latest information to make the great enterprise a success.

The PRESIDENT of the association acknowledged the toast, and proposed the "Health of Mr. Cooper" (burgh engineer of Edinburgh), who, he said, had been the mainspring of the success of their gathering in Edinburgh.

Mr. COOPER having briefly acknowledged the toast, the PRESIDENT gave "The Chairman," and spoke of his eminence as an engineer. Mr. Colam, he said, was a recognised authority on tramway work—the highest authority in the world, in fact, upon cable traction.

The CHAIRMAN, in reply, said that the association would probably arrange another visit to Edinburgh when the cable system was in full operation, and the corporation would then, he had no doubt, be only too glad to receive the members. The proceedings then terminated.

A special word of recognition is due to the men and the luncheon, characteristic in its indication of the completeness with which everything Mr. Colam does is carried through in every detail. The card bore, embossed, the arms of the city, was illustrated with an excellent portrait of the Lord Provost and with a view of the National Gallery and Castle, and was tastefully printed.

VISITS OF INSPECTION.

In the afternoon the members were divided into two parties, for the purpose of visiting a number of the municipal and other features of the city. The programme arranged for one section included the following visits:—

THE ARTISANS' DWELLINGS.

Those inspected are situated in a central and crowded part of the city, on one of the areas dealt with by the corporation under the Housing of the Working Classes Act. The buildings have a frontage to Cowgate of 150 ft., and are substantially built in Binny stone with red stone dressing. The entrance to the houses is from a high-level street—High School-yards—on the southern front. The houses are planned on the balcony principle, to give each an entrance direct to the outside air. The two tenements together

EDINBURGH: SOUTH FRONT OF TENEMENTS AT HIGH SCHOOL-YARDS.

accommodate fifty-six families, and provision is made so that the blocks can be extended at any future time. Mr. W. Bruce, of the burgh engineer's department, and several lay members of the Social Union, referred to in a recent SCOTSMAN (page 41), communicated a number of other particulars as to the construction and management of the dwellings. Our readers have already had an opportunity of perusing the paper read by Mr. Bruce before the meeting, and also the discussion thereon. The paper was given in our

EDINBURGH: WEST FRONT OF TENEMENTS AT TYNE-CASTLE.

issue of July 1st and the discussion last week. We give two illustrations representing respectively tenements at Tyne-castle meadows, a working-class suburb, and at Cowgate, in the centre of the city. It will be seen that the latter were the tenements visited.

THE ELECTRIC LIGHTING STATION.

The central electric lighting station is in Torphichen-street, in the west end of the city. It is a handsome building in stone, built in the Italian Renaissance style from designs by Mr. John Cooper, the burgh engineer. This large station was completed in April, 1895, and now is entirely fitted up with its machinery for generating electricity for lighting and power, all to the design and arrangement of Prof. A. B. W. Kennedy, of Westminster. The boiler-house is 150 ft. by 45 ft., with the coal store above of the same size, the coal being fed into automatic stokers in front of the powerful boilers, of which there will be seventeen. The engine-room is 100 ft. by 89 ft., in two sections—high-tension side and low-tension side. The engines are of the Willans & Robinson type, with Siemens' dynamo and Ferranti's alternators. The switchboard occupies the whole length of the engine-room on one end, over which are the battery-rooms, meter-testing rooms, stores, &c. Owing to the extraordinary success of the electric lighting in Edinburgh, the present station is rapidly becoming too small, and a beginning is soon to be made of the construction at McDonald-road of another station, which will be on a scale, equal to, if not greater than, the present central station. Mr. F. Newington, the resident electrical engineer, acted as electrician to the visitors

Full particulars of the works will, of course, be found in Mr. Newington's paper, which, together with the discussion, ap-

EDINBURGH: WEST FRONT OF CENTRAL ELECTRIC LIGHTING STATION (ENGINE ROOMS, &c.).

peared in our last issue. We give another illustration of the works in addition to the three given last week.

THE TOLL-CROSS CABLE TRAMWAY POWER STATION.

This cable power station, now in the course of completion, is situated at Tollcross, on an area of ground about an acre in extent, which was previously cleared under the improvement scheme. The group of buildings will form a complete depot, providing the necessary power and accommodation for driving five lines of cables operating the Braid Hills, Circular, Prince's-street, Murrayfield and Gorgie routes of tramways, soon to be placed under the cable system of traction. The buildings comprise the following, *viz.*—

The boiler house, 104 ft. by 40 ft., containing four large boilers of the marine dry back type, with superheaters above and the flues under the floor, two feedwater heaters and a Calvert's economiser.

The chimney is also placed here, and rises to a height of 175 ft. Coal storage is also provided above the boilers, the coal being fed automatically into mechanical stokers.

The engine and hauling machinery rooms are 103 ft. by 89 ft. by 40 ft. high. Two powerful travelling cranes traverse the width of these rooms, for raising and setting the heavy machinery. The machinery foundations are very substantially built of brick and cement, and vary from 10 ft. to 15 ft. in depth below the floor.

Engines and Machinery.—There will be three pairs of compound engines, each capable of developing 900 horse-power at 160 lb. steam pressure. The first motion shaft will have two pulleys of 14 ft. diameter, driving two pulleys of 30 ft. diameter on the second motion shaft by means of thirty-two cotton ropes of 1½ in. diameter. This second shaft will drive the grip and deflecting pulleys for the five lines of cables. Clutches are also provided for putting these in and out of gear. There will also be five large rope drums for running the new ropes into the lines when changing.

Tension Racers-Room.—Beyond the engine-room on the basement is the tension racers-room, 160 ft. by 89 ft., where the machinery for maintaining an equable tension on the cables will be placed; and beyond this, again, under the street in front of the building, is the depot road pit, 96 ft. by 19 ft., containing twenty pulleys of from 8 ft. to 11 ft. diameter for diverting the cables into the subway (120 ft. by 5 ft.) which runs out to Earl Grey-street pit.

Cable Cellar.—At right angles to the tension racers-room, also in the basement, is placed the cellar for storing the old cables. This is provided with a large rope drum, engine and machinery, for drawing the ropes out of the lines when those have to be changed.

Pump and Tank Rooms, &c.—At the side of the engine-room are the pump and tank rooms, for water storage, lavatories, engineers' offices, carsheds, &c.

Car Sheds and Storage of Cars.—The front part of the buildings is wholly set apart for the storage of about sixty cars. These cars will be elevated above the floors on open gantries, for the convenience of getting at the grippers and brakes and making any adjustments required. The cars enter the depot by an inclined plane on to a movable platform or traverser which runs the whole length of the car sheds, and are readily stored in the bays. Behind the car sheds are placed the stable, store-rooms and smithy and mechanics' shop.

Design and Cost.—The buildings have been substantially constructed of stone and brick, with iron and glass roofs, and are practically fireproof. The design of the front elevation to the new street and to Ponton-street is treated in a free interpretation of late Victorian Gothic work built in Corsehill stone. The cost of the buildings will be about £44,000.

Contractors.—The contractors are Mr. Colin MacAndrew, of Edinburgh, for the whole buildings; Messrs. Dick Kerr & Co., Limited, Kilmarnock, for the engines, hauling machinery and other plant; and Mr. George Sinclair, Leith, for the boilers, piping, pumps, &c.

Engineers.—The whole buildings and machinery are from the designs of Mr. W. N. Colam, C.E., and Mr. John Cooper, burgh engineer, engineers to the corporation for the cabling of the tramways. Mr. Colam accompanied the party of inspection and courteously replied to all the questions raised on the spot. Some illustrations of the cable power station at Tollcross and that at Shrubhill were given in our issue of July 8th, in connection with Mr. Colam's paper and the discussion arising out of it.

M'EWAN HALL.

At the M'Ewan Hall the following description was given of this magnificent feature of Edinburgh's architectural acquisitions:—

No doubt you are aware that this beautiful building was erected at the expense of Mr. William M'Ewan, member of Parliament for the central division of the city, and generously given by him to the University of Edinburgh for use as a graduation and concert hall. No doubt you are also aware that the building was designed by Dr. Robert Rowand Anderson, R.S.A., the eminent architect of the new medical school adjoining the hall.

The building is designed in the Early Italian Renaissance style of architecture, and has taken about nine years to erect and complete. The plans and sections laid out for your inspection are working drawings used during the erection. Considerable care had to be exercised in the setting out of the building, but I am glad to say the work was so accurately done that when the columns were built and tested on top of caps the variations of the distances from centre to centre did not exceed ¼ in. The semicircular shape of the building is after the plan of the ancient Greek theatre, and is seated for 2,600 comfortably. The dimensions of the hall internally are: On the large diameter, 106 ft.; the smaller diameter, about 66 ft. The diameter over the galleries is 134 ft., the height being 90 ft. to the dome light. The depth of the galleries is about 14 ft. The outer wall, which is 3 ft. 6 in. thick, is about 64 ft. high, and is strengthened with massive buttresses placed radially behind the large pillars you see supporting the dome. The dome rises about 38 ft. above the cornice, and is surmounted by an ornamental lantern 30 ft. in height. The total height from the street level to the top of lantern is about 130 ft.

Construction of Dome.—The roof is constructed of mild steel of an equal quality to that used in the Forth bridge. There are twenty-two massive lattice girders in the circle, attached at their tops to a heavy steel ring enclosing the circular light at the apex. The girders radiate from this ring so that the foot of a girder rests directly over the centre of one of the stone columns. The backs of the girders are kept about 2 in. clear of the stone work, to allow for expansion, and their feet are set upon turned steel rollers fitted in cast-iron bed-plates resting upon the stone caps of the pillars. The wall of the cresteroy, which you see is pierced with circular lights thirteen in number and about 7 ft. in diameter, is supported on the outside by strong flying buttresses, which are intended to convey to the vertical buttresses any lateral pressure that can take place. I may mention a fact which will show the high quality of this roof work. When the steel work was completed, and previous to the removal of the supporting staging, we had a fine silk cord stretched across the hall and under the steel work, and by the use of vertical ganging-rods between this cord and the under side of the central steel ring it was found, when the wedges were removed, that the sinking of the structure was less than ¼ in. The total weight of steel used in the construction amounts to about 200 tons. Externally the steel framework is covered with boarding and lead. Those of you who care to mount the stairs up to the roof will see one of the finest pieces of lead work in Edinburgh, or, I may venture to say, in the country. The lead used weighs 8 lb. to the superficial foot, and there is altogether about 140 tons of it on the roofs. The ceiling which you see is of boarding ½ in. thick, in very narrow widths and bent to the required curves. The red stone columns are 28 ft. in height from base to cap and 2 ft. 2 in. in diameter at the neck. We calculated that the weight to be sustained by each column at the under side of the cap amounts to slightly over 80 tons.

The two galleries are fitted with continuous benches in yellow pine wood stained, the balustrades in front being in oak. In the lower balustrade you will notice that each bay or division has a panel in the centre; on these panels are carved the monogram and crest of the donor, the arms of the university and the city. On the panel above the centre doorway is carved the words *Jacobus VI.*, that genial monarch being the founder of the university. On one side is the date 1584, being the year of the foundation of the university; on the other side is the date 1894, the year in which that particular portion of the work was executed, and probably some sanguine spirit really expected the building to be finished and opened in that year! While speaking about the galleries it may be interesting to some of you if I point out the rather clever way the stairs are arranged. In each of the two round towers projecting from the outer wall are constructed two stairs, one within the other, somewhat like a screw with a double thread. One of the stairs enters from the street and gives access to the upper gallery only, the other stair entering from the wide corridor and giving access only to the lower gallery, the idea being to prevent the occupants of the two galleries meeting until out in the street.

The whole of the area is done up in oak, the floor being laid with what is known as block flooring in walnut and oak panels laid on concrete. The flaps of the seats in the raised portion of the area are a Canadian production, and are made of five thicknesses of "Ouram" wood glued together transversely under enormous pressure. The flaps are very strong and yet very light. The platform and senate stalls and the screen behind are also constructed in oak. In the basement floor you will find provision made for storing hats and cloaks. The walls are lined with white glazed bricks, giving the place a light and cleanly appearance. In the centre of the basement is the store-room, where is stored the movable gallery which on the occasion of an orchestral concert is fitted up over the fixed platform and senate stalls. Behind this store are placed the steam batteries, the ventilating fans and engine, and also the electrically-driven machinery belonging to the organ. Our engineer, Mr. Mitchell, will explain this machinery to those of you who care to go below.

Warning and Ventilating.—The warning is by low-pressure steam, the fresh air being drawn in by a pair of 48-inch Blackburn fans and sent over the steam pipes in the battery chambers, passing into the hall through a number of ducts under the floor and in the walls, the warm fresh air being thus well distributed throughout the place. When empty the hall can be heated direct from the steam batteries by opening panels in the front of the platform. On the few occasions the hall has been used we have been able to keep the place quite fresh and comfortable and without the temperature varying more than one degree during the two or three hours each function lasted.

Electric Lighting.—Before arriving at the present arrangement of the lamps a number of experiments were made, first with arc lamps, then with the incandescent lamps which were finally adopted. As you see, a large pendant hangs in the centre of the dome, carrying thirty-nine lamps having 6,400 candle-power. Above the cornice and hid from view are placed 260 lamps of 16 candle-power each, and in each of the galleries are thirty-nine lamps of 32 candle-power each, giving within the hall a total illuminating power equivalent to 13,120 candles. The whole artificial illumination connected with the hall amounts to the equivalent of about 18,000 candle-power. The whole installation is found to be very successful.

Decoration.—The painted decoration of the interior was entrusted to Mr. W. M. Palin, of London, a clever young artist who worked like a slave for three years in producing the beautiful pictures you see around you. The whole of the figure work is painted on canvas fixed to the wood or plaster surfaces with white lead. The scheme of decoration on the dome is a series of symbolical figures typical of the various faculties in the university. Beginning at the left side, the figures are named Astronomy, Mathematics, Poetry, History, Divinity, Philosophy, Medicine, Oratory, Jurisprudence, Fine Arts, Music, Biology and Physics. In the spandril above the arch over the platform you observe a large painting, called the Temple of Fame. There are over eighty figures in the picture, representing students and philosophers working their way up to Fame. In the centre you will notice three goddesses, seated, and typical of Science, Art and Literature. Underneath the Temple of Fame are four large wall panels. The panel on the right has a figure representing Minerva seated upon a throne receiving a gift of the building; on the left of the goddess is a portrait of the donor, Mr. M'Ewan. On the left the composition represents "Fame crowning Success." The whole of the painted decoration is allowed by competent critics to be well worthy of the clever artist who designed and carried out the work. On the grand staircase ceiling, which was decorated by Messrs. Reid & Downie, of Edinburgh, are painted the arms of the trustees of the hall and the high officials of the university. "In the centre, on the north, are the arms of the donor: on the left those of Sir W. Turner, Lord Balfour and Sir William Muir; and on the right those of the late Mr. John Christison, the late principal, Sir Alexander Grant, and Mr. A. J. Balfour, the present chancellor. On the south side of the ceiling are the arms of the late Lord President Inglis and of the present Lord President Robertson, the whole work forming a piece of very rich colouring."

Organ.—The organ is by the Hope Jones Electric Organ Company, Birkenhead, and is thought to be the finest in the country. It contains over 2,400 speaking pipes, and the cable connecting the console with the speaking parts of the organ contains over 1,500 wires. The bellows are placed in the basement and are driven by a 10 horse-power electric motor. The cases were designed by Dr. Rowand Anderson, and executed by Mr. James Slater, of Edinburgh, and are made in oak. I regret that I am unable to describe in detail the working of this magnificent instrument, but through the courtesy of Mr. Collinson you will shortly hear its fine tones and be able to judge for yourselves of its high qualities. The cost of the organ, with its cases and the alterations on the building necessary for its accommodation, amounted to nearly £10,000. The cost of the decoration was also about £10,000, and the total sum paid by Mr. M'Ewan towards the balance of the cost of site and expenditure on the hall amounts to little less than £115,000. We do well to call it a princely gift.

As mentioned in the above description, Mr. J. H. Collinson, M.S.BAC.OXON., the organist of St. Mary's cathedral, delighted

the visitors with selections calculated to bring out in harmonious contrast the enormous power and the extreme delicacy of the organ. Votes of thanks, moved by the president of the association, were accorded with general enthusiasm.

The day's visits of the section concluded with an inspection of

THE EDINBURGH PUBLIC LIBRARY.

This building is situated in George IV. bridge, and is the outcome of a gift of £50,000 to the city of Edinburgh through the munificence of Mr. Andrew Carnegie, of Pittsburgh. It is a first-class and highly-equipped library, possessing large reading-rooms, boys' and girls' lending library and a general library, and a very valuable reference department in which there is also a collection of valuable antiquary books and manuscripts. The planning of the building, the arrangements for the storing of the books, and the mode of working the lending department, have all been carefully arranged, and the library may be considered to be a model of its kind. It is under the direction of Mr. Morrison, the city librarian, who was unwearingly in his explanation to the visitors of its main features. The buildings are in the French Renaissance style, from designs by Mr. G. Washington Browne, A.R.S.A.

The second section of the members were at the same time visiting the following:—

THE POWDERHALL REFUSE DISPOSAL WORKS.

This establishment is in the northern district of the city, and consists of stabling and other accommodation for twenty-two horses and all the carts, sweeping machines and other appliances of a branch cleansing depot. Here is also placed

EDINBURGH: GENERAL VIEW OF THE POWDERHALL REFUSE DESTROYER BUILDINGS FROM THE NORTH.

the refuse destructor of ten cells recently reconstructed on the Horsfall principle, together with the boiler and engine for the electric lighting plant. The whole operations of burning the refuse are conducted inside the buildings, so that all risk of nuisance may as far as possible be obviated. The chimney is 185 ft. high. The buildings are substantially constructed, Hailes stone and red Dumfriesshire stone being freely used. The whole of the buildings are in the Scottish

EDINBURGH: POWDERHALL REFUSE DESTROYER WORKS, EAST FRONT OF STABLING, ETC., TOWARDS BROUGHTON ROAD.

Baronial style, from designs by Mr. John Cooper, the burgh engineer. We need not refer to them further in detail, as they were fully dealt with in the paper by Mr. Young, already given in THE SCOTSMAN of July 8th, together with discussion and several illustrations. This week we give two general views of the works.

THE CHANCELOT ROLLER FLOUR MILLS.

This very large establishment is situated in the north of

EDINBURGH: THE CHANCELOT ROLLER FLOUR MILLS.

Edinburgh, and is one of the largest flour mills in Scotland. The plant and machinery is on the roller system, from the design of Mr. Henry Simon, Manchester, and possesses all the most modern features in the various processes. The buildings are erected in the French Renaissance style, are very substantial, and practically fireproof. The silo house is 137 ft. long by 34 ft. wide by 70 ft. high. The mill proper is 103 ft. 6 in. by 34 ft. and is five storeys high. The warehouse, 189 ft. long by 53 ft. wide, is six storeys in height and has a capacity for storing 50,000 sacks of flour. Its treatment is the Roman Corinthian order of architecture. The engine-room is a very fine one, being decorated in characteristic style emblematic of the trade. The central tower, rising to a conspicuous height, is a prominent landmark for miles round. It contains the large water tank for the Grinnell automatic sprinkler fire-extinction apparatus. There are two boilers, and the main engine, of 600 indicated horse-power, is by D. Stewart & Company, Limited, Glasgow. The ponds, situated to the west end of the building, contain 1,000,000 gallons of water for condensing and feedwater purposes. The mill was opened in 1894, and belongs to the Scottish Co-operative Wholesale Society, Limited, to whom we are indebted for the accompanying illustration.

THE SHRUBHILL CABLE TRAMWAY POWER STATION.

This station is situated at the present Horse Tramway Central Depot in Leith-walk. The engine-room, boiler-house, coal store and tension racers-room are very similar in plan to those described in the previous account of the Tollcross power station. The notable features of this station are, however, the very large provision which is being made for storage of the cars—150 of them will be housed here. The whole buildings, when completed, will cover an area of 6.65 acres. The joint engineers for the corporation are Mr. W. J. Colam and Mr. John Cooper, the burgh engineer. A general view of this station was given in our issue of July 8th, together with views of the Tollcross station, in connection with Mr. Colam's paper.

THE LEITH DOCKS.

The Leith docks, although only second in importance in Scotland, are continually being improved and extended under the able supervision of Mr. Peter Whyte, M.I.C.E., the dock engineer and superintendent. At the present time a very large new dock is being constructed, and tidal locks are to be formed connecting the new dock with the Albert dock and the harbour. The reclamation wall is already built, and the foundations for the locks and dock gates are proceeding. The whole machinery will be operated by hydraulic power. The dock works quay walls, railways and other works will occupy the next few years in completion. Very complete details of the recent extension of the docks will be found in the able paper read by Mr. Whyte and given in the present issue.

The following list of the books, selected by Mr. Platt in connection with the premium of £10 awarded by the association, may be of interest: Published by Spon—Tudsbury's "Water-works," Hood's "Warming Buildings," Boulnois' "Municipal Engineers' Hand-Book," and Codrington's "Roads"; published

by Crosby Lockwood & Co.—Burton's "Water Supply," Simm's "Tunnelling," and Clark's "Tramways"; published by Engineering—Dawson's "Electric Tramways"; published by Longman & Co.—Mill's "Railway Construction"; and Baker's "Masonry Construction," published by Chapman & Hall for Wiley & Sons. Of course it will readily be understood that, as every municipal engineer is probably in possession of an extensive professional library, some difficulty must necessarily be experienced in making a selection on such an occasion. We may also mention that four of the books—those by Hood, Boulnois, Codrington and Clark—were chosen to take the place of previous editions.

SOME MEMBERS OF COUNCIL.

On former occasions we have published supplement sheets containing portraits of the majority of the members of the council of the association. A number, however, still remained to be given, and some of these we present this week in the form of a special supplement, among the portraits being those of the two new members elected this year, Mr. Price and Mr. Collins, and the two members elected last year for the first time, Mr. Paton and Mr. Yabbiocom. Except in the cases of Mr. Lemon and Mr. Price, biographies have already been given in our columns in connection with various district meetings. That of Mr. Paton was given in our issue of May 23, 1895; Mr. Yabbiocom, October 2, 1896; and Mr. Collins, June 17, 1898. We append brief biographical notices of Mr. Lemon and Mr. Price.

MR. JAMES LEMON.

Mr. James Lemon, M.I.N.S.T.C.E., after going through the usual term of pupillage and filling minor offices, was appointed in the year 1859 assistant in the office of the late Sir Joseph Bazalgette. This was at the commencement of the metropolitan main drainage scheme, and he thus had an opportunity of gaining experience on the most important drainage works in the country. In the year 1866 he was elected by public competition to the office of borough engineer and surveyor of Southampton. After twelve years' service he resigned and went into private practice, the corporation retaining his services as consulting engineer for three years. In 1883 the water supply of the borough was attracting a good deal of attention, and it was well known Mr. Lemon held strong views in favour of the entire abandonment of the supply from the river Itchen and the adoption of a new supply from the chalk at Otterbourne (afterwards carried out). He was asked to become a candidate for the largest ward in the borough, and was elected without opposition. In 1889 he was also elected a member of the Hants County Council, and served on that body for six years. In November, 1891, he was unanimously elected mayor of the borough, which position he held for two years. He is a partner in the firm of Messrs. Lemon & Bizard, civil engineers, and surveyors, practising at Westminster and Southampton. He is also a member of the Institution of Civil Engineers; a fellow of the Royal Institute of British Architects, the Surveyors' Institution, the Geological Society, the Sanitary Institute, and the Meteorological Society; a member of the council of the Sanitary Institute and one of the examiners of that body,

and also of the Incorporated Association of Municipal and County Engineers. As our readers well know, Mr. Lemon was one of the founders of the latter association. He acted as its first vice-president and in 1876 was elected president. He is actively engaged in designing and carrying out public works in various towns, but still finds time to attend to the duties of the various bodies of which he is a member.

MR. JOHN PRICE.

Mr. John Price was educated at Manchester Grammar School and at the Victoria University, obtaining the Ashbury Exhibition at the university for civil engineering. In 1871 he entered the office of Mr. Hartley Watson, of Manchester, as articled pupil, and three years later was given charge of the construction of the Hollinwood branch of the Lancashire and Yorkshire Railway, as engineer to the contractor, Mr. James Evans. In 1876 he entered the office of Mr. Arthur Jacob, B.A., M.I.C.E., then consulting engineer to the Barrow-in-Furness Corporation, and was engaged upon the designs for the main drainage works of that town. On Mr. Jacob's appointment to Salford, Mr. Price was appointed resident engineer on these and other works, involving an expenditure of about £20,000. In 1878 he was elected to the appointment of engineer and surveyor to the Barton Sanitary Authority, which post he held until 1884, when he was appointed engineer and surveyor to the Toxteth Park Local Board. During this period he superintended the construction of main drainage works and works of sewage disposal costing nearly £50,000, and prepared plans for private street works estimated to cost nearly £10,000, the greater portion of which were carried out under his superintendence. He also acted during this period as consulting surveyor to four different highway authorities in connection with the Ship Canal Bill, 1883-4. On the extension of the boundaries of the city of Liverpool, whereby the district of four important urban district councils, including Toxteth Park, were added to the city, Mr. Price was offered the appointment of assistant city engineer, at a salary of £550 per annum. This position he held till July, 1896, when he was appointed city surveyor of Birmingham, and deputy engineer to the Tame and Rea Drainage Board, at a combined salary of £800 per annum. On the death of the late Mr. W. S. Till, in the earlier part of this year, he resigned his appointment with the drainage board, and was appointed city engineer and surveyor of Birmingham, at a salary of £1,000 per annum. Mr. Price, we may mention, besides being a member of the council of the Incorporated Association of Municipal and County Engineers, is a member of the Institution of Civil Engineers, a fellow of the Surveyors' Institution, and a vice-president of the Municipal Officers' Association.

Next week we shall conclude our report of this interesting annual meeting, giving some illustrations in connection with the visits made on Saturday, July 2nd, the third day of the meeting.

IMPERMEABLE CAPPED SOCKETS.

We give some illustrations of patented joiners or impermeable capped sockets, which have been brought out by the well-known sanitary engineering firm of George Jennings,

Fig. 1.—Joiner on Pipe Eye.

Fig. 2.—Joiner on Junction.

Fig. 3.—Sectional View.

Lambeth Palace-road, S.E., and the South-Western Pottery Works, Parkstone, Dorset. A few particulars of these joiners or socket will, no doubt, be of interest to our readers. They are intended for introduction into lines of stoneware pipe sewers, for the purpose of facilitating future connections and when required. It is considered to be especially valuable in the sewerage of new roads in connection with building estates, as it can be introduced freely, without risk, wherever a future connection is likely to be required, and has no detailed supervision is necessary to ensure complete security. The cap or cover of the socket being formed, together with the pipe on junction, in one piece of highly-vitrified glazed stoneware, it is claimed that leakage of any kind, either from without or from within, is absolutely impossible, whilst its removal, which can be speedily and safely accomplished by any bricklayer or handy pipelayer, leaves the open socket in readiness for the continuity of the branch drain. A few sharp blows upon a fine-edged chisel at the cutting groove are all that is necessary to ensure a clean fracture at this point. Further details as to sizes, prices, &c., may, of course, be obtained from the makers.

ACETYLENE GAS.

DEMONSTRATION AT EARL'S COURT.

On Thursday a number of Press representatives were invited by the Acetylene Gas Light, Power and Calcium Carbide Company, Limited, to view a large-scale installation of acetylene gas at the Earl's Court exhibition.

Gradually "the new illuminant" has been developed and made of practical use since Sir Humphry Davy discovered it some sixty years ago. In 1859 Bertholot named it "acetylene," but the difficulty of producing calcium carbide on a large scale stood in the way of progress until Moissan in France, and Wilson in America, simultaneously hit upon the method of coke and lime fusion by the heat of the electric arc. Now there are about a score of manufactories of carbide in different countries, and it is promised that the gas will soon be the cheapest artificial light in the market. Its photometric value as an illuminant is given as fifteen times that of coal gas, and it is stated to be cool and comparatively free from noxious vapours.

As seen at Earl's Court the production of acetylene by the new process seemed an easy matter. There were generators suited for a multiplicity of objects—from a cycle lamp to a street lamp, from a portable hand lamp to a lighthouse. In the generator is placed the calcium carbide, and the dripping of water upon it forms the gas ready for use. Apparently there was no danger in the operation. Calcium carbide itself will not burn on a fire, nor will it emit light if hammered. It becomes effective only by the action of the hydrogen of the water.

The installation at Earl's Court represents more than 12,000 candle-power, and includes a search-light which on clear nights has been seen from Epsom Downs. We understand that acetylene has not yet been tried here by a local authority, though in Hungary and North Italy towns are lighted with it, so that there is chance of distinction for a pioneer municipal engineer who likes to test it for street lighting and for the enrichment of coal gas. The address of the company is St. Olave's House, Ironmonger-lane, E.C.

DISCHARGING WORKMEN.

THE QUESTION OF NOTICE.

A case of considerable interest to surveyors and to local authorities was heard at the Horsham County Court, before his honour Judge Martineau, on Tuesday. Mr. Renwick, surveyor to the Horsham Urban District Council, was sued by a man named Buck for 18s., in lieu of a week's notice. Plaintiff said he had been in the employ of the council for over three years, and that a week or two ago the defendant dismissed him at a minute's notice, paying him his money up to that time and telling him he should not require his services further. He was paid 18s. per week, and he claimed that sum in lieu of notice, which he should have given had he left his employment. Mr. Renwick stated that the plaintiff was a labourer and was paid by the day and quarter. Plaintiff was dissatisfied over an odd hour, and he told him to finish up. All such employees as the plaintiff were engaged by the day, though they were paid by the week as a matter of conven-

ence. The engineers at the sewage and water works were permanent employees, because they were always required, but the others were engaged by the day, because a change in the weather or other unforeseen circumstances would render their services unnecessary. He had discharged many men at a moment's notice, and many men had left their work at similar notice. His honour said he had nothing to do with what was right or wrong as to the dismissal, but to do what was legal. There was a very common notion on the part of people that they were entitled to a week's notice, but the custom of the trade had to be considered in all cases. Agricultural labourers were engaged by the day, and consequently could be discharged at a minute's notice if their work was unsatisfactory and for many other reasons. He was satisfied that plaintiff was engaged by the day, and therefore gave judgment for the defendant.

King's Norton.—The council have decided to apply to the Local Government Board for sanction to borrow £6,372 for the execution of various works of sewerage.

Some Annual Municipal Engineering Records.

DUDLEY : NEW SOUTH WALES ; NEWCASTLE.

An annual report of the work carried out by the borough surveyor's department, and "of the expenditure incurred in repairing, lighting, watering and maintaining the respective roads and streets, also of other public works in the borough, for the year ended 25th March, 1898," has been presented by Mr. John Gammage, borough surveyor of Dudley.

The total length of roads and streets in the borough is 44 miles. Four new streets have been constructed during the year, and this has increased the total length by 482 yards. The total area of the roads and streets macadamised was 93,550 square yards; of this area 54,137 square yards were macadamised with Rowley stone and 39,413 square yards with cinders. The amount of materials used in the repair and maintenance of the roads was: Rowley macadam, 3,382 tons (342 tons of which were broken from old setts); broken cinders, 2,626 cubic yards; sand, 250 tons; ashes and cinder chippings, 3,754 loads; and water, 9,512 loads (equal to 2,405,800 gallons). The cost of maintaining the whole of the roads and streets was £5,519, including £976 for interest on loans and repayment of principal on works of footway paving. This amount is equal to about £125 per mile.

The cost of lighting, repairing, extinguishing, &c., the 804 lamps in the borough was £2,361, an average of about £2 18s. 8d. per lamp per annum. The cost of the water used for watering the roads and streets, and for supplying fountain urinals, &c., was £132. The following is a list of carts and machines used by the department in the work of cleansing and maintaining the several roads and streets: Nine water-carts, two vans, twelve mud-carts, four ordinary carts, two sweeping machines, three road scrapers and one steam roller.

The report proceeds to give details of several improvements and new works which were either completed during the year or which are at present in hand. Eighty-two notices and plans were received and approved for the erection of 123 houses, one theatre, one school, five workshops and thirty-three other buildings and additions.

In conclusion, Mr. Gammage points out that the traffic, a greater portion of which is through traffic, is yearly increasing, thus necessitating more repairs and consequently a greater expenditure. He considers that next year an increased amount for maintenance will have to be provided. "It will be seen," he says, "that the expenditure for the year has been £300 more than last year, but the cost per mile is only equal to the cost of the year 1894 and less than that of 1896. The average cost per mile for the last five years has been £123 12s. 7d."

* * *

Much information of a highly interesting nature is, we find, contained in the report for 1896 of the Department of Public Works of New South Wales, and the following details selected by us from the publication may assist our readers to form an idea of the manner in which the public moneys of the colony are being expended. Briefly, the gross expenditure for the year amounted to over £1,772,485, this sum being made up as follows: Establishment, £56,220; railway construction, £208,154; tramway construction, £6,562; harbours and rivers, £246,502; dredge service, £108,434; water supply, £28,972; roads and bridges, £776,400; sewerage, £132,816.

The report of the engineer-in-chief for railway and tramway construction shows that no new lines were completed or opened for traffic during the year, but that three new lines of the "Pioneer" class were in course of construction. As the weather remained favourable, no floods or heavy seas being experienced, very fair progress was made with the various works for the improvement, maintenance and convenience of navigation. The ever-pressing work of protection against floods, to which most of the rivers are so liable, occupied the attention of the department, and a considerable amount of work was carried out in this direction on the Richmond river and its tributaries, the Macleay river, and the Hunter river and its tributaries. Excellent results were obtained from the dredging operations, while the cost of them bore satisfactory comparison with previous years. Signal success more especially attended the use of the sand-pump dredges at Sydney and Newcastle. The reclamations effected by them formed a very valuable asset, which, states the report, if realised on an opportune time, would far more than repay the outlay on the work. As a consequence, the work of converting grab dredges into the much more efficient and economical sand-pump dredges was vigorously proceeded with at the Fitzroy Dock establishment.

During the year 125 new bridges were completed, aggregating 10,218 ft. in length, made up of 296 plain beam spans, seven timber truss spans, and four iron spans, the total cost being £70,492. As one instance of the valuable work accomplished in the direction of conserving water, mention is made of a weir which was built on the Macquarie river at a point 3 miles above the township of Warren. This weir throws back and retains the water for a distance of about 11 miles, and is estimated to impound something like 172,000,000 gallons. It would be impossible, the report observes, to overstate the supreme importance to the colony of the question of water conservation, as the development and settlement of the

country were absolutely dependent upon securing a permanent and regular supply of water.

Generally, the year with which the report deals was a good one for road work, the rainfall being normal, and there being no flood of any magnitude. The total roads mileage under the direct or indirect charge of the department had grown at the end of the year to 38,951 miles 76 chains, being an increase over the preceding year of 2,181 miles 50 chains. In addition to purely roads formation there were constructed 7 miles 36 chains of culverts, and 7,079 rods of fencing were erected. The bridges of 20-ft. span and over, for the maintenance of which the branch is responsible, numbered 2,722, having 7,655 spans, and an aggregate length of 260,519 ft., or 49 miles 27½ chains. The culverts totalled 31,073, with an aggregate length of 461,578 ft., or 87 miles 33½ chains. The average number of men employed by the roads branch during the year was 9,876, of whom 1,488 were directly employed by the branch, while 8,388 were contractors and their workmen.

With regard to the repairs and maintenance of bridges, which now demand a large and yearly-increasing expenditure, the assistant engineer suggests, as settlement advances in the colony, replacing timber structures, so far as practicable, by bridges of a more permanent character, and thus reducing the annual cost of repairs and maintenance. He points out that, in consequence of the improvement effected of late years to the surface of the roads and the cutting down of grades, the bridges are now required to bear the strain of much heavier loads than they were estimated to sustain at the time they were built. In the opinion of the department there is something to be said in favour of this contention. At the same time, they think they should not lose sight of the fact that in New South Wales they possess the best timber in the world for bridge building. It appears to Mr. Robert Hickson, the under-secretary for public works and commissioner for roads, who is responsible for this report, that the policy of the country should be to use this material—which with careful pricking has a life of from thirty to forty years—as largely as possible. There were cases, no doubt, where it would be more economical in the long run to erect iron, or, better still, stone bridges, but he feels satisfied that for many years to come it would be found more advantageous to use timber in the construction of a large proportion of the bridges. In travelling through the country one could not help remarking how bad the roads were in the vicinity of the towns, and how a long length of good road was spoiled by a few miles of bad road lying within a municipality. Under existing conditions Mr. Hickson sees no prospect of improving this state of affairs, inasmuch as, to become incorporated, the areas of the municipalities had to be of considerable size; consequently municipal councils were obliged to take over a road mileage quite beyond their means to maintain. It seemed to him that power should be granted to reduce the area, and so make the councils responsible only for those lengths of roads that lay within the inhabited portions of the municipalities. Attention is drawn in the report to the urgent need of legislation in the matter of width of tyres. The heavy loads borne on waggon wheels having narrow tyres cut up the roads to an excessive degree, and consequently entailed on the department a large expenditure for repairs.

During the year there was an expenditure of £132,816 in connection with the sewerage schemes for the metropolis, Newcastle and its suburbs, and some three or four country towns. The northern and southern metropolitan systems, which include the areas of the city of Sydney and of the municipalities of Redfern, Darlington, Waterloo, Alexandria, Paddington, Woollahra and Waverley were completed with the exception of some small areas lying around the foreshores of the harbour, the sewage from which would have to be lifted to the gravitation sewers. Work in connection with the western suburbs scheme was urgently pressed forward, and the extension of the main eastern branch sewer was almost completed. This extension provided for the drainage of a large area of Petersham, Leichhardt and Annandale. The main northern sewer was extended to Balmain. The sewage farm in connection with the western suburbs system was being prepared, and a good deal of work was being done in the levelling of the sandhills to form filter-beds for the reception of the sewage.

From January, 1895, to June, 1896, over 99 miles of new water mains, 28 miles of sewers (5½ miles being transferred from the Government) and 4½ miles of storm-water channels were laid by the metropolitan board, making a total of 89½ miles of water mains, 230 miles of sewers and 14½ miles of storm-water channels now under their control. The capital cost of the water and sewerage works combined stood, on June 30, 1896, at £5,565,704. The gross revenue for the eighteen months was £259,843, and the working expenses £67,759, absorbing £26·69 per cent. of the gross revenue and leaving a net revenue of £192,043, or a return of £3·46 per cent. on the capital debt of the board. The average daily supply of water was 16,645,014 gallons, and the estimated number of persons

supplied was 408,282. Among other improvements, some important works were carried out at the pumping station for the purpose of increasing the supply and improving the quality of the water.

Mr. Hickson concludes his valuable report with a reference to the magnitude of the business of his department. It will, he says, be readily understood that the economical disbursement of a sum of £1,772,485, which was the amount expended during the year, demands the exercise of incessant vigilance and intelligent supervision. During the year 46,798 vouchers were examined and checked to the minutest detail before being forwarded to the treasury for payment, 65,771 letters and other documents were received and recorded, 11,855 letters were written and despatched, and 5,061 contracts were entered into, being at the rate of about seventeen contracts per working day. Finally, he bears testimony to the energy and zeal displayed by all the officers, and to the satisfactory manner in which the work of the department had been performed.

Special reports were included in the body of the volume from the following, among other officials: Messrs. H. Deane, engineer in chief for railway construction; C. W. Darley, engineer in chief for public works; H. R. Carleton, principal assistant engineer for harbours and rivers; J. Davis, engineer for sewerage construction; E. M. de Burgh, principal assistant engineer for bridges; H. G. McKinney, principal assistant engineer; J. B. Benson, board engineer; and Percy Searr, principal assistant road engineer.

The value of the report is greatly enhanced by the addition of some admirable plans, map and views illustrative of works in progress or completed. We may mention specially the two views which give an excellent idea of the great outfall sewer across the Arneliffc sewage farm. The sewer is in triplicate, and the carrier is built on concrete arches of 50-ft. span springing from concrete piers.

In his annual report to the Town Improvement and Sanitary Committees of the Newcastle Corporation the city engineer, Mr. W. G. Laws, shows that the expenditure on the account of the first-named committee was £22,220, as against an estimate of £22,800. Sewering cost £8,917, flagging and paving £11,921, and special improvements £1,382. The 1898-9 estimates for these items are respectively £7,480, £13,130 and £1,270, totalling £21,880. The Sanitary Committee, by original and supplementary estimates, had a sum of £44,284 allowed for their year's work, the actual cost being £43,919, made up as follows: Roads, £10,768; street watering, £1,164; scavenging (including the removal of box ashes), £11,450; aeh-pit cleansing (including the removal of tub ashes), £11,857; sanitary work, £6,583; destructor (working), £924; special improvements, £1,173. The total sum which it is estimated will be required for the current year is £47,005. There is an excess of expenditure over original estimates of £2,317. Extra expenditure on road metal, increases in the number of horses and caris, and street watering practically account for the difference.

The general particulars furnished show that the city has now 1704 miles of sewers and drains of all sizes, and 179½ miles of streets. Scavenging exceeded the original estimate of £10,660 by £790, having actually cost £11,450. The cost of scavenging, Mr. Laws says, is increasing rather more rapidly than the population. Seven years ago it was 1s. per head, while now it costs just under 1s. 6d. per head. The public ask for more, the workmen ask for more, and the committee properly enough seems inclined to give more, so that this work may rise in cost still further. At the same time, it seems to him that Newcastle compares very favourably with other towns of similar size, both in the cleanliness of the streets and the cost of keeping them so.

The amount of refuse disposed of has been: Sent by rail as manure, 17,006 tons; sent by rail to deposit, 8,232 tons; sent by barge to sea, 23,787 tons; deposited in tips within the city, 51,073 tons; burnt at refuse destructor, Byker, 20,478 tons—total, 120,576 tons. These were collected at a nett cost of £28,732, or 4s. 9½d. per ton. The amount dealt with per house is 76½ cwt., at a cost of 18s. 1½d. per head. Of the population the amount is 108 cwt., at a cost of 2s. 7d. At Byker destructor the 22,715 tons burnt cost £795 17s. 5d. 8½d. per ton burnt, slightly less again than last year. Adding to this cost interest on capital at 4 per cent. and rent of site, the total cost was just 11½d. per ton. The cost of sending refuse to sea from Mitford-street was £1,742 for 23,787 tons; 1s. 5½d. per ton, or, adding interest at 4 per cent., 1s. 6½d. "Is it proper one more to point out," he asks, "what would be the saving to the rates if a destructor, instead of a refuse wharf, were established at Mitford-street? Without reckoning the difference in cost of the downhill load as against the uphill lead to Byker, there would be a saving of 9½d. upon 24,000 tons, equal to £950 per annum."

Under the head of relief labour no expenditure had been required during the past year. As to the water supply, Mr. Laws says: The season has not commenced so favourably as last year, as the company's reservoirs have never been full; but, on the other hand, there has been what is rather unusual, an increase in the month of May, so that the deficiency, which was 600,000,000 at the end of March, has been reduced to 300,000,000 early in May, leaving the stock at the end of the first week in May, though 200,000,000 less than last year,

yet just about the usual average for the date. On the whole, then, unless there be drought during the summer (of which there is no present sign), we may hope to have no scarcity. Since 1860 the sum of £1,844,269 has been spent on improvements in the way of sewerage, paving, &c. With a population of 223,000, and a rateable value of £1,116,307, the expenditure of the two committees last year worked out to 6s. 4d. per head, or 1s. 3½d. in the £1. The number of inhabited houses in the city is 31,710.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made, separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

203. Ditch: Interpretation of Width.—"E. R." writes: Will you please help me to solve the following—viz., What will be the width across the top of a ditch, the depth of which is to be 4 ft., the width at the bottom to be 3 ft., and the sides having a batter of 1 to 1?

As each side is to have a batter or slope of 1 to 1—that is, for each foot of rise the side slopes back 1 ft.—there will be for each side having a 4-ft. rise a total batter of 4 ft. The bottom width being 3 ft., the top width of the ditch therefore will be: 3 ft. + 1 ft. + 4 ft. = 11 ft.

204. Hydraulic Mean Depth, Meaning of.—"Perplexed" writes: I shall be glad if you will explain the meaning of the term "hydraulic mean depth of sewer."

Hydraulic mean depth, or radius, is the sectional area of the sewage flow divided by the wetted perimeter. The wetted perimeter is the length of the inner surface of a pipe, measured at right angles to the flow, which is in contact with the water flowing through the pipe. Thus, in the case of a 24-in. diameter pipe running full, the hydraulic mean depth will be

$$\frac{2 \text{ ft.} \times 2 \text{ ft.} \times 7854}{62832} = \frac{31416}{62832} = .5 \text{ ft.}$$

For a 6-in. diameter pipe the hydraulic mean depth will be

$$\frac{.5 \text{ ft.} \times .5 \text{ ft.} \times 7854}{15708} = \frac{196350}{15708} = .125 \text{ ft.}$$

In all cases where a circular sewer runs full or half full the hydraulic mean depth is equal to one-fourth the diameter.

LONDON WATER SUPPLY COMMISSION.

The Royal Commission met, on Monday, at the Guildhall, Westminster, under the presidency of Lord Llandaff.

Mr. ALLEN STONEHAM, Local Government Board arbitrator appointed under the Metropolitan Water Act, 1871, to audit the accounts of the London water companies, having explained his system, expressed the opinion that his powers were sufficiently wide to enable him to make a very satisfactory audit. He could not suggest any further powers with which he could be usefully entrusted.

Mr. REGINALD E. MIDDLETON, engineer of many of the New River Company's works, and joint engineer with Mr. Hunter of the Staines reservoirs, expressed a decided opinion that purchase of the water companies by any body whatsoever would be financially inexpedient in the interests of the consumers, who would be placed in a much worse position than at present. He did not mean to deny that the revenue would ultimately meet the charges, but that time would be very far distant. Whether the companies continued in existence, or whether purchase took place, some further capital expenditure on additional water supply would be necessary.

The Inventor of the Bunsen Burner.—The Bunsen burner is so closely related to ancient history that it must be quite a surprise to many people to hear of its inventor being alive and in active practice as professor of chemistry at the University of Heidelberg. Dr. Bunsen has just been presented with the Royal Albert Medal of the Society of Arts, in connection with which the council has published the following little eulogy: "Among the numerous and important scientific discoveries which have made the name of Bunsen famous, perhaps the most striking is that in which he was associated with his distinguished colleague, Professor Kirchhoff—viz., *spectrum analysis*, a discovery which has shed a new and unexpected light on the composition of terrestrial matter, and has enabled us to obtain a knowledge of the chemical composition of sun and stars. The contributions which Bunsen has made in the application of chemistry and physics to the arts and manufactures are of the utmost value, and their importance may be measured by two out of many instances. The Bunsen battery was, until the introduction of the dynamo, the cheapest source of electricity, the Bunsen gas burner, by which a non-luminous, smokeless but, highly heated flame is obtained, is not only still indispensable in all laboratory work, but is used for heating purposes in thousands of houses and factories, and for illumination, by the incandescence system, in millions of lamps.

Parliamentary Memoranda.

On Thursday, in the House of Lords, the London County Council (Money) Bill was read a second time, while the London County Council (Acton Sewage) Bill was given a third reading.

In the House of Commons the Lords' amendments to the Cromer Gas Bill, the Drogheda, Gas Bill and the Wigau Corporation Bill were agreed to. The Bacup Corporation Water Bill and the Dover Harbour Bill were each read a third time.

In the House of Lords on Friday the Renfrew Burgh and Harbour Extension Bill and the Devonport, Plymouth and Stoke Tramways Bill were read a second time. The Tottenham and Edmonton Gas Bill, the Dublin Port and Docks Bill, and the Matlock Urban District Council Bill were read a third time.

In the House of Commons the Lords' amendments to the Sheffield Corporation Bill and the Plymouth Corporation Bill were agreed to. The Halifax Corporation Bill, the Stirling Gas Bill and the Paignton Improvement Bill were read a third time.

In the House of Lords on Monday the St. Helen's Corporation Bill and the Keighley Corporation Bill were each read a second time. The following Bills were read a third time and passed: London Building Act (1894) Amendment Bill, Plymouth and Stonehouse Gas Bill, Bristol Tramways (Electrical Power, &c.) Bill, Coventry Corporation Gas Bill, Bristol Tramways (Extensions) Bill and Blackburn Corporation (Tramways, &c.) Bill.

In the House of Commons the following private Bills which came down from the Lords, were read the third time: Aberdeen Corporation (Tramways) Bill and Folkestone Water Bill. The following, which also came from the Lords, were ordered for third reading: Felixstowe and Walton Water Bill and Newtown Water Bill. The following, also from the Lords, were read the second time: Heywood Corporation Water Bill, Newcastle-upon-Tyne Corporation Bill and Seaham Harbour Bill. The Local Government (Ireland) Bill, after a short debate, was read a third time.

On Tuesday, in the House of Lords, the Paignton Improvement Bill was read a second time, while the Middlebrough Corporation (Gas) Bill and the Leyton Urban District Council Bill were read a third time. The Local Government (Ireland) Bill, which had been passed by the Commons, was brought up and read a first time.

In the House of Commons the Newhaven Harbour Bill was ordered for third reading. The Lords' amendments to the London County Council (Acton Sewage) Bill were considered and agreed to.

In the House of Commons on Wednesday the Metropolitan Electric Supply Bill was read a second time.

PRIVATE BILLS IN COMMITTEE.

London and South-Western Railway Bill and the London County Council and Lambeth Vestry.—The House of Commons committee, over which Mr. De Taton Egerton presided, cut away an important part of the London and South-Western Railway Bill when it was before them last week. The Bill when it passed the House of Lords earlier in the session embodied a scheme for the enlargement of Waterloo railway station by the compulsory acquisition of land extending between the Lower Marsh on the north and Waterloo-road on the west. Since the Bill had left the Lords the company had found that the cost would be so great, having regard to the attitude of the southern frontagers of Lower Marsh and the acquisition of properties in an easterly direction, that they had been compelled for the present to modify the scheme. It had been reduced to something like half its original proportions, so far as the additional area proposed to be acquired was concerned. The London County Council had offered no opposition to the Bill in the Lords, because the measure as presented had included provision for street improvements in which the council acquiesced. Now that the Bill had been so mutilated by the change of policy on the part of the company the advantage to the public would be so insignificant that the council felt bound to oppose the measure. They asked that Parliament should not sanction such an incomplete scheme, but compel the promoters to take it back and bring forward a more perfect proposal next session. The Lambeth Vestry also opposed the Bill on the ground that it did not sufficiently provide for the housing of the poorer classes, whose dwellings would be disturbed. The committee found that the preamble had not been proved so far as the enlargement of Waterloo station was concerned.

Chelsea Electric Supply Bill.—A House of Lords committee, presided over by the Earl of Northbrook, passed on Wednesday week a Bill promoted by the Chelsea Electricity Supply Company, Limited, in which powers were sought to acquire additional lands and erect generating stations. The Bill was opposed by the London County Council, the Chelsea Vestry, the Earl of Cadogan and the Rev. W. H. Webb Peplae, and the lessees and occupiers of houses in Flood-street, Chelsea. This, it was explained, was one of the Bills which led to the appointment of the joint committee on electrical energy which has been recently sitting under the presidency of Lord Cross. That committee, in their report, recommended that

in special circumstances electricity supply companies should be allowed to acquire land compulsorily, and it was contended that special circumstances existed in this case. The company, who had a capital of some £200,000, and were supplying with electricity nearly 100,000 8 candle-power lamps—an increase upon last year's supply of 20 per cent.—had reached the limits of the capacity of the generating station, and it had become necessary for them to provide further accommodation. They came to Parliament for compulsory powers because they had been threatened with an injunction, and they felt that without Parliamentary powers they would be blackmailed, first, by having to pay an exorbitant price for land which they required, and, second, by being taken into the Court of Chancery and prevented from carrying on their work. The objections raised by the various petitioners against the Bill related mostly to minor points. The county council, on the ground that some of the mains were in close proximity to the main sewers, claimed to have the power to supervise and control the lighting of the vestries. The Chelsea Vestry complained of gritty emanations and smoke from the chimney shaft and of vibration and noise, and suggested that the company should establish its large generating station outside London. Lord Cadogan's objection was that his property in the neighbourhood would be injuriously affected. The committee passed the Bill, but inserted a clause giving persons within a certain area of the company's works some compensation for any proved damage which might be done by the company's works to their houses.

Devonport Borough Extension Bill.—A Bill promoted by the Corporation of Devonport for the extension of the boundaries of the borough has been the subject of a spirited contest before a committee of the House of Commons presided over by Colonel Ganter. The opposition to the Bill came from the Parish Council of St. Budeaux, who objected to being annexed to Devonport. Mr. Balfour Browne, Q.C., who appeared for the St. Budeaux opposition, explained very fully the precedents bearing upon the case. If good reason for annexation were shown then Parliament should agree to it, but if the area taken in dissented Parliament ought not to assent unless strong grounds were brought forward in favour of the annexation. If they formed absolutely part of one community, if the streets were continuous, if their interests were the same, and if St. Budeaux were really a suburb of Devonport and the area was in an unsalutary condition, Parliament might well override their non-assent and pass the scheme. St. Budeaux was absolutely separated from Devonport by an arm of the sea, which was a good natural and physical boundary, and physical boundaries had before stood in the way of annexation. Having cited the cases of Leamington, Wigau and Plymouth, Mr. Browne went on to observe that people were not like flocks of sheep, to be driven into places to which they did not wish to go; and why should the people of St. Budeaux be driven into Devonport against their will. The districts were different in many ways, and St. Budeaux could manage the place better, more cheaply, and more to their own satisfaction, than Devonport could. It would not be a self-governing unit if the committee put them within the jurisdiction of Devonport. If it had been proved that St. Budeaux was a hot bed of disease and a pest, then there might be some reason for the scheme; but St. Budeaux was not the pest, Devonport was the pest. What Devonport wanted was simply to tax St. Budeaux. St. Budeaux had applied to the county council for urban powers, and their decision was awaiting the result of this Bill. The St. Budeaux scheme was better and cheaper than that proposed by the Corporation of Devonport. St. Budeaux was not only separated from Devonport by an arm of the sea, but it was separated by an intense longing to remain divided. The eloquence of the learned counsel was in vain. The committee passed the Bill, but they gave a concession as to rating.

Tynemouth Corporation Water Bill.—The Corporation of Tynemouth had to fight for their water Bill in the Lords, and the fight was renewed before Colonel Ganter's committee in the Commons last week. Powers were sought in the Bill to obtain additional water, to construct additional waterworks and to borrow £430,000. The corporation had to face the opposition of their former opponents, the County Council of Northumberland. The county council championed the cause of the authorities of the district north of Tynemouth, which had a population of 5,000 inhabitants and ought to have a pre-emption for the water. As the corporation had taken all the water from the Font some provision ought to be made for those who were living on a day-to-day supply. The corporation ought to be required to supply the surplus water at a certain price to be fixed, if necessary, by arbitration. Mr. Horatio Adamson, the town clerk of Tynemouth, in his evidence in support of the Bill stated that the corporation expected to obtain 2,500,000 gallons per day as the result of the construction of the additional works provided for in the Bill, and they required 1,500,000 gallons for their own purposes. The surplus they proposed to sell, he presumed, at a profit. The owners who opposed the project, including Earl Percy, would be compensated for any fishing rights they might have. Lord Percy, it appeared, regarded the storage

capacity of the reservoirs as insufficient. Mr. J. F. Smillie, who had been borough surveyor of Tynemouth since 1888, stated that it was absolutely essential that a new supply should be obtained. After obtaining the supply of water from the Font the corporation would abandon that at Whitby as soon as possible, although a spring yielding 90,000 gallons might still be used for street watering if necessary. The anticipated supply from the Font was 3,670,000 gallons per day, which would be sufficient to meet the whole requirements of the district for many years to come. The works now contemplated would convey only 2,500,000 gallons from the Font, and the surplus would thus be only 1,000,000 gallons a day. In a report which he had presented to the corporation he had said that between the northern limits of the borough there was in the district through which the gravitation main would pass a population of 40,000 without a reliable supply of water, and there was no obligation upon the Newcastle company, which now supplied that district, to continue to supply. Mr. G. Richardson Strachan, civil engineer, partner of Mr. Mansergh, also gave evidence, stating that the promoters would not run any risk of a polluted supply. It had been suggested that the rich Tynemouth Corporation might buy out the poor millowners and so take all the water, but in that case any person interested would have the right to apply for a mandamus to compel them to give the compensation water. The committee last week passed the Bill, subject to the insertion of clauses giving the district north of Tynemouth facilities for obtaining water and protecting the fishing rights of the owners of the streams feeding the proposed reservoir.

Plymouth Corporation Bill.—The Bill promoted by the Corporation of Plymouth went through the Lords with practically no opposition. The Bill conferred upon the corporation a variety of powers, among them being authority to use certain lands as a site for an electric generating station. Mr. J. Ellis, the town clerk, gave formal evidence before Lord Morley's committee in support of the measure. There was some discussion with reference to a clause providing that the corporation might appropriate and use for the purpose of the Act any lands within the borough for the time being vested in them as a municipal or sanitary authority which were not wanted for the purpose for which such lands were originally acquired, but that the corporation should not create or permit the creation of a nuisance on any of these lands. This had reference to the proposed generating station, and the town clerk explained that the works would not be constructed except on such lands as were described in the schedule. The Bill was ordered to be reported with amendments to the House.

Central Electrical Supply Company's Bill.—The Bill promoted by the Central Electrical Supply Company for power to construct a generating station on the Regent's canal at Northbank, St. John's Wood, adjoining the proposed terminus of the Great Central Railway, was thrown out by Lord Northbrook's House of Lords committee on Friday week. The Bill had to face four sets of opponents—the Great Central Railway Company, the Metropolitan Electric Supply Company, the London County Council and the Vestry of St. Marylebone—but it was the opposition of the Great Central Railway Company that was fatal to the measure. The main object which the promoters had in view in seeking powers to establish a generating station was to supply electrical energy in bulk to the Westminster and the St. James's and Pall Mall Electric Lighting Companies, the current being brought at high pressure to the area of supply under conditions laid down in the report of the recent Joint Committee on Electrical Energy. It was stated by Captain Bax and Mr. T. Dobson, general manager and engineer respectively of the Westminster Electric Supply Association, gave evidence as to the difficulty of finding a site for the generating station within the area of supply and the advantageous character of the proposed site. It appeared from the evidence of Mr. William Pollitt, the general manager of the Great Central Railway, that Parliamentary powers to purchase the site proposed by the Central Electrical Supply Company had been granted to his company by their Act of 1893. A serious mistake was made in allowing the power to lapse, but it was unintentional, and it was owing to the press of other matters that it had escaped attention. The committee held that the balance of public advantage in this case rested with the railway company, but the chairman intimated that when the next Bill in the list, the Great Central Railway Bill, came before them the committee would be prepared to consider a clause securing that, should it be decided to establish the generating station on the other side of the north bank away from the Regent's canal, the railway company should give the electrical company facilities for the use of the canal and provide siding accommodation.

Metropolitan Electric Supply Company's Bill.—The Bill promoted by the Metropolitan Electric Supply Company authorising the company to use lands acquired by them in the parishes of Acton and Willesden for the establishment of a large generating station, to convey the current into their district by means of cables leading along the Grand Junction canal, has been passed by a committee of the House of Lords, presided over by Lord Northbrook. The current is to be brought at high pressure to the areas of supply under conditions laid down in the report of the recent Joint Committee on Electrical Energy. The operations of the committee were

limited to their present area and to their maintaining existing conditions.

Coventry and Middlesbrough Corporation Gas Bills.—The House of Lords committee presided over by Lord Morley have passed the Bill promoted by the Corporation of Coventry for powers to borrow £250,000 for the construction of additions to the gasworks, and that promoted by the Corporation of Middlesbrough for authority to borrow £150,000 for the purpose of enlarging their gasworks. In neither case was any opposition offered, and as the Bills had already been passed by the House of Commons the two corporations will be able to carry out the additions.

Middlesex County Council Bill.—The Bill promoted by the Middlesex County Council for powers to make more effectual provision for preventing the pollution and obstruction of the streams in the county of Middlesex, and to confer further powers on the county council for that purpose; to give to the county council powers in relation to making loans to local authorities, main roads and other matters, and to enlarge in some respects the powers of district councils in the county, came before a House of Lords committee presided over by Lord Ribblesdale, on Monday of last week. When the measure was before the House of Commons Committee on Police and Sanitary Regulations the facts were very fully explained in our columns, and it is only necessary now to deal briefly with the principal features of the scheme which the county council have in view. In the Commons the Bill was opposed by the Thames Conservancy, the Grand Junction Canal Company, the North Metropolitan Railway and Canal Company, the London County Council, the Haaxwell Urban District Council, the Tottenham Urban District Council and the Vestry of St. Mary's, Islington, but of these opponents only the Grand Junction Canal Company and the North Metropolitan Railway and Canal Company were represented in the Lords. There were, however, two new sets of opponents who now sought special concessions—Messrs. Curtis and Harvey and Earl Percy. The Middlesex County Council were again represented by Mr. Worsley Taylor, Q.C., and Lord Robert Cecil, who championed it so successfully in the other House. Mr. Pember, Q.C., and Mr. F. W. Pember appeared for the North Metropolitan and Mr. Balfour Browne, Q.C., and Mr. G. A. R. FitzGerald for the Grand Junction Company. Mr. Lewis Coward appeared on behalf of Messrs. Curtis and Harvey, and Mr. Claude Baggallay, Q.C., and Mr. A. V. Fere for Earl Percy. Both Messrs. Curtis and Harvey and Earl Percy, who were riparian owners of certain streams which came within the scope of the Bill, claimed exemption from its provisions on the ground that they kept the Duke of Northumberland's river and the other streams over which they exercised riparian rights absolutely free from pollution. Mr. Littler, the chairman of the Middlesex County Council, expressed his willingness that they should be exempted so long as they kept the streams free from pollution, and this opposition was thus disposed of quite early in the proceedings. The only remaining contest, therefore, was with the two canal companies. With reference to the Brent, whose polluted condition throughout its entire course is notorious, powers were sought—in addition to general authority to prohibit pollution and to execute work, such as the deepening, enlargement and improvement of the river—to compel the North Metropolitan and Grand Junction Canal Companies to discharge out of the Brent reservoir, of which they are the owners, into that portion of the river Brent immediately below that reservoir, regularly throughout every twenty-four hours, a quantity of water not exceeding 4,000,000 gallons and not less than 3,000,000 gallons. The clause providing for this came up in the modified form in which it had passed the Commons. In substance it placed the council in the position and endowed them with all the powers of riparian owners, and gave general powers to the canal companies to agree with the council as to the sending of water down the Brent, which would provide that if the council succeeded in establishing in a court of law the right of riparian owners to compel the canal companies to send down compensation water under sec. 37 of the Act of 1793, the amount of compensation water should be fixed at 3,000,000 gallons per day, or such quantity as required. The county council contended that by the statute named they had the right to the whole of the water which was intercepted by the canal companies at the Brent reservoir, but they were willing to give up three-fourths of it to the companies. If in the legal proceedings the council were unsuccessful in establishing this point, then they would be entitled to so much water as they might require up to 3,000,000 gallons per day at an agreed price, or, in the case of difference, at a price to be settled by arbitration. They maintained that the canal companies were doing what Parliament never allowed any company or corporation to do—they were impounding the whole of the water in a dry time from the catchment area, taking it away and giving no compensation. Then when the time came when they could impound no more with safety to their embankments and their works generally they pulled up their sluices, but, instead of letting the water escape gradually, they opened them all at once and let the water go in a torrent. When the flood came it broke down the banks and tore up the bottom of the river, scooping out holes in one place and depositing shoals in another, and between the sewage deposited and the holes scooped out, the river in the summer months was simply stagnant pools and festering masses of sewage. Mr. R. D. M. Littler, Q.C., C.B., as chair-

man of the county council, described the general scope and explained the provisions of the Bill. As regards the canal companies or any local authorities who had the control of the streams, there was, he said, not the slightest intention to do anything unreasonable. Mr. Little emphasised the three evils experienced with regard to the streams of Middlesex. The first was the danger of ordinary pollution from sewage; the second the danger, arising from their circuitous route, of the rivers being choked up; and the third, the special difficulties arising from the exclusive ownership of the Brent reservoir being vested in the North Metropolitan and Grand Junction Railway and Canal Companies. That was why the county council sought to be endowed with the rights of riparian owners. Some local authorities—Willesden, for example—had done a great deal to remedy the present condition of the streams. That authority had spent £100,000 in improvements. Mr. Montague Sharpe, the deputy-lieutenant of Middlesex, and Mr. James Bigwood, member of Parliament for Brentford, gave evidence as to the wretched state of the Brent. Mr. Oliver Claude Robson, M.C.E., surveyor to the Willesden District Council, described the result of his inspection of the Brent, which for months at a time was simply a series of foul pools, and Mr. Charles Jones, M.C.E., surveyor to the Ealing District Council, told briefly the opinion he had formed from examinations he had made, and spoke as to the dangerous flooding of the river by the opening of the sluices at the reservoir. The canal companies again made a strong protest against clause 5 of the Bill, under which the council sought to be put in the position of riparian owners in regard to instituting and maintaining actions against the canal companies for the purpose of enforcing the powers given under the Act. On Tuesday, the committee passed the Bill, subject to amendments, to which the promoters acceded, defining more clearly the position the council was to assume as riparian owners.

Paignton District Council Bill.—The House of Commons Committee on Police and Sanitary Regulations, who have been exclusively occupied with Bills promoted by corporations and county authorities during the session, have now concluded their labours. The last measure they dealt with was the Bill conferring powers upon the Urban District Council of Paignton with reference to the purchase and laying-out of lands for recreation grounds, and to making better provision for the improvement of the public health in the local government district. It was shown that in this popular seaside resort, with its rapidly-increasing population, it was expedient in the interest of the health and prosperity of the district that the council should be empowered to purchase a piece of marshy land, and reclaim and lay it out as a recreation ground. By an ancient custom, ratified by a time-honoured enactment, all persons "resiant" and dwelling in the counties of Devon and Cornwall may remove sand from any place under the full sea-mark for the bettering of their land and the increase of their tillage, with the result that considerable quantities of sea sand, shingle and gravel were removed every year from the seashore at Paignton and disposed of for profit. So serious had the evil become, both as regard beach sands and foreshore and encroachments from the sea, that the corporation now sought powers to restrict the removal of the sand. It was also considered expedient that the maritime boundary of the district should be defined, and that the corporation should be invested with further powers over the seashore. Further powers were also required, in order to enable the council to make better provision with regard to the building of streets and sanitary matters. For the purchase and laying-out of the recreation ground by the council it was estimated that an expenditure of £3,000 would be necessary, and in connection with this and the other improvements contemplated it was proposed to borrow £10,000. The committee declared in their decision that in some respects the Bill gave powers relating to police and sanitary regulations in excess of the provisions or powers of the general law, but in most cases they were made in accordance with recent precedent. In the case of certain clauses inflicting a penalty on washing horse-fronts save in prescribed hours, regulations as to bicycles and powers to grant gratuities to officers and servants, they were amended upon the evidence given as to local necessity. The clause relating to restricting the removal of sand was allowed for the same reason. With these modifications the Bill was passed and reported to the House.

Burnley Corporation Tramways Bill.—Burnley and District Tramways Company struggled gallantly, but struggled in vain, before a committee of the House of Lords last week to prevent the Corporation of Burnley from getting the Bill empowering them to work the local tramways, which they had obtained authority to purchase, by electricity or any mechanical power, to effect street improvements and to erect a crematorium. The Bill was originally opposed by the Nelson Corporation and the district councils of Brierfield and Padiham, but as they had agreed to purchase the tramways in their respective districts and lease them to the Burnley Corporation their opposition had been withdrawn. This left the tramway company the only petitioners against the measure. Evidence in support of the Bill was given by the town clerk of Burnley, the former borough surveyor (Mr. Button) and Councillor Barrows. Mr. Button stated that the total length of the system was 7 miles, and of this the corporation proposed to acquire 5 miles. The present system was very defective,

both as to the permanent way and the service generally. More passing places were required and the fares needed revision. In consequence of the insufficient service rival lines of omnibuses had been established on some of the routes. Mr. Button admitted that the scheme of the corporation would not provide for a continuous system in the borough and outside, which would certainly be preferable to a disjointed service. The committee passed the Bill after hearing the argument of Mr. Worsley Taylor, q.c., on behalf of the company that they were in a better position to work the system satisfactorily than the corporation would be.

Rhymney and Aber Valleys Gas and Water Bill.—The question of the water supply of the Rhymney valley was very thoroughly discussed last week before the committee of the House of Lords presided over by Lord Clinton. The Bill was promoted for the purpose of obtaining powers to incorporate a company which is being established for the purpose of acquiring the undertakings of the Rhymney Valley Gas and Water Company, the new Tredegar Gas and Water Company, Limited, and the Caerphilly Gas Light, Coke and Water Company, the gasworks of the Rhymney Gas Company, Limited, and the waterworks of the Rhymney Iron Company, Limited, to construct new gasworks, and to supply gas and water within the limits prescribed. The local district councils within whose area of jurisdiction the new company proposed to operate took a watchful interest in the proceedings, but did not oppose the Bill, which was petitioned against by the Rhymney Iron Company only. Mr. Rees, engineer to several district councils in the neighbourhood of the Rhymney valley and engineer to the promoters, stated in his evidence that all the local authorities concerned were now in favour of the scheme as well as the landowners—the Marquis of Bute, Lord Worcester, Lord Tredegar and Lord Windsor. As far as the Rhymney Iron Company were concerned, their works were in part dismantled and the machinery had been removed. If they did not desire to sell their reservoir they might keep it, and the promoters would give them 150,000 gallons of water which would come from the brook upon which the reservoir was situated, and that would place them in a better position than they were in at present. Mr. Hill, waterworks engineer, who made an exhaustive examination of the catchment area, described the supply which the works would yield as being amply sufficient for the district and the limestone formation as good. There would be no difficulty whatever in the matter of the construction of the reservoirs. Upon this point his testimony was confirmed by the evidence of Mr. Stephenson, M.C.E., who said the formation was sufficiently water-tight for reservoir purposes. Dr. Redwood, the Rhymney medical officer of health, gave evidence as to the unsatisfactory condition of the water, to which illness had been clearly traceable. Many local witnesses were called, who spoke as to the necessity for a more efficient supply of water. Sir Henry Taylor, the chairman of the iron company, explained that the company had not opposed the Bill in the Commons because they had hoped that the negotiations in progress would have been satisfactory. They were prepared to sell the undertaking, but not on arbitration terms. The company claimed to be the judges of what was reasonable. Mr. Strong, a member of the Geological Survey of London and of the geological survey of the district, expressed the belief that the reservoirs would not hold water on account of the fissures and swallow-holes. At the close of the case it was announced that at last an understanding had been arrived at with the iron company. The promoters undertook that unless more than 25,000 gallons came down the stream they would not take any of it away. The compensation water was to be the first charge upon them, and the purchase of the iron company's works was to be deemed compulsory under the Lands Clauses Act. The committee passed the Bill with a clause to the effect just indicated.

UXBRIDGE NEW SEWERAGE WORKS.

OPENING CEREMONY.

The new sewage purification works of the Uxbridge Urban District Council, the effluent from which finally enters the Thames, were formally opened on the 9th inst. by Sir Fredk. Dixon Hartland, M.P., in the presence of the council and their engineer, Mr. C. Nicholson Lacey, of Westminster. The sewage is pumped into the precipitation tanks after treatment with ferrous, and then flows on to the filter-beds containing a layer of the well-known filtering material—polarite. The effluent was found to be of a high degree of purity and several of the visitors did not hesitate to taste it. Sir Fredk. Dixon Hartland, as chairman of the Thames Conservancy, congratulated the council upon the improvements effected. It may be mentioned that the sewage of Uxbridge was formerly treated in covered tanks without the use of chemicals and then passed through coke filters, but the results were so unsatisfactory that another system was adopted.

Millar's Karri and Jarrah Forests, Limited.—The returns from Australia are just to hand, and give the total output of both karri and jarrah for the half-year ended 30th June as 33,371 loads. This is a record, and is considerably in excess of the output for the corresponding period of last year.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XV.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

ROAD MATERIALS AND CONSTRUCTION

(continued).

SYENITE AND SYENITIC GRANITE.—*Syenite* is named from Syene, in Upper Egypt, where the rock is found.

True syenite consists of quartz, felspar and hornblende.

Syenitic granite consists of quartz, felspar, mica and hornblende.

Hornblende is an important mineral, occurring in great variety in composition and appearance, and is a silicate of magnesia, iron, lime and alumina, and often containing other substances. In *syenite* it takes the place of the mica of ordinary granite, whilst in *syenitic granite* it forms the fourth constituent, added to those of true granite. The commoner varieties of hornblende are dark green and black—these forming a large portion of the mass of greenstone (also known as *trap* or *whinstone*.) The mineral is hard and tough, and crystallises in prisms.

"The syenitic granites are on the whole tougher and more compact than the ordinary granites, take a fine polish and are exceedingly durable."* The darker colours are found to be the most durable.†

"Syenite occurs at Malvern and Charnwood Forest. It appears that both granite and syenite occur at Mountsorrel. The rock is of a pink colour, and has been worked also at Grooby (Leicestershire.) Bardon Hill is composed of it."‡

TRAP ROCKS.—"Trap" is an old term indefinitely applied to any eruptive rock, and is rather loosely used to designate various dark-coloured, heavy igneous rocks, including especially the felspathic-augitic rocks, basalt, dolerite, amygdaloid, &c., but including also some kinds of diorite.

Greenstone, also known as *trap* or *whinstone*, consists of felspar and hornblende; it sometimes has a granular crystalline structure, the grains being much finer than in granite, and at times so compact as to be without apparent grains. The colour is usually dark green, but varies. *Greenstone* is compact, hard, tough and durable, and splits up into small blocks, so that it is well suited for paving sets and road metal, but not for use in large masonry works.

Three varieties in common use may be mentioned—*Pennmaenmawr*, *Bardon Hill* and *Whinstone*. *Pennmaenmawr* stone, near Caernarvon, is a felsite occurring as an intrusive mass in the Cambrian (Lower Silurian) rocks near Conway. It is easily split by cutting a fine line with an axe in the direction required, and then giving the stone a few smart taps with a hammer.¹ *Bardon Hill* stone (Leicestershire) is largely used in the Midlands as a road metal. *Whinstone* is found in Wigtownshire, near Selkirk, in Kincardineshire, near Haddington, near Edinburgh, at Falkirk, in Perthshire, Fifeshire, Inverness, Ross and other places in Scotland.²

BASALT³ is "a rock of igneous origin, consisting of unguite and triclinic felspar, with grains of magnetic or titanite iron, and also little-green particles of olivine frequently disseminated. It is usually of a greenish-black colour, or of some dull-brown shade or black. It constitutes immense beds in some regions, and also occurs in veins or dykes cutting through other rocks. It has often a prismatic structure, as at the Giants' Causeway in Ireland, where the columns are as regular as if by the work of art. It is a very tough and heavy rock," and is one of the best materials for macadamising roads"; also it affords great resistance to crushing and is well adapted for crushing, &c.

Rowley Rag, a basalt found at Rowley Regis (Staffordshire), is columnar, and was considered by Jukes to be a lava flow during the cone period. It is used as a road metal, for paving sets, and for the manufacture of artificial stone. The material is also found in Armagh, Antrim and Londonderry.

*Great Ayton stone*⁴ is largely used in the north of England for repairing macadam roads. It is a basaltic rock obtained from Great Ayton, Cookfield and other places along the north of England dykes. The stone has a specific gravity of about 2.7, and is composed⁵ chiefly of silica, alumina, ferric and ferrous oxide, lime and magnesia.

CLAY SLATE.—Clay slate is a primary stratified rock of considerable hardness and density, but is no longer used for road making, as they crumble upon exposure and make a good deal of mud.

LIMESTONE.—The name *limestone* is applied to rocks consisting chiefly of calcium carbonate or carbonate of lime. There is, however, considerable difference both as regards chemical composition and physical characteristics even among stones of the same class. Limestone is a stratified rock, of sedimentary origin, and occurs in geological formations of all ages, the beds oftentimes being of enormous thickness.

Limestones are classified by the engineer according to their physical characteristics as follows: Marbles, compact limestone, granular limestone, shelly limestone and magnesium limestone.

Marble is the name given to any limestone which is sufficiently hard and compact to take a fine polish. It generally consists of pure calcium carbonate. "In the absence of better material marble may be used for road metal and paving sets, but it is brittle and not adapted to withstand a heavy traffic. Reads made with it are greasy in wet weather and dusty when dry."⁶

Compact Limestone.—This consists of calcium carbonate, either pure or mixed with sand and clay. It has a dull earthy appearance, and is grayish blue, black or mottled in colour. Some of the carboniferous limestones, the *Lias* limestone and *Kentish Rag* (cretaceous system) are of the compact class. *Kentish Rag* occurs in the Greensand formation, and is found in the central part of Kent in the neighbourhood of the towns of Sevenoaks, Maidstone, Lenham and others. *Ragstone* is suitable for paving sets and curbs, and is used for road metal, but makes a dusty road in dry weather. In respect to this stone Mr. Francis J. C. May, M.I.C.E., observes that "Kentish Rag is one of the oldest and one of the very best of building stones. There are several large quarries in the neighbourhood of Maidstone, which form one of its staple industries. It is a very useful stone for road metal, and is largely used on roads of moderate traffic and where the subsoil is dry. Its use is also valuable on hills in conjunction with flints. Indeed, a road made of rag and flints, in the proportion of two of rag to one of flints, will last longer and wear better than a road made of either material separately."⁷

Compact limestone in Torquay has been found to be "well fitted for forming good smooth roads when not required to carry excessive traffic."⁸

Granular Limestone.—This "consists of carbonate of lime in grains, which are in general shells or fragments of shells, cemented together by some compound of lime, silica and alumina, and often mixed with a greater or less quantity of sand. . . . In many cases it is so soft when first quarried that it can be cut with a knife and hardens by exposure to the air."⁹ This stone affords some of the principal building stones of this country—as the *Dolites*, including Portland, Bath and Caen stone—but is of no use as a road metal.

Quenast is a limestone from Belgium. At first sight it may be mistaken for granite, but it is softer than granite and does not wear so well. In colour it is a brownish grey.

Shelly Limestone consists (a) of small shells cemented together and showing no crystals on fracture, as—e.g., *Purbeck stone*—(b) of shells breaking with a highly crystalline fracture, as *Hopton Wood stone*. *Purbeck stone* (Oolitic) is of a brownish-grey colour, is much used for paving and is durable, but wears slippery. *Hopton Wood stone* (Derbyshire) is a carboniferous limestone, of a grey colour, is fine grained, compact, weathers well and is used for paving, steps, &c. It has been used for paving part of Abingdon-street, London.

Magnesian limestone is composed of carbonates of lime and magnesia, with a small quantity of silica, iron and alumina. "When the magnesia is present in the proportion of one molecule of carbonate of magnesia to one molecule of carbonate of lime the stone is called a *Dolomite*." *Bolsover Moor* and *Mansfield stone* are magnesian limestones. The stone has been very largely used for building purposes, including the Houses of Parliament. "In Britain it is found in the New Red Sandstone formation immediately above the coal."¹⁰

Limestone, as largely obtained from Skipton and Clithero, is used in many Yorkshire and Lancashire towns, but is not in any way equal to granite or basalt for road construction. Its power of resistance to crushing force is much less, and it is very sensitive to atmospheric changes. Its general use is probably accounted for by its cheapness of first cost.¹¹ Mr.

James Hall, borough surveyor of Stockton (1881), states* that "limestone alone is a very unsuitable material from its great affinity for water, which causes it in dry weather to crumble to dust. When mixed with whinstone, flints or other compact material, it is useful in causing the whole to bind quickly, and is therefore often used in roads of steep gradients, where it is difficult to get the stones bedded." More than one-half the roads in Ireland are repaired with limestone or limestone gravel, and for *light traffic* the blue limestone or limestone gravel, according to Mr. Dorman (county surveyor of Armagh), makes an excellent road. The white or grey limestone, he observes, is very inferior and wears rapidly.† Mr. H. P. Boulnois, in his valuable "Municipal Engineers' Hand-Book," writes on the use of limestone as a road metal as follows: "Many hundreds of miles of roadways in this country are made with limestone; they often make an excellent surface, as they possess a considerable power of binding together, but weather and very heavy traffic affect them considerably, as they all have a strong affinity for water; their very power of thus cementing themselves together causes a quantity of dust in dry and mud in wet weather."

Mr. Molesworth gives the crushing strain per square inch of "compact limestone" as 7,700 lb. whilst the average of six tests made by D. Kirkaldy & Sons on the "dark limestone," largely sold as road material by the Baxton Lime Firms Company, gives a crushing strain of 19,349 lb. per square inch.

SANDSTONE is a stratified rock, found in every geological formation above the primary rocks, but the best kinds on the whole are those which belong to the coal formation.‡ In composition it usually consists of grains of quartz, cemented together by silica, carbonates of lime and magnesia, alumina and oxide of iron. The stone in which the cementing material is nearly pure silica is the most durable, and that containing much alumina is the weakest. As a rule the weathering qualities of the stone are entirely dependent upon the cementing material, but where the grains are of carbonate of lime instead of quartz, and the cementing matter is silica, the grains are the first to fail. Sandstone is found of various colours, as white, yellow, brown, red and blue of many shades—usually depending upon the presence of iron. The stone is very largely used for building, flagging, &c. Prof. Rankine observes that it "is in general porous and capable of absorbing much water; but it is comparatively little injured by moisture, unless when built with its layers set on edge, in which case the expansion of water in freezing between the layers makes them split or 'scale' off from the surface of the stone. When it is built 'on its natural bed' any water which may penetrate between the edges of the layers has room readily to expand or escape."

"Some of the harder sandstones are used for setts and also for road metal, but they are inferior to the tougher materials, and roads metalled with them are muddy in wet and very dusty in dry weather."§

Prof. Ansted, in writing on roads, considered sandstone to be better than limestone, and hard limestone better than slate, while basalts and granites, he further stated, are exceedingly good or exceedingly bad, according to the proportion of alkaline earths (especially soda) which they contain.

Some of the principal varieties of sandstone in general use are:—

Bramley Fall (Leeds), originally a fairly coarse-grained sandstone of the Millstone Grit formation, of considerable strength and durability, and very extensively used for heavy engineering work. The old Bramley Fall quarries have now almost ceased to be worked, but a good deal of similar stone is now sold under the same name although quarried elsewhere.

Yorkshire stone comes from the coal measures and Millstone Grit series and the New Red Sandstone formation. It is used for heavy engineering work, and for flagging and landings; the best stone for the latter use comes from near Bradford and Halifax.¶

Scotgate Ash.—Used for landings, steps, setts, paving and building.

Mansfield stone is a siliceous dolomite occurring in the Permian system, between the New Red Sandstone and the carboniferous series.‡ It is an important building stone.

Craigneth stone is a very durable sandstone, consisting of quartz grains, siliceous cementing material and mica.

Brandon Hill stone (Gloucestershire) is largely used for paving the streets of Bristol.

Pennant stone (Fish Ponds, Bristol) is a good and durable sandstone, largely used for paving, &c.

FLINTS.—These are "found in nodules or as pebbles scattered through the chalk strata and in beds of gravel, apparently left after the washing away of the chalk."¶ The surface-picked flints are superior to quarry flints, and if tough make good roads, but they are too brittle for very heavy traffic. Mr. Ellice Clark, speaking at a meeting of municipal engineers held at Bristol, gave it as his experience that roads repaired with flints required no binding material.

VENTILATION OF SEWERS.

REPORT BY SIR A. R. BINNIE.

The following is the text of the report prepared by Sir A. R. Binnie, engineer to the London County Council, as to the result of a conference of engineers and surveyors of the several vestries and district boards of the metropolis on the ventilation of sewers:—

In accordance with the instructions of the committee, I issued two circular letters to the engineers and surveyors of the various vestries and district boards in the county, inviting them to a conference on the subject of the ventilation of sewers, with a view to some uniform system being adopted, if possible, for dealing with complaints of offensive emanations from gratings connected with both local and main sewers. In response to the invitation, a meeting was held at the County Hall on Friday, 25th February, at which upwards of forty of the gentlemen invited were present. A list of those who signed the attendance book, together with the names of the districts represented by them, is appended hereto. The discussion on the subject of the ventilation of sewers occupied a period of over two hours, and resulted in the following resolutions being passed:—

(1) That the closing of sewer ventilators in response to complaints increases the general evil, the diminution of which is to be attained by the multiplication of the ventilators at regular frequent intervals.

(2) That in connection with any interceptor hereafter fixed on a main house drain it is advisable to carry up a ventilating pipe from the sewer side of the interceptor, up the front, side or back of the house, to the satisfaction of the local sanitary authority, and that the outlet drain from the interceptor shall not be flap-trapped in sewer unless required by the local sanitary authority.

(3) That pipe ventilators up buildings, or otherwise, where possible, should always be adopted, in addition to surface ventilation. It will be observed that the general result of the conference has confirmed the action of the committee and the council in recent years, and that the remedy for sewer emanations is to be looked for from the maintenance of more frequent ventilating openings, both at the street level and by means of pipes carried up houses and other buildings. I would suggest that, as the meeting was a very representative one, this report be printed, and that copies be sent to each member of the council and to the engineers and surveyors of the district boards and vestries in the metropolis.

SANITARY WORKS AT DUMBARTON.

Mr. David Dunbar, county and district sanitary inspector, Dumbarton, has submitted his seventh annual report on the sanitary condition of the county and of the work carried out in his department during 1897. There were 1,717 nuisances dealt with, of which 923 were in the eastern district and 794 in the western district, showing an increase of 410 in the eastern district and 220 in the western district. There were 4,889 inspections made for the detection and removal of nuisances, 356 to dairies and cow sheds, 965 investigating the causes of infectious disease, and sixty-eight to factories and workshops, in addition to special inspections made as to the erection of lamps in the lighting districts in the parish of West Kilpatrick, and house-to-house inspections in consequence of outbreaks of measles and whooping cough in various parts of the county. The report proceeds to detail the work done in each of the districts of the county. In the eastern district a drainage scheme has been adopted for Duntocher village, whereby the sewage will be conveyed to a point in Duntocher burn, near the river Clyde, a distance of fully 1½ miles from the village. The sizes of the sewers range from 6 in. to 15 in. in diameter, and are provided with manholes and lampholes in suitable positions. The work is expected to be completed in about six months.

Cost of the Maidstone Epidemic.—According to the official balance-sheet, issued on Wednesday week, a sum of nearly £45,000 was spent in connection with the recent typhoid epidemic at Maidstone. The doctors' fees alone absorbed £5,200.

Church Sanitary Association.—The Rev. A. Robins, rector of Iloly Trinity, Windsor, recently presided at the Westminster Palace hotel, over the sixth annual meeting of this association, of which the Archbishop of York is president. He said that the association sought, by means of the Church's institutions in every parish, to prevent overcrowding and to provide better conditions of life for the poor, many of whom lived in places where the elementary deficiencies of civilisation could not be observed. He moved a resolution asking the association to seek by all means at its disposal to impress the Church with a sense of its duty and responsibility in calling upon the Government to deal drastically,—i.e., by compulsory legislation—with insanitary areas, which were fruitful of physical and moral disease, and death. This was seconded and agreed to. A resolution suggesting the desirability of placing all shelter for the poor under official control was also passed.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of The

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

QUERIES AND REPLIES.

BY-LAWS: ALTERATIONS AND ADDITIONS TO OLD BUILDINGS: WHAT IS A "NEW BUILDING"?—Mr. G. William Lacey, borough surveyor, Saffron Walden, writes: The by-laws in force prior to 1895, when model building by-laws were adopted, contained no reference whatever to the structure of new buildings, air space or ventilation, but only as regarded the construction of the drainage, water-closets and privies, cesspools and ash-pits. They provided for the inspection before occupation of all new houses and buildings, but did not compel the deposit of plans, simply strongly recommending that it should be done. The new by-laws with respect

to the alteration of buildings provide that "where any building has been erected in accordance with the requirements of any by-laws made by the sanitary authority under the Public Health Acts, and in force at the time of such erection, no person shall alter such building in such a way that the same as altered would, if at first so constructed, have contravened such by-laws," and also "every person who hall intend to alter a building, in regard to any matter as to which a by-law was in force when such building was erected, shall give to the sanitary authority notice in writing, &c., and shall deliver complete plans and sections, &c." It seems to me that under these circumstances—and, if so, it is very regrettable—that a person has, practically, a free hand in altering a building erected previous to the adoption of the new by-laws, and that the council is quite powerless to compel the deposit of plans or to regulate the building in any way. I should like your opinion on this. There is then the question of what is comprised in the term "alteration of a building." It has been held, I think, that an addition is an alteration, and I should esteem your views and information on the following case, as sketch. The new addition in question is of considerable size and is of one storey, and has communication by one door to the existing premises.

The whole question is whether the proposed alterations and additions amount to the erection of a new building. If they do, then the new by-laws are applicable; but if they do not, then the new by-laws are not applicable, save in so far as to prevent such alterations as would contravene the old by-laws (See Public Health Acts Amendment Act, 1890, sec. 23, sub-sec. (1)). By sec. 159 of the Public Health Act, 1875 the re-erection of any building pulled down to or below the ground floor, or the conversion into a dwelling-house of a building not originally constructed as such, or the conversion into more than one dwelling-house of a building originally constructed as one dwelling-house, shall be considered the erection of a new building. These, however, are only examples of "new buildings," the definition not being exhaustive. The question is a "question of fact" for the decision of the magistrate in each particular case. (*James v. Weyhill*, 61 L.T. (N.S.), 237; 18 J.P., 725). See some observations on this subject in *THE SURVEYOR* for 20th May last, p. 526.

CELLARS UNDER PAVEMENTS.—"Concise Reader" writes: Will you kindly inform me in your next issue under what sections of the Public Health Acts an urban district council have power to refuse passing a plan of a shop and dwelling-house by reason of a hatchway being shown on the footpath giving access to the cellar under the shop

This is a somewhat doubtful point. By sec. 140 of the Public Health Act, 1875, "all streets . . . repairable by the inhabitants at large . . . and the pavements, stones and other materials thereof . . . shall vest in and be under the control of the urban authority," and "any person who without the consent of the urban authority wilfully displaces or takes up . . . the pavement . . . in any street" is liable to penalties; and by sec. 26 of the same Act any person who without such consent "causes any vault, arch or cellar to be newly built or constructed under the carriageway of any street" incurs penalties. The latter section, however, refers to the carriageway only, and has no reference to the footpath. Then by sec. 73 of the Towns Improvement Clauses Act, 1847 (which section is incorporated with the Public Health Act, 1875), "whenever opening is made in the surface of any street . . . as an entrance into any vault or cellar, a door or covering shall be made by the occupier (or other, see sec. 160 of the 1875 Act) of such vault or cellar of iron or such other materials, and in such manner as the authority "direct, and such door or covering shall from time to time be kept in good repair by the occupier (or owner) of such vault or cellar;" and by sec. 35 of the Public Health Acts Amendment Act, 1890, "all vaults, arches and cellars under any street, shop and cellar-hoods, gratings, lights and can holes in the surface of any street . . . shall be kept in good condition and repair by the owners or occupiers of the same, or of the houses or buildings to which the same respectively belong." In "The Municipal and Sanitary Engineers' Hand-book," by H. Percy Houlton (third edition, p. 224, it is stated that it is generally assumed that the powers conferred by sec. 140 of the Act of 1875 enable the authority to prevent the construction of

cellars under the footpath without their consent. I am not aware, however, of any decision on this point: and it is characteristic of the hazy condition in which important questions are frequently left by legislation, absolute prohibition of an act—*viz.*, the taking up, &c., of a pavement—and, on the other hand, certain regulations which presuppose the legality of the prohibited act.

DETAILS OF OFFICER OF LOCAL AUTHORITY.—"A. T. A." writes: A. holds the office of inspector of nuisances, district and highway surveyor to an urban council, and has received the instruction of his committee to prepare a design for laying-out of the recreation ground, which plans have been approved by the council. Other works are now contemplated, such as public library, new offices, &c., and these he has also received instructions to prepare the drawings for. Can this work be said to belong to the surveyor's department, with a addition to his salary, or can the surveyor make a legal claim for fees? If so, what claim should he make, and should it be made as soon as the drawings are approved and before the work is begun, or after the works are completed, which may be a few years distant? In any case, would not the original drawings be the property of the surveyor?

An urban authority has power, under sec. 159 of the Public Health Act, 1875, to make regulations with respect to the duties of their officers. A specimen of such regulations is given in "The Municipal and Sanitary Engineers' Hand-book," by H. Percy Houlton (third edition, pp. 14, *et. seq.*), among which is included "(18) To prepare all plans, drawings and estimates required, and to superintend the execution of all improvements." And on page 25, in a "Table showing some of the duties of a town surveyor," is included "Landscape gardening—recreation grounds;" and, again, on page 6, among the duties of a town surveyor, are enumerated: "(7) As architect for the construction of . . . municipal buildings . . . cemetery chapels . . . and other similar work," and "(8) As landscape gardener for the laying-out of public recreation grounds. . . ." If in A's case there are any "regulations" he would be bound by them; and, if none, the presumption would be that his duties were the usual ones, and unless extra remuneration was expressly stipulated for beforehand he could not claim it. Assuming that the plans are made in pursuance of his duties, they would be the property of the authority in the absence of express stipulation to the contrary.

BUILDING ESTATE: LAYING OUT STREETS.—"Surveyor" writes: A piece of land is to be laid out within this district for building purposes, and the architect for the estate has submitted a plan and section for the laying-out of one street only, although boards are placed at different points in the land stating that such land is to be let for building purposes. Could not the council insist, under the enclosed by-laws, upon the owner submitting plans and sections of the whole estate, so as to enable them (the council) to fix the levels, &c., of the streets and sewers of such estate?

The by-laws provide that every person who shall intend to lay-out a street shall give to the authority notice of such intention, and deliver plans and sections (No. 95) and shall, before beginning to lay-out such street, give notice to the surveyor of the date on which he will begin to lay-out such street (No. 97). There is nothing, so far as I can see, in the by-laws requiring an owner to submit plans of a building estate as a whole; but, of course, he would have to submit plans of each street before laying it out.

PRIVATE STREET WORKS: SIDE STREET, PREMISES FRONTING, ADJOINING OR BUTTING.—"Frontage" writes: Referring to your answer to the above in this week's SURVEYOR, will you kindly inform me who is liable for the cost of the apportionment between A and B? (1) Should it be charged to the rates? Or (2), should the cost of the side street abutment be thrown over the whole of the street being apportioned?

Sec. 159 of the Public Health Act, 1875, does not as does sec. 77 of the Metropolitan Management Act, 1862, expressly make the frontagers liable for the intersections of streets. The point does not seem to have been decided, but it would appear that the cost of paving intersections should be borne by the rates under sec. 216 of the Public Health Act, 1875.

Town Hall Destroyed.—The town hall of Pietermaritzburg, where the sittings of the Legislative Council of Natal are held, was totally destroyed by fire last week. The damage is estimated at £60,000.

Ventilation of the "Fram."—The new expedition to the North Pole under the leadership of Otto Sverdrup, captain of the Fram during Dr. Nansen's expedition, left Christiania in that now historic craft on its second adventurous voyage to the far north on Friday, the 24th ult. Considerable alterations have been effected in the vessel. Special provision has been made for the ventilation of the saloon, the system of the well-known ventilating engineers, Messrs. R. Boyle & Sons, London and Glasgow, having been adopted for the purpose. As altered the ventilators are fixed on the flush deck so that the wind can reach them freely and unobstructedly while blowing from any quarter. We may mention that the "Boyle" system of ventilation was originally designed for the Fram.

Municipal Work in Progress and Projected.

It will be seen from our reports this week that, in the provinces at all events, plenty of activity prevails among local authorities, and in this connection we may draw special attention to the paragraphs referring to Blackpool, Burnley, Liverpool, Bolton, Barton, Leamington, Epsom, Hornsey, Horsham and Wimbledon. Of the metropolitan authorities the London County Council have decided to carry out several extensive improvements, and the Islington Vestry are pushing forward arrangements in connection with important electric lighting extensions.

METROPOLITAN AUTHORITIES.

LONDON COUNTY COUNCIL.

The chief matters which occupied the attention of the county council on Tuesday were the proposed new by-laws and the report of the Asylums Committee recommending that the Works Department should carry out the erection of the superstructure of the Horton asylum. With respect to the first-mentioned matter, the by-law for abating the nuisance caused by street cries was rejected, but the one for abating the nuisance caused by "noisy animals" was accepted, as was also the one relating to street betting. The proposal of the Asylums Committee was strongly supported, chiefly by the testimony of Mr. Howell Williams, who declared, as the result of a recent visit to the Belvedere establishment, that it is by no means fully employed. An amendment to refer the matter to the Finance Committee was defeated, together with a proposal to give the work to the lowest tenderer. Several other important matters were considered by the council, the chief of which are given below.

Loans to Local Authorities.—Upon the recommendation of the Finance Committee, it was agreed to lend the Bethnal Green Vestry £20,500 for the redemption of compulsory church rates; the Hackney Vestry £2,190 for electric lighting and other works; the Hampstead Vestry £39,980 for electric lighting; the Islington Vestry £9,600 for street improvements, and £23,840 for electric lighting works; the St. Pancras Vestry £16,560 for various works; the Shore-ditch Vestry £11,340 for electric lighting; and the Wandsworth District Board of Works £11,600 for paving works.

A Big Job for the Works Department.—Last March the manager of the Works Department offered to erect the asylum which is it is proposed to build at Horton, near Epsom, for £234,445. The architect's estimate being, however, £281,400, it was decided to invite tenders for the work. Three tenders were received in response to the advertisements, the lowest being £296,575, submitted by Messrs. Kirk & Randall. The Asylums Committee now brought up a report recommending that the work be done by the Works Department. Some discussion followed, but ultimately, on a show of hands, it was decided to adopt the recommendation of the committee.

A Costly Asylum.—The Asylums Committee reported that the sum of £350,000, specified as the cost of the Heath asylum, Bexley, would be exceeded.

More Thames Tunnels.—The Bridges Committee reported that two tenders had been received for the construction of the proposed Thames tunnel which is to connect Greenwich with Millwall. One was for £119,732 and the other for £155,000. The chief engineer, Sir Alexander R. Binnie, estimated that the work ought only to cost £83,175, and had been asked if he would himself construct the tunnel for that amount. He had consented to do so if an allowance was made for the cost of the necessary plant, which would approximately bring the outlay to £100,000. The committee therefore recommend that the tunnel should be constructed by Sir A. R. Binnie. The council, however, opposed the proposal, and the chairman of the committee withdrew the report. The same committee also reported that they were considering a scheme for constructing a tunnel under the Thames to connect Rotherhithe with Shadwell. In order to enable the committee to report fully to the council upon the subject, it was necessary that borings should be made to ascertain the nature of the ground through which it had been suggested the tunnel should be constructed. The committee therefore recommended that the council should sanction an expenditure of £1,400 for that purpose. This was agreed to.

Proposed Tramways Department.—The Highways Committee reported that, in view of the probable development of the council's policy as regarded the working of the tramways which it might in the future acquire, they were of opinion that it was expedient that a tramways department of the council should be established for the purpose of dealing with all matters relative to tramways acquired, or to be acquired, by the council. The committee further stated that, in accordance with the resolution of the council, they were endeavouring to arrange for the transfer to the council by agreement on January 1st next of the whole of the system of the London Tramways Company beyond the 2½ miles already purchased by the council. They submitted a recommendation for the establishment of a department for the administration of the tramways. The consideration of the report was postponed.

Proposed Widening of Lothbury.—The Improvements Committee reported that the City Corporation had asked the council to contribute part of the cost of widening that por-

tion of Lothbury between Old Jewry and Princes-street. The present width varies from 30ft. to 33ft., and the proposal of the corporation is to increase this to 60ft. by acquiring about 2,905 square feet of land from the trustees of the Bank of England, who are about to let the property on building lease. The estimated cost of the land is £72,625, to which must be added the cost of the paving works—*viz.*, £1,500—making a total of £74,500. The cost of widening the road to 50ft. only is estimated at £47,500. The committee stated that they understood that the corporation contemplated at some future time continuing the improvement by setting back the northern side of Gresham-street between Coleman-street and Basinghall-street and the southern side between Old Jewry and No. 54 Gresham-street, which was almost opposite Basinghall-street. One of the principal objects of the improvement was to provide an alternative route by way of Old Jewry for the vehicles, principally omnibuses, which at present used Princes-street. Old Jewry was at present less than 30ft. wide, and apparently it was not proposed to widen that thoroughfare. This being so, it did not appear to the committee that, if the improvement was carried out, Old Jewry could well be utilised as an alternative to the Princes-street route. They were also unable to learn that there was any intention on the part of the corporation to undertake the widening of Gresham-street throughout, and they could not therefore see that the widening of the small portion of Lothbury in question would in itself constitute an improvement of such general importance to the through traffic in London as to justify the council in contributing towards the cost. Holding this view, they felt that they had no alternative but to recommend "that the City Corporation be informed that the council do not see their way to contribute to the cost of the proposed widening of Lothbury between Old Jewry and Princes-street, as, in the opinion of the council, the improvement, as at present contemplated, is one which, if effected, should be undertaken by and at the cost of the City authorities." The consideration of the report was adjourned, owing to the late hour when the council reached it.

The Proposed Transfer of Powers.—After a short discussion the council decided to postpone until the autumn the consideration of the report of the Local Government and Taxation Committee on the transfer of powers from the council to the local authorities.

Tenders.—On the chairman reading over the list of tenders for various public works it was discovered that no tenders had been sent in for the erection of Hedor Buildings and Laleham Buildings, in connection with the Bethnal Green improvement scheme. The following tenders were opened: (a) For paving works in certain streets, Bethnal Green improvement scheme.—Trinidad Lake Asphalt Paving Company, £6,359; W. Griffiths, £6,738; Val de Travers Asphalt Paving Company, Limited, £6,964; W. Wade, £7,344; Brunswick Rock Asphalt Paving Company, £7,550; Bradshaw & Co., £7,653. (b) For making borings required in connection with the proposed Rotherhithe tunnel.—S. F. Baker & Son, £1,126; T. Docwra & Son, £1,179; J. Mowlem & Co., £1,210. (c) For repairs to arches of the Lambeth approach to Waterloo bridge.—Brunswick Rock Asphalt Paving Company, £8,978; Trinidad Lake Asphalt Paving Company, £12,854; Val de Travers Asphalt Paving Company, Limited, £13,107; Bradshaw & Co., £13,917. (d) For the demolition of the old bridge at Vauxhall, and for the partial construction of the new bridge.—Petrick Brothers, £166,568; Kirk & Randall, £174,499; J. S. Pearson & Son, Limited, £177,236.

METROPOLITAN ASYLUMS BOARD.

Sir Edwin H. Goldsworthy presided on Saturday at a meeting of the managers at County Hall, Spring-gardens. The clerk read a letter from the Local Government Board stating that they had under consideration a further letter relative to the managers' proposal to obtain tenders for the erection of the new head office without advertising, and that they did not feel justified in assenting to a departure from their regulations. A letter was received from the department sanctioning the expenditure of £11,223 Os. 3d. in respect of the provision and maintenance of ambulances and ambulance stations and other outlay connected therewith during the half-year ended March 26th. It was agreed to engage Sir J. Whittaker Ellis to act as valuer in connection with the proposed purchase of some property at Sutton belonging to the South Metropolitan School District Board.—A resolution of the Works Committee recommending the provision of a greenhouse at the Park hospital was adopted. Among the tenders accepted were the following: Fuller's Manufacturing Company, for the supply of roller blinds to the Western hospital; Ballard (Limited), for £127, for re-making a road at the same hospital; Messrs. Armstrong & Co., 116 Queen Victoria-street, for £267, for improving the drying accommodation at the same institution; and Mr. T. Knight (of Sidecup), for £378, for the erection of a destructor at the Gore Farm hospital.—The Works Committee recommended that the tender of Messrs. McCormick & Sons, of Northampton-street, for the partial reconstruction of the North-Eastern hospital, at the sum of £113,642, should be

accepted. The architect's revised estimate was £115,000. Messrs. McCornick's tender was accepted.

VESTRIES AND DISTRICT BOARDS.

Bermondsey.—On Monday the Baths Committee reported to the vestry the receipt of a specification from the surveyor for work in connection with the renovation of the laundry. The committee recommended that tenders should be invited for carrying out the work, and that they should be authorised to act in the matter. An amendment was moved that the surveyor should be instructed to undertake the work, but on a division this was rejected by thirty-two votes to twenty-five, and the original recommendation adopted. Mr. Layman, on behalf of the Works Committee, moved the adoption of the report relating to the Workmen's Compensation Act. The committee pointed out that there were three courses open to the vestry. One was to cover the risk by insurance, the second was to submit an alternative scheme to the Registrar of Friendly Societies, and the third was for the vestry to take the risk until some experience had been gained of the working of the Act. The committee recommended the vestry to adopt the last-mentioned course. In supporting this Mr. Layman stated that the insurance companies asked for high premiums, amounting to as much as 20s. per cent., and that in taking up the risk the companies required the insurance of all the vestry's employees, whether comprised within the scope of the Act or otherwise. It was best to continue as hitherto, and for the vestry to take its own risk. After some discussion the recommendation of the committee was unanimously adopted.—The General Purposes Committee reported the receipt of a letter from the London County Council, stating that they had had under consideration a letter from the Strand District Board of Works calling attention to the necessity for regulating the methods of advertising by the electric light and other similar devices, and asking the council whether they could not obtain the prohibition of advertising by means of search or flash lights thrown on the public highways. The council asked whether the vestry knew of any such advertisements in its district, and whether it considered it desirable that some by-law should be made for the regulation generally of these advertisements. On the recommendation of the committee it was resolved to inform the council that flash-light advertisements were occasionally shown in the parish, and that some by-law should be made for their regulation.—The Electric Lighting Committee reported the decision of the House of Commons committee in regard to the Bill to confirm the vestry's electric lighting provisional order. On the recommendation of the committee it was decided to submit a clause for insertion in the Bill consenting to purchase by agreement, or at a price to be fixed by an arbitrator appointed by the Board of Trade, the distributing mains in the parish laid by the London Electric Supply Corporation, such purchase to be completed before the vestry commenced to supply electricity. Mr. Cox, chairman of the Electric Lighting Committee, expressed the hope that the clause drafted to that effect would meet the wishes of the House of Commons committee, and that the provisional order would be confirmed. The cost of purchase was estimated at about £5,000.—The following tenders were received for the supply of bricks, at per 1,000: West Brothers, £2 per 1,000, delivered alongside the vestry's wharf, East-lane; Smeed, Dunn & Co., £2, less 2½ per cent., delivered at the same wharf; Tucker & Son, £2, £2 10s., and £2 18s., respectively per 1,000, delivered in trucks at Mint-street station; C. Burley, £1 19s., at the vestry wharf; the Weldon and Corby Brick Company, £1 17s., at Mint-street station; and Wakeley Brothers, £2 5s., at the vestry depot, Spa-road. The General Purposes Committee recommended the acceptance of the tender of the Weldon and Corby Brick Company, at £1 17s. per 1,000, the bricks to be supplied as required. The recommendation was agreed to.

Clerkenwell.—On Thursday, at a meeting of the vestry, the Works Committee reported that their attention had been called to the bad condition of the carriage-way of Clerkenwell-green, and having inspected it were of opinion that it was in need of repair; at the same time, they thought that a great improvement would be effected and the cost lessened if two large portions in the centre were paved with York paving or asphalt, and planted with trees. The estimated cost of the work, including the re-dressing and re-laying of the carriage-way, was £975, and they (the committee) begged to recommend that the work be carried out. The report was adopted.

Hackney.—At last week's meeting of the vestry, the General Purposes Committee reported that, in their opinion, it was desirable that the wool paving of Dalston-lane should, as an experiment, be done by the vestry, without the intervention of a contractor. They recommended that this course be adopted, the conditions of employment and rates of wages to be the same as those which the vestry would require a contractor to observe were the work carried out by contract. The recommendation was agreed to.

Hampstead.—The Free and Open Spaces Committee have resolved to recommend the vestry, at its next meeting, to contribute £16,000 to the Hampstead Heath Extension Fund for securing the Golden's-hill estate, of over 36 acres, as an addition to Hampstead Heath. About £40,000 is required for the purpose, towards which nearly £12,000 has already been secured by private subscription.

Islington.—At the vestry meeting, on Friday, Mr. Fuller

asked the chairman of the Electric Lighting Committee whether it was a fact that the committee were in the habit of granting to those who had been less than twelve months in the employ of the vestry holidays for which the vestry had to pay; and, secondly, by whose authority such permission was given. Mr. Quayle replied in the affirmative to the first question, and stated that the vestry gave the necessary authority in January of last year. The matter then dropped.—The Parliamentary Committee further reported having considered the question of establishing a fund against fire and other insurances, and had been furnished in connection with the matter with a return giving particulars of the vestry's existing fire and guarantee insurances. Being, however, of opinion that the vestry were not empowered by law either to create or to contribute to such a fund, the committee recommended that the consideration of the matter should be deferred until the introduction of the Bill for the reform of the local government of London, which would, in all probability, afford an opportunity for the local authorities to acquire the necessary powers to establish or contribute towards such a fund. The recommendation was unanimously adopted.—At the suggestion of the Electric Lighting Committee it was resolved to borrow £72,000 for the extension of the electricity works. In this connection the committee pointed out that they had instructed the architect to draw up plans, &c., for a considerable extension. The electrical engineer estimated that the increased boiler and engine house accommodation would be sufficient to contain the whole of the additional machinery required for about seven years, and he advised that plant, to the extent of 3,000 horse-power, should be placed on order forthwith, two engines and dynamos of 1,000 horse-power each, to be erected within twelve months, and the third to be erected within two years. The estimated cost is as follows: Six boilers and fittings, £5,400; three 1,000 horse-power engines, £16,500; three 600 kilowatt alternators, £15,000; steam and exhaust pipes, pumps, heaters, injectors, switch gear, regulators, connections and contingencies, £9,000; and estimate for building extensions, £22,500; being a total of £71,400.—The Works Committee submitted a scheme prepared by the chief surveyor for relieving the sewers of the Stroud Green-road district, in order to prevent the flooding of the Crouch Hill station during periods of heavy rainfall. It was resolved to submit the scheme to the county council for approval.—The same committee reported having considered returns obtained from the contractors for supplying horses and drivers for watering roads of the rates of wages paid to their employees. On the recommendation of the committee it was resolved to instruct the vestry clerk to give notice to Messrs. G. Malin & Son, Messrs. W. King & Son, and Mr. W. Watson that they were not paying the trade union rate of wages, of 24s. per week, and that unless they did so, and observed the conditions as to hours of labour in accordance with their contract, the vestry would enforce the penalty provided for them.—The following tenders were accepted by the Works Committee for the supply of horse forage during July: Messrs. D. N. Howell & Co., Snifferance wharf, Belvedere-road, S.E., 100 qrs of oats, equal to sample No. 1, at 16s. 9d. per qr; Mr. G. W. Stemp, 55 New Corn Exchange, E.C., 14 tons of mill bran, at 11s. per ton; Mr. Geo. Rose, Little Hallingbury, seven loads of hay, at 75s. per load; twelve loads of straw, at 33s. per load; and seven loads of mixture, at 77s. 6d. per load; Messrs. Turner, Byrne & Co., Cumberland hay market, N.W., seven loads of clover, at 87s. 6d. per load.—On the motion of Mr. Dove, as amended by Mr. Mills, the vestry passed a resolution that provision should be speedily made for the adequate accommodation of the staff by obtaining a site for the erection of municipal buildings and referring the question to the General Purposes Committee for consideration and report.

Kensington.—The Works and Sanitary Committee last week reported having given consideration to the result of the conference of engineers and surveyors of the several vestries and district boards in the metropolis on the subject of sewer ventilation. The Main Drainage Committee recommended that the council be requested to adopt the remedy for sewer emanations advocated by the conference in respect of the Conter's creek sewer in the parish, numerous complaints having been received from parishioners and the sanitary inspectors of offensive smells from sewer ventilators in streets in the line of the said sewer; also that the surveyor be requested to report to the committee as to any practicable action which might be taken by the vestry to give effect in this parish to the third recommendation of the conference. This, it may be remembered, was as follows: (3) That pipe ventilators up buildings, or otherwise, when possible, should always be adopted, in addition to surface ventilators." The recommendations were agreed to.

Marylebone.—The vestry resolved at the meeting held on Thursday that in the advertisements to be issued for the positions of district superintendents and superintendents of cleansing and of sewers and drains it should be stipulated that no pensions would be granted at the expiration of service.—On the recommendation of the Sanitary Committee it was resolved to accept the offer of Messrs. Mead & Co. to remove the manure from the stables in the parish by way of experiment for three months and at the rates of charge to owners mentioned in the report of the medical officer of

health.—The same committee stated, with regard to the reference to consider and report if Part II. of the Housing of the Working Classes Act could and ought to be applied in the parish, that they did not see their way to recommend the vestry to take any action in the matter at the present time. The consideration of the report was adjourned.—It was mentioned that the preamble of the Bill promoted by the Metropolitan Electric Supply Company for the acquisition of the land for the erection of a generating station at Willesden had been passed. So far as Marylebone was concerned the vestry had been successful in securing the insertion of a clause which upheld the vestry's agreement with the company of the 1st October, 1889, and which bound the company to maintain the generating stations in South-street and Rathbone-place.—The vestry referred to the Sanitary Committee a letter from the county council threatening to take proceedings, at the cost of the vestry, should the latter not take effect steps to abate the smoke nuisance. In this connection Mr. Brook-Bitching stated that the Court of Common Council had had to take proceedings against the county council for the same offence in regard to their river steamers. The very people who complained were themselves guilty of the same nuisance.—The vestry postponed the consideration of the following notice of motion by Mr. T. W. Baker: "That, having regard to the increased liability of the vestry in the employment of their labour coming under the Workmen's Compensation Act, it be referred to the Parliamentary committee to bring up a report as to how many of the workmen come under the Act, and the advisability of insurance or otherwise, and at what rate it can be effected."

Newington.—On Wednesday the Roads and Depot Committee recommended that they should be empowered to accept a tender, if necessary, during the recess for the erection of the proposed flats in Manor-place, in accordance with plans and specification prepared by the architect, Mr. Plumb. The recommendation was adopted.—The Lighting Committee recommended that the vestry should undertake by direct labour, under the supervision of the surveyor, the removal and relaying of pavement and excavation of trenches in connection with the laying of the electric light mains. The recommendation was carried.—The committee also recommended, and the vestry decided, that the National Telephone Company should be permitted to lay in the same trenches as those made for the electric light mains their telephone pipes and cables, under the supervision of the vestry's consulting engineers, on condition that the company should bear a moiety of the expense of taking up and relaying the footpaths and excavating the trenches.

Plumstead.—It is reported that the vestry, who are themselves considering the question of applying for a provisional order for an electric supply, have received notice from the Woolwich District Electric Light Company of their intention to apply for powers to light Plumstead with electricity. The vestry have decided to oppose the granting of the order.

Poplar.—The district board of works have decided to pave a portion of East India Dock-road with hard wood, at an estimated cost of £420.

Shoreditch.—At the vestry meeting on Tuesday the Finance Committee recommended that application should be made to the county council for a loan of £10,653 at 2½ per cent., for engineering works in connection with the baths and wash-houses. The vestry clerk pointed out that the county council had raised the rate of interest on loans exceeding £10,000 to 3 per cent. In that connection the clerk mentioned that he had been in communication with the Public Works and Loans Commissioners, who had offered to advance the amount of the loan at 2½ per cent. An amendment was accordingly moved and carried referring the recommendation back to the committee for further consideration.—A letter was read from the county council in reference to the nuisance arising from peat litter manure, and asking for the vestry's views on the subject. The communication was referred to the Public Health Committee.—A further letter from the county council was read enclosing copy of a resolution passed by the council proposing to obtain powers for the reconstruction of the Cat and Mutton bridge on condition of the Hackney Vestry contributing £5,000 and the Shoreditch Vestry £17,000 towards the cost of the work. The subject was referred to the Works Committee.—A petition was submitted asking the vestry to pave Old-street with wood, and this was also relegated to the Works Committee.—Tenders were received and opened by the chairman of the vestry for the supply of boilers and transformers in connection with the electric light station. In view of the long vacation, it was unanimously resolved to authorise the Lighting Committee to accept tenders and report their action to the vestry. The committee were also empowered to have specifications prepared and tenders invited and dealt with for the extension of the boiler-houses and battery-room at the electricity works.—In reply to representations made by the county council on the subject of the smoke nuisance, the Public Health Committee recommended that a reply should be sent stating that the vestry were taking proceedings to abate the evil. The recommendation was, however, referred back to the committee, in order that an explanation might be forwarded to the county council of the difficulty experienced in enforcing the law in the police courts.—On the motion of

Mr. Winkler the Works Committee were authorised to invite tenders for reconstructing a portion of the Britannia-street sewer.

St. George-in-the-East.—At a meeting of the vestry on Thursday the Finance Committee recommended that a memorial be sent to the London County Council in favour of a communication between Rotherhithe and Wapping, and asking that a deputation from the vestry might be received on the subject. Mr. Jacobs moved the adoption of the report, and referred to the importance of the subject. Notwithstanding the Tower bridge, there was still, he said, a need for further facilities of communication. The London County Council were practically pledged in the matter, though the committee was unable to decide in favour of either a tunnel or a bridge. Mr. C. Barratt seconded and the motion was agreed to.

St. Pancras.—The vestry last week adopted a recommendation of the Works Committee that the carriageway in front of the North London Hospital for Consumption, in Grafton-street, be repaved with hard wood grouted in pitch, at a cost of £250.—On the recommendation of the Baths Committee it was resolved to authorise the vestry clerk to complete the purchase of freehold and leasehold interests in Bayham-place, for the extension and improvement of the laundry in King-street.—The Baths and Wash-Houses Committee asked for authority to invite tenders from well engineers for the sinking of a well at the King-street baths in accordance with a specification prepared by the borough engineer. After some discussion the vestry gave the desired permission. The Baths Committee also recommended that applications should be invited, by advertisement, from architects who have had experience in the designing and carrying out of public baths and wash-houses and are willing to submit designs for the new baths in the Prince of Wales-road, and that six firms be selected therefrom to compete; that the architect of the design placed first in order of merit be asked to carry out the work at the usual charges approved by the Royal Institute of British Architects; and that a premium of £50 be awarded to each of the five unsuccessful architects; and that a professional assessor should be appointed, at a fee of 100 guineas, to report and advise the committee on the designs that would be received. The recommendations were adopted.—Dr. Smith, for the Electric Lighting Committee, reported that they had, in consequence of complaints received respecting the alternate extinction of the arc lamps at midnight, viewed after midnight the localities complained of. It was found generally that the thoroughfares were sufficiently well lighted when half the lamps were extinguished, with the exception of two or three places which cannot be improved unless the whole of the lamps are kept in lighting till daylight. The committee deemed it sufficiently important that these special places should be lighted, and had given instructions for the whole of the lamps throughout the parish to be left in lighting throughout the night.—The Highways Committee recommended that advertisements should be issued inviting tenders for the supply of hard wood paving blocks, required at a later period for the repaving of Guildford-street and Midland-road, in order that merchants might be enabled to arrange for the importation of the material when it became necessary for the work to be put in hand. The recommendation was adopted.—The following tenders were considered for the supply of condensing plant and steam pipes for the Regent's Park electric light station: Meehan & Sons, £5,000; Klein Engineering Co., Limited, £4,875; W. Gales & Co., £4,306 10s. 10d.; John Fraser & Son, £4,155 14s. 4d.; T. Ledward & Co. (informal), £3,097; Fairbrother & Co. (informal), £3,231. The tender of Messrs. John Fraser & Son, of Millwall, was accepted.

St. Saviour's.—Last week, at a meeting of the district board of works, the surveyor intimated that the wood paving of Borough High-street had been completed in eight days. It was done at the rate of 30,000 blocks daily.—It was also reported that final arrangements had been made with the London County Council for the improvement of Bear-lane.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Derbyshire.—At their meeting on the 6th inst. the county council adopted a report of the Asylum Committee recommending that £39,990 be expended on extensions at the asylum.

Essex.—At a meeting of the county council on the 5th inst. Dr. Thresh, the medical officer of health, reported that he had received a letter from Halstead, saying that some pollution of the river Colne had occurred, and that all the fish were being poisoned. Upon investigation he found that a gasometer tank belonging to a private firm had been pumped out into the river and had caused the mischief. The gentleman responsible assured him that he had no idea that it would have any deleterious effect. No doubt no liquor of this character would be again discharged into the river from these works. The committee reported that they had directed a letter to be written to Messrs. S. Courtauld & Co., Limited, stating that they considered the matter a serious one, and that it must not occur again."

West Riding.—The county council adopted, at their meeting on the 13th inst., the following resolution: That the Finance Committee apply to the Local Government Board for sanction to the borrowing of £43,600 for the purchase of the Storless estate, comprising 629 acres, on which to build a new asylum, and for incidental expenses, the period of repayment suggested being thirty years.

MUNICIPAL CORPORATIONS.

Accrington.—The town council recently approved the action of the Legal and Parliamentary Committee, who, having considered a letter from the Local Government Board declining to sanction a loan for the construction of a main sewer for the Baxenden district, because of the unsatisfactory state of the effluent produced at the Accrington and Church joint outfall sewerage works, passed a resolution placing upon record its opinion that the joint sewerage board ought forthwith to proceed with the construction of further filter-beds, and ought also to enter into negotiations for the purchase of land for filtration purposes. The Health Committee considered a communication from the Local Government Board emphasising the necessity for an infectious diseases hospital other than the present small-pox hospital, and the town clerk was instructed to reply that the refusal of the Local Government Board to sanction a loan for the Baxenden sewer had placed the corporation in a great difficulty, inasmuch as until that sewer was constructed there was no outlet for the sewage from the site already secured for an infectious diseases hospital.

Bath.—On the 12th inst., at a meeting of the Rivers Pollution Prevention and Floods Committee, it was reported that a letter had been sent to the Local Government Board, asking whether sanction might be given for a practical scheme—namely, for sewage collection—leaving the question of disposal until it was seen whether the Exeter experiment with the septic system was successful. The board wrote that they could not entertain this proposal. The committee agreed to leave further action until the matter came before the town council.

Birmingham.—The question of the class of workmen's dwellings to be erected on the land in Milk-street, which was cleared by the corporation of that city some time ago, was considered on Tuesday week by the joint committee, composed of members of the Improvement and Health Committees. The plans were approved, and it was decided that a report should be presented at the next council meeting recommending the approval of the plans prepared by Mr. Tait, the manager of the improvement department. The rent of the houses will work out at an average of about 1s. 6d. per room.

Bolton.—Approval has been given to the recommendations of the electrical engineer (Mr. Arthur Ellis) for extensions of the electric lighting plant and a change from the present alternating current to the continuous current for the central part of the town. The cost for extensions on the alternating current principle was estimated at £16,830, and for the introduction of the continuous current the engineer says the £21,576 is required.

Bournemouth.—On the 6th inst. the following tenders for an electrical installation at the pier, the pleasure grounds and the winter gardens, were received: The Walsall Electrical Company, Limited, £2,695; Leonard G. Tate, £2,997; Siemens Brothers & Co., Limited, £2,192; Crompton & Co., Limited, £2,097; Johnson & Phillips, £2,083; Brush Electrical Engineering Company, £1,598; R. Algar & Sons, £1,867; Cash Robinson & Co., £1,784 *is. 4d.* A letter from the secretary of the Local Government Board was read, stating that the board would not be prepared to further consider the applications for sanction to borrow £1,600 and £900 until the council had decided whether or not they could generate their own electricity.

Brighton.—The council recently adopted the report of a committee, stating that they (the committee) had tried to find the best reflector for the electric lamps, and recommended that their men at the electricity works could make for about 6s. each. They thought it advisable to spend £282 in putting in a radiator in connection with the old chimney shaft. It would save the shaft from the tremendous heat, which had caused it to crack.

Bristol.—The site at the back of the council-house, Bristol, is being cleared for the erection of the temporary council chamber, the cost of which is to be limited by resolution of the council to £2,500. The building is to be erected under the supervision of the city engineer, Mr. T. H. Yallicom.

Burnley.—The town council have instructed the Finance Committee to apply to the Local Government Board for sanction to the borrowing of £50,140 for the purchase of property, and for extending the gas and electric light works.

Burton.—It has been resolved to apply to the Local Government Board for sanction to borrow £50,140 for the execution of various works, chiefly in connection with the gas and electric light undertakings.

Cambridge.—On account of the rise in the price of wood blocks the town council have decided to apply to the Local Government Board for permission to increase their proposed levy for paving works from £15,000 to £17,269.

Chesterfield.—It was announced, at a meeting of the town council last week, that it had been decided to reduce the price of gas for power purposes to 2s. 6d. per 1,000 cubic feet.

Colne.—On Wednesday of last week, at Colne, a Local Government Board inquiry was held into an application of the Borough of Colne for sanction to a loan of £24,400 for works of private street improvement and £4,200 for the erection of stables in Spring-lane.

Devonport.—The council at a recent meeting gave their consideration to a report of Prof. Kennedy on the proposed light and power station.

Dudley.—The desirability of purchasing the gasworks is under the consideration of a committee of the town council.

Durham.—A committee has been appointed by the town council to prepare a report on the lighting of the city by incandescent lamps or electricity.

Evesham.—Mr. P. H. Fletcher, manager of the corporation gasworks, has submitted a report to the Gas Committee giving details of improvements and extensions, estimated to cost £2,270, which he considers will be necessary in the near future if the consumption of gas continues to increase. Consideration of the report has been deferred.

Hereford.—The council have decided to adopt the recommendation of a committee that application should be made for powers to borrow the necessary money to purchase a site for electricity works.

Hove.—The town council have accepted the tender of Messrs. J. Parsons & Sons, Hove, at £1,227, for road-making and other works in Walsingham-road, and that of the same firm, at £293, for laying asphalt paving in Queen's-gardens, from Grand-avenue to Palmeira-mews (a distance of about 870 yards).

Leamington.—Last week the council adopted a series of recommendations recently drawn up by the Technical Instruction and Free Library Committee with reference to the proposed new free library and technical institute for the borough. It is proposed that £12,000 shall be spent on the new building, exclusive of land and furnishing, the work of design to be thrown open to competition—the first premium to be awarded the accepted design, the author to have the privilege of carrying out the work; the second premium to be 50 guineas.

Liverpool.—The members of the city council have resolved to provide themselves with a new council chamber at the lowest possible cost, and accepted at their last meeting the proposal of Sir Thomas Hughes to make alterations in the present chamber, at an estimated cost of £8,000, rather than erect an entirely new council-house on the site of St. George's church, at a probable cost of £60,000.

Ludlow.—The corporation decided at a recent meeting to apply for a provisional order for the supply of electricity in the borough. It was stated that the £300 a year at present paid to the gas company would pay the interest on the loan that would be necessary in connection with the installation of electric light.

Manchester.—The special Tramways Committee of the Manchester Corporation met on Friday. It was decided to visit Liverpool for the purpose of inspecting some electric trams. The Liverpool Corporation contemplate employing electricity as the motive power for the tramway system of that city, and the cars, which are of different patterns, have been sent there by their respective makers for experimental purposes. The Manchester committee, having regard to the future use of electricity for the tramways here, decided to take advantage of the opportunity of seeing the new cars at work.

Oldham.—The annual inspection of the gasworks by the corporation Gas Committee was made last week. At the Hollinwood station the new retorts attracted attention, and at the Higginsshaw works a coke elevator and screener that have recently been put into use.

Ryde.—The formal opening of an organ erected in the town hall at a cost of £1,000 took place on Monday of last week.

Scarborough.—A committee having considered the question of a suitable site for the refuse destructor, and the borough engineer having submitted a report upon the matter, it has been resolved that the town clerk be instructed to write to the Office of Woods inquiring if they will allow the corporation to take a long lease of the land comprising about 7 acres adjoining the Scarborough and Whitby railway, on the Crown's Northstead estate, for a site for a refuse destructor, and, if so, upon what terms.

Woodstock.—A fire camp and review, promoted by the National Fire Brigades Union, will be held from August 24th to the 24th in Blenheim Park, the estate of the Duke of Marlborough.

Worthing.—An inspector of the Local Government Board last week held an inquiry with respect to the application of the town council for sanction to borrow £762 for street improvement works.

URBAN DISTRICT COUNCILS.

Aston Manor.—The tender of Mr. W. Cotterill, Aston Manor, has been accepted for painting and decorating the council offices and free library.

Bakewell.—The council recently took possession of the undertaking of the Bakewell Gas Light Company, which they purchased at a cost of £11,522, and of this sum £1,200 was paid to the Duke of Rutland for his reversionary interest and freehold. At a special meeting of the council, on Thursday evening, a cheque was signed for £10,350. The original capital of the company was £1,500, in 300 shares, and by this transfer the shareholders receive about £34 per share.

Bognor.—The district council have under consideration the advisability of lighting the esplanade and pier with electricity.

Bromsgrove.—On Friday Mr. W. O. E. Meade-King, M.C.E., held an inquiry at the town hall, Bromsgrove, touching the application of the urban district council for sanction to borrow £1,200 for purposes of street improvement and £600 for the purchase of land for purposes of public walks and pleasure grounds. The surveyor, Mr. R. H. Nowell, attended the proceedings. No opposition was offered.

Castleton.—Mr. H. Percy Bounois, engineering inspector of the Local Government Board, attended at the council offices recently to make inquiries respecting the council's application to borrow £2,250 to pay for additional land required for sewage disposal works. Mr. Clayton (principal assistant to Mr. J. Diggle, the engineer for the sewage works scheme) explained the plans and proposals.

Chesterton.—It was stated, at the last monthly meeting of this body, that the Sewerage Committee had given their consideration to the question of dealing with the smells emanating from the manholes, and had asked the surveyor to prepare plans showing where ventilating shafts were desirable. They had come to the conclusion that they would for the present authorise eight shafts to be erected in different points of the system, where the surveyor had advised the smells were most pungent. If, after those shafts had been fixed, there were still manholes which were offensive, then the committee would take them also into consideration and put up further shafts. For the present, however, they believed eight would be sufficient to obviate the smells complained of. It was decided to erect the shafts.

Epsom.—The Local Government Board have held an inquiry into an application of the council for sanction to borrow £40 for works of sewerage and £3,400 for the purposes of a recreation ground.—The district council, who were recently fined in respect of the pollution of the Hoggs Mill river, have applied to the Local Government Board for sanction to a loan of £17,000 for the drainage of Ewell.

Erdington.—On Wednesday of last week Mr. W. O. E. Meade-King, inspector of the Local Government Board, held an inquiry at the council offices, Erdington, in reference to an application by the council for sanction to borrow £3,000 for works of surface-water drainage, £1,321 for purpose of sewerage, and £424 for the purchase of land, and a cottage for purposes of a refuse tip. Mr. W. Ashford, clerk to the council, in supporting the application, said, in reference to the last-named sum, the council, under pressure of the Local Government Board, the county council and the medical officer, had undertaken the removal of house refuse and the emptying of ash-pits, but one of the principal difficulties in the carrying out of that work was the obtaining of proper tips and convenient wharf accommodation on the canal.

Grange-over-Sands.—The council have adopted plans, and are making application to the Local Government Board for powers to borrow £10,000 to carry out certain improvements which have been under consideration for three and a half years. It is proposed that the sewage which now drains upon the foreshore at various points shall be collected and carried beyond the town along the railway embankment, outside which will be erected a promenade. The new sea wall will reclaim 5½ acres of land, which will probably be used as a recreation ground.

Halesowen.—A Local Government Board inquiry was held on Thursday with respect to an application of the district council for permission to borrow upwards of £1,150 for completing works of sewerage at Hasbury, Halesowen and Hawee.

Handsworth.—At the last monthly meeting of the council a letter was received from the Board of Trade stating that they had consented to the use of steam on the South Staffordshire tramways for a further period of six months. By a small majority the council decided to erect a public convenience in the Stafford-road. A few months ago a similar convenience in this road was demolished by order of the council.

Hoylake and West Kirby.—Recently, at a meeting of the General Purposes Committee of the council, consideration was given to a scheme for the improvement of the Hoylake lake. In the course of the discussion it was explained that in the original scheme provision was made for the expenditure of about £5,000 for dredging purposes, while the scheme itself involved an expenditure of £13,500. It was further stated

that the sum of about £800 per annum would also be required for dredging purposes in addition to the expenditure of £5,000, and that this would involve the payment of £1,000 to £1,400 a year as the result of the adoption of the original scheme. Numerous resolutions and amendments were proposed at the meeting, but it was eventually decided to call another meeting of the ratepayers to place before them the present position of the original scheme.

Horsham.—The council, at a recent meeting, adopted the report of a committee recommending an application to the Board of Trade for a license to supply electricity within the urban district, at an estimated cost of a little over £10,000.

Lepton.—The council have accepted the following tenders for the extension of the electric lighting plant: Accumulators—The Hart Secondary Battery Syndicate, £1,450; Switchboards—The General Electric Company, £150; Cables—The Western Electric Company (schedule prices).

RURAL DISTRICT COUNCILS.

Croydon.—The district council, at a recent meeting, resolved to apply to the Local Government Board for sanction to a loan of £14,000 for the purpose of the drainage of Coulsdon, to include £1,300 for Sanderstead, and also to provide for the drainage of Russell-hill schools and Cane-hill asylum.

Hartley Witney, Hants.—Mr. Herbert H. Law, C.E., one of the inspectors of the Local Government Board, held an inquiry on the 12th inst., in reply to the application of the council to borrow £5,500 for works of sewerage and sewage disposal. The scheme was unopposed. After the inquiry the inspector proceeded to view the site proposed for sewage disposal, which is on the septic tank system. The engineers for the scheme are Messrs. Fairbank & Son, civil engineers, of York and Westminster, S.W.

Wantage.—The tender of Mr. W. A. Wheeler, at £154, has been accepted for the carrying out of certain sewerage works.

SCOTLAND AND IRELAND.

Aberdeen.—The annual inspection of the waterworks took place on the 5th inst. Lord Provost Mearns and the members of the town council drove to Invercarnie and made the usual investigation of the works, giving particular attention to the parts of the aqueduct where sewage matter has been found to percolate.—A new swimming bath was last week formally opened by the Lord Provost. The pond measures 90 ft. in length by 35 ft. in breadth. The depth of water at the shallow end is 3 ft. 6 in., gradually deepening to 7 ft. 6 in. at the other end. The pond, which should prove a useful adjunct to the bathing station at all seasons—and, it is to be hoped, also a profitable convenience—is situated in an underground building, the walls of which are of concrete, lined with cement inside. The cost of the station, including the original building, up to date is estimated at £12,000. Mr. John Rust, the city architect, designed the alterations.

Peebles.—The town council have offered to take over the gas undertaking, giving the shareholders 10 per cent. annuities on their holdings for thirty-five years, after which the council will buy up the concern at £157 10s. per £100 value of stock, the burgh to pay the cost of the transfer.

Holborn Public Library.—We have received the sixth annual report of the commissioners of this institution, the affairs of which, judging from the contents of the pamphlet, are in a highly satisfactory condition.

Business Announcement.—We have been informed that, finding it necessary to have larger premises, Messrs. Hall Brothers, wholesale manufacturers of electrical apparatus, 18 Fenchurch-buildings, Fenchurch-street, E.C., have removed to 156 Upper Thames-street and 21 Bush-lane, Cannon-street, E.C.

From the Editor.—We may occasionally have to return to contributors manuscripts which circumstances prevent our using. It is not a congenial task, and one is anxious to soften it as much as may be by some courteous formula. *The Referee of India* gives the following sample of the courtesies of Chinese editors, and we quote it with the request that it may be understood, though somewhat long for every-day use, to accompany our own "declined with thanks": "Illustrious Brother of the Sun and Moon.—Behold thy servant prostrate before thy feet. I kowtow to thee, and beg that of thy graciousness thou mayest grant that I may speak and live. Thy honoured manuscript has deigned to cast the light of its august countenance upon us. With raptures we have perused it. By the bones of my ancestors, never have I encountered such with such pathos, such lofty thought! With fear and trembling I return the writing. Were I to publish the treasure you send me, the Emperor would order that it should be made the standard, and that none be published except such as equalled it. Knowing literature as I do, and that it would be impossible in ten thousand years to equal what you have done, I send your writing back. Ten thousand times I crave your pardon. Behold my head is at your feet. Do what you will.—our servant's servant,—THE EDITOR."

Personal.

Mr. Robert Dryden has been appointed burgh surveyor of Dalkeith.

Lancaster Corporation have selected Mr. J. Fisher, of Lancaster, to fill the post of building inspector.

Mr. C. H. Broadbent, of Otley, has been appointed surveyor and sanitary inspector to the Gaisley District Council.

Out of twenty-six applicants, Mr. J. W. Garbutt, of Barnsley, has been appointed surveyor to the Farsley Urban District Council.

Mr. Diggle, assistant surveyor of Heywood, has been appointed district surveyor for Mossley by the urban district council.

Romford Urban District Council have increased the salary of Mr. Herbert T. Ridgo, their assistant surveyor, by £15 per annum.

Mr. S. Donald, gas analyst to the Dundee Corporation Gas Committee, has been granted an increase of salary of £25 per annum.

Mr. H. Riley, surveyor and water engineer to the Gainsborough Urban District Council, has had his salary increased by £50 per annum.

Mr. W. Ryle Wright, the borough engineer of Barnsley, will shortly visit the United States for the purpose, it is reported, of picking up new ideas on matters concerning his profession.

Mr. H. W. Corrie, surveyor to the Neston and Parkgate Urban District Council, has resigned his post in order to take up a similar appointment under the Lower Bebington Urban District Council.

Brightlingsea Urban District Council have adopted a report recommending the engagement of Mr. H. Goodyear, surveyor to the Colchester Town Council, as consulting engineer in connection with the waterworks.

Mr. Byrom, the chairman of the Bury Corporation Gas Committee, at a recent meeting of the town council, stated that Mr. Simmonds, the new gas manager, had put the works in good order and was showing marked ability.

Mr. Herbert S. Goodall, formerly a pupil of Mr. W. Wing, F.I.A.S., of Caversham, Reading, has been appointed assistant to the surveyor of the urban district of Farnborough. Twenty applications for the post were received.

At a recent meeting of the town council of Bridgwater it was unanimously resolved to increase the salary of the borough engineer, Mr. Francis Parr, to £280. Further annual increases of £10 are also to be granted, bringing up the amount to £300.

In our reference last week to Mr. Macdonald that gentleman was inadvertently described as the resident waterworks engineer to the Newport Borough Council. Mr. Macdonald, of course, holds the position of manager. Mr. N. Holloway is the resident engineer.

We regret to announce the sudden death, at the Golden Lion Hotel, Ipswich, of Mr. Walter Horne, who for some years was borough surveyor and waterworks engineer of Worthing. At the time of his decease he was representing Messrs. Hain, Baker & Co., engineers, 13 Grosvenor-road, Westminster.

A deputation of six members of the Corporation of York and the borough engineer (Mr. A. Creer) have been visiting Southampton to inspect the new drainage works and refuse destructors. After visiting the municipal buildings they were shown over the various works by the borough engineer, Mr. W. B. G. Bennett.

At last week's meeting of the South Bank Urban District Council a letter was read from Mr. Poole tendering his resignation as surveyor and inspector of nuisances, owing to having accepted a superior position under the Seton Urban District Council. The resignation was accepted, and it was agreed to advertise for a qualified surveyor at an open salary.

Mr. John Mallinson, who is at present chief assistant to Mr. O. J. Kirby, borough engineer and surveyor of Batley, has been appointed town surveyor of Skipton, in succession to his late father, Mr. Thomas Mallinson. The deceased gentleman's name was, we find, incorrectly given in our last issue as Mr. John Mallinson. We regret the error, which, however, did not originate with us.

At a meeting of the Norfolk County Council, on the 2nd inst., the county surveyor, Mr. Heslop, applied for some remuneration in respect of the surveillance of works carried out at the asylum during the last two years, and necessitating an expenditure of £7,000. Some discussion followed, but it was eventually decided to refer the matter to the Finance and General Purposes Committee.

In moving the acceptance of the resignation of Mr. Oliver Winter, the surveyor to the Vestry of St. George-the-Martyr, last week, a member of that body remarked that if they had dealt more liberally with Mr. Winter they might have retained his valuable services. But, he added, St. George's

vestrymen did not appreciate brains. The chairman and several others spoke eulogistically of Mr. Winter's services.

The first business transacted at Thursday's meeting of the Ichen Urban District Council was the appointment of a surveyor. The committee who had been elected at the last meeting to bring up a report upon the thirty-three applications received had selected three candidates, who were present, and he interviewed by the board. Eventually Mr. Thomas G. Collingwood was appointed, at a salary of £125 per annum.

Ill health has, we learn, compelled Mr. F. Harman Lewis, the borough electrical engineer of Wolverhampton, to send in his resignation. Mr. Lewis commenced his duties under the corporation in May, 1893, at a salary of £300 per annum. Last week his resignation was accepted by the council with regret, but upon the recommendation of the Lighting Committee it was decided to retain his services as consulting engineer, at a salary of £150 per annum.

Mr. William Thomas Olive, who was for ten years chief assistant to the city surveyor of Manchester, and afterwards for five years resident engineer on the Manchester sewerage scheme recently completed, and which was designed by him, is at present on a visit to Manchester. He left England for Cape Colony in 1895, and has there successfully carried out a great scheme for the sewerage of the city of Cape Town, involving an expenditure of £300,000. Mr. Olive returns to the Cape in August.

On Saturday last, by kind permission of Mr. Edward Parry, of Nottingham, the staff of the borough engineer and surveyor of Leicester, and the members of the Leicester Society of Architects, were conveyed over the section of the new Great Central Railway from Aylestone to East Leake and back, by engine and waggons placed at their disposal by the contractor, Mr. H. Lovatt. The resident engineer, Mr. G. B. Chalcraft, accompanied the party and gave a description of the works. On the motion of Mr. Alderman Sawday, seconded by Mr. E. George Mawley, a hearty vote of thanks was accorded Mr. Chalcraft and Mr. Lovatt for the pleasure afforded.

At the Warrington Town Hall, on Friday, Mr. Herbert W. Longdin was presented with a gold watch, subscribed for by the officials of the corporation and friends. Mr. Longdin, it may be mentioned, is leaving the town to take up the duties of assistant surveyor to the Heston and Isleworth Urban District Council. The mayor, in making the presentation, spoke in eulogistic terms of the professional capabilities of Mr. Longdin and of the valuable services rendered by him to the corporation. He and the whole of the members of the corporation could not help regretting that they were losing the services of so valuable an official. They at the same time wished him every success in his new sphere.

The mayor of Gloucester presided over an interesting ceremony last week, when Mr. H. J. Weaver, the assistant city surveyor, was presented with a handsome eight-day clock, bearing the following inscription: "Presented to Mr. H. J. Weaver by members of the corporation, officials and staff of the city of Gloucester, on his appointment as borough engineer of King's Lynn." The mayor, in the course of an address, congratulated Mr. Weaver upon his new appointment, and also upon his pluck and perseverance in endeavouring to improve his position. He (the mayor) did not believe in young men sticking to one post or in one office all their days, waiting for the shoes to drop off the older feet, so that they might drop into their shoes. They should keep looking around and see the advertisements which were from time to time inserted in the newspapers which were especially adapted for their work, and so benefit themselves.

We much regret to announce the death of Mr. Hudson Reah, who for the past twenty years has filled the important position of borough surveyor and water engineer to the Preston Corporation. Mr. Reah, we learn, returned from the Isle of Man on Friday, and proceeded immediately to Alston. After tea, at his residence, Garstang-road, he complained of feeling unwell, and at 8 o'clock he had a paralytic seizure, from which death resulted about 10.30 on Saturday night. Mr. Reah, previous to being appointed borough surveyor of Preston in 1878, held a similar office at Darlington. Here he succeeded Mr. R. N. Hunter, who resigned on commencing business in the town. Mr. Reah was appointed at the same time that Mr. Hamer was chosen town clerk. The deceased gentleman carried out with great ability some very important works, the chief being the construction of a sewage farm at Freckleton, which cost about £130,000, and at the time of his death he was supervising works at Alston in connection with the extension of the Preston water supply by the building of a large reservoir. This latter undertaking, it is expected, will also cost over £100,000. The responsibilities of directing the expenditure of such large amounts Mr. Reah discharged with abilities which quite justified the choice of the council in selecting him, and his sudden death has brought forth expressions of regret from all hands. Mr. Reah, who was fifty-eight years of age, leaves a widow, a son and several daughters.

NEW OPEN SPACE FOR EAST HAM.

OPENING OF THE CENTRAL PARK.

On Tuesday, the 5th inst., Councillor Knight, J.P., chairman of the East Ham Urban District Council, performed the ceremony of opening the new Central Park in White Horse-lane. The following are a few particulars with respect to the park: In 1896 the district council purchased 17 acres of freehold land, with Ranelagh House and various buildings, from Colonel Burgess, for £8,500. Part of the land was pasture and part arable—some of the latter being held on lease with other land by Mr. W. Hollington, and a small part with a barn by Mr. J. G. Hollington. In one case the lease expired a few months ago, and in the other it happened that the barn was burnt down, and, as it was no longer needed, an arrangement was made to divide the insurance money and take possession of the land. Subsequently Colonel Burgess proposed to develop the adjoining land for building purposes, and it was thought desirable to acquire, if possible, further land for the park while it was to be had, and negotiations for that purpose resulted in the council purchasing from Colonel Burgess 8 acres more for £4,000, making the area of the park 25 acres and the total cost of the land £12,500. The shape of the land adapts itself to useful development, and the plans for laying it out, prepared by the council's surveyor, Mr. W. H. Savage, provide for a large area of grass, where cricket, football and other games can be played, besides affording full scope for the children. A corner for young children is to be set apart. There will be four entrances, so as to provide for the several parts of the ward. The whole of the northern boundary is to be laid out as flower gardens, facing the south—the whole length of the walks thereto being nearly 1 mile, and in the midst of this there is to be a handsome band-stand, surrounded by a large circular open space, planted with acacias, where people can be seated to hear the music. Near this a shelter is to be provided. The total length of roads and walks is very considerable. The plans also provide for an open-air bath, 90 ft. by 30 ft., properly screened; the erection of a lodge for the gardener, greenhouse and frames, and the fencing of the site. The total estimated cost of the work mentioned is £4,200. The Local Government Board have sanctioned loans for the purchase of the land and for laying-out, &c. The latter work was only commenced a few months ago, and so far as it has progressed has cost £1,675, and there is every reason to expect that the amount provided will not be exceeded.

Councillor KNIGHT, in declaring the park open for the public for ever, said that one parish in which his work laid, with a population of 70,000 (about the same as East Ham), had not a square foot of ground belonging to the people, and what was more, could not get it. East Ham, with its 3,500 acres, had acres and acres of open spaces, yet Lime-house, with 5,000 acres, had not a foot, and it could not be disputed that futurity would thank the East Ham Council for taking steps to secure these open spaces for healthful purposes.

Lord TEYNHAM, deputy-chairman of the Metropolitan Public Gardens Association, proposed, on behalf of the public, a vote of thanks to the district council for acquiring the park, and this was carried.

Councillor MURRY proposed a vote of thanks to the surveyor and his assistants, including the workmen. In their surveyor, he said, they had a good officer, and the acquisition of this land was a pet scheme of his. He had also shown good judgment in the laying-out of the grounds and in the smartness with which they had been got ready, yet his other work had not been neglected.

The vote having been carried,

Mr. SAVAGE, the surveyor, thanked them sincerely on behalf of himself and his ever-ready and willing assistants, Messrs. O. Anstead and J. E. Birch. A lock round would show that the gardens were a credit to the gardener, Mr. Lucas. The workmen also had evidently given a fair day's work for a fair day's money. Among his multifarious duties nothing had given him greater pleasure than the acquisition of open spaces in the neighbourhood, and they were all pleased that Lord Teynham had that day honoured them with his presence and encouraged them in their work. They all knew and recognised the great and good work done by the Metropolitan Gardens Association in and around London, thus transforming London, once so ugly, into one of the handsomest cities in the world.

A number of other votes of thanks were passed and the proceedings concluded.

Lead-lined Iron Pipes.—In the letter we published last week with the above heading the patentees' names should have been Brighton & Vennart, not Brighton & Jennings as printed. The works are at Cremorne Wharf, Lots-road, Chelsea, S.W., 55 Chancery-lane being merely the registered offices of the company.

An Award.—Messrs. Joseph Place & Sons, Limited, the well-known sanitary pipe, glazed brick and fire brick manufacturers, have, we understand, been awarded the first prize (a silver medal) at the Royal Lancashire Agricultural Show in the competition open to all England for the best collection of feeding-troughs for cattle.

SOME RECENT PUBLICATIONS.

SOME PERIODICALS.

The July number of *The Architectural Review* (1s.) has, as usual, some special features of remarkable excellence. The coloured chromotype supplement plate illustrating the open-air pulpit at Vitre, Brittany, is a highly artistic production. There is also a sixteen-page supplement constituting the third series illustrative of architecture and design at the Royal Academy. Mention should also be made of the admirable supplement portrait of the late Sir E. Burne-Jones. Among other articles, not only dealt with by able writers but well and profusely illustrated, we may mention "Fountains and Water Treatment," "The Church of St. Mary-the-Virgin, Oxford," "Abyssinian Churches" and "The Life and Work of Welby Pugin."—The July issue of *Cassier's Magazine*, like that of the previous month, cannot be commended to the notice of our readers as being strong in subjects of municipal engineering interest, the entire issue being given up to articles on battleships and the other forms of tremendous war engines which constitute the modern navy. At present everyone is more or less interested in the subject, especially as recent operations in Cuba and the Philippines will probably compel experts to modify considerably a good many of the opinions hitherto held.—In *Brick* (Chicago) for July we observe an illustrated article on sewer-pipe joints in England, in the course of which descriptions are given of all the well-known patents of this class, such as the Stanford joint, Doulton's joint, Hassall's double-lined joint, Green's "turn-invert" pipe joint, Button's "secure" joint, Sykes' patent joint, Place's "lock" joint, Ames & Crosta's joint and others. Another article gives an interesting account of the extensive sewer-pipe works and potteries of Red Wing, Minnesota, and there is, of course, the usual variety of current information in regard to the great brick industry of the United States.—In *Daily's* (1s.) for July a good deal of attention is given to cricket, as is only natural at this time of year. The customary portrait and biography is that of the Hon. Alfred Lyttleton, M.P., who in his time was one of the very finest exponents of the game. Other articles deal with jockeying, fishing, the turf in various aspects, and other branches of field sports.—In *Knowledge* for July (6d.) articles on "The Karkinkosok, or World of Crustacea," "A Classic Legacy of Agriculture," "The Petroleum Industry" and "Botanical Studies" are continued, and there is the usual well-illustrated treatment of other scientific subjects.—The July number of the *American Monthly Review of Reviews* (New York) is naturally very much monopolised by the war, and municipal questions are, for once, conspicuous by their entire absence. There are appreciative notices of Mr. Gladstone, and some cordial reference to the better feeling and understanding which have been growing up of late between England and the United States.—Our American contemporary, *The Sanitarian* (New York), is more medical than engineering, but is full of interesting reading to those who follow the sanitary developments of the day.—From Messrs. Cassell & Co., Limited, we have received *Clews* (6d.) and *Work* (6d.). Among other subjects dealt with in the latter we observe electro-magnets, foundry core-boxes, perspective drawing, photographic lenses and weighing machines.—*The Quarry* (6d.) has an able editorial on the new state of affairs with regard to compensation to workmen, and there is an interesting illustrated description of the celebrated Cleo Hill quarries in Shropshire.—*The Builders' Merchant* has much useful matter within the province with which it deals.—We have also received *The Indian Engineer, Building Industries* (Glasgow, 6d.), *The Sanitary Inspector's Journal* (6d.), *The Journal of the Society of the Estate Clerks of Works*, *The Analyst* (1s.) and *The Surveyor* (Sydney).

SOUTHPORT GASWORKS.

A YEAR'S RESULTS.

Mr. John Booth, manager of the Southport Corporation gasworks, stated, in his report for the year ended March 31st, submitted at a meeting of the town council last week, that the total quantity of gas made during the year was 365,694,000 cubic feet, or a decrease of 0.2 per cent. as compared with the previous year. This is only the second time during the period of forty-eight years over which the history of the works extends that there has been a falling off in the make of gas, and it is attributed to the substitution of the electric light for gas for private lighting and to the mildness of the winter months. The revenue from gas sold for purposes other than lighting had increased by £2,677, but this gas had been sold at practically cost price, and in view of the decreased consumption of profitable gas it had not been possible to maintain the profits of previous years. Compared with 1896-7, the nett profit for the year showed a decrease of £2,322 15s. 2d. Among the causes of the falling off there were mentioned the abolition of meter rents (equal to about £1,300 per annum), the large expenditure out of revenue for the relaying and enlargement of mains, and the falling off in revenue from residuals. Having regard to these circumstances, Mr. Booth expressed the opinion that the results of the year's working must be considered satisfactory.

THE TELEPHONE SERVICE.

Another meeting of the Select Committee of the House of Commons appointed to inquire into the working of the telephone service was held on Friday, under the presidency of Mr. Hanbury.

Mr. JAMES STAATS FORBES, chairman of the National Telephone Company, was called. He stated that before he signed the 1892 agreement he had a verbal promise given him by Mr. Goschen and Sir James Ferguson, and later on by Mr. Arnold Morley, that the right accorded to the Post Office by the agreement to grant competing licenses would only be used in the event of the company so conducting itself as to make competition a necessity. There was, however, no record of this important verbal agreement. As to the company, they were free to compete with the Post Office when and where they like. Thus if a new telephone area were created, and the postal authorities decided to establish an exchange of their own, the company would not be debarred from competing in that area. When the 1892 agreement was signed it was also verbally understood that the company should buy up all the existing licenses, and so leave the Post Office with only one telephone authority to deal with when the licenses expired in 1911. With regard to the suggestion that the company were in the habit of accordng preferential treatment to certain of their subscribers, Mr. Forbes said that they possessed a free hand to do as they wished in the matter. They were a commercial company, and this was one of the weapons with which they might have to fight. They had never exercised this power, still they proposed to reserve all their rights, as cases might arise when the exercise of them would be necessary. The company would, however, be prepared to enter into an undertaking to supply every reputable applicant able to give proper security with a telephone, providing that a similar obligation was imposed on any competitor they might be called upon to face. The company were in the habit of compelling all their subscribers to enter into an agreement to allow the company to erect wires over their houses. This was a necessity, especially in face of the fact that some corporations refused way-leaves over or under public roads. If sufficient compensation were given them, however, they might be induced to give up this plan. He also reminded the committee that local authorities possessed certain powers with regard to the breaking up of streets, which the company did not, and could not obtain. He thought that if competition were allowed, these rights should be accorded to the National Company.

The committee met again on Tuesday.

Mr. FORBES confirmed a previous statement that the company would not have entered into the temporary agreement of 1892 unless they had received an assurance that the Postmaster-General would consider any reasonable proposition the company made in regard to the extension of areas. The question of competition in areas was another vital point. He would not say that he objected to the granting of licenses to municipalities on the ground that it would be a breach of faith on the part of the Government; it would not be consistent with equity. Replying to other questions, Mr. Forbes said he was strongly opposed to competition in the interests of the public. He believed the Post Office were the only body who could give an effective service to the country, and personally he should be opposed to giving powers to municipalities to set up such a service. In 1904 the Government would probably be forced to come to terms of some kind with the National Company, or to take over the whole concern or to compete, although he should be sorry to see that course adopted, because to have two separate systems in the same area would be a great waste of energy and cause great inconvenience to the telephone subscribers, half of whom would be in one service and half in another.

THE SANITARY INSTITUTE.

EXAMINATIONS AT CARDIFF.

At an examination in practical sanitary science, held in Cardiff, on the 8th and 9th inst., the following two candidates presented themselves and were granted certificates: Mr. J. E. Jarvis, 14 Lipson-vaie, Plymouth, and Mr. W. J. Tamlyn, The Parade, Minehead, Somerset. The following were the questions set for answer in writing:

- (1) Define motion, velocity, force, matter and pressure.
- (2) What is the action of waters of varying composition on lead pipes? What is the best method of dealing with the distribution of water known to take up lead? What quantity of lead in water is considered objectionable? And how would you ascertain its presence? (3) Define the expression "degrees of hardness," as applied to potable waters. How would you estimate the hardness of water? (4) What considerations would govern your selection of a site for an in-pounding reservoir in a mountainous district? How would you proceed to ascertain the quantity of water available for supply? (5) What are the constituents of Portland cement, and from what does it derive its hydraulicity? What is the setting of the cement due to? How would you proceed to test a sample of cement? (6) Under what conditions is carbon-monoxide gas sometimes found in the air of inhabited places? What is known about the physiological effects of

this gas on human beings? (7) What process would you recommend for dealing with the sewage from an ordinary town previous to its discharge into a brook, the flow of which is twenty times that of the dry-weather flow of the sewage? (8) Give the substance of the London County Council by-laws in reference to the construction of new water-closets. How far do the same by-laws apply to the alteration of existing water closets?

At an examination for sanitary inspectors, held on the same days, forty candidates presented themselves, and thirty were certified, as regards their sanitary knowledge, competent to discharge the duties of inspectors of nuisances. The following were the questions set for answer in writing:

- (1) Define a "canal boat." State when such boats may be used as dwellings, and give the usual regulations applicable to them. (2) What powers have sanitary authorities for regulating dairies and cowsheds? State briefly the provisions of the regulations usually enforced. (3) What head of water is sufficient for testing stoneware socket-jointed pipes and what time should elapse between making the joint (Portland cement) and applying the test? (4) Give detailed directions for disinfecting the surfaces of a room, with an area of 2,500 cubic feet, by means of (a) a liquid disinfectant, and (b) a gaseous disinfectant. (5) Describe the method you would use, and the instruments you would employ, if asked to make a complete and detailed report upon an ordinary house as to (a) the ventilation, (b) the drainage, (c) the sanitary appliances, and (d) the general sanitary condition. (6) What are the nuisances that are likely to arise from the carrying on of the business of a fat melter? How may they be obviated? (7) State the relative advantages and disadvantages of a combined and separate system of dealing with the sewage and rainfall of an urban district. (8) What statutory provisions relating to an adequate pure supply of water to premises are in force (a) under the Public Health Act, 1875, and (b) under the Public Health (London) Act, 1891?

SEWAGE DISPOSAL IN DARWEN.

Recently, at a meeting of the General Purposes Committee of the Darwen Corporation, a letter was read from the Local Government Board with reference to the report made by their inspector, General Crozier, after the inquiry held by him with regard to the application of the town council for sanction to borrow £6,670 for a refuse destructor and £2,500 for works of sewage and sewerage disposal, and complaining of departures from the original scheme at the sewage works without their consent. The letter also states that the board will not be prepared to further consider the application now before them until they have been furnished with an undertaking, in the form of a resolution, that, in addition to the system of chemical treatment and artificial filtration of the sewage adopted, the land at the sewage works will be used as originally intended. Further, the board will not be prepared to agree to the omission of sludge-presses unless they are satisfied that other suitable means for the disposal of the sludge will be adopted. The committee resolved that application be made to the board that they approve of coke filters, and it was respectfully submitted that in five out of twelve filters where coke had been used it had proved as effective as pulurite. With regard to sludge presses, the council had under consideration the question of deciding on suitable means for disposing of the sewage, and for that purpose are making experiments, and in due course a scheme will be submitted to the board. The town council further undertake that the whole of the 17 acres of land available shall be prepared, and at all times utilised for the treatment of the sewage effluent by downward filtration, and for this purpose the borough engineer be directed to prepare plans of estimate, with a view to applying to the board for their sanction to borrow the amount required.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

BOROUGH ENGINEER.—July 22nd.—Corporation of Pietermaritzburg, Natal, South Africa. £800.—Messrs. Ford Brothers, 14 Southampton-street, Fitzroy-square, London, W.

ASSISTANT BUILDINGS INSPECTOR.—July 23rd.—Corporation of Bournemouth. £104.—Mr. F. W. Lacey, M.I.C.E., borough engineer and surveyor.

YARD FOREMAN AND STOREKEEPER.—July 23rd.—Vestry of St. Matthew, Bethnal Green. £2.—Mr. F. W. Barratt, surveyor to the vestry.

BOROUGH ENGINEER AND SURVEYOR'S ASSISTANT.—July 23rd.—Corporation of Warrington. £100.—Mr. Thomas Longdin, borough engineer and surveyor.

SURVEYOR, INSPECTOR OF NUISANCES AND NEW BUILDINGS.—July 25th.—Birkenshaw Urban District Council. £60.—Mr. W. Haigh, J.E., chairman of the council.

ASSISTANT PLUMBING INSPECTOR.—July 25th.—Corporation of Birmingham.—Mr. E. Antouy Lees, secretary to the Water Committee, 44 Broad-street, Birmingham.

ASSISTANT SURVEYOR AND INSPECTOR OF NUISANCES.—July 26th.—Uxbridge Rural District Council. £75.—Mr. Charles Woodbridge, clerk to the council.

SEWAGE WORKS MANAGER.—July 27th.—Yendon Urban District Council.—Mr. Clifton Lund, surveyor to the council.

JUNIOR ASSISTANT SURVEYOR.—July 27th.—County Borough of Middlesbrough. £80.—Mr. Frank Baker, borough engineer.

BUILDING INSPECTOR.—July 27th.—County Borough of Middlesbrough.—Mr. Frank Baker, borough engineer.

COUNTY SURVEYOR.—August 1st.—Herefordshire County Council. £100.—The County Clerk, Shirehall, Hereford.

BOROUGH ENGINEER AND SURVEYOR'S ASSISTANT.—August 1st.—Corporation of Warrington. £100.—Mr. Thos. Longdin, borough engineer and surveyor.

SURVEYOR AND INSPECTOR OF NUISANCES.—August 1st.—Shildon and East Thirkley Urban District Council. £120.—Mr. J. T. Proud, clerk to the council.

SUPERINTENDENT OF HOUSE REFUSE REMOVAL.—August 1st.—Handsworth Urban District Council. £2 5s.—Mr. E. Kenworthy, A.M.I.C.E., surveyor to the council.

ASSISTANT INSPECTOR OF NUISANCES, WATER INSPECTOR AND SURVEYOR.—August 5th.—Conway Rural District Council. £100.—Mr. T. E. Parry, clerk to the council.

CITY ENGINEER.—August 31st.—Corporation of Wellington, New Zealand. £800.—Agent-General for New Zealand, London.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

BEIGHOR.—July 22nd.—Supply of 5,000 ft. of 6-in. granite edge kerb, 250 tons of granite pavers, and 5,000 tons of granite spalls.—Mr. Francis J. C. May, A.M.I.C.E., borough engineer and surveyor.

SOUTH SHIELDS.—July 22nd.—Laying of 185 lineal yards of double line of steel-girder tramway.—Mr. S. S. Burgess, A.M.I.C.E., borough engineer.

MIDDEAST.—July 23rd.—Supply of disinfectants, for the rural district council.—Mr. Edward Albery, clerk to the council.

COLCHE.—July 23rd.—Erection of technical schools and a public library in Albert-road.—Mr. Alfred Varley, town clerk.

LEWES.—July 23rd.—Supply of 500 tons of 2-in. broken blue Guernsey, Cherbourg or Belgian granite, 100 tons of coarse granite screenings, 650 tons of broken surface-picked flints and 150 tons of Piddinghoe gravel.—Mr. Montague S. Bicker, town clerk.

LESLINGTON.—July 23rd.—Supply of eleven water-vans, four water-carts, forty-five sets of trunks and distributors for water-vans, thirty-five dust-vans and five sweeping machines.—Mr. J. Patten Barber, vestry surveyor.

CHELTENHAM.—July 25th.—Supply of stoneware pipes and cement for twelve months.—Mr. E. T. Brydges, town clerk.

NEWCASTLE.—July 25th.—Construction of filter-bed tanks and the laying and fixing of mains and other ironwork at the pumping station, Stockingford, for the urban district council.—Mr. J. S. Pickering, A.M.I.C.E., waterworks engineer.

MOLEY.—July 25th.—Leveling, paving, kerbing and flagging of 4½-acre, Woodworth-square and Charles-street.—Mr. W. E. Putnam, A.M.I.C.E., borough engineer and surveyor.

SOUTHEND-ON-SEA.—July 25th.—Making-up of Manor-road, Seaford-road, Clifton Drive, Station-road and Elmer-avenue.—Mr. Alfred Fidler, A.M.I.C.E., borough surveyor.

CLERKENWELL.—July 25th.—Paving of a portion of the footway of Colney Hatch-lane with tar paving, for the vestry.—Mr. R. E. Paget, clerk to the vestry.

CHESHUNT.—July 25th.—Supply of six complete suits of firemen's uniform, for the urban district council.—Mr. S. Towilson, A.M.I.C.E., surveyor to the council.

EXMOUTH.—July 26th.—Laying of about 1,850 ft. run of granite kerb in Park-road and Park-avenue, and 980 ft. run in Bury-street; about 365 yards super. of channelling and crossings in Park-road and Park-avenue; about 692 yards super. of asphalt in Park-road; about 704 yards super. of 4-in. indicated concrete slab paving in Park-avenue; and about 1,904 yards super. of 2-in. patent Victoria stone paving in Bury-street, for the urban district council.—Mr. G. Eades Echus, M.I.C.E., surveyor to the council.

CHESHUNT.—July 26th.—Construction of about 1,200 ft. of 4ft. diameter brick culvert, the laying of 2,300 ft. of granite kerb in Windmill-lane, and kerbing works in Park-lane and Eleonor-road, for the urban district council.—Mr. S. Towilson, A.M.I.C.E., surveyor to the council.

WILLESDEN.—July 26th.—Road-making and paving works in Pine-road, Cricklewood; Burrows-road, Kensal Rise; Harlesten-gardens, Harlesten, and West Ella-road, Harlesten, for the urban district council.—Mr. O. Claude Robson, M.I.C.E., engineer to the council.

HAYWARDS HEATH.—July 26th.—Supply of about 825 tons of granite, 6 tons of granite chippings and 60 tons of coarse gravel, for the urban district council.—Mr. Edward Waugh, clerk to the council.

RYE.—July 26th.—Sea defence works on the east foreshore, for the urban district council.—Mr. Arthur Bowlands, clerk to the council.

HULL.—July 26th.—Supply of east-iron spigot and socket pipes and irregulars required during the year ending August 31, 1898.—Mr. F. J. Bancroft, gas and water engineer, Town Hall, Hull.

WEST HAM.—July 26th.—Construction of about 1,200 lineal yards of sewers, 7 ft., 6 ft. and 3 ft. 6 in. diameter.—Mr. Lewis Angell, borough surveyor.

WEST HAM.—July 26th.—Making-up of Freeman-lane-road, Haslemere-road, New-street (Plaistow) and Old-street (Plaistow).—Mr. Lewis Angell, borough surveyor.

ICEWORK.—July 26th.—Construction of main sewers and outfall works for the township of Hule, for the rural district council.—Mr. Geo. Leigh, clerk to the council.

WEST HAM.—July 26th.—Erection of twenty-nine working-class dwellings in Hermit-road, Plaistow.—Mr. Lewis Angell, borough surveyor.

ADAMS' PATENT SEWAGE LIFT CO. ENGINEERS, YORK And Old Queen St., Westminster, London.

ABSOLUTELY AUTOMATIC SEWAGE LIFTING

(i.e., NO ENGINE is required and no attention),

The FIRST COST of Installation being the ONLY Cost.

AS USED AT

Grimshy, Glasgow, Echester, Hoylake, Johnstone, &c., &c., and many other towns in England, on the Continent, and the United States.

WRITE FOR TESTIMONIALS.

PATENT TRUINVERT PIPE.

To put it shortly, this pipe secures true alignment of invert, increased strength in the socket, three gas and water-tight connections at every joint, and, while allowing for a slight settlement when first laid, forms an absolutely rigid joint directly the cement sets.

POINTS:

- 1.—Gas and Water-Tight Joints easily made under water.
2.—True Alignment of Invert.
3.—Socket the strongest part of the pipe.
4.—No special junctions required.

AA—Holes for pouring in cement or composition.
BB—Strengthened and Lengthened Socket.

CC—Inner Socket and Rest.
EE—Chamber for cement or composition.
FF—Stanford Joint in new position.

OATES & GREEN, Ltd., Halifax.

REIGATE.—For the execution of certain paving works.—Mr. Clair J. Grece, town clerk:—

The Committee require the services of a competent Clerk of Works, to supervise the above drainage work.

It is essential that the candidate should be intimately acquainted and have had a considerable experience in seeing large systems of domestic drainage work carried out.

Applications, stating age, qualifications, works carried out and salary required, together with copies of three recent testimonials, to be sent to me not later than Saturday, July 30th next.

JOHN LITTLE,
Sanitary Engineer.

Viaduct Chambers, Carlisle.
July 16, 1898.

HEREFORDSHIRE COUNTY COUNCIL. COUNTY SURVEYOR.

The Roads and Bridges Committee of the above Council are prepared to receive applications for the office of County Surveyor, which must be lodged with the Clerk of the Council by the 1st August. The person appointed (who must not be more than forty years of age) will be required to devote his whole time to the duties, and to supervise county buildings, bridges and about 500 miles of main road, at present repaired by highway authorities under contract. Salary, £400, to include travelling expenses. An office provided.

Particulars as to duties, &c., will be forwarded on application to the Clerk to the Council, Shirehall, Hereford.

Canvassing members of the Committee or Council will be considered a disqualification.

COUNTY BOROUGH OF MIDDLESBROUGH.

The Streets Committee are prepared to receive applications for the position of Junior Assistant in the Borough Surveyor's department.

Applicants must have had some experience in surveying, levelling, architectural drawing and the working of the Model By-Laws. Salary, £80 per annum.

Also for the position of Building Inspector.

Applicants must have had some experience in the carrying out of the Model By-Laws of the Local Government Board.

Applications for each appointment, stating age, experience,

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

- Easily and quickly laid by unskilled workmen.
- Perfect alignment of invert secured.
- Joint readily made absolutely watertight.
- Cheapest Patent Joint in the market.

ARCHITECTURAL ASSISTANT.—Required, a competent Architectural Assistant, with good knowledge of ironwork, construction, details, quantities and estimates, for the surveyor's office in a county borough. Salary, £120 a year.—Applications, stating age, qualifications, references, &c., accompanied by copies of not more than three recent testimonials, to be sent in at once, addressed Box 78, Office of THE SURVEYOR, 21 Bride-lane, Fleet-street, E.C.

TENDERS WANTED.

SLOUGH URBAN DISTRICT COUNCIL. STREET WORKS.

The above Council are prepared to receive tenders for Making-up the Streets known as Chalvey Vale (under the Private Streets Works Act, 1892), consisting of about 1,200 yards of Kerbing and Channelling, 2,200 super. yards Footway and 4,400 super. yards of Flint Roadway, &c.

Plans, sections and amended specification may be seen, and schedule of quantities obtained, at the office of the Surveyor to the Council, No. 1 Mackenzie-street, Slough, between the hours of 10 a.m. and 1 p.m., upon payment of a deposit of 1 guinea, which will be returned on the receipt of a *file* tender on the prescribed form.

Tenders, addressed to the "Chairman of the Council," duly sealed, to be delivered at the Office of the Council, No. 1 Mackenzie-street, Slough, not later than Saturday, the 6th day of August next, endorsed "Street Works."

JANDUS PATENT ELECTRIC ARC LAMP.

Gold Medal, Hull Exhibition, 1898.

It is claimed that the Master Patents held by the Jandus Arc Lamp and Electric Company, control the arrangements which are essential in every successful enclosed arc lamp.

The Only Lamp that is trimmed without moving the Globe.

Cannot get Out of Order, as it has Only One Working Part.

No other Carbons should be used in the Jandus Lamp except those supplied by the Firm, for which the Lamps sent out are adjusted.

JANDUS ENCLOSED ARC LAMP.

Burns 150 to 200 Hours without re-trimming.

No hissing. No danger from falling particles of Carbon.

No skilled labor required. A steady light. A great saving in cost of Carbons. Gives the same useful light as the open arc lamp for the same expenditure of power.

No flimsy racks, clockwork, or flexible cords are used in this lamp. Burns singly on circuits of 90 to 200 volts, 2 in series on all voltages from 200 to 250, and 3 or more in series if fitted with automatic cutout.

THE ENCLOSED ARC LAMP. THE ENCLOSED ARC LAMP THE ENCLOSED ARC LAMP. THE ENCLOSED ARC LAMP

The phenomenal success of the Jandus Lamp, which was the Pioneer in enclosed Arc Lamps, has brought a host of imitations. Users should not be put off with the cheaper lamps.

July, 1898.

ALDERSHOT URBAN DISTRICT COUNCIL. TO ROAD CONTRACTORS AND OTHERS.

The Aldershot Urban District Council are prepared to receive tenders for the Metalling, Kerbing, Channelling, Paving, &c., of the following new streets:—

St. Michael's-road,
St. George's-road,
St. Joseph's-road.

Plans and specifications may be seen, and forms of tender obtained, by applying at the office of the Surveyor to the Council, No. 126 Victoria-road, Aldershot.

Sureties will be required.
Tenders, endorsed "Tenders for New Streets," are to be delivered in a sealed envelope at my office not later than 9 a.m. on Wednesday, the 3rd day of August next.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
W. E. FOSTER,
Clerk to the Council.

126 Victoria-road.
July 12, 1898.

WANDSWORTH DISTRICT BOARD OF WORKS.

TO WOOD PAVING CONTRACTORS AND OTHERS.
The Board of Works for the Wandsworth District are prepared to receive tenders for providing and laying, complete, in Upper Richmond-road, Putney, about 14,000 superficial yards of Wood Block Paving (creosoted deal) on 6 in. of cement concrete, including the breaking-up and carting to the parish depot (a distance of under 1 mile) of the present macadam and all superfluous earth and rubbish.

The specification and plan may be seen, and forms of tender obtained, at the Surveyor's office, No. 153 High-street, Putney, S.W., between the hours of 10 and 4 (Saturdays, 10 till 1).

Tenders are to be delivered, under seal, at the offices of the Board, East-hill, Wandsworth, endorsed "Wood Paving," on or before Tuesday, August 2nd next, and must contain the names and addresses of two responsible persons to join the contractor in a contract for the due execution thereof.

No tender will be received unless it is made upon one of the printed forms provided for the purpose.

The Board do not plodge themselves to accept the lowest or any tender.

(By order of the Board of Works for the Wandsworth District)

HENRY GEORGE HILLS,
Clerk to the Board.

East-hill, Wandsworth, S.W.
July 20, 1898.

BOROUGH OF SOUTHEND-ON-SEA. TO ROAD CONTRACTORS AND OTHERS.

The Corporation invite tenders for Street Works in the making-up of the following streets:—

Manor-road, }
Seaforth-road, } West Cliff.

Minutes of Proceedings.

Protection of Water Supplies.

The withdrawal by Mr. Chaplin of the clauses which had been prepared by the Local Government Board with the object of securing the protection of sources of water supply, and of punishing companies who failed to exercise the powers conferred upon them by Parliament to provide a constant supply of pure and wholesome water within the areas they undertake to serve, may be accepted as an indication that the Government do not contemplate any action in the matter during the present session. The purpose which the president of the Local Government Board had in view was in every respect commendable, but, as we pointed out in these columns some weeks ago, the method by which he proposed to proceed was open to very damaging criticism. As a matter of fact, the objections raised, although not insurmountable, were so strong and so very generally expressed—not openly, of course, but through the channels which are invariably used when Ministers desire to test the opinion of Parliament upon a question before it comes up for debate—that it was considered advisable to proceed no further with the clauses. The method of procedure was unquestionably bad. The Bill selected for bringing the question before the House—the Higham and Hundred of Hoo Water Bill—was of the simplest possible character, consisting of some five clauses only, devised to amend a previous Act of the company, but not to confer additional powers of any kind. The clauses submitted by the President of the Local Government Board were, on the other hand, of a far-reaching character, affecting an infinite variety of interests. The little company had probably failed in its duty, but not to a greater extent than scores of other companies had done in various parts of the country. Why, therefore, should it be selected for punishment, while larger and more powerful offenders were allowed to go scot-free? No reason could be advanced. It looked as if the company had been selected by reason of its very weakness. The clauses were to be inserted in all water Bills that came hereafter before the House. This would undoubtedly have provided the public with safeguards for the future, but against the companies that had already got their powers there was no remedy whatever. It might be assumed that in course of time every company would come to Parliament at one period or another for additional powers, and thus be brought within the scope of the new provisions, but could any process be slower, more clumsy and ineffectual? Surely the proper, regular and equitable course would have been to introduce a public Act to amend the Waterworks Clauses Act.

Strong as these objections were, they by no means exhausted the indictment against the clauses. Serious questions of principle, public policy and Parliamentary procedure were raised. The clauses were in direct contravention of the principle acted upon every session by the House of Commons in appoint-

ing the Select Committee on Police and Sanitary Regulations. That principle is that no amendment of the general law shall be allowed by a private Bill without previous inquiry by the committee with respect to the reasons which would justify the amendment and the conditions under which it should be allowed to take place. This, of course, struck the weak spot in the proposed method of procedure. No argument could be adduced in support of inserting the clauses in the particular Bill chosen which would not apply with much greater force to every water company's undertaking in the kingdom. Another weapon which the opponents to the clauses were able to handle effectively was that they were an attempt to override the decisions of the several select committees to whom the Higham and Hundred of Hoo and other water Bills of the session were referred. These committees, we may remark, had before them the recommendations of the Local Government Board upon which the clauses were based, but declined to adopt them for the reason that they were in violation of the well-known and well-understood principle of Parliament which we have already explained. The clauses, moreover, were in themselves a serious breach of the Standing Orders of Parliament, and would have plunged the Bills affected into serious Standing Order difficulties during their future progress. The opponents did not forget to show that the clauses were illogical and capricious in application, inasmuch as while it was intended to bring them into operation in the case of one of the very smallest water companies—supplying a sparsely-populated rural district getting its supply from wells sunk upwards of 150 ft. in the chalk-beds of Kent, a supply which, although not so large as required, was reasonably pure—there were large undertakings, both in the metropolis and in the country, obtaining their water under conditions of great complexity, which involved risk of pollution, that would not be brought within the operation of the clauses until they happened to be promoting a Bill in Parliament, possibly a quarter of a century hence. The clauses were, furthermore, condemned as impracticable, ineffectual, vexatious and dangerous—impracticable and ineffectual because they did not ensure that the samples of water taken for purposes of analyses were the same as the water to be supplied to the consumer; vexatious and dangerous because they would lead to great conflict of jurisdiction between water companies and local authorities while conferring no commensurate benefit upon the consumer. The sampling of water for purposes of analysis raises the question of the much-debated Harrogate clause, which was objected to, in the case of several Bills this session, because of its sheer inefficiency. It provides for samples of water taken from the reservoirs being tested, whereas the filtration works of the company or local authority concerned are usually established, or to be established, to deal with the water after it has left the reservoir and before it reaches the con-

sumer. The consumer himself was not required to take a sample of water and submit it for analysis by a competent person.

The tribunal itself which was to impose the penalty was taken exception to as being incompetent to deal with matters of such a highly-specialised character. For that reason its decisions would fail to inspire confidence. Above and beyond this it was maintained that, while water supply companies and authorities were to be penalised for failure to provide a supply of pure and wholesome water, the failure itself might arise from circumstances entirely beyond their control, inasmuch as no power was given them to prevent the pollution of the sources over which they had no jurisdiction. These are all very weighty arguments, and we are ourselves inclined to doubt whether the clauses would not have had a tendency to weaken the sense of responsibility which medical officers of health now feel in the discharge of this most essential part of their functions. While every precaution ought certainly to be taken to see that water is kept free from pollution, it is manifestly undesirable that power should be placed in the hands of consumers, grossly ignorant in the majority of cases of technical details, to raise a scare as to the water supply of any particular place. The cases of Maidstone and King's Lynn are scandalous instances of the results of neglecting clear and obvious precautions, and they show the absolute necessity for Parliament stepping in and insisting with a strong hand that the public health shall be protected; but there is a danger which might become a very serious and damaging thing to a health resort were the feelings of an ignorant populace stirred up, possibly for some interested purpose, against a particular water service. A matter so delicate as the impeachment of the water supply ought only to be possible on the trained judgment of an expert and not by the expression of irresponsible opinion. By the withdrawal of Mr. Chaplin's clauses the way is clear for the introduction of a Bill next year to amend the Waterworks Clauses Act, and it is to be hoped that meanwhile the best advice will be sought in the framing of a measure which, while securing the object in view, will not be open to the objections which have proved fatal to the present proposals.

* * *

A Voice from the Local Government Board.

Not the least interesting item in the [last issue of *The Journal of State Medicine* is the report—apparently verbatim as regards some of the speeches—of the recent annual dinner of the Royal Institute of Public Health, of which somewhat pompously-named body our contemporary, whose title, consistently enough, is also of the high-sounding order, is the official organ. Our excuse for allowing some weeks to elapse before referring to this function is that those who control the affairs of the institute seem to be somewhat chary of issuing invitations to the Press apart from the big dailies, none of which, so far as we are aware, reported the proceedings at any length. Our reason for referring to the matter at all is to be found in the fact that the institute had secured the presence of the Parliamentary Secretary to the Local Government Board, and Mr. T. W. Russell not only spoke at considerable length, but explained with tolerable clearness the attitude of the Local Government Board with regard to one or two important and troublesome questions of local government. For this many people will be duly grateful, and we therefore consider it desirable to bring the right honourable gentleman's remarks to the attention of our readers, who might otherwise have remained in ignorance of something which they will no doubt be glad to know. We wish to explain, however, that by the foregoing remark we have no intention of suggesting that the perusal of the *Journal of State Medicine* is confined to those connected with the body of which it is the official organ, but that is by the way. No branch of municipal and sanitary en-

gineering is more important than water supply. Thus Mr. T. W. Russell, as reported—

They had the misfortune in Maidstone to have a serious epidemic, by which a number of lives—he could not say precisely how many—were lost. So far as anything could be proved in this world—though it had been held to be open to dispute whether Napoleon Bonaparte ever existed—it was proved that that epidemic was due to the water supply. There had been similar epidemics in King's Lynn and other towns, all due to the same cause.

This declaration, coming as it does with all the weight of official position, is the more interesting from the fact that we have been assured, on more or less competent authority, that the Maidstone epidemic was chiefly, if not wholly, due to defective drainage and sewerage. That such sanitary defects will lower the vitality of a community and render the members of it more susceptible to an epidemic needs no demonstration at this time of day; but it is quite another thing to imply that but for the existence of the defects referred to there would have been no epidemic, and that the outbreak was not directly attributable to a polluted water supply. The presence of the specific virus of typhoid fever in the Maidstone water supply may not have been so conclusively proved as it might have been, but there was absolutely no question as to gross pollution of certain sources with organic matter of the most offensive character, and the probability is that when the bacteriological examination was made the specific pollution had passed away after having done its deadly work. Bacteriologists have still much to do, but one thing they have done—they have proved to demonstration the existence of specific microbes, though we hope they will be able by and by to tell us better what to do with them now that they have been found. It has also been proved with tolerable certainty that the typhoid bacillus is water-borne, and that, while it seems to find a congenial habitat in certain soils, especially polluted soils, there is no reason to believe that it can be transmitted aerially. Yet that is what the theory of defective drainage and sewerage comes to. Are we to assume, then, that bacteriology is unreliable in its methods and conclusions? Lowered vitality, resulting from insanitary conditions, is bound to make an epidemic worse than it would otherwise have been; but that remark would hold good of any infectious or contagious disease, and it by no means follows that the absence of such conditions would have prevented the Maidstone epidemic. If the virus of typhoid finds its way into a water supply, and there are no means of arresting it—and such means, in the shape of filters, for example, were notoriously absent at Maidstone—an outbreak is inevitable. It has been asserted that houses in which the sanitary arrangements were satisfactory escaped the disease; but that is a somewhat loose statement, the accuracy of which it would be very difficult to verify. Nor do we remember such an assertion in any of the responsible reports published in connection with the outbreak. On the other hand, it was recognised that the incidence of the epidemic corresponded closely with the part of the town served with water from the polluted sources, the remainder of the town practically escaping unless through secondary causes. Judging from the remarks of Mr. T. W. Russell, it is quite evident that the opponents of the water supply theory have not converted the Local Government Board. On another phase of the water supply question Mr. Russell is reported to have expressed himself thus:

The Local Government Board, a body which was pretty well abused, being in possession of the facts he had stated, thought that the opportunity arose this session, when no fewer than twenty-one Water Bills were before the House of Commons, of trying to do a stroke of business on behalf of the public health. The Board proposed to insert clauses in those Bills which would have helped to secure that the water to be supplied was pure water. But the House of Commons arose in its might, and the clauses had to be withdrawn. The House of Commons was all in favour of public health. It was all in favour of pure water, but it wanted to have the clauses in the shape of a public Bill, and the clauses had to

go. He fully believed that if the President of the Local Government Board were to introduce those identical clauses in a public Bill next session there would still be great opposition to them.

In a separate article we have endeavoured—not unsuccessfully we hope—to show that the House of Commons was quite justified in arising in its might and demanding the withdrawal of the clauses in the form in which they were introduced. It is not necessary to anticipate what will happen if the clauses are introduced in the form of a public Bill. When such a Bill has been actually rejected it will be time enough then to consider the position. Like Mr. Russell, we hope “that the question would be pressed, so that those who undertook to supply the public with pure water should carry out the undertaking.” Now for sewage disposal. In the reported words of Mr. Russell,—

It was a question of exceeding difficulty. Let them take the case of large towns like Manchester and Liverpool. This question had become the greatest problem they had to face. The responsible authorities of such towns had a tremendous interest in the public health of their localities, and the large towns approached the Local Government Board and asked privileges of it; but the board was bound by Act of Parliament, and gave them the stereotyped reply:—“Sewage must go through land.” The answer the board received was either that land was so costly that it became an intolerable tax, or that it could not be had at all, or that it was not suitable. That was an awkward position for a public authority, but it was the position of a large number of great towns at that moment. They went to the Local Government Board, therefore, and pleaded for alternative processes. The board being, as he had said, bound by Act of Parliament, had to take refuge, as every department had to do, in a Royal Commission.

Mr. Russell omitted to mention that the Royal Commission proceeds to sit *in camera*, a detail in regard to which we have already had occasion to express some opinions.

* * *

Urban District Councils and their Surveyors.

In another column we give some particulars of the common-sense and enlightened manner in which the Cirencester Urban District Council have recently dealt with the representations of their surveyor in regard to his duties and emoluments. Having filled the combined position of surveyor, sanitary inspector and rate collector since 1895, Mr. Hibbert naturally concluded that he was justified in asking for an increase of salary, and also thought the time appropriate for asking relief from a portion of his work, on the ground that his duties as surveyor and inspector had largely increased. The reasonable spirit in which the General Purposes Committee and the council generally approached the question is worthy of all praise, especially as such an attitude is by no means so common as could be desired. The first consideration was the manner in which the surveyor had acquitted himself in the past. From the report of the committee we learn that he had not only discharged his duties generally to the satisfaction of the committees, but had prepared plans of sewerage and drainage works, street improvement works and bath renovation, and had carried through, satisfactorily all of those works that had so far been executed. For the extra work undertaken in connection with the preparation of a new scheme of surface-water drainage a special fee was awarded. Though such considerations alone might justify an increase of salary, the committee were only doing their duty in inquiring as to the rates of remuneration in similar cases elsewhere. The result was a recommendation in favour of a substantial increase of salary, and the manner in which the committee and the council recognised the facts of the case is worthy of all praise, though we regret to observe that there were two dissentients, who, while admitting the surveyor's claims, would have reduced any recognition to such grudging limits as to make it worse than none at all. Not the least important of the council's decisions was that of relieving Mr. Hibbert of a portion of his duties by placing the col-

lection of the rates in other hands, having regard to heavier responsibilities owing to the transference of the waterworks, the increase of work generally, and the expected further increase through the execution of the surface-water drainage works. Of the wisdom and expediency of such a decision there can be no question. Unless under very exceptional circumstances the combination of the duties of rate collector with those of surveyor to a local authority is quite indefensible. There is no doubt, however, that the practice is much less common than formerly.

* * *

Sanitary Work in Cuba.

In speaking last week of the close connection between yellow fever and sanitation we remarked that among other forms of activity there was plenty of scope for sanitary engineering in Cuba if the towns and cities are to be made decently habitable. The fact that yellow fever and the various deadly malarial fevers prevail almost exclusively in the towns is too significant to permit of any but one conclusion. A recent writer, in dealing with the future of the island generally, has touched incidentally on the question of sanitation, particularly with reference to drainage and water supply. Such sewers as do exist are described as being built without the most elementary knowledge—horrible contrivances in which the congested filth of years breeds disease and vile odours. Provision for flushing is unknown, and to the abominable condition of the towns is traced the prevalence of fevers, small-pox and dysentery in the island. These diseases are uncommon on the isolated estates, and in the opinion of many they might be largely eliminated from the island by giving attention to the most ordinary rules of sanitation. As to water supply, that of Havana is said to be fairly good, but in most other towns there is little besides the rain water stored during the wet season in great stone cisterns beneath the houses. This state of affairs seems to be more the fault of the executive than of inability on the part of the people to appreciate the advantages of a good water supply. Taxes may be raised for works or for coal to keep pumps going, but the money has been known to be actually banked to the credit of the officials or the coal bought and then resold for their benefit. The matter is all the more deplorable from the fact that excellent springs abound in most places and small rivers of good water are fairly common.

* * *

The Edinburgh Meeting.

It will be observed that we this week conclude our report of the recent annual meeting of the Incorporated Association of Municipal and County Engineers with some notes on the visits of inspection which took place on the third day of the meeting. Of the conspicuous features of the meeting and its general success we need not now speak at any length, as we have dealt with the subject in some closing remarks at the end of our report. The more purely social functions—which are practically inevitable on such occasions—were as successful as any others, and this gratifying circumstance may to a large extent be attributed to the fact that the hospitable reception accorded to the visitors left nothing to be desired. At the dinner and luncheons the Lord Provost and other members of the town council expressed the most cordial sentiments, and throughout the meeting showed the liveliest interest in the proceedings, conspicuous in this respect being Bailie Mackenzie, who took an effective part in more than one discussion. Nor was appreciation of municipal engineers and their work confined to councillors. In another column we quote from the representative Scottish daily paper an extract which clearly indicates the appreciative attitude of the Press. The meeting will be a pleasant reminiscence for all who attended it.

Association of Municipal and County Engineers.

ANNUAL MEETING AT EDINBURGH.—V.

EDINBURGH: ST. GILES' CATHEDRAL.

With this instalment we conclude our report of the annual meeting with an account of the proceedings of the third and last day, the earlier portion of which was devoted to the purposes of the meeting in the shape of visits to various places of interest in continuation of those paid on the previous day.

THIRD DAY'S PROCEEDINGS

(Saturday, July 2nd).

VISITS OF INSPECTION.

On Saturday, the third and last day of the meeting, two parties were again formed, one of them visiting

THE FORTH BRIDGE.

The drive to this wonderful engineering triumph is one of the most pleasant in the district, skirting as it does the grounds of Dalmeny, the seat of the Earl of Rosebery. Of the bridge itself, the connecting link between the southern and northern portions of the North British Railway system, nothing can now be said that has not already been written. A few sternly practical notes may, however, be recalled to mind. Old as was the cantilever principle, it had previously been introduced only in works of comparatively small dimensions, but in the case of the Forth structure the engineers had to construct a bridge 30 fathoms above high-water mark, and crossing two channels, each a third of a mile in width. Had it not been for the intervening island of Inchgarvie, on which the northern central pier partly rests, the project would have been impracticable. The extreme length of the bridge, including the approach viaduct, is 2,765 yards, and the actual length of the cantilever portion 1,780 yards. The weight of the Siemens' rolled steel used in it is 51,000 tons, the extreme height of the steel structure above the mean water level is over 370 ft., the rail level above high water is 156½ ft. About 8,000,000 rivets were used in the bridge, and 32 miles of bent plates in the tubes. Allowance is made for contraction and expansion to the extent of 1 in. per 100 ft. over the whole bridge. The wind pressure allowed for was 56 lb. per square foot of area, amounting in the aggregate to about 7,700 tons of lateral pressure on the cantilever portion of the bridge. When it is necessary to paint the iron work about 25 acres of surface has to be gone over. The total cost, not including the railway approaches, was nearly £2,500,000. The work was commenced in April, 1883, and the bridge was opened for traffic in March, 1890. In the meantime some 4,000 men had been employed on it. It is, of course, the work of Sir John Fowler and Sir Benjamin Baker, Sir William Arrol being the contractor. In

our illustration (*see* succeeding page) are shown, for comparison, the two other famous bridges for which Sir William Arrol was the contractor. For the use of the block we are indebted to our contemporary, *The Scots Pictorial*. The Tay bridge, which carries the North British Railway across the next estuary, is longer than the Forth bridge, but does not rival it in height. In this last respect the wonderful work which the municipal engineers inspected with such interest may at present claim to be the greatest bridge in the world.

THE SCOTT MONUMENT.

While the first party were at the Forth bridge the remainder of the members were afforded an opportunity of seeing some of the chief architectural features of Edinburgh. First on the list was the Scott Monument, but time did not permit of an ascent to its platforms. It was erected in 1840-44, after a design by the ill-fated George M. Kemp, at a cost of £15,650. Its Gothic spire, rising from four grand arches, reaches a height of 200 ft. Beneath these is a sitting statue of Scott, by Steell, and in various niches are thirty-two statuettes of characters in the novelist's works.

ST. GILES' CATHEDRAL,

which was next visited, dates historically from the ninth century, but architecturally has no extant feature of later date than the fourteenth century. It became a cathedral in 1633, on the creation of the short-lived bishopric of Edinburgh. Its most remarkable feature is its crown-shaped spire, and among the noteworthy incidents associated with it are the preaching of John Knox, the hurling of Jenny Geddes' stool at the head of the Dean of Edinburgh, the swearing of the Solemn League and Covenant, and the imprisonment within it of Covenanters captured at the battle of Rullion Green. Renovations and restorations in 1829-32, 1872-73, 1879 and 1883, have left the building a somewhat perplexing, though highly interesting, study for the eclesiologist.

THE CASTLE,

already shown in more than one of the views we have given of Edinburgh, crowns a precipitous rock which rises to an altitude of 445 ft. above the sea-level. Here, though a passing heavy shower of rain for the moment damped the ardour of the exploring engineers, all of interest was conscientiously explained and inspected. Under the long vaulted archway surmounted by an old state prison—which of old held the Earl of Argyle and many another illustrious captive—they passed; the Parliament Hall was duly exploited; in the Crown-room they saw and listened to the story of the discovery of the ancient regalia of Scotland; the tiny St. Margaret's chapel—

a Norman edifice—the oldest existing building in Edinburgh and the only portion of the castle of earlier date than the fifteenth century, was visited; famous old Mons Meg received its share of attention; and there was enjoyed the glorious view over “long miles of masonry,” and the

Far landscapes where the sea
Smiles on in softest witchery.

HOLYROOD,

The Museum of Science and Art was to have been visited,

gateway of the western front. Then the historical apartments of Holyrood Palace were visited; and here were seen the picture gallery, hung with about 100 ill-painted and imaginary portraits of Scottish kings, and Queen Mary's apartments, with the vestibule once stained with the blood of Rizzio. An illustration of the Palace was given in our last issue.

THE CALTON HILL.

The return from Holyrood was made by way of the Burns

SIR WM. ARROL'S THREE BRIDGES—FORTH, TAY AND TOWER.

but as time did not permit the party drove next to Holyrood, where the ruins of the abbey chapel were first seen. Practically all that remains of it now is a fragment of the ancient nave and of a wall built by the early reformers across the east end to adapt it to the forms of Protestant worship. The most noticeable portions are the exquisite Norman cloister doorway, on the south side; the richly-sculptured arcade which ornaments the face of the tower; and the Decarated

Monument and the base of Calton Hill. There was no time to ascend the latter, but probably its main features were already familiar to those who had been fortunate enough to be in Edinburgh during the whole period of the meeting. The Calton and Castle hills, and Arthur's Seat, and the precipitous Salisbury Crags in its foreground, are natural objects which dominate the city and fill the eye from almost any point of view. Nor is it possible to overlook the towering

monument to Nelson, which tops the Calton Hill, nor that picturesque "folly" which was intended to be a reproduction of the Parthenon at Athens, but which never got nearer completion than the twelve columns, with their basement and architrave, which were sufficient to absorb some £16,000. The Calton Hill, and the return thence by Prince's-street, were the last incidents of a meeting which will be memorable in the history of the association's foregatherings.

CONCLUSION.

A few general remarks before closing this report of the annual meeting of 1898. First, on a point which was so much the subject of general comment that it remains uppermost in

EDINBURGH: THE SCOTT MONUMENT.

the mind. We refer to the conspicuous distinction achieved by the new president of the association, Mr. O. Claude Robson. As an engineer Mr. Robson's name was widely known and honoured; it came as something of a revelation to find him a ready and cultivated public speaker, and altogether an admirable chairman, whether presiding over a professional conference or a social function. The association could not have been happier in their choice.

Secondly, with regard to another element which made for the unequalled success of the annual meeting. Mr. Cooper, the burgh engineer, may not be recalled to memory by this allusion, since his share in ensuring this success may not have been so obvious. He is the most modest of men. But it is to him we refer, for to him is due the lion's share of credit for his unobtrusive labour, his forethought, his never-failing courtesy, his thorough grasp of every detail of Edinburgh's municipal works. Personally, we shall not soon forget the prompt and able assistance rendered to us both by Mr. Cooper and by the chief members of his loyal staff.

Another matter which was on all men's minds was the absence of any municipal buildings adequate to the civic life of Edinburgh or in keeping with her wonderful natural beauty and imposing architectural features. Time was when the authorities beguiled architects into a great competition for an effective city hall, which was never built; and presumably the opportunity has passed, for the present municipal buildings are being extended. The work is in the competent hands of Mr. Morham, the city architect, who may be trusted to carry out artistically all that he has been empowered to do. But we imagine Edinburgh will still retain the peculiarity of having for its finest buildings only educational institutions, and for its civic headquarters a makeshift structure unworthy of the splendid possibilities of the site it will cover.

Finally, as to the general success of the meeting. Of this there can be no question. There were grave doubts as to whether the numbers of papers to be read would not have necessitated the squeezing out altogether of some of them, or at least of the discussions upon them. But, thanks in great measure to the tact of the president and to the businesslike directness of the remarks of nearly all the speakers, the work

was got through, and practically the whole programme was carried out as arranged.

THE SCOTSMAN ON MUNICIPAL ENGINEERS.

The following eloquent and pertinent remarks, which appeared in our able and influential Scottish contemporary, are certainly worth quoting, and will be perused with pleasure by our readers:—

"Year by year the tale of peripatetic congresses grows apace, and the months of July, August and September have become as much the set season of their sittings as May is the season for the meetings of evangelists in Exeter Hall. Ill-natured critics, and those labouring under the burden of a hospitality ungraciously rendered, have at times asked whether knowledge is really increased by all this going to and fro upon the earth. They have marked the disproportion between the armies of science and the numbers of the camp-followers whom they bring in their train, and hinted that meetings of sections and presidential addresses merely serve as a pretext for picnics, banquets and excursions. Whatever ground there may be in general for such churlish grumblings, they are singularly inappropriate in regard to such an association as that of Municipal and County Engineers, which is holding its annual sittings in Edinburgh at present. For most men of science these annual gatherings are at best an opportunity for the interchange of ideas and the communication of results obtained. Where they meet is a matter of indifference, and is generally determined by circumstances which have little connection with the main object of the meeting. On the other hand, to such an association as that of the Municipal and County Engineers the place of meeting is all-important. Their work is practical: it can only be learned by experience, and by seeing what has actually been done in different places. Description is unprofitable compared with actual inspection, and their yearly peregrinations from place to place give the members of the association an opportunity of learning much whereby their knowledge would otherwise be at best meagre and imperfect. The calling that they pursue can hardly be said to be in its infancy. Rome had its municipal engineers, and to this day it enjoys the fruits of their labours. But if not in its infancy, it is certainly in its youth. The growth of our cities, the demands that their inhabitants make for more

EDINBURGH: THE BURNS MONUMENT.

water, more light, better means of communication, and better sanitary conditions, have brought new problems, which are still being worked out and which can best be worked out by bringing to bear upon them all the experience that is available. Failure in this sense is often as valuable as success, and in both respects Edinburgh has its lessons for those who have selected it as their place of meeting. In the majority of the subjects which come before them for discussion the general public takes but a languid interest, though it is acutely critical as to the results achieved. It cares little how its refuse is disposed of as long as it is disposed of. It is not concerned with the relative merits of low-tension or high-

tion currents as long as the resultant light is cheap and bright; it cares not how sewers are ventilated as long as they are well ventilated. Perhaps, too, after all this is the safest and most logical position, and by giving free discretion to those who serve it, while scanning carefully the results achieved, it will be best served. Poets may dream of ideal cities, but under modern circumstances it is the municipal engineer who must realise their ideals."

SOME MEMBERS OF THE COUNCIL.

We this week present another supplement sheet containing portraits of members of the council, thus completing the series. With three exceptions, biographical notices have already appeared in our columns. We append those not previously given:—

MR. G. R. W. WHEELER.

Mr. G. R. W. Wheeler, ASSOC. M. INST. C. E., was educated at a private school at Sutton. After serving his articles with an architect and surveyor, he was successful in obtaining a position under the Kensington Vestry as assistant surveyor. In 1882 he was appointed surveyor to the Westminster Vestry, which post he still occupies. During the time he has been at Westminster Mr. Wheeler has carried out many miles of wood and asphalt paving and several large sewerage works. He has also designed new stables for the vestry, as well as a mortuary, &c. Mr. Wheeler was elected an associate member of the Institution of Civil Engineers in 1883.

MR. J. W. M. SMITH.

Mr. J. W. M. Smith received his education at a private school near Liverpool, and subsequently at Liverpool College. He served his articles in the engineer's office of the Mersey Docks and Harbour Board, afterwards acting as an assistant in that office. In 1872 he was unanimously elected borough surveyor of Wrexham, and this position he holds at the present time. Besides the many works of drainage extensions and town improvements, Mr. Smith has supervised the laying-out of the new cemetery, the new cattle markets and the borough offices, art school, &c. In conjunction with Lieut.-Colonel Jones, V.C., he has also had charge of the designing and carrying out of the reconstruction and extension of the sewage disposal works, including the laying-out of a new sewage farm. Mr. Smith became a member of the Incorporated Association of Municipal and County Engineers soon after its formation, and has been honorary district secretary for North Wales for several years.

MR. JOHN COOK.

Mr. John Cook, ASSOC. M. INST. C. E., commenced his professional career in 1874, in the office of the then Local Board of Health, Darwen. He there served articles with Mr. William Stubbs, ASSOC. M. INST. C. E., now borough and water engineer of Blackburn, and was afterwards engaged as chief assistant. In 1884 he was appointed chief assistant to Mr. J. Cartwright, M. INST. C. E., borough and water engineer of the county borough of Bury, which position he held until 1890, when he was appointed to the position he now holds—viz., borough surveyor and water engineer of Lancaster. During the time he was at Darwen and Bury many important schemes were designed and carried out by him, including sewage works, reservoirs, bridges, culverts, railways, &c. At Lancaster he has successfully carried out extensive street improvements, the construction of tramways, new fire station, electric light installation, infectious diseases hospital, extension and re-modelling of baths and wash-houses, astronomical observatory, and extensions to waterworks. At the present time is constructing by administration a large storage and service reservoir, besides several large street improvements and new buildings.

THE TELEPHONE SERVICE.

Mr. Hanbury again presided at a meeting of the Select Committee of the House of Commons, held on Thursday.

Mr. COURTENAY BOYLE, secretary to the Board of Trade, who first gave evidence in regard to the working of the provisional order system under the Electric Lighting Acts of 1882 and 1888, said he saw no objection to giving municipalities powers to supply a telephone under provisional orders, just as they supplied electric light. The procedure was very simple and the cost very slight. Before the principles of procedure were laid down the opposition to orders was very decided, but now it was not serious at all.

Sir R. HUNTER, solicitor to the Post Office, considered that if provisional orders were granted for supplying a telephone service the privileges of the Post Office would be trench upon. The licensing authority should be the Postmaster-General, and not the Board of Trade. The procedure in regard to the granting of the provisional order should be conducted by the Post Office.

Mr. GAINES, general manager of the National Telephone Company, the next witness, pointed out that in granting licenses to municipalities a difficulty would occur in giving trunk-line communication to the new exchange areas. The Post Office would probably have to spend £250,000, without a shilling of revenue from it, in laying down junction wires between the new exchanges and the nearest trunk-wire terminal stations.

Mr. GOSCHEN, First Lord of the Admiralty, referred, in the course of his evidence, to a portion of a speech of his in the House of Commons on March 29, 1892, which, he thought, stated his policy regarding the competition of municipalities very clearly. It ran: "Therefore all the licensees have been warned that the Government have retained the power in their own hands, and it will not be against either the spirit or the letter of the license if we establish trunk lines. But I do think it would be against the spirit of the license if we were to take the local arrangements entirely into our hands, during the continuance of that license, to the detriment of those who on the faith of that license have been extending their system up to the present moment." His recollection and interpretation of that passage would be that if immediately after the signing of the agreement they had entered into competition with the company it would have been against the policy they intended. But, on the other hand, their discretion was not tied in any way, though that point should not be pressed too far. The Post Office must retain entire discretion, and he did not think it would be against the agreement to raise such competition as was clearly contemplated both in the agreement and in the Treasury minute. But he thought it would have been a surprise to the company, and they would have considered it as hard usage, if the moment after signing the agreement competition had been established against them throughout the country. That would not have prevented competition in any particular locality. They reserved competition in particular areas as a power for themselves and for succeeding Governments. But the idea at the moment was that taking over the trunk lines was not to establish competition immediately, as they had enough on their hands with the trunk wires. The Treasury minute was later than his speech, and therefore a more formal embodiment of the Government's policy, but it seemed to him conclusively as to the intention of the latter. Continuing, he thought it was impossible that he could have given Mr. Forbes (the chairman of the National Company) any assurance that the policy so enunciated would be departed from, and he could not think, he said in closing his evidence, that the granting by the Post Office of a license to a municipality would now be an evasion of the spirit of the agreement.

Mr. GAINES, recalled on Friday, submitted, in the course of his evidence, that it was essential in justice to his company that there should be an appeal against the absolute veto of the local authority. Municipalities would have way-leave powers, and they could deny them to the company. That was not competition. In the event of licenses being granted, he said it would be most unjust if the period during which they should run were extended beyond the period of the company's license—namely, 1911. They asked to be placed on a footing of absolute equality, nothing more. In the course of further evidence witness expressed the opinion that the telephone service had been laid down on quite wrong principles—the price should be according to user and not subscription. Such a system would, he thought, do a great deal to popularise the service. If licenses were taken up by municipalities in competition with the company, and the business was conducted at a loss, it would not be fair that Parliament should allow that loss to be thrown on 82 per cent. of the ratepayers who would get no return whatever for the expenditure incurred. On the other hand, if municipalities conducted the business at a profit, it would be almost impossible for the State to resume possession of the telephones at any future time. No Government would be strong enough to take away the service from the municipalities if they were working it at a profit.

SANITATION IN COLOMBO.

According to *Indian Engineering*, it is claimed that the Health Department of the Colombo Municipality have removed the foulest defect in the sanitation of Colombo, and have, at a minimum of cost and annoyance, substituted a regular and reliable service for the removal and disposal of night-soil. The acceptance of the service is optional, and it is a tribute to its efficiency that it has been practically adopted universally. It offends no race or caste prejudice, and it has been organised without adding to the rates. The public latrines are no longer a nuisance to passers-by. The depots, now under efficient control, are open to inspection at any time and are absolutely free of offence. The only serious failure has been caused by the cineraters. The municipal engineer to whom the work of erection was entrusted has not as yet succeeded in providing a method for the speedy destruction of refuse. Meanwhile burial with deodorants and disinfectants is still continued, and under constant supervision works well.

Eastleigh.—At a recent meeting of the district council the clerk said he had the pleasure of reporting that he had received the sanction of the Local Government Board to the erection of new offices, and that they had not insisted upon the alterations which were recently the subject of discussion. The board sanctioned the borrowing of the sum of £3,600 for the purpose of erecting offices, and of £1,400 for the provision of a fire station, stabling, and storage accommodation, &c., the money to be borrowed for a period of thirty years.

Comparative Reports of General Practice.

XXV.—INCANDESCENT GAS LIGHTING : ALDERSHOT REPORT.

In presenting a report recently to the Roads and Lighting Committee of the Aldershot Urban District Council on the lighting of the district, Mr. Nelson F. Dennis, surveyor to that body, incorporated some interesting information on incandescent gas lighting which he had gleaned as the result of inquiries as to the experiences of other districts in this direction. The detailed replies are given below. In the course of his general report Mr. Dennis says:—

The public street lighting is done by 285 lamps, supplied with gas on the average meter system, there being eleven lamps per meter for the area supplied by the gas and water companies, and in The Avenue eleven lamps are supplied by the Government, there being a meter to each lamp. The lighting, extinguishing and repairs are performed under a contract with a man who employs three others to assist him in the work, the gas company supplying gas only, at the rate of 2s. 9d. per 1,000 cubic feet, bearing a discount of 10 per cent. The average number of hours each lamp is alight throughout the year is about 2,300, and the average cost per lamp per annum upon the present system is: Gas, £2 0s. 10d.; lighting, extinguishing and repairs, 13s. 1d.; total, £2 13s. 11d. The painting of lanterns and columns produces a further average expenditure of 9d. per lamp per annum.

I believe it will be admitted that the lighting of the streets generally, and the main business thoroughfares particularly, is unsatisfactory, which, however, cannot be said to be due to a depreciation in the quality of the gas supplied, the test indicating the illuminating power to be slightly in excess of the standard—*viz.*, 15 candle-power—but to the fact that of late years, through the advent of many devices for improved lighting, the mind has gradually become accustomed to things more brilliant, and what was considered efficient a few years ago has by degrees become inadequate for present purposes.

THE QUESTION OF MANTLES.

Your committee have taken measures to improve the lighting by the adoption of a new type of lantern and by experimenting in the past with the incandescent burner, which experiments, owing to the abnormal breakage of mantles, had to be discontinued as, I am informed, an absolute failure. I cannot help thinking that that failure was due, in a great measure, to preventable causes. Holding that view, I ascertained from the engineers and surveyors of several towns their experience with regard to incandescent lighting. In some districts it has not gone beyond the experimental stage, but in others, such as Croydon, Eastbourne, Surbiton and Teddington, it is superseding the flat-flame burner, whilst at St. Mary Abbots, Kensington, 350 incandescent burners are in use. It appears that about six mantles per lamp per annum are required on an average. The number, however, varies in different towns, which is governed, doubtless, to a great extent by local conditions and circumstances varying in each, therefore I do not consider that the average experience in that respect would be a fair criterion upon which to base an estimate. There are several agencies at work which tend to destroy the mantles, among others natural decay—which very seldom happens—vibration caused by traffic, insufficient care on the part of the men in lighting and cleaning, and excessive draughts. There are several appliances which, by their adoption, are said to diminish the destruction of mantles by vibration, but of those I do not at present intend to speak. Great care by the lamplighters is necessary in dealing with the incandescent lamp. This was fully demonstrated at Horsey, where the saving in mantles, when the lighting and extinguishing was performed by men accustomed to the work, amounted to 100 per cent. Many mantles are broken in lighting and extinguishing the lamps upon the ordinary ring and hook system, and to avoid this I suggest that an alteration be made to the lever by slightly loosening it so as to work freely, and by attaching a small lead weight to the end of each chain, the mere process of lifting one weight by the lighting rod will suffice to set the lever in motion. This, I believe, would save some of the time that would otherwise be occupied in fishing for the ring, and would obviate the breakages caused by unnecessary jerks. Notwithstanding the additional care and attention a system of incandescent gas lighting of necessity demands, it appears from the returns I have received, and from which much valuable information may be obtained, that one man can control from seventy to 100 lamps. It would not, therefore, were a general scheme of incandescent lighting adopted for the district, be necessary to increase the number of lamplighters beyond that which at present exists.

I have tested the consumption of gas and the candle-power of the burner in use for street lighting, and the following table gives the results as compared with similar tests made with the "C" Welsbach burner:—

Burner.	Gas consumed.	Candle-Power.	
		Flat Flame.	Side Flame.
Burner in use	5'06	135	112
"C" Welsbach burner	3'50, including by-pass during day	135	123
		33	

Upon the consumption of gas a saving per lamp per annum would result in a money value of 8s. 7d., which would no doubt be absorbed by the charges for renewals, but the lighting efficiency would be increased considerably. In obtaining the above results the incandescent burner was so regulated to consume the quantity of gas stated, and I consider it desirable that all such burners should be tested and regulated before being fixed, in order to prevent the passage of gas in excess of what would be necessary for perfect incandescence. An excess of gas has the effect of blackening the mantles.

I beg to recommend that your committee authorise me to make experiments with a view to ascertain the best methods and appliances to be adopted for incandescent lighting, keeping in view the desirability of reducing to a minimum the cost of chimney, stick and mantle renewals. I would further recommend for the purpose the purchase of three of Marjage's patent street lanterns and burners, three of the anti-vibration patent spring burners, three of Gloyne's new patent anti-vibration springs for fitting to burners and one double Clay's patent shock-proof, &c., fittings, supplied by Messrs. H. Greene & Son.*

The following are the detailed replies received in answer to the queries addressed to various towns:—

ASTON MANOR.

At Aston Manor incandescent gas lighting is in the experimental stage, only two large Bray's lamps being fitted with the burners. The Anti-Vibration Incandescent Gas Lighting Company, of 12 and 14 Westgate-arcade, Bradford, have fitted up the two lamps with their burners and mantles (three in each lamp) at their own expense, and with the understanding, that, when called upon, they shall replace the old burners and leave the lamps as before. No special means have been adopted for lighting and extinguishing the burners, and as yet it is impossible to say how many burners can be controlled by one man. No special lanterns have been adopted for the lamps.

BECKENHAM.

In this district thirty-nine lamps are fitted with incandescent burners (twenty-eight with bulb burners and eleven with ordinary burners). Seven others were fixed fifteen months ago and the remainder in March last, all being fitted with by-passes. It is impossible to give the number of burners capable of being controlled by one man, as the greater part of the lamps are being attended to by the gas company. The average number of mantles used on the eight lamps under the control of the council for the six months ended September 25th last was three-and-a-half per lamp, and the total number of hours each lamp is alight is about 3,848. In one or two cases special lanterns have been used, but it is found that the ordinary 14-in. lantern is quite suitable. Since last March twenty-eight lamps have been taken in hand by the gas company, who make the same charge for cleaning and lighting as for the other lamps in the district. They also charge 10s. per lamp per annum to cover the cost of the mantles, &c., plus the cost of gas actually consumed as ascertained by the meter. For the ordinary street lighting a fixed inclusive sum per annum is paid to the gas company, so the cost of the incandescent lighting cannot be compared until a full year under the present arrangement has been completed.

BOURNEMOUTH.

Sixty-two lamps are fitted with incandescent burners in this borough. This system of lighting has, however, only been adopted for about twelve months. The "C" by-pass burner, with metal chimney and glass bulb, is used to enable the lighting and extinguishing to be effectually carried out, and severity burners are controlled (lighted, cleaned and extinguished) by one man. The burners require taking apart and cleaning very frequently, and it is estimated that five mantles are found necessary for each lamp per annum. Along the main roads each lamp is alight for about 2,000 hours per annum. No special lanterns have been adopted for incandescent lighting, and the gas company do not undertake the lighting and extinguishing of the lamps. The company only supply the gas, and the saving in gas almost pays for the mantles.

CANTERBURY.

No particulars as to incandescent gas lighting were received from this borough, as the mantles had not been in use sufficiently long to take notice of the results.

CROYDON.

At Croydon there are 850 lamps fitted with incandescent burners. This system of lighting has only been adopted for about twelve months, but it gives great satisfaction, and

* It should be remembered that since this report was written the Incandescent Gas Light Company, Limited, have placed upon the market a new and improved incandescent gas burner, of which some details were given in our issue of May 20th.—ED. THE SURVEYOR.

will, no doubt, be extended into most of the roads where the electric light is not used. The Croydon Gas Company provide the ordinary gas lamps and keep them in repair, light and extinguish them, at the rate of £3 6s. 6d. per lamp per annum. For the incandescent lamps they provide everything in the same way at the cost of 4s. 3d. extra each lamp per annum.

EASTBOURNE.

About 350 lamps are fitted with incandescent burners at this seaside resort. This system of lighting has been in use since 1894, and is at present being extended. No special method is adopted for lighting and extinguishing the burners, except that a bent nail is fixed in the ordinary torch. As regards control, one man is able to attend to the same number of incandescent lamps as to the ordinary lamps. Occasionally a little difficulty is experienced with the mantles, but Mr. R. M. Gloyne, the borough surveyor, has patented and introduced a spring which effectually prevents damage by vibration, and which the corporation have adopted after long trial. Each lamp is alight for 3,000 hours during the year, and no special lanterns have been adopted for use with the mantles. The gas company do not undertake the lighting and extinguishing of the lamps, they only supply the gas. All the incandescent burners before being fitted are regulated to 3½ cubic feet per hour.

GLOUCESTER.

At Gloucester sixteen lamps are fitted with incandescent burners, and these have been in use for two years. No special means have been adopted for lighting and extinguishing the lamps, the ordinary by-pass burner being used. The number of lamps one man is able to control depends very largely upon circumstances, such as distance apart, or whether the positions are very exposed, as at the corner of streets, &c. Some difficulty is very often experienced with the mantles, and the life of the mantles is very uncertain. Two mantles, even in one lamp, will frequently have lives very disproportionate. The average number of mantles used per lamp per annum is, however, about six. The number of hours per annum each lamp is alight is about 3,500. No special lanterns have been adopted for the incandescent lamps, but the gas company are experimenting with special lanterns having anti-vibrators fixed to the burners. The lighting and extinguishing of the ordinary lamps is carried out by the gas company, but the corporation maintain the incandescent lamps. There is at present a dual payment, and a fair comparison of the charges cannot, therefore, be made. If maintained under contract a comparison would be in favour of the incandescent system, if the illuminating power is considered. The average hourly consumption is about 4.25 cubic feet per burner, including the gas burnt during the day by the by-pass. Magnesium carbides used on the tubes beneath the mantles are found to lengthen the life of the mantles.

HALIFAX.

The incandescent system of gas lighting in this borough is only in the experimental stage, and consequently no particulars are forthcoming. Twenty lamps have been under trial for about six months, but it has not yet been definitely decided to extend the system.

HORNSEY.

is another of the authorities who are at present only experimenting with the incandescent gas lighting system. About 100 lamps are fitted with the burners, the "C" burner with by-pass lever and chain and the Incandescent Gas Company's suspension frame being used. At present the lighting is in sections only, and no definite particulars can be given with reference to the number of lamps one man is able to control. Recent results show that the average life of the mantles is about fifty-two days. During the year each burner is alight for about 3,940 hours, and the lighting, extinguishing, cleaning, &c., is done by the district council's own staff. The lanterns in use for this system of lighting is the "Hornsey Council" lantern—a lantern built to the council's own design by Messrs. Pontifex & Co.

KETTERING.

At this town six lamps were fitted up for trial and used from November 10, 1894, to January 26, 1895, and then replaced by ordinary burners. Three lamps were also tried from January 26 to April 6, 1895, the consumption of gas being measured. In the first trial one lamp consumed 2,100 cubic feet of gas against an average of 2,486 cubic feet for ordinary lamps, and in the second trial the three lamps averaged 1,066 cubic feet against 1,772 cubic feet for ordinary lamps. Only one lamp had a special lantern, but this did not seem to give any advantage. The lamps were found to be quite as easy to light as the ordinary lamps, the by-pass being used. They took, however, much longer to clean, more care being necessary. The lamps were discontinued after these trials, as, owing to the rapid deterioration of light, the frequent necessary repairs and the small saving of gas, they were not considered satisfactory.

KENSINGTON.

has 350 gas lamps fitted with incandescent burners, these having been in use for about four years. The by-pass is adopted for the lighting and extinguishing of the lamps, which are alight for about 3,500 hours in each year. One man is able to take charge of 100 lamps, but no difficulty is

experienced with the mantles. The average life of each mantle is about 400 hours. In the wide streets of the parish a special lantern is used for the incandescent lamps. The gas company do not undertake the lighting, extinguishing, &c., of the lamps, that work being done by the vestry's own staff. The gas is supplied by the company by the average meter system—one meter to twenty lamps.

KING'S NORTON.

At this town the incandescent system of gas lighting has been in use for about three years, the number of lamps at present fitted with the burners being 100. No special means of any kind have been adopted for lighting and extinguishing the lamps, and one man is able to control about twenty-seven incandescent lamps and thirty ordinary lamps. Under ordinary circumstances no difficulty is experienced with the mantles, eight of which are found necessary for each in the course of twelve months. During winter the lamps are alight for about fourteen hours per day, and during the summer for about six hours per day. This gives an average for the whole year of about ten hours per day. No special lanterns have been adopted for the incandescent gas lamps. The district council carry out the lighting of the lamps themselves. The consumption of gas by the old burners was 10 cubic feet per hour, but by the incandescent burner it is 3½ cubic feet per hour.

SURBITON.

All the lamps in this district are fitted with incandescent gas burners. A portion of them have been in use for about twelve months, but the whole of them were fitted with the burners about six months ago. Each lamp is fitted with a by-pass for extinguishing and lighting. The number of lamps controlled by one man is not known, as the gas company carry out the work of lighting and extinguishing. It is, however, believed to be about 100. No difficulty is experienced with the mantles beyond frequent renewals. The lamps are in use each day during the year from sunset to sunrise. Messrs. Sugg & Co.'s "Kensington" pattern improved lantern is adopted for use on the incandescent lamps. An arrangement has been entered into with the gas company whereby they extinguish and light the lamps for £3 5s. 6d. per lamp per annum, including all charges for cleaning, maintenance, &c.

TEDDINGTON.

At Teddington all the lamps are fitted with the incandescent gas burners, but this system of lighting has only been in use for about twelve months. The lighting, extinguishing and cleaning is in the hands of the gas company, and four men are engaged to do the work in eighty minutes. No great difficulty is experienced with the mantles. The exact number of mantles used per lamp per annum is not known, but it is believed to average about four to six. The lamps are alight for 3,630 hours each year, but no special mantles have been adopted for the lamps. The gas company undertake to supply the incandescent burners complete for 15s. 6d. each, and light, clean, extinguish and repair the lanterns, and supply the gas for the sum of £3 8s. 6d. per lamp per annum. The Lighting Committee of the district council, when considering the question of incandescent lighting, reduced the number of hours over 4,000, which, together with the saving in gas consumed by the new burner, effected a yearly saving of £103.

WIMBORNE.

has no lamps fitted with the incandescent burners. Certain lamps were some time ago fitted with the burners by the gas company as an experiment, and their quotation for supplying gas and lighting from sunset to sunrise, including the cleaning and repairing of the lanterns, and the supply of the mantles, burners, &c., was £4 5s. per lamp per annum.

LAMBETH VESTRY AND CONTRACTORS.

THE KENNINGTON ROAD BATHS.

At a meeting of the Lambeth Vestry, on Thursday, Mr. F. S. Price gave notice of motion that a committee of five members be appointed to report generally upon the question of the Kennington-road baths and particularly on the following points: (1) The dates of the contracts and the dates respectively at which the various works were to be finished. (2) Whether there have been any breaches of the "time" clauses; and, if so, whether notice has been given to the contractors that the penalties would be enforced. (3) The architect having advised the Baths Committee that the breaches of the contracts be waived, to ascertain fully his reasons for such advice. (4) If the penalties were enforced, what saving of public money would be effected. (5) How it was that the commissioners did not detect at the outset the omission by the architect from the specifications of any provision for boilers, machinery and other work, involving an additional outlay of over £8,500. (6) The date at which the omission first came to the knowledge of the commissioners, and their reasons for withholding it from the vestry. (7) The commissioners having come to the vestry for approval of the original estimate for building, why they did not adopt the same course with respect to the attainment well and the electric lighting.

The Water Supply of Ramsgate.

EXTENSIVE IMPROVEMENTS.

A large company assembled, on the 28th ult., to witness the opening ceremony in connection with the new pumping station, which has been erected at Whitehall to the design and under the supervision of the borough engineer, Mr. W. A. McIntosh Valon, and Mr. Arthur Valon.

THE NEW PUMPING STATION.

The building forming the new pumping station is in three divisions, the centre or main building being 63 ft. by 59 ft. by 25 ft. high. This, says *The East Kent Times*, is lined throughout with glazed bricks, and has an iron roof supported in the centre with cast iron columns. The flooring is composed of a tessellated pavement laid on concrete, the borough arms being tastefully worked in colours at the central entrance. The main building covers the machinery, which consists of an engine 50 horse-power nominal working up to 90 horse-power. On the ground floor there has been placed a condenser. The air is withdrawn by a vacuum pump, and the vacuum thus made is kept steadily at 27 lb. on the square inch. This improvement abolishes the necessity of using the jet condenser worked by the engine itself, while at the same time it saves the loss of at least 60,000 gallons of fresh water per day. All the valves controlling the main supply pipes leading to the reservoirs are here brought under cover, and the foreman in charge has within range of his vision the whole of the machinery for raising the water, as well as the valves controlling its issue from the pumps to the reservoirs. It may be mentioned that the ventilation of the building is made as nearly perfect as possible by the insertion of a water-driven fan in one of the ornamental outlets of the building.

THE BOILER-HOUSE.

Adjoining the main building and directly connected with it is the boiler-house, 25 ft. by 59 ft. 6 in. by 16 ft. In this two Lancashire boilers, 30 ft. long by 7 ft. 6 in. in diameter, have been set, the working pressure being 80 lb. These boilers are worked alternately. In the front of the boilers iron plates have been laid down, to form easy shovelling spaces for the fuel. In the flat roof, immediately over the boilers, has been inserted a water-driven fan, the water for driving being taken from the pumping main in the same way as for the main building. On the opposite side of the main building is the smiths' and engineers' shop, 26 ft. by 15 ft. by 16 ft., the stores 13 ft. 6 in. by 15 ft. by 16 ft., and the office 13 ft. 6 in. by 15 ft. by 16 ft. These are of convenient size, joined to and entered from the main building, the front view of which is shown, as well as may be from a photograph, in our illustration. The outside of the building is made presentable by the use of grey terra-cotta, the design of which not only adds beauty, but gives strength to the buildings. The sloping roofs are covered with red tiles and the flat roofs with zinc. For the comfort of the men, at a short distance from the main building have been erected a bath-room and lavatory. In the execution of this work it was necessary to build over and cover in the then existing engine-house before interfering with it. This made the work difficult and somewhat hazardous, as any accident of such a kind as would have stopped the working of the machinery would have meant the stoppage of the supply of water to the town and the district. We are indebted to the proprietors of *The East Kent Times* for the accompanying illustration of the building. The contractors were Messrs. Parson.

BRISTOL ELECTRIC LIGHTING.

IMPORTANT EXTENSIONS.

Extensive preparations have been, and are being, made at the Bristol Corporation electrical station, Templemeads, to supply the power that will shortly be required to light the main thoroughfares beyond the present bounds, and to cope with the ever-increasing demands from private individuals for electrical force. The building, according to *The Bristol Times*, has been extended about two-thirds of its original size—about 80 ft. in all—in the direction of Temple Meads, so that now there is a fine engine-room, 210 ft. long. Being a continuance of the original structure, both the design and the material employed are similar. The walls are of pressed Cattybrook bricks, the lower portion of the street

wall being of granite. The walls and bases and the plant rest upon piles driven to a depth of 44 ft., and the new chimney stack stands upon an immense mass of concrete and granite. The work, of a very substantial character, has been done by Mr. C. A. Hayes, to the design of Mr. Henry Williams.

The capacity of the engine-room is rather more than doubled, and machinery of very much larger size has been ordered. In the boiler-house have been placed five additional Lancashire boilers, the whole number now being twelve. The new portion of the boiler-house is a few feet wider than the original portion; hence room has been provided for laying down economisers, which enable gases to pass from the boiler flues to be used for heating water, and thus effect considerable saving. The boilers are fed with coal from the bunkers by means of elevators, conveyors and screws, with this important alteration, that the apparatus is driven by electrical motors instead of by small engines. The latter are not so economical as motors, consequently the results will be better financially, and the motors being entirely cased in, greater cleanliness will prevail in the boiler-room. The feed and other pumps here are also worked by electrical motors, instead of steam as formerly. Indeed, the whole of the plant now put down, with the exception of the main engines, is worked by electrical motors, thus enabling the larger engines, with much higher efficiency than smaller ones, to

RAMSGATE WATERWORKS: PUMPING STATION AT WHITEHALL.

be used. The coal bunkers have been very much increased, the new ones alone having a capacity rather more than double that of the former ones. On the roof of the bunkers have been placed two capacious tanks, one for the storage of softened water, for use in the boilers, and the other for the storage of ordinary water, to be employed in keeping cool certain parts of the engines. Along the top of the coal bunkers the coal tramway has also been extended.

In the engine-room have been put down two large steam alternators, each of which is capable of supplying electricity sufficient for 14,000 incandescent lamps, and another similar engine is on order and will be delivered before the winter—for which the department is fully equipped—for the extended street lighting. One additional dynamo is already fixed and is ready for running, another is complete at the works of the manufacturer and ready for testing, and a third is to be delivered within the next two months. Before the winter comes there will be between 4,000 and 5,000 horse-power of engines in the engine-room. Of this plant the present street lighting only needs 100 horse-power to be used at any one time, and the additional street lighting, for which cables are being laid, will require another 200 horse-power. It will be seen, therefore, that the street lamps make a very small demand upon the total resources of the station. The condensing plant has been tripled in capacity. Up to within the last month or two there has only been one condenser, capable of dealing with the exhaust steam from rather more than 2,000 horse-power engines. A circulating pump for use in connection with the same is electrically driven. Although considerable plant has been recently added—and there is more to come—room has been recently added—and there is more to come—room will yet remain for a couple more boilers and another 14,000-light steam alternator; but the business is growing so rapidly that before long it may be found prudent to further increase the plant.

New Ladies' Bath at Sheffield.

NEW LADIES' BATH AT SHEFFIELD: INTERIOR OF THE BUILDING.

Mrs. Franklin, the mayoress of Sheffield, on the 13th ult., opened a new public bath, which has been erected for ladies at the Glossop-road baths.

The baths building, which included two swimming baths, Turkish bath, &c., were purchased by the corporation in 1895. Very extensive repairs were found necessary, as both swimming baths were leaky, the second-class bath leaking at the rate of about 6 in. per day. This work was at once taken in

this respect was provided by reserving the gentlemen's bath on one or two days each week. Mr. C. F. Wike, the city surveyor, who had planned and carried out the alterations to the old baths, was accordingly instructed to design a ladies' swimming bath to be built on the site of the old second-class bath and bath saloon, and the building shown in the illustration is the result. The builder's contract was £5,129 and the heating contract £500, but the latter sum does not include boilers or laundry apparatus, which were included in the contract for the old bath alterations. The new ladies' swimming bath is 75 ft. by 25 ft., and varies in depth from 3 ft. 3 in. to 5 ft. 6 in. Thirty-five dressing boxes are provided, together with ten slipper baths.

The contractor for the alterations and the erection of the new bath was Mr. George Webster, of Sheffield, and the heating and engineering throughout has been entrusted to Messrs. Bradford & Co., of Salford.

NEW LADIES' BATH AT SHEFFIELD: EXTERIOR OF THE BUILDING.

hand, at a cost of about £3,500 for structural work and alterations and £1,800 for new boiler heating apparatus and engineering work. Subsequently the town council decided to erect a new bath for ladies. This was much needed, as there was no such bath in the city, and the only accommodation in

MANCHESTER STEAM USERS' ASSOCIATION.

We have received a copy of a memorandum prepared by Mr. Stronmeyer, chief engineer to this body, and read at the recent annual meeting. The useful advice to boiler attendants which was issued in the beginning of the year is here reprinted, with the addition of a few practical remarks on the best method of cleaning boilers and economisers, fuller explanations of the injury caused to boilers by incrustation and grease, and an appeal to steam users to spare their boilers by using less oil in their cylinders. Some interesting comparisons are given as to the costs of explosions of boilers other than those approved by the association. That body, we learn, is still in the proud position of having had only one explosion out of the 6,000 boilers entrusted to its care. It is pointed out that of 215 persons killed or injured during the last five years, the large proportion of about one in thirteen were boiler owners or their sons or managers, and steam users are urged, for their own personal safety, to insist on having their boilers properly inspected. The memorandum also refers to the average cost of explosions distributed over the entire number of boilers in the United Kingdom, the calculation being made in view of the increased liabilities imposed upon factory owners by the Workmen's Compensation Act, which came into force on the 1st inst. Mr. Stronmeyer also gives an appreciative notice of the career of his predecessor, the late Mr. Lavington E. Fletcher, with special reference to his services to steam users and engineers and the estimation in which those services are held.]

The Sterilisation of Water.

THE VAILLARD AND DESMAROUX APPARATUS.

There is no sanitary problem more important to-day than the provision for domestic, and especially for potable, purposes of water which shall be as nearly as possible absolutely pure from a bacteriological point of view. Indeed, this may without hesitation be described as quite the most important and most pressing sanitary problem of the day; and in support of this statement it is only necessary to recall the typhoid outbreaks of last year—essentially water-borne epidemics. Generally speaking, the question of a pure water supply resolves itself into two broad divisions—the prevention of pollution at the original sources, whether watersheds or wells, and, in the second place, the treatment of the water when stored or on delivery. It is with the latter phase of the question that we are at present concerned. Hitherto the treatment has been practically confined to filtration, but not a few competent authorities have grave doubts as to the ultimate efficacy of the process, whether adopted on a large scale at waterworks with sand and gravel as the filtering media or on a small scale in the shape of domestic filtration. The latter, indeed, may be purely mischievous unless the most scrupulous care is experienced, not only in the choice of a filtering apparatus, but also in keeping it in proper order. Our readers do not require to be told what the results are likely to be if objectionable matter is allowed to accumulate on the filter. Boiling, again, has long been recommended to the household as an infallible remedy, but it has the obvious objection of quite destroying the flavour of the water.

To overcome the last-named as well as other serious difficulties was the object of MM. Vaillard and Desmaroux in designing the apparatus in connection with which we give two illustrations, one representing the elevation of the apparatus in two sizes, a small-size apparatus being seen at the extreme left of the larger one. Our second illustration is a diagram of an installation of the apparatus adapted to the requirements of a town of 40,000 inhabitants. Such installations, we believe, have been fixed at Tsarsitsine in Russia and Manaus in Brazil. It will thus be seen that the inventors have aimed at producing an apparatus both on a comparatively large scale in connection with municipal and other waterworks, and on a smaller scale for the purposes of hotels, asylums, hospitals, barracks, camps, private houses and various industries, and the process should certainly receive attention from authorities, officials, and others interested.

To ensure the complete destruction of all organisms the water is heated to a temperature of 230 degrees to 239 degrees, the heating, however, being done in a closed vessel, so that

none of the natural gases are evolved, the salts are not deposited, and the water leaves the apparatus only a degree or two higher in temperature than it enters. There is also the additional security that the cooling of the water takes place out of all contact with the air, so that no contamination can arise from that source. The following were the conditions which the inventors set themselves to fulfil as essential to a satisfactory solution of the problem of supplying potable sterilised water: (1) The water is to be bacteriologically pure; (2) the flavour, salts and limpidity are to be preserved; (3) the water is to be emitted cold; (4) large quantities must be obtainable at a moderate cost; (5) the plant must be inexpensive, so that it may be of general utility.

The sterilising apparatus consists essentially of two parts—the heater and the cooler. In the former the water, which has passed through the cooler on its way from the supply is heated, as already stated, to a temperature several degrees above the boiling point. Thus the water leaves the heater effectually sterilised, and it then passes into the cooler, which is arranged on a somewhat novel principle. It consists of a double-spiral of pipes, one series of which carries the cold water from the source to the heater, while the other series conveys the hot water from the heater to the outlet. The apparatus can be made to deliver from 2 to 500 gallons per hour, and hence it can be adapted to all requirements, from those of a town of several thousand inhabitants to those of a single household.

In connection with the water supply of a district it is suggested that a central station might be constructed, where the requisite number of sterilisers could be sufficiently worked by a common heating arrangement. It is further suggested that use might be made of the waste heat from pumping engines. As a temporary expedient for checking an epidemic traceable to an impure water supply, it is pointed out that with a very slight expenditure of time, trouble or money, sterilising apparatus might be placed in public positions at various points about the town. The inhabitants could then fetch their water from the nearest steriliser or a municipal service could be instituted for its distribution.

But equally important is the supply of pure water to public institutions, such as hospitals, hotels, asylums, barracks, &c., and it is pointed out that the addition to the expense of the water supply per head would be quite negligible in comparison with the greatly-increased safety of the inmates. In hospitals the sterilisers could be run in connection with heating chambers, which are necessary for the now universal

antiseptic treatment, and by a simple arrangement could be made to deliver both hot and cold sterilised water. We are informed that the apparatus is now in use in several French hospitals, including the sanatorium of St. Trojan, and that it has also been fitted at Netley hospital. Assuming that the results are as satisfactory as we have reason to believe they are, the advantages of such an apparatus in connection with hotels, asylums, barracks, camps, military expeditions, prisons, factories, colleges and schools are obvious enough. Finally, even if the system is not adopted for public purposes, the householder, who should always be solicitous for the health of his family, may take the matter into his own hands by making use of the small form of apparatus. For this a small petroleum lamp or gas flame is quite sufficient, so that after the first outlay the expense is small.

There are, of course, a large number of industries in which the use of bacteriologically pure water should be regarded as absolutely necessary. Among these we may mention the manufacture of artificial ice and of malt liquors. In conclusion we may briefly summarise the advantages claimed by the inventors for the apparatus. They point out that it combines simplicity with small initial cost and slight cost of maintenance; that it can be manufactured from a small size, suitable for domestic purposes, to supply 20 litres per hour to one large enough for supplying a small town for ordinary purposes; that it is portable, and will give from any

KIRKBY-IN-ASHFIELD WATER SUPPLY.

LOCAL GOVERNMENT BOARD INQUIRY.

Major-General H. Darley Crozier, A.E., conducted an inquiry on Wednesday of last week, on behalf of the Local Government Board, with reference to an application of the Kirkby-in-Ashfield Urban District Council for sanction to borrow £9,200 for the purposes of water supply.

Mr. G. H. Hibbert, clerk to the council, made a statement, from which it appeared that the district, which had now a population of 9,000, had grown very rapidly of late years, and was being supplied with water from the Sutton-in-Ashfield council's waterworks, for which they were paying 16d. per 1,000 gallons. The supply had been extremely intermittent, and on that account, as well as on the ground of its unsatisfactory quality caused through the extension of the works, they asked for sanction to borrow money to erect their own works. The loan would provide £1,200 for compensation to the Sutton authority and contingencies, £1,280 lbs. for rising main and service main, £1,200 for the reservoir, £1,500 for the sinking of a well and lining the same, £2,000 for duplicate pumping machinery, and £1,000 for pumping station, engine-house, &c. The engineer, Mr. W. H. Radford, estimated that by having their own works the council would save £917 a year. At present they were paying Sutton

PLAN OF INSTALLATION FOR A TOWN OF 40,000 INHABITANTS.

ordinary river water, in the course of a few minutes, a constant supply of pure cold water at the rate of 1,000 litres per hour; that wood, coal or liquid fuel can be used for the apparatus, the consumption of coal for an apparatus of the size indicated being only a few pounds per hour; that coal, gas, petroleum or steam can be used to operate the fixed machinery; and that in all public institutions having steam-circulating pipes for heating purposes it would simply be necessary to connect the loop to these pipes and fix the apparatus wherever desired. An apparatus for which so many advantages can be claimed certainly merits investigation on the part of those interested in the important question of the purity of water supplies.

The apparatus has certainly found a large amount of favour in France. For more than eighteen months it has been fixed at the Sanatorium de St. Trojan (le d'Oleron) and we understand that it has given entire satisfaction. Since its adoption at the Chateaudun barracks typhoid fever has almost entirely disappeared, and the apparatus is also in use at a number of other barracks, as well as at Cherbourg in connection with the French navy. An apparatus has also been fixed at the residence of Baron Rothschild, Chantilly, and negotiations are in progress for installations in the towns of Castres, Carcassone, Cannes, Toulouse, Beziers, and elsewhere.

The address of the company is the Water Sterilisation Syndicate, Limited, 152 Winchester House, E.C., and we may also mention that an apparatus has recently been on view at the Sanitary Institute, Margaret-street, W., where it has been inspected by a number of medical men, engineers and others.

York.—The city council have received a report from the town clerk stating that he had received from the Local Government Board sanction to borrow £1,805 for street improvements in Skeldergate, Barker-hill and Spurriergate; £354 for the purchase of old cottages in Hootham, and laying-out the ground adjoining the Abbey walls; and £5,936 for carrying out improvements in Parliament-street, Heslington-road, South-bank and other streets.—It is proposed to accept the tender of Messrs. Parker & Sharp, contractors, York, at the sum of £7,174, for the erection of the electric lighting station. The Electric Lighting Committee have had before them the question of adapting the dynamos and instruments for use afterwards for electric traction. The extra cost will be £274, and the committee ask for instructions of the council.

£1,420 for water. The medical officer, Dr. Mackenzie, strongly supported the scheme, and stated that epidemics of typhoid fever were indirectly due to the intermittent supply from Sutton, the people having gone to some of the old wells for water. There was no opposition to the scheme.

ROYAL INSTITUTE OF PUBLIC HEALTH.

THE CONGRESS AT DUBLIN.

The preliminary programme of the congress to be held by the Royal Institute of Public Health in Dublin, from the 18th to the 23rd August, has been issued. Particulars of the congress have at various times been published in our columns, but the programme gives some additional information. The presidential address will be delivered by Sir Charles A. Cameron, M.D., in the Examination Hall, Trinity College, on Thursday, the 18th of August, at 12 o'clock. Among the subjects selected for discussion the following will be of most interest to municipal engineers: The water supply of urban and rural populations, the pollution of rivers and the treatment of sewage, Irish health resorts, climate in relation to hospital sites, the designing and construction of hospitals, designs for lunatic asylums, heating and ventilation of public buildings, housing of the working classes, construction of fumigating and disinfecting chambers, designs and construction of refuge destructors, also in relation to sites of dwellings, housing of the working classes (including the very poor), municipalisation of tramways and public lighting, prevention of hideous boardings and structures in the streets of the city, the terminable household system in regard to municipal sanitation, the extension of towns as a means of promoting public health and the housing of the poor.

In addition to the papers and discussions it is proposed that inspection shall be made of the principal buildings in connection with the Public Health Department of the corporation, and their workings explained to the delegates. Large public works and institutions throughout the city will also be visited, and there will be visits to the scientific departments in and around the city. The Health Exhibition of the congress will be held, by kind permission of the Senate, in the Royal University Buildings, 18th to 27th August. Full information concerning this department will be furnished on application to the hon. secretary, Mr. G. Ross, M.A., F.F., 61 Dawson-street, Dublin.

CORRESPONDENCE.

Sewer Ventilation.—Mr. Edward Pitts, secretary of Webb's Engineering Company, Limited, 52 Queen Victoria-street, E.C., writes: In your report of the annual meeting of the Association of Municipal and County Engineers, held at Edinburgh, published in your issue of the 15th inst., Mr. Pickering, of Nuneaton, makes the following statement: "Another process which had been brought before them was the destruction of sewer gas by the consumption of coal gas. They had some of these gas destructors at work as an experiment, but they found that if the gas light went out the system of ventilation was made very much worse. He did not think there was an engineer who had put up these gas destructors who did not find them go out and leave the sewers unventilated." As Mr. Pickering does not give the name of the apparatus to which he refers, I must ask you to kindly get him to do this, as we are interested in a sewer gas extractor and destructor which has been in use a considerable time and has received the approval of many of the leading engineers of this country. We have received testimonials from many engineers of most important towns, and wherever our apparatus has been tried it has given entire satisfaction; in no case has it been known to fail in the manner Mr. Pickering mentions. We have never supplied our destructors to Nuneaton, therefore we do not think Mr. Pickering has had the opportunity of testing our method, which is the only one of its kind on the market at the present time that I am aware of, and as this statement, appearing as it does in your valuable paper, will come under the notice of most of the engineers in this country, and is calculated to do us a serious injury, we must ask you to be good enough to get Mr. Pickering to name the apparatus he talks of, otherwise undoubtedly it will be thought that he refers to Webb's patent sewer gas extractor and destructor, which is the property of this company. I do not doubt for a moment that Mr. Pickering speaks truthfully and in perfect good faith, and does not refer to our destructors; but, as I have before mentioned, I have no knowledge of any other apparatus of a similar description on the market, and see no reason why he should not give the name of the apparatus in question, or the name of the maker or makers. I enclose for your perusal a circular containing some of the testimonials which we have received, which will bear out my letter. You are at perfect liberty to apply to any of the gentlemen whose names are attached as to the genuineness of these testimonials, or I shall be pleased to show you the originals at this office.

[We insert Mr. Pitts's letter with pleasure, but we must point out that it would be rather out of place for us to approach Mr. Pickering in the matter, as that gentleman is himself the sole judge of what he should say on the subject, and may not consider that he is under any obligation to add to his remarks. The letter, of course, speaks for itself. The names to which Mr. Pitt refers in his last sentence include those of some well-known municipal engineers, and no assurance is required as to the genuineness of the testimonials.—Ed. THE SURVEYOR.]

Illuminating Gas from Sewage Sludge.—Mr. Edward A. Harman, Corporation Gasworks, Huddersfield, writes: At the recent annual conference of the Association of Municipal and County Engineers in Edinburgh, Mr. Cameron read a paper upon the above subject. As bearing somewhat indirectly upon it, permit me to state that I made some experiments with sludge from the corporation sewage works of this town some twelve months since, with a view to ascertaining whether there were sufficient gases existing in the sludge to make it worth while carbonising. I had a whole week's test, the result of which was as follows:—

Summary of Tests.

Date, 1897.	Gas made per ton. Cubic feet.	Illuminating Power, Candles.	Moisture, Per cent.
June 11th	3,680	11	63
" 14th	3,670	12	40
" "	3,920	15	40
" 15th	5,360, 6,000	16.1	35
" 16th	5,360, 5,120	16.3	35
" "	5,440, 5,760	16.74	27
" 17th	5,600, 5,840	16.1	27
" "	6,320, 6,560	14.7	27
" "	7,200, 6,000	7.6	25
" 18th	5,200, 5,520	8.4	25
" "	5,680, 5,120	8.2	25
Average	5,440	12.92	33

It will be apparent that, as only 5,440 cubic feet of gas of an illuminating power of 12.92 candles was obtainable per ton on an average, it was not economical to do anything with the refuse, with the present prices of coal; but in cases of emergency it would be worth further consideration. The average moisture in the material was 33 per cent.; and there was the further serious objection that the sludge contained large quantities of minute organisms. It occurs to me that these tests may have some slight interest, although upon different lines from those indicated in Edinburgh. Needless to add, such treatment of sludge is a perfect destructor.

ARBITRATIONS AND AWARDS.

On Thursday Mr. Shaw, Q.C., M.P., as oversman in the arbitration between the city of Perth and Mr. Rollo, of Rodney Lodge, in regard to compensation for loss and damage sustained by the latter through the erection of a new bridge at Perth, issued his final decision. The sum claimed by Mr. Rollo was £20,000, but on the hearing of the case in Edinburgh, a month ago, Mr. Shaw awarded claim at £3,785. The commissioners and Mr. Rollo appealed against the decision, but on again hearing parties' agents the oversman adhered to his former findings.

On Tuesday, at the Guildhall, Westminster, Mr. Trontbeck and a special jury heard the case of Roberts v. The London County Council, a claim for about £33,000 as compensation in respect of the freehold interest in the premises Nos. 268, 270 and 271 Strand, which have been acquired by the London County Council for the purposes of the Strand improvement. The premises Nos. 270 and 271 are in the occupation of Mr. Nutt, at £650 a year, on lease for twenty-one years from 1888; while No. 268 is at present vacant, the front being let as an advertising station at £130 a year. It appeared that Mr. Nutt had to expend about £1,000 on the premises as one of the conditions of the lease, and it was submitted, on behalf of the claimant, that the present rental value on the premises 270-271 Strand is £900 a year. Sir J. Whitaker Ellis valued the property Nos. 270 and 271 for the term of the lease at £6,500, and in reversion (deferred twelve years on the 3 per cent. table) at £15,700; and No. 268 at £310 a year (on the 5 per cent. table), £7,750; a total of £29,950, to which he added 10 per cent. for compulsory sale, making £32,945, to which one year's rent of No. 268 had to be added as a *solatium* for the interference with the letting of the property subsequent to the date of the notice to treat. On behalf of the London County Council the rental in the lease of Nos. 270-271 was stated to be full, and the reversionary rental as not more than £700, while the rental of No. 268 was estimated at £200. From this there was a deduction for repairs, and the total valuations averaged £21,600. The jury awarded the claimant the sum of £25,850, plus one year's rent of No. 268, making a total of £26,100.

STOCKPORT SEWERAGE WORKS.

In the presence of a number of members of the Stockport Corporation, a trial was recently made of the engines and pumps just completed at the sewage outfall works, now almost completed, on the Chedale side of the river at Heaton Mersey. For the past four years, says *The Manchester Guardian*, the work of constructing a main intercepting sewer has been in progress. It is equal to 7 ft. diameter through the town, and runs to a depth of 60 ft. in the red sandstone rock, crossing under the river three times, twice by inverted siphons. A peculiar difficulty was met with in a number of tunnels, 5 ft. to 6 ft. square, formed many years ago for the purpose of conveying water from the upper reaches of the river to the mills in the valley, and which crossed the route of the sewer at almost the same level. For the purpose of treating the sewage to be conveyed by this sewer the corporation purchased 95 acres of land, of which 60 acres are now under construction into filtration areas of 5 or 6 acres each, for the purposes of intermittent filtration after the sewage has passed through the tanks and been treated with lime for purification and precipitation. There are eight tanks, each covering an area of 120 ft. by 60 ft.

THE MACHINERY.

It is necessary to raise the sewage from the sewer to the tanks, and the machinery for this purpose, which was set in motion last week as a trial, comprises two boilers constructed by Mr. T. Oldham, Heaton Norris, and capable of a pressure of 200 lb. to the square inch, and a pair of horizontal compound double-crank jet-condensing engines and pumps, erected by Mr. J. H. Gwynne, of London, known as the "Invincible," and each pump capable of lifting 18,000 gallons per minute 19 ft. high, having a 27-in. suction.

Mr. A. M. Fowler, the engineer, under whose direction the works have been carried out at a cost so far of some £140,000, expressed satisfaction with the working of the machinery. He said there had been great difficulty in obtaining a supply of water for the engines for condensing purposes and for general use on the sewage outfall works. A well sunk 25 ft. failed to yield sufficient supply. A borehole was then carried to a depth of 240 ft. into the red sandstone and produced 5,000 gallons per hour, and the problem of lifting the water to the top of the buildings without placing machinery outside the main structure was solved by pneumatic action. The borehole was sealed at the top, having been lined with iron pipe, and a small pipe, 3 in. diameter, was put down inside the larger pipes and the water forced up. The air engine which effects this result will also be used for pressing the mud and for other purposes. Messrs. Hughes & Lancaster, of Westminster, put down this apparatus, which is said to be novel in this district. The engineer further expressed strong hopes of being able to produce a satisfactory effluent.

Parliamentary Memoranda.

On Thursday, in the House of Lords, the Southampton Gas Bill and the Maldon Water Bill were each read a third time and passed.

The Local Government (Ireland) Bill.—This Bill was read a second time, after a three hours' debate and without a division. Lord Ashbourne, in moving the reading, expressed an earnest hope that all classes and all interests in Ireland would loyally combine to work out its provisions to the best of their ability. That hope was strengthened, among other things, by the desire shown by many of the leading and experienced country gentlemen who had long taken part in the administration of the grand jury system, and he sincerely trusted that the proposals embodied in the Bill would be found to operate with firmness and justness to all concerned.

In the House of Commons the Lords' amendments to the Matlock Urban District Council Bill and the Tottenham and Edmonton Gas Bill were agreed to. The following Bills from the Lords were read the third time: Felixstowe and Walton Water Bill and the Newton Water Bill. The Chelsea Electric Supply Bill was read a second time.

In the House of Lords on Friday the Clacton-on-Sea Gas and Water Bill was read a third time and passed.

In the House of Commons the Lords' amendments to the following Bills were agreed to: Blackburn Corporation (Tramways, &c.) Bill, Bristol Tramways (Electrical Power, &c.) Bill, Bristol Tramways (Extensions) Bill, and Plymouth and Stonehouse Gas Bill. The Newhaven Harbour Bill was read the third time (Queen's consent, on behalf of the Crown to be signified).

On Monday the House of Lords met at 3 o'clock, to hear the Royal assent given by commission to several Bills which had passed both Houses. When the Speaker and the House of Commons appeared at the bar the Royal assent was given to the following private Acts: The Local Government Board's Provisional Orders Confirmation (Nos. 4 to 12) Acts, Gas Orders Confirmation (No. 1 and 2) Acts, Edinburgh Improvement Scheme Provisional Order Confirmation Act, Local Government Board (Ireland) Provisional Orders Confirmation (No. 3) Act, Leithburgh Provisional Order Confirmation Act, Electric Lighting Orders Confirmation (Nos. 6, 10, 11 and 14) Acts, Pier and Harbour Orders Confirmation (No. 1) Act, Local Government Board's Provisional Orders Confirmation (Gas) Act, Local Government Board's Provisional Orders Confirmation (Housing of the Working Classes) Act, Aberdeen Corporation (Tramways) Act, Staines Reservoirs Act, Belfast Harbour Act, Blackpool Improvement Act, Sheringham Gas and Water Act, Carmarthen Improvement Act, Northern Urban District Water Act, North Warwickshire Water Act, Gainsborough Gas Act, Southend Waterworks Act, Southwark and Vauxhall Water Act, Yeovil Corporation Act, Iford Improvement Act, Cranbrook District Water Act, Crawley and District Water Act, East Ham Improvement Act, Wishaw Water (Additional Supply) Act, Liskeard Corporation Act, Norwich Electric Tramways Act, Cardiff Corporation Act, Dundee Corporation (Tramways) Act, Cromer Gas Act, Drogheda (Corporation) Gas Act, Dover Harbour Act, London Building Act, 1894 (Amendment) Act, Plymouth Corporation Act, Stirling Gas Act, London County Council (Acton Sewage) Act, Halifax Corporation Act, Folkestone Water Act, City of Norwich Waterworks Act, Blackpool and Fleetwood Tramroad Act, Hamilton Water Act, Kettering Water Act, Kow Bridge Act, Bacup Corporation Water Act, Highnam and Hundred of Hoo Water (Amendment) Act, Dublin Southern District Tramways Act, Matlock Urban District Council Act, Tottenham and Edmonton Gas Act, Felixstowe and Walton Water Act, Newtown Water Act, Blackburn Corporation (Tramways, &c.) Act, Bristol Tramways (Electrical Power, &c.) Act, Bristol Tramways (Extensions) Act, Plymouth and Stonehouse Gas Act, and the Newhaven and Seaford Sea Defences Act. The ordinary business was then proceeded with. The Burnley Corporation (Tramways, &c.) Bill was read the third time. The House then went into committee on the Local Government (Ireland) Bill. After considerable discussion, the Bill, with several amendments, was reported to the House, and yesterday was fixed for the report stage.

In the House of Commons the Clontarf and Hill of Howth Tramroad Bill and the Tynemouth Corporation Water Bill were read the third time and passed with amendments. The Electric Lighting Provisional Orders (No. 12) Bill was considered, and also read the third time and passed.

On Tuesday, in the House of Lords, the Liverpool Corporation Bill, the London County Council (Money) Bill and the Middlesex County Council Bill were read the third time. Lord Windsor intimated that he did not intend to proceed with the Public Libraries Bill, which was down for second reading.

In the House of Commons the Newhaven and Seaford Water Bill was considered, with amendments, and ordered to be read the third time. The Electric Lighting Provisional Orders (Nos. 7 and 8) Bills were read a second time and committed, and the Lords' amendments to the Locomotives on Highways Bill were considered and agreed to. Mr. Hanbury introduced a new Bill to transfer to the commissioners of the township of Kingstown certain roads and lands now vested

in the Commissioners of Kingstown Harbour, and for other purposes. The Bill was read a first time.

On Wednesday, in the House of Commons, the Buckie (Clory) Harbour Bill was read a third time and passed, with amendments, together with the Pier and Harbour Provisional Orders (No. 2) Bill, the Tramways Orders Confirmation (No. 2) Bill and the Water Orders Confirmation Bill. The Electric Lighting Provisional Orders (No. 5) Bill and the Tramways Orders Confirmation (No. 1) Bill, as amended, were considered and ordered to be read the third time yesterday.

PRIVATE BILLS IN COMMITTEE.

London United Tramways Bill.—When the Bill promoted by the London United Tramways Company recently came before a committee of the House of Lords, presided over by Lord Ribblesdale, the London County Council did not appear as opponents. The negotiations that had taken place with that authority had resulted in an understanding by which both the overhead and underground systems of electric traction were to be tested side by side, and then the council were satisfied. The Bill was presented in the modified form in which it had passed the Commons. It provided that the company should be empowered to extend their existing lines from Kew bridge to Hounslow, through Brentford, along the Chiswick high road, and from Brentford along the Boston road to Hanwell, and to introduce electrically throughout the whole of the system. The Bill was again opposed by the Middlesex County Council, but the point in dispute related to the contributions of the company to local authorities in respect of the maintenance of roads. The committee passed the Bill, but decided that any contributions received by the local authorities from the company should be handed over to the Middlesex County Council. In the case of Chiswick it was decided that an apportionment should be agreed upon between the district council and the county council.

Marylebone and Bernoulessey Electric Lighting Bills.—Underlying the Bills promoted by the vestries of Marylebone and Bernoulessey for the confirmation of the provisional orders granted by the Board of Trade to enable them to undertake the supply of electricity within their district was an important principle which the House of Commons Committee presided over by Sir A. F. Gordon have decided against the vestries. Incidentally, the decision arrived at implies a censure on the Board of Trade. Not long ago the principle itself was raised in the House of Commons by Mr. Cripps, q.c., the member for Stroud, who severely condemned the Board of Trade for authorising indiscriminate competition, by granting two or more provisional orders to companies and local authorities operating within the same area. Companies are at present in existence which have obtained powers to supply the districts in question with electricity mainly for the purpose of lighting, and now the vestries came forward with provisional orders empowering them to establish competitive services. The Board of Trade had passed the provisional orders, and Mr. Cripps characterised this as in substance expropriation without compensation, and declared it to be a serious and dangerous infringement of the recognised principle of security that every man should be compensated before his property, and particularly property guaranteed by an Act of Parliament, could be attacked or depreciated. Mr. Ritchie, in defending the department of which he is the ministerial head, had no hesitation in saying that, had the Board of Trade not acted as they did, they would not have met the approval of Parliament. How far he was right will be seen from the sequel. The Bill of the Marylebone Vestry was opposed before the committee by the Metropolitan Electric Supply Corporation, who at present supply the district with electricity. Mr. Worsley Taylor, q.c., the counsel for the promoters, put the issue very clearly before the committee. There were two questions to consider—whether there should be an alternative system of supply by somebody, and whether that somebody should be the local authority. He urged, of course, the value of competition, which would secure an advantage to the consumer and a regulation price, as well as the additional advantage of a different system. The vestry had received applications from two companies to obtain their sanction to supply electricity, but they thought it better to undertake the supply themselves. Mr. T. Brooke Hitching, l.c.c., chairman of the Electric Lighting Committee of the Marylebone Vestry, who gave evidence in support of the Bill, stated that he considered competition would lead to a better light and lower price. Mr. Balfour Browne, q.c., on behalf of the company, who had expended £320,000 on their electric system in the district, contended that a report of Sir F. Marinden and a letter of the Board of Trade proved that they had never contemplated the competition of a local authority with an established company. In the case of two rival companies the board had advised that these should not be of the same system. In the case of gas and water companies Parliament had distinctly refused to allow the local authority to take powers unless they purchased the rights of the company in possession. The company had a capital of £782,500, and if the committee granted powers to the vestry the result would be that at the end of forty-two years the undertaking would

be of no value. Sir John Lubbock, M.P., called on behalf of the opponents, expressed the opinion that there had been an understanding that the agreement with the vestry would secure them against competition from the local authority. Mr. F. Bailey, managing director of the company, and Mr. R. Hammond, consulting electrical engineer, gave evidence to the same effect. The committee decided that they could not confirm the provisional order. The Bermondsey case differed from the Marylebone in this respect. The opposing company—the London Electric Supply Corporation—had not applied a single unit of electrical energy within their area, although they had been established in 1889. The main trunk had been laid, but it had been done for the supply of the district beyond the parish. The vestry had applied for the electric light to be furnished to their public buildings, the town hall and the public library, without success, and they had, therefore, determined to undertake a separate supply. Mr. Robert Stewart Bain, the managing director of the company, stated that since 1892 they had not had a single demand for the supply of electric light in Bermondsey. Of the 3,000,000 or 4,000,000 lamps which they supplied only 1,462 were in Bermondsey. The committee, after consultation, suggested that the order should be withdrawn, as the point raised in it was not ripe for discussion. They were of opinion that the local authority should consider the question in the light of purchase. They thought that if by an original order, or by purchase, any local authority became the sole power for electric lighting in their district they should not be interfered with by competitors from the granting of a provisional order to any company in the district. Mr. Littler, Q.C., who represented the vestry, intimated that they would like to take the view of the company as to purchase and get the order, so as to save expense. Mr. Pembroke Stephens, Q.C., stated, on behalf of the company, that if an agreement as to the purchase of the works was arrived at the vestry could get an unopposed order next year. There the matter rests. After giving the Bermondsey Vestry and the London Electric Corporation an opportunity for negotiation, Sir A. F. Godson's committee resumed consideration on Thursday of the Bill to confirm the provisional order in the case of Bermondsey. The committee had suggested that the order should be withdrawn until next session, but they were willing to postpone the question, so that the vestry might consider the advisability of acquiring the company's undertaking by purchase. They had laid down that a local authority, becoming by purchase or otherwise the sole electric lighting authority in a district, should be protected from competition. On Thursday Mr. Littler, Q.C., on behalf of the vestry, offered to insert a clause in the Bill by which that authority would only be able to exercise the powers conferred upon them after acquiring by purchase the mains and works already laid down by the company, the terms to be fixed by arbitration, and the company's powers of supply to altogether cease on the completion of the purchase. Mr. Pembroke Stephens, for the company, argued that the matter should not be allowed to proceed further. After listening to the arguments advanced and deliberating in private, the committee decided to confirm the order with the additional clause submitted.

Newhaven and Seaford Water Bill.—When the session began there were two Bills before Parliament in which powers were sought to supply Newhaven and Seaford with water. The first, and in some respects the more important of the two, never reached the committee stage. It was defeated on technical objections, taken as to non-compliance with standing orders. It provided for the constitution and incorporation of a water board for the urban districts of Newhaven and Seaford and the rural district of Newhaven Union, for the transfer to the board of the undertaking of the Newhaven and Seaford Water Company, Limited, for the construction of additional waterworks and supply of water within the prescribed limits, and for powers to raise £93,000. This Bill was promoted by the three local authorities named, but objection was raised to it by the Newhaven and Seaford Water Company, Limited, on the ground that the opinion of the ratepayers had not been taken with regard to the scheme, and the objection was fatal. The other Bill was submitted by the Newhaven and Seaford Water Company, who came to Parliament for powers to dissolve the present company and re-incorporate it, with powers to construct additional waterworks and supply water within extended limits, and to raise £25,000 new capital. This measure was very vigorously opposed before a House of Commons committee, presided over by Sir A. F. Godson, on Monday by the urban district councils of Newhaven and Seaford. The company, it appeared, had promoted a similar Bill last year, but it had been rejected on the strength of expert evidence, called on behalf of the district councils, to prove that a new well which they proposed to sink in the chalk beds would not yield a sufficient supply of pure and wholesome water to meet the requirements of the district. Since last year, however, the company had under the statutory powers they already possessed purchased the site for the new well, at the place proposed in last year's Bill, constructed the well, and had found that it yielded an abundant supply of excellent water. Up to the last two years the company had been drawing 230,000 gallons a day, but since the new well had been sunk they had proved that they could draw up to 700,000 gallons. They had stopped up the old Farmhouse

well, to which exception had been taken, so that it should not contaminate the new source of supply. The new well had been sunk at a cost of £11,000. The company, while fairly prosperous, had not paid exceptionally large dividends. For the first two years after its establishment in 1881 it had paid no dividend, but after that time the dividends went on increasing until it paid 6 per cent. The average dividend paid since the waterworks started was 3 per cent. It was contended by the opposing councils that the site of the new well was objectionable by reason of its proximity to the sea; that, like the existing Farmhouse well, the water would in time become impure by reason of the excess of saline, and that a sufficient supply could not be depended upon. The district councils sought the insertion of a clause in the Bill to compel the company to agree to the purchase of the undertaking by the proposed water board, to which reference has already been made, the price, failing agreement, to be fixed by an arbitrator. The clause stipulated, however, that no compensation should be given to the company for any works they might construct after July, 1897, thus debarring the company from the recoupment of their outlay in connection with the construction of the new works. Mr. Robert Lamb, the chairman of the Newhaven and Seaford Water Company, sketched the history of the company, and stated that the authorised capital amounted to £30,000. They had still £7,400 of the capital they were authorised to raise unissued. Mr. F. T. Courtney, M.I.C.E., Mr. Hawkesley, M.I.C.E., Prof. Boyd Dawkins, and Mr. Whitaker, the well-known geologist, gave evidence to the effect that the site selected was the best that could possibly be chosen to supply Newhaven on the one side and Seaford on the other, that the water from the new well was absolutely pure, that the well was capable of supplying from 1,000,000 to 2,000,000 gallons per day, and that there was no danger of an inflow of salt water so long as they did not over-pump. The district councils brought forward a large amount of engineering evidence, with a view to showing that the new well sunk by the company at Poverty Bottom was, by reason of its proximity to the sea, liable to be contaminated by salt water. Among the witnesses called were Mr. Archibald Millar, M.I.C.E., Mr. Henry Rolfe, M.I.C.E., and Mr. E. S. Burstall, M.I.C.E., who had all inspected the well and the site of the new reservoir, and they declared that it was inevitable that some time or other—it might be years or it might be months—when the sea level was reached by the pumping operations that the promoters should come in contact with salt water. The committee passed the Bill, but inserted a clause providing that the local authorities might acquire the undertaking by compulsory purchase at a price to be fixed by an arbitrator. It was provided, however, that the arbitrator should take into consideration the works executed under the Bill and under the former statutory powers of the company.

London County Council General Powers Bill.—The London County Council encountered a good deal of opposition in connection with the promotion of their General Powers Bill, an omnibus measure, providing for a variety of improvements. The improvements contemplated included the construction of a new street in continuation of Roehampton-street, Westminster, the widening of York-road, Battersea, and the Albert Embankment, and the reconstruction of the Rosemary Branch bridge of the Regent's canal. The petitioners against the Bill, when it came the other day before a committee of the House of Lords, presided over by Lord Ribblesdale, were the Wandsworth District Board of Works, the South London Tramways Company, and Mr. R. R. Fairbairn and other watermen. Sir Alexander Binnie, the chief engineer to the London County Council, stated that all the improvements proposed in the Bill were very necessary in the public interest. The Bill was passed, but clauses were inserted giving protection to various interests, particularly those of the tramway company.

Portsmouth Corporation Tramway Bill.—The Bill promoted by the Corporation of Portsmouth for the acquisition of the tramway system of the town was passed by a committee of the House of Commons, presided over by the chairman of Ways and Means, on Tuesday. After a comparatively smooth passage through the Lords the measure was threatened with serious opposition in the Commons. This opposition was led by Mr. A. W. White, the chief promoter of the Cosham Light Railway. He objected to a clause extending the powers of the Portsmouth Town Council over the Cosham section of the line for seven years beyond the period when the Cosham Parish Council could acquire it at valuation. This clause was inserted to protect the interests of the ratepayers of Portsmouth, who will incur an expenditure of some thousands of pounds in the equipment of the line for electric traction, and it was considered to be manifestly unfair that almost immediately after the completion of this work the Cosham Parish Council should have the right to step in and take possession at the price of old metal. Rather than this, the corporation were determined that if the opposition were not withdrawn the electrical equipment of the Cosham line should not be proceeded with. Mr. White's real object was to force the hands of the corporation, so that they would have to give him a connection at Cosham between their system and the light railway, and also to give him many powers over their lines to North End. The corporation had no objection to make arrangements with the Light Railway Company later on, but they declined to be bound hand and foot to the adaptation of

their system to the light railway. Mr. White, having failed to obtain the support of the Fareham Rural District Council, withdrew his opposition almost at the last moment, and the Bill went through.

Gas Light and Coke Company's Bill and London County Council.—The Bill promoted by the Gas Light and Coke Company for the conversion and consolidation of their capital had again to face the opposition of the London County Council before a select committee of the House of Lords presided over by the Earl of Camperdown, an opposition which it will be remembered was unsuccessful in the Lower House. The company in the Bill sought powers to consolidate and convert the existing stock into 4 per cent. consolidated preference stock, 3½ per cent. maximum stock, ordinary stock with a standard rate of dividend of 4 per cent and 3 per cent. consolidated debenture stock. The county council in their petition raised the question of the price of gas charged by the company to North London consumers as compared with that fixed by the South Metropolitan Gas Company and other companies in the south of London. It was explained, on behalf of the promoters, that the proposed conversion would make the stock a tangible and useful investment stock for small holders, readily realisable and marketable. By fixing the price to be charged for gas and applying the sliding scale in regard to dividends, Parliament had made the consumer predominant partner with the company in any economy secured in the production of gas. The sliding scale had operated enormously to the advantage of the consumer, by cheapening gas. Were the price raised the company would be obliged to decrease the dividend; were the price lowered the dividend could be increased above the 10 per cent. fixed in their Act. The company, with a standard price of 3s. 9d., were now charging 3s. per 1,000 cubic feet, and the last dividend was 12½ per cent. Before the company was compelled to fix the price at 3s., and thereby come under the penalty of smaller dividends imposed by the sliding scale, the stock stood in the market at £312, and it now stood at about £275. Anybody who went into the market and bought £100 of stock therefore had to pay roughly about £300 for it. It was almost unintelligible to the small investor, whom it was especially desirable to encourage, to become a holder in gas undertakings, that after paying £300 he received a certificate for only £100 of stock. The object of the Bill was to convert the stock by exactly correlative and proportionate conversion into a stock bearing a lower rate of dividend, and therefore commanding a smaller proportionate price in the market. There were at present fifteen different descriptions of gas light and coke stock on the market, and it was proposed to convert them into three descriptions of stock and a debenture stock. The operation of the sliding scale as to the price of gas would remain unchanged, and the position of the 250,000 consumers would not be affected one atom. Mr. J. W. Field, secretary and general manager of the company, stated that they wanted to get rid of the anomaly of being charged with having 12½ per cent. stock when really the investor buying shares under the auction clauses received only 4 per cent.; and they desired to get rid of the ambiguous nature of their capital account. On behalf of the County Council it was argued that the company were really asking to be allowed to put £1,800,000, or thereabout, into their pockets. Mr. H. E. Haward, comptroller of the London County Council, stated that he thought the proposed conversion would enhance the saleable value of the stock. It appeared to him that the sole object of the promoters was to make the stock more marketable, and therefore increase its price. Should the county council acquire the undertaking, the stock exchange value would indirectly affect the award of an arbitrator when fixing the purchase price. The committee passed the Bill, but inserted a clause to the effect that in the event of purchase by a public or local authority the market prices of the stock should not be taken into consideration by the arbitrator.

Renfrew Burgh and Harbour Extension Bill.—The House of Lords have wrecked the Bill promoted by the Corporation of Renfrew for the extension of the burgh and harbour. A committee of the House of Commons gave the measure, which provided for a considerable extension of the burgh area along the Clyde and the construction of a commodious new dock, fifteen days' patient consideration, deciding that the council should be allowed to construct the dock, but limiting the extension of the burgh to the property to be acquired for dock purposes. The Lords' Committee presided over by the Earl of Kintore threw out the Bill after four days' hearing. Some of the most powerful interests on the Clydeside came forward to oppose the measure. At the head of them was the Clyde Trust, who objected to it, as they had objected to Kilpatrick dock scheme last year, because they saw in it an attempt to subvert their authority and to put an end to their monopoly in matters affecting the navigation of the river. The Corporation of Glasgow, the Greenock Harbour Trustees, the Cart Navigation Trust, the Glasgow and South-Western Railway Company, were all hostile to the Bill. It was explained on behalf of the promoters that the burgh extension portion of the Bill might be said to have dropped, because the Committee of the House of Commons had only allowed such an extension of the burgh as was necessary to enable the dock to be enlarged, with a fair margin round it for sidings and so forth, so that the dock might be within the limits of the burgh. The Bill was therefore practically one for the

extension of the harbour. The dock was to have an area of 15 or 16 acres of water and 1,300 or 1,400 yards of quays, furnished with all modern appliances for dealing expeditiously with the coal and iron traffic, which it was believed would form the staple trade. The corporation would also have 35 acres of land for sidings and storage a matter of very considerable importance in connection with such a project. The estimated cost of the work was rather over £200,000, and the borrowing powers were £250,000. Mr. Forman, C.F., and Sir John Wolf Barry laid the engineering details of the scheme before the committee, but Mr. Forman's evidence only took an hour and a half, whereas he sat in the witness chair two and a half days in the other House. Mr. Harper, the joint town clerk of Renfrew, gave the committee the most positive assurance that the Bill was promoted by the Corporation of Renfrew alone and that the dock would be constructed and managed by them. The petitions of the Clyde Trustees and the Corporation of Glasgow were based on the theory that they had a monopoly in the dock accommodation of the Clyde for 20 miles, and that, having regard to their enormous outlay in improving the navigation, their rights ought not to be encroached upon by rivals. Lord Provost Richmond explained what the Clyde Trust had done for the river, claiming that they had been the making of it, and insisted that the new dock would seriously injure the Trust. It was not needed, inasmuch as the facilities afforded for the traffic at the existing docks were ample. Since the Kilpatrick dock scheme was thrown out last year the new Prince's dock, constructed at great cost, had been completed and opened. The Clyde Trust, he said, had 100 acres of land at Shield Hall admirably suited for dock accommodation when it should be required. They had £5,000,000 or £6,000,000 outstanding to the public, and he was of opinion that if this dock were made their bonds would be seriously affected. It was probable that if a dock were made at Renfrew it would take away part of the trade of Glasgow; but that did not prove that a dock at Renfrew was required. He firmly maintained that no outside authority should be allowed to put down a dock on territory under the jurisdiction of the Clyde Trustees. Mr. John Ure, the deputy-chairman of the trustees, declared that, so far from the harbour being congested, it was capable of doing a great deal more work than it was doing now. The Earl of Kintore, in giving the decision of the committee on Friday, said they had given the measure earnest consideration, and were unanimously of opinion that it should not be allowed to proceed.

Rochdale Corporation Water Bill.—After disposing of the Bury Corporation Bill, Colonel Ginter's House of Commons committee took up the measure promoted by the Corporation of Rochdale for the acquisition of the Todmorden waterworks, in pursuance of their agreement with the waterworks company for authority to construct additional works and for power to borrow £450,000 for the purposes of the undertaking. The Todmorden Corporation, the West Riding of Yorkshire County Council, the West Riding Rivers Board, the Corporation of Dewsbury and the Littleborough District Council petitioned against the Bill in the other House, but now the only opposing corporation was Littleborough. It was explained that new waterworks had become a matter of urgency in Rochdale, whose population had now increased to 107,000, and whose water service was 1,352,000 gallons per day. To meet the requirements of the town and district it was proposed to acquire the reservoir of the Todmorden Waterworks Company at Ramsden Clough, which had the storage capacity of 104,000,000, and was capable of yielding a supply of 450,000 gallons after allowing for compensation water. The capacity of the present Rochdale reservoir was 2,000,000 gallons per day, which would probably be equal to the demand for two or three years, but it was estimated that by the year 1906 not less than 2,500,000 gallons would be required to supply the town and district. Messrs. Molesworth manufacturers, whose water supply was affected by the scheme, obtained a clause providing that, should their mills be injured by the diversion of water as the result of the new project, their property should be acquired by the corporation at valuation price. Littleborough District Council were anxious to impose such conditions upon the promoters as would entitle the smaller authority to establish a water supply of their own at some future time.

Opening of Highgate Wood.—The Duchess of Albany on Saturday visited Highgate, for the purpose of formally opening the Queen's Wood, which has hitherto been known as Churchyard Bottom Wood, but has received its new name in commemoration of the fact that the money required for its purchase was raised in the year of her Majesty's diamond jubilee. The wood, which comprises a portion of the primeval forest of Middlesex, comprises 52 acres, and has been purchased from the Ecclesiastical Commissioners for the sum of £25,000, towards which the Hornsey Urban District Council contributed £10,000, the Middlesex County Council £5,000, the Islington Vestry £2,000, and the St. Pancras Vestry £1,000. The wood has been enclosed with a 6-ft. iron fence, and all the paths have lately been re-made. Two other pieces of land have been added to it, and a lodge and refreshment pavilion are in course of erection. The wood will be under the control of the Hornsey Urban District Council.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XVI.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

ROAD MATERIALS AND CONSTRUCTION (continued).

GRAVEL.—Gravel consists of small loose stones which have become rounded and worn by the action of water. It is found in alluvial deposits, drift, sea beaches and river beds, both recent and ancient. If free from large quantities of earthy matter and of a flinty nature it may be used for roads of very light traffic, but will require constant attention to maintain a good surface. Owing to the smooth character of the stones it is difficult to roll in, and often may be seen to move forward in a wavelike manner in front of a steam roller even when considerable quantities of binding material are used. There is no advantage therefore in using "double-screened" gravel, as the fine stuff or "hoggin" screened out must invariably be again added in the form of a "binding material" before the surface can be consolidated. Gravel surfaces, especially if subjected to much traffic, are seriously affected by wet weather and frost; also during the processes of scraping and scavenging large quantities of road material are unavoidably carted away.

The general remarks of Sir H. Parnell in his valuable "Treatise on Roads" will be of interest. He says: "With respect to the subject generally of road materials, it may be observed that the best descriptions consist of basalt, granite, quartz, syenite and porphyry rocks.* The *whinstones* found in different parts of the United Kingdom, Guernsey *granite*, Mountsorrel and Hartshill stone of Leicestershire, and the *pebbles* of Shropshire, Staffordshire and Warwickshire are among the best of the stones now commonly in use. The *schistose stones* will make smooth roads, being of a slaty and argillaceous structure, but are rapidly destroyed when wet by the pressure of wheels, and occasion great expense in scraping and constantly laying on new coatings. *Limestone* is defective in the same respect. It wears rapidly away when wet, and therefore when the traffic is very great it is an expensive material. *Sandstone* is much too weak for the surface of a road; it will never make a hard one, but it is very well adapted to the purpose of a foundation pavement.

Flints vary very much in quality as a road material. The hardest of them are nearly as good as the best limestone, but the softer kinds are quickly crushed by the wheels of carriages and make heavy and dirty roads. *Gravel*, when it consists of pebbles of the hard sorts of stones, is a good material, particularly when the pebbles are so large as to admit of their being broken; but when it consists of limestone, sandstone or flint it is a very bad one, for it wears so rapidly that the crust of a road made with it always consists of a large portion of the earthy matter to which it is reduced. This prevents the gravel from becoming consolidated, and renders a road made with it extremely defective with respect to that perfect hardness which it ought to have."

"Coefficients of quality for various road materials have been obtained by the engineers of the French Administration des Ponts et Chaussées'. The quality was assumed to be in inverse proportion to the quantity consumed on a length of road with the same traffic, and measurements of traffic and wear were systematically made to arrive at correct results. These processes requiring great care and considerable time, direct experiments on resistance to crushing and to rubbing and collision have also been made on 673 samples of road materials of all kinds. The coefficients obtained by these experiments, which were found to agree fairly well with those arrived at by actual wear in the roads, are summarised in the following table. The coefficient 20 is equivalent to 'excellent,' 10 to 'sufficiently good,' and 5 to 'bad.'"[†]

Material.	Coefficient of Wear.	Coefficient of Crushing.
Basalt	12.5 to 21.2	12.1 to 16.00
Porphyry	14.1 to 22.9	8.3 to 16.3
Gneiss	10.3 to 19	13.4 to 14.8
Granite	7.3 to 18	7.7 to 15.8
Syenite	11.6 to 12.7	12.4 to 13.00
Slag	14.5 to 15.3	7.2 to 11.1
Quartzite	13.8 to 30	12.3 to 21.6
Quartzose sandstone	14.3 to 26.2	9.9 to 16.6
Quartz	12.9 to 17.8	12.3 to 13.2
Silex	9.8 to 21.3	14.2 to 17.6
Chalk flints	3.5 to 16.8	17.8 to 25.5
Limestone	6.6 to 15.7	6.5 to 13.5

The breaking of stone for road metal is either effected by

* *Porphyry* is a term used somewhat loosely to designate a rock consisting of a fine-grained base (usually feldspathic) through which crystals, as of feldspar or quartz, are disseminated. There are red, purple and green varieties which are highly esteemed as marbles.—Webster's "International Dictionary."

† "Encyclopædia Britannica," art. "Roads and Streets."

hand or by machine. Hand-broken stone makes the best roadways, as machines crush the material and do not turn it out in fairly uniform and cubical pieces as required for road coatings. There are also large quantities of small stuff, that separated by the revolving screen being, however, frequently used as "binding." The tendency of stone-breaking machines is to deliver large quantities of material of a very irregular pyramidal form, a difficulty which has not yet been overcome. Long, thin or flaky pieces of stone may pass several times through a machine before being broken fit for road material. The cost of breaking a hard tough stone by machine is about 1s. per ton, whilst the same work performed by manual labour costs from 2s. to 2s. 6d. per ton.* Prof. Rankine states that "the stone-breaking machine of Messrs. Blake breaks stone into cubes of about 1½ in. in the side, with an expenditure of power at the rate of from 1 horse-power to 1½ horse-power for each cubic yard broken per hour." Mr. A. M. Fowler speaks of having found great difficulty in making good roads with a steam roller and stones broken by Blake's machine, as they were not sufficiently cubical, although they did very well for the bottom.†

The wear and tear of stone-breaking machines is very considerable, and, in a case described‡ by Mr. Arthur Jacob, B.A., M.I.C.E., the actual repairs cost £124 in twelve months, representing 62½ per cent. of the original price of the machine.

"A good stone-breaker will break 2 cubic yards of hard limestone to the ordinary gauge in a day, and some men will break more. Hard siliceous stones and igneous rocks can only be broken at a rate of 1½ or of 1 cubic yard per day. Of some of the toughest, such as Guernsey granite, a man can only break on an average half a cubic yard per day. River gravel, field stones, or flints, which are already of a small size, can be broken at the rate of 3 or 4 cubic yards per day."§

As 55 per cent. of broken road metal is solid the weight of a cubic yard can be calculated as follows:—

$$W \times 27 \times .55 = \text{weight of a cubic yard broken for road metal,}$$

W being the weight of a cubic foot of the stone.

Mr. D. Kinnear Clark, M.I.C.E., gives the following rules:|
(a) To find the area of surface that can be covered by 1 ton of broken granite, when the thickness of the layer is given: divide 32 by the thickness of the layer, in inches, unrolled; or, divide 24 by the thickness of the layer, in inches, when rolled. The quotient is the area in square yards.

(b) To find the area of surface that can be covered by 1 cubic yard of broken granite, when the thickness of the layer is given: When the metal is not rolled, divide 36 by the thickness in inches; the quotient is the number of square yards that can be covered. When the metal is rolled, divide 27 by the final thickness, in inches, to give the required quotient.

The specific gravity of granites vary from 2.60 to 3.00, the volume of a ton equals from 12 to 14 cubic feet, and the weight of a cubic yard of solid granite is from 1.93 to 2.25 tons, or about 2 tons on the average. A cubic foot equals about 1½ cwt.

Granite absorbs on an average 10 lb. (a gallon) of water per cubic yard, or about 1/11th of its weight.

Various opinions have been entertained as to the proper size to which stones should be broken for road metal. Ordinarily the stone is reduced, by means of a steel-faced hammer, to pieces approximating to a cubical shape and weighing not more than 6 oz.* which is the average weight of a cube of stone measuring 1.6 in. on its side.

Mr. Bonlnois states† that "an old method of gauging used to be such a size as the stone-breaker could put in his mouth," but this was a varying gauge and unsatisfactory to all persons concerned, and 'to pass all ways through a ring of 2½ in. internal diameter' is now the size very often adopted.‡

Telford specified road metal to be broken so that the largest piece should pass through a ring 2½ in. diameter, a mode of gauging which is certainly more convenient in practice than that of weighing, and has therefore become general.

In connection with the subject of the size or weight of materials to be used, the observations of Mr. E. B. Ellicott-Clark, M.I.C.E., made at a meeting of municipal engineers at Hanley, in 1886, will be of interest:—

"Some difference of opinion exists as to the sizes to which stone should be reduced for metalling a road. There is a prevailing opinion that all stones should be broken to pass a

* The actual prices must, of course, vary with the nature of the stone and the value of the labour.

gauge of 1½ in. The writer ventures to express the opinion that this is an error. All the hardest stone, like granite, trap, rock, basalt, the Devonshire dolerite and similar rocks, should be broken to a smaller gauge than flints and the hardest limestone, which in their turn should be broken smaller than such materials as Kentish rag and stones of a similar character. The method of specifying the dimensions of stone should be abandoned for the weight test. Macadam says: "Every piece of stone put on to a road which exceeds 1 in. in any of its dimensions is mischievous," and in most of his specifications he insists on no stone weighing more than 6 oz. Parnell adopts 2½ in.* for the largest dimensions. To within the past few years the latter size was very generally adopted, irrespective of the quality of the material. It has been the fashion now for upwards of half a century, when repairing roads with granite and the harder rocks, to have the stones broken as uniformly as possible. The results of this are that, though the general surface may be in good repair, the road will be full of small rises and depressions, the surfaces of which are also rough, stones rising abruptly above the general surface of the road. It is this which causes granite macadam roads to be so unsuitable for light-sprung vehicles, such as cyclists use. The author has recently been led to investigate the cause of complaints arising from cyclists when travelling over what was apparently a well-kept road, and he has come to the conclusion that it is of as much importance to have stones of different sizes as it is to have a maximum size. The proportion of different sizes requires yet to be determined. So far as his investigations have gone, he gives the following as closely approximating upon the proper proportions of sizes:—

	Maximum Weight.	Minimum Weight.
Granite and similar rocks ...	3½	6.
Flints and similar stones ...	5	½
Limestones and similar stones ...	6	1

One-half of the total quantity to be of the maximum weight, one-eighth of the minimum weight, the remaining three-eighths to be composed of stones varying between the maximum and minimum. This brings us to the question of *binding materials*. A road formed of different-sized stones will require no binding materials. In a former paper on this subject, published ten years ago, the author stated his conviction that the 'decadence of modern roads commenced with the using of binding material,' the introduction of which was coincident with the use of stones broken to a uniform size. Longer experience has confirmed this, and, though in practice he is compelled to use materials to bind (?) roads, he does so very sparingly, and only because of the inability to obtain materials broken to various sizes in sufficient quantity. If the demand is, however, generally set up for proportions of different-sized stones, the necessary quantities will soon find their way into the market."

Mr. Thomas Codrington writes: "The stone for a new road should pass a 2½-in. ring; for repairs 2½-in. or 2-in. ring. ... Broken road material contains 55 per cent. solid stone to 15 per cent. of void space. Specimens of good road surfaces weigh from 93 per cent. to 95 per cent. of the weight of the solid stone of which they are made. In the coating of a well-maintained road the proportion of stones of various sizes varies, but generally from one-third to one-half is found to consist of detritus under ¾-in. in diameter, and there is a very constant proportion of about one-fifth of mud and detritus under ¼-in. in diameter. This appears to be the amount necessary to fill the voids between the fragments of stone when compacted together. In an ill-kept road, from which the mud is not removed, the proportion of detritus is much higher, and mud may constitute nearly one-half of the content. In proportion, as the detritus and mud are kept down to the minimum by constant removal from the surface, so will the road be able to resist the action of wet and frost and the wear of the traffic."

Construction.—Generally speaking, there are three classes of macadamised roads—viz.,—

(1) Roads as constructed by Mr. Macadam, consisting simply of a coating of broken stone laid upon the natural ground.

(2) Roads as constructed by Mr. Telford, with the distinguished feature of a "pitched foundation" upon which to lay the "metalling."

(3) Roads having a concrete foundation, as used by Sir J. Macneil, on the Highgate Archway (London) road.

The class of road, quality and thickness of materials, to be adopted in any particular situation will necessarily depend upon the circumstances of the case, and the amount and nature of the traffic accommodated must also be kept prominently in mind in determining upon the details of its construction. There can be no model type of road which can be fitly adopted universally. For a park or pleasure garden it will generally be sufficient to form the roads or drives by simply shaping the earth to a curved contour and covering it with 3 in. or 4 in. of fine gravel, hand rolled; for an ordinary country road, with a comparatively small amount of traffic, a

coating of about 9 in. of broken stone, laid upon the natural ground properly shaped, will be adequate; whilst for main roads between large towns and all roads having a considerable amount of traffic a solid pitched foundation with a good coating of about 9 in. of broken granite will be necessary, in order that the road may be as hard and durable as possible, so that loads may be conveyed over it with a minimum expenditure of traction power, which should be the main object to be aimed at in all road-making operations.

ELECTRIC LIGHTING AT BURY ST. EDMUNDS.

INQUIRY BY THE LOCAL GOVERNMENT BOARD.

Mr. H. Percy Boulton recently held an inquiry, on behalf of the Local Government Board, with reference to an application of the Bury St. Edmunds Town Council for sanction to a loan of £20,000 for electric lighting purposes. Mr. J. C. Smith, the borough surveyor, and Mr. Medhurst, the electrical engineer, attended in support of the application.

In opening the inquiry, Mr. Blofeld, who appeared on behalf of the town council, said that in October, 1895, the council appointed a committee, composed of the leading business men of position and capacity in the town, to consider the subject of electrically lighting the town. One of the first steps taken was to visit Bedford, and the committee were so pleased with the system of electric lighting there that they instructed the engineer of those works, Mr. Medhurst, to prepare a scheme for Bury. Mr. Medhurst did so, and the learned counsel went on to summarise the principal points of the scheme. The charge for the light was to be 6d. per unit, which would make it cheaper than gas at 3s. 6d., which the people of the town were paying. The estimated consumption in the first instance was 80,000 units, which would bring in a revenue of £2,000; and the engineer was careful to point out that the revenue would increase in a much greater ratio than the working expenses.

In 1896 application was made for a provisional order, which was obtained in due time without any objection being raised with regard to it by any inhabitant, a fact upon which counsel commented strongly. Reading over the sections of this order, Mr. Blofeld stopped to make an explanation of public importance. Many persons were under the impression, he said, that if they did not live within the area to be compulsorily lighted by such an order they could not obtain the light, and would therefore derive no benefit from it. But that was a mistake. If any six owners or occupiers in any street or part of a street within the whole district applied for the electric light the undertakers were bound to supply it. On December 14, 1897, the council passed a resolution to apply to the Local Government Board to borrow £20,000 in order to carry out the scheme finally approved and adopted. So far as this affected public lighting, the facts were that there were now 323 gas lamps, which cost the town £583 a year, including a calculation for interest on the £2,500 advanced to the gas company, and that under the electric lighting system there would be six arc lamps and 120 incandescence lamps, which would cost £438. As a matter of fact, Mr. Blofeld said, the lighting of the town was at present very insufficient.

After evidence had been given by several members of the council,

Mr. MEDHURST was called, and explained his scheme at some length. Upon the calculation that 80,000 units could be produced at 3d. per unit and sold at 6d., the estimate showed a net profit of £229 10s. This allowed for £1,000 expenditure on interest and sinking fund, and £510 receipts on the public lighting service, plus 75 per cent. for interest on the £2,500. Witness instanced a number of towns in which electric lighting schemes were carried on at a gross profit.

Mr. EGERTON SAVER, distributing electrical engineer to the Hampstead Vestry, was also examined with regard to the cost of the proposed scheme at Bury. He gave figures in detail which differed materially from those of Mr. Medhurst, making out that the total annual cost of lighting the town by electricity would be something like £1,587. The actual increase of expenditure, as compared with the old system, would be at least £800 a year in the opinion of this witness. In cross-examination, Mr. Saver modified some of his figures. He accepted Mr. Blofeld's interrogatory statement that there were two authorities upon the point—Mr. Preece and Mr. Arthur Wright. Mr. Medhurst might have adopted the views of the first-named expert; witness himself took the authority of Mr. Wright, believing that he was right.

Several other minor witnesses were examined and the inquiry closed.

Sheffield.—A statement has been prepared showing the cost of the site, erection and furnishing of the new town hall. This shows that the site, which consists of 6,412 square yards, was purchased for £49,000, the cost of erection was £110,632 10s. 7d., and the cost of furnishing £22,395 4s. 10d., making a total of £182,128 15s. 6d. This is £12,110 15s. 6d. in excess of the money that the corporation have power to borrow for the town hall, and the Improvement Committee now recommend that the city council apply to the Local Government Board for their sanction to the borrowing of £12,000, the balance of £110 15s. 6d. to be raised out of the borough rate.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

TRAMWAY COMPANY: LEASE FROM LOCAL AUTHORITY: COVENANT TO INDEMNIFY FROM "ALL EXPENSES WHATSOEVER": LIABILITY FOR RATES AND TAXES.—The decision of the House of Lords in the Scotch appeal case of *Glasgow Corporation v. Glasgow Tramway and Omnibus Company* (11th July) turned upon the construction of a clause in the lease of certain tramways from the corporation to the company, providing that the latter should "pay to the corporation the expenses of borrowing, management, &c.," and that "this provision shall be construed so as to keep the corporation free from all expenses whatever in connection with the said tramways." The question was, Did this clause render the company liable, as between themselves and the corporation, to pay rates and taxes, local and imperial, which, apart from special contract, would ultimately fall upon the latter as "actual proprietors" of the tramways, by virtue of sec. 6 of the Valuation Act, 1854? It would appear that the company themselves had until recently considered that they were so liable, since during the term of twenty-three years granted by the lease they had paid the rates and taxes, and had not deducted the amounts thereof from the rent paid by them to the corporation. They now, however, sought to recover the sums so paid, amounting to £14,246, and the Court below gave judgment in their favour. In reversing that judgment and allowing the appeal of the corporation the House interpreted the clause in question in its widest sense. Lord Watson, in the course of a lengthy judgment, said that in his opinion the provision ought to be construed in connection with the whole stipulations of the lease so far as these related to the considerations passing between the corporation and the company. Viewed in that light, the general scheme of the lease was that the obligation of constructing the tramways was to rest upon the corporation, it being in the contemplation of both parties that the corporation was to raise money for that purpose by borrowing upon its own credit. On the other hand, the company undertook the whole cost of maintenance and repair during the period of their tenure; and they agreed to pay 3 per cent. per annum on the gross sum from time to time expended by the corporation on capital account, the interest falling due upon the money from time to time borrowed by the corporation on capital account, and interest on the expenses incurred by the corporation and by the board of police in obtaining statutory power of construction in the year 1870, or incident to the execution of the lease. The substance of the scheme, as embodied in these stipulations, appeared to have been that no pecuniary obligation was to attach to the corporation beyond that of borrowing funds in order to pay for the construction of the tramways, and that the company during the currency of their right were to relieve the corporation of all other outlays connected with or incident to the performance of the obligation to construct, or incident to their position as proprietors of that which they had constructed. Continuing, his lordship said: "I have had no difficulty in coming to the conclusion that payment of assessments, whether imperial or local, levied from the owner in respect of a tramway or other erection *in solo* is an expense connected with such tramway or erection. But for the construction of the tramway no such liability would have arisen. I am, for these reasons, of opinion that the first plea is well founded, and that the company are suing for a sum of which they were bound by their lease to relieve the corporation." Other pleas raised by the corporation were that the only right of recovery given to the company was to deduct the rates from their rent, a remedy which they had failed to pursue and therefore lost; and that, even assuming that they had the alternative remedy of an action, their claim was barred by "taciturnity and *mora*." Upon these pleas, however, no decision was pronounced, there being no necessity for it.

QUERIES AND REPLIES.

SURVEYOR TO RURAL DISTRICT COUNCIL.—"C." writes: Can a rural district council legally claim the fees and profits which may accrue on a patent proposed to be brought out by their surveyor whilst in their service? The terms of his appointment are: To devote the whole of his time to the duties of the office, perform all work required to be done as engineer and surveyor in respect of sewerage and waterworks and other works directed by the council, the commission thereon to be paid to the council, and that he be not allowed private practice, but be at liberty to take one pupil. If the claim is legal, would another person's name used for the registry of the patent meet the difficulty, as no part of the time devoted to the surveyor's official duties has been used in the preparation of the subject of the patent?

Assuming that there is nothing in the agreement affecting the question except the clause quoted, the council clearly can have no such claim.

PUBLIC HEALTH ACT, 1875, SEC. 150.—"C. I. W." writes: The street shown on the accompanying sketch is now being made up under sec. 150 of the Public Health Act, 1875. Abutting on this street are two streets, 36 ft. wide, marked A and B (which have not been taken over by the authority), and a right-of-way, 5 ft. wide, marked C, which leads to the

backs of houses abutting on the street in question and another street parallel with it, which is repairable by the inhabitants at large. In apportioning the expenses, can the cost of paving, &c. of the intersections of the streets and right-of-way, marked A, B and C, be charged on the whole of the owners of houses and land abutting on the street now being made up? If not, please say who would be liable.

The above section does not (as does sec. 77 of the Metropolitan Management Act, 1862) expressly authorise the authority to charge the frontagers with the expenses of paving the street, "including the cost of paving at the points of intersection of streets." It is, therefore, doubtful whether in an urban district the cost of paving the intersections is recoverable from the frontagers. If not recoverable from the frontagers, these expenses would presumably be defrayed as provided by sec. 216 of the Public Health Act, 1875. As to whether the owners of the soil of the streets A and B and footpath C are liable to contribute to the cost of making up the street, it would appear that they are not so holders A, B and C have been irrevocably dedicated to the public (see *Plumstead Board of Works v. British Land Company, L.R. 10, Q.B. 203*). This case, however, was decided under the Metropolitan Act and not under the Public Health Act.

APPORTIONMENT OF PRIVATE STREET WORKS.—"A. B." writes: How should the costs of private street works be apportioned (1) when the works are carried as far as line A in

sketch, (2) when carried to B, (3) when carried to C? Also, would property situated at Q be liable for any of the cost in any of the above three cases?

(1) In this case the owners of premises fronting on that portion of the street which has been made up should be charged, (2) and (3) See reply to "C. I. W."

Bath.—Messrs. Henry Spaekman and Henry Williams, who were asked to act as arbitrators in a dispute between the corporation and Mr. H. P. Tanner, the owner of property to be demolished in connection with the London-street improvement, recently wrote stating that their award was ready, the fees amounting to £52 8s. 3d. The value of the property is £1,075. A committee, thinking the charges too high, declined to take up this award, leaving it to Mr. Tanner, who had claimed £1,600 against 1,000 guineas offered.—The clerk was instructed, on the recommendation of the sub-committee, to take steps to get the tramway company to repair the tram lines and area in Cheap-street.—The city surveyor had reported to the sub-committee respecting the drainage at Upper Hedgemoad, and an additional outlay of £60 was recommended in connection with this work. This was agreed to.

Municipal Work in Progress and Projected.

Both the London County Council and the Court of Common Council have this week decided to carry out a number of extensive improvements. News of other important works projected will be found in the paragraphs relating to Blackpool, Douglas (Isle of Man), Halifax, Mansfield, Sunderland, Widnes, Wallasey, Leicester, Paisley and Scunthorpe.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

Following the custom of his predecessors, Mr. T. McKinnon Wood, at the outset of the proceedings on Tuesday, delivered his annual address on the work of the council during the past year. This was soon concluded, however, and the council proceeded to dispose of an agenda which filled eighty pages. Mr. Benn carried his proposal for establishing a department for the administration of the council's tramways, an amendment favouring delay being promptly rejected by seventy-five votes to thirty-five. Several improvement schemes which have been awaiting the decision of the council for some time were also dealt with on Tuesday, the council in every case except one deciding in favour of having them carried out. A number of other important matters were disposed of, the chief of which will be found below, and the council adjourned for the summer recess till Tuesday, the 4th October.

Loans to Local Authorities.—Upon the recommendation of the Finance Committee it was agreed to lead the Bermondsey Vestry £4,000 for paving works, the Newington Vestry £5,000 for various works at the parish depot, the Shoreditch Vestry £10,650 for engineering works at the baths and wash-houses, and the Wandsworth District Board of Works £1,800 for underground conveniences.

Widening of Fleet-street.—The Improvements Committee reported that they had received a letter from the City Corporation stating that, as an opportunity is now presented for continuing the widening of Fleet-street by setting back the premises Nos. 19 and 20 (Gosling's bank), they are prepared to arrange, as opportunity occurs, for the widening of that portion of the thoroughfare between Falcon-court (opposite St. Dunstan's church) and the City boundary (opposite Bell-yard) provided the council will agree to contribute in the same proportion as in the case of the part of Fleet-street between Ludgate-circus and Salisbury-courts—viz., one-half. The plan submitted by the City authorities shows that the width of Fleet-street between Falcon-court and the City boundary varies from 53 ft. to 56 ft., and it is proposed to increase this to a uniform width of about 60 ft. by adding to the public way a strip of land having a length of about 400 ft. and a maximum width in the centre of 5 ft., and tapering to a point at either end. The committee were advised by the council's valuer that, assuming that the land will be obtained at about the same price per foot as that paid for land acquired for the widening of other portions of Fleet-street, the cost will work out at about £36,000, but, as this is merely an empirical estimate, they think that £40,000 should be taken as the basis of the council's contribution, which should be limited to one-half of the net cost, not exceeding £20,000. They therefore recommended "that the council do contribute, on the usual conditions, one-half of the net cost of setting back the southern side of Fleet-street between Falcon-court and the City boundary, as shown upon the plan submitted by the City Corporation, such contribution not to exceed the sum of £20,000." The recommendation of the committee was agreed to.

Extension of Hampstead Heath.—On the recommendation of the Parks Committee it was unanimously agreed to contribute £12,000 towards the purchase of the Golder's Hill estate as an addition to Hampstead Heath.

Proposed Widening of Leathers.—The Improvements Committee again brought up their report, full particulars of which appeared in our last issue, recommending that the council should inform the City Corporation that they could not see their way to contribute towards the above improvement, as in their opinion it should be undertaken at the cost of the City authorities. Some discussion followed, in which Mr. Henry Clarke moved an amendment, that the matter should be referred back for further consideration, as he thought the work might be done for £40,000, and all the corporation were asking for was a contribution of £20,000. The amendment was, however, lost and the recommendation of the committee agreed to.

New Relief Sewer.—On the recommendation of the Main Drainage Committee it was agreed to spend £125,000 on the construction of a new relief sewer from Gainsborough-road, Hackney Wick, to the Abbey Mills pumping station, the work to be carried out by the Works Department.

Additional Tramway Stabling at Lea Bridge.—The Highways Committee were authorised to spend £20,000 for the erection by the North Metropolitan Tramway Company of additional stabling and other buildings at Lea Bridge.

Additional Office Accommodation.—A report was presented by the Establishment Committee recommending the council to purchase land and to erect new offices in Warwick-street,

Pall Mall, at a cost of £25,000. The recommendation was adopted.

Proposed Tramways Department.—The Highways Committee recommended the council to agree to the formation of a tramways department, and to instruct the General Purposes Committee to confer and report upon the organisation of the department, and to advise the council upon the question of what salary should be assigned to the chief officer of that department. A long and animated discussion ensued, during which it was casually stated that it was the intention of some of the members of the Highways Committee to offer a salary of £1,500 a year. Mr. Benn, the chairman of the committee, deprecated the action of members in stating facts which were only known to the committee. Whatever salary was recommended, the council would have the opportunity of approving or condemning it, and no appointment would be made without the sanction of the council. The recommendation of the committee was, upon a division, carried by seventy-five to thirty-five.

Tenders.—The Main Drainage Committee recommended that the tender of the Safety Concentric Wiring Company, Limited, amounting to £4,900, for the supply and erection of the engines, dynamos, accumulators, &c., required for the electric light installation at Crossness outfall, be accepted; that the tenders of Messrs. J. H. Pickup & Co., Limited, amounting to £2,713, for the supply and erection of the wiring, lamps and fittings required for the electric light installation at Crossness outfall be accepted; that the tender of Messrs. John Penn & Sons, Limited, amounting to £16,500, for converting four beam engines at the Crossness outfall into triple-expansion engines be accepted; that the tender of Mr. John Cochrane, amounting to £8,150, for the supply and erection of the compound pumping engines required in connection with the sledge-settling channels at the Barking outfall be accepted; that the tender of the Brunswick Rock Asphaltic Company, amounting to £8,978 13s. 7d., for repairing the tops of the arches of Waterloo bridge approaches be accepted; that the council accept the tender of Messrs. Baker & Son, amounting to £1,126 ss., for making borings in the line of the proposed Rotherhithe tunnel; and that the estimate of £170,000, submitted by the Finance Committee for the building of that portion of new Vauxhall bridge up to springing level be approved, and that the tender of Messrs. Pethick Brothers for the work, amounting to £165,435 1s. 6d., be accepted. The recommendations were adopted.

COURT OF COMMON COUNCIL.

The corporation met on Thursday, under the presidency of the Lord Mayor. An influential deputation attended, representing persons in business in Crutchedfriars and the neighbourhood, and suggested that, having reference to the large vacant site stretching from Fenchurch-street to Crutchedfriars, opportunity might be taken of improving the communication by connecting the streets with a broad public thoroughfare. The memorial was referred to a committee to consider.—The Finance and Improvements Committee submitted for approval a plan for continuing the improvement of Fleet-street by making it 60 ft. wide westward of St. Dunstan's church to the City boundary. They recommended that, on the London County Council signifying their intention of contributing half the net cost of carrying out that section of the improvement, notice be served to acquire the ground needed in front of Messrs. Gosling's bank, and that they (the committee) be authorised to take the necessary steps for setting back the other premises as opportunities occurred. The report was carried.—It was announced by the Finance and Improvement Committee that a claim for the freehold interest in No. 44 Cheapside had been settled by a jury for £6,850.—The court approved of schemes for making London-wall and Blomfield-street (between Tower Chambers, Moor-gate-street, and Blomfield House) 50 ft. and 60 ft. wide, at estimated costs respectively of £44,000 and £93,500. In the opinion of the committee the 50 ft. widening should be adopted, but they recommended that before any action was taken by the corporation in the matter the views of the London County Council should be ascertained as to the alternative lines of improvement, and that the council should be asked to co-operate with the corporation by contributing half the net cost of the scheme which in their opinion it would be most desirable to carry out.—The Streets Committee, in a report on a new automatic hydrant designed with the object of reducing the expenses of checking the quantity of water consumed for watering and washing streets, recommended that, before the adoption of the system generally, an experiment with the hydrants should be tried in Cheapside, King William-street and Lower Thames-street, at an estimated cost of about £220. This was carried.—A report was brought up from the City Lands Committee enclosing a letter from the Home Secretary conveying the terms upon which the Government would be ready to co-operate in the scheme for the rebuilding of the sessions-house, Old Bailey. The letter stated that the Government would be ready to hand over to the corporation the mulo wing of Newgate prison in consideration of the sum of £40,000. The report was agreed to.—It was decided to spend £530 in fitting im-

proved dust-shoots to the dwellings in Corporation Buildings, Farringdon-road, to replace those condemned by the sanitary authorities.—The Streets Committee were authorised to take the necessary steps for converting the present underground convenience in Farringdon-street into a latrine for women, the structure in New Bridge-street being unsuitable for adaptation for both sexes.—The tender of Mr. W. Shurrin, of £1,197, for the construction of an underground convenience in Alderman's-walk, Bishopsgate, was accepted.—The court, having accepted a tender of the Improved Wood Company, Limited, for £942, for paving the carriageway of John-street, Minories, then adjourned for the summer vacation.

VESTRIES AND DISTRICT BOARDS.

Battersea.—On Wednesday the vestry resolved to apply to the county council for sanction to borrow £8,541 for the purchase of additional property in connection with the site for the electric light station, and to the same authority for permission to borrow £35,000 for the erection of new baths and wash-houses. It was resolved that the contract should be carried out by the Works Department as soon as the necessary sanction had been obtained.—The Finance Committee further reported having considered a letter from the Battersea Trades and Labour Council as follows: "That, having regard to the recent serious and fatal accidents that have taken place on buildings in course of erection and alteration, this council is of opinion that improvement is greatly needed in the method of inspection of such buildings, and as steps to such improvement begs to ask the London County Council to adopt the following suggested regulations with regard to district surveyors: (1) That all district surveyors should devote the whole of their time to the duties of district surveying; (2) that they should be paid a salary by the London County Council, and that all building fees (if continued) should be paid to the council direct; (3) that an office be provided for the district surveyor at the local vestry hall or offices, so that he may be brought into closer touch with the local authorities." On the recommendation of the committee the vestry decided to adopt the resolutions and to forward copies to the London County Council and to the vestries and district boards. The House Committee recommended, and the vestry resolved, to procure six screw-tip vans (not painted) for the dust department from the Bristol Waggon and Carriage Works Company, at the price of £40 each.—The Health Committee announced that they had conferred with the Baths Committee as to the suitability of the land adjoining the baths, Latchmere-road, as a site for the proposed mortuary and coroner's court, and they recommended that the necessary steps be taken to erect the building upon the site in question. This was agreed to.—The Works Committee had had under consideration the question as to the arrangements to be made for cutting the hard wood blocks recently ordered. The committee suggested that the arrangements should be carried out at the dust depot in accordance with a plan prepared by Mr. Pidditch, the vestry surveyor, at a cost of £200. This was agreed to without discussion, and it was decided to accept, at £108 10s, the tender of Messrs. T. Robinson & Son for the execution of the work, exclusive of the cost of shuffling and belting.—A letter was read from Mr. H. G. Hills, clerk to the Wandsworth District Board of Works, forwarding copy of resolutions passed by that board on the subject of the telephone service, and asking the vestry if they concurred in those views to pass similar resolutions. The resolutions, which were referred to the Finance Committee, were as follows: (1) That having regard to the opinions expressed by Mr. J. W. Benn on the 16th and 21st June, 1898, before the Select Committee of the House Commons appointed to inquire into the telephone service, and their divergence from those expressed by the representatives of the local authorities, and particularly by the representatives of this board, at the conference held on the 14th June, 1898, on this subject, and on behalf of whom Mr. Benn was giving evidence, this board thinks it of importance to record its views as follows: (a) That the telephone service is already of so great public importance and is calculated to become of such general use and benefit that it ought to be exclusively exercised by Government, and for the reason (among others) that it is essential for a successful service that it be under one and the same supreme and exclusive authority for the whole country; (b) that it is not desirable that the telephone service should be undertaken by the London County Council and the other local authorities, whether in competition with or after purchase from the National Telephone Company; (c) that the Post Office should not undertake a distinct telephone service in competition with the National Telephone Company, but, on terms to be arrived at by arbitration or other means mutually agreed, should take over the undertaking and property of the company.

Camberwell.—The vestry on Wednesday devoted some three hours to the consideration of recommendations of the Plant and Scavenging Committee in favour of acquiring various sites and properties in order to provide depot and establishing accommodation, the purchase prices amounting to a total of about £23,000. It was eventually decided to empower the chairman of the vestry (Mr. Cousins), the vestry clerk (Mr. C. W. Tagg) and others to carry out the negotiations necessary to complete the purchase of the sites and properties.—The Finance Committee reported having had under consideration the Workmen's Compensation Act, that

they had received circulars from companies quoting premiums for the insurance of the vestry workmen's, and that a communication had been received from the vestry of St. Margaret, Westminster, suggesting the establishment of a mutual insurance fund among local authorities. The committee recommended that the vestry of St. Margaret and St. John, Westminster, be informed that the vestry is in accord with its suggestion and would be pleased to take part in any conference, and that at present the vestry take no action in insuring against accidents until it has seen how the Act works. These recommendations were adopted.—It was resolved to inform the county council that the vestry considered it advisable that the generating station of the County of London and Brush Company for the supply of electricity in Camberwell should be located in the parish, and not at Wandsworth.—The consideration of the following recommendations of the General Purposes Committee was postponed: (a) That the work of wood-paving the north and east sides of Camberwell-green, Grove-lane (Church-street to Daneville-road), Church-street, Peckham High-street and Queen's-road, Peckham, to Pomeroy-street, and also certain portions of Ilval-street and Southampton-street, be carried out by the vestry workmen, under the direction of the surveyor; (b) that tenders be obtained for the supply of wood blocks for this work; (c) that a special clerk of works be engaged by the surveyor to supervise the work.—The lowest tenders of the following were accepted for tar-paving works, the first prices being for streets and the second for tar-paving in trenches: A. C. W. Holman, 2s. and 2s.; J. Smart, 1s. 11½d. and 2s. 6d.; Brunswick Rock Asphalt Company, 2s. 9d. and 3s. 6d.; and W. G. Cloke, 3s. 3d. and 3s. 6d. Tenders from the following were accepted for the supply of fodder: A. C. Taylor, Rathbone & Son, H. S. Shipton, Taylor & Son, and Hood & Moore's Stores, Limited.

Kensington.—Last week the clerk submitted to the vestry a letter from the clerk to the London County Council, stating that the council would apply to Parliament in the session of 1899 for powers to carry out the improvement in Kensington High-street, subject to a contribution by the vestry of one-third of the net cost, and that they were in negotiation with the Vestry of St. Margaret and St. John, Westminster, with reference to a contribution from that body. A discussion arose on the communication, and the question of whether the vestry should contribute one-third of the cost was brought up by a member. Mr. Robinson remarked that the vestry had already decided that they should contribute, and the question dropped.

Lambeth.—On the suggestion of the General Purposes Committee the vestry resolved, at their meeting on Thursday, to hire a steam roller from Messrs. Aveling & Porter, Rochester, with a view to purchasing it at the end of three months, at a cost of £378.—The same committee reported that during the quarter ending Lady Day last it was found necessary to buy 51 tons of Portland cement from Messrs. Francis & Co., in consequence of Messrs. Wakeley Brothers, the contractors for the cement, failing to deliver; and from Messrs. Wakeley's account was deducted the sum of £21 14s. 3d., the difference between Messrs. Francis' price and their contract price. Having reconsidered the matter, the vestry decided to forego half the difference and only deduct £10 17s. 2d.—Mr. Farmer announced for the Wharf and Cleansing Committee that the Thames Conservancy Commissioners had fixed the 12th October for the deputation from the vestry to wait upon them in regard to the scheme for embanking the Thames at the vestry wharf. As the delay would cause considerable inconvenience the surveyor, Mr. J. P. Norrington, had written to the commissioners asking for an earlier appointment before the commencement of the recess.—It was decided to apply to the county council for a loan of £4,000 for wood paving purposes.—The Finance Committee submitted the accounts of the South London Electric Supply Corporation, and in doing so the committee recommended that the Board of Trade should be requested to hold an official inquiry into the circumstances of the transfer of the vestry's provisional order to Mr. Sav, and into the means employed to secure the transfer. A heated discussion ensued, it being stated that members of the vestry, whose names were not mentioned, had been bribed to vote for the transfer to the extent of the payment of a total of £1,000. The resolution was eventually carried unanimously, the name of the Local Government Board being added as an alternative to the Board of Trade as the authority to conduct the suggested investigation.—On the motion of Mr. Quick it was decided to appoint a committee to inquire into and report upon the condition of the tramways belonging to the South London Tramways Company.

Lee.—Last week the Carlton surveyor was instructed by the district board of works to obtain at an early date from the vestries and district boards of the metropolis particulars of the cost of purchase of horses, carts, harness and other incidental details, and the opinion of such authorities as to whether the result of carrying out works by direct employment of the vestry's or board's own staff and plant is desirable or otherwise, such information when received to be tabulated and submitted to the committee.

Lewisham.—At a meeting of the district board of works last week, Mr. W. H. Dawson drew attention to the serious

complaints which had been made in regard to emanations at Catford-hill, Perry-hill and other places in the district from the London County Council's new sewer, and stating that during the last few days living in these neighbourhoods in comfort had been impossible for this reason. It was decided immediately to call the attention of the London County Council, as a matter of urgency, to serious nuisances and great danger to health arising from emanations from the council's sewer at Catford-hill and Perry-hill, and that the council be requested to take steps for the immediate abatement of the nuisance, and that to assist towards this result the board withdraw its objection to ventilating shafts in the locality, provided the pattern and situation were approved by the surveyor, and that the council be requested to close the surface sewers forthwith and to provide shafts where necessary in the district.

Mile End.—At a meeting of the vestry last week, the Dusting, Cleansing and Watering Committee reported that they recently visited the vestry's land at Edmonton on which is deposited the house refuse which cannot otherwise at present be disposed of; that they found the same burning in several places, which in their opinion was the result of spontaneous combustion; that they were strongly of opinion that all the material which is at present being carried to Edmonton ought to be destroyed within or near the hamlet; that if this course were adopted it would result in an annual saving, and not make the board liable to a charge of causing a nuisance from burning; and that the committee were of opinion that if no better site could be found it would be advantageous to erect a modern destructor upon the present depot at Devonshire-street if the freehold of the land could be acquired. They therefore recommended that authority be given to them to negotiate terms upon which a suitable site can be acquired. The recommendation was unanimously agreed to.

Rotherhithe.—On Tuesday of last week, at a meeting of the vestry, Mr. Vezey, on behalf of the deputation which waited upon the Bridges Committee of the London County Council with reference to the projected Rotherhithe tunnel, stated the committee promised that all possible speed should be made in the construction of the tunnel. The surveyor stated that shafts were already being sunk, and Mr. Glanville added that the council had that day voted £1,400 for experimental works.—The vestry accepted the tenders of Messrs. J. H. Picken & Co., amounting to £79 and £178 respectively, for providing additional ventilation in the council chamber and for installing the electric light at the town hall. The vestry had already made arrangements with the London Electric Supply Corporation for bringing a main up to the town hall, along Lower-road, and for supplying the current.

St. James, Westminster.—The vestry on Thursday received a deputation, introduced by Mr. Arthur Newton, asking that the vestry would again consider the question of granting permission to the National Telephone Company to place its telephone cables underground in the parish. Mr. Newton stated that the company could undertake the work without serious interference with the traffic, and that the company would be prepared to pay for the concession. The deputation having retired, the vestry proceeded to consider a report of the Works Committee recommending that the application of the National Telephone Company for sanction to lay mains to distributing stations in a number of streets in the parish, especially in consequence of the inconvenience caused to subscribers through the recent fire in Heddou-street, should not be granted. After considerable discussion the vestry adopted an amendment, moved by Mr. Mitchell, referring the recommendation back to the committee for further consideration and report.—On the recommendation of the General Purposes Committee it was decided to invite tenders from local firms for the repair, cleansing and re-painting of the whole of the vestry hall.—The committee further stated that they had considered a letter from the Vestry of St. Margaret and St. John, Westminster, stating, with reference to the Workmen's Compensation Act, 1897, that, having regard to the excessive rates of premium quoted by some of the assurance offices, they were desirous of suggesting whether it might not be found mutually advantageous if local authorities in combination were to form an assurance fund from which claims could be met, and asking the vestry's opinion on the subject, with a view to a meeting of representatives of concurring authorities being called to consider the matter. On the recommendation of the committee the vestry decided to appoint representatives to attend the conference.—A letter was read from the Battersea Vestry stating that they had addressed a communication to the London County Council asking them to insert a clause in their next General Powers Bill empowering the local authorities to erect dwellings under Part 3 of the Housing of the Working Classes Act.—The vestry referred to committee a letter from the Works Committee of the Islington Vestry, stating that they had under consideration the Metropolitan Management Acts Amendment (By-Laws) Bill, which authorises the London County Council to make by-laws relating to the construction and laying of drains, inquiring if the vestry were of opinion that the council should have such powers, and asking what action the vestry were taking in the matter.

St. Marylebone.—The vestry, at their meeting on Thursday, considered a letter from Messrs. Greenwell & Co., their

solicitors, informing them of the non-confirmation of the electric lighting provisional order granted by the Board of Trade. On the motion of Mr. J. Brook-Hitching, it was resolved to refer the question to the Electric Lighting Committee for report, and to make a further inquiry as to the present position of the vestry. The proposer of the motion stated that, although failure had been the result in that instance, it did not follow that failure would result on subsequent occasions. It was desirable, he said, that if not by Parliamentary aid, at least by purchase, the vestry should obtain possession of the undertaking for lighting the parish.—The vestry also referred to the Electric Lighting Committee a letter from the county council asking for support in opposing the Metropolitan Electric Supply Company's Bill. The council intimated its intention to seek the insertion of a clause to empower the local authorities to combine for the purchase, at a date to be fixed, of the works proposed by the Bill, and for them to be worked for their mutual benefit.—The Metropolitan Electric Supply Company wrote asking whether the vestry would be prepared to entertain a proposal to light the whole of the streets in the parish by electricity. The letter was also entrusted to the Electric Lighting Committee for consideration and report.—Dr. Sumpster moved the adoption of the report of the Sanitary Committee, stating that the committee did not see their way to recommend any steps being taken at present under Part 2 of the Housing of the Working Classes Act. After some discussion the report was adopted.—The Works Committee recommended the acceptance of the tender of Messrs. Bart, Boulton & Haywood for the supply of a large quantity of Swedish yellow deal blocks and hard wood were discussed at some length, but eventually the recommendation was referred back to the committee for further consideration.—Mr. W. H. Garbutt, vestry clerk, read letters from the Battersea Vestry suggesting that the vestries should have powers to act under Part 3 of the Housing of the Working Classes Act, and asking them whether the vestry would be prepared to assist in the promotion of a Bill to deal with the London water supply. The letters were referred to the Parliamentary Committee.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Herefordshire.—At a meeting of the council on the 9th inst. it was resolved, on the recommendation of the Asylum Committee, to enlarge the asylum by 150 beds.

Norfolk.—The county council have decided to offer no opposition to the light railway which is proposed to construct from Trowse, Norwich, to Beccles and Ladden.

MUNICIPAL CORPORATIONS.

Blackpool.—At a recent meeting of the town council letters were submitted from the Local Government Board consenting to the adoption of the overhead trolley system of electric traction on the corporation tramways, and as to the department's sanction to the borrowing by the corporation of an additional £10,000 for electric lighting extension in the borough. A member, who moved the adoption of the proceedings of the Electric Lighting and Tramways Committee, said that in addition to the £10,000 sanction had been obtained for the borrowing of a further sum of £9,400, which was applied for at the same time. They had already spent £1,000 on motors and other things, so that, whatever system was adopted, this amount of money had been expended. In answer to a question, he said they were not adopting any system at present, and the committee were determined to have the whole scheme before them shortly, with explanations from the engineer.—A report has been issued by the corporation of the deputation's visit to Dymchurch, near Hythe, and Cromer, concerning the system of groynes erected there by Mr. Case. It is intended to widen 3 miles of Blackpool promenade, and Mr. Case says the front ought to be groyned in order to prevent the sea wall being undermined. The deputation report favourably of what they saw, and recommend an experiment on North Shore works, which have just been completed at a cost of over £100,000.—On Thursday Colonel Lund held a Local Government Board inquiry into an application of the corporation for sanction to borrow £5,000 for a new sewer outlet at the Gym, £1,751 for private street improvements and £671 for public street improvements. It was stated that the new sewer outlet was rendered necessary by the great increase of property at North Shore. There was no objection.

Douglas, Isle of Man.—Negotiations have passed between the town council and the Isle of Man Tramways and Electric Power Company with regard to the Upper Douglas cable tramway. The chairman of the company had stated that, if the council would take a section over at the amount it cost the company, the latter would pay a fixed sum of £1,500 per annum for the Douglas Bay section in addition to the 15 per cent. on the gross receipts now payable to the council. At the last meeting of the town council Councillor Chadwick proposed that the offer should be referred to a committee, but after some discussion it was decided that it should not be entertained.—The Tynwald Court sat at Douglas on Tuesday of last week to inquire into the petition of the town council

to borrow £16,000 for the purposes of building a row of artisans' dwellings, improving the infectious diseases hospital and purchasing property for street improvements. The committee took a quantity of evidence, and it is understood will report in favour of the applicants, except that they will probably insist on the artisans' dwellings being erected in a locality other than that chosen by the council.

Halifax.—A Local Government Board inquiry has been held by Mr. Herbert H. Law, M.C.E., respecting an application of the corporation for sanction to borrow £88,987 for various purposes, including street improvements and works in connection with the Birks Hall estate and £19,940 for the erection of a new police court and station. The Tramways Committee of the corporation on Thursday resolved to extend the electric tramways to Salterhebbles and Skircoat Green on one side of the town and to Boothtown on the other. It is also proposed to construct a line up Warley-road, to connect the terminus at King's Cross with that at Highroad Well.

Kidderminster.—At the monthly meeting of the town council on the 20th inst., the Drainage and Waterworks Committee reported that, it being found impossible to maintain a constant water supply during the summer months owing to a diminished supply in the wells, they were unanimously of opinion that it was imperative that an additional supply should be obtained without delay. They recommended therefore that a new well and borehole be made in the gardens at the rear of the cottages in the New-road, and that they be empowered to obtain estimates and accept tenders for the work. After a long debate the report was adopted.—It was decided to carry out the widening of the Sutton-road at its junction with the Stearport-road according to plans prepared by Mr. Shepherd, the surveyor.

Leeds.—The Highways Committee of the city council have decided upon further extensions of their tramway service. Lines are to be laid down from Wellington-road along Arnsley-road to the bottom of Brauch-road, Armsley; also from Meanwood-road along Cambridge-road and Woodhouse-street, across Hyde Park-corner, down Victoria-road and on Cardigan-lane. Parliamentary powers have already been obtained for carrying out these extensions.

Leicester.—At a special meeting of the town council on Tuesday the report of the Highway and Sewerage Committee, which recommended the adoption of a scheme of new tributary sewers for the borough, and that an application be made to the Local Government Board for sanction to a loan of £30,299 for executing the first section of the scheme, was adopted with only one dissident. Another recommendation of the committee, to the effect that an arrangement be entered into with Messrs. H. L. Powys-Keck and S. Harris for an improvement of Ervington-road from Mere-road to the brook, and that an application be made to the Local Government Board for sanction to a loan of £3,433 in connection therewith, was also adopted. It was further agreed that an arrangement should be made with the Great Central Railway Company with respect to the improvement of Bridge-street and Bath-lane, and that an application should be made to the Local Government Board for sanction to a loan of £2,200 for sewerage and paving works in Newark-street.—On the recommendation of the Sanitary Committee it was decided to accept the tender of Messrs. J. E. Johnson & Son for erecting the new isolation hospital at Gilroca, at a cost of £48,381. It was explained that the architect's estimate was £54,000, but, owing to alterations made in the plans by the Local Government Board and an increase in wages, it was thought that that sum would be largely exceeded.—The Parks and Recreation Grounds Committee recommended that the council should purchase 20 acres of land at the junction of Saffron-lane and Knighton-lane from the trustees of the estate of Colonel Craddock, at £500 per acre, for the purpose of a recreation ground. The recommendation was referred back to the committee for further consideration.—The Lunatic Asylum Committee submitted for the approval of the council a contract with Messrs. Moss & Son for works in connection with the asylum, at the sum of £58,716. The contract was approved.

Lichfield.—The Streets and Highways Committee of the corporation have decided to experiment with an acetylene lamp for street lighting.

Liverpool.—Colonel Marsh, R.E., held an inquiry last week on behalf of the Local Government Board, with reference to an application of the corporation for sanction to borrow £100,000 for the extension of the museum and the erection of the new technical institute.

Macclesfield.—Mr. Eaton, chairman of the Gas Committee, commenting on the results of the past year's working of the gas undertaking, at the last monthly meeting of the town council, said the profit, amounting to £2,626, was, with two exceptions, the largest amount of profit made during the last thirteen years. In one of the exceptional years referred to the gas was being sold at 3s. per 1,000 cubic feet, and in the other at 2s. 10d. per 1,000 cubic feet, while in the past year the price had been 2s. 6d., the lowest price ever reached since the acquisition of the works by the corporation. The prepayment meters were now clearly beginning to be a source of profit. During the past year the amount received from them had been £2,391, and at a rough calculation £270

of that was profit. Thanks to the increasing popularity of gas for cooking purposes, the consumption of gas in the mid-summer quarter continued to increase, the year 1896-7 showing an increase for that quarter of 23 per cent. over the corresponding quarter of the previous year, while during the year recently ended the increase had been at the rate of 25 per cent.

Madron.—Colonel W. R. Slacke, R.E., conducted an inquiry recently, on behalf of the Local Government Board, into an application of the council to borrow £724 for works of water supply and £130 for works of sewerage. Mr. Martin, of Exeter, who gave details of the first scheme, stated that the source of the supply was a spring at Tregannah, whence the water was taken in 3-in. pipes to a reservoir of 100,000 gallons capacity overlooking Telcarne, and thence in 5-in. pipes to the town, where stand pipes would be provided. There would be no house-to-house supply.

Manchester.—The Special Tramways Committee of the Manchester Corporation have resolved to pay a visit to Liverpool, in order to inspect twelve samples of electric tram cars. The cars are stated to have been obtained at Liverpool for the purpose of being tried.

Mansfield.—The application of the town council for sanction to borrow £15,900 for sewerage and sewage disposal works was the subject of a Local Government Board inquiry conducted last week by Major-General H. D. Crozier, R.E.

Sunderland.—On the 13th inst. an inquiry was held, on behalf of the Local Government Board, with reference to the application of the town council for sanction to borrow £26,000 for electric light extensions and £25,650 under the Housing of the Working Classes Act, 1890. Mr. F. M. Bewey, the town clerk, explained that the deficiency on the corporation electric lighting scheme, for the first year of £642 and for the second year of £982, had been this year converted into a net profit of £164 or more. They asked that the loans might be for a period not shorter than thirty years. In the case of the other application it was proposed to entirely demolish and sweep away an extensive area of insanitary property, which Mr. Ronnithwaite, the borough engineer, characterised as a menace to public safety, and to erect model dwellings on the vacant site thus provided.

Widnes.—A Local Government Board inquiry has been held concerning an application of the corporation for sanction to borrow £8,041 for the proposed extension of the infectious diseases hospital at Crow Woods.

URBAN DISTRICT COUNCILS.

Broadstairs.—The council have received notices from the Isle of Thanet Light Railway and also from the County of London and Brush Provincial Electric Light Company of their intention to apply for powers to supply electric energy in Broadstairs and St. Peter's. The Lighting Committee have been requested to act in the matter.

Scunthorpe.—The district council have appointed Messrs. Stevenson & Birstall, of London, engineers for their new gas and water works. The tender of Messrs. Vivian's Boring and Exploration Company, Whitehaven, for sinking the bore the required size and depth has been accepted, the amount being £4,495. A Bill is to be promoted in the next session of Parliament by the council authorising them to manufacture and supply gas, and conferring on them powers with respect to the supply of water and for other purposes. Messrs. Timmins, whose scheme the council have adopted, was the next lowest tender to that of Messrs. Vivian's.—The contract for kerbing, channelling, metalling, asphalt paving, and other works necessary for the construction of six new streets to be taken over by the council, has been let to Mr. George Holiday for £1,088.

Swindon New Town.—Mr. E. A. Sandford Fawcett, Local Government Board inspector, held a public inquiry on Thursday concerning the application of the district council for sanction to borrow £4,650 for works of private street improvement and £3,300 for channelling all public streets at present not channelled. Among those who attended the inquiry were Mr. H. J. Hamp, the surveyor, and Mr. J. N. Jefferies, the assistant surveyor. After receiving particulars, supplied by the surveyor and the clerk, the inspector inspected the streets included in the scheme.

Tunstall.—Two communications from the Potteries Extension Tramways Company were read at a recent meeting of the district council. The first announced the company's intention to apply to the Board of Trade to prolong the time limited for the completion of the work authorised under their order of 1896 to February 7, 1899, and the clerk was instructed to inform the company that the council were prepared to consent to the extension asked for, but that any further application would be most strenuously opposed. In their second letter the company stated that they proposed to apply to the Board of Trade for a provisional order authorising them to supply electrical energy for the lighting of Tunstall. The council decided to oppose the application.

Walsley.—A Local Government Board inquiry was held on the 20th inst. with respect to an application of the district council for power to borrow £14,130 for public works, pleasure grounds and other purposes. Mr. H. D. Cook, clerk to the council, detailed the various schemes.

SCOTLAND AND IRELAND.

Alloa.—The burgh commissioners last week gave their consideration to the question of applying for a provisional order for electric lighting. A motion to make the application was eventually carried by eight votes to three.

Annan.—It is reported that at a recent meeting of the Burgh Commission a committee was appointed to draw up a report with regard to the electric lighting of Annan. It was proposed either to use the old water mill, situated about a mile up on the river Annan, which was burned down a few years ago, or to use the old cotton mill in Pert-street, which is also driven by water-power. When the report came up, however, it was agreed to let it lie on the table in the meantime.

Belfast.—A new electric lighting station is being erected for the corporation in East Bridge-street. It will contain an engine-room to accommodate engines and dynamos to the extent of about 5,000 horse-power, and a boiler-house. At the west end are the public offices, battery, and test-rooms and store-rooms, while the general offices for the staff are situated upstairs. The whole scheme was designed by Mr. Victor A. H. McCowen, electrical engineer to the corporation, and the work has been carried out by Messrs. J. & W. Stewart.

Clontarf.—On the 7th inst. an inspector of the Local Government Board held an inquiry with reference to an application of the commissioners for sanction to a loan of £150 for the purpose of constructing a main sewer and water main in Seafield-avenue, Dollymount. It is intended to place the proposed main through some 400 yards of the road. The district is a very rising one, and many new houses are being built. Formal evidence was given, and there being no opposition the proceedings terminated.

Dumfries.—New public baths and wash-houses, which have been presented to the town by a lady resident, were formally handed over by her to the town council on the 14th inst. The building, which has been erected in the Greensands Park, contains ten separate washing apartments, with laundry-room, eight plunge baths, and two spray, shower and wave baths. It has been built from the plans of Mr. Barbour, Dumfries, and the cost will approximate to £4,000.—Mr. G. Malani, gas manager, in his report of the work done in his department during the past year, states that the amount of gas made was 72,783,000 cubic feet, or 9,953 cubic feet per ton of coal and oil, as against 70,034,000 cubic feet, or 10,140 cubic feet per ton, in the preceding year. The gas sold was 64,735,200 cubic feet, as against 64,477,000 cubic feet, and the unaccounted-for gas was 11.06 per cent. The scrubbing plant is being increased to 1,000,000 cubic feet per day. In Mr. Malani's opinion additional holder capacity is urgently needed, while a great increase in coal storage would be very desirable.

Dundee.—At a recent meeting of the Gas Committee of the Dundee Town Council, a report was submitted by the electrical engineer with regard to the proposed extension of the electric lighting area of the city. After consideration, the committee agreed to recommend the erection of twenty-seven lamps, at an estimated cost of £538, the running cost being £550 per annum.

Edinburgh.—On the representation of the resident engineer, the Electric Lighting Committee of the Edinburgh Town Council have recommended an extension of the low-tension continuous-current mains to Balcarres-street, the usual guarantee being given. The probable cost is £1,000. It has also been agreed to recommend acceptance of an offer for new offices, stores and other buildings at the corporation's electric lighting station in Dewar-place to somewhat over £6,000. The Board of Trade have formally intimated to the solicitors of the Edinburgh Street Tramways Company their approval of the agreement for the sale of the Portobello lines to the city of Edinburgh.—The town council have approved a proposal to offer £65,000 to the North British Railway Company for Port Hopetoun, as a site upon which to erect the proposed Usher hall.

Edin.—The question of the price of gas was the subject of a wordy discussion at a recent meeting of the town council. It was proposed that the rate be continued at 4s. 7d. per 1,000 cubic feet, as at present, but an amendment was moved in favour of fixing the price at 4s. 2d. per 1,000 cubic feet. On being put to the vote the original motion was, however, carried.

Glasgow.—In consequence of Messrs. Goddard, Massey & Warner, Nottingham, declining to proceed with their contract to supply the laundry machinery required at Ruchill hospital in terms of the specification, the next lowest offer, that of Messrs. D. & J. Tullis, Kilbowie, amounting to £3,696, has been accepted, and the Nottingham firm have been notified that the corporation hold them liable for £807, the difference being the amount of their contract and the one which has now been accepted.

Greenock.—At the last monthly meeting of the burgh commission, on the 19th inst., a letter was read from the H. B. Electric Light Company, London, stating that they intend to apply to the Board of Trade for an order to supply the burgh with electric light. It was agreed to instruct the town

clerk to acknowledge the receipt of the letter and to intimate that the commissioners would oppose this application.

Greenock.—At the last monthly meeting of the police board a letter was submitted from the North British Supply Company, Limited, intimating their intention to again apply for a provisional order for the burgh of Greenock on or before 21st December. The letter was remitted for consideration.

Inverness.—A meeting of the town council was held on the 18th inst. for the purpose of considering a report on the subject of the introduction of the electric light into the burgh. The sub-committee recommended that before approaching the community to ascertain whether or not they desired electric light to be introduced by the corporation, a report on the approximate cost of introduction and the cost at which the light could be supplied to the consumers should be got from a competent authority. The recommendation was adopted.

Paisley.—In connection with the offer of the British Electric Traction Company to run the Paisley tramways by means of the trolley system, it is stated, says a contemporary, that a section of the town council have raised the proposal that they should approach the Glasgow Corporation to see if they would be willing to lease the burgh streets from the council and work the tramways as a part of their system, in the same way as is done at Pollokshaws, Govan, and other places adjoining the city.

Perth.—At a recent meeting of the Waterworks Committee it was agreed to recommend that the building to be erected in connection with the waterworks extensions should be sufficient to accommodate two engines. The estimates are understood to have warranted the committee in coming to this decision.—The Perth District Committee of the county council, at their last quarterly meeting, had under consideration the estimates of Mr. Scott, the surveyor, for the erection of the proposed bridge across the May at Forteviot. The clerk intimated that the estimates were £650 for a bridge to carry extraordinary traffic and £150 for ordinary traffic. Some discussion followed, and ultimately it was agreed by a large majority to erect the bridge for extraordinary traffic.

Queenstown.—New salt-water baths have just been erected at Queenstown by Mr. D. Forde, from the designs of Mr. D. J. O'Kealey, C.E. There are four entrances to the building, the main entrance being at the west end. The men's bath, which is at the westward end of the main building, is 70 ft. long by 40 ft. wide. It is surrounded by a balcony on all sides, and, in addition to which, on the north side are dressing-rooms. The bath, which has a graduated floor, is over 9 ft. deep at its western end. Steps are erected at each angle for the use of the bathers. The women's bath, at the eastern end of the building, is 50 ft. long and 40 ft. wide. The baths will be refilled at every tide.

Shandon.—The hydropathic baths at this town were lately completely gutted by fire. The building included Turkish, swimming, and a general suite of ladies' and gentlemen's baths. The damage is estimated at between £3,000 and £4,000.

Tain.—The price of gas is to be reduced by the gas commissioners from 6s. 8d. to 6s. 3d. per 1,000 cubic feet. This makes a total reduction of 4s. 10d. per 1,000 cubic feet since the gas undertaking was acquired by the town council, six years ago.

FOREIGN AND COLONIAL.

Singapore.—The municipal commissioners have decided to light the town with oil on the termination of the gas company's contract in December next, until they are able to take up the lighting of the town by gas or electricity.

St Helier, Jersey.—The municipality have accepted the tender of the Horsfall Furnace Syndicate, Limited, for a refuse destructor with accessories complete for steam-raising.

Berlin.—The municipality have resolved, reports *The Building News*, to construct a system of underground electric tramways, 25 to 30 kilometres long, and costing from 40,000,000 marks to 80,000,000 marks.

Received too late for Classification.

BOROUGH OF FOLKESTONE.

Wanted, in the Borough Engineer and Surveyor's Office, an Assistant, accustomed to surveying, levelling and the general routine of a municipal surveyor's office. Salary, £104 per annum.

Applications, stating age, experience and qualifications, and accompanied by not more than three recent testimonials, to be delivered at my office not later than Thursday, the 14th day of August, endorsed "Assistant."

Convassing members of the council will be considered a disqualification.

JOHN WHITE, A.M.I.C.E.,

Borough Engineer.

Engineer and Surveyor's Office,

29 Dover-road, Folkestone.

July 27, 1898.

Personal.

Southampton Borough Council have increased the salary of Mr. Lee, their electrical engineer, from £180 to £210 per annum.

The Sandwich Town Council, sitting as a committee, last week appointed Mr. Charles J. Conquest to the post of borough surveyor.

Messrs. Sands & Walker, of Nottingham, have been instructed by the Bingham Rural District Council to prepare a scheme of sewerage and sewage disposal for their district.

Mr. John H. Fraser, private street works assistant on the staff of the borough surveyor of Wolverhampton, Mr. J. W. Bradley, has been appointed engineering assistant to the borough surveyor of Burton-on-Trent.

At the last meeting of the Chesterfield Rural District Council it was resolved "that the resolution passed at the last meeting, increasing the highway surveyors' salaries by £30 and £20 respectively, be rescinded."

The Water and Sewers Committee of the Swansea Corporation last week appointed Mr. Barnett, of Pateley Bridge, resident engineer of the Cray water supply scheme, in succession to Mr. Smallpiece, at a salary of £450 per annum.

Mr. Arthur W. Ward has been appointed chief assistant to Mr. O. J. Kirby, borough engineer of Batley. Mr. Ward served his articles with Mr. S. Stead, borough surveyor of Harrogate, and was an assistant with him up to twelve months ago.

Last week Mr. W. Swain, of Sowerby Bridge, was appointed drainages and building inspector under the Bath Corporation, in succession to Mr. Craven, who has been appointed assistant sanitary inspector. There were twenty-three candidates for the post.

Mr. W. M. Jameson, surveyor to the South Hornsey Urban District Council, was last week appointed surveyor to the Whitechapel District Board of Works, in succession to Mr. J. P. Waddington, who has accepted the surveyorship to the St. Marylebone Vestry.

At the invitation of Mr. Samuel W. Johnson, who is president of the Institution of Mechanical Engineers, the members of that institution attended a reception and garden party at the Nottingham Castle and Museum yesterday. During the day visits were paid to a number of works in the city.

Mr. E. J. Scown, of the borough engineer's office, Plymouth, Mr. J. McArthur, Southampton, and Mr. W. S. Douthwaite, Lancaster, have been appointed chief engineering assistant, temporary assistant and building inspector respectively in the office of Mr. K. P. Campbell, borough engineer and surveyor of Huddersfield.

Mr. William Green, senr., superintendent of the Lighting Department of the Birmingham Corporation, having retired under the provisions of the superannuation scheme, the Public Works Committee have temporarily appointed Mr. William Green, junr., who has been assistant superintendent for the past twenty years, in his place.

At a meeting of the Roads and Bridges Committee of the Glamorgan County Council on Thursday seventy-six applications were received for the post of road inspector. The following five applicants were selected to appear before a futuro meeting: Alexander Mark, Bridgend; Thomas Oakley, Aberdare; Joseph Rees, Penygraig; Harry T. Jones, Clydach; and David Williams, Aberdare.

Mr. Vincent Turner has been appointed assistant to the water engineer of the Wakefield Corporation. He is an old Mason Engineering College student, and has been articled for three years to the borough surveyor of Wolverhampton. During this period he has qualified for the studentship of the Institution of Civil Engineers, the Surveyors' Institution, and as a graduate of the Institution of Mechanical Engineers.

It is reported that the General Purposes Committee of the Batley Corporation have agreed to allow Mr. O. J. Kirby, the borough surveyor, to act as expert adviser and engineer to the Manufacturers' Committee in connection with the preparation of some scheme for dealing with trade effluents, in response to the demand from the West Riding Rivers Board. It is stated that Mr. Kirby will prepare plans and submit them to the committee at once.

Mr. Buckley, road surveyor to the Birmingham Corporation, who for some time past has been in failing health, recently expressed a desire to retire under the superannuation scheme. The Public Works Committee have accepted his resignation, and have decided to advertise for an experienced road surveyor to take his place, at a salary of £300 per annum, rising by annual increments of £20 to £400. Mr. Buckley's salary was £500 per annum.

Upwards of twenty employees of the Batley Corporation held their annual outing last week to Holford. A *char-a-banc* was requisitioned, and a start made about 8 o'clock, the outward journey being made by way of Berry Brow, Horley and Brockholes. Lunch was served at the Commercial Inn,

and afterwards the party, under the guidance of Mr. Barrowclough, the water engineer, paid a visit to the extensive waterworks owned by the corporation. The Bilberry reservoir was also visited during the day. After dinner a hearty vote of thanks was passed to Mr. Barrowclough. The return journey was by way of Lockwood and Huddersfield.

At the last meeting of the Harpenden Urban District Council a letter was read from the Local Government Board regarding the appointment of Mr. William Walton as surveyor and inspector of nuisance stating that they observed, from the answers to queries put by them, that Mr. Walton was to be allowed to continue in business as an architect. If this was the case he should enter into an undertaking with the council to provide that he would wholly abstain, in private business, from engaging in any works arising out of, or connected in any way with, the duties of his office of inspector. The council agreed to reply confirming to these requirements.

On Thursday the Cirencester Urban District Council had under consideration a report of the Streets and General Purposes Committee in regard to the salary of Mr. T. Hibbert, the surveyor. Up to the present, it seems, Mr. Hibbert has been receiving £185 yearly, although at the time of his appointment it was recognised that that amount would necessitate a revision after a time. During the period of his appointment Mr. Hibbert has prepared plans of and executed sewerage and drainage works, street improvement works and bath renovation, and has in every case satisfied the committee charged with the execution of each particular work. In the opinion of the committee the time had come when Mr. Hibbert should be relieved of some portion of his work, and that relief, they considered, could be best afforded by placing the collection of the rates (until now one of Mr. Hibbert's duties) in other hands. The report, which included the recommendation for the advancement of the salary to £225 per annum, was eventually adopted, the chairman remarking that it was evident, from inquiries they had made as to the rates of payment in other places, the present salary was not adequate remuneration.

On the occasion of Mr. Blackman's leaving Aberdeen to fill the position of electrical engineer to the Poplar District Board of Works, he was on Friday, in the offices of the Aberdeen electricity works, Cotton-street, made the recipient of a complete set of ivory dress-knives and forks in a handsome walnut case. Among those present were Mr. Alexander Smith, manager of the gas department, and Mr. J. A. Bell, the newly-appointed city electrician. Mr. Smith, in making the presentation, remarked that he felt both glad and sorry—glad that Mr. Blackman had secured a better appointment, but, on the other hand, sorry to lose Mr. Blackman as electrical engineer to the Corporation of Aberdeen. He felt sure that they would all follow Mr. Blackman's future with the greatest possible interest. He took advantage of the opportunity afforded to welcome Mr. Bell, and trusted that they would all get along harmoniously together. Mr. Smith then formally handed over the present to Mr. Blackman with the hope that both he and Mrs. Blackman would long be spared to use and enjoy it. Mr. Blackman thanked the company heartily, not only for the handsome gift, but also for the expressions of goodwill which accompanied it. He felt sure that he had the entire sympathy and goodwill of the staff, as had been evinced on many occasions. In concluding, he trusted that if any of those present had occasion to visit London they would not leave the city without paying him a visit. Mr. Bell in a few remarks thanked those present for the way they had received the kind sentiments that had been expressed by Mr. Smith. He said that this was perhaps the only known instance where the new city electrician had had the opportunity of seeing the send-off of his predecessor.

Bootle.—The town council have accepted the tender of Mr. Walter Musker, of Bootle, to carry out an electric lighting station at Pine-grove, for the sum of £6,598.—Electric lighting charges will shortly be fixed on a sliding scale.

Birkenhead.—Good progress is reported as being made with the scheme for providing a municipal tramway service on the overhead trolley system. At a recent meeting the Special Tramways Committee brought up a list of routes, and it was arranged to schedule these in next session's application for a tramways provisional order.

Bournemouth.—At a meeting of the town council on the 20th inst. the Roads Committee reported that they had considered the following tenders for making-up Alington and Heron Court roads, Portman-place and St. John's-avenue: Messrs. Grounds & Newton, £401; and Mr. George Troke, £408. They recommended that the lowest tender be accepted, and this was agreed to. The same committee reported that a letter had been received from the Local Government Board authorising a loan of £480 for the works in the above roads, and another stating that the board were not prepared to sanction a loan of £500 for the continuation of Bradley-road.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

IRISH DISTRICT MEETING AT CORK.

The following are the arrangements for the above meeting, which will be held on Friday and Saturday, August 5th and 6th:—

FRIDAY, AUGUST 5TH.

- 11.30 a.m.—The members will be received in the council chamber, Municipal Buildings, by the Right Worshipful P. H. Meade, Esq., Mayor of Cork. Reading of the minutes.
- 12 noon.—The following papers will be read and discussed: (1) "Restoration of Municipal Buildings and Description of Cork Waterworks, with means adopted for checking Waste of Water," by Mr. H. A. Cutler, city engineer, Cork; (2) "Description of Cork Electric Tramways," by Mr. Bevilly Griffin, A.M.I.C.E., resident engineer for the contractor for permanent way; and (3) "Main Roads under County Councils," by Mr. R. H. Dorman, county surveyor, Armagh.
- 2 p.m.—Luncheon, which will kindly be provided by the mayor.
- 3 p.m.—Visit to Cork Electric Tramway and Lighting Company's central station and other works in course of construction in the city.
- 4.30 p.m.—Special train (Cork and Muskerry Light Railway) to visit Blarney and St. Anne's, where tea will be provided by Mr. R. Bertie, J.P., chairman of the company. The engineer for the railway, Mr. W. H. Hill, will accompany the members. On returning to Cork the members will dine together at the Imperial Hotel, at 7.30 o'clock. Dinner tickets 5s. each (wines extra).

SATURDAY, AUGUST 6TH.

Visit to Queenstown Waterworks.

- 10 a.m.—The members will meet at the Municipal Buildings and drive to Tippetstown, site of head works. Messrs. Kirkby & Dorman, the engineers, will explain the scheme on the ground.
- 1 p.m.—Leave Queenstown Junction for Queenstown.
- 1.30 p.m.—Luncheon at Queen's Hotel, Queenstown, provided by the local members.
- 2.30 p.m.—Start on board American tender for a cruise round Cork harbour and visit harbour works; and also Cork, Blackrock and Passage Railway extension to Crosshaven. Messrs. James Price, M.I.C.E., harbour engineer, and S. Perry, engineer to the railway company, will accompany the members. Afternoon tea will be provided by Mrs. Kirkby, at Miramar, Queenstown, where the steamer will touch during the afternoon.
- Hotels recommended—Imperial, Victoria, Métropole, Moore's and Turner's.
- Train and boat services—Leave Euston, 8.45 p.m. and Holyhead, Arrive Cork, 10.35 a.m. Leave Paddington, Tuesdays, Thursdays and Saturdays, 4.30 p.m., for New Milford. Arrive Cork, 9 a.m.
- R. H. DORMAN, M.I.C.E., THOMAS COLE, A.M.I.C.E., Secretary,
Hon. Sec. Irish District, 11 Victoria-street,
Armagh. Westminster, S.W.

LONDON WATER SUPPLY COMMISSION.

The Royal Commission on the London Water Supply, presided over by Lord Llandaff, held their thirty-first sitting at the Guildhall, Westminster, on Monday.

Mr. REGINALD S. MIDDLETON, assistant commissioner to Lord Balfour's commission and one of the engineers of the Thames reservoir scheme, who was called at the close of the previous meeting, continued his evidence. Dealing first with the probable increase of the population of London and its effect upon the purity of the water of the Thames, he said that the population of greater London in 1891, which amounted to 5,732,950, was 500,795 in excess of the population supplied by the eight water companies; but he had taken the larger figure as the basis of his calculations, and with an estimated rate of increase of 15.2 per cent. per annum the population would not amount in 1931 to 11,250,000. He had satisfied himself—and in this respect he was supported by the calculations of Sir Benjamin Baker and Mr. Deacon—that it would be possible to obtain from the Thames something more than 400,000,000 gallons a day without depleting the river to such an extent as to reduce the flow over Teddington weir below 200,000,000 gallons a day. If local authorities of Middlesex and Hertfordshire and elsewhere supplied their respective districts from wells, it would not have any appreciable effect on the river Thames. This, he said, in reply to a question, is also true of the river Lea. He did not agree with the evidence of other witnesses that pumping from the wells in the Lea valley would have a very sensible effect. Replying to further questions, the witness went on to say that Lord Balfour's commission did not express or imply any insistence upon Staines as the only site for storage reservoirs when they gave a preference to the scheme laid before them by Messrs. Hunter & Fraser. They merely expressed their approval of reservoirs of this type situated in the Thames valley as near

to the intakes of the companies as possible. Moreover, the conditions which no doubt influenced Messrs. Hunter & Fraser to place their intakes above Bell weir—namely, that Staines, Sunbury and other villages on the banks of the Thames drained into cesspools—no longer existed, for Sunbury, Weylbridge, Walton and Hampton had all instituted sewage disposal works, or were constructing them, and consequently they were equally suitable with Staines as sites for storage reservoirs. Moreover, so far from the increasing population of the Thames valley having had a deteriorating effect on the raw Thames water as found at Hampton, the reverse appeared to be the case, and there had been a notable decrease in the organic impurity of the Thames at the point where it was utilised for the water supply of London. This was borne out by the latest report of the Rivers Pollution Commission, and also by Sir E. Frankland's annual reports on the metropolitan water supply. The witness then handed in a series of tables and calculations for the purpose of showing that it was possible to obtain within a certain area adjacent to the metropolis 645,000,000 gallons of water a day, which was sufficient to enable the companies to go on supplying London with water for a long period, and that therefore, when they had the materials at hand, it was unnecessary to go to Wales. In further cross-examination witness said he thought that further wells could be sunk in the chalk basin of the Thames to produce at least 190,000,000 gallons a day, probably more. He considered that a storage of 1,802,000,000 gallons was necessary to satisfy the conditions laid down by Lord Balfour's commission in order to provide for the present average supply of 130,000,000 gallons a day.

Mr. PEMBER pointed out that the cubical capacity of the Staines reservoirs must not be measured by the 30,000,000 gallons a day which they were authorised by Parliament to supply, as they were capable of supplying 54,000,000 a day, and even more. The London County Council estimates for the Welsh supply had been compared with the known cost of the Thirlmere and Vyrnwy supplies, and with the estimated cost of the Elan valley supply, and it was believed that the expenditure incurred in providing, in addition to the existing supply, a further supply of 123,500,000 gallons daily from Wales would be about £21,000,000, while the cost of the Thames reservoirs storage scheme to supply a like amount would be little more than £5,000,000, to which would have to be added a further sum of £500,000 for the pipe line from Hampton, or other place of drawing the supply, into the districts of the companies.

The commission adjourned until the beginning of November.

LAMBETH VESTRY AND THE SMOKE NUISANCE.

With regard to complaints made by the London County Council as to the smoke nuisance in Lambeth, the Sanitary Committee, at the meeting of the vestry on Thursday, submitted a lengthy report on the subject by the medical officer of health, who had had the question under consideration from the beginning of the year and prior to representations made by the county council. During the course of his inspections the medical officer found that in all cases patent appliances were in use in connection with the different boilers and furnaces—e.g., Ellis & Evans' forced or induced draughts, rucking bars, patent grids (opening and shutting automatically or otherwise), atom jet, mechanical stokers, split bridges, &c., so that every reasonable precaution appears to have been taken in connection with the construction of the furnaces and boilers themselves. With reference to the question of coal, the medical officer stated that in all cases the excuse offered is the inability of the various firms to obtain the best Welsh steam or smokeless coal, owing to the South Wales strike, and there is no doubt but that the use of second-class (and inferior) coal has recently increased the smoke nuisance in Lambeth, as elsewhere. It is a matter for the vestry to decide as to whether this excuse shall be considered a valid one in the future, or whether written notice should not be sent to the various Lambeth firms to the effect that after a certain period (say three months) this excuse will not be accepted by the vestry. Having regard to all the circumstances of the case, the vestry decided, on the recommendation of the Sanitary Committee, that the evidence submitted did not warrant any further legal proceedings being taken in the matter.

New Weir on the Upper Thames.—The Thames Conservators have decided to construct a new deep weir on the upper Thames at Sonning, near Reading.

Berlin Pavements.—It appears, from some statistics furnished by the United States consul at Berlin respecting the carriage pavements of that city, that wood pavement does not find much favour there. The area of pavements is 6,500,405 square yards, and of this area a little less than 74 per cent. has stone pavements, about 25 per cent. asphalt, and a fraction over 1 per cent. wood. The consul states that the proportion of asphalt is steadily increasing. The soil consists of coarse gritty sand, forming apparently an excellent foundation for the heavy 8-in. layer of gravel and cement, over which the 2-in. covering of asphalt is spread.

NEW FORTS AT DOVER.

DETAILS OF THE CONTRACTS.

For the protection of the great national harbour now being constructed at Dover by Messrs. Pearson & Son, the Government have decided to construct three powerful forts, and contracts have now been signed and sealed. All the forts will be on the cliffs. The one at the eastern end of the harbour will be at Langdon, and known as Langdon fort, the contract for this having been secured by Messrs. Johnson, of 66 Watling-street, London. The other two will be at Western Heights, the contractors for these being Messrs. Patrick, of Point Pleasant, Wansworth. The forts are to be erected simultaneously, and the contractors are under very heavy penalties—something like £6 a day—to complete them within eighteen months from date.

The forts are to be armed with the most modern guns. At Langdon fort there will be two 9-in. B.L. wire guns, besides 6-in. B.L. quick-firers, all erected on barlette mountings. The tender of the successful contractor for this fort was 15 per cent. above schedule. It is estimated that 9,000 yards of concrete will be used at the Langdon fort alone, with a thick splinter-proof centre.

The construction of the two forts at the Western Heights by Messrs. Patrick will be a very difficult operation, on account of the awkward position of the sites for conveying material, and to overcome the difficulty a road will have to be cut through the Ropewalk meadow and a bridge thrown across the trenches.

It is stipulated that the three forts shall be erected before the turret at the Admiralty pier, containing two 80-ton guns, is dismantled, so that there is a prospect apparently of at least another eighteen months or two years before the extension of the Admiralty pier, in connection with the construction of the harbour, can be gone on with. This delay will be particularly felt in regard to the commercial harbour, which suffers so much from the want of the protection which the extension of the Admiralty pier will provide.

The contractors for the eastern fort have been granted office accommodation at the hospital building of the disused convict prison, which is situated close by.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

COUNTY SURVEYOR.—August 1st.—Herefordshire County Council. £400.—The County Clerk, Shirehall, Hereford.

BOROUGH ENGINEER AND SURVEYOR'S ASSISTANT.—August 1st.—Corporation of Warrington. £100.—Mr. Thos. Longdin, borough engineer and surveyor.

SURVEYOR AND INSPECTOR OF NUISANCES.—August 1st.—Shildon and East Thickley Urban District Council. £120.—Mr. J. T. Proud, clerk to the council.

SUPERINTENDENT OF HOUSE REFUSE REMOVAL.—August 1st.—Handsworth Urban District Council. £2 5s.—Mr. E. Kenworthy, A.M.L.C.E., surveyor to the council.

INSPECTOR OF NUISANCES.—August 1st.—Failsworth Urban District Council. £90.—Mr. H. C. Broome, clerk to the council.

JUNIOR ASSISTANT ELECTRICAL ENGINEER.—August 2nd.—Wolverhampton Corporation. £80.—Mr. Horatio Brevitt, town clerk.

CLERK OF WORKS.—August 2nd.—Kettering Urban District Council. £3.—Mr. Thomas R. Smith, surveyor to the council.

CLERKS FOR CITY ENGINEER'S OFFICE (Two).—August 3rd.—Hull Corporation. £65 and £40.—Mr. A. E. White, city engineer.

ASSISTANT INSPECTOR OF NUISANCES, WATER INSPECTOR AND SURVEYOR.—August 5th.—Cowway Rural District Council. £100.—Mr. T. E. Parry, clerk to the council.

CLERKS OF WORKS (Two).—August 6th.—Edmonton Urban District Council. £3 3s.—Mr. G. Eedes Eachus, M.L.C.E., engineer and surveyor to the council.

SURVEYOR AND INSPECTOR.—August 5th.—Street Urban District Council. £90.—Mr. S. Thompson Clothier, clerk to the council.

INSPECTOR OF NUISANCES.—August 15th.—Highworth and Swindon Rural District Council. £120.—Mr. Join P. Kirby, clerk to the council.

ARCHITECTURAL ASSISTANT.—August 19th.—Beckenham Urban District Council. £3 3s.—Mr. J. A. Angoll, surveyor to the council.

CITY ENGINEER.—August 31st.—Corporation of Wellington, New Zealand. £800.—Agent-General for New Zealand, London.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

PLYMOUTH.—September 24th.—Erection of shops and dwelling-houses fronting Tavistock-street. £250.—Mr. J. H. Ellis, town clerk.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

WIMBLEDON.—July 29th.—Making-up of Ridgway-gardens and Edgehill (section 2), for the urban district council.—Mr. W. H. Whitfield, clerk to the council.

Telegrams: "WILKES, BIRMINGHAM."

BURTON-UPON-TRENT.—July 29th.—Construction and erection of a new retort-house at the gasworks, for the corporation.—Mr. F. L. Ramsden, engineer, Gas and Electric Light Works, Burton-upon-Trent.

HUNSTAYTON.—July 30th.—Construction of a telescopic gasholder, for the urban district council.—Mr. J. S. B. Gleser, clerk to the council.

KETTERING.—July 30th.—Erection of a green-house, 30 ft. long by 12 ft. wide, in the cemetery, for the urban district council.—Mr. Thos. R. Smith, surveyor to the council.

GRAY HARWOOD.—July 30th.—Erection of a block of offices in Pellet-street, for the urban district council.—Mr. R. Clippendale, clerk to the council.

ST. THOMAS-LE-APOSTLE (near Exeter).—July 30th.—Supply and fixing of the gas engines and centrifugal pumps required in connection with the new sewage outfall works, for the urban district council.—Mr. S. Churchward, surveyor to the council.

LEYLAND.—July 30th.—Construction of precipitation tanks, filters, reservoir, engine and boiler house, conduits, subsoil drainage, &c., for the urban district council.—Mr. William Wrennall, 9 Harrington-street, Liverpool.

WHITTABLE.—August 1st.—Supply of about 300 tons of granite or quartzite chippings, 100 ft. run of 10-in. by 5-in. granite kerling, 100 ft. run of 10-in. by 5-in. granite channelling, and Portland cement, for the urban district council.—Mr. Alfred Goldfinch, surveyor to the council.

CHIFFSWOLD.—August 1st.—Laying of 1,000 superficial yards of granite and cement concrete for footways in Bridge-street and Station-road, for the urban district council.—Mr. F. Feather, surveyor to the council.

RYDE.—August 2nd.—Supply and delivery, and also laying, of about 1,650 yards of 4-in. and 120 yards of 3-in. cast-iron pipes.—Mr. C. Mathew, borough engineer.

WARRSWICK.—August 2nd.—Providing and laying of about 14,000 superficial yards of wood block paving (crossed deal) in Richmond-road, Putney, for the district board of works.—Mr. Henry George Hills, clerk to the board.

WIMBORNE.—August 2nd.—Construction of the following streets, for the urban district council: Union-road, Copland-road, Montrose-avenue, Station-grove, Chaplin-road, Talbot-road, Napier-road, Stanley-avenue, Peel-road and Priory Park-road.—Mr. C. L. Whitehead, junr., engineer to the council.

BRIGHTON.—August 2nd.—Alterations and additions to the gentleman's cloak-room and lavatory at the Royal Pavilion.—Mr. Francis J. C. May, M.E.C.E., borough engineer and surveyor.

TOTTENHAM.—August 2nd.—Construction of 12-in. and 9-in. sewers in Fairview-road, South Tottenham, for the urban district council.—Mr. P. E. Murphy, engineer to the council.

RYZANCE.—August 2nd.—Laying of between 500 and 600 super. yards of Jarraballie jarrah wood paving in St. Clare-street.—Mr. George H. Small, borough surveyor.

SHRODSITCU.—August 3rd.—Construction of an underground conveniences in Hoxton-street.—Mr. J. Rush Dixon, A.M.E.C.E., engineer and surveyor to the vestry.

NEWMARKET.—August 3rd.—Supply of 1,500 tons of best broken Leicestershire granite metalling, for the urban district council.—Mr. S. J. Ennion, clerk to the council.

ALDEBROTH.—August 3rd.—Works of metalling, kerbing, channelling, paving, &c., in St. Michael's-road, St. George's-road and St. Joseph's-road, for the urban district council.—Mr. W. E. Foster, clerk to the council.

HAMPTON WICK.—August 3rd.—Laying of about 1,000 yards of limestone tar paving, for the urban district council.—Mr. J. Nixon Horsfield, surveyor to the council.

DONCASTER.—August 3rd.—Erection of an isolation hospital adjoining Common-lane, Bulby.—Mr. William H. R. Crabtree, borough surveyor.

HEDDERFIELD.—August 4th.—Supply and delivery of not less than 3,000 tons of granite setts.—Mr. F. C. Lloyd, town clerk.

ILKESTON.—August 4th.—Supply of a new pumping engine, for the Little Hallam pumping station.—Mr. H. J. Kilford, borough surveyor and water engineer.

SHEFFIELD.—August 4th.—Providing and laying of about 2,000 superficial yards of 3-in. cast-iron pipes and for the construction of a covered service reservoir and conduit, for the rural district council.—Mr. A. Rowell, engineer and surveyor to the council.

ASHTON-IN-MAKERFIELD.—August 4th.—Supply and delivery of 200 tons of 2-in. best hand-broke granite macadam and 50 tons of 1-in. clean sharp granite chippings, for the urban district council.—Mr. John W. Liveredge, surveyor to the council.

BEDFORD.—August 4th.—Supply of cast-iron cylinders, valves, standard pipes, deck and floor plates, girders, handstocks and other appliances required for the outlet towers of Gouthwaite reservoir.—Mr. James Watson, M.E.C.E., waterworks-engineer, Town Hall, Bradford.

WALSLEY.—August 5th.—Supply of about 1,500 tons of Geopony granite or Queenst stone, for the urban district council.—Mr. William Hewitt, clerk to the council.

SLOUGH.—August 6th.—Supply of 1,300 tons of 2-in. broken granite field flints and about 600 tons of 1-in. machine-broken and hand-broke granite, for the urban district council.—Mr. W. W. Cooper, surveyor to the council.

NEWTON-IN-MAKERFIELD.—August 6th.—Makings-up Torland, Alpine, Peel, Nelson, Water and Brookfield-streets and Bradleigh-couval, for the urban district council.—Mr. W. W. Shirley, clerk to the council.

PERRIN.—August 6th.—Extension of the quay at the harbour.—Mr. William MacLesh, town clerk.

SLOUGH.—August 6th.—Making-up works in the Artycs known as Chulvey Vale, for the urban district council.—Mr. G. H. Claresby, clerk to the council.

GUTHRIE.—August 6th.—Construction of certain surface-water drains, including new works of drainage in connection therewith.—Mr. C. G. Mason, borough surveyor.

ADERGAVENNY.—August 8th.—Erection of a footbridge and the construction of a culvert at the Old Mill, Coneyrow Lower, for the rural district council.—Mr. John Gill, surveyor to the council.

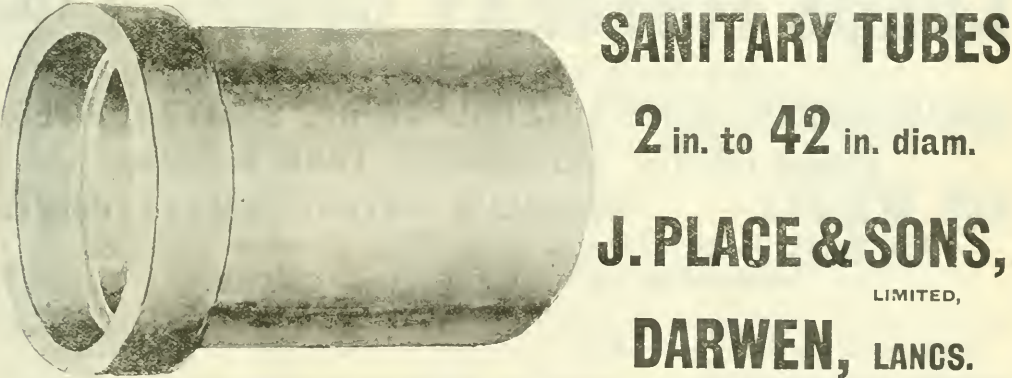

PADSTON.—August 8th.—Supply of 400 yards of 24-in. cast-iron pipes, for the urban district council.—Mr. J. Gregson, A.M.E.C.E., engineer and surveyor to the council.

CRACKEN-LE-FRITH.—August 10th.—Construction of a concrete service reservoir, and the providing and laying of about 11 miles of cast-iron mains for the water supply of the township of Bamford, for the rural district council.—Mr. J. Burton Boycott, clerk to the council.

WREXHAM.—August 10th.—Erection of a bridge over the river Gwyrffro, at a place called Birt-y-bollen, in the township of Bracton, for the urban district council.—Mr. John Strachan, surveyor to the council, Crispian Lodge, Wrexham.

HUNSLY.—August 13th.—Laying and jointing of about 0,150 yards of 3-in. cast-iron pipes, also fixing and walling-in of about twenty valves and hydrants for the Templenewasm and Thorpe Stapleton water supply, for the rural district council.—Mr. W. B. Finder, clerk to the council.

GLOUCESTER.—August 15th.—Erection of an infectious diseases hospital at Over.—Mr. Geo. Sheffield Blakeway, town clerk.

As adopted for the Drainage of Eastbourne, Southampton, Warrington, Staines, Ipswich, Norwich, Felixstowe, and many other places, both in this country and abroad.

For Pamphlets and Particulars apply to—
HUGHES & LANCASTER,
47 Victoria Street, Westminster, S.W.
CONTRACTORS FOR DRAINAGE AND WATER SUPPLY WORKS.

SHOEBURTH.—August 15th.—Erection of a new battery-room, boiler-house and extension of offices at the electricity supply station, Coronet-street.—Mr. H. Mansfield Robinson, vestry clerk.

BATH.—August 15th.—Erection of boundary walls, the railing, kerbing, paving and channelling of footpaths, and other works opposite the town hall, for the urban district council.—Mr. George Ball, A.M.C.E., surveyor to the council.

WOLVEHAMPTON.—August 16th.—Supply of cast-iron, wrought-iron and steel work required for structural and other purposes at the swimming bath and assembly hall to be erected in Bath-place.—Mr. J. W. Bradley, borough surveyor.

ROTTERHAM.—August 23rd.—Construction of sewers, outfall works, and other works connected therewith, for the corporation.—Mr. R. E. W. Barrington, Bank Buildings, Wolverhampton.

HOYLAKE AND WEST KIRBY.—Supply of about 2,500 lineal yards of standards and railing for promenades, for the urban district council.—Mr. Thomas Foster, engineer to the council.

BROMLEY.—For works of sewerage, levelling, paving, metalling, channelling and making-good The Avenue, Buckley, for the urban district council.—Mr. Fred. H. Norman, clerk to the council.—

R. Ballard, Limited, Kilburn £1,326
E. Peill & Son, Bromley 1,236
Mowlens & Co., Westminster 1,156

HARROW.—Accepted for the supply of about 1,600 tons of 1½-in. hand-broken granite and ½-in. granite chippings, for the urban district council.—Mr. T. Charles, surveyor to the council:—

1½-in. Hand-Broken Granite (per ton).—The Cleo Hill Dhu Stone Company, Ludlow, Salop, 14s. 6d.
½-in. Granite Chippings (per ton).—The Cleo Hill Dhu Stone Company, Ludlow, Salop, 11s. 11d.

1½-in. Hand-Broken Granite (per ton).—W. H. Murray & Co., King William-street, E.C., 10s. 9d.

ILFORD.—For the supply of sludge-pressing machinery, oil engine and other apparatus at the outfall works, Loxford-lane, for the urban district council.—Messrs. John Taylor, Sons & Santo Crimp, 27 George-street, London, S.W.:

J. Wolstenholme, Radcliffe, Lancs. £1,400
S. B. Johnson & Co., Stratford, E.* 1,245
Goddard, Massey & Warner, Nottingham 1,167
T. C. Williams & Sons, Reading 1,060

KEIGHLEY.—Accepted for the erection of twelve artisans' dwellings in Lawkholme-lane.—Mr. W. H. Hopkinson, A.M.I.C.E., borough engineer:—

Masons' Work.—J. W. Fishburn, Silsden, near Keighley, £1,498.
Joiners' Work.—F. Driver, Keighley, £200.
Plumbers' Work.—J. Harrison, Keighley, £25.
Slaters' Work.—W. Thornton, Keighley, £143.
Plasterers' Work.—J. King, Keighley, £176.

LEICESTER.—For the erection of thirty-eight butchers' stalls at the general market.—Mr. E. George Mawbey, borough surveyor:—

J. E. Johnson & Son, Leicester £325
F. H. Stevens, Leicester 308
W. T. Burbridge, Leicester 300
Hardington & Elliott, Leicester 287
Gretton, Leicester 286
J. C. Kellett, Leicester 275
T. G. Cross, Leicester 275
T. Herbert, Leicester 236
W. Gimson & Sons, Leicester 229
D. Gadd, Leicester 225
P. Neal, Leicester 220
Tyers & Yates, Leicester* 205

LONDON.—For the erection of the first section of the proposed permanent North-Eastern Hospital, St. Andrew's-road, Tottenham, for the Metropolitan Asylums Board.—Mr. T. Duncombe Mann, clerk to the board:—

Martin, Wells & Co., Vauxhall £139,725
Leslie & Co., Limited, Kensington-square 121,145
W. Johnson & Co., Limited, Wandsworth Common 111,340
Spencer, Santo & Co., Limited, Westminster 114,975
McCormick & Sons, Northampton-street, N.* 113,642

TENDERS.

*ACCEPTED.

ALVASTON.—For various pipe-laying works for the water supply of the town, for the urban district council.—Mr. J. Edward Willcox, Union Chambers, 63 Temple-row, Birmingham:—

J. G. Fincher & Co., Stratford-on-Avon £1,260
W. H. Smith & Son, Bristol 1,044
J. Mackay, Smethwick 950
W. Jowett, Hensworth, near Wakefield 850
H. Shardlow, Nottingham 850
J. Roberts, Stratford-on-Avon 785
T. Vale, Stourport 748
Batchelor & Snowdon, Cardiff 741
H. Law, Chester-road, Erdington 735
J. W. Lord, Henly-in-Arden* 640

ALVASTON.—For the supply of cast-iron water pipes in connection with the water supply of the town, for the urban district council.—Mr. J. Edward Willcox, Union Chambers, 63 Temple-row, Birmingham:—

Stanton Ironworks Company, Limited, near Nottingham, £283.
Sheepbridge Coal and Iron Company, Chesterfield, £202.
J. & S. Roberts, West Bromwich,* £257.

H. R. Merton & Co., Metal Exchange Buildings, London (agents for R. D. Wood & Co., Philadelphia).—3 in., £5 17s. 3d. per ton; 4 in., £5 14s. 3d. per ton; 5 in., £5 18s. 3d. per ton. Specials of ordinary shapes and sizes, £5 7s. 6d. per ton; flanged specials, including facing and boring, £14 7s. 6d. per ton.

BOURNEMOUTH.—For making-up Aington and Heron Court roads, Portman-place and St. John's-avenue.—Mr. F. W. Lacey, M.I.C.E., borough engineer and surveyor:—

G. Troke £409
Grounds & Newton* 401

LEEDS FIRECLAY COMPLY., LTD.

APPOINTMENTS OPEN.

BECKENHAM URBAN DISTRICT COUNCIL. ARCHITECTURAL ASSISTANT.

Required, temporarily, in the Surveyor's office, Beckenham, an experienced Architectural Draughtsman. One having experience of swimming baths and technical institutes preferred. Salary, £3 3s. per week.

Applications, stating age and experience, accompanied by not more than three testimonials, to be sent to Mr. J. A. Angell, Surveyor, Council Offices, Beckenham, Kent, by Friday, August 19th.

EDMONTON URBAN DISTRICT COUNCIL. CLERK OF WORKS.

The Edmonton Urban District Council invite applications for the appointment of Two Clerks of Works for certain Private Street Improvement Works in their district.

The appointment will be for a period of about six months, and candidates must be prepared to enter upon the duties within one week after notice from the Council's Engineer.

The salary will be 3 guineas per week, and the persons appointed will be required to devote their whole time to the duties of the office.

Applications, with copies of not more than three recent testimonials, to be sent to Mr. G. Eedes Esclus, M.INST.C.E., Engineer and Surveyor to the Council, Town Hall, Edmonton, on or before the 6th day of August, 1898.

Canvassing will disqualify.

(By order),
WM. FRANCIS PAYNE,
Clerk.

Town Hall, Edmonton.
July 22, 1898.

ARCHITECTURAL ASSISTANT.—Required, a competent Architectural Assistant, with good knowledge of ironwork, construction, details, quantities and estimates, for the surveyor's office in a county borough. Salary, £120 a year.—Applications, stating age, qualifications, references, &c., accompanied by copies of not more than three recent testimonials, to be sent in at once, addressed Box 78, Office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

COMPETITION.

VESTRY OF ST. PANCRAS. TO BATHS ARCHITECTS.

The Vestry of St. Pancras invite applications from Architects who have had experience in designing and supervising the construction of public baths and wash-houses, and are willing to submit designs for the Vestry's new baths in the northern part of the parish. From those sending applications six will be selected to compete. A professional assessor will be appointed to report and advise on the designs sent in. The architect of the design placed first in order of merit will be asked to carry out the work at the usual institute charges, and the five unsuccessful architects will be awarded a premium of £50 each. The several designs sent in will become the property of the Vestry.

Applications to be sent to the undersigned not later than the 25th August, 1898.

C. H. F. BARRETT,
Vestry Clerk.

Vestry Hall, Pancras-road, N.W.

TENDERS WANTED.

COUNTY BOROUGH OF WOLVERHAMPTON.
NEW BATHS.—CONTRACT No. 7.

The Parks and Baths Committee invite tenders for Cast-Iron, Wrought-Iron and Steel Work required for structural and other purposes in Swimming Bath and Assembly Hall to be erected in Bath-place, Wolverhampton.

Drawings may be seen, and specification, bill of quantities and form of tender obtained, on application at the offices of the undersigned.

Sealed tenders, endorsed "Tender for Iron and Steel Work for Bath, &c.," and addressed to the Chairman of the Parks and Baths Committee, must be delivered at the Town Clerk's office not later than 9 o'clock a.m. on Tuesday, August 16, 1898.

The contractor will be required to enter into an undertaking to pay not less than the minimum standard rate of wages of the district and to observe certain hours of labour in accordance with the resolution of the Town Council.

The lowest or any tender will not necessarily be accepted.

J. W. BRADLEY, c.e.,
Borough Surveyor.

Town Hall, Wolverhampton.
July, 1898.

THE URBAN DISTRICT COUNCIL OF
HOYLAKE AND WEST KIRBY are prepared to receive designs and tenders for about 2,500 lineal yards of Standards and Railing for Promenades.

Particulars may be had upon application to the undersigned,
THOMAS FOSTER,
Engineer.

Public Offices, Hoylake, Cheshire.
July 20, 1898.

BOROUGH OF RYDE.
TO PIPE FOUNDERS AND LAYERS.

The Corporation of the Borough of Ryde invite tenders for the Supply and Delivery at Ryde, and also for Laying, about 1,650 yards of 4-in. and 120 yards of 3-in. Cast-Iron Pipes, with Valves, Hydrants and other Castings.

Specifications and forms of tender may be had and any further information may be obtained, on payment of 1 guinea, which will be returned on receipt of a *bonâ-fide* tender, from Mr. C. Mathew, Borough Engineer, Town Hall.

Sealed tenders, endorsed "Tender for Pipes" or "Tender for Pipe-laying," must be delivered, free of charge, to the

Town Clerk, Town Hall, Ryde, not later than Tuesday, 2nd August.

The Corporation do not bind themselves to accept the lowest or any tender.

CHAS. G. VINCENT,
Town Clerk.

Ryde.

July 18, 1898.

BOROUGH OF ROTHERHAM.

SEWERAGE AND SEWAGE DISPOSAL WORKS.

CONTRACTS No. 1 AND 2.

The Corporation of Rotherham is prepared to receive tenders from competent persons for the Construction of Sewers, Outfall Works and other work connected therewith.

The Drawings may be seen, and copies of the specification, bill of quantities and form of tender may be obtained from the Engineer, Mr. R. E. W. Berrington, Bank Buildings, Wolverhampton, on and after Thursday, July 28th next, on payment of 5 guineas, which will be returned on receipt of a *bonâ-fide* tender.

The contractor must not pay less than the standard rate of wages paid in the district, and must observe the proper conditions of labour, and no sub-contracting will be allowed except by permission of the Corporation.

Sealed tenders, addressed to me and endorsed "Tender for Sewerage Works, Contract No. 1 or 2," as the case may be, are to be delivered at my office, Town Hall, Rotherham, at or before noon on Tuesday, August 23rd next.

The Corporation does not bind itself to accept the lowest or any tender.

H. H. HICKMOTT,
Town Clerk.

Town Clerk's Office, Rotherham.
July 12, 1898.

BOROUGH OF GUILDFORD.
SURFACE-WATER DRAINAGE.

The Town Council are prepared to receive tenders for the reconstruction of certain Surface-Water Drains within the borough, including new works of drainage in connection therewith.

A specification, containing bill of quantities, form of tender and general conditions of contract, may be obtained on application to Mr. C. G. Mason, c.e., the Borough Surveyor, at his

Minutes of Proceedings.

The Telephone Inquiry.

The labours of the Select Committee appointed to inquire into the question of the acquisition of the telephone service by municipalities are drawing to a close, and it may be of some interest to sum up the most important facts tendered in evidence. The scope of the inquiry has been fairly wide. It will be remembered that the committee were instructed to ascertain whether the telephone service is or is likely to become of such general benefit as to justify its being undertaken by municipal authorities, regard being had to local finance; and, if so, whether they should have power to undertake such service in the districts of other local authorities outside the area of their own jurisdiction, and what powers, duties and obligations ought to be conferred or imposed upon such local authorities. The beginning of the inquiry was marked by full and exhaustive evidence, given by General Post Office officials, as to the exact position of the telephone company in its relation to that department. It is hardly necessary to say that under a decision of the High Court the Postmaster-General was held to have complete control over telephones and that no system could be carried on without special license granted by him. A very important point was established in the evidence given on behalf of the Post Office in reference to the question of competition. There is little doubt that former Postmasters-General—the late Mr. Raikes in particular—contemplated competition in various parts of the country, and though to a great extent limited by their official position, direct encouragement was given to competition by granting licenses to other companies than the National Telephone Company; but whatever faults may be laid to the door of the National Telephone Company, it has been able to show marked ability for absorbing all and every competitor. Although in a sense the telephone company has been under the direction of the Post Office, and has been even termed in some quarters an unofficial department of the Post Office, it has been unmistakably set forth that without the consent of the local authority no company had any right whatever to lay telephone wires between an exchange and a subscriber's house, and even the authority of the Postmaster-General could not override the powers vested in the representatives of the ratepayers. Sir Robert Hunter, solicitor to the General Post Office, in giving evidence before the committee defined the present position of municipalities with regard to telephony. First of all a corporation must obtain a license from the Postmaster-General, and with authority to exercise his right of way—leave could take up its own streets, but without that license a corporation could not so act. In the case of a municipality carrying on business or seeking to extend the telephone outside its own district; in some other borough for example, it would be in the same position as the National Telephone Company

now occupies—it would have to obtain permission to go into the borough, and, if granted, it would be compelled to go to the road authority for permission to take up the road; and if that were refused it would have to go to the magistrates. Within its own area a corporation would to a certain extent adjudicate on its own account.

The evidence of Mr. Lamb, who has had charge of the telephone and telegraph departments of the General Post Office, seems to be clearly directed against a municipal scheme of any sort. He considered that it was undesirable in the public interests that a private company should have a monopoly; but, on the other hand, he was firmly convinced that the establishment in one town of competing services of telephones would not be in the interests of the public; and he concluded his statements by declaring that the whole thing should be in the hands of the General Post Office. The point raised by Mr. Lamb against competition certainly receives some corroboration from the fact that a good deal of inconvenience has attended the competition in various towns of the country between the National Telephone Company and the General Post Office. In these places subscribers to one system have been compelled to become subscribers to the other in order to keep up a continuity of their business connections. There seems to have been a good many applications on the part of local authorities for licenses to operate telephone systems in their own localities, but in every case the Post Office seems to have considered itself justified in not granting the request, although admitting in the towns of Glasgow, Tunbridge Wells and Manchester, from which corporations applications were received that the telephone service was defective. No doubt the Post Office officials have been acting under the impression that some immediate action would have been taken by the Government, and probably little fault can be found with them for the view they have taken. The official view of Mr. Lamb may be briefly set forward—that he would not permit a municipality to start a system where none existed, and he would not give sanction to enable a municipality to buy out the existing service of the company. Considering the clear and specific nature of the subject set before the committee, there seems to have been in the course of the inquiry some drifting away from the real question at issue, and the questions put to witnesses seem to suggest that the Post Office in dealing with the National Telephone Company had been inclined to favour them to a greater extent than they ought to have done, and when Sir James Fergusson, who was Postmaster-General from December, 1891, to August, 1892, was examined an attempt was made to show that the Post Office had given greater facilities to the National Telephone Company for extending their areas than they were altogether justified in doing. But that phase of the matter is not of very great moment from the municipal point of view. In a subsequent issue we shall

have occasion to make some further reference to the evidence given before the inquiry.

* * *

**The
Responsibilities
of
Employers:
A New Phase.**

We have heard a great deal lately about the Workmen's Compensation Act and the onerous nature of the liabilities to which the employers of labour are thereby subjected. It is not our intention to enter upon the discussion at the present moment, but the prominence given to it seems naturally to recall attention to certain responsibilities of employers in other directions which have not received so much notice. In the month of January last an application of a somewhat novel character was made to Mr. Justice Stirling upon interlocutory motion in an action of *Chase v. the London County Council and Others*. A note of the application appeared in our "Law Notes" column (vol. xiii., p. 238), and we do not hesitate to say that the case was one of very considerable interest and importance to local authorities and their contractors, and, indeed, to all large employers of labour. Let us briefly remind our readers of the facts. The London County Council, in the exercise of their statutory powers and duties, proposed to erect an asylum for pauper lunatics. For this purpose they acquired an estate and entered into a contract with Messrs. Leslie & Co. (their co-defendants in the action) for the construction of the foundations of the proposed building. The carrying out of the works necessarily involved the employment of large numbers of workmen, who were imported from a distance, and left to make their own arrangements as to lodging and sleeping accommodation. The plaintiff was the owner of farm lands adjoining the estate, and according to his account these workmen had been guilty of almost every conceivable act of trespass and nuisance upon his property, breaking down his fences for firewood, treading down his crops, sleeping in his barns, using his hay, chasing his cattle, and committing acts of indecency. The plaintiff sought to fix the responsibility for this state of things upon the council and their contractors, alleging that they had failed to provide proper accommodation for the men and had neglected to fence off the road by which they went to and from the works. He therefore asked for an injunction restraining the council and the contractors from collecting together "large numbers of disorderly persons" without providing by means of fences or walls for the protection of his land. No injunction was granted, but it is significant that liberty was reserved to the plaintiff to renew his application in the event of any further contract being entered into by the council for the erection of the asylum. Even more significant are some observations made by the learned judge, which serve to show how nicely the scales were balanced. We quote from the report of the judgment:—

Looking at all the circumstances of the case, his lordship thought he ought not to interfere by way of interlocutory injunction. Although he had come to that conclusion, he thought the matter required serious consideration on the part of the county council; even if the possibility of their being held legally liable for what had happened be left out of consideration, still they might reasonably be expected, as owners of this property, on which they were erecting extensive buildings, to take care to minimise the inconvenience caused to neighbouring owners and occupiers by the presence of so large a body of men under imperfect control. There was one step which his lordship would point out that the county council might possibly take. The proposed asylum must at some time necessarily be fenced off. It would be very reasonable if the fences were erected before the building was proceeded with, so that they might be used for the purpose of preventing those trespasses.

It is an old-established principle that "if a person collects together a crowd of people to the annoyance of his neighbours that is a nuisance for which he is liable," but so far as we are aware the doctrine has never been applied to a set of circumstances such as those we are now considering. Indeed, Mr. Justice Stirling expressly stated that in his opinion the

plaintiff's claim went considerably beyond the doctrine itself, although at the same time he "was not prepared to say that the claim was not to some extent well founded." The *dictum* is attributable to Lord Tenterden, and was pronounced in the case of *The King v. Moore* (3 B. & Act, 184). In that case the defendant was the owner of shooting grounds—both for target and pigeon shooting—and disorderly crowds collected outside the grounds to shoot at those pigeons which escaped, causing a great noise and disturbance and doing mischief by the shot. He was indicted for a nuisance, and found guilty, and the verdict was upheld by the Court of King's Bench. There are obvious differences between that case and the London County Council case. Nevertheless, having regard to the qualifications subject to which the injunction was refused in the latter and to the judge's observations which we have quoted, too much reliance should not be placed upon those distinctions. At all events it would seem that in future contractors for works necessitating the assemblage of large numbers of workpeople at a distance from their homes must either take precautions to secure the proper accommodation and orderly conduct of the latter or face the possibility of litigation with its attendant anxieties and expense. We think that this is a factor in the responsibilities of employers which has hitherto hardly, if at all, entered into their calculations; and we venture to suggest that it deserves serious consideration.

* * *

**Local Authorities
and
Officials.**

In our last issue we had occasion to comment very favourably on the manner in which the Chesterton Urban District Council had dealt with their surveyor in regard to remuneration. It is to be regretted, however, that the opportunities of speaking thus favourably, whether in connection with remuneration or in other respects, are not so common as might be desired, especially among the smaller authorities. There is, for example, the question of municipal appointments and the abuses which sometimes attend them. This week we publish a communication on the subject from a Scottish contributor. The contribution is a signed one, and thus it should be understood that we do not identify ourselves with everything our contributor says. But while a few of his statements seem to us a little too extreme and somewhat too sweeping in their application, the evils of which he complains undoubtedly do prevail to a very serious extent, though certainly not to the same extent as formerly. Nor do we think that in the appointments of municipal engineers there is so much to object to as in the case of some other classes of municipal officials. This remark, of course, refers more particularly to the higher appointments, for in the cities and large towns public opinion must of necessity have a stronger and more steady effect. On the force of public opinion the ultimate reliance must be placed, and if that fails so much the worse. Unhappily, cases still occur from time to time of an appointment being advertised and a man with some local claims being selected in preference to other candidates whose qualifications may be immensely superior, and who have been put to needless trouble and expense. An authority may have good ground to think that a man on the spot may best suit their requirements, but in that case to advertise the appointment as open to public competition is a farce and a fraud. But reviewing the appointments that have been made for some years back in towns of any importance, the majority have probably been made on *bona-fide* lines, with the object of getting the best man available, no matter where he hails from. Unfortunately, the remark does not apply to the smaller authorities; but for our part we have certainly waged unceasing war against the abuses, and will continue to do so. We fear, however, that it is scarcely practicable to adopt our correspondent's suggestion and take the

power of appointing municipal officials away from the authorities concerned and hand it over to certain professional bodies, however eminent. The central government would probably look with little favour upon such a policy, the authorities concerned would oppose it tooth and nail, and it is doubtful if the professional bodies referred to would welcome their new responsibility. No doubt these bodies would be better judges of professional competence, but is it quite certain that they would not in turn be susceptible to undue influence? On the other hand, the authorities would have nothing to lose and everything to gain by seeking the advice of one or more eminent professional men to help them in their task of selection. The question, however, is one in regard to which we would gladly welcome the opinions of readers, many of whom are so directly interested in it.

* * *

Provisional Orders in 1898.

This week we give the concluding instalment of our reports of the proceedings in connection with Private Bills in Committee. At the beginning of the year we made arrangements to publish these reports in a comprehensive and accurate form, and as the information thus brought together is not to be found elsewhere in anything like adequate shape, we have no doubt that it has proved both interesting and valuable to many classes of our readers. It will be observed that we are also giving a complete list of Provisional Orders for 1898, and this also should prove of value to contractors, engineers and others, especially as the results of the various applications are given. That local authorities, as well as companies, are eager to avail themselves of the facilities for obtaining powers to execute new public works and extend old ones under Provisional Orders is fully demonstrated by the annually increasing volume of Orders issued by the Board of Trade. This year the number is greater than it has ever been, and it testifies to the very remarkable activity of local authorities in the enlargement of their sphere of operations and influence. The cause of the growing popularity of the Provisional Order is not difficult to understand. The process is both less complicated and less costly than a Parliamentary Bill. With simplicity and economy on its side, it is extremely likely that procedure by Provisional Order will be far more generally adopted in the near future than it is now. Lord Balfour of Burleigh, the Secretary for Scotland, who has given a large amount of attention to the question, stated in his evidence before the Select Committee on Private Bill Procedure a few weeks ago that he looked to an extension of the Provisional Order system as a means of relief from the congestion of business in the Parliamentary committee-rooms. Whether the relief comes from that quarter or not, it is quite certain that Provisional Orders are an important part of the machinery of the State, and many of our readers will be interested in the results of the work done through their instrumentality during the session.

The True Function of the Dust Destructor: Testimony from Edinburgh.

We have frequently expressed keen appreciation of the economic and sanitary value of dust destructors, but we have failed to share the cheery optimism which has characterised many of the statements made by the advocates for the incineration of dust. One of the essential facts to be remembered in considering a dust destructor scheme is the variation of local conditions, and the necessity of this is abundantly illustrated in Mr. Young's recent paper before the Incorporated Association of Municipal and County Engineers at Edinburgh. How widely different are the components that go to make up towns' refuse is clearly demonstrated by an analysis of London and Edinburgh refuse. In the case of the former breeze,

cinders and ashes, or what we may term fair burnable matter, forms 64 per cent. of the whole, but in the case of Edinburgh it forms less than 26 per cent. Probably one of the most valuable lessons to be drawn from the Edinburgh experience is the legal one, and if Mr. Young had done no more than summarise the view of the Scotch Courts on dust destructors constituting nuisance he would have rendered a valuable service to the association. It is clear that unless great skill is exercised dust destructors may become an intolerable nuisance to surrounding property, and it is equally clear that the Courts would not be slow to grant injunctions. The main grounds of the action brought against the Edinburgh Corporation were the escape of noxious gases and vapours and the diffusion of noxious dust and other matter over contiguous property. Probably inefficient working was mainly responsible for the early troubles, and it is clear that as much skill is necessary in burning refuse as in burning coal. A discussion on dust destructors inevitably concludes with one question. Is the system worth combining with an electric lighting scheme? It was not surprising, therefore, that in discussing Mr. Young's paper the question was clearly raised as to the value of destructors for raising steam to run lighting plant. The subject has been always an alluring one to the town councillor, but we have pointed out more than once the limited assistance which can be rendered to an electricity works by any scheme of dust destruction. It is quite true that steam can be raised by such means, and it ought to be utilised, if it is possible to do so, with economy, but it is obvious that when a combined scheme is undertaken there is more difficulty in securing suitable sites, and if an electric lighting system in a town develops, as it ought to do, the total horse-power developed from that towns' refuse would form a small proportion of the total horse-power required to run the electric lighting plant. Moreover, it should never be forgotten that the cost of fuel in modern electricity works is one of the smallest items in the cost of production.

An Appointment at Erith.

In our correspondence columns we print, with the omission of some passages that did not seem desirable to reproduce, a letter from a correspondent who was a candidate recently for an appointment under the Erith Urban District Council. The office was described as that of building and drainage inspector, but the duties will practically be those of assistant surveyor. To this responsible post the council have appointed a carpenter, who was formerly a member of the body, and is about fifty years of age. Though, no doubt, a very estimable person, his qualifications can scarcely be those which are required in such an office, or equal to those of his chief opponent, Mr. Jennings, who was, indeed, the only suitable selected candidate. The salary was not excessive, but it was sufficient to satisfy many an able young man on the threshold of his professional career. How it came that three out of four selected candidates were respectively a bricklayer, a carpenter and joiner, and a builder, we must leave our readers to conjecture. Our correspondent's letter comes as a striking confirmation of the strictures made elsewhere in the present issue as to the objectionable manner in which many appointments are made by the smaller authorities. The matter calls for no further comment from us, as the action of the council stands condemned on the face of it; but some good may be done by publicity, in gradually evolving a better and more determined public opinion in these matters. We cannot but condemn the feeble action of the chairman, who gave the casting vote in favour of the local candidate simply on that ground alone. It is satisfactory to note, from the cutting enclosed by our correspondent, that this gross piece of jobbery has been severely condemned by the local press.

The Bacterio-Chemical Study of Sewage.

THE SLUDGE QUESTION.

In view of the attention which the sewage disposal question has of late been receiving, and the extreme divergences of opinion which have arisen in connection with recent developments, the following paper, recently read before the Institution of Civil Engineers of Ireland, will no doubt be of interest to our readers:—

RECENT ADVANCES IN THE BACTERIO-CHEMICAL STUDY OF SEWAGE AND POLLUTED WATERS. SEWAGE SLUDGES.

By W. E. ADENEY, D.S.C., F.I.C.,
Curator in the Royal University, Dublin.

In a paper under the above title, which I had the honour of reading before the members of this institution,* I described and detailed the results of a research which I had made on the changes which the common bacteria of nature bring about in the *soluble* organic matters of polluted waters. Among other things I gave experimental data to show that the polluting matters in a foul water may be divided into two classes—*viz.*, (1) unfermented organic matter, and (2) ammonium compounds. I also showed that, under aerobic conditions, the common bacteria of nature bring about the purification of polluted waters by two successive and sharply-defined stages of chemical change. During the first stage the unfermented organic matters alone suffer change, and they are completely broken down, their carbon and nitrogen being almost entirely converted into carbon dioxide and ammonia respectively; a small quantity only of organic matter remaining as such, and that in a highly-changed or oxidised form. During the second stage the ammonium compounds are oxidised to nitrous and nitric acids, and finally completely to nitric acid. The altered organic matters, resulting from the first stage of change, playing the important rôle, in the second stage of change, of determining the complete oxidation of the ammonia to nitric acid. In the complete absence of these altered organic matters it should be remembered that nitrifying bacteria carry the oxidation of ammonia only to nitroic acid and no further.

Another important conclusion, which I showed could be drawn from the experimental results which I described to you, was, that there is a simple quantitative relationship between—(1) the quantities of polluting matters present in a sewage; (2) the products of the complete fermentation of these matters; and (3) the volume of atmospheric oxygen consumed during the formation of the products; and that it is quite possible to accurately determine the quantities of polluting matters in a sewage; the organic matters in terms of carbon dioxide and ammonia formed, and of the volume of oxygen consumed, during the first stage of their fermentation; and the ammonium compounds in terms of the nitric acid formed, and of the oxygen consumed, during their complete nitrification.

I suggested in my first paper that the two stages of change here referred to should be designated by the terms "bacteriolytic" and "nitrification." I have, however, given reasons, in a paper more recently published,† for preferring to denote them by the terms "carbon oxidation" and "nitrogen oxidation, or nitrification," respectively. With these introductory remarks I may pass on to the subject of this paper—the solid matters of sewage, or sewage sludges. And I propose to limit the consideration of this subject to the question—how these matters can be treated in sewage works so as to prevent "after-putrefaction" being set up in them; not by the application of antiseptics, but by furnishing to them the conditions necessary for their slow combustion by means of bacteria, or, in other words, by furnishing the necessary conditions for their aerobic fermentation.

PRECIPITATION BY MANGANESE COMPOUNDS.

It may at once be stated that it is quite possible and practically easy to ensure the conditions I refer to in sewage sludges if we use suitable substances in the process known as clarification in purification works; such compounds are those of the element manganese. The marked efficiency of the compounds of this element in sewage precipitation or clarification has been admitted by a number of observers, among whom I may mention Prof. Hartley, F.R.S., Mr. Slater and the late Mr. Macdonald Graham; but the true explanation of the cause of this efficiency has, so far as I know, only recently been discovered.

I was led to this discovery quite by accident. During some of my earlier work on sewage, some years ago, I made an experiment to ascertain whether sewage, after treatment with an excess of a neutral solution of permanganate of potash, would suffer, without further treatment, "after-putrefaction." This experiment was conducted in a large glass vessel in the

laboratory with about 2 gallons of sewage; a neutral water solution of permanganate of potash was added slowly to the sewage until it remained for some time pink in colour. The permanganate was of course decomposed—hydrated peroxide of manganese, a brown insoluble body, being precipitated in big flakes. On keeping this vessel with its contents undisturbed for two or three days, I found the sewage did undergo putrefaction, but I noticed in addition a change which was quite unlooked for. It was a change in the composition of the precipitated peroxide of manganese, which was indicated by a gradual change which took place in its colour, from dark brown to yellowish-white. In a few days the change was complete, and the well-known brown colour of the peroxide had completely given way to a yellowish-white, except by powerful re-agents.

Now, such a change as here indicated was entirely unlooked for, because the peroxide of manganese happens to be one of the most stable oxides known, and one of the most difficult to reduce under ordinary conditions. On examination of the yellowish-white substance it proved to be manganous carbonate, with not a trace of peroxide left in it. It was evident from this that the change which the peroxide had undergone was one of reduction, and then of conversion into manganous carbonate. I need scarcely point out that the reduction of a higher oxide of manganese, such as the precipitated peroxide, to the form of manganous oxide under the conditions described was the more surprising since the lower or manganous oxide is so unstable that, even when kept under water, it is rapidly oxidised to the form of peroxide.

With the general chemical characters of the peroxide of manganese in mind, it was impossible to avoid the conclusion that its reduction to manganous carbonate was due to some, at least, of the organisms which were abundantly present in the sewage in which it was immersed, and that the decomposition was probably analogous in character to that which Gayon and Dupetit have shown nitre to undergo when it is present in waters containing organic matters and the other constituents requisite for the growth of bacteria.

It will be remembered that I explained in my previous paper that these observers regard the decomposition of nitre under these conditions as a fermentation, consisting of a direct oxidation of the organic carbon at the expense of the available oxygen of the nitre, and that the decomposition may be expressed by the three following equations:—

If the decomposition of the peroxide above described be regarded as analogous in character, then it should be reduced to manganous oxide, MnO, and oxygen. The latter should combine with organic carbon to form carbon dioxide, while the former should combine with the carbon dioxide formed during the fermentation and form manganous carbonate, which is, I may remark, a stable substance, thus:—

These reactions will be found on calculation to give rise to a considerable quantity of heat, and constitute, therefore, a source of considerable energy to the organisms.

The question, however, whether the reduction of the peroxide was, or was not, due to organisms was capable of being settled by direct experiment; and my friend and colleague, Dr. E. J. M'Weney, Professor of Pathology and Bacteriology in the Catholic University School of Medicine, very kindly undertook to make some direct experiments on the subject for me. He immersed some freshly precipitated peroxide of manganese in carefully sterilised nutrient liquid media. No growth of organisms occurred and no reduction of the peroxide was obtained. When, however, he seeded the nutrient media with some particles of manganous carbonate, previously obtained by the reduction of the peroxide in sewage, a rapid and abundant growth and development of living organisms took place in the media; and at the same time it was noticed that the brown colour of the peroxide immersed therein was gradually and completely changed into a yellowish-white substance, which I found on examination to be manganous carbonate.

We may therefore take it for granted that the organisms ordinarily to be found in sewage are capable of reducing peroxide of manganese, and in doing so effect an oxidation of the organic matter at the expense of part of the oxygen combined with the manganese, forming first carbon dioxide, and then manganous carbonate. Here, then, we have the key to the explanation of the observed efficiency of manganese compounds for the treatment of sewage. Having thus arrived at the explanation of the nature and cause of the chemical changes which peroxide of manganese undergoes when immersed in ordinary water-carried sewage, it was necessary to determine whether a similar series of changes are obtained

* "Transactions of Institution of Civil Engineers of Ireland," vol. xxx., p. 45. Reprinted in *Engineering*, vol. lxi., pp. 728-730, and 762-764 (1896).

when the peroxide is mixed with the *solid* organic matters of sewage.

PEROXIDE OF MANGANESE—EFFECT ON SOLID ORGANIC SEWAGE MATTERS.

Fortunately I had an opportunity of testing this point soon after my original experiment, on a somewhat large scale, at some purification works, where manganese of soda was being employed for treating the sewage. At the works referred to the heavier portions of the solid matter in suspension in the sewage was first separated by mechanical subsidence; the sewage was then mixed with a water solution of manganate of soda; the peroxide, which afterwards separated out, was allowed to subside, together with matters which remained in suspension in the sewage, to the bottom of the tank in which the operation was conducted. It was finally drawn off from the tank in the ordinary form of sludge. I obtained several hundredweights of this sludge, and first drained it on a gravel bed, and, when of sufficient consistence, I made it up into a large heap, and left it exposed to the air in a covered shed. After about three months' time I found the interior portions of the heap still wet and of a clay-like consistence; they had assumed a grey colour, and only those portions of the heap immediately exposed to the air had retained the original brown colour of the peroxide. There was a complete absence of offensive odour in every part of the heap; any odour that was noticed resembled that of ordinary cultivated garden soil.

From the change of colour and from the absence of offensive odour in the interior portions of the heap it was fair to conclude that the peroxide had suffered a change in composition, and had exerted an influence, both similar in character to those which obtained when the peroxide was simply immersed in the liquid sewage. To gain, however, positive proof of this a careful examination of portions of the interior part of the heap was made. Some of the portions were air-dried, and submitted to chemical analysis with the following results*—

	Percentage.
Insoluble mineral matter ...	16.66
Moisture ...	15.68
Organic matter ...	8.35
MnO ...	24.60
CaO ...	2.7
Fe ₂ O ₃ ...	10.06
Al ₂ O ₃ ...	
CO ₂ ...	18.98
Other bases ...	2.705
Other acids ...	0.96
	100.695

NOTE.—The wet sludge contained 0.14 per cent. ammonia; no nitrites, nor nitrates, were present in it.

These results show that the manganese was present in the interior parts of the heap as manganous carbonate; a careful examination was made for peroxide of manganese, but with negative results. Sulphides and other products of putrefactive fermentation were also tested for, but no indication of their presence was obtained.

The organic matters which remained in the heap of sludge after the peroxide had been thus completely changed into manganous carbonate were next examined, and they were found to be of very great interest. A special analysis of some air-dried portions of the sludge showed that they (the air-dried portions) contained 4.7 per cent. of organic carbon and 0.67 of organic nitrogen. These organic matters were further found to be practically completely soluble in a solution of sodium carbonate, and they then formed dark brown solutions precisely similar in colour and in chemical characters to those brown organic matters which are always present in cultivated soils, and which are known under the name of *humus*.

The fermentative properties of these organic matters were next examined by the methods which I described in my first paper. An experiment was first made to ascertain whether the organic matters in the interior portions of the heap had been completely fermented, or whether there still remained any in an unfermented condition. For this experiment some pieces, about 40 grammes in weight, were detached from interior parts of the heap, and while still in the wet condition were mixed with 2 litres of good tap water, and then preserved in bottles out of contact with air, as described in my first paper, for twenty-one days. On analysing the dissolved gases and the inorganic nitrogen compounds in the water before and after keeping for the twenty-one days indications of a considerable fermentation were found, as was, of course, anticipated. The whole of the dissolved oxygen of the water had been consumed, and a large volume of carbon dioxide had been formed; but, inasmuch as no appreciable increase in the amount of ammonia originally present was detected, and the water remained perfectly free from offensive odour, it appeared evident that practically all the organic matters in the pieces of sludge employed for the experiment had previously suffered a first-stage fermentation, or *carbon oxidation*, as I prefer to call this stage or fermentation.

It was fair to conclude, therefore, that the organic matters

originally present in the sludge had suffered as complete a change as the peroxide, and that the changes in these two constituents of the sludge heap had been coincident, the organic matters undergoing a slow combustion or carbon oxidation, the peroxide supplying the oxygen required for such fermentation, and suffering a consequent reduction, and a final conversion into manganous carbonate. The organic matters in the fermented sludge were subjected, however, to further experiment, to ascertain whether they possessed the characteristic properties of fermented organic matters. For this purpose an extract of them was made by means of a solution of carbonate of soda, and the fermented properties of the extract were carefully studied.

The details and results of experiments with this extract have already been published,* and I need only repeat here the main results obtained. The organic matters in question were found to possess all the properties characteristic of fermented organic matters, and described in my first communication to this institution. For example, when solutions of them were kept out of contact with air they were found to undergo fermentative change, but very slowly. When, however, the same solutions were mixed with ammonium compounds the latter were readily oxidised to nitric acid in their presence.

I have, perhaps, quoted sufficient evidence to show that peroxide of manganese when mixed in sufficient quantity with the *solid* organic matters to be found in sewage may perform the part of an oxygen carrier to the organisms also present in the sewage, and enable them to effect a complete carbon oxidation of those organic matters, changing them into the inoffensive forms of matter—carbon dioxide, water, ammonia and humus. The question which, no doubt, will be regarded as an important one by the members of this institution is, Can manganese compounds be obtained at a sufficiently cheap rate to render their employment possible in the treatment of sewage on the large scale?

IS THE USE OF MANGANESE COMPOUNDS PRACTICABLE?

I am glad to be in a position to state that this question has been taken up by my friend, Mr. T. A. Shegog, F.R.C., director of technical instruction under the Monmouthshire County Council, and formerly a student and assistant chemist in the Royal College of Science, Dublin. I am glad, also, to be able to state that Mr. Shegog has been most successful. He is now manufacturing a crude manganese sewage precipitant which he can sell at as low a price as any of the good precipitants in the market. I have, myself, had an opportunity of examining the efficiency of his precipitant in the treatment of sewage at some small purification works, and can testify that it has proved successful in completely deodorising the sludges obtained at the works, and in promoting a healthy fermentation also in the soluble organic matters of the sewage treated to an extent quite beyond my anticipations. But it is only fair to Mr. Shegog that the description of the manufacture of his precipitant, and details as to its efficiency in sewage treatment, should be left to himself.

This paper completes the subject which I first had the honour of bringing before the notice of the members of this institution in 1896, and I trust I have given sufficient evidence to show that the *purification of sewage is simply a matter of modified aerobic bacterial fermentation*—that is, bacterial fermentation under the condition of an ample supply of oxygen in the free state or in certain forms of combination, such as nitre and peroxide of manganese; and that this statement holds good for the solid organic matters of sewage, as well as for those in solution; and that, further, it is quite possible to provide on a large scale the supply of oxygen requisite for the aerobic fermentation of both soluble and insoluble forms of organic matters in sewage.

So far as regards the cost of making provision for the necessary oxygen supply, I showed in my first paper how this could be accurately calculated for the organic matters in solution in any sewage, from data easily obtainable by the methods of examination I had employed in my studies. I trust it will not be long before Mr. Shegog will be in a position to give us an estimate of the cost of providing an oxygen supply on a large scale for the aerobic fermentation of the insoluble, or solid, forms of organic matters in sewage sludges.

Rhyl.—The council were recently informed that the General Purposes Committee had considered a proposal to introduce electric light and electric tramways into Rhyl, and after discussion it was resolved to ask Mr. Buddicom to submit a more detailed scheme for the consideration of the council.—The town clerk said he had received several notices of intention to apply to the Board of Trade for provisional orders to supply Rhyl with electric light. One was from the solicitors representing Mr. Buddicom, and another from "The Rhyl Electricity Company," who, on inquiry being made, turned out to be the British Insulated Wire Company, Limited, whose offices are at Prescott. The other applicants were the United Electric and Traction Company. The consideration of the several applications was deferred pending the receipt of Mr. Buddicom's detailed scheme.

* See "Scientific Proceedings," Royal Dublin Society, vol. viii. (N.S.), part iv., p. 217, 1895.

* See "Transactions of the Royal Dublin Society," vol. vi., No. 31, 1897, before referred to.

Municipal Electric Tramways.

The success which municipalities have achieved in the working of electric lighting undertakings has no doubt had considerable influence on the question of corporation electric tramways. To some extent there is considerable relationship between the electric lighting and the working of an electric tramway in a town, because within certain limits the works that have been put down for lighting may be used also for the purpose of supplying electrical energy for working the local tramway system. The unmistakable tendency of provincial boroughs to-day is towards combined schemes of lighting and tramways. Such an arrangement permits of the generating plant for both purposes being supervised by the same staff, and it obviously decreases the capital cost of the tramway system, where it is possible to house the tramway plant in the same building as that used for electric lighting. In most of the large boroughs the local authorities have quite made up their minds as to the desirability of working tramways themselves, and it is hardly necessary to point out that the towns of Glasgow, Manchester, Sheffield, Leeds, Dover, Plymouth and Liverpool have decided to equip tramway lines with electrical apparatus or they have already completed some such scheme.

THE OVERHEAD WIRE AND CONDUIT SYSTEMS.

It is interesting to point out that in the whole of the tramway schemes of this country, whether in the hands of local authorities or joint-stock companies, the overhead wire system is the only one that is being adopted. It may, then, be taken for granted that the objections about which one has heard so much are not considered insuperable. Moreover, the lines at Bristol and Leeds have probably done much to eradicate the natural prejudices of members of local authorities against the suspended wire. The position of affairs there clearly indicate that all electrical systems the overhead wire seems to be the only one that can at the present moment be safely adopted. Neither the conduit system nor the accumulator system have been yet sufficiently developed to be able to compete under average conditions with the overhead system. It is perfectly true that the conduit system is a workable one, and the same may, with perhaps more limitations, be said of the accumulator system; but having disposed of the æsthetic objections to the suspended wire, the question narrows itself down to one of initial cost, and that has been the determining factor in the minds of municipalities.

In the present state of tramway practice the conduit system may be said to cost from £10,000 to £20,000 per mile of track, while the overhead system would cost something between £2,000 and £10,000 per mile. In Berlin the price per mile of the electric conduit system is given by the company as £6,450, while the overhead electric system cost £2,400. The Union Electric Company of that city state that the conduit costs about four times as much as the overhead. The great house of Messrs. Siemens & Halske state that the conduit will cost from £4,000 to £5,000 more than the overhead per mile of double track. The complete equipment of the overhead line in Brussels is £5,410 for the overhead and £9,800 for the conduit per mile of track. In Buda-Pesth, where the conduit system has been developed to an enormous extent the average cost per mile is two-and-a-half times that of the overhead system. In the estimates that have been recently submitted to the Liverpool Corporation, Mr. Pearson, the American electrical engineer, who has had great experience in laying down both systems of tramways, states that the estimate for 1 mile of straight track for the overhead trolley would be £5,822, while for 1 mile of straight track of the slotted conduit system the initial cost would be £9,648. But it is not only in the initial cost that the conduit system compares somewhat unfavourably with the overhead wire system. The question of maintenance is a very important one, and experience suggests that, while the maintenance of the overhead system might be £60 per year per mile of track, that figure would be increased to £180 per year for maintaining each mile of an underground conduit system.

CLOSED CONDUIT AND ACCUMULATOR SYSTEMS.

It will be seen, therefore, that from the financial aspect the conduit system is for most towns hopelessly out of court and the so-called closed conduit systems are still more out of consideration, because in all probability the initial cost would be higher than the slotted conduit and the maintenance charges would be particularly heavy. Apart from the question of £ s. d., an open slot in the middle of the street is not a very desirable thing. Under some circumstances it might prove positively dangerous, and wherever the system was adopted it would be necessary to have the slot so narrow that it would cause great difficulties in working.

The accumulator system has undoubtedly merits, the chief being that it permits the care to be self-contained and it does not necessitate any special construction of track. Moreover, it permits the car to be absolutely independent of a central power-house, which is practically the heart of an overhead or a conduit system. Still there are no doubt objections to this system. It cannot at the present moment be maintained that it is particularly efficient, and, what is more important than all, it has not yet been established that the system has reached a stage where the maintenance charges can be said to have approached a reasonable limit for such

undertakings, and before there is any development in the direction of self-contained electric cars it will be necessary to have more experience and more figures at one's disposal before they can be conscientiously recommended.

COST OF THE OVERHEAD WIRE SYSTEM.

Quite recently there has been, especially in a daily temporary, considerable agitation as to what it really costs to work an overhead tramway system. It has been maintained for a long time that the average cost should be about 6d. per car mile. There are many examples of the cost being much lower than 6d. and few cases where it has been higher. The Brussels lines equipped with the overhead electric system cost 4½d., Dresden, which possesses two systems of electric tramways, cost in one case 6d. per car mile and in the other 386d.; Remscheid electric lines cost 4d. per car mile, and, to quote an instance from America, the railroad commissioners of the State of Connecticut showed in some recent figures that the average cost per car mile on nine electric tramways was 5½d.

It may with some reason be urged that these figures have very little significance in this country, because they probably do not represent the conditions that generally obtain here.

It is not, however, a matter of great difficulty to secure returns from the lines that have been working for some time in the United Kingdom. On the old electric tramway line of Leeds, which was put up when practically very little was known about the economical working of tramways, the cost per every car mile run was about 5½d.; but, to come to more recent examples, we can quote that of Bristol, where electricity has been employed on different sections of the Bristol Tramway Company's lines, sections, moreover, that hitherto were impossible for horses to work, yet the cost per car mile has been shown to be no more than 5½d. This is an interesting example, because one has an opportunity of comparing that figure with what the horse lines cost in the same city, and from last year's report we find that the horse lines have cost 9½d. per car mile. At Coventry the economical nature of an electric tramway service has been amply demonstrated, and the curious part about this is that previous to the institution of the electric system there tramway systems of any description had been complete failures and two companies had gone into liquidation in their attempts to provide the people of Coventry with a tramway service. The electric tramway company of that city has not only been able to declare a dividend of 8 per cent., notwithstanding that the line passes through sparsely-populated districts, but has been able to demonstrate that the cost of working the line is not more than 6d. per car mile.

We can give a still more favourable illustration in the case of the Dover Corporation tramways, which have been for the past four or five months worked on the overhead wire system. The borough engineer says that the cost per car mile is only 5½d., and this is very important, because the conditions prevailing in Dover are not altogether ideal ones for the economical working of an electric tramway system, as the corporation buy the necessary electrical energy to work their service from the local electric lighting company, and the charge made for energy is, if not excessive, a good deal more than it would cost the corporation if they manufactured it themselves.

Therefore, out of the few electric systems at present in use in this country, it can be shown that on four lines at least the total cost of working is under 6d., a state of things that ought to demonstrate that electricity is certainly the most economical agent for tramways, because it can be said from figures that are open to everybody that the horse lines of this country average 9d. per car mile, while steam lines rarely cost less than 11d. and in some cases more. Some recent figures relating to the comparative cost of various systems of traction in Paris are interesting, and they show us that horses cost 855d.; accumulators, 839d.; steam locomotives, 539d.; and the overhead trolley system, 462d. per car mile. These figures ought to be convincing, because the overhead system in Paris has certainly not had particularly fair play.

It is interesting to note the relation of tramways to the population in some of the chief American cities, some European and those in the United Kingdom. They will, at any rate, show that there is considerable room for extending the tramway systems, and thus make them more popular vehicles than they have proved to be in the past.

CORRESPONDENCE.

Strange Doings at Erith.—Mr. A. H. Jennings, surveyor to the Carshalton Urban District Council, writes: I am reluctantly compelled to draw your attention to the result of an appointment which is deserving of publicity through your valuable paper. The advertisement ran as follows: "The Urban District Council of Erith require an inspector to superintend the laying of private drains and connections to the sewers of the council, and to inspect the construction of new buildings and generally assist the surveyor. He must have a practical knowledge of works of drainage, the construction of buildings, the preparation of plans, and be fully competent to keep all books and accounts connected with the office of surveyor. Salary, £140." The applicants, I understood, numbered nearly 150, and a selection of six was made to interview the council and to "produce original testimonials with specimens of plans and draining work." Being a selected candidate, I made my appearance at the appointed time, and found my chances more favourable than expected, two being absent. Meeting my fellow-candidates, I soon found, to my surprise, that their respective callings were as follows: (1) Bricklayers' foreman, (2) bricklayer, (3) carpenter (a former member of the council), but, unfortunately, out of work. The monotony of waiting an hour and a half was broken by mutual conversation, chiefly on the laws of sanitation, but when an attempt of mine to advance the cause of smoke, air and water for the testing of drains was derided I held my tongue and spoke nothing. At last we were summoned before the council. I produced my qualifications, original testimonials, and specimen drawings of street work, sewers and drains; also copy regulations for private house connections to main sewers in this district (the supervision of which has been one of my chief duties), when I was catechised by the apparent supporters of the local man on such questions as these: Had I ever used a trowel? Could I lay bricks? Had I experience with jerry builders? and similar questions. On the local carpenter being called a second time my hopes vanished, for it was soon announced that he had been successful, although I was informed the voting between him and myself were equal, the chairman giving his casting vote in the carpenter's favour because he was a local man. My cause for complaint is the misleading advertisement, which tempts so many experienced and qualified men to waste their valuable time in applying for an appointment when the result is practically known beforehand. Why should not the Council of Erith advertise locally if a local man, even if devoid of experience, is intended to be appointed against all comers of whatever qualifications they may possess. If the Erith Council had been wise they would have left the appointment to the engineer of their sewerage scheme, or even the surveyor. This scheme, I understood, costs nearly £100,000, and its success depends largely upon the manner in which the private house drains are connected. Time will prove the folly of such a procedure. Yet this is a council, I presume, pledged to study the interests of their rate-payers and uninterested devotion to the public service. I enclose herewith the local paper, marked, giving particulars of the appointment, and editorial comments in stronger and more eloquent terms than words of mine have described.

Illuminating Gas from Sewage Sludge.—Mr. Edward A. Harman, engineer and manager of the Huddersfield Corporation gasworks, writes: Will you kindly permit me to supplement my letter to you last week upon the above subject. The sewage sludge, containing an average moisture of 33 per cent., naturally involved serious loss of heat in the retorts. It was difficult to wholly carbonise the material *per se*. When drawing a retort, although the outside of the material appeared to be carbonised, it was noticeable there was still a quantity of gas left in it. At the conclusion of the regular tests I tried a small portion mixed with half coal, and was satisfied that further experiments in that direction would undoubtedly yield vastly improved results. Although

sewage sludge would not be economical to carbonise ordinarily for gas manufacture, yet in case of emergency, when coal stocks were short, some such system might be worked temporarily with considerable advantage, especially upon works where an oil gas plant is available for maintaining the illuminating power to the required standard. If ordinary gas coal is considered as yielding approximately 1,000 cubic feet of gas per ton of 16 candle-power, a multiple of 100,000 cubic feet is obtained. With the sewage sludge experiments, as published in your last week's issue, the material yielded 5,440 cubic feet of 12 3/4 candles, which gives a multiple of 70,284 cubic feet, or only 41 per cent. of that obtained from coal. Drying the material apparently had prejudicial effects, evaporating the oil contained in it. I understand the residue "dust" left in the retort after carbonising is valuable for filtration purpose. Singularly enough, the laboratory tests led one to anticipate very much better results. There was evidently a serious decomposition of gas in the retort due possibly to the outside of the material being first carbonised and the gases evolving from the inner cone having to force their passage through the incandescent coke. When making the experiments it seemed most desirable that the material should be stirred up in some manner during the process of carbonising, and Yeaton's revolving retort suggested itself as being suitable for such purpose. The variability of the composition of sewage sludge is a characteristic feature of it, and this is clearly demonstrated in the results indicated last week both as to quantity and quality of the gas made.

Urban District Councils and their Surveyors.—Mr. T. Hibbert, surveyor to the Cirencester Urban District Council, writes: In your account of the report of the Street and General Purposes Committee respecting my increase of salary and relief from duties of rate collector, which appeared in the columns of THE SURVEYOR issued on Friday last, the 29th ult., there is an important omission. The report of the committee, which was adopted by the council, not only carries with it an increase of salary to £225 per annum as from the 24th June last, but it also ensures further annual increments of £10, £10 and £5, which will bring up the total to £250 a year with the advent of June 24, 1901. In these days, when, as you put it, dealing with applications for increases of salary in a reasonable spirit is all too rare, and lest my council's considerate dealing with me should be wrongly understood, to the possible detriment of any other surveyor who may be supporting a similar application with a reference to your account of my increase, it would seem to be due to my council and myself that the full effect of the adoption of the committee's report should be published, hence my troubling you with this communication.

Gas Cremators.—"Acme" writes: I would like to be placed in communication with any one who can furnish me with information regarding any method by which fumes or gases of a noxious nature are destroyed by any form of cremator.

Communications, addressed to "Cremator" at the offices of this paper, will be forwarded to our correspondent.—Ed. THE SURVEYOR.

MANCHESTER SEWAGE DIFFICULTY.

At a meeting of the Rivers Committee of the Manchester Corporation, on the 25th ult., the financial position of the committee was one of the subjects brought under consideration. Recently the Finance Committee called the attention of the Rivers Committee to the heavy adverse balance which exists in connection with the sewage works and scheme, and to the fact that the deficiency has greatly increased during the present year. It was stated that, as the result of an interview with the authorities of the Local Government Board, that body was prepared to grant borrowing powers as a means of obtaining money to pay off the committee's liabilities if a provisional order was obtained for the purchase for sewage treatment purposes of 213 acres of land at Flixton, an area which was scheduled in 1893. The committee decided to resume their powers in the next Parliamentary session, with a view to obtaining the consent of the Local Government Board to borrowing powers. The present liabilities of the Rivers Committee amount to between £60,000 and £80,000, and without some course being taken the whole amount would require to be found out of the city rates. It is probable that powers for borrowing from £100,000 to £150,000 will be obtained.

London's Water Supply.—The water examiners in their report on the composition and quality of the water supplied to London during the month ended June 30th state that all the 182 samples of water collected by them from the mains of the London water companies taking their supply from the Thames and Lea were found to be clear, bright and well filtered.

Tenders Wanted. The Secretary of State for Foreign Affairs has received a despatch from her Majesty's Consul at Genoa, stating that tenders are invited by the municipality of Spezia for the supply of 2,500 tons of gas coal for the gas-works at that place. A copy of the conditions of the contract may be examined at the commercial department of the Foreign Office any day between the hours of 11 a.m. and 5 p.m.

The Appointing of Municipal Engineers and Surveyors.

By ALEXANDER MACLACHLAN, ASSOC.M.INST.C.E.

It is believed by many members of the engineering profession that municipal engineers and surveyors are the best paid in the profession. Thus, when vacancies occur in this department of engineering, there are large numbers of applicants, and the competition is very keen, and canvassing, although confessedly counted a disqualification, is, nevertheless, carried on to a great extent. So much is this the case that the art of applying for municipal appointments, with all the canvassing and propping and getting-up of the requisite number of testimonials, has become one of the fine arts, a knowledge of which, it is said, is positively essential in these degenerate days to obtain situations. On the other hand, it is well known that when a vacancy occurs in the official municipal staff in many cases the man has already been chosen for the place, and the place for the man, even before an advertisement has been inserted in the papers. The situation is advertised merely to allow the chosen one an opportunity of applying with the public for a situation already given him. This is done to try and deceive the public into the belief that it is a *bonâ-fide* advertisement of an open and free competition to all properly and duly qualified to occupy an important and responsible public appointment. But the public are not so easily deceived, and pretty well know to whom the situation will be given. "Send in your application, apply, and we will secure you the appointment," say the two or three knowing ones of brief authority and influence. So he whom they delight to honour hies him home, wrestles through the composition and writing of a hypocritical mockery of an application, and gets it printed with the so-called testimonials procured from people who know little or nothing about him or are utterly incapable of judging of his fitness. So he gets the place, and into the power of the knowing ones at the same time. These knowing ones ever after this annex that man's services to themselves, to serve their own little ends—for did not they get him the appointment? Thus he is robbed of his liberty of action, and becomes but a tool in their hands to do their work—dirty and mean enough work at the best—and to further their own little schemes and plans; and this all to the prejudice of the public interests.

There are few public appointments into which more enters the elements of influence and favour than into municipal appointments; and the appointing of a municipal engineer is in this respect not a whit behind even the appointment of a city or town clerk.

It is a very difficult thing for even able experts to judge of a man's suitability and fitness for a high public appointment. It is strange and extraordinary that men who commonly compose our town or county councils, corporations, magistrates, &c., should be allowed by the public to decide the appointments of men entrusted with the engineering, building and sanitation of our large cities and towns. One would be apt to think that it would be a safer and wiser plan to give the adjudication of such appointments to judges specially fitted by their recognised high attainments and abilities and great and extensive practice in their particular professions. Such learned institutions or associations as the Institution of Civil Engineers, the Royal Institute of British Architects, or the Incorporated Association of Municipal and County Engineers, the Surveyors' Institution, the Sanitary Institute, &c., contain any number of experts highly qualified in their respective professions for selecting from among applicants the most suitable candidates for the several municipal situations.

The days are gone now when simply masons, joiners or plumbers, with nothing more to recommend them but the goodwill of their magisterial acquaintances, can be allowed to occupy the highly important and responsible positions of municipal or county engineers. But time was when such things were permitted and encouraged, and freely and openly practised; and appointments were given by friend to friend, irrespective of ability, fitness, experience or knowledge. Consequently, in town and county, to put it very mildly, things were in a bad way, a very bad way indeed, for many long years to come. Mistakes were made, money was misspent in useless works, or even in mischievous and dangerous works; and, what is far more important than the misspending of money, neglect, culpable neglect, was shown, especially in regard to drainage and water supply, or the want of them, resulting in disease and death to many of the unsuspecting inhabitants of city, town and village.

The duties of the municipal engineer are exceedingly varied and difficult, and they are becoming more and more so every day. Besides being an expert in a few professions, such as that of a surveyor, architect, civil, mechanical, hydraulic and sanitary engineer, he must now be not unacquainted with that profession which deals with that subtle, mysterious and wonderful something called electricity, in order to supply the illuminant of the day, or at least to work in harmony with the electrical expert chosen for that purpose. Those informed on all the particular details of knowledge and the great experience and sagacity required to fill such onerous

and responsible positions as modern municipal engineers, surveyors, architects, &c., will hardly admit that a baker, tailor, fishmonger and carter—for such are the bulk of our magistrates—are altogether fitted to judge as to who should give us electric light, gas, water, tramway, cable or electric cars, streets, roads, sewers, bridges, public buildings, city or town halls, municipal buildings, hospitals, universities, destructors and what not. The baker, tailor, fishmonger and carter may be all very good at their respective trades, and even possess a certain amount of experience and knowledge of municipal affairs, and know how to work elections and speak at meetings—rowdy and noisy enough at times—but they are hardly the clever, discerning, well-informed, educated and good gentlemen that an honest and conscientious public should have to decide its environment and conduct and control its affairs.

According to sec. 140 of the London Building Act, 1894, applicants for district surveyorships require to send with their applications certificates of the Royal Institute of British Architects that they are competent to perform such duties. This is all very well as far as it goes, but particular fitness of candidates for particular appointments might well be given over to the Royal Institute of British Architects to settle or determine. It is becoming common to stipulate that candidates for civil, mechanical or electrical engineering appointments must be either members or associate members of the Institutions of Civil, Mechanical or Electrical Engineers. This is an excellent stipulation, but these appointments also might well be delegated over to committees of these august and learned bodies to adjudicate.

Therefore it can hardly be considered out of the way to say that the judging of the proficiency of applicants for filling public appointments, as indicated, should be entrusted to experts in the particular professions required to be known and practised by the successful competitors. It is to be hoped that this will become in the future the general order of the day, and not the exception, so that the public interests may be safeguarded and the most efficient and able men be chosen to fill public appointments.

LIVERPOOL SEWAGE FARM.

The following communication recently appeared in a Liverpool contemporary, under the signature of Sigmund Stein: I took the opportunity, on the occasion of my inspection of the Liverpool Corporation sewage farms in West Derby and Walton respecting their suitability for the growing of sugar beetroot, of investigating the work of this filtering method. Through the kindness of our city engineer, Mr. J. A. Brodie, and Mr. Cooper, I received for analysis samples (taken the same time) of the original sewage of the West Derby sewage farm, and also of the drained and filtered water (sent into the brook), and I publish now the result of my analysis. The same is very satisfactory, and gives great credit to our city engineer and his staff. The drained water is nearly pure, and the organic oxidisable matters which cause putrefaction have been extracted to the greatest part and have been absorbed by the soil. I may mention that I planted experimentally sugar beetroot on the corporation sewage farms in Walton and West Derby, and the result of this experiment will be published in due course.

ANALYSIS OF (IN 100,000 PARTS) THE SEWAGE.

	Original.	Drained.
Dry substance...	132.73	92.16
Organic substance ...	37.19	16.84

Phosphoric Acid (P ₂ O ₅)87	.05
Sulphuric Acid (S.O ₃) ...	7.14	6.23
Chlorine ...	42.44	17.58
Potassium ...	7.62	1.17
Sodium ...	32.10	13.64
Lime ...	13.47	14.21

Wolverhampton.—An inquiry was held recently respecting an application of the council for permission to borrow a sum of £1,855 for the purpose of laying-out an "open space" above the vaults of the hall. The inquiry was held by Mr. W. O. E. Meade-King, on behalf of the Local Government Board.

New Bridge at Keswick.—A new steel-rope suspension bridge, of 90 ft. span, has just been opened at Keswick. The bridge is erected over the river Greta, and is for the convenience of the public in gaining access to the Fitz park from that part of the town. The bridge was designed and supplied by Mr. Louis Harper, A.M.I.C.E., of Aberdeen.

The Telephone Service.

The Select Committee of the House of Commons, which is engaged in an inquiry into the Telephone Service, held two more sittings last week.

Mr. ROBERT GIBSON, Lord Mayor of Manchester, was called. He said he wished to contradict the statement made by Mr. Gaine, manager of the National Telephone Company, that the negotiations between the Manchester Corporation and the neighbouring local authorities as to the working of the electric tramways had completely broken down. So far from that being the fact, the arrangements were in a most satisfactory position. The Manchester Corporation had entered into a special agreement with the National Telephone Company as to the granting of underground way-leaves, but there was nothing at all in the agreement which could create a monopoly for the company. He considered that the whole of the telephone service should be in the hands of the Post Office.

Mr. LAMB, second secretary to the Post Office, was recalled, and invited by the chairman to give any objections there might be, from the Post Office point of view, to the granting of municipal licenses. Witness said that the opinions which he expressed were his own, and not those of the present Postmaster-General. While it was impossible not to sympathise to a certain extent with the Glasgow Corporation, he could not agree with the remedies proposed by that body. He was sure that the granting of municipal licenses would strengthen the hands of the company, because, as a general principle of competition, the municipal system would fail, and if that happened the company would have a greater claim for goodwill in case of purchase. But supposing that the municipal system did not fail, then, having proved themselves proper authorities for administering the telephone service, the municipalities must retain the administration for all time; and it became at once a question whether Parliament was to rescind its decision placing the telephone service in the hands of the Post Office. The corporations would not be willing to accept licenses terminating in 1911; and in any case their licenses would strike at the root of any development of the telephone system in the rural districts. If the most profitable part of the telephone business were to be handed over to the municipalities, no one would undertake the cost of establishing the telephones in the country areas. Hitherto the municipalities had adopted a very courteous and friendly attitude towards the Post Office in the matter of way-leaves, but the position would be completely changed when the municipalities became the competitors of the Post Office. Then, under any system of municipal licenses, the difficulties of administration at the Post Office must be greatly increased. There would be innumerable managers to settle with and much more work in auditing the accounts. The municipalities would not give any trunk system, such as the Post Office gave. As to terminals, it would be absurd to expect efficient and harmonious working between the different municipal exchanges in the country. The tendency would be to retard the trunk-wire system. The want of harmonious working between local exchanges would be the greatest obstacle to a truly national service, and the granting of municipal licenses would encourage further inroads on the monopoly of the Postmaster-General in regard to every new telegraphic invention. As to the question of telephone licenses being granted by the Board of Trade under provisional orders, just as electric lighting orders were granted, he thought there was no analogy between the two cases. Electric lighting was the business of no Government department, while the telephone service was the business of the Post Office. It was not reasonable that the Board of Trade should govern the discretion of the Treasury and the Post Office as to supply and price. Then as to the Post Office itself granting provisional orders, it was erroneous to suppose that the National Telephone Company was the mere licensee of the Postmaster-General. In reply to a question, witness said he was not in favour of any competition by the Post Office or by municipalities. He would leave the telephone service in the hands of the company until 1911 without any competition as long as they gave a fairly good service.

Sir S. JOHNSON, town clerk of Nottingham, and one of the four representatives delegated by the Association of Municipal Corporations on this question, was next called. The association, he said, was almost unanimously in favour of a Post Office telephone system, and, failing that, they desired to have municipal licenses. Nottingham, however, had not applied for and did not desire to have a license, as it looked forward to the time when the whole service would be taken over by the State. Nottingham had a very good service provided by the company, but it left out large areas which no one but the State would undertake to serve. The town council had an agreement with the company as to way-leaves, but nothing was provided as to rates or preferences. Sufficient protection was afforded by the fact that the agreement could be terminated at twelve months' notice.

Mr. JOHN GAVEY, second assistant engineer to the Post Office, next gave evidence, describing the toll system of working the telephones which was established in Switzerland, and which he had inspected this year and reported upon to the Post Office.

Mr. A. D. PROVAND, M.P., was called and questioned by Mr. CAWLEY, who called witness's attention to the following question and answer which occurred in the course of Mr. Forbes's evidence: "But you remarked the other day that nobody would be foolish enough, and no body of subscribers would be foolish enough, to start a company in the present tenuro?—Only on the same principles which were developed by the Manchester Company—getting hold of people's money on mistaken pretensions, I will not apply a harder term to it, ending in failure and being bought up." Witness said that statement was intended to cast reflection on him and those who co-operated with him in connection with the Manchester Company. He characterised the statement as simply a calumnious falsehood. It had been made to the committee by Mr. Forbes, and he claimed to be heard in reply to it. He was not going to be defamed in that way. He went on to say that after the Mutual Company started they compelled the National Company to lower their rates. They refused to sell to the National Company because that company refused to carry out their policy of a double-wire system. He and his friends went into the telephone business as reformers, and they brought about extraordinary reforms. The Duke of Marlborough started the new company in London, and they sold to that company because they agreed to their terms. In cross-examination witness denied the statement of Mr. Forbes that the telephone service in this country was better developed than anywhere else. In Germany, Switzerland, Holland, and Norway and Sweden, there were much better services than in England, and the number of telephones in proportion to population was enormously larger. The only way to break down a monopoly was to have different systems, though one first-rate service would be the ideal. That, however, was not obtainable except by competition. In Manchester, for instance, they had to begin with a very bad and expensive service, but by competition they were able to get a much better one. He would prefer to see the service in the hands of the municipalities rather than in the hands of the Post Office. The Post Office would have to spend more capital, and, as far as he could see, their rates would be much higher. The Post Office had only the General Post Office buildings in towns, whereas the municipalities had ready to hand a number of buildings which they might make use of for laying down a telephone service. In the next place, he thought that if the telephones were in the hands of municipalities the management would be much better. No one could get any redress from the Post Office. Rural districts could be better served by local bodies than by the Post Office. Even a local company would be better than the Post Office.

Mr. SINCLAIR, engineer to the National Telephone Company, then gave evidence to show that the average initial cost to the company of setting up an exchange was £57 per subscriber, and that over a series of years this amount became reduced to between £38 and £40. It was absolutely impossible to establish an exchange at rates varying from £12 to £24, as had been suggested. In his opinion, if the company were to start *de novo* to give such a service as they were now giving it could not be done under £51 per subscriber. In reply to Mr. Bartley and the chairman, witness said that he did consider two rival systems in one area detrimental to the public using the telephones. He was aware that the National Telephone Company went to certain places where there was a Post Office system, but at the time they did so the company was an ordinary licensee, and there were twelve others in the country. He did not think the company were under any obligation to the Post Office to supply a particular type of telephone, but they were under a strong obligation to supply the best they could find. He could not say whether the Post Office had any power to prevent the company using any instrument. If it was the fact that the company was the only licensee that could establish a single-wire system, it was not their practice to do so. They had not put up a single wire for many years.

Mr. LAMB, second secretary to the Post Office, was then recalled, and said, in answer to the chairman, that the wires between exchanges were not the property of the company, but were laid by the Post Office and used by the company at a rental. The earliest of these wires was handed over in September, 1896. Having mentioned various places in the country in which wires were so leased, witness went on to say that the leases had not yet been actually executed, and the arrangement rested on correspondence at present. Formal agreements had been drafted but not settled. He thought the correspondence bound the Post Office. As the agreements were drafted the leases were for the remainder of the term under the license, with power to the Post Office to terminate in 1901, or at any time when the company was taken over, if it should be taken over. He was not able to say from memory whether that point had been absolutely settled, but it was in the draft agreement. The general terms and conditions of the draft agreement were intended to be applicable to all cases, but no doubt certain particulars would have to be settled in each case. The draft agreement had not yet been submitted to the company, and the regulation of the use of these wires rested at present on the corres-

pendence. The company had been paying rent for these wires.

Sir Robert Hunter, solicitor to the Post Office, was also questioned on the same point, and the committee then adjourned.

ELECTRIC LIGHTING OF MORLEY.

NEW CORPORATION WORKS OPENED.

The new electric lighting works erected by the Corporation of Morley from the plans of Mr. Hammond, at a cost of £21,219, were recently opened by the chairman of the Electric Lighting Committee.

The generating works are situated in the Corporation-street, between the new public baths and the corporation depot. The buildings, which were designed by the late borough surveyor (Mr. M. H. Sykes), are placed on the south side of the land reserved for the generating works, and are so arranged that a considerable area of land is reserved for future extensions. The total area of the site consists of 4,132 square yards. The engine-house is 40 ft. wide by 38 ft. long, with switch-room at one end. At a height of 20 ft. an overhead travelling crane runs along steel rails the full length of the engine-house. The test-room is conveniently situated at the east side of the switch-room, the floors of which rooms are laid with wood-block flooring. The accumulator-room, 40 ft. by 12 ft. 6 in., is placed over the switch-room and test-room, and is approached by a staircase near the main entrance. The boiler-house is placed parallel with the engine-house, on the west side thereof, and is 68 ft. long by 48 ft. wide. Along the west side of the boiler-house are placed the coal bunkers, 10 ft. wide, and the pump-room, 10 ft. by 12 ft. At present there are two Lancashire boilers, 30 ft. by 8 ft. diameter, and accommodation is provided for two others of equal size. The officers are situated over the work and store-rooms, and are approached by two staircases, one being from the main entrance-hall and the other being a spiral staircase from the boiler-house to the chief engineer's private office. The contracts for the buildings have been carried out by local firms, as follows: Building and masons' work—Messrs. Newton & Asquith; joiners' work—Mr. D. Marsden; plumbers' work—Mr. Eirth; plasterers' work—Mr. Wilson; slaters' work—Messrs. D. Thornton & Sons; painters' work—Mr. W. Lawton. The two main engines are made by Messrs. Pollitt & Wiggell, of Sowerby Bridge. They are of the horizontal compound non-condensing type, with cylinders 14 in. and 23½ in. diameter, 30 in. stroke, running at a speed of 100 revolutions per minute with a working pressure of 130 lb. per square inch. The two alternators are the Electric Construction Company's fly-wheel machines. The exciting current for the alternators is supplied by a separate direct-current plant. It may be mentioned that for some three months past the works have been in operation successfully.

The system adopted is the high-pressure alternating, with a pressure of 200 volts at the consumers' terminals. It should be explained that Morley is a somewhat scattered town, and the high-pressure alternating system, perhaps, offered the readiest facilities for adequately meeting the future demands. The two Lancashire boilers are each capable of evaporating 7,000 lb. of water per hour at 125 lb. pressure. The most interesting feature about the boiler-house is that the mechanical coal stokers are actuated by an electric motor. The generating plant is entirely in accordance with modern ideas, and the principal machines are combined with the engine fly-wheel. We have already referred briefly to the two sets of 120 kilowatt fly-wheel alternators and to the direct current exciting plant of 30 kilowatts capacity which is provided to excite the field magnets of the alternators. There is also a motor alternator, to which further reference will be made. The cylinders of the two main engines are arranged side by side with the alternators running between them. The diameter over the poles of the alternators is 13 ft., and the weight of the fly-wheel, including the field magnets which it carries, is 10 tons. What makes the system of special interest is the provision of accumulators which will no doubt exercise a marked economy in the operation of the plant. The battery of accumulators comprises fifty-seven cells of the Chloride Company's manufacture, and is capable of giving a discharge of 250 amperes for two hours, or 100 amperes for six hours, or 70 amperes for ten hours, with a terminal electromotive force of 1,000 volts. The battery is charged by means of the exciting plant referred to, and is then utilised to drain the motor alternator which will supply the whole of the current required during the daytime. When necessary the battery will also supply current for exciting the field magnets of the large alternators. There are two switchboards, one of which is devoted to the alternator and feeder circuits, the other being exclusively used for the exciters, batteries and the motor alternator.

The mains consist of concentric conductors, each one insulated by a di-electric of bituminised fibre, the outer di-electric being slotted with a very heavy covering of lead, and finished by a yarn braid, and compounded. These cables are drawn into stoneware ducts or pipes. The high-pressure mains are connected to six sub-stations, whence current is distributed to consumers. At these sub-stations are arranged the necessary transformers which convert the high-pressure current into a low one suitable for distribution to the consumers.

The street lighting is on a small scale and is mainly experimental. The lamp columns carry an arc lamp and two incandescent lamps, switching gear being provided in the base of the column for the purpose of extinguishing the arc and putting on the incandescents, which is done at midnight. A small transformer is also placed in each lamp-post, for the purpose of reducing the pressure of the current to that necessary for the arc.

The Morley Corporation are to be congratulated upon the completion of the works, which represent the very latest practice in the generation and distribution of electricity.

COMBINED DRAINAGE.

REPORT TO THE LAMBETH VESTRY.

Mr. J. P. Norrington, surveyor to the Lambeth Vestry, has presented a report to that body on the subject of combined drainage. He begins by remarking, that while under circumstances combined drainage may be accepted, in most cases it is advisable that each property should have a separate drain communicating directly with the sewer in the road. Mr. Norrington then continues as follows:—

The method of construction I advocate is that every property should have a manhole at the back to receive the branch drain, and a manhole in the front to facilitate ready access to the syphon and the connection to the sewer. All the drains to be laid in a perfectly straight line and surrounded with 6 in. of concrete. In this way every part of a drain is immediately under control, and should any impediment to the flow or stoppage arise it can be cleared by rods; also, the main line from manhole to manhole can even be examined by means of lights, should any defect be suspected. The possibility of a defect arising in this main line, when laid in the manner described, is so very remote as hardly to entitle it to consideration in connection with this question.

In years past the construction of drains has been carried out in such an inferior manner that an objection has arisen to the passage of drains underneath a dwelling, and a person letting or selling a property likes to be able to say that the drains do not pass under it. It is also possible that such a statement enables a slightly-increased price or rent to be obtained for the dwelling. Combined drainage, by saving a number of connections to the main sewer, in many cases is cheaper in construction than the system of providing a separate drain to each house.

CONDITIONS FOR COMBINED DRAINS.

The vestry is, in my opinion, justified in meeting the above-mentioned objections to drains passing under houses, and in sanctioning a method that will lessen the original cost of building, provided that the following conditions can be complied with in the construction of the combined drain or sewer:—

(1) That the drain be laid in a passage at the back of the houses. The said passage either to open to a side street or to a passage at the flank of the houses leading to the street in front.

(2) That the drain be laid under precisely the same conditions as a main sewer.

(3) That the number of manholes provided to the main drain shall be ample for the purposes of access, examination, cleansing and flushing.

(4) That there shall be a clear space or passage, 5 ft. wide, between buildings for this sewer to pass under, with an undertaking on the part of the owners not at any time to build over the said space or passage. This arrangement will permit of the reconstruction of the sewer without difficulty at any future time, should it be necessary.

(5) That the owners undertake the future paving, cleansing and maintenance of the said passage, which should be kept closed by means of doors or gates with spring locks.

(6) That each house should have a separate manhole and an interceptor between the manhole and the combined drain or sewer.

The provision of the clear space or passage overcomes the great difficulties and delay frequently caused by an owner or tenant refusing to allow his property to be entered, on the ground that he has not created the obstruction or that he is not going to have his premises pulled up for the benefit of others, &c. If a passageway is insisted on it affords an opportunity of removing the dust, &c., without carrying it through the houses. Subject to the above conditions, I see no objection to the vestry undertaking the permanent maintenance of such a combined drain or sewer.

The principle of accepting the maintenance of the combined drain as a sewer is carried out in many other districts, in some cases without the safeguards for ready access, &c., which I consider necessary and reasonable. As to the question of the number of houses which should discharge into a combined drain, I see no reason to impose any limit to the number, provided that the capacity of the sewer is sufficient. The greater the number of properties discharging into a sewer the more constant is the flow, and the more frequently and completely will it be flushed. It is manifest that the rainfall from twenty roofs and yards would be more beneficial to such a drain than the rainfall of only a few properties.

Provisional Orders for 1898.

REMARKABLE ACTIVITY AMONG LOCAL AUTHORITIES.

In another column we have some remarks on the subject of provisional orders generally, but with special reference to the following details, which we have been at considerable pains to procure and which will no doubt be serviceable. Whilst there has been an increase in the total number of provisional orders, it is in electric undertakings that this mode of procedure has found most general acceptance. In the present year thirteen applications for tramway provisional orders, representing a capital expenditure of £412,230, have been made, and of these nine have been granted. Eleven applications were made for gas provisional orders, representing an outlay of about £250,000, and of these nine have been granted. Applications for water provisional orders numbered seven, representing an expenditure of about £120,000, and six of them have been granted. The applications for electric lighting provisional orders were no less than eighty-four in number, and the capital represented was £2,148,670. Of the orders applied for, sixty-seven have been granted. Leaving the present session out of consideration, it appears that since the passing of the Electric Lighting Acts of 1882 and 1890 560 orders have been applied for, 310 of the applications have been granted by the Board of Trade and 357 confirmed by Parliament. The orders which have been dealt with during the present session are as follows:—

TRAMWAY PROVISIONAL ORDERS.

Blackpool, St. Anne's and Lytham Tramways.—To authorise the Blackpool, St. Anne's and Lytham Tramways Company to construct additional tramways and to apply certain provisions of the Acts of 1893 and 1896. Length of new line, 55 chains; estimated cost, £4,830. Granted.

Carlisle Tramways.—To authorise the construction of tramways in and near the city of Carlisle to be worked by electrical or any power. Length, 7 miles 14 chains; cost, £36,750. Granted.

East Ham Urban Council Tramways.—To authorise the urban district council to construct tramways to be worked by electrical or any power. Length, 3 miles 58 chains; cost, £19,107. Granted.

Eccleshill Urban Council Tramways.—To authorise the urban district council to construct tramways to be worked by electrical or any power, and to confer running powers over the Bradford Corporation tramways. Length, 42 chains; cost, £2,900. Granted.

Great Crosby Tramways.—To authorise the urban district council to construct tramways to be worked by electrical or any power, and to provide for the transfer of powers with the consent of the Board of Trade. Length, 2 miles 22 chains; cost £14,635. Granted.

Higgate and Finchley Tramways.—To authorise the construction of tramways in the parishes or districts of St. Mary, Islington, Hornsey and Finchley, to be worked by mechanical or other power, and to enter into running and working agreements. Length, 3 miles 79 chains; cost, £34,052. Refused on the ground that the consent of the local authorities had not been obtained.

Huddersfield Corporation Tramways.—To authorise the Huddersfield Corporation to construct additional tramways and to enter into working agreements with the Linthwaite District Council. Length, 2 miles 52 chains; cost, £15,277. Granted.

Linthwaite Tramways.—To authorise the Linthwaite Urban District Council to construct a tramway in their district to be worked by electrical or any power and to enter into agreements with the Corporation of Huddersfield. Length, 2 miles 91 chains; cost, £17,928. Granted.

Liverpool Corporation Tramways Extension.—To authorise the corporation to construct additional tramways in the city and to apply certain provisions of the order of 1883 and the Act of 1897. Length, 15 miles 36 chains; cost, £159,000. Granted.

Llandudno Urban District Council Tramways.—To authorise the Llandudno Urban District Council to construct a tramway in their district to be worked by electrical or any power. Length, 2 miles 65 chains; cost, £21,243. Refused on account of the council having failed to obtain the consent of certain property owners.

North Staffordshire Tramways.—To authorise the construction of tramways in Stoke-upon-Trent, Newcastle-under-Lyme, Hanley, Fenton and adjoining places to be worked by electrical or any power, and to vary sec. 43 of the Tramways Act of 1870 as to the purchase of tramways by the local authority. Length, 5 miles 37 chains; cost, £30,000. Refused on account of the company having failed to obtain the consent of the local authorities.

Oxford Tramways Extension.—To authorise the construction of an additional tramway in the City of Oxford and to provide for the purchase of the tramways by the local authority. Length, 63 chains; cost, £3,670. Granted.

Waterbury-with-Seaforth Tramways.—To authorise the Urban District Council to construct tramways to be worked by electrical or any power and to transfer the undertaking with the consent of the Board of Trade. Length, 1 mile 53 chains; cost, £10,119. Granted.

West Hartlepool Tramways.—To authorise the (to be) Electric Tramways Company, Limited, to construct additional tramways in the borough of West Hartlepool to be worked by electrical or any power. Length, 22 chains; cost, £18,800. Granted.

Woolwich and South-East London Tramways.—To authorise the construction of tramways in Woolwich and Plumstead to be worked by electrical or any power. Length, 2 miles 36 chains; cost, £10,910. Refused on the ground that the consent of the local authority had not been obtained.

GAS PROVISIONAL ORDERS.

Budleigh Salterton Gas.—To empower the Budleigh Salterton Gas Company, Limited, to maintain and continue the gasworks; to construct new works; to raise capital by shares, original £3,000, additional £19,000, by loan £5,500; proposed standard price per 1,000 cubic feet, 5s. Granted.

Canmore Gas.—To empower Canmore, Hedgesford and District Gas Company, Limited, to maintain and continue gasworks; to raise capital by shares, original £10,000, additional £10,000, by loan £12,500; proposed standard price, 5s. Granted.

Churwell Gas.—To empower the Churwell Gaslight Company to maintain and continue gasworks; to raise capital by shares, original £3,075, additional £2,925, by loan £1,500; proposed standard price, 4s. 2d. Refused on account of the Morley authority having obtained powers by a Bill passed this session to acquire the Churwell undertaking.

Coatbridge Gas.—To empower the Coatbridge Gas Company to raise additional capital, £25,000 by shares, £6,250 by loan. Granted.

Coalwall Gas.—To empower the Coalwall Gas Company, Limited, to maintain and continue the gasworks; to raise capital by shares, original £5,000, additional £5,000, by loan £2,500; proposed standard price, 4s. Granted.

Crossgates, Hulton and Sowerby Gas.—To empower the Crossgates, Hulton and Sowerby Gas Company, Limited, to maintain, continue and extend the gasworks; to raise capital by shares, original £10,000, additional £2,000, by loan £3,000; proposed standard price, 4s. Granted.

Freshwater Gas.—To empower the Freshwater Gas Company, Limited, to construct, maintain and extend the gasworks; to raise capital, £12,000 by shares, £3,000 by loan; proposed maximum price, 5s. Refused in consequence of opposition by the local authority.

Great Marlow Gas.—To empower the Great Marlow Gas Company, Limited, to maintain and continue the gasworks and extend the area of supply; to raise capital by shares, original £9,000, additional £21,000, by loan £7,500; proposed standard price, 4s. 8d. Granted.

King's Lynn Gas.—To empower the King's Lynn Gas Company to raise £8,000 capital and to construct additional works. Granted.

Slough Gas.—To empower the Slough Gas and Coke Company to acquire additional land and to construct new works. Granted.

Whitechurch (Salop) Gas.—To empower the Whitechurch (Salop) Gas Company, Limited, to maintain and continue gasworks; to raise capital by shares, original £20,500, additional £9,500, by loan £7,500; proposed maximum price, 5s. Granted.

WATER PROVISIONAL ORDERS.

Broughton-in-Furness Water.—To empower the Broughton-in-Furness Water Company, Limited, to construct and maintain the waterworks and extend the supply; to raise capital, £1,700 by shares, £437 by loan. Granted.

Ightham and Wrotham Water.—To empower C. G. Hale to construct and maintain water-works and to supply Ightham and Wrotham with water. Refused in consequence of opposition by the local authority.

Borough of Portsmouth Water.—To empower the Portsmouth Waterworks Company to raise additional capital, £4,500 by shares and £15,000 by loan. Granted.

Ross Water.—To empower the undertakings of the Ross waterworks to raise additional capital, £5,000 by shares and £1,250 by loan. Granted.

St. Neot's Water.—To empower the St. Neot's Water Company to construct and maintain waterworks, and to raise additional capital, £3,000 by shares and £750 by loan. Granted.

South Hayling Water.—To empower the South Hayling Water Company, Limited, to construct and maintain water-works and extend the limits of supply. Granted.

Wrexham Water.—To empower the Wrexham Waterworks Company to raise additional capital, £10,000 by shares and £10,000 by loan. Granted.

ELECTRIC LIGHTING PROVISIONAL ORDERS.

Alderbury and Blyth Electric Lighting Company.—To authorise the protest, magistrates and council of the borough of Alderbury to supply electricity within that borough; to raise £10,000 capital. Granted.

Aldershot Electric Lighting Order.—To authorise the Aldershot Urban District Council to supply electricity to raise £18,000 capital. Granted.

Ashted Moor Electric Lighting Order.—To authorise the

Aston Manor Urban District Council to supply electricity; to raise £10,000 capital. Granted.

Barnes Electric Lighting Order.—To authorise Barnes Urban District Council to supply electricity; to raise £20,000 capital. Granted.

Batley Electric Lighting Order.—To authorise the mayor, aldermen and burgesses of Batley to supply electricity; to raise £25,000 capital. Granted.

Bermundsey Electric Lighting Order.—To authorise the Vestry of Bermundsey to supply electricity within the parish; to raise £16,000 capital. Granted.

Bermundsey, Rotherhithe, Greenwich and Lewisham Electric Lighting Order.—To authorise the County of London and Brush Provincial Electric Lighting Company, Limited, to supply electricity in the parishes named; to raise £25,000 capital. With regard to Bermundsey, preference was given by the Board of Trade to the application received from the local authority. With regard to the other districts, the promoters failed to produce the consents of the local authorities or to satisfy the board that they should be dispensed with. The board therefore refused to grant the order.

Bethnal Green, Poplar and Whitechapel Electric Lighting Order.—To authorise the County of London and Brush Provincial Electric Lighting Company to supply electricity; to raise £25,000 capital. Refused on account of the promoters failing to produce the consents of the local authorities.

Birkdale Electric Lighting Order.—To authorise the Birkdale Urban District Council to supply electricity within their district; to raise £20,000 capital. Granted.

Bolton Electric Lighting Order.—To authorise the mayor, aldermen and burgesses of Bolton to supply electricity within the borough and townships of Astley Bridge, Heaton, Smith Hills, Darcy Lever, Breighmet, Lostack, Deane-over-Hulton, Middle Hulton, Tonge and Great Lever; to raise £15,000 capital. Granted.

Brechin Electric Lighting Order.—To authorise the provost and councillors of the Royal Burgh of Brechin to supply electricity; to raise £10,000. Granted.

Bridgwater Corporation Electric Lighting Order.—To authorise the mayor, aldermen and burgesses of Bridgwater to supply electricity within that borough; to raise £17,500 capital. Granted.

Burslem Electric Lighting Order.—To authorise the mayor, aldermen and burgesses of Burslem to supply electricity within the borough; to raise £22,000 capital. Granted.

Chelmsford Rural District Electric Lighting Order.—To authorise the Chelmsford Electric Supply Company, Limited, to supply electricity within the parishes of Writtle, Great Baddow, Bromfield, Springfield and Widford within the Chelmsford rural district; to raise £600 capital. Granted.

Chichester Corporation Electric Lighting Order.—To authorise the mayor, aldermen and citizens of Chichester to supply electricity within the city; to raise £25,000. Granted.

Chislehurst Electric Lighting Order.—To authorise the Chislehurst Electric Supply Company, Limited, to supply electricity within a portion of the parish of Chislehurst; to raise £15,000. Granted.

Chorley Corporation Electric Lighting Order.—To authorise the mayor, aldermen and burgesses of Chorley to supply electricity within the borough; to raise £12,000. Granted.

Colne Corporation Electric Lighting Order.—To authorise the mayor, aldermen and burgesses of Colne to supply electricity; to raise £10,000. Granted.

Crewe Electric Lighting Order.—To empower the mayor, aldermen and burgesses of Crewe to supply electricity; to raise £25,000. Granted.

Darlington Electric Lighting Order.—To extend the area within which the Corporation of Darlington may supply electricity, under the Darlington Electric Lighting Order, 1890; to raise £10,000 additional capital. Granted.

Dartford Electric Lighting Order.—To authorise the Dartford Urban Council to supply electricity within the borough; to raise £7,000. Granted.

Doncaster Corporation Electric Lighting Order.—To authorise the mayor, aldermen and burgesses to supply electricity; to raise £60,000. Granted.

East Ham Electric Lighting Order.—To authorise the district council to supply electricity; to raise £12,650. Granted.

East Stonehouse Electric Lighting Order.—To authorise the East Stonehouse Urban Council to supply electricity; to raise £15,000. Granted.

Gravesend Electric Lighting Order.—To authorise the mayor, aldermen and burgesses to supply electricity; to raise £18,920. Granted.

Greenock, Port Glasgow and Gourock Electric Lighting Order.—To authorise the North British Electrical Supply Company, Limited, to supply electricity in Port Glasgow and Gourock; to raise £50,000 capital. Refused on account of the promoters having failed to produce the consents of the local authorities.

Hamilton Electric Lighting Order.—To authorise the provost, magistrates and councillors to supply electricity; to raise £10,000 capital. Granted.

Hastings Corporation Electric Lighting Order.—To authorise the mayor, aldermen and burgesses of Hastings to supply electricity; to raise £75,000. Granted.

Hereford Electric Lighting Order.—To authorise the mayor, aldermen, and burgesses of Hastings to supply electricity; to raise £24,196 capital. Granted.

Holborn and St. Giles Electric Lighting Order.—To authorise the County of London and Brush Provincial Electric Lighting Company, Limited, to supply electricity within a portion of the Holborn district, the district of St. Giles' and the extra parochial places of Lincoln's Inn, Gray's Inn, Staple Inn and Furnival's Inn; to raise £25,000. Order granted in respect of part of the district.

Holborn District Electric Lighting Order.—To authorise the Charing Cross and Strand Electricity Supply Corporation, Limited, to supply electricity within a portion of the Holborn district; to raise £30,000. Order granted in respect of part of the district and part of St. Giles district, the remaining portion of the districts applied for being included in the Holborn and St. Giles electric lighting order.

Hornsey Electric Lighting Order.—To authorise the Hornsey Urban District Council to supply electricity; to raise £35,000 capital. Granted.

Hove (Aldrington) Electric Lighting Order.—To authorise Hove Urban District Council to supply electricity; to raise £30,000. Granted.

Ilford Electric Lighting Order.—To authorise the Ilford Urban District Council to supply electricity; to raise £10,000. Granted.

King's Norton Electric Lighting Order.—To authorise King's Norton Rural District Council to supply electricity within the parishes of King's Norton and Northfield; to raise £20,000. Granted.

Kingswinford Electric Lighting Order.—To authorise the district council to supply electricity; to raise £12,500. Granted.

Leatherhead Electric Lighting Order.—To authorise the district council to supply electricity; to raise £8,000. Granted.

Leigh-on-Sea Electric Lighting Order.—To authorise the district council to supply electricity; to raise £18,500. Granted.

Lewis Corporation Electric Lighting Order.—To authorise the mayor, aldermen and burgesses to supply electricity; to raise £16,000. Granted.

Lewisham District Electric Lighting Order.—To authorise the Lewisham Board of Works to supply electricity; to raise £45,000 capital. Refused on account of certain requirements of the Electric Lighting Act, 1882, and the Board of Trade rules not having been complied with.

Lewisham Electric Lighting Order.—To authorise the Great Western Electric Light and Power Company, Limited, to supply electricity; to raise £50,000. Refused on account of promoters failing to produce the consent of the local authority.

Lowestoft Electric Lighting Order.—To authorise the mayor, aldermen and burgesses to supply electricity; to raise £20,000 capital. Granted.

Maidenhead Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £15,000. Granted.

Margam Electric Lighting Order.—To authorise the district council to supply electricity; to raise £10,000. Granted.

Melton Mowbray Electric Lighting Order.—To authorise the Melton Mowbray Electric Light Company, Limited, to supply electricity in Melton Mowbray and the parishes of Sysouby, Welby, Eye Kettleby, Burton Layars and Thorpe Arnold; to raise £10,000. Granted.

Middlesbrough Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £50,000. Granted.

Midland Electric Power Distribution Order.—To authorise the Midland Electric Corporation for Power Distribution, Limited, to supply electricity; granted in respect of the borough of Wednesbury, and in the urban districts of Bilston, Coseley and Darlaston; Heath Town, Rowley Regis, Sedgley, Short Heath, Tipton, Wednesfield, and Willenhall, and the rural district of Walsall; to raise £200,000. Granted.

Mitchellstow Electric Lighting Order.—To authorise the Mitchellstow guardians to supply electricity in the town; to raise £900. Refused on account of ratepayers' objections.

Montrose Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £10,000. Granted.

Norwich Extension Electric Lighting Order.—To authorise Norwich Electricity Company, Limited, to supply electricity in the town and adjoining parishes; to raise £2,000. Granted.

Nuneaton Electric Lighting Order.—To authorise the Nuneaton Electric Company, Limited, to supply electricity within portions of the parishes of Nuneaton and Chilvers Coton; to raise £6,500. Granted.

Oldbury Electric Lighting Order.—To authorise the district council to supply electricity; to raise £24,000. Granted.

Ossett Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £10,000. Granted.

Partick Electric Lighting Order.—To authorise the Kelvin-side Electricity Company, Limited, to supply electricity; to raise £33,604. Refused on account of failure to produce the consent of the local authority.

Penarth Electric Lighting Order.—To authorise the Penarth Electric Lighting Company, Limited, to supply electricity; to raise £25,000. Granted.

Perth Electric Lighting Order.—To authorise the Perth Commissioners to supply electricity; to raise £25,000. Granted.

Peterborough Electric Lighting Order.—To authorise the Peterborough Electric Light and Power Company, Limited, to supply electricity; to raise £25,000. Refused on account of the promoters failing to produce the consent of the local authority.

Prescot District Electric Lighting Order.—To authorise the British Insulated Wire Company, Limited, to supply elec-

tricity within the urban district of Hayton-with-Roby; to raise £7,500. Granted.

Preston (Extensions) Electric Lighting Order.—To authorise the National Electric Supply Company, Limited, to supply electricity within the Finwood urban district and part of Preston rural district; to raise £2,000. Granted.

Rangate Electric Lighting Order.—To authorise the Electric Supply Corporation, Limited, to supply electricity in Ramsgate; to raise £15,770. Refused on account of promoters failing to produce the consent of the local authority.

Ravenmarsh Electric Lighting Order.—To authorise the district council to supply electricity; to raise £2,000. Granted.

Rochdale Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £22,000. Granted.

Rotherham Corporation Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £30,000. Granted.

Rothsay Electric Lighting Order.—To authorise the magistrates and town council to supply electricity; to raise £7,000. Granted.

Royal Leamington Spa Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £50,000. Application was refused; and a similar application by the Midland Electric Light and Power Company was withdrawn.

Ryde Electric Lighting Order.—To authorise the Ryde Electric Light and Power Company, Limited, to supply electricity; to raise £25,000 capital. Refused.

St. Alban's Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £13,800. Granted.

St. Anne's-on-the-Sea Electric Lighting Order.—To authorise the district council to supply electricity; to raise £10,000. Granted.

St. Giles District Electric Lighting Order.—To authorise the Charing Cross and Strand Electricity Supply Corporation, Limited, to supply electricity in St. Giles parish. Granted.

St. Marylebone Electric Lighting Order.—To authorise the Vestry of St. Marylebone to supply electricity; to raise £75,000. This order was granted by the Board of Trade, but the Bill providing for its confirmation was subsequently rejected by Parliament. Another order to authorise the county of London and Brush Provincial Electric Lighting Company, Limited, to supply electricity within the parish of St. Marylebone and to raise £100,000 was refused.

Shrewsbury Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £24,000. Granted.

Smethwick Electric Lighting Order.—To authorise the district council to supply electricity; to raise £28,500. Granted.

Stoke-upon-Trent Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £20,000. Granted.

Warrington Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £17,500. Granted.

West Bromwich Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £20,000. Granted.

Westgate-on-Sea Electric Lighting Order.—To authorise the Isle of Thanet District Council to supply electricity; to raise £10,000. Refused on account of objections from the ratepayers.

Weston-super-Mare Electric Lighting Order.—To authorise the Weston-super-Mare Electric Light and Power Syndicate to supply electricity; to raise £25,000. Refused on account of failure to produce the consent of the local authority.

Weymouth and Melcombe Regis Electric Lighting Order.—To authorise the corporation to supply electricity; to raise £30,000. Granted.

Whiston Electric Lighting Order.—To authorise the Whiston Rural District Council to supply electricity; to raise £5,000. Granted.

Willenden Electric Lighting Order.—To authorise the Willenden Urban District Council to supply electricity; to raise £16,000. Granted.

DARTFORD ROADS.

In compliance with the request of the Dartford Rural District Council, Mr. J. Hookins, the surveyor, recently presented a report on the maintenance of the highways under his control. The cost of the work, in his opinion, was governed by the following considerations—*viz.*, the weight of traffic passing over the roads, the existence of, and the facilities for, obtaining good hard stone in the several parishes within the district, the local cost of manual and horse labour, and the standard of repair to which the inhabitants of each particular district require them to be kept.

TRAFFIC.

The Dartford district, it may be mentioned, is the first rural district out of the metropolitan area on the south-eastern side; its roads reach to within 9 miles of London bridge, and in that part the traffic is of a semi-metropolitan character, and has greatly increased since the Woolwich free ferry was opened. Its roads adjoin and partially surround the urban districts of Dartford, Erith and Bexley, which contain a population of upwards of 40,000. The coal, manure and mercantile traffic to and from these towns over the roads is immense, more especially from Dartford and Erith. There is also a very heavy traffic to and from the paper and flour mills on the river Darent; and the carriage of coal to the West Kent gasworks at Crayford, Mr. Hookins is informed,

reaches to over 4,000 tons per annum. Then a very heavy traffic arises from the wharves on the river Thames and Dartford creek, and from the numerous railway stations and sidings in the district. Several traction engines are kept within the district, and numerous others are constantly passing through, and the repairs arising from the crushing and destructive power of these machines alone to the municipal roads forms no inconsiderable item in the cost of the repairs. Undoubtedly the traffic in the district is as heavy as, if not heavier than, in any of the rural districts surrounding London.

MAINTENANCE.

The absence of any hard rock in the district suitable for road-making must, with an ever-increasing traffic, debar the council from maintaining their roads at a comparatively low cost. They have in about seven or eight of their eighteen parishes an appreciable quantity of flints picked from the land; these have to be carted for miles to the other parts of the district at great expense in horse labour, so much so that it is found more economical to use granite in many places. Considerable sections of the roads have to be conted with the hardest imported granite to sustain the traffic over them, and the surveyor points out that it therefore costs upwards of £500 per mile to granite a road, which in many cases has to be renewed every third or fourth year. He adds that the cost of horse and manual labour is undoubtedly from 30 to 40 per cent. higher in the Dartford district, in comparison with the cost in many of the rural districts in other counties and in Wales.

Mr. Hookins thinks that the roads are as well maintained and have as good a surface as any roads in the kingdom. One thing contributing to that has been the use of the steam roller; the authority was one of the first in the country to adopt rolling the whole of the material throughout the rural roads of the district. Although the average cost, inclusive of horse and manual labour, is from £4 to £5 per mile, this luxury has been vastly appreciated by the inhabitants of the district.

If the expense of repairs in some hundreds of inexpensive districts in England and Wales are added to, or pooled with, the cost of a comparatively few expensive districts like the semi-suburban and market-garden districts of Dartford, an average of the whole must, Mr. Hookins considers, palpably be valueless as a comparison. For example, if nine provincial towns spending £100 per mile on their roads and one London vestry spending £600 are taken, these together would give an average of £150 per mile, and would be most misleading to the general public, who only look at the result of the averaging without examining the method by which it has been obtained. This could be of no practical use whatever as a basis for proving that one was economical and the other extravagant. It would be most unfair, Mr. Hookins adds, to assert that the district was not economically managed without taking into account the foregoing considerations. The law of averages cannot possibly apply to the cost of road maintenance as any true guide without the law of local circumstances being coupled therewith.

HOUSING OF THE WORKING CLASSES.

A conference convened by the Bermondsey Vestry was held at the Town hall, Spa-road, Bermondsey, on the 15th ult. for the consideration of the question of overcrowding and the housing of the working-classes. Delegates were sent from twenty-eight of the London vestries and district boards. Mr. W. W. Tyler, chairman of the Bermondsey Vestry, was elected chairman of the conference. As the result of a very lengthy discussion, in which it was contended that the mere enforcement of the by-laws with respect to houses let in lodgings or the provision of cheap railway fares would not effectually remedy overcrowding, the conference agreed to the following motion: "That the London County Council be asked to exercise their power under part 3 of the Housing of the Working Classes Act, to provide accommodation within the county of London where required." The conference also passed a resolution calling upon the London County Council "to insert a clause in their General Powers Bill of 1899 to enable metropolitan vestries and district boards to erect municipal dwellings under part 3 of the Housing of the Working Classes Act, 1890." Other resolutions agreed to expressed the opinion that the London County Council ought to contribute to the cost of the dwellings erected by the local authorities, that the management and retention of such dwellings should be permanently vested in the local authority, and that, in view of the heavy cost of land in London, the local authorities should not be compelled to repay the cost of such land out of the income from the dwellings, and that the period for borrowing for buildings should be extended to 100 years.

Hexham.—At the last monthly meeting of the district council the Hospital Committee presented a report recommending that the clerk be instructed to make application to the Local Government Board for permission to erect a permanent general hospital, with accommodation for small-pox patients, on the ground belonging to the guardians at the workhouse. The report was adopted.

Parliamentary Memoranda.

On Thursday, in the House of Lords, the London County Council (General Powers) Bill, the Devonport, Plymouth and Stoke Tramways Bill (now the Devonport and District Tramways Bill), the Mid-Kent Water Bill and the Middlesex County Council Bill were read a third time and passed. Lord Balfour moved the second reading of the Rivers Pollution Prevention (Border County Councils) (No. 2) Bill, and explained that its object was to empower county councils to appoint joint committees for the purposes of preventing the pollution of a river where the river ran through portions of Scotland and Ireland. The Bill was read a second time. The Local Government (Ireland) Bill was then considered on report. (On the motion of Lord Danraven, clause 19, relating to ancient monuments, was struck out and a new clause substituted providing *inter alia* that a county council might prosecute for any penalty under sec. 6 of the Ancient Monuments Protection Act, 1882. Lord Ingham moved to insert in clause 27 a new subsection, having practically the same object as the amendment moved in committee by Lord Londonderry and then negatived—*viz.*, to extend the 25 per cent. limit imposed on the extra expenditure to be incurred by district councils upon roads to various other branches of expenditure by those bodies. Lord Ashbourne strongly opposed the amendment, and after some further discussion the amendment was negatived by thirty-six votes to fifteen. Several other amendments were proposed by Irish peers, but most of them, after discussion, were not pressed; and, the report stage having been completed, the third reading of the Bill was fixed for the following day.

In the House of Commons the Lords' amendments to the Clacton-on-Sea Gas and Water Bill, the Malden Water Bill and the Senthampton Gas Bill were considered and agreed to; while the Paisley Corporation (Loans) Bill, the Electric Lighting Provisional Orders (No. 5) Bill and the Tramways Orders Confirmation (No. 1) Bill were read a third time and passed with amendments. The Kingstown Harbour Roads Transfer Bill was also read a second time.

On Friday, in the House of Lords, the Glasgow Corporation (Sewage, &c.) Bill and the Aber Valleys Gas and Water Bill were read the third time and passed. After the insertion of some drafting amendments, the Local Government (Ireland) Bill was also read the third time and passed.

In the House of Commons the Lords' amendments to the Barnley Corporation (Tramways, &c.) Bill, the Ipswich Dock Commission Bill and the Usk Valley Railway Bill were considered and agreed to. The Manchester Carriage and Tramways Company Bill was read the third time and passed, without amendment; while the Newhaven and Seaford Water Bill was read the third time and passed with amendments. The Electric Lighting Provisional Order (No. 15) Bill was also read a second time and committed. On Saturday, in the House of Commons, the Kingstown Harbour Roads Transfer Bill was considered in committee and reported, without amendments, to the House.

On Monday, in the House of Lords, the Rivers Pollution Prevention (Border County Councils) (No. 2) Bill was read the third time and passed.

In the House of Commons the Lords' amendments to the Sheffield Corporation Bill, the London County Council (General Powers) Bill, the London County Council (Money) Bill and the Mid-Kent Water Bill were considered and agreed to. The Portsmouth Corporation Tramways Bill was read a third time and passed with amendments; while the following Bills, ordered to lie upon the table, were considered and afterwards, the standing orders having been suspended, were read the third time: The Carlisle Corporation Water Bill, the Fife Water and Gas Bill, the Forres Water Bill, the Newcastle-upon-Tyne Corporation Bill, and the Newcastle and Gateshead Water Bill. The Tramways Orders Confirmation (No. 3) Bill, as amended, was also considered, and afterwards read the third time and passed with an amendment.

On Tuesday the House of Lords met at 3 o'clock to hear the Royal assent given by commission to certain Bills. The Speaker and the House of Commons having appeared at the bar, the Royal Commission was read and the Royal assent duly given to the following Bills: The Rivers Pollution Prevention (Border Councils) Act, the Electric Lighting Orders Confirmation (Nos. 9 and 13) Acts, the Pier and Harbour Orders Confirmation (No. 2) Act, the Tramways Orders Confirmation (No. 2) Act, the Water Orders Confirmation Act, the Coventry Corporation Gas Act, the Leyton Urban District Council Act, the Middlesbrough Corporation (Gas) Act, the Tynemouth Corporation (Water) Act, the Dublin Port and Docks Act, the Clontarf and Hill of Howth Tramroad Act, the Clacton Gas and Water Act, the Malden Water Act, the Southampton Gas Act, the Paisley Corporation (Loans) Act, the Barnley Corporation (Tramways, &c.) Act and the Ipswich Dock Act. The ordinary business of the House was then proceeded with. The Keighley Corporation Bill, the Wey Valley Water Bill, the Paignton Improvement Bill, the London United Tramways Bill, and, after the standing orders had been dispensed with, the St. Helen's Corporation Bill were read a third time and passed.

In the House of Commons the Chelsea Electricity Supply Bill, the Heywood Corporation Water Bill, the Metropolitan, Electric Supply Bill, the Rochdale Corporation Water Bill and the Todmorden Corporation Water Bill were considered and afterwards, the standing orders having been suspended, read the third time and passed with amendments. The Lords' amendments to the Local Government Provisional Orders (No. 13) Bill and the Metropolitan Common Scheme (East Sheen) Provisional Order Bill were considered and agreed to.

On Wednesday, in the House of Commons, the Seaham Harbour Bill and the Waltham-on-Avon Urban District Council Bill were read a third time and passed with amendments. The Lords' amendments to the Local Government (Ireland) Bill were considered. On the amendment giving to the Galway Town Improvement Commissioners the same powers in Galway as were possessed by the mayor and corporation of a county borough, the Speaker ruled that the Lords' amendment was a breach of the privileges of the House, inasmuch as it created a new rating authority. The motion that the House agree with the amendment was consequently not put. (On the first of the Lords' amendments creating two-member constituencies for district councils the Attorney-General moved that the House should agree with the Lords' amendment. A long debate followed, but the motion was carried on a division by 116 to 64, and the Lords' amendment was accordingly agreed to. The other Lords' amendments were, with some slight modifications, also agreed to.)

PRIVATE BILLS IN COMMITTEE.

Bury Corporation Water Bill.—The Bill promoted by the Corporation of Bury for the purpose of enabling them to purchase lands for the purposes of their water undertaking; to obtain land for a public library, an art gallery and an infectious diseases hospital; and to borrow money to the amount of £275,000, was passed last week by a committee of the House of Commons, presided over by Colonel Gmter. The opposition, although still strong, was less formidable than when the measure was before Lord Poltimore's House of Lords committee in May last. The Lancashire County Council, then foremost among the opponents, had been conciliated. The present opposition, which was directed to the waterworks clauses, emanated from the Bury Rural District Council and several other neighbouring authorities, who contended that the proposed power to make additional changes on the outside districts for water supply was contrary to public policy, unjustifiable and inequitable. From the evidence of the town clerk of Bury, Mr. J. Haslam, and the engineer of the corporation, Mr. J. Cartwright, it appeared that in 1872 the Bury Commissioners purchased the undertakings of the Bury and Radcliffe Waterworks Company, and the Haslingden and Rawtenstall Waterworks Company for £237,000; and in 1876, when the borough was incorporated, the corporation took the works over. The revenue from the combined undertakings in 1874 was £18,538 and last year £37,966. The corporation had spent £277,941 on the waterworks since they acquired them. They supplied 61,000 out of 62,000 in the borough of Bury, and 97,000 out of 140,000 inhabitants in the outside districts of Haslingden, Rawtenstall, Ramsbottom, Radcliffe, Whitefield, Prestwich and Little Lever, together with the area under the jurisdiction of the Bury Rural District Council. Out of a total revenue of £35,000 in respect of waterworks and meters the borough of Bury contributed £15,000. The charges varied, the minimum being at Prestwich, where they had as competitors the Corporation of Manchester, and they had to make the same charges as that body. The revenue from Prestwich was £1,174, but if they charged what they were entitled to charge it would have been £250 a year more. Except in one or two years, when they made a slight profit, the water undertaking had been a loss to the town council, no less than £70,000 having been charged on the borough rate in and since 1872. The outside districts had made no contribution towards the deficit. One of the objects of the Bill was to redress that inequality by entitling the corporation to claim from the outside districts a fair contribution, but the primary object was to acquire the watersheds, where pollution took place. The corporation desired to treat all alike, and had no intention of making a profit out of the water supply. Any surplus would go in the reduction of prices. The area of supply was about 18 miles long by 4 miles broad, and some of the houses were 850 ft. above sea level. Mr. Cartwright's evidence related mainly to the necessity for increasing the supply and purifying the water. For the latter purpose it was essential that the corporation should be armed with the means of protecting the sources of supply. They were prepared to meet the requirements of the Local Government Board in the matter by establishing filtration areas, which would involve an additional expenditure of some £30,000 or £40,000. The committee, in passing the Bill, accepted the proposal made by Mr. Pembroke Stephens, q.c., who (with Mr. Pope, q.c., and Mr. Lloyd) appeared for the promoters, with reference to a sinking fund, but intimated that in allowing the measure to proceed they did not prejudice any future action that might be taken by the outside

local authorities. They considered that no maximum was needed, as it was just as much to the interest of Bury to keep down the price as it was to that of the outside local authorities.

Rochdale Corporation Water Bill.—The spirited antagonism offered by the District Council of Littleborough to the Bill promoted by the Corporation of Rochdale for the acquisition of the Todmorden waterworks, in pursuance of their agreement with the waterworks company of that Yorkshire town for authority to construct additional works and to borrow £450,000, failed to influence Colonel Gantley's House of Commons committee in favour of the smaller local authority. The Bill was passed without consideration of any kind to the claim of Littleborough that the Todmorden undertaking should be reserved for their use when they took in hand a waterworks scheme for the supply of the district under their jurisdiction. Rochdale Corporation will now have at their command a service which will be sufficient for their requirements for many years to come.

London Electric Bills.—Three electric bills affecting the metropolis were under the consideration of Parliamentary committees last week. Two of them, which had already passed the Lords, were dealt with by a House of Commons committee presided over by Mr. Brynndd Jones, and the third was under the consideration of a Lords committee presided over by Lord Pirbright. The first taken up by Mr. Brynndd Jones was the measure promoted by the Metropolitan Electric Supply Company to enable them to establish a large station for the generation of electricity at Willesden and to bring the current into the company's area of supply by a conduit laid along the Grand Junction canal. The Bill was opposed by the St. Giles District Board of Works and the London County Council. The company proposed to avail themselves of the recommendations of the joint committee which had during the session considered various measures before Parliament relating to electricity. The company started with a capital of £250,000, but that had been increased to £1,000,000. The amount they had spent on works was £782,500, and there were five generating stations—one at Sardinia-street, one at Rathbone-place, one at Manchester-square, one at Amberley-road and one at White-hall. It was impossible to enlarge the present works, so a new site—and a very excellent one it was—had been found at Willesden. It would enable the company to get their mains into their district of supply without breaking up any streets or roads, inasmuch as they would be laid along the foothills of the Grand Junction canal. The cost of the site was £12,500 and that of the works and the mains £400,000. The St. Giles Board of Works were apprehensive that the new generating station would be substituted for the one already existing in the district, and there would then be no generating station for them to acquire if they wished to buy the undertaking in their district—only cables, wires and mains. They asked that the company should be placed under obligation to continue the existing generating station, but Mr. Halford Browne, *q.c.*, on behalf of the promoters, pointed out that this would put the company under an obligation to which they were not subject now, inasmuch as they could abandon their station to-morrow if they liked. Moreover, it must not be assumed that the St. Giles board had a right to buy the Sardinia-street station, for that station supplied the Strand and Holborn districts as well. Mr. Worsley Taylor, *q.c.*, for the London County Council, asked for the insertion of clauses which would enable the county council to purchase the undertaking at the expiration of the statutory period of forty-two years. Were the Bill passed in the form submitted it would render the right of purchase which the local authorities had under the existing law absolutely inoperative. At present each separate parish had the right to purchase so much of the undertaking as was situated within its limits, but distributing mains without a generating station would be useless. The county council, it was urged, had ample means and the staff necessary for the purpose of carrying on a large electrical undertaking. The committee passed the measure and imposed no obligation upon the promoters with regard to purchase. The Bill promoted by the Chelsea Electricity Supply Company, Limited, to authorise them to compulsorily acquire lands in their district on which to erect a generating station next came before the committee. There were two opponents, Mr. H. C. Pennell, represented by Mr. Bowen Rowlands, and the London Assurance Company, represented by Mr. Pembroke Stephens, *q.c.*, who submitted that property owned by them would be injuriously affected by the erection of the works contemplated. The principal purpose which the company had in view was to obtain compulsory powers for the acquisition of land, in order that they might be free from actions for creating a nuisance should they conduct their business with proper care—that is to say, they sought no immunity from actions if they failed to conduct their business with due and necessary precautions. The London County Council and other local authorities had opposed the Bill in the other House, but they did not press their objections in the Commons. The company had originally a generating station at Cadogan-gardens, but they were obliged, in consequence of an injunction having been obtained by a gentleman in the neighbourhood, to remove it to Flood-street, where it now stands. It was proposed to extend this station, and the consideration at first mentioned in connection with one portion of the land was £200, but the owner insisted that, instead of buying the small piece they

required, the company must purchase a much larger area, which he valued at £500,000. This was more than the resources of the company would justify them in acquiring, so they declined the offer. The owner, Mr. Holland, thereupon endeavoured to obtain an injunction to restrain the company from carrying on their business on the ground that they were causing a nuisance by vibration. An inspection, in pursuance of an order by the High Court of Justice, was made in February, Sir P. Bramwell acting for the company and Mr. Swinburne for Mr. Holland, and the conclusion arrived at was that there was no vibration at all. Mr. Frank King, the engineer-in-chief to the company, declared that the demand for electricity had lately been increasing so rapidly in Chelsea that unless they obtained possession of the proposed site almost immediately they would be unable to fulfil their obligations. The company had taken great pains, and had, in fact, altered their machinery more than once in order to avoid vibration. The foundations had been so prepared that whatever vibration was caused by the machinery was deadened in the foundations and not communicated to the surrounding ground. The ground was first levelled and a concrete bed laid, and on that was placed a thick layer of hair felt, upon which again was a foundation about 12 ft. in depth of solid concrete. Upon this the engine rests. Mr. Pembroke Stephens, on behalf of the London Assurance Company, explained that what that corporation complained of was that if the Bill passed and the company did anything amounting to a nuisance the petitioners would have no redress, because in the present Bill the nuisance clause was got rid of. Mr. Bowen Rowlands, on behalf of Mr. Cholmondeley Pennell, asked the committee to insert a clause which would reserve to him the right of obtaining from the company compensation for any damage which he might prove he had sustained. The company passed the Bill, and inserted a clause giving a certain amount of protection. The Bill investigated by Lord Pirbright's committee provided for the confirmation of two provisional orders, relating to the district of High Holborn and St. Giles. The first order gave the County of London and Brush Provincial Electric Lighting Company power to supply electrical energy within the area to the west of Gryn's Inn-road and north of High Holborn, including Lincoln's Inn, Gryn's Inn, Staple Inn and Farnival's Inn, and the second empowered the Charing Cross and Strand Electricity Supply Corporation to supply electrical energy to the area south of New Oxford-street and High Holborn. The Bill was opposed by the Metropolitan Electric Supply Company on the ground that as they already supplied the district with electricity, and as no complaint had been made against their service, their territory ought not to be invaded by new companies. Competition, they argued, would not benefit the consumer. The promoters of the two orders included in the Bill argued, on the other hand, that it would. Mr. Edward Seal, secretary of the Brush Company, stated that they were supplying light at an average of 4.7 per cent, whereas the Metropolitan Company's average was about 6d. They were paying a dividend at the rate of about 7 per cent., and had no difficulty in getting capital. Mr. W. H. Patechett, engineer-in-chief to this company, said that in the Strand and St. Martin's district there was competition which, he thought, was good for both companies, and had assuredly benefited the public by several reductions in price. Counsel for the Metropolitan Company argued that competition within this district ought not to be sanctioned by Parliament. They had spent large sums of money, and had in every way done their best for the public. There was nothing in the nature of electricity which differentiated it from gas, and open competition with gas companies had only led to bad gas, high price and public inconvenience. The company passed the Bill confirming the orders.

Windsor Dock Bill.—The House of Lords have wrecked the Windsor Dock Bill, just as they wrecked the Kennew Burgh and Harbour Extension Bill. In the Commons Prof. Stuart's Committee gave eighteen days to the consideration of the project for the construction of the splendid new dock at Penarth, to rival the finest basins of the Cardiff and Barry companies; but the labour was useless, for all that the Commons committee did the Lords have undone. The Bill was in everything but name the project of the Taff Vale Railway Company, and it had the support and sympathy of the Corporation of Cardiff and many of the local authorities of South Wales, who saw in it the possibility of increased advantages to the public, greater facilities for the shipment of mineral produce and more economical charges. It is useless to speculate on the reasons which influenced Lord Welby's committee in their decision to throw out the Bill. The powerful interests experienced by the Marquis of Bute were simply too strong for the Taff, who, however, made out an excellent case for additional dock accommodation in the neighbourhood of Cardiff.

Stockport.—At a meeting of the Stockport Electric Lighting Committee, held recently, it was reported that the public supply for street lighting would be available at the beginning of November, and that tradesmen would also be supplied then under specially-advantageous arrangements. The committee will also enter specially for the supply of electric power in manufacturing processes. The inauguration of an electric tramway system is under consideration.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XVII.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

ROAD MATERIALS AND CONSTRUCTION (continued).

Macadam's Plan of Construction.—Although considerable credit is due to Mr. Macadam for the general improvements he effected in roads under his charge by means of the adoption of the practice of putting "broken stone upon a road which should unite by its own angles so as to form a solid hard surface," yet he appears to have entertained some very erroneous notions in respect to the proper construction of new roads. He has stated

"That a foundation of bottoming of large stones is unnecessary and injurious on any kind of subsoil."

"That the maximum strength or depth of metal requisite for any road is only 10 in."

"That the duration only, and not the condition of, a road depends upon the quality and nature of the material used."

"That free stone will make as good a road as any other kind of stone."

"That it is no matter whether the substratum be soft or hard." In fact, that he "should rather prefer a soft one to a hard one," or even a bog, "if it was not such a bog as would not allow a man to walk over it."

These ideas are, of course, entirely at variance with the first principles of science and with universal experience. It was thought that when the road materials rested upon a soft and yielding bed they were less likely to be crushed by the passage of heavy traffic over them than when the foundation was hard and solid.

The foundation, however, of a road must be looked upon as its most essential part, and "the outer surface (or broken stone coating) should be regarded merely as a covering to protect the actual working road beneath, which should be sufficiently firm

FIG. 26.—RESIDENTIAL ROAD.

and substantial to support the whole of the traffic to be carried over it."* In short, the function of the road metal-ling is to take the wear, and that of the foundation to carry the weight of the traffic.

In forming roads wholly of broken stone the ground must be first prepared by levelling its irregularities and forming the surface to the intended contour of the finished roadway. Should the subsoil be of a soft, wet and retentive nature, it must be efficiently drained by means of cross drains, laid in the manner already described, at frequent intervals across the roadway, and discharging into deep side ditches, to be cut on each side of the road to a sufficient depth below the formation surface. In the case of a very soft or boggy ground, layers of faggots or brushwood are also frequently laid with advantage over its surface, and upon these the materials are spread. If the tract over which the road is to be formed consists of newly-made ground, as in the case of embankments, it should first be consolidated by punning or rolling. The ground surface having been properly prepared, the broken stone is spread uniformly over the road, by means of a shovel and rake, in successive layers of about 3 in. in depth, allowing, in the absence of a steam roller, time between the layers for their proper consolidation by the traffic. The total thickness of coating which will be required will necessarily depend upon the nature and extent of the traffic and upon the firmness or otherwise of the bed upon which it is laid. From 6 in. to 12 in. is the usual thickness, varying according to circumstances. Over the stone when laid "binding material," consisting of fine gravel, sand or road scrapings, is frequently spread, with a view of assisting the consolidation of the road metal and of making the traffic easier over the new surface. Its use was strongly objected to by McAdam, and although at the present time it is very generally used by surveyors, it should be dispensed with wherever possible, and only used in the least possible quantities at any time. Telford usually covered a newly-metalled surface with about $\frac{1}{2}$ in. of gravel as a "binding," but this is now rendered unnecessary, the use of the steam roller for effectually and quickly consolidating fresh-laid road metal having become so general.

* "The Construction of Roads and Streets," by Law and Clark.

In respect to this class of road Sir H. Parnell observes that "experience has fully established their fitness for roads of great traffic in comparison with those made with a proper foundation. The reason is very obvious, for if a coating of small broken stones be laid on the natural soil the weight of carriage wheels passing over it forces the lower course of the stones into the soil, while the soil is forced up into the interstices between them; the clean body of stones first laid on to make the road is thus converted into a mixed body of stones and earth, and, consequently, the surface of the road cannot but be very imperfect as to hardness. It is necessarily heavy in wet weather, on account of the mud the earth makes on its surface, and, in warm weather, on account of a quantity of dry dirt. A road made on this plan will require, for two or three years after it is said to be finished, the expenditure of large sums in new materials to bring it into anything like even an imperfectly consolidated state; and, after all that can be done, such a road will always run heavy, and break up after several frosts; for, as the natural soil on which such a road is laid is always more or less damp and wet, it will necessarily keep the body of materials of which the road is made damp and wet; in consequence of which the surface of the road will wear down quickly. Hard frosts will penetrate through the materials into the under soil, and when thaws take place break up the whole surface."

Although this form of construction has been very largely adopted throughout the country, it is only suitable for minor roads with a small amount of traffic.

Telford's Plan of Construction.—The most prominent feature of this mode of construction, as has already been said, is the use of a solid "pitched foundation." A specification of Telford's, describing the manner of forming a road of

this kind of 30 ft. in width, taken from a contract for making a part of the Holyhead road, has been given at length.

The method of laying down the foundation, also the objects and merits justly claimed for it, are best set forth in Mr. Telford's own words*: "This foundation is a regular close pavement of stones, carefully set by hand, and varying in height from 8 in. to 6 in., to suit the curvature of the road; these stones are all set on edge, but with the flat one lowest, so that each shall rest perfectly firm. The interstices are then pinned with small stones, and care is taken that no stone shall be broader than 4 in. or 5 in., as the upper stratum does not bind upon them so well when they much exceed that breadth. The pavement thus constructed is quite firm and immovable, and forms a complete separation between the top stratum of broken stones and the retentive soil below. Any water which may percolate through the surface is received among the stones of the pavement, and runs from them into the next leading or cross drain, and there escapes."

"The different parts of the Holyhead road, which have been newly made with a strong bottoming of stone pavement, place beyond all question the advantage of this mode of construction; the strength and hardness of the surface admit of carriages being drawn over it with the least possible distress to horses. The surface materials, by being on a dry bed and not mixed with the subsoil, become perfectly fastened together in a solid mass, and receive no other injury by carriages passing over them than the mere perpendicular pressure of the wheels; whereas, when the materials lie on earth, the earth that necessarily mixes with them is affected by wet and frost; the mass is always more or less loose, and the passing of carriages produces motion among all the pieces of stone, which, causing their rubbing together, wears them on all sides, and hence the more rapid decay of them when thus laid on earth than when laid on a bottoming of rough stone pavement. As the materials wear out less rapidly on such a road the expense of keeping it in repair is proportionally reduced. The expense of scraping and removing the drift is not only diminished,

* First report of Mr. Telford on the Holyhead road, May, 1824; also sixth report, May 23, 1829.

but with Hartshill stone, Guernsey granite, or other stone equally hard, is nearly altogether avoided."

In a roadway of 30 ft. in width, constructed after Telford's plan, a convexity or rise of 6 in. was obtained at the crown, the convexity of 4 ft. from the centre being $\frac{1}{2}$ in., at 9 ft., 2 in., and at 15 ft., 6 in., thus giving the form of a flat ellipse.

The stone employed for the foundation may be such as would not be suitable for other purposes, as metalling, building retaining walls, &c., and may therefore frequently be obtained locally for this purpose. Chalk may be used to form the foundation if kept sufficiently deep to be entirely out of the reach of frost. Mr. McNeill states that "sandstone, limestone or schists, or such as can be had in the neighbourhood, may be used for the purpose; any stone, almost, will answer that will bear weight and not decompose by the atmosphere."

The "bottoming" being thus properly performed, a coating, of about 6 in. or 9 in. in depth, of some hard and tough road metal, such as Guernsey granite or whinstone, should then be uniformly laid down, and rolled in in layers by the aid of the

foundation is thoroughly set. When this has taken place a top covering of broken stone is laid on 3 in. in depth, forming a solid road throughout.

In respect to the laying on of the first coat of stone, Mr. Thomas Hughes observes* that "the beneficial effect arising from the practice of laying on the gravel exactly at the proper time—i.e., just before the concrete has become quite hard—is that the lower stones, pressed by their own weight and by those above them, sink partially into the concrete, and thus remain fixed in a matrix from which they could not easily be dislodged. The lower pebbles being thus fixed, and their rolling motion consequently prevented, an immediate tendency to bind is communicated to the rest of the material; a fact which must be evident if we consider that the state called binding, or rather that produced by the binding, is nothing more than the solidity arising from the complete fixing and wedging of every part of the covering, so that the pebbles no longer possess the power of moving about and rubbing against each other."

This form of construction was applied by Mr. Charles Pen-

FIG. 27.—BUSINESS ROAD.

steam roller or consolidated by the traffic, the surface being well attended to during the process, and all hollows or ruts which may appear being at once filled in with road metal. If the road material is, as it should be, in angular cubical pieces, so that their angles may interlock with each other, no binding material will be required.

In and about the metropolis the foundation of a macadamised road is usually formed of "hard core," a term which is applied to a heterogeneous mixture consisting of broken stone brick rubbish, clinker, broken pottery and various other hard materials. In the north of England, and generally in towns situated near blast furnaces, the foundation is formed of slag. The thickness of the hard-core foundation will depend upon the nature of the subsoil, upon the amount of traffic, and also upon the nature of the material used, but 12 in. may be regarded as the minimum thickness, and this should be consolidated by rolling to about 9 in., all hollow places being at once filled in and made level.

Upon this a 5-in. layer of Thames ballast or gravel should be uniformly spread and consolidated to about 3 in. in depth. Then, to receive and withstand the wear and tear of the traffic, a 6-in. coating of broken Guernsey granite should be laid down in two layers and well rolled. About $\frac{1}{2}$ in. of sharp sand is frequently scattered over the surface, and the whole consolidated by rolling and watering. In London a road constructed after the above manner would cost about 6s. per square yard.

For ordinary country roads the ground should be excavated in the usual manner to an approximate circular segment, and the foundation formed of rough stones, flints, &c., to a thickness of at least 12 in., and covered with a 6-in. coating of broken flints. Binding material is not generally used, and steam rolling in many country districts is almost unknown, the new metalling being left to be gradually worked in by the traffic, assisted by occasional attention to the raking in of ruts and hollows appearing on the surface.

Roads with Concrete Foundations.—Roads have been constructed with concrete foundations and have proved very successful, but the process is too expensive for general application, and has therefore not been very extensively adopted, except in special situations, upon bad ground, or where the road is intended to be paved with granite, wood or asphalt. Mr. Henry Law, C.E., states† that "one of the principal advantages attending the employment of concrete as a foundation for roads is that a good and solid road may be made with materials such as round pebbly gravel, which, on any other mode of application, would be ill-adapted to the purpose, and would form a very imperfect road."

The concrete for the foundation may consist of good clean gravel, containing a little sand, mixed with hydraulic lime in the proportion of four or six parts of the former to one of the latter. The mixture being thoroughly well incorporated, is at once wheeled into position, spread over the roadway to a depth of 6 in., trimmed and spread to the form of the roadway surface. Upon this, just before the concrete has become hard, a layer of broken stone or gravel, 3 in. in thickness, is laid, the traffic not being allowed upon the surface until the

fold to the Brixton and Walworth roads with marked success, also in Southwark-street a 12-in. bed of lias lime concrete was put down, and Mr. McNeill suggested this plan for use upon the Highgate Archway-road. The circumstances leading to its adoption upon the latter road are interesting as well as instructive, owing to the difficulties to be overcome, and will therefore be briefly described.

ELECTRIC LIGHT PROVISIONAL ORDERS.

LOCAL AUTHORITIES AND COMPANIES.

The electric lighting industry in the United Kingdom has always been hindered rather than fostered by the Acts which relate to it. One notorious electric lighting Act practically strangled it at birth, and retarded developments for something like ten years. To-day, says *The Pall Mall Gazette*, the struggle is between companies holding provisional orders to supply electricity and municipal corporations anxious to control so important a supply. The corporations and vestries which have gone in for electric lighting have, almost without exception, done wisely and well up to now, and, owing to the encouraging example of the pioneer bodies in this movement, some £6,000,000 of rates are at present invested in electric lighting ventures. As a rule there has been an absence of competition, even rival companies holding provisional orders for the same district preferring to map out limits for themselves instead of indulging in cut-throat antagonism; and tendency of the Board of Trade has been to restrict the number of provisional orders for one district, so as to prevent ruinous competition. A committee of the House of Lords, however, has just decided in favour of granting concurrent powers to companies to trade in districts already monopolised by local authorities. Whether such competition would succeed is beyond the point, as numerous applications for the purpose have already been received. The decision is likely to fall very heavily on the authorities, because, whereas in the opposite case, when a local authority sought powers to work in competition with a company, it has always been a point of honour for the authority to buy out the company first (sometimes at a very high price), the present rule does not make it incumbent on the company to buy out the authority, and exposes an authority which is already at work to the risk of a purely fictitious competition on the part of companies formed solely for the purpose of being bought off. Such a state of things would not be fair to the authorities, nor could it be tolerated by the ratepayers, whose money they would have to squander.

St. Helens.—The corporation have been informed that the Local Government Bond have sanctioned the borrowing of £17,500 for proposed improved lighting arrangements of the borough. The Electric Lighting and Traction Committee have instructed the borough surveyor to prepare plans for the concentration of the whole of the electric plant, both for lighting and traction purposes, at the Boundary-road site.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

QUERIES AND REPLIES.

CELLAR OPENING ON FOOTWAY.—"Barrelway" writes: Will you be good enough to inform me if an urban council have the power to refuse to allow a barrelway in connection with a cellar being built in and opening on the footpath.

If by a "barrelway" is meant something comprised within the opening, I do not think the council can object so long as sec. 73 of the Towns Improvement Clauses Act, 1847, is complied with, but if it means something extending over the pavement, I think the council can refuse to allow it.

CONVERSION OF PRIVIES INTO WATER-CLOSETS: HOUSE DRAINS: CONNECTION WITH SEWERS.—"Kumbo" writes: Our sanitary inspector has served several owners with notices to abate a nuisance on their property by converting privies into water-closets. Plans have been deposited for the drainage of the same. I have taken objection to the way they wish to carry out the work, see Plan No. 1, and have recom-

PLAN No. 1.

PLAN No. 2.

- A—Water-closets.
- B—Yard and area gullies.
- C—Kitchen sinks.
- D—Rain-water pipes.
- E—Syphon traps.
- F—Ventilators.
- Existing drains.
- New drains.
- Public sewer.

mended them to connect to the existing drains, as per Plan No. 2, also to have "a window built in an external wall, 2 ft. long by 1 ft. wide, exclusive of the frame," and "to provide constant means of ventilation by at least one air brick built in an external wall." The owners object to do the work as requested. One owner has four houses and intends executing the drainage as shown on Plan No. 1, contending that we have no by-laws applicable to old houses, and can connect the drains as they choose, so long as they abate the nuisance, submit a plan showing the mode of connection and due notice of their intention to carry out the work. You will observe by the dotted lines that each house has a separate connection to the public sewer. We have adopted the Public Health Acts Amendment Act, 1890, but have made no by-laws applicable to the drainage of old buildings. These houses have been built twenty-five years. (1) Are they old houses within the meaning of the term *old houses*? (2) Can we compel them to connect each house into the existing drain? (3) Can we compel a window and an air brick? (4) If the owners have power to do as they propose, will all of the drainage systems (as shown), or any of them, become *sewers* vested in the council to cleanse and maintain? And, further, they propose to remove the gullies and refix them, leave all the disused drains in and simply stop the end of each drain up. (5) Have we power to compel them to remove all the disused drains and to stop up the junction at the point of connection with the public sewer?

(1) The term "old houses," in connection with by-laws, I understand to mean houses erected before the by-laws were in force. But the point is immaterial in the case under consideration. So far as I

rather from the statements in the query, what has happened is this. The local authority have served certain notices under sec. 41 of the Public Health Act, 1875, requiring the conversion of privies upon certain premises into water-closets, and the owners have thereupon given notices to the authority under sec. 21 of the same Act of their intention to empty their drains into the public sewer. Both these sections apply to both old and new houses. (2) "Existing sewer" I presume is meant. This is a difficult question. The section (sec. 21) is general in its terms, and allows the owner of "any premises" to cause "his drains" to empty into the sewers on the conditions therein specified, one of them being that he shall comply with the regulations of the authority. The regulations are in the entire discretion of the authority (Lumley's "Public Health Acts," p. 52, fifth edition), and presumably, therefore, a regulation requiring each house to be separately drained would not be *ultra vires*. So far as I am aware, however, the point has not been decided in any reported case. There is no express regulation to this effect in the printed "Regulations" which accompany the query, but the provision that "the whole arrangement of the drainage of the buildings must be approved by the surveyor" is very wide, and would appear *prima facie* to empower him to veto the proposed combined drainage scheme. (3) There is a regulation to this effect, but it is doubtful whether it is not *ultra vires*, as this can hardly be said to have reference to "the mode in which the communications between such drains and sewers are to be made." (4) The combined drain would become a sewer vested in the authority and repairable by them—i.e., assuming all the houses connected with it to belong to the same owner—if they belong to two or more owners then sec. 19 of the Public Health Act, 1890, applies. (5) I think the general clause in the regulations, that the whole arrangement must be approved by the surveyor, would cover this.

A GRASPING CORPORATION.

The people of Glasgow have for years been regarded by such portions of the rest of the world as knew anything about them as most patient slaves of the most advanced type of town councildom. The corporation, we are informed, says *The Railway World*, manage everything for the people that can possibly be managed municipally, and it attempts to manage some things which could be better done by private enterprise. The officials would even like to regulate in detail the life of the individual, and who knows but we shall find them starting, say, co-operative stores, for the alleged good of the community. But at present the corporation are seized with a new and high ambition. The plain man would have thought that the addition four years ago to the multifarious duties of the town council of working the tramways in the city would have been enough to satiate the municipal may for ten or twenty years. But the appetite grows with what it feeds upon. The proposals recently made by a company to build an electric light railway from Glasgow to Paisley, which would run on the high road and join the tramway system of the two towns, has been strenuously rejected by the Glasgow Corporation so far as the part of the line within their area is concerned. Not only so, but this militant town council have approached the local authority of the county of Renfrew, through whose district most of the proposed light railway would run, and have succeeded in persuading a committee of that authority that they also should oppose the scheme.

But more remains behind. These Glasgow town councillors have actually persuaded the presumably mild and innocent rural committee to support the preposterous proposal that the Corporation of Glasgow should themselves build a tramway through Renfrewshire to Paisley. It seems that the town council contemplate applying next year to Parliament for power to build and work the line, and that they had been spurred on to that course by the promotion of the scheme now before the Light Railway Commissioners. It is hardly necessary to point out that such a proposal is absurd. If it was granted we should soon have town councils all over the country going beyond their functions as the governing bodies of towns and operating inter-urban tramways through rural districts. It required a Glasgow town council's audacity to conceive such a scheme, and it will be very surprising if Parliament grants it. A few weeks ago a case occurred in Parliament which is probably the nearest approach up till now to the Glasgow proposal, but which is a very mild affair in comparison. The Corporation of Burnley are promoting a tramways Bill in the present session, and among its proposals is one to enable the corporation to take a lease of some short lengths of tramways which lie beyond the borough boundary, but form an integral portion of the tramways of Burnley. The committee of the House of Commons before whom the Bill came sanctioned this proposal, but in their report to the House they specially mentioned that they only did so in view of the peculiar circumstances of the locality, and this although there was no appearance in opposition to the Bill. There should not be much doubt as to what course a Parliamentary committee will take when an unblushing town council asks powers to build and work 4 or 5 miles of tramway along a county road into a town in another county.

Municipal Work in Progress and Projected.

This week we are able to give very little news with respect to projected works in the metropolis as the majority of the local authorities have adjourned their meetings for the summer recess. In the provinces, however, several extensive works are projected, notably at Bristol, Chorley, Lincoln, Barry and Taunton.

METROPOLITAN AUTHORITIES. METROPOLITAN ASYLUMS BOARD.

An ordinary meeting of the above body was held at the County Hall, Spring-gardens, London, S.W., on Saturday. A letter was read from the Local Government Board forwarding a copy of a notice which Dr. Farquharson, M.P., had placed on the order book of the House of Commons asking for a return showing the actual cost of each of the managers' hospitals in comparison with the original estimate. The managers' observations thereon were asked.—The North-Western Hospital Committee reported that they had issued advertisements for tenders for the work of making-up, &c., the main road of the hospital in accordance with a plan and specification prepared by Messrs. Pennington & Son, architects. They recommended that the tender of R. Ballard, Limited, for making-up the main road, &c., and repairing paths, &c., at the North-Western hospital, at the sum of £643, should be accepted. The architect's estimate for the work was £1,080. After some slight discussion with reference to the disparity between the architect's estimate and Messrs. Ballard's tender the recommendation was adopted. The following is a list of the tenders received: Messrs. Ballard, Limited, Childs Hill, N., £643; Mr. Ephraim Hollingsworth, Ilendon, £996 10s.; Messrs. C. W. Killingback & Co., Camden Town, £997; Mr. Thomas Adams, Green-lanes goods station, Great Eastern Railway, £1,035; Mr. William Griffiths, Bishopsgate-street Without, £1,049; Mr. George Bell, Tottenham, N., £1,079; Mr. Robert Jackson, 92 Upper Tollington-park, N., £1,187; Mr. A. J. Cole, Notting Hill, W., £1,215 *rs. 6d.*; and Messrs. B. Newell & Co., Kensington, £1,286.—The board accepted without discussion the tender of Messrs. John Shillitoe & Son, of Bury St. Edmunds, for the erection of the new head office buildings, at the sum of £47,532, in accordance with plans and specification prepared by Mr. E. T. Hall, architect. The following is a list of the tenders received: Messrs. John Shillitoe & Son, Bury St. Edmunds, £47,532; Messrs. Foster & Dicksee, Rugby and London, £48,980; Messrs. W. Pattison & Sons, Parliament-street, S.W., £51,243; Messrs. Leslie & Co., Limited, Kensington-square, W., £51,043; Messrs. E. Lawrence & Sons, May-road, City-road, £54,127; Mr. B. E. Nightingale, Albert Works, S.W., £54,827; and Mr. Henry Lovatt, Wolverhampton, not priced. The architect's revised estimate was £46,328.—The tender was accepted of the India-Rubber, Gutta-Percha and Telegraph Works Company, Limited, of Silvertown, E., for the supply of dynamo and engines required in connection with the proposed electric lighting installation at the Northern hospital, at the sum of £1,705 for dynamo and engines and £71 for the spare armature. The consulting engineer's revised estimate was £1,900.—The board accepted the tender of Messrs. Taylor & Sons, of Marsden, Yorks, for the supply of boilers, at the sum of £725, in connection with the proposed electric light installation at the Northern hospital. The consulting engineer's revised estimate (including the cost of certain mechanical stocks, tenders for which are still under consideration) was £1,000.—A recommendation by the Darentn Asylum and Schools Committee "that steps be at once taken to insure the managers against claims for compensation under the Workmen's Compensation Act, 1897, for injuries received in the performance of their duties by workmen in the board's service," was, after discussion, referred to the Finance Committee for consideration and report.—After considering several other matters the board adjourned till the 10th September.

VESTRIES AND DISTRICT BOARDS.

St. Marylebone.—The vestry on the 28th ult. reversed its previous decision in regard to the wood paving of Maids-vale. It was resolved to authorise the Works Committee to obtain and submit tenders for the supply of hard wood blocks for the paving of Maids-vale, and to accept the tender of Messrs. Burt, Boulton & Haywood for Swedish yellow deal blocks for the paving of three other streets, provided that the firm would supply 250,000 blocks at the same price per 1,000 (£5 *lss. 9d.*) as that contained in their tender for 750,000 blocks which was rejected at the previous meeting.—The Sanitary Committee were authorised to invite tenders for the construction of an underground convenience in East-street and to bring the proposals before the vestry for consideration. Mr. C. Warren moved that it be referred to the Sanitary and Sewers Committee to consider and report on the practicability of providing free accommodation for women, the same as now supplied to men, in the underground conveniences in the parish. This was rejected. On the motion of Mr. J. M. Butler it was resolved to refer to the Works Committee to consider and report as to the desirability of the surveyor annually inspecting the coal plates on the public footways in the parish, with a view to compelling the

owners to substitute new plates for all those found defective. The Baths Committee were empowered to make inquiries as to the cost of providing plant at the baths and wash-houses to enable the vestry to generate electricity for the lighting of those buildings, and the surveyor was instructed to prepare a specification and invite tenders for improving the ventilation of the wash-houses.—The tender of Messrs. Wright & Adams, of 81 Seymour-place, amounting to £71 5s., was accepted for the annual cleaning and other work at the court-house.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Berkshire.—At the last quarterly meeting of the county council, after a lengthy discussion, the following resolution was adopted: That it be referred to the Highways Committee to prepare a report to the council dealing with the extent to which steam-rolling might be adopted upon the county roads, or some of them, together with the cost thereof.

Middlesex.—At a meeting on the 25th ult. it was resolved to inform the Ecclesiastical Commissioners that the county council were not prepared to increase beyond £1,100 the price offered for the site for the proposed court-houses at Enfield. It was resolved, on the recommendation of the Finance Committee, to apply to the Local Government Board for consent to borrow £55,000 for the purchase of the Napsbury site, St. Albans, for the purpose of an additional county asylum; the period of repayment to be extended over thirty years or such further period as the board might be disposed to sanction. In connection with this matter the Asylum Committee reported that by their directions Dr. Gardiner Hill and Mr. Roland Plumbie had inspected and reported upon some asylums in Scotland and in the north of England. This joint report would be very valuable to the committee in connection with the consideration of the question of the kind of asylum to be provided for Middlesex. The committee hoped after the vacation to be in a position to submit preliminary sketches of the proposed new asylum.—The Asylum Committee were authorised to expend £530 in providing a cow-house with iron partitions for the asylum at Wandsworth.—It was resolved to inform the Bucks County Council that the council would be prepared to contribute a sum not exceeding £1,000 in respect of a bridge costing £3,500, or more, subject to the plans being approved by the council and to a satisfactory arrangement being made as to future maintenance. The proposed bridge is to be built over the Colne between West Drayton and Iver. The Highways Committee recommended that Turkey-street bridge, Enfield Wash, should be widened in accordance with the plans submitted, so as to provide a roadway of 27 ft. and one footpath of 6 ft.; and that the county surveyor be instructed to prepare drawings and specifications, and to invite tenders by advertisement, for carrying out the work. These recommendations were adopted.—It was decided to take no action in respect of the insurance of the roadmen under the Workmen's Compensation Act. In discussing this question the Highways Committee stated that the only reason why insurance would be necessary would be in connection with the work of steam rolling, but that "this particular work on the main roads repaired by the county council was done by a contractor, whose contract provided "that the contractor shall take all responsibility for any accident or damage that may happen or be done consequent upon the use of the roller." It is to be noted that the county's roadmen work in gangs at the same spot, but not actually with the steam rollers.—On the recommendation of the Technical Education Committee it was resolved to approve the plans submitted showing the proposed alterations necessary to adapt the Yeast House premises, adjoining the Tottenham Polytechnic, for the purposes of a plumbers' and carpenters' shop, and the second floor of the Tottenham Polytechnic main building for the purposes of chemical and physical laboratories; and to instruct the county surveyor to prepare working drawings and specifications, and to procure tenders for the execution of the work, from five firms approved by the committee.—The Finance Committee reported that the county surveyor had submitted a specification of external and internal painting and repairs required to be done at the Guildhall. Tenders had been obtained for the work from the following firms for the undermentioned amounts: Woolward & Co., £330; Patman & Potheringham, £325; A. Porter, £246; Phillips & Son, £238; and Higgs & Hill, Limited, £224. The tender of Messrs. Higgs & Hill, Limited, was accepted.

Shropshire.—At the quarterly meeting of the county council, on the 25rd inst., the Roads and Bridges Committee reported that they had had under their consideration an application from Clan district council for a grant towards the erection of a bridge over the river Onny at Whiteoak, on the road leading from a Norbury to Craven Arms. The total cost would be £455, and the committee recommended a grant of one-third of that amount, the local council to provide one-third, and the remainder to be raised by public subscription. It was recommended that the council should, if possible, enter

into agreements with Wellington, Ellesmere and Whitchurch for the repair of the main roads in those districts by the three separate authorities, at a cost of £75 per mile. The committee had appointed a sub-committee to consider the desirability of insuring the men employed with the steam rollers on the county road, so as to meet liabilities which may arise under the Workmen's Compensation Act. It was estimated that £2,836 would be needed to meet the expenses of the main roads for the quarter. The report was adopted without discussion.—The Local Government Committee's report stated that a memorial had been submitted to them by the Wellington Rural District Council requesting the Board of Trade to use their influence with the Great Western Railway Company to do away with four level crossings over their railway between Wellington and Oakenegates, and substitute bridges or subways. The committee recommended that the council support the memorial. The report was adopted.—The Visiting Committee to the Salop and Montgomery Lunatic Asylum presented a report, which stated that the surveyor had prepared an estimate for connecting the asylum drains with the new system of sewers for the borough, and the cost would be about £500. The asylum was reported to be much overcrowded. There was accommodation for 811 patients, and it was suggested that the buildings should be enlarged so as to accommodate 1,000. The county surveyor had the matter in hand, and the committee would report further upon the subject at the next council meeting. The report was adopted.

Warwickshire.—The County Roads and Bridges Committee reported at the last quarterly meeting of the county council that, having received a petition from the Foleshill Rural District Council "showing that the canal bridge on the main road from Coventry to Bell Green, known as the navigation bridge, 12 ft. wide, is dangerous both to vehicle and pedestrian traffic, owing to the steepness of the approaches and of the narrowness of the bridge, that the bridge is very largely used, that the canal company are willing to erect a bridge 36 ft. wide for the sum of £600, that until the bridge is reconstructed the tramway company are debarred from carrying their line to Bell Green, which is a great disadvantage to the neighbourhood, and asking the council to pay a proportion of the £600. They recommended that the council do undertake to contribute one moiety of the cost of widening and improving the bridge, such contribution not to exceed the sum of £250." The report was adopted.—The County Buildings Committee recommended that the portico at the judge's house be restored, at a cost not to exceed £70; and that the tender of Mr. John Webb for the erection of the sub-post station in Lorzells-road, Aston Manor, at the price of £2,222, be accepted. This report was also adopted.

West Sussex.—Acting on a report from the county surveyor as to the advisability of having a depot for stores at Horsham, the Roads and Bridges Committee, at the last meeting of the county council, recommended that a plot of 2 roads 14 poles of land, situated at the back of Upper New-street, be leased for twenty-six years, at an annual rental of £3; and also that a shed and fences be erected on the land and other necessary works carried out, at an estimated cost of £325. The recommendation was agreed to.

MUNICIPAL CORPORATIONS.

Birmingham.—The Baths and Parks Committee, accompanied by the lord mayor, made their annual inspection on Saturday week of the parks and recreation grounds of the city. They left the council house at 2 o'clock, and drove by way of Calthorpe-park, Cannon-hill, Queen's-park, Harborne, Summerfield-park, Burbury-street-gardens, Aston-park, Adderley-park, Victoria-park, Small Heath, Palsall Heath-park, &c., thence to Village Green House, Moseley, the residence of the chairman of committee, where they were entertained to tea.—Last week an inquiry was held at the council house by Mr. W. O. E. Mende-King, Local Government Board inspector, relative to an application of the corporation for sanction to borrow £5,000 for sewerage works.

Bradford.—The council recently decided to light the street lamps at Frisinghall by electricity. The district has up to the present been lighted by the Shipley Gas Light Company, who charge a much higher price than the corporation do. The corporation have been greatly pressed to make some arrangement with the Shipley company, but have failed to do so, and in the alternative have determined to extend the electric cables to these places by degrees.—The corporation have concluded terms with Colonel Maude for the purchase of his manorial rights over Baildon Moor. The property includes Shipley Glen and Baildon Green, the total area being 770 acres, comprising charming woodland scenery, which is to be preserved for recreative purposes.

Bristol.—At a recent meeting of the Sanitary Committee of the corporation the assistant clerk reported that sanction had been received from the Local Government Board to loans of £10,000 for wood paving and £266 for repairing a sewer in Redcross-street.

Cardiff.—At a recent meeting of the Public Works Committee of the Cardiff Town Council, held at the town hall, a letter was read from the Local Government Board stating that the draft by-laws relating to new streets and buildings were still under consideration. It is now nearly

ten years since the first draft of these by-laws was submitted to the board at Whitehall, and, owing to the delay in their consideration and the necessary amendments that were subsequently required, this extraordinary delay has taken place.

Chorley.—At the monthly meeting of the town council, on Thursday, Mr. Stone, in moving the adoption of the minutes of the Sewage Works Committee, reported that a deputation had waited upon the Local Government Board with respect to their insistence on land irrigation of the effluent after treatment by precipitation before they would grant the loan of £6,500 for sewage disposal, and stated that Sir Hugh Owen had, in response to the deputation, consented to reconsider the question.

Conway.—New municipal buildings are in course of erection at Conway, from plans by Mr. R. Davies, of Bangor. The contractors are Messrs. Thorp & Son, of Llandudno. The town council have just completed the repair of the town walls. Gangways have been provided between Upper Gate and the Conway river in seven places, and the promenade along the existing portion of the walls is complete.

Dudley.—At the Board of Trade offices, Whitehall, Sir T. Courtenay Boyle, secretary to that board, who was accompanied by Mr. Hopwood, C.B. (secretary of the Railway Department), Sir Francis Marindin, Sir Thomas Blomefield, Mr. A. T. Thring and Mr. H. A. Steward (secretary to the Light Railway Commissioners), recently held an inquiry in regard to the objections raised by the Dudley Town Council to the confirmation of the order made by the Light Railway Commissioners authorising the construction of certain lines by the British Electric Traction Company.

Godalming.—The town council have resolved to purchase the Frith Hill, Godalming and Farncombe Water Company, and a committee have been formed to arrange all formalities, and, if necessary, to promote a Bill in Parliament for the acquisition of the undertaking. According to the terms agreed upon in the negotiations, the corporation's liability in purchasing the concern will be £67,250, involving £2,858 8s. 7½d. yearly. The annual repayment of the borough's existing loans is equivalent to a rate of 2s. 1½d. in the £1.

Hastings.—The town council had before them on the 20th ult. a report of the Parks Committee recommending that a plan and estimate be adopted for the laying-out of Whitecroft as a park. After some discussion the report was, however, referred back on the ground that the estimate of £4,000 was more than had been thought would be required, and the scheme provided simply for roads and fences, and only £250 for planting, while there was no provision for green-houses and a caretaker's house.

Hastings.—The town council have decided to give the incandescent gas lighting a trial in the Hollington district, where there are no public lamps at present. Being approached on the matter, the gas company offered to supply gas, maintain the mantles and chimneys, and light and extinguish the lamps, at £3 7s. 8d. per lamp per annum, being the same price as charged for ordinary single-burner lamps, such price, however, to be subject to revision at the end of each year. The council have resolved to have thirty-four lamps lighted in the district on these terms.

Lincoln.—On Friday week Mr. P. Gordon Smith, architect to the Local Government Board, and Major-General H. D. Crozier, R.E., one of the inspectors of the Local Government Board, held an inquiry into the application of the town council for sanction to borrow £6,500 for the erection of houses at New Boultham, under the provisions of Part III. of the Housing of the Working Classes Act, 1890, and £1,944 for works of street improvement. The proposals were explained by Mr. H. K. Hebl, the deputy town clerk, and Mr. McBrain, the city surveyor.

Mansfield.—At the monthly meeting of the town council, on the 22nd ult., it was resolved that the seal of the council be affixed to a petition against the General Powers Distributing Bill.—A recommendation by the Free Library Committee that a scheme proposed by the Plesley Hill Committee for the formation of a branch library be adopted was confirmed.

Maldon.—Colonel W. R. Slacke, R.E., an inspector to the Local Government Board, held an inquiry recently, as to the application of the council to borrow £724 for works of water supply for Tolcarne, £1,425 for works of water supply and £1,301 for works of sewerage for Heamoor.—The district council have unanimously decided to request the Local Government Board to hold their inquiry into the Parley water supply scheme as early as possible, so that the work might be commenced in the autumn, when labour would be more plentiful and cheaper than in the spring.

Newcastle.—The Town Improvement Committee of the Newcastle Corporation met recently, when plans were submitted on behalf of Mr. Watson-Armstrong for laying out streets 45 acres of land at North Henton, in the neighbourhood of Chillingham-road. It is proposed to build from 600 to 800 houses. Mr. F. W. Rich, of Newcastle-on-Tyne, is the architect. The committee passed the plans.

Northwich.—At a recent meeting of the council a letter was read from the clerk to the county council, stating that the Main Roads Committee had recommended the council to make

the following contributions to the Northwich authority towards bridging the river Dane and providing an alternative route from London-road to the lower portion of Witton, thus avoiding one of the most treacherous of the subsiding roads in the district: To land over the present Northwich town girder bridge, estimated to be of the value of £1,000; to contribute one-third the cost of removing and refixing it, and the like proportion of the cost of constructing the proposed new road, exclusive of the cost of acquiring any land necessary to do so. The county council also agreed to maintain and repair in perpetuity the structure of the bridge when erected.

Otley.—Mr. H. Percy Boulnois, recently conducted an inquiry, on behalf of the Local Government Board, into an application of this authority for sanction to borrow £600 for works of sewerage in respect of certain houses which it is proposed to erect.

Penarth.—The Board of Trade have granted a provisional order authorising the supply of electricity by the Penarth Electric Lighting Company, Limited. The company have scheduled an extensive list of streets for the compulsory area in which mains must be laid within two years. Provision is made in the order for the acquisition of the undertaking by the council after a period of fifteen years.

Plymouth.—A letter from Mr. R. Priestley Shires, on behalf of the architects of Plymouth, was read at the last meeting of the Special Works Committee of the Plymouth Corporation. It intimated that they were unanimously agreed that their objections to the terms of the competition in connection with the Tavistock-road improvement scheme were reasonable, and were of considerable importance to them professionally. They therefore requested the committee to reconsider and adopt at least the general principle underlying the suggestions they had put forward. Under the circumstances the committee recommend the council to make it an open competition, on the conditions originally laid down for the competition restricted to Plymouth architects.

Portsmouth.—An inquiry was recently conducted by Mr. W. O. E. Mende-King, on behalf of the Local Government Board, in reference to an application of the council for sanction to borrow £3,000 for purposes of sewerage.

Richmond, Yorks.—In reply to an application from the corporation to the Local Government Board for the approval of the sale of certain corporate lands, the transfer of a certain amount of 2½ per cent. consolidated stock, and of the appropriation of the sums realised to defray the cost of the erection of a farmhouse and buildings, Mr. G. W. Wilcocks held an inquiry at Richmond town hall last week.

Ripley.—Mr. A. S. E. Fawcett, inspector of the Local Government Board, held an inquiry in the town hall, Ripley, recently, with reference to the application of the council to obtain leave to borrow £1,000 for extension of the mains for water supply and for sewerage purposes. No opposition was offered. It was stated, that owing to the growth of the town, it had been found necessary to extend the water mains and provide additional facilities for sewerage. The surveyor submitted plans of the sewerage scheme. The proceedings having terminated, the inspector visited the localities which had formed the subject of inquiry.

Ryde.—Consideration was recently given to a proposal to appoint a committee "to consider the subject of the introduction of electricity into the town of Ryde, with power to employ a consulting engineer to advise fully on the subject and to bring up a report at an early date." It was urged that, as it had been decided to light the town by electricity, it was the duty of the corporation to ascertain the best means of doing it. It was eventually decided to appoint the committee.

Salford.—The following resolution has been adopted by the council: "That the council be recommended to purchase the land abutting on the westerly end of Great Cheetham-street East, containing about 21,683 square yards, as a grass playground for the district, at 3d. per square yard and twenty-five years' purchase, and that the requisite application be made to the Local Government Board for sanction to borrow the purchase money."

Southampton.—It was reported, at a recent meeting of the town council, that Mr. W. H. Brothers, secretary to the British Association of Waterworks Engineers, had forwarded a resolution passed by the association during their recent visit to Southampton, thanking the mayor and corporation for the courteous and hospitable welcome accorded to the members, and for the many facilities and conveniences placed at their disposal.—A letter was read from the Local Government Board acknowledging the receipt of their letter of the 15th inst., with reference to the scheme of the Town Council of Southampton for the provision of artisans' dwellings. The board consented to the deviation from the scheme, for the execution of which they had sanctioned a loan of £14,500 on the 28th January, and asked that that sanction might be returned with a detailed estimate of the cost of the new scheme. The board accepted the new scheme providing accommodation for 186 persons, and they expected the town council to submit at an early date proposals on the housing of sixty-four more persons, to make up the 250 referred to in Article 111 (5) (b) of the provisional order of 1895. The communication was referred to the Housing of the Working Classes

Committee.—The corporation recently took over the whole tram and bus system in the borough. The cost has yet to be fixed, and arbitration to this end is going on between the company and the corporation. In six months' time it is proposed to abolish horse traction and use only electricity.—Colonel A. G. Dornford, Local Government Board inspector, has held an inquiry for the purpose of hearing evidence on behalf of an application made by the Southampton Town Council for sanction to borrow £2,500 for technical instruction purposes.

Tamworth.—On Friday Colonel J. T. Marsh, R.E., held an inquiry, on behalf of the Local Government Board, respecting an application of the town council for an order sanctioning an improvement scheme under the Housing of the Working Classes Act, 1890, which involves the demolition of Bradbury-square. The town clerk and the borough surveyor explained the scheme, and the inspector subsequently visited the area involved.

Taunton.—At a special meeting of the council, held lately, the Electric Lighting Committee recommended the acceptance of a tender, amounting to £1,456, for the carrying out of certain works, subject to the sanction of the Local Government Board to the proposed loan of £11,500, but with power for the committee to arrange with the tenderers to at once carry out urgent works included in the tender, and also for the committee to proceed with the sub-station and a portion of the mains to supply the Staplegrave and Rowbarton districts, the whole of such urgent works amounting to about £2,000. The committee also recommended the acceptance of a tender, amounting to £1,325, for electric arc lighting. Both recommendations were adopted.

Tiverton.—The result of the year's working of the gas undertaking is a profit of £198, which makes a total profit of £2,347 realised since the corporation acquired the works, three years ago. The gas produced last year amounted to 25,000,000 cubic feet, of which 6.22 per cent. was lost by leakage. The total capital of £20,000, £868 remains unspent, and is to be used to provide a new gasholder. The manager is well pleased with the increased number of stoves on fire, and he expects a great development in this department from the reduction in the price of gas for cooking to 3s. 6d. per 1,000 cubic feet.

URBAN DISTRICT COUNCILS.

Abergele and Pensarn.—The district council have applied to the Local Government Board for sanction to a loan of £3,500 for the carrying out of a promenade and other improvements.

Barry.—At a meeting of the Finance Committee of the district council last week a communication was read from the Local Government Board giving power to borrow £4,321 for roads around Romilly Park and £1,180 for the drainage of the same. It was decided to borrow an additional sum of £13,000 for public works in the district.

Clayton.—On Saturday week a new open space, known as Victoria Park, was formally opened to the public, thereby bringing to its consummation a project started in commemoration of the Queen's diamond jubilee. The ground which has been utilised for the purpose was formerly the village green, and was practically vested in the overseers, from whom it has been transferred to the district council. The park forms a square, with buildings on every side, in Greenwell-row, Green Side, Riva Syke and Co-operation-rod. It has been surrounded with iron railings, and very neatly laid out in grass plots, flower-beds and walks. At the upper end is a terrace, in front of which the principle flower-bed—a large one of circular shape—has been formed. The area of the park is about 2½ acres, and the expenditure upon it is estimated at about £1,150.

Coalville.—A motion in favour of steps being taken to purchase the 11stoke gasworks was submitted at the last fortnightly meeting of the district council. The motion was not, however, seconded, and so fell to the ground.

Enfield.—A letter was read at the last meeting of the district council from the medical officer of health to the Hackney Vestry, asking if the council had decided to join in the conference to be held at the House of Commons on the question of the pollution of the river Lea and a main drainage scheme for the Lea valley. The more united the districts were in the neighbourhood of the river the better prospect there would be of the Government taking some action to alter the present condition of the river. It was decided to reply that a deputation would attend the conference.

Finchley.—The North London Electricity Company have written to the district council, stating that they intended to apply to the Board of Trade and to Parliament in the ensuing session for a provisional order authorising them to supply electricity within the area of the council. The letter has been referred to the Highways Committee.

Friern Barnet.—The district council have appointed a committee to inquire and report as to the erection of cottages under the Housing of the Working Classes Act.

Hexham.—Mr. W. A. Duent on the 20th ult. conducted an inquiry, on behalf of the Local Government Board, with reference to an application of the district council for sanction to borrow £806 for water supply works. Mr. W. Prud-

dah, clerk to the council, and Mr. R. T. Surtees, surveyor to the council, explained the proposed works. There was no opposition to the application, and it was stated that the council themselves were perfectly unanimous upon it.

Holme Cultram.—The district council have been making inquiries, with a view to the lighting of the streets of Silloth, on the Solway, with acetylene gas. The British Illuminating Gas Company, in reply to these inquiries, state that they can supply street lamps, with generators, at £6 16s. each, and are prepared to send one on approval free of charge. The council have decided to obtain a lamp on trial, but as it will be impossible, whatever the result of the trial, to get acetylene gas lamps erected in the streets in time for the coming lighting season, it has been agreed to ask the North British Railway Company, who own the gasworks at Silloth, to light the town with coal gas, as usual, during the coming winter.

Hornsey.—At a recent meeting of the district council tenders were opened for the erection of a new fire station at Muswell Hill, as follows: Willmott & Sons, £1,295; Chessum, £1,241; Houghton & Sons, £1,217; Smith & Son, £1,130; and Irwin, £1,102. The lowest tender was accepted.

Prestatyn.—The district council have resolved to apply to the Local Government Board for sanction to a loan of £3,000 for the purpose of drainage and general improvements.

Rounds.—The district council have purchased by public auction, for £700, a site in the High-street on which to erect municipal buildings.

Saltburn.—At a recent special meeting of the district council the clerk reported that Mr. Carriek, whose tender for the work required in the laying-out of the new cemetery was accepted at the last meeting, had withdrawn his tender, as he had found that he had left out £100 for drainage. This occasioned much discussion, but as the additional sum did not bring the amount of Mr. Carriek's tender up to the next highest it was agreed to allow the tender to be amended.

South Hornsey.—At a recent meeting of the district council unanimously adopted a resolution in favour of the establishment of a public library in the district. Some months ago a poll of the ratepayers was taken, and the result showed a large majority in favour of the library.

Surbiton.—A meeting of this council was held on the 11th inst., when it was stated that the arrangements for obtaining an electric lighting provisional order had been completed.—A committee reported having visited the sewage farm, when the surveyor explained his proposals for preventing the effluent from the filtering beds percolating through the present earth and clay division, so that separate cleansing might be possible. They carefully considered two suggestions made by the surveyor, and agreed that division walls would be the most effective and permanent barrier between the upper and lower beds. They therefore recommended, as an experiment, that dwarf concrete walls be built between certain of the beds, and that tenders be invited for the work.

Tottenham.—The district council have appointed a committee to consider the question of erecting municipal buildings.

Wimbleton.—The surveyor, Mr. C. H. Cooper, has submitted an estimate showing that the cost of erecting the new infectious diseases hospital in accordance with the plans approved by the Local Government Board would be £17,000.

Wimslow.—At a meeting of the district council on Monday week the clerk reported that the Local Government Board had refused to sanction the application of the council for permission to borrow for six years the sum of £600, which was needed for road improvements in the district. They would only allow the council to borrow for three years.

Withington.—Colonel Smith, R.E., Local Government Board inspector, recently held an inquiry at the Withington town hall into an application of the council for power to borrow £3,118 for works of private street improvement and £177 for works of sewerage. The surveyor informed the inspector that the sewerage had become necessary owing to the attention of the council having been drawn by the Mersey and Irwell Joint Committee to the fact that the present sewer, which was made before the urban council was constituted, was connected with the storm-water overflow and allowed the sewage to pass into the river Mersey, causing pollution. The main sewer ran along Barlow Moor-road, and by means of the proposed works they would be able to divert the sewage into that. The inspector promised to report to the Local Government Board in due course. There was no opposition.

RURAL DISTRICT COUNCILS.

Barrow-on-Soar.—The Local Government Board have given notice that they will hold an inquiry with respect to an application of the council for sanction to a loan of £3,000 for sewerage works in the parish of Barkby.

Blackwell.—In respect to the pollution of a stream at Blackwell, complaints of which had been made by the Duke of Devonshire's agent, a letter from the Hucknall Heathwaite Urban District Council was read at the last fortnightly meeting of the district council, stating that they were engaged on

a sewage scheme for the whole district, which they hoped would remedy any pollution they were at present responsible for. The medical officer presented an analytical report on samples of water taken from various places in the course of the stream. It was decided to communicate the result of the medical officer's report to the Hucknall council, and to state that the South Normanton representatives were to meet the surveyor and investigate the matter.

Felkenham.—At a recent meeting of the council the chairman reported that the deputation who inspected the new system of coal filtration of sewage at Malvern were perfectly satisfied with its operation, and recommended the same system to be adopted at Astwood Bank. The clerk was instructed to procure plans and estimates for two coal filters.

Helston.—Colonel A. G. Durnford, R.E., has held an inquiry, on behalf of the Local Government Board, respecting an application of the council for sanction to borrow £500 for sewerage works in the west end of the parish of Landewednack. Several ratepayers opposed the scheme.

Kingsbridge.—At the last meeting of this authority the Admiralty wrote offering £200 towards making a new road and sea wall between Inner and Outer Hope, which had been before the council for several years. It was agreed to commence the work as soon as possible, the tender of Mr. George Hooper, for £401, being accepted.

Richmond, Yorks.—The district council have engaged Mr. Hurry W. Taylor, of St. Nicholas Chambers, Newcastle, to report upon the best means of supplying the village of Middleton Tyas with water. In consequence of the prolonged drought most of the springs and wells are dry.

Southmolton.—At a recent meeting of the district council it was reported that three tenders had been received for the erection of a new bridge at Town Moor Water, Worlington—viz., Mr. F. A. Hooper, Chittlehampton, £36 10s.; Mr. F. Hill, Chawleigh, £43; and Mr. W. Amory, Chumleigh, £49. It was resolved to accept the tender of Mr. Hooper.

SCOTLAND AND IRELAND.

Arbroath.—At a meeting of the Public Health Committee, on Friday week, a letter was read from the Local Government Board enclosing a copy of a petition signed by a number of residents in Arbroath complaining of the insufficiency of the water supply. The clerk was instructed to reply that the commissioners were at present engaged in attempting to augment the water supply of the burgh.

Belfast.—The tender of Messrs. J. & W. Stewart, Adelaide-street, Belfast, has been accepted by the harbour commissioners for the extension of the electric lighting station at Abercorn basin.

Dundee.—A joint meeting of the Works Committee and the Gas Committee was held on Friday, week when the burgh engineer submitted a report as to a proposal to widen Ferry-road at a point opposite the gasworks, and to construct a footpath, 10 ft. wide, to the east between Ferry-road and Dock-street. Objection was taken to the width of the footpath, several members being of opinion that it ought to be made very much wider; but ultimately it was agreed to recommend the council in terms of the engineer's report. The cost to each department is estimated at fully £1,700.

Edinburgh.—From a financial, and indeed from every point of view the electric light has been, says a contemporary, a remarkable success in Edinburgh. It is under the management of the corporation, and that management has been excellent. The light is supplied at an unusually low rate, and despite this there is a profit to the community. During the year ended May 13, 1898, the report for which has now been issued, the total output was, for private lighting power 2,659,763 units, an increase over the previous year of nearly 90 per cent., and for public lighting £34,666, making a total of 2,804,423 Board of Trade units. The income from private lighting and power has been £30,024 4s. 2d., and from public lighting £7,993 5s., in all £38,017 9s. 2d. The total expenditure, including interest and sinking fund, has been £39,365 1s. 11d., leaving a net profit of £7,649 7s. 3d. Of this sum £4,000 is to be put to reserve, leaving £3,649 7s. 3d. available as a contribution to the rates.

Glasgow.—The Water Sub-Committee of the corporation considered on Saturday week the tenders submitted for the supply of 1,000 tons of pipes. Offers were sent in by four Glasgow and two Philadelphia firms, the prices by local firms ranging from £5,960 upwards, and American £4,437. It was stated that the tenders by the American firms were for 12-ft. lengths, instead of 9-ft., as specified. The committee, in view of the great difference in the offers of the local and the American firms, which amounts to £670 per 1,000 tons, agreed to re-advertise for further offers, alternatively for 9-ft. and 12-ft. lengths.

Billing's Burner Syndicate, Limited, of 180 Wardour-street, W., have supplied a large number of non-mantle incandescent gas-light burners for lighting the Washington Music Hall, Bathoreen, S.W., which has recently undergone alterations and redecorations.

Personal.

Mr. Harrison, who for the past five years has been assistant borough engineer at Newport, has been appointed surveyor to the St. George's Vestry, Southwark.

Mr. Alfred Wilson, of Sidmouth, has been appointed surveyor, inspector of nuisances, sanitary inspector and water inspector to the Ashburton Urban District Council.

The salary of Mr. H. J. Ridge, assistant surveyor to the Romford Urban District Council, was, at a meeting of the council on the 18th ult., increased by £15 per annum.

Mr. Thomas A. Busbridge, surveyor to the Chesterfield Rural District Council, has resigned his position in order to take up a similar one under the Spilsby Rural District Council.

Mr. William Plant, of the borough engineer's department, Stafford, has been appointed assistant in the sewerage department of the Leicester Corporation, at a salary of £2 2s. per week.

On the 30th ult. Mr. F. J. Whittaker, highway surveyor to the Peterborough Rural District Council, was unanimously appointed to the additional office of haiding surveyor to the council.

At an adjourned meeting of the Roads Committee of the Glamorgan County Council, held recently, Mr. Alexander Mark, of Bridgend, was appointed road surveyor for the Bridgend district.

Mr. Alfred Clibbens, of the city surveyor's office, Bristol, has been appointed surveying assistant in the office of Mr. E. G. Mawley, borough engineer and surveyor of Leicester, at a salary of £2 5s. per week.

At the quarterly meeting of the Wolverhampton Town Council, on Tuesday a recommendation in favour of increasing the salary of Mr. J. Garfield, the manager of the Barnhurst sewerage works, was adopted after a short discussion.

Mr. John Hunt Hedley, of the firm of Messrs. Thos. F. Hedley & Sons, of Sunderland and Westminster, has been piced by the Board of Trade on the list of surveyors and umpires from which selections are made by the board for appointment in cases of disputed compensation for land, &c.

At the last meeting of the Lancashire County Council it was decided to appoint Mr. William Harold Radford to the office of county bridgemaster, at a salary of £1,000 per annum, with travelling expenses. It was also decided to appoint Mr. William Higginson Schofield, the senior district surveyor, county surveyor, at a salary of £500 per annum.

The sixty-five years' age limit has been reached by Mr. E. D. Goddard, superintendent in the Birmingham Gas Department, but at last week's meeting of the city council the Gas Committee were authorised to retain the services of Mr. Goddard till October next year. Mr. Alderman Pollack explained that Mr. Goddard will then have been connected with the gas undertaking for forty years.

Among the proposals to be brought forward at the Keighley Town Council meeting on Tuesday, are the increase of the salary of Mr. Hopkinson, borough engineer, from £300 to £350, with an honorarium of £50 for extra services rendered in connection with the Bill now before Parliament, the increase of the salary of Mr. Joseph Smith, water superintendent, from £90 to £100, and the fixing of the salary of Mr. Wharfe, assistant sanitary inspector, at £78.

Mr. Alfred J. Hoppe has been appointed superintendent of the Ebbingham-street works of the Sheffield United Gas Company. Mr. Hoppe was for three years a pupil to Mr. F. W. Stevenson when that gentleman held the position of engineer and manager to the Chester Gas Company, and he afterwards acted for two years as assistant to Mr. Robert Hunter, who succeeded Mr. Stevenson at Chester. He was then appointed chief assistant at the Halifax Corporation gasworks, under Mr. Thos. Holgate, a post he has held for the past eight years. He will take up his new duties on 1st September.

Dr. H. McLean Wilson recently read a paper before the Bristol Medical Association, at their meeting in Edinburgh, on "River Pollution." Dealing with the question whether the present laws relating to river pollution were sufficient, he referred to the Act of 1876 and to the Bill at present before Parliament. With regard to the former, he held that it was far from sufficient, and he then proceeded to point out what he considered the weak points of the new Bill. The most important omission, he thought, was that there was no prohibition of new pollution. It would be a mistake if the Bill were permitted to pass. In conclusion, he expressed himself as opposed to the standard of purity.

The Local Government Board do not like the idea of a dual appointment of chief sanitary inspector and surveyor. The board stated, says *London*, that since the arrangement by which the late chief sanitary inspector of Stoke Newington held also the office of surveyor was assented to, their experience had led them to the conclusion that the combination of the two offices was objectionable in a district such as Stoke

Newington, as leading to neglect of the duties of the office of sanitary inspector. They asked the vestry to reconsider the matter, with a view to separate offices being appointed. The vestry, however, are quite satisfied with themselves, and have politely informed the Whitehall authorities that they desire the continuance of the old-fashioned arrangement.

At the last meeting of the Middlesex County Council the Highways Committee submitted the following letter from Mr. Henry T. Wakelam, who was recently appointed county surveyor: "Will you kindly ask your committee, at their next meeting, to allow me the privilege of taking pupils into the offices at the Guildhall after I take up my duties there as county surveyor. The committee will be aware that it is an almost general custom throughout the country for engineers and surveyors to take pupils, and I trust your committee will give me the right of having not more than two pupils in the office at a time. They would be trained chiefly in the general drawing office, and the county would reap the benefit of their services, they being solely engaged in the work of the county." On the recommendation of the committee the council resolved to permit the new surveyor, who will take up his duties in October, to have two pupils.

A meeting of the Newark Rural District Council was held on Tuesday, for the purpose of electing a new surveyor to fill the vacancy caused by the resignation of Mr. Tom Vickers. The report of the committee appointed to consider the applications stated that they had had before them applications from a large number of qualified persons for the post of highway surveyor and inspector of nuisances, and after careful consideration had selected the following three candidates in the order named: Mr. Cecil Stewart Hodges, of Nottingham; Mr. Goddard, of Ware; and Mr. Ralph Oakden, of West Ham. The chairman said there were about forty-five candidates, but the majority of them were urban men, who had not been used to country life and country traffic. The committee had therefore selected the above, any of whom they considered eligible for the appointment. The applications were then read. Each of the candidates attended, and answered such questions as the council desired to put. The council then voted by ballot, nine votes being recorded for Mr. Oakden, seven for Mr. Hodges and one for Mr. Goddard. Mr. Oakden was therefore declared elected.

At the quarterly meeting of the Roads and Bridges Committee of the West Sussex County Council, on the 5th ult., the county surveyor laid before the committee a request that the subject of the assistance in his department might be considered, and stated that since he was appointed a stone quarry had been acquired and worked by the county, foot-path repairs had been extensively carried out, and upwards of 1 mile of kerb had been laid, a steam roller with stone-breaker had been purchased, and a second roller with haulage tackle, &c., had been ordered and would be delivered for use in August of this year; also, that it was necessary that these extra works should have additional superintendence to ensure efficient and economical working, and at present only one assistant, at 25s. per week, was appointed for both office and outdoor assistance. He recommended that the present assistant be allowed a substantial increase to cover everything, including out-of-pocket expenses, that he be employed more out of doors in general supervision, and that some clerical assistance be allowed. The committee decided to recommend the council "that the surveyor be allowed a sum of £2 a week for an assistant, to cover all out-of-pocket expenses, also that he be allowed a sum of 5s. a week for clerical assistance in his office, such allowances to commence as from July 23, 1898, when the present allowance of 25s. per week should cease." The recommendation has since been adopted by the council.

Southport.—The Health Committee of the corporation have resolved to revive their recommendation for the erection of a town's destructor as now a matter of urgency.

Runcorn.—Runcorn possesses considerable advantages for the production of electric light, and the council have had the subject under consideration for years without result. Their hands are now being forced, notice having been given by the Electrical Power Distribution Company, London, of their intention to apply to the Board of Trade for a provisional order to supply electricity within the district. Believing such power should be vested in the council, the committee have decided to make application accordingly.

Sewage Purification at Leigh.—At a meeting of the Leigh and Atherton Joint Sewerage Board on the 20th ult., Monday week was fixed as the date for commencing to receive and treat the sewage of the two districts at the new works, which are now practically completed. The expenditure up to date on the works is nearly £55,000, and loans to the amount of £24,088 have been sanctioned. The farm contains 233 acres, and £18,888 has been borrowed for land and buildings, £17,400 for sewage, and £27,800 for outfall works. The sewage will be treated by chemical filtration, and the works are claimed to be among the most complete and best equipped in the country.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

IRISH DISTRICT MEETING AT CORK.

The following are the arrangements for the above meeting, which will be held to-day and to-morrow:—

TO-DAY.

- 11.30 a.m.—The members will be received in the council chamber, Municipal Buildings, by the Right Worshipful P. H. Meade, Esq., Mayor of Cork. Reading of the minutes.
- 12 noon.—The following papers will be read and discussed: (1) "Restoration of Municipal Buildings and Description of Cork Waterworks, with means adopted for checking Waste of Water," by Mr. H. A. Cutler, city engineer, Cork; (2) "Description of Cork Electric Tramways," by Mr. Beverly Griffin, A.M.I.C.E., resident engineer for the contractor for permanent way; and (3) "Main Roads under County Councils," by Mr. R. H. Dorman, county surveyor, Armagh.
- 2 p.m.—Luncheon, which will kindly be provided by the mayor.
- 3 p.m.—Visit to Cork Electric Tramway and Lighting Company's central station and other works in course of construction in the city.
- 4.30 p.m.—Special train (Cork and Muskerry Light Railway) to visit Blarney and St. Anne's, where tea will be provided by Mr. R. Bertie, J.P., chairman of the company. The engineer for the railway, Mr. W. H. Hill, will accompany the members. On returning to Cork the members will dine together at the Imperial Hotel, at 7.30 o'clock. Dinner tickets 5s. each (wines extra).

TO-MORROW.

Visit to Queenstown Waterworks.

- 10 a.m.—The members will meet at the Municipal Buildings and drive to Tipptostown, site of head works. Messrs. Kirby & Dorn, the engineers, will explain the scheme on the ground.
- 1 p.m.—Leave Queenstown Junction for Queenstown.
- 1.30 p.m.—Luncheon at Queen's Hotel, Queenstown, provided by the local members.
- 2.30 p.m.—Start on board American tender for a cruise round Cork harbour and visit harbour works; and also Cork, Blackrock and Passage Railway extension to Crosshaven. Messrs. James Price, M.I.C.E., harbour engineer, and S. Perry, engineer to the railway company, will accompany the members. Afternoon tea will be provided by Mrs. Kirby, at Miramar, Queenstown, where the steamer will touch during the afternoon.

R. H. DORMAN, M.I.C.E., THOMAS COLE, A.M.I.C.E., Secretary,
Hon. Sec. Irish District, 11 Victoria-street,
Armagh. Westminster, S.W.

ELECTRIC LIGHT AT SALFORD.

PROPOSAL TO BORROW £33,000.

Lieut.-Colonel Albert C. Smith, representing the Local Government Board, held an inquiry into an application by the Salford Corporation for power to borrow £33,000 for purposes of electric lighting and £2,230 for the construction of storm-water overflows on the main intercepting sewer at Hough-lane, Springfield-lane and Regent-road.

From the opening statement of the town clerk (Mr. S. Brown) and the evidence of the borough treasurer (Mr. J. E. Elliott), the electrical engineer (Mr. C. L. Turner) and the chairman of the Electricity Committee of the corporation (Mr. Haworth), it appeared that £57,770 has been already borrowed for the purposes of the electric installation, and that of the £33,000 now sought to be borrowed £10,000 is required for land for a large new generating station at Strawberry-hill, Pendleton, £10,700 for electrical mains and £11,300 for three battery sub-stations in the different districts of the borough, together with accumulators and the necessary machinery for charging and discharging the accumulators.

In illustration of the urgent necessity for the provision of land for a new station, figures were given showing the great increase in the demand for the current. In the quarter ended June, 1897, the amount of current sold was 11,513 units; in the quarter ended September, 1897, it was 16,234 units; in the quarter ended December, 1897, it was 67,876 units; in the quarter ended March, 1898, it was 80,595 units; and during the quarter ended June last it was 43,944 units, or getting on for four times the quantity sold in the corresponding quarter of last year. The demand was still increasing, and if one of the battery sub-stations was not completed by the coming winter the Electricity Committee would be in a fix. The witnesses said they expected to have in the coming winter new customers for 20,000 N candle-power lamps; applications had been received for motive power equal to about 2,000 horse-power, and motive power equal to about 6,000 horse-power would be required to drive the tramscars by electricity.

With regard to the £2,200 required for storm-water overflows, Mr. J. Corbett, the borough engineer, stated that on the intercepting sewer by which the sewage of the borough

was carried to the sewage works at Mode Wheel there are at present three storm overflows. The additional overflows now proposed to be constructed were for a part of the sewer that was in the most populous part of the borough. At that point there was ½ miles of intercepting sewer without any overflow to the main sewer, although there was some small overflows to the individual sewers. Frequent complaints had been made about the flooding of the district, and it was felt that something ought to be done to remove all cause of complaint.

At the conclusion of the inquiry the inspector visited the sites of the proposed works, and also accepted an invitation by Alderman Jenkins, on behalf of the River Conservancy Committee, to visit the sewage works at Mode Wheel.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

CLERKS OF WORKS (Two).—August 6th.—Edmonton Urban District Council. £3 3s.—Mr. G. Eedes Eachus, M.I.C.E., engineer and surveyor to the council.

SURVEYOR AND INSPECTOR.—August 5th.—Street Urban District Council. £90.—Mr. S. Thompson Clothier, clerk to the council.

SURVEYOR.—August 8th.—Yardley Rural District Council. £250.—Mr. F. L. Thompson, clerk to the council.

CLERK OF WORKS.—August 8th.—Corporation of Chepping Wycombe. £3.—Mr. T. J. Rushbrooke, borough surveyor.

INSPECTOR OF NUISANCES.—August 8th.—Corporation of Eastbourne. £104.—The Town Clerk.

SURVEYOR.—August 9th.—Cleckheaton Urban District Council. £150.—Mr. J. Armitage, clerk to the council.

DRAUGHTSMAN AND ASSISTANT FOR GAS ENGINEER'S OFFICE.—August 10th.—Corporation of Halifax. £2 10s.—Mr. Thos. Holgate, gas engineer and manager.

ASSISTANT BOROUGH ENGINEER AND SURVEYOR.—August 11th.—County borough of Newport, Mon. £150.—Mr. Albert A. Newman, town clerk.

BUILDING ASSISTANT FOR THE WORKS DEPARTMENT.—August 13th.—London County Council. £300.—Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, London, S.W.

ENGINEERING ASSISTANT FOR WORKS DEPARTMENT.—August 13th.—London County Council. £300.—Mr. C. J. Stewart, county clerk, County Hall, Spring-gardens, London, S.W.

QUANTITY TAKER FOR THE WORKS DEPARTMENT.—August 13th.—London County Council. £3 10s.—Mr. C. J. Stewart, county clerk, County Hall, Spring-gardens, London, S.W.

GENERAL FOREMAN OF WORKS.—August 15th.—Corporation of the City of Canterbury. £2 2s.—Mr. A. H. Campbell, city surveyor.

INSPECTOR OF NUISANCES.—August 15th.—Highworth and Swindon Rural District Council. £120.—Mr. John P. Kirby, clerk to the council.

SURVEYOR AND INSPECTOR OF NUISANCES.—August 17th.—South Hornsey Urban District Council. £250.—Mr. Edward B. Bennett, clerk to the council.

INSPECTOR OF SEWERS.—August 18th.—Corporation of Coventry. £2.—Mr. J. E. Swindlehurst, city engineer and surveyor.

ARCHITECTURAL ASSISTANT.—August 19th.—Beckenham Urban District Council. £3 3s.—Mr. J. A. Angell, surveyor to the council.

CIVIL ENGINEERING ASSISTANT.—August 23rd.—Corporation of the City of Hull. £85.—Mr. A. E. White, city engineer.

CITY ENGINEER.—August 31st.—Corporation of Wellington, New Zealand. £800.—Agent-General for New Zealand, London.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

ST. PANCRAS.—August 25th.—Erection of public baths and wash-houses.—Mr. C. H. J. Barrett, vestry clerk.

PLYMOUTH.—September 24th.—Erection of shops and dwelling-houses fronting Tavistock-street. £250.—Mr. J. H. Ellis, town clerk.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

SLough.—August 6th.—Supply of 4,300 tons of 2-in. broken clean field flags and about 500 tons of 1½-in. machine-broken and hand-broken granite, for the urban district council.—Mr. W. W. Cooper, surveyor to the council.

NEWTON-IN-MAKESFIELD.—August 6th.—Making-up Iorland, Alpine, Peel, Nelson, Water and Brookfield-streets and Braughton-road, for the urban district council.—Mr. W. W. Shirley, clerk to the council.

PRETH.—August 6th.—Extension of the quay at the harbour.—Mr. William MacLeish, town clerk.

SLough.—August 6th.—Making-up works in the streets known as

Chalvey Vale, for the urban district council.—Mr. G. H. Charsley, clerk to the council.

GUILDFORD.—August 8th.—Construction of certain surface-water drains, including new works of drainage in connection therewith.—Mr. C. G. Mason, borough surveyor.

WOBBEROOTH (NEAR BARNESLEY).—August 8th.—Conversion of an engine-house in furnace yard into a dwelling-house, for the urban district council.—Mr. J. Whitaker, surveyor to the council.

DROBINGTON (Yorks).—August 8th.—Leveling, channelling, kerbing and flagging of about 150 lineal yards of cutaway on the Leeds and Whitehall-road, for the urban district council.—Mr. Henry Roberts, surveyor to the council.

ABERDEENY.—August 8th.—Erection of a footbridge and the construction of a culvert at the Old Mill, Cwmroly Lower, for the rural district council.—Mr. John Gill, surveyor to the council.

PADHAM.—August 8th.—Supply of 408 yards of 24-in. cast-iron pipes, for the urban district council.—Mr. J. Gregson, A.M.I.C.E., engineer and surveyor to the council.

KEIGBLEY.—August 9th.—Paving, flagging, kerbing, &c., of Back Arrowth-street.—Mr. W. H. Hopkinson, borough surveyor.

BENINGWORTH.—August 9th.—Construction of about 677 lineal yards of sanitary pipe sewer in Washington-terrace and Washington-gardens.—The Borough Surveyor.

CHRETSKY.—August 9th.—Making-up of an accommodation road between Long Cross and Chobham-road, for the urban district council.—Mr. Arthur W. South, surveyor to the council.

HEAFIELDSTONE (Durham).—August 10th.—Formation of a portion of new streets at Blackhill, for the urban district council.—Mr. John Dixon, surveyor to the council.

GLAMORGANSHIRE.—August 10th.—Improvement of Gellifaelog bridge, for the county council.—Mr. T. Mansel Franklin, clerk to the county Council Offices, Cardiff.

HILTON.—August 10th.—Erection of a superintendent engineer's house at the Bratch waterworks, for the urban district council.—Mr. John Wassell, clerk to the council.

CHAPEL-EN-LE-FRITH.—August 10th.—Construction of a concrete service reservoir, and the providing and laying of about 1½ miles of cast-iron mains for the water supply of the township of Bamford, for the rural district council.—Mr. J. Burton Boycott, clerk to the council.

NEW MILLS.—August 10th.—Supply and delivery of 1,280 yards of 3-in. turned and bored cast-iron mains and 600 yards of 2-in. turned and bored mains, for the urban district council.—Mr. Joseph Pollitt, clerk to the council.

GLAMORGANSHIRE.—August 10th.—Improvement of the main road at Llanbrich, for the county council.—Mr. T. Mansel Franklin, county clerk, County Hall, Cardiff.

WREXHAM.—August 10th.—Erection of a bridge over the river Gwenfro, at a place called Stryp y badden, in the township of Broughton, for the urban district council.—Mr. John Strachan, surveyor to the council, Crispin Lodge, Wrexham.

THORNHILL (Yorks).—August 13th.—Supply of flushing valves, manhole and lampole covers, &c., for the urban district council.—Mr. S. W. Parker, surveyor to the council.

HESLET.—August 13th.—Laying and jointing of about 6,150 yards of 3-in. cast-iron pipes, also fixing and walling-in of about twenty valves and hydrants for the Templenewasm and Thorpe Stapleton water supply, for the rural district council.—Mr. W. B. Pinder, clerk to the council.

DEWSBURY.—August 13th.—Excavators' work required in the construction of a tank at the gasworks, Savile Town.—Mr. H. Pearlen, A.M.I.C.E., borough surveyor.

SHEFFIELD.—August 15th.—Extension of car sheds, consisting of two-span steel roof, car pits, stores, boundary wall, latrines, fence, &c., at Tinsley.—Mr. Charles F. Wike, city surveyor.

HASTINGS.—August 15th.—Supply of 120,000 9-in. by 3-in. by 1-in. jettor road paving blocks.—Mr. P. H. Palmer, M.I.C.E., borough engineer.

GLoucester.—August 15th.—Erection of an infectious diseases hospital at Over.—Mr. Geo. Sheffield Blackway, town clerk.

SHROEDITION.—August 15th.—Erection of a new battery room, boiler house and extension of offices at the electricity supply station, the Market street.—Mr. H. Mansfield Robinson, vestry clerk.

BAXHILL.—August 15th.—Erection of boundary walls, the railing, kerling, paving and channelling of footpaths, and other works opposite the town hall, for the urban district council.—Mr. George Bell, A.M.I.C.E., surveyor to the council.

ROMSEY.—August 16th.—Erection of a concrete retaining wall in the Abbey.—The Borough Surveyor.

PERMAROCK.—August 16th.—Erection of buildings and foundations in connection with the township electric light works, for the commissioners.—Mr. Robert Hammond, 64 Victoria-street, London, S.W.

WOLVERHAMPTON.—August 16th.—Supply of cast-iron, wrought-iron and steel work required for structural and other purposes at the swimming bath and assembly hall to be erected in Bush-piece.—Mr. J. W. Bradley, borough surveyor.

ILKESTON.—August 18th.—Construction of a new filter-bed at the Little Inham works.—Mr. H. J. Kilford, borough surveyor.

HAMPTON.—August 20th.—Supply and delivery of a 10-ton steam roller, for the urban district council.—Mr. John Kemp, A.M.I.C.E., surveyor to the council.

OXFORD.—August 22nd.—Supply and laying of cast-iron and stone-work pipe carriers, brick and concrete work in manholes and distributing chambers, land drainage, embanking, road making and other works on land adjoining the corporation sewage farm.—Mr. R. Bacon, town clerk.

TEDDINGTON.—August 22nd.—Making-up of Clarence-road, for the urban district council.—Mr. M. Hain-worth, surveyor to the council.

CARSHALTON.—August 23rd.—Widening of High-street, for the urban district council.—Mr. W. W. Gale, A.M.I.C.E., surveyor to the council.

STEVENSAGE.—August 23rd.—Supply of 500 tons of 1½-in. broken Guernsey, Leicester or other granite, for the urban district council.—Mr. William Oswald Times, clerk to the council.

CHESTER.—August 23rd.—Supply of 200 tons of broken 1-in. Guernsey or Guernsey granite and 620 yards of hand-picked flints, for the urban district council.—Mr. W. W. Gale, A.M.I.C.E., surveyor to the council.

LIPDON.—August 23rd.—Construction of an underground latrine in The Broadway, for the urban district council.—Mr. Herbert Shaw, A.M.I.C.E., surveyor to the council.

ROTHESHAM.—August 23rd.—Construction of sewers, outfall works, and other works connected therewith, for the corporation.—Mr. R. E. W. Berrington, Bank Buildings, Wolverhampton.

HOYLAK and WEST KERBY.—Supply of about 2,500 lineal yards of standards and railing for promenades, for the urban district council.—Mr. Thomas Foster, engineer to the council.

ADAMS' PATENT SEWAGE LIFT CO. ENGINEERS, YORK
And Old Queen St., Westminster, London.

ABSOLUTELY AUTOMATIC SEWAGE LIFTING

(i.e., NO ENGINE is required and no attention),

The **FIRST COST** of Installation being the **ONLY** Cost.

AS USED AT

Grimshy, Glasgow, Ebchester, Hoylake, Johnstone, &c., &c., and many other towns in England, on the Continent, and the United States.

WRITE FOR TESTIMONIALS.

PATENT TRUINVERT PIPE.

AA—Holes for pouring in cement or composition.
BB—Strengthened and Lengthened Socket.

CC—Inner Socket and Rest.
EE—Chamber for cement or composition.
FF—Standard Joint in new position.

To put it shortly, this pipe secures true alignment of invert, increased strength in the socket, three gas and water-tight connections at every joint, and, while allowing for a slight settlement when first laid, forms an absolutely rigid joint directly the cement sets

POINTS:

- 1.—Gas and Water-Tight Joints easily made under water.
- 2.—True Alignment of Invert.
- 3.—Socket the strongest part of the pipe.
- 4.—No special junctions required.

OATES & GREEN, Ltd., Halifax.

TENDERS.

***ACCEPTED.**

BERMONDSEY.—For the supply of 40,000 bricks.—Mr. Frank Sumner, vestry surveyor.

At per 1,000, delivered alongside vestry's wharf, East-lane.—West Brothers, £2; Sneed, Dean & Co., £2 (2½ per cent. off); C. Burley, £1 19s.

At per 1,000, delivered in trucks at Mint-atreet station.—Tucker & Son, £2 15s., £2 10s., £2; Weldon & Corby Brick Company,* £1 17s.

At per 1,000, delivered at the vestry's depot, Spa-road.—Wakeley Brothers, £2 5s.

LEICESTER.—For the erection and completion of a new isolation hospital for the borough, consisting of administrative block, five fever pavilions, two isolation blocks, discharging blocks, laundry, mortuary, porter's lodge, &c.—Mr. James Bell, town clerk:—

E. Fox, Leicester	457,629
H. Herbert & Sons, Leicester	54,851
Hardington & Elliott, Leicester	52,753
T. Herbert, Leicester	51,338
W. M. Sharp, Leicester	50,645
Clark & Garrett, Leicester	50,006
Merredieu & Wort, Stevenage, Herts.	49,350
J. E. Johnson & Son, Leicester*	48,381

DARTFORD.—For the making-up, &c., of Priory-lane, for the urban district council.—Mr. W. Harston, surveyor to the council:—

Mowlem & Co., London	£210
T. Adams, Wood Green N.	196
Kent Road Company, Gravesend*	185

SOUTHAMPTON.—For the erection of a cart-shed at the wharf at Chapel.—Mr. W. B. G. Bennett, borough engineer:—

G. Webb & Co., Southampton	4587
H. W. Bull, Southampton	587
Jenkins & Sons, Southampton	574
S. Nichols, Southampton	483
J. Nichol, Southampton	462
F. Osman, Southampton*	444

NOTICES.

THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER may be ordered direct, through any of Messrs. Smith & Son's book-stalls, or of any newsgazet in the United Kingdom. Applications to the Offices for single copies by post must in all cases be accompanied by stamps.

The Prepaid Subscription (including postage) is as follows:

	Twelve Months.	Six Months.	Three Months.
United Kingdom	16s.	7s. 6d.	3s. 9d.
Continent, the Colonies, India, United States, &c.	19s.	9s. 6d.	4s. 9d.

The International News Company, 83 and 85 Duane-street, New York City; The Toronto News Company, Toronto; and The Montreal News Company, Montreal, have been appointed agents in the United States and Canada for the sale of THE SURVEYOR. A thin paper edition is printed for circulation abroad.

APPOINTMENTS OPEN.

CITY OF HULL.

The Corporation require a Civil Engineering Assistant in the City Engineer's office, at £85 per annum.

It is essential that candidates should be quick and neat draughtsmen.

Applications, stating age, experience and qualifications, are to be delivered to the undersigned on or before Tuesday, the 23rd August.

Testimonials need not be sent in the first instance.

(By order)

A. E. WHITE,
City Engineer.

Town Hall, Hull.

July 30, 1898.

DISTRICT OF SOUTH HORNSEY.

SURVEYOR AND INSPECTOR OF NUISANCES.

The District Council invite applications for the appointment of a Surveyor and Inspector of Nuisances.

The district comprises an area of 230 acres, a population of 17,200 and about 2,430 houses, and is fully developed.

The duties will be these ordinarily required from a surveyor and inspector of nuisances to an urban sanitary authority.

All applicants must satisfy the Council that they are ac-

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

- Easily and quickly laid by unskilled workmen.
- Perfect alignment of invert secured.
- Joint readily made absolutely watertight.
- Cheapest Patent Joint in the market.

Prices and further particulars on application to J. PLACE & SONS, Ltd., Darwen.

ARTHUR KOPPEL, 96 Leadenhall St., LONDON, E.C.

qualified with the duties of those offices, and must hold the certificate of the Sanitary Institute.

The salary will be as Surveyor £175, per annum, with residence; and as Inspector of Nuisances, £75 per annum, making together £250 a year.

Applications, endorsed "Surveyorship," stating age and qualifications, with particulars of previous experience, and enclosing copies of not more than three recent testimonials, must be received here not later than 5 o'clock p.m. on the 17th of August next.

Personal canvassing will be deemed a disqualification.

EDWARD B. BENNETT,
Clerk to the District Council.

Offices, Milton-road, South Hornsey, London, N.
July 28, 1898.

COUNTY BOROUGH OF NEWPORT. ASSISTANT BOROUGH ENGINEER.

The Corporation require the services of an experienced Assistant Borough Engineer and Surveyor (not more than thirty-five years of age), at a salary commencing at £150 and rising by yearly advances of £10 to £250. List of duties may be obtained from the Borough Engineer, Newport.

Applications, stating age, qualifications and experience, accompanied by not more than three recent testimonials, must be sent to my office, endorsed "Assistant Borough Engineer," not later than 10 a.m. on the 11th August next.

Canvassing strictly prohibited.

ALBERT A. NEWMAN,
Town Clerk.

Town Hall, Newport.
July 30, 1898.

CITY OF COVENTRY. INSPECTOR OF SEWERS.

The Corporation of Coventry are prepared to receive applications from qualified persons for the position of Inspector of Sewers.

The person appointed will require to have had experience in the construction of brick and pipe sewers and the maintenance of the same, and will be required to take charge of the staff engaged in the general supervision and maintenance of the sewerage system.

The candidate appointed will act under the immediate direction of the City Engineer, his hours will be the same as those of the working staff, and he will be required to keep all the books necessary.

Wages will be at the rate of £2 per week.

Applications, in candidate's own handwriting, stating age (which must be between thirty and forty-five years), experience, past and present employment, accompanied by copies of not more than three recent testimonials and endorsed "Inspector of Sewers," to be sent to the undersigned on or before Thursday, the 18th August.

Canvassing, directly or indirectly, will be considered a disqualification.

J. E. SWINDLEHURST,
City Engineer and Surveyor.

St. Mary's Hall, Coventry.
July 29, 1898.

CITY OF CANTERBURY. GENERAL FOREMAN OF WORKS.

Required, by the Corporation of the City of Canterbury, a thoroughly experienced and qualified Foreman of Works and Workmen, to work under the immediate direction of the City Surveyor. He must be accustomed to the handling of large staffs of men, and well up in road and street pavement works; also in sewer and drain construction. Hours, 6 a.m. to 6 p.m. and 1½ hours off. Wages, 32s. per week.

Applications, in candidate's own handwriting, stating age, and giving full details of experience, present and past situations, and enclosing copies of three testimonials of recent date, to be addressed to the undersigned not later than Monday, 15th August next.

Canvassing members of Council will disqualify.

A. H. CAMPBELL,
City Surveyor.

Canterbury.

THE LONDON COUNTY COUNCIL invite applications for employment as Quantity Taker in the Building Branch of the Works Department.

Candidates must have had considerable experience in the taking off of quantities and ordering materials for large jobs. Salary, £3 10s. per week.

The person appointed will be required to give his whole time and energies to the service of the Council.

Applications must be on forms to be obtained by sending a stamped addressed foolscap envelope to the London County Council Works Department, Belvedere-road, Lambeth, S.E.

The latest time for receiving applications is 10 o'clock a.m. on Saturday, 13th August.

C. J. STEWART,
Clerk of the Council.

July 28, 1898.

JANDUS PATENT ELECTRIC ARC LAMP.

Gold Medal, Hull Exhibition, 1898.

It is claimed that the Master Patents held by the Jandus Arc Lamp and Electric Company, control the arrangements which are essential in every successful enclosed arc lamp.

The Only Lamp that is trimmed without moving the Globe. Cannot get Out of Order, as it has Only One Working Part. No other Carbons should be used in the Jandus Lamp except those supplied by the Firm, for which the Lamps sent out are adjusted.

Jandus Enclosed Arc Lamp.

Burns 150 to 200 Hours without re-trimming.

No hissing. No danger from falling particles of Carbon. No skilled labor required. A steady light. A great saving in cost of Carbons. Gives the same useful light as the open arc lamp for the same expenditure of power.

No flimsy racks, clockwork, or flexible cords are used in this lamp. Burns singly on circuits of 90 to 200 volts, 2 in series on all voltages from 200 to 250, and 3 or more in series if fitted with automatic cutout.

THE ENCLOSED ARC LAMP. THE ENCLOSED ARC LAMP. THE ENCLOSED ARC LAMP.

The phenomenal success of the Jandus Lamp, which was the Pioneer in enclosed Arc Lamps, has brought a host of imitations. Users should not be put off with the cheaper lamps.

Sole Agents for the English Company:—MESSRS.

DRAKE & GORHAM,

Head Offices: 66 VICTORIA STREET, WESTMINSTER, LONDON, S.W.

Branch Offices at MANCHESTER and GLASGOW.

THE LONDON COUNTY COUNCIL is prepared to receive applications for employment as an Assistant in the Engineering Branch of the Works Department, at a commencing salary of £300 per annum (no pension attached).

Candidates must have had considerable experience in the actual carrying out of engineering works and in the management of men.

The person appointed will require to give his whole time and energies to the service of the Council.

Applications must be on forms to be obtained by sending a stamped addressed foolscap envelope to the London County Council Works Department, Belvedere-road, Lambeth, S.E.

The latest time for receiving applications is 11 o'clock a.m. on Saturday, the 13th August.

C. J. STEWART,
Clerk to the Council.

July 28, 1898.

THE LONDON COUNTY COUNCIL is prepared to receive applications for employment as Assistant in the Building Branch of the Works Department, at a salary of £300 per annum (no pension attached).

Candidates must have had experience in the actual carrying out of large building operations, and have a thorough knowledge of the different trades and materials.

The person appointed will be required to give his whole time and energies to the service of the Council.

Applications must be on forms to be obtained by sending a stamped addressed foolscap envelope to the London County Council Works Department, Belvedere-road, Lambeth, S.E.

The latest time for receiving applications is 10 o'clock a.m. on Saturday, the 13th August.

C. J. STEWART,
Clerk to the Council.

July 28, 1898.

BECKENHAM URBAN DISTRICT COUNCIL.
ARCHITECTURAL ASSISTANT.

Required, temporarily, in the Surveyor's office, Beckenham, an experienced Architectural Draughtsman. One having experience of swimming baths and technical institutes preferred. Salary, £3 3s. per week.

Applications, stating age and experience, accompanied by not more than three testimonials, to be sent to Mr. J. A. Angell, Surveyor, Council Offices, Beckenham, Kent, by Friday, August 19th.

TENDERS WANTED.

NEWTON-IN-MAKERFIELD URBAN DISTRICT COUNCIL.

TENDERS FOR STREET-MAKING.

The above Council invite tenders for the Materials and Labour required in Excavating and Making the following Private Streets within their district—viz., Portland, Alpine, Peel, Nelson, Water and Brookfield-streets and Bradleigh-road—according to plans, sections and specifications prepared by the Council's surveyor.

Tenderers are requested to forward alternative tenders for each street—i.e. (a) for paving the roadway with setts and (b) for macadamising the roadway.

Quantities for the work and any further particulars required may be obtained on application to the Surveyor, at his office, Town Hall, Earlestown, between the hours of 9 a.m. and 5.30 p.m.

Tenders, endorsed "Streets," addressed to the Chairman of the Highways Committee, to be delivered at his office not later than 10 a.m. on Saturday, the 6th of August, 1898.

The Council do not bind themselves to accept the lowest or any tender.

W. W. SHIRLEY,
Clerk to the Council.

Town Hall, Earlestown, Newton-le-Willows.
July 21, 1898.

THE URBAN DISTRICT COUNCIL OF HOYLAKE AND WEST KIRBY are prepared to receive designs and tenders for about 2,500 lineal yards of Standards and Railing for Promenades.

Particulars may be had upon application to the undersigned.

THOMAS FOSTER,
Engineer.

Public Offices, Hoylake, Cheshire.

Minutes of Proceedings.

Extraordinary Traffic. It is curious how sometimes language, apparently the most precise and simple, will reveal latent ambiguities and difficulties in its application to actual facts. Acts of Parliament, unfortunately, are not always marked either by simplicity or precision of language, but at first sight one would say that the meaning of sec. 23 of the Highways and Locomotives (Amendment) Act, 1878, is so clear that he who runs may read. And yet (to mention one only of the points on which questions productive of litigation have arisen under this section), when a local authority have to proceed to recover expenses of extraordinary traffic, it is in many cases by no means an easy matter to determine who is the person "by whose order such weight or traffic has been conducted." This question cropped up in the early days of the Act, and in several cases it was held that either the employer or his contractor could be proceeded against, whilst in one instance the owner of traction engines who let them to move manure for a farmer was held to be liable. On the other hand there are cases reported in which, original contractors having employed sub-contractors, it was held that the latter alone were liable, being under no obligation to do the carting in any particular manner. Yet, again, in another instance a contractor who sub-contracted with three owners of traction engines was held to be the person "by whose order" the traffic had been conducted. In a recent case, which went to the House of Lords, the traffic consisted of the carriage by means of traction engines of materials for additions to a mansion house. No contractor was employed, the owner of the house himself ordering the materials at a price inclusive of delivery, but without giving any special directions either as to the mode of delivery or the route to be taken. The Divisional Court of Queen's Bench held that the owner was liable; but this decision was reversed in the Court of Appeal, Lord Justice Lopes, however, dissenting. (*Lord Gerard v. Kent County Council*, noted at p. 216 of vol. xi. of THE SURVEYOR). The decision was arrived at upon consideration of the fact that the dealer who supplied the goods was not a mere servant, and that the mode in which he was to carry out his contract was left entirely to his own discretion. The dissenting judge, on the other hand, wished to read "by whose order" as meaning "in consequence of whose order," and pointed out the difficulties that might arise in the case of a person employing a number of different tradesmen whose aggregate traffic might cause damage, though it would be impossible to bring home that damage to either of them individually.

This decision of the Court of Appeal was confirmed by the House of Lords. Lord Herschell's judgment is very instructive. He disposes of Lord Justice Lopes' suggested reading by "the simple answer . . . that is not what the statute has

said"; and with regard to the imagined difficulties in the case of a person employing a number of tradesmen, he shows that the adoption of that reading would lead to equal difficulties in the converse case. "You might have a man in business conducting a large traffic . . . and the several persons for whom he was building houses . . . having only ordered an amount of goods, the carriage of which would not lead to extraordinary traffic, they would be under no liability." In a still more recent case, contractors for the building of a lunatic asylum employed a sub-contractor to haul materials. The sub-contractor agreed to supply carts and horses as and when required, to provide workmen, to unload the materials from railway trucks, and to haul them to such place on the works as should be pointed out by the contractor, receiving from the latter such assistance as should be necessary, and only to use such roads as should be pointed out to him. Moreover, the sub-contractor was to employ no cart or traction engine which the contractor should certify to be improper for the service. It was held by the Court of Appeal that the contractor was not liable (*Pethick v. County Council of Dorset*, noted in this issue). In this case the Court expressly followed *Lord Gerard v. Kent County Council*. It will be seen, however, that Pethick's case goes considerably further in the direction of the immunity of the person who is in reality the prime mover, or *causa causans*, of the traffic. In the course of the judgment already referred to Lord Herschell said, "If the person sought to be charged has had nothing to do with the conduct of the traffic, or the mode in which it is to be conducted, and has had no power to give orders in relation to it, then I think it is impossible to say that it was by his order that the traffic was conducted." Now, in Pethick's case the contractor undoubtedly had "power to give orders in relation to the traffic," under the terms of his contract with the sub-contractor. This, indeed, seems to have been fully recognised by the Court, but nevertheless it was held that, not having in fact exercised that power, the contractor was not liable. Altogether it cannot be said that any very definite rule can be deduced from the decided cases. In each instance the decision turned upon the facts, and in no two instances were the facts precisely identical. Speaking generally, however, and without attempting to draw any hard and fast line, we think it may be inferred that where the person who actually conducts the traffic is not a mere servant, and has no special directions, but is left to his own discretion as to how he will carry out his contract, he alone is the responsible person and not the party who employs him, and this notwithstanding that the latter may have reserved to himself full powers of supervision and discretion, provided he has not in fact exercised that right. It may be observed in passing that, whoever is liable, the liability ceases on his death,

proceedings under this section being in the nature of a personal tort and incapable of being taken against his executor.

The question of what is "extraordinary traffic" within the meaning of the section mentioned above has been equally fruitful in litigation. Traffic arising out of a recognised industry in a district has been held not to be "extraordinary traffic," though greater than the other traffic and not continuous. Yet a case is reported in which the cartage of stone along a road not adapted for heavy traffic was held to be "extraordinary traffic," although stone quarrying was a recognised business in the neighbourhood. In one of the earlier reported cases the carting of building materials along a road generally used for agricultural traffic was held not to be extraordinary traffic. This decision, however, was disapproved in a subsequent case which went to the Court of Appeal (*Hill v. Thomas*, L.R. [1893] 2 Q.B., 233), and in which Lord Justice Bowen gave the following definition, or rather explanation, of the meaning of the term "extraordinary traffic":—

Extraordinary traffic is really a carriage of articles over the road, at either one or more times, which is so exceptional in the quality or quantity of articles carried, or in the mode or time of user of the road, as substantially to alter and increase the burden imposed by ordinary traffic on the road, and to cause damage and expense thereby beyond what is common.

This may be regarded as the authoritative judicial declaration on the question, and, though difficulties may arise in its application to exceptional sets of circumstances, it affords valuable guidance in ordinary cases. As a rule it is easier to determine whether traffic is extraordinary than it is to decide against whom proceedings should be taken to recover expenses in respect thereof. The answer to the latter question may, as we have seen, depend to a great extent upon the terms of certain contracts, the contents of which are unknown to the local authority.

* * *

The Telephone Inquiry.

Some additional comments may be made on the evidence at this inquiry in continuation of the remarks given in our last issue. The most direct evidence given was that of Mr. A. R. Bennett, whom we may describe as the "corporation expert," and who was probably the chief technical witness brought against the existing *régime*. While the evidence given by this witness was chiefly of a technical nature, his conclusions are that a municipality would be able to provide a much cheaper service than is being furnished at the present time by the National Telephone Company. The estimate he made for the Glasgow Corporation was for £5 5s. per subscriber, which he reckoned would enable the corporation to get a return for its capital outlay, and he thought that careful management of the local authorities throughout the country might even improve upon that amount. A local authority had no expensive board of directors to pay, and it was free from many other charges which a company would have to meet. This witness disagreed entirely with the views of the Post Office officials on the subject of competition, and he declared that it would be in the best interests of the public to permit competition in any given areas, but he would not commit himself to the opinion that local authorities would be the best competitors. He maintained, however, that local management was a very essential feature in telephones, and whether that local management came from a municipality or a local company did not, in his opinion, affect the matter much; what was wanted was a knowledge of the local requirements.*

It was not until the inquiry had been in progress for some time that the views of prominent members of municipalities and local governing authorities were put forward, and perhaps the most important evidence adduced on the question of municipal control was that contributed by Mr. Benn on

behalf of the London County Council. From this it appears that the County Council have ascertained whether the telephone users of London were satisfied with the existing service, and in 1895, out of 2,500 subscribers communicated with, 1,305 were generally dissatisfied. They had just lately been sending round to ascertain what was the present position of those persons who were then complaining, and so far they had succeeded in dealing with 561 cases. They found that there were eight persons now satisfied with the service, fifty-three had changed their address, thirty-six had discontinued through dissatisfaction, and 235 were still dissatisfied for various reasons. The general summary of complaints was as follows: General inefficiency, 65; delay in getting connection, 213; indistinctness, 189; ringing-off before conversation was finished, 196; and failure to get connection on account of being engaged, 217. This is undoubtedly a black list, but it is nevertheless satisfactory to notice that Mr. Benn has somewhat moderated his opinion on the subject of a municipally-worked telephone scheme by saying that if the Post Office will enter into the matter on the basis of honest and thorough competition there will be no necessity for the London County Council to take up this work. Failing that, he considers the County Council would do very much better for London than the National Telephone Company, and he based his contention on the fact that they had greater advantages with regard to way-leaves, fire stations and other places being open to them which would not be available to the National Telephone Company, and therefore they could manage a system altogether more efficiently and cheaply. Coming to actual figures, he calculated that they would be able to reduce the present telephone charges down to £10 per subscriber during the first five years, and reduce it to £9 afterwards. It seemed to be established, however, that special legislation would be necessary, apart from the question of granting a telephone license to the County Council, for, as things stood at present, it would be within the rights of any vestry to refuse to grant the County Council powers to take up its streets; and, therefore, it would be necessary to go to Parliament for powers having special reference to this phase of the subject. It will be remembered that we have endeavoured to demonstrate that the telephone service is one which must necessarily serve only a limited section of the community. Mr. Benn, however, does not agree with this view, for he considers that a telephone service cannot be described as meeting the needs of a small class, because it must be evident that if the telephone is a necessary adjunct to commercial and business firms then the advantages which result in increased business must extend to the carmen and warehousemen. It would seem, however, that whatever benefits employees of a firm might get from the telephone being used by their employers, they might have to pay a direct tax for the purpose of providing a cheaper telephone system, from which they obtain no direct benefit. The figures advanced by the London County Council through its engineer are scarcely as reliable as one would have expected, and certainly differ very materially from ascertained figures of actual working.

The best evidence, however, from the municipal point of view, was that contributed by various members of the Glasgow municipality, and Dr. Colquhoun, a member of the Glasgow Town Council, considered that it was both desirable and, in fact, necessary that the corporation should take the telephone service up. In his opinion the telephone in Glasgow had not been developed, and had been confined merely to the large businesses and manufacturers. They had received between 4,000 and 5,000 applications from prospective users, and these were from all classes of the community. He voiced the opinion of the town council when he said that the municipality would be able to give a much more efficient service both to the corporation itself and to the general public. These opinions were corroborated

by Mr. Colville, Mr. Nichol, Mr. Chisholm and other members of the town council. There was a point of considerable importance raised in the examination of the Scottish witnesses with reference to the profits made out of operating a system. It was their opinion that the scheme should not be carried on for the purpose of relieving the general taxation, but that the system should be carried on for the public good, and that any profits made should go in reducing telephone charges. We have already dealt with this peculiar Scottish view of things, and we need hardly re-iterate what seems to be self-evident. If the ratepayers are responsible for the initial capital expended some return should be made to them, and a direct return cannot be made to all unless it be by reducing taxation, because the users of the telephone will be small compared with the total number of ratepayers. In the present issue we report the concluding proceedings of the inquiry and summarise the main findings of the committee. We shall take an early opportunity of commenting upon these. In the meantime we need only say that not only will they be received with more than usual interest by local authorities, but that they will probably tend to force the Government to declare whether the State should undertake the telephone system or whether powers should be granted to local authorities.

The Cork Meeting.

The Cork meeting of municipal engineers was a great success, and in some respects it was even remarkably successful. It is true that a larger attendance might have been expected, but the limited number of members who put in an appearance can no doubt be accounted for in various ways. The distance was too great for many English members to travel, especially as they had gone in considerable strength to Edinburgh a month before to attend the annual meeting. It might have been thought, however, that the meeting would have attracted more than actually put in an appearance, especially as the programme was obviously of unusual interest. According to the last published list of members the Irish contingent number thirty-six, and this being the case the comparatively small number who attended was rather disappointing, though, perhaps, the unpromising outlook at the last moment as to the weather may have deterred some from carrying out their intention of being present. However that may be, we believe we are correct in asserting that the number of members who attended fell considerably short of the number who had written accepting. This, unfortunately, is by no means an uncommon experience for district secretaries, but it is certainly one to be avoided if possible. It can only be avoided by the exercise of a little consideration on the part of the members themselves. It is scarcely fair to those organising a meeting to send an acceptance unless one is tolerably sure of being able to attend, but if an acceptance be sent every effort should be made to be present. The council of the association are sometimes adversely criticised on the score of shortcomings, but the members should not forget that they themselves have duties. The loss, however, was to those who were absent, for, apart from rather bad weather on Friday, the meeting was equally pleasurable and profitable. The Irish reputation for hospitality was more than maintained, and in this respect the genial mayor, Mr. P. H. Meade, whose portrait we give in another column, led the way in a fashion that was beyond praise. Members of the town council and others evinced the liveliest interest in the proceedings, and a genuine appreciation of the work of municipal engineers which was equally gratifying to the visitors and creditable to themselves. As for the proceedings, the interest which the papers of Mr. Cutler, Mr. Griffin and Mr. Dorman excited can easily be gauged from the discussions, of which we give a full report. Special attention was attracted by Mr. Cutler's ability in

dealing with the defective construction of the municipal buildings and with the waste of water, and due credit should be given to Mr. Griffin for the obliging and energetic manner in which he came to the aid of the meeting by contributing a paper at very short notice. The visits, like the papers, were instructive and interesting, and will receive due attention in our next issue. All who took part in the function, whether or not they were connected with the association or the town council, seemed animated by feelings which might almost be described as enthusiastic, and neither on Friday nor Saturday was there a single jarring note.

A Carnarvon Rural District.

Complaints of outbreaks of infectious disease and of general sanitary shortcomings in the area administered by the Bettws-y-Coed Rural District Council led, in the natural course of things, to an inquiry by a medical inspector of the Local Government Board. From Dr. Wheaton's report, which has now been issued, we learn that the district is mostly mountainous and uncultivated, that the people are resident in villages, and that the chief sanitary defect is probably in connection with the water supply, though it is far from being the only defect. In very few of the villages is the supply at all satisfactory, either as to quality or to quantity. As a rule it is taken from the rivers and streams, which are often subject to very gross forms of pollution, and there is no attempt at storage or filtration. This state of affairs is the more surprising when we find Dr. Wheaton pointing out that the district abounds in lakes, the water of which is in nearly all cases free from risk of pollution, and which are situated at a high level, thus forming natural reservoirs from which the district could be supplied by gravitation without difficulty. He adds that the quickly-flowing nature of the streams can hardly allow of any purification of them by subsidence, and that filth entering above the intakes must be very quickly conveyed to the latter, with serious risk to the health of the consumers. We have recently had occasion to speak at some length of the pressing necessity for some legal machinery which would compel local authorities to fulfil their obligations to provide adequate water supplies in rural districts. One Local Government Board report after another confirms the pressing nature of the problem. In regard also to sewerage and to excrement and refuse disposal, an unsatisfactory condition of things exists in these Carnarvonshire villages. Dr. Wheaton leaves no doubt as to where the responsibility lies. The medical officer has from time to time drawn the attention of the council to the urgent sanitary needs of the district, but—"hitherto his recommendations have not been carried out." The inspector of nuisances seems to carry out his work intelligently and conscientiously, especially in reporting nuisances, but—"he receives no encouragement from the council." We may remark, in passing, that inspector of nuisances, inspector of sewers and supervisor of waterworks is a somewhat singular combination of offices, and should command something more than £60 a year, especially when the holder devotes the whole of his time to his duties. There is no accommodation for the reception of cases of infectious disease. "It is evident," remarks the inspector, "that the action taken by the district council for the sanitary improvement of their district has been almost nil." The county council have granted their application for the conversion of the parish into an urban district. Possibly this administrative promotion may act as a stimulus to the members, but their record as a rural district inspires no great hopes for the future.

Seaford.—At a special meeting of the district council on the 2nd inst. a resolution was adopted recommending that the necessary steps be taken to purchase the undertaking of the water company.

Association of Municipal and County Engineers.

IRISH DISTRICT MEETING AT CORK.—I.

CORK: ST. PATRICK'S QUAY FROM ST. PATRICK'S BRIDGE.

The "beautiful city of Cork"—to use Spenser's phrase—was the scene of an Irish district meeting on Friday and Saturday, the fourth meeting of the kind, as the president remarked, that had ever been held in Ireland, the last having been that at Londonderry, in August, 1895. The third town in importance and commercial prosperity in Ireland, Cork is looked upon as the capital of the South. Even to those who

The diversity finds very concentrated expression in the steeple of Shandon church, two sides of which are built of limestone and the other two of red sandstone.

The origin of the city is traced back to the foundation of the cathedral by St. Fin Barre, the patron saint of Cork, early in the seventh century. A more effective settlement was made by the Danes in the beginning of the eleventh century, from which point the real foundation of the place may be said to date. Little or nothing, however, is on record until Anglo-Norman days. The city had a somewhat eventful record during Stuart and Jacobite times, and until last century was surrounded with a wall. When the troublous periods mentioned had passed away the walls were destroyed and the inhabitants settled down to the development of trade, with the results that we have already indicated.

The north and south branches of the river are lined with fine quays of cut limestone. The city is rich in churches, both Roman Catholic and Anglican. The foundation-stone of the new cathedral was laid in 1865. The other Protestant churches, as a rule, are not very imposing externally, but some of the Roman Catholic places of worship are magnificent structures, ranking among the finest modern ecclesiastical edifices in Ireland. A brief reference may here be made to the most prominent public buildings. The Court House is an elegant Grecian structure, with a Corinthian portico, about 30 ft. in height. The Corn Exchange and some of the principal banks are handsome buildings of cut limestone. On a portion of the Corn Exchange site the Municipal Buildings, containing the mayor's office, council chamber and the offices

THE RIGHT WORSHIPFUL P. H. MEADE,
Mayor of Cork.

have never visited Ireland the name of the river on which the city stands should be familiar from the famous lyric in which Father Prout immortalised

The bells of Shandon,
That sound so grandly on
The pleasant waters
Of the river Lee.

In the city itself, to say nothing of the surrounding country, the visitor finds in Cork certain elements of the picturesque. The streets are tolerably spacious, but somewhat irregular in their formation. This is attributed to the fact that the town was originally built on the banks of the streams which separated islands that are now united as one. These channels were gradually arched over, some as recently as the beginning of the present century, and roadways formed over them. The resulting state of affairs is that the river now divides into two parts just above Cork, and after passing it reunites and swells out into the harbour of Queenstown. The town, of course, has long extended beyond the limits of the islands, and the two branches of the river practically divide the city into three parts, the intercommunication between these being carried on by means of eight bridges, the chief of which are St. Patrick's and Parnell bridges. The want of regularity in the streets extends to the buildings, though in the case of the latter it might be better to speak of want of uniformity, both in style and in colour. In one part of the town the building stone is reddish-brown in colour, in another it is of a cold grey tint. Other structures, again, are of brick, sometimes whitewashed and sometimes colored, and many of them are protected from the weather by slate of a very dark colour.

MR. A. MCCARTHY,
Town Clerk of Cork.

of the various departments, have been erected. This structure we need not further refer to, as it is dealt with in Mr. Cutler's paper. The Commercial Buildings and the Chamber of Commerce may also be mentioned as prominent structures. The Custom House is built at the junction of the two branches of the river.

CORK: MUNICIPAL BUILDINGS.

Among educational, charitable and other institutions mention may be made of the Queen's College, a fine structure in the Tudor-Gothic style, and of the Crawford Municipal Schools of Science and Art. The latter edifice was opened by the Prince and Princess of Wales during their visit to Ireland in 1885. The site of the old Custom House was granted by the Crown to the corporation for the erection of the building, which was the gift of Mr. William H. Crawford. The Cork District Lunatic Asylum occupies a fine position on the brow of a hill on the western suburb, and a fine view of the building was obtained by the members on Friday when travelling on the Cork and Muskerry Light Railway.

A few words may be said as to the trade of the city and its commercial activity. The merchants have the advantages of the double waterway on which to ship their goods for conveyance to all ports of the United Kingdom. Queenstown, again, acts as a convenient port of transhipment, and thus the exports of the city find their way to every part of the globe. Butter-making is the chief industry, not only in the county but in the province of Munster, but the exports embrace cattle, pigs, dairy produce and generally all kinds of provisions. Among the industries are the manufacture of tweed and other kinds of woollen goods, leather and agricultural implements, flax and hemp spinning, iron founding, brewing, distilling and chemical works.

We may appropriately conclude this brief preliminary sketch of the city by a few facts as to its municipal history and position. The corporation—which now consists of a mayor, sheriff, thirteen aldermen and forty-two councillors—is of very ancient date. At first the place was a borough by prescription. Its oldest charter was one granted by King John, when Earl of Morton, and acting as Viceroy of Ireland, during the reign of his father, Henry II. The principal charter, however, is that of James I. The population of the city is 97,281, its rateable value £234,507, and its area 46,080 acres. The corporation maintain the water supply, the markets, the Crawford School of Science and Art and the Public Library.

FRIDAY'S PROCEEDINGS.

As was expected, the attendance consisted for the most part of members located in Ireland. Owing to the distance it was scarcely likely that many members from England would be able to attend, especially as so many had travelled to Edinburgh a month before to attend the annual meeting. The proceedings began at 11.30 on Friday, when the members were cordially received in the Council Chamber, Municipal Buildings, by the Right Worshipful Mayor, Mr. P. H. Mende, who was accompanied by the town clerk, Mr. A. McCarthy. Among those present were the following:—

- PRESIDENT: O. Claude Robson, London.
- MEMBERS OF COUNCIL: R. H. Dorman, Armagh; J. Cook, Lancaster; and T. Cole, London, secretary.
- MEMBERS: G. R. Andrews, London; A. G. McBeath, Sale, England; C. Botterill, Fullham; M. Buckley, Drumcondra; H. A. Cutler, city engineer, Cork; M. J. Fleming, Waterford; J. Horan, county surveyor, Limerick; S. A. Kirkby, M.A., Cantab, county surveyor, Cork (South); R. W. Longfield,

county surveyor, Donegal; A. O. Lyons, county surveyor, Cork (east); J. Morgan, Portlaware; J. Smith, county surveyor, Galway; and H. Dawkin Williams, Bridgend, Wales.

VISITORS: C. H. W. Biggs, London; C. G. Doran, Queenstown Waterworks; Beverley Griffin, resident engineer to contractor for permanent way of Cork Electric Tramways; W. H. Hill, Cork; W. H. Hill, junr., engineer Cork and Muskerry Light Railway; M. J. McMullon, Cork; C. H. Mery, secretary and resident engineer to Cork Electric Tramways and Lighting Company; W. Paton, London; R. T. Perry, Blackrock and Passage Railway, Cork; and H. S. Ridings, Dulwich, London.

The MAYOR, in extending a hearty welcome to the visitors on behalf of the citizens of Cork, said he believed that was their first visit to the city in their organised representative capacity, but he only re-echoed the wishes of the people of Cork, without distinction, when he said that he hoped they might often have the pleasure of meeting them again. As a body, he need not say that they represented a class of professional gentlemen, the importance of whose work it would not be easy to over-estimate. In their hands he might say that the health and happiness of vast bodies of their citizens rested. Town councillors, he was quite aware, wore not the most angelic or lovable of beings at times. Perhaps they had an undue sense of their own importance, and that made them rather obstreperous at times, but the very worst of them would never think of questioning the opinion of their engineers, who used their high position with a most conscientious regard for the welfare of the people. He hoped to meet them again in Cork, and he was confident that in no part of the United Kingdom could they depend upon a more cordial welcome than in that ancient city of Cork.

His worship then vacated the chair, which was taken by The PRESIDENT, who, on behalf of the Incorporated Association of Municipal and County Engineers, thanked the mayor very heartily for the kind reception accorded on that occasion. Hitherto their meetings had been held in the sister kingdoms of England and Scotland. That was only the fourth meeting held in Ireland, the previous meetings having been held in Dublin, Belfast and Derry. Notwithstanding the few visits the Association had paid to that country, he was sure they would all be pleased to know that the Association numbered about 900 members, including nearly the whole of the Irish surveyors—a body of gentlemen of whom they were justly proud, and who did honour to the Association. He thanked his worship for giving them that opportunity of meeting their Irish brethren in somewhat greater numbers than they could do on the other side of the Irish Channel. He was sure the meeting would prove both interesting and instructive to the members, and that incidentally it would prove beneficial to those whom they served in various parts of the country.

Mr. R. H. DORMAN, the hon. secretary for the Irish district, then read the minutes of the last district meeting, which were duly adopted and signed. The meeting next proceeded to elect an hon. district secretary.

Mr. H. A. CUTLER (Cork) said he had great pleasure in proposing that Mr. R. H. Dorman, Armagh, be re-elected to

the position for the coming year. He was sure he had discharged his duties up to the present to the greatest satisfaction of everybody, and from what he had seen of Mr. Dorman's ability in organising that meeting he was certain they could not have a better district secretary.

Mr. S. A. KIRKEY (Cork) said he had the greatest pleasure in seconding the proposition. For many years Mr. Dorman had taken the greatest interest in the Association, and, in fact, with everything connected with the progress of the work they had at heart.

The motion, having been put to the meeting, was adopted unanimously, and

The PRESIDENT, addressing Mr. Dorman, said he had very great pleasure in stating that he had been re-elected hon. secretary for the Irish district for the succeeding year, and personally he was only too glad to find that Mr. Dorman was willing to take office again. He was sure the association was to be congratulated on having such a district secretary.

Mr. DORMAN thanked them for the honour they had done him in re-electing him to the office of hon. secretary for the Irish district. He was the oldest member of the association in Ireland, and would certainly do his best to forward its interests in future.

The next business on the agenda was the reading and discussion of papers, the following being the first one taken—

RESTORATION OF MUNICIPAL BUILDINGS AND DESCRIPTION OF CORK WATERWORKS.

By HENRY A. CUTLER, ASSOC. M. INST. C. E.,
City Engineer.

Mr. Henry A. Cutler began his professional career in 1877 with a firm of contractors, for whom he acted as agent on the Cinderford waterworks and the Chiswick sewage outfall works. From 1879 to 1882 he was attached to Mr. A. T. Walmisley, M. I. C. E., of Westminster, engineer to the Dover Harbour Board, and was subsequently employed for four years as assistant to Mr. W. H. Fox, borough engineer of Barrow-in-Furness. On leaving that town Mr. Cutler returned to the office of Mr. A. T. Walmisley, as chief assistant, with whom he remained for two years, at the time joining the staff of the late Mr. Joseph Gordon, M. I. C. E., then borough engineer of Leicester, and afterwards chief engineer to the London County Council. This appointment was vacated when Mr. Cutler was selected for the post of borough engineer of Rawtenstall, in which capacity he served for seven years. In 1896 the city engineership of Cork became vacant under circumstances which need not now be recalled, and the corporation decided to adopt the course—an unusual one, so far as municipal engineers are concerned—of selecting the new official as the result of a stringent competitive examination. Mr. Cutler came out of the ordeal in brilliant fashion at the head of the list, with no fewer than 76 per cent. of marks, and was immediately appointed to the vacant office. Those who attended the meeting last week had abundant opportunities of observing how well the policy of the corporation has been justified, and how readily they themselves appreciate the fact. Mr. Cutler was awarded a "Millar" prize by the Institution of Civil Engineers for a student paper on "The Stability of Voussoir Arches," and is one of the authors of *Cutler and Edges' "Curve Tables."*

For many years the Corporation of Cork had under consideration the erection of municipal buildings, as great inconvenience was experienced through having the various departments located in different parts of the city. In the year 1889 the town council decided to purchase the Corn Exchange, and by alterations and additions, which were completed in 1891, to make the building suitable for the requirements of the city. The old Corn Exchange, with a slight modification of the front elevation, occupies the central portion of the new building, the wings on the east and west sides being entirely new. The roof of the old building was removed, and an upper floor, carrying the council chamber and other offices, constructed on girders and columns over the ground floor, which is now used as a vestibule. Before the work was completed serious settlements occurred in both wings, and within a very short time after completion the openings had to be braced and various temporary measures adopted to prevent accidents occurring.

In 1896 the author was instructed to report to the town council on the then state of the buildings and on the work necessary for their restoration, together with an estimate of the cost. On surveying the buildings the concrete foundations of the wings were found to have insufficient spread and to be too thin for the weight they carried, as evidenced by the longitudinal cracks in the concrete under the walls; they

were also laid practically on the surface of the ground, without more than about 6 in. of excavation. The foundations of the old walls to which the new work was bonded were on a bed of gravel 17 ft. below the floor line, and the ground above the gravel consisted of about 10 ft. of slob, or blue mud, surmounted by about 6 ft. of filling.

The walls of the new wings, which were rough rubble plastered externally with cement, were found to have sunk about 6 in. in the middle of their length, the ends being suspended from the old walls to which they were bonded. Large and dangerous cracks were found in all the new work, some of the relieving arches had dropped out, and the floors and roofs had followed the sinking of the walls. Some of the old walls were cracked with the extra weight caused by the new walls being bonded in to them. The two central columns in the vestibule supporting the girders under the council chamber had sunk about 1 in. and were considerably overloaded, while the girders which they were supporting were strained to their elastic limit, and the joists of the council chamber floor were only about half the necessary strength.

After carefully considering the cost, the author reported to the council that it would not only be considerably cheaper to underpin the walls and raise the floors and roof than to pull down and rebuild, but that the work could be done without turning the officers out of the building. The estimated cost of underpinning and restoring the building to its original condition, including the erection of six cast-iron stanchions to support the defective girders over the vestibule and the forming of two new offices and two new strong-rooms, was £2,000, and the actual cost of the work has been little, if anything, over the estimate. In deciding to underpin the defective building the only doubt in the mind of the author was whether the pumping of the water with which the ground was charged would cause further settlements before the foundations could be put in, and it was only by the exercise of the greatest care that failure was avoided. Before the walls were underpinned all the openings were temporarily braced with timber, and the walls were further supported by half-timber raking shores properly footed and secured by oak keys inserted right through the walls.

The underpinning was done, in lengths of about 9 ft., with cement concrete mixed in the proportion of six to one, one 9-ft. pier being built under the centre of the length of each wall before any other holes were sunk. When a central pier was completed holes were sunk for piers on each side simultaneously, leaving a space of about 9 ft. between the piers, thus leaving alternate bays standing on the original foundation. Had it been found necessary, it was intended to afterwards excavate the bays between the alternate piers, thus making a continuous foundation; but the piers appear to be amply sufficient. In making the excavations the ground was first cleared to the underside of the original foundations, and two trenches cut at right angles to the walls about 6 ft. apart, deep enough to get steel needles under the concrete. The needles were 12-in. by 6-in. rolled joists 12 ft. long, supported at their ends by half timbers about 10 ft. long, laid in trenches cut parallel to the walls. When the half-timber sleepers and needles had been placed in position and wedged up, the ground was excavated on one side of the wall only for the length of the intended pier, about 3 ft. 6 in. wide, and 5 ft. below the underside of the old concrete. The ground under the walls was then excavated as far back only as the width of the footing. The excavation below the point described was cut to the exact dimensions of the intended pier, so that the concrete could be brought up without any casing, the extra width at the top being only necessary for the access of the men and for casting out the excavated earth. When the excavations had been carried to a depth within 2 ft. of the gravel the work was stopped until low water, as the ground was fairly dry down to that point, but if the work was carried any further without the precaution mentioned the bottom was found to burst up and cause a delay of two or three tides, besides involving extra pumping and endangering the building. Before the excavation was proceeded with sufficient materials were gauged and mixed dry to form a bed of concrete over the bottom of the hole about 3 ft. thick, and about an hour before low water the remaining 2 ft. was excavated, the concrete mixed with a small quantity of water and deposited before the tide had risen appreciably. The filling of the concrete was continued till the level of the underside of the needles was reached, then a pier was formed between the needles within about 1 in. of the underside of the old foundation, the space being packed tight with concrete when the lower portion had properly set. By making the space as small as consistent with proper filling no appreciable shrinkage occurred and the ramming could be done more effectually. When the central pier had set for about three days the needles were removed and the side spaces packed with concrete in the same manner as the central portion, thus completing the pier.

The foundations for the stanchions in the vestibule were formed with concrete, and were carried to the same depth as the piers for underpinning. The height from the finished concrete foundations to the underside of the girders was 1½ in. greater than the length of the stanchions, and when the stanchions were put in position they were wedged up tight to the underside of the girders by driving iron wedges between the concrete and the base plates; a bank of clay was then formed all round, about 3 in. from the edge of the

bare stanchion, and the space grouted with neat cement. When the grout had set, the iron wedges were drawn and the holes filled up with cement. By the method adopted part of the load on the girders was at once transferred to the stanchions, the cost of a stone template was saved, and a thoroughly uniform bed was obtained. The base plates had two holes, 2 in. in diameter, cast close to the web of the stanchion, which allowed free vent for the air when the grout was poured in from the outside of the base plate, and showed when the grout filled the space by its rising in the holes. Two of the stanchions are embedded in the walls of two new rooms formed in the vestibule, while four are encased in concrete, with stone caps and base, and finished in imitation of the two columns previously existing.

The joists of the council chamber floor, which had a span of 26 ft., were of the ordinary width of 12 in. apart, but had a scantling only of 12 in. by 2 in., and had saggid in the centre about 2 1/2 in. By fixing rolled-steel girders under the

- SECTION -

- PLAN -

CORK: UNDERPINNING OF MUNICIPAL BUILDINGS.

joists, so as to divide the span into two, the necessary strength was obtained, and wedges could be used for taking the sag out of the floor. When the foundations were completed and the building was considered secure the floors and roof were jacked up to their original position. All loose plaster was stripped from the walls inside and out, the jambs of openings were taken down, plumbed and rebuilt cills and heads were set level, defective arches rebuilt loose and shattered walling taken out and rebuilt, and all cracks stopped and filled with cement grout. A large quantity of new plastering had to be executed, and most of the windows, doors, frames and linings had to be taken out and partly renewed and repaired; but any detailed description of such work would not be of interest and is not worth describing.

DESCRIPTION OF THE CORK WATERWORKS, AND MEANS ADOPTED FOR CHECKING WASTE.

The city of Cork is supplied with water from two reservoirs,

situated above the city, and into which the water is pumped from the river Lee. The upper, or high-level, reservoir has a capacity of 721,500 gallons, and supplies water to 17,760 persons, whilst the low-level reservoir has a capacity of 3,404,000 gallons, and supplies water to 68,529 persons, making a sum total of 86,289 persons who use the city water for domestic purposes. Like other commercial towns, a large quantity of water is also used for trade purposes, most of which is taken from the city mains.

The power required for pumping is derived from the following steam engines and turbines—viz., one horizontal low-pressure condensing engine, capable of delivering 68,596 gallons per hour to the low-level reservoir and 22,066 gallons per hour to the high-level reservoir; two beam engines, each capable of delivering 55,501 gallons per hour to the low-level reservoir one Cornish engine, capable of delivering 69,228 gallons per hour to the low-level reservoir; two "New American" turbines, capable of delivering jointly 56,982 gallons per hour to the low-level reservoir and 24,102 gallons per hour to the high-level reservoir; and one old turbine, capable of delivering 46,818 gallons per hour to the low-level reservoir. Summarizing the foregoing figures, the total pumping capacity of the plant is as follows:—

Steam Plant.		
	Low-level Gallons.	High-level Gallons.
Horizontal engine	68,596	26,066
Two beam engines	111,002	—
Cornish engine	69,228	—
Water Plant.		
Two "New American" turbines ...	56,982	24,102
One old turbine	46,818	—
Hourly delivery from all machinery	352,599	50,168

With the exception of the two "New American" turbines, the whole of the foregoing pumping plant is wasteful and obsolete. The coal consumed per horse-power hour by the steam plant varies between 5.5 lb. and 6.5 lb., and the efficiency of the old turbines is considerably below that which can be obtained from a well-designed turbine of the present day. At the present time two other "New American" turbines are being erected, of the same power as the present ones, and when completed it will be possible to pump the whole of the water for the city supply by water-power, except for two or three months in the year, when the quantity of water flowing down the river is insufficient to work all the turbines. After the erection of the new turbines it will be a matter of calculation as to whether the annual repayment of principal, with interest, necessary for the erection of new steam plant will be less than the saving which modern machinery could effect, and this can only be determined from data now being obtained as to the actual average horse-power hours lost by the water plant per annum in consequence of insufficiency of water for driving.

The water of the river Lee at the intake is a good potable water, containing only 4.5 deg. of hardness, and is an excellent water for domestic purposes, besides which it does not attack lead pipes. In times of heavy rainfall large quantities of peat and decayed vegetable matter are brought down the river, causing great discoloration and deposits in the reservoirs, water mains and services, but at the present time plans are being prepared for the erection of filters, which, when completed, will no doubt relieve the minds of the consumers from the uneasiness always felt when drinking water is discoloured. A large sum of money was expended by the corporation, about sixteen years ago in constructing a filter tunnel along the bank of the Lee, but as the quantity of water obtained is totally inadequate to the requirements of the city, the bulk of the water has to be pumped direct from the river.

In 1895 the corporation were advised that an underground river was flowing through the valley of the Lee, from which a pure supply might be obtained by pumping from wells sunk into the gravel beneath an overlying impervious stratum. Trial borings were sunk and cross-sections of the valley obtained, which showed about 16 ft. of impervious earth, with coarse gravel beneath, overlying the old red sandstone rock. The gravel varied in thickness from nil at the sides to 70 ft. near the centre of the valley.

On being supplied with the data obtained, the author reported to the corporation on the scheme, but could not recommend its adoption, as the area of the valley of the Lee, which is apparently the catchment area of the underground reservoir, would only be large enough to supply 2,000,000 gallons per day, assuming a percolation of 4 in. per annum, whereas the consumption at the time of reporting was over 6,000,000 daily. It is probable that to some extent the river Lee may also feed the underground reservoir through fissures or changes in the overlying stratum, but as it was reported that the borings showed the impervious bed in which the river Lee flows to be practically uniform, and that the water in the bore-holes rose above the level of the river at a time when its discharge was above the normal, one would not be safe in making any such assumption. Had the data obtained led to the supposition that sufficient water for the supply of the city could be obtained, the cone of depression at the wells caused by pumping such a large quantity would no doubt have lowered the water level to 50 ft., or 60 ft. below the surface, which would have added considerably to the present

cost of pumping. The new works and machinery necessary would also have entailed a large expenditure, and would have required a boldness bordering on the reckless to advocate such a scheme with such a supply as that at present obtainable.

The daily quantity of water supplied through the water mains to the city for all purposes in 1896 had reached the enormous quantity of 71 gallons per head, with the result that the higher portions of the city were entirely without water except during the night and early morning. The pressure in many of the mains was so small as to be totally inadequate for the extinction of fires, and the pumping plant was taxed to its utmost capacity. Early in 1897, under the author's directions, the most strenuous exertions were made to prevent the waste of water, with the result that at the end of the year the water supplied to the city for all purposes had been reduced to 48 gallons per head.

The area of supply of the high-level mains being comparatively small, the Deacon meter system was introduced, with very satisfactory results, but owing to the large first cost, and the difficulty of dividing the low-level system up into small areas of control, the system was not introduced in the low-level supply area except in three sub-districts. As no regulations with regard to pipes and fittings were in force, and no sort of control had been exercised over the laying of house services, house-to-house tests at night by stethoscoping the stop-cocks was impossible, for very few stop-cocks were in existence except inside the dwellings.

The means adopted for checking the waste were as follows. An adequate staff of inspectors was engaged during the day in inspecting house services and serving notices. Two turn-cocks, with an intimate knowledge of the mains, valves and hydrants, were sent out during the day to stethoscope the valves and hydrants, and to report at the office any from which a noise was heard. The noisy valves were located on a plan of the water mains prepared for the purpose (no plan having previously existed), and a rough tracing made of all the mains supplied through each, together with the valves on the branch mains, and between 12 p.m. and 4 a.m. a small staff was sent out to locate the defects causing the noises. Before trying to locate the cause of a noise in a valve it was again sounded, as in some cases it was found to have ceased altogether at night when the consumption was at a minimum; but if it still existed all the branch mains were shut off, and if the noise was then heard the defect was known to be confined to the particular main controlled by the valve, but if not, the branch valves were opened one after the other until the noise again occurred, when the main in which the defect existed became known. Having located the defect within the limit of a particular main, the surface of the ground immediately over the main was sounded every 2 or 3 yards with a stethoscope, until the exact position of the defect was located.

In many instances noises have been found at hydrants without the valves on the mains they were attached to being affected, which, as a rule, indicates a leak within a short distance of the hydrant, and is easily located with the stethoscope. With Deacon meters it is possible to tell the quantity of water at any time flowing through the mains they control, either separately or collectively, which is no doubt a much more refined test than the rough-and-ready method of sounding the valves, but at the same time it is of very little use without the stethoscope to locate defects. The stethoscope is a most valuable instrument in the hands of a man experienced in its use, and will locate a leak as definitely as if it could be seen.

The principal difficulties now encountered in reducing the waste still further occur through the total inadequacy of the service pipes and house fittings to withstand the increased pressure in the mains, and it is only by rigorously enforcing the waterworks regulations recently passed by the Cork Town Council that any headway can be made. In some districts, where the pressure was excessive, a great reduction of waste has been made by the use of pressure-reducing valves on the mains, as it has been found that fittings which were previously always out of repair give considerably less trouble.

In writing this paper for the association I feel that it is only a makeshift, but pressure of work and the short time I have held office in Cork must be my excuse for any shortcomings.

DISCUSSION OF MR. CUTLER'S PAPER.

Mr. W. H. HILL (Cork) said he would have been delighted to have made some remarks if he had had the least idea that he would have been called upon, for he came simply as a visitor. He might say, however, that he was connected with these municipal buildings before Mr. Cutler came to Cork. He knew a great deal about them at one time, and he almost thought it hopeless to attempt any restoration at all, the walls were in such a damaged state. Mr. Cutler and his gang, however, set to work patiently, and he was glad to say that it was carried out, as described by Mr. Cutler, efficiently and well, though at one time it appeared to him (Mr. Hill) to be hopeless. From his observation he could say that it was a good job, and he did not think they were going to have any further subsidence, as all the foundations now rested on the gravel bed. The entire building was now not only perfectly secure, but was a homogeneous building.

Mr. J. COOK (Lancashire) said he would like to ask Mr. Cutler the number of men he put on each shift for detecting waste. That might be of interest and value to the members

of the Association. Before his time Lancaster was in a very similar position, but the Deacon meters were utilised and the great waste was checked. He thought Mr. Cutler had done very well in using pressure-reducing valves, and he would like to know of what make they were. He thought Mr. Cutler had given them a very able paper.

Mr. S. A. KIRKBY (Cork) said he was hardly able to offer much criticism upon the subject under discussion, because he had not had the pleasure of seeing the work in progress. He had seen the buildings before Mr. Cutler took them in hand, he had seen them since, and they all felt a degree of security in them now that they did not feel previously. As regarded the actual work itself, he was not really competent to say anything. He knew that the whole of Cork was built more or less on treacherous ground, and that in dealing with heavy buildings great care had to be taken. He thought, therefore, that it was highly creditable to Mr. Cutler that, without any previous information of the quagmires prevalent there, the work should have been carried out without the slightest hitch. Mr. Cutler was very lucky indeed not to have had a similar experience to what he (the speaker) had in constructing the Youghal bridge, where they came upon a strata of quicksand, which caused the cylinders to sink down sometimes 16 ft. or 18 ft. at a run. He was afraid he could not say what would have become of that building if Mr. Cutler had met with such a catastrophe. He believed the citizens of Cork were much pleased with Mr. Cutler's work.

Mr. M. J. FLEMING (Waterford) was compelled to say that the consumption of water in Cork was enormously expensive. The present consumption of water was 48 gallons per head, and in Waterford, with a constant supply at high pressure, their consumption was only at the rate of 24 gallons, though

CORK: ST. FIN BARRE'S CATHEDRAL.

altogether, including water sold, it would perhaps be at the rate of 27 gallons per head. In regard to the economising of water and the checking of waste, he approved of the Deacon meters very much. He had had some of them lately in Waterford, and by their means he had managed to reduce very considerably the waste in districts where it occurred from leaking pipes. He believed these meters were well worth using in all towns supplying water under high pressure.

The President proposed a cordial vote of thanks to Mr. Cutler for the interesting paper he had given them. The papers on both subjects—the clerical bit of underpinning of the building and the ingenious checking of waste water—showed his good judgment. He thought it was not only creditable and gratifying to Mr. Cutler himself but to the corporation whom he served.

Mr. BUCKLEY (Drimcandra) had great pleasure in seconding the vote of thanks to Mr. Cutler. He had listened with great interest to both papers, and he was sorry he did not see the work before it was commenced. He had, however, seen it when it was finished, and found it most interesting.

The vote of thanks having been unanimously agreed to, Mr. CUTLER, in acknowledging the vote of thanks and replying upon the discussion, said that in regard to the first paper Mr. Kirkley had made some remarks to the effect that he (Mr. Cutler) had had no previous knowledge of the ground. It was the case that he did not know from personal knowledge, but from inquiry, that the foundations of the old building went down to the bed of gravel, to which he had underpinned the new structure. Knowing that the old building stood well on the gravel, of course he was safe in going down to the old underpinning. Mr. Cook had asked

as to the number of men he had put on each shift in checking waste water, but that depended upon what they were doing. If they used Deacon meters the number of men employed depended upon the number of mains served off one meter. In some cases the area supplied off a Deacon meter was rather too large. If they were testing by the noise in the valves, three men only were necessary. The pressure-reducing valves were manufactured by the Palestine Engineering Company.

The following paper was then read:—

CORK ELECTRIC TRAMWAYS.

By BEVERLEY GRIFFIN, ASSOCIATE ENGINEER.

Mr. Beverley Griffin has been associated with public works since 1872, when he became resident engineer on the Great Northern Railway from Louth to Lincoln, the late Mr. J. H. Tolmie, M.I.C.E., being chief engineer. He held the position until after the opening of the line in 1877. In 1878 he was engaged by Mr. John Addy, M.I.C.E., in connection with the Peterborough sewerage works. In 1881 Messrs. Water, Smith & Watson, contractors, appointed him their constructive engineer on the works of the railway from Crewe to Andover. Mr. Griffin was next engaged upon the Halesowen (Dingle) viaduct, a steel structure over 100 ft. in height, at the completion of which much satisfaction was expressed by the Board of Trade and Mr. Griffin's employers. Having reconstrued the East and West Junction Railway, Mr. Griffin was afterwards engaged by the late Mr. Charles Liddell, C.E., in 1886, to build the Metropolitan Railway between Harrow and Rickmansworth, acting in the capacity of engineer and contractor. He received much praise for his indefatigable exertion. Several light railways opening up in Ireland in 1889, Mr. W. M. Murphy asked him to undertake the construction for him of the South Clare Railway. The exceptional character of these works gave him much responsibility, and he well deserved the praise he received on their completion. In 1893, by request of the directors of the company, he undertook the building of the Henley-in-Arden Railway, and, acting again as engineer and contractor, finished the work (which had been commenced by the late Mr. Brassey) to the complete satisfaction of his directors and the Great Western Railway—by whom the line is worked. Whilst at Henley-in-Arden he carried out the waterworks and main drainage of the place, and also all the house connections for the local authority. Then in 1896 Mr. Griffin was sent for by the Vale of Glamorgan Railway (Sir James Schuster, M.I.C.E., chief engineer), to complete the Baidred section. Those works were of a heavy character, but almost before their completion Mr. Murphy again requisitioned his services to carry out the Cork Electric Tramways—now completed.

It is worthy of note that the Cork Electric Tramways and Lighting Company, Limited, incorporated by order in council, 1897, is the first company in the British Isles supplying electricity for traction and lighting from one central station. The tramways are for the most part single lines with passing places. The length of the track is 11 miles. There are 1½ miles of track beyond the city boundary on the Douglas road, and this portion is laid with sleepers. The sleepers are rectangular, cross-bed, 6 ft. long, 9 in. wide and 4½ in. thick, and there are eleven to each pair of 30-ft. rails. The rails are fastened down to the sleepers by thirty dog spikes and fourteen frog bolts and clips. The steepest grade is 1 in 14, and the sharpest curve is 27 ft. radius.

The passing places are 3 chains in length, and the space between each pair of rails is 4 ft. 6 in.; but when centro pales are used the space between the tracks is 6 ft. 6 in. The gauge is 2 ft. 11½ in., and was determined with a view to the probable use of the tramway for conveying the trucks of the Muskerry Light Railway Company to and from the quays and, for interchange of traffic with the Cork and Passage Company. The Muskerry Company's gauge is 3 ft., and that of the Cork and Passage Company is being converted from 5-ft. 3-in. to a 3-ft. gauge.

The rails are of the girder type, of steel, weighing 83 lb. per yard, and are of American manufacture. They are 30 ft. long, 6½ in. deep, and are slotted for the tie-bars, and drilled for the fish-bolts and electrical bonding. The fish-plates are of steel, 26 in. long, weighing 56 lb. per pair, and the outer plate is the larger, giving support to the tail head. The tie-bars are of wrought iron, 2 in. by 3 in., weighing 10½ lb., double-natted at both ends, placed at 8-ft. centres and 3 ft. from the ends of the rails. The points are of chilled steel, and were supplied by Messrs. Miller & Co., of Edinburgh, and Messrs. Dick Kerr & Co., London.

The crossings are built up as the work proceeds, and the rails are cut and scarfed for this purpose by one of Hill & Son's cold-steel cutting saws. The scarf is held to the crossing rail by special made fish-plates forged to suit, and a plate,

6 ft. long by 1 ft. 6 in. by 1 in., is placed beneath and bolted up to the rail flange with ten bolts, 2 in. by 1½ in. The crossing is completed by cutting a groove through the head of the crossing rail. The rails are laid upon a continuous bed of Portland cement concrete (five to one), 6 in. deep and 7 ft. wide. The roadway between the rails, and 18 in. outside each rail, is paved with Welsh granite setts, 6 in. deep and 4½ in. wide, laid on a ½-in. bed of sand, and grouted with Portland cement mortar (three to one), well swept into the joints.

The city of Cork is built on an island formed by two branches of the river Lee. The tramway has to cross the river twice, first by Parnell swivel bridge, a steel structure, and again on Patrick's bridge, which is of stone. At both points the track is double, and in order to facilitate the running of the cars two short tracks of single line have been laid along Marlborough-street and Robert-street, then giving an up and down way. These streets have been laid to run out with wood block paving laid on Portland cement concrete, 6 in. thick, and a double junction formed at each end of the streets to be used in case of obstruction in either street.

The power station is conveniently situated near the Cork and Passage Railway terminals. The site upon which the station is built was once a slop, and to obtain a foundation 137 pitch pine piles, 12 in. by 12 in., were driven 37 ft. below the surface level of the street, at 5-ft. centres, placed zigzag, and upon these concrete (six to one) was laid. The walls are of 18-in. brickwork, with pilasters for carrying the overhead gantry crane, carried up at 10-ft. intervals. An additional pile was driven under each pilaster.

The station is 100 ft. long by 101 ft., and consists of engine and boiler rooms, with battery-room. The plant comprises three tandem horizontal compound condensing McIntosh & Seymour engines, directly coupled to 220 kilowatt generators, running 150 revolutions per minute. The Wheeler standard condensers have each a capacity of from 8,000 lb. to 12,000 lb. steam per hour. The three boilers by Babcock & Wilcox have each 2,531 square feet of heating surface, and capable of evaporating 8,000 lb. of water per hour. There is also an auxiliary heater, combined hot well and filter tank, and duplicate set of Edmiston filters. Compound feed-water pumps are in the engine room. The condensing water will be taken from the river. A tank, 20 ft. by 11 ft. by 8 ft., will be erected outside the building, holding a reserve of 10,000 gallons, for use in the event of the city supply, which serves the boilers, being shut off. The battery-room contains 256 Tudor cells, capable of discharging 110 amperes for seven hours. The booster for regulating the charge of the cells is situate in the engine-room. The switchboard consists of a combination of

CORK ELECTRIC TRAMWAYS: POWER-HOUSE.

tramway and lighting panels, the same machines being interchangeable in either service. The engine-beds are of six to one Portland cement concrete, 8 ft. in depth, laid upon ninety-six pitch pine piles, 12 in. by 12 in., driven at 5-ft. centres.

The chimney is of steel, and was built by Messrs. Keeler & Co., of Williamsport, Pa. The height is 130 ft., and the diameter at base is 12 ft., curving in to 7 ft. 6 in. at 12 ft. above ground, and finishing 7 ft. 6 in. at top. The stack is built of rivetted plates, 4 ft. 6 in. in height, three plates forming a course. They are ½ in. thick at bottom, decreasing ¼ in. for every 32 ft., and finishing 1 in. thick. The breeching nozzle, 6 ft. wide and 7 ft. high, connecting the brick flue is reinforced by the addition of a 2-ft. 6-in. angle iron, forming an arch up the sides and over the top of the nozzle. The stack is lined with 4½-in. radial fire-bricks, set to fracture. A water guard is fixed at the top of the chimney, made of 3-in. angle iron, turned down to cover the brick lining. The base plate is of cast iron, 2 in. thick and 15 ft. diameter, in eight parts, strongly ribbed and joined by 1½ in. bolts. The base, 21 ft. square, is of Portland cement concrete (six to one), and built upon a foundation of twenty-five pitch pine piles, 12 in.

CORK ELECTRIC TRAMWAYS: INTERIOR OF POWER-HOUSE.

by 12 in., and anchor bolts, 14 ft. long by 2½ in. diameter, were placed in position before the concreting commenced. The advantages claimed for the steel shaft are saving of time in the erection and cost in the structure. The time occupied in erecting was about five weeks, and the brick lining occupied twenty days. The saving in cost over a brick stack was about 25 per cent.

The electrical equipment is of the trolley type, overhead construction, carried on the pole-bracket system. The poles are built in three sections of 6-in., 6-in. and 7-in. best tubular steel, made by overlapping joints, shrunk together while hot. The double-bracket pole, placed in the streets where double tracks are laid, will carry an arc lamp besides the trolley wires; the single-bracket pole the trolley wires only. The poles are placed about 120 ft. apart where the line is straight. The cars (eighteen in number) are built to carry twenty passengers inside and twenty-four outside, and will be electrically lighted. The car-shed, 125 ft. long by 70 ft., built on ground adjoining the power station, will contain pits for inspection and cleaning the cars, and a repair shop. The rails are efficiently bonded with two Chicago bonds to each joint, and also cross-bonded at short intervals. Where the track approaches Parnell swivel bridge the rail ends will be held in a casting, acting as a kerb to both sides of the opening portion. The kerb will be bolted down to the structure, and prevent lateral motion or jumping when the cars enter or leave the bridge. Span wires will only be used in one or two instances, where there are double curves in the street. A tramway station has been laid out at Father Mathew's statue, in Patrick-street, where four lines of track have been laid with double cross-over roads, and here the cars can meet for interchange of passengers.

DISCUSSION OF MR. GRIFFIN'S PAPER.

Mr. CUTLER said he was sure they were all very much indebted to Mr. Griffin for his very able paper, more especially as he had filled up a gap at the last moment. He would like to make a remark in regard to the tramways, although he was interested in them as city engineer of Cork. He considered the paving of the tramway to be a question very worthy of discussion—as to whether the setts should be bound up with cement and sand, or with pitch and gravel. From his own point of view, and from the point of view of the tramways, he thought that pitch was far preferable to cement. When cement and sand were used it was necessary to keep traffic off for some time if they wanted it to set properly. As traffic became considerably congested there was no place that could be protected long enough to allow the gravel to set. The result was that the joints were broken, the setts became uneven, and in the long run it cost the tramway company two or three times as much as if the setts had been bound with pitch. Another serious question was whether a tramway should be laid upon a public road with sleepers. They knew it was cheaper, but the result was the breaking up of the surface within a very short time, probably to take the sleepers out to renew them, thus having the roadway in a constantly broken state. He thought those points were worthy of discussion, and he would like to hear the views of other gentlemen in regard to them.

Mr. R. H. DORMAN (Armsgh) said he differed entirely from

Mr. Cutler in regard to grouting. His experience had been chiefly in the south, and particularly in London, where, as a rule, grouting was done with cement and sand. He knew that in the North of England pitch and gravel were customary. If they had a perfectly solid foundation beneath he thought the grouting with cement and sand was the best thing. Of course, if it was not given time to set, and there was a subsidence, it would not set afterwards. He thought Mr. Cutler was right in regard to wooden cross-sleepers. He observed that the gauge of the tramway was 2 ft. 1¼ in., and that of the Muskerry and Cork and Passage lines was 3 ft., and he would like to know why the ½ in. difference existed.

Mr. J. W. WAERLE (Longton) said that in regard to the wooden sleepers he could corroborate what Mr. Cutler had said. The North Staffordshire tramway was laid some years ago on wooden sleepers, heavy locomotive engines of 10 or 12 tons had to pass over the line, and its history was that it got into a wretched condition. Ultimately it was decided to relay the line, and little by little it was done with girder rails. That was carried out three years ago, and after two years they were again in a shabby condition, for every time a locomotive passed over the line a longitudinal vibration was set up. It is now in almost as bad a condition as it was under the old Vignolles system. The setts of the North Staffordshire Company were originally laid with cement, and when they took up a portion of the pavement they found that there had been no cohesion whatever between the cement grouting and the setts.

Mr. J. BUCKLEY (Drumcondra) said he was very glad to hear a strong opinion expressed against the sleepers. In his district—a township adjoining the city of Dublin—the Dublin United Tramway Company proposed to lay part of the tramway in wooden sleepers. In reporting to his board he opposed that course, and they asked the company to lay down setts in the centre of the road. He was glad to say, that so far as he was aware—the draft order had not been finally issued—he had been the means of saving the tramway company from the expense of having to relay their tramway in a very short time.

Mr. S. A. KIRKBY (Cork) said he had listened to the paper read by Mr. Griffin with very great pleasure. He thought the question of a tramway on sleepers, either longitudinal or transverse, was not one that would commend itself to the experience of anyone, but in country districts it was often a question of expenditure only—a question of cutting down expense to the lowest minimum. It was often the only thing to do. In this case of the Cork tramways, when the order was first sought, the question was very carefully gone into by the Finance Committee of the Grand Jury. It was shown to them that if this part of the tramway was not laid on sleepers that it would make such a difference in cost as to prevent the promoters from going on with the project, if concrete foundations and granite setts were insisted upon. With regard to their endurance of heavy wear and tear, they had an example in the Muskerry tramway. A portion of it was laid on transverse sleepers, sunk some 12 in. or 18 in. below the surface. They put blocks on each sleeper. That plan had stood the test of time very well, and he himself had been very much surprised to see what little packing it

had required. The traffic on the line was in excess of that of any tramway he had seen elsewhere. There was often a passenger train of thirteen carriages, and a luggage train of eight or ten carriages heavily freighted, moving over it. Where economy was essential he thought transverse sleepers well packed and bound might be safely used. That was the experience that had come within his range in the matter.

The PRESIDENT proposed a hearty vote of thanks to Mr. Griffin for his interesting paper. It teemed with useful information to the engineer who was in any way connected with tramway matters, and he was sure it would be a very valuable addition to the "Proceedings."

Mr. Cook (Lancaster), in seconding the proposition, said he thought the question of sleepers was a very important one.

The vote of thanks having been unanimously accorded, Mr. Griffin, in replying, said that Mr. Cutler drew attention to the grouting in pitch reinforcement. For speed there was not the slightest doubt that pitch grouting would be preferable. There was a serious difficulty in this case, because in laying the tramway through streets in which there was great traffic they had to turn the traffic on almost before the work was properly set, and the only thing they did to protect it was to lay a sort of carpet of sand upon the surface. In regard to the sleepers on the country roads, the life of the sleepers, of course, depended upon the quality of the timber and cross-rotting. In places where the traffic would be squeezed into a very narrow space, the tramway took the same form as in the city—concrete foundations and sets. Mr. Dorman had asked why the gauge of the tram line was 2 ft. 11 in., while that of the light railway was 3 ft. Before commencing the tramway, and whilst discussing the gauge, he made some experiments with the assistance of Mr. Hill, engineer to the Muskerry railway, whether it was possible to work the tracks of the Muskerry line on the tramway. They came to the conclusion that it was, by adjusting the gauge. They found that in order that the flange of the Muskerry trucks should get a good grip on the surface of the tramway rails, the distance between the inner surface of the tramway rails should be slightly less than that on the Muskerry line. They tried a truck on the tramway, and they would have no hesitation in taking those trucks through the city in the same way as they took their own. He had seen sleepers taken out soon after they had been in ten years, and when well ballasted with gravel and sand he thought they would last quite as long as was reasonable.

The third and last paper was the following:—

MAIN ROADS UNDER COUNTY COUNCILS IN IRELAND.

By R. H. DORMAN, M.INST.C.E.,
County Surveyor, Armagh.

[A portrait and biography of Mr. Dorman appeared in our issue of September 5, 1895.]

The present meeting of the Association of Municipal and County Engineers in Cork appears to the author to be a fitting opportunity for referring to the future management of county works in Ireland. It is unnecessary for the author to refer to the good work done under the grand jury system in Ireland during the past sixty years. The network of roads, maintained with efficiency and economy, which cover the face of the country are a record of the signal success attained by grand juries in this respect. But, in order to demonstrate the economy and saving effected under the grand jury system, I would like to refer to an extract taken from some information recently compiled by Mr. Wilson, county surveyor of Fermanagh: "Shortly after the Grand Jury Act was passed, and when the office of county surveyor was instituted in 1834, there were 13,191 miles of road under contract in Ireland, at an annual cost of £225,316, or an average cost of £17 6s. per mile. In 1895 there were 53,061 miles of roads under contract in Ireland, at an annual cost of £660,532, or only an average cost of £12 9s. per mile. Had the average cost remained as it was in 1834, then the cost of the roads in Ireland in 1895 would have been £918,007, or £257,475 more than it actually was. Now, not taking into account the increase in the cost of labour between 1834, when a labourer was 6d. a day, and 1895, when a labourer was 2s. a day, it may be fairly argued that the institution of county surveyor and the grand jury system in Ireland has saved the county something like £257,475 per annum. This is enhanced when it is remembered that before county surveyors were appointed the main and post roads were largely, if not altogether, maintained by the Board of Public Works, or by the turnpike system, whereas both of these systems have now been abolished, and the roads are altogether maintained by the grand juries, from which it appears that, in spite of the more expensive roads having been thrown on the grand juries, still, after the appointment of the present system, there has been a considerable decrease in the average cost of the maintenance of public roads." Notwithstanding this statement, there is yet no doubt that for many years past the grand jury system has laboured under many difficulties. Among other disadvantages the Act contained no powers for the purchase of any plant, such as steam rollers, stone-breakers, &c., and the want of these had seriously impeded other progress being made in the conditions of road maintenance, and has rendered some changes in the laws, at any rate in this respect, imperative.

But it is not to dwell on the past that I have commenced

this paper—our thoughts are with the future and with the probable changes which may result under the new system. A glance at the new bill and the schedule attached show that the general arrangements proposed for the carrying out of works, &c., follow very closely on the lines contained in the Grand Jury Act. In one important particular, however, the procedure is quite new. I refer to sec. 8, part 1, of the bill, which commences as follows:—(1) One-half of the maintenance, enlargement or improvement of any main roads shall be levied off the administrative county, and the other off the county districts in which the road is situate; (2) every road, the maintenance of which at the passing of this Act is levied partly off the county at large and partly off any barony, shall be a main road until it ceases so to be as hereinafter provided; and the enactments respecting main roads shall be repealed; (3) the council of each county may, upon the report of the county surveyor, make a general statement declaring what roads in the county shall be main roads, and any roads not mentioned in such declaration shall cease to be a main road, and at any time after the end of five years the council may, if they think fit, reconsider the declaration and make a new declaration, and so on, at intervals of not less than five years, &c.

The first thing to note in connection with these clauses is that the enactments with regard to mail-car roads shall cease. The absurdity of the law requiring the cost of maintenance of any road over which a mail-car passed to be levied off the county at large is too apparent to merit discussion. I will only mention that in my county of Armagh the cost of maintenance of mail-car roads has in recent years varied

CORK: SCHOOL OF ART AND FREE LIBRARY.

from £12 per mile to £180 per mile, and in exceptional cases the cost has gone up to £900 per mile. For instance, only last year over 2 miles of the main road from Armagh to Castleblayney was made up at a cost of £900 per mile, and half the cost of this work was levied off the county at large, because a light car carrying a mail bag passed over it twice a day.

I believe that one or more grand juries, already anticipating this change in the law, have assumed the section of the Act dealing with main roads to be obsolete, and made a declaration to the effect that all roads, whether post roads or not, should be repaired entirely at the cost of the baronies in which they were situated.

Adverting now to clause 3. There is no doubt that this clause will lead to much discussion by every county council in Ireland, and it will be interesting to note the declarations which will be made respecting main roads in each county. It appears to me that the two chief elements which should decide whether a road should be declared a main road or not are (1) the cost of maintenance; (2) is the road one of the main arteries of the country over which the general public are accustomed to travel for diverse purposes? Considering these elements conjointly we may have (a) leading roads connecting important towns and villages, and costing a high rate to maintain; (b) unimportant roads, with little traffic over them, used chiefly by the local farmers, and some of them open at one end only; (c) several intermediate classes—for instance, important cross roads leading from one main artery to another, or roads which in the ordinary sense of the term would be considered main or leading roads, but which do not connect any towns or important villages, and over which there is little traffic, or we may have roads carrying heavy traffic leading to railway stations, mines or similar places, and terminating there.

So many circumstances and conditions will have to be considered in different cases that it will probably be impossible for any county council or county surveyor to lay down any hard-and-fast rule. I will, however, for a moment consider the case of the co. Armagh. In this county the roads are classed as first, second, third and fourth class. The cost of the first class for the past twelve months averaged £41 15s. per mile, the second class £15 5s. per mile, the third class £9 5s. per mile, and the fourth class £8 6s. per mile. Now for this county I would suggest, but do not propose, that a road which is a main artery of the county over which the general public travel for diverse purposes, and which has for

the previous three years cost on the average £24 per mile per annum to repair, should be termed a main road, and the expense of maintaining same should be levied half off the county at large. It may be noticed that the sum of £24 per mile is equivalent to 57.5 per cent. of the average cost of the existing first-class roads in co. Armagh.

It is quite possible that some county councils may decide to declare all county roads main roads, and other councils may refuse to declare any roads main roads, but I consider that either of these views of the question would be unreasonable. If all roads in the county were declared main roads a large number of by-roads used exclusively for local traffic would be included, and it would be unfair to make the expense of repairing these roads a charge on the county at large, because the number of by-roads in different baronies is not proportional to the area, or to the valuation of the baronies—the proportion of by-roads under contract in some baronies being much greater than in others. On the other hand, if no roads were declared main roads the cost of maintaining important roads would in some cases be an unfair tax on the district through which the road, or part of a road, passed. For instance, we may have a road carrying heavy traffic connecting two important towns, say, 10 or 15 miles apart, but passing for part of its way through a poor district, or through a district which did not participate or benefit largely in the traffic passing over the roads. It would be manifestly unfair that these districts should pay the whole cost of maintaining such roads, the traffic over which they did not benefit by, or only to a limited extent. Finally, I think it will be conceded that a proportion of the roads in every county should be declared main roads, but it will require much discrimination on the part of each county council to decide what roads should be included in the declaration.

Turning now to the consideration of footpaths by the sides of main roads. It was for several years, subsequent to the passing of the Local Government Act of 1888, a vexed question in England whether footpaths should be considered as part of a road or not, but it appears to have been ultimately decided that the whole space from quick to quick formed part of the road, and that therefore the footpaths should be included in the cost of maintaining the roads of which they form part. In Ireland, although the practice of dealing with footpaths on the sides of main roads seems to vary, I believe it has been decided that the footpath does not form part of the road under the Grand Jury Act, and sec. 52 of the Act seems to favour this view. As it is not intended to repeal that portion of sec. 52 referring to the matter, it will be interesting to note how the question will eventually be decided in this country. I am personally rather in favour of footpaths being included as part of the road, and it is certainly desirable that the road and footpath by the side of it should be included in the one contract.

As regards the future maintenance of roads in this country—that is, whether they should be maintained under the contract system or by the county surveyor's own staff—I think the general opinion among county surveyors is that the most economical method of maintaining the by-roads is under the contract system, but that for the main roads contracts should only be entered into for the supplying of material, and that the rest of the work should be carried out by the surveyor's own staff. I was for a long time in favour of the contract system, but I have in recent years completely changed my opinion. In the co. Armagh, when presentments are now given into the county surveyor's hands to execute, the amount of the presentment is lodged to a particular account in the bank, and the county surveyor is authorised to draw on this account for the amount of the presentment. My experience of this method of working is that I can, with ready money in my own hands, carry out contracts, no matter whether they be for maintenance works or special works, for main roads or by-roads, for at least 25 per cent. less than under the contract system. I do not suggest, however, that county councils should refuse to accept any tenders for works in the first instance. I would rather suggest that they should accept tenders for all contracts except the main roads, and I am strongly of opinion that these roads should be maintained strictly by the county surveyor's own staff. This arrangement would no doubt necessitate an increase in the county surveyor's staff, but the better results which would be obtained would far more than repay the cost of the extra staff. I would leave it an open question whether the county surveyor should raise his own material, or whether a contract should be entered into for it. This can only be determined by local conditions. I would then, if I had all the main roads in a county in my own hands, arrange as follows:—

(1) As regards materials, I would enter into a contract for the requisite quantity of material if I could obtain it at a reasonable price, if not I would raise and break it myself. My experience, however, is that I can usually obtain it by contract nearly as cheaply as I could put it out myself.

(2) Consolidation of material. I would, as a rule, roll in about 75 per cent. of all the material put out on the main roads, but on good hard roads I would roll in as much as 90 per cent. I would advise the purchase of as many steam rollers as could be conveniently kept at work all the year round, but in some counties it might be more convenient for the present to hire the rollers as required.

(3) Surface work. I would divide the county up into districts, and I would appoint a foreman for each district. I would put a sufficient number of men under him for the proper surfacing of the roads, and I would hold each foreman responsible for the proper care of the roads in his district. Each foreman and surfaceman would be registered, and I would divide the men into two grades—first and second. The first grade I would term the permanent class, and the second grade probationary or temporary. I would recommend the county council to provide an old-age pension for men who have served satisfactorily in the first grade for a number of years.

(4) Horse brooms and horse scrapers. I would provide these in the neighborhood of towns, where the traffic is heavy, also in country districts where long stretches of level roads exist, but in hilly districts they are troublesome to work, and the roads could be more easily attended to with hand scrapers.

(5) I would keep an assistant at the head office, who would be responsible for the accuracy of all pay-sheets and time-sheets. I would arrange for all sheets to reach the head office on each alternate Friday morning, when they would be inspected, and cheques issued by the county surveyor and forwarded to the assistants for the amounts. The assistants would then distribute the amounts among the different foremen.

In conclusion, I would only point out that the conditions under which traffic is being conducted in this country has to some extent changed during recent years, and further changes in this respect are imminent. The tourist traffic in Ireland is being rapidly developed, and myriads of cyclists are inundating the country; that hydrant-headed monster, the traction engine, is making its appearance particularly in the north of Ireland, and we may look forward at no distant date to see the light carts of this country superseded by a heavier class and perhaps by motor cars. These changes will not be viewed with favour or appreciation by the people of this country at first, but for its proper development and progress they are inevitable, and the authorities who have control of the roads should be prepared for this. I would here refer to the necessity for the authorities in Ireland together framing, if they have power, a set of by-laws for the conduct of traction engines, which would apply all over the country. Much annoyance and inconvenience will be caused to owners of traction

CORK: CITY COURT HOUSE.

engines if a different set of by-laws is framed for each county, and it would be for the benefit of all concerned if one set of by-laws could be framed applicable to the whole country at large.

I stated in the first part of this paper that the roads in Ireland had been maintained with efficiency and economy in the past, but the majority of our roads are only strong enough for light traffic, and would be quickly squeezed out of shape by the passing of a traction engine or other heavy motor over them in wet weather; further, many of our roads are not properly surfaced, this work being done generally at irregular intervals and in a slovenly manner. The main roads in England are rapidly improving and being brought to a high state of perfection, and if we in Ireland are to keep pace with the present rate of progress in England we shall have to pay more attention to the strengthening and to the surfacing of our roads.

DISCUSSION OF MR. DORMAN'S PAPER.

THE PRESIDENT trusted they would hear from some of the county surveyors on the very interesting paper that had been read by Mr. Dorman.

MR. A. O. LYONS, county surveyor, East Riding, co. Cork, having briefly proposed the accordance of a vote of thanks to the author, said the subject he (Mr. Dorman) had taken in hand was very large. The new Bill brought into Parliament

would very much alter the system of keeping up public works in Ireland, but it would involve a great deal of trouble on the county surveyors until things got into shape. The questions raised in the paper were so numerous and important that he would not occupy their time in entering into a discussion at that stage.

Mr. JOHN HORAN (Limerick) seconded the vote of thanks. The paper was a most interesting one, and came very opportunely, but it dealt with such a big subject that it would be wrong to keep them to-day to discuss it on its merits and at length. Mr. Dorman was in favour of putting one-half of the maintenance of the main roads on the county at large. With that he disagreed, and his experience in Limerick would lead him to put the whole of the maintenance on the county at large. He had had no experience of any other county. Mr. Dorman had mentioned what he thought was a very excessive cost incurred in the making of roads that required strengthening. He referred to the road from Armagh to Castleblayney, which he stated was made up at a cost of £960 per mile. County surveyors knew where labour was cheap, and he thought a very respectable new road could have been made for that sum. As regarded the declaring of what roads were main roads, he thought the county council would not trouble themselves very much on that point, and it would rest in the hands of the county surveyors to say what were main roads and what were not. He would be against asking important assistants to become pay clerks. He would like assistants to be professional men, and if eventually the roads were put in the hands of the county surveyors they ought to be paid for those men by the county councils. He was sorry to hear Mr. Dorman speak disrespectfully of the traction engine. He thought it was better than the old 2½-in. tyre, that cut into their roads so much. He was greatly in favour of the steam roller, and could quote a case where he introduced it and considerably improved an important road. It was a nice point that Mr. Dorman made about the by-laws for traction engines. There should be no difficulty with the new bodies in bringing it about, for those bodies would be subject to the control of the Local Government Board, and there should be no difficulty in forming proper by-laws for use throughout the country. He had no doubt they would wonder why the county surveyor viewed with apprehension the introduction of a popular form of government. The immediate result would be to place in the hands of the board of guardians what was previously done by grand juries. Of course they, as loyal men, would do their best to work under them, and they could only hope that the new bodies would rise to a sense of the increased responsibilities placed upon them.

Mr. H. A. CUTLER, city engineer of Cork, said he had no knowledge of the county roads in the country, but their cost surprised him. He would ask Mr. Dorman how many men per mile he considered fair on those roads. It would be useful information to himself, not having had experience of that class of work. What length of road would he put under a good foreman, and would he require him to keep a horse? Or what form of locomotion would he recommend? He should have some means of getting round his district.

Mr. R. W. LONGFIELD (Donegal) remarked that they all looked forward with a considerable amount of apprehension and curiosity to see what the new bodies would do. He thought that in the North of Ireland there would be a considerable amount of friction between the district and county councils. There would be a large amount of trouble on the whole, and a deal of odium would be thrown on the county surveyor. Regarding traction engines, he knew one road personally in the north of Donegal where the engine had done a great deal of good. It broke up the road first by putting on a good deal of stuff, and subsequently turned it into an excellent highway. In Donegal a great deal of harm had been done by the extreme narrowness of the tyres of the cars. He believed that a law existed in France compelling those vehicles to have tyres not less than 4 in. wide, and it would, he thought, be a very good thing if such a law could be brought into force in Ireland. He quite agreed with Mr. Dorman in saying that in Ireland they would have to improve very much to keep pace with the tourist traffic—and especially bicycles.

Mr. S. A. KIRKBY (East Riding, Cork) said he would like, for his own information, to ask Mr. Dorman what power the county councils would in future have to frame regulations for traction engines or any heavy engines. None of the existing by-laws dealt with the case, and the last Act passed by Parliament specially exempted Ireland from its operation. He himself had considerable difficulty in dealing with traction engines, locomotives and goods trains having gone over the public roads. Their legal advisers had not yet been able to find a satisfactory way to enable grand juries to make proper regulations for that traffic. As regarded the contract system and the carrying out of works by the county surveyor, he could say that he agreed with Mr. Dorman. He had had experience with both, and he had to say that he preferred the contract system. It was, according to his experience, more economical, and from the selfish point of view more satisfactory to the surveyor.

Mr. DORMAN, in reply, first thanked those present for the vote of thanks they had been good enough to pass him for his paper. Mr. Horan, he continued, had asked with regard

to the main road from Armagh to Castleblayney. The expense was entirely for making-up. The road got into a bad state. The actual cost of the road in future would be about 10s. per perch, or £106 per mile. Mr. Horan objected to the assistant at the head office dealing with the pay-sheets. Perhaps he did not understand what he (the speaker) meant. He thought it always wise to keep the youngest assistant at the head office in order that he might learn his business. While he was there he might as well undertake the care of the pay-sheets. Mr. Cutler had asked him about the number of men on a road, but he could not make an estimate. Mr. Kirkby had referred to certain by-laws being framed, but he could not reply to the question he had asked. He (Mr. Kirkby) preferred the contract system, and he was quite right if he could get a sufficient number of good contractors. The worst thing in connection with the grand jury system was the practice of accepting the lowest tender. Nothing had given him more trouble than accepting the tenders of rotten contractors. Not only did the men themselves give trouble, but so did their securities. He found that by taking the main roads into his own hands, and working them with his own staff, he could save 25 per cent.

The PRESIDENT said that in putting the vote of thanks he had to say that the paper of Mr. Dorman would prove a valuable appendix to the one he had already written and included in their "Proceedings," and which he had seen more than once quoted as an authority. There was one matter he would like to ask Mr. Dorman with regard to the cost of roads. That was so low that it made the mouths of them in the metropolis water, and he would ask Mr. Dorman if the £24 per mile included the whole of the roads of the country or merely the roads in the hands of the county surveyor. He presumed there were other roads maintained by local authority. With regard to cyclists, he supposed they were having the same trouble as they in the neighbourhood of London were. The motor-car and cyclists had caused a considerable increase, and he would be glad to know if that question was as troublesome in Ireland in the matter of costs.

The vote of thanks having been passed with acclamation, the sitting then closed.

This concluded the proceedings so far as regards the reading and discussion of papers. The remainder of the meeting will be dealt with in our next issue.

PARLIAMENTARY MEMORANDA.

On Thursday, in the House of Lords, the West Ham Corporation Bill was read a third time and passed.

In the House of Commons the Lords' amendments were considered to the Bolton, Turton and Westhoughton Extension Bill, Glasgow Corporation (Sewage, &c.) Bill, and Rhymney and Aber Valleys Gas and Water Bill. The Bills were ordered for third reading.

In the House of Lords on Friday their lordships agreed with the Commons' amendments to the Lords' amendments to the Local Government (Ireland) Bill.

In the House of Commons the Lords' amendments to the following Bills were considered, and the Bills ordered for third reading: Liverpool Corporation Bill and the Middlesex County Council Bill.

On Monday, in the House of Lords, the Kingstown Harbour Roads Transfer Bill passed through committee without amendment.

In the House of Commons a member asked the Secretary of the Treasury whether his attention had been drawn to the publication in full detail in the Press of the report of the Telephone Committee. He wished to know whether steps would not be taken to prevent newspapers publishing confidential documents which certainly ought not to appear. Mr. Hanbury, in his reply, said that every possible step had been taken to ascertain how the filching of the paper occurred, but hitherto without success. He could only say that in his opinion, and in the opinion of the committee, the practice complained of was becoming absolutely intolerable.

In the House of Lords on Tuesday the Kingstown Harbour Roads Transfer Bill, the Metropolitan Commons Bill and the Public Loans Bill were read a third time and passed.

In the House of Commons the report from the Select Committee on Telephones was brought up and read.

Shanklin.—On the 29th ult. Prince Hermann of Saxe-Weimar performed the ceremony of the installation of an auxiliary water supply for the district of Shanklin. Owing to the rapid growth of the place there has been danger of inconvenience owing to the want of an adequate supply of water, but it is now believed that a constant supply of pure water is assured.

An Annual Outing.—An enjoyable excursion to Margate was last week made by the employees of Messrs. Young & Marten, of Stratford, E. An excellent dinner, presided over by the general manager, Mr. E. Montague Edwards, was served at the Terrace Hotel, and at the subsequent proceedings Mr. Edwards, in responding to the toast of his health, said he trusted that he might be spared in health and strength to be present at many future gatherings of the kind. ☐

New Sewerage Scheme at Exmouth.

SANITATION AT THE SEASIDE.

Mr. H. H. Law, Local Government Board inspector, recently held an inquiry at the Town Hall, Exmouth—a popular Devonshire seaside resort—relative to an application from the urban district council to borrow £24,500 for the new sewerage works. The proceedings were watched by several members of the council and a large number of ratepayers.

In opening the case for the council, Mr. Adams, the clerk, informed the inspector that the population of Exmouth was 10,000 and the annual assessable value £54,000, while the outstanding loans amounted to £13,396.

Several owners and occupiers of property who opposed the scheme were represented by Mr. Beal, of Exeter; Mr. H. Adams opposed, on behalf of Mr. Carter, the erection of the pumping station; and the Rev. O. Reichel appeared to offer some suggestions relative to the conditions on which the loan should be issued.

Evidence was first given by Mr. Strahan, assistant to Mr. Mansergh, of Westminster, the engineer who prepared the scheme. He described the existing condition of affairs, which resulted in flooding during storms, causing the sewage to make its appearance. Withycombe, which had recently been added to Exmouth, was innocent of sewerage. The essential feature of the projected scheme was to have a high-level sewer, starting at the present outlet, skirting round two of the hills, cutting through Withycombe, and at such a level that the sewage, whatever the state of the tide or however great the rainfall, would discharge clear out, although it would be, of course, under pressure. He proposed to erect a pumping station to take the sewage from the Exeter-road low-level area to the high-level sewer for the purpose of discharge. The pumping station would take the sewage and such portion of the roof water as he could not exclude. The existing system of sewerage, he believed, did its work comfortably in its early stages, but as the town grew the amount of the sewage to be discharged became overpowering. He proposed to have the existing system to deal with an area which contained 5,000 people. The experiment should, he thought, be made as to whether, when the demands made upon it was thus restricted, the old system would revert to its old efficiency. He had no doubt that it would, as the sewer would not be overburdened, as it had been hitherto. The scheme proposed to discharge the sewage into deep water 160 yards from the present point of discharge. Provision had been made to meet a possible increase of the population to 20,000. The high-level sewer would be capable of discharging 8,500,000 gallons of sewage every twenty-four hours, and assuming the full amount of sewage, 600,000 gallons, was present, there would be provision for dealing with twelve times that maximum. He described in detail the pumping station, which, he said, had been so arranged that no one would be able to see the sewage in its progress from the low to the high level. In the pumping station even all that would be open to view would be a large engine and two small ones. Anyone objecting to such a station would be alarming himself about nothing. A site for the pumping station had not yet been obtained, and he understood that if difficulties were thrown in the way a provisional order would be applied for to get the land necessary. There would be no abandonment of an existing work on which a debt still remained. He had made arrangements to utilize all existing sewers, although their use would be in some instances altered. For instance, the Exeter-road sewer, which now dealt with sewage and storm water, would under the new circumstances be used for storm water only. Dealing with the discharge, he said the sewage would never be tide-locked during neap tide, but it would be for two hours at the outside during spring tide. The advantage of the outlet at the present point was that if the time should come when Exmouth was very rich the sewage could be carried out still further to Orcombe Point.

In answer to Mr. Beal, the witness said he had been told that the land at the marsh had been laid out for building sites, and that there would be a difficulty in getting it. He did not know that until he came there, but he should have thought that the owners would have given them the land, because until the pumping station was erected it was no good for building purposes. Asked as to what was his opinion of the value of the land, the witness said that that was one of the things of which he knew nothing. Whenever a pumping station was to be put down in a marsh it was always stated that it was to be used as a building site. As an engineer he might say it was possible to put the pumping station on the other side of the railway line, but it would be unreasonable to do so. It would have to be taken to a much lower level and would cost a great deal more money. The pumping station would look like a respectable laundry, and as for the sewage, they would not see it or smell it. Continuing, he said the cost of working and maintenance of the scheme would be £300 a year. The annual repayment of the loan would be £1,706, and that would be covered by a rate of 103d. in the £1, but he preferred to put it at 11d. in the £1, because the cost of the scheme might grow a little in working it

out. In answer to Mr. H. Adams, who said he appeared for Mr. Carter, the owner of the land, Mr. Strahan said the capacity for the pumping station would allow for a large increase of population.

Mr. Orchard, of Exeter-road, objected to the scheme as being too elaborate and costly. He did not question that it would be effective, but in view of the fact that Exeter, with 40,000 inhabitants, had recently applied for and obtained a loan of £40,000 to work their sewage on the septic system, it appeared to him that they at Exmouth perhaps might adopt that, or an alternative scheme at a less cost, to provide for the sewage of 10,000 inhabitants, or less than one-fourth of the population of Exeter.

Mr. S. Tupman, Exeter-road, also objected to the scheme on the ground of its costly character.

Mr. Ponsford, also of Exeter-road, opposed the proposed site of the pumping station on the ground that it would depreciate the value of the property by one-half. He thought the station should be placed further north.

Dr. Kemp, medical officer of health, said he considered the scheme would meet the wants of the district, but he should have liked to see the sewage of Littleham included. At present it contaminated the scheme. He said he should also prefer the outfall to be in the deep water at Orcombe point, but Mr. Strahan pointed out that that would cost £9,000 extra.

The Rev. O. Reichel said the district was not purely urban, but embraced a large agricultural area. There were 500 acres of houses, and another 500 acres of land in Withycombe parish which might be built upon. No provision was made in the present scheme for Littleham parish. The Exmouth District Council could really be acting as a purveyor of sewage discharge, and the charge should be borne by those who benefited by it. He also thought that the repayment of the loan should be by instalments and not on the annuity system.

Mr. Carter pointed out that the whole of the land in the rural portion only paid a quarter of the district rate. In other words, out of a 1s. 3d. rate the urban wards paid £2,900 and the rural wards only £527.

Mr. C. J. Ross raised the question of whether, seeing the extensive building operations going on towards the east, it would not be better, while the scheme was under consideration, to carry the sewage right out to Orcombe Point.

Mr. Pratt said the necessity for the works did not arise in the rural districts.

The inspector pointed out that his board did not grant a special drainage district except under very special circumstances. They all knew that the rates on land was one quarter what they were on houses, and if any works were carried out in the rural districts the people in the urban portion would have to pay four times the amount that the rural population paid. Therefore both sides of the question had to be considered.

Mr. Pratt protested against land at so low a level as the site in question being built upon.

A ratepayer asked whether, if the loan was sanctioned, the scheme would be carried out as submitted, and not deviated from, as was the case in the previous instance.

The inspector said if the scheme was sanctioned it would be a very irregular thing to deviate from it, and if on being proceeded with it was found that something else had to be done for which more money was wanted one of the first questions asked would be, "Has it been carried out in accordance with the conditions sanctioned by the Local Government Board?" Of course they had to rely to a great extent upon the good faith of the authorities concerned.

PUBLIC SLAUGHTER-HOUSES FOR LONDON.

The Public Health Committee of the London County Council have issued a report as to the desirability of establishing public slaughter-houses throughout London. The committee think that every effort should be made to render the places self-supporting, but that it would be futile at present to attempt to submit estimates, as so much will depend upon the locality of the sites, the circumstances of the trade and the character of the buildings. They propose to transmit their opinions on the matter to the Local Government Board, with an intimation that the council are prepared to accept such responsibilities as may be necessary to give effect in London to the recommendations of the Royal Commission on Tuberculosis, and to ask the Local Government Board whether they will include in any legislation introduced by them in connection with the commission's report the provisions which will be necessary for this purpose.

Royston.—A loan of £250 for the purchase of lamps and the extension of street lighting by the district council has been sanctioned by the Local Government Board.

Comparative Reports of General Practice.

XXVI.—REFUSE DESTROYERS: TIVERTON REPORT.—I.

For several years past the disposal of house refuse at Tiverton has been a question of ever-increasing difficulty, mainly on account of the absence of suitable places in close proximity to the town for tipping the rubbish where it will not be likely to create a nuisance. It was decided to inquire into the method of burning, and after a general report from the borough surveyor, Mr. J. Siddalls, it was decided that a sub-committee, consisting of Councillors Barrons, Pless and Deering, should visit and report upon the refuse destructors adopted in various towns. The guiding considerations in the selection of the towns to be visited were: (1) The type of destructor furnace in use, one or more installations of each of the systems in operation being seen; and (2) the character of the locality. In selecting a town an endeavour was made to ascertain the merits of the system under various conditions as to population, nature of district, whether residential or manufacturing, and the different descriptions of town refuse. These considerations are pointed out in the course of the report, which concludes with the general findings of the deputation. After a general description of the construction and working of a destructor, the report proceeds to deal with the various places visited. These were Bath, Winchester, Hornsey, Leyton, Shorditch, Cambridge, Loughborough, Bradford, Rochdale, Farnworth and Oldham. The report continues thus:—

BATH (Population 52,000).

We found eight cells of the "Perfectus" type in use, the makers being Messrs. Goddard, Massey & Warner, of Nottingham. Eight cells are worked in winter and six in summer; but in the winter more cells are wanted, and two additional ones are to be erected of the same type. During this, the winter season, the cells are worked by four men by day and three by night. The installation was erected in 1895, and cost, including roadways and buildings, £11,000. The superintendent, Mr. J. Barter, tells us that the plant has worked continuously since its erection, without any trouble, and has cost very little in repairs.

The refuse is brought up an inclined roadway and shot on to the platform at the top of the furnaces, the tins and iron utensils are picked out and put to a heap to be taken away, and the rest is fed into hoppers, which when full are discharged into the furnace below by pulling a lever releasing the bottom of the hopper, after which the process is repeated. The clinker is sifted, the fine ash is made into mortar and sold, and there is a good demand for it. The rough clinker is broken fine in a mill and made up with cement into paving stones, kerb and channel blocks, which are used in the streets of the city or elsewhere.

The motive power is provided by steam raised in a boiler from the waste heat of the furnace, and is much more than enough to drive the 20 horse-power engine required. The amount of refuse destroyed per week is 240 tons, which is equal to 5 tons per cell per day of twenty-four hours. The cost of burning is 8d. per ton, without reckoning anything for interest of capital or allowing for value of steam raised or clinkers made. The chimney is 165 ft. high, and we could detect nothing but a slight vapour leaving the top and discernible for a very short distance. There are many houses in the immediate locality of the works the occupants of which have never complained respecting the destructor, and just opposite is a public park and recreation ground.

WINCHESTER (Population 20,000).

The destructor here is of the "Fryer" type of two cells, one cell erected fourteen and the other seven years ago by Messrs. Manlove, Allott & Co., of Nottingham. Meldrum steam-blowers were added six months ago, and the opinion of the superintendent, Mr. H. Lamb, is that "they can now do about double the work, and make a better clinker." The furnace bars are kept in a better state by the moisture of the steam, and therefore last longer, but the brick lining suffers from the greater heat. There is a better combustion, and therefore greater efficiency in the disposal of the refuse.

Although the steam blast is very effective, it would, in our judgment, be an objectionable feature, owing to the noise made by it. This, however, is not unavoidable, for we found at other places a powerful blast being used with very little noise. Eighty to 100 tons a week are burned; the large tins and iron pans are sorted out and buried, but the small tins are put through the furnace, and the solder melted out into the clinker. The furnaces are worked every day and night, except that the men are only in attendance six hours each Sunday; for the remainder of the week two men are at work by day and one by night.

The works are on the outskirts of the city, but there are many good houses close by, and a building estate is being laid out adjoining the site of the works, and we were assured there were no complaints, except a few as to smoke before the blowers were put in. The destructor has been erected at the sewage outfall, and the waste heat is used for assisting in raising steam for pumping the sewage to the farm, which is situated about $\frac{1}{2}$ mile away; this is effected by means of a

Green's economiser fixed in the hot-air flue, which saves about 30 per cent. of the coal bill as compared with former costs.

The chimney of the pumping station has been utilised and is 80 ft. high; we could see nothing but a small quantity of light-coloured smoke coming from it. There is a good demand for the ashes at 1s. 6d. per load and for the clinker at 2s. per load; what is not sold is made up by hand into paving stones. The clinker here is of very hard quality.

BURNSEY (Population 70,000).

The destructor works are at the central depot, and we were very much interested here in observing the completeness of the stabling, repairing shops, mortuary, public disinfectant and other municipal works, which were shown to us by the council's engineer, Mr. E. J. Lovgrove. The destructor is of the "Perfectus" type (similar to that at Bath), and there are twelve cells working every day except Sunday, when the fires are banked up until Monday morning. There is no forced draught, the furnaces easily disposing of the present quantity of refuse. With the increase of the population it may become necessary to add forced draught.

The repairs to the furnaces up to the present have been very small, only one new set of furnace-bars having been fixed to the first six cells erected. The works are in the midst of a populous district, houses being built right up to the walls surrounding the works. There are good houses not 20 yards from the chimney stack, which is 217 ft. in height, and the entrance is in the High-street of the town, but no complaints are made on account of the destructor.

The clinker is a fairly good one, although not so hard as at Winchester. It is used for making slabs under pressure, which cost 1s. 9d. per superficial yard to make, including cement and allowing for value of clinker. A new hydraulic machine is being erected for pressing the slabs, when the cost will be reduced to 1s. 3d. per yard. No granite is used with the clinker, and the blocks are extremely hard, well finished and of even texture.

There is a great demand for clinker; when they have any to sell, which is seldom, 2s. a load is charged. It is used by the authority for many purposes besides making paving slabs, for instance as hard cores for foundation of new streets, bottom course for concrete or other paving, and a scheme for workmen's dwellings is in course of erection, the whole of the brickwork of which is being built with clinker mortar and the foundations constructed with clinker concrete; indeed, the demand for the clinker for their own purposes is so great that they cannot provide anything like enough for their own requirements.

Mr. Lovgrove informed us that, after allowing for repairs, interest and repayment of capital and crediting value of clinker (2s. per load), the total cost of disposal works out at 1s. 8d. to 1s. 10d. per ton of refuse destroyed. The waste heat is utilised to raise steam in a multitubular boiler, and a 12 horse-power nominal engine provides power for a variety of purposes in connection with the sanitary depot.

LEYTON (Population 90,000).
