(d) Means of Communication.—A Select Committee of the House of Commons, which reported in the year 1868, said: "Next to the general influence of the seasons, upon which the regular supply of our wants and a great proportion of our comforts so much depend, there is, perhaps, no circumstance more interesting to men in a civilised state than the perfection of the means of interior communication." Since that period the introduction and extension of railways and tramways has done much to improve our means of transport and communication, but the completion of the network of lines of internal communication and of traffic in our outlying and rural districts will, I think, be accomplished by the adoption of motor vehicles. Their absolute independence of route, of prepared way, of central generating station, and of one another, renders it possible for us to use them where the regular supply of our wants and a great proportion of our comforts so much depend, there is, perhaps, no circumstance more interesting to men in a civilised state than the perfection of the means of interior communication." Since that period the introduction and extension of railways and tramways has done much to improve our means of transport and communication, but the completion of the network of lines of internal communication and of traffic in our outlying and rural districts will, I think, be accomplished by the adoption of motor vehicles. Their absolute independence of route, of prepared way, of central generating station, and of one another, renders it possible for us to use them where the regular supply of our wants and a great proportion of our comforts so much depend, there is, perhaps, no circumstance more interesting to men in a civilised state than the perfection of the means of interior communication."

In rural districts, owing to insufficient or fluctuating traffic, it frequently does not pay to lay down either a rail or a tram way, in consequence of which considerable inconvenience, and even hardship, is inflicted upon a long-suffering portion of the population. Motor vehicles, which require neither metallic path nor ballasted track and can change their routes according to demand, offer a solution of the difficulty and a means of assisting the depressed agriculturalist. I venture to commend the motor vehicle to representatives of county councils and rural district councils as a possible means of reaching markets from which their constituents are now shut out by excessive railway rates or absolute lack of connection, and of putting their districts into closer touch with latter-day progress by affording the inhabitants increased facilities for travel.

(e) Incidental Advantages.—There are not a few minor advantages attached to the use of motor vehicles. In towns, for circulation within a prescribed area, it is highly probable that accumulator propulsion of cabs and similar light vehicles will provide a moderate day-load for electric generating stations. Motor vehicles will not halt, take freight, shy, or cause damage to persons or property, so long as they are in charge of a man of ordinary intelligence, for their control is simple and certain. Another matter, one also which affects

the public health, is the prospective diminution of the diurnal roar of street traffic which distracts our attention and tries our nerves. This will be achieved by removing the horse in a number of instances and, in order to protect the mechanical parts of the motor vehicle, fitting rubber tyres to the wheels. Again, as affecting the public health and the prosperity of the country wayside, a means of supplementing the bicycle for touring purposes is presented which could scarcely be improved upon.

CONCLUDING REMARKS.

In concluding his paper the author said:—

Before concluding, I wish to direct attention to the fact that in the few years that have elapsed since the revival of interest in the value and scope of motor traffic the most striking feature in this country has been the marked lack of public interest as compared with that evinced by our near neighbours, the French. This apparent apathy does not of necessity, indicate anything beyond that peculiar conservatism which is so characteristic of a Briton, even when his personal welfare and convenience are affected; but I submit that the movement deserves and demands recognition and encouragement. There is no reason to call for the extinction of the horse, which has a higher calling than a life of drudgery in hauling conveyances laden with goods and human beings through the streets and up the steep hills of our towns. It will ease our consciences to let this work devolve upon the motor. The present contention is that as the inconvenience, trouble, expense and general sanitary difficulties of street cleansing are almost entirely due to the excretions of the horse and to the hammering and distorting action of its hoofs, and as the same can be diminished by the use of motor vehicles, which also possess advantages as affecting the expense of refuse removal, the relief of congested thoroughfares, and the perfection of internal communication, sanitarians, as a body, should encourage the introduction and use of the more novel means of locomotion. In conclusion, I desire to acknowledge the fact that the subject of motor vehicles has already attracted the attention of some sanitarians, the engineers of Chelsea, Leicester, Wolverhampton and Liverpool having to my knowledge already taken steps to adopt them. I am also indebted to the cleansing superintendents of Glasgow, Derby, Huddersfield, Hull, Leeds and Sheffield for information bearing on part of my paper.

Mr. Shrapnell Smith, on concluding the reading of his paper, proposed that the conference should pass the following motion: "That this conference of municipal engineers, assembled in connection with the congress of the Sanitary Institute, this 28th day of September, 1898, is of opinion that the introduction and use of efficient motor vehicles should be encouraged by county, municipal, urban and other authorities, in view of the fact that the extended use of such vehicles would contribute to the general improvement of the sanitary condition of our streets and towns; and this meeting recommends that the council of the Sanitary Institute make known this opinion as widely as possible."

DISCUSSION.

It having been agreed to discuss both Mr. Moss Flower's and Mr. Shrapnell Smith's papers together,

Mr. PRICE (Birmingham) opened the debate by seconding the resolution proposed by the reader of the latter paper, especially as Mr. Smith had added the word "efficient." If all vehicles used in Birmingham were motor cars, Mr. Price said, the corporation could afford to have all the streets paved with wood.

Mr. EYRES said that, so far as his own experience went, he had seen motor cars which worked well and were free from excessive noise, but he had seen others which were abominations. He was sure that if there was a demand manufacturers would be able to put something on the road which was "efficient."

Mr. J. WILLIAMS (Mountain Ash, South Wales) referred to the tests of road metal published in *The Western Mail*, and made by Prof. Elliott, tests which were called those for "percussive-attrition," and which it was alleged had never been made before. He had had the pleasure of correcting this impression, as he had many years ago devised a machine similar to that used by Prof. Elliott. Cardiff was using a material which might not stand the test of "percussive-attrition" but was good for all the purposes of road-making. One of the great advantages of motor cars would be their enabling them to use local material which, though not necessarily the best, would make a road that would be good and easy for locomotion.

Mr. E. P. HOOLEY (Notts) thought Mr. Shrapnell Smith might possibly have read his paper with advantage in ten years' time. Mr. Smith had spoken of a motor car to carry 5 tons. Well, there had been started at Mansfield a company which was going to run motors to take the place of tram cars, but their vehicles could not even carry five persons, much less 5 tons. He thought the figures in the paper were mostly "jumped at." The Mansfield company had said they must have special roads for their motor cars, as granite wore out the rubber. It struck him that motor cars wanted not only special roads, but the whole of a road, if not for their steering for room for the horses they caused to shy. Roads for them would either have to be wood or tar paved. He would like to hear whether there was any chance of county authorities getting the benefit of the 5-guinea license for

motor cars. Referring to locomotives on highways, he thought municipal engineers who had not yet seen the new Locomotives on Highways Act, which would come into force on January 1st, should certainly do so, as it contained clauses which should be carefully studied.

Mr. PHILLIPS (Gloucester), as a county surveyor thought all county authorities would welcome "efficient" motor cars—that is, those that would not frighten horses, would travel without undue noise, and would carry freight at reasonable rates. It seemed to him, however, that motor cars improved as slowly as had traction engines. It was only the poverty of his county that caused him to employ these latter.

Councillor GLOVER (Mayor of Warwick), as a manufacturer said his firm were giving every attention to the subject. He thought it unwise to "rush" the matter, and to put on the roads motor cars of any sort which were not effective. He had been giving prolonged thought and experiments to a motor car he was making for dusting and watering, but he did not think it wise to put it on the market until he felt it was as perfect as it could be made.

Mr. MAWBY (Leicester) had advertised for tenders for motor cars. The difficulty seemed to be in the fuel for power. He had only had four proposals—two for Welsh coal and two for oils—and none were satisfactory. He had worked the matter out, and had come to the conclusion that if in Leicester they could use motor cars in their scavenging department they would effect a saving, and he would have no hesitation in adopting them if they could get a good one. He had been to Chiswick and seen a car working on a flat gradient. He then saw it, loaded with 3½ tons, go splendidly up a gradient of 1 in 12. He found also the driver could easily stop on an incline and start again, and that the car could be turned in a radius of 15 ft. He came away very highly satisfied on these points. He agreed with the author that as soon as they could get good motor cars they could be used with advantage in many ways.

Mr. SHRAPNELL SMITH, in reply, said the horse-power of motor vehicles on gradients was one of the most vital questions. They must be able to stop and start. In Liverpool they had been put to the severest test with satisfactory results. They had been run, carrying 5 tons, over the most horrible cobble roads, up gradients of 1 in 17, 35 miles for four days in succession, and had come through with the consumption of oil he had mentioned. They started from the river side and ran through traffic, and the delay was only nine minutes for the four days for the four vehicles under test. The use of kerosene or the best coal avoided the smoke nuisance. As to whether it was wheels or horses' hoofs that did all the damage to the roads, he would ask them, if they were cyclists, which part of the road they chose for riding. Was it where the horses' hoofs went? He had not said motors were ready for adoption; he had asked them to encourage their introduction and use. The Mansfield car Mr. Hooley had referred to was only made to carry 2 tons.

The resolution proposed by Mr. Shrapnell Smith was then put and carried, and on the motion of the president of the conference votes of thanks were unanimously awarded to Mr. Moss Flower and Mr. Shrapnell Smith for their papers.

The members of the conference then lunched together at the Grand Hotel, and in the afternoon visits were made to various works in Birmingham, in accordance with the programme given in our issue of September 23rd. We hope to be able to give some account of these works in a subsequent issue.

THE HEALTH EXHIBITION.

FIRST NOTICE.

Space will not permit us to give anything like an exhaustive notice of the numerous stands at the Health Exhibition, which, as noted in our last issue, was opened at Birmingham by the Lord Mayor on the 27th ult., and will remain open until the 22nd of the current month. Generally speaking, it may be said that, while there is little that is absolutely novel, the exhibition as a whole shows that great strides have been made, even in the past twelve months, in the artistic finish and practical development of the details of sanitary appliances. We give hereafter a few particulars of the more notable of the exhibits, taking them in the numerical order of the catalogue.

Mr. WILLIAM EGINGTON, of 176 Waterloo-road, Birmingham, occupies Stand No. 1 with a portable sewer-gas extractor and destroyer. A fan, driven by any convenient motive power, is intended to extract the gas and to force it through a fire. In conjunction with the extractor and destroyer there is an arrangement for vapourising chemicals under the action of another fire, so that with the assistance of drop-plates and airproof mats a section of sewer can be disinfected. The idea is to treat specially-infected areas.

Messrs. SHANKS & Co., of the Tubal Works, Barlhead, have a show which is perhaps the most conspicuous of its kind at Bingley Hall. Its chief feature is the collection of beautifully-decorated baths and really exquisitely designed and finished bath-room accessories. Here are to be seen applications of the well-known firm's vitreous enamel for baths and lavatories, which gives a surface equal to white porcelain enamel but at considerably less cost; spray baths for public baths and other institutions, fixed in ranges and intended to replace plunge baths; hospital baths, lavatories, sinks and

closets; and trough-closets and latrines for schools. Especially noticeable is the new 1898 pattern of the "Fin de Siècle" bath, with sprayed end, dispensing with a siphon, and a spray rack and soap tray attached to the end of the bath; while among their closets conspicuous is the "Barrhead" siphonic closet, with a new vulcanite seat which is quite non-absorbent and is claimed to be more sanitary than wood. It is being used in several hospitals and infirmaries now being erected. A feature of another closet, the "Silent Combination," is indicated in its title. A strong objection to siphonic closets has been their noisiness. Messrs. Shanks really seem to have overcome this, and at last to have produced a closet which is practically silent in working without sacrifice of efficiency in flushing.

Mr. GEORGE JENNINGS, of Lambeth Palace-road, London, has also a stand which will compare favourably with any in the exhibition. We hope to have an opportunity of referring to it in more detail in a later issue, but it may be noted here that he includes a splendid array of baths, lavatories, closets, urinals, sinks and the like, many of them incorporating recent improvements.

Messrs. DOUTLON & Co., of Lambeth, have also an exhibit worthy of their world-wide reputation. Baths of all kinds—shower, douche, spray and plunge—are again conspicuous. One is struck with the attractive qualities of their vitreous enamelling, an effective process which is cheaper than porcelain and the older enamels, is really artistic, and is impervious to the acids of soap. Some sinks shown are also remarkable for the beauty of the white-glazed fireclay and for the "truth" of their lines. A ceramic ware fireplace, erected in terra-cotta and suitably glazed and decorated, will also be noticed; and of course one sees, too, some beautiful examples of Doulton ware panels. The artistic and the practical combine harmoniously on Messrs. Doulton's two stalls.

Messrs. THOMAS WRAGG & SONS, of Swadlowcote, Burton-on-Trent, have a goodly show of Hassall's well-known pipes, channels in white enamel and salt-glazed, gulleys, intercepting traps, sinks, lavatories, closets and other appliances.

THE SEPTIC TANK SYNDICATE, Limited, of 7 and 8 Belford-circus, Exeter, show a model of a complete installation of the Cameron septic tank and five filters, and another working model of an installation for small isolated residences and explanatory diagrams. Mr. Cameron's system of sewage treatment is so well known to our readers that we need not further refer to it here. Adjoining is the stand of Messrs. FARBER, BARBER & Co., of Cannon-street, Birmingham, who, as agents, show automatic tanks, baths, lavatories, the Hellwell patent system of glazing, and other appliances; next we come to the five earth-closets shown by the BRITISH SANITARY COMPANY, of Bothwell-street, Glasgow; and beyond that to the large and attractive exhibit of Messrs. W. HARRIDAN & Co., Limited, of Newcastle-on-Tyne, in which the prominent features are yard sinks, gulleys, channels and intercepting traps for inspection chambers, closets, lavatories, and the well-known specialties associated with the name of "Barron."

Messrs. S. DIBBLE & SON, of Ledsam-street, Birmingham, show a sink and automatic waste-water closet, in which the pan is flushed by the water from the sink without the aid of a separate flushing apparatus; Messrs. JOSEPH SANKEY & SONS, of Bilston, show three steel-clad and copper-lined baths; Messrs. F. C. CALVERT & Co., of Bradford, are represented by a show-case of their well-known disinfectants and other preparations; Mr. W. T. ALLEN, of Whitehouse-street, Aston-road, Birmingham, shows automatic latrines and water-closets; Messrs. CALLENDER & MONTGOMERY, of 11 Victoria-street, London, show samples of those excellent inventions—Callender's bituminous damp course and "Jhilmil" lathing; Messrs. L. HUGH BRISTOW & Co., Limited, of Victoria-street, London, show a portable plant of Riddell's patent filter; and Messrs. C. ISLER & Co., of Bear-lane, Southwark-street, London, exhibit their invaluable tube-welding apparatus.

TYNFORDS, Limited, of Cliffe Vale Potteries, Hanley, have an exhibit of considerable importance and interest. One notices the beautiful design of their "Bidet" closet, which in compact form comprises all the arrangements for spray, douche and thorough flushing; their "Deluge" closet, too-well known to need description; the "Orion," a new feature in wash-down closets, made of a special kind of ware ("Vitrina"), for which they claim non-absorption, even should the surface glaze be in any way accidentally removed; the "Tyxford," a siphonic closet for which it is claimed that it has the advantages of a large surface area of water, depth of seal, almost noiselessness in action, and particularly simplicity of construction and ease of fitting. A new bath shown is one of fireclay, with all the appearance of a first-class marble bath, but with the advantage over marble of being non-porous and practically undestructible. It is fitted for spray, douche or hand-douche, and its arrangements for hot and cold water are in most compact form. One notices particularly its handsome hand-douche appliance, the latter rubber tube being encased in a patent bright spiral metal covering, its large extended tray at the back, its inboard inverted rim, and a ribbed bottom to do away with the possibility of accidents from slipping. The "Atmos" anal lavatory is a neat arrangement of two basins on one slab of earthenware; and near it is the "Adamant" urinal, made in various styles and designs and in a great variety of materials, fireclay, with inlaid tile trends and concealed channel. A notable feature of the stand is a three-division sink, 6 ft. long by 24 in., a

size very seldom attempted, owing to difficulties of manufacture. Here also are a number of siphonic closets, of hopper and drain, with a special one for the use of flushing purposes; a sink which has been adapted for hospital use in connection with the Birmingham Workhouse; an automatic hospital sink, consisting of a siphonic washing basin, with "Neros" standing water fitting for basins and enlarged outlet; the "Barrhead" latrine sink, consisting of double compartment sink for washing purposes, a sprayer, and receptacle for garbage to be retained and protected from burning, and with the firm's patent "Inserta" in its wooden rim to prevent chipping; a surgical instrument sink, a most useful appliance for washing surgical implements; and the "C.V." lavatory range, marbled with the design of marbling; and the "Athina Neros" range of three lavatory basins. Space will permit us to notice only a few more of the many exhibits—the "Inserta" combination closet, an ingenious adaptation of wood to the rim so as to avoid risk of fouling or of destruction of the material; this is the closet which has been adopted by the Manchester Corporation for their municipal lodging-houses.

THE PENDELTON SANITARY ENGINEERING COMPANY, of Pendleton, Manchester, have erected an elaborate red-tick wall to show the working of Dr. Quine's sanitary ash-tray; Messrs. ROWE, BROTHER & Co., of the City Lead Works, Manchester, have on view specimens of lead manufactures; and Messrs. EYRE & Co., of London, Birmingham and Smethwick, show closets, flushing tanks and plumbers' trade work of considerable merit.

Messrs. ADAMS & Co., of York, Leeds, London, Birmingham and other places, are the occupiers of the next stall. The new ware, "Titanite," manufactured by this firm has a beautiful appearance and should find favour. It is composed of a new mixture of clays, which are claimed to give the strength of fire-clay with the finish of queen's ware. Lavatories, sink-sinks and closets are all shown in this ware. The hospital closet is especially designed for this work, and, combined with enamelled iron-casing for flush pipe in a special cistern, is particularly useful for asylum work, where it is desirable that no projection or ledge should be visible. The Adams insular multiple closets are for school and factory use, a great improvement on the old latrine and trough closet. Other fittings are surgeon's lavatory and a slop-sink, with drainer and water jet for cleaning bed-pans for hospitals and infirmaries; and two special types of urinals. One special feature is the Adams new improved disconnecting siphoned trap, which has the eye for inspection in a direct line with the drain, and thus gives greater facility for rodding and enables it to be used as a lamp-eye as well. Besides these advantages, the trap itself has its outlet much nearer the inlet than in the ordinary type, and it is thus easily reached, by hand from the inspection chamber. The Adams patent sewage lift is shown in operation. This apparatus is now widely known in this country and abroad for its ingenious adaptation to the raising of low-level sewage to any desired level. Where available the high-level sewage in the same district can be used by means of this apparatus to raise the low-level sewage. In other cases clean water may be used to do the work in such a way that this water may be afterwards applied to other purposes, so that whether sewage or water is used to give the power required, the first cost of the apparatus is, in nearly all cases, the only cost, there being no outlay whatever for maintenance and repairs. These sewage lifts already, installed in actual works (some for four and five years now) are giving every satisfaction, and can be inspected on application to Adams' Patent Sewage Lift Company at York.

Passing on to the exhibit of Messrs. GEORGE SKELLY & Co., Limited, of Tamworth, there will be found an array of closets, drain pipes, damp-proof courses, chimney tops, sinks and other useful appliances, most of them well tried and appreciated; while adjoining are the shows of Messrs. SUTTON & Co., of Overseal, near Ashby-de-la-Zouch, who exhibit their selected salt-glazed stoneware pipes, bends, junctions, channels and other connections, their street and other gulleys, and a well-chosen variety of their other appliances; and of DAY'S AUTOMATIC WASTE-WATER CLOSET CO., Limited, whose chief feature is the well-known "Stafford" automatic waste-water closet.

The following is the full list of awards:—

Senior Medal.

Adams' Automatic Sewage Lift.—Adams & Co., Birmingham. Jaeger Wooten Underclothing.—Allports, 21 and 23 Colindale Avenue, Birmingham.

Case for Water Analysis and Chemicals in Soils for Water Analysis.—Burgess, Welme & Co., Snow-hill Buildings, London, E.C.

Compressed Chemical Substances.—Burgess, Welme & Co., Snow-hill Buildings, London, E.C.

Products of Coal Tar and Ammoniacal Liquor.—Burgess, Welme & Co., Snow-hill Buildings, London, E.C.

Pure Carbolic Acid.—F. C. Calvert & Co., Bradford, Manchester.

Patent Compound Paper and Paper.—Sutton & Co., Limited, 17 Hanley Road, London, E.C.

- Equifex Pressure Disinfecting Apparatus.—J. Defries & Sons, Limited, 147 Houndsditch, London, E.C.
- "Fryston" Range.—Ferrybridge Foundry Company, Ferrybridge, Yorks.
- Pure Cocos.—J. S. Fry & Sons, Limited, Union-street, Bristol.
- Shone's Hydro-Pneumatic Ejector.—Hughes & Lancaster, 47 Victoria-street, London, S.W.
- Automatic Water Steriliser.—Maiche, Limited, 4 St. Mary-axe, London, E.C.
- Mercury Gas Governor.—J. Stott & Co., Vernon Works, Oldham.
- Vaillard Desmaronx Water Steriliser.—Jas. E. Webb, 52 Queen Victoria-street, London, E.C.
- Brougham Ambulance.—Wilson & Stockall, County Ambulance Works, Bury, Lancashire.
- Accident Ambulance.—Wilson & Stockall, County Ambulance Works, Bury, Lancashire.
- Bronze Medals.*
- Adamant Plaster for Walls and Ceilings.—The Adamant Company, Limited, 6 Commercial-street, Birmingham.
- Wedge Disc Valve.—Adams & Co., Birmingham.
- Method of Aërating Water by Means of Compressed Carbon Dioxide.—Aërotors, Limited, Broad Street-avenue, London, E.C.
- Simplex Cinder-sifter.—Arkininstall Brothers, Milk-street, Birmingham.
- Liquid Sulphur Dioxide for Disinfection.—A. Boake Roberts & Co., Limited, Stratford, London, E.
- Petanelle Fabrics.—Brion, Pate, Burke & Co., 15 Walbrook, London, E.C.
- Expanding Drain Stopper.—Burn Brothers, 23 Charing-cross, London, S.W.
- Rapid Mixer for Liquids.—Burt, Boulton & Haywood, Limited, 64 Cannon-street, London, E.C.
- Callender Pure Bitumen for Linings.—Callender & Montgomery, 11 Victoria-street, London, S.W.
- "Perfect" Straining Cover for Cooking Utensils.—The Cannon Hollow-Ware Company, Limited, Bilston, Staffs.
- The "Chef" Gas-cooker.—The Cannon Hollow-Ware Company, Limited, Bilston, Staffs.
- Aërated Waters.—Chemists' Aërated and Mineral Water Associations, Limited, The Rock Spring Works, Cheston-road, Aston, Birmingham.
- Whitehead's Automatic Taps for Drawing off Liquids.—Clark's "Optimus" Coffee Company, Queens-road, South Lambeth, London, S.W.
- Automatic Gas-Stove.—Davis Gas-Stove Company, Limited, Camberwell, London, S.E.
- Low-pressure Ventilating Radiator.—A. R. Dean, Limited, Corporation-street, Birmingham.
- Fibrous Plaster.—A. R. Dean, Limited, Corporation-street, Birmingham.
- Louvre Air Bricks.—J. Duckett & Sons, Limited, Burnley, Lancashire.
- Enamelled Glazed Urinals.—J. Duckett & Son, Limited, Burnley, Lancashire.
- Jackson's Self-feeding Water-boiler.—Eclipse Brass and Copper Company, Limited, Harrison-road Works, Halifax.
- The "Helliwell" System of Glazing.—Farrer, Barber & Co., 36 Cannon-street, Birmingham.
- Combined Sink and Lavatory.—Farrer, Barber & Co., 36 Cannon-street, Birmingham.
- Formalin.—Formalin Hygienic Company, 9 St. Mary-at-Hill, London, E.C.
- Adaptation of the Braille System to Phonetic Reporting for the Blind.—General Institution for the Blind, Birmingham, Edgbaston, Birmingham.
- New Rotary Watering-Van.—W. Glover & Sons, Limited, Eagle Works, Warwick.
- Floor Channels, with Sockets for Waste Pipes.—W. Harriman & Co., Limited, Fenkle-street, Newcastle-on-Tyne.
- Barron's Channel Bends made to pass a Drain Plug.—W. Harriman & Co., Limited, Fenkle-street, Newcastle-on-Tyne.
- Biscuits.—A. Hughes, 88 Moor-street, Birmingham.
- Hutchings' Food-steamers.—G. J. Hutchings, 94 Clerkenwell-road, London, E.C.
- Tube Wells.—C. Isler & Co., Bear-lane, Southwark, London, S.E.
- Jeyes' Fluid.—Jeyes' Sanitary Compounds Company, Limited, 64 Cannon-street, London, E.C.
- Reversible Window with Lines and Weights.—Joues James, 317 Albert-road, Aston, Birmingham.
- Paragon Washer, Wringer and Mangle.—E. N. Kenworthy & Co., Alpha Works, Oldham.
- "Equipoise" Wringer and Mangle.—E. N. Kenworthy & Co., Alpha Works, Oldham.
- Chinosol.—Bernard Kuhn, 36 St. Mary-at-Hill, London, E.C.
- Wall Decorations in Leeds Faience.—Leeds Art Pottery and Tile Company, Leathley-road, Leeds.
- Willenden Paper.—C. A. Line, Burlington Chambers, New-street, Birmingham.
- Tynecastle Canvas.—C. A. Line, Burlington Chambers, New-street, Birmingham.
- Mellin's Food for Invalids.—Mellin's Food Company, Limited, Peckham, London, S.E.
- Boiler Bath.—Mould's Patent Boiler Bath Company, 3 Union-passage, Birmingham.
- Izal.—Newton Chambers & Co., Thorncliffe, Sheffield.
- Glazed Stoneware Manger.—Oates & Green, Limited, Halifax.
- Salt-glazed Wash-Tub and Rubber Combined.—Oates & Green, Limited, Halifax.
- Jones' Combination Bath.—Parker, Winder & Achurch, Limited, Broad-street, Birmingham.
- Ventilated Hot Closet for Eagle Stove.—Parker, Winder & Achurch, Limited, Broad-street, Birmingham.
- Penny-in-the-Slot Prepayment Gas-meter.—W. Parkinson & Co., Bell Barn-road, Birmingham.
- Dr. Quine's Ash-Bin.—Pendleton Sanitary Engineering Company, Leaf-square, Pendleton, Manchester.
- Thermometer for Hospital Wards.—W. W. Rolston, 120 Pope-street, Albion-street, Birmingham.
- Lead Pipe made in any Length.—Rowe, Brothers & Co., City Lead Works, Clement-street, Birmingham.
- Water-Closet Ventilating Fan Worked by High-pressure Supply to Flushing Cistern.—Sanitary Ventilating Syndicate, 40 Lower Ormond-quay, Dublin.
- Aërated Waters.—Schweppes, Limited, Colwall, Malvern.
- Perfecto Lavatory.—Shanks & Co., Barrhead, N.B.
- Perfecto Bath.—Shanks & Co., Barrhead, N.B.
- "Duresco"—Silicate Paint Company, Limited, Charlton, London, S.E.
- Aërated Waters Prepared from Distilled Water.—Sonthall Brothers & Barclay, Lower Priory, Birmingham.
- Steam Tip-Waggon.—Steam Carriage and Waggon Company, Homefield, Chiswick.
- Hydraulic Ram with Valve.—Stocks, Sons & Taylor, Berkeley-street, Birmingham.
- Improved "Challenge" Ironing Machine.—Summerscales & Co., Phoenix Foundry, Keighley, Yorks.
- Washing Machine for Disinfecting under Steam-pressure.—Summerscales & Co., Phoenix Foundry, Keighley, Yorks.
- Green's Wyrust Channels and Inlets for Manholes.—Sutton & Co., Union Pottery, Overseal, near Ashby-de-la-Zouch.
- "Axis" Water-Closet, with screw brass joint.—Twyfords, Limited, Hanley.
- Triple Vegetable-Sink.—Twyfords, Limited, Hanley.
- "Ideal" Sink in two compartments.—Twyfords, Limited, Hanley.
- Chlorox.—United Alkali Company, Limited, Gaskell and Deacon Works, Widnes.
- Concentrated Vimbos.—Vimbos, Limited, 130 Queen Victoria-street, London, E.C.
- "Whitely" Exerciser.—Whitely Health Exerciser, Limited, 29 Maltby-street, Bernoldsey, London, S.E.
- Deferred for Practical Trial.*
- Automatic Flushing-Tank.—Wm. Thomas Allen, Whitehouse-street, Aston-road, Birmingham.
- "Acme" Ventilator.—T. Ash & Co., 37 Cannon-street, Birmingham.
- Eureka Lead Water-pipe.—A. Barnclough & Co., Limited, Eureka Lead Works, Heckmondwike.
- Steam Heater for Hot-Water Warming and Supply.—Burn Brothers, 23 Charing Cross, London, S.W.
- A Court and Binny's System of Hot-Water Warming and Supply.—Burn Brothers, 23 Charing Cross, London, S.W.
- Automatic Grease-flusher.—J. Duckett & Son, Limited, Burnley, Lancs.
- Automatic Syphon-Cistern.—J. Duckett & Son, Limited, Burnley, Lancs.
- Automatic Flushing-Tank.—Evered & Co., Limited, 27 Drury-lane, London, W.C.
- Automatic Flushing-Tank.—Farrer, Barber & Co., 36 Cannon-street, Birmingham.
- Fischer System of Water Filtration.—Hughes & Lancaster, 47 Victoria-street, London, S.W.
- Daplex Supply and Sanitary Waste-Valve.—George Jennings Palace-road, Lambeth, London, S.E.
- "Viking" Condensed Milk.—Fred Lomax, 27 Freeman-street, Birmingham.
- Chimney Pot.—Mansfield Patents Company, Queen-street Chambers, Mansfield, Notts.
- Mansfield Ventilator.—Mansfield Patents Company, Queen-street Chambers, Mansfield, Notts.
- Pullen's "Scorcher" Paint-Lamp.—Martineau, Beames & Madeley, Holloway Head, Birmingham.
- "Victoria" Ventilator.—Parker, Winder & Achurch, Limited, Broad-street, Birmingham.
- "Empress" Ventilator.—Parker, Winder & Achurch, Limited, Broad-street, Birmingham.
- "Standard" Ventilator.—Parker, Winder & Achurch, Limited, Broad-street, Birmingham.
- Zinc Roofing.—Plant & Co., 66 Dale-end, Birmingham.
- "Protene" Food.—Protene Company, Limited, 36 Welbeck-street, London, W.
- "Septic" Tank.—"Septic" Tank Syndicate, 7 Bedford-circus, Exeter.
- Non-concussion Taps.—Shanks & Co., Barrhead, N.B.
- Spiralvent Chimney Top.—G. Skey & Co., Wilcote Works, Tanworth.
- Sterilite Filters.—Sterilite Filter Company, 15 Haymarket-street, Bury.

Quarries for Hoating Drying-Sheds.—Sutton & Co., Union Pottery, Oversal, near Ashby-de-la-Zouch.
 "Twyckiff" Syphon Closet.—Twyfords, Limited, Ilanley.
 "Excel" Silver.—J. E. Webb, 52 Queen Victoria-street, London, E.C.

In our next issue we shall continue our report of the general proceedings of the congress, selecting, in accordance with our usual custom, the papers and discussions in which our readers are likely to be interested. We shall also conclude our notice of the exhibits.

MUNICIPAL OFFICERS' ASSOCIATION.

THE QUESTION OF SUPERANNUATION.

In our last issue we made a brief reference to the joint report of the chairman and secretary of the Municipal Officers' Association in regard to the superannuation conference convened by that body. The following is the text of the report:

In continuation of the report presented last year we regret being unable to place on record the passing of the Local Authorities Officers' Superannuation Bill. The conference, at its meeting, held at 117 Holborn, on the 14th November, 1897, decided to re-introduce the Bill again in Parliament in the session of 1898, and to ask the delegates to approach members of Parliament with the view of getting promises for the ballot. A number of members balloted, but, unfortunately, none were successful in obtaining a good place.

Sir H. Seymour King, K.C.I.E., very kindly undertook the charge of the measure, which was read a first time on February 22, 1898, and was put down for second reading on April 5th, 18th, 19th, May, 17th, 18th, and finally on June 17th; but, finding that it was hopeless to proceed further, the measure was then dropped. At the same meeting Mr. C. William Tagg was appointed to take charge of the Bill on behalf of the conference, and Mr. C. J. F. Carnell, hon. secretary, and the associations and societies represented on the conference, were asked to subscribe £10 each towards the expenses. The question of the introduction of other Bills was very fully gone into, and a committee of four—viz., Messrs. C. W. Fagg, Dr. Dudfield, Geo. Chaloner, and C. J. F. Carnell—was appointed to confer with other associations and societies (who might be contemplating such action) as to the best method of bringing the passing of the Bill to a successful issue.

The Metropolitan Local Government (Officers') Association, on being informed of the appointment of this committee, wrote a letter stating that a special meeting would be held on January 17, 1898, to confer with it. Messrs. Dudfield, Geo. Chaloner and C. J. F. Carnell attended. As a result of this interview a letter was received from the Metropolitan Local Government Officers' Association expressing the hope that in the interest of the two Bills all reference to the officers to whom the Superannuation Act, 1895, applies should be omitted from the Conference Bill. This letter was submitted to the conference on January 24th, and the following resolution was passed:—

"That this conference, representing every section of municipal officers throughout the country, cannot see its way to omit from the Conference Bill all reference to the officers to whom the Superannuation Act, 1895, applies, and that it sees no reason why the two Bills should not be introduced side by side; moreover, the Bill promoted by the Metropolitan Local Government Officers' Association is deemed to be unsatisfactory, inasmuch as officers are unable to count their years of service from one local authority to another."

They were also informed that the conference would be prepared to give all possible support to the measure, feeling sure that their association would reciprocate the kindly feeling, and if both Bills passed a second reading and were referred to the same committee, arrangements would doubtless be made to meet the necessities of the case and to prevent clashing of interests.

THE DRAINAGE OF NEWHAVEN.

The following extract is taken from *The East Sussex News*. We understand that the sewer in question is about a mile long, and was laid twelve years ago by a contractor without proper supervision. The extract is as follows: The Newhaven Urban District Council have received a report from their surveyor (Mr. E. J. Rayner) which caused them great anxiety. It is in reference to the main sewer from Elphick-road to the culvert, and the information contained in the document will be found to be of a very startling character. This particularly refers to the portions from Huggett's Barn to Bassex-place, from Bishopstone-terrace to Sea View House, and from Messrs. Colgate & Gray's place near the cricket ground to the pond, as in each instance the fall is the wrong way, while two other lengths are reported as being dead level—viz., from the Bridge Hotel to the Ship Hotel and from 74 to 73 Chapel-street. There is an insufficient fall in four cases, the incline varying from 1 in 375 from the river bank to the Bridge Hotel, to 1 in 1,372 from the coastguard station

to Messrs. Colgate's office, with the portions from 73 Chapel-street to Bishopstone-terrace and from Sussex-place to 74 Chapel-street an even worse, the fall in one case being 1 in 6,500 and in the other 1 in 8,150. The only satisfactory feature of the report is the statement, in regard to the sewer from the ventilator to the culvert, which is spoken of as good, the inclination being 1 in 56. To summarise the results arrived at it may be mentioned that three portions fell the wrong way, three are spoken of as having an insufficient fall, two as being dead level, four as being fair, one as being bad, four as being very bad, and one as being good. The obvious inference is that nearly the whole of the main sewer from Elphick-road to the culvert will have to be taken up and re-laid, and the ratepayers may therefore rest assured that their contributions towards the cost of local government will not decrease at present. However, they will be able to console themselves with the fact that even a high rate is preferable to periodical outbreaks of infectious disease, and that there will be such other risks no doubt can exist while sewage is expected to run uphill.

NEW PUBLIC BUILDINGS AT WEST HAM.

Mr. J. Passmore Edwards yesterday opened a new technical institute and central free public library erected by the West Ham Corporation. He also laid the foundation-stone of a natural history museum, which will be built close by. The new buildings, which stand at the corner of Romford-road and Water-Lane, Stratford, are in the form of a large quadrangle. The technical institute has its main front and entrance in the Romford-road, its upper floor extending over the library premises in Water-Lane. It is in what may be called a free Renaissance style, the exterior being of Portland stone and red brick. The design of the interior is throughout utilitarian. In the large hall lectures will be given and examinations held. The hall may be let for purposes which will not interfere with the work of the institute. Every department is well equipped, special attention being paid to the chemical laboratories and the engineering workshops. The institute will be wholly under the control of the municipality, and will be financed from municipal sources. The buildings have cost £45,000, and a further £15,000 has been spent on equipment and fittings. The new central library is wholly on the ground floor, and is fitted with all the modern appliances of such institutions. The reading-room is 110 ft. long by 30 ft. wide. It is surrounded with a tiled dado embellished with literary maxims in an ornamental border. The cost of the building has been between £8,000 and £9,000, and about £1,000 has been spent on the furniture and fittings. Messrs. Gibson & Russell were the architects of the buildings. The whole of the buildings will be lighted by electricity supplied from the corporation mains.

QUERIES AND REPLIES.

SL 1350, re-managing Queries should be made separate, a white paper, in plain black-ink lines. Lettering in figures should be bold and plain.

213. Sewage Disposal: Triplicate Treatment.—"A.C." writes: Can you or any of your readers inform me of cases in this country where town sewage is subjected to the combined treatment of chemical precipitation, artificial filtration and land filtration?

We are not aware of any instance where sewage is treated on the triplicate system, such as that referred to by our correspondent. We believe that at Sutton (Surrey), Wimbledon, Friern Barnet and one or two other places in the south the several systems may be seen at work side by side, portions of the sewage being precipitated in settling tanks, and the topwater drawn off and treated on fine grain artificial filters or on land, according as one or the other may be ready to receive it, while another portion is treated on coarse-grain bacteria filters, the filtrate being further treated on fine-grain bacteria filters or on land. But we do not know of any town which in practice treats its sewage on the lines named by the querist. Perhaps some of our correspondents will be able to assist us with information which may be useful to our correspondent.

Street-watering in London.—Mr. Henry C. Jones, clerk to the Board of Works for the St. Giles district, has addressed the following letter to *The Times*: "In your issue of the 20th ult., 'C. F. M.' suggests that the practice of watering the gutters of the carriage ways pavements should be discontinued, on the ground that very many inconvenient engines and riders in calved down of vehicles in consequence of this partial watering. May I permit a brief notice on your issue to say that this course was suggested by Sir E. R. C. Bradford, Chief Commissioner of Police of the Metropolitan Police, in a circular which he issued to local authorities recently on August 24th last, as he attached great importance to this work being carried out in the way now employed. It was found that the practice would had largely effected a saving of watering led to accidents."

Comparative Reports of General Practice.

XXIX.—ELECTRIC LIGHTING : BECKENHAM REPORT.—I.

Mr. John A. Angell, engineer and surveyor to the Beckenham Urban District Council, not long ago submitted to that body a preliminary report on the proposed electric lighting of the district. After pointing out that a provisional order was obtained in 1890, and that in 1893 a report on the subject was presented by Mr. Gisbert Kapp, the report proceeds as follows:—

THE MUNICIPALISATION OF ELECTRIC LIGHTING.

Until within recent years it was the usual practice of local authorities to favour the undertaking of electric lighting by private companies. Lately, however, public opinion has changed, so that, whilst formerly the majority of undertakings were private companies, in the year 1896 only fifty-nine companies existed, as compared with seventy-four municipal undertakings. Again, in 1890, out of fifty-seven provisional orders applied for one-fourth only were granted to local authorities, whilst in 1896 twenty-seven out of a total of thirty provisional orders were taken up by local authorities. During the present year over thirty local authorities have applied to the Board of Trade for provisional orders.

The loans raised by local authorities, on the sanction of the Local Government Board, for electric lighting have also steadily increased during recent years, thus: In 1890-91 the loans sanctioned amounted to £10,000; in 1891-92, £101,000; 1892-93, £115,000; 1893-94, £572,000; 1894-95, £560,000; and in 1895-96, £796,500. During 1896 loans were raised by forty local authorities, the maximum period allowed by the Local Government Board for repayment being (with one exception) twenty-five years.

Among other more or less cogent reasons in favour of municipalisation are: That (1) the creation of a monopoly (certain to be profitable in the future, though not in the immediate present) is prevented. (2) Greater confidence is felt and greater public support obtained. (3) A heavy cost is involved in buying out a private company prior to the termination of the statutory period.* (4) Public street lighting should be in the hands of the local authority. (5) The capital cost is raised on easier terms by a local authority.

There is, perhaps, but little force in the latter contention (No. 5), inasmuch as a local authority must from the outset pay annual instalments of sinking fund and interest (equivalent approximately to 6 per cent. on the total amount of the loan) out of revenue, or, in default, out of public rates. Whilst admitting that in the earlier years deficits are almost inherent to the undertaking,† yet the prevention of a monopoly would in itself seem to be all-important, and, in the light of present experience (especially in relation to water and telephones), an imperative duty on the present generation. Indeed, as to the wisdom of municipalisation, there appears to be no doubt, inasmuch as, whilst the deficits of early years will probably represent a less burden on the rates than the subsequent cost of buying out a private company, ultimately, under proper management, all such undertakings cannot be otherwise than profitable. The policy, therefore, of leasing to a private company for a term of years the rights of supply does not appear to me to recommend itself.

As to whether a local authority shall of its own initiative enter upon an undertaking purely on its own merits, and in advance of suggested competition by a private company, is, of course, a matter for consideration, the determining factors

* Under the Electric Lighting Act, 1888, sec. 2, the council may, by compulsory purchase, acquire an electric light undertaking after the expiration of forty-two years, or thereafter at subsequent intervals of ten years, at the then fair market value, without addition for compulsory sale, goodwill or profits.

At Bromley the provisional order has been transferred to a private company for the statutory period of forty-two years, under agreement for re-transfer to, and at the option of, the council on the following terms—(1), Purchase price after seven years from date of transfer 20 per cent. above capital expended (less depreciation), after fourteen years 16 per cent., twenty-one years, 12 per cent., twenty-eight years 8 per cent., thirty-five years 4 per cent. Assuming Beckenham to adopt the same course, purchasing, say, after fourteen years, the comparative financial results of the two modes of working, by (a) company, (b) local authority, would be approximately as follows:—

I. COMPANY.		£	s
For compulsory purchase of Stage I. by local authority after, say, fourteen years, 16 per cent. on capital cost (£20,000)		3,200	
II. LOCAL AUTHORITY.			
Aggregate deficits (Appendix I.) of first three years of working		2,000	
Balance in favour of council as undertakers			500
Annual profits for eleven years, at £500 per annum			5,500
Balance in favour of council on fourteen years' working			45,800

This amount, £45,800, would therefore represent the estimated loss* to the council during the fourteen years if the provisional order were transferred to a private company.

(In connection with this Beckenham Mr. Angell points out that computation of annual profits for eleven years at £500 per annum is only an estimate, being the probable profit of the fourth year, which amount would increase year by year.)

* As the Local Government Board will probably not extend the requirement of loan by 10 to 12 per cent.

† Brighton and Tonbridge Wells are exceptions, in all whatever having been made on the rates.

being public feeling, character and needs of the districts, and probability or otherwise of early success.

In the matter of electric lighting, as in most other things, Beckenham presents features special to itself. Its large area, unusually scattered houses, distance apart, great depth of front gardens, prevalent leasehold system, migratory habits of its residents and consequent diminished interest in local affairs, long summer and winter vacations, absence of any convenient central site for the generating station, represent disadvantages. On the other hand, the wide roads, bordered with trees, lend themselves effectively to street lighting from the centre of the road; laying of cables, &c., is facilitated by gravel paths or margins; and high-class residences are precisely those from which demand is likely to be active. Absence of many shops is no grave disadvantage, for, although a fair proportion of shops to houses is preferable, shop supply in itself is brief and heavy and to that extent unremunerative.

Whilst the growth of incandescent gas lighting during the past four or five years has checked and probably will continue to check the development of electric lighting generally, Beckenham has neither more nor less to fear in this respect than other districts. In my opinion the time is approaching when gas companies will of their own initiative substitute incandescent gas for ordinary street lighting.

Speaking generally, metropolitan suburbs, such as Beckenham, do not present such favourable conditions of success as provincial towns, partly owing to the less migratory habits of their inhabitants, and partly to the fact that local energy, enterprise and initiative is more concentrated on local concerns in such self-contained centres.

The sanitary and economic advantages of electric light do not require emphasising. The non-consumption of air and absence of impure waste products of combustion are important recommendations. A very considerable saving (not sufficiently appreciated by the public generally) is also effected in whitewashing and cleansing walls, ceilings, ro-papery, re-decoration, renewing delicate fabrics, &c. The comparative immunity from fire afforded by electric light is also a point in its favour.

The street lighting also, if effectively done, presents a very attractive feature, serving not only to advertise the light, but tending to attract residents to the district, and when here to induce them to stay, inasmuch as but few persons will by choice quit a brilliantly-lighted, and consequently cheerful, district for one in which comparatively depressing feeble yellow gaslight prevails.

In considering the financial, as distinct from the technical, aspect of municipalising electric light three considerations present themselves—viz:—

- (1) Capital cost.
- (2) Working expenses (including repayment of loan).
- (3) Revenue.

Capital cost can be determined with a fair degree of accuracy; even if somewhat under-estimated, the comparatively small increased repayments do not materially affect the prosperity of the scheme. Estimates of both working expenses and revenue are merely conjectural, especially so in respect to revenue, based as it is on a suppositious rate. Nevertheless, says Mr. Angell in concluding this part of his report, as on revenue depends the success of the undertaking, some effort should be made to determine possibilities.

MR. GISEBERT KAPP'S REPORT.

In referring to Mr. Kapp's report Mr. Angell tells us that, for the purposes of estimates, he divided the scheme into two stages, the first stage comprising compulsory streets and streets down which the mains must necessarily pass to reach these latter, and the second stage, streets in which a supply will eventually be required. Mr. Angell, however, has submitted new proposals, under which the scheme may be divided into three stages, each stage working progressively outwards from the generating station in Arthur-road, and including on its way (where deemed advisable) all minor streets. It is not considered that the operations in any one stage need necessarily await the completion of the previous stage or stages. On the contrary, it is held that the principal cables once laid in stage No. 1, as indicated in the schedule which forms Appendix II. of the report, subsequent stages and minor streets could be dealt with wholly or partially as riper experience might determine. Stages Nos. 1 and 3, it is thought, might be carried out, in whole or in part, at one and the same time.

Having thus created two stages of lighting, Mr. Kapp estimated that in each stage respectively one-fourth and one-half of the total number of houses would take current, and he further assumed that the first stage (one house in four) would take supply shortly, and the second stage (one house in two) be reached in from three to five years. Mr. Angell, however, is of opinion that two or three years of deficit must elapse before one house in four is supplied, and that it is doubtful whether any electric lighting scheme in this country has arrived at the second stage (one house in two) even after

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SEWER "MADE FOR PROFIT": PUBLIC HEALTH ACT, 1875, SECS. 13 AND 144; HIGHWAY ACT, 1835, SECS. 67 AND 68.—An interesting contribution to the cases relating to the definition of a "sewer" is afforded by the decision in *Croydale v. Sunbury-on-Thames Urban District Council* (Chancery Division, Mr. Justice Stirling). The plaintiff was the owner of a field on the west side of a road known as Green-street. The field slopes downward from the street, and then rises again. In the dip are two ponds. On the same side of Green-street was at one time an open ditch, from which there ran down a line of pipes, which discharged into one of the ponds. The end of this line of pipes next to the ditch was protected by a grating at a level of more than 2 ft. below the surface of the road, while the end next to the pond projected to the extent of 6 in. or thereabouts. In December, 1896, the plaintiff, with a view to filling up the pond, removed the line of pipes so far as it existed on his land. Subsequently the council entered on the plaintiff's lands, and cut a trench between the ditch and the field, for the purpose of running off the surface water from Green-street. The present action was thereupon brought, claiming (1) a declaration that the defendants are not entitled without the leave or license of the plaintiff to draw the surface water from Green-street, or from any of the roads or streets in the parish of Sunbury-on-Thames, into the plaintiff's pond or land, or to lay down or make on the plaintiff's land or use any drain pipe or trench for any such purpose, and (2) an injunction. Mr. Justice Stirling, in giving judgment, said that the defendants justified their acts under (1) the powers conferred on them as the urban authority by the Public Health Act, 1875; (2) their powers as the highway authority under sec. 144 of that Act and the Highway Act, 1835. His lordship then referred to the evidence, and came to the conclusion that the line of pipes was laid down in 1858 or 1859 by the then tenant of the field for the purpose of getting a better supply of water for the use of cattle, and that subsequently the surveyors of highways from time to time caused the rubbish deposited on the grating at the ditch end of the pipes to be removed, but that it was not established that such surveyors repaired or even cleansed the pipes themselves. The first question was whether the defendants could justify what they had done under the powers conferred by the Public Health Act, 1875, secs. 13 to 17. It was established by *Durrant v. Branksome Urban District Council* (L.R., 1897, 2 ch., 291) that the sewers to which the Act applied include sewers for the removal of surface water. That being so, the pipes constituted a sewer within the definition contained in sec. 4. It was, however, contended for the plaintiff that they fell within the definition contained in sec. 13—viz., "sewers made by any person for his own profit." In *Minehead Local Board v. Luttrell* (L.R., 1894, 2 ch., 178) it was held that sewers constructed by a landowner for the use of persons by whom he was to be remunerated by a direct money payment for the use of them fell within the exception. The word "profit," however, was not, in his opinion, to be restricted to a direct money payment, *Ferrand v. Hallas Land and Building Company* (L.R., 1898, 2 Q.B., 135). When the object of making the sewer was neither for sanitary or ordinary drainage purposes, but to enable the land to be occupied more profitably, or to avoid an expenditure which would otherwise have to be incurred in order that the occupation might be equally beneficial, it seemed to him that the sewer was made for the profit of the occupier. Sec. 16 was referred to, but, whatever might be done hereafter, the defendants had not as yet brought themselves within its terms. So far as the evidence went no report was obtained from a surveyor, nor any notice given to the owners and occupiers. It was, then, to be considered whether the defendants derived any sanction for their acts from the Highway Act, 1835. The clauses relied on were secs. 67 and 68. The former authorised the highway authorities to "make, skour, cleanse and keep open all ditches, gutters, drains or watercourses, and also to make and lay . . . trucks, tunnels, plateis or bridges . . . in and through any lands or grounds adjoining or lying near to any highway." That section, however widely it was construed, only authorised the making and keeping open of ditches and drains in and through lands adjoining a highway, and did not authorise the discharge of the contents of any ditch or drain on such lands. Unless, then, the pond could be treated as part of the drainage system under the control of the authorities, those sections did not empower the defendants to discharge the surface water into the plaintiff's pond, and the case of *Croft v. Rickmansworth Highway Board* ([1888] L.R. 39 ch., D. 272) shows that the pond could not be so regarded. In his judgment, therefore, this defence also failed the defendants. It was, lastly, contended that an injunction ought not to be granted, because the defendants

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

might thereafter put in force the powers conferred by sec. 16 of the Public Health Act, 1875. At present, however, they did not show that they were in a position to do so. Down to the present time they had been in the wrong. His lordship therefore made the declaration and granted the injunction asked for by the plaintiff.

PUBLIC HEALTH ACT, 1875, SEC. 16: CARRYING SEWER THROUGH PRIVATE LANDS: "REASONABLE NOTICE."—The above section, it will be remembered, empowers a local authority, "after giving reasonable notice in writing to the owner or occupier (if, on the report of the surveyor, it appears necessary)," to carry any sewer into, through or under any lands whatsoever in their district. In *Hutchings v. Seaford Urban District Council* (Chancery Division, 21st September), the plaintiff was the owner of an estate near Eastbourne, adjoining a high road, in which a sewer had recently been laid. Parallel with the high road there ran another road, known as Sutton-road, and a road called Hindover-road ran into it at an angle. All the land between the high road and Sutton-road was the plaintiff's property. A drainage scheme being in progress, it was desired to drain certain houses on the Hindover-road which were at present drained by a cess-pool arrangement. On August 23, 1898, the defendants served the plaintiff with the following notice: "Take notice that the urban district council for the urban district of Seaford, in the county of Sussex, intend, under and by virtue of the powers to that behalf conferred upon them by the Public Health Act, 1875, to carry a sewer into, through or under certain lands in the district of which you are the owner—that is to say, across the lands situated between Sutton-road and Eastbourne-road, in the parish of Seaford, from points A and B as shown on the enclosed plan." On August 29th the defendants acted upon the notice by entering upon the plaintiff's land and commencing the works. The report made by the defendants' surveyor as to the necessity for carrying the sewer through the plaintiff's land was in the following terms: "The cesspool into which the houses in Hindover-road drain has again filled and requires emptying. I have had great difficulty in finding a place for the disposal of its contents, and have had to cart it nearly half a mile. I consider it very necessary that the property should be drained into the main system, which is now laid sufficiently far to connect in Sutton-road. The course should be across the fields into Sutton-road at right angles." It was submitted, on behalf of the plaintiff, that the notice, being only a five-day notice, was not a reasonable notice as required by the section; and, further, that the report made by the surveyor did not show that it appeared to be necessary that the sewer should be carried through the plaintiff's land. The report merely said that the course "should" be across the fields, not that that route was necessary. *Levis v. Weston-super-Mare Local Board* (40 Ch. Div., 65) was referred to. The plaintiff therefore asked for an interim injunction to restrain the defendants until the trial of the action or further order from trespassing on his land and from opening up the soil or laying pipes thereunder. Mr. Justice Channell, however, without calling upon the defendants' counsel, refused the application. He said: "I have no doubt that in this case the real question is merely one as to the amount of compensation to be paid by the defendants. There is no ground for granting an injunction. Personally, I think that the action is misconceived. I see no necessity for an interim injunction. The defects in the notice and report (if they exist) could be remedied in a very short time, and the injunction must be refused. As to costs, they will be costs in the action."

QUERIES AND REPLIES.

BUILDING PLANS.—"Plans" writes: Will you be so good as to inform me through the medium of your paper whether I have power to refuse to accept any plans unless they are drawn upon tracing linen? Our local by-laws say nothing whatever about the matter, and I do not care to do anything unless I have the power to enforce what I ask.

In the absence of any by-laws requiring plans to be drawn upon tracing linen, I do not think this can be insisted upon.

London United Tramways.—The directors of the London United Tramways, Limited, have addressed a letter to the London County Council requesting that sanction may be given to the early introduction of overhead electric traction upon the few miles of the system inside the county of London, in order that the system may be simultaneously applied to all the company's lines.

Some Recent Publications.

REMOVAL AND DISPOSAL OF TOWN REFUSE.

A comprehensive, accurate and thoroughly adequate textbook on this subject has long been wanted, and we have no hesitation in saying that the want has been at last supplied by Mr. Wm. H. Maxwell, assistant engineer and surveyor to the Leyton Urban District Council, in his book, *THE REMOVAL AND DISPOSAL OF TOWN REFUSE* (London: The Sanitary Publishing Company, 5 Fetter-lane, Fleet-street, E.C. Price 15s.). The author correctly remarks that a good deal has been written on the subject from time to time, either in the form of detached "papers," reports or pamphlets, but that no attempt had been made to deal with the subject practically in the compass of a single volume and with anything like completeness. To accomplish this was the object Mr. Maxwell set before himself, and the better to carry out his task he tells us that he divided his subject into four primary divisions—a *resumé* of the law bearing on the subject; a consideration of the nature of town refuse; a discussion of the various systems of collection; and, finally, an investigation of the methods of its sanitary and economical disposal, or in some cases utilisation.

It will thus be seen that Mr. Maxwell started with a very adequate conception of this problem, and there can be no question of the thorough, intelligent and conscientious manner in which the work has been accomplished. The book is the outcome of extensive knowledge, wide reading and a firm comprehension of the whole problem in all its bearings. In his excellently-worded preface the author gives a lucid statement of the general question, and also clearly indicates the scope of his book and the limits of the task he set himself. His chief aim has been to give, in a clear and impartial form, such a statement of facts and results as would enable any intelligent student to put himself abreast of our present knowledge of the subject, to understand what has been done in the past, and thus be in a position to keep pace with future developments. The book is not put forward as a medium for the exposition of new and original views with regard to the collection, disposal or utilisation of town's refuse. This can no doubt be largely explained by the fact that progress in municipal work depends to a very great extent on accumulated experience, and of no problem is this more true than of that now dealt with by Mr. Maxwell. With this reservation, however, we cannot but consider that the author might have allowed himself a little more latitude in the expression of purely personal opinions. From what we know of his work we have no hesitation in saying that such a course would certainly not have detracted from either the interest or the value of the book. As a compilation and work of reference it has very distinct value, but to many who will consult its pages it would have been of much greater utility had it been more critical in character. In closing his preface the author trusts that the book may be found of service, not only to municipal engineers and surveyors, but also to members of sanitary authorities in carrying out their investigations into a subject which must ever constitute one of the most arduous and important duties which a local authority has to perform. Experienced municipal engineers and surveyors will, no doubt, be able to discriminate for themselves amid the mass of information that Mr. Maxwell provides, but the novice and the amateur generally stand in need of some critical assistance, which Mr. Maxwell would have been justified in attempting to supply. This is shown by the temperate and impartial way in which the author in his preface discusses the much-debated question of combined undertakings—that is to say, the utilisation of refuse as fuel for steam production in connection with electric lighting. In a subsequent edition the author would do well to develop criticism and comment in the body of the book. We observe that in connection with the typical combined undertaking—that of Shoreditch—there is little that is new forthcoming, though the promoters of the experiment have promised much and long.

We can only refer briefly to the contents of the various chapters, which have been very carefully and methodically arranged. The first chapter is general, and, in addition to a sketch of the legal aspect of the question, there are remarks on the scavenging and cleansing of streets, the disposal of street refuse and on street-watering. The second chapter is devoted to the collection and ultimate disposal of house refuse. The term "refuse" is defined, its composition, quality and temporary storage are discussed, and an account given of the different methods of collection. The third and fourth chapters discuss respectively the removal of excreta and the disposal of town refuse by the various methods in vogue. The importance of these opening chapters from the point of view of the municipal engineer is obvious. Naturally, much of a book devoted to the subject of town refuse will be taken up with the discussion of dust destructors, and Mr. Maxwell has done a real service in bringing together all the information available to date on so important a subject, though the service would have been greater still had the author's plan permitted of an attempt to discriminate between the relative values of the various types of destructors instead of merely describing them from information obtained. A special

word of commendation is due for the carefully-compiled information contained in Chapter X., in which a most interesting and valuable mass of details are brought together with reference to refuse disposal and destructor installations at various towns. This body of information will retain its value for a long time to come, and Mr. Maxwell duly expresses his obligations to the borough engineers and surveyors who supplied him liberally with plans and details. The volume concludes with a chapter on the interesting subject of thermal storage, from which the author expects a good deal ultimately. The book is well illustrated, both in regard to the quantity and the quality of the illustrations. The printing is good, and the general get-up tasteful and pleasing.

LIGHT AND AIR.

THE LAW OF LIGHT AND AIR (London: *Estes & Co., Office, Price 6s.*) is the subject and the title of a work by Mr. Alfred A. Hudson, author of the well-known work on building contracts, and Mr. Arnold Inman, both, as is customary in connection with such compilations, being barristers-at-law. The object of the author has been to produce, in a compact form, a digest of the law of light and air, for the use of lawyers, surveyors and students, and they have been tolerably successful in achieving their object. The principle adopted for the arrangement of the work can also be commended. An endeavour has been made, as far as possible, to explain the rules of the law and then to set out in chronological order the cases from which such rules have been deduced, thus placing before the reader a short but complete history of the law under each branch of the subject. Naturally the greater part of the volume is devoted to the subject of light, the last chapter only being devoted exclusively to the cognate subject of air. The first chapter consists of introduction and definitions, and among the various aspects of the question to which subsequent chapters are devoted are: The creation of the easement of light by prescription (apart from statute) or by lost grant, or alienation of the easement of light by express grant, creation of the easement of light by statute (Prescription Act), extent of light conferred by prescription, creation of the easement of light by implied grant, right to light acquired by acquiescence, extinction of the easement of light, tenant and reversioner, interference with the easement of light by obstruction, remedies by action, and proceedings generally. There are some useful illustrative diagrams given; an appendix contains the full text of the Prescription Act, and one or two forms of agreement which have come before the Courts; a table of cases in which reference has been made to all the recognised reports; and an index, which is fairly complete.

TWO WORKS OF REFERENCE.

The eighth edition of *KELLY'S DIRECTORY OF THE BUILDING TRADES* (Kelly's Directories, Limited, 11, High Holborn, W.C. Price 30s.) has recently been issued, and the result is that a work of reference indispensable to all engaged in any branch of the building trade has been brought thoroughly up to date. The arrangement and classification are excellent, but the many merits of the compilation are too well known at this time of day to require pointing out. The great volume and importance of the building trade in its various ramifications is illustrated by some exceptionally significant figures in the preface, from which we take the following concluding remarks: "It may not be out of place to add that the amount of labour involved in the production of this work has been very great. As on former occasions, the whole of the names therein have been personally visited by a large staff of canvassers, and the returns made by them have afterwards been arranged by a staff of clerks specially trained to the work. Every care has been taken to render the work as accurate and as complete as possible, and the proprietors believe that this edition will be found equal in every respect to the previous editions of the work." Those who have occasion to use the volume will have no difficulty in endorsing any of these statements.

THE LONDON MANUAL (London: Edward Lloyd, Limited, Salisbury-square, E.C. Price 15s., cloth 18s. 6d.) for 1898-99 has an introduction by Sir Walter Besant on the survey of London, and has a number of illustrations by Alfred Parsons, Joseph Pennell, Herbert Ralton and Fred. Pogson. It is a companion volume to the *METROPOLITAN YEAR-BOOK* published by the same firm, and also edited by Mr. Robert Donald, editor of *London*. The compilation when first issued created a highly-favourable impression which cannot fail to be confirmed by this re-issue. It seems a model of what such a work of reference should be, and is not likely to be superseded by any similar work. The get-up is tasteful and pleasing, the arrangement is good, the matter is well condensed and presented, exactly what is required being given, and finally there is the crowning merit of extreme accuracy.

Simla.—The Government of the Punjab have sanctioned the application of the municipality for permission to borrow 3 lakhs of rupees to complete the extension of the water-works.

Municipal Work in Progress and Projected.

The paragraphs referring to Croydon, Lancaster, Middlesbrough, Lowestoft, Reigate, Ripon, Scarborough, Coalville, Leatherhead and Heron Bay contain all the important news that has come to hand this week with respect to the progress of extensive municipal undertakings in the provinces. In the metropolis it will be noticed that the London County Council have resumed business, while St. George-in-the-East Vestry and the Strand District Board of Works are engaged in carrying out fairly extensive works.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

The members of the County Council on Tuesday met for the first time since the summer vacation, and obviously they had to face an unusually full agenda. Before the sitting closed the old subject of the London water supply was introduced by a motion which had been placed on the paper by Mr. W. Crooks, one of the labour members for Peplur. This subject has been receiving an unusually large amount of attention in the Press during the vacation, owing to the failure of the East London Water Company's supply, and, naturally, some public interest was felt as to the attitude the council would take up in the matter. No decision was, however, arrived at, the debate being adjourned until the next sitting. An important report of the Highways Committee, dealing with the purchase of the undertakings of the London Tramways Company, was also postponed for consideration until next week. Full particulars of this report will be found in another column.

Loans for Public Works.—Upon the recommendation of the Finance Committee, it was agreed to lend the Battersea Vestry £1,545 for the erection of public conveniences; the Islington Vestry £21,010 for street improvements, laying-out open space by Cattle Market, &c.; St. George's (East) Vestry £3,000 for paving works; and the Westminster Vestry £15,000 for similar purposes.

Proposed Transfer of Powers.—Consideration was resumed of the report of the Local Government and Taxation Committee dealing with proposals for the transfer to local authorities of certain powers now possessed and exercised by the council. The recommendations of the committee, it will be remembered, were based upon resolutions passed by a conference held some time ago between members of the council and representatives of the local authorities of the metropolis. Several of the recommendations were adopted when the matter was first before the council. The council now adopted, without comment, the two recommendations referring to powers for the removal of unauthorised signs and the storing of wood and timber. After some discussion they also adopted the following recommendation: "That the maintenance of the Victoria-embankment and portions of streets adjoining in the precincts of the Savoy and the footways of the Albert and Chelsea embankments be transferred to the local authorities, and that the lighting, watering and cleansing of the Victoria-embankment and the footways of the Albert and Chelsea-embankments be transferred to the local authorities, subject to the maintenance and lighting of the walls of the embankments being retained by the council." The council further agreed: "(1) That the maintenance of main roads be transferred to the local authorities. (2) That the power of sanctioning the closing of streets for repairs be transferred to the local authorities. (3) That the words 'with the sanction of the council' be omitted from the provision enabling vestries and district boards to close or stop up streets during paving or sewerage works. (4) That the power of the council to require main roads when maintained by a vestry or district board to be repaired to the council's satisfaction be repealed on transfer of such roads to the vestry or district board. (5) That the local authorities be given concurrent power with the council to apply to Parliament for powers to make improvements of public utility wholly within their districts and intended to be paid for wholly out of their funds." Several other minor recommendations were also adopted; and the whole of the various recommendations were referred to the Parliamentary Committee, in order that a report might be presented on the proper steps to be taken to give effect to them.

Greenwich Tunnel.—The Bridges Committee recommended the council to invite tenders for the construction of the proposed tunnel under the river Thames at Greenwich. This was agreed to.

Purchase of the London Tramways.—A report of the Highways Committee recommending the council to purchase the undertakings of the London Tramways Company for £560,000 was postponed for consideration till next week.

London Water Supply.—Mr. Crooks obtained urgency for the following motion: "That, in view of the existing difficulty in obtaining an adequate supply of water in a large portion of the county of London, it be an instruction to the Water Committee to forthwith submit its proposals with regard to legislation affecting the water supply in the ensuing session of Parliament." In moving the resolution he said that the council knew the urgency of the case. They had been told over and over again that the water companies

were quite capable of minding their own business, and of giving the people of London a full, adequate, and above all, pure supply of water. He was sick and tired of the promises of the water companies and the platitudes of the Government, and hoped the council would go for a full, efficient and pure supply from Wales or from any other source that was capable of giving it. Mr. Stuart, M.P., in seconding the motion said the present distress in the East-End was due to the culpable negligence of the East London Company in putting into effect the legislation which they themselves promoted for the very purpose of avoiding a scarcity of water. Mr. Beachcroft supported the motion, but moved the addition of words directing the committee to obtain the opinion of an engineer as to the works required for connecting the mains and works of the several companies, for use in cases of urgency. After discussion, in which Mr. McDougall, the Rev. F. Williams and Sir A. Arnold took part, the debate was adjourned.

Tenders.—It was announced that no tenders had been received in reply to the council's invitation in respect to the creation of two blocks of working-class buildings on the Boundary-street area and some cottage dwellings at Brook-street, Limehouse.—The following tenders were opened by the chairman for painting works at the Abbey Mills pumping station, &c.: Messrs. A. J. Wick, £2,602; A. H. Innes, £2,154; E. Proctor, £2,172; F. W. Harris, £2,251; D. Gibb & Co., £2,558; E. F. Tolley, £2,774; Vigor & Co., £2,812; and J. Kybett, £4,872.

VESTRIES AND DISTRICT BOARDS.

Bermudsey.—On Monday the vestry considered a long report from the Sanitary and Public Health Committee in reference to the conference held some time ago on the subject of overcrowding and housing of the working classes, when twenty-three vestries and district boards were represented. The committee recommended that the county council should be asked to exercise its powers under Part III. of the Housing of the Working Classes Act, so as to provide accommodation within the county of London. This was agreed to.—It was also resolved to approach the county council with a view to the insertion of a clause in their General Powers Bill for 1899 to enable vestries and boards of works to erect municipal buildings under Part III. of the same Act.—The Sanitary Committee further reported on the result of negotiations with the Rotherhithe Vestry on the subject of the construction at joint expense of two underground conveniences at the end of Southwark Park-road by Jamaica-road and at the junction of Galleway-road with Southwark Park-road. The committee stated that the Rotherhithe authority had referred the question to committee for consideration, and this, in the opinion of the committee, showed that there was every prospect of some arrangement being arrived at.—On the recommendation of the General Purposes Committee it was decided to invite tenders from six firms for a steam crane to be fixed at the wharf.—The following tenders were considered for the purchase of old iron at the depot: Isaacs & Son (accepted), £1 14s. per ton; B. Hyams, £1 12s.; and C. H. Lloyd, £1 10s.

Hackney.—At last week's meeting of the vestry the public analyst reported that the sample of water taken from Tumbling Bay, Hackney Marshes (river Lea), possessed a foul sewage odour and was undistinquishable from sewage.

Hammersmith.—The vestry, at their meeting last week, decided not to support the proposal of the London County Council for establishing a laboratory for the examination of pathological matter by a bacteriologist.—The clerk was instructed to inform the Battersea Vestry, in reply to their circular-letter, that the vestry were in favour of district surveyors being under the direct control of the vestries or district boards.—A letter was read from Mr. J. C. Robinson, managing director of the London United Tramways, to the effect that the directors felt the time was opportune to reopen negotiations with the London County Council asking its assent to the introduction of the overhead trolley system of electric traction on the lines in Hammersmith. The matter was referred to a committee of the whole vestry.

Holborn.—At Monday's meeting of the district board of works tenders were received for asphalt paving works in the carriageway in Farringdon-road, footways in Farringdon-road, and asphalt paving works in Emerald-street.—The surveyor was instructed to prepare plans and obtain estimates for a new urinal in Cross-street, Leather-lane; also for an underground convenience at Rosebery-avenue and Clerkenwell-road.—It was decided to re-pave a portion of Theobald's-road with wood.

Lambeth.—A meeting of this vestry was held on Thursday, when the Sewers Committee recommended the vestry to join with Battersea in urging the London County Council to adopt regulations with regard to district surveyors, with the view to minimising the dangers of accidents from buildings in course of erection and alteration.—The vestry agreed to support Battersea as recommended. In May of last year the vestry accepted an offer, made by the late Sir Henry Donlon, of a statue of her Majesty, which (at the close of the Victorian Exhibition at Earl's Court, where it was to be ex-

hibited) Sir Henry desired should be erected in the enclosure on the east side of Lambeth Bridge. Messrs. Doulton have now written informing the vestry that they were prepared to proceed with the erection of the statue, but the General Purposes Committee found that the enclosure referred to was under the charge of the London County Council. They therefore directed that the matter should be placed before the London County Council, with the view to the erection of the statue on the site in question.—The Baths Committee reported that, in the absence of Mr. Tiltman on the Continent, they were unable to take any action in relation to the latter's letter on the subject of the cost of the Kennington-road baths, which was published in *THE SURVEYOR* on August 12th.—In connection with the heavy expenditure anticipated for the repairs of Brixton Hill, the General Purposes Committee pointed out that, as the tramways in the district would shortly pass into the possession of the county council, they had given instructions for only those repairs that were absolutely necessary to be carried out. In the meantime Mr. J. P. Norrington, the surveyor, had been requested to place himself in communication with the county council, with a view to arrangements being made for the complete repair of Brixton Hill.

Lewisham.—At a special meeting of the district board of works, last week, it was resolved to apply to the Board of Trade for a provisional order for supplying the district with electricity.

Newington.—The vestry, on Wednesday of last week, concurred in the following suggested regulations with regard to district surveyors—namely, that all district surveyors should devote the whole of their time to the duties of district surveying; that they should be paid a salary by the London County Council, and that all building fees (if continued) should be paid to the council direct; that an office be provided for the district surveyor at the local vestry hall or offices, so that he may be brought into closer touch with the local authorities.—Resolutions were adopted in favour of by-laws being made for the regulation generally of search and flash light advertisements, and in favour of street lamp-posts that are within a few feet of a fire alarm being painted a bright red colour, in order to indicate the positions of the fire alarms.—The vestry also resolved to construct an underground conveniences for both sexes in South-place, by the side of the Kennington Theatre.

Paddington.—The vestry, at their meeting on Tuesday, decided to object to the theory of certain other vestries, that vestries and local authorities should have the power of erecting dwellings for the working classes. Their opinion is that the only effective way to stop overcrowding and improve the housing of the working classes is to enforce by-laws with respect to houses let in lodgings.—The tender of Messrs. Boyer & Son was accepted for the supply of about 800 cubic yards of river Colne coarse shingle, for frosty roads, at the rate of 4s. 8d. per ton.—The carriage-way paving in Westbourne Street-mews was ordered to be relaid with old red-dressed pitching stones as far as possible, at an estimated cost of £325.—The roadway in Warwick-place in front of the Warwick Castle public-house was also ordered to be relaid with granite pitching.—The surveyor was instructed to embody in his report on the cost of the wood paving works for the year a statement as to the condition of the Baltic deal pavings which have been removed from the streets recently repaved with wood.—A deputation was appointed to wait upon the Improvement Committee of the London County Council and explain the necessity of carrying out the proposed Westbourne-terrace road bridge improvements forthwith.

Poplar.—The board have adopted a report of the Electric Lighting Committee recommending that the offer of the trustees of the German estate to sell to the board, for the purpose of an electric station, the piece of vacant ground now in the occupation of the board, and situated between Violet-road and Glaucus-street, and adjoining the Board School site, for the sum of £3,000, the board to forego a claim for paving, amounting to £104 12s. 5d. in respect of the land, and to pay all costs, including negotiation, &c., be accepted.

Shoreditch.—The vestry, at a meeting on Tuesday, resolved to renew the fire insurance of the electric lighting station and refuse destructor with the Fire Art and General Insurance Company, at the annual premiums of £65 12s. 6d. and £32 3s. 9d. respectively for the sum of £52,000.—On the recommendation of the Lighting Committee it was decided to order a 100-kilowatt transformer from the Electric Construction Company for the sum of £881, and to advertise for tenders for two smaller transformers of 66-kilowatt capacity each.—The Scavenging Committee asked for authority to dispose of an old gas engine and to substitute an electric motor, at a cost not exceeding £100. This was agreed to.—The underectioned tenders were submitted for the erection of a shelter in the Charles-square recreation ground: Messrs. Schooley & Son (accepted), £68 10s.; Messrs. J. Ivory, £68 10s.; and Messrs. Jarvis & Son, £73.

Strand.—A meeting of the district board of works was held on Wednesday of last week. On the recommendation of the Works Committee it was decided to construct an underground latrine in Leicester-square, at an estimated cost

of £1,500.—The board declined to accede to the application of the Charing Cross Hospital authorities and others for the closing of Bedford-court, Chandos-street.—A long discussion took place on the application of the National Telephone Company for permission to erect a wood and iron bus at Holles-street, Clare Market but the recommendation of the Works Committee to give the requisite permission to the company was, however, agreed to.—The Improvements and Parliamentary Committee reported that they had been asked to take common action with other metropolitan authorities in favour of vesting the water supply in the people of London, but, while of opinion that the control of the supply should be placed in the hands of a central authority, they were not prepared to express any further opinion until the report of the Royal Commission now considering the subject was published. The report was adopted. It was decided to erect a dust destructor, on the Horsfall system, on the Shot Tower Wharf.—A letter was read from Mr. Sydney Smith, late hon. secretary of the Sir Augustus Harris Memorial Fund, asking the board to take over the repair and control of the drinking fountain erected to the memory of Sir Augustus at Drury-lane Theatre. The subject was remitted to the Works Committee for consideration and report.

St. George-in-the-East. The vestry have decided to invite tenders for the enlargement of the vestry hall. The cost of the work is estimated at £7,000, and it is thought that the seating accommodation will be increased from 300 to 500.

St. Marylebone.—At the last meeting of the vestry, Mr. Waddington, the surveyor, drew attention to the lack of accommodation for the staff, which was shortly to be increased. During the discussion reference was made to the projected new vestry hall, but eventually the representations of the surveyor were referred to the Works Committee for consideration and report.—It was resolved, on the recommendation of the Works Committee, to give permission to Messrs. Peter Robinson, Limited, to erect six electric arc lamps in Oxford-street and to Messrs. Gardiner to put up seven lamps of a similar type in Edgware-road.

St. Pancras.—On Wednesday the vestry received a report from the Electricity and Public Lighting Committee giving details of the position of the municipal electric light undertaking. The accounts, which related to the six months ended the 30th June last, showed that during that period the total revenue amounted to £17,408, being an increase of £3,088 over the corresponding half of last year. The expenditure on trading account reached £11,556, leaving a surplus of £5,852 to meet interest charges and instalments on loans amounting to £4,686. The net result of the six months was a profit of £1,166, which, together with the sum of £1,717 brought forward from last year, made a total of £2,883. The introduction of the maximum demand indicator system and other reductions had resulted in an actual decrease of £800 in the income, whilst the coal bill had been increased by £500, largely owing to the troubles in the coal trade.—The Health Committee reported that they had considered a representation from the medical officer of health directing attention to the fact that when the vestry takes over a sewer that has hitherto been regarded as a drain there is a transfer of responsibilities and liabilities which makes matters extremely complicated. The medical officer had suggested that it should be made perfectly clear to the tenant, leaseholder and freeholder what the transfer meant in each case, and obtain the consent and undertaking in writing from each of the parties interested. Having considered the matter in connection with an opinion obtained on the subject from the solicitors, the Health Committee recommended that no action should be taken in the matter. This was agreed to.—The Dusting and Refuse Destructor Committee announced that they had considered the question of erecting in the destructor yard the three boilers removed from the Regent's Park central electric light station, and had conferred with Mr. S. Baynes, the chief electrical engineer, on the subject. The engineer explained that it would be necessary to place the boilers over the cells, and expressed the opinion that it would require at least three cells to heat each boiler. He proposed that two of the boilers should be fixed above the six south cells, and be provided with a by-pass for the escape of the heat when the boilers were not in use. He also informed the committee that it would be advisable for an arrangement to be made whereby the furnaces might be stocked with fuel, if found necessary, during the hours of full load. On the recommendation of the committee the vestry authorised the arrangement suggested to be carried into effect.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Norfolk.—The county council have decided not to pay the claim of the Walsoken Urban District Council for his year's purchase in English iron castings and fittings for water works is cheaper. The district council thereupon applied to the Local Government Board, but this course has not been allowed to interfere. As the result of negotiations the county council have offered to pay if the claim is reduced to the amount that foreign granite would have cost. The district council have decided to invoke arbitration.

MUNICIPAL CORPORATIONS.

Birmingham.—Contract No. 12 on the Eban aqueduct, being the section from Cleobury Mortimer to Hagley, has been let to Messrs. Morrison & Mason, Limited, of Glasgow, at £412,415 19s. 5d. This firm are already the contractors for three sections of the aqueduct, and the new contract places the continuous length from Dolau to Hagley, a total of 51½ miles, in their hands. The aqueduct over contract No. 12 is all in pipes or syphon, and includes the bridges over the Severn and Stour.

Canterbury.—Plans for the erection of the proposed new Guildhall, which have been prepared by the city surveyor are under the consideration of the city council. They show a frontage of 118 ft. in Guildhall-street and 56 ft. in High-street. On the ground floor will be a magistrates' court and the county and bankruptcy court. The upper floor will be taken up with the council chamber, committee-room and mayor's parlour, together with the offices of the town clerk. The chief entrance will be in Guildhall-street. The style is described as "a free Gothic treatment of secular character."

Croydon.—The Local Government Board have sanctioned the corporation's application for a loan of £23,262 for the purposes of electric lighting extensions at Norwood.

Doncaster.—Last week the town council, in committee, resolved to carry out a scheme for lighting the town by electricity. Mr. Schultred, of London, is to be engaged to carry out the work.

Dudley.—A recent report of the Public Works Committee stated that several members of the council had purchased a building estate between the Buffery-road and the recreation ground, containing 17 acres, or thereabouts, upon which it was contemplated to erect houses, mostly for the artisan classes, and that they were prepared to sell to the corporation a piece of land adjoining the recreation ground, containing 7,000 square yards or thereabouts. The committee, having considered the offer, are of opinion that the enlargement of the recreation ground as proposed would be advantageous and a great improvement, and recommended that it be accepted on the following terms: "That the corporation purchase the land to be thrown into the recreation ground at the amount of the accepted estimate for making the roads; that the purchase money shall be paid when the roads are made to the satisfaction of the borough surveyor and when not less than fifty houses, yielding an annual gross rental of £600, are erected and finished; possession of the land to be added to the recreation ground to be given on the adoption by the council of these recommendations and a conveyance executed to the corporation; and that the amount of the purchase be included in a future loan."

Eccles.—It has been decided by the town council to apply to the Local Government Board for sanction to a loan of £275 for the construction of a sewer in Liverpool-road, Peel Green.

Hythe.—The town council recently considered the advisability of applying for a provisional electric lighting order. The question arose in consequence of an application from the Folkestone Electric Supply Company. It was decided to take preliminary steps, but before expense is incurred the matter will be confirmed by the council.

Keighley.—The town council have resolved to purchase 9,650 square yards of land as a site for the proposed public slaughter-house. They have also resolved to apply to the Board of Trade for a provisional order to enable them to supply electricity within the borough.

Kidderminster.—Last week a deputation from the Thornhill, Liversedge and Ilkestonwike councils visited Kidderminster and inspected the Kidderminster and Stourport electric tramway, in view of electric developments in the district they came from. They were met by Mr. Lycett, district manager of the British Electric Traction Company, and the information they desired was given to them.

Lancaster.—At a meeting of the town council, held last week, it was resolved to apply for sanction to borrow £20,250 for extending the electric lighting, constructing a new river wall and railing on the rampart at Skerton, carrying out improvements in Church-street and Horse Shoe Corner, &c.

Licester.—Representatives of the corporation and of the tramways company have agreed to an arrangement for the sale of the tramways undertaking to the town council for the sum of £155,000, or £11 15s. per £10 share. The undertaking has paid 5 per cent. since 1891, and the gross annual receipts are £40,000.

Lincoln.—It has been decided by the council to abandon a scheme for providing workmen's dwellings, in consequence of the Local Government Board requiring amendments in the plans, estimated to cost an additional £200.

Lowestoft.—Mr. W. C. C. Hawtayne has been instructed by the town council to prepare a scheme for lighting the borough by electricity, and to include the provision of power for traction purposes in consequence of an application by Messrs. Scanton & Co. as the East Anglian Electric Light Railway. This railway is intended to extend from Caister to Southwold, running through Lowestoft and Yarmouth, Hop-

ton, Certon, Kessingland and Wrentham. In and near the towns and villages the rails are to be laid along the public roads flush with the surface, whilst the remaining length of the line will follow the roadside. Except at the termini, there are to be no stations. The cost is estimated at £300,000.

Manchester.—A meeting of the special committee of the Manchester Corporation appointed to consider the question of the telephone service in Manchester was held at the Manchester town hall last week. The subject was fully debated, and it was resolved that the chairman should prepare a report and submit it to a subsequent meeting.

Middlesbrough.—At a special meeting of the Sanitary Committee of the corporation, on Thursday, a report by Mr. J. Mansergh, with regard to the drainage of the town, and, more particularly, the preventing of the flooding in the marsh district, was considered. The recommendations of Mr. Mansergh embodied a scheme which would cost £40,000. The surveyor was requested to prepare specifications for the new iron sewer in Marsh-road, this being a very small portion of the entire scheme.

Newport, Mon.—On the 28th ult. a Local Government Board inquiry was held into a proposal of the corporation to borrow £6,150 for electric light extension, and £760 for providing a steam roller, road scarifier, &c. There was no opposition. The electric light has been in use for some years in Newport.

Reigate.—Dr. R. D. R. Sweeting, Local Government Board inspector, held an inquiry at the town hall, Reigate, on the 21st ult., relative to the council's application for sanction to borrow £11,000 for the purchase of a site and the erection thereon of a new hospital for infectious diseases. The town clerk, in opening the inquiry, explained that the present building was erected to meet an emergency, but the corporation proceeded to devote their attention to the acquisition of a site for a hospital of a more permanent character, whereupon the old small-pox hospital might be renitted to its old purpose, or used as an auxiliary temporary establishment to the permanent structure it was now proposed to erect. He also stated that negotiations had been entered into with the rural sanitary authority with a view to having a joint hospital, but these had failed, owing to the exorbitant terms imposed by the rural authority. The total area of the proposed site was about 3½ acres; it was situated about half a mile beyond the boundary of the borough, in a very suburban situation, and was far removed from any source of infection or any objection on the part of any person whatsoever.

Ripon.—Colonel C. E. Luard, R.E., Local Government Board inspector, held an inquiry last week with reference to an application of the corporation for sanction to borrow £10,000 for purposes of gas improvements and £500 for the construction of public underground conveniences in the Market-place.

Saffron Walden.—A Local Government Board inquiry has been held by Mr. George Willecks with respect to an application of the town council for sanction to borrow £1,400 for works of street improvement.

Scarborough.—Colonel Luard, R.E., Local Government Board inspector, held an inquiry at the Scarborough town hall last week with respect to the application of the corporation for their approval to the disposal by the council of certain corporate land situated in Seamer-road, and of the borrowing of £33,575 for the purchase of the St. Nicholas House estate for municipal purposes and for purposes of public walks and pleasure grounds. In referring to the proposed purchase of the St. Nicholas estate the town clerk said that the accommodation in his department was most unsuitable and inadequate. The reason the corporation were purchasing the grounds was that they would make most attractive and beautiful public pleasure grounds in the centre of the town. There was also a danger of the property getting into the hands of speculative builders.

Worcester.—At the meeting of the city council on Tuesday the Water and Sewerage Committee reported that the Local Government Board objected that the area of irrigation land for the new sewage works, in connection with which the council had resolved to apply for sanction to a loan of £52,000 to carry out, was not sufficient. The board had since expressed themselves satisfied with the increased area provided by alteration in the site of tanks and filters. The board also raised the point of the method of crossing the river, which Messrs. Beesley intended to carry out by pipes laid in the bed of the river by means of a coffer dam. Messrs. Beesley had since recommended the crossing of the river by a double line of pipes in an iron tunnel, stating that the plans, with the alterations proposed, could be carried out for the original estimate of £48,165.

York.—A Local Government Board inquiry has been held with respect to an application of the city council for sanction to borrow £2,500 for the purchase of certain land for hospital purposes.

URBAN DISTRICT COUNCILS.

Coalville.—The sanction of the Local Government Board has been received by the district council to the borrowing of £22,992 for sewerage and water schemes.

Horne Bay.—The reconstruction of the sea wall and pro-

monade at Horne Bay, which were so extensively damaged in the destructive gales of last November, is to be proceeded with at once, the estimated cost being placed by Mr. Baldwin Latham at £10,000.

Holyhead.—Colonel Darnford recently held an inquiry, on behalf of the Local Government Board, with reference to an application of the district council for sanction to borrow £1,000 for the purchase of land as a site for the proposed public abattoir.

Leatherhead.—The urban district council have resolved to apply to the Local Government Board for sanction to a loan of £30,000 to carry out Mr. Frederick Beesley's scheme for the drainage of the town. The amount includes the council's proportion of the joint outfall works with Ashted.

Newton Abbot.—A loan for the purchase of Courtenay Park and the improvement of the sewage outfall works has been sanctioned by the Local Government Board.

Rainford.—An important meeting of the council was held recently, the details of a new water scheme being made public. At a special meeting, held a month ago, the council decided to adopt a scheme by which the St. Helens Corporation should supply the water, and that the council should apply to the Local Government Board for power to borrow £6,000 for the purpose. The necessary information has been forwarded to the Local Government Board by the clerk to the council, Mr. B. Smith, and by the water engineer of the St. Helens Corporation, Mr. J. J. Lackland, by which it appears that the estimated cost of the whole scheme will be £6,000. The water will be supplied from the Eccleston Hill pumping station of the corporation to a concrete covered reservoir to be constructed at an elevated point in the township on ground near the quarry alongside the Occupation-road. A Local Government Board inquiry will be held at an early date with respect to the proposal.

Tottenham.—At a meeting of the district council on Wednesday it was decided to apply to the Board of Trade for a provisional order to supply electricity within the district and to oppose the applications which have been made for the purpose by several companies. The working of the electric light in connection with a dust destructor is also contemplated.

Wadebridge.—The urban district council having applied to the Local Government Board for sanction to borrow an additional sum of £1,000 for purposes of water supply, Colonel A. G. Hepper, R.E., held the usual inquiry on the 28th ult. There was no opposition.

Wellingborough.—Sir Philip Magnus on Thursday last opened a new technical school at Wellingborough. The building has been erected by the council at a cost of £3,000 exclusive of the site.

Woking.—At the last meeting of the district council it was decided, on the recommendation of the engineer, to accept the tender of Messrs. S. H. Johnson & Co., at £2,496, for the supply of sledge-pressing machinery, and the tender of the Hydraulic Engineering Company, of London and Chester, at £958, for the supply of generators, and £3,150 for the supply of out-station motors and pumps to duplicate. It was also decided to erect two cottages at the outfall site for workmen, and to purchase a piece of land in Walton-road for the erection of a tank and pumping machinery in connection with water-storage and flushing. The drainage scheme is being carried out under the supervision of Mr. W. Santo Crimp, of the firm of Messrs. Taylor, Sons & Santo Crimp, and another few months will see the completion of the main sewer by the contractor, Mr. H. Weldon, of Birmingham.

RURAL DISTRICT COUNCILS.

Axbridge.—An inquiry was held on Friday by Mr. H. Percy Boutnois, an inspector of the Local Government Board, touching an application by the council for sanction to borrow £3,200 for works of water supply for the parish of Winscombe. Mr. A. Powell explained his scheme. He had taken several gaugings at the spring head; that in April last showed 95,000 gallons per twenty-four hours, that in May 90,000, and on the 23rd ult. 85,000. The population to be supplied was 700, and they would require 30,000 gallons per day. The scheme involved no engineering difficulties.

Congleton.—On Tuesday of last week Colonel A. G. Darnford, R.E., conducted an inquiry respecting an application which the rural district council had made to the Local Government Board for sanction to borrow £250 for works of sewerage for the township of Holmes Chapel. Mr. H. Ferrand, clerk to the rural district council, appeared in support of the application.

Eaton Bray.—At a meeting of this council, held on Friday, a letter was read from the Local Government Board notifying their consent to the borrowing of £1,750 for the proposed water scheme prepared by Mr. McKenzie, the engineer to the council. At the same meeting Mr. McKenzie received instructions to prepare plans, &c. for a sewerage scheme which is now being urged forward by the Upper Board.

Epsom.—The council have applied to the Local Government Board for sanction to borrow £13,000 for the drainage of Ashted, including a proportion of the joint outfall with Leatherhead. The engineers are Messrs. Fredk. Beesley & Son, of Westminster.

Luton.—At a recent meeting of the rural district council it was reported by the surveyor that the water supply at Leagrave, near Luton, had totally failed, and boring operations had been commenced near to the bed of the Lea to secure water. The council decided to give a guarantee to the Luton Water Company to insure a return of 10 per cent. on the cost of the company laying water mains to Stopsley.

Ruthin.—Mr. E. Evans, surveyor for the Llandyrnog district, at the last monthly meeting of the district council submitted a further report upon the proposal to construct waterworks to supply a number of parishes on the eastward slope and floor of the Vale of Clwyd, in view of the fact that Llandyrnog now asked to be included. The total estimate for a supply sufficient to meet the requirements of many times the present population was £3,247, and the interest and sinking fund was to be borne by the consumers. After some discussion it was agreed to engage Mr. Thomas, Wrexham, to report on the scheme, and to prepare working plans, estimates, &c.

Shepton Mallet.—A Local Government Board inquiry has been held by Mr. H. Percy Boutnois relative to an application of the council for sanction to borrow the sum of £1,400 for the carrying out of a scheme of water supply for portions of the parish of Douling. Mr. William Phelps, surveyor to the council, explained the scheme, which includes the erection of a wind engine for pumping. Mr. J. Wallis Titt, of Warminster, Wilts, a specialist on wind engines, also gave evidence.

Sunderland.—A mysterious and extensive underground fire was reported at the meeting of the district council on Wednesday. The sewers at Grangetown are in a very heated condition, and water pipes are also affected, the drinking water coming warm from the taps. The surveyor has been instructed to examine and report upon the outbreak, which it is feared will be extinguished only with much difficulty. Since the great conflagration in July last there has been quite an epidemic of fires occurring almost daily in Sunderland, and the corporation are making public trials of fire engines from leading firms in the country.

Wing.—A new brick bridge has recently been constructed for this council, situate at Northall, from the plans and under the superintendence of Mr. McKenzie, the council's surveyor. This bridge takes the place of a single arched ring of brickwork of a very flat curvature, which was much too light for the increased traffic of the district. Another improved feature at Slapton bridge (now in course of construction) is the alteration of the approaches, whereby the gradients will be 1 in 30 and 1 in 18, in lieu of 1 in 9'6 and 1 in 11'2; the side walls are constructed of brick in cement to a batter, with 5-in. square oak posts and diagonal side-rails. The road formation is made up with good hard materials, the contract having been let to Mr. Hamerton, of Wing, at £351.

ADVERTISEMENTS

Received too late for Classification.

HAMPTON URBAN DISTRICT COUNCIL. TEMPORARY ASSISTANT.

Wanted, at once, for a few months, a Temporary Assistant, to undertake the preparation of surveys, plans, sections, &c., for private street works, and to supervise the construction of private street works now in progress.

Applicants must be good and accurate surveyors, levellers and draughtsmen, and have had experience in the superintendence of the construction of similar works. Salary, £3 per week. Age not to exceed thirty five years.

Applications, in writing, accompanied by copies only of recent testimonials, to be sent to me not later than the 17th October inst.

JOHN KEMP, ASSOC. M.A.S.T.C.E.,

Surveyor to the Council.

District Council Offices, Hampton, Middlesex.

October 6, 1898.

HARROW URBAN DISTRICT COUNCIL. TO CONTRACTORS.

The Harrow Urban District Council are prepared to receive tenders for Making-up Byron, Kingsfield and Valentine roads, at Harrow-on-the-Hill.

Plans and specifications may be inspected at the Council's office, High-street, Harrow, between 10 and 4, after Tuesday, the 11th of October, 1898.

Bills of quantities and forms of tender will be supplied on payment of 3 guineas, which will be returned on the receipt of a *bona-fide* tender and the return of the whole of the documents issued.

All information can be obtained from the undersigned.

Sealed tenders, on the forms issued, endorsed "Private Streets," to be sent to R. E. H. Fisher, Esq., Clerk to the Council, Council Offices, Harrow, not later than Tuesday, the 25th of October, 1898.

The Council do not bind themselves to accept the lowest or any tender.

T. CHARLES,

Surveyor to the Council.

Harrow-on-the-Hill.

October 6, 1898

Personal.

Mr. T. H. Negns, surveyor to the Glemsford Urban District Council, has received an increase of salary.

Mr. E. Davies, of Shrewsbury, has been appointed second engineering assistant to the Edmonton Urban District Council.

Carmarthen Town Council have acceded to the request of Mr. Finglab, the borough surveyor, for leave of absence on the occasion of his forthcoming marriage.

Mr. Kiddy has been appointed municipal electric light inspector at Bulwayo, at a salary of £150 per annum. This is in addition to his present position as Government electrician.

Twenty-nine applications have been received for the position of resident electrical engineer at Greenock. Three of the applicants have been selected to appear before the Finance Committee.

Mr. D. McLeod, assistant at the Aberdeen Corporation electricity works, was recently the recipient of a smoker's cabinet and two engineering books, on the occasion of his leaving the station to become manager of some Dublin manufacturing works.

A letter was last week received by the Chelmsford Town Council from Mr. G. H. Sasse, stating that he was feeling very much out of health, and asking to be relieved of his duties for a period of three weeks. The application was at once acceded to.

The paper on "Gasworks Machinery," which was read by Mr. Edward A. Harman, engineer and manager of the Huddersfield Corporation gasworks, before the Society of Engineers, some few months back, has been published by the society in pamphlet form.

The town council of Norwich last week adopted a resolution of the General Purposes Committee recommending the appointment of Mr. T. O. Cudbird, a temporary assistant in the city engineer's department, as an assistant, at an annual salary of £110 per annum.

We regret to announce the death, which occurred on Sunday, of Mr. Jeremiah Jowett, the surveyor to the Rural District Council of Lancaster. Mr. Jowett, who was sixty-nine years of age, had served the council for some twenty years. He had to supervise a wide area.

The borough surveyor of Retford, Mr. J. D. Kennedy, was last week made the recipient of a handsome set of fish carvers, in return for his valuable services as honorary secretary to the Ground Committee of the Retford Bowling Club and as a mark of the general esteem of the members.

The town council of Sutton Coldfield have adopted a resolution of the Highways Committee recommending the increasing of the salary of Mr. A. Riley (who for the past four years has filled the position of superintendent of the Highways Department) to £156 per annum.

The following are the selected candidates for the appointment of surveyor to the Briddington Urban District Council: Messrs. W. Pym Jones, surveyor, Lynton; P. Mawbey, assistant surveyor, Rugby; G. Goddard, surveyor, Ware; and F. Matthews, assistant surveyor, Hastings. There were, we learn, sixty-nine candidates, and some remarkably good applications. The above-named gentlemen will appear before the council to-day.

The remains of Mr. Davidson Hainsworth, building inspector to the Leeds Corporation, who died on Thursday, at Blackpool, after a brief illness, were interred in Woodhouse Cemetery on Saturday. A preliminary service took place in Woodhouse Moor Wesleyan Chapel, and the gathering there and at the graveside indicated that the deceased had many friends. The whole of the staff of the late gentleman's department was present.

Prior to a recent meeting of the Sanitary Committee of the Broadstairs Urban District Council an interesting ceremony took place, Mr. H. Hurd, the surveyor, being presented with an elegant polished walnut-wood certificate upon which had been fixed a silver plate with the following inscription: "Presented by the members and officers of the Broadstairs and St. Peter's Urban District Council to Howard Hurd, district surveyor, on the occasion of his marriage, September, 1898. H. S. D. Byron, Chairman."

A special meeting of the High Furness Highway Board was held last week, when consideration was given to the question of appointing a successor to the late surveyor, Mr. R. P. Nelson. There were thirteen applications for the post. The number was, however, reduced to three—namely, Messrs. R. T. Johnston and Ellwood (members of the board) and Mr. William Newby, architect, Kirkby-in-Furness. The latter gentleman (Mr. Newby) was appointed by a substantial majority. The appointment of Mr. Newby has caused a feeling of general satisfaction.

The names of the following three gentlemen have been submitted to the St. Pancras Vestry by Mr. E. A. Greening, vice-chairman of the Royal Institute of British Architects, as being competent to act as assessors in respect of com-

petitive designs to be submitted to the vestry for the erection of new public baths and wash-houses in Prince of Wales-road: Mr. Aston Webb, 19 Queen Anne's Gate, S.W.; Mr. John Slater, 46 Berners-street, W.; and Prof. T. Roger Smith, 130 Temple Chambers, E.C. The nomination of these gentlemen by the vice-president is due to the absence abroad of the president of the Institute.

At a meeting of the Shoreditch Vestry, on Tuesday, the Town Hall Committee reported that they had under consideration the question of the proposed alterations to the old fire-station buildings, and had deemed it advisable to vary the vestry's reference to the name of only one architect. The committee accordingly recommended that the three following architects should be asked to submit plans for the carrying out of the work, at a fee of £10 10s. each, such fee to be merged into the commission in the case of the successful architect: Mr. R. S. Ayling, Parliamentary Mansions, Westminster, S.W.; Mr. R. P. Day, Bloomsbury-square, W.C.; and Messrs. Spalding & Cross, Queen-street, Chapside, E.C. The recommendation was, however, not adopted, it being eventually decided to advertise for competitive designs.

A spirit of unrest has lately been in evidence within the area governed by the Wakefield Rural District Council, and several of the townships are applying to the West Riding County Council for powers to become urban authorities. The Wakefield City Council are at the same time endeavouring to make terms with some of these townships which more immediately adjoin its boundaries to enter the city area on special rating terms. As a result of these changes Mr. Frank Massie, who for the last nine years has been the engineer to the rural authority, has commenced private practice in Wakefield as a civil engineer and surveyor, whilst still retaining his position as engineer to the rural council until the necessary arrangements for the transfer are made. Mr. Massie has quite recently been unanimously appointed to the position of consulting surveyor to the Sandal Magna Urban District Council.

The roadmen of the western district of Perthshire met recently at Duablane and presented Mr. George A. Calder, road surveyor, with a handsome marble timepiece, on the occasion of his marriage. His intended wife was also made the recipient of a gold bangle. There was a full representation of the road staff, and also a few of Mr. Calder's personal friends, present at the meeting. The chairman, in making the presentation, said that Mr. Calder's quiet and affable manners had won him the esteem of his superiors as well as the respect and love of those who had the good fortune to work under him, the former knowing that in him they had a servant who would do his duty under any circumstances whatsoever, and the latter being convinced that under him they would always get justice and that kind and considerate treatment which bound master and servants together and created harmony and confidence between them.

The death took place on Tuesday, in his sixty-third year, of Mr. Christopher Oakley, past-president of the Surveyors' Institution, and senior partner in the firm of Messrs. Daniel Smith, Son & Oakley, auctioneers and surveyors, of Waterloo-place, Pall Mall. He was one of the original members of the Surveyors' Institution, and last year occupied the position of president. He was a Fellow of the Geological Society, a director of the Auction Mart Company, a member of the Committee of the Estate Exchange, and one of the trustees of the Auctioneers and Surveyors Clerks' Provident Institution. Mr. Oakley was engaged in innumerable compensation cases, and was for many years one of the surveyors to the Board of Trade and one of the consulting surveyors to the Charity Commissioners. For many years, too, he had resided at Chislehurst, he had served on the Kent County Council, and was a member of the Kent Antiquarian Society. The funeral will take place at the parish church, Chislehurst, to-morrow, at 2 o'clock.

Mr. William Welch, superintendent of the waterworks pumping station at Aston, Birmingham, on Friday completed his term of service with the corporation. He retires on superannuation. Mr. Welch entered the service of the late waterworks company on July 1, 1863, as superintendent at Aston, and has held that position continuously since that date, first under the company, and then under the corporation. Mr. Welch's term expired on June 30th last, but by resolution of the council his services were continued to September 30th, so as to enable him to complete the erection of certain new plant which was being carried out under his personal supervision. During the term of his long service many important extensions and alterations at Aston have taken place, and Mr. Welch's experience and thorough acquaintance with the station have been of great advantage to the corporation. On Friday he was presented with a gold watch as a parting token of respect from the members of the staff and the workpeople of the station. The presentation was made by the secretary in the presence of the contributors, and Mr. Welch feelingly and appropriately acknowledged the gift and bade farewell to his old associates.

THE SOUTH LONDON TRAMWAYS.

PROPOSED PURCHASE BY THE COUNTY COUNCIL.

The Highways Committee of the London County Council have prepared another report on the negotiations for the purchase by the council of the London Tramways Company's system. Early in July last the committee reported that they were in negotiation for the purchase by the council of the whole of the London Tramways Company's system, including not only that portion with regard to which the council on the 21st of June preceding decided to give notice to purchase under the purchase sections of several of the company's Acts, but also certain tramways at Streatham and Tooting not immediately purchasable by the council, but exclusive of the 2½ miles of tramways and one depot which the council had already arranged to purchase for the sum of £22,872. They then stated that they had authorised the valuer to negotiate with the company's representative up to £800,000, which included a sum in consideration of the prospective profits of the Streatham and Tooting lines referred to. This offer the company was not prepared to accept, but suggested that the value of certain of the assets of the company, property and buildings, rolling stock, leases, harness, and plant and machinery, should for the purposes of the purchase be taken at the total amount shown in respect of them in the company's books on the 31st December, 1897—namely, £509,570—and as there was little difference between this amount and the valuer's estimate in respect of these items, the committee provisionally agreed to the suggestion. At that time they anticipated that the question of the value of the lines and the amount to be allowed in respect of prospective profits on lines not immediately purchasable would have to be referred to arbitration.

The committee now report that, as the result of further consideration and negotiations, they authorised the valuer to increase the offer on behalf of the council to £550,000, and the directors of the company stated they were prepared to advise the shareholders to accept that sum for the whole of the company's undertaking, exclusive, of course, of the 2½ miles of tramway and one depot the purchase of which had already been provided for. This offer the committee considered both fair to the council and the company, having regard to all the circumstances, and especially to the fact that by its acceptance all the expense and trouble of arbitration would be avoided, and they then intimated that they would recommend the council to purchase on those terms. At an extraordinary general meeting of the shareholders of the company, held on the 5th of August last, the directors were authorised by a special resolution to take the necessary steps for completing and carrying out the sale of the undertaking to the council upon the terms above stated, and that resolution was confirmed at a subsequent meeting. So far, therefore, as the company were concerned the matter was settled, and it only remained for the committee to obtain the sanction of the council to the arrangement provisionally made by them on their behalf with the company. After communication with the company's representatives as to the date for the transfer of the undertaking, they had come to the conclusion that, in order to give time for the purchase to be completed and the other necessary preliminary arrangements to be made, January 1st next would be the most convenient date, and the company had given an assurance in writing that the whole of the property would be thoroughly maintained until the day of transfer. The company had also undertaken to continue until December 31, 1898, the arrangement sanctioned by the council in May last, by which the company works and accounts to the council for the profits on the 2½ miles already purchased by the council. The agreed purchase price of £550,000 was for the company's undertaking only, and did not cover the provender and other consumable stores which would be in hand at the date of the transfer, nor the value of unexpired terms of licences, Excise duties, insurance policies, and other outgoings at that date. The amount to be paid by the council under those heads would have to be settled by agreement, or, failing that, by arbitration after the purchase of the undertaking should have been completed. No provision had been made in the annual maintenance estimates for those items of expenditure, the necessity for which could not be foreseen when the estimates were prepared, and they proposed at a later date to ask the Finance Committee to submit to the council the necessary estimate on maintenance account to cover that and other expenditure in connection with the working of the tramways up to March 31, 1899, the end of the council's financial year. With reference to the working and the management of the tramways should the council agree to the purchase, the committee point out that in July last the council decided to establish a tramways department, and referred it to the Highways and General Purposes Committees to confer and report upon the organisation of the department. They were in communication with the General Purposes Committee upon the subject, and there was little doubt that they would be in a position, before the time for the transfer of the undertaking should arrive, to report jointly with that committee upon the subject of the reference.

At the conclusion of their report the committee submit a definite recommendation, asking the council to sanction the

purchase on the terms agreed and to pass a vote of £800,000 for that purpose, £850,000 being for the purchase money and £10,000 provision for payment of stamp duty and other expenses of the transfer. The committee also seek to be authorised to settle the precise terms of the agreement to give effect to the purchase.

THE WATER SUPPLY OF PAISLEY.

GRAVE ACCUSATIONS.

On Friday, at a meeting of the Public Health Committee of the Paisley Town Council, the medical officer, Dr. Donald, submitted a report on an epidemic of enteric fever, which at present exists in the town. From substantial evidence which had been brought before them he had no hesitation in affirming that the water had become locally polluted. Possibly the majority of the committee were not aware of the fact that terminal end pipes were retroverted into the sewer, to be used for flushing purposes, separated from any direct communication by a valve—the whole system being underground, with no means by which this dangerous arrangement could be submitted to frequent examination. He had consulted prominent engineers with regard to these valves, and they informed him that they readily went wrong, particularly if used for a long period.

Was it right that the water should be separated from poison by a valve which was down under the ground for years and was never seen, and, farther, might become imperfect in its workings? Should it by any chance become obstructed, reargitation up the connecting pipe must take place, and if the valve were in the slightest degree defective, with the additions in the water pipe favourable, what was the unfortunate result? Pollution of the water. He submitted a sample of water pipe taken from East Linchman-street, which was occluded almost entirely with incrustations irregularly distributed to form cavities, which in the admittance of fluid matter or gas from the drain became nothing more nor less than little cesspools within the pipes. He felt convinced he had laid sufficient evidence before them in support of this very feasible theory, and that the majority would agree that the risk they ran was too appalling. He was not without hope that this contention would have the support of some, and that the public health would not be permitted to suffer from arrangements in the water system which were undoubtedly wrong, and demanded most urgent reform, by having certain structural alterations made and a systematic examination of the water from time to time, so that the element might be rendered above suspicion. Meantime he suggested extra flushing of the water and pipes and thorough disinfection of the sewers. A long discussion took place on the report, and it is understood that the committee agreed to the suggestions made by the medical officer.

Peebles.—At the last annual meeting of the Peebles Gas Light Company the annual report, which was submitted, showed the sum of £1,012 to be at the credit of the profit and lost account, and the directors recommended payment of the usual dividend of 10 per cent., which would absorb £580, leaving £432 to be carried forward. The chairman intimated that the draft of the agreement between the company and the town council for the acquisition of the company's undertaking by the corporation had now been adjusted by the agents of the parties, and that in all probability that would be the last annual meeting of the company.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

INSPECTOR OF NEW BUILDINGS AND DRAINAGE WORK.—October 8th.—Hornsey Urban District Council. £160.—Mr. E. J. Lovegrove, engineer and surveyor to the council.

HARBOUR ENGINEER.—October 10th.—Waterford Harbour Commissioners. £150.—Mr. J. Allingham, jun., secretary to the commissioners, Harbour Office, Waterford.

SURVEYOR OF HIGHWAYS.—October 10th.—Pickering Rural District Council.—Mr. Robert Kitching, clerk to the council.

BOROUGH AND HIGHWAY SURVEYOR, WATER ENGINEER, INSPECTOR OF NUISANCES, &c.—October 10th.—Pwllheli Corporation. £140.—Mr. Evan R. Davies, town clerk.

SEWER FOREMAN.—October 11th.—Borough of Maidstone. £1 15s.—Mr. Herbert Monckton, town clerk.

DISTRICT ROAD SURVEYOR.—October 11th.—Derbyshire County Council. £160.—Mr. N. J. Hughes-Hallett, county clerk, County Offices, Derby.

SURVEYOR OF HIGHWAYS.—October 11th.—Spalding Urban District Council. £100.—Mr. H. H. Harvey, clerk to the council.

STEAM ROLLER DRIVER.—October 12th.—Maidstone Rural District Council. 28s.—Mr. Sidney Stallard, surveyor to the council.

MANAGER FOR SEWAGE PURIFICATION OUTFALL WORKS.—October 13th.—County Borough of Stockport.—Mr. Walter Hyde, town clerk.

FOREMAN.—October 14th.—Staines Rural District Council. 27s. 6d.—Mr. George W. Manning, engineer and surveyor to the council.

ASSISTANT SURVEYOR.—October 17th.—Garston Urban District Council. £110.—Mr. F. W. Bowden, A.M.I.C.E., surveyor to the council.

SURVEYOR.—October 17th.—Twickenham Urban District Council. £260.—Mr. H. Jason Saunders, clerk to the council.

ENGINEER, SURVEYOR AND SANITARY INSPECTOR.—October 19th.—Wembley (Middlesex) Urban District Council. £220.—Mr. John Smith, clerk to the council.

GENERAL ENGINEERING ASSISTANT.—October 20th.—Corporation of Birkenhead. £110.—Mr. Charles Brownridge, A.M.I.C.E., borough engineer and surveyor.

ELECTRICAL ENGINEER.—October 24th.—East Ham Urban District Council. £300.—Mr. W. H. Savage, A.M.I.C.E., engineer and surveyor to the council.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

ABERAVON.—December 1st.—Extension of the covered market, at a cost not to exceed £5,000. £21.—The Borough Surveyor.

CHERTSEY.—December 23rd.—Sewerage and sewage disposal scheme for the No. 1 and 2 wards of the district. £50, £30 and £20.—Mr. T. E. Harland Chaldecote, clerk to the council.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

ISLINGTON.—October 7th.—Supply and fixing of pipes, valves, &c., in connection with the provision of a supply of water to the public gardens and recreation grounds in Market-road, Holloway.—Mr. J. Palace Barber, vestry surveyor.

HULL.—October 7th.—Supply and erection of a 7-ton overhead traveller (hand-power) for a span of 42 ft. 9 in.—Mr. A. E. White, city engineer.

TOTNES.—October 7th.—Erection of post and rail fencing at Lower Longcombe, Herry Pomeroy, for the rural district council.—Mr. Thos. W. Windcutt, clerk to the council.

HASTINGS.—October 7th.—Laying of about 9,000 yards run of 16-in. water main and about 2,850 yards of 10-in. main in connection with the Brede Valley water scheme.—Mr. P. H. Palmer, M.I.C.E., water engineer, Town Hall, Hastings.

SWINTON AND PENDLEBURY.—October 8th.—Repairing of Swinton Hall-road, Stinton-road and Partington-lane, for the urban district council.—Mr. Henry Entwistle, surveyor to the council.

HULL.—October 8th.—Sinking and construction of east-iron shafts and subway at the Queen's dock basin, for the corporation.—Mr. F. J. Battersif, water and gas engineer.

SWINTON AND PENDLEBURY.—October 8th.—Construction of a surface-water-drain, for the urban district council.—Mr. Henry Entwistle, surveyor to the council.

SWINTON AND PENDLEBURY.—October 8th.—Supply of 175 tons of granite setts, for the urban district council.—Mr. Henry Entwistle, surveyor to the council.

BISHOP STORTON.—October 8th.—Supply of from 1,200 to 1,500 tons of 1½-in. broken granite and from 100 to 150 tons of 1-in. granite chips, for the urban district council.—Mr. William Gee, clerk to the council.

STAINES.—October 8th.—Supply of mackintoshes and waterproof overalls, for the use of the out-door staff, for the rural district council.—Mr. G. W. Manning, surveyor to the council.

PRESTON.—October 8th.—Various sewerage and sewage disposal works for the township of Farington, for the rural district council.—Mr. James Clark, clerk to the council.

FRATHERSTONE.—October 10th.—Laying of about 2½ miles of 5-in. east-iron water main, for the urban district council.—Mr. W. A. Falliser, engineer and surveyor to the council.

SITTINGBORNE.—October 10th.—Supply of about 100 yards of Guernsey or Alderney granite, for the urban district council.—Mr. W. J. Harris, clerk to the council.

OSSETT.—October 10th.—Levelling, making-up and surface draining of a portion of the new road between Grays and Tibury dock, and also the construction of a bridge culvert on the road, for the rural district council.—Mr. R. T. Stewart, surveyor to the council.

OSSETT.—October 10th.—Levelling, making-up, kerbing and surface-draining works in certain streets in the parish of Chadwell St. Mary, for the rural district council.—Mr. R. T. Stewart, surveyor to the council.

ROTHWELL.—October 11th.—Levelling, paving, flagging and making-up of Smithson-street, Mell-urne-street, Melbourne-grove, Melbourne-place and Sidney-street, for the urban district council.—Mr. J. T. Peers, surveyor to the council.

BRIDGWATER.—October 11th.—Making-up, channelling, metalling, kerbing and tar paving of Washington-terrace and Washington-gardens.—Mr. W. E. Baker, town clerk.

BRIDGWATER.—October 11th.—Repairing of the roof at the Market House, Cornhill.—Mr. W. T. Baker, town clerk.

NOTICES.

THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER may be ordered direct, through any of Messrs. Smith & Son's book-stalls, or of any newsvender in the United Kingdom. Applications to the Offices for single copies by post must in all cases be accompanied by stamps.

The Kensington Patent Syphonic Closet Traps and Closets

Embrace all the qualities of a First-Class Valve Closet at less than one-fifth the cost. WHEN FIXED WILL LAST A LIFE-TIME.

Meeting with all the Requirements of the London County Council.

May be obtained of all leading Lead and Sanitary Goods' Merchants.

Illustrated Price Lists may be had from

THE ANCHOR SANITARY POTTERIES, SWADLINCOTE.

ADVANTAGES.

IT is fixed exactly as a common hopper and trap, with earthenware or lead outlets; or the trap may be had entirely of 10 lb. cast lead.

IT CANNOT GET OUT OF ORDER.

Only requires TWO gallons of water to properly flush it, and it has no puff pipes or other complicated parts.

It has a water service of 10 in. by 8 in., or more if required, an absolute water seal of 5 in., and cannot under any conditions be syphoned out.

W. FASSIE, Esq., C.E. (deceased), said it was preferable to any other closet. The trap can be adapted to the "Household," "Swift," "Sirex," "Iris," or any similar closet basin. The price enables it to be used in Cottage, Villa or Building, whilst it cannot be equalled for the best of Mansions. Special after-flush cisterns made to suit the closet.

The Prepaid Subscription (including postage) is as follows :

	Twelve Months.	Six Months.	Three Months.
United Kingdom	16s.	7s. 6d.	3s. 9d.
Continent, the Colonies, India, United States, &c.	19s.	9s. 6d.	4s. 9d.

The International News Company, 83 and 85 Duane-street New York City; The Toronto News Company, Toronto; and The Montreal News Company, Montreal, have been appointed agents in the United States and Canada for the sale of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER. A thin paper edition is printed for circulation abroad.

APPOINTMENTS OPEN.

WEMBLEY (MIDDLESEX) URBAN DISTRICT COUNCIL.

APPOINTMENT OF ENGINEER, SURVEYOR AND SANITARY INSPECTOR.

The Wembley Urban District Council is prepared to receive applications from gentlemen desirous of filling the above posts, at the combined and inclusive salaries of £220, rising by annual increments of £15 to a maximum of £280 per annum.

Forms of application, and full particulars as to the duties, can be obtained by sending a stamped directed envelope (foolscap) to my office.

Application forms, duly filled up and accompanied by copies of not more than three recent testimonials, should be sent to me, in sealed envelopes, marked "Engineer, &c.," by not later than 6 o'clock on Wednesday, the 19th October, 1898.

Selected candidates will be written to, and third-class railway fare only will be allowed.

Canvassing the members, directly or indirectly, is strictly prohibited and will be deemed a disqualification.

(By order)
JNO. SMITH,

Clerk to the Council.

Public Offices, Wembley, Middlesex.

September 22, 1898.

BOROUGH OF BIRKENHEAD.

The Corporation of Birkenhead are prepared to receive applications for the position of General Engineering Assistant in the Borough Engineer and Surveyor's office, at a salary of £110 per annum, rising by annual increments of £10 to £175 per annum.

Candidates must have had experience in a municipal engineer's office, and be not less than twenty-three years of age nor more than twenty-eight years of age.

Applications, in candidate's own handwriting, stating age and experience, and accompanied by copies of not more than three recent testimonials, sealed and endorsed "Engineering Assistant," must be delivered at the office of Mr. Charles Brownridge, A.M.I.C.E., Borough Engineer and Surveyor, Town Hall, Birkenhead, by 12 o'clock noon, on Thursday, the 20th October, 1898.

Canvassing will be deemed a disqualification.
Borough Engineer's Office, Town Hall, Birkenhead.

September 29, 1898.

**BOROUGH OF MAIDSTONE.
SEWER FOREMAN.**

The Drainage Committee of the Corporation are prepared to receive applications from qualified persons for the post of Sewer Foreman.

Applicants must have had experience in the construction of brick and pipe sewers and the maintenance of the same, and will be required to take charge of the staff engaged in construction and maintenance of the sewerage system, and assist in the work when necessary.

The person appointed will act under the immediate direction of the Borough Surveyor, and his hours will be the same as the working staff, and he will be required to keep all the necessary books.

Wages will be at the rate of £1 15s. per week.

Applications, in candidate's own handwriting, stating age (which must not exceed forty-five years), experience, past and present employment, accompanied by copies of not more than three recent testimonials, and endorsed "Sewer Foreman," to be sent to the undersigned on or before Tuesday, 11th October, 1898.

Canvassing, directly or indirectly, will be considered a disqualification.

MAIDSTONE RURAL DISTRICT COUNCIL.

The above Council require the services of a competent Steam Roller Driver.

Applicants must have had previous experience in the driving and management of steam roller, and must be competent to execute any slight repairs thereto.

The appointment in the first instance will be for about four months, but, if the selected driver gives satisfaction, the appointment will in all probability be made a permanency.

Wages, 28s. per week.

Applications, stating age and previous experience, accompanied by two testimonials of recent date as to character and suitability, must be sent, in own handwriting, to the undersigned not later than Wednesday, October 12, 1898.

SIDNEY STALLARD,
Surveyor.

October 1, 1898.

TWICKENHAM URBAN DISTRICT COUNCIL.**APPOINTMENT OF SURVEYOR.**

The Council invite applications for the appointment of Surveyor for their district, which has a population of about 18,000 and a rateable value of £121,000, and approaching 40 miles of roads.

The salary will be £260 for the first year, with annual increments thereafter of £20 until a maximum salary of £400 per annum is obtained.

The person appointed must reside within the district and devote his whole time to the duties of his office (no private work being allowed).

He must be thoroughly competent to carry out the duties prescribed by the Public Health Acts, and to undertake and superintend works usually performed by sanitary authorities.

The appointment will be subject to one month's notice on either side.

Sealed applications, endorsed "Surveyor," stating age, qualifications and experience, accompanied by copies of not more than four testimonials, must reach me on or before Monday, the 17th October, 1898.

Personal canvassing will be a disqualification.

(By order)

H. JASON SAUNDERS,
Clerk to the Council.

Town Hall, Twickenham.
September 30, 1898.

**COUNTY BOROUGH OF STOCKPORT.
SEWAGE PURIFICATION WORKS.**

Wanted, a Manager, to take charge of Sewage Outfall Works, situate at Henthside Farm, Cheadle Heath, about 1½ miles from Stockport. The estate is 95 acres in extent, 60 acres being prepared for sewage treatment. The sewage is pumped into the tanks: dry weather flow about, 2,500,000 gallons per day. The buildings contain chemical tanks, boilers, duplicate centrifugal pumps, duplicate engine-power grinding mills, mixers, three mud presses, and other machinery.

Applicants must be experienced in the treatment of sewage by precipitation, the pressing of mud, and the farming of land by sewage effluent.

Applications, stating age, salary required, extent of experience, accompanied by copies of testimonials, and endorsed "Sewage Farm Manager," to be addressed "The Town Clerk, Stockport," and sent in not later than October 13, 1898.

WALTER HYDE,
Town Clerk.

**EAST HAM URBAN DISTRICT COUNCIL.
ELECTRICAL ENGINEER.**

The above-named Council require the services of an Electrical Engineer for the preparation of a scheme of electric lighting combined with tramways, and the ultimate management and maintenance of the same after completion.

The person appointed must be prepared to reside in the district and devote the whole of his time to the duties of the office. The salary will be £300 per annum, with necessary offices and assistance, and, as the district is a rapidly increasing one, the position is likely to improve.

All further particulars, together with a form of application, may be obtained upon application to Mr. W. H. Savage, A.M.I.C.E., the Engineer and Surveyor to the Council, at the Public Offices, East Ham.

Applications to be sent, in the printed envelope provided for the purpose, and enclosing copies of three recent testimonials, or or before Monday, October 24th next.

Canvassing members of the Council, either directly or indirectly, is strictly prohibited and will disqualify any candidate.

G. E. WILSON,
Clerk to the Council.

STAINES RURAL DISTRICT COUNCIL.—Wanted, Road Foreman, used to steam roller, tar paving, kerbing, and general work. Wages, 27s. weekly.—Apply, stating age and experience, to Mr. G. W. Manning, Surveyor to the Council, not later than the 12th proximo.

TENDERS WANTED.

BOROUGH OF REIGATE.
TO CONTRACTORS.
The Council of the Borough of Reigate, acting as an urban district council, invite tenders for the construction of a

Bacteriological Filter and other incidental works at the Precipitation Works, Earlswood, within the said borough.

The whole of the work is to be executed in accordance with a plan, section and specification prepared by Mr. W. H. Prescott, C.E., the Borough Surveyor, and which may be seen at his office at the Market Hall, Redhill, Surrey, where also forms of tender may be obtained.

Sealed tenders, endorsed "Tender for Filter," are to be delivered in my office, No. 84 Station Road, Redhill, not later than 12 o'clock at noon on Thursday, the 13th day of October next.

The Council does not bind itself to accept the lowest or any tender.

Given under my hand this 26th day of September, 1898.

(By order of the Council)
CLAIR J. GRECE,
Town Clerk.

RUGBY URBAN DISTRICT COUNCIL.

PUMPING MAIN.

TO CONTRACTORS AND OTHERS.

The Urban District Council of Rugby invite tenders for supplying, laying and jointing about 960 yards of Cast-Iron Pumping Main from the Avon Waterworks to Railway-terrace, Rugby.

The drawings can be seen at my office, where a copy of the specification, bill of quantities and form of tender can be obtained on payment of 1 guinea, which will be returned on receipt of a bond-fide tender.

Sealed tenders, endorsed "Pumping Main," to be sent to Mr. T. M. Wratishaw, Clerk to the Council, Rugby, on or before the 24th instant.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
D. G. MACDONALD, ASSOC. M. INST. C. E.,
Engineer and Surveyor.

Rugby.

HODDESDON URBAN DISTRICT COUNCIL.
TO ROAD AND SEWER CONTRACTORS.

The above Council invite tenders for the Making-up of three Streets in their district, comprising a total length of 3,400 ft.

The works include Carriageways, Footways and Kerbs. Tenders are also invited for the construction of Surface-Water Sewers, comprising 44 yards of 15-in. Cast-Iron Pipe, 32 yards of 15-in. Stoneware Pipe, 383 yards of 12-in. Stoneware Pipe, 953 yards of 9-in. Stoneware Pipe and 131 yards of 6-in. Stoneware Pipe, with the necessary Junctions, Man-holes, Tumbling Bays, Ventilators, Catchpits, &c.

Plans and sections may be seen at the office of the undersigned, from whom the specifications, quantities, forms of tender and contract may be obtained on payment of 3 guineas, which sum will be returned to non-successful contractors on the receipt of a *bond-fide* tender and the return of the specifications, quantities, forms of tender and contract, and to the successful contractor on his executing his contract and bond.

Tenders must be on the forms supplied by the council and accompanied by the schedule of prices, and must be delivered at the office of the Council, addressed to the Chairman, Highways Committee, Council Offices, High-street, Hoddesdon, sealed and endorsed "Tender for Works," by not later than noon on Monday, the 24th day of October inst.

The Council do not bind themselves to accept the lowest or any tender, and reserve the right of letting both contracts to one contractor or otherwise.

T. SALKIELD,
Surveyor.

Briscoe-road, Hoddesdon.
October 1, 1898.

TWICKENHAM URBAN DISTRICT COUNCIL.

BROKEN GRANITE.

The Twickenham Urban District Council invite tenders for the supply of about 2,000 cubic yards of 2-in. Broken Blue Guernesey Granite or Cherbourg Quartzite, suitable for road-metalling, to be delivered alongside Richmond Bridge or Church Draw Docks, within the parish of Twickenham, as required.

Tenders, with samples, to be sent in to me, endorsed "Tender for Granite," on or before noon on Thursday, 13th October, 1898.

Forms, on which the tenders only will be received, and full particulars may be obtained at the office of Mr. G. B. Laffan, Surveyor to the Council, Town Hall, Twickenham.

The party whose tender is accepted will be required to enter into a contract and deliver 100 cubic yards of the granite within fourteen days from the date of the Surveyor's order, and the remainder of the granite to be delivered within three months from the date of the signing of the contract. The Council does not bind itself to accept the lowest or any tender.

(By order)
H. JASON SAUNDERS,
Clerk to the Council.

Town Hall, Twickenham.
October 1, 1898.

ORSETT RURAL DISTRICT COUNCIL.

PRIVATE STREET WORKS.

CHADWELL ST. MARY PARISH (TILBURY).

Tenders are invited for the Levelling, Making-up, Kerbing and Surface Draining the following streets or parts of streets in the parish of Chadwell St. Mary—viz., Montreal-road, for a distance of 1,880 ft. from its junction with Dock-road; Quebec-road, Toronto-road, for a distance of 1,501 ft. from its junction with Dock-road; Calcutta-road, for a distance of 692 ft. from its junction with Montreal-road; Sydney-road, for a distance of 785 ft. from Toronto-road; and Dock-road, from the boundary of the London, Tilbury and Southend Railway Company's property to the boundary between the parishes of Chadwell St. Mary and Little Thurrock.

Plans and specifications can be seen, and bills of quantities obtained, at the office of the Council's Surveyor, Mr. R. T. Stewart, Orsett, Essex, by making an appointment with him.

Sealed tenders, to be endorsed "Tilbury Streets," to be delivered to the undersigned not later than Monday, October 10, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)

Minutes of Proceedings.

Value of Municipal Trading.

The question of the appropriate limits of municipal enterprise—or "municipal trading," to use the phrase that has been coming into fashion—has of late received a good deal of attention from economists. This was especially noticeable at the recent meeting of the British Association, when the section devoted to economics spent considerable time in debating the subject in various aspects. In connection with the special undertakings with which municipalities have for some time been closely identified, several erroneous statements have been made; and these, in the interests of all concerned, but particularly in the interests of municipal trading, invite some criticism. There can, of course, be no question as to the great development of municipal undertakings at the present day. In the valuable paper published in our issue of September 16th Mr. Pearson clearly demonstrated the vitality with which municipalities have been animated in their various enterprises. The total indebtedness of £93,000,000 sterling, which figure represents municipal loans at the present moment, is a measure of the activity of corporations in undertaking work for the benefit of the community. It is true that nearly half of that sum is invested in waterworks, but the capital account of those departments that are more distinctly trading in their character, such as electric lighting, gasworks and so on, stands at a very considerable figure. Nor can it be said that the results of such work suggest any immediate limit to the indebtedness that is being cheerfully undertaken by almost every municipality in the kingdom. It is hardly necessary to repeat some of the stock arguments that can be always deduced in favour of municipal trading, but these arguments are considerably strengthened by what we may term the extraordinary success that has followed the operations of corporations in the direction of tramways and electric lighting. Examples in connection with electric tramways are few, but we have already shown that in the completed systems success has been pronounced from the commencement. In speaking of the indebtedness of local authorities it must not be forgotten that these gigantic sums have been raised at exceedingly low rates of interest, probably a half, and in some cases a third, of what it would cost any joint-stock company. Dealing, however, with some of the misconceptions that have been promulgated, we must raise a strong protest against the remark, frequently repeated, that "there is no special reason why the credit of the ratepayers should be pledged to enable a capitalist to procure power for his mills at a cheaper rate." This especially relates to those cases in which a municipality undertakes to supply energy, no matter in what form, for power purposes throughout its district, but it is the very essence of municipal activity that it should supply a ratepayer with lighting, even when pledging the credit of the majority, more cheaply than he can supply it himself or be sup-

plied by any other person. It is obvious that when a municipality undertakes a supply of power and lighting some one or more consumers are bound to derive relatively more advantage than many others. In particular, take the case of electric lighting. Its introduction by a corporation in many towns has permitted the owners of textile industries to work longer hours during the winter months, because by the aid of electric lighting they are enabled to match colours, which they could not possibly do previously by any other artificial light. If the owners of such a factory obtain their light from the public mains they pay in a correspondingly greater degree for the greater relative advantage than does the man who merely uses two or three lights for household purposes. The same truism will hold in the case of any other municipal supply; it is obvious that it will be cheaper to make power on a large scale and distribute to users than it will be for consumers to make it themselves. Iron workers, for example, may, in the exercise of their special work, employ large lengths of steam pipes for the operation of scattered steam engines. This is an uneconomical, though in some circumstances a necessary, method, but if a municipality will offer in such a case to supply electrical energy at a fairly low rate, the iron worker may abandon his steam engines and use electric motors. Nor could it be seriously urged that a municipality was exceeding its duties to the ratepayers if it sought to supply power in such a case. Moreover, a consumer is usually a ratepayer, and according to his value as a consumer so is his value as a ratepayer. If he is a large user of power or lighting, it may be taken for granted that he is a large ratepayer. It would not be difficult to produce other instances in which a municipality may be ostensibly benefitting one man more than another. The householder whose premises abut on main streets may be said to obtain a greater relative advantage from a good system of street sweeping and scavenging than the man who lives a considerable distance away from the main thoroughfare. One of the most unfair statements, however, made against municipalities is that "in those cases where they own the gasworks they show considerable reluctance to admit electric lighting into the district, because it might depreciate the value of the gasworks." Such a suggestion is absolutely erroneous, and it can be shown conclusively that electric lighting has been most successful in those towns where the corporations have for years owned the gasworks. The Manchester gasworks are among the largest municipally-owned undertakings in the world, but it would be difficult for anybody to say that the electric lighting system had suffered in the slightest degree; indeed, the very contrary can be shown, for the Manchester Corporation electric lighting works may be held to be pre-eminent among provincial works.

On the vexed question of what shall be done with the profits derived from municipal activity we have

previously made some remarks, and we see no reason to alter the opinion formerly expressed to the effect that until the majority of ratepayers are obtaining some direct benefit from a corporation undertaking there should be some distribution of profit, when obtained, in the shape of a reduction of rates. Electric lighting is especially an instance where profits, at any rate for the first few years, should be devoted to some extent towards alleviating rates, because, in spite of the success that has attended the introduction of electricity, some years must elapse before it can be in any sense a universal illuminant. The whole matter is put into a nutshell in the case of Bristol, where at the present moment there are 1,000 consumers and 60,000 ratepayers. The credit of those ratepayers was pledged when the work was first undertaken, and it would be grossly unfair if the 1,000 consumers were, in their capacity of ratepayers, to receive the whole of the advantages that might arise from the successful operation of the system. Turning to another aspect of the question, it is surprising to find such an antiquated statement being repeated as that "municipalities cannot command the same ability as companies"; such a suggestion argues a lack of knowledge and experience of what really obtains. The engineers and surveyors, the lawyers, the agents, and officials generally, who are directly connected with municipal interests stand, it is needless to say, very high in their respective professions; nor is there any neglect of work merely because there is likely to be a change of employers from time to time. Members of committee may come and go, but the body corporate as directly representing the interests of the ratepayers is always in existence, and there is too much light thrown upon the doings of municipal departments for there to be much likelihood of waste occurring in time or money. In a sense there is probably more responsibility felt in the conduct of municipal work than in the undertakings carried out by companies. The record of joint-stock enterprise in this country on the grounds of probity and excellence of work does not stand on the same level as that of municipalities. We are often referred to America as furnishing an example of the disastrous effects of municipalities undertaking public supplies, but the life and institutions of the two countries are totally at variance. In comparison with this country America is new to municipal life, and has not yet freed itself from the tyranny of cliques, Tammany Halls and caucuses generally. But if municipal work has not been a success in America, can it be urged that the operations of companies in the United States have done very much for the consumer? It is the country above all others in which monopolist rings and trusts have exercised the most potent influence for evil. Leaving that phase of the subject, we come to another, equally important from the municipal point of view, What should be the limits of municipal trading? It is obviously difficult to lay down any hard and fast rules. We should not, however, like to see corporations or other local authorities embark upon the sale of provisions or become universal milk sellers, and we must confess even to some apprehension regarding the "Gothenburg" system of running beer-shops. But in such essentially public work as lighting, water supply, the distribution of power and the operation of tramway systems there is surely little to be said against it. The limit of municipal enterprise should be found in restricting it to those operations that are confined for the most part within the locality. Tramways occasionally, in order to make a complete system, might with advantage be extended beyond the municipal boundary, with the concurrence of the outlying local authorities, just in the same way as water is supplied to some outside authorities by large towns. We admit that the very fact of going beyond a municipal boundary tells against the telephone system, because, as we have pointed out, the utility of the telephone service depends upon the distance and area over which

conversations can be held, and this will become more marked with the greater development of trunk line services.

* * *

We note with satisfaction that **Superannuation**, the agitation over the question of superannuation for municipal officers is once more being resumed, and that those who are exerting themselves in the matter are in no way discouraged by the want of success which has hitherto attended their efforts. Given the necessary amount of energy and intelligent adaptation of means to the end in view, success must come sooner or later, though the sooner it comes the better. The conference convened by the Municipal Officers' Association, as we have already announced, have been considering the question of again promoting legislation in the next session of Parliament, and it has been decided to invite all associations and societies representing municipal officers to again send delegates to the conference. In this connection we would draw the attention of our readers to the letter from Mr. C. J. F. Carnell, honorary secretary of the Municipal Officers' Association, which appears in another column. We expect to be able to report a good attendance of municipal officers at the forthcoming meeting, and that a satisfactory course of action will be unanimously decided upon. Above all, we hope that municipal engineers will be adequately represented at the gathering. The Incorporated Association of Municipal and County Engineers will no doubt give the Bill the same hearty support as last year, though it will be remembered that it was considered desirable to extend support also to the Bill promoted by the Metropolitan Local Government Officers' Association, so long as the two Bills did not clash. The object of the smaller Bill, of course, is to make compulsory the provisions in the Superannuation Act, 1866, by which metropolitan local authorities were given discretion to grant superannuation to their officers. Last week we published a report from the chairman and secretary of the Municipal Officers' Association dealing with the present position of affairs, and from that report it will be seen that some slight friction has arisen in connection with the two Bills. The promoters of the smaller Bill apparently wish that all reference to metropolitan officers be omitted from the larger, a request to which the conference, as representing municipal officers all over the country, cannot very well agree, especially as the smaller Bill makes no provision for counting years of service from one local authority to another. A Bill of only partial application is not likely to stand as good a chance as a complete measure representing a unanimous demand on the part of municipal officers, both metropolitan and provincial. If the larger Bill were sure of acceptance by Parliament there would, of course, be no necessity for the smaller and sectional one; but, as things are, metropolitan officials naturally argue that they should not be expected to surrender their chance of making the Bill of 1865 compulsory. On the other hand, in spite of the discretionary powers vested in metropolitan authorities by that measure, it may reasonably be doubted if Parliament would make superannuation compulsory without extending the privilege to municipal officers throughout the country generally. At the same time there is no saying what Parliament in its wisdom may or may not do. There is the analogous case of the poor law officers as a precedent. In their case superannuation had long been permissible, and Parliament made it compulsory, though why they have a greater claim than other classes of local government officers would be very difficult to say. In regard to the two Bills under discussion, it should not be difficult to come to a harmonious understanding. The right policy, as in other things, will be that which tends to the greatest good of the greatest number, and a sectional measure is certainly to be deprecated if it can possibly be avoided without injustice. We hope to

find that the forthcoming meeting will result in a satisfactory arrangement.

The Ventilation of House Drains and Sewers.

Notwithstanding the difficulties which beset the question of the ventilation of house drains and of sewers,—for the two are interdependent—and notwithstanding that the subject is being repeatedly considered and discussed at all sanitary congresses, it is apparent that we get no nearer a solution of the difficulty. It is, we must admit, somewhat of a reflection on municipal engineers and medical officers that progress is so slow, and that practically we are no further advanced in our knowledge as to how to compass the evil than we were twenty years ago. There is, it cannot, we think, be gainsaid, no approach to any consensus of opinion among health officers on any phase of the question. In some districts it is found that the free ventilation of sewers by road-surface ventilators and shafts carried up the sides of houses is carried out, and that house drains are also ventilated in themselves, but disconnected, so far as sewer air is concerned, from the sewerage system. In a closely adjacent district road-surface ventilators are entirely abolished, as being an unmitigated nuisance, and tall expensive columns are erected in the footways of every street, while the house drains are constructed without disconnecting traps, the private drains being utilised to ventilate the sewer; or, where disconnecting traps are provided, each house is “adorned” with two ventilating shafts, one for the “ventilation” of the sewer and the other for the “ventilation” of the house drain—an incongruity which the poor householder is unable to fathom, and which experts are generally unable to explain away. In another district may be found a system of sewers in which no ventilation whatever is provided for, and in still another artificial means of disinfection of sewer air is provided for.

Each of the systems has its advocates, who claim that their particular method is, and only can be, right, and medical men are for ever proclaiming that almost all the ills that flesh is heir to are due to the influence of sewer gas. We venture to state that all this diversity of practice is due to an ignorance of the subject, which ought not to be permitted to continue. Medical officers of health, we notice, claim that the subject is one in regard to which surveyors should not have a monopoly of opinion as to a solution of the question, but, from a perusal of papers and opinions given by them at the recent Sanitary Institute congress, they are as widely chaotic in their views as municipal engineers, and though unable, as it appears to us, to suggest a remedy, they are enabled to work mischief, for in one case we noticed that a medical officer of health announced that a corporation acting on his advice had removed all ventilators of sewers up private houses, and no alternative means of ventilation appears to have been substituted for the ventilators displaced. Unless the medical officer can show, as he appears to have been unable to show at the recent congress, that his abilities are limited to criticism only, he must of necessity not be seriously counted upon as being able to assist in a solution of the problem. We think, however, that this is not the case; but we hope that the engineer and the chemist will jointly be able to do much, and we would suggest that the matter be taken up in a proper spirit and that experiments be carried out on strictly scientific lines to investigate and determine the remedy for what is at present a very unsatisfactory and chaotic muddle.

Progress in Sanitary Engineering.

In matters of detail there are many points of difference in engineering practice in England and in America, but the essentials must, of course, be the same in both countries, and, indeed, in all civilised countries. This was illustrated at the recent convention of the American Society of Civil Engineers, when the president, Mr. Alphonse

Fteley, gave, as the annual address, a comprehensive review of engineering progress during the preceding year. In connection with water supply he drew attention to some pressing aspects. He pointed out that extravagant consumption, or rather waste, appears to increase as increased provision is made to meet it, and that unless some more rational method than that now in use be employed to regulate consumption it will be impossible to make reasonable provision to meet it. With the increased demand for water come also more exacting requirements as to its purity. Filtration processes have been installed, their action studied, and much valuable information gathered. Radical chemical and biological changes have been found to take place in the operation of filtering, and bacterial life has been recognised as the most potent instrument for the conversion of organic matters into mineral compounds. Mr. Fteley also proceeded to sum up the equally vital question of sewage disposal and the pollution of rivers. The necessity for the final discharge of sewage into streams that may subsequently be used as sources of water supply makes equally necessary the application of means for rendering the sewage innocuous. The worst pollution of streams, of course, has arisen, not from domestic sewage, but from trade refuse, and at the present moment the solution of the problem seems much nearer realisation in the former respect than in the latter, even without Archdeacon Sheringham's wonderful suggestions of “huge furnaces,” “lofty chimneys” and “chemical ingredients.”

Remuneration for Special Work.

When a municipal engineer carries out successfully some extensive scheme outside the ordinary routine of his duties, and thereby probably saves the town a large sum of money, surely no wrong is done to the ratepayers, but rather the reverse, by making due recognition in the shape of some special remuneration over and above the official's salary. A little encouragement judiciously given is generally a profitable investment, but if some people had their way there would be none. One or two members of the Waterford Corporation are of this type, but we are glad to say that on a recent occasion they did not have their own way. At the last meeting of the council a proposal was under consideration to increase the salary of the borough engineer, and the recommendation of the committee also contained a reference to the granting of some special remuneration for the designing and carrying out of the sewage works when these works were completed. This proposal gave offence to one or two members, and it was even described as a “dangerous precedent.” The recommendation, however, was passed, and it is not likely that the corporation or ratepayers will have any reason to regret their generosity.

A Chairman Infringing By-Laws.

It is never a very easy task for the surveyors to local authorities to enforce by-laws, but the difficulty is much greater when an infringement is committed by a member of the local authority and the chairman to boot. This was the case the other day at Bray, where the chairman of the commissioners, who might have been expected to know better and to set an example, appears not only to have ignored the by-laws, but to have made a complaint against the surveyor, because the latter insisted on the by-laws being complied with. This the offended chairman called “red-tapeism.” He had applied for water to be turned on where he was carrying out certain building operations. That was not done, for the reason, as afterwards transpired, that no plans had been deposited. Much was said about the unwisdom of hampering and checking building operations, and thus injuring the town; but by-laws are made with a necessary object in view, and if even the chairman does not respect them, who will?

Principal Features of Electric Lighting Systems.—VI.*

TWO MODERN LOW-PRESSURE SYSTEMS.

In the last article on this subject it was suggested that perhaps the best way of bringing out the principal features of modern municipal works employing low-pressure current would be to describe systems of the latest type. With this object in view it is proposed to set forth the principal features of the Bradford system and the one owned by the Chester Corporation.

THE BRADFORD WORKS

provide an instance of the best practice that obtains to-day. Both in size and arrangement the works rank among the best in the kingdom, the plant having been arranged and carried out by the present city electrical engineer, Mr. H. Gibbings. The dynamo and engine-room is 85 ft. long, 61 ft. wide and 28 ft. high, with steel roof, which is in one span and boarded with pitch pine. Accommodation is provided for twelve engines and dynamos. The boiler-house is 105 ft. long, 48 ft. wide, and 28 ft. high to the steel lattice girders which carry the roof. The latter is provided with large louvred ventilators for carrying away escaping steam and skylights for giving light. In order that the cooling arrangements may be expeditiously carried out, and with as little labour as possible, the coal carts enter by special entrance gates, and, after being weighed in the weigh-house, pass up a slight

running in a bath of oil lubricating all the working parts by splash. The range of speed capable of being regulated by hand is from 270 to 300 revolutions per minute. Four of the dynamos are of Siemens' multipolar type and coupled direct to the engine. They give an output of 750 amperes and 500 volts at a speed of 300 revolutions per minute. The armature is of the usual Siemens' drum pattern, with stranded bar conductors, but the diameter in this case is nearly twice the length of the pole pieces.

THE BOILER-HOUSE.

Considerable interest attaches to the boiler-house, for the type of boiler used is radically different from what one usually meets in electricity works. There are two of the marine type, made by Messrs. John Brown & Co., Limited, fitted with Ellis & Eaves' induced draught apparatus, each providing steam for 600 horse-power when working on a consumption of 20 lb. of water per indicated horse-power, and capable when forced of providing 800 indicated horse-power. They are 9 ft. 9 in. mean diameter by 10 ft. 6 in. long, and fitted with two Parves' flues each, the diameter of flues being 2 ft. 10 in. inside. There are in each boiler 110 Servé tubes, which are 3½ in. outside diameter; the shell plates are 1½ in. thick, front and back end plates ¾ in., furnaces ½ in., the

CHESTER CORPORATION ELECTRICITY WORKS: ENGINE AND DYNAMO ROOM.

incline to a roadway running alongside the boiler-house, from which the coals can be easily tipped through the large doorways direct into the extensive bunkers below. For condensing purposes a cooling reservoir has been constructed near a brook, some 90 yards distant from the works. The water, controlled by a sluice, can be drawn from the brook through a settling tank into the reservoir. The latter is constructed of brickwork in cement, concrete and masonry. Efficient cooling of the condensing water is attained by the architect's system of guide-walls, by which the water is given time to part with its heat by travelling a maximum distance before returning to the condenser. From the reservoir the water travels in large cast-iron pipes to a well—built of brickwork in cement and concrete—near the engine-house, whence it is drawn by the circulating pumps to the surface condenser, from which it returns in open cast-iron troughs to the reservoir.

The engines are Willans' patent central-valve triple-expansion type, having three cranks at 120° apart, two of the engines being each of 600 indicated horse-power when running at 300 revolutions per minute with a steam pressure of 180 lb. per square inch at the stop-valve; the cranks

working pressure 200 lb. per square inch, and grate area 34 square feet. It is stated that at the six and a half-hours' evaporative test 620 horse-power was obtained easily, burning 40 lb. of coal per square foot of grate per hour. By reference to the illustration† of the boilers some idea of the draught system may be gained. The cold air for the combustion of the fuel enters from the back end of the boiler, passing along the outer space, A A' to the valves, B and B', in furnace fronts; on its way this cold air is guided round the outside of the "inner" space C, in a "helical" direction by partitions set up as shown. After combustion the waste hot gases leaving the boiler pass through the smoke-box into inner space C, and are made by similar partitions to pass round and in close contact with the boiler in a "helical" direction on their way to the suction fan. The boiler by these means is thoroughly enveloped in the escaping heat, effectually preventing either "radiation," "condensation" or straining of the boiler under forced conditions, such as rapid

* Through a printer's error the last article in this series was numbered VI, instead of V. The remaining contributions will be published in quick succession.—Ed. THE SURVEYOR.

† See special Supplement sheet.

generation of steam from cold water or sudden and greatly-increased evaporation. The cold air on its way to the valves also absorbs a large amount of heat from the escaping gases, and so enters the furnaces at a greatly-increased temperature, with resultant economy. No blocking up of the bottom boiler tubes through any deposit in the smoke-box can take place, as such a deposit, if any, drops to the bottom of the inner casing C, from whence it is easily removed by doors at front. The doors D are placed so as to allow of a brush being passed through to sweep away any sooty deposit from the boiler shell, should any such deposit take place.

The surface-condenser which is employed has been manufactured by Messrs. Cole, Marchant & Morley, of Bradford, and is large enough to deal with 30,000 lb. of steam per hour at 200 deg. Fahr.; it consists of about 2,500 square feet of solid-drawn brass tubing, secured into brass tube plates with screwed ferrules; on each end of the condenser doors are provided, to give access to the tubes for cleaning out, &c. To the side of the condenser two single-acting air-pumps are bolted, each being 12 in. diameter and 9 in. stroke. These pumps draw the condensed water from the condenser, and deliver it into a storage cistern some distance above their own level; they are driven by a Rosling & Appleby electric motor and spur gearing, the former being coupled direct to the main switchboard close by; the pump resistances are arranged with seven notches, so that the speed and power of the motor can be varied to suit the requirements of the load on the station. The centrifugal circulating-pumps for the same plant deliver together 2,500 gallons per minute through the condenser; the pumps draw their water from a well close to the engine-house, which well is connected by means of a large pipe to the cooling reservoirs, the delivery from the pumps is taken through the condenser and delivered by 12-in. pipes outside the engine-house, from which place the water runs in open troughs back into the cooling reservoirs. The main steam pipes consist of one horizontal ring of 10-in. bore lap-welded steel tubes, having cast-iron tee-pieces for derivation of boiler and engine branch pipes. The branch pipes are of solid-drawn copper. The main exhaust pipes consist of 20-in. bore cast-iron pipes, made in sections, with inlets formed for connecting the branch pipes, which are from 14-in. to 18-in. bore.

The distribution of electrical energy from this station is on the most modern lines and entails distributing electricity to consumers at 200 volts, and from the consumer's point of view the system has worked extremely well. The cables, which are of the British Insulated Wire Company's manufacture, consist of five lines, each 1,030 yards in length, of 1.5 square inch sectional area, high-conductivity copper. The insulation material used consists of high-class hemp paper, specially manufactured and impregnated with resin oil. The insulation is protected with a solid lead tube of a radial thickness of $\frac{1}{4}$ in. A further protection consists of two ribbons of mild sheet steel, wound one over the other so that the convolutions of the upper layer overlap those portions of the cable left unprotected by the lower layer. One thousand and fifty yards of three-core pilot wire is also laid with the above cable, to which the registering instruments on the switchboard are connected.

THE CHESTER WORKS.

The chief points of interest in the Chester Corporation electric lighting system arise from the employment of a three-wire system with 420 volts across the two outers and the use of 210 volts in the houses. It clearly shows the unmitigable extension of area which is permitted to the low-pressure system by the use of 200 volts in the houses, and that the objections from the consumer's point of view are immaterial compared with those that might arise in a system which is changed over from 110 to 220 volts. The distance of the extreme feeding point from the generating station is 1,622 yards, and the greatest distance of a consumer's terminals from the generating plant is 1,900 yards; but we believe it is the intention to go considerably beyond these points, and there seems to be no reason against a further extension. In the use of 200 volts in the houses no trouble of a serious nature seems to have been experienced, nor has it been necessary to materially alter the methods of wiring that are usual with the lower pressure.

Commencing with the steam-raising plant, the boilers consist of three Babcock-Wilcox boilers, the working pressure of which is 160 lb., each evaporating 5,000 lb. of water. An interesting feature in connection with the steam-raising plant is the Green's economiser, consisting of 14 tubes, the scrapers of which are driven by an electric motor. The economiser is intended to raise 1,000 gallons of water per hour from 60 deg. to 200 deg. Fahr. There is a feed-water tank, which is kept supplied with water from the town mains; it is also connected with the discharge pipe from the condenser. The engine-room plant consists of Belliss two-crank compound engines combined with Parker dynamos. The dynamos, which are of the shunt-wound type, are mounted upon an extension of engine bed-plate, and coupled direct to the crank shafts. The machines shown in the foregoing illustration are of great interest and play a very important part in the operation of the system. It will be observed that the four machines are connected together, the two middle machines forming in themselves a motor dynamo, or, as it is more commonly termed, a balancing transformer, which serves

as a matter of fact, to balance the system. In other words, it helps to steady the voltage on the two sides of the three-wire mains. One of these two machines is the motor, and not only drives its companion, but also the two end dynamos, whose function is to assist in charging the battery of accumulators. The accumulators, of which there are two sets, furnish current for the demand during the day and also at night. There is nothing very unusual in the arrangement of mains; main feeders are run to one central point, from which five branch sub-feeders are run and connected at different points to the distributing mains.

TYPHOID NEAR PLYMOUTH.

According to a morning contemporary, a serious outbreak of typhoid fever has taken place at Honicknowle, a village containing about 500 inhabitants, 4 miles north of Plymouth. At present there are twenty-three cases under treatment, while in another village close by there are fourteen more patients, and signs of the disease are now showing themselves at a third village, called Egg Buckland. All these places are within the area of the Plymouth Rural District Council, and one of the most serious features of the outbreak is that from this area comes a great deal of the dairy produce with which Plymouth is supplied daily.

The epidemic is ascribed to the defective drainage, or rather to the absence of any proper system, and the consequent pollution of the streams and wells from which the people draw their water. The district council are now being openly accused of procrastination, and all the blame for the present disastrous outbreak is being laid at their door. As far back as 1893 strong representations were made to this body as to the insanitary condition of the area affected.

"Grossly polluted" is the description applied to the water supply by the council's own medical officer of health. It is alleged that from all points of the compass the people of Honicknowle are confronted by obnoxious odours, and samples of the water taken by visitors to the fever-stricken districts have a most disgusting smell. The village is surrounded on almost every side by accumulations of offensive matter.

Six children from one family are now in Plymouth borough isolation hospital, and one case has proved fatal. The usual precautions are being taken to prevent the spread of the disease.

LOCAL AUTHORITIES AND ELECTRIC LIGHTING.

Lord George Hamilton, M.P., has forwarded the following letter to the Acton Urban District Council, who had asked him to oppose the Bill promoted in the last session of Parliament by the General Power Distributing Company. The Bill excited much opposition among local authorities which had taken up electric lighting orders or were proposing to do so. "India Office, Whitehall, S.W. Sir,—I have to acknowledge the receipt of your letter of July 22nd. I am in favour of local authorities having control over the lighting in their districts, and, where practicable, applying the profits of such enterprise to the reduction of the rates of the locality. On the other hand, private enterprise will often develop experiments and initiate improved methods of lighting which the local authority may not be able to conduct themselves, and it is by the combination of the two methods that the community at large may be most benefited. The Bill to which you call my attention is postponed till next session, and I shall be glad, when it comes up in a new shape, to hear what the views of the Acton District Council are."

Trade Publications.—Mr. John Jones, the well-known sanitary specialist, of 16 Church-street, Chelsea, S.W., has sent us a copy of a recent catalogue of sanitary goods. He draws special attention to the many new improvements, patent and otherwise, that have been submitted to and tested by sanitary experts, and these he especially recommends for use. Among these goods may be mentioned his automatic airtight manhole covers, which were awarded the medal of the Sanitary Institute at the Liverpool Health Exhibition in 1894, his patent drain ventilation system, improved deep-seal gullies, air-inlet ventilators, drain and pipe stoppers, and drain-testing appliances. The catalogue is well printed and contains numerous illustrations. It should certainly be referred to by architects, builders and others, who require information relative to all kinds of sanitary specialties. From Mr. W. Duncan Tucker, Phoenix Saw Mills, Lawsons-road, South Tottenham, we have also received an illustrated catalogue and price list of doors, window-lines, sashes, curtains, &c. A new feature of the catalogue is the horticultural sections, which have been prepared to meet the growing demand for horticultural buildings; and a special page at the end of the catalogue is devoted to illustrations of various horticultural buildings which have been manufactured by the firm. This gives a good idea of the class of work they are prepared to undertake. Among the various goods manufactured, electric light wire casings may also be mentioned.

The Sanitary Institute.

THE SEVENTEENTH ANNUAL CONGRESS.—III.

In our last issue it will be remembered that we gave a full report of the papers and discussions in connection with the conference of municipal and county engineers at the recent congress at Birmingham. This week it will be seen that, instead of adhering to the formal and arbitrary divisions into sections and conferences, we have made a variation in our method of dealing with the proceedings, and trust that it will be acceptable to our readers.

HOUSING THE LABOURING CLASSES.

In resuming our report we have grouped together some of the references to the difficult and pressing problem of dealing with insanitary areas in the larger towns and providing dwelling accommodation therein for the poorer classes. At the conference of municipal representatives interesting papers were read by Dr. J. F. J. Sykes, medical officer of health to the St. Pancras Vestry, and by Mr. Peter Addie, F.S.I., lately the manager of the Birmingham improvement scheme.

DWELLING ACCOMMODATION IN LARGE CITIES.

Dr. SYKES in his paper said it was profitable to review the subject from a social as well as a structural aspect, since usage and sanitary precautions must form the basis of structural accommodation. He proceeded to point out that the functions and requirements to be provided for the individual in the modern dwelling were in approximate order of greatest necessity: (1) sleeping, (2) food storage, (3) cooking, (4) warming, (5) excretion, (6) ablution, (7) clothes washing, (8) deposit of refuse, (9) open space for refuse, drying clothes, &c., (10) bathing, not partial but total ablation of the body, and (11) living, including reading, writing, work, recreation, &c., for brevity called "living." In the next place it was advisable to picture the possibilities, whether desirable or not, of the case of a single individual living in one room, and the provision that would be necessary if separate rooms or places were required for the purposes mentioned. These points were thrown by Dr. Sykes very neatly into tabular form. In the first column the various purposes to be provided for were enumerated as follows: Living, sleeping, food storage, cooking and warming, ablution, clothes washing, bathing, deposit of refuse, and an open space (for drying clothes and storing refuse). The provision in a single room for these purposes would be: Table and chairs, bed, cupboard (ventilated into open air), range, draw-tap and sink, wash-tub, bath or tub, pail, and window-sill. The corresponding provision in separate places would be: Parlour, bed-room, larder, kitchen, scullery, wash-house with copper, bath-room, bin, and yard or balcony. The water-closet, it was pointed out, must in any case be provided for separately. As not only individuals, but whole families, in our cities and large towns existed in single rooms under such conditions, it was necessary to form some idea of the

PROVISION REQUIRED

to be made for those who had neither the means nor the knowledge to provide for themselves. In providing dwelling accommodation healthy family life should, above all things, be most encouraged and bettered, and no amount of collective accommodation for men only or women only would touch that great question. The two-roomed dwelling was the very minimum family accommodation possible; but it must be recognised that family life entirely carried out in two rooms could not be regarded as the standard of "home" in which the bulk of the young population of the nation should be reared and trained as future citizens, however humble their walk in life. As both of these rooms might, sooner or later, require to be used as bed-rooms, they must further consider how the second room may have removed from it such provision as might be made elsewhere. Food storage, cooking and warming, ablution and clothes washing might be so removed to a combined kitchen, larder, scullery and wash-house, and so they reached a three-roomed self-contained dwelling. The possibility of installing a food cupboard, a cooking range, a draw-tap and sink and a washing copper in the same room must be admitted. The combination of kitchen, larder, scullery and wash-house had this great disadvantage—that the room being applied to so many purposes it could not well be used for any other. The separation of this into two rooms, a scullery and a kitchen, enabled the kitchen to be freed from the other purposes and to be usable as a living-room, this in turn dispensing with a bed-room being so used, as must of necessity otherwise be the case. Here, then, they reached the four-roomed self-contained family dwelling. In proof of the fact that progress is being made in this direction, Dr. Sykes quoted some extremely interesting figures drawn up by Dr. J. B. Russell, the well-known medical officer of health of Glasgow, showing that during the last quarter of a century there had in that city been a steady increase in the percentage of the population living in two, three and four rooms, and a corresponding decrease in the percentage of those in one room and also in the case of those living in five rooms and upwards. The

number of people living in four-room dwellings, as well as those in three-room dwellings, showed a continuous and increasing proportion, the greatest gain of all being ultimately in the three-room dwellings. But the remarkable point was that, whereas in the decennium 1871-81 the proportion of persons living in two-room dwellings increased 3·2 per cent., and the proportion in three-room 2·8, in the decennium 1881-91 the proportion in two-room dwellings only increased 2·8, whereas the proportion in three rooms rose 3·7 per cent. Above all towered the notable fact that the proportion of persons living in one-room dwellings fell between 1871 and 1891 from 30·4 to 18·0 per cent. of the total number of the population, and it was significant that the increase of proportion appeared to be converging towards the three and four roomed dwelling. Unfortunately, no such valuable comparative figures were available for England and Wales, or any English towns, Dr. J. B. Russell's method having only been adopted at the last census in 1891, but he presented a table showing the percentage of population in one, two, three and four rooms in the whole of England and Wales, in the rural districts, in the urban districts, in St. Luke's, one of the most crowded, and in Lewisham, one of the least crowded districts in London. Comparing the St. Luke's figures with those of Glasgow, Dr. Sykes pointed out that the former had about the same proportion of population housed in three rooms, and a slightly larger proportion in four rooms, a very much larger proportion in five rooms and over, and a much smaller proportion in two rooms, but a somewhat larger proportion in one room. Comparing Lewisham with St. Luke's, the great difference was that in Lewisham 53·8 per cent. less of the population lived in one and two rooms and 55·8 per cent. more in five or more rooms than in St. Luke's. That, no doubt, was due to the difference between the classes inhabiting a semi-rural and choice residential suburban area as compared with a crowded central area in a large city. After a reference to the difficulty of accurately estimating the normal proportion of urban population living in several-roomed houses, Dr. Sykes proceeded to consider whether it was possible to reduce

THE NUMBER OF ROOMS

in the ideal self-contained large family dwelling of four rooms—namely, two bed-rooms, a kitchen and a living-room, a scullery, wash-house and larder, and a water-closet, with yard or balcony. If the family were very small one bed-room might suffice, and the number of rooms be reduced to three, constituting what might be regarded as the ideal self-contained small family dwelling. Could any further reduction be made, and how? At some sacrifice of family life and independence in the construction of buildings containing numerous dwellings, another room might be dropped off by setting the larder in the kitchen wall, opening to the air, and constructing a scullery and wash-house for the common use of several families, and where that form of construction was adopted the water-closets were treated in a similar manner. In some cases the scullery was also separated from the wash-house, the scullery being placed close to the dwellings and the wash-houses collected together at a distance. That class of dwellings might be better known as associated dwellings, in contra-distinction to self-contained dwellings. It was important that the water-tap and the water-closet should be as nearly accessible to the dwellings they served as possible, in every case on the same floor of the building, and that such provision should be made for every twelve occupants or less. The water supply and drainage should strictly conform with official regulations, for in buildings in which the number of occupants was multiplied the danger incident to defects was proportionately increased. Proceeding to refer to

VENTILATION,

Dr. Sykes said that some years ago Dr. Arthur Newsholme, in a paper read before the Royal Statistical Society, showed that in London houses constructed in separate dwellings or common-stair dwellings houses appeared statistically not to have any particular influence upon health except in this respect—that they produced a greater prevalence of those forms of infectious diseases for which there was no hospital provision, such as measles, whooping-cough, &c. The lesson to be learnt from these statistical researches was that the staircases and passages of such houses must be so constructed as to be fully and permanently open to the outer air. That necessity was the more obvious when it was pictured that the separate dwelling all open on to the common stair and passages, and that the dwelling-rooms of each dwelling were also all in direct aerial communication with each other and were not separated by a ventilated staircase-well as in the older type of house. The statistical researches of Dr. Tatham, superintendent of statistics at Somerset House, when medical officer of health for Manchester, into the mortality and morbidity of back-to-back houses furthermore pointed to the necessity for having through ventilation to each dwelling—that is, that a back-to-back type must not be adopted, but

that one or more of the rooms must be situated on the opposite front of the building to the other room or rooms, so as to allow of thorough perfilation when windows and doors were opened. In this connection it need scarcely be added no water-closet should have direct aerial communication with any room of a dwelling, and especially where the rooms were in direct aerial communication with each other, and, furthermore, that every dwelling should have close access to a modern open space, in the form of a yard or balcony, wherein to place refuse or any objectionable matters and for other purposes. In planning, this open space might be made the means of cutting off the water-closet from aerial communication with the dwelling. As to open spaces at the front and rear of the building, it was now accepted that these should be as wide, and might be as wide again, as the height of the house. The erection of baths in corridors and spare corners had not met with successful application, and the only provision that appeared to succeed in large blocks of separate dwellings was the erection of a separate building, fitted with baths and furnished with hot and cold water under the care of an attendant. To that building also might be conveniently added another containing the wash-houses of associated dwellings. The concluding part of the paper was devoted to the question of

CUBIC SPACE,

which divided itself into (1) the cubic capacity or size of dwelling-rooms, and (2) the cubic space per head. Although it had been necessary for the purpose of lucid description to regard a scullery and wash-house as a room, it was not a fit place for living or sleeping in, and could not be included in the term dwelling-room. One of the principal points governing the size of dwelling-rooms was the means of ventilation, and the smaller a room the greater the difficulty of ventilating it, so that restriction must be placed upon the reduction of size in new buildings. The standard height now generally adopted was 9 ft. and the minimum area 96 square feet, say 12 ft. by 8 ft., or 11 ft. by 9 ft., or 10 ft. by 10 ft., a cubic capacity of something under 900 cubic feet. The cubic space per head was the most difficult point of all to deal with in practice, and must be regarded similarly as the most important. In 1851 the Common Lodging-Houses Act was passed, which placed the control of common lodging-houses in the hands of the police, with power to make by-laws. At that period there was no doubt some difficulty in fixing the minimum amount of cubic space per head to be enforced, and it appeared to have been fixed successively at 240, 260, 280 and 300 cubic feet, at which point it stood at present. It would be interesting to know how this amount was reached, and it was a curious coincidence that if they measured a bedstead 6 ft. long with a 2 ft. gangway at the bottom and 2 1/2 ft. wide with a 1 1/2 ft. gangway at the side, they arrived at an area of 8 ft. by 4 ft., the minimum amount of floor space in which it was possible to put an approachable bedstead, and if that be multiplied by 7 1/2 ft., the minimum height probably adopted at that period, since cellar dwellings of a less height than 7 ft. were illegal, they arrived at a cubic space of 240 cubic feet, and it required but the addition of a few inches to each dimension to raise that space to 260, 280 and 300 cubic feet. It was highly probable, therefore, that that minimum was a purely mechanical calculation in packing, the requirement of the human subject being overlooked; 300 cubic feet still remained the minimum standard of cubic space for sleeping-rooms. It was true that a recent Factory and Workshop Act only provided for 250 cubic feet per head, but a person awake had more control over the condition of the air breathed than a person asleep for perhaps eight hours at a stretch. The Local Government Board's Model By-Laws provided for 400 cubic feet in tenement-rooms, used both for living and sleeping, and the 300 was recommended to be increased in the dormitories of common lodging-houses that might require it. Many years ago the late Dr. Edmund Parkes showed that, calculated on a physiological basis, the human adult required 10,000 cubic feet of space, because in order to maintain the air in a sufficient state of average purity in a dwelling-room it was necessary to supply 3,000 cubic feet of air per hour, and the air in this climate could not be changed more often than three times per hour. The medical profession were now strongly advocating the cure and mitigation of consumption, or tubercular phthisis—essentially a disease spread by crowding—by fresh air treatment. Was it out of place to advocate even more strenuously the prevention of the disease by fresh air, by the provision of more cubic space, and especially by raising the present inadequate minimum standard. The adoption of the maximum as a working standard was scarcely practicable, but it was practicable to advance the minimum standard to 400 cubic feet at the very least in all cases, and if the landed fresh air treatment meant anything, it meant, firstly, a decided step in that direction. A standard of two persons per room was adopted in schemes for re-housing and in census returns for measuring overcrowding. With regard to the latter, it gave no idea of the amount of cubic space per head, inasmuch as the sizes of the rooms were not known. In reference to the former, to design dwellings allowing 500, 600 or 700 cubic feet per head, without providing any means of preventing that allowance to be reduced, was practically futile. Dr. Sykes concluded his paper with a further plea in favour of increasing the minimum limit.

INSANITARY AREAS AND IMPROVEMENT SCHEMES.

Mr. ADAMS, whose paper was entitled "The Revival of Insanitary Areas and the Management of Improvement Schemes under the Housing of the Working Classes Act," said that most of the improvement schemes were carried out under the Artisans' and Labourers' Dwellings Improvement Act, 38 and 39 Vic., and the Housing of the Working Classes Act, 53 and 54 Vic., and then proceeded to give details of schemes carried out at Swansea and Birmingham, both of which towns had adopted the 1875 Act immediately after its passing. In the case of the Swansea scheme a very heavy charge remained, but an undesirable colony had been removed from the centre of the town, a marked improvement made upon the death rate of that particular area (40 per 1,000), the rateable value had been increased, and a continual source of complaint, both as to health and crime, absolutely abolished. What was known as Alexandra-road was evolved and cut through a very squalid and dilapidated area. It included 14 acres, 3 acres of which were devoted to streets. The usual stipulation was made for the housing of the disturbed population, but it was shown that local enterprise was sufficient in the undeveloped portions of the borough to provide for the people displaced, and the scheme was accordingly modified and the salvages were relieved from the embargo of being used only for the purpose of the re-erection of artisans' dwellings. The cost of the scheme was estimated to be—for the property required, £79,166, and the estimated value of salvages and houses not taken down was £67,978. Deducted from this was the corporation interest in property to be taken in the Greenhill district—viz., £1,044—leaving an estimated permanent charge to the borough of £11,044. That amount, however, was very much exceeded, the actual amount borrowed for the purposes being £120,000. In

THE BIRMINGHAM SCHEME

the area dealt with was 45 acres, of which 9 acres were used for new streets. In St. Mary's ward the death rate was 26.82 per 1,000, as compared with 13.11 in Edgbaston ward. Corporation-street, the principal thoroughfare, was begun in August, 1878, and completed for traffic early in 1882. The width of the street was ultimately fixed at 66 ft. of which each footway absorbed 14 ft. The length of the portion now opened was 831 yards. The length of the section still to be made was 633 yards, making a total length of 1,464 yards. Several other new streets had been constructed and others materially widened. During the progress of the scheme it was found necessary to obtain modification orders, varying the powers originally given, but no unnecessary difficulties were raised by the confirming authority. For the accommodation of persons of the labouring classes displaced by the scheme an outlying area lying between Newtown-row and Summer-lane was acquired, and upon the site sixty-two workmen's houses and twenty retail shops had been erected by lessees of the corporation. Upon the land in the area set apart for the erection of similar dwellings 163 houses had been erected by the corporation. The total quantity of land purchased was 218,009 square yards, or about 45 acres. This had been disposed of as follows, the figures, of course, denoting square yards: Let on building lease, 57,872; sold or exchanged, 17,393; site of Victoria-courts, 5,600; site of artisans' dwellings in Ryder-street, 9,776; required for new streets and widening old ones, 49,526; still occupied by re-erecting property, 76,375; cleared for letting, 10,567. About 1,867 houses and 814 other buildings had been acquired, and of these 1,042 houses and 427 other buildings had been taken down. Fifty-seven licensed premises were included in the above, and up to the present time twenty-three had been abandoned, the remainder being still in existence or transferred to new buildings erected upon the area. The town clerk of Birmingham, in a paper read to the Royal Statistical Society on the

FINANCIAL ASPECT

of the scheme, said: "The dwelling-house improvement fund, created under the Artisans' and Labourers' Dwellings Act and order, has been a great cost to the corporation, but the results have amply justified the expenditure." The Dwelling-House Improvement Account at March 31, 1898, was as follows: Net expenditure on general capital account, £1,651,137; net expenditure on artisans' dwellings, £18,000; deficiency on revenue account accumulated during the years 1880-92, now capitalised, £117,011; the total net expenditure on capital account being thus £1,686,148. The money required for the scheme was borrowed for a term of sixty years, with the exception of the £18,000 expended on the erection of the artisans' dwellings, which was borrowed partly for forty and partly for fifty years. An annual sum was provided from income each year for the repayment of the loans sufficient to repay the whole within the periods for which they had been borrowed. The amount set aside for the purpose last year was £15,523, and the total amount so provided since the commencement of the scheme was £221,977, and the sum deducted from the net capital expenditure as above left the present liability in respect of the undertaking at £1,464,171. In return for the large expenditure the corporation were now in possession of an income from well secured ground rents amounting to about £11,000 per annum, which would be further increased during the next four years (without any new letting) to about £13,000

per annum, but from that figure must be deducted a rent charge of £3,000 payable in respect of property acquired from the trustees of King Edward VI. Grammar School, leaving the net income from ground rents at £40,000 per annum. A rental of about £18,500 per annum was also being derived from the shops, houses and other buildings still standing on the improvement area, and after deducting £4,000 from that item in respect of rates, repairs and other outgoings, a net income was available from that source of about £14,500 per annum. There was still some uncleared land unlet and near Corporation-street which was at present producing no rental, but it was estimated that that would bring in, sooner or later, a further income of about £1,000 per annum. On the other hand, interest on loans, sinking fund charges and management expenses entailed a total outgoing of about £69,000 per annum, which was £16,500 in excess of the present income. That deficiency had to be provided from the rates, and since the scheme was initiated in 1876 some saving from £460 in 1876 to £25,000 in 1891, and £17,000 in 1898-99, and making a total up to the present time of £234,607, had been provided by the ratepayers. The annual contributions from the rates would continue to be reduced every year until the loans were paid off—about forty-four years hence. The undertaking would then be free of charge, and the whole of the net rental income of, say, £53,000 per annum, could be carried to the credit of the funds of the city. The town clerk had pointed out that the income would be further increased some fifteen years later by the expiration of the leases which were for seventy-five years, and the consequent reversion to the corporation of the valuable land with the costly buildings that had been erected thereon in Corporation-street and the adjoining thoroughfares; and that if no great change took place in the value of property in the city during the interval it might be safely assumed that the corporation will then be in possession of a clear income of over £100,000 per annum from the scheme. From calculations made by the town clerk it appeared that if the £100,000 per annum, the ultimate estimated rental, were capitalised at 3 per cent., and the necessary deduction made for the difference in date at which the full benefit accrued, the result would be about £3,000,000, or about the same sum as the contributions from the rates would realise at 3 per cent. compound interest. The town clerk had further said that the scheme would, in fact, have formed a kind of savings bank for the benefit of posterity, while the sacrifice made by the present ratepayers had had its reward in the street improvements, increased rateable value, vastly improved sanitary condition of the area, involving a greatly depressed death rate, and the impetus that had been given by the construction of the new streets to the trade of the city and the general circulation of money occasioned by the improvements. The corporation had themselves erected workmen's dwellings for the working classes on the area acquired. They would gladly have allowed private persons to provide suitable dwellings for the working class on the cleared ground, but, with the exception of the land on which the sixty-two houses mentioned were erected, none was let for the purpose. It was consequently proposed by the Improvement Committee that the corporation should sanction the expenditure of £5,250 on the erection of a block of model dwellings on the flat system, but that proposal was not accepted. Some time afterwards the council sanctioned the erection of twenty-two through cottages before mentioned, at an estimated cost of £4,000. These dwellings were at once let to respectable tenants at 5s. 6d. per week. The applications were largely in excess of the number of houses. Encouraged by the first experiment, the corporation afterwards embarked in the erection of eighty-one additional artisans' dwellings, at a cost of about £14,000. These houses were similar to those previously built, their accommodation consisting of a front living-room, 13 ft. by 12 ft. 6 in.; front bed-room, first floor, 13 ft. by 12 ft. 6 in.; kitchen, 12 ft. by 9 ft.; back bed-room, 12 ft. by 9 ft.; and attic, 13 ft. by 13 ft.; a separate water-closet being provided for each family. There was an asphalted or concreted yard common to each block, and wash-houses in proportion to the number of dwellings. These houses were let at rents of 6s., 5s. 6d. and 6s. per week, and produced a net income of £790 per annum, which, after providing for the interest and sinking fund, was sufficient to pay an average ground rent, spread over seventy-five years, of 10d. per square yard per annum. The Local Government Board always insisted on the erection of dwellings for the working classes on the area acquired. Mr. Addie then proceeded to give a few particulars of the

DIFFERENT KINDS OF DWELLINGS

that had come under his notice. The dwellings erected by the Birmingham Corporation in Hyder-street he had already described. In Dublin the corporation erected five-storey flats, dual houses and one-storey cottages. In Liverpool five and six-storey flats, and in Manchester the same course was followed; but in each of these cities huge flats had been abandoned, and the dual houses were now in favour. In London the flat system, by reason of the scarcity of land, seemed imperative. Under the Act of 1890 the Birmingham Corporation had formulated a small scheme for the removal of an insanitary area in Milk-street, the site being very near to the centre of the town. The acquisition of the land and of the buildings necessitated an expenditure of about £6,000. Under the provisional order the corporation were required

to house 170 persons of the working classes, and for that purpose the city council had recently adopted plans, prepared by his successor, Mr. Tart, on the dual house principle. The plans now awaited the sanction of the Local Government Board. The tenements were arranged in four terraces, and comprised twenty-four houses, each containing one living-room and one bed-room, and thirty-seven containing more than one bed-room. The rooms averaged: Living-room, 13 ft. 4 in. by 14 ft.; bed-room, 8 ft. 2 in. by 14 ft.; and bed-room, 9 ft. by 9 ft., the smaller bed-room being designed for children only. The rents had been fixed at 1s. 6d. per week per living-rooms, that is 3s. and 4s. 6d. per dwelling. Each tenement would be provided with a separate water-closet, scullery accommodation and ash receptacle. It would be noticed that the upper storey was approached by a balcony, and that design permitted each door and window to have the maximum sunlight and air. The financial aspect of the Milk-street scheme was: Estimated cost of building, including paving, &c., £8,975; road-making, £140; contingencies, £897; and land at 5s. per yard (4,030 yards), £1,907; giving a total of £11,025. The estimated annual statement would be: Estimated rental, £659 2s.; outgoings, £219 14s.; giving a balance of £439 8s., against which had to be put interest and sinking fund on £11,025, amounting to £441. The Improvement Committee, in reporting to the council, had said: "The cost of the Milk-street site was £6,000. Deducting from this sum the £1,007 charged to the houses, leaves £4,993 to be provided for. The interest and sinking fund will amount to £199, and this annual payment from the rates must be considered as the city's payment for the sanitary improvement thus made." Mr. Addie devoted the latter part of his paper to some interesting general observations. As municipal representatives were aware, the housing of the working classes was

A MOST DIFFICULT PROBLEM,

and any scheme which was formulated received considerable opposition. It was difficult to provide for a population of so diverse a character as the working classes. What he might term the respectable element was hampered and weighed down by a number of thriftless and unclean people who abused any provision which was made for them. Possibly that difficulty might be removed in the future by universal education, but he was afraid that many years would elapse before the dwellings which municipalities so liberally provided would be appreciated and used to the best advantage. He would add a word or two with reference to the second and third parts of the Act. Part II. was utilised at present by local authorities for the purpose of closing isolated houses, or groups of houses, which were unfit for habitation because their condition was dangerous or injurious to health. He was afraid that the operations of authorities were frequently hindered by the reluctance which magistrates sometimes exhibited in making the necessary orders. In many instances the justices appeared to disregard the evidence of medical men and surveyors skilled in the subject; and as the authorities had no power to appeal against the magistrate's decision, a great many insanitary dwellings continued to exist. There could be no doubt that that was one of the greatest blots on the Act, and until it was removed no lasting and permanent benefit could ensue. The subject of appeal had, he believed, been discussed by the Municipal Corporations Association at the instance of the Nottingham Corporation, and he sincerely trusted that some result might follow their deliberations. This part of the Act also provided machinery to enable local authorities to purchase houses, in order to open up alleys and courts. If a medical officer found that any building, although not in itself unfit for habitation, was so situated that by reason of its proximity to, or contact with, any other buildings it stopped ventilation, or conduced to other buildings being unfit for habitation, or if it prevented proper measures being carried out to remedy a nuisance which was injurious to health, he might represent such first-mentioned building as an obstructive building, whereupon the local authority might take steps to secure its removal. It was worthy of note that the local authority would only have to pay compensation for the actual space taken, and would not be obliged to buy the whole of the owner's land, but would only bear the cost of the severance. Under the third part of the Act the local authority was empowered to provide lodging-houses or cottages for the working classes. Several municipalities have acted under this part of the Act—viz., Manchester, Southampton, Glasgow, &c. It was, however, beyond the scope of his paper to discuss the character of the buildings provided. Mr. Addie's

CONCLUDING REMARKS

were as follows: "I can only add that it is a matter of deep regret that many of the houses inhabited by the working class are not in the state of repair they should be, and that infectious diseases claim the majority of their victims from these houses. A wide field is offered in most towns for the application of both part one and part two of the Act; for there is no doubt that, as the landlords execute as few repairs as possible, the decay of the property increases year by year, and the classes of tenants there-by degenerate. If the local authority do not step in after a area becomes insanitary. In many of our large towns there exist courts and alleys without number where perpetrators of crime and vice coun-

gregate. It is to be earnestly hoped that municipal representatives will study closely the provision of the Housing of the Working Classes Act, so that these plague spots may be abolished, light and air admitted, and the lives of the working men rendered brighter and happier.

DISCUSSION.

The two foregoing papers were discussed together, and in opening the debate Alderman Cook, the president of the conference, said the great trouble was in clearing the sites. All manner of difficulties had to be encountered in clearing the land. The only way of getting rid of these plague spots, however, was for the municipal authorities to take the land over.

The papers were further discussed at some length, most of the speakers agreeing that the great thing needed was provision for the very poor, and that those who could pay 4s. 6d. a week could obtain proper accommodation, as a rule, without the intervention of the local authorities. The need of a legal definition of overcrowding and of legal provision for the prevention of the evil was also generally emphasised.

The President said that in the latest scheme the Birmingham Corporation altogether ignored the term "artisan" and "working classes" and went in boldly for a scheme for the labouring classes. The committee estimated the loss at £200 a year, and the council adopted the scheme unanimously.

In the course of the replies of the readers of the papers Mr. Annie met with sympathy in his remark that the Local Government Board had been a great stumbling-block, and had put the drag on the wheel of all enterprise and public spirit in the housing of the poor.

Alderman STUTTON (chairman of the Health Committee of Warrington) felt so strongly on the subject that he suggested a resolution asking the legislature to consider the necessity of passing a law to enable corporations to provide suitable dwellings for the very poor, and to compel them to reside in such dwellings when so provided. The latter clause provoked considerable laughter, and the chairman ruled the proposition out of order.

In the conference of medical officers of health Dr. H. Scurfield, medical officer for Sanderland, read a paper on the

NECESSITY FOR AMENDMENT OF PART I. OF THE HOUSING OF THE WORKING CLASSES ACT, 1890.

Dr. SCURFIELD, in the opening paragraph of his paper, ventured to express the opinion that the beneficial effect of Part I. of this Act would be much greater if the proceedings preliminary to the execution of an improvement scheme were simplified and more liberty given to the local authority in determining the type of buildings to be erected on the "unhealthy area." In most towns the proposal to spend the ratepayers' money over such schemes would arouse great opposition, and would only be carried by the strenuous efforts of a few ardent sanitary reformers. Before the long-drawn-out proceedings in connection with the execution of the scheme were carried to a conclusion the enthusiasm of even a very ardent sanitary reformer would probably have been considerably cooled, and he would think twice before he advocated a second improvement scheme. In Sanderland there was a large district occupied by property in a very insanitary condition which could only be dealt with by improvement schemes. So far

ONE SCHEME,

dealing with a small portion of this district known as the "Hat Case" area, had been attempted. The area was about half an acre in extent, and there were about 450 persons living on it when the official representation was made to the council by the medical officer of health on August 31, 1893. The improvement scheme was completed in September and advertised in October, 1893. The petition to the Local Government Board for the confirmation of the scheme was forwarded on November 27, 1893. The Local Government Board inquiry was held on January 18, 1894, and the provisional order was made on May 8, 1894. On September 26, 1894, a second Local Government Board inquiry was held, on an application to modify the scheme. In September, 1896, the purchase of properties was so far completed as to enable a competition for designs for workmen's dwellings to be advertised. The prizes in the competition were awarded in January, 1897. The first prize plans were then somewhat amended, and provisionally approved by the council in March, 1897. The architect who drew up the plans and the borough surveyor were then deputed to interview the architect to the Local Government Board, with a view to making such modifications, if any, in the plans as might be necessary for securing the approval of the Local Government Board. After this interview the plans were again amended. The amended plans were approved by the council in June, 1897, and formally submitted to the Local Government Board on July 12, 1898. In submitting the plans the town clerk represented that there was practically no one living on the area, and that the buildings were mostly in ruins, and that the council therefore wished to build on the whole area at once, instead of only on one-half. On November 30th a reply was received from the Local Government Board desiring to know the exact proposals of the council as to the relaxation of the regulations requiring only one-half of the area to be cleared and built upon at a time, and at the same time stating that the plans were not satisfactory for the following reasons: (1) The plans provided insufficient open space; (2) the plans pro-

vided accommodation for too few persons; (3) the plans provided one-room tenements. As regards objection (2), the plans provided accommodation for 151 persons instead of accommodation for 144 persons displaced. On December 18th a deputation waited on the Local Government Board with objections to the plans. As a result of the interview the plans were again amended, by providing more open space and accommodation for fewer persons, and by doing away with the one-room tenements. The amended plans were approved by the Health Committee, and provisionally submitted to the Local Government Board on February 4, 1898. On March 11th the plans were returned by the Board, with a intimation that if the plans were now formally submitted to the Board by the council the Board would be prepared to direct a local inquiry to be held. On May 25th the plans were approved by the council, and on June 6th they were submitted to the Local Government Board. On June 13th an inquiry was held by the Local Government Board. On June 19th and eight months had thus elapsed since the petition was made to the Local Government Board for the confirmation of the scheme. Of this period two years were spent in the purchase of properties, and about four months in the competition for the plans of workmen's dwellings, the remainder of the time having been spent in correspondence and negotiations with the Local Government Board. Already more than eighteen months had elapsed since the architects were awarded the prize in the competition, but there was no prospect of an early start in the erection of the buildings. All

THIS DELAY

was very disheartening to citizens who were really anxious to see the sanitary condition of their town improved. It appeared to Mr. Scurfield that the local authority might safely be entrusted with the erection of workmen's dwellings under this Act without having to submit every detail of the plans for the approval of the Local Government Board. Surely a local authority had a more valuable opinion than the Local Government Board on such a question as whether it was desirable to provide one-roomed tenements or not. In Newcastle-upon-Tyne an improvement scheme was given up because the Local Government Board would not sanction one-roomed tenements, and this part of the Act had become a dead letter. "In other towns," remarked Mr. Scurfield in conclusion, "I expect the same result will ensue unless the Act is amended so as to simplify the proceedings and give more liberty to the local authority in the execution of improvement schemes."

DISCUSSION.

Dr. R. S. MARSDEN (Birkenhead) strongly condemned one-roomed tenements, as likely to create pig-like conditions of living; but Dr. ESTACE HILL urged that tenements of three or four rooms were often let off to lodgers and greatly overcrowded. He favoured a great limitation of the Local Government Board's powers of supervision. Dr. H. MANLEY (West Bromwich), Dr. F. VACHER (Birkenhead), Dr. ROBERTSON (Sheffield) and Dr. S. BARWISE (Derby) all thought one-roomed tenements would be an advantage in dealing with a certain class of people.

On the conclusion of the discussion a motion was carried recommending the council of the Institute to take steps to secure an amendment of the Act, to simplify the execution of improvement schemes, and to give more liberty to local authorities in the erection of buildings on unhealthy areas.

At the conference of sanitary inspectors Mr. T. C. Barralet read a paper on

OVERCROWDING AND ITS REMEDIES.

Mr. BARRALET in the course of his paper, said that the tendency of populations to concentrate into towns was one of the characteristics of the human race, and became accentuated by civilisation. All attempts to stop that tendency by legislation had failed, as evidenced by the growth of London. Civilised commercial life tied the labourer to the towns as completely as the serfs of the middle ages were tied to the soil. The price we paid for being the leading manufacturers of the world was the divorce of half our population from the fields and the decay of rural life. Railways and manufactures had proved potent forces in concentrating populations on small areas, and the spread of education in rural districts had swelled the immigration to the towns. On the other hand, there was a growing tendency among richer townsmen to live in the country, but the number was so infinitesimal as to have practically no effect on overcrowding in the cities, while it positively aggravated it in the villages. An abnormal growth of population was not necessarily a good thing in itself, but might imply that the conditions of life were unfavourable. A high standard of comfort generally implied a low birth rate. The mere aggregation of dwellings, however, would not appear to be so inimical to health, inasmuch as the mortality returns from densely-populated urban districts did not much differ from those of less density, and the birth rates generally were yearly approximating to the normal. It was the overcrowding in dwellings that was fraught with such physical and moral degradation, and the various Public Health Acts had failed to cope with the difficulty. Indeed, there was reason to believe that such overcrowding was more prevalent than ever, since the revelations of the 1891 census, the evidence of the late Lord Shaftesbury before the Parliamentary Commission of 1885, and published results of in-

vestigations into the housing of the working classes in the villages. The Public Health Acts were punitive and coercive, not remedial; they gave no definition of overcrowding, and were powerless to deal with the type of overcrowding which might be described as intermittent; they failed also in giving a sanitary officer no right to initiate proceedings. The writer gave several instances occurring in his own district. At seaside lodgings and boarding-houses it was notorious that overcrowding was rampant, but one seldom heard of proceedings. Overcrowding would continue to exist while it paid the owner, and while such owners dominated local authorities. Rents, especially of cottages, had risen universally, and in rural districts within easy reach of London were 50 per cent. higher than twenty-five years ago. The Model By-Laws, though good in essence, had intensified overcrowding by increasing the cost of building; the writer urged that timber-framed cottages should be permitted in the country under restrictions, and that provision should be made to ensure a minimum air space in bed-rooms. Public authorities had not availed themselves to a great extent of the powers to provide dwellings conferred by the

HOUSING OF THE WORKING CLASSES ACT OF 1890

and cognate Acts. Many of the large towns, however, had attempted to grapple with the overcrowding problem by the erection of dwellings, either in blocks, detached cottages or lodging-houses, generally with favourable financial results. In rural districts the Act had proved practically abortive through its clumsy and unworkable procedure and the composition of rural governing bodies. Ireland was far ahead of Great Britain in the public provision of labourers' cottages. Municipal ownership had obvious advantages, and in the writer's opinion economic objections were overborne by the crying evils of overcrowding and the urgent need for the erection of decent dwellings. All measures aiming at making a working man the nominal owner of the house he lived in by advances from the public funds were to be deprecated as inimical to good sanitation in general and strongly provocative of overcrowding. Much might be done in mitigation by the encouragement and extension of cheap travel, but it must not be sectional or it would aggravate the evil it was intended to remedy; the zone system, as in Austria-Hungary, if adopted by our railways would cause our cities to grow symmetrically, instead of at the least desirable extremities. Emigration might be a palliative for overcrowding, but it was not to be recommended, for our country is not overcrowded, no matter how our dwellings may be. Though we could not attain the late Sir B. W. Richardson's ideal in our cities of twenty-five persons to the acre, and the late Prof. Nxling's minimum of 600 cubic feet in a room for each individual, we could keep them steadily before us, and by using all the means in our power remove to some extent one of the greatest blots on our civilisation.

THE HEALTH EXHIBITION.

SECOND NOTICE.

In continuing our notice of the prominent exhibits, a brief reference may be made to the list of awards published in our last issue. Of the firms whose exhibits we noticed a silver medal has been awarded to Messrs. Adams & Co., Leeds and York, for their automatic sewage lift. Bronze medals have been awarded to the following firms mentioned in last week's notice: Shanks & Co., Barhead, for their "Perfecto" lavatory and "Perfecto" bath; Callender & Montgomery, 11 Victoria-street, S.W., for Callender's pure bitumen for linings; C. Isler & Co., Bear-lane, Southwark, S.E., for their well-known tube wells; Twyford's, Limited, Hanley, for their axis water-closet, with screw brass joint, their triple vegetable sink, and for their "Ideal" sink in two compartments; Pendleton Sanitary Engineering Company, Pendleton, Manchester, for Dr. Quine's ash-bin; Rowe Brothers & Co., City Head Works, Clement-street, Birmingham, for lead pipe made in any length; Farrer, Barber & Co., 36 Cannon-street, Birmingham, for the "Helliwell" system of glazing and a combined sink and lavatory; Adams & Co., for a wedge disc valve; Sutton & Co., Union Pottery, Overseal, near Ashby-de-la-Zouch, for Green's "Wyyurist" channels and inlets for manholes; and W. Harriman & Co., Limited, Newcastle-on-Tyne, for floor channels, with sockets for wash pipes, and Barron's channel bends made to pass a drain pipe.

At Stall No. 27, Messrs. W. M. BODDELL & SONS, Brown-street Ironworks, Leigh, Lancs., had two interesting gully exhibits—a self-flushing gully for house drains and a street gully, with appliance for flushing for town mains, testing with smoke test and ventilation.—A new boiler bath for small villas and workmen's dwellings was the chief exhibit of MOLL'S PATENT BOILER BATH COMPANY, 3 Union-passage, Birmingham. This bath, for which a bronze medal has been awarded, is 4 ft. 6 in. by about 2 ft. inside measure. It is heated underneath by a small coal or slack fire, having a fire-box at one end for that purpose. It has a double flue, so that when the water is sufficiently hot the heat is cut off by closing a damper, which closes one flue and opens the other.

—Mr. JOHN JONES, the well-known sanitary expert, of Carlyle Works, Church-street, Chelsea, S.W., had quite a formidable array of sanitary appliances on view, comprising drain-testing apparatus, manhole covers, cisterns, gullies and other goods, the mere mention of which would occupy considerable space. Mr. Jones recently issued and revised a

very comprehensive illustrated catalogue, from which those interested in sanitary manufactures can obtain full details of his manufactures.

Some cisterns, closets and general sanitary fittings shown by Messrs. MARTINEAU, BEAMES & MADELEY, Limited, Holloway Head, Birmingham, were deserving of notice. The "Vortex" valveless syphon cistern (Madeley's patent) is constructed both in enamelled iron and in fireclay. Other cisterns are the "Appleford" and the "Whirlpool," and among the closets may be mentioned the "Clyde," the "Isis" and the "Dart."—A general but very attractive display of baths, lavatories, urinals, flushing cisterns, closets, &c., was given by Messrs. PLANT & Co., 66 Dale-end, Birmingham.—A noticeable exhibit was that of Messrs. BURN BROTHERS, of Charing Cross, S.W. We have had occasion from time to time to draw attention to some of the more noteworthy of this well-known firm's specialities in the manufacture of sanitary appliances. To mention only a few of the exhibits, there were on view drain pipes, inspection chambers, branches, bends, traps, gullies, lavatories, sinks, manhole covers, drain stoppers, &c. The firm have been awarded a bronze medal for their expanding drain-stopper.

Mr. H. PULLEN CANDY, Ashley-road, Altrincham, near Manchester, was in evidence with a working model of his automatic self-propelled distributor. The object of this invention is to enable sewage to be delivered in an even manner, irrespective of the size of the filtering material, upon bacteria filter-beds, and for continually aerating them. This arrangement, we are told, enables sewage to be filtered at the rate of 1,000 gallons per square yard per twenty-four hours, and produce as good a result as can otherwise be obtained while filtering at about 200 gallons per square yard per twenty-four hours. Mr. Candy had also on view automatic changers for alternately delivering sewage to and discharging effluent from bacteria filter-beds, and these appliances will, no doubt, receive attention from municipal and other engineers interested in sewage disposal.—The stall of the MANSFIELD'S PATENTS COMPANY, Queen-street Chambers, Mansfield, Notts, was conspicuous with a display of the various patents with which the name of the company is associated, these comprising sanitary connections for lead and earthenware, and for lead and iron pipes respectively; wash-down pedestal closet basins; ventilators for soil, drain and sewer pipes; and the company's patent chimney pots.—Six pedestal closets with Edwards' patent connection between lead and earthenware were shown by the inventor, Mr. CHARLES HOWARD EDWARDS.

The number and variety of the appliances exhibited by Messrs. GASKELL, CHAMBERS & FOLKES, Dale End Works, Birmingham, made their display one of the most noticeable in the exhibition, but we can mention only a few of the prominent articles, such as the "Municipal" closet, the "Chantry" cistern, the "Sampson" closet, the "Vosta" closet, the "Spedon" closet, and a remarkable variety of fittings, among which the "Warrior" brackets were conspicuous. Some well-finished urinals, lavatories, baths and sinks were also on view.—Mr. A. T. COOPER, 92 Moray-road, N., exhibited his suction and vacuum pump, to which we have drawn attention on previous occasions; and Messrs. S. & T. UNDERWOOD, 180 Granville-street, Birmingham, had on view their automatic deodoriser, which was recently described and illustrated in our columns.

At stall No. 41 models of the Horsfall refuse destructor, with recent patented improvements of grate bars and parts of furnaces, were to be seen, together with diagrams and photographs of destructors and smoke-consuming boiler furnaces. Our readers are too familiar with the work of the Horsfall Furnace Syndicate, Limited, Leeds, of which Mr. F. L. Watson is manager, to render any further details necessary here. It will be remembered that the installations at Norwich and Edinburgh have recently been described in our columns.—Another firm with whose work our readers are familiar is HUGHES & LANCASTER, 47 Victoria-street, S.W., so well-known as the manufacturers of Shone's hydro-pneumatic ejector, a model of which was on view. This system of dealing with the sewage of low-lying and flat areas by gravitation alone is familiar to the great majority of our readers. Additional interest attached to the model from the fact that the compressed air for its working was supplied by a hydraulic or gravity air-compressor and a small electrically-driven air compressor. An equally interesting display by the same firm was the model of the celebrated Fischer system of water filtration, of which some details have appeared in our columns. A silver medal has been awarded in connection with Shone's ejector.

Messrs. J. DUCKETT & SON, Limited, the well-known sanitary ware manufacturers, of Burnley, exhibited an interesting variety of articles made in their highly-glazed amber ware. Among their exhibits our attention was particularly attracted by a row of isolated syphonic latrines, flushed from a cistern of similar material. A set of urinals for three persons showed this glazed amber ware to great effect. For the latter exhibit Messrs. Duckett have been awarded a bronze medal, and a similar recognition has been awarded for a louvre air-brick in salt-glazed ware. Slop-water closets, which are well-known to be one of this firm's specialities, were to be seen in two varieties. Their familiar B arrangement has an improved access to the tipper, and the alteration seems to be a very good device. The other form has a top flush, and is

provided with a combined pedestal and trap above the floor level. In the isolated latrines, which embody a clever idea, siphonic force is employed in the flushing-cistern and also in the latrines, the latter being cut off before the cistern has ceased working, when a sufficient quantity of water is kept back to re-fill the basins after each flush. By simply turning a tap the closet basins and horizontal pipe can be entirely emptied if required. Among other prominent features of an interesting display we may mention the "Climber" clean-water closet, for which a medal was awarded last year, grease traps, street gulleys and automatic flushing tanks. Some of these appliances were to be seen at work. Bronze medals have been awarded to Messrs. Duckett for lavre air-bricks and enamelled-glazed urinals.

Another firm whose exhibits were too numerous to admit of mention in detail were MESSRS. OATES & GREEN, Limited, well known for the excellence of their salt-glazed ware. In addition to a variety of gulleys and traps, there were several specialities worthy of notice on the part of the visitor interested in sanitation. Among those which caught our attention were some lavatory basins in cream and salt-glaze, for use in schools, public offices, &c., and a new form of urinal, in the construction of which the object has been to ensure that the water in flowing down would not fail to cover the whole surface, and thus keep the face of the urinal absolutely clean—a very essential condition our readers will admit. The "Wilby" patent tipper for waste-water closets, for which the firm claim an almost perfect flush, was shown at work side by side with the ordinary forward flush, and a test we understand, showed that the backward flush possessed an undoubtedly greater power. With the water-tipper the tipper box is cleared with every flush, which is not the case with the ordinary forward flushing arrangement. The firm are introducing a new method for fixing their mangers in stalls and boxes, and other minor improvements. Altogether their exhibit was one of undeniable merit. We may mention that Messrs. Oates & Green have just issued a new catalogue, to which we shall have occasion to refer in a future issue. As would be observed from our report last week, they have been awarded bronze medals in connection with the Birmingham Exhibition for their salt-glazed wash-tub and rubber combined, and their glazed stoneware manger.

The manufacturers of JOHNSON'S SANITARY APPLIANCES, Limited, Cobden Chambers, Corporation-street, Birmingham, have come into considerable prominence and favour. The exhibits on the firm's stall comprised Johnson's street gully, Johnson's circular gully, Johnson's yard and sink gully, and Price & Johnson's patent lifting and locking apparatus. We may mention some of the advantages claimed by the makers for their appliances, and no doubt our readers, as opportunity offers, will test for themselves the merits of the inventions. In regard to the gulleys, a number of claims are made: (1) They have water seals of sufficient depth to prevent sewer gas escaping, but allowing the water to pass down the drain as fast as the drain pipe can take it away. (2) The seals are so arranged that frost or dry summer weather does not affect them. (3) Nothing can pass through likely to obstruct the drain. (4) No sticks, straws, cloth, stones, &c., can pass beyond the mud receiver. (5) They effectually stop rats or vermin entering from the sewer. (6) They can be cleaned in one minute without breaking the seals and without any tools. (7) They have mud receivers, which retain the more solid particles. (8) No brick or stone work is required, nor skill in fixing. (9) They are adapted for use for all domestic purposes, and in urinals, stables, cowsheds, slaughter-houses, street gulleys, manholes, and any place where there is likely to be sediment or refuse which obstructs other gulleys or traps, these seals being self-cleaning. (10) The street gulleys and manholes are so constructed that a steam roller, or any heavy weight, does not affect them or the earthenware connection and other settings. (11) They can be obtained in cast or malleable iron, or other metals, galvanized if necessary, or earthenware, made any size or strength, to suit all positions and purposes. In the twelfth and last place the makers claim that the cost of the gulleys and their advantages will compare favourably with any others in the market. The advantages claimed for the lifting and locking apparatus are not quite so formidable in point of number. We are told, however, that (1) the cover when dropped is automatically locked; (2) by means of a hook the lock can be released, and at the same time a leverage of ten to one is obtained in freeing the cover; (3) it obviates the great trouble and expense hitherto entailed in taking up a cover and frame rusted or fixed by mud together; (4) the cover is retained in a vertical position when in use, thus preventing accidents which might occur consequent on the cover dropping; and (5) that the apparatus, while considerably enhancing the practical usefulness of covers, can be attached to them at very small cost.

In continuing our report next week reference will be made to two remaining papers on the subject of the housing of the labouring classes, after which we shall deal with the interesting papers that were read in the various sections and conferences on the subject of sewage treatment and disposal. The third and concluding notice of the exhibits at the Health Exhibition will also be given. Owing to the pressure of other matters we were compelled to hold over a portion of this.

ARBITRATIONS AND AWARDS.

Mr. J. Manser, chairman of the Board of Waterworks, Corporation of Thorday and Priory in last week's number has an arbitration to fix the price to be paid by the Board for the undertaking for the construction of an outfall pipe from the Kingsbury works. Mr. Corlett Watson and Mr. T. S. Campbell were chosen as arbitrators the former for the Corporation and the latter for the company. The value for the pipe, assumed to be the value of the undertaking is about £12,000 and the arbitration value is about £8000. The company's value is about £12,000.

Mr. S. H. Crowther, of Huddersfield, the secretary to the General waterworks arbitrators, has awarded the sum of £8,410 as the price to be paid by the district council for the undertaking and interest of the water company. The costs of the arbitration are, by agreement to be also paid by the council. The arbitrator was named by Mr. Fenwick, one of the expert witnesses for the company, at thirty years' purchase of the net annual profit (£4900), and by Mr. Charles Gott at twenty-five years' purchase. For the council it was contended that not more than six years' purchase should be allowed as compensation for disturbance, the company having no statutory powers. The company had, however, an agreement with the Bradford Corporation, which had yet fifteen and a half years to run, and it would appear that the award had been made on the basis of this agreement.

INSTITUTION OF CIVIL ENGINEERS.

ASSOCIATION OF BIRMINGHAM STUDENTS.

We have received a copy of the syllabus of this association for the session 1898-99, which in a neat form gives a list of the meetings arranged, names of members, and all other information as to the association and its objects. This association appears to be forging its way steadily ahead, each session showing an improvement on the last. Several successful visits have been carried out during the summer, and now an excellent list of papers is issued. Among others, Dr. Bostock Hill will read a paper on "Some Observations on Sewage and Modern Methods of Treatment," and Prof. H. F. Bursall, of Mason College, will give a paper on "The Experimental Study of Heat Engines." The session opens on Thursday, October 27th, when the president, Mr. J. C. Vaudrey, M.P.E., will deliver his inaugural address.

As a rule the members dine together before the meetings, and at the close light refreshments are served. The annual dinner has been fixed to take place at the Grand Hotel on February 2, 1899, when Mr. Preece, president of the Institution of Civil Engineers, has promised to be present. We note that Mr. Henry C. Adams, of the city surveyor's office, Birmingham, still retains the honorary secretaryship, this being the fifth year in succession that he has been called upon to fulfil the arduous duties of that post.

CROYDON MUNICIPAL OFFICERS' ASSOCIATION.

At a recent meeting of public officials of the Corporation of Croydon, the Croydon Rural District Council and the local school board, it was resolved to adopt a resolution suggesting the formation of an association to be known under the above title. The objects of the body are, briefly, to promote a knowledge of the principles of local government and provide means of social intercourse and recreation among the members. In the course of the proceedings it was announced by the hon. secretary (Mr. John Earwicker, borough engineer's department) that the town clerk, Mr. E. Mawdsley, would read a paper at the first meeting if the association, which will be held in the town hall on Friday the 28th inst. at 8 p.m.

Fire Insurance.—We have received the "special risks" supplement to the electrical installation rules of the Liverpool and London and Globe Insurance Company. These supplements are to be issued from time to time, dealing especially with the particular precautions which are shown by experience to be desirable. Various classes of buildings are dealt with, including, of course, central stations. The hints as to the arrangement of details tending to diminish the risks of fire form a useful addition to the general rules and assist in achieving one of the objects of the company—viz., the elimination of all unnecessary risks to life.

The Sewage Commission.—A visit was paid, on Tuesday of last week, to the sewage works of the Manchester Corporation at Davyhulme by several members of the Royal Commission on Sewage Treatment. The visitors made a complete inspection of the works, and the progress of treatment and purification of the sewage observed there. On Friday the commission also paid a visit to the Beckwith Corporation sewage works on the Rochdale estate. The works were thoroughly inspected by Mr. S. S. Platt, the borough engineer, supplying all the necessary information. Special attention was paid to the structure and condition of the filter-beds.

Loughborough and its Water Supply.

THE NEW BLACKBROOK SCHEME : ENGINEERS' REPORT.

In our last issue we mentioned that the Loughborough Corporation had decided to proceed at once with the important scheme for the extension of the water supply, for which Parliamentary powers were obtained last year. The engineers, Messrs. G. & F. W. Hodson, have prepared an exhaustive report, from which we take some details which will be of interest to many of our readers.

HISTORY OF THE LOUGHBOROUGH SUPPLY.

Beginning with a historical sketch of the Loughborough water supply, the engineers state that in 1866 a proposal was made to incorporate a private company to obtain water from the Blackbrook valley, and make a reservoir of 75,000,000 gallons capacity on the site of the old canal reservoirs, bringing the water to filter-beds at Nanpantan, and thence to the town. The old canal reservoir at Blackbrook was made in 1797, before the forest was enclosed, to feed the Charwood Forest canal, which was constructed for the conveyance of coal from the collieries at Coleorton to Loughborough and Leicester, and thence to London. The canal terminated at Nanpantan, where the coal was to be loaded into waggons, and brought along a tramway to the coal wharf on the Derby road. The embankment of the reservoir was of earthwork, but its construction showed that works of that kind were very

proved to be quite wrong, and the population of 12,000, for which the works were designed, was reached in 1871, and further increased to 14,611 at the census of 1881, when one-sixth of the total supply was being taken by three customers for trade purposes. In 1878 the board were made aware that the occurrence of a summer drought would jeopardise the supply to the town, but no steps were taken till 1880, when negotiations were opened for the acquisition of the Blackbrook water rights; but as the rainfall of intervening years had sufficed to maintain the supply, the negotiations were dropped.

Nothing further was done until 1882, when Mr. Eaton, of Sheffield, was called in to advise. He considered that if provision were made for 18,000, or a prospective increase for forty years on the population then supplied (14,000), the board would have made all needful provision for the future, and he reported strongly against a reservoir at Blackbrook, and in favour of one above that at Nanpantan, at a cost of £26,125. As the estimate of population was obviously much too low, and the extra supply would only be 150,000 gallons a day, nothing was done on this report. In 1883 Prof. Henry Robinson was consulted in reference to the Woodbrook only, and he advised a reservoir on that source of supply immediately above Buck Hill Bridge, for a population of 25,000. No

LOUGHBOROUGH WATERWORKS: SITE OF THE PROPOSED BLACKBROOK DAM.

little understood in those days, and the materials used were quite unsuitable. The tradition among the old residents in the forest was that the reservoir was never brought into use. As soon as it commenced to fill, leaks appeared, and at the first flood the embankment was carried away. It was probable that the proposed water company intended to restore the old embankment, but the scheme was vigorously opposed by the local board, and an agreement was eventually come to by which it was withdrawn.

The local board having undertaken to make waterworks themselves, a scheme was drawn up in 1866 for the construction of the Nanpantan reservoir as it now exists, and an Act of Parliament obtained for carrying it out. The money was borrowed for a period of forty years, and the greater part had now been repaid, so that in the course of a few years these works would become the absolute property of the town. The engineer, Mr. James Simpson, stated that the population having remained stationary at 11,000 for some years past, and there being "no probability of a large increase at any time," it was therefore assumed that "a quantity of 25 gallons for a population of 12,000 persons, or 300,000 gallons per day, will be an ample supply for all purposes for some time to come." This estimate of the increase in population

action was taken on these suggestions, because it was apparent that the Woodbrook valley could not possibly yield the quantity estimated. During this period of indecision the population continued to increase, and with it the water consumption, and on the occurrence of the drought of 1884, which lasted into December, notwithstanding all precautions, the reservoir at Nanpantan was completely emptied, and remained so for many weeks, the town being dependent upon the small flow of the brook, and a temporary waterworks constructed on the Derby-road, for which all the water yielded by the Bnrleigh brook was pumped into the mains after filtration. This latter measure considerably mitigated the inconvenience arising from the want of an ample water supply, and very fortunately the town remained free from epidemic disease.

After this experience the necessity for an augmented supply was plainly apparent, and as the conviction had gained ground that the Blackbrook scheme was the only one which could be safely relied upon to meet the increasing demands of the growing population, Mr. de Lisle was again approached, to ascertain his terms for the water rights. In the meantime the Leicester Corporation prepared a scheme for the construction of a reservoir to hold 475,000,000 gallons, from

which water was to be pumped over the Forest into their district. This was approved by a majority of one only on the Leicester Council, and was therefore not carried further. The Loughborough authority had meanwhile purchased lands lower down the Blackbrook, and prepared Parliamentary plans for a scheme to intercept and pump the water through Sheppesh to the Nanpantan reservoir, and on the intimation that the Leicester Corporation did not intend to proceed negotiations were again resumed with Mr. de Lisle, and an agreement entered into for the purchase of his rights. When Leicester found Loughborough had effected this agreement and were proceeding to Parliament to secure the watershed, they deposited a Bill in opposition, and the result of the fight in the committee-rooms was the defeat of the Leicester Bill and the passing of the Loughborough Bill, which secured the Blackbrook watershed for ever for the use of the inhabitants of Loughborough. The works contemplated in the 1886 Act were immediately carried out, consisting of the laying of a 15-in. pipe from Blackbrook along the bed of the old canal to Nanpantan, and the execution of simple works for diverting the water out of the Blackbrook into the Nanpantan reservoir, forming the first instalment of the work necessary for utilising all the water the Blackbrook is capable of yielding. The existing supply, therefore, consists of the Woodbrook watershed, averaged by the small reservoir at Nanpantan, and in addition the dry-weather flow of the Blackbrook brought down to Nanpantan reservoir by the 15-in. main.

THE NEW DAM AND RESERVOIR.

After referring to the general principles of water supplies from surface streams, the engineers explain that the general purpose of an impounding reservoir is to store up the winter rains, which yield the larger proportion of the annual flow to the streams, so as to make them available in the summer months, when the yield of the stream is below the needs of the population; but a reservoir only of sufficient size to do this would necessarily fail in its intended object, because of the variation in amount of rainfall from year to year. It is therefore necessary that the reservoir should be capable of averaging the yield over an extremely dry year, when the rainfall may amount to only two-thirds of the average, and also over a succession of dry years, such as are known to be of common occurrence, when the continued rainfall of three consecutive years may fall as much as one-fifth below the average. The yield of the Woodbrook is to some extent averaged by the reservoir at Nanpantan, but it is not sufficiently large to equalise the winter and summer water, and into this reservoir is conducted during the summer months, as soon as there is any room, the whole of the dry weather flow of the Blackbrook, the winter water from which is absolutely lost for want of storage.

For some years past it has been apparent that the existing arrangements are insufficient for the increasing population and consumption of the borough, and the future increase will in all probability be at a still greater rate, considering the extension of existing industries and the introduction of new ones, and the favourable conditions for the growth of the borough. Under these circumstances it must be obvious that the time has come when the augmentation of the water supply can no longer be safely delayed. The Act of Parliament obtained last year to enable the Water Committee to complete the scheme of water supply from Blackbrook empowered the corporation to impound the whole of the water flowing off the watershed. It authorises the construction of a reservoir by forming a dam across the narrowest part of the gorge in the Blackbrook valley at or about the site of the old canal embankment. This dam will be 61 ft. 6 in. high above the level of the brook, and will form a lake nearly 1 mile in length and 2½ miles round. The dam is intended to be a solid construction, with concrete and masonry, extending across the valley, and excavated below the bed of the brook right down to the solid rock. The total height of the dam from the foundation to the summit will be 85 ft. or thereabouts, and the length across the valley will be 475 ft. A calculation as to the capacity of the reservoir shows that when filled to the height of 365 ft. above mean sea-level it will contain 506,000,000 gallons, or 253 days' supply of 2,000,000 gallons a day, which is sufficient to balance the yield of the brook over three dry years. The Act permits a slight variation of this level, and careful gangings of the rainfall flowing off the watershed are now being taken to give further data for finally settling the exact height of the dam, a matter of great importance, in view of the fact that an additional foot in height will increase the capacity by 20,000,000 gallons, and a further foot by 42,000,000 gallons, thus making ample provision for the evaporation which will take place from the surface of the reservoir.

The report next discusses the construction of an earth embankment and a masonry dam, and states that the natural conditions of the Blackbrook valley are more favourable to the latter. Details as to the materials are also considered, and the engineers continue their statement with the information that the profile of the blackbrook valley happens to be such that no large storage of water can be obtained until the dam is carried up to a considerable height. At 10 ft. above brook level the storage capacity is only the insignificant quantity of 10,000,000 gallons, at 20 ft., which is the level of the highest of the present intakes, it only reaches 35,000,000,

when for practical purposes the reservoir may be considered empty. Beyond this point the increase becomes more rapid, and at 36 ft. the storage capacity is 135,000,000, at 40 ft. 250,000,000, at 60 ft. 506,000,000, so that one-half of the total quantity is held in the top 14 ft. In the discussion which has taken place from time to time with the Water Committee it has been suggested that, as the town may not require the whole of the Blackbrook water in the immediate future, part of the work authorised by the Act should be omitted, but the committee have come to the conclusion that it is not advisable to do this for the following reasons. If the capacity of the reservoir was reduced by one-half, then only the 14 ft. of concrete and masonry at the top of the dam would be saved, because the foundations and lower part would have to be built of the full strength if it was ever intended to carry it to its proper height at a later period. The top portion of the dam is comparatively thin in proportion to the sub-structure, and the reduction of the reservoir to half its size would only save the comparatively small sum of £4,605. The effect of this would be that the Blackbrook could then only be made to yield 1,330,000 gallons instead of 2,000,000 per day, and 660,000 would overflow from the reservoir to the sea, and be for ever lost, whereas if the reservoir is constructed to retain it, it will be available for profitable sale. A further objection, and by far the most serious one, is that the powers of the council to make this reservoir entirely lapse in June, 1905, and all work not completed on that date must necessarily be abandoned.

The height to which the water will be held will cause a submergence of a portion of the road leading from Botany Bay to One Barrow Lodge, rendering a diversion of the road necessary. It will therefore be carried along the hillside at a higher level, and the reservoir itself crossed by a viaduct of three spans. The Charnwood Forest railway affords great facilities for bringing the materials necessary for the construction of the works, and a siding connection can be cheaply made direct to the site of the dam. A matter of vital importance, both from the point of security and economy, will be the washing thoroughly clean of all materials to be built into the dam. In the winter there will be an ample quantity of water for this, but the works will often have to be altogether suspended at that time of the year owing to the weather, and during the dry months of the year it is necessary to take the whole yield of the Blackbrook to maintain the supply of the town. The engineers point out that every year the works are delayed will accentuate this trouble and will necessarily add materially to the ultimate cost. It is desirable, therefore, both on grounds of prudence and economy, that a commencement should be made. Works of this nature, if they are to be securely built, cannot be unduly hurried, whatever the urgency may be, and they will take possibly from three to four years for their construction after a commencement has been fairly made, and as it will occupy some months to work out all the drawings and prepare the specifications, it will not be possible to get the contract let much before next spring. In conclusion the engineers say: "We are, therefore, clearly of opinion that the council ought now to pass the resolutions necessary to authorise the commencement of the works."

As already stated, the decision to proceed with the works was adopted unanimously, on the motion of Councillor Cartwright, chairman of the Water Committee, who ably expounded the necessity of the scheme and its financial bearings. We give an illustration of the spot at which the dam is to be constructed.

Tenders Wanted.—The Secretary of State for Foreign Affairs has received a despatch from her Majesty's Consul-General at Warsaw stating that the municipal council of that city invite tenders for the working of the tramways of Warsaw under municipal control. Horse traction is at present in use, but it is intended to introduce electricity as soon as possible. Information as to the conditions can be obtained from the Magistrat de la Ville de Varsovie, Varsovie, Russie.

New Artificial Stone. A Scotch firm is manufacturing an artificial stone which is said to stand every test and to be impervious to all vagaries of the weather. The process, says a contemporary, is a simple one, and the ingredients of the stone, chiefly lime and sand, are not expensive commodities, so that it is believed that the artificial product will be able to compete with the real. The lime and sand having been thoroughly incorporated, are passed into moulding boxes, which may be of any convenient size or shape, and these are placed within the converter. Water at high pressure and having a high temperature is then pumped into the converter, to cause the necessary chemical union between the lime and sand, and the resulting mass is also subjected to a temperature of about 400 deg. Fahr. by the action of superheated steam. In about thirty hours the process of curing is run off, but the heat is continued, in order that the steam may be from the moulding boxes, for another fifty hours. The boxes are then removed from the converter, and the stone within them is practically ready for use. The process is now in progress from which it is hoped that other products of Nature's laboratory, such as slate and marble, will presently be successfully imitated.

Comparative Reports of General Practice.

XXIX.—ELECTRIC LIGHTING: BECKENHAM REPORT.—II.

CHOICE OF SYSTEM AND BOARD OF TRADE REGULATIONS.*

As regards the system to be adopted, the report continues, in view of the large area and straggling character of the district a high-pressure system alone (with underground cables) is suitable, but whether high-pressure alternating or high-pressure continuous (Oxford system) is a matter for future consideration. The latter system possesses several advantages, more especially in relation to street lighting, motive power for machinery, cars, cabs, &c. A low-pressure system is out of question, as even its adoption in conjunction with high pressure would involve complications and prevent that simplicity of working so essential to economical administration.

Apart from the utilisation of house refuse for fuel, thermal storage, and some minor improvements in plant, no important modifications have occurred since Mr. Kapp's report, such as would materially reduce the capital cost of the undertaking.

WIRING OF HOUSES.

On this subject Mr. Angell says:—

As regards the cost to householders of wiring houses, inclusive of plain 8 candle-power lamps, switches, wiring, &c., on house side of meter, a charge of £1 per point or lamp should suffice.—(Appendix IV.) Elaborate fittings, brackets, &c., would considerably enhance the cost, according to the taste of each individual consumer. The approximate cost of wiring a six-roomed house of, say, £30 rental, would be £11, of a twelve-roomed house of, say, £60 rental, £27, of a sixteen-roomed house of, say, £100 rental, £55, and so on.

In most towns consumers are left to make their own arrangements for the wiring of their houses, with the result that progress is slow and demand for current inactive. In a few towns some system of free wiring prevails, and to this system I wish to direct the council's special attention. By this system householders are enabled to get their houses wired by a free wiring syndicate or by the local authority free of initial cost, the wiring agency recouping themselves by a slightly increased charge per unit of current or by quarterly repayments of their outlay.

To many persons the initial cost is a fatal objection; to others, short leases, agreements and tenancies are equally fatal objections. Apart from mere inertia also, in view of their inexperience of electrical matters generally, a tendency exists on the part of private householders to shirk the responsibility, trouble, risk and enterprise involved in arranging with contractors for the execution of the work.

For the local authority to lay down costly plant and miles of cables, &c., and to then await private customers, without recognition of their (the customers') difficulties and without endeavour to meet them, is, in my opinion, a suicidal policy, and, doubtless, accounts largely for the non-success of local undertakings. In some localities, under specially favouring circumstances, success comes early, despite lack of originality and lack on the part of the local authority in the absence, however, of natural inducements, and where, especially, leasehold system and migratory habits prevail. Early success is entirely dependent on the extent to which the local authority foster the demand for current by assisting private householders over the initial difficulties of house wiring.

There are five methods in vogue by which wiring may be effected—viz., by private householders employing—

(1) A local or other contractor and paying the actual cost of the work.

(2) Free wiring company, who bear the capital cost, but recoup themselves by charging the householder an extra amount (2d. to 1d.) per unit of current consumed.

(3) The local authority, the consumer paying the actual cost of work, plus 10 per cent. for supervision.

(4) The local authority, the consumer paying a percentage on the cost of the works for a term of years.

(5) The local authority an increased quarterly charge per unit being made to the consumer, to cover interest and sinking fund, with option of purchasing the wiring by consumer at any period after five years.

As I consider, Mr. Angell continues, the question of free wiring to be of the *utmost importance*, I have given a synopsis of the various methods of dealing with this most complicated question, adopted in the few towns in which the difficulty has been recognised and met.

It will be seen therefrom that free wiring does not necessarily entail a loss to the local authority. The risk that, where a house has been free-wired, succeeding tenants may

* The recent Board of Trade revision of regulations, whilst invaluable in the case of a low-pressure system (giving it, indeed, a fresh lease of life), has a less, although not altogether unimportant, bearing on high-pressure systems.

† I.e.—With transformers placed in special sub-stations at various points of the district or in each consumer's house, to convert the high-pressure current of, say, 2,500 volts, to a high-pressure current of from 110 to 220 volts, for service distribution (the latter pressure being now permissible under the Board of Trade regulations).

‡ In methods 2 and 5 the extra charge per unit consumed obviously bears unfavourably on large consumers, unless a sliding scale be adopted.

refuse to take current, is obviously nominal. Who that has electric light for the same, or even a somewhat higher charge (with its hygienic advantages, cleanliness, convenience and comfort), will revert to gas in preference? In respect to landlord's fixtures, protection is obtained in the same manner as by a gas company who supply gas fittings on the "peny-in-the-slot" principle. Additional protection is also afforded in this matter by the Shoreditch agreement (Appendix III). Sec. 25, Electric Lighting Act, 1882, further protects the council against distress on wires, fittings, &c., or on bankruptcy of tenant.

PUBLIC LIGHTING.

Under this head Mr. Angell has the following remarks:—

Mr. Kapp does not refer to public street lighting or include the cost in his estimates. In my opinion the substitution of electricity for gas in public lighting should evidence a distinct improvement. Residents are apt to judge of the probable brilliancy of the light in their own dwellings by that of the street lighting, and disappointment with the latter may considerably modify private demand.

In other words, street lighting should be sufficiently brilliant and impressive to act as an advertisement.

If no greater illuminating power be provided than that of the present gas burners the cost would be much the same—viz., about £3 per 16 candle-power lamp. If, however, a greater illuminating power is required, say, equal to that of the present incandescent gas lighting (40 to 60 candle-power), the cost would be increased considerably. Arc light (from 1,500 to 2,000 candle-power) in main thoroughfares (each costing about £20 annually) would entail still further expense, but when spaced at not greater intervals than 80 yards would give a most brilliant and inspiring effect.

I would suggest, therefore, says Mr. Angell, that at the outset arc lamps of from 1,500 to 2,000 candle-power* should be placed at intervals of 80 yards in the High-street and Southend-road (from Croydon-road to Copers Copse-road), in Rectory-road and Bromley-road to its junction with Manor-road; these lights to be automatically changed at, say, 11 p.m. to 16 candle-power glow lamps, one or two to each column. Ultimately, as cables are laid down the principal roads, No. 2 glow lights of 16 candle-power each, and in secondary streets No. 2 glow lights 8 candle-power each, with double lens, should be fixed to each existing lamp column. The estimates include a sum of £300 (to be increased subsequently when the profit-earning stage arrives or as may be found desirable) for improved street lighting.

FINANCIAL STATISTICS OF MUNICIPAL UNDERTAKINGS.†

In an appendix to the report are statistics respecting the electric lighting installations of various towns, specially obtained for the information of the council. Whilst statistics from other towns may or may not be of great value generally, the districts dealt with are, mostly, somewhat akin to Beckenham in respect to population and general conditions. It will be seen, the surveyor continues, that generally years of profit are as yet but in anticipation (mostly in the immediate future), and that much valuable information awaits districts in which local enterprise is restrained for the next few years.

Electric light is now supplied in 132 provincial towns in the United Kingdom; in seventy-four cases by the respective local authorities and in fifty-nine by private companies. Excluding towns containing populations of over 100,000, & including those from which no information is to hand, it appears that in the remaining twenty-six towns in which the local authority are the undertakers the following averages obtain:—

Average expenses	£3,750
Average revenue	3,665
Average annual loss	£115

Of twenty-four provincial private companies, the average percentage paid for the year 1896 was 3 per cent.

In only four cases in the metropolis are the local authorities the undertakers—viz., St. Pancras, Shoreditch, Islington and Hammersmith. In eleven cases the lighting is effected by private companies, the approximate average dividend being 5 per cent., of which the most adjacent—viz., the Crystal Palace District Electric Supply Company—is the only company showing a loss.‡

* As at Tunbridge Wells, Ealing, &c.

† The light from which is greatly intensified by the use of Reissner or double lens, fitted to either new or existing lanterns, by which also shadows are prevented and a degree of continuity of lighting along the footway is obtained.

‡ Total number of municipal stations in the United Kingdom, seventy-four (viz., thirty-five, as given in Appendix V.; ten, supply only just or not yet commenced; nine, queries not replied to; twenty large towns from which information not solicited—total seventy-four).

§ Aberdeen, Belfast, Birkenhead, Blackburn, Bolton, Bradford, Brighton, Bristol, Cardiff, Derby, Dublin, Dundee, Edinburgh, Glasgow, Hull, Leicester, Liverpool, Manchester, Nottingham, Oldham, Portsmouth, Salford, Sunderland and West Ham.

¶ A loss for the year 1895 (equivalent to £4,000 if allowance be made for repayment of loan as in the case of a local authority).

In the case of the few localities most closely akin to Beckenham the following results obtain for the past year (1896):—

Name of District.	Population.	Supply commenced.	Profit.	Loss.
Ealing	30,000	1894	—	300
Hampstead	75,419	1891	1,832	—
Kingston-on-Thames	27,000	1893	—	1,326
Lancaster	31,000	1894	85	—
Taunton	20,000	1890	—	215
Tunbridge Wells	30,000	1895	800	—

Of these Ealing, Tunbridge Wells and Hampstead give favourable results; concerning the two former (the one a London suburb and the other a provincial centre) a few words may not be out of place.

EALING.

Ealing bears the reputation of being an enterprising and up-to-date suburb, with swimming baths, dust and sewage-sludge destructor works, wood-paved streets, electric lighting, &c. Not only is it, of course, a metropolitan suburb and high-class residential district, such as Beckenham, but it is in other respects more comparable with it than are provincial towns and districts. Electric supply, &c. (high-pressure alternating system with sub-transformer stations), has now been available for three years, the annual losses being first year, £1,500; second year, £1,100; third year, £300. A certain profit is, however, anticipated this year, application for supply being now more than can readily be dealt with. The street lighting is by seventy-eight arc lamps, at intervals of 75 yards, also by 300 incandescent lights (16 candle-power) fixed to existing lamp-posts. The charge to consumers is 6d. per unit, or for over 1,000 units per quarter 5d., with a 10 per cent. discount for prompt payments.

The comparative success of this installation is, doubtless, partly owing to the provision of "free services," the services being laid by the council to the meter inside the house; a great concession, inasmuch as under the Board of Trade regulations it otherwise devolves on occupiers to lay the entire services, whether situate on private ground or in the roadway, distant more than 60 ft. from the distributing main. The cost of wiring churches and board schools is also advanced by the council, repayable by annual instalments covering a period of seven years; a wise policy, not on account of the profit on the supply, but in regard to its advertising value.

TUNBRIDGE WELLS.*

At Tunbridge Wells the last financial year realised a profit of £890, than which (having regard to capital sunk) no more favourable results have been obtained elsewhere. The installation appears to have been popular from the outset, since in its third year the number of lamps average fifty-three per 100 persons, as against an average of twenty-nine per 100 in the twenty-eight towns (with populations under 100,000) given in Appendix V., a not inconsiderable demand being made by occupiers of comparatively small property. Having regard to the present profit, realised with only 300 customers out of a possible 4,900 (who can be supplied without further extension of mains, 3½ miles having already been laid), what the profit of future years will be is doubtless a matter of pleasant speculation in the district.

The engineer states that "the light is a thorough success and greatly appreciated," that the demands for light are continuously increasing, and that new machinery is being laid down as a consequence. He further states that "the council have cause to congratulate themselves on being the only town working on the high-pressure system that has not made a call on the rates in their first completed year's working."

As a favourite pleasure resort, Tunbridge Wells is perhaps more comparable with a seaside watering place than with ordinary suburban residential districts—for purpose of comparison, therefore, perhaps Ealing or Hampstead would prove more useful data.

Mr. Angell concludes his preliminary remarks as follows:—

As the council will doubtless, in the event of proceeding with the scheme, decide to take expert advice, the following, among other engineers, may be mentioned: Lord Kelvin, Profs. Hopkinson, Kennedy, Robinson and Ayrton, Messrs. Kapp, Peerce, R. Hammond, Manville, Shoobred, R. P. Wilson and Dobson. The rental fee is 5 per cent. on the cost of the installation.

After interviews with many leading borough electrical engineers, and after endeavour to diagnose, so to speak, the causes of comparative success or failure in various districts, both in respect to general local conditions and to means adopted for creating a demand, I am of opinion that conditions of success are not absent in the case of Beckenham, and that, whilst partial and insufficient measures may prove staid and unprofitable for many years, a well-conceived scheme, pushed forward with the energy and intelligence generally associated with large commercial and industrial undertakings, must within a few years become not only a self-supporting but a profit-earning institution, tending to lessen local rates, and to give to the district during winter time an attractiveness similar in degree, though different in kind, to that which so abundantly characterises it during the summer season.

* High-pressure alternating system with sub-transformer stations.

THE SURVEYORS' INSTITUTION.

ORDINARY GENERAL MEETING.

The first ordinary general meeting of the session 1898-99 will be held at the temporary premises of the Institution on Monday, November 14th, when the president, Mr. Robert Vigers, will deliver an opening address. The chair will be taken at 8 o'clock.

STUDENTS' PRELIMINARY EXAMINATION, 1898.

Those proposing to enter their names for the students' preliminary examination, to be held on the 15th and 16th of January next, must intimate their intention to the secretary before the last day of November. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London. Irish candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS, 1899.

Students eligible for the proficiency examinations (which will commence on the 20th of March next) must give notice of the sub-division (Table A of Rules) in which they elect to be examined, not later than the 31st inst. Examinations qualifying for the classes of "Professional Associates" and "Fellows" will also commence on the 27th of March next. Names of applicants for these latter examinations to be sent in before the 31st inst. All particulars as to days, subjects and course of examination will be forwarded on application to the secretary. English candidates for the professional examinations will be examined in London. Irish candidates will be examined in Dublin.

PROPOSED SPECIAL-CERTIFICATE EXAMINATIONS (FOR MEMBERS), 1899.

Notice is also given that the next special-certificate examinations in forestry, sanitary science and land surveying and levelling are proposed to be held on Tuesday, Wednesday and Thursday, the 13th, 14th and 15th of June. Particulars of these examinations can be obtained from the secretary.

JUNIOR MEETINGS.

The first of four meetings of examinees and students authorised (subject to certain conditions) by the council to be held during the present session will take place at the temporary premises of the institution on Monday, the 21st November, 1898, the chair to be taken at 7 o'clock. All inquiries with reference to the junior meetings should be addressed to Mr. A. Norman Garrard, 8 Frederick's-place, Old Jewry, E.C.

NEW PUBLIC LIBRARY AND MUSEUM AT KILMARNOCK.

The memorial-stone of a new public library and museum which is in the course of erection at Ebank, Kilmarnock, was laid on the 17th inst. by Mrs. Robert Dick, of Glasgow, the wife of the donor. The building is of the Italian style of architecture. The leading feature of the design is the portico at the front entrance, its pediment terminating with the figure of Britannia, and on tympanum, the Kilmarnock arms, with supporters. The building is partly two storeys and partly one storey in height, the frontage being about 138 ft. in length, with a total depth of 114 ft. At the main entrance there is a spacious entrance hall, to the right of which is the reading-room and to the left the library-rooms. In the rear is a lecture hall, 60 ft. by 36 ft., with a platform and gallery. On the second floor the main staircase leads to a large vestibule, with a dome of coloured glass, to the right and left of which are the two wings of the museum, each having a floor area of 1,750 square feet. Here ample accommodation is provided for the magnificent Thomson and Braidwood collections presented to the town. All the appointments are on the most modern and liberal scale. The estimates for the work amount to about £11,000. The architect is Mr. R. S. Ingram and the builder Mr. Andrew Calderwood.

After the foundation stone was laid Mrs. Dick was presented with a silver trowel from the contractor, ex-Bailie Calderwood, and with a handsome sashet and spirit-level from Mr. W. S. Ingram, the architect. The proceedings were favoured with very fine weather.

Surveyors' Institution Proceedings.—The Surveyors' Institution have issued a revised index to the "Professional Notes," vols. i-viii. (1886-98) together with two appendices. This index has been designed to save members of the institution the trouble and inconvenience of searching for information through the contents of the eight completed volumes of the "Professional Notes." Moreover, the opportunity of its preparation has been taken to combine and simplify many of the entries and to add numerous cross references. The appendices, we may mention, contain an alphabetical list of names of the contributors to the eight volumes, and a similar list of law cases reported in the "Professional Notes" during the same period.

CORRESPONDENCE.

Superannuation of Municipal Officers.—Mr. C. J. F. Carnell, hon. sec. of the Municipal Officers' Association, 117 Holborn, London, E.C., writes: May I be permitted to call attention, through your columns, to the conference of municipal officers, to be held at Sion College, Victoria-embankment, London, E.C., on Monday, the 31st inst., at 8 o'clock p.m., in furtherance of the superannuation movement. The Local Authorities Officers' Superannuation Bill has already been twice introduced into Parliament, but has not yet been passed into law, and every effort will have to be made by municipal officers throughout the country during the next session to bring the measure to a successful issue. The present Government have recognised the poor law officers' and the teachers' just claims by giving them superannuation Acts, and we are only asking that similar benefits may be conferred upon the officers of the municipal service. I trust every municipal officer will endeavour to be present and make this meeting known as much as possible. Further particulars will be announced in due course.

Royal Commission on Sewage Treatment.—"Egawes" writes: During the past few days the above commission have been visiting some sewage works in different parts of the country. Now it is well known that Lancashire contains a very large number of towns; in most of them sewage works (more or less successful) are in operation. I have received certain information which makes me somewhat anxious as to the soundness of the conclusions the commission may eventually arrive at, and I should like to ask, through you, two questions, which someone with more knowledge than I possess may be able to answer: (1) Is it a fact that the commission have spent only two or three days in Lancashire inspections? (2) Is it a fact that the commission made most of their visits (few as they are) to towns where very little useful information could be gained, and have kept away from towns where artificial filters (not bacteria ones) have worked most successfully for years without any land treatment? If the answer to these questions is in the affirmative, I say the commission will not have all the evidence before them why land treatment is in a very many cases quite unnecessary; and I also fear the bacteria system is unduly pressed upon them to the exclusion of the oxidising system of filtration, which has done and is doing such good work when intelligently managed. In conclusion I may instance the commission's visits to Manchester sewage works. What did the members learn there? Chiefly, I imagine, how sewage works ought *not* to be constructed. There is nothing reliable there to help them as to the land question, nor as to the relative merits of the two systems of "filtration" I have named. In this connection I just want to point out what is often overlooked in comparing the two systems. However efficient the bacteria system may be, the cost of an installation is four or five times as great as one with oxidising filters. Moreover, the recent trials at Davyhulme are merely experimental and quite unreliable as yet.

Sanitary Institute Congress: The Question of Papers.—Dr. Charles Porter, M.D., F.R.S., D.P.H., C.A.M.B., medical officer of health, Stockport, writes: With reference to your well-timed remarks as to the inefficiency of the arrangements in regard to papers read at the recent congress, may I be permitted to state that on 21st September I sent to the secretary of the institute a paper upon "The Flushing of Sanitary Conveniences, &c., and the Effect of Disconnecting Traps thereupon," embodying the results of a careful inquiry conducted by direction of the Sanitary Committee of this county borough. On the 23rd September I received from him an intimation of its receipt and submission to the committee appointed to consider and group the papers. In the meantime I had an elaborate model made of the apparatus used in the large number of experiments which the paper recorded, and took the same to Birmingham with me. On Wednesday, 28th, the first working day of the congress, on looking through the programme I saw no mention of my paper, and naturally concluded that on account of the comparative lateness of its receipt, or for some other reason, it was not proposed that the paper should be read. At the closing meeting of the congress, however, Major Lanorock Flower, the recording secretary of your section, stated in his report, to my great surprise and annoyance, "that a paper by Dr. Porter on 'The Flushing of Sanitary Conveniences, &c.,' had not been read." I think I have much reason for complaint, that, though my paper was received on 22nd September, I received no intimation whatever from the secretary of the institute either of its acceptance or of the section to which it had been assigned. I quite admit that the lateness of its receipt (six days before the congress) may account for its non-appearance on the programme, but it certainly does not account for the secretary's very discourteous failure to send any intimation as to its fate either to my official address or to the congress post office. The secretary in a subsequent communication appears to imply that I was to some extent in fault for not having attended the Engineering section on Thursday, 29th ult., but as he had omitted to inform me in what section my paper was to be read, or whether it was to be read at all, I am unable to understand why I should be supposed to have attended the Engineering section. I feel that this explana-

tion is due to the section, and if your suggestions result in more efficient and courteous methods of organisation at Southampton you will undoubtedly have done a public service.

ELECTRIC TRACTION IN LONDON.

ATTITUDE OF THE LONDON COUNTY COUNCIL.

The Highways Committee of the London County Council have prepared a report relative to the application of the London United Tramways Company, Limited, for permission to apply to the Board of Trade for authority to use the overhead trolley system of electrical traction on those parts of the company's lines which are situated in the county of London—viz., (a) from the Askew Arms to the Uxbridge-road railway station, (b) from the Uxbridge-road station by Goldhawk-road to Young's-corner, and (c) from Young's-corner to Hammersmith-broadway, the total distance being rather more than 4½ miles. Mr. J. C. Robinson, engineer and manager of the company, states, that with a view to facilitating an arrangement being come to, the directors of the company would be prepared to hand over, free of charge, to the council, should they decide to purchase the undertaking at the expiration of the statutory period (which in this case will, in accordance with the provisions of sec. 13 of the London United Tramways Order, 1895, be after July 6, 1909) the whole property in the feeder cables or main laid down in the streets, together with the standards and overhead wires there, thus leaving the question of the purchase of the tramways, &c., under the purchase clause of the Tramways Act, 1870, absolutely unprejudiced. The directors would, further, it is stated, be willing to enter into agreement to remove the standards and other electrical apparatus at any time during the currency of the term on receiving a year's notice from the council to do so; and the company would adopt, subject to the approval of the Board of Trade, any other mode of traction which the council may at any future time find in practical operation, and acknowledged to be superior to, and more efficient than, the overhead trolley system. It is stated, moreover, that, should the council hereafter construct tramways to connect with the company's system, the company will, if required by the Board of Trade, adopt on their lines such method of mechanical haulage as the council may have adopted for their connecting lines.

In the report the committee state that they are still of the opinion, which they have previously expressed, that the overhead trolley system of electrical traction is unsuitable for the more crowded of the London thoroughfares; but they think that, as the company are desirous of making an experiment, and have offered to make concessions which will probably be of considerable benefit to the council should the experiment ultimately prove successful, and have, further, expressed their willingness to adopt any other system which may be proved superior after further experience shall have been gained, the council might in the circumstances give consent to the application being made by the company for authority to use the overhead trolley system of electrical traction, but so far only as regards that part of the company's tramways as is between the Askew Arms and the Uxbridge-road railway station. This consent, if given, will enable the company to apply to the Board of Trade to be allowed an opportunity for a full and satisfactory trial of the experiment upon a road quite at the outskirts of the county; and the committee consider that the council should, for the present at any rate, not go further than this, and that before giving consent to the use of the overhead system on the two routes (b) and (c), above indicated, the council should ascertain whether the system proves successful in the Uxbridge-road and is not a source of inconvenience.

The committee therefore decided to recommend the council: "That Mr. J. C. Robinson, managing director and engineer of the London United Tramways, Limited, be informed, in reply to his letter, dated September 27, 1898, that the council will consent, on the terms stated in that letter, to an application being made to the Board of Trade by the company for authority to use the overhead trolley system of electrical traction on the portion of the company's tramways between the Askew Arms and the Uxbridge-road railway station, a distance of 1 mile 3 furlongs and 3 chains; but that this consent will only be given on the company giving a written undertaking that the underground conduit system of electrical traction, or failing that horse traction, shall be used on the other tramways referred to in the letter—namely, (1) from the Uxbridge-road railway station by Goldhawk-road to Young's-corner; and (2) from Young's-corner to Hammersmith-broadway."

Devonport.—Terms have been arranged between the corporation and the Great Western Railway Company for the erection of a high-level bridge over Western Mill lake, and an application is to be made to the Local Government Board for sanction to borrow the money for the purpose.—On Thursday, at a meeting of the council, the Sanitary Committee submitted a report from the Burial Sub-Committee recommending the purchase of about 52 acres of land at Weston Mill for a new cemetery, at a price of £25,000. The report was unanimously adopted.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

HIGHWAY: STEAM ROLLER: DANGEROUS NUISANCE.—In the recent case of *Moore v. The Wharfedale Rural District Council and the Otley Urban District Council* (Otley County Court) the plaintiff sought to recover damages for injuries to his horse and waggonee sustained in consequence of the horse being frightened by a steam roller belonging to the Otley Council, and hired from them by the Wharfedale Council. The plaintiff's contention was that the roller was not properly attended, and that the men in charge, or some of them, were drinking in a public-house at the time of the accident. From the evidence of his witnesses it appeared that the roller was standing in the middle of the road, and emitting black smoke and steam; that there was no one near it except a young man, believed to be the son of the driver; and that the driver himself was in the tap-room of an adjacent public-house. According to the evidence for the defence, on the other hand, there was no smoke or steam, the men in charge were at their posts, and the accident was due to the driver of the waggonee whipping the horse. The learned judge, however, was dissatisfied with the defendants' witnesses, and came to the conclusion that their evidence could not be relied on. He was of opinion that the roller was left in such a position that it was likely to frighten horses, that it had been left in that position while the driver went into the inn to have something to drink, and without any of those protections which under the circumstances should have been made by these responsible. He therefore gave judgment in favour of the plaintiff for £10 as against the Wharfedale Council, the question of the liability of the Otley Council being left over for further consideration.

QUERIES AND REPLIES.

STREETS IN URBAN DISTRICTS.—"A Builder" writes: Has an urban district council power to take action for offences under sec. 149, Public Health Act, 1875, when the streets are under the jurisdiction of the county council but within the urban district? Also under the same circumstances regarding the non-erection of hearings, &c., when altering buildings?

As to offences under sec. 149, in my opinion the district council could proceed for penalties, notwithstanding the fact of the streets being under the jurisdiction of the county council. Sec. 251 provides that proceedings for the recovery of any penalty under this Act shall not be had or taken by any person other than by (*inter alia*) the local authority of the district in which the offence is committed. As to the hearings required by sec. 34 of the Public Health Act Amendment Act, 1890, the case is similar, it being provided by sec. 4 of that Act that offences and penalties thereunder may be prosecuted and recovered in like manner and subject to the same provisions as offences, &c., under the Public Health Acts.

BY-LAWS: "WALL" OF WATER-CLOSET: IS A DOOR A WALL? "Perplexed" writes: On inspecting a building in my district I find the water-closet on the ground floor so constructed that only the entrance door is external, and no window is constructed in accordance with By-Law 68. The builder contends the doorway is an external wall, in which he intends to construct a window, to comply with By-Law 68. We have adopted the Model By-Laws, and I enclose a sketch of same. I have refused to pass the building, in consequence of "one of its sides not being an external wall" and "the window of water-closet not being constructed in an external wall." Would you kindly state whether I am correct?

In my opinion "Perplexed" is justified in refusing to pass this building. I am not aware of any decision to the effect that a door is a wall, and should be surprised to learn that the builder can give any authority for his contention, which appears to me absurd upon the face of it.

ENGINEER AND SURVEYOR TO RURAL DISTRICT COUNCIL.—"Surveyor" writes: I shall feel obliged if you will let me know through your valuable paper whether an engineer and surveyor to a rural district council has a right to sign orders for materials required in his department, or is it necessary that all such orders be signed by the clerk to the council? I am told that under the old administration, when rural sanitary authorities consisted of members of the board of guardians, it was a rule, or rather an order of the Local Government Board, that all orders required by the surveyor should be signed by the clerk, and probably that order still applies to officials under board of guardians. Since the formation of district councils district councillors are, by virtue of their office, members of the board of guardians, and not, as hitherto, when rural sanitary authorities consisted of the rural members of the board of guardians. Does this rule therefore still apply to rural district councils, the same clerk acting for both authorities?

I can find no reference to this point either in Lambley's "Public Health Acts" or Glen's "Law of Public Health." Lumbley refers to

certain orders of the Local Government Board, dated 23rd March, 1881, but on referring to these I find they apply only to sanitary inspectors and medical officers of health. I should advise "Surveyor" to apply for information to the Local Government Board.

BUILDING ESTATE: NEW STREET.—"Saltorial" writes: I shall be greatly obliged if you will kindly favour me with your opinion in regard to the following: The plan enclosed represents an estate proposed to be laid out for building purposes, and plans have been submitted to the local authority for nine new streets and 360 houses, somewhat on the lines shown on plan. AB is a highway repairable by the council, and varies in width from 16 ft. to 32 ft. AD and BC are "occupation roads" and have never been repaired by the public. AD varies in width from 8 ft. to 14 ft. and BC from 9 ft. to 14 ft. There are no other buildings adjoining the estate except those shown. Our by-laws (copy enclosed) require a 36 ft. new street. (1) Will the laying-out of the

estate as shown constitute AB, BC and AD, or any of them, new streets within the meaning of By-Law No. 4? (1) am aware that this is a question of fact for decision by the magistrates, but should like your opinion. (2) What width (i.e., width as interpreted in By-Law No. 1) can the council compel those streets to be laid-out? (3) Supposing answer to Question 2 to be "18 ft. from centre of present road," will this apply to opposite buildings as at southern end of "street" BC, in which case the entire width would only be 22 ft. 6 in. (4) If answer to Question 1 is in the affirmative, can the person laying-out streets be compelled (a) to flag, pave, sewer and make good streets AD and BC; (b) to lay footpath or sewer in street AB?

(1) In my opinion the erection of the proposed buildings would constitute the laying-out of AB, AD and BC as new streets. (2) If intended for use as carriage roads, the required width would be 30 ft. under By-Law No. 1. (3) In a case under the Metropolitan Management Act, 1862, sec. 98 (which requires a new street to be widened to the width of 16 ft.), it was held that the enactment would be satisfied by the owner of land on one side of the street setting back his fence 20 ft. from the crown of the road, although the result would be to leave the road less than 16 ft. wide (*Taylor v. Metropolitan Board of Works*, L.R. 2 Q.B., 249). This case would probably be followed in interpreting local by-laws requiring a specified width of street. (4) Under By-Law 6, clause (e), he could be compelled to construct footways. In my opinion he could not be compelled to kerb, as, although clause (e) of the same by-law refers to the kerb, it does not in express terms require a kerb to be provided, but merely prescribes the height of the "kerb or outer edge of such footway." There appears to be no by-law under which he could be compelled to flag, pave or sewer. As to roads AD and BC, however, the council could of course proceed under sec. 150 of the Public Health Act, 1875, or (if adopted) under the Private Street Works Act, 1842.

Dorking.—The end now seems near in connection with the much-vexed water question, the shareholders of the water company having decided to sell their undertaking to the urban district council. This decision was arrived at by a small majority only.

Municipal Work in Progress and Projected.

The most important news which has this week come to hand with reference to the progress and inception of municipal works in the provinces will be found in the paragraphs relating to Bournemouth, Brighton, Middlesbrough, Ealington and Southend. In regard to the metropolis similar information is given in connection with Battersea, Hampstead and Lewisham.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

The discussion on Mr. Crook's motion instructing the Water Committee to submit forthwith proposals with regard to legislation affecting the London water supply in the ensuing session of Parliament was the chief feature of the meeting at Spring-gardens on Tuesday. Several of the members took part in the discussion, and nearly all seemed to be of opinion that the only solution of the present state of affairs in the East-End was the municipalisation of London's water supply. This, as Mr. Shaw-Lefevre pointed out, would have prevented the famine in that district, as the various companies would have been connected. Two other important matters also occupied the attention of the council—*viz.*, the telephone service and the proposed introduction of public slaughter-houses. Further particulars are given below.

The Purchase of the Tramways.—The Highways Committee presented a report recommending the council to enter into an agreement with the London Tramways Company for the purchase of the whole of the company's undertaking, with the exception of the 2½ miles and the Lawson-street depot already purchased, for the sum of £850,000, and an additional amount, to be settled by agreement or arbitration, in respect of the provender and other consumable stores in hand at the date of transfer. The details of this report appeared in the last issue of THE SURVEYOR. The recommendation of the committee was adopted, and the committee were authorised to settle the precise terms of the agreement, to give effect to the resolution and to report to the council.

The East London Water Supply.—The debate was resumed on the following resolution, moved last week by Mr. Crooks: "That, in view of the existing difficulty in obtaining an adequate supply of water in a large portion of the county of London, it be an instruction to the Water Committee to forthwith submit their proposals with regard to legislation affecting the water supply in the ensuing session of Parliament." To this Mr. Becheroff had moved an amendment to add to the resolution the words: "And also to obtain the opinion of the engineer as to what works are required to provide for connecting the mains and works of the several companies for use in cases of emergency." Mr. Dickinson opened the debate, and said the proposal of going to Wales for a water supply was not a visionary one at all, but the only solution of the difficulty that would meet the necessities of the case. Dr. White, Mr. Shaw-Lefevre, Mr. Westacott and others also took part in the discussion, nearly all supporting Mr. Dickinson's opinion of the present state of affairs. Ultimately, on a division, the amendment was carried by eighty-eight votes to fifteen. Colonel Ford then moved a further amendment, but it was rejected by a large majority, and the resolution as previously amended was adopted.

Public Slaughter-Houses.—The Public Health Committee presented a report with reference to the provision of public slaughter-houses, and recommended that, as a first step towards ensuring the proper inspection of meat, private slaughter-houses should cease to exist, and that butchers should, in substitution, be afforded such facilities as are necessary for the killing of animals in public slaughter-houses to be erected by the council. They further recommended that a copy of the committee's report, and of the council's resolution upon it, should be sent to the Local Government Board, with an intimation that the council were prepared to accept such responsibilities as might be necessary to give effect in London to the recommendations of the Royal Commission on Tuberculosis, and that the board be asked whether they will include in any legislation introduced in connection with the Royal Commission's report the provisions which would be necessary for this purpose. Some discussion followed, in the course of which a desire was expressed by several members for the production of the medical officer's report on the question. The discussion was therefore adjourned.

The Telephone Service.—The Highways Committee reported that since the report of the Select Committee on Telephones was issued it had been stated in the newspapers that the Postmaster-General had informed the Corporation of Glasgow that he would grant a license, terminable in 1911, subject to the corporation obtaining next session the necessary powers to establish and work a telephone system. The committee thought the council were clearly of opinion that a competing service was necessary, and it appeared to them that, having regard to the evidence given before the select committee and to the terms of a certain portion of the report, the best course for the council to take at the present juncture would be to ask the Postmaster-General whether he intended to take the necessary measures for establishing an

efficient telephone service for London, independent of the National Telephone Company's system. Should he state that he was not in a position, or was not disposed to do so, it would be open for the council to renew their application for a license, and if such license were obtained to apply to Parliament for powers to establish and work a municipal telephone service for London. They recommended: "That the attention of the Postmaster-General be called to the expression of opinion in the report of the Select Committee on Telephones that general, immediate and effective competition by either the Post Office or the local authority is necessary, and that a really efficient Post Office service affords the best means for ensuring such competition; and that he be asked whether, in view of that expression of opinion, it is his intention to take the necessary measures for establishing an efficient telephone system for the county of London." This was agreed to without discussion.

The Smoke Nuisance.—On the motion of Mr. Fletcher it was agreed to refer to the Public Control Committee to report the steps they are taking to enforce the Public Health (London) Act so far as it relates to the smoke nuisance, and whether they need any additional powers for that purpose.

Supervision of Buildings.—It was agreed, on the motion of Mr. Becheroff, "That as the present system which obtains in London with regard to the supervision of buildings and the responsibility for their proper construction, both from a structural and sanitary point of view, is unsatisfactory, it be an instruction to the Building Act Committee to report fully on the subject."

COURT OF COMMON COUNCIL.

At last Thursday's meeting of this body a member asked whether the court could be informed if any steps had been taken by the Streets Committee with regard to the lighting of the side streets of the City by electricity or the purchase of the City of London Electric Lighting Company's undertaking. It was stated that endeavours would be made to prepare a report on the subject.—A report was received from the Officers' Committee asking for authority to obtain the necessary fittings for the installation of the electric light in the court-room of the late Commissioners of Sewers and the offices of the engineer, at an additional cost of £15 beyond the £120 provided for the installation. The new offices, it was mentioned, were practically completed, and it was hoped that it would be possible before the end of the year to present a report setting out the entire cost of the buildings.

METROPOLITAN ASYLUMS BOARD.

Sir E. H. Galsworthy occupied the chair at a meeting of this authority on Saturday. A letter was received from the Local Government Board proposing that the inquiry into the cost of the erection of the Brook Hospital should commence on Monday, the 17th inst., at 12 noon. They asked if the manager's offices would be available for the purpose. It was resolved to reply in the affirmative. The chairman, in reply to a question, said that no official information had been received in regard to the mode of procedure which it was intended to follow.—Upon the recommendation of the Finance Committee it was resolved to submit an application to the Local Government Board for an order sanctioning a further expenditure of £2,413 in connection with the contract of Messrs. W. Johnson & Co., Limited, for alterations and additions to the South-Western Hospital.—The following resolution was also adopted: "That it be referred to the General Purposes Committee to consider the desirability or otherwise of the board establishing a bacteriological laboratory for London, or of making other arrangements for providing bacteriological assistance in the diagnosis of infectious diseases, with power to obtain the opinion of the several metropolitan sanitary authorities upon the subject."

VESTRIES AND DISTRICT BOARDS.

Battersea.—At the vestry meeting on Wednesday the Finance and Law Committee stated that they had considered the Workmen's Compensation Act, in conjunction with a report from the solicitor, and that it was not intended to specially deal with the question, but to treat each case as occasion might arise.—It was resolved to approve an estimate of £10,000 for the channelling and kerbing of various streets throughout the parish, and one of £11,935 for paving Bridge-road, Park-road and a portion of Albert Bridge-road with cross-bed deal blocks.—In connection with the change in the incidence of diphtheria, it was decided to draw the attention of the London County Council to the matter, and to urge that steps should be taken to ventilate the main sewers in the district, and in the meantime it was resolved to take action in order to ventilate the local sewers.—The Health Committee announced the receipt of a letter from the Hon. Stephen Coleridge, hon. secretary of the Anti-Vivisection Society, with reference to the proposal of the London County Council to apply to Parliament for powers to establish a bacteriological laboratory, stating that the society hoped that the vestry would pause before giving adhesion to a scheme for endorsing the torture of animals out of the rates, and would refuse to support the proposals of the council in the

matter.—It was announced that a Local Government Board inquiry had been held the previous day in reference to the vestry's application for permission to borrow £12,478 for the erection of new baths and wash-houses in Battersea Park-road.—It was decided to refer to the Finance and Law Committee a letter received from Mr. H. S. Samuel, M.P., on the subject of a Bill which the hon. member proposes to introduce in the next Parliamentary session in order to compel the water companies to connect their mains so as to provide for cases of emergency.

Clckenwell.—The vestry have been informed by the London County Council that they will accept the latter's offer of £100 for the small triangular plot of land at the Farringdon-road corner of Rosebery-avenue on condition that the vestry will pave it, plant it with trees and maintain it as an open space, a condition with which, it is understood, they are ready to comply.

Fulham.—On the recommendation of the Lighting and Dust Destructor Committee the vestry resolved, at their meeting last week, to accept the tender of the Horsfall Furnace Syndicate for the erection of a dust destructor.

Hampstead.—After a long discussion, it was on Thursday resolved "That no action be taken at present with reference to the circular letter, received 21st July from the vestry of Battersea, stating that they had requested the London County Council to insert a clause in their next General Powers Bill empowering local authorities to erect dwellings for the working classes under the Housing of the Working Classes Act, 1890."—The Finance Committee reported that, pursuant to the authority delegated to them, they had instructed the vestry clerk to make the necessary application to the Local Government Board for sanction to raise a loan of £5,920 in respect of the expenditure on the new baths buildings. This was approved.

Kensington.—Last week the vestry adopted a resolution, which was ordered to be sent to the London County Council, in favour of the duties of district surveyor and parish surveyor being discharged by one official appointed by the local authority, corresponding to the borough and town surveyors and engineers outside London, a change which has received the approval of three conferences of delegates from the metropolitan vestries and district boards, and will do away with the defects in the present system resulting from overlapping of jurisdiction and want of regular, systematic supervision.

Lewisham.—At a recent meeting of the district board of works the Works Committee reported that they had considered the notice of the Blackheath and Greenwich District Electric Lighting Company, Limited, of their intention to lay main and electric wires from the boundary of their parish next Greenwich, along Lewisham-road, Lewisham-hill, and Aberdeen-terrace, Haddo-villas, Eliot-vale, and Eliot-place, Blackheath. The surveyor recommended that from the bottom of Lewisham-hill to Walerand-road the mains should be laid in the footpath, and in the other streets in the roadways, and on those and the usual conditions as to reinstatement of roads, &c., the committee recommended the approval of the works, subject to the consent of the London County Council. This was agreed to.—It was decided to request the Works Committee to give their consideration to a recommendation of the local committee to construct an underground convenience, at an estimated cost of £1,800 or £2,000.

Rotherhithe.—It was last week reported that the Local Government Board had addressed to the London County Council a letter stating that they were not satisfied that proper accommodation could be prepared for 550 persons by the erection of block tenements on the Fulford-street and Braddon-street area, as proposed in the scheme submitted. They were prepared, however, to consider any further observations which the London County Council and the vestry might offer with respect to the scheme. The clerk was directed to reply that the matter was being dealt with by Mr. Scorgie, the surveyor, and the county council officials.

St. George-the-Martyr.—On Tuesday week, at a meeting of the vestry, a letter was received from the clerk to the London County Council stating that he had laid before the Improvements Committee the vestry's letter inquiring whether it was true that considerable delay was likely to ensue in carrying out a certain improvement in Long-lane, and urging the desirability of proceeding with the work without delay. In reply he had to inform the vestry that the committee regretted that delay had certainly occurred, owing to the Home Office not having yet approved the scheme for rehousing the persons of the labouring classes who would be displaced. Under the Act of Parliament authorising the improvement the council were prevented from acquiring the necessary property until they had received the approval of the Home Secretary to the rehousing scheme. It was hoped, however, that the approval would not be longer withheld, so that the council might commence and press forward the work to completion with all expedition.

St. Pancras.—The ratepayers of St. Pancras have, by a majority of 3,429 votes, negatived the proposal, made for the second time, to adopt the Public Libraries Act, 1892. On the

last occasion that a poll in the matter was taken (in 1891) the proposal was negatived by a majority of 1,678.

PROVINCIAL AND GREATER LONDON COUNCILS.

Essex.—At last week's meeting of the county council the Highways Committee reported on the district footpaths measurements at Ilford, involving an estimated expenditure of £2,222, should be authorised to be estimated. Some discussion followed, and eventually the committee agreed to the necessary decision to agree to so large an expenditure.

Norfolk.—At the last quarterly meeting of the county council the special committee entered into the consideration of the strengthening of the county bridges not sufficiently strong to carry the traffic as reported that they had received a report, with a sketch, from the county surveyor regarding eleven bridges to be the necessary work to which would cost £2,625. The committee recommended the repair of Stone Bridge, £140, on the Holt and Dereham road; East Harling Bridge, £140, near the Easton and Claxton Bridge, £20, between Easton and Brampton, included in the latter case; to the Loddon and Caesaring Rural District Council paying half the cost. Denton Wash Bridge, £140, between Harleston and Bluney, was recommended to stand over for the present; and with regard to Stadwell Bridge, £240, on a district road between Stadwell and Bratton, it was reported that the cost was being estimated as to the liability of the county council to repair the bridge. The committee suggested that they should be empowered and authorised to accept tenders for the work as recommended to be done. This the council agreed to.

MUNICIPAL CORPORATIONS.

Bournemouth.—The Local Government Board have sanctioned a loan of £8,926 to reconstruct the sewer in the valley of the Bourne.—A technical and a secondary school is to be built, at a cost of £49,000.—A scheme for municipal tramways is to be discussed by the council at an early date.

Brighton.—The town council on Thursday adopted a scheme for clearing a considerable area in the eastern part of the borough. Over 700 persons will be displaced, but accommodation for 400 will be provided on the site, where a better class of houses have been erected. Making allowance for the value of the land, it is estimated that this improvement will cost nearly £25,000.—According to a statement by the mayor, a committee of the corporation are being inundated with proposals of companies to construct tramways in Brighton. Hitherto such masses of locomotion have been vetoed, but a feeling is growing in favour of the introduction of tramways, at any rate in the hilly districts of the borough.

Chester.—It was announced at the last meeting of the city corporation that the Duke of Westminster had presented to the city 3 acres of ornamental ground near Crozon Park, known as the Dingle, for recreation and other purposes.

Derby.—At a monthly meeting of the town council, on Wednesday of last week, the Baths Committee reported that after a careful consideration of the whole question they had decided to recommend the council to provide both swimming and slipper baths for the southern end of the town, instead of any extension being made at Bull-street. The reception of the report was moved by Mr. A. Ottewill, who, after it had been carried, moved "That the Baths Committee be instructed to look out for a site for a new baths at the southern end of the town." In doing so Councillor Ottewill said there was no doubt about it, baths were greatly needed in the southern end of the town. In the matter of baths Derby was far behind Sheffield and other Midland towns, where there were central baths and branch baths established all over the town. After some discussion the resolution was adopted.—At the same meeting Alderman Sowter moved that the sum of £140 15s. be granted for the purchase of portions of land in Old Chester-road, the Morledge, Devonshire street and Osborne-road for street widening, and that application be made to the Local Government Board for a loan to borrow the sum of £140 15s. for this purpose. The resolution was also adopted.

Durham.—The city council last week received, on their recommendation of the Electric Lighting Committee, an application for an electric light provisional order and to hold a special meeting to further consider the matter. At the special meeting a report will be submitted by Mr. W. C. C. Haselgrave on a scheme for the city.

Falmouth.—The question of promoting a bill for the purchase of the gas and water works was discussed at a statutory meeting of the corporation on Monday of last week. In moving a resolution in favour of the purchase the mayor said that it was necessary to make a statement that they could bring the matter before the ratepayers, as the company's Act gave them the power to do so. He said that the works within ten years ago had been sold to the corporation, but that the Highways Committee had not yet received the necessary sanction for that period. There was a considerable amount of business that passed, but it was made that the corporation should not be allowed to allow of an opinion being formed as to the purchase of the works, otherwise of the purchase. It was proposed, however, that

the data would be forthcoming, and that Mr. A. Silverthorne's report would be submitted to the council and to the ratepayers. The resolution was then carried by ten votes to four.

Gateshead.—At the monthly meeting of the town council, held last week, the Town Hall Committee recommended the confirmation of a provisional agreement for the purchase of the office of the Permanent Building Society for £2,500, it being proposed to utilise the late post office for the offices of the medical officer, inspector of nuisances and inspector of weights and measures, and to use the large room at the back as part of the public library. The report was, after considerable discussion, adopted.—The Watch Committee recommended that a new police station should be erected on the site belonging to the corporation at the junction of Old and New Durham roads, in accordance with the plan prepared by the town surveyor, and that the cost be paid out of the revenue. After discussion the report was referred back to the committee for further consideration.

Hartlepool.—At a meeting of the town council on the 5th inst. it was resolved to apply to the Board of Trade for a provisional order to empower the corporation to adopt electricity for public and private use within the borough. The town clerk is to be instructed to take the necessary steps to carry out the resolution.

Hastings.—The corporation are promoting a new town's Bill, by which they seek to obtain powers to enable them to carry out various schemes for the improvement of the borough. An innovation completed this year—the construction of green enclosures on the front line, to give a relief from the monotony of asphalt—has been warmly applauded by the numerous summer visitors.

Hull.—The Electric Lighting Committee, at a recent meeting, accepted the tender of Messrs. Newton & Chambers, Sheffield, at £473, for the erection of an iron roof in connection with the extended portion of the electricity works in Sculcoates-lane. Mr. Good's tender, at £2,532, for the extension of the station buildings, was also accepted. The opening of the station in Sculcoates-lane is to take place on Thursday.

Macclesfield.—On Monday of last week a museum, presented to the town by Mr. Pownall Brocklehurst, of Macclesfield, and Miss Brocklehurst, was formally handed over to the corporation with public ceremonial. The building and endowment will cost the donors £10,000.

Middlesbrough.—A special meeting of the Electric Lighting Committee was held on the 5th inst. for the purpose of considering plans and specifications for a proposed scheme of electric lighting for the borough. It was originally intended to lay down plant estimated to cost £25,000, but a larger scheme was suggested, and it was unanimously thought that this would prove more advantageous to the town. This scheme was adopted, and it was decided to apply to the Local Government Board for sanction to borrow £36,000.

Oswestry.—The Sanitary Committee last week recommended that an infectious diseases hospital be provided for the borough, and reported that they had appointed a sub-committee to visit suggested sites. The recommendation was adopted.

Penzance.—The town council have resolved not to accept the offer of the Edmundson's Electricity Corporation, Limited, to undertake the supply of electricity for the town.

Reigate.—The question of purchasing the undertakings of the Redhill and Reigate gas companies was the subject of a special meeting of the town council recently. The mayor reminded the meeting that upon the House of Lords refusing to pass the Bills promoted by the gas companies last session the council were authorised to give the companies notice that they would promote a Bill for the purchase of both undertakings. It was with that object in view that the special meeting of the council was called. He moved that the council be authorised to promote the necessary Bill. A somewhat lengthy discussion followed, but in the end the motion was rejected.

Southend.—A special meeting of the town council is to be held on the 26th inst., to decide whether to apply for a light railway order for laying down a system of electric trams for the principal streets of the borough, including Prittlewell, Leigh, Southchurch, Westcliff, &c. The council already have an electric lighting order, and it is proposed to put down a combined lighting and tram plant. The tram scheme would include 10 miles of system, and the total cost, including buildings, would be about £80,000.

Wells.—The General Purposes Committee reported at last week's meeting of the corporation that inasmuch as the successful architect's estimate of a proposed new hall and post office, built according to his own designs, would only cost £4,550, and the lowest tender was £9,192, they had written asking the architect to return the £25 premium paid him.

West Bromwich.—The Electric Lighting Committee have decided to ask the town council to authorise them to engage an expert to advise them as to the best means of carrying out the electric lighting order.

URBAN DISTRICT COUNCILS.

Borking.—At the district council meeting on Thursday a report, by Mr. James Lemon, M.C.E., on the suggested treatment of Westcott drainage at Dorking outfall, was read. The report stated it was desirable, in the interest of all parties, that Dorking should accept the responsibility of the sewage disposal of Westcott. It was resolved to refer the financial question to the Finance and General Purposes Committee for consideration and report.

Erdington.—The sanction of the Local Government Board has been received by the council to the following loans—*viz.*, £1,321 for sewage works, £3,000 for surface-water drainage works, and £420 for the purchase of a tip, wharf, &c.—The board will hold an inquiry on Wednesday next in connection with an application of the council for sanction to a loan of £2,300 for public street improvement works. Colonel W. M. Ducat, R.E. will conduct the proceedings.

Eton.—The five following tenders were received at the last monthly meeting of the district council for the erection of an engineer's cottage at the pumping station: Messrs. Goddard & Sons, £990; Mr. H. Birchfoot, £978; Mr. Willett, £865; Messrs. H. Cooper & Sons, £857 10s.; and Messrs. Butcher & Henry, £981 9s. 6d. The tenders were referred to the Pumping Station Committee for consideration.

Coole.—At their last meeting the district council decided to erect a public swimming bath on a site in Pasture-road. The building will comprise two swimming baths, one 75 ft. long by 25 ft. wide and the other 50 ft. long by 25 ft. wide; ten slipper baths, gallery to the large bath, waiting-rooms, laundry and boiler-house, and caretaker's residence.

Levenshulme.—Local Government Board sanction to the borrowing of £2,624 for private street improvements has been received by the district council.

Llanely.—The following motion was last week considered by the council: "That the council make inquiry of the Llanely Gas Light Company as to their being prepared to negotiate the sale of their works and undertaking, and as to the possible cost of acquiring the same." In support of the motion it was contended that under good management the gasworks should prove a profitable undertaking. The tendency throughout the country was the municipalisation of such works, and there was no reason why municipalisation should not be adopted in Llanely. The motion was eventually rejected.

Maidstone.—The council had under consideration last week a letter recently received from the Local Government Board intimating to the corporation that they could be granted a loan of only £15,000 for three years to cover the cost of the typhoid epidemic of last autumn. The borough authorities had applied for sanction to borrow £18,000, the actual cost of the epidemic to the ratepayers, the repayments to be spread over a period of twenty years, and the decision of the Local Government Board had come as a great surprise to them. Last week the council resolved that Mr. Chaplin should be asked to receive a deputation on the subject, to be introduced by Mr. Cornwallis, M.P. It was pointed out that Worthing was granted a loan for ten years in similar circumstances, and it was urged that Maidstone, having regard to the greater severity of the epidemic from which it had suffered, had a right to expect equally generous treatment.

Matlock.—Through the Duke of Rutland the devisees of the late Sir Joseph Whitworth on Thursday presented to the public of Matlock for ever the Whitworth Institute and Park and the Whitworth Hospital at Darley Dale. The gifts cost considerably over £100,000, and they are endowed in perpetuity with a considerable income.

Portsmouth.—Dealing with the question of the water supply, the clerk recently read a letter which had been received from the Portsmouth Water Company in reply to a communication from the council with regard to the deficient supply. The letter stated that a previous letter of the company had reference solely to the resumption of the supply as it existed before the drought. If, however, the letter was with reference to obtaining a new supply, the company informed the council that the borings referred to had been most satisfactory. Instructions had been given for estimates to be obtained, and for the work to be proceeded with at once. The company were determined to do all in their power to give the district a continuous and good supply. The reply was considered to be satisfactory.

Slough.—The district council on Monday unanimously resolved to instruct a committee to prepare a scheme for supplying the town with electric light. It was intimated that the light might be generated by the superfluous steam-power at the sewage pumping station, and that it would pay to do this for the supply of public lamps alone.

Stourbridge.—Colonel A. G. Durnford, an inspector of the Local Government Board, held an inquiry on Thursday relative to the application of the district council for sanction to borrow £600 for the erection of stables and for the provision of asphalt manufacturing plant. There was no opposition to the proposal, and the necessary information was submitted to the inspector by Mr. Goddard, the town clerk, and Mr. Fiddian, the surveyor.

Uttoxeter.—A special meeting of the council was recently held to consider the question of a more abundant water supply. In some parts of the town, it was stated by the chairman, water was only obtainable for about an hour in the morning. As they all knew, the negotiations for additional water had been going on for some time, but they must push the business forward as much as possible. They had also to consider the question of sewage disposal. Things in this respect have been bad enough for some time, but if they had a larger water supply there would be still more need for adequate sewage disposal. The district was reported free from infectious disease, but this could not be expected to continue if sanitation were neglected. He suggested that the two schemes should be taken at the same time. The report of the Sanitary Committee was read, in which it was advised that the water scheme be carried out as soon as possible, and that Mr. Wilcox, of Birmingham, be asked to come over at an early date and advise the council as to which scheme would be most advisable, as good springs were available at Cresswell and at Quicksill. The council went into committee on the sewage question.

Waterloo.—A Local Government Board inquiry was held recently respecting an application of the district council for sanction to borrow £750 for public lighting purposes. It was explained that the application was divided into two heads. The first was for £559 for the lighting of Great George's-road and South-road. In these roads gas is to make way for electricity. The Liverpool and District Lighting Company, Limited, had obtained an order in 1896 for supplying the district with power of lighting. They had erected a generation station, and the works were now in operation. The lamps to be used were similar to those used in Liverpool. Half the cost of the service loss was to be defrayed by the lighting company and half by the council. The Electric Lighting Company would lay the mains, the council provide the standards and carriers, and the lighting company would fix and maintain them. The remaining £200 was in respect of an electric light installation in the town hall.

RURAL DISTRICT COUNCILS.

Hollingsbourn.—The attention of the district council was on Thursday called to the insufficient water supply at Sandway, Leamham, where there was only one well to supply sixteen houses. The owners are to be called upon to obtain an increased supply.

Maldon.—An inquiry into the application of the district council for permission to borrow £10,775 for the carrying out of the Parleigh water supply scheme, which includes the parishes of Althorne, Cold Norton, Hazleleigh, Letchington, North Farbridge, Parleigh, Stow Maria and Woodham Mortimer, has been held by Major-General H. D. Crozier, R.E., an inspector of the Local Government Board.

Shepton Mallet.—A Local Government Board inquiry has been held by Mr. H. Percy Boulnois relative to an application of the council for sanction to borrow the sum of £1,400 for the carrying out of a scheme of water supply for portions of the parish of Doulting. Mr. William Phelps, surveyor to the council, explained the scheme, which includes the erection of a wind engine for pumping. Mr. J. Wallis Titt, of Warminster, Wilts., a specialist on wind engines, also gave evidence.

SCOTLAND AND IRELAND.

Aberdein.—In accordance with the provisions of the Housing of the Working Classes Act, the town council recently made an application to the Secretary for Scotland for an arbitrator to decide as to the disputed properties in Exchequer-row area. Lieutenant-Colonel Frederick Bailey, Edinburgh, has been appointed to adjudicate the claims affected by the scheme.

Belfast.—The following resolution has been adopted by the Electric Committee of the corporation: "That the corporation be recommended to promote a Bill in Parliament for the laying and working of electric tramways in the city of Belfast, especially in those streets not already provided with a tram service, with power to acquire rights over any existing tramways within the city, and for all other purposes necessary for the establishment of an electric tram service in the city."

Cupar, Fife.—A long report was submitted to the town council at a recent meeting by the committee appointed to consider the question of purchasing the gasworks. The report, after dealing with the company's accounts, expressed the opinion that it was not in the public interest to purchase the works unless a decided eventual profit could be shown or some immediate advantage to consumers secured; but the purchase price suggested (£16,000 or £14,000) would not admit of this. Turning to the question of electricity, the report stated that it compared favourably in price with gas. A London company had offered to pay the expenses of obtaining a provisional order, to work the order, and to sell the undertaking, if necessary, to the council at the end of twenty years for capital and 15 per cent. premium. This company would light the streets at 4d. per unit, a price 4s. certified as equal to gas at 2s. 6d. per 1,000 cubic feet. There was some opposition to the report being adopted, one member declaring

that it was "entirely unsound in its premises, misleading in its conclusions, and not worth the printer's ink." It was, however, adopted.

Glasgow.—The memorial scheme of a new bridge spanning the tributary river Cart between Langside and the rapidly-growing suburb of Nowlands, was recently duly laid. The old Millbrae bridge was only 12 ft. wide. The new structure, which is in the course of erection alongside of it, is 50 ft. wide. The total cost of £1,523 is borne to the extent of £1,300 by the Renfrewshire County Council, which shares the responsibility for the bridge along with the Glasgow Corporation. The bridge is of Leithharbrigs red sandstone, with ring heads, springers, and parapet of grey granite, and the inside of the arch of white rock. The abutments will be surmounted by iron railings in extension of the parapet, and the foundations are of concrete, 12 ft. below the scene of the river. Messrs. John White and James Lang are the joint engineers, and Messrs. Morrison & Mason, Limited, of Glasgow, are the contractors. The Statute Labour Committee of Glasgow Corporation had again under consideration, at a meeting last week, the proposal to widen Buchanan-street at its junction with Argyle-street, by acquiring a strip of ground from Messrs. Stewart & McDonald, who are about to reconstruct their premises. A proposal to offer the firm £8,000 was defeated by three votes, and it was then agreed to leave the matter in the hands of the whole corporation.—The new service of electric cars on the Springburn route of the corporation tramways was inaugurated yesterday.

Kirkcaldy.—Considerable interest was manifested at the last meeting of the town council owing to the proposal, to which we have previously made reference, to municipalise the electric lighting and tramways. Letters were read from a local company offering to take up the scheme and allow the council to take them over at the end of thirty-five years, at a price fixed by arbitration. The Edmondston Electric Lighting Company offered to introduce electric lighting to the burgh, allowing the town to purchase the scheme at the end of ten years at 15 per cent. on the cost. A long and amusing discussion took place, a strong feeling being prevalent against the town taking up the scheme. It was ultimately agreed that the town council should apply for a provisional order to introduce the electric light themselves; while a subsequent motion was made to apply further for an Act of Parliament or provisional order to empower the council to introduce electric tramways. The idea is that the town, having got Parliamentary sanction for these schemes, could then hand them over to any company offering the best terms. A committee was appointed to arrange for procuring these orders.

Stirling.—At a recent meeting of the Eastern District Committee of the county council, a sub-committee appointed to consider the question of supplying the Polmont district with water reported on the matter. The committee said they had had under consideration three sources of supply. The first of these was from the Lochcote reservoir, belonging to the Bo'ness Commissioners, and the second the Forestburn reservoir, belonging to the Linlithgow County Council. To both of these schemes there was the objection that they could not be carried out except at very considerable cost, whilst with regard to a supply from the Lochcote reservoir there was the further disadvantage that the Bo'ness Commissioners could not guarantee a full supply of water. The committee afterwards considered the Lily Loch scheme, which was reported upon in 1894, and they were of opinion that that source of supply, if obtainable, would, on account of its altitude and purity, solve many of the difficulties in the way of supplying the higher-lying villages, and would in the long run prove the most satisfactory source. The report was, after discussion, adopted.

University College.—Prof. Osbert Chadwick, chairman of the Chadwick Trust, delivered his inaugural address at this institution on Wednesday afternoon, to open the course of municipal engineering, and lectures and demonstrations on municipal hygiene, instituted by the trustees. In our next issue we expect to refer in greater detail to the address, which was listened to with close attention by a large number of students.

Institution of Heating and Ventilating Engineers.—At the inaugural meeting of this body, held on Wednesday evening, at the Albion Hotel, Ludgate-circus, E.C., Mr. Walter Jones (vice-president), of Stonebridge, read an interesting paper, entitled "Heating and Ventilation." Mr. John Grandy, of Tyldesley and London, presided, and the proceedings, to which we hope to make further reference, terminated with a vote of thanks to the author.

The Sanitary Inspectors' Association.—The annual general meeting of this body, one of the oldest associations, will be held at Carpenter's Hall, London-wall, E.C., to-morrow, at 4 p.m., when the thirtieth annual report of the council will be considered, together with the annual financial statement and the report and conclusions of the scrutineers on the election of chairman and members of the council for the 1898-99 session. An election of members and associates will also take place.

Personal.

Mr. R. O. Wynne Roberts, the newly-appointed city engineer of Cape Town, leaves England on the 29th inst.

Mr. James Pursey has been selected by the Street Urban District Council to fill the post of town surveyor and inspector.

Mr. Richard Fleming, of Dundee, has been selected to fill the post of burgh and road surveyor of Carnoustie, at a salary of £100.

Mr. J. G. Griffin has been appointed assistant engineer at the electricity works of the Llandudno Urban District Council, at a salary of £100 per annum.

Mr. Richard Simmons, surveyor to the Portcawl Urban District Council, has been appointed surveyor to the Little Woolton Urban District Council.

Erdington Urban District Council at their last meeting increased the salary of their engineer and surveyor, Mr. Herbert H. Humphries, by the sum of £100 per annum.

At the last monthly meeting of the Rathmines Township Commissioners it was decided to increase the salary of Mr. Dixon, the township engineer, from £400 to £500 a year.

Mr. D. W. Slocombe, late assistant surveyor to the Nantylgo and Blaiva Urban District Council, has been appointed surveyor and inspector of nuisances to the Thame Urban District Council, Oxfordshire.

At a meeting of the Littlehampton Urban District Council, on the 6th inst., it was resolved to award the surveyor, Mr. H. Howard, 50 guineas for services as engineer in connection with the auxiliary water supply from Arundel.

The Herefordshire County Council on Saturday appointed Mr. Alfred Dryland, assistant surveyor to the Kent County Council, to the county surveyorship of Herefordshire, at a salary of £400 per annum. There were seventy-four applications for the position.

At a special meeting of the Bridlington Urban District Council, on Friday, Mr. Ernest R. Matthews, of Hastings, was appointed surveyor to the council, in succession to Mr. J. Freebairn Stow, who was recently appointed surveyor to the Chertsey Urban District Council.

Mr. B. Powell, assistant in the office of Mr. Herbert H. Humphries, engineer and surveyor to the Erdington Urban District Council, has recently received the appointment of assistant surveyor in the office of the engineer to the Birmingham, Tame and Rea Drainage Board.

At the last fortnightly meeting of the Merthyr Urban District Council applications for the post of temporary assistant surveyor to the council, at a salary of £150 a year, were considered, and it was decided to request three of the candidates to appear before the council at their next meeting.

Mr. E. Cross, of the Bradford Corporation electricity department, has been presented with a handsome writing desk, which had been subscribed for by the whole of the staff, on the occasion of his leaving to take up the appointment of assistant to Mr. J. A. Bell, city electrical engineer of Aberdeen.

We regret to announce the death of Mr. Cundall, senr., of the firm of Messrs. R. Cundall & Sons, Limited, of the Airedale Ironworks, Shipley, and 20 and 22 St. Bride-street, London, E.C., which took place at his London residence, 28 Ballater-road, Aero-lane, Brixton, S.W., on Saturday, the 24th ult., in his sixty-ninth year.

A wedding gift, in the form of a handsome dining-room clock and bronze ornaments *en suite*, has been presented to Mr. Frederick A. Price, deputy superintendent of the Manchester Corporation Gas Department, with a salver for Mrs. Price. The presentation was made, in the name of the subscribers, by Mr. C. Nickson, superintendent of the department.

The Highways Committee of the Salford Corporation have decided to submit the following recommendation to the town council in regard to the appointment of adviser on the proposed electric tramways for the borough: "That Mr. Charles Hopkinson be appointed to advise this committee upon the same terms as those upon which the late Dr. Hopkinson was appointed."

On Friday, at a meeting of the Annan District Committee, it was decided to amalgamate with the Dumfries District Committee in the supervision of the roads, and Mr. A. V. Hart, surveyor of the Dumfries district, was appointed to work also the Annan district, at a salary of £250, to be contributed equally by each district. There were 116 applicants for the post.

At the annual general meeting of the Architectural Association, held on Friday evening, the president, Mr. G. H. Fellowes Pryme, delivered an address, and congratulated the association on its prosperous position. The body was popular in every branch of the profession, its financial position was sound, and their able instructors offered students advantages in architectural education superior to those supplied by any other institution of the kind.

On Wednesday of last week, at a meeting of the Bridge-

water Rural District Council, a letter was read from Mr. S. Ingram tendering his resignation as surveyor to the council, in consequence of his having been appointed surveyor to the Devon County Council. The resignation was accepted, and several members were in favour of advertising for a successor at once, at a salary of £250 a year, whilst others favoured the adjournment of the consideration of the appointment to a special meeting, in order that the question might be considered with any alterations in the duties or the salary. The latter course was adopted.

Ninety-four applications for the office of borough surveyor were received by the Oswestry Town Council. Six of these candidates were subsequently selected, and Mr. G. W. Lacey, borough surveyor and waterworks manager, Saffron Walden, has since been unanimously appointed. The new official received his early training in the borough surveyor's office at Luton, and was chief assistant there for over three years, after which he was elected assistant surveyor and engineer of Kettering, which appointment he vacated, after three years' service, in favour of his present post.

Dr. James Burn Russell, who has been appointed medical member of the Local Government Board, is the author of a number of important works dealing with the subject of public health, and has held a number of public appointments. He succeeded Prof. Gairdner in 1872 as medical officer of health for Glasgow, and has held that post for twenty-two years. After graduating B.A. in 1858 he assisted Lord Kelvin, then Prof. Thomson, in his preparations for the Atlantic cable expedition, and was present at the splicing of the cable. In 1862 he graduated M.D., and some twenty-three years later the University of Glasgow conferred upon him the honorary degree of LL.D. Dr. Russell is a member of the Royal Commission on Sewage Disposal at present sitting.

At a recent meeting of the Reigate Town Council a member, in moving the adoption of a resolution recommending the increasing of the salary of the borough surveyor, Mr. W. H. Prescott, commented very favourably upon the satisfactory nature of the latter's work, and expressed the opinion that he (Mr. Prescott) had shown very great activity in personally superintending the various improvements that had been carried out. A local paper, in referring to the decision of the council to advance the salary to £300 per annum, remarks that it is worth while offering some inducement to Mr. Prescott to remain in the services of the borough. It would have been easy for him to have improved his position financially by getting an appointment elsewhere, and they all felt proud to be able to retain his services.

The following gentlemen, among others, were present on Tuesday at an inspection of the Central London Railway works, at the Post Office station, by a party of the Society of Engineers: Mr. W. Worby Beaumont, president; Mr. Henry Adams, past-president; Messrs. J. C. Fell and Charles Mason, vice-presidents; Messrs. J. Patten Barber, Joseph Bernays, George Burt, Percy Griffith, and R. St. George Moore, members of council; Mr. Perry F. Nurse, hon. secretary and treasurer; Messrs. H. W. Andrews, R. L. Andrews, J. C. Belton, A. R. Burch, W. G. Bower, H. O. Carr, S. O. Cooper-Coles, G. B. Cutler, F. E. Duckham, P. M. Faraday, N. Harker, W. H. Hill, A. E. Hubert, E. Hulburd, A. J. Lenton, W. R. Phillips, H. Pulett, J. J. Rawlings, G. M. Robins, F. A. Robinson, J. Waddington, Captain Walter Wood; and Mr. G. A. Fryce Cuxson, secretary.

A proposal of the Electricity Committee of the Bolton Town Council to advance the salary of Mr. Arthur Ellis, the electrical engineer, from £300 to £450 per annum from the 1st October and during the equipment of the tramways for electric traction, was the subject of a lengthy discussion at last week's meeting of the council. Some feeling was imparted into the matter by two so-called labour representatives, because the council on a division, just taken previously, had refused to give an advance in wages to the street sweepers. Councillor James Holt opened the discussion by moving an amendment to the effect that the advance to Mr. Ellis be £100, and not £150, per annum. On a division only six voted for the amendment, forty-three being against. The recommendation was therefore confirmed by an overwhelming majority.

Eighteen competitive designs were sent in from various parts of the country for the erection of the new constabulary offices, police and coroners' court, proposed to be erected by the Warrington Corporation on the site of the old barracks in Arpley-street. Mr. Bennett, president of the Manchester Society of Architects, who was appointed assessor on the nomination of the Royal Institute of British Architects, has awarded £100 for the first premiated design to Mr. R. Burns Dick, Northumberland-street, Newcastle-on-Tyne. The corporation have also decided to appoint him as the architect, and he will therefore superintend the carrying out of his own plans. The second premiated design is that of Messrs. Tapper & Cronch, 12 Gray's Inn Buildings, London, W.C., who receive £50; and the third design is that of Mr. J. Lane Fox, Bond-street, Dewsbury, who receives £25.

MUNICIPAL TRAMWAY ENTERPRISE.

While there is considerable disparity between the number of tramway systems owned by private companies and those operated by municipalities, the advocate of municipalisation need scarcely despair when he contemplates the following list of lines already in operation and those under construction and projected. When one remembers that it is only within the past few years that the legal restrictions which somewhat cramped municipal enterprise in the direction of tramways have been modified, the progress that has been made is somewhat remarkable. Electric working is the basis of most tramway developments at the present moment, and all municipal schemes have that method in view; indeed, it is no exaggeration to say that electricity has been the means of showing what a useful undertaking a local tramway service can be made. As we have pointed out in these columns, a local authority by combining lighting with tramway working is enabled not only to provide an efficient means of illumination at low rates, but can also furnish a quick tramway service at popular fares.

As we have mentioned before in the working of tramways, companies predominate at the present moment, but it would appear that the early conditions of electric lighting will be reproduced. For the first few years the chief work in public lighting was done by private enterprise, but how much that has been altered is shown by the fact that of the fifty-seven electricity works opened in this country since 1893-four are owned by municipalities and the remainder—thirteen—by companies.

Municipal electric tramways have been projected in the following towns: Aberdeen, Birkenhead, Birmingham, Cardiff, Cheltenham, Chesterfield, Derby, Dumdee, Edinburgh, Gates-

After a lengthy discussion as to the proposed route, the report, with a few slight amendments, was adopted.

PROPOSED PUBLIC LIBRARY FOR GLOUCESTER.

A proposal has been made to erect a new public library building at Friburg, with, in addition to the existing school building.

The library, says a contemporary, will comprise a reading library, reference library, lecture-room, news-room. It is proposed to appropriate the large room, formerly used as a museum but lately a technical drawing-room, for the reference library, and to utilize a small portion of it at the west end, together with the waste space beneath the principal stairs to the art school as a lecture-room, and also to erect on the south side of the existing library a lending library, with entrance hall. The lending library will be two storeys in height, with a large frontage light over the upper storey having galleries round and open centre, and with wall space for a large number of stacks and extra books. The galleries will be reached by a staircase, direct from the lending library—a book lift being also provided. Adjoining the lending library, and occupying the whole length of the land on the south side, will be the reading and news room, and in the basement accommodation will be provided for extra papers and stores, cloak-room, lavatories, &c. To compensate for the loss to the school of art of the technical drawing-room taken by this scheme for the reference library, additional accommodation for the school of art is to be provided above the free library—viz., a lecture-room and technical drawing room over the reading and news rooms, two cloak-rooms over the new hall, the space over the reference library

MUNICIPAL ELECTRIC TRAMWAYS IN THE UNITED KINGDOM.

Town.	System.	Number of Cars.	Length of System.	The Source of the Electricity Supply.	Mix. Credit.
Blackpool	Open conduit	16	3 miles	Separate plant	1 in 50

head, Huddersfield, Kirkcaldy, Leicester, Manchester, Newport, Nottingham, Oldham, Portsmouth, Salford, Southampton, St. Helens, Sunderland, Southport, Tynemouth, Wallasey, Wigan, Tunbridge Wells, Reading and York. Out of this list the undertakings in the following towns include the purchase of the existing tram lines from the local companies: Birmingham, Cardiff, Derby, Edinburgh, Leicester, Manchester, Nottingham, Oldham, Portsmouth, Salford, Southampton, St. Helens, Reading and York.

to be rearranged to suit the new conditions, but affording, as at present, a class-room, art master's-room, with lavatory and cloak-room. The buildings are estimated to cost about £5,000. The architects are Messrs. Waller & Son, of Gloucester.

TRAMWAYS MUNICIPALISATION AT SUNDERLAND.

OVERHEAD SYSTEM ADOPTED.

As we briefly announced in a recent issue, the Corporation of Sunderland have decided to take over the control of the borough tramways. This decision was arrived at as the result of a special meeting, which was held to consider the report of a committee dealing with the question. The committee's report recommended that steps should be taken to acquire the service and work it by means of the overhead trolley system. The extension of the lines was also recommended. The total cost of the carrying out of the scheme will be about £250,000. The tramways company's lease will expire on August 16, 1899.

A letter was read from the British Electrical Traction Company, offering to purchase the whole system and to extend it as desired, and suggesting that the decision of the council should be deferred until a conference with the company took place.

The chairman of the special committee presented his report, in the course of which he pointed out the advantages that would accrue to the town by the acquisition by the municipal authorities of the tramway service. A long discussion took place on the question of the working of the trams by the corporation, several members expressing the opinion that it would be well to retain in their own hands the power of leasing the trams. Ultimately, however, it was decided, by forty-two votes to three, to adopt clauses which bind the council to go to Parliament for powers for the purchase and the working of the tramways by the corporation.

* Including new cars on order.

VILLAGE WATER SUPPLIES.

A YORKSHIRE SCHEME.

The popular health resorts of Spannaton, Lastingham, Appleton-le-Moors and Cropton, villages situated in a particularly beautiful part of Yorkshire, have for some time past, it seems, been dependent for their water supply upon a number of more or less inadequate wells, giving water of a rather doubtful purity. To remedy this state of affairs a joint committee, formed by the Pickering and Kirby-Moor-side District Councils, in the autumn of last year advertised for an engineer to advise them with respect to a joint scheme of supply, and Mr. J. E. Parker, A.M.I.C.E., of Durham and Newcastle, was eventually instructed, as a result of that advertisement, to prepare the necessary plans.

A week or two ago the joint committee met at Pickering for the purposes of discussing the report, which was submitted by Mr. Parker, and which recommended that, owing to the varying volume of the springs from which he proposed to take the supply, it would be advantageous to divide the scheme into two parts—one for Spannaton, Lastingham and Appleton-le-Moors, and the other for Cropton alone. The first portion would comprise impounding tanks, together with a closed aqueduct leading to a covered service reservoir in Spannaton village, and from thence to Lastingham and Appleton. The second part of the scheme would deal with the impounding of the water from the Rigg End spring, Hartoft, conveying it by means of iron pipes to Cropton village, where a service reservoir would be provided.

The joint committee unanimously decided to give their approval to the scheme, and recommended that the work should be proceeded with as soon as possible.

Geneva. The switch in the point of the main electricity works of the city of Geneva, situated on the Rive, near Chevres, caught fire recently, and in a short time the entire works were destroyed. In consequence no transmission of the electric current for motive power and illumination existed throughout the canton of Geneva.

SPRING VALE FURNACES AND STEEL WORKS.

The visit of municipal engineers to these works, on the occasion of the recent district meeting at Bilston, was inevitably a hot and somewhat dusty experience, but one that was undeniably interesting and instructive. A brief account of the works will therefore be acceptable to our readers. We are indebted to Mr. C. L. N. Wilson, engineer and surveyor to the Bilston Urban District Council, for the following description:—

The works are situated in Bilston, adjoining the Grand Junction Canal, and are connected to the Lenden and North-Western and Great Western Railway systems. They are the property of Alfred Hickman, Limited, and are very extensive. Nine locomotives are kept at work in the yards and in taking the slag to the spoil banks. There are upwards of 10 miles of rails, and employment is found for over 1,000 men. There are six large blast furnaces, but only four of them are in blast at present, with eleven regenerative hot blast stoves of the Cowper, Ford & Moner type, heating the air supplied to the furnaces to a temperature of 1,400 deg. Fahr. The whole of the furnaces are blown by five massive blowing engines developing about 1,500 indicated horse-power. The furnaces turn out about 2,000 tons of pig iron per week, most of which is used in the adjoining steel works, where it is converted into Thomas Gilchrist steel by the now well-known process bearing that name. The minerals from which the pig iron is made are obtained in the neighbourhood, the North Staffordshire district and from Northamptonshire, and the fuel from Yorkshire and Wales.

The process of making steel by the Basic method is being largely carried on here, about 1,600 tons of ingot steel being produced per week. The pig iron from the furnaces is remelted in cupolas and then poured into the Bessemer converters in about 10-ton lots. It is then blown for about twenty minutes, so as to oxidise all the phosphorus, silicon, &c., in the iron, which now comes off as basic slag. The steel is next poured into ingot moulds, and after standing a few minutes the moulds are "stripped" from the ingot of steel. The ingot is then put into a Siemens' gas furnace, to be heated for rolling. This occupies but a few minutes, and the ingot of steel appears once more coming out of the gas furnace, and is tipped down in front of a powerful cogging mill, which rolls the ingot into greater length with less width and depth. In connection with this mill there is a tilting machine, to turn over and otherwise manipulate the rolled ingot, which saves a great deal of manual labour. The "bloom," as the steel is then called, is cropped off at each end by very strong shears, and is next passed on to be rolled either into plates, bars, angles, tees, flats, channels, or any other section necessary for constructional works, such as bridges, piers, roofs and waggons. The finished bars are sawn into lengths by a steam saw, and then are straightened ready for shipment.

There is a bar mill near the steel works rolling smaller sections of steel, provided with all the accessories required for that purpose.

The basic slag contains a large percentage of phosphate of lime, and about 600 tons of it is ground into powder each week and sold to farmers and root-growers for manurial purposes; it is specially valuable for grass and root growing, and is in great request.

There is a large colliery and a clay pit and brickworks in connection with the works and adjoining them, and altogether the works constitute a very good illustration of a Staffordshire iron and steel enterprise, and I think they are the largest in the county. There is in connection with the works a large and well fitted-up laboratory, where a number of expert chemists are engaged in making chemical analyses of the various ores and samples of the iron and steel produced, and also in making microscopic examination of these ores and samples.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

FOREMAN.—October 14th.—Staines Rural District Council. 27s. 6d.—Mr. George W. Manning, engineer and surveyor to the council.

ASSISTANT SURVEYOR.—October 17th.—Garston Urban District Council. £110.—Mr. F. W. Bowdon, A.M.I.C.E., surveyor to the council.

SLAUGHTER-HOUSE SUPERINTENDENT.—October 17th.—Corporation of Doncaster. 30s.—The Town Clerk.

TIME AND STORE KEEPER.—October 17th.—Vestry of Rotherhithe. 30s.—Mr. James J. Stokes, clerk to the vestry.

BUILDING INSPECTOR.—October 17th.—Edmonton Urban District Council. £130.—Mr. Wm. Francis Payne, clerk to the council.

TEMPORARY ASSISTANT.—October 17th.—Hampton Urban District Council. £3.—Mr. John Kemp, A.M.I.C.E., surveyor to the council.

SURVEYOR.—October 17th.—Twickenham Urban District Council. £260.—Mr. H. Jason Saunders, clerk to the council.

STORES CLERK FOR SURVEYOR'S DEPARTMENT.—October 17th.—Ealing Urban District Council. 25s.—Mr. W. Ruston, clerk to the council.

ENGINEER, SURVEYOR AND SANITARY INSPECTOR.—October 19th.—Wembley (Middlesex) Urban District Council. £220.—Mr. John Smith, clerk to the council.

ASSISTANT SURVEYOR.—October 20th.—Vestry of St. George-the-Martyr, Southwark. £130.—Mr. J. A. Johnson, clerk to the vestry.

GENERAL ENGINEERING ASSISTANT.—October 20th.—Corporation of Birkhead. £110.—Mr. Charles Brownridge, A.M.I.C.E., borough engineer and surveyor.

SEWAGE FARM MANAGER.—October 21st.—Willenhall Urban District Council. 21s.—Mr. Chas. J. Jenkin, A.M.I.C.E., engineer and surveyor to the council.

SURVEYOR.—October 21st.—Andenshaw Urban District Council. £140.—The Chairman of the Council.

INSPECTOR OF HOUSE DRAINS.—October 21st.—Vestry of St. John, Hampstead. £110.—Mr. Arthur P. Johnson, clerk to the vestry.

TEMPORARY ENGINEERING DRAUGHTSMAN.—October 22nd.—Corporation of Tiverton. £2.—Mr. J. Siddalls, borough surveyor.

BUILDING AND DRAINAGE INSPECTOR.—October 24th.—Corporation of Stockton-on-Tees. £100.—Mr. M. H. Sykes, borough engineer.

TEMPORARY ASSISTANT ENGINEER.—October 24th.—Drumcondra, Clonliffe and Glasnevin Township Commissioners. £50.—Mr. Michael Petit, town clerk, Drumcondra, co. Dublin.

ELECTRICAL ENGINEER.—October 24th.—East Ham Urban District Council. £300.—Mr. W. H. Savage, A.M.I.C.E., engineer and surveyor to the council.

HIGHWAY SURVEYOR.—October 25th.—Warwick Rural District Council. £120.—Mr. H. Consett Passman, clerk to the council.

BUILDING INSPECTOR.—October 25th.—Walthamstow Urban District Council. £3.—Mr. E. J. Gowen, clerk to the council.

ASSISTANT INSPECTOR OF NUISANCES.—October 29th.—Stretford District Council. £80.—Mr. George H. Abrahams, clerk to the council.

MUNICIPAL ENGINEER AND SURVEYOR.—October 29th.—Municipality of Woodstock, Cape Colony. £500.—Messrs. J. C. Mackinlay & Co., 27 Walbrook, London, E.C.

INSPECTOR OF NUISANCES.—October 29th.—Windsor Rural District Council. £130.—Mr. J. E. Gale, clerk to the council.

DEPUTY SURVEYOR.—November 3rd.—Brierley Hill Urban District Council. £100.—Mr. William Waldron, clerk to the council.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

FLYDS.—October 24th.—Sewerage scheme or schemes for the townships of Bishopclee, Northwick, Cawleton and Thornton, for the rural district council.—Mr. Fred. H. Brown, clerk to the council.

ABERAVON.—December 1st.—Extension of the covered market, at a cost not to exceed £5,000. £21.—The Borough Surveyor.

CHERTSEY.—December 23rd.—Sewerage and sewage disposal scheme for the No. 1 and 2 wards of the district. £50, £30 and £20.—Mr. T. E. Harland Chaldecot, clerk to the council.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

LEIGH.—October 14th.—Supply and erection of various electric lighting plant, for the urban district council.—Mr. Peregrine Thomas, clerk to the council.

LEIGH.—October 14th.—Alteration of a bench of inclined rotors, for the urban district council.—Mr. Peregrine Thomas, clerk to the council.

PERSTON.—October 14th.—Levelling, paving, channelling, &c., works in the back roads between St. Christopher's-road and St. Andrew's-road, and the back roads between St. Andrew's-road and St. David's-road.—The Borough Engineer.

SWYFOLD.—October 14th.—Erection of a steel and iron bridge at East Harding, for the county council.—Mr. T. H. B. Heslop, M.I.C.E., county surveyor, Norwich.

ROMFORD.—October 14th.—Erection of public baths, for the urban district council.—Mr. George Bailey, clerk to the council.

HULL.—October 14th.—Supply of sixty standards of creosoted redwood sleepers, 4in. by 7in., and 700,000 creosoted redwood paving blocks.—Mr. A. E. White, city engineer.

BANGOR.—October 15th.—Erection of buildings, chimney shaft, &c., for the electric light station.—Mr. John Gill, A.M.I.C.E., borough surveyor.

WESTMORELAND.—October 15th.—Widening of that portion of the Kendal to Ockentwaite-road near the back gateway of Levens Park, for the county council.—Mr. Joseph Bintley, county surveyor, Kendal.

SOUTHBOURGH.—October 15th.—Erection and completion of the proposed Victoria Hall and buildings in London-road, for the urban district council.—Mr. William Harner, surveyor to the council.

BLOOMSBURY.—October 15th.—Providing and fixing at the sewage outfall works, Cooper Bridge, various boilers, engines, economiser, &c.—Mr. James Parkinson, town clerk.

GLASGOW.—October 15th.—Supply of about 156 tons of 27-in. tubes, 1,273 tons of 24-in. spigot and socket turned and bored pipes and special castings.—Mr. James M. Gale, engineer of the corporation water department, City Chambers, Glasgow.

TUNDRIDGE WELLS.—October 15th.—Sewering and making-up of new roads on the sites of the proposed workmen's dwellings.—Mr. W. C. Cripps, town clerk.

TRICKENHAM.—October 16th.—Supply of 2,000 cubic yards of 24-in. broken blue Guernsey granite or Chelmsford quartzite, for the urban district council.—Mr. H. Jason Saunders, clerk to the council.

POSTPOOL.—October 17th.—Mr. H. H. Hindon, repair, &c., of the town hall, for the urban district council.—Mr. H. H. Hindon, clerk to the council.

BRACKENHURD.—October 17th.—Erection of public baths on a site adjoining Livingstone-street and Price-street.—Mr. Charles Brownridge, A.M.I.C.E., borough engineer and surveyor.

KINGSTON.—October 17th.—Supply during the ensuing twelve months of various stores, &c.—Mr. John Donnelly, town clerk.

FOINBUROUGH.—October 17th.—Various works in connection with gasholder tank at Granton.—Mr. James M'G. Jack, clerk to the commissioners.

WISHAW.—October 17th.—Supply of 12,000 tons of cast-iron pipes of 16-in., 18-in. and 19-in. diameter.—Mr. James Logan, town clerk.

MOUNTAIN ASH.—October 17th.—Supply and planting of trees and shrubs at the pleasure grounds, for the urban district council.—Mr. John Williams, surveyor to the council.

WARRINGTON.—October 18th.—Erection of a public convenience.—Mr. John Deas, Bank House, Sankey-road, Warrington.

LANCHESTER.—October 18th.—Erection of a new stone bridge over Newhouse burn, near Moorfields, for the rural district council.—Mr. W. H. Ritson, clerk to the council.

LEWISHAM.—October 18th.—Concreting the bed of the river Quaxey from the lough building to the river Ravensbourne (about 210 ft. in length), for the district board of works.—The Surveyor to the Board.

ABLEE.—October 18th.—Levelling, channelling, paving, &c., of Byron-street, for the urban district council.—Mr. W. Gibson, surveyor to the council.

KETCHLEY.—October 18th.—Sewering, paving, flagging and mackage of Salisbury-road and Clifton-road.—Mr. W. H. Hopkinson, A.M.I.C.E., borough engineer.

LEYTON.—October 18th.—Widening of a portion of Grove Green-road, for the urban district council.—Mr. William Dawson, M.I.C.E., engineer and surveyor to the council.

FELMAY.—October 19th.—Making-up and paving of Felden-street (section I) and Fynton-street, for the vestry.—Mr. Charles Bottrell, surveyor to the vestry.

DROGHEDA.—October 19th.—Construction of filter-beds and other works in connection with the waterworks.—The Borough Engineer.

SOUTH SHIELDS.—October 19th.—Supply and erection of various electric lighting plants.—The Borough Electrical Engineer.

GLAMORGANSHIRE.—October 19th.—Improvement of the main road at Whitechurch, near Cardiff, for the county council.—Mr. T. Mansel Francklin, clerk to the council.

WATFORD.—October 19th.—Supply of 100 tons of broken granite, for the urban district council.—Mr. H. Horton Turner, clerk to the council.

BETHNAL GREEN.—October 20th.—Supply of 100 galleys gratings, for the vestry.—Mr. F. W. Barratt, surveyor to the vestry.

ST. GEORGE-IN-THE-EAST.—October 20th.—Paving of certain footways in the parish with compressed asphalt, for the vestry.—Mr. G. A. Wilson, surveyor to the vestry.

KINGHLEY.—October 20th.—Supply of 1,700 tons of Goin, by 3-in. granite setts.—Mr. W. H. Hopkinson, A.M.I.C.E., borough engineer.

ST. GEORGE-IN-THE-EAST.—October 20th.—Erection of an addition to the vestry hall, in Cable-street, for the vestry.—Mr. G. A. Wilson, surveyor to the vestry.

CARLISLE.—October 21st.—Erection of a caretaker's lodge on the Saucers.—Mr. Henry C. Marks, A.M.I.C.E., city engineer.

INVERDALE.—October 21st.—Laying of about 1,000 yards of 10-in. gas mains at Pontypool, for the urban district council.—Mr. Walter H. Morgan, clerk to the council.

BLACKPOOL.—October 21st.—Construction of two main outfall sewers to the sea (2,400 ft. and 1,400 ft. in length respectively), with all necessary manholes, &c.—Mr. J. Wolstenholme, borough engineer.

WALSLOW.—October 21st.—Construction of certain sewers, for the urban district council.—Mr. William Cobbett, clerk to the council.

NEWTON-IN-MAKERSFIELD.—October 22nd.—Construction of a 2-in. storm overflow sewer, for the urban district council.—Mr. W. W. Shirley, clerk to the council.

COWES.—October 22nd.—Supply of about 1,000 yards of 6-in. and 400 yards of 4-in. cast-iron socket pipes, for the urban district council.—Mr. J. W. Webster, engineer and surveyor to the council.

COWES.—October 22nd.—Construction of a cast-iron water tank to hold 70,000 gallons, for the urban district council.—Mr. J. W. Webster, engineer and surveyor to the council.

LEBBURY.—October 22nd.—Construction of certain sewers, for the urban district council.—Mr. R. E. W. Borrington, engineer, Bank Buildings, Wolverhampton.

WILTSIRE.—October 23rd.—Erection of the new county offices at the back of Arlington House, Trowbridge, for the county council.—Mr. Charles S. Ayle, county surveyor, Stallard-street, Trowbridge.

MANCHESTER.—October 24th.—Supply and erection of new shafting, brackets, pulleys, &c., at the sewage works at Davyhulme, near Urmston.—The City Surveyor.

NEW SHOREHAM.—October 24th.—Supply of 400 cubic yards of clean hand-picked land flints, for the urban district council.—The Town Surveyor.

ROBEY.—October 24th.—Laying of about 900 yards of cast-iron pumping main from the Avon waterworks to Railway-terrace, for the urban district council.—Mr. D. G. Macdonald, A.M.I.C.E., engineer and surveyor.

HONDERSON.—October 24th.—Making-up of three streets in the district and the construction of various surface water sewers, &c., for the urban district council.—Mr. J. Salskiel, surveyor to the council.

ST. LEONARD.—October 25th.—Construction of an underground sanitary convenience in Golde-lane at its junction with Old-street, for the vestry.—The Surveyor to the Vestry.

BIRMINGHAM.—October 25th.—Erection of stabling and offices at Salfley Wharf at the corner of Crawley-street and Salfley Viaduct.—Mr. John Frier, city engineer and surveyor.

HARLOW.—October 25th.—Making-up of Byron, Kingsfield and Valentine roads, for the urban district council.—Mr. T. Charles, surveyor to the council.

LONDON.—October 25th.—Supply and erection of eight large gas engines, with starting engines and four small gas engines at the proposed Lots-road pumping station, Chelsea, for the county council.—Mr. C. J. Stewart, clerk to the council, Spring-gardens, London, S.W.

REDINGTON.—October 25th.—Levelling, metalling, channelling, paving and making-up of South-road, Lottmington-road, Woodland-road and Bridge-road, under the Private Street Works Act, 1892, for the urban district council.—Mr. H. H. Humphries, engineer and surveyor to the council.

EXETER.—October 25th.—Sewering of Minstead-road and the surface-water draining of Oakfield-road, for the urban district council.—Mr. Herbert H. Humphries, engineer and surveyor to the council.

REDINGTON.—October 25th.—Supply of about 7,500 yards of 24-in., 21-in., 18-in., 15-in., 12-in., 9-in. and 6-in. earthware socketed pipes, for the urban district council.—Mr. H. H. Humphries, engineer and surveyor to the council.

REDINGTON.—October 25th.—Supply of broken and unbroken stone for a period of twelve months, for the urban district council.—Mr. Herbert H. Humphries, engineer and surveyor to the council.

DOVER.—October 25th.—Laying of a new 12-in. cast-iron main and pipe from the sea to the baths.—Mr. Henry E. Stollrose, A.M.I.C.E., borough engineer.

HACKNEY.—October 25th.—Construction of a public and school commenced at the north-east corner of the town hall grounds, for the vestry.—Mr. James Lovagey, surveyor to the vestry.

BECK.—October 26th.—Erection of a new 12-in. cast-iron main in St. Marie's Place.—Mr. John Haslam, town clerk.

HULL.—October 27th.—Supply and erection of various electric lighting plant.—Mr. A. S. Barnard, city electrical engineer.

BACON.—October 28th.—Erection of a concrete wall and the execution of drainage and other works to support the landslip between the main road and the river Usk, near the village of Langwydd, for the county council.—Mr. H. Edgar Thomas, clerk to the council, County Hall, Brecon.

WALSLOW.—October 28th.—Sewering, kerbing, channelling and making-up of a private street about 200 yards in length, for the urban district council.—Mr. William Cobbett, clerk to the council.

APPOINTMENTS OPEN.

WEMBLEY (MIDDLESEX) URBAN DISTRICT COUNCIL.

APPOINTMENT OF ENGINEER, SURVEYOR AND SANITARY INSPECTOR.

The Wembley Urban District Council is prepared to receive applications from gentlemen desirous of filling the above posts, at the combined and inclusive salaries of £220, rising by annual increments of £15 to a maximum of £280 per annum.
 Forms of application, and full particulars as to the duties, can be obtained by sending a stamped directed envelope (foolscap) to my office.
 Application forms, duly filled up and accompanied by copies of not more than three recent testimonials, should be sent to me, in sealed envelopes, marked "Engineer, &c.," by not later than 6 o'clock on Wednesday, the 19th October, 1898.
 Selected candidates will be written to, and third-class railway fare only will be allowed.
 Canvassing the members, directly or indirectly, is strictly prohibited and will be deemed a disqualification.

(By order)

JNO. SMITH,

Clerk to the Council.

Public Offices, Wembley, Middlesex.
 September 22, 1898.

BOROUGH OF BIRKENHEAD.

The Corporation of Birkenhead are prepared to receive applications for the position of General Engineering Assistant in the Borough Engineer and Surveyor's office, at a salary of £110 per annum, rising by annual increments of £10 to £150 per annum.

Candidates must have had experience in a municipal engineer's office, and be not less than twenty-three years of age nor more than twenty-eight years of age.

Applications, in candidate's own handwriting, stating age and experience, and accompanied by copies of not more than three recent testimonials, sealed and endorsed "Engineering Assistant," must be delivered at the office of Mr. Charles Brownridge, A.M.I.C.E., Borough Engineer and Surveyor, Town Hall, Birkenhead, by 12 o'clock noon, on Thursday, the 20th October, 1898.

Canvassing will be deemed a disqualification.

Borough Engineer's Office, Town Hall, Birkenhead.

September 29, 1898.

EALING DISTRICT COUNCIL. SURVEYOR'S DEPARTMENT.

A Stores Clerk required; age not to exceed twenty-five; must be a neat writer, quick at figures and have a good knowledge of accounts; will be required to fill up his time in the Surveyor's office. Salary, 25s. weekly.

Applications, stating age, previous experience, and enclosing copies of three testimonials, to be sent to the undersigned, marked "Stores Clerk," on or before the 17th instant.

W. RUSTON,

Clerk.

Public Buildings, Ealing.
 October 5, 1898.

The Walthamstow Urban District Council invite applications for the post of Building Inspector.

Applicants must be fully qualified and competent by knowledge and experience to carry out the duties.

The salary offered is £3 weekly.

Candidates must apply in their own handwriting, stating their age and qualifications, particulars of past and present employment, and enclosing copies of three testimonials of recent date. Applications, marked "Building Inspector," to reach the undersigned before 5 o'clock p.m. on Friday, October 28, 1898.

Canvassing will disqualify.

E. J. GOWEN,
Clerk to the Council.

Town Hall, Walthamstow.
October 4, 1898.

WARWICK RURAL DISTRICT COUNCIL. APPOINTMENT OF HIGHWAY SURVEYOR.

Applications are invited for the office of Highway Surveyor for the above district.

The district comprises thirty parishes, with a population of 11,363, an area of 55,178 acres, and about 150 miles of district roads to be superintended and maintained.

The salary to be £120 per annum, and the Surveyor will be required to devote the whole of his time to the duties of his office, to provide himself with means of locomotion, and to reside in the district.

The person appointed must be fully competent to perform his duties, to keep the accounts prescribed by the Local Government Board's order, and generally to comply with the instructions of the Council.

Applications (marked "Highway Surveyor"), in the candidate's own handwriting with age, present and previous occupation, and accompanied by not more than three recent testimonials, to be forwarded to me not later than Friday, the 28th instant.

(By order of the Council)
H. CONSETT PASSMAN,
Clerk.

45 Bedford-street, Leamington Spa.
October 13, 1898.

VESTRY OF ST. JOHN, HAMPSHIRE. INSPECTOR OF HOUSE DRAINS WANTED.

The Vestry invite applications for the above office from competent men not under thirty nor over forty-five years of age.

The person appointed will be required to superintend the drainage of houses, including internal fittings, &c., and to see that the regulations and orders of the Vestry in respect of such work are carried out.

Further particulars may be obtained at the Surveyor's office, at the Vestry Hall.

Commencing salary, £110 per annum.

Applications, in candidate's own handwriting, stating age, previous experience and present employment, and accompanied by not more than three testimonials of recent date, to be sent in to me not later than 10 a.m. on Friday 21st October.

(By order)
ARTHUR P. JOHNSON,
Vestry Clerk.

Vestry Hall, Hampstead, N.W.
October 5, 1898.

HAMPTON URBAN DISTRICT COUNCIL. TEMPORARY ASSISTANT.

Wanted, at once, for a few months, a Temporary Assistant, to undertake the preparation of surveys, plans, sections, &c., for private street works, and to supervise the construction of private street works now in progress.

Applicants must be good and accurate surveyors, levellers and draughtsmen, and have had experience in the superintendence of the construction of similar works. Salary, £3 per week. Age not to exceed thirty five years.

Applications, in writing, accompanied by copies only of recent testimonials, to be sent to me not later than the 17th October inst.

JOHN KEMP, ASSOC. M. INST. C. E.,
Surveyor to the Council.

District Council Offices, Hampton, Middlesex.
October 6, 1898.

GARSTON URBAN DISTRICT COUNCIL.

The above Council require a qualified Assistant in the Surveyor's office; must be an accurate surveyor and leveller and neat draughtsman, having a thorough knowledge of building construction and competent to prepare working drawings and specifications. Applicants must be well acquainted with the Model By-Laws of the Local Government Board, and be competent to undertake the inspection of new buildings and the construction of drains, and have had at least five years' experience in a borough or district surveyor's office.

Salary to commence at £110 per annum.

Written applications only, in the candidate's handwriting, stating age, qualifications, present and past experience, together with copies of not more than four recent testimonials (which will not be returned), may be sent to the undersigned on or before the 17th day of October.

Canvassing will disqualify.

F. W. BOWDEN, ASSOC. M. INST. C. E.

Public Offices, Grassendale, West Liverpool.
October 5, 1898.

EAST HAM URBAN DISTRICT COUNCIL. ELECTRICAL ENGINEER.

The above-named Council require the services of an Electrical Engineer for the preparation of a scheme of electric lighting combined with tramways, and the ultimate management and maintenance of the same after completion.

The person appointed must be prepared to reside in the district and devote the whole of his time to the duties of the office. The salary will be £300 per annum, with necessary offices and assistance, and, as the district is a rapidly increasing one, the position is likely to improve.

All further particulars, together with a form of application, may be obtained upon application to Mr. W. H. Savage, A.M.I.C.E., the Engineer and Surveyor to the Council, at the Public Offices, East Ham.

Applications to be sent in the printed envelope provided for the purpose, and enclosing copies of three recent testimonials, on or before Monday, October 26th next.

Canvassing members of the Council, either directly or indirectly, is strictly prohibited and will disqualify any candidate.

C. E. WILSON,
Clerk to the Council.

Public Offices, East Ham, London, E.
September 27, 1898.

**URBAN SANITARY DISTRICT OF ROYTON.
TO PUMP MAKERS.**

The Royton Urban District Council solicit tenders for the Supply and Erection of Pumping Machinery to lift about 60,000 gallons of water per hour to a height of 60 ft., at the Council's sewage works, Street-bridge, Royton.

Specifications and other particulars may be obtained on application to Mr. Theo. S. McCallum, A.M.I.C.E., 4 Chapel-walks, Manchester, on sending a deposit of £1, which sum will be returned after receipt of a *bona-fide* tender.

The Council does not bind itself to accept the lowest or any tender.

Tenders (endorsed "Contract No. 17") must be delivered to the undersigned on or before the 10th day of November, 1898.

(Signed) THOS. BLEASDALE,
Clerk to the Council.

Town Hall, Royton.
October 5, 1898.

**ERDINGTON URBAN DISTRICT COUNCIL.
SUPPLY OF STONE FOR ROAD REPAIRING.**

The Highways and Buildings Committee of the above Council are prepared to receive tenders for the supply of Broken and Unbroken Stone to various points in their district for a period of twelve months.

Specifications, forms of tender and all information may be obtained upon application at my office, Public Hall, Erdington.

Tenders, accompanied by samples and endorsed "Tender for Stone," to be delivered to me not later than Tuesday, October 25, 1898.

The Council do not bind themselves to accept the lowest or any tender, and the tender of any firm paying less than the standard rate of wages current in their district will not be considered.

HERBERT H. HUMPHRIES,
District Engineer and Surveyor.

Public Hall, Erdington, Birmingham.
October 10, 1898.

**HODDESDON URBAN DISTRICT COUNCIL.
TO ROAD AND SEWER CONTRACTORS.**

The above Council invite tenders for the Making-up of three Streets in their district, comprising a total length of 3,400 ft.

The works include Carriageways, Footways and Kerbs. Tenders are also invited for the construction of Surface-Water Sewers, comprising 44 yards of 15-in. Cast-Iron Pipe, 32 yards of 15-in. Stoneware Pipe, 383 yards of 12-in. Stoneware Pipe, 953 yards of 9-in. Stoneware Pipe and 131 yards of 6-in. Stoneware Pipe, with the necessary Junctions, Manholes, Tumbling Bays, Ventilators, Catchpits, &c.

Plans and sections may be seen at the office of the undersigned, from whom the specifications, quantities, forms of tender and contract may be obtained on payment of 3 guineas.

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

- Easily and quickly laid by unskilled workmen.
- Perfect alignment of invert secured.
- Joint readily made absolutely watertight.
- Cheapest Patent Joint in the market.

Prices and further particulars on application to J. PLACE & SONS, Ltd., Darwen.

**The Kensington Patent Syphonic
Closet Traps and Closets**

Embrace all the qualities of a First-Class Valve Closet at less than one-fifth the cost.
WHEN FIXED WILL LAST A LIFE-TIME.

Meeting with all the Requirements of the London County Council.

May be obtained of all leading Lead and Sanitary Goods' Merchants.

Illustrated Price Lists may be had from

THE ANCHOR SANITARY POTTERIES, SWADLINCOTE.

ADVANTAGES.

It is fixed exactly as a common hopper and trap, with earthenware or lead outlets; or the trap may be had entirely of 10 lb. cast lead.

IT CANNOT GET OUT OF ORDER.

Only requires TWO gallons of water to properly flush it, and it has no pull pipes or other complicated parts.

It has a water service of 10 in. by 8 in., or more if required, an absolute water seal of 5 in., and cannot under any conditions be syphoned out.

W. EASSE, Esq., C.E. (deceased), said it was preferable to any other closet. The trap can be adapted to the "Household," "Swift," "Sirex," "Iris," or any similar closet basin. The price enables it to be used in Cottage, Villa or Building, whilst it cannot be equalled for the best of Mansions. Special after-flush cisterns made to suit the closet.

SURVEYORS' INSTITUTION EXAMINATIONS.—Complete courses of preparation, in class or by correspondence, in all divisions and sub-divisions. At the last four examinations the following prizes were obtained by Mr. Parry's pupils:—

1895 and 1896. Institution Prize, Driver Prize and Penfold Silver Medal.

1897. Institution Prize and Special Prize.

1898. Institution Prize, Special Prize, Driver Prize and Penfold Silver Medal and Crawler Prize (one of the two bracketed winners of the last).

At the examination of last March more than half of the successful list were Mr. Parry's pupils.—Apply to Mr. Richard Parry, F.S.I., A.M.I.C.E., &c., 27 Great George-street, Westminster (immediately opposite the Surveyors' Institution).

Minutes of Proceedings.

The Local Government Board and the Housing Problem.

There have recently been one or two vigorous deliverances in regard to the policy of the Local Government Board in connection with schemes for the housing of the poor. In the paper read at the recent Sanitary Institute congress at Birmingham, and reported in our issue of October 14th, Dr. Scurfield, medical officer of health for Sunderland, gave an account of the experience of that town. The first steps were taken in August, 1893, and in October of the same year the petition for the confirmation of the scheme was forwarded to the Local Government Board. The inquiry was held early in January, 1894, and the provisional order issued in the following May. In September of the same year a second inquiry was held to modify the scheme, and two years later the purchase of properties was so far advanced as to permit of advertising a competition. The premiums were duly awarded, and the first premiated designs provisionally approved by the council after some amendment. Then it was thought advisable that the architect and the borough surveyor should interview the architect to the Local Government Board, in order to ensure the ultimate approval of the plans by making any required modifications. The amended plans were quickly approved by the council, and then formally submitted to the Local Government Board, with a request that, as there was no one living on the area and the buildings were mostly in ruins, the council wished to build on the whole area at once instead of only on one-half. More than four months afterwards the Local Government Board wanted further information as to the latter proposal, and suddenly discovered that the plans provided (1) insufficient open space, (2) accommodation for too few persons, and (3) one-room tenements. In regard to objection (2) it is worth noting that while 480 persons were displaced the plans provided for the accommodation of 454 persons. The close of last year saw another deputation, and as a consequence thereof further amendments in regard to open space, the number to be provided for, and abolishing one-roomed tenements. The amended plans were submitted to the Local Government Board early in 1898, but the council were informed that another inquiry must be held. This duly took place in June, but there is not as yet a prospect of any early start in the erection of the buildings. Four years and eight months have elapsed since the Local Government Board were asked to confirm the scheme. Of this period about two years were spent in the purchase of the properties, about four months in the competition for the plans of the dwelling, and the balance in correspondence and negotiations with the Local Government Board.

So much for Dr. Scurfield, but he is by no means alone in his protest. Mr. MacBair, the city surveyor of Lincoln, recently found an opportunity of entering the arena in connection with the diocesan conference in that city, and he delivered himself

vigorously in speaking to a motion "that overcrowded and unsuitable dwelling-houses are detrimental to the spiritual, as well as to the sanitary welfare of the people." He first referred to the difficulty of finding a suitable term to define those for whom accommodation should be provided. "The labouring classes" was rather a vague term, and in Dublin they had coined a new expression—"the very poor." He himself confined his remarks to those who were earning 20s. a week and under. Flats, he said, were not wanted at Lincoln, for they they were not cared for. The rents should be 3s. and under per week. In Hull lately they had been building a large number of houses at 3s. 9d. per week. At the present time in Dublin there was a scheme to provide dwellings at rents varying from 1s. to 1s. 3d. per week; but to do that a free site was asked for and no rates or taxes were paid, which meant a reduction of at least 30 to 35 per cent. off the cost. Mr. MacBair finds that the provision required could only come from three possible sources:—(1) Ordinary commercial enterprise, (2) local authorities, and (3) sympathetic private enterprise—a phrase of his own coinage. The first source, he thought, might be dismissed, as the prospect was not sufficiently attractive. He then proceeded to ask why municipal enterprise should be behind benevolent private enterprise in this matter. We have always contended that municipal enterprise in this direction should be confined as much as possible to providing decent accommodation for those who could not provide for themselves and whose condition might otherwise be a danger to the community. In such a case the work must impose some burden on the rates, though it can scarcely fail to prove indirectly remunerative through its beneficial effects on the health of the community generally. But Mr. MacBair's point is that, even assuming that there would be no burden upon the rates, the local authorities have a difficulty in providing the accommodation required. Why? Because as a loan is required the central authorities intervene, and their policy has been to insist on requirements which render it impossible to provide the accommodation necessary. Mr. MacBair did not advocate the lowering of the ideal standard, but he contended—and he will have plenty of support in his contention—that the ideal cannot always be attained, and in that case they should be allowed to do the best possible under the circumstances. He also denied the contention of the Local Government Board that the modification of their demands necessarily meant insanitary dwellings, and bluntly asserted that those requirements practically vetoed the building of self-supporting houses. He argued, further, that as the Local Government Board insisted upon the repayment of the principal as well as the interest, an additional shilling a week, if not more, was thus placed upon the rent, and that it became a question whether the houses did not appear at the end of the thirty years to be the property of the working men

themselves, who were paying both principal and interest in their rent, and might naturally be expected to reap some ultimate benefit from so doing.

In short, Mr. MacBair charges the central authorities with obstructing a beneficent movement, and calls upon them to consider the special circumstances of localities, to demand the minimum and not the maximum of requirements, to make their rules less cast-iron, and not to insist in season and out of season with absolute compliance irrespective of local conditions. Mr. MacBair's arguments on the economic side of the question are strongly enforced by the concrete illustration in the case of Sunderland of the vexatious delays arising partly from procrastination and partly from rigid and unvarying requirements. Dr. Scurfield maintains that the local authority might safely be entrusted with the erection of workmen's dwellings under the Housing of the Working Classes Act, 1896, without having to submit every detail of the plans for the approval of the Local Government Board. The dissatisfaction is sufficiently great to make it desirable that the central authorities should seriously consider whether their requirements are not so great and so inflexibly insisted upon as to do more harm than good. Surely local considerations may be such as to justify, upon the report of a competent inspector after due inquiry, or after consideration of all the facts submitted by a local authority, an occasional modification of "model" requirements.

* * *

Municipal Work in Shoreditch.

The municipal reports and accounts of the borough of Shoreditch forms a portly and handsome volume of over 400 pages. It contains special reports from all the chief officials, including the surveyor, the lighting engineer and the chief electrical engineer. In municipal circles Shoreditch has for some time past been attracting no small share of attention on account of the combined scheme of electric lighting and dust destruction that is being carried out in the district, and the controversy that has arisen on the subject. At present, however, we have no intention of entering into the *pros* and *cons* of the matter, or of commenting on such figures or other details as are given in this volume. Mr. T. W. Baker has already criticised the figures, and we may have an early opportunity of dealing with the subject separately. In the meantime we may note one or two other points from the volume before us. The electricity station and the dust destructor are really part of a still larger combined scheme which consists in placing a remarkable collection of municipal institutions upon one site. During the year three of the main sections were completed, the electricity station, the dust destructor and the public library, leaving the baths and wash-houses and the technical institute, which will be completed in the ensuing year. The great event of importance last year was the opening of the combined works, which were duly blessed by Lord Kelvin. A scheme is also being carried out for the utilisation of the heat from the exhaust steam of the engines in the electricity station in heating the baths and wash-houses adjoining, and a contract for the necessary condensers, steam pipes and plant has been entered into, at a cost of £4,695. It is expected, according to the report of the town clerk, Dr. Mansfield Robinson, that this outlay will not only complete the economy of the electricity and dust destructor undertaking, but will save the Baths Committee a capital expenditure of £4,500 for boilers, which they would otherwise require, and an annual maintenance charge of £1,575 for fuel and the upkeep of boilers, while the condensation of the steam of the electricity engines is expected to be an advantage to their working, the scheme adopted costing nothing beyond the provision and upkeep of the condensers and the plant. From the resolution passed by the vestry

in March last it will be seen that superannuation for local government officials meets with scant favour in Shoreditch. That vestry is one of the few local authorities in the metropolis which have declared against the principle or petitioned against the Bill. In view of the conference on Monday next, and the fresh steps that are being taken to obtain the passing of the Bill, the resolution may be quoted here. It is to the following effect:—

That this vestry considers that the passing of the Poor Law Officers' Superannuation Act Amendment Act, 1896, was a gross injustice to the overburdened ratepayers, the great majority of whom are unprovided for in their old age, and hereby most emphatically condemns the Bill to amend the same so as to extend its provisions to the officers of vestries and other parochial bodies.

A petition against the Bill was duly presented to Parliament. It has been shown, however, that since the passing of the Act above referred to the amount obtained through the deduction of a percentage of salaries has far exceeded the amount which had to be paid away in allowances. So far, therefore, it has involved no "gross injustice to the overburdened ratepayers," and this argument, at all events, falls to the ground. The question, however, may be left in the meantime. In regard to the report of the surveyor, Mr. Rush Dixon, some of the more interesting facts and figures will appear among our abstracts of annual engineering records.

* * *

Municipalities and Rival Electric Companies.

The discussion which took place last week at the autumn general meeting of the Association of Municipal Corporations showed the unanimity that exists among corporations and their legal advisers as to the attitude that should be adopted in regard to the encroachments of private enterprise into districts which have been already exploited, as far as electric lighting is concerned, by the representatives and at the expense of the ratepayers. It is obvious that if Parliament were to grant power to the General Power Distributing Company or any similar enterprise it would not only seriously injure those undertakings, in which vast sums of money have been already embarked, but it would seriously cripple municipalities in their future operations. It is generally recognised that a municipality is well within its legitimate sphere of operations in undertaking to distribute electricity for lighting and power purposes. It is clear, therefore, that some protection ought to be given against the intrusion of a private enterprise, which first and foremost carries out its work for the purpose of obtaining profits for shareholders. If it could be pointed out that in any single instance a municipality had failed to do its duty to a consumer or to the ratepayers, then something might be urged in favour of an undertaking having joint powers in such a district, but it is beyond all dispute that corporations have in distributing electricity been able to supply at lower rates than those usually charged by private enterprise. To permit a great organisation, such as the General Power Distributing Company gives evidence of becoming, to enter a town and undersell a municipality would be to strike a vital blow at the security of capital, and in the interests of the community and, one may say, of the well-being of the nation indirectly, the protection that has hitherto been given to the investment of capital, whether in municipal undertakings or in private enterprise, should not be departed from at the present moment. Moreover, if such a policy were ever brought to a practical issue, it would be reversing the effect of previous legislation, which has granted large facilities to municipalities for carrying out works for the good of the ratepayers. It was evident in the discussion which took place last week that the association recognised the fact that the generation of electricity on a large scale,

such as is proposed by the distributing companies, would enable them to sell electricity in towns at probably lower rates than is at present being done. But the association was willing to admit that in those towns where electrical works have not yet been erected by municipalities that some arrangement might be arrived at between the corporation and the company. This is exactly the line on which we suggested that companies and municipalities should be able to carry on work together. A power distributing company might undertake to sell electricity in bulk to the municipality, and the whole of the distribution to consumers should be done by the local authority. It is probable that some such guarantee will be given when the Bill of the Power Distributing Company comes before Parliament next session for discussion.

Local Government Board Inquiries in 1897.

In our review of the annual report of the Local Government Board, last week, we referred in passing to the local inquiries that had been held by the engineering inspectors of the department named with regard to applications made to that department under the Local Government Acts of 1838 and 1894, and the Municipal Corporations Act, 1882. In view of the increased staff at the Local Government Board, it is interesting to note that, in addition to the inquiries mentioned, no fewer than 949 others were held. The majority of them had reference to applications from sanitary authorities for the sanction of the Board to the borrowing of money for the carrying out of works of a permanent character under the provisions of the Public Health Act, 1875, the Public Health (Interments) Act, 1879, the Public Libraries Acts, the Baths and Wash-Houses Act, the Allocations Act, 1887, the Electric Lighting Act, 1882, the Technical Instruction Act, 1889, the Housing of the Working Classes Act, 1890, the Public Health (London) Act, 1891, the Museums and Gymnasiums Act, 1891, the Highways and Bridges Act, 1891, the Private Streets Works Act, 1892, and local Acts. Fifty-five inquiries related to petitions for the issue of provisional orders under the Public Health Act, 1875, the Gas and Water Works Facilities Act, 1870, and the Housing of the Working Classes Act, 1890; ten to proposals to fix general rates for the compulsory supply of water under sec. 62 of the Public Health Act, 1875, and sec. 8 of the Public Health (Water) Act, 1878; nine to objections made to the construction by local authorities of works of sewerage, sewage disposal and water supply beyond the limits of their districts; and eight to applications for approval of schemes for providing accommodation for persons of the working class in lieu of houses demolished under the powers of local Acts. Among the subjects of other inquiries may be mentioned complaints under sec. 299 of the Public Health Act, 1875, of the default of sanitary authorities in the performance of their duty in the matter of sewerage and water supply, applications for urban powers, for the powers of the Public Health (Water) Act, 1875, for consent to take proceedings against manufacturers under the Rivers Pollution Prevention Act, 1876, and the Mersey and Irwell Joint Committee Act, 1892, for polluting streams by trade refuse, applications for approval of the constitution of special drainage districts, and for orders under Part II. of the Housing of the Working Classes Act, 1890, approving schemes for the reconstruction of insanitary areas.

Street Cleansing: Its Cost and Efficiency.

Another neat and well got-up volume is the report of the Hampstead Vestry for the year ended March 25, 1898. An abstract of the report of the surveyor, Mr. C. H. Lowe, will

appear in the usual course of our column of engineering records. In the meantime we may draw attention to some general remarks by Mr. Lowe on the subject of the cost and efficiency of street cleaning. He has something to say in regard to those fussy and irritable members of the public who are upset by every slight inconvenience, and who apparently think that the streets might be kept something like the deck of a liner. Mr. Lowe maintains that the work is now done regularly and systematically, and that the efficiency arrived at is as great as can be looked for while the existing means—men, money and appliances—remain as at present. Mr. Lowe points out that many of the suggestions made by those who write letters to the papers cannot be taken seriously; because, except at enormous cost, they are generally thoroughly impracticable. "All streets cannot be swept during the night, presenting a spic-and-span appearance to the parishioner as he leaves his house the first thing in the morning, nor can arrangements be made for a sprinkling machine to preease the men in dry weather to keep down the dust when the operation of sweeping goes on." Mr. Lowe also points out that comparisons with other parishes, boroughs or districts, are generally more or less worthless, as they do not take into account different sizes, situations, conditions and surroundings, and that municipal engineers are generally well-informed as to the many different plans followed throughout the country for the removal of objectionable matter from the streets. The point of the following remarks will at once be recognised by municipal engineers: "Surveyors exchange views freely, and seek and obtain information from each other on all points of importance, and it is certain that if there were an ideal in road-cleansing anywhere to be found which could readily be converted into the real and practical, it would soon become the common property of all concerned." But Mr. Lowe puts the whole thing in a nutshell when he says that it is chiefly a question of money, a fact which is generally lost sight of by ratepayers when they write to the papers, but is keenly remembered when they are invited to pay their rates.

Engineers and their Rewards.

Last week we had occasion to draw attention, in connection with the case of a certain urban district council, to the absurdly low terms that local authorities frequently offer as premiums in competitions. In the case in question the work required would probably have cost a competitor, on a moderate estimate, about three times as much as the amount of the first premium. That is bad enough, but the cutting process is being extended to the fees for work to be carried out. From a report of a district council to consider a scheme for the sewerage and sewage disposal of Bletchley, we observe that an engineer, who had been invited to submit proposals, had suggested a scheme estimated to cost £1,200. Questioned as to the fee expected, he is reported to have given the following somewhat remarkable reply: "I should be prepared, if engaged to get out the plans, to accept a fee approaching, say, 3 per cent. on the cost." The chairman generously ignored any distinction between a fee of 3 per cent. and one "approaching" 3 per cent. and by a strenuous mental effort arrived at the conclusion that the total fee would be £36. That sum the engineer agreed to accept, and, not to be outdone by the chairman in magnanimity, he preferred it to be a lump sum, as then, should the cost be more than his present estimate, it could not be said that he ran it up to draw the percentage." At all events he is to be congratulated on his professional scruple in regard to the district council, though scarcely in regard to his brother engineers. As we remarked in regard to premiums last week, the remedy lies practically with engineers themselves.

Principal Features of Electric Lighting Systems.—VII.*

THE OXFORD SYSTEM.

The principal features of the generation of electricity, both in the low-pressure continuous and the high-pressure alternating systems, have now been referred to. There is, however, another system to which reference may be made before discussing methods of distribution. It is that known as the Oxford system and involves the generation of direct currents at high potential and their transmission to sub-stations where motor transformers are employed. The motor transformer is a machine which practically reduces a high-voltage current to one of low voltage suitable for distribution to consumers. The machine is provided with an armature which has a double winding. It may be observed that an ordinary continuous-current machine has a single winding, and current is collected at the commutator bars and led off in the ordinary way. In the motor transformer, however, the armature carries a commutator at each end, to which the two distinctive windings are connected. A high-voltage current is brought to one set of brushes, which rub over the surface of the commutator, and at the other commutator a low-voltage current of 120 volts or 240 volts is obtained, in accordance with the requirements of the district. The advantages of this system are that it is possible to distribute electricity over a very wide area with a minimum expenditure of copper in the mains. The objections generally raised against the system are that it necessitates using high-voltage current at commutators, and this in the opinion of most electrical engineers, is a feature of some weakness. Certainly the distribution from the main power-house to the sub-stations, in which the motor transformers are placed, is by no means as simple as the distribution from power-houses to sub-stations, which is effected by high-pressure alternating current.

The most notable system on these lines is that at Oxford, which, though laid down some years ago, has continued to work until the present day without giving any trouble whatever. Moreover, considerable extensions have been carried out on a similar plan. There are three other towns in this country which employ a similar system, and in each case considerable success has been obtained with them. One of the last towns to adopt this system is Walsall, and it may be interesting to refer to the chief features of it. Walsall is a widely-scattered district, and it was considered that with the possibility of developing the use of electricity for motive power purposes, a high-pressure continuous with a sub-station distribution at low pressure, was the best system to adopt. The generating station is situated on the site of the old gasworks of the corporation, which some years ago were abandoned for the manufacture of gas, but subsequently proved an admirable site for a generating station. The building which contains the plant was really re-modelled from an old retort-house, and this building had a further advantage in being situated on the banks of a canal, from whence coal is easily shipped and ashes carried away. There is nothing unusual in the steam-raising plant which has been erected here. Lancashire boilers are employed. There are various mechanical details in connection with the steam pipes which are worthy of some note: the ring system of steam mains is employed, by which it is possible to completely isolate any steam plant that is necessary. The pipes in the engine-room are carried on pillars, but where they pass through the walls, and, indeed, on the pillars, iron rollers are employed, which permit of considerable movement at the time of expansion. The exhaust steam pipes are laid in underground pipes, and are led to the exhaust feeder, and afterwards they exhaust to the atmosphere.

The generating plant consists of compound engines, which work at a steam pressure of 125 lb. per square inch, directly coupled to generators, capable of giving an output of 40 amperes at 2,000 volts when running at a speed of 350 revolutions per minute. These are excited by means of small shunt-wound machines, which are driven by similar engines to those driving the large generators, and give a current of 60 amperes at 100 volts. The most interesting feature in the generating station, however, is the method of switching and operating the generators. In the system laid down some time previously at Oxford the sub-stations which contained the motor transformers were usually in charge of an attendant, who switched on the sub-station machines as required. In the case of Walsall, however, an attempt has been made to dispense with the services of an attendant at each sub-station, and automatic means were adopted by which it was possible for the switchboard attendant at the main power-house to start any of the machines in the various sub-stations. This has probably involved some complication in the switching devices and in the mains, but, as far as we know, the system has been worked with very little trouble. The main switchboard is divided, as is customary, into various sections or panels. There is a panel for each generator, which is fitted with the usual ammeter and an automatic cut-out, main switch, regulating devices, and sundry other apparatus. Other panels are devoted exclusively to the feeders, which are the mains connecting the main generating station with the sub-stations. These are provided with the usual measuring instruments, cut-outs and main switches, and other apparatus, to which we will now refer.

It will be seen from the reference we have made to the exciting plant that it is necessary to excite the large generators, that is, pass a current of electricity through the windings when starting them up. This excitation current is obtained from the small generators, or, if necessary, a storage battery can be utilised. The generators are run in parallel, and feed on to what is known as the main omnibus bar of the switchboard; to this bar all the feeders are connected, and through these the main supply of the station passes out to the sub-stations placed in different parts of the town. In order, however, to provide a supply of electricity to the consumers it is necessary to start up the transformers at the sub-stations, because it must be understood that the main station itself does not supply direct to the houses. To start the transformer, therefore, at one of the distant points the main switch on the feeder board is put on. The operation of this switch is a gradual one. First of all a resistance is placed in series with the high-tension side of the armature at the distant station and the series winding on the magnets of the transformer; by the aid of this resistance a small current will pass through the feeders which starts up the transformer. As it is brought up to the requisite speed the secondary winding of the armature becomes energised, and this current circulates through a special automatic switch, which has the effect of cutting out the series winding already referred to, leaving the shunt only to energise the magnets. The process of this operation can be watched very closely by the switchboard attendant at the main station. Then there comes into operation at the sub-station a long-range switch, which has the effect of connecting the secondary winding of the transformers to the distributing network, which is directly connected to the consumers' premises. A motor transformer is taken out of action by a process which is the reverse of that already referred to.

Perhaps, however, the matter will be a little clearer if we describe the contents of one of the sub-stations. In each sub-station there is a main transformer giving an output at the secondary terminals, or that portion of the machine which feeds direct in the low-pressure main, of 400 amperes at 105 volts. This, however, only occurs when a primary current of 1,950 volts is supplied through the primary terminals. The field magnets have two windings, one being in series with a primary high-tension armature or winding, and the other has a shunt across the low-tension armature. A long range switch is provided with each of the transformers, its purpose being to close the secondary circuit from the transformer to the network, it being operated from the central station. Combined with this switch is what is known as an automatic magnetic cut-out, which breaks the circuit in the event of too great a current being demanded, or in the event of a transformer for any reason failing to give its proper voltage, preventing current coming back from the network. That is not the only plant, however, which is provided at the main sub-stations, for here are arranged batteries of accumulators; and for the purpose of charging these there is provided what is known as a battery-charging transformer, which takes its primary current at 105 volts from the distributing network, giving an output at the secondary of 300 amperes at 35 volts. The network of distributing mains is very much on the usual lines, it is entirely fed from the transformers and sub-stations as well as from the main battery. The concentric type of mains are employed, and these are drawn into cast-iron pipes. The distribution is carried out on the two-wire system, the mains being single conductor lead sheathed and steel armoured. The system has now been in operation for over two years, and although the cost of production has not been very low, the system has done moderately well.

It cannot be denied, however, that this method of generation and distribution apparently possesses more complications than commend themselves to the electrical engineer as a rule, and, although it is possible by the aid of unremitting care and skill on the part of the engineer in charge to keep such a system in a perfect state, it is questionable whether there will be much extension on this plan. Moreover, it must be pointed out that the Oxford system was adopted at a time when direct-current stations were not permitted to supply electricity to houses at a greater voltage than 120. Since the introduction of 220 volts to houses the applications of the Oxford system have naturally become limited.

The next two or three articles will deal especially with combined stations for lighting and tramways, the distributing portion of electric lighting; and remarks will be made on the commercial aspects of electricity supply, with special reference to the methods adopted for charging consumers.

Dundee.—A central fire brigade station is about to be built in Ward-road and Conthons square, from plans by Mr. Mackison, the brigade engineer. The building will be five storeys in height, with a tower, capped with a domical roof, at the angle of the streets. The estimated cost is £6,150.

* The last article of this series appeared in our issue of October 14th.

The Sanitary Institute.

THE SEVENTEENTH ANNUAL CONGRESS.—V.

In continuing our report of the proceedings at the recent congress we give another instalment of the important papers read on the subject of the treatment and disposal of sewage. The following is the conclusion of the paper by Drs. Kenwood and Butler, read in the Physics, Chemistry and Biology section:—

THE NATURAL PURIFICATION OF SEWAGE

(concluded).

THE VALUE OF SECONDARY FILTERS.

It must be remembered, in speaking of the work of a filter, that it is not always manifest in the terms of a chemical analysis. Changes which can only be expressed in terms of stability and resistance are repeatedly made manifest. Thus, to take an illustration, the albuminoid ammonia figure of the effluent of No. 2 filter on June 23rd was 0.40. After an hour's rest in No. 3 it was reduced to 0.16, or 60 per cent. No. 2 in this instance had been charged with the effluent from No. 1 after the sewage had rested twenty-four hours in the anaerobic filter. Neither the twenty-four hours' rest in No. 1 nor the hour's rest in No. 2 had effected a satisfactory reduction in the albuminoid ammonia, but their combined action had doubtless so shaken the stability of the organic matter, which was expressed in terms of albuminoid ammonia, that in its passage through No. 3 filter it was reduced by 60 per cent. The example is one of many that were noted, and is taken as first to hand to illustrate the importance of multiple filters in completing a purifying process, the initial stages of which may not be disclosed in the ordinary form of an analysis. We satisfied ourselves by many experiments that by the use of secondary filters a much greater degree of purification can be obtained in a shorter time than by means of single filters.

A filter, like a living organism, not only ingests but excretes, and we have found it a useful working hypothesis to look upon each filter as possessing a state of equilibrium which affects its powers of absorption and excretion. The important point about this equilibrium of a filter worked regularly is that it tends to adjust itself to an average of the pollution of the intake. Thus the equilibrium of No. 1 differs from that of No. 2, and that of No. 2 from that of No. 3, the affluent of each, of course, having a pollution figure higher or lower than that of the other. It is for this reason that the necessity for multiple filters appears so great where strong sewages have to be dealt with. A filter will effect only a given percentage reduction on the pollution of its affluent when it has reached its maximum biological efficiency. If the pollution is high, and if we represent the purification which can be effected by the filter as 50 per cent., the effluent will still be a filthy liquid, and another 50 per cent. of reduction in another filter will leave 25 per cent. of the original pollution still to be disposed of.

The fact that the effluent which is first drawn off from an aerobic filter is relatively so much worse than that which comes away at a later stage, and that the filter may suddenly and inaccountably become overtaxed are further arguments for always making arrangements for passing the effluent through more than one aerobic filter. If a filter has rested the state of equilibrium should have been approached, and therefore its capacity for absorption should be greater—i.e., the percentage reduction should exceed the mean. On the other hand, if the effluent exceeds the mean two things occur: First, to attain to its habitual equilibrium the filter should absorb less per cent., and thus give a smaller percentage reduction; secondly, its state of equilibrium being determined by this as by other effluents, the equilibrium figure is raised and the percentage reduction increased in obedience to this new demand. These facts are supported by a study of the figures of our experiments.

The facts which we ascertained with reference to ammonia elimination into the atmosphere appear to show—first that where no material nitrification goes on in a filter the nitrogen equilibrium is established by elimination of free ammonia. It was while the filters were rested that the most striking differences were observed. The nitrifying filter gave off no free ammonia at rest; the non-nitrifying filter, on the other hand, gave off during the first twenty-four hours of rest ammonia—a mean of 0.39 milligram per square foot per hour. During the next twenty-four hours the ammonia eliminated was 1.8 milligram per square foot per hour, the mean for the succeeding forty-eight hours being only 0.06. The most active period of elimination is probably coincident with that of the most active reduction of the stored albuminoid ammonia to the free state, and the later stage of very low elimination with the attainment of the condition of nitrogen equilibrium. If this be so, we have a convenient means of discovering the period of rest required by a filter which has been overtaxed. It is only necessary to make daily estimations of the ammonia eliminated, and when the active elimination has ceased we should know that the filter had attained its equilibrium and was again ready for work.

The same tendency to equilibrium has been noted in the

estimation of the total and volatile solids, and to favour this equilibrium solids may be sometimes taken up from the filter and at others deposited in it; that something more than a mere straining of suspended mineral matter occurs, and that often an actual precipitation of dissolved solids takes place has been shown by the fact that often the reduction of non-volatile solids by rest in a comparatively coarse filter has been far in excess of anything we have been able to effect by filtering through a double thickness of fine filtering paper.

It has been repeatedly observed that the first rush of filtrate after opening the exit valve of a filter is associated with the escape of a large amount of suspended matter, some of which is of an organic character. Before the coke-breeze was placed in the model at University College it was very carefully washed in small quantities, yet when we removed it was found to be charged, even in No. 3 filter, with large quantities of fine particles of organic matter. This fact is suggestive, and points to the conclusion that, however the filter may be constructed as to material and size of the filtering medium, organic matter tends to collect in the filter, and is liable to be washed out from its lower zones when the rate of outflow is rapid. We found that by constructing our filters with a stratum of sharp sand at the bottom we were able to obviate this difficulty.

Our lowest albuminoid ammonia figures were got with the longest rest in our secondary filters. The point always to be borne in mind is that what has to take place is not merely the reduction of unstable matter to the ultimate stable condition, but the reduction of the more stable organic matter to the unstable. The reduction of the unstable to the stable or ultimate appears to be best effected by change of filters, that of stable to unstable by rest in a filter. High albuminoid ammonia, then, is an index for rest in a filter, high oxygen absorbed an index for passing to another filter under conditions permitting of good oxygenation.

GAS ABSORPTION BY SEWAGE.

A stoppered flask, containing about 200 c.c. of sewage, was placed under anaerobic conditions by replacing its superincumbent atmospheric air with hydrogen gas. Anticipating from what we had observed in our No. 1 tank, and from what is known to occur in Cameron's tank—a large evolution of gas from the sewage—provision was made for the escape of such gases. The flask was hermetically sealed by an india-rubber stopper, perforated so as to admit a piece of glass tubing, which, opening at one end into the superincumbent gas in the flask, was sealed at the other by dipping into a cylinder of mercury. On examining the flask next day the mercury had risen in the tube and stood over an inch above that in the cylinder.

This could not be accounted for by any change in the atmospheric temperature and pressure, and was manifestly due to diminished pressure in the flask from absorption of the hydrogen gas. Flasks containing atmospheric air, coal gas and nitrogen were placed under similar conditions, with the invariable result that the mercury rose in the tube, until in some cases it was sucked right over into the flasks. These gases are used by the micro-organisms in their life processes, and doubtless we have here one of Nature's provisions for maintaining the earth's supply of fixed nitrogen, although perhaps not so active a process as that suggested by Sir William Crookes for the salvation of the wheat consumer of the twentieth century. The absorption was most rapid in respect of atmospheric air, and fresh sewage seemed greedy for air; and if it could not get atmospheric air it took whatever came to hand.

After some weeks the mercury sinks in the tube, with the formation of black sulphide on the surface exposed to the flask atmosphere; but never in the flasks kept in the light, even for a period of many weeks, does it sink to its original level. Gas absorption was found to go on in fresh sewage in the dark and in the light, but more slowly in the dark. It was observed to occur in sewage kept at rest and in sewage kept in motion by slow continuous flow through a flask where a limited quantity of air or gas was exposed to it. Under such conditions it was found to absorb every particle of the available gas imprisoned in the flask, and that in the case of fresh sewage in a very short time. As the sewage got older less gas was absorbed, and there came a time, in the case of sewage kept in the dark, when gas was given off in considerable quantities. A quantity of this gas was allowed to collect in a flask, through which the sewage slowly flowed, and this gas was exposed to the action of fresh sewage, which very quickly absorbed it. Light, temperature and the age and amount of sludge in the sewage appeared to be the determining factors of gas production and absorption. To what extent each of these factors played a part was not determined, but it may safely be said that light and freshness seemed to favour gas absorption; darkness and age, gas production.

THE SEPTIC TANK.

Sewage kept out of contact with atmospheric air in the dark and at rest, so as to deposit its sludge—these are the

conditions under which the microbes work in the septic tank, and by reproducing these conditions on a small scale one is able to make sure that the same sewage is being dealt with. In comparing sewage kept under such conditions in bulk, as in the septic tank with sewage kept in the dark under similar conditions in a filter constantly sewage-logged, our investigations point decidedly in favour of the filter. As stated, the effect of the sewage resting in our No. 1 filter-bed was distinctly and progressively to reduce the colour, opacity and odour; sewage kept in the dark in a closed receptacle, on the other hand, showed a marked and to a time progressive increase in colour and less reduction of opacity. As we have seen, the albuminoid ammonia is reduced very considerably both for the hour and for the twenty-four hours' period of rest in No. 1, but in fresh sewage kept in the dark in a closed vessel the albuminoid ammonia remains the same or is very little reduced after twenty-four hours' rest under these conditions, although the free ammonia goes up. Thus a fresh sewage was found to have free ammonia 11.0, albuminoid 0.92, ammonia and oxygen absorbed in two hours 6.8. After twenty-four hours' rest in the dark the free ammonia was 13.05, albuminoid ammonia, 0.9, and oxygen absorbed 7.08. It would appear from this that the same changes which appear to occur in our No. 1 bed take place under these circumstances much more slowly and with less tendency to continuously progressive purification.

In order to satisfy ourselves upon this point, two separate quantities of fresh sewage were hermetically sealed and kept in the dark for several days. The following are the mean of the analytical results in parts per 100,000:—

	Free and Saline N H ₃	Albuminoid N H ₃
Fresh sewage after sedimentation)	6.0	0.69
Same sewage after 24 hours)	7.0	0.64
48 " " " " " " " " " "	8.5	0.68
72 " " " " " " " " " "	8.2	0.61
96 " " " " " " " " " "	9.5	0.44
144 " " " " " " " " " "	10.4	0.47
168 " " " " " " " " " "	9.8	0.46
192 " " " " " " " " " "	10.0	0.45
216 " " " " " " " " " "	10.5	0.46
240 " " " " " " " " " "	10.5	0.51

It appears to us, then, that upward filtration offers a better prospect of effecting the separation and solution of the suspended matters of sewage, and at the same time of reducing the pollution of the effluent, than does any system which aims at their removal by digestion in a hollow chamber such as the septic tank. The particles of filtering material seem to form a large area, from which organisms can more effectively work. A filter more completely reproduces the conditions under which the purification of polluted water is effected in Nature where anything analogous to a septic tank is unknown.

What are the results claimed for the septic tank? According to Dibdin, the oxidisable organic matter was reduced 30.8 per cent., the albuminoid ammonia 17.5 per cent., whereas in his coarse bacterial filter at Sutton the oxidisable organic matter in four hours was reduced 68 per cent., and the albuminoid ammonia 58.4 per cent. According to Moor, the albuminoid ammonia is reduced 36.4 per cent. and the oxidisable organic matter 67.4 per cent. Our No. 1 filter, however, effects a reduction in the oxygen absorbed amounting to 40 per cent., and in the albuminoid ammonia amounting to 37 per cent., if the sewage rests in it but one hour. There is not much reason to doubt, therefore, that a bacterial filter is better than a tank, and doubtless analytical results would show a greater difference between the two processes if the sewage experimented with conformed more to the standard of the sewage employed in our experiments. The Exeter sewage experimented with is very exceptionally weak. The total solids of all those analyses which we have seen furnish a mean of under 60, and the volatile solids of under 20 parts per 100,000; nitrates are sometimes present in it, the chlorine is about 6, and the free and albuminoid ammonia 1.4 and 0.17 respectively.

METHODS OF ANALYSIS AND STANDARDS.

Our experiments show that the value of the figures of the oxygen absorbed in four hours is not as great as many maintain; it is only an expression of that which is in a condition to be immediately oxidised, and takes no account of the pollution which has not reached that stage, and which may be far in excess of that which has. We found that both in sewage samples and in sewage effluents permanganate is reduced by them at a temperature of 80 deg. Fahr, even when stopped bottles scarcely larger than the bulk of the fluid placed within them are employed, in such variable and irregular quantities hour by hour up to and beyond twenty-four hours that it was impossible to fix upon a period of time when it might be held that the oxygen absorbed formed a fairly approximate proportion to the entire amount of oxidisable organic matter in the liquid. Much time was spent in trying to work out this subject, but our results do not warrant more than this statement.

The presence of putrescible matter as indicated by a high figure of oxygen absorbed in two hours may denote merely that a large proportion of the dissolved impurity has been reduced to that transitional phase which immediately precedes purification of an ultimate character. In other words,

the oxygen absorbed figure is often more a measure of purification or of a stage of purification than it is a term of pollution. Nitrates are a measure not of that pollution which may be oxidised, but of that which has been oxidised, and their presence gives no indication of what remains to be purified. Nor is their presence inconsistent with profound pollution, even of a sewage effluent. If high nitrates are a good sign, then free ammonia cannot be considered a bad one, for the only value of the nitrates depends upon their power of yielding nascent oxygen for the oxidation of residual pollution in the effluent, and this very action necessitates an increase of free ammonia by the reduction of the nitrates.

The presence of nitrates in an effluent must not therefore be regarded as in any sense an index of purification. With breeze and clinker we invariably got nitrates, with fine filtering material, such as coal dust or granite chips, they soon disappeared completely, and yet these effluents repeatedly showed higher standards of purification than many in which nitrates were present in abundance; the explanation being that there was a further burning up of residual organic matter at the expense of the oxygen of a nitrate. Abundant nitrates were found in stinking effluents which looked and acted like fermenting sewage, where the free ammonia exceeded 5 parts, and the organic ammonia 1.4, where the oxygen absorbed in two hours exceeded 4 and the volatile solids amounted to 75 parts per 100,000. On the other hand, we have had effluents where the albuminoid ammonia was 0.1 and the oxygen absorbed was 0.23, where no nitrates were present; and we have found nitrates in the effluent from one filter to disappear when the same effluent was collected and passed through another filter in which it had undergone a further stage of purification. The presence of nitrates appears to be very much a question of the calibre of the filtering material as affecting the aeration of the filter. If the material is coarse, nitrates will be found even in offensive effluents, if it is fine they may be absent from an exceedingly pure effluent. The presence of nitrates is no more an indication of active bacteriolysis than is the presence of free ammonia, since both are the products of biological action, and can be produced at will by modifying the conditions of filtration. It is interesting to note in this connection that in a filter constructed of granite chips, where practically no nitrification occurred, the filter gave off free ammonia far in excess of a filter constructed of coarse breeze, where nitrification was very active.

The evidence of purification, as afforded by good physical characters, is added to by oxidised nitrogen only if the organic nitrogen is low; and standards should not be based upon estimations of the amount of oxygen required to partially purify and the amount available in combination with nitrogen for the reduction of residual pollution, but rather on an estimation which finds expression in neither of these figures—viz., that of the total organic nitrogen in the effluent. The albuminoid ammonia figure is a fair indication of the organic pollution, but the organic nitrogen as estimated on Kjeldahl's principle is a much more inclusive estimation than the albuminoid ammonia, and it is almost as easily arrived at. Although it will be found that the organic nitrogen of Kjeldahl's process averages a little over twice the nitrogen of the albuminoid ammonia, though sometimes showing marked differences from the average, the fact that the two analytical figures do not bear a constant ratio to one another is significant and points to the adoption of the more inclusive estimation. The process as we employed it was as follows: 25 c.c. of effluent was made up to 500 c.c. with ammonia free distilled water, a little pure sodium carbonate was added, and then by means of a condenser the free and saline ammonia was distilled over and estimated. What remained behind in the boiling flask, generally 250 c.c., was allowed to cool and then 10 c.c. of pure concentrated sulphuric acid was added. All the water was next boiled off in the fume cupboard, the flask being supported on the slant. When nothing but a very pale yellow coloured acid remained this was allowed to cool, 200 c.c. of ammonia free water were added, and the acid was neutralised by sodic hydrate solution. The flask was then connected with the condenser, and the organic nitrogen was calculated from the total ammonia which came over in the distillate.

Experiments have convinced us that a standard for effluents having a low limit of organic nitrogen is to be preferred to any standard of oxygen absorbed, or of oxidised nitrogen, or to any figure of percentage purification on the original sewage, or to any ratio between the oxidised nitrogen and the oxygen taken from permanganate in a limited period of a few hours. It has been suggested that a standard of loss on ignition of the total solids should be established; but will any two chemists precisely agree upon the exact extent of such loss? It would, besides, be unfair to compare on such a basis the effluent with the original sewage. Such a comparison would indicate too small a degree of purification on account of the greater quantity of oxidised nitrogen and carbon in the effluent.

Again, the practice of calculating to a uniform standard of chlorine is misleading. Thus a raw sewage with 0.74 albuminoid ammonia and 6 of chlorine is treated on Cameron's method, and a sample of effluent yielded by the process gave albuminoid ammonia 0.11, chlorine 4.5. The percentage reduction of the albuminoid ammonia is 85 per cent., and this reduced to a common chlorine standard shows a purification of 80 per cent. It is thus admitted that the effluent is not

the effluent of the sample of sewage analysed, as judged by the chlorine, but that if the sewage which produced this effluent had been as strong as the sewage analysed the purification would have been 5 per cent. less. It is difficult to see on what grounds such an assumption can be based.

The fact is that no general standard applicable to all cases is possible or desirable. The best possible results must always be arrived at, and should be insisted upon with due regard to the nature of the sewage and to the conditions, volume and uses of the stream which is ultimately to receive it. The maximum impurity permissible will in certain cases be very slight indeed, in others a greater latitude may be conceded. It appears to us that what is most wanted is an uniform method of procedure in the taking of samples and in the performance of the analysis; as matters stand at present it is difficult to know what interpretation to place upon the results of different analysts' for any reason an attempt is made to compare their figures.

In the same section the following paper was read by Dr. Samuel Rideal, D.Sc., F.R.C.S.:

QUALITY OF SEWAGE AS INFLUENCING ITS MODE OF DISPOSAL.

Sewage may contain varying quantities of:—

(a) *Excretory substances.*

(1) **Solid Faeces.**—These consist of nitrogenous partially-digested matter, together with vegetable non-nitrogenous residues of the food. The former are easily liquefied, but the latter are slow in dissolving, being gradually attacked, chiefly by anaerobic bacteria, and broken down into soluble compounds of fetid odour and into black amorphous flocculi, which slowly deposit as black sludge.

(2) **Urine.**—The main source of ammonia, from fermentation of the urea, the proportion of urine being approximately indicated by the content of chlorine in excess of the content of chlorine in the water supply of the town.

(b) **Household waste.**—The larger solid substances pass to the ash-pits, but the drainings of these and their washings by

storm overflows in a sewage farm scheme the ground is liable to become waterlogged, and in a filtration process the excess of water by its volume and velocity tends to derange the purification plant, hence it is usually allowed to escape from the sewers by special outlets when above a certain amount, carrying with it a mixture of the unpurified sewage. The combined system also involves the construction and maintenance of sewers very much larger than the volume of the regular flow, in order to provide for occasional contingencies. This greater capacity presents inducements to the disposal of grosser refuse which would not be tolerated in a smaller sewer, and often it is impossible, except at rare intervals, to properly flush the entire surface of these large channels.

The "separate system," in which the sewage proper is kept apart from rainfall and storm water, has conduits of such size only as to preclude the possibility of the sewage becoming stagnant therein, the size being governed by the bore of the water main, since if a given diameter of pipe supplies all the water needed, a little above the same diameter is sufficient as an exit. Storm water passing rapidly off the land carries with it disease germs, as is shown by the repeated occurrence of epidemics when a sudden storm succeeds a period of drought. But the liquid is ordinarily supplied with abundance of the liquefying and oxidising bacteria, which if it be allowed to subside in auxiliary reservoirs will effect its purification rapidly, aided by the oxygen derived from the air, and by the nitrites and nitrates that rain water always contains. The sand, chalk, or especially the clay, may be a long time in subsiding, but when deposited will leave the water comparatively pure, and fit for flushing sewers, watering roads or for supplying the deficiency in rivers during dry seasons. Whatever system be adopted, the raw storm water of populous districts should never be allowed to pass in large volumes directly into a stream.

I may give, from my own analyses, an example of the influence both of the time of day and the rainfall on a strong sewage from one source.

Table showing Influence of Rain on Quality of Sewage. Parts per 100,000.

Time and Circumstances.	Flow in gallons per twenty-four hours.	Solids in Solution.	Cl.	O consumed.	Free NH ₃ .	Alb. NH ₃ .	Nitric N.	Nitrous N.
<i>Dry Weather, no Rain</i>								
10 a.m. to 5 p.m.	—	77.5	12.25	7.23	8.0	1.5	None	None
6 p.m. to 1 a.m.	54,000	45.0	6.25	6.91	2.90	0.6	"	"
2 a.m. to 9 a.m.	—	34.0	4.25	5.57	0.90	0.35	"	"
Total chlorine—41 lb. per day.								
<i>Heavy Storm.</i>								
10 a.m. to 5 p.m.	—	54.4	7.75	3.58	11.5	4.12	.056	None
6 p.m. to 1 a.m.	—	45.6	5.25	2.66	3.5	1.75	.014	Trace
2 a.m. to 9 a.m.	79,000	31.4	3.75	0.74	4.5	5.5	Trace	Very heavy
Total chlorine—44 lb. per day.								

Physical Characters.—Dry weather: Thick and fetid, fragments of paper and lumps of faecal matter abundant.
 Heavy storm: Turbid, yellow-brown, earthy odour.

rain, if they are uncovered, are received into the sewers, together with liquid food residues discharged down sinks. Vegetable refuse yields a liquid which is very foul and fermenting, developing butyric odours and sulphuretted hydrogen. Fragments of animal food putrefy and furnish a product allied to that from faeces. Diluting these is a fluctuating amount of soap water, varying at different days and times. Its advent is often conspicuous in sewages of small volume, through the white opalescence of the effluent, the alkalinity and odour—the latter occasionally indicating soaps or disinfectants. Household discharges other than urine may also temporarily raise the amount of chlorine.

- (c) *Rain and storm water.*
- (d) *Grit and detritus.*
- (e) *Manufacturing waste products.*

Rainfall and Storm Water.—Although, according to Baldwin Latham, a rainfall of 0.1 in. to 0.2 in. in an hour increases the outflow of a sewer to five or more times its volume, there is, as Santo Crimp found in gangways at Wimbledon, no exact relation between the rainfall as ordinarily recorded and the increment of flow at the outlet. The size, length and inclination of the sewer also clearly influence the result. At Exeter five-eighths of the ordinary rainfall is estimated to find its way into the sewers.

Both the quality of sewage and its quantity as affected by local circumstances therefore determine the choice of a system of sewerage. Under the "combined system" the effect of rain must not be considered as simple dilution, since the rain water carries the washings of the surfaces over which it has travelled. Where the rock or a clay bed is near the surface the showers will run off almost unchanged. From manured or peaty land there will be an addition of brown humous liquids, which are particularly difficult to decolorise. In towns the street drainage, even after prolonged rain, is mixed with complex dust, abraded clothing and wood, castings and emanations of man and animals, and particles of soot, iron, earth and stone, and is usually worse in character, especially from wood pavements, than an average sewage. Samples taken during rain have contained 18 to 38 parts per 100,000 of chlorine, 2 to 3 of albuminoid ammonia in solution, and as much as 80 to 120 of organic solids, suspended and dissolved.

For the safety of the sewers and the avoidance of flooding of basements, it is necessary under the combined system to construct special arrangements for storm overflow. Without

In the morning urine is prominent, as shown by the chlorine and by other signs; later on soapy water makes its appearance, with a white scum of fatty lime salts that tends to clog filters and leave a grossy deposit on channels; fixed alkalinity also appears, with an increase in the sodium salts; subsequently the sulphuretted odour of vegetable washings is evident, and the liquid may even become temporarily acid. The road detritus and heavier matters are usually caught in a grit chamber, while paper, string, and animal and vegetable fragments are commonly carried forward with the mixture, which rapidly becomes black, alkaline and putrescent.

FILTRATION OF CRUDE SEWAGE.

Crude sewage passed direct on to a filter-bed will usually cause fouling of the upper layers and an obstruction to the entrance of oxygen, so that the surface requires scraping and renewal with a frequency proportional to the amount and character of the solids. The following analyses show the alteration occasioned by mere mechanical straining or filtration. They are averages of thirteen hourly samples, from 6 a.m. to 6 p.m., taken from different sewers of a large town on the water-closet system in 1897.

Table showing Variation in Quality of Sewage in different Sewers of the same town.

Parts per 100,000.	Organic N.	Solids.	Cl.	Free NH ₃ .	Alb. NH ₃ .	O consumed.	Nitric N.	Nitrous N.

These examples show that the suspended solids contain about one-third of the organic nitrogen and half the carbonaceous matter of the sewage. It is easily seen that in systems where they are removed by sedimentation or by filter-presses a "sludge" will be produced which is highly putrescent and difficult of disposal, and of less manurial value than the matter left in solution. If sent on to land, the surface will be matted and clogged with an unhealthy deposit unless the soil is sandy or otherwise porous, as in the neighbourhood of Berlin, and, in addition, possesses other characters favourable to nitrification, such as the presence of lime, &c., as I pointed out in my paper at the Sanitary Institute in December, 1896 ("Joarn. San. Inst.," Vol. 18, Part 1.). Such land is frequently impossible of attainment near large towns, as is notably the case in the lower Mersey valley, where difficulties are still at an acute stage; moreover, it would be expensive, on account of its value for ordinary agriculture.

Septic systems like those of Cameron and Scott-Moncrieff submit the entire sewage, with only the deposition of grit, to the liquefying action of anaerobic bacteria, in an air-free dark space, with the result that the solids are dissolved to simpler organic compounds, with the final production of carbonic acid, ammonia and volatile gases, which are easily dealt with. Notwithstanding the fact that the experimental tank at Exeter has never been cleaned out, many people still cannot believe that paper, string, rag, feathers, &c., are dissolved. But it is undoubted that these substances do disappear, since only an amorphous peat-like residue is found. Brown and Morris have isolated a ferment, called "cystase," produced by fungi, which quickly dissolves celluloses ("Trans. Chem. Soc.," 1890, 497-503).

Van Tieghem describes several bacteria, especially *B. amylobacter*, which possess this hydrolysing power. ("Zeit. phys. Chem.," VI, 287, and De Bary's lectures; also J. G. Green, "Phil. Trans.," 1887, clxxviii., 57, Marshall Ward, "Annals of Botany," II, 319, 1888, and Reintzer, "Zeit. phys. Chem.," xxiii., 175-208, 1897). *B. amylobacter* is always found in putrefying infusions; it hydrolyses sugars, starches and cellulose, giving butyric acid and hydrogen, and is strongly anaerobic. In my own experiments I have found that the deposit from the effluent of a septic tank is capable of dissolving paper and cotton wool with evolution of gas. The putrefactive germs, as Sims Woodhead observes in a report on the Scott-Moncrieff septic process at Fowceter, "have nothing to do with the production of disease under natural conditions; in fact, the addition of large quantities of putrefactive germs interferes with the action of or destroys entirely many disease-producing germs."

In both of these septic systems the tank effluent contains dissolved in simpler forms all the solids and liquids which were present in the raw sewage, minus the considerable proportion that has disappeared by being converted into carbonic acid, marsh gas, hydrogen and nitrogen. I estimated that in the Exeter septic tank of 50,000 gallons about 12 lb. to 15 lb. of organic carbon (corresponding to 2 parts to 3 parts per 100,000) are completely oxidised each day to carbonic acid and removed in solution as the tank effluent, in addition to the gases evolved in the tank, which are considerable.

In the Dibdin or Sutton process, in which the sewage is pumped on to beds of coarse burnt ballast 4 ft. in depth, allowed to stand for two hours, and then discharged, and the bed allowed to remain "full of air" for five to seven hours, the object aimed at is aerobic, but the primary process is still a septic one. I have shown that in the Exeter filters a large volume of CO₂ and N₂ was given off in the filters, and as a number of the liquefying bacteria are facultatively aerobic, I am of the opinion, as expressed in my Sanitary Institute paper, that since the breaking down of the necessary presence of oxygen, it is better to carry out the preliminary liquefaction in a closed space than in an open bed. I believe, further, that the "resting full" period necessary in the Exeter filter and the Sutton beds is only necessary because the anaerobic change is not completed before. Nitrification is simply the conversion of ammonia into nitric acid in presence of air, and it should therefore be the object of all systems to get the organic matter of sewage entirely resolved into ammonia before the final oxidation upon the filter-bed.

Where, then, a concentrated sewage with a large proportion of coarse organic solids is to be dealt with, a septic system is indicated for the initial treatment, as requiring no previous screening nor settling basins, no large acreage of land, and as effectually settling the difficulty of sludge. Although faeces contain considerably less organic soluble matter than urine, yet, owing to the fact that they are composed to a large extent of cellulose and other materials not readily broken down in the alimentary canal during the short period they remain there, they will always, in common with vegetable matters, peelings, stalks, paper, rags, &c., occasion great difficulties in any system of treatment except a septic tank or roughing filter, in which, as we have seen, they are easily broken down by the bacteria. One strong reason for dissolving the solids is the deposit they form on the banks and in the slower parts of the streams. The Exeter tank has shown that ballast or stones are not necessary in the first part of the process, whilst upward roughing filters still commend themselves to others. This will be the case whether the sewage proceeds from midden or from water-closet towns. The average figures for these, as given by the Rivers Pollution Commissioners, show no very conspicuous difference in composition, while in earth-closet localities a similar uniformity was observed (Frankland).

It seems as if the inclusion of solid excreta was balanced by the water used for their carriage, and that in midden towns much of the chlorine of urine soaks into the earth.

Parts per 100,000.

	Solids.					Suspended Matter.		
	Solids.	Cl.	Org. C.	Org. N.	NH ₃	Total Combined N.	Mineral	Total.
Midden towns	82.4	11.54	4.18	2.97	5.43	6.45	17.8	21.3
Water-closet towns	72.2	10.66	4.70	2.20	6.70	7.73	24.2	20.5

Back-to-hack houses, where such an arrangement is still tolerated, by decreasing the influx of flush water give increased concentration to the sewage. Although the temperature of large sewers does not vary much, a hot and dry season usually causes a greater foulness and a more rapid putrefaction. Other circumstances that modify the quality or volume of the sewage are the size of the flush in water-closets and the number of public urinals. The behaviour of urine alone is somewhat different from that of mixed sewage, and will be further considered.

MANUFACTURING WASTE PRODUCTS.

In the case of manufacturing towns it was at first thought that the large amount of effluent which reaches the sewers dark from dyes, impregnated with special foul odours, or unduly acid or alkaline from chemicals, would be inimical to bacterial purification. The Local Government Board has, however, of late declined to sanction schemes for the drainage and sewage disposal of districts unless the manufacturers submitted their effluents to a preliminary treatment before passing them into the sewers.

Since the operation of the various Public Health Acts it has been found possible, and even remunerative, for manufacturers to utilise such waste products; and yet, especially in the North of England, there is frequently very great difficulty through this cause. On the whole, however, the effect of trade refuse has been greatly exaggerated. In the case of small settlements collected round factories the domestic products may be only in small proportions, and the effluent must be treated specially by chemical methods and not as a sewage proper. In large towns these discharges are usually so largely diluted that they cannot interfere with a bacterial process when rightly carried out.

It has been said that the antiseptic action of some chemicals would arrest the bacterial changes. But by actual cultures it has been shown that the amount of disinfectant required to kill, or even inhibit, the organisms is far in excess of what can be present in the mixed sewage. For example, at Yeovil, where arsenic as sulpharsenite of calcium is derived from the refuse of glove-making, I found that the maximum quantity of orpiment, As₂S₃, that could enter the sewers per week, if the whole amount escaped, was 2 cwt., equal in 120,000 gallons of sewage daily to 3.9 parts of As₂O₃ per 100,000, or .003 per cent., whereas Miquel observed that .06 per cent. of As₂O₃ was required to prevent bacterial growth, and Frankland and Ward assert that it has little effect on lower forms of life ("Joarn. Soc. Chem. Ind.," 1893, p. 1,053).

As an instance of an acid effluent, I found that a soap works at Exeter was discharging ½ ton of acid liquor daily. Even if this contained 1 per cent. of sulphuric acid, it would amount on 1,000,000 gallons of sewage to 0.1 parts per 100,000. But crude sewage has sufficient alkalinity to neutralise more than this amount of acid, provided the latter be not supplied in spurts, as when poured direct on a filter. I have already remarked on the beneficial mixing and "smoothing" effect of the septic tank on the great fluctuations that occur at different times in all varieties of sewage. I believe that the same natural neutralisation and precipitation would dispose of most metallic admixtures, such as iron salts, galvanizing pickle, &c.

With regard to tanning refuse, the antiseptic power of tannin itself is very small, and, moreover, it does not pay to

let much of it escape. At Exeter I estimated the daily quantity from the large tannery in that town as equivalent to that in 6 fluid ounces of brewed tea per head of population, and it certainly could have no influence. Effluents containing animal or vegetable matters, either suspended or in solution, as those from breweries, starch factories, &c., however foul and unfit to be discharged into rivers, present no difficulty to bacterial treatment, as the large numbers of the liquefying bacteria which they contain contribute to the efficiency of the process.

Popp and Becker ("Chem. Hyg. Inst., Frankfurt," 1896) found that "liquefying bacteria" were killed by 0.5 per cent. of sulphuric acid, or by 1 per cent. of sodium carbonate, an acidity or alkalinity that would be higher than the ordinary factory runnings, and would be brought down when mixed with the whole of the sewage to an unimportant factor. As an example I ascertained that at a certain paper mill 35 lb. of soda ash were used daily; the maximum addition to the alkalinity of the whole daily sewage was 0.3 parts per 100,000 or 0.00003 per cent.

Gas liquor and the effluents from timber works often contain a large quantity of suspended tar, which clogs up filter-beds and presses, and fouls the catch-pits and sewers. Therefore they must usually be excluded. The floating tarry film may possibly somewhat hinder the activity of the upper bacterial layer of a septic tank, but the aqueous liquid itself in its dilution would not be likely to interfere either by its sulphides, cyanides, ammonia or tar acids, inasmuch as many bacteria generate and live in a medium impregnated with ammonium sulphide, while cyanogen compounds are far less poisonous to lower organisms than to higher animals, and the strongest of the tar derivatives are not bactericidal, under 0.5 per cent., or 500 parts per 100,000, an impossible amount to be present. In exceptional cases, however, where intense acidity or other strong admixture cannot be avoided, the use of lime and a settling tank would become necessary; in this case a sludge would be created which would not be that of sewage.

The time of sojourn for an aerobic decomposition must vary with the age of the sewage. Many sewages require very little such change, so that the preliminary process is resolved into one of settling and of ensuring a liquid of more uniform composition for the filter-beds. Where the sewers are steep and not more than half to one mile in length the horse discharges come very quickly down with little appreciable alteration, whereas an old sewage which has undergone considerable fermentation and hydrolysis by meandering through a long old sewer of somewhat sluggish flow will scarcely require much stay in a tank except for purposes of mixing, and may almost be trusted to a well-aerated filter-bed alone, especially if a large amount of free ammonia be present and the nitrification be carefully maintained. Where, on the other hand, "albuminoid ammonia" is predominant, a longer stay in the tank and an encouragement of further septic change is desirable, as although there are many aerobic or facultative bacteria which will change "albuminoid" into "free" (and gases) in a filter designed to have a "resting full period," it is better that this change should precede nitrification in a separate plant.

Laundry effluents and excessive quantities of slop water such as emanate from large institutions are often troublesome, on account of their greasy deposit of lime soaps, which soon become fetid. If passed on to filters, the scum has a great tendency to produce clogging and to hinder oxidation. But under alkaline anaerobic conditions such grease becomes emulsified by admixture with other solids, and will be attacked and dissolved as ammonia salts. They should, however, proceed to the works as far as possible without dilution with other water, and with a rapid flow to avoid deposition outside.

EFFLUENTS AND POLLUTION.

A question frequently raised is the possibility of an effluent conveying disease germs. By this time it is well known that, fortunately, pathogenic bacteria as a rule do not thrive much below blood heat, and that they are rapidly crowded out and destroyed by the ordinary bacteria existing in common waters, and still more by the immense numbers present in sewage. I need hardly refer to the fact that the typhoid bacillus has only in rare cases been found even in waters and sewages to which it must obviously have penetrated. This disappearance is clearly explained by some experiments of Dr. Sims Woodhead at Exeter, when he found that crude sewages containing about 500,000 organisms per cubic centimetre, when inoculated into the filtered effluent of a septic tank, developed more than 1,000,000,000 in five days, thus overwhelming any pathogenic bacteria that might be present. In the same Local Government Board inquiry Dr. Pickard specially investigated the typhoid microbe, with reference to the action of crude sewage on it, and to the effect of a filter-bed on those germs which had survived a short exposure. He concluded that the sewage itself, even when sterilised, "was not only a bad food, but an actual poison" to these bacteria, that in the septic tank they suffered a rapid destruction, and that the filter-beds effect a further biological elimination, "so that there is no chance whatever of the filtered effluent causing typhoid fever if passed into the river."

Strong Sewages, smaller in volume but more concentrated in

organic matter, require special consideration and sometimes a separate treatment. If admitted untreated into municipal water courses, the local pollution is evident and will give rise to legal troubles. Among natural effluents that are exceptional in concentration, those from moors and bogs are frequently strongly brown in colour and devoid of dissolved oxygen; the humous matters, being singularly stable, have occasioned, especially in America, serious difficulties in all systems of sewage filtration by rendering the effluent coloured, and increasing the "oxygen consumed" figure, and possibly the "albuminoid ammonia," which are relied on in judging from arbitrary standards. A chemical treatment with lime, or lime with aluminium or ferric salts, is found to furnish a clean, colourless and particularly pure effluent, which in this case would actually have its value as a drinking water.

On the other hand, an effluent from works or large institutions, the flow from a collection of houses on the middle or earth-closet system, or the runnings from farmyards, pigeries and ditches of highly-manured land, will often by the odour and yellow colouration show that the main constituent is recent urine. Such a liquid is eminently unsuitable for either precipitation or passing through a porous filter of any kind, or even for placing on land until the first change, the hydrolysis of urea into ammonium carbonate, has been effected by organisms. The liquid will even then be so loaded with ammonia that it will not readily undergo nitrification; its tendency, in fact, will be to reduce any nitrate already formed into nitrite and nitrogen or its lower oxides, and to derange all systems of filtration through porous materials. For a strong or urinous sewage of this description, a preliminary detention until fermentation is completed is obviously essential before being diluted with naturally oxygenated water, as when discharged into a river, or before being admitted to a nitrifying filter, and in this latter case without special precautions the nitrification may be slow and incomplete.

NITROSIFICATION AND NITRIFICATION.

It is also important to remember, as pointed out in a former paper ("Jour. Soc. Arts," December 19, 1897), that the changes in the natural purification of sewage lead more to the production of nitrites than of nitrates. For the group of transformations working to this end, I use the term nitrosification, implying the production of nitrites and of nitrogen and its lower oxides by partial oxidation, as distinguished from the special reduction of nitrates called "denitrification," which was proved by Gayon and Dupetit to be "a fermentation involving direct burning up of the organic carbon at the expense of the oxygen of a nitrate." Nitrosification is not nearly so delicate a process or so difficult to initiate or control as nitrification, which it seems to invariably precede. It occurs best in the presence of diffused light and of a moderate amount of air, and is quite consistent with the growth of large numbers of green or brown algae which are at the same time engaged in reducing any nitrates present. The following experiments show some of the conditions of the changes.

Experiment 1.—Nine volumes of a tank effluent free from nitrate or nitrite were mixed with one volume of a coke-breeze filtrate containing 4.34 parts per 100,000 of nitric nitrogen (no nitrite), sealed in a flask without air, and kept for five days in a dark chamber at 150 deg. C. By this time the whole of the nitric nitrogen, amounting to 0.434 parts in the mixture, had disappeared, without formation of either nitrite or free nitrogen. The same liquid afterwards in a vessel partially full and exposed to light yielded nitrites in abundance.

Experiment 2.—A strongly urinous effluent to which potassium nitrate had been added in the proportion of 10 parts per 100,000 was seeded with the organisms (collected by a Pasteur filter) from a coke-breeze filter, and kept in the dark at room temperature in bottles nearly full. After fourteen days the liquid was turbid and had a sweetish urinous odour; a partial vacuum had been produced, as air entered freely on closing the stopper. The composition before and after was in parts per 100,000:—

	Nitric N.	Nitrous N.	Free NH ₃	Org. Loss	Specific Gravity
At commencement	10	0	8.0	2.80	—
After fourteen days	7.06	1.77	7.5	2.38	1.17

Physical Observations.—At commencement: Yellow, turbid. After fourteen days: As above, odourless.

In one day the formation of nitrite from nitrate in the dark was found to be equal to 0.21 parts of nitrous N. per 100,000.

Experiment 3.—A urinous effluent similar to the above preserved in a closed bottle containing air.

Analyses:—

	Org. N.	Nitric N.	Nitrous N.	Free NH ₃	Specific Gravity
Original	2.35	None	Trace	35.0	1.17
After sixty-seven days	2.35	Trace	1.87	34.5	1.10

Physical Observations.—Original: Yellow-brown, turbid, odour very foul, urinous.

After sixty-seven days: Much less colour, odour less urinous, turbid, but not very clear.

At first a white saccharine gum had formed, but had sunk with the sediment. No algae were visible.

Experiment A.—The result of the last experiment was diluted with four times its volume of tap water, containing 7 c.c. of free oxygen per litre and 0.2 parts per 100,000 of nitric nitrogen, and preserved in the light in a half-full bottle. In five days it was clear, inodorous and nearly colourless, and had only a very slight deposit in which green algae had made their appearance. But the nitrifying change was still prominent: the nitrous N had increased to 3.375 parts, calculated on the original, while the nitric N in the mixture was .091, so that the nitrate had actually been reduced. After this the nitrifying organism seems to have become predominant, as in fourteen days the liquid contained 3.06 parts per 100,000 of nitrogen as nitrate, and only traces of nitrite and of free ammonia, the green algae (apparently *protococcus viridis*) being luxuriant, and the water clear, nearly colourless and almost devoid of dissolved organic matter. These experiments explain the causes of failure noticed when attempts have been made to deal with raw sewage by bacterial action without due provision for allowing the changes to take place in natural sequence.

The amount of oxygen required for the processes of nitrification and nitrosification is shown in the following table:—

For production of	One Gramme of Nitrogen requires:—			
	Grammes of Oxygen.	Litres of Oxygen.	Litres of Air.	Litres of Oxygen-saturated water at 7° c. per litre.
N ₂ O ₅	2.85	2.0	10.0	286
N ₂ O ₃	1.7	1.2	6.0	170
N ₂ O ₂	1.13	0.8	4.0	114
N ₂ O	0.57	0.4	2.0	57
N	0	—	—	—

So that to nitrify in an effluent five parts of nitrogen per 100,000 (1 gramme in 20 litres) will demand about half its volume of air, or about fifteen volumes of fully aerated water. This explains the comparative failure and frequent collapse of filter-beds in large masses, especially if the fluid is a raw sewage or a merely screened or precipitated effluent without preliminary hydrolytic change, as with every 100,000 gallons of sewage about 50,000 gallons of air must be continuously supplied. Contrivances like fountains, cascades and weirs, can only raise the dissolved oxygen to the saturation point of about 7 c.c. per litre, or 700 gallons per 100,000; although useful, if simple, like the aerator at Exeter, they are quite inadequate.

The most rapid nitrification that I have seen occurs in the nitrifying trays of Scott-Moncrieff, using the effluent flowing from his special form of upward roughing filter in which the anaerobic change takes place. The plant in use at Ashted for a house sewage of strong character consists of nine perforated shallow trays of cast iron containing coke, supported vertically over one another at about 3 in. apart. It requires only about eight minutes for the liquid to pass through all the trays. In the early part of this year I collected samples from the different trays and obtained the results indicated in the annexed curves, on which I may offer the following remarks: (1) The nitrate has developed with extraordinary rapidity and to an extent that exceeds any other known process. (2) The nitrosification is much less marked—it rapidly reaches a maximum and then declines. (3) The free ammonia has been almost completely oxidised; at the same time the original yellowish colour, black suspended matter and sewage odour had disappeared.

In the table below I give the other figures for the first and last stages.

	Chlorine.	Dissolved oxygen consumed cc. per litre.	Available organic oxygen.
January 25th—Original...	9.0	9.84	minus 9.57
Last tray, "	...	0.39	plus 20.1
February 8th—Original...	6.3	0	minus 9.05
Last tray, "	...	6.84	plus 12.39

Thus the organic matter has been very greatly reduced for so brief a time of contact. The effluent is now in a state of rapid natural purification by means of its "available oxygen," a term I some time ago proposed for effluents rich in nitrates. We know by the researches of Warrington, Minro, Adney, Gayon and Dupetit, and others, that the oxygen of a nitrate is available for the burning up of organic matter, provided it has been properly fermented, as this has been. In my own experiments I have found that the large loss of nitrogen so often noticed was not accounted for by nitrous acid, ammonia, nor by nitrogen gas. Gayon and others have observed the production of nitrous oxide, which being soluble is not evolved, and has no doubt been overlooked by many observers. Therefore, to be on the safe side, I have allowed 4 atoms of "useful oxygen" to every 2 HNO₃—i.e., N₂O₅ to N₂O. Deducting from this the "oxygen consumed" figure, as representing the organic matters which are fairly easy of destruction, I call the surplus "available oxygen," ready to be drawn on to complete the purification. In the above case the quantity is obviously far greater than would be supplied by any process of mere aeration, hence such an effluent could be easily "finished" by a mechanical filter without fouling the latter, or could be beneficially applied to a small area of land, or mixed with a river of moderate volume not only without pollution, but possibly with an actual benefit to the stream.

I have hardly alluded to *chemical purification*, as I have frequently concurred in the opinion which is rapidly gaining ground that the use of chemicals is commonly a mistake.

In the recent Manchester report on sewage treatment it is stated that sewages at Oldham and Swinton after treatment by ferrous sulphate and lime, failed to nitrify in large circular filters. The result could have been foreseen, as not only does chemical precipitation remove a very large percentage of the useful bacteria present in sewage, and therefore hinders the hydrolytic change which must precede nitrification in the filters, but in this particular case the ferrous hydrate formed removed the whole of the dissolved oxygen from the sewage immediately before it reached the filters, where the maximum amount of free oxygen is obviously desired.

Still in the same section of the congress, Mr. W. E. Adney, D.Sc., F.I.C., of the Royal University of Ireland, read a paper on

THE BACTERIO-CHEMICAL ANALYSIS OF SEWAGE AND SEWAGE EFFLUENTS.

In the opening of his paper Mr. Adney remarked that as it had been generally accepted that the purification of polluted waters, under natural conditions, was the work of bacteria, and that all processes for the purification of sewage must, to be satisfactory, recognise this fact as a central principle, the question arose, Should not the methods employed for the analysis of the same water be based upon the fact that they are fermentative liquids, and that the information we ought to seek from analysing them was the amount of fermentative matter they contained apart from their other possible constituents. Mr. Adney then proceeded:—

METHODS OF ANALYSIS.

The methods in use at the present time for the analysis of polluted waters were originally worked out for the examination of potable waters, and although experience has shown them to be trustworthy for that particular purpose, they are, as it is now generally admitted, wholly unsuitable for the analysis of polluted waters. In making this statement I should like to guard myself against any idea that I wish to cast any discredit upon the classical work of Sir Edward Frankland on potable waters, or upon the work of the authors, Messrs. Wanklyn and Chapman, of that most valuable method of potable water analysis known as the albuminoid ammonia process. It is only necessary, to dispel any such idea, to point out the fact that the influence of bacteria in Nature, so far as their being the true agents concerned in the restoration of polluted waters to a condition of purity under natural conditions, was quite unknown and unsuspected at the time the researches of these chemists were being carried out.

It has been shown by bacterio-chemical researches* that the organic constituents of a potable water suffer practically no change by bacteria, and that the system of classification of potable waters into good, suspicious and bad, mainly according as the organic matters they contain come within certain well-defined and understood limits, is scientifically sound so long as the classification is confined to potable waters. Bacterio-chemical research has demonstrated, however, with even more force that the presence of organic matters in a water which can undergo change by bacteria gives rise to an entirely different set of considerations. We then require to know, not that the quantity of organic matter is represented by a certain figure or comes within certain limits, but what chemical changes they will undergo in the water, and what attendant influences such changes will exert in the water and everything that comes in contact with it—e.g., fish and vegetable life, and also the atmosphere and public health of the neighbourhood—and how these changes may be ascertained and put into concrete form for analytical purposes.

I propose to describe in this paper a simple process for the chemical analysis of polluted waters, based upon the considerations which I have above stated. I much regret it is not in my power to also deal with the bacteriology of the problem. I can only hope that bacteriologists will themselves take up the problem and work out systematically the part of it which belongs to their subject, as I feel confident that results of great interest and practical importance will follow such study. In order to gain a clear conception of the kind of information we require to know concerning foul waters, let us consider the nature of the changes which the polluting matters in them may undergo during the restoration of the water to a condition of purity by natural agencies.

THE CHANGES INVOLVED.

These changes have been fairly well worked out, at least in broad outline. It is known, for instance: (1) That the agents which bring about the purifying changes are bacteria. (2) That the germs of these organisms exist practically everywhere in Nature. (3) That the ordinary bacteria of Nature can attack, and completely oxidise, probably most, if not all, known organic substances with the exception of antiseptics. (4) That the chief condition necessary for the continued healthy life processes of these organisms is an adequate supply of oxygen in the free state or in certain forms of combination. This holds good for the solid matters in suspension, as well as for those in solution. (5) That the chemical changes set up by these organisms under the condition of a sufficient oxygen supply result in the complete break down of the organic matters in a foul water, and in their conversion to carbonic acid, ammonia, water, and nitric

* See "Chem. Sec. Journal," vol. XLIX., p. 677; also "Transactions, Royal Dublin Society," vol. v., Part II., 1896.

acid, together with the formation of small quantities of colouring matters, which although organic in composition are not to be regarded as polluting matters, since they are to be found present in more or less small quantities in all natural waters, including first class potable waters.

The process, then, of purification of foul waters by natural agencies is a true bacterial fermentation—a process presenting *per se* no danger to health if an adequate supply of oxygen be maintained during its continuation, but capable, in the absence of such adequate supply, of engendering conditions in the highest degree dangerous to public health. It is evident, therefore, that a method of analysis for drainage waters, to be satisfactory, must be capable of indicating the true polluting power of such a water—that is to say, it must indicate the quantity of fermentable organic matters the water may contain, the volume of oxygen which the bacteria will require to bring about their complete oxidation or fermentation, and the rate at which they will undergo fermentation. This information is necessary, it will be observed, before we can calculate what damage any drainage water will do if discharged into a given river, before we can state in fact whether the discharge of a foul water into a river will give rise to the evils of over-pollution in the river water or not.

We may take it, from what has already been said, that a river becomes over-polluted when the bacteria fermentation in its waters becomes so rapid that the atmospheric oxygen dissolved in them is consumed by the bacteria more quickly than it can be replenished in the ordinary way, that is by ordinary solution and diffusion through the water of fresh quantities of oxygen from the atmosphere. When this state of things arises anaerobic fermentation sets in, attended with all the offensiveness and dangers of putrefaction. The rapidity of the consumption of the dissolved oxygen depends upon the activity of the bacteria, and their activity depends upon the quantity and kind of polluting organic matters present in the water, the greater the quantity and the more favourable to growth of bacteria of the polluting matters the greater their activity and the more rapidly the chemical changes which they can bring about are completed.

SOME FUNDAMENTAL CONSIDERATIONS.

It will not, of course, escape the attention of the members of this section that a method of examination such as here indicated raises a number of fundamental considerations. All these fundamental points have been fully investigated. A description of the methods employed, and records of the experimental results obtained in the investigation, have already been published in the "Scientific Transactions of the Royal Dublin Society," Parts I., II., and III. in Vol. 5 (Series 2), Part II, 1895; and Part IV. in Vol. 6, Part II, 1897, under the title, "The Course and Nature of Fermentative Changes in Natural and Polluted Waters and in Artificial Solutions, as indicated by the Composition of the Dissolved Cases." An abridgement of these papers has been published in "The Transactions of the Institution of Civil Engineers of Ireland," 1896 and 1898. It is necessary for me to take up the time of the section by making a detailed reference to the results of this investigation, as those especially interested in them can refer to them at their leisure. I need only draw attention to some conclusions which bear directly upon the particular points I wish to deal with in this paper. They are as follows: (1) That the mixed organisms natural to foul waters practically behave as constant chemical factors during the complete fermentation or purification of the same under aerobic conditions; that is to say, they have been found to consume similar volumes of atmospheric oxygen during their complete fermentative action upon similar volumes of the same polluted water; (2) That the volumes of atmospheric oxygen consumed by the bacteria during their complete fermentation, under aerobic conditions, of a polluted water are directly proportional to the quantity of polluting matters in the waters; (3) That the mixed organisms of foul waters effect the complete fermentation of the polluting matters in the same in two separate and perfectly distinct stages.

During the first stage the organic matters are alone attacked, and they are completely changed into carbonic acid, ammonia water, and the colouring matters already referred to. After the completion of this stage a period of apparent rest ensues; then the second stage sets in, and during it the ammoniacal nitrogen is the central object of attack, and it is oxidised to nitric acid. The colouring matters formed during the first stage are also more or less completely converted into carbonic acid, water, and nitric acid. I have proposed to term these two stages of fermentation the carbon-oxidation and the nitrogen-oxidation stages respectively. The second stage may also be appropriately called the nitrification stage. Time will not permit me to dwell upon the interesting and considerations suggested by the above conclusions. I will only remark here that the chemical changes effected by bacteria have been found, so far as they have been studied, to come under, without exception, the principles of thermo-chemistry, and that it is not surprising, therefore, to find that bacteria function as constant chemical factors under the condition of a constant supply of oxygen. It is also, for the same reason, not surprising to find that the carbon-oxidation or first stage of fermentation is always found to be complete before the commencement of the nitrogen-oxidation stage.

We should have anticipated this from thermo-chemical principles.

BACTERIO-CHEMICAL ANALYSIS. A NEW METHOD.

Turning now to the question of formulating a method of analysis for foul waters based upon bacterio-chemical principles, it is scarcely necessary to observe that the main object of such a method must be the determination of the volume of atmospheric oxygen consumed during the carbon-oxidation stage of a known volume of a foul water. It should also be an object of the method to approximately indicate the rate of consumption of oxygen if necessary. I may remark here that in the rational analysis of polluted waters, for river pollution purposes, it is really only necessary to examine the first stage of fermentation, since we may take it from what has been stated that it is only during this stage that putrefaction could be set up in a river. The methods employed in the investigations already referred to can, of course, be used for the analysis of foul waters, but they are unnecessarily elaborate and slow for general analytical purposes. I have accordingly recently worked out a simple method suitable for general use. This method is carried out as follows:—

A bottle, generally an ordinary Winchester quart, is fitted with an india-rubber cork, in the centre of which a hole has been bored, and in which a short glass tube is fixed. The outer end of this tube is fitted with a short length of capillary india-rubber tubing, which can be closed, when necessary, by a piece of glass rod. The capacity of the bottle, with the cork in position, is first found. A known volume of the water to be analysed is then transferred to the bottle, and the cork securely fitted in, the free end of the rubber tube being left open. The bottle is then put aside for about an hour, to allow its contents to assume the temperature of the surrounding air, and to allow also the air in the bottle to become saturated with aqueous vapour. The temperature of the laboratory and the barometer are then noted, and the rubber tube is immediately closed by means of the glass rod. Finally, all the rubber parts are coated with shellac varnish, to prevent gaseous diffusion, and the bottle is put aside in the dark for fermentation for about four to six days.

Knowing the capacity of the bottle, the volume of the water introduced, and the temperature and pressure of the air at the time of corking, and remembering the fact that the air left in the bottle is saturated with aqueous vapour, we can calculate, from the known composition of the atmosphere, the exact volumes of nitrogen and of oxygen left in the bottle at the time of corking. Then if after the completion of the first stage of fermentation a small quantity of the air in the bottle be withdrawn by means of a suitable gas apparatus, measured and analysed, we shall have all the data necessary for determining the exact volume of oxygen consumed during the first stage of fermentation of the organic matters in the volume of the water taken for analysis.

The analysis is extremely simple; it only involves the determination of the volume of carbon dioxide, and of oxygen, by absorption, and of the nitrogen by difference. The calculation is also very simple. The experiments recorded in the researches already referred to show that it may be taken, with close approximation to the truth, that the nitrogen does not alter in volume to any appreciable extent during the fermentation, if the contents of the bottle be preserved at a fairly constant temperature, and if the volume of air in the bottle be not too small in proportion to that of the water. With this assumption as to the nitrogen, we can calculate the consumption of oxygen by deducting the volume of it, at N.T.P., found by analysis to be associated with the nitrogen in the bottle, at the end of the experiment, from the volume known to be present at the commencement of the experiment. The method, it will be observed, presents no difficulties either in manipulation or in calculation, and possesses the very great advantage of securing the examination of a water under conditions very similar to those which obtain in nature. The gas apparatus required is also extremely simple. Lange's nitrometer, or Hempel's gas burette and absorption pipettes, may be employed for the purpose. After a little experience no difficulty will be found in making an air-free connection between the gas apparatus and the experimental bottle.

SOME EXAMPLES.

A few examples of analyses by this method and by the albuminoid ammonia method will perhaps be the best means of demonstrating its value. The first four of the analyses quoted afford a very interesting study of river pollution, besides indicating the great practical value of the method as a means of investigating the nature of the polluting matters of a foul water. The fifth example demonstrates the impossibility of the old methods to even indicate the presence of a non-nitrogenous substance in a foul water, while, on the other hand, it proves the capability of the new method of indicating, not only the presence, but also the quantity, of such a substance in a foul water, in terms of the volume of atmospheric oxygen required for its complete bacterial fermentation. It must be noted that the matters in suspension in the samples were separated by subsidence and decantation before analysis.

Analyses of Polluted Waters showing the volumes of Atmospheric Oxygen required for the oxidation of the organic matters they contain by bacterial fermentation.

Results expressed in parts per 100,000, except the oxygen determinations, which are expressed as volumes, at N.T.P., per 100,000.

* Reprinted in *Engineering*, vol. lxx., pp. 728-730 and 762-764, 1896.

Results obtained after first stage of fermentation.

N. as ammonia ...	02	3	9	16	0
Oxygen consumed ...	229	845	2724	600	3324

Note.—In calculating the above volumes of oxygen the composition of the atmosphere was taken to be—nitrogen 79.1 and oxygen 20.9 per cent. by volume.

The first four samples were collected from a somewhat sluggish but fairly large river at points selected, to ascertain the effect of a number of discharges of sewage, more or less considerable in volume, along a flow of some 3 miles. The fifth sample was a solution of common soap. Sample 1 was collected at a point on the river above which, for at least a considerable distance, no discharge of sewage was discernible. Sample 2 was collected a short distance lower down the river, and just below the outfall of a moderate-sized sewer. Sample 3 was also collected lower down the river than point 1, but immediately after the discharge of a large volume of sewage into it. Sample 4 was collected some distance below points 2 and 3. A glance at the results recorded in the above table shows that the albuminoid ammonia determinations afford no information either as to the kind or as to the degree of pollution of the waters, but that the volumes of oxygen consumed, when considered together with the free ammonia determinations made before and after fermentation, indicate at once the state of the waters, both as to kind and degree of pollution. For example, the results from sample 1 prove that a slight fermentation took place, but, inasmuch as the free ammonia shows no change after fermentation, it is evident from what I have stated above that the river water was slightly, but only very slightly, polluted with carbon-oxidisable substances at point 1.

The like determinations for the samples 2 and 4 show at once a decided pollution by carbon-oxidisable substances; but if we take into account the fact that 100,000 volumes of good river water will hold in solution 700 to 800 volumes of oxygen at N.T.P., according to the season of the year, it becomes evident that the river was at neither point over-polluted in the sense above explained. It is not surprising, therefore, to find that these samples did not develop any odours when kept in a corked bottle and out of all contact with air. The oxygen and ammonia determinations for sample 3 indicate an amount of pollution by carbon-oxidisable bodies which must be regarded as over-pollution, from the definition of that state which I have given above. That this was the case is proved by the fact that a portion of it, which was kept in a closed air-free bottle, became extremely offensive.

If we now refer to the albuminoid ammonia determinations, it will be seen they exhibit no such indications of great variation in the degree of pollution. The determinations for samples 1, 2 and 4 show practically no variation from one another, and but very little even from sample 3. The results obtained from sample 5 clearly demonstrate the impossibility of the albuminoid ammonia process of even indicating the presence of a large class of organic substances—*viz.*, non-nitrogenous substances—which commonly occur in sewage and in other drainage waters, and which give rise to a very active bacterial fermentation, as the results above quoted prove.

SOME POINTS OF DETAIL.

Before concluding this paper there are one or two points of detail to which it may be well for me to make some reference. The first is as to the relative volume of a foul water, and of air-space to allow for in the bottles in which the fermentative tests are to be made. They must, of course, be varied according to the water to be examined—the greater the foulness the less will be the volume of the water required, or the greater will be the air-space which must be allowed for. I have found a convenient and suitable proportion to take is one of air to four, six or eight volumes of the water. I hope to shortly publish the record of a number of experiments dealing with this and some cognate points.

Another important detail is to decide how long the experiment be allowed to go on; a good working indication of this may be gained from the appearance of the water itself; after it has been fermenting for a day or two the turbidity, which from the first is more or less marked, decidedly increases and continues to increase for two or three days more, according to the foulness of the water; the turbidity then begins to lessen, and in a day or two more the water becomes almost clear, and a deposit of bacterial *æbris* settles down to the bottom of the bottle. When this appearance has decidedly set in the first stage of the fermentation may be considered as finished.

It is advisable to dilute a very foul sewage with four to five times its volume of distilled water, otherwise the fermentation will be unduly prolonged. It is unnecessary, for reasons I have already given, to allow the fermentation to proceed to the second stage. As a general rule five or seven days ought to be a sufficient time to allow a water to ferment, when the analysis is required for river pollution purposes. When the water to be examined is a sewage effluent or a trade waste

liquor care must be taken to separate before analysis traces of sulphate of alumina or other like bodies, which exert an unfavourable influence on bacterial fermentation, and which may be present in such waters. This may be effected by the careful addition of a few drops of sodium carbonate solution; after the precipitate, which is then formed, has settled down, the water may be decanted and subjected to fermentation.

One or two papers dealing with the question of sewage disposal still remain to be noticed, one of them being the extremely interesting contribution by Mr. Scott Moncrieff. We shall then give abstracts of some of the remaining papers of interest to our readers.

ARBITRATIONS AND AWARDS.

The resumed inquiry as to the value of the properties affected by the Tottenham Court-road improvement scheme of the London County Council, which scheme will be subject to "betterment" was held on Tuesday, before Mr. James Green, the arbitrator appointed by the Local Government Board. The cases dealt with comprised the Oxford Music Hall and the freehold and leasehold interests therein, and in Nos. 4, 14 and 16 Oxford-street, 1 and 1a Tottenham Court-road, and part of 11, 12 and 13 Boziers-court. Professional evidence on both sides was given before the arbitrator, whose award will be published simultaneously with that in the Strand improvement scheme. The Hon. Alfred Lyttleton, M.P., appeared for the London County Council; and Mr. Glen, Mr. Greene, Mr. Moresby, Mr. Brown and Mr. Courthope Manroe for the various owners.

At the Grand Hotel, Manchester, on Friday, the 7th inst., an arbitration was opened before Messrs. William Spinks, Leeds, and William Engle, Manchester, with Mr. Jos. Brierly, Blackburn, as umpire, to determine the amount to be paid by the Middleton Corporation to Messrs. Langton & Gilmour, the owners of an estate in Middleton, for compensation for damage sustained by reason of the defendants laying a sewer through the claimants' land. Mr. Sutton, Rochdale, appeared for the claimants and Mr. Bradbury for the defendants. Evidence was given by Mr. F. W. Stott, surveyor, Rochdale, and Mr. Brewster, Manchester, to the effect that a line of 15-in. pipes, 569 yards in length, with three manholes and three lamp-holes, having been laid through claimants' land, the property has sustained great damage as regards its value as building land, for which purpose it was intended, the defendants' action making it impossible to build on these plots under which the sewer is laid. A question was raised by the defendants as to the difficulty of draining the property there would be when built over. The claimants contended that there would be no difficulty in this matter, as two open ditches on the property, which they contended are sewers—as they have been partially piped—might be utilised. Claimants' valuation was as follows: 6,484 square yards of land not available for building on at 14d. per yard and twenty years' purchase, £810 10s.; deferred twenty years at 5 per cent., £305 9s. 6d.; 7,991 square yards of land depreciated in value at 1s. deferred twenty years at 5 per cent., £150 11s. 11d.; three manholes at £10, £30; three lamp-holes at £5, £15; total, £501 1s. 6d.

The further hearing of the case was then adjourned till Wednesday, the 12th inst., when the defendants' witnesses—*viz.*, Messrs. H. Batey, Manchester, W. Evans, and W. Welburn, borough surveyor, Middleton, gave evidence. It was explained by those witnesses that the land in question was most unsuitable for building on, as it would have to be filled up to a great depth, and it would be a long time before it would be ready for building operations to commence. They contended that when built upon the property could not be drained except into the defendants' sewer, as the open ditches referred to were not sewers; also that the land could be laid out so that the line of the sewer would not interfere so much with the building plots, and therefore so much land ought not to be claimed for or so high a price asked. Their valuation for the full value of the land was: 450 square yards at 1d. per yard and twenty years' purchase, deferred twenty years at 4 per cent., £15 5s. 6d.; 2,785 square yards at 1d. per yard and twenty years' purchase, deferred thirty-five years at 4 per cent., £58 14s. 4d.; total, £73 19s. 9d. Estimating the damage sustained by the claimants to be two-thirds of the full value of the land, the following figures would be obtained: Two-thirds of full value (£73 19s. 9d.), £19 6s. 6d.; 550 lineal yards by 3 yards wide, land occupied by sewer, at 1d. per yard and twenty years' purchase, deferred thirty-five years at 4 per cent., £12 18s. 1d.; allowance for manholes, &c., £20; total, £112 4s. 10d. The arbitrators failing to agree, the case was referred to the umpire, who will make his award in due course.

County Councils' Association.—The executive council of this body met on Wednesday, under the presidency of Sir John Hibbert, and, among other things, it was resolved to make a representation to the Earl of Morley, urging him to propose that the standing order of the House of Commons which gives a *locus standi* to county councils in Water Bills should be adapted for the House of Lords.

"The Genesis of Street Mud."

CARDIFF AND THE TESTING OF ROAD METAL.—II.

At the conclusion of our comments on the above subject in last week's issue of *THE SURVEYOR* we mentioned that just as we were going to press we had received a copy of *The Western Mail* of the previous Wednesday, in which appeared a further article on "The Genesis of Street Mud," consisting chiefly of a letter written by Prof. Elliott (in answer to a pamphlet which had been prepared and circulated by the owner of the Penlee quarries) correcting an error of transcription which appeared in the tests of Prof. Elliott as first published in *The Mail*. These corrected figures so materially affect the question at issue, that it is necessary to call further attention to them.

For the purpose of showing the effect of the error of transcription in Prof. Elliott's first report, together with the correction now made, we refer our readers to the following table, which places Prof. Elliott's first and second figures in reference to the two competitive stones in question in parallel columns, and we also give the results of the tests of the same two kinds of stones by Mr. Lovegrove, as published in our issue of November 5, 1897:—

PROF. ELLIOTT'S ATTRITION TESTS.

Stones.	As published in <i>The Western Mail</i> of September 23, 1898.	As corrected in <i>The Western Mail</i> of October 13, 1898.
	Dry Test.	Dry Test.
	Mud produced.	Mud produced.
German Basalt A	5.9 per cent.	5.9 per cent.
" " B	6.5 per cent.	6.5 per cent.
" " C	3.2 per cent.	5.8 per cent.
Penlee " "	7.2 per cent.	7.2 per cent.

MR. LOVEGROVE'S ATTRITION TESTS.

As published in *THE SURVEYOR* of November 5, 1897.

Dry Test.	Wet Test.	Mean of Dry and Wet Test.
Mud produced.	Mud produced.	Mud produced.
8.25 per cent.	11.47 per cent.	9.86 per cent.
6.54 per cent.	7.81 per cent.	7.17 per cent.

It was upon the figures given in the first of the above columns that the whole case of *The Western Mail* was founded, and upon the strength of these figures our contemporary, in its issue of September 23rd, held that Prof. Elliott's tests proved that Penlee stone produced twice as much mud as the German basalt sample C, and 50 per cent. more mud than the average of the three tests of the German stone A, B and C.

The argument deduced from these figures was, it will be remembered, that there was no economy in using Penlee stone as compared with German basalt; in fact, that the Cardiff surveyor was absolutely in the wrong in his recommendations to the corporation. Now, by applying the same method of calculation to the figures in the second column (which are Prof. Elliott's corrected figures) the results reduce the cent. per cent. to 24.14 per cent. upon sample C and the 50 per cent. to 18.69 per cent. upon the average of the three samples of basalt, while if we apply the same method of calculation to the tests of Mr. Lovegrove we find that the German stone produces 26.15 per cent. in the dry test, 46.86 per cent. in the wet test, and 36.5 per cent. in the mean of the dry and wet tests—more mud than is produced by the Penlee stone. Again, if we take the mean of Prof. Elliott's and Mr. Lovegrove's tests, it shows slightly in favour of Penlee stone, and we venture to think this would prove to be a very fair result if the tests were in all respects equal.

Even supposing that the two stones are practically of equal merit, the question of price has then to be taken into consideration, as we previously pointed out; and on this count again it would appear to be obvious that Mr. Harpur justifiably adopted the ordinary common-sense view of the matter.

On the day on which our last issue was published *The Western Mail* contained an account of a meeting of the Public Works Committee of the Cardiff Corporation, at which the borough engineer drew attention to the correction made by Prof. Elliott in his figures, and to the effect of this error upon the deductions *The Mail* had published in its first report.

The Cardiff borough engineer (says *The Mail*, in the remarks introductory to its account of the above meeting) is once more exhibiting his "backbone" over the mud question. Would it not be more conducive to the public interest if he showed greater readiness to calmly discuss matters, avoiding excitement on the one hand, and *ad misericordiam* appeals on the other? Surely the Cardiff borough engineer is capable of grasping the fact that the public have a right to call in question the action of the corporation, and even of its officials, while the latter have no right to attempt to reduce every controversy to a personal level. The borough engineer is certainly very badly advised in the course he has pursued—a public official should not allow himself to become a partisan. The borough engineer at the Public Works Committee yesterday laid great stress upon a single error in transcription which had occurred in Prof. Elliott's report on the attrition tests. Singularly enough, as shown by a note received from the borough engineer subsequently to the meeting of the com-

mittee, the latter in correcting Prof. Elliott made two errors in calculation.

The following is the borough engineer's statement to which *The Mail* refers:—

Mr. Harpur, referring to articles which had appeared in *The Western Mail*, said that certain statements had been made which he considered reflected upon him in respect of the advice he had given to the committee. He wished to explain that the whole foundation upon which the articles referred to had been built up had been absolutely and completely upset by Prof. Elliott's report, which appeared in Wednesday's *Western Mail*. In giving the quantity of mud produced by basalt in the first instance, he put it down at 3.2 per cent. from sample C. On Wednesday he corrected an error in transcription, which appeared in the original report, and stated that the figures "3.2 per cent." should have been 5.8. It was contended in *The Western Mail* that Penlee stone produced twice as much mud as basalt sample C, and 50 per cent. more mud than the average of samples A, B and C, but according to

Prof. Elliott's amended figures Penlee stone only produced 24.14 per cent. more mud than basalt sample C, and 18.69 per cent. than the average of the three tests A, B and C. He was very sorry himself, and expected Prof. Elliott was sorry, that the mistake had occurred. The papers containing the articles had been distributed widely. They had reached members of his profession, and were calculated to do him a considerable amount of damage. He did not like the soundness of his advice to the corporation being called into question by irresponsible journalism. Mr. Lovegrove's test, the result of which was given at the last meeting, showed that basalt stone produced a very much larger percentage of mud than the Penlee stone. He did not wish to call into question anything Mr. Elliott had done, but, as the committee would see, he had corrected an error which crept into his first report, and he (Mr. Harpur) thought it was only right the committee should have their attention called to it, otherwise, he thought, it would not be noticed. If the committee thought there was anything in those tests, he would be glad to pay the expenses of two members of the committee to London, to see the tests which Mr. Lovegrove had taken.

We note, in passing, that *The Mail* now seeks to throw upon Mr. Harpur the responsibility for importing personality into the discussion. This is no concern of ours, and we imagine that those who have read *The Mail* articles, which carry upon the face of them the desire to effect an end with but little regard for the professional reputation of an engineer of the highest standing among those best qualified to judge, will need no comment of ours to enable them to form a fair judgment upon the point. They will not forget that Mr. Harpur has been forced, as a public official, into defending himself against a series of attacks which might conceivably have lost him the confidence of his corporation, and under the circumstances, it appears to us, his justification has been urged by him with dignity, consistency and complete success. That this view is shared by those whom Mr. Harpur so loyally serves is evidenced by the following concluding lines of the report of the meeting already referred to:—

The mayor said the committee had no reason to underrate Mr. Harpur's ability, and he was certain the committee had absolute confidence in his recommendations and advice.

This, we take it, is a final answer to *The Western Mail*, and we imagine both Mr. Harpur and the Cardiff Corporation will in future treat with absolute disregard any further "technical lubrications"—to quote from the *Mail's* own graceful reference to our first article—from the same quarter.

Wallasey.—Mr. W. O. E. Meade-King recently held an inquiry, on behalf of the Local Government Board, with reference to an application of the district council for sanction to borrow £40,000 for gas-works purposes, £1,700 for street improvement purposes, and £1,198 for fire brigade purposes.

PUBLIC WORK IN MANCHESTER.

LOCAL GOVERNMENT BOARD INQUIRY.

Mr. George W. Willecks recently held an inquiry at Manchester, on behalf of the Local Government Board, with reference to an application of the city council for sanction to borrow the sum of £20,000 for purposes of public works and pleasure grounds. The inquiry was attended, among others, by Mr. T. Hindson, deputy town clerk, and Mr. T. de Courcy Meade, city surveyor.

Mr. Hindson, in opening the inquiry, explained that the application had reference to three grounds—the first at Oak-road, Crumpsall Park, the second at Boggart Hole Clough, and the third a new recreation ground to be formed in Higher Openshaw. The Openshaw scheme was an entirely new one, but both at Crumpsall Park and Boggart Hole Clough the land was already in the possession of the corporation, who, however, were desirous of erecting certain necessary buildings thereon. At Crumpsall it was proposed to erect a tool-shed, two blocks of conveniences, two flights of terrace steps, entrance lodge, hand-stand, and propagating-house, at a cost of £2,350; to expend on laying-out and planting £1,500; and on forming a draining passage on the Crumpsall Hall side, £250; a total of £4,100. At Boggart Hole Clough they desired to spend £2,000 on road-making and banking, £250 on footbridges, £2,000 on soiling, turfing and planting the banks, £1,000 on boundary harding, £500 on two blocks of conveniences, and £1,200 on six shelters; a total of £7,900. With regard to the Higher Openshaw ground, a provisional contract had been entered into by correspondence with Colonel Legh, lord of the manor of Openshaw, for the purchase of between 7 and 8 acres of fresh-land, at a cost of £1,000 per acre. The net purchase money was estimated at £7,500, expenses incidental to the purchase £120, and necessary works in adjacent streets £380; giving a total of £8,000.

Alderman EVANS said the works at Crumpsall Park would complete the estate in a satisfactory manner. Unless the land at Openshaw was acquired at the present time it would very soon be built upon. Crumpsall Park adjoined the Manchester workhouse, and was in the midst of a large, mixed population. It was acquired by the Crumpsall Local Board before the amalgamation of the district with Manchester, and he believed the ground would be of considerable benefit to the inhabitants. The Boggart Hole Clough would really accommodate the whole side of North Manchester, and hundreds of houses had recently been erected within a short distance of it. About 80 acres of the Clough were bought about five years ago for the purposes of a cemetery, and the recreation ground was rather more than 60 acres in extent. The Openshaw ground was also in the midst of a large working-class population.

Mr. T. DE COURCY MEADE, the city surveyor, presented plans of the proposed grounds and buildings, and fully explained them.

Mr. R. LAMB, general superintendent of the parks, open spaces and nurseries connected with the corporation, also gave evidence, and said some of the work had been proceeded with. That work consisted of repairing unsafe roads and excavating, and was executed in order that the corporation's workmen should not be dismissed.

Further evidence was also given, and the inquiry closed.

SEWAGE DISPOSAL AT CHELTENHAM.

The Local Government Board have, says *The Birmingham Daily Post*, practically refused to sanction an application of the Cheltenham Corporation for permission to raise £13,410 for the purposes of sewerage and sewage disposal. The corporation are the owners of sewage farms in villages to the west of the borough, and these farms have hitherto been let to farmers. The manner in which the sewage has been treated on the land has been the subject of loud and frequent complaint by the villagers of Staverton and Boddington, and it was with the object of meeting and remedying these complaints that much of the work was proposed to be done with the £13,410 the corporation wished to borrow. At the inquiry, held a few weeks ago by Colonel Marsh, on behalf of the Local Government Board, further expression was given to these complaints, with the result that, as appears from a letter now received by the town clerk of Cheltenham, the Local Government Board are "satisfied that the present arrangements for the treatment and disposal of the sewage are unsatisfactory." In particular the letter goes on to state: "It is observed by the inspector that there appears to be no proper supervision of the farms by the town council, that the system of irrigation adopted by the farmers is inefficient, and that there were indications of a great deal of the liquid sewage finding its way untreated into the ditches and watercourses. The board's experience shows that as a general rule the results which ensue upon a local authority divesting themselves of the direct control of sewage lands by letting the lands for agricultural purposes are unsatisfactory, as it not infrequently happens that the farmers are more concerned to make a profit for themselves than to properly purify the sewage. The board therefore consider it most desirable that the management of sewage farms should be entirely in the hands of the local authority, whose primary object would be to avoid creating a

nuisance or infringing the provisions of the Rivers Pollution Prevention Acts." Accordingly, the Local Government Board request that the town council will take this question into their immediate consideration, with the view of determining the present arrangements and taking the entire management of the sewage farms into their own hands. In any case, the town council are advised to consider the expediency of applying some such remedy for the complaints referred to as the use of aluminiferous or lime at the sewage works before the sewage is taken to the farms.

SHREWSBURY MAIN DRAINAGE SCHEME.

The laying of the foundation-stone of the Coleham pumping station, which was performed by the mayoress of Shrewsbury on Friday, marks the approaching completion of the Shrewsbury main drainage scheme, which has been in progress during the past eighteen months. All the main intercepting sewers surrounding the town have been laid, together with a high-level gravitation outfall, discharging at the outfall works at Monkmoor. The work has been one of unusual difficulty, on account of the physical characteristics of the town, the soil on arriving at water level consisting of extremely fine silt, a circumstance which led to the failure and abandonment of a scheme having the desired object in view which was commenced about twenty-five years ago.

The experience gained in that scheme, however, was not without its influence upon the design of the works now completed, since the engineers (Messrs. J. Taylor, Sons & Santo Crimp, of Westminster) determined to adopt a central position for the pumping station, in order to construct all the works above the level of the running silt. After its collection and delivery at the pumping station the sewage will be pumped by means of a pair of compound beam pumping engines, with a capacity of 6,000,000 gallons per day, into the gravitation outfall above mentioned. The outfall works consist of a set of tanks for the precipitation of the suspended matters, sludge-pressing plant and other works of the modern type. After clarification the effluent will be applied for its final purification to land, of which the town council have acquired 180 acres.

A VILLAGE WATER SUPPLY.

Mr. F. Drake Brockman, of Beechborough, we learn, is providing the inhabitants of Newington, a village near Folkestone, with a supply of water for drinking and domestic purposes, and for some time past the work has been in progress under the supervision of Mr. A. R. Bowles, engineer to the Sandgate Urban District Council, who himself was responsible for the preparation of the scheme. The source of supply, locally known as the Spring Head, is situated up in the hills, at a distance of about 1½ miles from Newington. A storage reservoir of adequate capacity has been constructed there, and a 3-in. service main has been laid to the village. The works, when completed, will have cost about £600.

INSTITUTION OF CIVIL ENGINEERS.

ORDINARY GENERAL MEETING.

The first ordinary general meeting of the 1898-99 session of the above Institution will be held on Tuesday, at 8 p.m., when Mr. W. H. Prece, C.B., F.R.S., the president, will deliver an address, which will be followed by the presentation of medals and prizes awarded by the council. At the close of this meeting the president will hold a reception in the library.

Maidstone Water Supply.—A meeting of the ratepayers convened by the mayor, was held at Maidstone on Wednesday, for the purpose of passing a resolution authorising the corporation to promote a Bill in Parliament to empower them to purchase the undertaking of the local water company. The resolution was carried by an overwhelming majority, but a poll was demanded. The result, it is expected, will be favourable to the purchase scheme, the epidemic of last year having converted many who were opposed to the proposal two years ago, when it was vetoed by the ratepayers.

"House Drainage: Its Inspection and Testing," by Richard J. Jenkins, (London: St. Bride's Press, Limited. Price 1s. net).—On the whole, says *The Engineer*, this is a useful little book; but every sanitary engineer has his own notions, and there is no scheme of house drainage that will not be criticised. Mr. Jenkins' views on the subject of water-closets, for example, will not be accepted generally as final. All valve closets are had, in our opinion. A 2-gallon flush is not sufficient. Mr. Jenkins seems to be unaware of the agitation against the intercepting chamber and the ventilating shaft now in progress. In the London clay a cement pipe joint may be the worst possible. But we cannot have everything in a little book like this, and it is so good that we feel somewhat ashamed of calling attention to its defects, which are, after all, more matters of opinion than reality.

CORRESPONDENCE.

Surveyor Baiting.—"An Interested Looker On" writes: It is refreshing to see that you have raised your powerful voice in defence of Mr. Harper, the borough surveyor, &c., of Cardiff. There are a considerable number of the non-thinking public who consider that surveyors are appointed and hold office simply to be kicked whenever the fit comes upon them for that sort of amusement. But I think a deal too much is being made of a very simple practical question. Of experts and professors I have a wholesome dread, and do not see the utility of erecting (figuratively) two steam-hammers to crack so small a nut as this at Cardiff. Here are two samples of road metal, about the wearing quality of which there is a dispute; why not lay down a coat of each sort of metal on a certain road where equal traffic would pass over each section or sample, and let the public judge at the end of a year which has stood the wear and tear best. This would be a practical test, not an expert's or professor's fad under conditions which do not come into the practical solution of this simple problem, and the nut would be cracked minus the aid of the two steam-hammers, so needlessly introduced.

Shoreditch Combined Electric Light and Dust Destructor Works.—Mr. H. E. Kerslaw, chairman of the Electric Light Committee of the Shoreditch Vestry, writes: I am at a loss to understand Mr. T. W. Baker's attack on the above scheme, especially when viewed in the light of the fact that Mr. Baker submitted a scheme to our vestry for dust destruction, in conjunction with the electric light, in 1893, but that scheme was so ridiculous in its proposals that the vestry, with but few dissentients, refused to have anything to do with it. Is it a bid for cheap notoriety? Or is Mr. Baker's criticism the justification of his own scheme, for he states, "I do not infer or wish to be understood that all dust destructors are or will be financial failures." Or is it the outcome of his chagrin that a more successful engineer should be in the happy position of being the first to successfully install an electric light and dust destruction combined scheme? Your contemporary, *London*, having facts at its disposal, cleverly answers this attack in the last issue, for it must be known to you, sir, that Mr. Baker's letter appears simultaneously in *THE SURVEYOR*, *London*, *The Contract Journal*, *The Electrical Engineer*, *Lighting*, *The Electrician* and *The Hackney Express* of this week—and, no doubt, there are more to follow—and I am put to the trouble, for the benefit of the many who are desirous of knowing the truth of our scheme, to reply to this unwarrantable attack. As *London* points out, the basis of Mr. Baker's calculations of financial results fall to the ground in the face of the fact that he has taken our vestry's financial reports, which only give accounts up to March this year and is based upon a twelve months' expenditure with a nine months' income, the first quarter of which is invariably a heavy loss to any undertaking. Mr. Baker very ably connects the two schemes—the sale of electricity and the destruction of dust—and asks which is correct. The vestry clerk's stated profit of £1,268 17s. 9d., or Mr. Baker's supposed total loss of £1,525 16s. 7d.? Well, I emphatically state, not Mr. Baker; and the vestry clerk is correct, so far as he goes, but from my point of view he does not go far enough. I will state here—and within the course of a few weeks justify my statement, as my committee's report on this matter will shortly be before the vestry; and when it has passed that board it can be made public—on our combined scheme we made a profit in this year's working, after making all allowances, of £2,000 nett. This is as emphatic as I can put it, although probably Mr. Baker will again say, "I note no amount for depreciation is allowed." I sincerely hope there never will be, because it must be remembered that we are paying back something like £5,000 per annum interest and capital on these undertakings, which means that in thirty years the dust destructor and electric lighting station will become a valuable freehold asset. That being so, where is the need of depreciation with the maintenance charges included in our estimates year by year? Further, I might add, as *London* reminds me, that the London County Council have practically verified the figures I have given you. Their valuer, in valuing us for assessment, went fully into these figures, and based our assessment upon a profit of £1,500. I cannot, without violating my position as chairman of this committee, give you details of the Scavenging Committee's figures, but they will all be included in the report I have mentioned, which I know is being anxiously awaited throughout the whole country, and which, I venture again to say, will give the satisfaction that this phenomenal scheme deserves.

Mr. H. Mansfield Robinson, vestry clerk, Shoreditch, writes: Mr. Baker, in his lengthy criticism of the above accounts in your last issue, makes such palpable blunders that, whilst I have no intention of entering into a controversy as to the success or otherwise of this scheme, it is necessary that I should correct Mr. Baker's misreading of plain English, as it is to similar perversion of facts that some of the "conflicting statements" he refers to are due. Mr. Baker's case consists of showing that the figures in my report (p. 2) do not harmonise with the surveyor's report and the electricity and destructor accounts. My statement, that the "destructor has also succeeded in destroying the whole of the dust in this parish and more besides up to a total of 18,812 tons in nine months" (p. 2) is not inconsistent, as Mr. Baker suggests,

with the surveyor's statement at p. 188, that "from the year" 18,378 tons were collected by the scavenging department, as the latter figures refer only to the refuse of Shoreditch, whereas my figures expressly include "more refuse," such as parish refuse from St. Luke's and trade refuse from the City sent to the destructor, and not collected by the scavenging department at all. Also, my figures as to coal burned were expressly stated to be for the month, and were taken from the revenue account (p. 361), whereas the conflicting figures at pp. 350 and 323 of the accounts are based in large type as accounts from March 25, 1897, to March 25, 1898; and Mr. Baker, as an engineer, ought to know that it takes many weeks' slow firing to prepare a destructor to make tests, &c., before steam-raising can be attempted. He makes the same mistake in the dust destructor maintenance cost, by comparing my figures for nine months with those for a year in the accounts, and when he asks dramatically, "Which are correct?" the obvious answer is that both figures are correct, as they are for different periods, and are expressly stated. On the one item of repayment of debt and interest one quarter's charge exceeds £288 alone. Now, either Mr. Baker knew he was comparing figures for dissimilar periods, and so tried to willfully mislead your readers, or he had not read the paragraphs or figures which he criticises, and criticism displaying such gross carelessness is unworthy of a schoolboy. Moreover, if Mr. Baker were to follow up the methods of his critique by suggesting to any trading company that they must pay back a large proportion of their capital (including cost of freehold land) to their shareholders out of income before they could declare a "profit," they would, I think, invite Mr. Baker to communicate his opinion to the marines. It may interest him to know that the valuer of the London County Council, from the nine months' figures out of which Mr. Baker distorts a loss of £1,522, values the first year's profits of this joint undertaking at £1,500, after allowing £800 for depreciation and £500 for establishment charges. As to the other "curious feature" Mr. Baker discovers in the increase of the Scavenging Committee's accounts, it hardly needs to be pointed out that the destructor undertaking has no more to do with the cost of collecting refuse and sweeping roads than it has to do with dubbing gullies or mending the streets. The increase in the stokers' wages over the contractor's estimate is due to the vestry adopting three shifts of eight hours each in place of the two shifts of twelve hours each, which were reckoned by the contractors on the lines of those destructors where the cost is "sweated" down out of labour. Possibly Mr. Baker has some cheaper and better scheme up his sleeve (as he darkly hints), but I would remind him that when he placed his scheme for this joint undertaking before the Shoreditch Vestry in 1893 (which found some curious support), he admitted he had not then built either an electricity station or dust destructor (his patent for the latter being then only on paper). Shoreditch has, at least, been wise enough not to trust the spending of what amounts to date to nearly £100,000 to amateur adventurers, and the results of the first full year's working (which should be published in about a fortnight) will, I think, bring quietness, if not conviction, to the most unreasoning opponents of this pioneer undertaking.

YARMOUTH SEA WATERWORKS.

A PROFITABLE UNDERTAKING.

For thirteen years the sea waterworks of the corporation have been at work without any serious breakdown. During the first five years 40,000,000 gallons were raised per annum; the last eight years over 100,000,000 gallons have been taken from the sea every year and used for flushing sewers, lavatories, animals, baths and street-watering. So great has been the demand, that the engine has been at work 12 hours per week. The water costs less than 1½d. per 1,000 gallons, and when the water company supplied it the corporation used to pay 1s. per 1,000 gallons. Not only has the 1½d. per 1,000 gallons paid all charges for capital repayment and interest, the use of salt water has effected considerable saving in repairs to gravel-made roads. The total expenditure on the existing works has been £5,600, and the gas engine raises 25,000 gallons per hour. The annual cost at first was £450, latterly it has reached £600. Now a larger supply is required, which necessitates an extension of the plant. The borough surveyor therefore recommended the town council, at their last week's meeting, to place electrically-driven triple pumps to raise 25,000 gallons per hour in a building at the north end of the South Beach gardens, with a service of 4-in. 3-in. and 8-in. pipes about the town, at a cost of £3,000, for which the annual interest and sinking fund charges would amount to £150. The recommendations of the surveyor were adopted without comment.

Llandudno.—A Local Government Board inquiry was recently held at Llandudno into an application of the district council for permission to borrow £1,701 for the provision of public slaughter-houses and £632 for a market and fire station. It was stated that the public slaughter-houses are intended to take the place of seven private slaughter-houses, as to the positions and insanitary state of which complaints have frequently been made by residents and visitors.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

215. Municipal Engineering Appointments in Canada, Qualifications Required for.—"B. B." writes: How are the engineering appointments made in the Canadian municipalities? Are the men trained at college, or are vacancies open to competition? Have English municipal engineers any chance of obtaining such berths in like manner to the appointments at Cape Town (South Africa) and Wellington (New Zealand)? I have a great desire to go to Canada, and I should like to know if it is possible to get a berth from here.

The reply to this query has been delayed, in order that we might obtain absolutely reliable information for the querist and others who may be similarly desirous of obtaining appointments in Canada. To this end we have been directing inquiries to engineers in Canada, and are now enabled to announce the following: (1) No qualifications are prescribed by law for a person to possess before he can become a municipal engineer in Canada; but in the majority of cities and towns the municipal engineers are members of the Association of Ontario Land Surveyors, which is what is known as a close corporation, admission to which is gained only by passing two examinations, classed as preliminary and final, in addition to which the candidate must have served his articles for a not less period than three years. The exceptions to this rule are in the case of surveyors duly authorised in other portions of her Majesty's dominions, or in the case of graduates in civil engineering from some recognised university. The secretary of the Association of Ontario Land Surveyors is Mr. A. J. Van Nostrand, Room D, Yonge-street Arcade, Toronto, who will, we understand, send a copy of the Surveyors' Act upon application. (2) When a city or town are about to engage an engineer, the vacancy is generally advertised in the leading provincial newspapers; but in many cases we are informed the local surveyor is also made the engineer. (3) Municipal engineers from England would at the present time, it is stated, stand a very poor chance of securing employment in Canada, although several English engineers have attained good positions in a few years. Such engineers would have, however, there is no doubt, it is said, made their mark if they had remained in England. (4) No special training is required of municipal engineers by law, but cities and towns are beginning to realise that an engineer should have a university training.

216. Highway Surveyorship: Certificate Recommended.—"Assistant Surveyor" writes: I wish to become a rural district surveyor. I am at present an assistant surveyor to a highway board. Would you kindly tell me what certificate would be of most help to me in seeking to obtain the above?

We are of opinion that the querist should obtain by examination the certificate of the Incorporated Association of Municipal and County Engineers, this being the best recognised and most valuable certificate an intending municipal or highway surveyor can obtain, which certificate will be of service to him in securing an appointment and in his future career. The secretary of the association is Mr. Thomas Cole, A.M.L.C.E., 11 Victoria-street, Westminster, S.W., from whom particulars and syllabus of the examinations may be obtained on application.

MUNICIPAL WORK IN BIRMINGHAM.

NEW SEWERAGE WORKS.

Important works of sewerage, which are roughly estimated to involve an expenditure of £60,000, formed the subject of a Local Government Board inquiry recently, Colonel A. G. Durnford, R.E., attending to receive evidence in support of the application of the council for sanction to borrow a sum of £35,760. The application was nipped. By far the larger proportion of the money, the town clerk explained, was in respect of the reconstruction of the Rea main sewer, between Lawley-street and Nechells, the estimate for which was £23,500. The old sewer was egg-shaped, and 5 ft. 9 in. in height and 3 ft. 6 in. in width. From gannings recently taken it had been found that the sewer conveyed about half of the sewage delivered at the outfall at Sallley, and its maintenance in proper working order was a matter of great consideration. When the sewer was examined it was found that the arch was cracked, the inverts were much worn, and in the opinion of the late experienced surveyor (Mr. Tilt) and the present surveyor (Mr. Price) immediate reconstruction was necessary. Owing to the large volume of sewage to be dealt with, any attempt to repair the sewer would be excessively costly, and for this and other reasons it was proposed to entirely do away with the old sewer. As the result of a conference between the city surveyor and the engineer of the Midland Railway Company, it was arranged that a new sewer, 6 in. circular, should be constructed upon a line almost parallel and close to the river Rea. The cost of constructing this new sewer, putting in the foundation and wall, was estimated by the surveyor at £28,000, and towards that amount the Midland Railway Company were willing to contribute £8,333, a third of the estimated cost. The company also requested the

Public Works Committee to divert and reconstruct that portion of the sewer between Lawley-street and Viaduct-street, and of the estimated cost of £2,800 they agreed to contribute £2,300. From the boundary of the Midland Railway Company's property the existing sewer ran through land of the corporation gas department, and in connection with extensions going on there the Gas Committee thought that it would be very advantageous if the new retort-house could be built over the site of the existing sewer. The diversion and reconstruction of the sewer was suggested to the Public Works Committee, and the total cost of that portion of the works, providing for a 7-in. circular sewer, was estimated at £21,000, towards which the Gas Committee agreed to contribute £13,000. Smaller items brought the total expenditure involved up to £57,000 odd, and the contributions thereto amounted to £23,633, leaving £33,000 odd to be borrowed. The application for sanction to borrow in respect of sewers included a further item of £2,260. The town clerk also called evidence before the inspector in support of the applications to borrow £7,000 for extensions at the Sallley depot wharf, and £4,730 for purposes of paving and other street improvements. In the latter connection £2,800 was required in respect of the purchase of property and other matters necessary for the rounding-off of an awkward bend in Longmore-street and Gooch-street, an improvement greatly to be desired in the public interest and safety. The inspector took careful notes of the evidence and promised to make an early report to the Local Government Board.

SUPERANNUATION OF MUNICIPAL OFFICERS.

LOCAL AUTHORITIES' OFFICERS' SUPERANNUATION BILL.

In connection with the conference, which has been convened for 8 o'clock on Monday, at Stion College, Victoria-embankment, E.C., the Municipal Officers' Association have, through their hon. secretary, Mr. C. J. F. Carnell, issued a circular, in the course of which he states:—

The object of the conference is to bring before the officers of the municipal service the absolute necessity of doing their utmost in the next session of Parliament to induce the local authorities under which they serve to view with favour the above Bill, and to secure promises of support from the member of Parliament representing their division. The conference, composed of three delegates sent by associations and societies representing municipal officers, is anxious to re-introduce the Bill next session, and with the assistance of every individual officer throughout the country is satisfied that the measure will eventually be passed into law.

I may say that in some quarters it has been urged that the fund would be a charge upon the rates, but this is not borne out by the working of the Poor Law Officers' Superannuation Act, 1896, and you will see from the following extract that for the six months ended Lady Day, 1897, after paying all superannuation allowances, there is a surplus in favour of the rates of £15,424.

Extract from the twenty-seventh annual report of the Local Government Board, 1897-98, p. 369:—

"Amount of percentage deducted from salaries, &c., under the Poor Law Officers' Superannuation Act, 1896.	£17,683.
"Amount paid as superannuation allowances under the provisions of the above Act	£1,259."

The following resolutions will be submitted: (1) "That this meeting, representing municipal officers throughout the country, pledges itself to do all in its power to secure the passing of the Local Authorities' Officers' Superannuation Bill in the next session of Parliament." (2) "That a copy of the above resolution be sent to the members of Parliament, asking them to support the measure."

Notice of motion by Mr. F. Cliffe (Incorporated Society of Inspectors of Weights and Measures): "In view of the passing of the Elementary Teachers' (Superannuation) Act, 1898, and the extension of that Act to Scotland, together with the statement in the House of Commons by Mr. Balfour when introducing the Bill, that 'he saw no reason why Scotch teachers should be placed in a different position in regard to superannuation to those in England,' this conference decides that the Local Authorities' Officers' Superannuation Bill, when next introduced into Parliament, shall also be extended so as to apply to Scotland."

The chair will be taken by Mr. C. William Tagg, chairman of the conference, supported by Sir John Blundell Maple, M.P., Major P. H. Dalbiac, M.P., John Lowles, Esq., M.P., and other influential gentlemen. No tickets will be required.

Johannesburg Sewerage Scheme.—The following special cable has been received at the London office of *The Johannesburg Standard and Diggers' News*: "The Government has arranged to inaugurate an adequate sewerage scheme for Johannesburg and the mines of the Witwatersrand. The water will be drawn from the surplus supplies of Zuurbekom, where there is more than ample for all requirements. The sewerage contract has been granted to Mr. E. Mendelssohn, who was largely responsible for the discovery of the Zuurbekom source and its addition to Johannesburg water supply."

Law Notes.

EDITED BY J. B. REIGNIER CONDOR, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, once & only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, questions of local interest should be referred to the "Local Editor." A copy of any letter sent must be drawn on a letter in black ink only. Correspondents should wish their names published, and their names and addresses.

PUBLIC HEALTH (LONDON) ACT, 1891, SEC. 120, SUB-SEC. (3).—This sub-section provides that where only two of the persons responsible for a nuisance have been proceeded against they may recover summarily from the others a proportionate part of the costs of and incidental to such proceedings and abating the nuisance, and of any fines or costs inflicted. In *Prevost v. Jolly* (Worship-street Police Court, 3rd October) the point in dispute was: What are costs of and incidental to the proceedings within the meaning of the section? The complainant had been summoned by the Poplar Board of Works in respect of a nuisance arising from a choked combined drain used for the drainage of several houses, some of which belonged to the complainant and some to the defendant. The complainant engaged a solicitor to appear in the proceedings by the board and called witnesses. An order was, however, made against him, in compliance with which he abated the nuisance. He now sought to recover from the defendant under this section a proportion of his solicitor's bill of costs and fees paid to witnesses, &c., as well as of the expense of putting the drain right. On behalf of the defendant it was contended that he had from the first been ready and willing to contribute to the expenses of abating the nuisance, that the complainant in allowing himself to be proceeded against and engaging a solicitor and defending the case had unnecessarily increased the expenses, and that these additional items were not costs of and incidental to the proceedings within the meaning of the section. The magistrate (Mr. Corser) decided in favour of the complainant and made an order for the payment of the proportion claimed, amounting to £17 3s. 9d.

QUERIES AND REPLIES.

PUBLIC HEALTH LAW RELATING TO SCOTLAND.—"Public Health Student" writes: Will you kindly inform me what Acts of Parliament to study that affect the public health of Scotland—e.g., the Act or Acts corresponding to Public Health Act, 1875, which does not apply to Scotland.

The law of public health relating to Scotland was consolidated in the Public Health (Scotland) Act, 1897 (60 and 61 Vic., c. 38), repealing wholly, or in part, several previous Acts. The unrepealed portions of the Local Government (Scotland) Act, 1890 (52 and 53 Vic., c. 50), and of the Local Government (Scotland) Act, 1891 (57 and 58 Vic., c. 68), should also be referred to, as well as 39 and 40 Vic., c. 31, sec. 6 (Public Works Loans), 39 and 40 Vic., c. 75, and 40 and 57 Vic., c. 31 (Rivers Pollution), 41 and 45 Vic., c. 37, sects. 5, 10 and 27 (Alkali, &c., Works).

BORROWING POWERS OF LOCAL AUTHORITY: PUBLIC HEALTH ACT, 1875, SEC. 235.—"Nemo" writes: Sec. 235 of the Public Health Act, 1875, gives power to raise a mortgage on land or works possessed by an authority for works of sewage disposal. My council have land, buildings and pumping plant at their sewage farm on a lease, the unexpired term of lease being thirty-eight years. Will the council be able to borrow on such lands, buildings, &c.? In other words, does the term "possessed," used in the section, mean that the authority must possess the freehold in order to borrow on such works?

In my opinion the borrowing powers conferred by this section are applicable to the land and buildings referred to. The Interpretation Act, 1889, sec. 3, provides that in every Act passed after the year 1850 the expression "land" shall include messuages, tenements and hereditaments, houses and buildings of any tenure.

SURVEYOR TO DISTRICT COUNCIL: SECURITY PREMIUM.—"Surveyor" writes: I have just been requested by my council to obtain a guarantee (according to the Public Health Act) for £100 from a guarantee society. This I have done, and have to pay an annual premium of 12s. 6d. Is there anything to prevent the council (if willing) paying the annual premium?

There appears to be nothing absolutely prohibiting this, but it might give rise to a question on the audit of the accounts. The better plan would be to make a trifling increase of salary to cover it.

TEMPORARY IRON MISSION HALL.—"Surveyor" also writes: Plans have been deposited for approval which is to be of a wood and iron structure (Humphries, Limited). The urban district council will not pass the plans, as they say they are not in accordance with the by-laws; they maintain that the walls should be of bricks. I enclose copy of by-laws for your reference. Will you kindly give me your opinion on the matter.

Assuming that the mission hall does not fall within the category of "exempted buildings" enumerated in By-Law 2, the question is whether it is a "new building." This is a "question of fact" for the magistrates to decide (*James v. H. Griffith*, 51 L.T. (N.S.), p. 27). The High Court has, however, in some cases considered the question, and it may be useful to note one or two of these. In *Richardson v. B...* (19 J.P., 61) a wooden structure, 30 ft. by 31 ft., standing on wheels, with spouts, a down corner and a supply of gas, and used as a butcher's shop, was held to be a new building. In *Stevens v. Goring* (29 J.P.,

C.P.) a wooden shop erected on a site not having no foundation or foundations in masonry, and capable of being taken down, was held to be a building. In *H. J. v. J. P.* (17 J.P., C.P., 99) a shed standing against a wall, with a roof of iron, and the roof and eaves consisting of six posts fixed to the ground and supported on a lattice-work which formed the roof, one side being leaned up with boards parallel to the posts, was held to be a building. In *Re the case of the post, &c.*, *Attorney v. Dudley v. Cradock* (London, E.C. District Council v. The Surveyors, &c.), where the Queen's Bench Division held that a corrugated-iron structure was a building, it was stated that the Council mentioned that it was exempt from by-laws relating to new buildings. In my opinion, having regard to these cases, the Council are justified in refusing to pass the plans.

PARTNERSHIP.—"A Young Surveyor" writes: (1) I shall be glad if your Law Editor will inform me, through the columns of your valuable paper, if it is possible and legal for a young surveyor (B) to join another in partnership (A finding all capital and B being a working partner), to receive a share of the profits of the business, and have all the usual powers as may be necessary or proper for the enjoyment of his rights and discharge of his duties as partner, and yet not to have any financial liability in respect of the business if this is expressly stipulated in the deed? (2) Can you kindly refer me to any book in which I shall find a really good form of a partnership deed with the usual mutual covenants?

(1) If B becomes a partner he cannot avoid financial liability, and any agreement (whether verbal or in writing) between two or more persons to share profits is *prima facie* evidence of partnership. He will, however, become manager to A in a salary equal to a proportionate share of profits, but in that case he would not have the rights of a partner, and a very carefully drawn agreement would be required. (2) I advise B to have a proper agreement prepared by a solicitor. It will be the cheapest in the end.

BY-LAWS: WALL OF WATER-CLOSET: IS A DOOR A WALL?—"R. O." writes: I cannot but express my surprise at the opinion given by you in your answer to "Perplexed," in your issue of the 14th inst. Although it may at first sight appear absurd to contend that a door is a wall, you must remember that the side of a room may contain a doorway, and that our speaks of the whole as a "wall" not a "wall and doorway," although the doorway may take up the greater portion of the wall. In the case of a water-closet the side is usually so small that a doorway takes up the whole of the wall; but it is, nevertheless, I maintain, a wall. Looking at the matter from a sanitary point of view, what earthly objection is there to the arrangement? The objects of the by-law are, I take it, that the light and air from outside may have direct access to the water-closet, and that any drain from the water-closet may pass direct to the outside. Are not these advantages fully secured by this arrangement? I should feel sincerely sorry for the builder whose house is condemned on, what appears to me, a paltry quibble.

I am quite ready to admit that a window in the door might answer every purpose, though as to this I am hardly qualified to express an opinion. This, however, is not the point. The query propounded by "Perplexed" was not whether "the objects of the by-law" would be "fully secured" by a window in the door, but whether he was "correct" (i.e., as I understand it legally justified) in refusing to pass a water-closet with this arrangement. Upon this point I adhere to the opinion already expressed. "R. O." argues that where "a doorway takes up the whole of the wall," it is, nevertheless, a wall. This is rather a puzzling proposition. In the first place the phrase "a doorway takes up the whole of the wall," if it has any meaning at all, must mean that the doorway occupies the place of, and is substituted for, a wall, and therefore that there is no wall. No wall standing, which "R. O." contends that "it" is a wall. But is a wall? Surely not the doorway? And yet there is nothing else left. To what then does "it" refer? Perhaps, however, "R. O." will consider this a "paltry quibble," and say that of course he means the door as ordinarily a window cannot be inserted in an empty doorway. If it is a doorway, what becomes of all the by-laws as to the construction and thickness of walls? With regard to the argument that where there is a doorway in the side of a room the whole is, nevertheless, called a "wall," not a wall and doorway, I do not see that this affects the question. Surely "R. O." would not contend that if in such a case a by-law required a window in the wall, it would be a compliance with that by-law to put a window in the doorway? And if not in that case, why in the case of a water-closet? It may or may not be that the by-law operates harshly, but as it stands it seems to me that "R. O." is contrary to plain logic to adopt the construction for which "R. O." contends.

A Presentation Portrait.—We have to acknowledge the receipt from the New York Insurance Company of a beautiful photographic portrait of Mr. W. McKinley, president of the United States, with his signature attached.

Bravery Rewarded.—In a recent issued list of awards the Royal Humane Society state that they have awarded a bronze medal to William Travis, employed by Messrs. Underwood Brothers, contractors, Duke Field, for having at great risk rescued a fellow workman from a narrow space, in which he had got jammed.

Municipal Work in Progress and Projected.

We are able this week to publish particulars of several important municipal works—namely, those being carried out by the local authorities at Hastings, Abercorn, Barry, Bexhill, Batley, Dorchester, Leeds, Manchester, Nelson and other places.

METROPOLITAN AUTHORITIES.

LONDON COUNTY COUNCIL.

The county council on Tuesday managed to dispose of their agenda—a comparatively small one—without much discussion. The only matter which elicited a discussion at all was the General Purposes Committee's report in reference to the proposed appointment of a "chief officer of tramways." Some members considered that the salary proposed to be offered—*viz.*, £1,500—was excessive, but eventually the committee's recommendation was adopted, after two amendments that the salary should be £1,000, and £1,250 rising by £50 per annum to £1,500 were rejected. The important joint report of the Housing of the Working Classes and the Improvement Committees, the recommendations of which involve an expenditure of £118,740, was again brought up and adopted without discussion.

Loans for Public Works.—Upon the recommendation of the Finance Committee it was agreed to lend the Chelsea Vestry £8,000 for paving works, the Islington Vestry £22,500 for electric lighting purposes, the St. Martin's Vestry £2,860 for paving works, the Shoreditch Vestry £8,200 for electric lighting purposes, and the Westminster Vestry £15,000 for paving works.

The Tramways Department.—The General Purposes Committee presented a report recommending that a head of the new Tramways Department, to be styled "Chief Officer of Tramways," should be appointed at a salary of £1,500 a year, and that advertisements should be issued inviting applications for the appointment. This was agreed to, after the rejection of amendments that the salary should be £1,000 and £1,250 per annum.

Retirement of the Superintending Architect.—The General Purposes Committee reported that Mr. Blashill, the superintending architect, had attained the age of sixty-eight years, and was entitled to retire on a pension. The normal age for retirement is sixty-five, but under special resolutions of the council Mr. Blashill's services had been retained during the past three years. The committee expressed the opinion that Mr. Blashill's services had been most devoted and valuable, and recommended that his pension should be £525 a year, being at the rate of 21-60ths of his salary of £1,500 a year, ten years being added to his eleven years of actual service, as authorised by the Superannuations Act, 1866. They also recommended that an advertisement should be inserted inviting applications for the appointment of a superintending architect, at a salary of £1,500 per annum. After considerable discussion, in the course of which several members paid high tributes to the value of Mr. Blashill's services to the council, the recommendation of the committee was adopted.

The Clare Market Relouising Scheme.—The Housing of the Working Classes and the Improvements Committee presented a joint report, in which they recommended the council to purchase from the Duke of Bedford, for £118,740, two plots of land in Drury-lane and one in Herbrand-street, near Woburn-place, Russell-square, in order to erect thereon dwellings to rehouse persons to be displaced by the Clare Market improvement scheme and the proposed new street from Holborn to the Strand. Full particulars of the report are published in another column. The recommendations of the committees were adopted without discussion.

Water Connections.—On the motion of Mr. Purchase, the Water Committee were instructed to consider and report as to the best means of compelling the London water companies to bear the cost of conveying the water from their mains to the houses, buildings, &c., of the consumers.

Proposed New Embankment.—Mr. Gilbert moved: "That it be referred to the Improvements Committee to report as to the cost of making an embankment on the south side of the Thames from Westminster Bridge to Blackfriars Bridge, and that they specially report on the following points: (a) on the desirability of retaining the whole of the property benefited by the improvement as the property of the council; (b) on the desirability of reserving a part of the site for a large housing scheme; and (c), after consultation with the Establishment Committee, on the advisability of reserving a site at the western end of the proposed embankment for a new council chamber and offices." As, however, the resolution found no second, the matter was dropped.

Tenders.—The following tenders were opened for the supply of gas engines for the Lots-road pumping station: Premier Gas Engine Company, Limited, £9,590; Campbell Gas Engine Company, Limited, £10,000; J. E. H. Andrews & Co., Limited, £10,300; Fielding & Platt, Limited, £10,150; J. Taylor & Sons, Limited, £10,620; and Crossley Brothers, Limited, £10,744.

COURT OF COMMON COUNCIL.

The Lord Mayor presided on Thursday at the usual meeting of the above body at the Guildhall. The City Lands Com-

mittee presented a report with reference to the throwing open to the public of the garden in the centre of Finsbury-circus. The committee recommended that the reference should be discharged, and in their report stated that the corporation had not exercised any right over the garden for many years past, and that the leaseholders objected to the garden being turned into an open space. One person having the "right of user" objecting to the opening of the garden could prevent the corporation from carrying out the proposal. Even if it were done, it would probably involve the compensation of various interests, while nothing could be done without an Act of Parliament. The members of the London Institution strongly objected to the proposition, believing that it would be highly detrimental to the institution and the objects for which it was established. Some discussion followed, in the course of which Mr. Morton moved, as an amendment, that the question should be referred to the Streets Committee to consider and report. Further discussion followed, Alderman Smallman suggesting that the court should take the present report as an answer to the reference to the committee, and that Mr. Morton should give notice of motion that the Streets Committee should consider the way in which the garden could be thrown open. This suggestion was accepted, and the amendment as altered adopted.—The court agreed to the expenditure of £530 in fitting improved dust-shoots to the dwellings in Corporation Buildings, Farringdon-road, to replace those condemned by the sanitary authorities. The court next proceeded to deal with the business of the Public Health Department, but no officers of the department being present (with the exception of Mr. H. M. Bates), the Lord Mayor adjourned the court, leaving the whole of the work of the department untouched.

METROPOLITAN ASYLUMS BOARD.

The Metropolitan Asylums Board met on Saturday, at the County Hall, Spring-gardens, Sir E. H. Galsworthy, the chairman of the board, presiding. It was mentioned that the inquiry ordered by the Local Government Board with regard to the cost of the Brook Hospital had been held, and proposed that a sum of £101,830, which remained unaccounted for by the board, should be applied for. This was agreed to.—After some discussion the managers decided to adopt a resolution of the General Purposes Committee to the effect that a reference to the committee from the board on the 8th inst. respecting the proposed establishment of a bacteriological laboratory for London should be discharged. It was pointed out that the reference had only been made after the London County Council had taken up the matter. It would be time enough for the board to take up the question if the county council decided to do nothing.

VESTRIES AND DISTRICT BOARDS.

Battersea.—At a meeting of the vestry on Wednesday, the Finance Committee reported that the London County Council had offered to lend £1,546 at 3½ per cent. for the construction of public conveniences in the shrubberies in Battersea Park. As the rate of interest was in excess of that charged in the past, the committee had applied to the Public Works Loan Commissioners, who were prepared to advance the amount required at 2½ per cent. On the recommendation of the committee it was resolved to borrow the money from the commissioners.—The vestry appointed two delegates to represent them at the forthcoming conference to be held at the Islington Vestry Hall to consider the question of the reform of the local government of London.—The Cemetery Committee announced that they had considered the drawings and specification prepared by the surveyor, Mr. J. T. Pilditch, together with the bills of quantities by the quantity surveyor, for the erection of six cottages at the Morden cemetery. As it appeared that the cost, as estimated by the quantity surveyor, would amount to £2,023, or £585 in excess of the surveyor's approximate estimate, the committee recommended that the proposal to build the cottages should be abandoned. The recommendation was, however, referred back to the committee for further consideration.—The Works Committee submitted a statement showing the actual cost of carrying out by direct labour the extension of the central library, Lavender Hill, as compared with the estimate. According to this statement the total cost, including 7½ per cent. for establishment expenses, amounted to £2,159, being £94 in excess of the original estimate. The vestry decided to receive the report.—A letter was read from the London County Council stating, in reply to the vestry's communication relative to the erection of workmen's dwellings, that the council had adopted a recommendation in favour of vestries and district boards of works being empowered to adopt Part III. of the Housing of the Working Classes Act, 1890. The council added that the subject had been referred to the Parliamentary Committee to report upon the steps to be taken in the matter.—In reply to a question as to the position of the electric lighting scheme, the chairman of the Lighting Committee stated that the project was "on the move."—The vestry sealed contracts with Messrs. Adams & Co. for the supply of sanitary fittings for the new chalets in Victoria-circus, and with the Tees Scoria Brick Company for the supply of Tees scoria channelling sets.

Crewnich.—A meeting of this board was held recently with reference to a suggestion from the chief officer of the fire brigade that where a street lamp was within a few feet of a fire alarm it should be painted a bright red. The District Committee recommended that the county council be informed that the board were prepared to adopt the suggestion, and that such lamps be painted that colour accordingly. This was agreed to.

Hampstead.—At last week's meeting of the vestry the Free and Open Spaces Committee reported that they had viewed the Golder's Hill estate, towards the purchase of which as an extension of Hampstead Heath the vestry recently voted £10,000; that they had taken part in a joint conference with the Acquisition Committee; and that, as a result of the conference, they recommended the vestry to forward the following recommendations to the London County Council: (1) That the estate should be dedicated absolutely to the use of the public for ever. (2) That the council should have power to enclose, or keep enclosed, the whole or any part of the estate, and to restrict by by-laws the use of such enclosed space by the public to the hours of daylight only. (3) That the council should take power to use the mansion, or any part thereof, for a museum, library, refreshment-rooms or any other purpose conducive to the instruction, amusement, health or convenience of the public. (4) That the Parks Committee of the council be asked to receive a deputation, consisting of the Free and Open Spaces Committee of the vestry and of the Golder's Hill Estate Acquisition Committee, when these recommendations are considered. The recommendations were adopted.

Lewisham.—Last week, at a meeting of the district board of works, the Blackheath and Lewisham Local Committee reported that their attention had been called to the condition of the concrete wall forming the bank of the mill pond at Southend, next the roadway. It had been suggested that the roadway should be widened and improved by throwing into it the strip of land along the pond. The committee recommended that the plan submitted be approved and forwarded to the freeholder for his approval, and that he be asked to give up the ground necessary for widening the road in the manner proposed. The committee were of opinion that this improvement, if carried out, would be one to the cost of which the board would be able to ask the London County Council to contribute. The recommendation was adopted.—The Works Committee reported that they had considered the memorandum from the Chief Commissioner of Police referring to the difficulty in dealing with the congested traffic of public thoroughfares occasioned by the watering of the sides of the streets. The surveyor had reported on the memorandum, and the committee concurred in the opinion expressed by him that it did not apply to streets such as those in the Lewisham district, but rather to paved and asphalted streets in the more crowded parts of London. They recommended, and the board approved, therefore, that no action be taken in the matter.

Limchouse.—A letter has been received from the London County Council stating that the Improvements Committee could not see their way to recommend the council to incur so large an expenditure as £1,030 for the purpose of providing hydraulic machinery to work the Wapping swing bridge. The letter has been referred to the Works Committee for consideration.

Paddington.—The vestry resolved last week, on the recommendation of the Finance Committee, to contribute the sum of £500 towards the purchase of the Golder's Hill estate for the extension of Hampstead Heath.

Westminster.—Last week, at a special meeting of the vestry, it was resolved "that, in view of the very large increase in the price to be paid to the contractor for slopping and dusting, a small committee be formed to consider and report to the vestry as to the practicability and advisability of the vestry doing their own slopping and dusting."

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Hertfordshire.—The county council, at a meeting on Monday, decided to memorialise the Local Government Board complaining that serious injury had been done to the water supply of the county by the enormous quantity daily abstracted from it by the London water companies. Sir John Evans stated that the Chadwell spring had failed, and the great spring at Wollmers Park, which formerly discharged over 1,000,000 gallons a day, had gone dry, in addition to which other springs had totally failed or were greatly reduced in volume. The heads of rivers were lower down the valleys than they had ever been known before. Numerous wells on the highlands were completely dry, and the bore pipes in waterless-heds had ceased to discharge. The council also gave instructions for evidence to be collected as to the condition of the springs, rivers, and water supply generally, to enable them to secure protection.

Middlesex. The General Purposes Committee of the county council, who have been considering the request of the syndicate which purchased Golder's Hill to give £1,000 towards the purchase price, have recommended that a grant of £500 be made. It was understood by the committee that

that would be sufficient, as the remaining £500 would be forthcoming from another source. These two sums will complete the £11,000 required.

Somersetshire.—At a meeting of the county council on the 15th inst. the Sanitary Committee reported that they had considered a further report from the Long Ashton Rural District Council with regard to the alleged pollution of the Long Ashton stream, and, in view of the unsatisfactory nature of such report, again recommended the council to direct that an independent report upon the state of the stream be made. The recommendation was adopted.

MUNICIPAL CORPORATIONS.

Bacup.—On the recommendation of the General Works Committee the town council have decided to take for their electric lighting order to a company.

Batley.—Local Government Board sanction has been received by the corporation to a loan of £15,500 for works of surface-water drainage.

Birmingham.—Sir Francis Marindin, Board of Trade inspector, recently visited the city for the purpose of making the septennial examination of the tramway lines. Among those who gave their assistance were Mr. T. Arndt (of the city surveyor's department) and Mr. H. Richardson (surveyor to the Aston Urban District Council), who met the party at the borough boundaries.

Bournemouth.—At the last meeting of the town council it was proposed to apply for powers, under the Light Railway Act, to lay down and work tramways in the borough. The proposal was, however, defeated.

Brighton.—The town, it is stated, was plunged into darkness on Thursday night owing to the temporary failure of the electric light. Just after 9 o'clock the current failed, and caused considerable inconvenience in the central thoroughfares, in business establishments, and in the main streets generally. Darkness reigned for twenty minutes, and there was much excitement in the theatres and music halls.

Bristol.—The city council have declined to proceed with the dock extension at Avonmouth. They however, have instructed the Docks Committee to report within three months on the cost of dockising the river Avon and making provision for the largest class of steamers afloat. The cost of the extension at Avonmouth hitherto has been reckoned at £1,500,000 and of dockisation at £2,000,000.

Bury.—At a recent meeting of the town council the Health Committee reported that the Abattoirs Sub-Committee had inspected the Birmingham abattoirs, and as a result had instructed Mr. Neill to draw up sketch plans; these plans had been submitted to a subsequent meeting of the sub-committee, the estimate for abattoirs, refrigerators and all necessary plant amounting to £14,000. The Health Committee recommended the council to adopt the principle of such plans and to instruct Mr. Neill to prepare the necessary working drawings and specifications. The recommendation was adopted.

Eccles.—On Saturday Major-General H. D. Crozier, R.E., inspector to the Local Government Board, opened an inquiry into an application of the town council for sanction to borrow £1,031 for works of private street improvements in Eccles and Patricroft. There was no opposition.

Hastings.—A Local Government Board inquiry was held on the 15th inst. into an application of the corporation to borrow a sum of £58,000 for the purpose of acquiring the undertaking of the Hastings Electric Light Company. The proceedings occupied a considerable time.

Ipswich.—The sanction of the Local Government Board has been received to the borrowing by the corporation of £4,000 for the construction of an overflow sewer from Hyde Park-corner to Constantine-read, and for the construction of the exteriors of sewers in Belstead-road and Branford-road. The plans for the works have been prepared by Mr. E. Buckham, the borough surveyor.

Kidderminster.—The seal of the council has been fixed to the agreement with the British Electric Traction Company for the sale of the Electric Lighting Order, 1891, to that company.

Leamington.—It was resolved, at a recent special meeting of the town council, to apply to the Board of Trade for a provisional order under the Electric Lighting Acts, 1882 and 1888, to authorise the council to supply electricity for public and private purposes within the borough.

Liverpool.—Since the Liverpool tramways were taken over by the corporation the question of electric traction has occupied the attention of the Tramways Committee. Already a new line on the overhead electric trolley system has been constructed, connecting the city with one of the southern suburbs, and at their next meeting the city council will be asked to authorize a scheme recommended by the city engineer, by which it is proposed to apply the system of electric traction to several of the existing lines, as well as to some short new lines about to be constructed.

Loughborough.—At a special meeting, held last week, the town council decided to present a Bill in the next session of Parliament to authorise the corporation to purchase and acquire, either by agreement or compulsorily, the under-

in diameter, measuring about 14 ft., and weighing upwards of 1 ton each, under the bed of the river has been accomplished, notwithstanding the large quantity of water and the looseness of the soil.

Swadincote.—The district council propose to obtain sanction to a loan of £32,000 for the purchase of the gasworks and the carrying out of necessary improvements. The improvements include the connection of the gasworks with the Midland Railway by means of a siding, at a cost not exceeding £190, and the extension of the gas mains to Stanton and Castle Gresley.

Wallasey.—At a special meeting of the district council, held last week, it was decided to promote a bill for taking over the tramways and working them by electricity, extending the promenade and widening roadways.—A public meeting of ratepayers to sanction the promotion of the bill was afterwards held, and an animated discussion took place, dwellers in Wallasey township objecting that their district was neglected while other parts were disproportionately improved. On a vote being taken, the chairman declared that the result was close, but that the resolution approving the bill was carried. Mr. R. W. Preston then demanded a poll of the district, which will be taken.

Yeovil.—The town council have appointed their surveyor, Mr. W. K. L. Armytage, engineer for the sewage disposal scheme about to be undertaken by them. The principle to be adopted is the septic tank system, the corporation having satisfied themselves of its efficiency after two years' working of the trial installation put down in September, 1896, under the surveyor's supervision, in conjunction with the Septic Tank Syndicate.

RURAL DISTRICT COUNCILS.

Eastry.—At a recent meeting of the council it was stated that the Local Government Board had sanctioned a loan of £1,900 for the purpose of providing a water supply.

Hayfield.—Local Government Board sanction has been received to a loan of £1,200 for the completion of the sewerage works.

Penistone.—At a meeting of the district council on Thursday a letter was read from the Local Government Board declining to modify their requirements in regard to the proposed scheme of sewage for Langsett. The clerk reported that the Sheffield Corporation would in all probability devise a less expensive scheme, which would meet the requirements until the waterworks were completed.

St. Thomas.—Members of public bodies, surveyors to councils and others have been anticipating with some degree of interest a case which it was announced would have been tried at the Devonshire Quarter Sessions at Exeter on Tuesday of last week. It would appear that the council, acting upon the reports of their surveyor from time to time, called the attention of Mr. Wm. Gibson, of Exeter, to the excessive wear and tear of their roads caused by his traction engines, particularly in the conveyance of large quantities of stone from quarries west of Exeter. A good deal of correspondence ensued between the clerk to the council (Mr. Arthur Ward) and the solicitors to Mr. Gibson (Messrs. Ford, Harris & Ford, Exeter), which culminated in an offer by the latter of a large quantity of stone, free and delivered without charge to any part of the council's district, in satisfaction of all claims against him up to the date of delivery. The offer was made without prejudice. It came before a meeting of the council on September 2nd. As the value of the stone offered was considerably below the claim preferred by the council against Mr. Gibson, this proposed compromise was rejected, and the council authorised their clerk to commence proceedings against the owner of the engines for the recovery of the amount of their bill. The tribunal for such suit is the court of quarter sessions, where it was stated the action would be heard. As the result of further negotiations between the parties, however, the matter is understood to have been arranged.

Tarvin, Cheshire.—An inquiry was on Thursday held by Colonel A. G. Durnford, R.E., on behalf of the Local Government Board, concerning an application of the council for sanction to borrow a sum of £1,500 for the purpose of providing a water supply for the townships of Tiverton, The Wain, Fearnall and Beeston. The wells in these villages are few and far between and yield a most scanty supply, many of them being dependent upon dip wells, which, of course, are exceedingly liable to pollution. Mr. Birch Kiloh, of Manchester, in explaining the scheme he had prepared, said that 20,000 gallons per day could be raised by the proposed works going three days a week. This would mean approximately about 20 gallons daily per inhabitant. If one well (already bored) prove insufficient, the scheme provided for the sinking of another near the present one.

SCOTLAND AND IRELAND.

Alloa. On the 13th inst. the provincial magistrate and commissioners made their annual inspection of Gairnorn waterworks. The party, beginning with the old services supply works, inspected in succession the settling ponds, filters, hydraulic pumps, overflow and reservoir in connection with both systems afterwards recommended by way of the

upper aqueduct as far as Forcreek, where each was served. The visitors found everything in good working order, and were gratified to find that an ample supply of water was passing from the upper hole into the latter.

Clydebank. The proposed new municipal buildings, as shown by the amended plans prepared by Mr. Miller, the architect of the 1901 Exhibition buildings, are a practical plan, and will cost, it is estimated, £274,000, which is £9,000 more than that of the previous plans drawn up by him. The public hall, especially, is remodelled on larger lines, and will now accommodate from 1,500 to 2,000 persons.

Edinburgh.—Some time ago the town council resolved to erect a new bridge over the Water of Leith at Bonnington. Negotiations were afterwards opened with the Leith Corporation, a portion of the bridge being in their hands, and a deputation to the Edinburgh and an interview with the Leith Town Council on the subject. The Leith representatives acquiesced in the Edinburgh proposals. The only point which now remains to be adjusted is the proportion of cost which each municipality should be asked to bear. The proposals, which involve an expenditure of over £5,000, include the widening and levelling of the roadway up to the railway station.

Glasgow.—The Gas Committee of the corporation have at present under consideration the question of extending the gasworks of the city. Mr. W. Foulis, the engineer, recommends the purchase of ground extending to about 110 acres, Monkland canal and the Caledonian railway branch line, for the erection of works capable of manufacturing 40,000,000 cubic feet per day, thus enabling the corporation to close the Dalmarock works, which at present produce only 6,000,000 cubic feet per day. The Telephone Council have agreed, in view of the proposed municipal installation, to erect as an experiment an automatic switchboard in the municipal buildings for trial. The system is in use in one or two cities in America. Its object is to dispense with the services of the telephone girls, the subscribers, by aid of this device, making their own connections.

Limerick.—The Board of Works have intimated to the corporation that the Treasury are now prepared to grant the application of the corporation for sanction to a loan of £5,000, with which it is proposed to carry out improvements in Irish-town and English-town. A provisional order authorising the scheme under the Housing of the Working Classes Act, 1890, has already been obtained.

Perth.—The Lord Provost recently inaugurated the new manure depot at Friarton, new stables and a culvert, by means of which a hide and the sewage of the general prison and the Craigie district are conveyed direct to the river, leaving a valuable piece of ground to be used for other purposes. The works have been carried out at a cost of upwards of £8,300. At the last quarterly meeting of the Central District Committee of this authority it was remitted to the Special Water Committee of Comrie to instruct Mr. Copeland, C.E. Glasgow, to prepare working plans and specifications and to obtain estimates for the proposed works. Mr. Copeland estimated the total expenditure at £1,500, when it was resolved to borrow the sum of £1,600.

Port Glasgow. At last week's meeting of the town council it was agreed to carry out improvements at the baths, at a cost of £100. It is proposed to extend the dressing-room accommodation and to erect a gymnasium.

Received into late for Classification.

CORPORATION OF THE CITY OF BIRMINGHAM.

The Public Works Committee are prepared to receive applications for the appointment of a District Road Surveyor, in the City Surveyor's Department, at a commencing salary of £130 per annum.

Candidates, whose age is not to exceed forty years, must be thoroughly qualified persons, having had active practical experience in the construction, superintending and maintenance of roads and streets, and of the various classes of pavement used therefor; and also in the management of large bodies of workmen, and should be able to set out works accurately, take all necessary measurements and prepare estimates of cost.

The candidate elected will have charge of one of the five districts into which the city is divided for road purposes. He will be required to reside in his own district, and will be employed the same number of hours as the working staff. He will also be required to subscribe to the superintention scheme, and to devote the whole of his life-time to the service of the Corporation.

Applications, in candidate's own handwriting, stating age, experience, past and present employment, and accompanied with copies of not more than three recent testimonials, enclosed "District Road Surveyor," to be sent to the undersigned not later than 11th November next.

Candidates, either directly or indirectly, will be considered a disqualification.

JOHN PRICE,

City Engineer and Surveyor.

The Council Chamber, Birmingham,
October 27, 1898.

Personal.

Birstall Urban District Council have increased the salary of their surveyor, Mr. John I. Longden.

Portsmouth Town Council have decided to insure the whole of their electrical staff against accidents.

The Erdington Urban District Council have increased the salary of their surveyor by £100 per annum.

Mr. R. E. Hughes, surveyor to the Prestatyn Urban District Council, has submitted his resignation to that authority.

The salary of Mr. A. Wyllie, borough electrical engineer of Walsall, has been raised from £200 to £300 per annum.

The Urban District Council of Mold, Flintshire, have accepted the resignation of Mr. John Rowlands, engineer at their sewage farm.

Mr. C. H. Robinson, of Oldham, has been appointed an assistant at the central electric lighting station of the Dewsbury Town Council.

Mr. Sidney R. Smith, of Manchester, has been appointed to the position of engineering assistant under the Ilfracombe Urban District Council.

Mr. H. T. Hughes, Tilston, Malpas, has been appointed district road surveyor to the Chapel-en-le-Frith district of the Derbyshire County Council.

Mr. David Rosser, Newbiggin, has been appointed, from a number of applications, to the post of surveyor to the Newbiggin Urban District Council.

The death has occurred, at the early age of thirty-eight, of Mr. James Young, of the well-known firm of James Young & Son, railway and public works contractors.

Messrs. Lomax & Lomax, of Westminster and Manchester, have received instructions to report upon the best means of disposing of the sewage of Mödling, Vienna.

Mr. Peers, Deansgate, Manchester, has been appointed electrical engineer to the Buckley Urban District Council. There were thirty-four applications for the position.

Mr. Streeter, of Desborough, Derbyshire, has been appointed surveyor and inspector of nuisances to the Winton Urban District Council, at a salary of £140 per annum.

Mr. A. Colson, gas and electrical engineer to the Leicester Corporation, recently opened the winter session of the Leicester Literary and Philosophical Society with a lecture on "Electricity."

Mr. William Furnham, of the surveyor's department of the Vestry of St. Margaret and St. John, Westminster, has been appointed to the post of surveyor to the Milton-next-Sittingbourne Urban District Council.

The value of the estate of Dr. John Hopkinson, F.R.S., of "Holmwood," Wimbledon, and 26 Victoria-street, S.W., electrical engineer, who was killed on the Alps on the 27th August, has been sworn at £74,672.

On Friday, at a special meeting of the Pickering Rural District Council, Mr. J. W. Plews, who holds the position of surveyor to the Sherburn Rural District Council, was elected to a similar post under the first-named body.

The death has taken place of Mr. Philip Bracegirdle, the oldest servant of the Wilmstow Urban District Council. The deceased gentleman had been surveyor to the council for some twenty years, and was well known in all parts of the country.

Last week's business of the Merthyr Urban District Council included the appointment of an assistant surveyor. Three gentlemen, selected at a previous meeting, appeared, and the voting resulted in the election of Mr. Richard Abraham, of Cefn. The salary is £150 per annum.

The Building Clauses Committee of the Leeds Corporation have recommended the appointment of Mr. William Towers for the position of chief inspector of buildings, a post rendered vacant by the death of Mr. David Hainsworth. Mr. Towers has for twenty-two years acted as Mr. Hainsworth's assistant.

Mr. W. J. Dibdin was on Wednesday examined before the Royal Commission on Sewage Disposal sitting in Great George-street, Westminster. The commissioners were expected to visit the Sutton works this week, with a view to seeing the operations of the bacterial system in use at the sewage farm.

Major-General Phipps Carey, chief engineering inspector to the Local Government Board, and Mr. Rienzi Walton, deputy chief engineering inspector of the Local Government Board, visited Sutton recently to inspect the sewage works and examine the system of sewage purification adopted there. They were shown over the works by Mr. W. J. Dibdin, chairman of the council, and the surveyor, Mr. Chambers Smith, and both inspectors seemed highly pleased with the system and the result obtained. A full report of an interesting Local Government Board inquiry at Sutton is unavoidably held over, but will appear in our next issue.

At the last meeting of the Tendring Rural District Council the clerk reported that three of the six candidates selected by the Highways Committee for the appointment of highway surveyor were in attendance—namely, Mr. W. Coles, surveyor to the Stratford-on-Avon Rural District Council; Mr. G. F. Taylor, assistant surveyor in the Leeds Corporation Highway Department; and Mr. J. Garratt, Fakenham, surveyor of main roads under the Norfolk County Council. Two other candidates had written declining the invitation to attend on finding that the salary was inclusive of the keep of a horse. The candidates present having each been before the council, Mr. Coles was elected to the position.

The Baths Committee reported, at the meeting of the St. Pancras Vestry on Wednesday, that they had considered a letter from Mr. E. A. Gruning, vice-president of the Royal Institute of British Architects, nominating, on behalf of the president, three gentlemen for the vestry to select one for the appointment of assessor in respect of the designs for the new baths. The committee pointed out that the assessor to be appointed should have practical experience in the planning and carrying out of public baths and wash-houses, and the names of the gentlemen submitted, although architects of eminence, did not appear to them to possess this qualification. The president was asked to nominate three gentlemen competent to advise on the subject of baths architecture, and the committee thought it was possible that the vice-president may have misconstrued the meaning which was intended to be conveyed by these words. In these circumstances the committee had instructed that a further communication should be addressed, thanking him for his letter, and asking, in view of the probable misconception of the meaning of the words used, whether he would desire to reconsider his reply.

The council of the Institution of Civil Engineers have made the following awards out of the trust funds at their disposal for the purpose for original papers dealt with during the year 1897-98. The formal presentation will take place at the institution on Tuesday, November 1st, at 8 p.m.: Telford medals and premiums—A. H. Preece (London) and H. C. Stanley (Brisbane, Queensland); Watt medals and premiums—H. L. Callendar, M.A., F.R.S. (London), and J. T. Nicolson (Montreal, Canada); George Stephenson medals and premiums—Whateley Eliot (Plymouth), W. O. E. Meade-King (London), and W. P. Marshall (Birmingham); the Crompton prize—E. W. Anderson (Erith); Telford premiums—L. B. Atkinson (Cardiff), Henry Fowler (Horwich), W. L. Strange (Bombay), F. J. Waring, C.M.G. (London), D. W. Bruntton (Denver, U.S.A.), Wilfred Airy, M.A. (London), E. M. Bryant, B.Sc. (Newcastle-on-Tyne), D. B. Butler (London), and H. V. Champion (Victoria); the James Forrest medal—W. L. Brown, M.Sc. (London); Miller prizes—C. E. Wolf, B.Sc. (Derby), A. D. Koigwin (Ashford), Harold Williams (Kingston), J. T. Morris (London), H. C. Adams (Birmingham), H. O. Enoch (Bradford), B. K. Adams (Colombo), A. B. E. Blackburn (Wednesbury), Thomas Carter (Newcastle), P. F. Storey (Manchester), D. E. Lloyd-Davies (Bewdley) and Wilfred Hall, M.A. (Corbridge-on-Tyne).

As intimated in last week's issue of THE SURVEYOR, several of Mr. G. B. Laffan's professional friends and neighbours entertained him to dinner at the Trocadero Restaurant on Saturday, in order to offer their congratulations and wish him success previous to his departure to take up the duties of his new appointment as engineer to the Pietermaritzburg Corporation. Mr. O. Claude Robson, president of the Association of Municipal and County Engineers, occupied the chair, and Mr. W. Weaver, the vice-chair. In addition to the guest of the evening, there were also present Messrs. C. Jones and A. M. Fowler (past-presidents), C. Botherill (Fulham), J. H. Brierley (Richmond), C. H. Cooper (Wimbledon), W. Fairley (Mortlake), S. G. Gamble (Metropolitan Fire Brigade), M. Hainsworth (Teddington), J. Kemp (Hampton), E. J. Lovegrove (Hornsey), G. B. Tomes (Barnes) and F. Sumner (Bermondsey). Between thirty and forty telegrams and letters were received from brother surveyors, the editor of THE SURVEYOR and other friends expressing regret at their inability to be present, and conveying their best wishes to Mr. Laffan. In a particularly happy speech the chairman proposed the principal toast of the evening, in the course of which he referred in eulogistic terms to Mr. Laffan's past services as hon. district secretary for the Home Counties. In so doing he paid a high tribute to Mr. Laffan's professional abilities, which had at all times been freely placed at the disposal of the association and his professional brethren, and of behalf of those present offered Mr. Laffan hearty congratulations, and wished him God-speed, health and happiness in his new home. Mr. Laffan, in reply, desired to assure not only those present, but also many other friends who had written him in such kind terms, of his sincere appreciation of their good wishes and the kindly feeling evinced towards him that evening, and which he should never forget, and stated that he would endeavour to further the interests of the association and try to bring his brother engineers in South Africa into closer touch with those in the old country. The usual votes of thanks, &c., terminated a most successful and enjoyable function.

CLARE MARKET RE-HOUSING AND IMPROVEMENT SCHEME.

REPORT TO THE LONDON COUNTY COUNCIL.

In connection with the Clare Market re-housing scheme now in progress, and with the proposed construction of a new street from Holborn to the Strand, in respect of which application is to be made to Parliament in the next session, the Housing of the Working Classes and Improvement Committee of the London County Council have drafted a joint report relative to the question of obtaining sites for re-housing purposes in the immediate vicinity of the two schemes.

The report states that in carrying into effect the first-mentioned scheme about 3,038 persons will be displaced. Of this number it is proposed to make provision on the area for 750 persons, and for 1,500 on the Millbank site, leaving 788 not provided for. By the formation of the new street site at 3,030 persons, including women and children, will also be displaced, and the proposal to be made to Parliament is that all the persons who are dependent on fixed employment in the neighbourhood should be re-housed within about a mile of their residences, and that adequate provision should be made for the remainder of the persons to be displaced. This would mean that 1,816 persons would have to be accommodated within about a mile of the improvement.

Learning that land in the neighbourhood of Drury-lane was vacant, the report states, the committee entered into negotiations with the owner, the Duke of Bedford, with the result that he expressed his willingness to sell two sites in Drury-lane, and also a larger site fronting Herbrand-street, near Woburn-place. The duke, however, stipulated, as one of the conditions of the sale, that the council should undertake, in the event of their obtaining and exercising powers to construct the new street, to convey to him a strip of land which will form a portion of the western horn of the crescent which it is proposed to form at the southern end of the main street. This is to enable the duke to develop the adjoining land, of which he is the owner. With regard to this stipulation of the duke, the committee consider that it may well be accepted. They therefore strongly advise the acquisition of the three sites, such acquisition to be effected under Part III. of the Housing of the Working Classes Act, 1890. If this be done accommodation can be provided for 180 persons on the site in Drury-lane, adjoining Drury-lane Theatre, for 360 persons upon the other site in Drury-lane, and for 460 persons upon the site in Herbrand-street, making a total of 1,000 persons on the three sites. This will enable the council to accommodate on the Clare Market area a large number of the persons displaced by the formation of the new street from Holborn to the Strand. In the event of the council failing to obtain Parliamentary powers for the new street (a contingency which the committee think it is hardly necessary to contemplate) the cost of the three sites may be recouped, as an amendment of the Clare Market scheme may be sought to enable the council to sell land on the Clare Market area, which but for the acquisition of the three sites would have been used for housing purposes. Failing this, the additional accommodation for re-housing can, with much advantage, be utilised in connection with other clearance schemes where the council are required to make provision within a certain distance from the scheme. The price asked for the three sites (£118,740) is, in the opinion of the committee, perfectly reasonable.

In concluding the report, the committee state: "It will be observed that one of the conditions of sale is that the three sites shall be purchased by the council by November 1, 1898, or as soon as practicable thereafter, whilst the other proposals are made subject to the council obtaining and exercising powers to form the new street from Holborn to the Strand. We have thought it right, before reporting to the council, to take the opinion of the solicitor on the question whether the council have full statutory powers to enter into the complete arrangement with the duke. The solicitor advises that the council at present possess full statutory powers, and we have ascertained that there is sufficient financial provision under the vote made in connection with re-housing persons of the working classes to enable the purchase of the three sites to be at once effected. Having regard to the favourable character of the proposals and to the expressed desire of the council to do all within their power to assist the poor persons of the labouring class now housed under such unhealthy conditions in the district in question, we have no hesitation in strongly advising the council to complete the arrangement with the duke."

At the end of the report are the formal resolutions embodying the above suggestions of the committee.

Dorchester.—The town council has now adopted a new scheme of sewerage and sewage disposal for the town. The council have decided not to adopt the Exeter system, but the sewage will be chemically treated at the outfall. A loan of £16,000 to cover the entire cost will be at once applied for. The council also decided to promote a bill in Parliament for the compulsory purchase of the undertaking of the Dorchester Gas Company.

THE BROOK HOSPITAL.

CONCLUSIONS OF THE INQUIRY.

The Local Government Board pay into the Hospital account under which the cost of the Brook Hospital is to be met, the statement for the year 1897-8. A report of the previous session is referred to in the report.

Mr. Aldwyckie, who was the principal examiner of the account, further stated that the account for the year 1897-8 is in accordance with the report of the previous session, but that the work was done in a more economical manner, and that the two inspectors of accounts had been appointed to audit the account. The inspector said that he had no objection to the account, but that the sum was paid to the contractors without the board knowing what it was for.

Mr. T. D. Mann, clerk to the board, said that the money was paid to the contractors by the architect. The inspector replied that it was paid to the board to be paid to the contractors, and that the board had no right to pay it to the contractors. The board had no right to pay it to the contractors, and that the board had no right to pay it to the contractors. The board had no right to pay it to the contractors, and that the board had no right to pay it to the contractors.

Mr. Brown, who was the chairman of the Brook Hospital Committee at the time of the construction of the building, stated that certain small items were authorised by himself, in company with other members of the committee, when going over the building, and he was ready to accept full responsibility for everything he did.

Mr. E. White, chairman of the special committee of investigation, said the whole of the extras, with trifling exceptions, would have been included in the specification if the board had not built the hospital so hurriedly. The board should be protected by a clause in the contracts to the effect that no extras would be paid for unless countersigned by the clerk. The architect should not have the power of spending the money of the ratepayers without the sanction of those who represented them. In this case the architect very rarely had a receipt.

With regard to the £19,000 expenditure upon the foundations, it had to be remembered that enormous quantities of concrete were used, and some of the blocks were 30 ft. by 20 ft. The hospital was completed was, however, a first-class one.

Mr. Brown also addressed the inspector, alluding especially to the difficulties of the site, and to the fact that the whole scheme for the hospital was prepared in three weeks. He added that the minimum amount paid was in excess of the various contracts by about £5,000. He thought it fair to the architect to say that very few things which he ordered could be called unnecessary.

The inquiry was concluded, and the inspector said he would make his report to the Local Government Board.

ROYAL COMMISSION ON SEWAGE DISPOSAL.

The Earl of Halesleigh, in a circular letter to the President, that it has been brought to the notice of the Royal Commission on Sewage Disposal that there is an tendency on the part of some manufacturers and local authorities to postpone the carrying out of works for the purification of trade refuse and sewage until the commission have issued their report, his lordship thinks it desirable to state that a considerable time, perhaps over some years, must elapse before the commission can arrive at any final conclusions on a subject which necessarily involves detailed and prolonged scientific investigation. Any delay in settlement, he added, would be viewed by the commission with the gravest concern.

PROPOSED PIER FOR LYNMOUTH.

We understand that a provisional committee is to be formed for the next session of Parliament for the construction of a pier at Lynmouth, from plans prepared by Mr. T. M. M. M. The scheme provides for a pier of 200 ft. long, and 10 ft. wide, from the seaward end of the pier to the shore, and a pier of 100 ft. long, and 10 ft. wide, from the shore to the pier. The pier will be a concrete pier, and will be a first-class pier. The pier will be a concrete pier, and will be a first-class pier.

Swansea.—The town council has now adopted a new scheme of sewerage and sewage disposal for the town. The council have decided not to adopt the Exeter system, but the sewage will be chemically treated at the outfall. A loan of £16,000 to cover the entire cost will be at once applied for. The council also decided to promote a bill in Parliament for the compulsory purchase of the undertaking of the Swansea Gas Company.

THE SURVEYORS' INSTITUTION.

ORDINARY GENERAL MEETING.

The first ordinary general meeting of the session 1898-99 will be held at the temporary premises of the institution on Monday, November 14th, when the president, Mr. Robert Vigers, will deliver an opening address. The chair will be taken at 8 o'clock.

STUDENTS' PRELIMINARY EXAMINATION, 1899.

Those proposing to enter their names for the students' preliminary examination, to be held on the 18th and 19th of January next, must intimate their intention to the secretary before the last day of November. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London. Irish candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS, 1899.

Students eligible for the proficiency examinations (which will commence on the 20th of March next) must give notice of the sub-division (Table A of Rules) in which they elect to be examined, not later than the 31st inst. Examinations qualifying for the classes of "Professional Associates" and "Fellows" will also commence on the 20th of March next. Names of applicants for these latter examinations to be sent in before the 31st inst. All particulars as to days, subjects and course of examination will be forwarded on application to the secretary. English candidates for the professional examinations will be examined in London. Irish candidates will be examined in Dublin.

PROPOSED SPECIAL-CERTIFICATE EXAMINATIONS (FOR MEMBERS), 1899.

Notice is also given that the next special-certificate examinations in forestry, sanitary science and land surveying and levelling are proposed to be held on Tuesday, Wednesday and Thursday, the 13th, 14th and 15th of June. Particulars of these examinations can be obtained from the secretary.

JUNIOR MEETINGS.

The first of four meetings of examinees and students authorised (subject to certain conditions) by the council to be held during the present session will take place at the temporary premises of the institution on Monday, the 21st November, 1898, the chair to be taken at 7 o'clock. All inquiries with reference to the junior meetings should be addressed to Mr. A. Norman Garrard, 8 Frederick's-place, Old Jewry, E.C.

ASSOCIATION OF MUNICIPAL CORPORATIONS.

Sir A. K. Rollit, M.P., presided, on Wednesday of last week, at the autumn general meeting of the Association of Municipal Corporations, held at the Westminster Palace Hotel. There was a large attendance, and among those present were the Lord Mayors of Manchester and Sheffield, and the Mayor of Nottingham.

Following an address by the president,

The Mayor of Nottingham moved: "That this association affirms the principle that where local authorities have, with the sanction of Parliament, established, or are in the course of establishing, undertakings for public benefit, and have not failed in the performance of their duties, it is not right or expedient that powers should be granted to companies to compete with such local authorities." He severely criticised the action of the House of Lords in passing the General Electrical Power Distributing Company's Bill, which contained most revolutionary proposals. The motion was adopted unanimously, while a further resolution requesting the council of the association to organise an opposition to the Bill was also agreed to.

The deputy town clerk of Huddersfield moved: "That the association represent to the Local Government Board, the Postmaster-General and the Treasury the expediency of legislation being so framed that the Postmaster-General be empowered to grant licences which shall be self-contained, and confer all necessary and incidental powers for the supply of telephony by local authorities, including borrowing powers." He pointed out that under the present system there must be delay in the spread of telephony, as before local authorities could be fully invested with the powers to undertake the installation of telephones two Parliamentary sessions must elapse. The motion was seconded, but was eventually rejected, it being remarked that the principle involved in the proposition was absolutely contrary to the line adopted throughout by the association in regard to telephones.

Mr. S. Compton, of Rawtenstall, moved: "That, in the opinion of this association, such advance in the means of sewage disposal has been made that the continued demand of the Local Government Board for not less than 1 acre of filtering land per 2,000 of population is not necessary in all cases, but is often a hardship on sanitary authorities; that the time has come when some option of method should be allowed to authorities, according to quality of sewage and local circumstances; and that the Law Committee be and is hereby requested forthwith to use its utmost influence with

the Royal Commission now sitting and the Local Government Board in such manner as it deems best to secure such option."

No support being given to the resolution, it was allowed to drop.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

ASSISTANT INSPECTOR OF NUISANCES.—October 29th.—Stretford District Council. £80.—Mr. George H. Abrahams, clerk to the council.

MUNICIPAL ENGINEER AND SURVEYOR.—October 29th.—Municipality of Woolstock, Cape Colony. £500.—Messrs. J. C. Mackinlay & Co., 27 Walbrook, London, E.C.

INSPECTOR OF NUISANCES.—October 29th.—Windsor Rural District Council. £130.—Mr. J. E. Gale, clerk to the council.

SEWER FOREMAN.—November 1st.—Tottenham Urban District Council. £150.—Mr. P. E. Murphy, engineer to the council.

WORKING ENGINEER AND SUPERINTENDENT OF WATERWORKS AND MAINS.—November 1st.—Leighton Buzzard Urban District Council. £150.—Mr. G. L. B. Calcott, clerk to the council.

BOROUGH SURVEYOR.—November 1st.—Corporation of Saffron Walden. £175.—Mr. W. Adams, town clerk.

CLERK OF WORKS.—November 2nd.—Shereditch Vestry. £3 3s.—Mr. H. Mansfield Robinson, clerk to the vestry.

DISTRICT SURVEYOR.—November 2nd.—Bridgewater Rural District Council.—£225.—Mr. T. M. Reed, clerk to the council.

DEPUTY SURVEYOR.—November 3rd.—Brierley Hill Urban District Council. £100.—Mr. William Waldron, clerk to the council.

DISTRICT BUILDING INSPECTOR.—November 4th.—Corporation of Wolverhampton. £2 5s.—Mr. J. W. Bradley, borough engineer and surveyor.

SURVEYOR.—November 4th.—Lancaster Rural District Council. £150.—Mr. Joseph Ennon, clerk to the council.

TEMPORARY ASSISTANT.—November 7th.—St. Helens Corporation. £2 15s.—Mr. Geo. J. C. Broom, M.I.C.E., borough engineer.

GENERAL FOREMAN.—November 7th.—Morecambe Urban District Council. 33s.—Mr. Jno. Bond, surveyor to the council.

SECOND ASSISTANT.—November 12th.—County Borough of Hanley. £80.—Mr. Joseph Lebley, borough engineer and surveyor.

SUPERINTENDENT AT THE CORPORATION WHARF.—November 12th.—County Borough of Southampton. £200.—Mr. George B. Nalder, town clerk.

ASSISTANT FOR ABSTRACTING AND BILLING.—"A. B.," office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

ASSISTANT FOR TAKING-OUT AND MEASURING-UP.—"A. B.," office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

ABERAVON.—December 1st.—Extension of the covered market, at a cost not to exceed 45,000. £21.—The Borough Surveyor.

APPOINTMENTS OPEN.

MORECAMBE DISTRICT COUNCIL. The above Council require the services of a General Foreman over the outside men in their employ. He must be fully qualified and competent by knowledge and experience to carry out his duties.

The wages offered are 33s. weekly. Also the services of a Time and Store Keeper, one accustomed to such duties preferred.

The wages offered are 22s. weekly. Lists of duties can be seen by applying at the offices of the Council.

Applicants must apply in their own handwriting, stating their age and qualifications, particulars of their past and present employment, enclosing not more than three testimonials of recent date. All applications to be sent under cover, and endorsed "General Foreman" or "Time and Store Keeper," to the undersigned not later than noon on Monday, the 7th day of November next.

(By order)

JNO. BOND,

Surveyor to the Council.

Council Offices, Morecambe.
October 25, 1898.

BOROUGH OF SAFFRON WALDEN. BOROUGH SURVEYOR.

The Council of the Borough of Saffron Walden invite applications for the appointment of a Borough Surveyor, at a salary of £175 a year.

The person appointed must devote the whole of his time to the service of the Corporation.

He must be thoroughly competent to carry out the duties prescribed by the Public Health Acts, to act as waterworks manager, and to undertake and superintend works usually performed by sanitary authorities.

Further particulars of the duties and the conditions of employment may be obtained at my office.

Applications, endorsed "Borough Surveyor," stating age, qualifications and experience, accompanied by copies of three testimonials, which will not be returned, must reach me on or before Tuesday, the 1st November next.

Personal canvassing will be a disqualification.

(By order of the Council)

W. ADAMS,

Town Clerk.

Saffron Walden,
October 17, 1898.

COUNTY BOROUGH OF SOUTHAMPTON.
APPOINTMENT OF SUPERINTENDENT AT
THE CORPORATION WHARF.

The Corporation of Southampton invite applications for the appointment of Superintendent at the Wharf.

The person appointed to have the entire charge of the wharf and the employees, and be responsible for all materials coming in and going out. To superintend the precipitation of the sewage, and have the entire charge of the works under the Borough Engineer as Chief officer. To be responsible for the safe keeping of the horses, carts, fodder, materials and everything on the wharf.

Applicants having a knowledge of machinery preferred. Salary, £200 per annum.

The person appointed will be required to devote the whole of his time to the duties of the office.

Applications, endorsed "Superintendent," and copies of three recent testimonials, with full particulars as to previous experience, age, &c., to be sent to my office on or before the 12th November next.

Caussing will disqualify.

(By order)

GEORGE B. NALDER,
 Town Clerk.

Municipal Offices, Southampton.
 October 20, 1898.

COUNTY BOROUGH OF WOLVERHAMPTON.

The Public Works Committee is prepared to receive applications for the post of District Building Inspector.

Applicants must have had experience in the working of the Model By-Laws and be well versed in sanitary building construction and the interpretation of plans. Wages, 45s. per week. A bicycle provided; staff hours.

Applications, in own handwriting, with not more than three recent testimonials (copies), to be sent to the undersigned on or before the 4th prox.

J. W. BRADLEY,
 Borough Engineer and Surveyor.

Town Hall, Wolverhampton.

LEIGHTON BUZZARD URBAN DISTRICT
COUNCIL.

APPOINTMENT OF WORKING ENGINEER AND
SUPERINTENDENT OF WATERWORKS AND MAINS.

The above Council invite applications for the post of Working Engineer and Superintendent of Waterworks and Mains. Applicants will be required to devote their whole time and attention to the Council's work at the pumping station and ejector stations, and to superintend the connections to the sewers and water mains, and to assist generally in matters appertaining to the work and management of the sewers and waterworks. Preference will be given to one having a knowledge of Shomo's system. The salary offered is £120 a year, rising £5 a year to £130, with use of house adjoining the waterworks (except a committee-room) rent free, rates and taxes to be paid by the Council. The engagement will be monthly, to be terminated by one month's notice on either side.

Applications, in the handwriting of the candidates, stating age and qualifications, with three recent testimonials, to be sent to me not later than the 1st day of November, 1898.

Caussing is prohibited and will be considered a disqualification.

G. L. B. CALCOTT,
 Clerk to the Council.

Leighton Buzzard.
 October 17, 1898.

COUNTY BOROUGH OF HANLEY.

A Second Assistant is required in the Borough Surveyor's Office, Hanley, at a salary of £80 per annum, rising £10 a year to £100.

Applicants should have had practical experience in surveying, levelling, and general work of a town surveyor's office.

Applications, in candidate's own handwriting, stating age and experience, together with copies of not more than three recent testimonials, sealed and endorsed "Assistant Surveyor," must be delivered at the office of the undersigned not later than 12 o'clock noon on November 12, 1898.

JOSEPH LOBLEY,
 Borough Engineer and Surveyor.

Town Hall, Hanley.
 October 25, 1898.

LANCASTER RURAL DISTRICT COUNCIL.
APPOINTMENT OF SURVEYOR.

The above-named Council invite applications for the appointment of Surveyor for their district, which has an area of 55,174 acres, a population of about 11,830, an assessable value of £110,970, and about 190 miles of highways.

The appointment will be for one year, at a salary of £150, with reasonable and necessary travelling expenses allowed.

The person appointed must reside in or near Lancaster and devote the whole of his time to the duties of his office.

He will be required and must be thoroughly competent to carry out the duties devolving on a surveyor under the Public Health Acts; superintend the making, repairing and improving of all parish highways and bridges within the district

of the Council; and also must be well acquainted with the Model By-Laws of the Local Government Board.

The appointment will be determinable by one month's notice on either side.

Personal canvassing will be deemed a disqualification.

Applications, in candidate's handwriting, stating age, qualifications, when at liberty, and experience, accompanied by copies of not more than four testimonials, must reach me not later than Friday, the 14th day of November, 1898.

JOSEPH KENNION,
 Clerk to the Council.

5 Daltou Square, Lancaster.
 October 24, 1898.

COUNTY BOROUGH OF ST. HELENS.

Wanted, for six or eight months, a fully-qualified Assistant, to prepare plans for the completion of sewage system in outlying districts. Salary, £2 15s. per week.—Apply, not later than the 7th November, to Mr. Geo. J. C. Broom, M.I.N.S.T.C.E., Borough Engineer, St. Helens.

WANTED, a thoroughly competent Assistant, for abstracting and billing. State salary to "A. B.," office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

WANTED, a thoroughly competent Assistant, for taking-out and measuring-up. State salary to "A. B.," office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

COMPETITION.

CITY OF BRADFORD.

INTENDED CENTRAL FIRE BRIGADE STATION.

TO ARCHITECTS.

The Corporation of the City of Bradford are prepared to receive Competitive Designs for the Erection of a Central Fire Brigade Station. Three premiums are offered to competing architects—viz., £100, £50 and £30. Plan of the site, with printed instructions, may be had on application at the City Surveyor's office on and after Monday, the 31st inst., on payment of 1 guinea, to be returned after receipt of design. The designs must be sent in not later than Monday, the 2nd of January, 1899.

(By order)
 GEORGE MCGUIRE,
 Town Clerk.

Town Clerk's Office, Bradford.
 October 25, 1898.

TENDERS WANTED.

WILLESDEN DISTRICT COUNCIL.
TO ROAD CONTRACTORS.

The Willesden District Council are prepared to receive tenders for the execution of the following works:—

Road-making Works.—Extension of Glynfield-road, Willesden (150 ft. lineal); widening Rockhall passage, Cricklewood (115 ft. lineal).

Sewer Work.—Relaying sewer, Church-road, Willesden (391 ft. lineal).

Plans and specifications may be seen, and all further particulars obtained, on and after Monday, October 31, 1898, upon application to Mr. O. Claude Robson, M.I.N.S.T.C.E., Engineer to the Council, Public Offices, Dyne-road, Kilburn, N.W.

The tenders, upon printed forms and endorsed "Improvements," to be delivered at the offices of the Council not later than 4 p.m. on Tuesday, November 8, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
 STANLEY W. BALL,
 Clerk to the Council.

Public Offices, Dyne-road, Kilburn, N.W.
 October 26, 1898.

BOROUGH OF WORTHING.
TO GRANITE MERCHANTS.

The Corporation are prepared to receive tenders for 2,700 ft. of 12-in. by 6-in. Granite Kerbs and a quantity of Broken Granite, delivered at Worthing station.

Forms of tender and further particulars may be obtained from the undersigned.

Sealed tenders, endorsed "Tender for Kerbs" or "Tender for Broken Granite," as the case may be, to be sent in to me on or before Wednesday, November 16, 1898.

The Corporation do not bind themselves to accept the lowest or any tender.

FRANK ROBERTS, M.I.N.S.T.C.E.,
 Borough Engineer and Surveyor.

Municipal Offices, Worthing.
 October 24, 1898.

WILLESDEN DISTRICT COUNCIL.
TO ROAD CONTRACTORS.

The Willesden District Council are prepared to receive tenders for the execution of certain Road-making and Paving Works in Preston-mews, Willesden.

Plan and specification may be seen, and all further particu-

bars obtained, on and after Monday, October 31, 1898, upon application to Mr. O. Claude Robson, M.INST.C.E., Engineer to the Council, Public Offices, Dyne-road, Kilburn, N.W.

The tenders, upon printed forms and endorsed "Private Streets," to be delivered at the offices of the Council not later than 4 p.m. on Tuesday, November 3, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
STANLEY W. BALL,
Clerk to the Council.

Public Offices, Dyne-road, Kilburn, N.W.
October 26, 1898.

NEW HUNSTANTON URBAN DISTRICT COUNCIL. CONTRACT FOR REFUSE DESTROYER AND BOILER.

The Urban District Council of New Hunstanton is prepared to receive tenders for the Erection of one of Messrs. Meldrum Brothers' Patent Refuse Destroyers and a Cornish Boiler.

Copies of the specification and tender can be obtained, on and after Friday, the 21st of October next, at the offices of the Council, Hunstanton, or at the office of the Engineers, Messrs. Stevenson & Burstall, 38 Parliament-street, Westminster, S.W., on payment of 1 guinea.

Sealed tenders, endorsed "Tender for Refuse Destroyer, &c.," are to be forwarded to the undersigned not later than Thursday, November 3, 1898.

J. S. B. GLASIER,
Clerk.

BOROUGH OF SOUTHEND-ON-SEA. TO CONTRACTORS AND OTHERS.

The Corporation invite tenders for the Excavation of a Lake, the supply and erection of a Wrought-Iron Unclimbable Fence, the construction of a Cast-Iron Conduit, and the construction of a Concrete Groyne.

Plans, sections and specifications may be seen, and bills of quantities and forms of tender obtained, on and after Monday, the 31st day of October (on payment of £1 Is., which will be returned on receipt of a *bona-fide* tender), upon application to Mr. Alfred Fidler, ASSOC. M.INST.C.E., Borough Surveyor, Clarence-road, Southend.

No tender will be considered unless made on the prescribed form.

Sealed tenders (marked "Tender for Lake, &c.") to be delivered at my office before 10 o'clock on the morning of Thursday, the 10th day of November.

The Corporation will not be bound to accept the lowest or any tender.

(By order)
WILLIAM H. SNOW,
Town Clerk.

Southend-on-Sea.
October 24, 1898.

BOROUGH OF SOUTHEND-ON-SEA. TO STONE MERCHANTS.

IMPROVED DRAIN CLINOMETER.

THIS Drain Clinometer, which is a thoroughly well-made and reliable instrument, is intended for the use of Builders, Medical Officers of Health, Sanitary Inspectors and others for testing the slope of drain pipes. The arc is fixed at the extreme end of the Clinometer so as to allow of a close reading and distinct graduation, and is divided on one edge to degrees and quarter degrees, and on the other edge to gradients of 1 in 20, 1 in 30, 1 in 40, 1 in 50, 1 in 60, 1 in 70 and 1 in 80. The adjustment is by means of a nut and a ball, working against a spiral spring. The "Bubble" is ground and divided.

The Clinometer is made of tank and nicely finished, and measures 12 x 2 1/2 x 1 1/2 in.

PRICE: With Electric Lamp £1 7s. 6d.; With Brass Fittings, £1 2s. 6d.; With Magnetic Compass extra 2s. 6d.

Minutes of Proceedings.

Limits of Municipal Enterprise.

As our readers are aware, we have frequently referred to the question of the just limits of municipal enterprise and municipal trading, and we observe with interest that the topic, which may be said to belong to the philosophy of local government, was discussed very effectively by Sir Henry Fowler in a speech delivered on Monday at a mayoral banquet at Wolverhampton. On the whole, we find very little cause to find fault with the views of Sir Henry, who as a former president of the Local Government Board and the author of the Local Government Act, 1894, must command attention when he deals with such a subject. There is undoubtedly a tendency to increase municipal powers and responsibilities, and, as Sir Henry Fowler says, the basis of the argument in favour of municipalisation is a tendency towards combination, so that the public may secure greater advantages in various departments more easily and more cheaply than could be secured by private enterprise. But the question is, Where is the line to be drawn? Broadly speaking, we have always maintained that those great public services which are necessarily in the nature of monopolies—water supply, sewerage, sewage disposal, lighting, and tramway services are the most prominent—can be most advantageously undertaken by the local authorities; but it is as well that we should be reminded occasionally, as we were by Sir Henry Fowler, that private enterprise, controlled by practical men and carried on under the supervision of those whose pecuniary interest is bound up in the success and development of such enterprise, is the basis of our commercial life. While disclaiming any attempt to draw a rigid frontier line between municipal and private enterprise, Sir Henry Fowler endeavoured to point out some of the conditions which seemed to him necessary for the successful carrying on of municipal enterprises. His first endeavour was to define—broadly, it is true, but on the whole judiciously—the limits of municipal enterprises. These, he thinks, should be confined to undertakings which require Parliamentary sanction and legislative powers for their establishment and control, or, in other words, they should deal only with those enterprises which no private company or proprietors could establish or conduct themselves—enterprises requiring compulsory powers. Companies can, of course, obtain the necessary powers in certain cases, as we see in connection with water supply, lighting and tramways. Sir Henry's meaning can be discerned, but the wording of his sentence was rather defective. The question really is to decide whether enterprises such as those mentioned can, from the point of view of the public good, be more advantageously undertaken by the local authorities or by companies. There is no doubt as to the general trend of public opinion on the subject. As a better illustration of his meaning, Sir Henry Fowler referred to the question of the streets and roads of a borough, which cannot be

disturbed by any private company or individual unless legislative powers are first obtained, and he maintained that the municipality alone should have full control over enterprises requiring the breaking up of the thoroughfares—an opinion with which only a small minority, we imagine, would disagree.

The second condition formulated by Sir Henry Fowler is that enterprises undertaken by local authorities should be for the common good and for the general use of the community. The cycle industry was cited as not a suitable object of municipal solicitude, while water supply, lighting and tramways were cited on the other side. Public control, of course, necessarily implies monopoly, unless in certain exceptional cases. In some matters it is impossible there can be any competition; in others it is undesirable. In regard to tramways, for example, it is impossible to have two sets of tram lines running through a street. They must be under one control. In other words, there must be a monopoly, and if there is to be a monopoly in matters directly affecting the health and well-being of the whole community, the balance of argument is in favour of entrusting it to the local authority as directly representing the interests of the ratepayers. Another condition suggested—and one with which there is not much cause to quarrel—is that a municipal enterprise should be one which can be carried on not only more efficiently, but more cheaply, than it can be carried on by a private company. Before concluding Sir Henry Fowler referred to the much-debated question which we have frequently discussed in our columns, especially in connection with electric lighting—whether undertakings acquired by the community should be carried on by the local authority at a profit; in other words, whether profits should be devoted to a general reduction of rates, or whether advantage should be taken of the opportunity to reduce the price of the particular service. Sir Henry Fowler cited the case of the controversy which had taken place in the North of England in connection with the manufacture of gas. One municipality, he said, had carried on the manufacture and supply at a profit, and transferred the profit for various public improvements, whilst another municipality had acted on the principle of supplying gas to the community at a little more than its bare cost. As we have pointed out on previous occasions, much depends on whether the thing supplied is of general consumption or is restricted to a minority. So long as the latter is the case, to reduce the price unduly is to favour this minority at the expense of the general ratepayers, who are entitled to demand that a share of the profits should be devoted to the relief of the general burden of rates. Sir Henry Fowler himself forcibly emphasised the point, when, according to the report, he said—

The community must pay for certain services by taxation, such, for instance, as the police, the necessary works for the protection of the public health, the lighting and repairs of

the streets, and many other matters which he need not detail; but they must always remember that the general use did not justify universal taxation. Many of them, for instance, were votaries of tobacco. He (Sir Henry) did not smoke, and they had no right to tax him so that they might buy their tobacco (laughter). The same with regard to tea-drinking. If they charged a higher price for any article than the cost of its production the consumer was taxed, but if, on the other hand, they charged a lower price than they put the tax on the general taxpayer.

But whatever difference of opinion there may be on this question in regard to matters of detail, there should be general agreement with the sentiment with which Sir Henry Fowler concluded his remarks—that the true secret of strength and success in any municipal enterprise in which we may embark is having at our back the full force of a favourable public opinion.

* * *

The Position of "Superannuation."

The conference of municipal officers held at Sion College on Monday fully bore out the opinion we previously held, and do not hesitate to express, as to the supineness of municipal officials on the question of superannuation. In the special issue of THE SURVEYOR published at the beginning of this year we dealt with the matter from several points of view and endeavoured to elicit signs of interest in the subject. They were not forthcoming. The statements of several speakers at the conference convince us that general, active and united interest does not exist. Never was there a measure of more vital importance to municipal officials than the Local Officers' Superannuation Bill. To us it is simply incredible and inexplicable that its chances of becoming a statute should have been damned by faint, half-hearted and disunited support. Municipal engineers cannot be exempted from this reproach, yet of all sections of local officers they have perhaps the greatest stake in the securing of compulsory superannuation. Among chief officials they alone, almost without exception, give their whole time—the best of their years, their abilities, their experience—to their employers. Medical officers and clerks to authorities have in many cases private practices to which they devote a portion of their time. Yet we are inclined almost to say that among officials it is the municipal engineers of the country who have been least energetic and effective in supporting those who have laboured to secure for them the certainty of at least a living income in the day of permanent infirmity or old age. Why? Is it indolence? Is it want of unity? Is it failure to realise the indisputable boon the Bill seeks to confer upon them? Is it that abject sort of pessimism which cannot fight against odds? If we can sting the inactive into such mental activity as is involved in subjecting themselves to this sort of catechism, we venture to think they will find that there is not one of these attitudes which is excusable or tenable. In 1896 poor law officials secured compulsory superannuation by dint of fine generalship and persistent pegging away. Next year board school teachers, thanks to a precedent of such obvious application, were equally successful. This is the year of grace, 1898, but the sequence has not been sustained. The bringing into line of other local officers cannot yet be recorded, nor can we honestly say that their case has made much progress. When the poor law officials urged their claims they were able to quote the resolutions "in favour" of 400 boards of guardians, while there was not one of such authorities "against." In the Local Officers' Superannuation Bill there are 1,932 authorities interested, and up to the present actually only 400 of these have even got to the length of expressing any sort of opinion at all about the measure. And we conjecture—the able chairman of the conference is no doubt in possession of the exact figures—that it would have been better if the 400 had been still fewer, for their resolutions were in the majority of instances "against." In a few words, the position of the Bill is this. There are sufficient members of Parliament in its favour

to secure its being adopted as a Government measure if the Local Government Board commend it. But the Local Government Board will not support it unless—and this is the *crux* of the whole unless matter—a majority of the municipal authorities who will have to administer the Bill petition in its favour. One is irresistibly reminded of the stick that would not beat the dog, and the dog that would not bite the pig, and the pig that would not get over the stile, and the old lady who was thereby troubled. Some one has got to move the municipal authorities, and then there will be progress all along the line. Until this is accomplished there will be a deadlock. We incline to the opinion, though we whisper it with bated breath, that authorities may occasionally be guided aright by united, persistent and tactful efforts of officials. Moreover, it is worth remembering that the Press is usually credited, especially by journalists, with some power in the land. Let it be somebody's business in every district to secure the interest of local journals to at least such an extent as, one may reasonably expect, a conscientious and fair-minded editor would be willing to go; and such an extent need involve no more than educating ratepayers and their representatives up to a knowledge of the fact that superannuation, as proposed by the Bill we have referred to, is not going to be another tax upon the rates. This, in the words of the chairman of the conference, is a "trump card," and it should be played for all it is worth.

* * *

Provisional Orders in 1897.

An appendix to the recently issued report of the Local Government Board for 1897 contains tables with respect to the Provisional Orders issued during last year, showing the areas affected, the purposes of the orders, and the titles of the confirming Acts. In addition to seventeen Provisional Orders under the Local Government Act, 1888, sixty-seven Orders were also issued under the Public Health Act, 1875, and one under the Gas and Water Works Facilities Act, 1870. Of these sixty-eight Orders all but one were included in confirming Bills in the session of 1897. Twenty-six of the Orders issued in pursuance of the Local Government Board's powers under the Public Health Act, 1875, put in force with reference to the lands described in the schedules to the orders, the powers of the Lands Clauses Acts with respect to the purchasing and taking of lands otherwise than by agreement by twenty urban and six rural district councils. The purposes for which the lands were authorised to be acquired included the widening and improvement of streets, the formation of new streets, the disposal of sewage, the construction of waterworks, and the provision of sites for pleasure grounds. Of the remaining Provisional Orders thirty-seven were issued in pursuance of the Local Government Board's powers under the Public Health Act, 1875, for the repeal, alteration and amendment of Local Acts and Provisional Orders Confirmation Acts. The Provisional Orders altering and amending local Acts dealt with a variety of matters. For example, the corporations of Bootle, Chorley and Scarborough were authorised to require the provision of water-closets in the cases of new buildings and in lieu of other accommodation in existing buildings; the Birmingham Corporation to make superannuation allowances to their officers and servants; and the St. Helens Corporation, with the consent of the Duchy of Lancaster, to alienate certain specified portions of Thalto Heath, which had been granted to them as a recreation ground. Other local authorities were authorised to carry out gas and water works, and in the case of Harrogate mineral waterworks, and to purchase and use lands, make and carry out agreements, and borrow moneys for the purposes specified. Not a few Provisional Orders had reference to by-laws. A number of local authorities were authorised to make by-laws with respect to water and waste-water

closets, the regulation of parks, and the width and construction of new streets and passages. Three of the Provisional Orders were issued with the object of combining urban and rural areas for the execution of schemes of main sewerage. Under sec. 276 of the Public Health Act, 1875, sec. 5 of the Public Health Acts Amendment Act, 1890, and sec. 4 of the Private Street Works Act, 1892, no fewer than 117 orders were issued investing rural district councils with the powers conferred on urban district councils by certain sections of those Acts. In a large number of cases the urban powers given were those contained in secs. 42, 44, 157 and 158 of the Public Health Act, 1875, and sec. 23 of the Public Health Acts Amendment Act, 1890, relating to the cleansing and watering of streets and the making of by-laws for the prevention of nuisances and with respect to new buildings. In a number of cases the Board conferred the powers contained in secs. 39 and 66 of the Act of 1875 as to the provision of sanitary conveniences and fire-plugs, those of sec. 154 for the widening of streets or the construction of new streets, of the first and second paragraphs of sec. 160 with regard to the naming of streets and the numbering of houses and to ruinous or dangerous buildings, and the powers given by the first paragraph of sec. 161 to enter into contracts for lighting purposes and to provide lighting apparatus; also the powers of secs. 169 (paragraphs 2 and 3) and 170 for the sanitary regulation of slaughter-houses, of sec. 171 with regard to obstructions and nuisances in streets, and of the Private Street Works Act, 1892, as to the making-up of specified private streets.

by dint of official authority would be disastrous in the extreme. Finally, the correspondent above referred to draws attention to the serious difficulty arising from the private financial interests involved in the sewage disposal question. Another correspondent, signing himself "District Councillor," makes the somewhat startling statement that a certain rural district council which proposed to treat the sewage by means of bacteria beds on the Dibdin lines has been informed that no loan for the purpose will be sanctioned by the Local Government Board unless the process is recommended in the report of the Royal Commission now sitting. We should be much surprised to hear that this deliverance came from the Local Government Board, at all events without the usual qualification that no loan would be sanctioned without subsequent treatment of the effluent on land. The whole correspondence, however, points to the existence of a highly unsatisfactory state of affairs. In another column we give a full report of the recent inquiry at Sutton, where it is proposed to extend the treatment by Dibdin bacteria beds. The inquiry should provide a good test of the present attitude of the Local Government Board, and the decision of the department will be awaited with no small interest. To say nothing of the inquiry, it is significant, as we stated last week, that the chief engineering inspector and the deputy chief engineering inspector of the Local Government Board—Major-General Carty and Colonel J. Ord Hasted—have both recently visited the works at Sutton.

* * *

Local Authorities and the Royal Commission on Sewage Disposal. The letter of Lord Iddesleigh to *The Times*, which we reproduced in our last issue, has attracted a good deal of attention and some adverse criticisms, including two rejoinders in the columns of our Printing House square contemporary. These we give in another column. It will be remembered that the members of the commission, through their noble chairman, expressed the "gravest concern" on account of the statements that many local authorities and manufacturers proposed to delay the execution of schemes of sewage disposal and for the purification of trade effluents until the report of the commission has been published. It would be more correct to say that the grave concern arises from the fact that, according to his lordship, "a considerable time, perhaps even some years, must elapse before the commission can arrive at any final conclusions on a subject which necessarily involves detailed and prolonged scientific investigation." The noble chairman has been answered, more or less bluntly, that there is an alternative to the terrifying prospect that causes him and his fellow-commissioners so much concern, and that is for the commission to bestir themselves and issue their report within a reasonable time, say a year, for it is averred that there is nothing in the nature of the investigations to justify a longer period being required. As for the delay of which local authorities and manufacturers are suspected, a possible alternative for them is the carrying out of schemes which, on the strength of the forthcoming report, may ultimately be described as inadequate. One of the correspondents of our contemporary, in the course of an incisive letter, points out that the proper function of the commission is not to evolve an ideal system by means of exhaustive experiments in bacteriology and chemistry, but "to collate, digest and report upon the enormous mass of practical experience and knowledge obtained from the actual working of numerous sewage disposal systems, but never yet brought to a focus or treated as a whole. Only a very small minority of the commission are really experts in this particular question, and even if they formulated a system satisfactory to themselves it would be just as likely to become obsolete as any of its predecessors, and any attempt to give it finality

* * *

London Water Supply. As will be seen from our report of the London County Council meeting on Tuesday, that body have decided to resume their water supply campaign without waiting for the report of Lord Llandaff's Commission, now sitting. A lengthy report, which we give in another column, has been drawn up by the Water Committee, and has been before the council for a fortnight. On Tuesday the whole of the recommendations with which the report concludes were adopted. The proposals of the council divide themselves into two great schemes, which will be formulated in the shape of Bills—the acquisition of the present undertakings of the companies and the provision of a long-distance supply from Wales. The former scheme would naturally weld the present undertakings into one, and would have the advantage of facilitating that inter-connection between the mains the necessity of which was so plainly demonstrated during the recent scarcity in the East-End. In connection with a long-distance supply from Wales, there is something to be said both for and against the attempt to obtain Parliamentary powers without waiting for the report of Lord Llandaff's Commission. It must be admitted that Royal Commissions rarely result in any definite action being taken, however much the air may be cleared in certain directions, and the opinion has been strengthened during the past two years of scarcity that the commission appointed in 1891, and presided over by Lord Balfour of Burleigh, quite underestimated the gravity of the situation when their report was published two years later. On the other hand, it may reasonably be doubted if either the Government or the legislature will countenance schemes the verdict on which might be materially influenced if postponed till after the publication of the report of the Royal Commission now sitting. The weight of argument has always seemed to us to be in favour, not only of the acquisition of the present undertakings on reasonable terms by a representative body, but of the ultimate provision of a long-distance supply. It is to be feared, however, that until the publication of the report referred to the prospects of success for the council's proposals are none too rosy. Even should the report of the commission be of an adverse nature, the question is one which must ultimately be decided by public opinion.

The Sanitary Institute.

THE SEVENTEENTH ANNUAL CONGRESS.—VI.

We continue our abstracts of the papers and discussions at the recent Birmingham congress. In the section devoted to Physics, Chemistry and Biology, one of the most interesting papers in connection with sewage disposal was that read by Mr. W. D. Scott-Moncrieff on

THE BIOLYSIS OF SEWAGE.

In the course of his paper Mr. Scott-Moncrieff said that he had been engaged in the solution of the sewage problem, upon purely biological lines, since 1891, but he had refrained from reading a paper on the subject because until quite recently there had been a lack of facts necessary to the formation of definite conclusions. But within the last twelve months he had not only been able to reach finality in the results obtained, but the method of obtaining them threw the whole process open to examination in detail at any required number of stages. The state of knowledge at the time he commenced to make experiments, in 1891, might be judged from the fact that the apparatus now spoken of as the first in England to have proved the capacity of micro-organisms to throw the organic matter of sewage into solution and produce nitrates in the effluent was referred to at that time by a high authority as dependent wholly upon mechanical causes for the results obtained. He referred to the roughing filter at the high-level outfall at Wimbledon. He mentioned this to show that definite information was of very recent date, and it was hardly necessary to add that a nebulous condition often gave rise to inaccurate statements, not to speak of still more nebulous claims to originality. Mr. Scott-Moncrieff then proceeded as follows:—

THE WORKING HYPOTHESIS.

The working hypothesis of the advocates for the purification of sewage by biolysis is based upon a belief that the effete substances contained in sewage are within the capacity of Nature to deal with unaided by the use of chemicals. Seeing that Nature does carry out the work of purification, sooner or later, without any assistance from man, and that, as a matter of fact, no great accumulations of inert effete substances exist at all, the hypothesis may be regarded as a truism, and the problem really resolves itself into the discovery of methods by which Nature can be so aided in the case of sewage that it can be purified on the largest scale at a reasonable cost without creating a nuisance and without the use of chemicals. This is which has to be proved, not as a laboratory experiment, but as an available and practical process.

I have made use of the term "biolysis" because the decomposition which occurs in the conversion of food into its original elements are not due to bacterial processes only, but to changes which take place in the digestive organs as well. In dealing with sewage the advocates of purely natural methods contend that after the changes which have taken place in the digestive organs, or even without them, bacteria are capable of completing the work of purification. Now, supposing there were no apparatus in existence to show that this is true, there are, nevertheless, certain facts available for forming a judgment as to the conditions which such an apparatus would have to comply with in order to obtain the best results. These facts may be arranged in the following sequence: (1) The process of purification by biolysis is not instantaneous, but gradual. (2) Dividing it into any convenient number of stages or periods, each of these must represent a different character of food supply. (3) No one kind of organism is capable of flourishing in all the different media or stages equally well. It follows that each stage should occur regularly if each differentiated group of organisms is to work to the best advantage.

Working upon these data, the conditions theoretically most favourable would be first to sterilise the sewage, then subject it to a special cultivation of organisms best suited to throw the organic matter into solution, then, when these had performed the maximum amount of work, sterilise again, subject it to another special cultivation of organisms, and so on. If this were done we know that the organisms employed in the last stage would be incapable of flourishing in the conditions favourable to the first stage, and *vice versa*. This I have been able to prove by the very simple experiment of rearranging the various stages of nitrification—placing the seventh in the place of the second, the second in the place of the seventh, and so on. Now, although the process of repeated sterilisations with different cultivations between each is not practicable, it was very important to keep these theoretical conditions clearly in one's mind, because it was obvious that the principle would have to be realised in practice if the best results were to be obtained.

PRECIPITATION *versus* SOLUTION.

It had long been observed in the chemical treatment of sewage that there were greater difficulties in carrying out the process of purification after suspended matters had been

disposed of than occurred in their removal. Sir Edward Frankland in a summary of the work done in the laboratory of the Royal Commission on Rivers Pollution says: "All classes of processes are to a great extent successful in removing polluting organic matter in suspension . . . but the getting rid of suspended matters is a simple problem compared with the removal of organic matters in solution." This was written years before the employment of micro-organisms had taken a tangible form. It was a strong argument for the removal of as much suspended matter as possible, so that the organic matters in solution might be reduced in quantity and more easily disposed of.

This opinion becoming widely embraced by those responsible for the carrying out of sewage works, led to the general adoption of precipitation of the suspended matters by chemicals as a cardinal preliminary to all further treatment. Whatever views may be held by Sir Edward Frankland in the light of recent developments, there is little doubt that he would have looked upon the bacterial treatment of sewage, at the time of the Rivers Pollution Commission, with anything but favour if he had understood that the first step in the process was to throw the whole of the organic matters into solution. This would appear, on the face of it, to be opposed to all the prevailing beliefs, because it seemed to add to the difficulty of dealing with what was generally admitted to be the most difficult part of the process. We now know that the question altogether hinges not upon the amount of the organic matter in solution but upon its instability and susceptibility to further and rapid changes in the direction of complete mineralisation, and we also know that this condition of instability can be much more easily produced by biolysis than by any artificial chemical means. As to the relative difficulty between the first and second stages of the process indicated by Dr. Frankland and very generally accepted, it is evident that if the process of throwing the matters into solution by a bacterial fermentation produced the necessary amount of instability required for a further natural process of mineralisation, the problem would be solved if this process could be completed, and it would follow that there would be no sludge, and that the effluent would be a theoretically perfect fertilising medium with all the original organic matter decomposed into the form most readily assimilated by plants. All the experience obtained from my earlier experiments went to show that the process of throwing the organic matter into solution was even more easily carried out than that of getting rid of the suspended matters referred to by Sir Edward Frankland, and the apparatus I have used is shown on Diagram I., Fig. 1 being a plan, Fig. 2 a longitudinal, and Fig. 3 a transverse, section of what has been generally called a "cultivation" tank. The following is a description of the first apparatus of this kind, which was constructed in 1891 and is still in use. It is about 2½ ft. wide, 10 ft. in length, and about 3 ft. deep at the deepest part. The entire sewage discharges and waste waters from a household of ten to twelve persons, with the exception of the grease, which is held back as far as possible by a grease trap, finds its way into one end of this tank at the point CC. The liquid portion rises through a perforated grating E, and then through a layer of flints till it reaches the level of the outflow pipe JJ, which is about 2 in. below the level of the invert of the drain AA. The depth of the filtering material is only about 14 in.

THE RESULTS OBTAINED.

The invariable results obtained from several installations of this apparatus proved that practically complete liquefaction of the organic matter could be obtained without trouble of any kind, and that the amount of organic sludge was a negligible quantity. Where there was inorganic detritus it had, of course, to be provided for by deposition in the ordinary way in a sump or catch-pit. It remained to be found out whether or not the breaking up of the organic matter which occurred in the "cultivation" tank was carried sufficiently far to insure its complete mineralisation under natural conditions by some convenient and inexpensive apparatus, and this part of the problem I found to be the most difficult. Several proofs of the sufficiency of the breaking up process were soon available. When discharging the effluent from a "cultivation" tank into a stream of relative greater volume I found that no perceptible pollution occurred, but that there was a fall in the quantity of free and albuminoid ammonia out of all proportion to the amount of dilution.

It will be noticed, from the following analysis, that the ratio of dilution could be closely estimated by the chlorine content of the effluent and that of the stream, and while the dilution was about as 3 to 1, the fall in the quantity of albuminoid ammonia was from .25 to .035, or about as 7 to 1, and the free ammonia as about 20 to 1. This proved beyond doubt that the organic matter contained in the effluent from the "cultivation" tank was capable of being rapidly oxidised in the stream, and from this I argued that if channels could be provided with the same amount of dilution they would be

all that was necessary to give similar results.* The chemists, however, insisted upon judging the process from the analysis of the effluent as it escaped from the "cultivation" tanks. The argument about the instability of the organic matter was never entertained at all, and although in the case above referred to there could be no reasonable objection made to the water that was passed into the river, they said that the process must be judged from the results obtained from the apparatus itself.

embodies the third part of the process, which, again, is subdivided into any required number of stages, according to the standard of purification which it is wished to maintain. This analysis is shown on the first line of the table, which gives analyses of the changes which occur during the process of nitrification.

THE APPARATUS DESCRIBED.
The original apparatus was as follows: I constructed nine wooden boxes with perforated bottoms, each of them 2 ft.

Scott-Moncrieff System of Purification. Date when Sample taken, September 12, 1893.

Description.	Smell.	Reaction.	Clearness.—Inches of water of this type could be run.	Ammonia (Wanklyn).							
				Chlorine, grains per gallon.	Total Solids, grains per gallon.	Free.	Albuminoid.	Chlorine, parts per 100,000.	Total Solids, grains per 100,000.	Free.	Albuminoid.
Effluent	Slightly unpleasant	Practically neutral	6.8	3.3	4.71	43	61.1	1.72	2.46	.17	.25
Brook water taken 5 yards from effluent outlet	Slightly musty	Neutral	—	2.0	2.86	38	54	.52	.74	.04	.06
Brook water at bottom corner, about 30 yards	More musty than above.	Neutral	—	1.3	1.86	27	30	.09	.13	.024	.035

This impressed me more than ever with the necessity for providing more highly oxidising conditions, and also for separating, if possible, the various stages of the process into differentiated colonies of nitrifying organisms, as already referred to. Accepting the analysis of the diluted effluent as a proof that the first stage of anaerobic fermentation was sufficient to produce the required amount of instability in the organic content of the effluent, it was evident that in sewage containing a certain amount of free oxygen the first changes that occurred would be aerobic in character, and even when all available oxygen was absent it only showed that it had been used up and that some organic change had occurred as a consequence. The process as a whole must then consist of several stages, in the first of which the available oxygen will be used up by aerobic organisms, and the second would depend upon the action of anaerobic organisms with liquefactions of the organic matter, and a conversion of its nitrogenous constituents into nitreous as free ammonia with other changes due to the fermentative conditions.

The case could therefore be stated in another way, and the necessary sequence would be—first, that favourable conditions should be provided by well-ventilated and self-cleansing sewers for the work of a mixed group of aerobic organisms; that the conditions should then be reversed, becoming unfavourable to the aerobic and favourable to the anaerobic organisms, and that the conditions should again be reversed, being unfavourable to the anaerobic organisms and highly favourable to differentiated colonies of nitrifying organisms, which are best suited to carry on and complete the final mineralisation of the organic matter by converting the free ammonia into nitrogen as nitric acid.

Presuming that the "cultivation" tank as above described

long by 7 in. wide by 7 in. deep, an allowance of 2 in. on each side being made, so that each box had an effective area of 1 square foot through which the effluent passed. These boxes I placed one above the other upon a framework, and filled them to a depth of 6 in. in each box with coke, broken so as to pass through a ring 1 in. diameter. Over the uppermost box I fixed two small tilting V-shaped trays, which automatically discharged their contents when the liquid reached a level that upset their equilibrium, as they were hung upon small trunnions fixed at the proper point to effect this movement, working upon supports fixed to the ends of the highest box. Over this column of boxes a large tank was fixed, into which the effluent was pumped after it came through the "cultivation" tank. The flow of the effluent was so regulated and measured that an estimate could at any moment be made of the rate in terms of gallons per acre per twenty-four hours. Between each of the boxes there was an air space of about 2 in., and a receptacle was provided at the bottom which held about twelve hours' flow. By placing shallow dishes between the boxes samples could be taken simultaneously and a complete set of analyses of the whole series of changes could be made consecutively. The arrangement of the trays is shown on Diagram I, Figs. 3, 5 and 6, also Diagrams II, III, and IV. The apparatus was set to work on October 25th last, and kept constantly going both night and day for about three months, this lengthy trial being made with the object of discovering if there was any tendency to clogging of the material in the boxes, everything being perfectly free from accumulations, and the effluent running at the rate of a little over 1,000,000 gallons per acre during the whole period. Dr. Rideal made a series of analyses which are shown in the table.

Table showing successive stages of Mineralisation by Nitrifying Organisms. Ashstead Experiments, February, 1898.

Description of Samples.	A Chlorine.	B Free NH ₃	C N	D Albuminoid NH ₃	E N	F Oxygen consumed.	G O ₂ consumed minus O ₂ required by Nitrogen Nitrogen.	H Nitrous Nitrogen.	I Nitric Nitrogen.	J Total Nitrogen.	K = Usual Oxygen N ₂ O to N ₂ O ₅ .	L Total Oxidised Nitrogen.	M Available Oxygen consumed.	N Total Volatilised N (Kjeldahl).	O Total Organic Nitrogen.	P Total Inorganic Nitrogen.	Q Total Nitrogen of all kinds.	
																		Chlorine.

was a satisfactory method of carrying out the first two stages, I give a typical analysis of the effluent obtained from it, and will then go on to describe the very simple apparatus which

THE MOST INTERESTING RESULT of the experiments is the rapid conversion of the nitrogen compounds into nitreous and nitric acid, and a high figure has been maintained throughout, varying from 7 to about 9 parts per 100,000. The conversion from the first line of results to the bottom line, which gives an analysis of the effluent from the ninth tray, occurs in something under ten minutes, showing the extraordinary rapidity with which mineralisation

* The method of treating sewage by dilution only has been seriously considered both in Germany and the United States, and it is now being used for dealing with the sewage of Chicago, but no notice seems to have been taken of the important element of instability of the organic matter produced by previous bacterial fermentation.

occurs when the conditions are favourable. By transposing the trays so as to upset the natural survival of organisms in the sequence the whole process was arrested, a high-coloured and inferior effluent being the immediate result, and one or two days were required to re-establish the conditions which had been disturbed.

It occurred to me that the arrangement as described could be used to obtain graphic illustrations of the changes as they took place, and the nitrogen lines are shown upon Chart 1. All the other changes can be graphically shown in a similar manner, and when these are superimposed one upon the other a complete view is obtained of how they are related to each other. The lines of increase crossing the lines of decrease afford a practically perfect method of obtaining information as to what is going on, and a curious setting back of the lines of increase with a corresponding change in the line of oxygen consumed in the case of the 5th Colony pointed to a critical state of the biological conditions at that part of the process; that is shown upon Chart No. 2. It is a subject of great regret to me that a large installation at Caterham, dealing with the entire discharge from the barracks, has not been completed in time to allow of the results being brought into this paper. These I hope will soon be made public.

What appears to be certain is that full information can now be obtained, both chemically and bacteriologically, as to what actually goes on during the whole process of nitrification. I should add that I have made provision for discovering, if possible, the point to which the anaerobic changes should be carried and beyond which they ought to be arrested. Estimation by error appeared to me to be the only way of arriving at any certainty with regard to this important element in the process. With this end in view, I have constructed a closed chamber, in which the anaerobic conditions are greatly intensified by means of inverted glazed earthenware vessels piled up inside the chamber. As each of these forms a separate cell, in which the gases of decomposition accumulate, and as these, numbering over 500, are placed in the body of the liquid, and as arrangements are also made for discharging the effluent at various stages of the anaerobic decomposition over the nitrifying trays, it is hoped that some definite knowledge may be gained as to the proper point to which these first stages should be carried. As I have already said, my apology for reading this paper is that there is now a prospect of light being thrown upon the process of biolysis at all its stages, and that we shall be no longer working in the dark. Two analyses are given in addition to those made by Dr. Rideal, one by Sir Edward Frankland and the other by Mr. Raymond Ross.

The concluding paper in this section was one entitled "The Flora of Sewage," by Prof. Rubert Boyce, M.B. As this paper does not seem to be procurable, we regret that we are unable to give an abstract. If opportunity offers, however, we shall make good the deficiency in an early issue.

DISCUSSION.

The papers of Messrs. Kenwood, Rideal, Scott-Moncrieff, Adney and Boyce, were discussed together.

Prof. FRANKLAND said the rapid disposal of sewage was first gone into by chemists, and under them obtained greatest perfection. He did not think there was anything which could surpass the results obtained by intermittent downward filtration and irrigation. In many manufacturing parts of the country the streams were in a shockingly polluted state, so that there was no chance of them ever being able to be used for drinking purposes. What they desired to ascertain was whether the effluent was capable of entering into putrefaction or not, and whether similar action took place when the sewage was mixed with the stream. He should like to see more generally introduced the incubator test for sewage effluent, which should also be extended to sewage mixtures. Manufacturers were frequently guilty of wholesale pollution, and it seemed to him that the only remedy open to public authorities was to obtain powers to coerce the manufacturers to distribute as much as possible the escape of waste liquors over twenty-four hours, and in the case of really dangerous liquids to make them first undergo a process of purification. Powers had been obtained at Bilston that nothing should be

admitted into a sewer that would damage the sewer or living crops. They also had the additional power to exclude anything which damaged purification processes.

Lieutenant-Colonel JONES, V.C. (London), argued that until they had filters on a large scale and they were tried with all matters that came down a sewer for a considerable time they must proceed with great caution.

Dr. PORTER (Stockport) said in the Mersey and Irwell district of Lancashire there were streams which could never be used for purposes of water supply. He therefore submitted that no unnecessary harassing of manufacturing interests should be insisted upon merely for sentimental and aesthetic reasons.

Dr. KATE FERRY (Dublin) urged that until the question of the cost of filters and working was put aside with other systems of sewage purification engineers were not in a position to get off the fence on which they had sat so long.

Mr. W. J. DIBDIN (Stutton, Surrey), said if they treated sewage by excessive doses of lime, by carbolic acid, or any material which would act as a disinfectant, they arrested that systematic process of destruction of the organic matters and simply held up for a time the natural purifying action.

Dr. HEWITT (Cheshire) gave the results of some experiments at Manchester, which showed, he said, that the effluent in the tanks could be so dealt with under Mr. Dibdin's process that it was good enough to turn into a slow-moving large body like the Ship Canal. He considered that the incubator test was a safe addition to the oxygen absorbed test.

Mr. A. J. MARTIN (Exeter) said the use of a sewage tank was preferable at Exeter. Unless they were dealing solely with domestic sewage on a separate system they would have a large amount of mineral matter and mud in suspension coming down the sewage. The effect of this in cultivation filters must be very disastrous. It had also been proved that the destruction of organisms in a tank was considerable, owing to the time of exposure to action.

Dr. G. SMS WOODHEAD, who presided over the section (Physics, Chemistry and Biology) in which the papers were read, spoke with satisfaction of the great advance made since last year's congress. Then they could only deal with generalities, but now they had definite data to go upon, and the authors of the various papers had provided data to keep them going for at least another twelve months. (Laughter).

Other gentlemen taking part in the discussion were Messrs. R. Burford (Taunton) and A. S. Ackerman (Westminster), and the authors of the papers replied.

The papers already given may be supplemented by one read at the conference of municipal representatives by the Rev. Dr. Cox, F.S.A., chairman of the Brixworth Rural District Council. The paper, which dealt with both the sewerage and sewage disposal of rural districts, was entitled

VILLAGE SEWERAGE SCHEMES: EXPERIMENTS IN THE RURAL DISTRICT OF BRIXWORTH.

In the opening of his paper the author remarked that there was no rural district of England, of at all similar area and population, that could compare for a moment with the Brixworth district in the large number of its sanitary experiments. It might be of profit to others to know of their attempts and their failures. He then proceeded as follows:—

The Brixworth district consists of thirty-six district villages or hamlets, with an aggregate population of 12,000, and an area of 62,648 acres. Out of the total seventeen are seweraged. The seventeen seweraged villages have an approximate population of 3,000, and the nineteen unsewered of 4,000. About 1873 the system of water-carried sewage was before the sanitary authority. In that year the experiment of water-flushed sewers discharging into a small filtration bed was begun at Moulton, the largest village in the district. The second to be seweraged was Brixworth, the next largest in population; this experiment was carried out in 1877, together with that of Walgrave. The two last villages to be seweraged were Pitsford and Boughton; the works for both these villages were finished in 1895, but they were ordered by the old authority. Since the Local Government Act of 1894, which provided for a popularly elected district council, attempts to extend sewerage schemes to other small villages have been successfully resisted. The resistance of the very large majority of the council has not been based upon economical considerations, but rather upon the belief that most of the previous experiments in this direction have been distinct failures.

The removal of refuse and excreta by water carriage, which is the ordinary sewage method of towns, pre-supposes (if the method is to be successful), five conditions:—(1) a copious water supply; (2) properly-laid sewers, with adequate fall; (3) an efficiency of suitable land for irrigation or filtration purposes; (4) a large outlay; and (5) good and continuous management. It is my contention that the many experiments of the Brixworth district, several of a quarter of a century duration, prove that it is practically impossible to find these conditions co-existent in rural districts or amid small village populations, and that the health of the village will not be permanently promoted by a water-carried system, but will rather in the long run materially suffer. Evidence was laid before the Public Health Amendment Bill Committee in 1877 as to the sewerage of several Brixworth union villages, and the local nuisance inspector, when examined by Mr. Pell, stated that the system thoroughly answered. But at that

time it was far too soon to draw any satisfactory conclusions. How have the five conditions mentioned above as essential to success worked out in our rural district? Let us take them serially in a brief fashion.

(1) A COPIOUS WATER SUPPLY.

Nearly in village sanitation this provision should stand absolutely first. At the same time, it is possible to have two copious a water supply running in your sewers, if the village is in a district abounding in surface springs. This has been and still is the case with the village Brixworth (sewered in 1877), where the amount of water that constantly gets into the sewers is sufficient (according to the estimate of our inspector) to cover the whole area of the filtration-bed 2 in. deep once in every twenty-four hours. The result is disastrous; the effluent into the adjoining brook is never good and occasionally singularly foul.

Throughout our seventeen sewered villages there is only one in which the question of the water supply was thought out and engineered before the sewerage scheme was begun, and it is the only one in which each closet is supplied with a cistern. Chapel Brampton is the solitary instance, with which I am acquainted, where a water-carried sewerage system, as applied to a rural village, can be said to be a success. This village, with a population of 217, is on Earl Spencer's estate. The water supply and sewerage works were executed by Mr. Griffiths at his lordship's charges, and were for the date (1880) admirable of their kind, and even now produce fairly satisfactory results.* It is difficult, however, to imagine that any rural sanitary authority would have undertaken such a scheme, and it would have been almost more than any rates could possibly have borne. Here, and here only in our district, was the right principle followed—*viz.*, the construction of a reservoir, fed by a wheel and pumped from a clear spring supply at some distance, before ever the sewers and the connected closets were constructed.

Nowhere, save at Chapel Brampton, out of our seventeen schemes are the connected closets technically water-closets. They are simply pan-closets, and to keep them sweet water has to be hand-carried and thrown down each day. The water in several of our sewered villages is at a considerable distance from many of the cottages. It is unreasonable to expect that the average cottage housewife, when she has fetched the water for varied domestic purposes, will care to regularly hand-flush the closet. The consequence is that many of the pans get coated with filth and choked up from time to time. To sewer a village without at first providing for the flushing of each pan, even if the flushing tanks of the main sewer are kept well supplied, is a curse instead of a blessing. The connections, often of considerable length, thus remain practically unflushed from year's end to year's and occasionally get fouled and choked. I have seen several such connections opened which were in a very nasty condition.

(2) PROPERLY LAID SEWERS WITH ADEQUATE FALL.

To secure a good fall to the filtration-beds, in an undulating district like ours, the risk is incurred of selecting a bed close to the brook or stream in that valley. This has been done by us at Walgrave, where the bed almost touches the brook, and is in consequence subject to an overflow during heavy rains, with disastrous results. A like mistake was made at Moulton and Harleston. The very last scheme at Loughton (1895) is also on the verge of the stream. At Brixworth the fall of the sewers was not sufficient, and there and elsewhere they were not laid straight. Outward angles sometimes occurred, whilst manholes and ventilation shafts were unknown in the earlier examples which were held up to admiration in 1878. In the earlier examples, and in some of later date, the sewer drain pipes were nsoccketed and the joints were merely made of clay. In two cases—namely, at Guilsborough (a large village at Cold Ashby)—the main sewers are simply unconnected culverts. Into these closer connections have been made, and is it to be wondered at that Guilsborough has at the present time failed to purge itself of diphtheria, which has been constantly recurring during the past twelvemonth?

The grievous thing about a badly-laid system in a country village is the great difficulty in persuading the local authority to incur the necessary expenses of altering or improving the scheme. The initial expense is brought up against the reformer, and often nothing but a serious epidemic will rouse the parish and the authority to enter upon remedial measures.

(3) A SUFFICIENCY OF SUITABLE LAND FOR IRRIGATION OR FILTRATION PURPOSES.

When the Local Government Board sanctioned the earlier of the Brixworth district schemes, their ideas as to the quantity of land required for effective natural filtration were very meagre, and remained so for some time. Moulton, with a population of 1,400, had 1½ acres; Brixworth with 1,700, 1 acre; and Walgrave with 600, half an acre. Even Litsford, so late as 1894, with a population of 500, was only required to have half an acre. The consequence of this is that, although working fairly smoothly for two or three years, the land becomes sewage sick (or clogged with more or less solid organic matter), and a variety of expedients have to be tried

to freshen it. At last another small bit of land has to be added; but this is, after all, only a temporary expedient, for the old evils will be reproduced after the lapse of another year or two.

Our beds are for the most part planted with mangel-wurzels, but one or two grow osiers, and another ash-poles. In several cases the beds are of stiff clay—here the question of natural filtration (whatever the size) is altogether hopeless. Spraton is one of the worst of our examples of this kind. A satisfactory effluent has never been obtained there, save for very brief periods, and at times the discharge into the small adjacent stream has been very bad. The foulness of the effluent led some few years ago to legal proceedings against the old authority, when an injunction was obtained. It will be remembered that at last year's congress at Leeds, Dr. Barwise said that for drainage on to clay an acre of land would only suffice for twenty-five people. At this rate the Spraton bed ought to have an area of 37 acres, instead of consisting, as at present, of a single acre. In short, where there is a clay subsoil, any proposal to entrust to it sewage, without the use of tanks, is rank folly and doomed ere long to certain failure.

(4) A LARGE OUTLAY.

Sir Henry Acland laid this down as an axiom of successful water-carried sewerage some fifteen years ago, and year after year yields proof of its absolute truth. This is one of the chief reasons against such a system for small rural populations. The large populations and the successful commercial undertakings of our towns, together with the obviously stern necessity of having a reservoird water supply and some kind of sewage scheme, make such matters comparatively easy to carry out on a satisfactory scale in boroughs. But agricultural depression, dwindling population and common-sense opposition make it exceedingly difficult to carry out a thorough and therefore an expensive scheme in the country. One inspector tells me that several of our more recent instances of village sewerage were rendered far less effective by the cutting down of the original estimates.

(5) GOOD AND CONTINUOUS MANAGEMENT.

This was laid down by Mr. Rocchling, at the Newcastle congress, as one of the two absolute necessities for successful sewage farming, whether big or small, the other being a good soil. Without considerable annual outlay, this good management cannot be attained in villages; and yet the rates seem scarcely able to bear it, and the proper control of a sewage system and its disposal bed is almost unknown. At all events continuous management does not exist in the Brixworth district. I cannot at this point do better than quote the words of our inspector in a recent communication to me: "To get a good effluent even from the best made bed on the best soil there must be good management. When a man is not constantly employed he should at least attend to the turning of the sewage twice a day. Many parishes pay a man to turn the sewage only 2s. 6d. a week, and the man has to walk a mile or more to and from the bed. Neglect of management is one of the main causes of beds going wrong." So late as May 9, 1889, it was resolved by the authority, on the motion of Mr. Albert Pell, to employ a man one day each week on the Brixworth and Spraton filtration grounds!

With regard to river pollution, our filtration-beds are serious and continuous offenders, as will be seen in detail from the appended table. They have recently been severely condemned by the surveyor of the county council. Comparatively small attention has hitherto been given to river pollution from beds so small as ours; the gravity of dealing with town effluents has been sufficient, but now that the county council has appointed so distinguished a medical officer of health as Mr. C. E. Paget further steps will probably be taken. The results to rivers from the foul effluents of small villages should not be disregarded, for it would be easy to work out a calculation which would prove that if only the other rural districts of Northamptonshire had followed the lead of Brixworth in 1873, after a like ration and with like methods—the river Nene would long ago have become one continuous stinking open sewer.

With regard to the equally grave question of the effect on the health of the district itself from these numerous village sewer schemes, it is impossible to give full or accurate statistics. For the old authority was so enamoured of these schemes that other sanitary precautions were absolutely eschewed. Brixworth was the only rural sanitary authority in England that persistently defied the Local Government Board and the Public Health Act of 1875, by having no medical officer of health to make periodical visits and reports. This reproach was only removed last year. Brixworth, too, under the old régime, refused to adopt the Notification of Diseases Act; this reproach, after four defaults, was only removed last month. Still there is no doubt whatever that, broadly speaking, the health of our unsewered villages are better than those that are sewerd; and this I have deliberately stated before a Local Government Board inspector at a public inquiry.

Under all the circumstances detailed in this paper, it is grievous to have to state that the Local Government Board refuse us leave, when wanting to improve the foul effluent at Brixworth and Walgrave, to try precipitating tanks, unless we add to the acreage of beds that have already failed. Whereas, if the tanks succeeded as well as elsewhere, no

* This Chapel Brampton scheme was fully illustrated and described in Sir Henry Acland's treatise, "Health in the Village," published in 1884.

land would be required. The central authorities seem blindly wedded to natural as opposed to artificial filtration, though the former has proved a dismal failure in villages and a constant vexation in many towns.

It is even more astounding to have to state that, on the complaint of a single non-resident individual, the Local Government Board have recently declared the Brixworth Council in default as to the "sufficient sewerage" of one of the healthiest of their villages, Holcot, with a dwindling population of only some 300. The inspector, who conducted the inquiry, refused to allow the question of the disposal of the sewage (if a scheme was adopted) to be even named, but as the subsoil is the stiffest clay in the district, and as the sewers would have to be laid in the need water-bearing bed, the council unanimously refused thus to jeopardise the health of the inhabitants.

Failure is written large right across the Brixworth district in their well-meant but disastrous attempts to deal with village sewerage by natural filtration. The moral of it all seems to be that rural authorities dealing with small populations should try every expedient rather than water-carried sewerage. But that if that system has to be adopted, water must be conveyed to every closet, and the outfall should enter precipitating tanks, or be treated in settling tanks before it reaches the filter-bed.

Some diagrams illustrative of Mr. Scott-Moncrieff's interesting paper reached us too late for this week's issue. We expect, however, to give them in our next issue, as they have an important bearing on certain passages of the paper. After a reference to Dr. Child's able lecture on the pollution of rivers, we shall proceed to deal with some remaining papers on various subjects of interest to our readers.

MUNICIPAL PROGRESS IN LEICESTER.

OPENING OF NEWARKE BRIDGE.

On the 24th ult the Mayor of Leicester, as the head of a progressive municipality, opened for public traffic the Newarke bridge, which has been erected to connect a large outlying industrial district with the centre of the town. The ceremony was attended by a large number of members of the corporation and others who take a deep interest in the public life and prosperity of the town. The bridge, which is a very imposing structure, built in the Gothic style of the Perpendicular period, so as to be in keeping with the ancient buildings and gateways in the neighbourhood, was designed by the borough surveyor, Mr. G. E. Mawbey, who is to be congratulated on the satisfactory character of the work, the cost of which, together with works of sewerage, paving, purchase of land and repairing the demolished buildings of Trinity Hospital, will compare very favourably with the £15,500 estimated and loaned for the purpose. It might be mentioned that the bridge will considerably reduce the distances from several points of the central part of the town to the Hickey and Narborough-road districts, and the gradients will be much easier than by the present Applegate-street route, no part of the carriageway being steeper than an inclination of 1 in 33. The land for the carrying out of this improvement was acquired from the Trinity Hospital trustees by an agreement on advantageous terms to both parties, which practically amounted to an exchange of that land for certain lands in Mill-lane and Jarrom-street, representing a cost of about £1,700, the corporation, in addition, paying to the hospital trustees the sum of £1,800, being the estimated cost of replacing that portion of the hospital building which has been demolished.

The bridge consists of two concrete elliptical arches, each 38 ft. span by 52 ft. 6 in. along the soffit. The arches are supported by massive concrete abutments, with a centre pier in the flood course. The work of construction, which has been carried out by Messrs. Bentley, Son & Partington, was by no means an easy task, great difficulty having been experienced in getting in the foundations, owing to the large volume of water which found its way into the excavations from the flood course through the gravel overlying the marl, under a pressure varying from 10 ft. to 14 ft. The foundations are carried down to the solid red marl, a depth of about 9 ft. below the bed of the flood course. As proof of the solidity of the work, it might be mentioned that among the material used in the bridge are about 5,500 tons of Portland cement concrete—the weight of the concrete in the arches being 1,100 tons—and about 524 tons of stone masonry. The concrete above the water and ground levels is faced with stone from Boden's Matlock quarries, and in the centre pier below the water-line with blue brickwork in cement. The concrete in the foundations of the abutments and pier is composed of one part of Portland cement to eight parts of broken granite and granite gravel, and in the abutments it was laid in layers at right angles to the thrust of the arches.

THE ARCHES

were built upon massive wood centres, carried on piles driven into the bed of the river. Those on the western side had to be specially constructed, so as to not only safely support the great weight of concrete and masonry of the arches, but to allow an opening through them 20 ft. wide and 9 ft. high, to provide for the boat traffic without interruption. The laggings or coverings of the centres were 2 in. thick, and covered

with very thick brown paper, which was coated with soft soap in order to give a smooth surface to the intrados of the *in situ* concrete of the arches. On this brown paper covering wrought V-shaped strips were nailed, to give the soffit the appearance of stone-worked Voussoirs; in fact, these concrete arches were actually constructed in separate courses, just as a stone arch would be, excepting that the concrete was laid in its plastic condition in radiated layers between wood frames instead of being set in solid blocks, as would have been the case with stonework. Nevertheless, the concrete, instead of being one homogeneous mass, has really bed joints between each layer similar to masonry construction, as each course of concrete was allowed sufficient time to set before another course was put in. The arches are 3 ft. thick at the crown and about 4 ft. 6 in. at the haunches, and the rise of them from the springing of the semi-ellipse is 8 ft. About five weeks after the arches were keyed in the centres were lowered from the weight they had supported by the gradual withdrawal of the numerous large pairs of folding wedges upon which they had been supported, and it is satisfactory to know that there is no sign of settlement or crack in any part of this somewhat unusual method of construction. Great care had to be taken throughout the winter months to protect the concrete from being damaged by frost; in fact, this part of the work had to be stopped for several weeks on this account. The upper surfaces of the arches, abutments and counterforts are covered with a layer of asphalt 1 in. thick, and provided with "weep" drains to carry off any water which may percolate through the roadway.

The stone parapets have sunk traceried panels and mullions. Over the abutments and centre pier six ornamental towers or piers will be constructed; those over the abutments will be 10 ft. 3 in. and those over the centre pier 4 ft. 3 in. above the top of the parapets. They will be octagonal, with traceried panels and crenellated tops. Besides the ordinary storm, foul and clean trade-water sewers, which have been laid under the new road, a storm overflow culvert has been laid from the Newarke to the river, to give relief to the western main sewer in time of heavy rains. During the excavation for these sewers two underground passages were discovered and a few coins were found. The largest passage was about 2 yards wide by 3 yards high, with walls of granite rubble masonry, and with a Gothic-shaped roof very solidly constructed with Switland slate built in lime mortar.

The bridge and new approach from the Newarke have a total width of 50 ft., consisting of a 30-ft. carriageway and two 10-ft. canseways. The Newarke has also been widened, mostly to 50 ft., all along the front of the almshouses from the Technical Schools to the corner of Asynn-street. The carriageway, excepting for a short length, is paved with 3-in. by 5-in. granite setts upon 9-in. of cement concrete, and grouted with pitch and tar. A piece, however, immediately opposite St. Mary's vicarage is paved with jarrah wood. The footways are also paved with concrete slabs, which were laid by the corporation staff as an additional attraction to the structure. Trees have been planted on each side of the new approaches, and the bridge and the approaches will be lighted by an ample number of ornamental lamp columns with the Victorian incandescent lamps, which are being provided. Messrs. Bentley, Son & Partington were the contractors for the bridge, the amount of their tender being £8,732; while Mr. H. C. Leadbeater has acted as the borough surveyor's chief assistant in the work and Mr. W. Thrall as clerk of the works.

COMBINED DRAINAGE IN LAMBETH.

A short time ago the Sewers Committee of the Lambeth Vestry were instructed to submit replies to certain questions raised by Alderman Hubbard in relation to combined drainage. One of the points upon which information was sought was as to whether there is an order of the vestry regulating the width of a passageway along which combined drainage is sanctioned, and the size of the pipe in connection therewith.

In reply to this question the Sewers Committee reported, at the last meeting of the vestry, that there is at present no order regulating the width of a passageway along which a combined drain is sanctioned, nor the size of the combined drain. It has, however, for some time past been the custom of the committee to stipulate that the passageway down which the combined drain passes shall, if possible, be at least 5 ft. in width, in order that the footings of the walls of the houses may not be interfered with in excavating for laying the drain or for future repair of it. As regards the size of the drain, the committee consider that this is a matter for the exercise of their discretion.

The committee also stated that the whole question of combined drainage is at present under the joint consideration of themselves and the Sanitary Committee, and that a report on the matter will shortly be presented to the vestry.

A further question asked was as to whether an order has been issued requiring builders to put in improved gullies with back and side inlets. In reply to this the committee stated that according to their knowledge no such order has been issued; so that a builder may, if he so chooses, terminate the sink, bath, or other wastes or rain-water pipes over gully gratings. The present drainage regulations mention back and side inlet gullies only, but this regulation does not appear to have been approved or adopted by the vestry.

Comparative Reports of General Practice.

XXIX. ELECTRIC LIGHTING : BECKENHAM REPORT.—III.

The first and second instalments of Mr. Angell's report appeared in our issues of October 7th and 14th. Included in the report were a number of interesting appendices, with which we now proceed to deal.

ESTIMATED PROFIT AND LOSS.

In his first appendix Mr. Angell presented a table showing the estimated profit and loss in district No. 1 at various stages of supply. For one house in eight, and with 2,953 8 candle-power lamps, the working expenses, including repayments, are estimated as follows: Private lighting, £1,887; street lighting, £300; and dust destruction, £60; a total of £2,787. The estimated revenue is £1,107, which gives a loss of £1,680. With one house in six, and with 3,937 lamps, the estimated working expenses are: Private lighting, £2,044; street lighting, £300; and dust destruction, £60; a total of £2,944. The revenue being estimated at £1,476, there is thus a deficit of £1,468. With one house in four, and 5,906 lamps, the estimated working expenses are: Private lighting, £2,357; street lighting, £300; and dust destruction, £60; a total of £3,257. Deducting an estimated revenue of £2,215, there is a loss of £1,042. With one house in three, and 7,874 lamps, the estimated working expenses are £3,570, of which £2,670 is for private lighting, the two remaining items being the same throughout. With an estimated revenue of £2,952 there is thus a loss of £618. Finally, with one house in two, and 11,812 lamps, the working expenses are estimated at £1,196, private lighting being put down at £3,296, and the other items as before. The revenue being estimated at £4,430, there is thus a profit of £234. Mr. Angell remarks in connection with his tabular statement, that as soon as an annual profit is realised a reserve fund should be created, to cover the cost of renewing cables, &c. In regard to street lighting, the cost of arc lighting is estimated at £100. Deducting £100, the saving on gas, the nett extra cost is thus £300. To ascertain the financial result of the electric lighting scheme alone, the cost of dust destruction (£600) must be deducted from the annual deficits and added to annual profits. The time interval between any of the stages is a matter of speculation, and may be one or more years, according to public demand for supply.

Appendix II. contains the schedule of streets, and Appendix III. matter relative to forms and agreements in connection with the

FREE WIRING OF HOUSES.

A few notes abstracted from this appendix will no doubt be of interest. The Shore ditch Vestry in their circular to customers state that, as they will have to maintain a staff of electric wiremen and joiners, they have resolved to estimate for, and undertake the execution of, private work for installations. The vestry will charge for such work the actual cost to them of labour and material, plus 10 per cent. for supervision. A reasonable deposit will be required before the work is put in hand. The borough engineer of Ilauley writes as follows: "The proposal is that an agreement for free wiring should be entered into and signed by both occupier and owner agreeing to pay, say, 10 per cent. on the cost of the work for a period of, say, ten years." The wiring will, of course, be executed and paid for by the council, and a loan for the purpose has been sanctioned by the Local Government Board.

At Shore ditch there is an alternative method. By an agreement between the vestry of the first part, the National Electric Free Wiring Company, Limited, of the second part, and the occupier (or owner or lessee for an unexpired term of years) of the premises on the third part, it is agreed, among other things, (1) That the wiring company should wire and fit up the premises in accordance with the fire insurance company's regulations free of cost to the consumer. (2) That the installation should be the property of the supply company unless paid for as provided in the agreement. (3) The consumer may, after the expiration of five years, purchase the installation at cost price, plus 20 per cent., and less 1½ per cent. per annum for depreciation. (4) Neither the supply company nor the wiring company are to be liable for repairs or maintenance, but the wiring company, without charge, to make good all defects of workmanship within six months after installation. (5) The consumer shall, until purchase, pay the supply company for the use of the installation 3d. per unit supplied, the minimum payment in any year to be 1s. per 8 candle-power lamp. (6) If a consumer ceases to take supply, or makes default in payment, the supply company may remove the installation, making good any damage. (7) The supply may be cut off if payments are in arrear and not paid on demand. When the consumer is only the occupier, the following memorandum is signed by the landlord: "I, the undersigned, being landlord of the above-named consumer, and being owner (or lessee for an unexpired term of . . . years) of the said premises, hereby consent to the installation of wires and fittings in the said premises upon the terms and conditions of the above agreement."

At Wallasey, the consumer, having applied to be supplied with electric current, and for their premises to be wired and fitted up on the free wiring system, undertakes to conform

in every respect to the conditions specified in the form of agreement. Among these conditions are the following: (1) The council, at their cost, undertake to wire and fit up the premises ready for electric supply, the consumer to be responsible for any damage to cables and fittings fixed on such premises and to pay for current at the rate of . . . per Board of Trade unit. (The wiring is not actually executed by the Wallasey Council, but by the National Electric Free Wiring Company, Limited, as their agents and contractors.) (2) The consumer has the option of purchasing wires and fittings outright at any time after the expiration of five years at cost price, plus 20 per cent., but minus 1½ per cent. per annum for depreciation. (3) The council are to keep a stock of fittings at the show-room for customers' selection. (4) Renewals are to be made at the consumers' cost.

A fourth appendix contained a synopsis of Mr. Kapp's report of November, 1893. One of the suggestions was that, in order to arrive at the approximate demand, a circular letter be sent to each householder in the streets in which mains will be laid giving estimate of cost of fittings and inquiring what number of lamps, if any, such householders would be likely to require. In regard to this Mr. Angell remarks, "Such a preliminary canvass might serve as an advertisement, but otherwise at so early a stage it has little to recommend it, and is, indeed, misleading. As a rule, it would appear that but few advance promises are obtained, and that many of these are unfulfilled. On the other hand, many from whom no replies are received take the light notwithstanding. It is preferable to lay mains down streets where in the judgment of the local authority a demand is likely to exist or to be created, after which a canvass may be made, probably with some degree of profit."

PARTICULARS OF INSTALLATIONS.

Appendix V. embodied in tabular form some interesting particulars in regard to various installations obtained in reply to queries addressed to various towns. These details we reproduce as follows:—

AYR.

(Population, 26,000; rateable value, £151,149.)

Ayr, it might be stated, is the only Scotch town of which particulars are given in the report. A high-tension installation has been in operation in the burgh since May, 1896. Its original cost was £26,000, and it supplies the equivalent of 9,000 8 candle-power lamps. No demands have yet been received for power for motors. The revenue of the last financial year was £1,865, and the working expenses amounted to £3,192, so that a loss of £1,327 was experienced. The price per unit is 6d. and 4d., Wright's system being followed; but a reduction, which is confidently expected to improve the affairs of the works, is contemplated. Gas is charged for at the rate of 3s. 9d. per 1,000 cubic feet.

BLACKPOOL.

(Population, 35,000; rateable value, £250,000.)

A sum of £50,000 was spent upon the works in this town, which are of the high-tension alternating type, with low tension distribution. They were opened in August, 1893, and supply the equivalent of 30,000 8 candle-power lamps. Last year's working resulted in a profit of £828, the revenue being £10,633 and the working expenses £9,805. Wright's system of charging has been adopted, the price for the first hour being 8d. per unit; for subsequent hours the charge is 2d. per unit. Profits are expected to increase. Gas costs 2s. 4d. per 1,000 cubic feet.

BLACKBURN.

(Population, 126,000; rateable value, £441,111.)

The three-wire low-tension system is in operation in the centre of the town, while the outer districts have a high-tension alternating supply. The works, which have run since February, 1895, cost £35,000 to erect. They drive the equivalent of 12,700 8 candle-power lamps, and also supply current for motors. Last year's working showed a loss of only 45s., the revenue being £3,612 and the working expenses £3,417. During the first hour a charge of 6d. per unit is imposed, and for subsequent hours 3d. per unit. A discount of 5 per cent. is also allowed. Profits are expected to increase. Gas cost 3s. 7d. and 2s. 9d. per 1,000 ft.

BOLTON.

(Population, 115,000; rateable value, £428,520.)

At Bolton the high-tension alternating system of lighting has been adopted. The works were erected at a cost of £55,615, and have supplied current since October, 1894. Power equivalent to 27,000 8 candle-power lamps is supplied, but none is used in connection with motors. The revenue and working expenses of last year were respectively £4,486 and £4,756—a loss of £270. Charges are made as follows: For the first hour 6d., afterwards 3d. per unit. A reduction of price is anticipated, as is a profit on the working of the installation. Gas costs 3s. per 1,000 cubic feet.

BIRMINGHAM.

(Population, 115,102; rateable value, £732,764.)

The low-tension continuous system is combined with the

high-tension alternating system at Brighton. Current was first supplied in September, 1891, and the output is now equivalent to 75,427 8 candle-power lamps. Motor power is supplied. Last year the revenue amounted to £26,527, and, as the working expenses only amounted to £20,644, a profit of £5,883 resulted. As regards the price, for the first hour a charge of 7d. per unit is made, this afterwards being reduced to 1½d. per unit. At present no reduction in the charges is contemplated, and the profits are not expected to increase. In Brighton gas costs 2s. 9d. per 1,000 cubic feet.

BRISTOL.

(Population, 226,576; rateable value, £1,061,143.)

With a high-tension alternating plant, which was erected at a cost of £110,000, the Bristol authorities supply the equivalent of 43,615 8 candle-power lamps. Current was first supplied in October, 1893. The result of last year's working was a profit of £487, the revenue and expenses being respectively £14,388 and £13,901. The price per unit is 6d., and it is not expected that any reduction will be made; larger profits, however, are expected. A charge of 2s. 6d. per 1,000 cubic feet is made for gas.

BURNLEY.

(Population, 95,000; rateable value, £320,000.)

A low-tension three-wire installation is at work here. The original cost of the works was £26,000, and the first supply dates from August, 1893. Power sufficient for 15,000 8 candle-power lamps is supplied, but none is used in connection with motors. A profit of £712 resulted from last year's working, the revenue being £3,579 and the expenses £2,867. The price per unit is 5d., less 5 per cent. No reduction is expected to be made. Gas costs 2s. 3d. per 1,000 cubic feet.

BURTON-ON-TRENT.

(Population, 49,000; rateable value, £244,785.)

At Burton-on Trent an installation on the high-tension alternating system, which cost £30,000 to erect, is in use, and current has been supplied since February, 1894. The amount at present supplied is sufficient for 7,600 8 candle-power lamps. There is no demand for power for motors. A loss of £1,579 is shown on last year's working. The revenue was £1,521 and the expenses £3,100. A charge of 6d. per unit is made, but a reduction is anticipated. Gas costs 2s. 6d. per 1,000 ft.

BURY.

(Population, 57,000; rateable value, £244,785.)

The low-tension continuous system is in use at Bury, where current has been available since November, 1896. A sum of £22,000 was expended upon the erection of the works, which supply an equivalent of 3,185 8 candle-power lamps. No electricity is supplied for motors. The charge for the first hour is 6d. per unit, and for the second 3d. A reduction is not anticipated, nor is it expected that profits will increase. The price of gas in Bury is 2s. 2d. Nothing, it may be mentioned, is given in this return regarding revenue or expenditure.

CHELTENHAM.

(Population, 47,500; rateable value, £272,619.)

At this town, where £36,416 was spent upon a high-tension alternating system, with sub-stations, the date of the first supply was May, 1895. Electric motors are not used. In the last financial year the revenue totalled only £1,945, as against £3,100 working expenses. This leaves a deficit of £1,155. No immediate change is expected in connection with the electric light charges, which are stated to be from 3½d. to 6d. Considerable profits are expected to result shortly, and the year dealt with in the report is itself likely to result favourably, as the revenue has increased. Gas in the district is charged for at the rate of 2s. 4d. per 1,000 cubic feet.

COVENTRY.

(Population, 53,000; rateable value, £183,674.)

A high-tension alternating system is at work here. It cost £20,000 to erect, and was started in January, 1896; the equivalent of 8,000 8 candle-power lamps are supplied, but no power is distributed for the use of motors. With a fixed charge of 6d. per unit, last year's accounts resulted in the revenue and expenses balancing equally at £1,300. The authorities hope to be able to make both a reduction in price and earn a profit in the future working. The price of gas is 2s. 5d.

DERBY.

(Population, 91,146; rateable value, £357,233.)

Here a high-tension system with transformer stations is in use. The original cost of the works was £58,650; they were started in October, 1893, and now supply power equal to dealing with 17,580 8 candle-power lamps. There is a small demand for power with which to drive motors. The last financial year's accounts showed a loss of £1,453, the income and expenditure being respectively £6,866 and £8,319. This deficit is, however, explained by large extensions which at present are earning no revenue, but future working will, it is confidently expected, result profitably. During the first one and a half hours the charge per unit is 6d.; afterwards it is 3d. per unit. Gas in the town costs 2s. 8d. per 1,000 cubic feet.

DEWSBURY.

(Population, 31,000; rateable value, £114,000.)

Current has been available in Dewsbury since December,

1894, the date when the electric lighting plant, which is on the high-tension system with transformer stations—and which cost £21,260—first started work. The equivalent of 7,155 8 candle-power lamps are supplied, and there is a slight demand in connection with motors. Here also a loss has been experienced on the working of the undertaking, the revenue for the last financial year having been £3,733, and working expenses £3,879, leaving a deficit of £146. A profit is shortly expected to be made. For the first one and a half hours 6d. per unit is charged, and afterwards 3½d. The price of gas per 1,000 cubic feet is 3s.

EALING.

(Population, 30,000; rateable value, £200,000.)

A sum of £59,000 was spent upon the installation at Ealing, which is on the high-pressure alternating system with sub-stations. It has been working since October, 1884, and at present supplies power sufficient to deal with 12,684 8 candle-power lamps. No energy is used for motor purposes. Revenue and working expenses amounted to respectively £4,975 and £5,292, thus leaving a deficit of £317. Sixpence per unit is charged for current, but a reduction is anticipated. Profits, also, are expected. The price of gas is 2s. 11d.

FAREHAM.

(Population, 7,934; rateable value, £24,000.)

A high-pressure alternating system with transformers is working in this town, where current has been available since September, 1891. The works cost £4,500 to build and supply power sufficient for 1,152 8 candle-power lamps. In this case a loss of £819 was experienced during the last financial year, the revenue being £543 and the expenses of working £1,362. The cost of maintaining the public lamps was not however, included in the accounts. The current costs 6d. per unit, while gas can be obtained at the rate of 1,000 cubic feet for 3s. 9d.

NEW PUBLIC BATHS AT TUNBRIDGE WELLS.

The new public baths erected by the Tunbridge Wells Town Council in Monson-road, at a cost of £10,000, were recently formally opened. The interior walls of the swimming tank are of brick, with glazed tiles for the lower portion, and a gallery surrounds the bath, under which the dressing-boxes abut on to the platform which encloses the water surface, and which has a mosaic pavement. The dressing-boxes are of pitch pine, on the half-door system, and warmed with steam radiators. The sides of the bath are of white glazed tiles, and the bottom of mosaic pavement, in which the borough arms may be traced. The roof has a 55 ft. span, and is 70 ft. from the water surface to the apex of the glass lantern; the bath is 105 ft. long, and 55 ft. wide, the actual water surface is 90 ft. by 30 ft., with a depth varying from 6 ft. 6 in. to 3 ft. 0 in., which can be increased 6 in. for polo matches, while a spray is introduced for cleaning the surface of the water. The gallery will hold 300 spectators, and the walls are for a height of 8 ft. lined with glazed bricks, and the remaining portion with red bricks. At one end of the bath an alcove contains a shower-bath, and there is the usual lavatory accommodation. Behind the bath is the boiler-house, with a couple of Cornish boilers, a steam laundry for bath linen, and a drying oven for towels. A subway encircles the bath, in which the various pipes can be easily reached in case of need. Over the boiler-house is a tall chimney shaft. The building was designed and its erection superintended by Mr. W. Mellor, the borough surveyor. Messrs. Longley & Co. were the contractors for the building; Messrs. T. Bradford & Co., of Salford, for the engineering; and Messrs. Diespeker, for the mosaic paving. The electric light is utilised all over the building.

THE WATER SUPPLY OF BROOMFLEET.

The water question, which has been a source of perplexity to the members of the Howden Rural District Council for some time, again came up for consideration at a recent meeting. A letter was received from the Local Government Board forwarding copies of letters from several residents of Broomfleet complaining of the condition of the water, which was described as sewage matter. They forwarded a sample of the water, which they said was "unfit for human nature to use," and complained that the matter had been in the hands of the council for three years without result. The Local Government Board concluded by asking for the council's observations on the matter. The council also received a report from Mr. Bohn, engineer, of Hull, on the subject. The purport of the report was that Rowdale, Wooddale and Wooddale springs on the wolds would furnish supplies equal to the demands. He recommended a 3-in. pipe to Broomfleet and a 2-in. pipe to the adjoining farms and lock cottages, and calculated that when the work was completed a discharge of 55,000 gallons per day would be given. The cost of the work to Broomfleet would be £1,287, and if the pipes were taken on to the farmhouses alluded to the extra outlay would be £773. After some discussion it was decided to refer the matter to a committee.

London Water Supply.

PROPOSALS OF THE WATER COMMITTEE OF THE COUNTY COUNCIL.

On the 11th ult. the London County Council passed the following resolution: "That in view of the existing difficulty of obtaining an adequate supply of water in a large portion of the county of London, it be an instruction to the Water Committee to forthwith submit its proposals with regard to legislation affecting the water supply in the ensuing session of Parliament." This resolution the Water Committee have now fully considered, and on Tuesday their report was considered by the members of the council.

The committee state that it will be remembered that in May last they submitted a report to the council stating that, owing to the continuance of the sitting of the Royal Commission on London Water Supply, they did not deem it advisable at that moment to make any proposals for legislation on the subject of water, but that in their opinion it would be well for the council to suspend their standing orders so as to leave them free after the summer recess to make any recommendations that might appear to be necessary. The council, therefore, have now to consider whether they will continue to wait for the report of the Royal Commission before taking any action in the direction of legislation, or whether they will at once formulate their proposals and lay them before Parliament in the coming session. In view of the very serious state of affairs that has been shown to exist during the last few months, the committee themselves believe that it is the duty of the council to take every possible step to enable the legislature to have before them in the coming session specific proposals for solving the problem of the London water supply upon the lines of the council's policy. There were two main facts appearing from the experience of the last twelve months. First, that one-quarter of the population of London had recently been subjected to a series of water famines by reason of the default of the East London Water Company; and, secondly, that the drought of the present year had reduced the flow of the rivers Thames and Lea to so low a state as to make it certain that these rivers could not in a dry year yield the supply which the Royal Commission, presided over by Lord Balfour of Burleigh, relied upon in making their report. Those two matters, although closely connected, might for the purposes of discussion be kept distinct, because it was possible by temporary measures to satisfy the needs of East London immediately, whereas it would take ten or fifteen years to carry out the necessary works for providing for the permanent requirements of London generally.

During with the question of

IMMEDIATE REMEDIES.

the committee state that in their opinion the only satisfactory means of remedying the state of affairs in East London rests in pressing forward the old policy of the council—namely, the

ACQUISITION OF THE EIGHT METROPOLITAN WATER COMPANIES. They point out that if the council's Bills of 1895 had become law there would have been no famine in East London in the present year. The council would have come into possession of all the undertakings in 1896, and would have been able with little difficulty to utilise for East London the water generally available for the metropolis, of which there had been sufficient even during the present drought. Any scheme which contemplated the continuance of the individual companies was open to the objection that each company possessing a margin of available water would naturally desire to retain such margin for the possible needs of its own consumers. It was only by uniform management that the whole of the water available for the metropolis could be efficiently made use of for all parts of the area. Although schemes of amalgamation, or of combination of the companies, had been put forward as capable of effecting this object, they were attended by so many difficulties and were open to so great objections that the committee were convinced that the only satisfactory system of uniform management lay in a public authority possessing the entire supply. They proposed, therefore, legislation upon the lines of the council's purchase Bills, subject to certain observations. The council's Bills had always provided for the

IMMEDIATE TRANSFER

of the companies' undertakings, with subsequent arbitration as to price. That proposal had been the subject of some criticism, but they believed it to be indispensable in the pressing circumstances of the case, and quite capable of justification when accompanied, as it had been, by provisions assuring the shareholders against loss of income during the interval between the transfer and the payment of the purchase money. The actual vesting of the undertakings in the council could not prejudice the shareholders, nor did they wish it to prejudice the question of the future position of the outside areas, and they therefore proposed a resolution which made that clear.

The committee point out that the plan of proceeding by separate Bills was adopted formerly for reasons of Parliamentary expediency, but the consideration which the subject underwent in 1895 should operate so as to shorten the period

of discussion in the coming session and make it possible to unite the proposals for purchase in one Bill. They accordingly propose that the council should proceed by one Bill for the purchase of all the companies, and, in order to make the council's proposals a complete and immediate protection against further famines in East London or elsewhere, they suggest that the Bill should contain clauses enabling the council to take in hand forthwith the work of consolidating the several systems, and connecting and laying mains, &c., so that the whole might be at the earliest possible moment adapted to meet the needs of the whole of the metropolis.

On the question of the

ARBITRATION CLAUSE

the committee think that the precise form of the clause may be left to be considered by the Parliamentary Committee, and suggest that at present the council should only pass a general resolution on the subject. The views of the council throughout had been that, while prepared to pay the fair and reasonable value of the water undertakings, such value ought only to be decided with due regard to many important matters. One of those matters was the contention then put forward by the council, that the companies were rapidly nearing the end of their resources, and would shortly come face to face with a very large expenditure necessary for procuring an additional supply. The experience since gained had entirely borne out that view. In the last three years all the companies, except the Kent company, had been to Parliament for additional powers, and the default of the East London Company was a matter of notoriety. The present proposal was that the arbitration clause should be drafted in such a form that it should be certain that under it the arbitrator would, in the case of each company, have regard to all such circumstances as might be brought before him, such as, for instance, in the case of East London, its inability to provide for its population and the necessity of its obtaining other supplies.

As to the question of dealing with the

OUTSIDE AREAS,

the committee state that the matter is naturally one of difficulty, but the council had already on other occasions agreed to the principle of according to the outside authorities the same freedom of administering their own supply as the council claimed for themselves. The further question, as regards the separation of sources, might be left over for negotiation with the outside authorities.

With reference to the council's agreement with

THE CITY CORPORATION

to give one-eighth of the seats on the council's future Water Committee to nominees of the corporation, the committee state that they are not sure how far the corporation have abandoned their views in favour of purchase, the evidence put forward by them before the Royal Commission being somewhat uncertain. If, however, they still supported the principle of purchase, the committee thought the council were bound to adhere to their arrangement, and suggested that the corporation should be asked at once whether they would assist the council on the lines of the old agreement.

In the second portion of the report the committee deal with the

FUTURE SUPPLY OF LONDON,

and in this connection they state:—

It will be remembered that the conclusion arrived at by Lord Balfour's Commission, that sufficient water to satisfy the requirements of London up to the year 1931 could be obtained from the valleys of the Thames and the Lea, were based upon the view that these valleys could be relied upon to yield at least an average daily supply of 300,000,000 gallons and 92,500,000 gallons respectively. Although from the outset entertaining grave doubts as to the correctness of this view, we have hitherto accepted it and devoted our attention specially to the question of the cost of a storage system necessary for giving such supply, as compared with the cost of bringing water from Wales, and, having become convinced that the storage scheme would prove in the end the most costly and least satisfactory of the two, we tendered evidence before the present Royal Commission, to show that reservoirs at Staines capable of supplying 300,000,000 gallons a day, without depletion of the Thames in dry years, must be very large and very costly. The present year has been dryer than any previous year in recent times, and it is evident now that a reservoir system capable of meeting the needs of a year such as 1898 must be of such magnitude as practically puts all storage schemes out of the question. But, beyond this, the experience gained in connection with the law of the rivers Lea and Thames during the present session has entirely confirmed us in our belief that

LORD BALFOUR'S COMMISSION WERE MIS-

into erroneous views as to the quantity of water obtainable in dry years. The report of the commission was founded on the Lea was undoubtedly based to a great extent upon the

evidence given on behalf of the East London and the New River Companies. This evidence was that between them they could supply over 110,000,000 gallons a day, and that this quantity could be largely increased by storage reservoirs in the Lea valley. Since then the New River Company have admitted that they can obtain from their works only 24,000,000 gallons a day, instead of 34,000,000 gallons as stated to Lord Balfour's Commission, and the East London Company, although they have doubled the capacity of their storage reservoirs, have nevertheless made default. The fact is that during the whole of the present year the entire volume of the river Lea has been used, and yet there has been a famine. Moreover, the average flow in September last over Field's weir was only 8,250,000 gallons a day (of which it is believed a large portion was water contributed by the New River Company), whereas the information before Lord Balfour's Commission was to the effect that the minimum known flow of the river for any month at that spot was 17,500,000 gallons. With regard to the Thames, the information before the commission showed that its minimum total flow in one month was 308,000,000 gallons a day. Last August the flow was only 272,000,000 gallons, and in September it dropped to about 200,000,000 gallons, out of which the Thames companies had the right to abstract 150,500,000 gallons, and did, in fact, in August draw 129,900,000 gallons. These facts have convinced us that it is impossible to depend in a very dry year upon the quantity of water which the commissioners reported as being obtainable; and if this is so their report affords no solution of the problem of metropolitan water supply. The evidence of the present year therefore seems to justify conclusively the views hitherto held by the council as to the necessity of immediately proceeding with some scheme for the future supply of the metropolis on lines other than those suggested by Lord Balfour's Commission. The council have already decided that in their opinion the solution lies in having

RESORT TO THE WELSH MOUNTAINS

to obtain the necessary supplementary supply, and the time has now arrived for giving effect to this resolution. Our report upon this subject, discussed at the council meetings on February 25 and April 21, 1896, gave a detailed statement of our entire proposals, and thereupon the council resolved that the requisite augmentation of the supplies of water should be derived from some other source than the Thames and Lea; that the valleys of the Usk, the Wye and the Towy would furnish a suitable area from which supplies might be derived, and that the Usk section should be undertaken in the first instance. After passing these resolutions, however, delay was incurred by reason of the council desiring further advice from Sir B. Baker and Mr. Deacon, and although in 1897 these engineers reported in favour of the Welsh scheme as compared with that of storage in the Thames valley, by that time the present Royal Commission had been appointed by the Government, and thus we again felt ourselves unable to recommend the council to take Parliamentary action. We proceeded, nevertheless, with the plans and sections, and these have all been completed for both portions of the Welsh scheme. The work that remains to be done in order to lay complete proposals before Parliament will take about three months to execute, but the referencing for the portion of land taken for the reservoirs, &c., can be completed in proper time, and it should not be impossible, if the referencing for the conduits is finished before Parliament meets, to obtain a suspension of standing orders so as to enable Parliament to have the scheme properly before it. We therefore propose that the council should deposit a Bill for obtaining water from Wales, but in doing so we advise the council to make an alteration in its former resolution. The Welsh scheme, as approved in 1896, was divided into two parts—namely, the Usk section and the Wye section. We then advised the council to take up the Usk section in the first instance, but since that date Sir Benjamin Baker and Mr. Deacon have expressed a preference in favour of the Wye section. The reasons which actuated us in recommending the former were purely reasons of policy, and as the engineer himself has throughout preferred to put forward the

WYE SECTION FIRST,

and recommends it now strongly as being the better and the cheaper of the two, we think the council would do well to rescind its former resolution and order a Bill to be promoted for obtaining water from the valleys of the Wye and Towy upon the lines set out in our former report with reference to that portion of the engineer's scheme. The estimate of cost in our former report has been slightly reduced, the total amount necessary for providing a daily supply of 200,000,000 gallons being £16,546,000, and this will probably be expended in three instalments.

In concluding the report the committee recommend the council to adopt the following resolutions: (1) That a Bill be promoted in the coming session of Parliament for the purchase by the council of the undertakings of the eight metropolitan water companies by agreement, or, failing agreement, by compulsion. (2) That, subject to such provision as may be made by Parliament as to the ultimate relationship between London and the outside authorities, provision be made for the undertakings of the companies vesting in the council at a date not later than six months after the passing of the Act. (3) That the Bill contain provisions authorising the council to proceed

forthwith with the connecting and laying of mains and other works necessary in order to enable it to protect any part of the metropolis from want of water. (4) That the arbitration clause be so framed as to render it certain that in the case of each company the arbitrator will have regard to all such circumstances as may be brought before him, and that no allowance shall be made in respect of compulsory sale except for cost of reinvestment (if any). (5) That, subject to further negotiation thereon with the local authorities, the clauses with respect to the supply of outside areas should follow the principle of the Bills promoted by the council in 1895. (6) That the understanding with the corporation of the City of London with regard to their representation on the Water Committee be adhered to, if they so desire. (7) That a Bill (or Bills) be promoted in the coming session of Parliament for the purpose of empowering the council to bring an additional supply of water to London from the watersheds of the Wye and Towy on the general lines of the report of the Water Committee approved by the council, April 21, 1896, in so far as it applies to the Wye section of the engineer's scheme. (8) That it be referred to the Parliamentary Committee to prepare and present to the council the necessary Bills for carrying out the above resolutions.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

217. Passage of an Electric Current.—Mr. Egbert Rushton, engineer and surveyor to the Cleethorpes District Council, writes: Would the presence of mud and dirt, &c., between sheet copper and rusty steel, though the two were bolted together, interfere with the efficient passing from one to the other of an electric current? Assuming that the answer to the above be "yes," is there anything cheap and efficient I could place between the two metals so as to prevent the entrance of mud and dirt, &c., and which would not interfere with the current.

Mud and dirt would certainly help to make the joint a bad one, but rust would, more than anything, tend to retard the passage of a current between the two metals. Under most conditions the best means of making the junction of the two metals an efficient one would be to remove the dirt and rust and solder them together.

218. Motor Dust-Vans.—Mr. D. J. Ebbets, engineer and surveyor to the Acton Urban District Council, writes: I am desirous of obtaining information concerning motor dust-vans. I should be greatly obliged if you can tell me of any authorities who are using them. I am aware that the Chiswick Urban District Council use them, but would be glad to know of any other authorities who so use them.

We are unable to discover that any local authority other than the Chiswick Urban District Council have adopted motor dust-vans. The Steam Carriage and Waggon Company, Limited, Chiswick, may be able to render some information on the point. Possibly Mr. E. Shrapnell Smith, honorary secretary of the Liverpool Self-propelled Traffic Association, Liverpool, the author of a paper on "Motor Vehicles," read at the recent Sanitary Institute congress, may be able to assist the querist. We shall be glad if any of our subscribers can give any information.

219. Curious Taste in Water after Filtration.—"Puzzled" writes: Can you tell me the cause of a curious taste in water resembling cucumber? I have lately been troubled with this peculiarity in water supplied by some works of which I have the control. The works have been constructed for about forty years, and not until last autumn, filtered through sand and gravel, and is then pumped up to supply the inhabitants. The taste, which can be detected for some miles up the stream, can scarcely be distinguished as it leaves the filter-beds, but becomes very marked when it is in the mains and is under pressure. Analysis fails to give any information excepting that there is nothing deleterious in it?

The pollution referred to by the querist is most probably of organic origin, derived from vegetable matter over or through which the stream or some of the distributories passes. A careful examination of the banks should be made, and samples of water taken at different points, when the source of pollution should be by this means located. Having done this, the remedy will be comparatively easy.

The Sanitary Inspectors' Association.—An extraordinary meeting of the above association will be held at Carpenters' Hall, London-wall, E.C., to-morrow, at 6 p.m. At this meeting Mr. T. J. Moss Flever, chairman of the council, will deliver his inaugural address.

Society of Engineers.—The next ordinary meeting of this society will be held at the Royal United Service Institution, Whitehall, on Monday, when a paper will be read by Mr. Werry F. Nursey, past-president, on "The Preparation of Rhea Fibre for Textile Purposes." The chair will be taken at 7.30 p.m. precisely.

Sewage Disposal at Sutton.

LOCAL GOVERNMENT BOARD INQUIRY.

Mr. R. H. Bicknell, Local Government Board inspector, conducted an inquiry on the 18th ult. into an application of the Sutton (Surrey) Urban District Council for sanction to borrow £3,500 for works of street improvement, £1,600 for works of sewage disposal, and £190 for additions to the stables and the making of a cart-shed.

Mr. W. J. DIBBIN, J.R., who is the chairman of the council, was first examined in connection with the loan for purposes of sewage disposal. He stated that in 1887 both himself and Dr. Dupré expressed an opinion, from investigation, that the future treatment of sewage would be by bacteria. Experiments by the State Board of Massachusetts entirely confirmed that view, and in 1891 the London County Council decided to make experiments at Barking. Experiments were made, resulting in the construction of a coke-breeze bed of an acre in extent, and this was brought into use in 1892. The result was satisfactory, and the experiments had been continued under his supervision until he resigned his position as chemist to the London County Council, about eighteen months ago. He gave up his office in October last. In 1892 he was elected, being a resident of Sutton, as a member of the old local board, and he suggested to the board, they being about to institute their present sewage works, that they should try the system of treating the sewage by as economical a process as possible by relying upon

COKE-BREEZE OR OTHER MATERIAL

for fine beds for the purification of the sewage, similar to those used at Barking, after preliminary treatment. These beds were made, the material being coke-breeze, sand, and sand and polarite. The Polarite Company offered the board polarite at £7 per ton, and he suggested other material costing shillings. The work was done by a paid servant of the public on the one hand (speaking of himself as chemist to the London County Council), and by ratepayers, speaking of the board and of himself as a representative of the ratepayers on the Sutton Local Board. He wanted the inspector to take particular notice that these coke-breeze beds were precisely similar to those beds used at Exeter by the Septic Tank Company, and which were found satisfactory, as would be seen by Mr. Cameron's statement submitted to the Local Government Board inspector at the inquiry at Exeter. As a result of the work done by these fine beds, it was shown that the tank effluent could be purified by this simple treatment over prepared land, because they showed that it did not matter what they used for preparing the beds. It really was a process of downward filtration worked intermittently. It was really prepared land, these beds. The result having been established, he submitted to the members of the council about two years ago that they should further experiment, by filling one of their precipitating tanks with coarse burnt ballast or coke-breeze for treating the crude sewage directly upon it, letting the effluent from this pass into the fine beds, and allowing the bacteria to eat up the sludge; and this was done. It was the outcome of public work, and not of work of a speculative character. It was a ratepayers' scheme entirely. The suggestion was carried out, and the first coarse bed was brought into use in November, 1896. As a result of the first six months' work he presented a report to the council, in his capacity as a townsman, to the chairman of the urban district council, and it came to this, that they found that the sludge was completely removed. Their

NEW COARSE BACTERIA-BED

took the place of the precipitating tank, and the results showed that the sludge was done away with, and that the oxidisable matter was reduced by the coarse beds to the extent of 63 per cent. and by the combined beds to 85 per cent. If they measured by the albuminoid of ammonia process it was reduced in the coarse beds 58 per cent. and in the combined beds 78 per cent. The final effluent was free from all objectionable odour, and remained perfectly sweet on being kept either in open or closed vessels. Three other coarse beds were made from time to time by filling up the precipitating tanks, and were still working. They hoped, by the Local Government Board granting this loan, they would be able to make a sufficient number of beds to deal with the whole of their sewage in accordance with the surveyor's report of February, 1898, which would effect an economy of nearly £500 per annum when this system was complete. Dr. Jacob, the medical officer to the council, would tell the inspector his opinion of the character of

THE EFFLUENTS

he had examined from time to time, and they should also submit to the inspector that during the whole of this time they had completely satisfied the requirements of the Thames Conservancy, whose inspector informed him personally that they were quite satisfied with the effluent. The analysis would show a most important and interesting fact—that in March, 1897, when they were overworking the beds with a view to ascertaining their maximum power, their power fell off and the purification of the organic matter was reduced; but even then, under these abnormal conditions, taking the very worst time when they tried to put them out of order,

there was no nuisance whatever, and as soon as they gave them a few days' rest their recuperative power was so great that their full action was immediately restored. He pointed that out, because it had been used as an argument that the beds were not reliable; but it showed, on the contrary, that they were entirely under control and could be worked at all times. This was

A RATEPAYERS' SYSTEM,

worked out at the cost of the ratepayers by the ratepayers' representatives, and given to the ratepayers by the united exertions of public men all along the line, because without the help and assistance received from the members of that council it could not have been done, and it went without saying that England had to thank the members of the Sutton Council for showing how this difficult problem might be solved without any question of royalties or patents. The cost was a minimum that any works could be made for, and a minimum of plant was required; and the results were such that they would be able to satisfy the inspector that they had only to extend the area of the beds, and sewage, as Sir Edward Frankland showed in his report to the Thames Conservators, could be brought back into the character of original drinking water. They had here a perfect system of land treatment, in which the action which generally took place on land properly worked was concentrated, accelerated and controlled. The treatment at sewage farms, as hitherto followed, had been a treatment prescribed from want of knowledge and the precise process through which sewage passed was haphazard and uncertain. In this case, knowing all the conditions, they submitted to the inspector that they had a system which was economical and efficacious in the highest degree, and they asked him to assist them in granting permission to adopt the system for the treatment of the whole of the sewage at Sutton, and thus assist the ratepayers in getting the work done most economically and as satisfactorily as possible.

Mr. C. CHAMBERS SMITH, surveyor to the council, said the estimated flow of sewage was 30 gallons per head of the population. The existing capacities of the coarse filters was 101,600 gallons, and it was proposed to increase this to 443,500 gallons. This was allowing for filling the tanks twice a day, but in practice they filled them three times per day, so that they had allowed one-third more, in order to be on the safe side always. The capacity of the present five beds was 233,586 gallons, and it was proposed to increase this to 462,786 gallons. They had 24 acres 17 perches of land at present available for the treatment of sewage. The land was stiff clay.

Mr. DIBBIN said one of the results of the increased purity of the effluent had been to enable them to grow wheat, for which they had secured a net profit of £24 per acre, which, he ventured to think, was the highest profit ever obtained on a sewage farm. That was a natural advantage, and a very great one, but one that arose consequent upon their being better able to deal with the effluent. It was possible to fill the tanks six or seven times a day in case of storm.

Dr. JACOB, medical officer of health, supported the application from his observations of the results of the treatment of the sewage in the past.

On the termination of the inquiry the inspector paid a visit to the farm, and is understood to have been much gratified with the system and the condition of the works generally.

ELECTRIC LIGHT IN BRUSSELS.

On the 22nd July last the first trial of the complete electric light installation in the Gare du Midi in Brussels was made, and, according to *The Journal of the Society of Arts*, pronounced thoroughly satisfactory. When the city authorities of Brussels a few years ago proposed lighting public places, such as railway stations, parks, &c., by electricity, and supplying electricity to subscribers at the same rate as gas, a great cry was raised and protestations made against the innovation, arguing that it would ruin the gasworks and injuriously affect the communal exchequer. Recent statistics show that during the past year not only has the use of electricity increased, but that the profit from the sale of gas is considerably in excess of that of previous years. Deducting the amount expended for establishing plant, &c., the city derived a profit of £8,800. The most important installation recently made in Brussels is in the King's palace. When the work is finally completed there will be 7,500 lamps, of which a large number will be of 5 candle-power, employed in the chandeliers illuminating the ball and reception rooms. There are, according to the United States consul at Brussels, about 47,391 lamps, reduced in units of 16 candles, in the city system, averaging 117 lamps per 100 running meters of canalised streets. This number includes 770 arc lamps and twenty-eight electric motors, the latter varying from $\frac{1}{2}$ th to 10 horse-power, with a total of 105 horse-power. In view of the increasing use of electricity in Belgium, the consul is of opinion that there is an excellent opportunity for the introduction of electric apparatus of all kinds.

THE LOCAL OFFICERS' SUPERANNUATION BILL.

MEETING OF THE MUNICIPAL OFFICERS' ASSOCIATION.

Mr. C. William Tagg, clerk to the Camberwell Vestry, on Monday evening occupied the chair at a conference, held at Sten College, Victoria-embankment, for the purpose of bringing before municipal officers the necessity of making efforts to induce their authorities to support the Local Officers' Superannuation Bill, and to take steps to secure assistance from the Parliamentary representatives of their districts.

The CHAIRMAN delivered a long address. He explained that the meeting had been convened for practical purposes, and that they desired to arrive at some practical decision as to how they were to get their Bill through the next session of Parliament. As yet there had been no really practical result, although a trump card had appeared in the annual report of the Local Government Board, which showed the result obtained in the working of the Poor Law Officers' Superannuation Act—namely, a profit in favour of the ratepayer of £15,000. It had been objected that the measure would place another burden on the back of the ratepayer, but they had always argued that that would not be the case, and that it would be a measure of justice to be equally fair to both the official and the ratepayer. The average salary of municipal officers in this country was £100 per annum, and it was impossible to make any provision for retirement out of that sum. They desired that the local authorities—who, he regretted to say, had not responded in the manner in which they had been expected to—should grant superannuation on a scheme under which the officers would contribute. As far as Parliament was concerned they were safe, but it was for themselves to obtain the consideration and support of their authorities, the majority of whom had up to the present refused to approve the movement. Several, however, had adopted resolutions in its favour. He thought that the allowance they asked for was a reasonable one. It was not a question of pension; it was one of deferred pay, and, in his opinion, it required settlement. Mr. Tagg, following a reference to the proposed inclusion of workmen in the Bill, then concluded his remarks by expressing a hope that the proceedings would be fruitful of good work, and, furthermore, that another step might be made in the right direction.

Mr. MATTHEW HALE, clerk to the Holborn District Board of Works, next submitted a motion pledging the meeting to do all in its power to secure the passing of the Local Authorities Officers' Superannuation Bill in the next session of Parliament, and, in the course of a brief address, said he considered the task of the association to be a gigantic one, and one which required much perseverance on the part of everyone engaged in municipal duties.

Dr. ORME DUDFIELD, medical officer of health to the Paddington Vestry—who has been connected with the association, as a member, since its formation—referred to the appointment of independent committees, which he agreed was satisfactory. Continuing, he mentioned that it had been contended that officers with good salaries should provide for their old age. The stipends, however, were generally so low that that was seldom possible. He felt sure he would have the approval of the meeting in seconding the motion.

Mr. JOHN LEWLES, M.P., in supporting the motion, remarked that it gave him great pleasure to be enabled to show his sympathy with the movement, which he promised he would do all in his power to support. Sympathy had been shown by Parliament, who really only required a little pressure from the various authorities. He spoke, he was sure, the opinion of a number of his fellow-members when he said that unless municipal officers were paid a higher salary in their earlier years they could not be expected to shift for themselves and provide for their old age. Local government in England, he went on, was of a very high standard compared with that of many foreign countries which he had visited, and it was because he wished to keep our municipal life pure and the officers free from corruption that he advocated their being treated in as handsome a manner as possible, and all their reasonable claims satisfied. He was always sorry, he added, to see good officers transferred because of a cheese-paring policy. In the present Government they had, he thought, a sympathetic body, and he was sure that their efforts would ultimately be crowned with success.

Mr. E. J. HALSEY, chairman of the Surrey County Council, also spoke in favour of the motion, and agreed that the arguments which had been used by Mr. Lewles were the right ones. There was a general reluctance on the part of local authorities to interest themselves in the superannuation question; but, speaking personally, he would do everything he possibly could to support the movement.

Mr. RUTHERGLEN (Kensington) expressed his thorough belief in the ultimate success of the scheme—which was perfectly reasonable in character—and strongly condemned the action of certain members of the House in endeavouring to prejudice Parliament as to the effects of the Bill if passed.

The CHAIRMAN made some further remarks, emphasising the importance of securing the support of the local authorities, and then formally moved the adoption of the motion, which was carried unanimously.

A discussion afterwards took place as to the best methods to be employed to ensure the success of the Bill, and the

first speaker gave it as his opinion that that could be made all the more possible by influencing members of the House and persuading them to give their support to the measure in Parliament. Mr. W. J. FLETCHER, county surveyor of Dorset, however, differed from that view, and maintained that more good would result by furnishing the various authorities with statistics relating to the working of the scheme. He warned them not to rely upon their Parliamentary representatives. The CHAIRMAN remarked that it would be better to leave the members of Parliament to themselves, as Parliament would not stir in the matter until the members moved. Other speakers, including Messrs. COOK, READ (Dorset) and HUNTER, followed, and the proceedings terminated with the negating of a motion proposing the extension of the association's Bill so as to apply to Scotland

CORRESPONDENCE.

"The Genesis of Street Mud."—Mr. Robert Phillips, county surveyor, Gloucester, writes: The crushing tests of stone are always interesting, and for the information of your readers I send you some I had taken in 1886. The 3-in. cubes were carefully selected, ground true, and bedded between pine. Your readers will notice that the Bristol limestone, a far inferior road stone, stood a greater test than the Cleo Hill basalt, showing the fallacy of crushing tests. If you add to this, and the attrition tests heating to 120 deg. and immersion while hot, and a freezing test of three hours' duration, you have reached about the limit of tests, and must fall back on the test of user for a lengthened period.

[ENCLOSURE.]

Three specimens, carefully and impartially selected by an independent and experienced person from stone, actually supplied for use on the roads, of each of the kinds named below, have been sent up to Messrs. Kirkaldy & Son, of 99 Southwark-street, London, to be tested by them as to their comparative resistance to a thrusting stress.

The following are the results:—

LONDON'S STREETS.

In an address he gave the other day at King's College Prof. Simpson referred to the importance of cleanliness in the streets. The condition of public thoroughfares had, he declared, a very important influence upon the degrees of health of the people. It was impossible to say that London, except it was the City, was conspicuous for the cleanliness of its streets. London was magnificently paved, but the matter which was allowed to remain in the streets in a state of putrefaction was a serious menace to health. London was a healthy city, taken by the standard of his death rate, but if health consisted of being and feeling well it was possible that investigation in that direction might lead them to modify their views as to the healthiness of London.

London Water Supply.—Mr. H. S. Samuel has received promises from a number of members of Parliament to ballot next session for a place for his Metropolitan Water Bill in the event of the Queen's speech not containing an assurance that legislation shall be introduced on the subject. Mr. Samuel's Bill, which has already been submitted to Mr. Chaplin, seeks to compel the various water companies in the metropolis to form junctions of mains, to enter into agreements with each other, and to give power to the Local Government Board to appoint an officer to report upon the quality, quantity and pressure of the water supplied by the companies.

* In common use in the county, the sample being above the average.

Association of Municipal and County Engineers.

MIDLAND DISTRICT MEETING AT BILSTON.

It will be remembered in connection with our report of the Midland Counties District Meeting of the Incorporated Association of Municipal and County Engineers at Bilston, on September 17th, that Mr. Wilson, the engineer and surveyor to the urban district council, in response to a request from Mr. J. T. Evans and others, readily consented to supplement his paper and interesting paper entitled "Seven Years' Work in a Black Country Town," by additional particulars in regard to the public baths, the main roads, the technical school and the waterworks. These details have now been embodied in the following:

SUPPLEMENT TO SEVEN YEARS IN A BLACK COUNTRY TOWN.

By C. L. N. WILSON, A.M.I.C.E., & Co.
PUBLIC BATHS.

It should be pointed out that, whilst the council would not object to making a profit out of the public baths, they never expected them to pay even working expenses, but considered that it would be conducive to the health and welfare of the town if they could induce the men employed in the ironworks and collieries to frequently use the baths and prevent youths from using the canal. With this object in view the charges for admission were fixed at so low a figure that it is possible, on three days per week, to obtain a slipper bath (hot and cold water), a cold-water shower bath and a swimming bath, with the use of one clean towel, for the sum of one penny.

The total number of bathers for the year ended March 31, 1897, was 23,088, or an average of 141 per week all the year round; the highest number using the baths in one week being 1,518 (week ended June 16, 1896), and the lowest fifty-six (week ended February 2, 1897); the average earnings from each bather being a fraction over 2½d.

Cost of Working for Year ended March 31, 1897.

WATERWORKS.

Year ended March 31, 1898.

The quantity of water pumped was 355,583,665 gallons. The cost of pumping, distribution, repayment of interest, and including £811 ls. paid to the contractor for extra wages and £157 9s. 5d. for new works, was £6,502 19s. 5½d., and equates a total cost of just over 1½d. per 100 gallons. The receipts from water rent for the same period were £5,377 8s. 5½d.

Mr. Wilson concluded his supplementary paper with a short description of the Spring Vale Furnaces and Steel Works, which were visited on the occasion. This description has already appeared in our columns, and is therefore not reproduced.

RIVER POLLUTION IN WALES.

COUNTY COUNCILS' ACTION.

A joint committee, appointed by the county councils of Monmouth and Glamorgan, met at the county offices, Cardiff, on Saturday, to consider the question of the pollution of the river Rhymney. A letter was read from the Rhymney Urban District Council, in which they gave explanations as to why they had not proceeded with their sewerage scheme. The committee, having considered the letter at some length, gave instructions that no loss should be issued to the Rhymney Urban District Council, the Bodwellly Urban District Council, and the Gellifray Rural District Council, to the effect that unless effective sewerage schemes were carried out for the respective districts, and sanction afforded the committee that they were in intention to carry any efficient scheme, a legal proceeding to prevent pollution of the river would be taken against the local authorities.

Calcutta.—After a hard day's work, during two or three days, the Calcutta Corporation have been held by a heavy majority, the names of the members of the Calcutta Corporation were read by the speaker of the Council. The Corporation are now in a very bad state of affairs, for they are in order to complete the work of reform already begun in a court of law, and are termed to punish summarily any member of the Council who is now at liberty to take any other course than that of the Corporation.

ASSOCIATION OF BIRMINGHAM STUDENTS OF THE INSTITUTION OF CIVIL ENGINEERS.

The opening meeting of the 1898-99 session of the above institution was held on Thursday, when the members paid a visit in the afternoon to the engine works of Messrs. G. E. Belliss & Co., then dined together at the Grand Hotel, and assembled again at the Midland Institute at 7.30, to hear the inaugural address of the president, Mr. J. C. Vaudrey, M.I.C.E.

After transacting the usual formal business, the president announced that the council of the Institution of Civil Engineers had awarded four "Miller" prizes to the members of the association—viz., Messrs. A. E. E. Blackburn and D. E. Lloyd-Davis for papers read before the local association, and C. E. Wolf and Henry C. Adams (the hon. sec. of the association) for papers read before the students in London.

THE PRESIDENT'S ADDRESS

brought forward some of the more prominent features that have marked the history and progress of electrical engineering. To be an electrical engineer, he said, a thorough engineering training is absolutely essential. Be an engineer first, and an electrician after if you will. Twenty years have hardly passed since Edison started the scientific world by his discovery of the effect of passing an electric current through a carbon filament sealed in an air-exhausted globe. The old truism, that the road of pioneers was strewn with failures, was no exception in the case of electrical engineering.

THE EARLY SCHEMES OF PUBLIC LIGHTING

from an engineering point of view lacked system, uniformity and business prudence. The early dynamo was inefficient, and a machine producing 50 kilowatts was called "a jumbo." High-speed engines as a commercial factor were non-existent. Incandescent lamps were not made of a higher voltage than 60 volts, and cost about 5s. each. The first Electric Lighting Act was passed in 1882, and gave a limiting period of twenty-one years, the property passing to the local authority at the end of that time at the then value. This Act retarded progress, but effectually put a stop to many ill-natured and un-called-for schemes. Since 1888 several systems have been adopted for underground distribution, but sufficient time has hardly elapsed to determine which will be the survivor. The conditions absolutely essential are that the copper should be permanently isolated and that the insulation should not be affected by damp or changes of temperature, and should be protected from mechanical injury. The Callendar system of laying insulated cables in iron troughs, the cable being surrounded by pure bitumen, was first adopted in Liverpool by Mr. Vaudrey and his colleague, Mr. Holmes, and the greater portion of the mains in Birmingham have been dealt with in a similar manner. With regard to

GENERATING MACHINERY,

the electrical engineer owes a deep debt of gratitude to Willans for the high-speed central-valve engine, which can be run safely at such a speed as to allow the dynamo to be coupled direct to the crank shafts. Messrs. Belliss & Co., of Birmingham, have established a well-earned reputation with their type of plant. Electric tramway engineering should not be lost sight of by the student, as it offers a new opening to those now entering the profession. Underground railways are being brought rapidly to the front. The railway engineer, the hydraulic engineer, and those in charge of our municipal work and gas supplies, will all have to know something of electrical work. A large railway contractor has recently spent some £10,000 in electrical plant for temporary motor work and other uses on a large railway contract he has on hand. There is a great tendency to specialise, and often the student is apt to think his own special subject is the one which will enable him to make his way in life; and I would advise him never to lose sight of the power a wide knowledge of engineering, added to that of a specialist, gives him. Buildings are all lighted now with a brilliancy that was inconceivable even ten years ago, and from a sanitary view the very air we live in must be purer.

THE NEW GENERAL HOSPITAL AT BIRMINGHAM

is perhaps the highest ideal of a pure condition of life, all owing to electricity. The world at large will be immeasurably richer for the advantages of electricity, and those taking part in such works, in whatever form they may assume, are engaged in a work with which they will hereafter be proud to have been associated.

INSTITUTION OF CIVIL ENGINEERS.

THE PRESIDENTIAL ADDRESS.

The above institution held the first meeting of their eightieth session on Tuesday evening, when the president, Mr. W. H. Preece, C.E., F.R.S., engineer-in-chief and electrician to the Post Office, took the chair for the first time.

In delivering the customary inaugural address the President expressed his gratitude for the honour done him, and said he was very proud, not only for the sake of that branch of the profession to which he specially belonged, but also because he was a member of the great Civil Service of this country. After referring to the position occupied by the

institution as the representative of engineering science in this country, the president turned to the subject of TECHNICAL EDUCATION.

He pointed out that a knowledge of matter and of energy was the foundation of all the engineer's actions, and this, combined with the power of thinking, was the root of technical training. There was a fashion for technical education just now in Great Britain, and enormous sums of money were being spent. It was well that the country had awakened from its conservatism and apathy. Our trade was suffering, even in our own colonies, from the competition of our Continental neighbours, who were said to be beating us by their technically superior hand labour. This was because we were suffering from the superior commercial skill of the principals at home and the accomplished polyglot traveller abroad, as well as from a financial system that was more moral and sound than that rampant in England through the gross abuses of the Limited Liability Act of 1862. In Germany financial support was readily subscribed for a new industry by the generous and enlightened policy of its banks. In England a syndicate, a pioneer company, and, finally, an appeal to the public for an enlarged limited company, were required. The industry was established, but with a capital overloaded by the harpies sprung from the operation of that Act. The same industry could be established in Germany with probably half the capital, the manufacturer would be supervised with greater skill, and it would be developed as a business by better trained agents, for educational methods had begun at the wrong end. We ought to teach the masters first, and then the men; moreover, we had to teach the teachers and those who had control of the purse-strings. Mr. Preece proceeded to refer to some of the practical applications of the science of electricity. Beginning with lightning conductors, he went on to speak of

TELEGRAPHY,

mentioning that he had used a portion of the first line ever constructed, made by Cooke & Wheatstone in 1837 to connect Camden Town and Euston-grove station, to complete a special circuit between Buckingham Palace and the General Post Office, used by the Queen on her Diamond Jubilee day. This pioneer line of 1837 was $1\frac{1}{2}$ mile long; now the system of British telegraphs contained 1,111,366 miles of wire. Progress had never been checked. The introduction of the telephone was revolutionising the mode of transacting business. Its progress in Great Britain had been checked by financial complications. Telephony, like the post and telegraph, was an imperial business, and ought to be in the hands of the State. In the working of railways the employment of electricity had not only been highly beneficial in the security of human life, but it had vastly increased the capacity of a road to carry trains, while its introduction into our houses had added materially to the comfort and luxury of home. In supplying light without defiling the air of our dwellings electricity had proved a true benefactor of the human race, while on board ship the electric light had been pre-eminently successful. With regard to

ELECTRIC TRACTION,

everywhere our great cities were rising to the occasion. Indeed, to neglect to supply tramways where they would be useful, healthful and valuable was, to a certain extent, an abuse of the trust confided to the municipality by the legislature. Electrometallurgy was now a very large business, and destined to increase still more, for the generation of electrical energy was becoming better understood and more cheaply effected. It was remarkable that our coalfields had not been utilised in this direction, for on a coalfield where coal of good calorific value was raised at a cost of 3s. a ton electrical energy could be generated more cheaply than by a waterfall, even at Niagara. In conclusion, Mr. Preece hoped he had impressed on them the universality of electricity. Though its followers were now regarded as specialists, the period was not distant when it must cease to be a speciality. Every engineer must ultimately become an electrician, and electricity would be the most general, the most useful and the most interesting form in which he applied the fundamental principles of energy to the wants, the comforts and the happiness of mankind.

A vote of thanks was unanimously accorded Mr. Preece for his address. The distribution of the medals and prizes then followed.

"Modern Opera Houses and Theatres."—The third volume of "Modern Opera Houses and Theatres," by Mr. Edwin O. Sachs, architect, is to be issued during this month, and this monumental work will thus see completion before the end of the year. As before, so with the impending volume, Mr. Sachs' programme will be materially extended, and there will, for instance, be no less than 900 illustrations, as compared with the 250 he originally promised his subscribers. The third volume will comprise a treatise on theatres generally, with various supplements; and having special regard for the interest evinced in modern forms of construction, a particular chapter has been devoted to constructional ironwork as applied to the playhouse, both on cantilever principles and otherwise. The publisher is Mr. Batsford, of High Holborn, and with the completion of the work the subscription list will be closed, the price hereof being 15 guineas.

The Belfast Municipal Electricity Works.

Some years ago the Belfast Corporation instituted what proved to be a most interesting departure in electric lighting. They commenced a public supply of electricity, and relied upon gas engines as a source of power. The experiment, which it undoubtedly was, did not prove altogether successful, and although it cannot be said that the results of Belfast experience can be urged against the use of gas engines for electric lighting, it is clear that the faith of the Belfast Corporation is not sufficient to induce them to carry out extensions with similar plant. In dealing, then, with the demand that has arisen in Belfast and was growing rapidly, it was resolved to meet it by building a new station, which would be entirely equipped with steam plant. The works have now been completed, and were recently opened formally by the Viceroy of Ireland, on the same occasion as the laying of the foundation-stone of the city hall, of which proposed building we give some details in another column. They are in every respect among the most important in the country, not only on account of the size of the generating station, but by reason of the magnitude of the plant which has been erected. The works are situated within 150 yards of the river, from which an ample supply of water can be obtained. It also permits of the easy delivery of coal, and the site is in a central position with regard to distribution. It is computed that the ground will provide buildings sufficient to house 20,000 horse-power of plant. At the present moment four Lancashire boilers have been erected, which work at a pressure of 160 lb. per square inch. They are fitted with Hopkinson's mountings, and while one is to be fired by hand, the others are furnished with mechanical stokers; those, by the way, are driven through a countershaft by a motor. The inevitable Green's economiser is employed, which has 216 tubes, the scrapers for these being driven by an electric motor. Coal bunkers extend the whole length of the boilers, and are provided with doors which open on to an elevated road, from whence carts can be unloaded without much difficulty. We believe it is the intention to subsequently provide coal conveyors, and already provisions have been made for an overhead tramway from the riverside. The steam mains have been erected on the ring principle, the pipes are solid-drawn copper, and Hopkinson valves are employed. Tanks capable of storing 20,000 gallons have been erected below the boilers, and, in addition, there are two distinct supplies from the city mains.

THE ENGINE-HOUSE AND THE BATTERY-ROOM.

The engine-house is probably one of the finest in the country, and in it at the present moment are four Belliss steam dynamos, two having a capacity of 100 kilowatts and two of 200 kilowatts. The smaller sets consist of two crank compound engines, coupled direct to a 50 kilowatt dynamo. These are apparently intended for day supply, and in addition for charging the batteries. The larger sets—viz, the 200 kilowatt, develop current at from 400 to 500 volts. The engines which drive these machines are of the three crank compound type. With a view to dealing with the supply of current for traction purposes, which we trust will not be long before it is required, one of the sets has been furnished with a heavier type of fly-wheel. At the generating station there are also arranged a pair of boosters and a balancing motor generator. Adjoining this room is the battery-room, in which are arranged two batteries of accumulators, consisting of 130 cells of the "Phuro-King" type, which have a capacity of 500 amperes hours at a discharge rate of 100 amperes. They are also capable of discharging at 300 amperes for one hour. The switchboard is placed on a platform some 13 ft. above the floor level, six being arranged for feeders, eight for dynamos, and others for the motor generators and battery generators. With a view to making it as fireproof as possible, the panels are carried on the steel framework, and there are the usual measuring and recording instruments; each machine has also in circuit with it an automatic cut-out. Feeders are provided on both poles, with ammeter, fuses and switches. From this board the regulation of the batteries can be carried on, the switches in the battery-room being actuated through shaft and level gearing. If necessary, the battery switch can also be operated in the battery-room. The system of distribution has been carried out on the three-wire system, with 440 volts between the outer wires and 220 between either outer and the middle wire.

The network of distributing mains is fed at several points by the feeders from the generating station. Meters are provided by which the engineer in charge can maintain a proper pressure in the network. The mains are of single-core cable, insulated with vulcanised bitumen, and drawn into boulder earthenware conduits when laid under footways or into cast-iron pipes under roadways. In other portions of the town lead-covered and armoured three-core cable is used.

ESTIMATED CONSUMPTION.

It is interesting to mention that the demand indicator system of charging is now in operation, and it is considered that when the advantages of this become generally known there will be a considerable accession of consumers. At the present moment there are connected to the Belfast mains an equivalent to 20,000 S. candle-power lamps, and this includes 150 horse-power in motors. Just prior to the completion of the new station the total number of applications received

was up to an equivalent of 8,000 S. candle-power lamps, and it is estimated that in order to cope with the growing demands it will be necessary to order fresh plant at once. It may be interesting to observe that the whole of these extensions have been carried out by the city electrical engineer, Mr. Victor McCowen, and it was in consequence of his report, presented to the Electric Lighting Committee a 1896, that the scheme was adopted. In the report presented at that time Mr. McCowen observed that they had spent £33,000 in the gas engine station, that all the available room of the engines had been taken up, and that it was necessary to build another station. Although availing themselves as far as possible of the old system, it was necessary, in Mr. McCowen's opinion, to put the plant in a position more contiguous to the area where a large demand was likely to arise, and, in order to meet the demand that was likely to arise at a considerable distance from the old station, the engineer recommended the adoption of a 440-volt system, on the three-wire method, which gives 220 volts in the houses. This would enable the corporation to distribute current economically at a distance of about 2 miles from the station. It was suggested in the report that consumers beyond such area could be best supplied on the high-tension transformer system or from battery-substations, these sub-stations being placed at the end of the feeders and the batteries being charged from the central station, in this manner obtaining longer running hours from the plant.

The conclusion of Mr. McCowen's report was to the effect that by the combination of a steam-driven and a gas-driven station supplying the same mains they would be able to get economical results. The steam station would take the bulk of the winter load, and the gas station would take the peak of the load, being, as well, always ready to take up a fog or dark-day load; the gas driven station would be able to do the summer load when the steam station might be shut down for a few months, with the exception of a run off and on to charge the batteries, or arrangements could be made to charge these batteries in summer from the gas-driven station.

ARBITRATIONS AND AWARDS.

The award in an arbitration case of Coode, Shilston & Co. v. St. Anstoll Urban District Council, in respect of compensation for land required by the council for street improvements around a fine block of buildings just erected by the firm, has been received. The council offered £111. The claim before the arbitrators amounted to about £1,300, being based upon the actual rental, and doubled in consequence of the whole of the land (about 335 ft.) being frontage. The award to the company amounts to £303, the council to pay all costs. In a similar claim by R. W. Rogers, grocer, Fore-street, an award of £12 was made, and costs to be paid by the council. Coode, Shilston & Co. (who also represented Mr. Rogers) appointed Mr. H. Drew, of Exeter, their arbitrator, and Mr. A. Body, of Plymouth, acted for the council, the umpire being Mr. G. C. Smyth Richards, of Barnstaple.

At the Sheriff's Court, Red Lion-square, on Thursday, before Mr. Under-Sheriff Burrell and a special jury, a claim against the London County Council by the Clothworkers' Company was heard in respect of freehold wharf property on the Surrey side of Vauxhall bridge, let on lease to Messrs. Francis & Co., Limited, for a term, of which fifty-two years were unexpired, at a ground rent of £515 a year. Sir Edward Clarke, q.c., and Mr. Edward Boyle, q.c., were counsel for the claimants, and they called Sir J. W. Ellis, Mr. Bousfield and Mr. James Green, who all agreed that the value of the property, including the customary 10 per cent., was £22,650. For the London County Council Mr. Littler, q.c., and Mr. Morton were retained, and called Mr. Alderman Green, Mr. Farmer, Mr. Horsey and Mr. Field, whose valuations were £14,162, including the 10 per cent. The jury returned a verdict for the claimants for £22,650.

Mr. James Mansergh, of Westminster, the umpire appointed in the arbitration between the Morley Corporation and the Morley Gas Company to fix the price to be paid for the undertaking of the Morley Gas Company, has now made his award. The arbitration was held last month, at the Hotel Victoria, London. The amount of the claim for the gas company was about £133,650, and the witnesses for the corporation put the value at about £80,000, which latter amount, however, did not include any allowance for compulsory purchase or cost of re-investment, these matters being left by the corporation witnesses to be dealt with by the umpire. The amount of the award is £100,895 2s. In addition to the gas undertaking, the corporation will be entitled to the balance of various insurance and contingent funds, which amount to about £10,000 after the payment thereon of certain losses of the Morley Gas Company. The corporation will also acquire some freehold property in the centre of the town, which belongs to the gas company, and some other land and premises by the company but not at present used for the purposes of the gasworks.

ROYAL COMMISSION ON SEWAGE DISPOSAL.

REPLIES TO THE CHAIRMAN'S LETTER.

The following letters have appeared in *The Times* in answer to the letter of Lord Iddesleigh, to which we made reference in our last issue. A correspondent, signing himself "A. B.," writes:—

"Lord Iddesleigh's letter in *The Times* of the 21st opens up a question the importance of which neither the public nor the legislature appears as yet to have realised.

"He says that the Commission on Sewage Disposal would view with the gravest concern any postponement on the part of local authorities of the carrying out of works for the purification of trade refuse and sewage until the commission have issued their report. He also says that a considerable time, perhaps even some years, must elapse before that report appears. Which does Lord Iddesleigh suppose will weigh most in the minds of local authorities—the grave concern of a little group of gentlemen at Westminster, or the serious risk that whatever plan they may adopt for the disposal of sewage and trade refuse will be condemned as inadequate by the Local Government Board, armed with the report of this commission? Lord Iddesleigh has struck the heaviest blow that has been dealt to sanitary progress for many years.

"The question for the public, and a very grave question it is from the ratepayers' point of view, is this—What is the proper scope and aim of a commission of this kind? Is its proper business to collate, digest and report upon the enormous mass of practical experience and knowledge obtained from the actual working of numerous sewage disposal systems, but never yet brought to a focus or treated as a whole? Or is it the proper business of the commission to neglect all that practical work and to embark upon a prolonged search for an ideal system of its own—a search carried out by means of laboratory experiments in bacteriology and chemistry, and therefore having at least but a dubious relation to practical needs? Common sense would choose the first alternative without hesitation, first because it alone offers the smallest practical help within a reasonable time, and secondly because it is the only kind of investigation which the composition of this commission fits it to undertake. The commission itself has chosen the second alternative, which commits it to an investigation of a highly speculative and theoretical character and of wholly indefinite duration. For such an investigation the commission is absolutely unfit. Were such a thing desired, it ought obviously to be entrusted to two or three experts. But nothing of the kind is desired or called for. Were such an investigation completed and published, the report would either be so much waste paper, or it would stereotype a method of sewage disposal which, on the one hand would be used to condemn existing and practically efficient systems, and on the other would be an absolute bar to advance. There is no finality in science. Whatever the commission may discover, at whatever point it may stop, there will be more to discover just beyond. The commission is repeating the blunder made some years ago in another department, when this country was allowed to drop fifteen years behind other nations in armaments, because some sapient persons at the War Office were waiting for the appearance of the ultimate and unimprovable type of gun. Sewage disposal is practically brought to a stand for an indefinite period, because this commission is looking for an ideal system of its own, which, when found, is as likely as not to be rendered obsolete in twelve months.

"But there is more than this. The commission, working on its present lines, is in great danger of becoming a gigantic job. There is money, a great deal of money, in this sewage question. It is one of the biggest social questions with which the people of this country have to deal. The fishing inquiry, on which the commission is embarked, means in itself a large expenditure, and it may be indefinitely protracted. It further opens the door to the creation of patent rights, controlling indispensable details of the machinery to be subsequently forced upon all local authorities by the action of the Local Government Board. Has the Government so much as made the stipulation, loudly called for in the interests of the public, that no such private rights shall be, directly or indirectly, founded upon any results arrived at in the progress of this inquiry?"

"The second letter, which appeared over the *nom de plume* of "District Councillor," was as follows:—

"The letter of Lord Iddesleigh, pointing out the probable delay in issuing the report of the Royal Commission on Sewage Disposal, is of great importance to rural district councils which are anxious at once to make a sanitary disposal of their sewage, but cannot do so without obtaining from the Local Government Board the sanction of a loan. The rural district council to which I belong has determined to treat the sewage of a town of 1,000 inhabitants, which at present pollutes an important stream, by what is known as 'Dibdin's Biological Process,' which has been at work for the town of Winsford for many years, and has also been successfully adopted at Oswestry. The district council, however, is informed that no loan for the purpose will be sanctioned by the Local Government Board unless the process is recommended in the report of the Royal Commission now sitting."

DOUGLAS SEWERAGE SCHEME.

Mr. S. H. Adams, of Adams' Patent Sewage Lift Company, York, writing under the date of 31st October, has addressed the following communication with reference to the above subject to the editor of *The Isle of Man Times*: I have read to-day, for the first time, the discussion upon Mr. Mansergh's report. One or two points are raised to which, with your permission, I would refer. (1) We were providing two distinct air pipes, so that each lift is independent of the other. (2) The screen is really a continuation of the sewer, perforated where it passes through the flush tank that liquid may enter the latter whilst solids pass on to the sewer. It is desirable, although not ordinarily essential, that the lift should be looked at once a week. An ordinary workman can do this, no special attendant being required. (3) I give a list of a few towns in which our lifts have been in constant work for varying periods: London, Glasgow, Grimsby, Bridlington, Hlsley, Hoylake, Barmouth, Bucknall, Malton, Ebbwastert, Johnstone (N.P.), Newmarket, Portsmouth, Godalming, Beamish (county Durham), and on the Continent and abroad. In four of these the supply is crude sewage. Plans have passed and are still before the Local Government Board for other schemes. Malvern, the well-known health resort, has adopted our system, the work being now in progress—here the sewage is used for supply. In no sense is the sewage lift experimental. It has one moving part—a plain flap valve—against the many of engines and pumps. Every installation is absolutely guaranteed to do the work required of it. The adoption of the lift then becomes in a sense a question of cost. As sewage is the motive power this is costless, and as the lifts require no special attendant no provision under the head of maintenance is necessary, the first is then the only cost. The lifts will thus pay for themselves in a given number of years. Mr. Marshall Petre, borough engineer of Grimsby, writing on October 14th last, says: "In reply to your inquiry, the sewage lift you fixed for this corporation over four years ago continues working to my entire satisfaction, and I am pleased to say has cost us nothing whatever throughout the time in the way of repairs and maintenance. Several deputations have inspected the lift and have expressed themselves highly satisfied with it."

SYPHONIC CLOSET TRAPS AND CLOSETS.

We give an illustration of a siphonic trap and closet which attracted some attention at the recent sanitary congress at Birmingham, as satisfying the chief requirements of a modern water-closet. This appliance is known as the "Kensington" siphonic closet trap and closet, and is manufactured by the Anchor Sanitary Potteries, Swadlincote. It has a water surface of 10 in. by 8 in., or more if required, and a water seal of 5 in., which, it is claimed, cannot under any circumstances be siphoned out. Among other advantages claimed for this closet are that it is fixed exactly as a

common hopper and trap, with earthenware or lead outlets; that it is self-cleansing, and without any puff pipes or other complicated parts that are liable to get out of order; that only 2 gallons of water are required to flush it properly, thus getting over the difficulty of the 3-gallon flush, a quantity which is not always forthcoming; and that its moderate cost enables it to be used in all classes of buildings. We may also mention that the trap can be fitted separately to other closets. The appliance is certainly worth the attention of sanitarians, architects, builders, property owners, and others.

Road Locomotive.—Under the Locomotives Act, 1898, county councils are empowered to make by-laws for the regulation of road locomotive traffic, and to fix the fees for licenses granted to locomotives. In several instances scales of fees have already been adopted. In respect to the making of by-laws, however, the County Councils' Association have resolved to move the Local Government Board to issue model by-laws, and a committee, consisting of Lord Trenchard, Mr. H. Hobhouse, M.P., Mr. R. D. Lither, G.C., and Mr. F. C. Hilton, have been appointed to draw up suggestions for submission to the board.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who desire wish their names published should furnish a non de plume.

HIGHWAY: STEAM ROLLER: DANGEROUS NOISE.—It will be remembered that in the case of *Moon v. The Wharfedale Rural District Council and The Otley Urban District Council* (noted at p. 489 ante), judgment was given in favour of the plaintiff as against the Wharfedale Council, the question of the liability of the Otley Council being reserved. The learned judge of the Otley County Court has now decided that question, holding that the latter council are also liable. In the course of his judgment his honour said: "This was an action against the two councils to recover damages for injuries to the plaintiff's carriage through the horse taking fright at a steam roller belonging to the Otley Council, but, which was at the time being used by the Wharfedale Council. The Otley Council agreed with the Wharfedale Council to let them the roller, and a man to take charge of it, for a fixed sum per day. The Otley Council selected and paid the man whom they sent with the roller, whose name was Jennings. On the day in question the Wharfedale Council employed four other men, whose duty it was to go two before and two behind the roller, and to help persons desiring to drive past it needing assistance. The surveyor to the Wharfedale Council pointed out to Jennings what roads were to be rolled, and left him in charge. Jennings left the roller, and went to refresh himself at a public-house, the roller being at the time stationary. He left his son, who was one of the four men employed by the Wharfedale Council, on the engine. The other man, who would have been in front of the engine when in motion, went away also. Jennings' son, whilst his father was away, proceeded to get up steam, and in doing so caused the engine to emit a quantity of black smoke and create a considerable noise. Whilst it was doing so the plaintiff's carriage was driven past it. There was no one to give assistance, and the horses took fright, and, notwithstanding the efforts of the coachman, the carriage was upset and seriously injured. I am of opinion that the steam roller in the condition in which it was—giving off quantities of smoke, causing considerable noise, and not protected by men waiting to render assistance to vehicles—was a nuisance, and that as the Wharfedale Council were responsible for its being in the high road, they were answerable for the damages. I must therefore give judgment against them. The Otley Council were not, I think, responsible for the nuisance, as they had no control over the place to which the roller was sent, but it is agreed that the accident happened through the negligence of Jennings, and that the Otley Council were his masters and liable for his negligence. I am of opinion that Jennings was negligent in leaving the roller, and that, whether he ordered his son to get up steam or not, he was responsible for the way in which the engine was dealt with in his absence. It remains for me to consider which of the defendants was his master within the rule of law which makes a master responsible for the negligent act of his servant. This, I am of opinion, depends whether his negligence was in relation to an act which he was doing under the instructions of one defendant or the other. It appears to me that in all that he did in the management of the engine he was acting under the direction and for the benefit of the Otley Council. I am of opinion that the negligence of which Jennings in fact was guilty related to the management of the engine and the mode of getting up steam, and therefore that the Otley Council were for this purpose his masters and were liable for the damage that was caused. I give judgment, therefore, against them also.

QUERIES AND REPLIES.

WATER RIGHTS.—"Kosmos" writes: A rural district council acquires the right to sink a well and take water from a piece of land for a village supply. The well is sunk 26 ft. deep and about 30 ft. from a spring issuing from the side of a hill. It is found that when the water is pumped from the well at a certain rate the spring ceases to flow. There is no channel connecting the spring with the well, except several natural crevices in the rock, through which the water flows when it rises above a certain level in the well. The owner of a mill into whose mill stream the spring used to flow threatens action. Has he any grounds? Would the grounds of action be any stronger if a trench were cut from the well to convey the water by gravitation, provided the site of the spring were not interfered with? The water would not again reach the stream.

The general rule is that a riparian proprietor's right extends only to the defined stream, and not to that portion of the water which, though eventually by percolation or otherwise it may reach and supply the defined stream, does not yet run in a defined stream (*Deakin v. Powell*, 11 Exch., 603). In that case the plaintiff's well is more than fifty years had been worked by the stream of a brook, which was supplied by subterranean waters, a swamp and a well formed by a

stream flowing outside of a hill, the waters of all of which occasionally overflowed and ran down the defendant's land, in no defined channel, into the brook. It was held that the plaintiff had no right, as against the defendant, to the natural flow of any of the waters. In the case given in the query it is not stated whether or not the water from the spring flows into the brook into a defined channel. Assuming that it does not flow in a defined channel, I do not think the plaintiff would succeed in an action, unless he has acquired a right by prescription (see also *Roadcross v. Taylor*, 11 Exch., 390). If, however, the water flows from the spring to the stream in a defined channel, the millowner may have acquired a right to its uninterrupted flow by prescription—i.e., twenty years' uninterrupted enjoyment.

OFFICER TO LOCAL AUTHORITY: TERMINATION OF APPOINTMENT.—"Lex" writes: On the 10th day of July, 1895, I was elected surveyor and sanitary inspector to the Rural District Council (northern division), and received the following letter from the clerk: "I have to inform you that you were, at the meeting of the rural district council, elected to the post of surveyor and inspector for the Northern or sub-district. Your appointment is to be until December 31st next." The letter was dated July 12, 1895. I was reappointed in December for six months, and reappointed again in August for twelve months. My appointment terminates next Monday, and I understand that the surveyor for the Southern district is to take over the duties of both divisions on Monday next. My salary is paid quarterly. The question is, Am I entitled to any notice, as I have had none; and, if so, how much, as I presume that if I wished to leave next Monday I could not do so without giving the council notice, and I do not see why it should not cut both ways.

The appointment having been for a term certain, which has expired, "Lex" is not legally entitled to any notice nor required to give any. It would undoubtedly, however, have been no more than common courtesy in the authority to have given him an earlier intimation of their intention not to renew his engagement.

HOUSE DRAINAGE: PUBLIC HEALTH ACT, 1875, SEC. 23.—(1) "X.Y.Z." has just completed an extensive sewerage scheme, which is to drain old property as a rule. The sewer in one case goes close past the end gable of a row of nine or ten houses which are not drained, the end house of which is close to the sewer. Would "X.Y.Z." be right in compelling owner to construct a branch sewer behind these houses and connect drains therewith, as per par 3, sec. 23, Public Health Act, 1875. If sewer can be charged on owner would a notice under sec. 23 be sufficient? (2) Could you call a house *effectually* drained where the drains are not laid straight to line or gradient and the joints are made of clay, but still are working fairly well and create no perceptible nuisance? (3) In several cases the old sewers are running through the back yards, about 6 ft. from the houses. Would "X.Y.Z." be justified in making owner connect drain into new sewer in back street, assuming he could prove the old drains were not as they should be?

(1) The effect of this section is briefly as follows: Where a house is without a drain sufficient for effectual drainage the authority shall require the owner or occupier to drain into a sewer not more than 100 ft. distant, or (failing such a sewer) into a cesspool, &c. If the owner, &c., fails to comply the authority may do the work and recover the cost from the owner. Then comes the proviso (referred to by "X.Y.Z." as par. 3) that where, in the opinion of the authority, greater expense would be incurred in causing the drains of two or more houses to empty into an existing sewer "pursuant to this section" than in providing and connecting with a new sewer they may construct a new sewer and require the owners to drain into it, and may apportion the cost of such sewer amongst the various owners. In my opinion the power conferred by this proviso is only exercisable where there is an existing sewer within 100 ft. of the property, as it is only in that case that the owner could be compelled to drain into it. The words "pursuant to this section" seem to me to show that this is the intention. It is not stated in the query whether or not there was, prior to the construction of the new sewer, any existing sewer within 100 ft. of these houses. If there was such a sewer, and if in the opinion of the authority the cost of draining into it would have exceeded the cost of providing and connecting with the new sewer, then I think the owners could be charged with the latter, pursuant to the proviso. If, however, there was no existing sewer into which the owners could have been compelled to drain, then, in my opinion, they cannot be charged with the cost of constructing the new sewer. They can, of course, be compelled (assuming they have effectual drains) to drain into the new sewer under the first part of the section. (2) I do not think a house would be held to be "without a drain sufficient for effectual drainage" in such a case. (See the notes to this section in Lamb's "Public Health Acts," 8th edition, p. 54.) (3) Yes, if the drains are not "sufficient for effectual drainage."

Auctioneers' Institute.—The session of the Auctioneers' Institute will commence on Tuesday next, the 8th inst., when Mr. Alexander Macnamara, Q.C., will read a paper on the "Lectures Hall, 57 Chancery Lane, W.C., upon 'The Effect of Recent Decisions on the Liabilities and Rights of Owners in Respect of the Drainage of Buildings.'" The chair will be taken by the president, Mr. Edward Dobson, at 7.45 p.m.

Municipal Work in Progress and Projected.

The paragraphs relating to Newmarket, Wimbledon, Barry, Llandudno, Croydon, Barnsley, Batley, Douglas (Isle of Man), Leamington, Salford and Southampton contain the most important news which has this week come to hand in reference to municipal works in the provinces. In connection with the metropolis similar news is given under the headings of Shoreditch and Lambeth.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

Practically the whole of the meeting of the county council on Tuesday was occupied in the consideration of the long and important report of the Water Committee dealing with the question of the water supply of London, both as regards the present supply and future requirements. Particulars of the report are given in full in another column; it is not therefore necessary to refer to them at any length here. The report elicited a lengthy discussion, but the recommendations of the committee were eventually adopted almost unanimously. The majority of the members of both parties in the council seemed to be of opinion that no time should be lost in remedying the present state of affairs, this opinion being evidently arrived at in view of the recent failure in the East-End supply. Some also thought that the Government would not be likely to sanction such a gigantic scheme until the report of the Royal Commission had been submitted, and that, consequently, the promotion of a Bill in the next session would only lead to a waste of money. These latter therefore proposed that the report should be postponed until the report of the Royal Commission had been submitted. The amendment was, however, lost by a majority of eighty-six votes.

Loans for Public Works.—Upon the recommendation of the Finance Committee, it was agreed to lend the Newington Vestry £10,000 for electric lighting purposes, the Shoreditch Vestry £10,470 for similar purposes, and the Wandsworth District Board of Works £3,000 for the extension of Wandsworth cemetery.

London Water Supply.—The Water Committee presented their report on the subject of the purchase of the undertakings of the London water companies and the provision of a supplementary water supply from Wales, a full summary of which will be found in another column. Mr. Dickinson, chairman of the committee, in moving the reception of the report, urged that the experience of the past summer had proved that any further delay would be a serious matter for London. The report was received. On the first recommendation—that a Bill be promoted in the next session of Parliament for the purchase of the undertakings of the water companies by agreement, or, failing agreement, by compulsion—Lord Onslow moved an amendment in favour of delay pending the report of the Royal Commission who are inquiring into the subject. After a long discussion the amendment was rejected by 101 votes to fifteen. The recommendation was then agreed to, as well as a series of subsequent recommendations, including one for the promotion of a Bill empowering the council to bring an additional supply of water to London from the watersheds of the Wye and Towy in Wales.

VESTRIES AND DISTRICT BOARDS.

Hackney.—The Hackney baths are proving too small to meet the demands made by the ratepayers, and the Baths Committee have under consideration a scheme for enlarging their premises by pulling down an old building adjoining, and erecting new premises in harmony with the existing premises. This would provide accommodation for twenty additional men's private baths and six women's baths. It is estimated that the cost of the necessary alterations would be about £3,000.

Lambeth.—The Baths Committee, at the last meeting of the vestry, reported that they had again considered the question of the well at the Kennington-road baths. Messrs. Baker, the engineers for the work, recommended that the boring into the chalk below the bottom of the guide pipe should be continued for not less than 150 ft. to 200 ft. Acting upon this suggestion, the committee asked the vestry to sanction the boring being carried down to a depth not exceeding 200 ft., at the prices mentioned in THE SURVEYOR of the 21st ult. An attempt was made to get the report referred back for further consideration, but on a division this was defeated by thirty-nine votes to twenty-five. The recommendation of the committee was then put to the meeting and adopted. The General Purposes Committee announced the receipt from Messrs. A. & F. Mannelle of a letter notifying the completion of all the vestry's orders for York paving, and asking that they might continue delivery in anticipation of future orders, so as to prevent the rubbing mills being shut down. At the suggestion of the surveyor, who reported that there was little stone in stock, the vestry adopted a recommendation of the committee to order a further 10,000 ft. from the firm under the existing contract.—It was reported by the Wharf Committee that a deputation waited upon the Lower River Committee of the Thames Conservancy with regard to the

scheme for a proposed embankment at Pedlar's Acre. The members of the deputation were informed that the Conservancy Commissioners would again give consideration to the subject.—The consideration of the recommendations of the Vestry Hall Committee, which were referred to in THE SURVEYOR a fortnight ago under the heading of "Lambeth's Proposed Town Hall," were postponed.—It had been intended to elect a committee of eight members to inquire into the statements and charges made on the subject of the transfer of the vestry's electric lighting provisional order, but in the absence of Mr. Cooper, on whose motion the original resolution was adopted, the matter was deferred until the next meeting. In connection with this subject Mr. Price proposes to move "that all members who voted against the vestry exercising the electric lighting order be invited to sign a document pledging themselves to take no action, either legal or otherwise, if Messrs. Hubbard, Lock & Wightman will attend and state to the special committee the full particulars of the information which they have stated in the vestry is within their knowledge."

Marylebone.—About two hours were last week again devoted by the vestry to the consideration of the question of the electric lighting of the parish. A fortnight ago the vestry resolved to give statutory notice of intention to apply again to the Board of Trade for an electric light provisional order, and last week Mr. Brooke-Hitching, chairman of the Electric Lighting Committee, brought forward a recommendation that the committee should be empowered to enter into preliminary negotiations with the Metropolitan Electric Supply Company for the purchase of that part of the company's undertaking situated in Marylebone, and to report to the vestry on the matter. The discussion was of a very animated nature, and at times assumed a personal character. Two amendments were moved, one seeking to vary the terms of the recommendation and the other proposing the postponement of the matter with a view to the reconstitution of the Electric Lighting Committee. These amendments were, however, rejected, and eventually the recommendation of the committee was adopted without any dissent.—A letter was read from the London County Council drawing the attention of the vestry to the Canals Protection Act, which empowered the vestry to enforce the provision of proper fencing alongside canals. The letter was referred to the Works Committee.—The Works Committee recommended the vestry not to entertain a proposal to place a rest at the lower end of Mortimer-street, but this was allowed to stand over.—It was decided to refer to the Works Committee, with power to act, a petition referring to the wood paving of the north entrance to Devonshire-mews South.

Poplar.—Last week a deputation of members of the Bow Vestry waited on the district board with reference to the proposed erection of a footbridge over the canal between Wansbeck-road and Monier-road. It was stated that a bridge at the place suggested would prove a great boon to the public. Since the closing of the canal gate there had been a great loss to the trade of Bow, and if the board would give the matter their favourable consideration their action would receive the approbation of the ratepayers generally. The matter was referred to the Works Committee for consideration.

Shoreditch.—The vestry, at their meeting on Tuesday, were recommended by the Finance Committee to apply to the Local Government Board for sanction to borrow £10,500 for additional works at the Hoxton baths and wash-houses, and, on permission being obtained, to ask the London County Council to advance the amount. After some discussion the recommendation was adopted, excluding that part referring to the proposed application to the county council on the ground that the loan might possibly be advanced at a lower rate of interest by the Public Works Loan Commissioners.—The Lighting Committee announced that they had considered a report from the chief engineer stating that many of the inhabitants of the Haggerston district had promised to take a supply of current to such an extent as to warrant the construction of a new sub-station. Pending that work being carried out, the committee recommended that a new main should be laid, at a cost of £2,200, the current to be supplied temporarily from two existing sub-stations. This was agreed to.—The Lighting Committee obtained sanction to an expenditure of £520 on the purchase of a further supply of electricity meters.—The surveyor, Mr. J. Rush Dixon, recently submitted to the Works Committee an estimate of the cost of paving the footways in Marlborough-road and other thoroughfares, the amount being £1,962. The committee recommended that the Finance Committee should be authorised to raise a loan for the carrying out of the work. By the consent of the vestry the report was, however, withdrawn.—The Baths Committee reported that they had considered an estimate from the architects for providing temporary flooring over the swimming baths, at a cost of £862. In view of the proposal to use these baths in the "off season" for places of entertainment, the committee recommended that the work should be proceeded with, and that they should be authorised to advertise for tenders for the carrying out of the work. After considerable discussion the recommendation was agreed

to.—Having fully considered the question of sinking an artesian well, and bearing in mind the present cost of water, the joint Electric Lighting and Baths Sub-Committee expressed the opinion that it would be a distinct economy to sink a well at the Coronet-street premises, where there was every prospect of an ample supply of water being obtained. The committee accordingly recommended that the work should be undertaken, and that the Lighting Committee should be empowered to advertise for tenders for the work. The recommendation was adopted.

**PROVINCIAL AND GREATER LONDON
AUTHORITIES.
COUNTY COUNCILS.**

East Riding.—With respect to a letter read from the Sealcoates Rural District Council suggesting that a hospital for the reception of patients suffering from infectious diseases should be provided by the county council for the whole of their district, the Sanitary Committee have resolved that the clerk be instructed to inform the Sealcoates Rural District Council that if they would make application under the Isolation Hospitals Act, 1893, in the manner provided by the Act, the committee would be prepared to carefully consider the matter.

Middlesex.—The county council decided, at the monthly meeting on the 27th ult., to acquire the lease of the chapel in Clarence-road, Teddington, for the purpose of a court-house, and to expend £250 in carrying out the necessary alterations and repairs.—On the recommendation of the Finance Committee it was resolved to approve an estimate of £2,500, being the council's contribution towards the cost of the wood paving of High-street and Kew Bridge-road, to be carried out on behalf of the Brentford Urban District Council. The wood paving is to consist of creosoted fir blocks.—It was decided to inform the Chiswick Urban District Council that the county council were willing to contribute a sum not exceeding £394 towards the cost of paving with Victoria stone a portion of the footpath of the High-road, Chiswick.—Reporting on the proposed new lines of the London United Tramways Company, the Highways Committee stated that the company had submitted drawings showing the projected construction of the tramways and plans indicating the position of the poles for carrying the overhead wires in the Acton district. The committee mentioned that they had given their approval to the drawings and plans, subject to the tram line in Kew Bridge-road and High-street being paved with creosoted fir blocks, to that in Halfpenny and Boston-lane being paved partly with the same kind of wood and partly with granite sets, and to that in the main road in Heston and Islesworth and in Lower Boston-lane being laid with granite sets. On the recommendation of the committee the council endorsed their action, and authorised the committee to approve any further plans and take any other steps necessary in connection with the construction of the tramways in the five districts concerned.—Last July the council intimated to the Bucks. County Council their readiness to contribute £1,000 in respect of a bridge costing £3,500 to be built over the Colne between West Drayton and Iver. Since then the Bucks County Council have offered to provide a similar amount towards the bridge. In this connection the Highways Committee announced the receipt of representations from the Uxbridge Rural District Council and the Iver Parish Council asking that the scheme should not be allowed to fall through by declining to furnish the requisite funds to meet the Bucks. County Council. On the recommendation of the committee, however, it was decided not to alter the previous decision to contribute £1,000.—The Fitchley Urban District Council, according to a further report of the Highways Committee, had given notice of intention to proceed to arbitration with the Local Government Board in respect of the maintenance of the footways on the main roads in their district during the past two years. The committee recommended, and it was decided, that the county solicitor should be instructed to require that the arbitration shall extend to the question of the annual payment, not only as regards footways, but also as concerns carriageways, and that the solicitor should be empowered to employ counsel and obtain such engineering evidence as might be necessary in addition to that of Mr. Wakelam, the county surveyor.—The joint committee of the county councils of Middlesex and Surrey presented a report, which is referred to in another column, in regard to the proposed new bridge at Kew.—The following tenders were received for adapting part of the reporters' room at the Guildhall as a reference-room for the surveyor's department: Phillips & Son, Baker-street (accepted), £35; A. Porter, Tottenham, £41 9s.; and Higgs & Hill, Limited, £57 10s.

MUNICIPAL CORPORATIONS.

Barnsley.—Colonel W. Langton Coke, M.A.C.F., an inspector of the Local Government Board, held an inquiry on Friday, at the town hall, Barnsley, into an application of the town council to borrow £25,000 for an installation of the electric light. The works are proposed to be erected on a site adjoining the premises of the highways and waterworks departments, and will consist in the first instance of a plant for 6,000 8 candle-power lamps, so arranged that its capacity can be doubled by the expenditure of £2,000 in machinery and £500 in plant.

Barrow-in-Furness.—The Barrow-in-Furness Tramway Company, Limited, have agreed to sell their undertaking to the British Electric Traction Company, Limited, for the sum of £22,754, but before they can complete the transfer the corporation have the right of refusal to buy at the same price. The question has been considered by the General Purposes Committee of the council, and the feeling is in favour of allowing the tramways to be absorbed by the British Electric Traction Company, Limited. The corporation hope to supply the company with electricity from their new works. The tramways, which are between 6 and 7 miles in length, originally cost over £60,000.

Batley.—Local Government Board sanction has been received by the corporation to the borrowing of £15,500 for works of surface-water drainage.

Chester.—The city council have adopted plans by Messrs. Douglas & Minshall for the erection of public baths in Farnsworth-street, at an estimated cost of £11,000. The plans provide for one swimming bath, 60 ft. long by 30 ft., a second swimming bath, 80 ft. by 30 ft., with slipper baths, vapour baths, &c. In connection with the scheme a new road will be made from Foregate-street to the site of the baths, near Grosvenor Park.

Cheltenham.—It is stated that the Local Government Board have practically refused to authorise the borrowing by the corporation of £13,410 for sewerage and sewage disposal purposes.

Darlington.—The electric lighting scheme for the town is reported to be still making satisfactory progress. Prof. Kennedy, to whom the matter was referred, has just submitted the ground plans of the proposed works to the Gas-works Committee, and the borough surveyor has been instructed to draw up specifications for the buildings, &c. The next step will be to obtain the sanction of the Local Government Board to the borrowing of the necessary money.

Devonport.—Mr. Charles Chadwell, Mr. James Dingle and the borough surveyor have inspected Vauxhall Bridge, London (now being demolished by Messrs. Pethick Brothers, of Plymouth), with a view to acquiring a portion of it for use in reconstructing the Camel's Head Bridge. They advise the corporation not to purchase either of the spans, and recommend a steel bridge for the purpose required.

Douglas, Isle of Man.—On Thursday a committee of the Tynwald Court sat in the matter of the application of the corporation for authority to borrow £20,000 for the purpose of improving the drainage of Douglas, in addition to the sum of £35,000 already authorised to be borrowed for the purpose. The Clerk of the Rolls presided and there was a full attendance of the committee. There were fifty-eight basements in the town below the high-tide mark. Mr. E. H. Stevenson, of London, the author of the high and low level scheme adopted by the corporation, gave evidence as to the liability of the basements in the town to be flooded, and said that he had seen black sewage matter in some of the basements at high water. Several householders and owners of property in the low-lying part of Douglas gave evidence in support of the opposition. They declared that any flooding was not due to sea water, but heavy rains, and had been obviated since storm outlets had been provided. It was, they also declared, a simple matter to put in a contrivance to keep the water out.

Huddersfield.—On the 22nd ult. Sir W. H. Broadbent opened the new municipal sanatorium which has been erected at Mill Hill, Dalton, one of the outlying portions of the borough. The site of the hospital is about 2 miles from the centre of the town, and the buildings are erected on the pavilion principle. From the administration block there is a covered way leading to the three ward pavilions, each of which will provide accommodation for thirty patients. There is also an isolation block in course of erection. Further, there are the receiving and discharge blocks, laundry, disinfecting blocks, and other buildings. There are ninety beds, which, with seventy at the Birky establishment, twenty in the small-pox department at Mill Hill, and ten in the additional isolation block, gives a total accommodation of 190 beds. The total cost of the sanatorium up to September last was £24,667 4s. exclusive of the land, and the total contracts amounted to about £30,000.

Leamington.—The town council propose to build a free library and technical institute on the Perkins'-gardens site, at a cost of £12,000, exclusive of land.

Leeds.—In connection with the York-street insaniary area improvement scheme, the Sanitary Committee of the corporation have provisionally arranged for the purchase of properties there involving an expenditure of, in the aggregate, over £12,000. Continuing, also, the improvements in North-street, it is proposed to buy a shop and premises on the east side of that thoroughfare on the basis of £2,000. An interesting report was recently presented to a committee of this authority in reference to the result of an experiment with the Diddin system at Knotsrop, which was recently adopted by the council. The treatment of the sewage had, it was stated, given every indication of the possible solution of the difficulty of dealing with so large an accumulation of 20,000,000 gallons per day, including sewage accumulated in the city and its trade effluents.

Middlesbrough.—On Saturday Colonel Hepper, Local Government Board inspector, held an inquiry at Middlesbrough into an application of the Middlesbrough Corporation to borrow £1,200 for the purpose of erecting public conveniences at the corner of Albert-road and Corporation-road. After an examination of the plans and estimates submitted by the borough engineer, Mr. Baker, the inspector visited the sites. It is anticipated that the income derived from the contemplated conveniences will be sufficient to pay interest and redemption on the money borrowed and also for their maintenance.

Retford.—At a special meeting of this authority, on Monday, it was unanimously decided that application be made to the Board of Trade to license the council to supply electricity under the Electric Lighting Act, 1882, for public or private purposes within the district of the borough of Retford, and that the town clerk take the necessary steps for carrying out the resolution.

Salford.—Major-General H. D. Crozier, R.E., Local Government Board inspector, held an inquiry on the 21st ult. concerning the application of the town council for approval of a modification of the scheme relating to the borough which was confirmed by the Local Government Board's Provisional Orders Confirmation (Housing of the Working Classes) Act, 1891. The town council asks for sanction to the borrowing of £45,000 for the purpose of the Housing of the Working Classes Act, 1890, £10,765 for purposes of street improvements, £8,000 for purposes of public walks and pleasure grounds, and £3,200 for the purpose of defraying half the cost of widening Regent-road bridge. There was a considerable attendance of members of the council and of the general public.—The borough engineer was recently instructed to submit a report as to the best method of laying and constructing the sewer in back passages so that the burden of their repair should be as small as possible. He recommended that all drains should be constructed with a good fall, be properly jointed, provided with a flashing eye and vent shaft at the upper end, and an inspection chamber at the outlet end; and that when thus laid the corporation should flush adequately, regularly and periodically. Sewers thus laid and flushed will throw practically no burden upon the ratepayers beyond the cost of flushing. This report was adopted by the committee, and approved by the council at its meeting last Friday.

Sheffield.—On Tuesday of last week, at a private meeting of the city council, the lord mayor brought up a proposal to purchase from the Duke of Norfolk the whole of his markets and market rights in Sheffield. A letter was read from his lordship agreeing to sell for £530,000. Twenty years ago, it was stated, the corporation endeavoured to acquire the markets, but disagreements arose and the negotiations came to nothing. The gross income of the markets is £18,866.

Southampton.—Mr. W. A. Ducat, Local Government Board inspector, held a public inquiry at Southampton on Thursday, in respect of an application by the town council for sanction to the borrowing of £7,000 for the erection of artisans' dwellings, £246 for a new manual fire engine and two fire escapes, and £72 for water vans.

Worthing.—Mr. F. H. Tulloch has held an inquiry, on behalf of the Local Government Board, respecting an application of the town council for sanction to borrow £345 for works of sewage disposal. Mr. F. Roberts, the borough surveyor, attended the proceedings, which were of a purely formal character.

Wrexham.—The Local Government Board recently held an inquiry in reference to an application of the town council for permission to borrow the sum of £3,125 for market purposes and £400 for certain footpath improvements.

URBAN DISTRICT COUNCILS.

Barry.—Mr. E. Sandford Fawcett, an inspector of the Local Government Board, held an inquiry recently with respect to applications made by the council for power to borrow about £11,500 for street improvements in the town—namely, £6,340 for public and private street works, including £105 for the widening of St. Nicholas-road, Barry, together with £4,820 for the formation of a new road round the Victoria Park, late Cadoxton Common, the acquirement of which was empowered under the Council's Act of 1896. The necessary formal evidence was given, and, there being no objection whatever on the part of the ratepayers, the commissioner proposed to inspect the sites of the proposed new works.

Bridlington.—It has been decided by the Sanitary and Foreshore Committee to recommend the council to sanction the erection of an infectious diseases hospital for the town, at a cost of about £4,000. It has also been resolved to recommend the erection of a destructor, at an estimated cost of £1,000.

Caepphilly.—Local Government Board sanction has been received to an application of the council to borrow a sum of £36,000 for purposes of sewerage and sewage disposal. The district proposed to be drained by this scheme is about 17,000 acres. The scheme is in two sections—*viz.*, Rhymney Valley and the Aber Valley. Future requirements are looked to in the arrangement of the scheme. Both mains will fall into a sewage farm called Gwainybara, in the hamlet of Vaes. This

farm has been purchased under a provisional order, and the sewage disposal scheme proposed to be adopted is the intermittent and broad irrigation system. The council had anxiously waited the result of the recent inquiry, as the state of sanitation in the district is such as demands immediate attention. It is considered to reflect very great credit on the officers of the council, especially Mr. Harpur, the surveyor, that the scheme has been approved in its entirety.

Chiswick.—At a recent meeting of the district council the Works Committee presented a report with reference to correspondence which had passed between the clerk and the London United Tramways Company upon the question of electric trolleys. The committee approved of the wires being fixed at a height of 21 ft. from the surface of the highway, the trolley poles to be so constructed that they may be used as lamp columns. The report was adopted.

Fenny Stratford.—At the last fortnightly meeting of this body the surveyor produced and explained amended plans for the treatment of the sewage of the district by the septic tank system, which would result in the annual saving of £100 in the working expenses. It was resolved to forward the plans to the Local Government Board.

Felixtowe and Walton.—The district council have decided to seek Parliamentary powers next session to carry out extensive works of sea defence, including the reconstruction of the sea wall and promenade in accordance with plans prepared by Mr. Henry Millar, of Ipswich, the county surveyor of East Suffolk.

Iford.—In addition to the public park, the district council last week made arrangements for the purchase of 32 acres of land in the southern ward for the purpose of a recreation ground, at a cost of £350 per acre.

Ledbury.—At a special meeting of the council, held last week, the following tenders for sewerage works were received: Messrs. Johnson Brothers, Hereford, £2,528; J. Bentley, Southport, £2,616; H. Holloway, Wolverhampton, £2,733; Owen James, Wolverhampton, £2,849 10s. 2d.; John Mackay, Hereford, £2,876 13s.; George Law, Kidderminster, £2,878; T. Vale, Stourport, £3,063; W. L. Meredith, Gloucester, £3,374 16s.; D. Smith, Ledbury, £3,397; and W. Braithwaite & Co., Leeds, £4,000. Messrs. Johnson's tender, being the lowest, was accepted.

Llandudno.—The council have decided upon an expenditure of £14,000 for the erection of municipal buildings, which are to be completed by May 1, 1900.

Newmarket.—The district council have under consideration a report and scheme by Mr. F. Beasley for the main drainage of the district. The estimated cost, including a refuse destructor and workmen's cottages, is about £37,500.

Shipley.—Last week, at a meeting of the council, the adoption of the minutes of the Electric Lighting Committee, which showed that the proposed compulsory area of supply of electricity had been determined upon, and steps had been taken in relation to the application for a provisional order empowering the council to supply electricity.

Walker.—A special meeting of the council, held last week, passed the following resolution, with one dissentient: "That application be made to the Board of Trade for a provisional order, under the Electric Lighting Acts, 1882 and 1888, to authorise the urban district council to supply electricity for the public and private purposes as defined by the Electric Lighting Acts within the urban district of Walker."

Watford.—The Local Government Board have informed the district council that they are willing to comply with their application for sanction to borrow £1,650 for water supply on the understanding that the mains are laid at a depth of 3 ft.—An inspector of the Local Government Board has held an inquiry respecting an application of the district council for sanction to borrow £4,800 for the purposes of public walks and pleasure grounds.

Wimbledon.—The works which the district council have at present in hand include the completion of the depot buildings, the contract for which was let at £9,144. The main-block facing Queen's-road has a frontage of over 500 ft., and includes stabling for thirty-nine horses, with sheds which can be converted into stables and give room for an additional forty-seven horses. In the centre of the block are dwellings for the storkeeper and horsekeeper. A rear block contains storkeeper's office, stores, workshops and six isolation boxes. The flood-prevention works, the contract for which was let to Messrs. B. Cooke & Co. in June last, at £8,332, is almost completed. There are also in hand at the present moment private street improvement works which have been let at a total of £10,187. During the year a Johnson's twin tandem air-compressor, 20-in. stroke with 10-in. diameter steam cylinders, has been erected. A new bridge, carrying Garp-road over the London and South-Western Railway Company's and the District Railway Company's property, is being fixed. Considerable progress has been made in the construction of the station and the laying of mains for supplying the district with electricity. Quantities for the isolation hospital, in accordance with plans prepared by the surveyor, are being taken out by Messrs. Arding, Bond & Buzzard. The council are, with their own men, also constructing 2 acres of nitrification filters at the sewage works.

RURAL DISTRICT COUNCILS.

Belper.—At a meeting on the 22nd ult. the district council resolved to lease 2 acres of land for dealing with the sewage disposal of South Wingfield, and also that application be made to the Local Government Board for their sanction to a loan of £750 for constructing works of water supply for the township of Holbrook.

Chesterton.—The council have purchased a 10-ton steam roller from Messrs. Aveling & Porter.

Croydon.—A Local Government Board inquiry was held at Beddington, on the 25th ult., into an application of the council to borrow £16,000 for the purpose of providing a joint cemetery for the parishes of Beddington, Wallington and Conisland. The application was opposed by several landowners in the neighbourhood on the ground of a possible contamination of the water supply. The plans for laying-out the cemetery and for the chapel were prepared by the council's surveyor, Mr. R. M. Chart, F.S.I., of Croydon, who gave evidence in support of the scheme. The inquiry will be reopened to-day (Friday).

Ruthin.—The district council have adopted the plans and a scheme, prepared by Mr. John E. Thomas, of Wrexham, for the proposed new water supply for the parishes of Llangwylfan, Llandynog, Llanychan, Llanyngys and Llangyhalaf, in the Vale of Clwyd. The source of supply will be Nant y Ne, on the western slopes of Moel Fanman, the gathering ground being 307 acres on the open mountain, formed of Upper Silurian rocks.

St. Germain's, Cornwall.—The district council have decided to instruct Messrs. Jenkin & Son, engineers, of Liskeard, to prepare plans and specifications for taking water from their mains for the supply of the village of St. Stephen-by-Saltash.

Wortley.—On Thursday Colonel Coke, C.E., Local Government Board inspector, held an inquiry in reference to an application by the district council to borrow £3,700 for the purpose of supplying with water from Hall Broom—the source of the present Stannington supply—the villages of Worrall Stubbin, Holdworth, Loxley and Stacey Bank. Mr. G. E. Beaumont, the council's engineer, explained the plans and proposals. The water is stated to be exceptionally soft and pure, this being proved by analysis. About 6½ miles of pipes will be required, and a deep valley will have to be crossed. The altitude of the source of supply is 1,665 ft. above ordnance datum.

SCOTLAND AND IRELAND.

Arbroath.—In forwarding to the town council a report of Sir Henry Littlejohn on the water supply of Arbroath the secretary of the Local Government Board at Edinburgh has stated that it is obvious that that gentleman, while anxious to give due credit to the local authority for their efforts to improve the water supply and fully disposed to await the issue of those efforts, still regards with apprehension the unfinished condition of the sewers and the absence of a margin of supply applicable to the extinction of fire.

Belfast.—It is stated that the Finance Committee, after considerable discussion, last week agreed to the construction of 6 miles of new tramway, it being understood that the corporation would lay the lines in such a manner that if any system of electric traction was afterwards decided upon they would not require to be relaid. The new lines are to be all double lines, and the tramway company, it is also understood, agree on their part to pay 5½ per cent. on the outlay to the corporation, the lines, of course, to be the property of the corporation and to be kept in repair by that body.

Johnstone.—The burgh commissioners and a number of local gentlemen recently met at the gasworks to witness the ceremony of turning on the gas at the new telescope gasholder. The holder has a capacity of 210,000 cubic feet. On the motion of Mr. McGilchrist (the engineer of the work), Provost Thomson was called upon to perform the ceremony. He said the storage capacity of the holder previous to the present enlargement was 120,000 cubic feet, and now it was doubled. The gasworks were acquired by the burgh in 1879. In 1880 the price was 5s. 1d. per 1,000 cubic feet, while at the present time the price is 3s. 4d. per 1,000 cubic feet, or a reduction of 2s. 1d. per 1,000 cubic feet. They had also reduced the debt of the purchase price by £11,000. The provost passed a high eulogium on the contractors who had done the excavation for the original holder, which was put down seven years ago. He also spoke highly of the contractors for the work of this holder, Messrs. Laidlaw & Co., Limited.

Kirkcaldy.—The town council have decided to apply for a special Act of Parliament for powers to construct the proposed tramways, and to have a clause inserted giving the council the option of handing over the construction and working of the tramways to a company.

Motherwell.—The Police Commissioners have had under consideration a scheme of electric lighting. The estimated cost of the scheme is between £23,000 and £24,000, which will give private lighting and also street lighting with thirty arc lamps and 100 32 candle-power incandescent lamps, and also for motive power. The report was approved and the convener of the Lighting Committee instructed to push forward the work as rapidly as possible.

INSTITUTION OF CIVIL ENGINEERS.

ORDINARY MEETING.

The second ordinary meeting of the 1898-99 session of the above Institution will be held on Tuesday, at 8 p.m., when a paper will be read by Prof. W. E. Roberts-Anstey, F.R.S.E., on "The Extraction of Nickel." A discussion will follow the reading of the paper.

STUDENTS' MEETING.

A meeting for students of the Institution will be held on Friday, the 1st inst., when a paper will be read by Mr. Cecil Lightfoot on "Liquid Air: A short description of the production and summary of its application to the chemical and other industries." The chair will be taken, at 8 p.m. by Mr. W. H. Preece, C.B., F.R.S.E., the president.

Shoreditch Combined Scheme.—A communication from Mr. T. W. Baker on this subject reached us just as we were going to press, having evidently been delayed in delivery owing to the envelope being insufficiently addressed. It will, however, appear in our next issue.

Laundry Machinery.—In these days of municipal baths and wash-houses the improvement of laundry machinery is of increasing importance. Mr. J. Appleyard, Harris-street, Bradford, said our contemporary, *The Laundry Record*, on a recent occasion, is placing on the market a new collar-rolling machine, which is likely to be very successful and a credit to the British laundry engineering interest. It is a six-roller machine, that is to say, the collar or other article that is to be ironed passes under five rollers and over a drum, and the machine has a capacity of fully 1,000 collars an hour. This we have tested, watch in hand. One or two minor details are being perfected, but the machine will very shortly be ready. The collars are delivered into a basket arranged conveniently to the hands of the operator.

Santiago (Cuba).—A remarkable change has come over the spirit of the dream of Santiago, which with an unenviable reputation as one of the dirtiest and most unhealthy cities in Cuba is, under the judicious system introduced by General Wood, who happens to possess the additional qualification of being a physician, becoming, it is said, almost a model of cleanliness. The city has been divided into five sections, each under the general supervision of a medical man, with inspectors of sewers, streets, &c., under whom are a number of street-cleaners. The refuse is burnt daily, disinfectants are used wherever necessary, and the people are fined, not only for uncleanness against the public good, but for failure to report deaths and unhealthy conditions. The result on the death rate has been remarkable, for after only a month of this treatment the death rate was declared to have fallen from an average of 70 to 20 a day.

ADVERTISEMENTS

Received to Int. for Classification.

FOR SALE.—Steam Road-Roller, by Aveling & Porter, in splendid condition; 4 horse-power compound; weight, 15 tons; age, four years. Has not done much work, County Council taking the work it was bought for. This roller is worth inspection.—Apply "C.A.," office of THE SURVEYOR, 21 Bride-lane, E.C.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL. ROAD FOREMAN.

The above Council are prepared to receive applications for the appointment of a Road Foreman.

Candidates (whose age must not exceed forty-five) must be thoroughly qualified persons, having had active practical experience in the scavenging and maintenance of roads, and of the various pavements used, and also in the control and management of large bodies of workmen, horses and carts, and should be able to set out works accurately, and take all necessary measurements.

He must have had experience in the management and construction of sewers and drains, and will be required to reside within a specified distance of the Council's stables, and will be employed the same number of hours as the working staff, and is to devote the whole of such time to the service of the Council, under the direction of the Surveyor. He will be required to keep all the necessary books in connection with his work.

The salary will be 50s. per week, payable weekly. A horse and trap will be provided, for the business of the Council only.

List of duties and forms of application can be obtained from the Surveyor.

Applications, in candidate's own handwriting, stating age and qualifications, particulars of present and past employment, including copies of not more than three recent testimonials (of which the selected candidates must produce the originals), must be sent in to the undersigned on or before 10 a.m. on Tuesday, November 15th, endorsed "General Foreman."

Canvassing will be a disqualification.

W. A. DAVIES, A.M.I.C.E.

Engineer and Surveyor to the Council.

Town Hall, Heston, Middlesex.
November 2, 1898.

Personal.

Mr. E. R. Matthews has succeeded Mr. J. F. Stow as surveyor to the Bridlington Urban District Council.

The Newington Vestry have decided to advertise for a resident engineer at their electrical works, at a salary of £250 per annum.

Mr. G. F. Deacon has been retained in connection with certain works of water supply which are being undertaken by the Todmorden Town Council.

Mr. G. H. Hamly, borough surveyor of Lowestoft, was among those present on Friday evening at the annual dinner of the corporation, held in the public hall.

The death took place last week of Mr. William John Mott. He was thirty-six years of age, and has been gas manager at Selby for six months. He was formerly in Halifax.

The town commissioners of New Ross, co. Wexford, have instructed Mr. W. Kaye Parry, of Dublin, to report upon the best source for the proposed water supply for the town.

Mr. D. Crampton, who has held the office of surveyor to the Spalding Urban District Council, has resigned that position, although he still retains the post of market inspector.

Port Glasgow Town Council have granted an honorarium of £20 to Mr. Wm. Mackie, the gas manager, in recognition of extra services rendered in connection with improvements at the gasworks.

The Preston Town Council have adopted a minute of the Streets and Buildings Committee recommending that Mr. J. H. Smeethurst be appointed deputy surveyor, at a salary of £200 per annum.

On Friday, at a special meeting of the Selby Urban District Council, Mr. T. H. Alderson, assistant gas manager at Halifax, was appointed gas manager to the council, in the room of the late Mr. W. J. Mott, at a salary of £200 per annum.

We learn that Mr. Walter Percival, of Longton, has been appointed to the post of assistant surveyor to the Longton Town Council, rendered vacant by the resignation of Mr. C. A. Benbow. Mr. Percival's salary will commence at £120 per annum.

A very interesting lecture on the "Welsh Water Scheme" was delivered on Friday by Mr. E. Antony Lees, of the Water Department of the Birmingham Corporation, to a large and appreciative audience. A vote of thanks to Mr. Lees brought the proceedings to a close.

Whitechapel District Board have decided to grant a sum of £60 to Mr. Wilson for duties performed by him as acting surveyor between the time that Mr. Waddington resigned his appointment as surveyor and the time when such duties were undertaken by Mr. Jameson.

Mr. J. A. McPherson, A.M.I.C.E., contributed a paper, entitled "Notes upon Regulating and Recording Apparatus for Reservoirs, Gauge Weirs and the Flow of Water," at a meeting of the Bristol Association of Engineers, held on Saturday evening, under the presidency of Mr. T. H. Yabbicom.

Mr. A. J. Dickenson, of the building department of the Sheffield city surveyor's office, has been appointed borough surveyor and water engineer of Pwllheli, North Wales. Mr. Dickenson is one of the lecturers in building construction at the evening technical department of the Sheffield University College.

Mr. George J. Bouchier, assistant surveyor to the Ashton-in-Makerfield Urban District Council, has been appointed, by a unanimous vote of the Haydock Urban District Council, to the post of clerk and surveyor to that authority. Mr. L. Davenport Thompson, Mr. Bouchier's predecessor, has, we understand, secured a position under the Lancashire County Council.

Last week, at a meeting of the Lancaster Town Council, the Water Committee reported that the Lancaster Rural District Council had written to Mr. J. Cook, the borough engineer, asking him, on account of the death of Mr. Jowett, the surveyor to the district council, to undertake the preparation of the preliminary plans and estimates in connection with a certain application to the Local Government Board.

Prior to Tuesday's meeting of the London County Council, Mr. McKinnon Wood, the chairman of the council, presented Sir Arthur Arnold, who was the chairman of the council in 1895-96 and 1896-97, with his portrait, which has been painted by Mr. Leonard Watts. Sir Arthur was also presented with a silver casket containing the autographs of the subscribers, whilst Lady Arnold was presented with a replica of her husband's picture.

The death has taken place, after a brief illness, of Mr. John White, borough surveyor of Folkestone. The cause is stated to have been enteric fever and acute peritonitis. Mr. White, who was only thirty-one years of age, was the pupil of the late Mr. Couquet, whom he succeeded. He was a man of most amiable disposition, and all who came in contact with him speak of him in the most affectionate terms. The

funeral took place on Thursday afternoon amid every manifestation of sympathy and regret.

A letter was recently read from Mr. C. A. Benbow tendering his resignation as assistant borough surveyor of Longton. The following motion, which was adopted by the Improvement Committee, has since been approved by the council: "That the resignation of Mr. C. A. Benbow, assistant borough surveyor, be accepted with regret, and that the members of this committee desire to express their sense of the valuable services rendered by Mr. Benbow for their past seventeen years, and their congratulations on his appointment as surveyor of highways for the parish of Stone, and their best wishes for his future success and prosperity."

After a lingering illness, Mr. Joseph Potts, burgh architect and surveyor of Partick, died at his residence late on Friday. Mr. Potts had been ill since February last, and the commissioners granted leave of absence in the hope that he might be benefited by change of air and scenery. Mr. Potts spent the summer months in Wigtonshire, but on returning home he was still unfit for his duties, and his illness for the past two months was serious. He entered the service of the burgh twenty-one years ago, and was fifty-six years of age. During that time he discharged his duties to the satisfaction of all, and he was held in high esteem by the burgh officials and the general public.

Mr. Fred. W. Pearce, the newly-appointed surveyor to the Twickenham Urban District Council, is thirty-two years of age, and has for the last twelve years been employed in the engineer's and surveyor's department of the Wimbledon Urban District Council, four years assistant under Mr. W. Sauto Crimp, and eight years as assistant surveyor. He has assisted in the design and construction of many important works in Wimbledon, and has had a considerably varied experience in this capacity. His testimonials are excellent, and include one from Mr. W. Sauto Crimp, who describes him as being particularly well-informed in matters relating to road and sewer maintenance and construction.

Sutton (Surrey) Urban District Council last week decided to increase the salary of their surveyor, Mr. C. Chambers Smith, by £50. A like advance, it is understood, will also be made next year, so as to bring the amount up to £350. A councillor, in endorsing certain remarks which had been made in reference to Mr. Smith's duties, said that there was no doubt that the latter had shown himself to be a superlatively good man. He was a man much above the average intelligence, and had carried out his duties in a manner which had evoked many favourable expressions of opinion from the ratepayers. Men in his position were looked upon as somewhat migratory. They went to the place where they could get the most money, and he thought it would be a graceful act on the part of the council, having regard to the fact that he started at £250—it would be a graceful way of showing their appreciation of the diligence and attention he had shown in important matters in the town, if they offered him some increment of salary, which would induce him to stay for at least another couple of years. Other members expressed themselves in similar terms. But the highest compliment to the surveyor is, in the opinion of a local journal, the fact that the ratepayers, in consequence of the general improvement of their roads and paths, and their appreciation of Mr. Smith's efforts, are generally agreed that he is worthy of the increase.

The death is reported of Mr. Latimer Clark, who was intimately associated with the developments of our present system of electric telegraphs and submarine cables. Born in 1822, at Great Marlow, he gained his first practical experience in railway engineering, being appointed in 1847 resident assistant engineer under Robert Stephenson at the building of the Britannia and Conway tubular bridges. A joint paper by Sir Charles Bright and Mr. Clark was contributed to the British Association in 1861, and was the means of putting electrical measurement on a firm basis. After it had been read, Sir William Thomson, now Lord Kelvin, obtained the appointment of a committee to devise a national system of electrical units, and the result of its labours was the absolute system now in universal use, the terms volt, ampere, ohm, &c., being adopted according to suggestions made in Bright and Clark's paper. The "Elementary Treatise on Electrical Measurement," which has become a standard work, appeared in 1868, and a few years later Mr. Clarke, in conjunction with Mr. R. Sabine, published "Electrical Tables and Formulae." In 1873 he described the Clark standard voltaic cell, which has proved of great value in promoting accurate measurements of electrical potentials. Mr. Clark was deputy chairman of the St. James's and Pall Mall Electric Light Company, and as a partner in the firm of Clark, Ford & Taylor had to do with the manufacture and laying of thousands of miles of cable in various parts of the world. One of the founders of the Society of Telegraph Engineers (now the Institution of Electrical Engineers), he became the fourth president of that body in 1875, delivering an inaugural address that contained an interesting account of the early history of the electric telegraph. He was elected a member of the Institution of Civil Engineers in 1858 and of the Royal Society in 1889.

BELFAST NEW CITY HALL.

DESCRIPTION OF THE BUILDING.

In connection with the recent visit of Earl Cadogan, Lord Lieutenant of Ireland, to Belfast, for the purpose of laying the foundation-stone of the proposed new city hall and opening the corporation's new electric light station, the following particulars of the city hall will, no doubt, be of considerable interest to many of our readers.

The new hall is to be erected on the site of the old White Linen Hall, which some years ago ceased to be used for the purpose for which it was originally built. An Act of Parliament was obtained by the corporation in 1890 to enable them to utilise this site, and as soon as the old buildings of the hall were demolished competitive designs were invited for the erection of the proposed new buildings. Mr. Alfred Waterhouse, R.A., having been appointed to examine and report upon the designs, selected the designs of Mr. A. B. Thomas, of Westminster. This selection was approved by the corporation, and a contract was then entered into with Messrs. H. & J. Martin, Limited, of Belfast, to carry out the erection of the buildings, the contract price amounting to about £150,000.

The proposed buildings are in rectangular form, the external dimensions being 300 ft. in length and 250 ft. in depth, the internal quadrangle being 180 ft. by 130 ft. A large portion of the site remains outside the city hall, and will, we understand, be planted, but a great many of the trees will, of course, be preserved. The lower story of the building is in the simple form of a heavily-rusticated basement. This will give effect to the upper or principal storey, which is divided regularly by an order of Ionic design, surmounted by a richly-carved cornice and balustrade. The principal feature will be the dome surmounting the entrance hall. It is upwards of 150 ft. high to the lantern, 56 ft. diameter at the peristyle—the circular range of columns—and 40 ft. diameter at the drum of the dome. At each corner of the building is an angle tower, and these are almost 100 ft. high by 25 ft. diameter. At the principal entrance is a small stone-domed carriage-way, designed to give size and scale to the edifice. The portion devoted to a public hall includes a hall measuring 120 ft. by 60 ft., together with a refreshment-room and a stago and dressing-rooms. In the planning of the building the first special point which may be mentioned is that the suite of reception-rooms and the large public hall with its adjuncts are designed on the first floor and intercommunicate, thus forming a continuous set of apartments well adapted for the requirements of civic receptions and large functions of various kinds. With the spacious entrance hall and marble staircase under the dome, these may be considered the great feature of the design internally. The next point to be specially mentioned in that the large public hall and its adjuncts are so arranged that they can be shut off entirely from the rest of the building, and being provided with separate entrances and exits, can be employed quite apart from and with it in the least degree interfering with what may be described as the municipal portion of the building. Separate and distinct entrances and exits from the street have also been supplied to the offices in which the payment of rates and gas are made, and thus the inconvenience of so many people passing in and out of the main building is obviated. The various committees will in future each have a room adjoining the private offices of the principal of the respective departments, the object being to facilitate as much as possible the work of all the committees. In the internal arrangements accommodation has been provided for the city officials and the following departments: Town clerk, city surveyor, health department, accountant, city cashier, gas department, electric light department, rate offices, school attendance department, market department, weights and measures department, &c. The reception-rooms embrace, first, an apartment measuring 50 ft. by 30 ft., which will be specially set apart for receptions; next the council-chamber, the dimensions of which are 70 ft. by 38 ft., together with the following: Ante-room, robing-room, writing-room, banquet hall (70 ft. by 38 ft.), and three apartments for the Lord Mayor exclusively—viz., his reception-room, parlour and retiring-room.

LITTLEHAMPTON WATER SUPPLY.

In accordance with instructions, Mr. H. Howard, surveyor to the Littlehampton Urban District Council, has prepared a report in reference to a proposal of his council to construct new permanent water supply works for their district.

The council, we understand from the report, propose to obtain the supply from Warningcamp by means of a bore, 12 in. diameter, sunk in the chalk to a depth of from 150 ft. to 200 ft. This bore-hole it is proposed to construct of steel tubing, which will be perforated from the bottom upwards for about 50 ft. The suction and delivery pipes, in duplicate, are also to be 12 in. in diameter, and will be connected directly to the bore. The engines and pumps (condensing triple expansion) will be duplicated and of the most modern and efficient type, each being capable of raising and delivering to the reservoir not less than 500 gallons per minute. The boilers, also in duplicate, will be of the Lancashire type, and will develop an ordinary working pressure of 100 lb. per square inch. The rising main, which is to be con-

structed from the pump to the reservoir, a distance of about 655 yards, will be 12 in. in diameter.

THE SERVICE RESERVOIR

will be sunk for about half its depth on the side near road close to Batworth Park House, and the surplus soil will be used for forming the embankment. It will be constructed of selected hard-stock bricks in cement mortar, with asphaltum watertight coating in the wall on a concrete bottom, while the internal faces of the walls and bottoms will be finished in Portland cement or other suitable facing material. The reservoir will be rectangular in form, and its total capacity 500,000 gallons, equivalent to rather more than three days' supply, reckoned on the average amount used per day during the past summer. If required, extra space can be provided for the construction of an additional reservoir in the case of any increase in the present demands.

The buildings, which will be erected at the source of the supply at Warningcamp, will include engine and boiler houses, with chimney from 50 ft. to 60 ft. in height, store and coal sheds and engineer's cottage. They will be constructed of hard-stock bricks, red kiln bricks and stone. A cart road, 12 ft. wide and about 235 yards long, will also be constructed leading to the works. About 420 yards of 10-in. delivery main will also be laid from the reservoir through the grounds of Batworth Park to Crossbush, and will be connected with a 10-in. main recently laid by the council. This latter main will unite with the council's 6-in. main at Water-lane (Lyminster and Littlehampton boundary), where provision has been made for a 10-in. extension to that of the present main at Littlehampton waterworks, so as to complete the circuit. It is probable that the 6-in. off the 10-in. main at Arundel-road will be competent to serve the requirements of the town for a few years to come with the increased pressure from a higher reservoir, and as the laying down of about 1,700 yards of 10-in. pipe from Water-lane to the main at the present works, with valves, would represent a cost of £1,280, from which no material gain for some time would result in the general distribution, it does not appear to be absolutely necessary for this section of the scheme to be carried out in connection with the new works, though it is one which can be easily done at any time when the necessity arises. The council's present waterworks will, on the completion of this new undertaking, form a useful stand-by, and as the whole of the plant, buildings, &c., are in a fairly good condition, the annual cost of maintenance will be comparatively very small.

The above report was adopted by the district council at their last meeting, and Mr. Howard was instructed to proceed with the preparation of the necessary specifications, &c.

PROPOSED NEW BRIDGE AT KEW.

At the last monthly meeting of the Middlesex County Council the Finance Committee, on behalf of the joint committee of Surrey and Middlesex, presented supplementary estimates to the extent of £35,000 for the rebuilding of Kew Bridge. The report of the joint committee showed that while the estimate of the total cost of the widening, given by their engineer, Sir J. Wolfe Barry, was £118,000, the lowest of seven tenders received for the work, that of Mr. Easton Gibb, of Skipton, Yorkshire, was £169,288. In reply to a request for an explanation, Sir J. Wolfe Barry reported that his estimate was based on the prices paid for similar work at the Tower Bridge, with a considerable addition. He suggested that the cost of all work in the neighbourhood of London had been steadily increasing during the past two years, owing to the obligations imposed by the Employers' Liability Act, the action of the London County Council with regard to the terms of labour, and the great demand for materials at the present time. He estimated that £20,000 to £25,000 might be saved by the substitution of internal brickwork or concrete for stonework. The committee further reported that they had ascertained that a reduction of about £20,000 might be made on Mr. Gibb's contract in the way suggested, and they recommended that the tender should be accepted for a sum not exceeding £150,000, and that a Bill be promoted to authorise the additional borrowing. It was moved as an amendment to the report of the joint committee that the council should not ascertain the proposed additional expenditure, but should refer the matter back to the joint committee, with a view to bringing the total cost of the bridge approximately within the amount authorised by Parliament, and this was carried by thirty-two votes to eight.

Huddersfield.—At the last monthly meeting of the town council a letter was read from the Post Office authorities in London stating that when the necessary powers to enable the corporation to work an exchange system had been obtained, the Postmaster-General will be prepared to give the corporation a license for a telephone exchange. The matter was discussed at considerable length, and eventually the following resolution was passed:—"That this council memorialise the proper authorities that the Postmaster-General should be authorised to grant self-contained licenses to corporations to work telephone exchanges, and that such licenses should confer all necessary and incidental powers, including borrowing powers."

THE SURVEYORS' INSTITUTION.

ORDINARY GENERAL MEETING.

The first ordinary general meeting of the session 1898-99 will be held at the temporary premises of the institution on Monday, the 14th inst., when the president, Mr. Robert Vigers, will deliver an opening address. The chair will be taken at 8 o'clock.

STUDENTS' PRELIMINARY EXAMINATION, 1899.

Those proposing to enter their names for the students' preliminary examination, to be held on the 18th and 19th of January next, must intimate their intention to the secretary before the last day of November. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London. Irish candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS, 1899.

Students eligible for the proficiency examinations (which will commence on the 20th of March next) must give notice of the sub-division (Table A of Rules) in which they elect to be examined, not later than the 31st inst. Examinations qualifying for the classes of "Professional Associates" and "Fellows" will also commence on the 20th of March next. Names of applicants for these latter examinations to be sent in before the 31st inst. All particulars as to days, subjects and course of examination will be forwarded on application to the secretary. English candidates for the professional examinations will be examined in London. Irish candidates will be examined in Dublin.

PROPOSED SPECIAL-CERTIFICATE EXAMINATIONS (FOR MEMBERS), 1899.

Notice is also given that the next special-certificate examinations in forestry, sanitary science and land surveying and levelling are proposed to be held on Tuesday, Wednesday and Thursday, the 13th, 14th and 15th of June. Particulars of these examinations can be obtained from the secretary.

JUNIOR MEETINGS.

The first of four meetings of examinees and students authorised (subject to certain conditions) by the council to be held during the present session will take place at the temporary premises of the institution on Monday, the 21st inst., 1898, the chair to be taken at 7 o'clock. All inquiries with reference to the junior meetings should be addressed to Mr. A. Norman Garrard, 8 Frederick's-place, Old Jewry, E.C.

(which must be between twenty-eight and thirty-five), accompanied by not more than three copies of recent testimonials, and endorsed "Building Inspector," to be sent to Mr. J. Cserwright, Borough Engineer, on or before Saturday, the 19th instant.

Canvassing will be considered a disqualification.

JOHN HASLAM,
Town Clerk.

TARVIN RURAL DISTRICT COUNCIL. APPOINTMENT OF A SURVEYOR OF HIGHWAYS AND INSPECTOR OF NUISANCES.

The Tarvin Rural District Council invite applications for the appointment of Surveyor and Inspector for the Southern Division of their district, at a salary of £130 per annum.

Candidates must not be less than twenty-five nor more than forty years of age, and preference will be given to those who are able to prepare plans and drawings of sewerage works, &c.

The appointment will be made subject to the approval of the Local Government Board.

Applications, in candidate's own handwriting, accompanied with copies of not more than three recent testimonials, must reach the undersigned not later than the 17th November inst.

Canvassing will disqualify.

EDWARD EVANS LLOYD,
Clerk.

Crypt Chambers, Chester.
November 2, 1898.

CORPORATION OF THE CITY OF BIRMINGHAM.

The Public Works Committee are prepared to receive applications for the appointment of a District Road Surveyor in the City Surveyor's department, at a commencing salary of £130 per annum.

Candidates, whose age is not to exceed forty years, must be thoroughly qualified persons, having had active, practical experience in the construction, scavenging and maintenance of roads and streets; and on the various classes of pavement used therefor; and also in the management of large bodies of workmen; and should be able to set out works accurately, take all necessary measurements and prepare estimates of cost.

The candidate elected will have charge of one of the five districts into which the city is divided for road purposes.

He will be required to reside in his own district, and will be

employed the same number of hours as the working staff. He will also be required to subscribe to the superannuation scheme, and to devote the whole of his time to the service of the Corporation.

Applications, in candidate's own handwriting, stating age, experience, past and present employment, and accompanied with copies of not more than three recent testimonials, endorsed "District Road Surveyor," to be sent to the undersigned not later than November 11th next.

Canvassing, either directly or indirectly, will be considered a disqualification.

JOHN PRICE,
City Engineer and Surveyor.

The Council House, Birmingham.
October 27, 1898.

WIMBLEDON URBAN DISTRICT COUNCIL. ASSISTANT SURVEYOR.

The Wimbledon Urban District Council require an Assistant Surveyor. The salary is £200 a year, rising to £250 by annual increments of £10. Applicants must be under thirty years of age, must be conversant with all details of building construction, and must have had experience in the office of a surveyor to a municipal or local authority.

The area of the district is 3,220 acres, and the estimated population 38,500.

Applications, stating age and qualifications, and endorsed "Assistant Surveyorship," to be sent to me, accompanied by copies of three testimonials of recent date (which will be returned so as to be received not later than noon on the 14th instant.

Canvassing is prohibited.

W. H. WHITFIELD,
Clerk to the Council.

November 1, 1898.

WANTED, in a Provincial Gas Works, a young man as Junior Draughtsman and Analyst. Commencing salary, £65 per annum.—Apply, stating age and experience, to Box 91, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, London, E.C.

PUPIL.—Engineer on a large modern gasworks, in a healthy Northern town, has a vacancy for a Pupil. Premium required.—Apply to Box 90, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, London, E.C.

Town Clerk's Office, Bradford.
October 25, 1898.

TENDERS WANTED.

WILLESDEN DISTRICT COUNCIL.
TO ROAD CONTRACTORS.

The Willesden District Council are prepared to receive tenders for the execution of certain Road-making and Paving Works in Preston-mews, Willesden.

Plan and specification may be seen, and all further particulars obtained, on and after Monday, October 31, 1898, upon application to Mr. O. Claude Robson, M.I.N.S.T.C.E., Engineer to the Council, Public Offices, Dyne-road, Kilburn, N.W.

The tenders, upon printed forms and endorsed "Private Streets," to be delivered at the offices of the Council not later than 4 p.m. on Tuesday, November 8, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
STANLEY W. BALL,
Clerk to the Council.

Public Offices, Dyne-road, Kilburn, N.W.
October 26, 1898.

BOROUGH OF STAFFORD.

The Corporation invite tenders for a Stone-breaking Machine, with jaws about 12 in. by 9 in., to have revolving screens, one to take out the dust, one to a 3 in. and one to 1 1/2 in. gauge, to be complete in every respect, and delivered at the corporation depot ready for fixing. Further particulars may be obtained on application to Mr. W. Blackshaw, Borough Engineer, Stafford.

Sealed tenders, endorsed "Tender for Stone Breaker," addressed to the Chairman of the Works Committee, to be left at the Town Clerk's office, Martin-street, not later than 10 a.m. on Monday, the 21st of November, 1898.

MATT. F. BLAKISTON,
Town Clerk.

Martin-street, Stafford.
October 31, 1898.

URBAN DISTRICT OF ABERTILLERY.
TO CONTRACTORS.

The above Council are prepared to receive tenders for the making of a New Road from Abertillery to Aberbeeg, a distance of about 2 miles.

They are also prepared to receive tenders for the Widening of an existing Highway between Aberbeeg and Cruanlin, a distance of about 2 1/2 miles.

Plans may be seen and specification, bill of quantities and form of tender obtained on application to Mr. James McBean, Engineer and Surveyor to the Council, at his office, No. 1 King-street, Abertillery.

A charge of £2 2s. will be made for each copy of the specification and bill of quantities, which will be returned on receipt of a bond-fide tender.

Sealed tenders, endorsed separately "New Road" or "Road Widening," as the case may be, to be sent to the undersigned on or before Saturday, the 19th day of November, 1898.

No tender will be entertained unless sent in on the prescribed form.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
(Signed) JNO. ALEX. SHEPARD,
Clerk to the Council.

EAST RETFORD DRAINAGE.

The Corporation of East Retford, acting as the Urban District Council, invite tenders for the construction in the Borough of East Retford of about 20,000 lineal yards of Stoneware and Iron Pipe Sewers, with manholes, lampholes, storm overflow, ventilators, ejector chamber and ejectors, cast-iron rising main, and other works connected therewith; also precipitation tanks, engine and boiler houses, chimney shaft, press-house, stores and office, carriers, underdraining and levelling land, roads, fencing, and other works connected therewith; also the maintenance thereof for a period of twelve calendar months after completion.

Specification, with bill of quantities and schedule of prices, may be obtained from the Engineer, Mr. J. C. Melliss, M.L.C.E., 264 Gresham House, Old Broad-street, London, E.C., or from the Borough Surveyor, Retford, and the plans may be seen at their offices on and after November the 8th on payment of £10, which will be returned on receipt of a bond-fide tender.

Sealed tenders, properly filled in and addressed on the outside, are to be sent to me before noon on Friday, the 25th day of November, 1898.

The Council does not bind itself to accept the lowest or any tender.

SAMUEL JONES,
Town Clerk.

Town Hall, East Retford.
October 31, 1898.

PLUMSTEAD VESTRY.**PAVING NEW STREETS.****NOTICE TO CONTRACTORS.**

The Plumstead Vestry invite tenders for Paving and Making-up part of Formount-road and part of Old Mill-road (as New Streets), comprising kerbing, channelling, roadway and tar paving.

The person or firm whose tender is accepted will, in the case of all workmen to be employed by him or them, be required to pay wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Vestry's list (such rates of wages and hours of labour will be

inserted in a schedule, and form part of the contract), and will also be required to enter into a formal contract and bond, with two approved sureties, for the due performance of the contract.

Plans may be seen, and form of tender, specification and approximate quantities, also lists of wages and hours of labour, may be obtained on application to Mr. W. C. Gow, C.E., Surveyor to the Vestry, on and after Monday, the 7th November, on deposit of £2, which sum will be returned on receipt of a bond-fide tender, provided such tender is not subsequently withdrawn.

The Vestry does not bind itself to accept the lowest or any tender, and reserves the right to let the tar paving separately.

Sealed tenders, properly filled in, must be sent to me at the Vestry Hall, on or before Wednesday, the 16th November, 1898, not later than 4 p.m., in envelope marked "Tender for Paving."

(By order)
EDWIN HUGHES,
Vestry Clerk.

Minutes of Proceedings.

Municipalities and Electric Tramways.

Probably one of the most important papers published by the London County Council during recent years is Mr. J. Allen Baker's report on some forms of mechanical tramway traction.* Although the paper has special reference to the best form of traction for London, there is little doubt that the information collected and the conclusions arrived at will be of great use to all municipalities in considering the question of applying electricity to tramway work. One cannot but think that electricity for tramway purposes reaches its highest degree of utility when its growth coincides with that of the development of districts. It is this factor, no doubt, which accounts for the immense progress that has taken place in the United States and Canada during the past few years. The influence that a well-equipped tramway service has upon a town is demonstrated in the report under discussion. Mr. Allen Baker states:—

Cities that were hitherto confined to limited areas have had their congested inhabitants scattered to large suburban districts by the introduction of tramways, and property in suburban and outlying districts has in consequence immensely increased in value. In many districts numbers of towns and villages are connected by a perfect network of trams, and it is freely admitted that one of the greatest features in the improved social conditions of the people is the development of their mechanical tramways.

How great an influence electricity is exerting upon social life has been shown before in these columns, and it is of the utmost consequence that such an important body as the London County Council, the premier municipal organisation in the country, should recognise this fact. Apart from carrying passengers swiftly and efficiently, electric tramways in many towns are fulfilling functions of equal importance. In many cities they are utilised for municipal services of various sorts, such as street sweeping, sprinkling, postal delivery and collection. Although such functions could only be discharged properly when a tramway ran down every street, it is obvious that they can be relied upon to carry out some important work. It must be pointed out, however, that in considering American achievements in electric traction there is not likely to be the speedy development in this country that has characterised the States.

The very fact that municipalities are considering closely the question of tramways will in many cases delay the introduction of electricity; and that arises not so much from any want of conviction on the part of local authorities that electricity is not a suitable agent, but because most of the tramways of the country are still owned by companies, and it is not until their license has run its legal course that we may expect any startling development in the equipment of tramways for electrical working. At the same time there are many municipalities who have arrived at

the point when they must either take over the local tramway service or grant an extension of leases to companies, with fuller powers as to the method of operating them. There is scarcely any local authority that has considered the subject of tramway traction and has not arrived at the conclusion that horses are quite unsuitable for such work, and that some form of mechanical traction must be adopted in order to provide an efficient and economical service. The tramways in London at the present moment are, judged by American conditions, not considered to have reached any magnitude, yet on the lines in existence no fewer than 25,000 horses are employed. If these were immediately removed the saving of wear to streets and the greater cleanliness effected would not be unimportant. The one great difficulty to be grappled with in London is that of dealing with the great congestion that forms so characteristic a feature of our present streets. Underground railways will do much to relieve the tension, but there is little doubt that if a well organised and equipped service of surface railways or tramways, offering rapid and cheap transit, were to be adopted it would aid very materially in enabling the masses of population to live outside the town. The question that has exercised the minds of town councillors, of county councillors and members of municipal bodies is, What is the system to adopt? A good deal of information has been collected by municipalities when considering the question, and it is perhaps a pity that the ideas and experiences of the various municipal bodies are not collected, or at any rate put in such a form that they would form a guide to the various municipalities that will, if not immediately considering the question, be shortly called upon to do so. It is an expensive matter to send deputations abroad and to different parts of the country where tramway systems are in operation, and although one might expect any given municipality to argue that the opinions of other towns would probably be useless to them, still one cannot help thinking that some joint action in a matter affecting the ratepayers all over the country should be arrived at.

It will now be of some interest to consider the various conclusions that Mr. Baker has arrived at with regard to different systems, and at the same time to offer some criticism where, in our opinion, it is needed. It will be difficult for anyone, even when not imbued with much enthusiasm for electrical methods, to disagree with the conclusions of the report that steam, so far as tramways are concerned, is not likely to be extended in any direction; and, moreover, if one may judge by the experience in Leeds, Huddersfield, Burnley and other towns, where tramways have been operated on such a system, we are likely to see the method almost immediately supplanted. In the most notable instance of steam tramways operated by a municipality, in fact, with the exception of Leeds, perhaps

* The report, which is well and profusely illustrated, can be obtained from Messrs. P. S. King & Sons, 9 Bridge-street, Westminster, S.W., price 1s., or 1s. 2d. post free.

the only instance in the country—we refer to that in Huddersfield—the experience has by no means been satisfactory. For some years the system has been practically run at a loss; yet the ratepayers were so dependent upon it as a means of conveyance from one part of the district to another that they preferred the levying of a small rate to meet the losses arising from the operation of the system rather than that the system should be abandoned. The expenses of operating the Huddersfield steam lines have been exceedingly heavy; at one time they were as much as 1s. 3d. per car mile, and even of later years have not been lower than 1s. per car mile. If electricity can show in the case of Huddersfield a reduction of 3d. or 4d. per car mile it will mean that a handsome profit would be derived from the operation of such a system. Electrical engineers claim that electricity should be able to operate almost any system in this country at 6d. or 7d. per car mile. Certainly the limited experience on tramway lines in this country bears out the fact. Whether, however, in the exceedingly difficult district of Huddersfield a similar experience will be obtained it is difficult to say. The Huddersfield Corporation, however, are convinced that electricity in some form or other is the most suitable means of operating their tramways, and we may shortly expect some developments in this direction. It was thought for some time that oil motors, which were tested in London, Croydon and Greenwich, were likely to be adopted to some considerable extent in the operation of tramways, but absolutely no progress has been made on this system since the first experiments, and if the extensive experiments in Chicago during 1893 go for anything this system may be considered completely out of court.

Gas motors, however, have proved to be by no means an inefficient and uneconomical system, and gas motor tramcars have been tried and are now in use on short lines in Dresden and Dessau; but what is of more interest to English municipalities is that a line of 7 miles has been very recently installed at Blackpool, running between Blackpool, St. Anne's and Lytham. Certainly the system has been shown to be capable of improvement; moreover, if we can accept the figures advanced by the Gas Motor Company, it appears to be a most economical one, but it is doubtful when any municipality considers the disadvantages arising from such a system whether this consideration is likely to help very much in its extension. It is interesting to mention, apart from the report under discussion, that in spite of elaborate estimates which were prepared for the Dover Corporation at the time when they were contemplating adopting electricity for tramway purposes, and in which it was shown that under certain conditions gas cars could in point of economy compare most favourably with electricity, yet, after a most careful investigation into the merits of the system, the Dover Corporation rejected the method in favour of electrical working. How successful this system has proved we have recently shown in these columns, the results being that at the conclusion of the first year's working a considerable profit was handed over to the alleviation of rates. Returning, however, to the question of gas-driven systems of tramcars, the following passage may be quoted:—

The cars are generally worked by means of a double-cylinder gas-engine placed under the seat, the fly-wheel being enclosed in a recess in the side of the car. Ordinary coal gas, at a pressure of 150 lb. to the square inch, is stored in the cylinders, which are carried under the seat. These require to be recharged at the compressing station every 9 miles. Thirty-five cubic feet of gas is used per car mile. The process of recharging occupies about one minute.

It is not difficult to place one's finger upon the drawbacks in such a system. In the first place, whether the car is running or at a standstill, it is necessary that the gas motor shall be continually rotating, on account of the difficulties in starting, and therefore the car, whether at a standstill or running, is subject to almost the same vibration. Moreover, it need hardly be urged how inconvenient and

uncomfortable such a method will be to passengers, and, curiously enough, the Blackpool system, which has a somewhat steep gradient, has demonstrated another serious drawback, and that is that the laden cars have sometimes a difficulty in surmounting the gradient, and if stopped require to go back and recommence the ascent. There is also considerable smell given off from the motors, and though the practice may not be considered a dangerous one, still it is not a point in favour of any system of tramcars that reservoirs containing high-pressure gas have to be carried. The system, moreover, has not even the advantage of the self-contained electrical car, because the gas on the motors must necessarily be fired by a flame, and there may be always the danger of a fire occurring.

Compressed air has been long projected for cars, and Mr. Baker quotes instances where such systems have been working. In Paris, Bernc, St. Quentin, Angouleme and Lyons systems have been at work for a considerable time. Cars have been used on the New York lines for some time, and the conclusion arrived at by Mr. Baker is that "they appeared to work well and to be under perfect control." Here, again, one could soon raise objection—it is necessary to carry cylinders in which compressed air is stored. Although it is claimed that properly-made cylinders can be ruptured without flying to pieces, still, some latent defects in the metal may at any time develop, with the consequent scattering of fragments. There appears to have been considerable improvements effected in this system, and certainly it is not open to the same objection as the gas-driven car, for there is, of course, an entire absence of smell, and the mechanism seems to admit of a considerable amount of flexibility. It is admitted by the engineers of the compressed air companies that the cars are heavier than those employed in the overhead wire system. Moreover, Mr. Pearson, in the report of the Liverpool Corporation Tramways Committee, stated that it would cost 1d. per car mile more than the electric conduit which had been installed in New York. We cannot, however, do better than quote Mr. Baker's final conclusion on the compressed air system. He states:—

Since I visited New York the Knight-Headley and Hardie Company, under the title of the American Air-Power Company, have been amalgamated, and I have been informed that the Metropolitan Traction Company of New York, upon whose lines I saw the trial air car, have decided to lay down a further compressing plant and extend the use of the system to some of the cross lines, in place of their present horse cars; but on the main avenues this company have shown their preference for electric traction, and have just completed a further 55 miles of electric conduit.

The further points raised by Mr. Baker in his report as to the merits and demerits of other systems we will leave for another article.

The Making of By-Laws.

* * * The annual report of the Local Government Board for 1897 gives some interesting statistics respecting the making of by-laws during the year under the Public Health Act, 1875, the Public Health (Interments) Act, 1879, the Housing of the Working Classes Act, 1885, the Public Health Acts (Amendment) Act, 1890, the Public Health (London) Act, 1891, and the Acts incorporated with the first-mentioned Act. We are told that there is marked evidence of continued activity on the part of local authorities in making by-laws on the more important sanitary matters, such as scavenging, the prevention of nuisances, the regulation of common lodging-houses, the construction of buildings and the regulation of offensive trades. The majority of these by-laws were based on the model series prepared by the Local Government Board, and they comprised forty-two series relating to the cleansing of footways and pavements, the removal of house refuse and the cleansing of ash-pits, &c., and for regulating the times for the removal or carriage of noxious matter; fifty series relating to the prevention of nuisance arising from filth and of the keeping of animals so as to be injurious to health; thirty

series dealing with the regulation of common lodging-houses; 122 series with respect to the construction of new streets and buildings; two series for the management, &c., of public slaughter-houses; six series with respect to houses let in lodgings or occupied by members of more than one family; two series as to cemeteries; four series with respect to mortuaries; thirteen series for the regulation of offensive trades so as to prevent or diminish their noxious or injurious effects; one series for securing the decent lodging and accommodation of persons engaged in picking hops, fruit and vegetables; and eight series for securing the decent conduct of persons using public sanitary conveniences. Several series of by-laws, proposed to be made under sec. 9 of the Housing of the Working Classes Act, 1885, and sec. 95 of the Public Health (London) Act, 1891, with respect to tents, vans, sheds and similar structures used for human habitation, with a view to securing their habitable condition and for preventing the spread of infectious disease, &c., have been under the consideration of the Local Government Board during the year, and eight series were confirmed. A "model" series of these has been framed for the assistance of local authorities. The by-laws confirmed under the Public Health Acts also included twenty-four series with regard to public walks and pleasure grounds; two series with respect to the regulation of horses and asses for hire; six series as to pleasure boats and vessels; and seven series with respect to whirligigs, swings and shooting galleries. Under the powers of the Acts incorporated with the Public Health Act, 1875, eight series of by-laws confirmed during the year were made with respect to markets, forty-two series with respect to private slaughter-houses, twelve series with reference to hackney carriages, twelve relating to omnibuses, and one series relating to public bathing. The Board approved eight series of by-laws made under the Baths and Wash-Houses Acts, and confirmed two series of rules and regulations under the Tramways Act, 1870. Twenty-four sets of by-laws or regulations submitted by local authorities and public companies in pursuance of provisions in various local Acts were also confirmed or approved by the Local Government Board in the course of the year. In an appendix to the report are given the names of the various local authorities and other particulars. Reference is again made to the practice of the Board in requesting that by-laws and regulations may be, in the first instance, submitted in draft, so that before they are actually made their details may be examined from legal, sanitary and technical points of view. It is also satisfactory to hear that advantage has been experienced from holding conferences between officers of the Board and representatives of the local authority proposing the by-laws. Many such conferences, we are told, took place during the year, and in several cases it was found desirable to hold local inquiries for the purpose of ascertaining the special circumstances in which certain exceptional clauses were deemed necessary. The discussion on by-laws intiated by Mr. Pickering at the recent congress of the Sanitary Institute at Birmingham indicated the existence of considerable dissatisfaction among local authorities and their officials with the too rigid attitude of the Local Government Board in practically demanding, irrespective of special local conditions and needs, one uniform code of by-laws throughout the country, based on their own "model" series. The Local Government Board, however, seem quite satisfied of the wisdom and correctness of their policy, but we doubt if it would obtain much support outside of Whitehall.

The Municipal Telephone.

Subject to the sanction of Parliament, which is by no means a foregone conclusion, we may be said to have reached the era of municipal telephones. The granting by the Postmaster-General of a license to the Glasgow Corporation to equip and

carry on a system of telephones has naturally led other bodies to consider the question more closely than they have hitherto done. It would only be fair to grant powers to other municipalities that might apply for them, although the reasons that induced the Glasgow Corporation to apply for permission to erect their own system might not obtain in other towns. There is no doubt that Glasgow has been suffering for a good many years from a bad telephone system, and we can speak from personal experience on this point. Supposing, however, that the Postmaster-General grants various licenses in different parts of the kingdom, and such licenses receive the direct sanction of Parliament, it must be obvious that for some years much confusion would obtain. In a large town four, or even five, years would probably elapse before the system could be at the service of telephone users; and it must not be forgotten that all licenses granted by the Postmaster-General will expire in 1911. It does not follow that these licenses may not be renewed, but it is clear that the Postmaster-General is reserving to himself the right of operating the entire telephone system of the country if conditions are favourable for such a course. Therefore a telephone system may be laid down by a municipality at considerable expense and in a few years be entirely superseded, because it is clear that the Post Office would not take over any system which did not commend itself to its engineering department. Hence it might follow that a large sum of money would have been invested in plant which had become practically useless. As we have before pointed out, the telephone service is not comparable with electric lighting, because the telephone subscriber wants more than the mere local service. Although the success of the agitation so persistently urged by the Glasgow Corporation may doubtless impress many municipalities, it is probable that those seeking relief from the present system will follow the lead of the London County Council in urging as strongly as possible the taking over of the telephone system by the Post Office. Unless some such course be adopted we are afraid municipalities will in many cases attempt to supply a telephone service and much public money may be wasted.

The Typhoid Bacillus in the Soil.

In the Shoreditch Vestry annual report, to which we have already referred, Dr. Fraser Bryett, medical officer of health, refers to the recent investigations of Dr. Sidney Martin, F.R.S., on behalf of the Local Government Board, respecting the behaviour of the bacillus of enteric fever in the soil. These investigations, so far as they have been pursued, tend, he thinks, to show that in earth which is originally polluted, as is likely to be the case in the vicinity of defective drains, leaky cesspits, or in the neighbourhood of dwellings in crowded and poor localities, the micro-organisms which give rise to enteric fever are capable not only of retaining their vitality for months, but of increasing and multiplying in numbers. On the other hand, in soils which are not exposed to pollution the micro-organisms are unable to flourish and rapidly become extinct. Dr. Bryett points out that similar results have been arrived at by at least one other investigator in the same field of research, and he is justified in saying that they go to emphasise the great importance of sanitary work executed under the supervision of the officials of local authorities in respect to such matters as the proper paving and drainage of yards and areas in connection with dwellings, and the construction of drains and other sanitary arrangements, in such a way as to prevent the pollution of the soil. A timely appeal is made for the paving with impervious material of courts, *cul-de-sacs* and narrow streets in localities occupied by poor people. When so paved every shower of water helps to wash them clean, and thus by facilitating cleansing, and preventing the pollution of the soil the comfort of the people is promoted and the standard of health raised.

Principal Features of Electric Lighting Systems.—VIII.

COMBINED LIGHTING AND TRAMWAY SYSTEMS.

It is hardly necessary to say that one of the chief developments in a municipal supply is that of combining plant for furnishing electricity both for lighting and tramway purposes. This arises mainly from the desire of municipalities to cheapen the cost of electricity, and it is obvious that when a local authority is operating a tramway by electrical means considerable economy will be effected if the plant can be housed in the one building. It is held that such an arrangement would provide the electrical machinery with a day load, and by thus giving a good load factor during the greater part of the twenty-four hours a very considerable saving would be effected, with the result that the production of electricity would be materially cheapened. There is a good deal of experience to guide municipalities in this direction, for combined systems have been in operation for a considerable time in different parts of the Continent and in America. It has been held in this country that by combining plant in such a way electric current ought to be produced for all purposes at from 1½d. to 3d. per unit, according to the demand. Even when a company operates an electrical tramway system it is under some circumstances much better for it to obtain its electricity from the local supply, be it municipal or other-

can be effected by combining the interests in some such way, the most conspicuous departure from this rule is in the case of Glasgow, where the recently opened municipal tramways are not supplied with current from the existing lighting station, but separate plant has been erected. This, however, arises not so much from the belief on the part of the Glasgow Corporation that no economy can be effected by combined works, but it had its origin in a dispute between the Tramway Committee and the Lighting Committee, with the almost deplorable result that the former committee refused to obtain its supply from the already existing system. In all other systems, however, where tramways are being introduced, the prevalent desire on the part of municipalities is to obtain the advantages derived from a combined system of tramway and lighting plant. One of the most notable instances is that of Halifax, where a large system of municipal electric tramways is being operated in conjunction with the lighting of the town.

THE HALIFAX WORKS.

This is a very interesting example, because the current supplied for lighting purposes in this town is wholly unsuited for propelling electric trams, and it has been necessary to

HALIFAX MUNICIPAL ELECTRICITY WORKS.

wise, than to put down plant for the sole purpose of supplying electrical energy for tramway purposes. To quote from a paper communicated some time ago to the Association of Municipal Electrical Engineers:—

"This has been realised on the Continent, where in several large towns the tramway companies are buying current from municipal electric light works. The lowest price paid is at Geneva, where the tramway company guarantees a minimum consumption of 500,000 units per annum, and pays 1'15d. per Board of Trade unit. Hamburg is another example of a tramway company buying current from a lighting station. In this case the tramway company guarantees a minimum annual consumption of 2,500,000 units. The lighting company has to pay a fine of 9'6d. for every car mile which the tramway company may not be able to run, owing to any failure in the power plant. The total expenses of the tramway company, including depreciation, maintenance, interest on bonds, sinking fund, &c., are only 3'95d. per car mile. Hamburg is, so far, the largest electric tramway system in Europe, and its success is an accomplished fact. The management state in the last year's annual report that the introduction of electric traction has, without the slightest doubt, very much improved the earning capacity and diminished the working expenses of the system; further, that on the lines where electricity has superseded horses the number of passengers carried has increased more than 32 per cent., and the receipts have increased nearly 35 per cent."

Although it is generally accepted that striking economies

put down special plant to give a direct current supply; but such an arrangement gives all the advantages arising from having the whole of the plant under the supervision of one staff. The illustration gives a general idea of the works as they exist to-day. The plant which is being used for the purpose of generating electricity for tramway purposes is the third machine visible in the illustration. It will be interesting to give some details of this particular plant, because no doubt it will have some bearing on future systems where combined plant is to be used. The generator is of the continuous-current type, and driven by ropes from an engine which was originally put down for driving an alternator. It is of the four-pole type, having an output of 220 amperes at 500 to 550 volts. But one of the most interesting machines in the present station is a motor alternator, which acts as a sort of buffer state between the tramway and the lighting systems. It consists of a continuous-current dynamo, which is driven, through ropes, by means of an alternating-current motor. This machine possesses two valuable functions. If an alternating current is sent into the motor it drives the continuous-current dynamo, which is thereby enabled to deliver current into the tramway circuit, but it is possible for the continuous-current machine to be turned into a motor, and thus reverse the operation and drive the alternating-current machine, thereby enabling it to give an alternating current which can be delivered into the lighting circuit. In order, however, that this should be done a battery of accumulators is provided, and thus it is possible to call upon this store of electrical energy

to drive the continuous-current machine as a motor and the alternating machine as a generator. This combination will effect two purposes at once. Through the medium of the alternating machine driving the continuous the whole of the tramway service will be operated during the early morning, and then by reversing the motor alternator the whole of the lights in the town will be kept going during the hours of light load. The arrangement provides what is undoubtedly a novel feature in alternating-current systems; previously all alternating works had been compelled to keep a staff all night to keep the few lamps supplied that may be burning, but by means of the combination adopted at Halifax it will be actually possible to shut down the station at night and thus rely on the battery to drive the continuous-current machines, which will in turn drive the alternator, and thus give off an alternating-current suitable for distribution into the lighting mains, without the necessity of having anybody in attendance. In the case of Halifax the whole of the switching devices are arranged on different boards, there is a board specifically used for controlling the whole of the lighting and a second board placed in a separate part of the building is used entirely for tramway purposes.

It will be interesting to quote the opinion of Mr. Stewart, who has until recently acted as municipal electrical engineer of Derby, on the subject of combined plants for lighting and tramway purposes. The conclusions are those shared by most municipal engineers, and were recently brought before the convention of municipal electrical men held some time ago:—

"The first consideration is, Shall the current be supplied from the existing works? This, I believe, should be answered in the affirmative, for the sufficient reasons that the same buildings, boiler, power and plant will answer the purpose, and the necessary spare plant will not be augmented, but, on the contrary, considerably reduced in proportion to the output, as accumulators would be introduced to, as far as possible, reduce the necessity of adding plant to take the load over the lines when the maximum load for the ordinary supply occurs at the same time as the traction load.

"Secondly, the cost of keeping accounts will be very much reduced, as the work that is necessary to keep the electricity works accounts will not be added to, as would be the case when a separate power-house is laid down. The power need would be metered as for an ordinary consumer and charged for as such. The interest and sinking fund on the capital outlay on buildings will not be increased, or only slightly so, which would not be the case if a separate power-house were decided upon. The same staff of men practically would do, or in any case with a small increase only necessary. The same engineer would in consequence control the whole supply. Having decided so far, that the one works should do all the work necessary to supply electrical energy for whatever purpose it may be required, it cannot too carefully be considered as to what arrangements should be made to save confusion and friction between committees or the various departments into which the work of corporations is divided. The committee, I think, should be composed of a definite number of gentlemen, which should be divided into two sub-committees—one to be responsible for the supply of electricity, arranging of prices and managing the supply works; the second to be responsible for the tramways' equipment and management; and each should report its recommendation to the ordinary committee meetings."

MR. PREECE'S ADDRESS.

• THE PROGRESS OF ELECTRICITY.

In our last issue we gave a brief abstract of Mr. Preece's address as president of the Institution of Civil Engineers. The following communication, which we have received from a correspondent, embraces some interesting points not included in our abstract:—

It was only natural that Mr. W. H. Preece, C.E., the president of the Institution of Civil Engineers, should have chosen the subject of electricity for his presidential address on the 1st inst. There is no man living who has had so much practical experience in the application of this force to the uses of mankind, and his address was consequently listened to with wrapt attention by an appreciative audience. After an admirable defence of the Government "official," he gave some statistics of the present strength of the Institution of Civil Engineers, amounting to 7,000 members, of whom 71 per cent. are home members, 21 per cent. are colonial members and 8 per cent. are foreign members. These he divided into the railway engineer, the mechanical engineer, the naval architect, the mining engineer, the sanitary engineer, the gas engineer, the hydraulic engineer, the electrical engineer, the chemical engineer and the marine engineer. He spoke of the advantage of examinations, but pointed out the difficulty of obtaining really competent practical teachers. "The ideal professor of pure abstract science is a very charming personage, but he is a very arrogant and dogmatic individual, and, being a sort of little monarch in his own laboratory and lecture room, surrounded by devoted subjects, his word is law, and he regards the world at large, especially the practical world, as outside his domain and beneath his notice." Speaking later

on of "Energy," Mr. Preece thought that the title of "Engineer" should be rather that of "Energeer."

THE TELEGRAPH AND THE TELEPHONE.

The president, turning to his familiar subject of electricity, said that he had studied under Michael Faraday fifty years ago, and he pointed out the practical advances of this form of energy since that time. With regard to telegraphy, he said that, whereas in 1847 the pioneer line was only 10 miles in length, there were at the present time no less than 1,111,366 miles of British telegraph wires and cables. Speaking of the insulation of underground cables, he strongly advocated paper covering, protected by lead. He spoke of the future advances which were almost perfected in connection with "Telegraphy," or writing telegraphs, and of wireless telegraphy, and in connection with the telephone he gave a history of its development, and pointed out that there were at present 152,019 telephones in use in this country. He gave some interesting details of the use of telegraphy in connection with the working of railways, whereby travelling had been rendered so safe, and he gave tables to show how accidents, in consequence, had decreased. For instance, in 1874 one person in 5,500,000 journeys was killed, in 1881 one person in 22,500,000 journeys, in 1894 one in 57,000,000 journeys, and in 1896 one in 196,000,000 journeys. In 1897, he said, twenty-four persons only were killed in railway accidents when travelling. A first-class compartment on one of our great railways is the safest place in the world. "It is safer than bed, for in 1896 1,806 persons were suffocated in bed. It is safer than a dining-room, for in the same year 148 persons were choked by food." And this with more than 20,000 miles of railway line open for passenger traffic.

ELECTRIC LIGHTING.

After touching on the domestic electrical appliances, such as the bell, the fire and burglar alarms, lifts, ventilators, heating by radiators, cooking in ovens, boiling water, heating flat irons, and even curling tongs! Mr. Preece proceeded to give particulars with regard to the electric light, showing that, whereas there were only 135 electric light stations in this country, there were 2,589 in the United States. The capital invested in this country in such undertakings was nearly £8,000,000 and in the States £52,000,000. On the cost of production Mr. Preece said electricity could be generated continuously during the twenty-four hours at a fraction of 1d. per unit, but if used solely for light it may cost 3d. per unit. "The cheaper the supply of energy per unit the more certain and speedy the advent of the electric light as the poor man's lamp, and the more beneficial its introduction into the confined, ill-ventilated and overcrowded houses of the working classes. By improving the locomotion to the suburbs and enabling them to live in pure air, and by cleansing the air they breathe of the impurities due to the combustion of tallow, oil and gas, the more readily should the public fall down and worship the golden image which Parliament and science have set up."

On the question of traction Mr. Preece said that the first experimental line was constructed by Dr. Siemens, in Berlin, in 1879. In 1881 there was only one short experimental line in America—viz., in Cleveland, Ohio; now there are more miles of line so worked in Cleveland alone than in the whole of the United Kingdom, the reason being the climatic influences of the States, the habits of the people, the cost of horseflesh and the necessity for more rapid transit.

ELECTRIC TRACTION.

He considered that the slow advance of electric traction in this country was due to the restrictive clauses of the Act of 1870; but as these are now removed there ought to be a rapid development of this form of traction. Speaking of the storage battery, Mr. Preece said it fulfils a very important function in the economical working of an electric railway. It equalises the pressure on the circuits, it meets the fluctuations of the load, it takes in current when the load is light, and it lets out current when the load is heavy. "Electric traction is invading even our streets. The number of unstable and weak-kneed cart horses seems destined to be reduced by their electric competitor, while the pride of London, the fleet hansom, will be freed from an obstructive and not always sweet-smelling rival competitor. When the real storage battery is produced the auto-mobile problem will be solved."

Mr. Preece then referred to electro-chemistry, and also to the transmission of power. With regard to the latter he said "the energy wasted in waterfalls is enough to maintain in operation the industries of the world." At Tivoli, 15 miles from Rome, the energy of the falls lights Rome and drives the trams, and he gave other instances of similar transmission. Such transmission was effecting a great economy in coal consumption in workshops and factories. The efficiency of steam-driven shafting is poor, scattered steam engines and long steam piping run away with money; the motor is used only when and where wanted, and costs nothing when idle. In conclusion, Mr. Preece said that "every engineer must ultimately become an electrician, and electricity will be the most general, the most useful and the most interesting form in which he applies the fundamental principles of energy to the wants, the comforts and the happiness of mankind." After all there is nothing like ketcher, and President Preece may be right in his prophecy.

Comparative Reports of General Practice.

XXIX.—ELECTRIC LIGHTING : BECKENHAM REPORT.—IV.

We now give the remaining

PARTICULARS OF INSTALLATIONS.

GREAT YARMOUTH.

(Population, 50,000; rateable value, £178,500.)

This town possesses a high-tension alternating installation, which cost £32,000 to erect. The works have been running since January, 1895, and supply power equal to dealing with 9,500 8 candle-power lamps; but there is no demand for motors. There also there is shown a loss on last year's working, the revenue being £2,342 and the working expenses £3,558—a deficiency of £616. Profits, however, are anticipated. Current is charged for at the rate of 6d. per unit, and gas costs 3s. per 1,000 cubic feet.

HAMSTEAD.

(Population, 75,449; rateable value, £805,443.)

A high-tension alternating system is at work here. It was started in October, 1894, and produces power sufficient to deal with the equivalent of 50,000 8 candle-power lamps. The original cost of the works was £83,330. Motor-power is not used. Last year's revenue and working expenses were respectively £12,510 and £10,957, leaving a substantial profit of £1,553. Current is charged for at the rate of 6d. per unit, but it is expected to be able to reduce this charge and at the same time to earn considerably larger profits. The cost of gas at Hamstead is 2s. 10d. per 1,000 cubic feet.

HUDDERSFIELD.

(Population, 96,000; rateable value, £435,000.)

The installation at Huddersfield is, like that of Hamstead, on the high-tension alternating principle, but the cost of erection was only £65,000. Current (which is now capable of supplying 40,000 8 candle-power lamps) has been available since July, 1893. There is no demand for power purposes. The profit on the last financial year's working totalled £445, the revenue being £6,864 and the expenditure £6,419. A charge of 6d. per unit, less discount, is imposed, but a reduction is anticipated, as is an increase of profits. Gas costs 2s. 9d. per 1,000 cubic feet.

KINGSTON-ON-THAMES.

(Population, 27,057; rateable value, £129,218.)

A high-tension alternating system is also in operation at Kingston, the date of the first supply being October, 1893. A sum of £29,497 was spent upon the works, which have a capacity of 10,050 8 candle-power lamps. No applications for motor-power have as yet been made. In this case a loss was experienced, as the working expenses—£4,339—exceeded the revenue by £1,326. Charging is made at the rate of 6d. for the first two hours and 4d. for subsequent hours, and no reduction is expected. A profit is expected on future working, and the corporation are so satisfied with the past results that large extensions are being carried out. The price of gas is 2s. 11d. per 1,000 cubic feet.

LANCASTER.

(Population, 31,034; rateable value, £131,978.)

The system adopted at Lancaster is a three-wire low-tension one, which cost £22,984 to erect. Current was first supplied in April, 1894, and the present output is capable of dealing with the equivalent of 10,500 8 candle-power lamps; a small demand for motor-power is also met. The last financial year's revenue was £2,475 and the expenditure £2,387—a surplus of £88; 5d. per unit is charged, and this not likely to be reduced. A large profit, however, is expected. In Lancaster gas costs 2s. 6d. per 1,000 cubic feet.

LEYTON.

(Population, 80,000; rateable value, £217,750.)

At Leyton, where a low-tension system is at work, a sum of £26,000 was spent upon the works, and current, which is now capable of supplying 4,000 8 candle-power lamps, has been available since September, 1896. As a result of seven months' working the revenue and expenditure were respectively £600 and £1,000, thus showing a loss of £400. The charge for current is the same as at Lancaster—namely, 5d. per unit—and no reduction in this direction is expected to be made. It should be mentioned that the station is rapidly attaining a profit-earning state. Gas costs between 3s. and 4s. per 1,000 cubic feet.

NELSON.

(Population, 35,000; rateable value, £91,000.)

With a two-wire low-tension system, which was completed in 1892 and cost £10,600 to lay down, the equivalent of 5,620 8 candle-power lamps are supplied in Nelson. No demand for motor-power is made. Charging 5d. per unit, loss 5 per cent., the authorities have earned a profit of £304, but are expecting to shortly be able to make a reduction in price together with an accompanying increase in profits. At present the installation is not being carried on to its full capacity. Gas in the district cost 2s. 6d. per 1,000 cubic feet.

NEWPORT, MON.

(Population, 54,695; rateable value, £249,422.)

At Newport, where a high-tension alternating system is carried on, current has been supplied since October, 1895. The original cost of the installation was £43,000, and the equivalent of 15,000 8 candle-power lamps is supplied. There is no demand for motors. The last financial year's working resulted in a loss of £962, the revenue being £3,386 and the working expenses £4,348, but a profit is expected to be made in the course of two years. A charge of 6d. per unit is made for current. Gas costs 3s. 2d. per 1,000 cubic feet.

NOTTINGHAM.

(Population, 213,877; rateable value, £857,479.)

The three-wire low-tension continuous-current system has been adopted here, and current has been supplied since September, 1894. The works, which can deal with the equivalent of 25,476 8 candle-power lamps, cost £67,887 to build. There is no demand for power for purposes of motors. Profits on last year's working amounted to £2,284, the charges for current being 6d. for the first hour and 4d. for subsequent hours. Larger profits are, however, expected. Gas costs 2s. 2d. per 1,000 cubic feet.

OLDHAM.

(Population, 131,463; rateable value, £634,496.)

At Oldham a low-pressure three-wire installation has been working since March, 1894, and is now supplying current capable of dealing with 15,766 8 candle-power lamps. The costs of the works was £39,600. Motor-power is supplied. Revenue and expenditure totalled £5,564 and £4,521 respectively, thus showing a profit of £1,043. Wright's system of charging has been adopted by the authorities, and the prices are 4½d. and 3½d. per unit. Considerably larger profits are expected. Gas costs 2s. 3d. per 1,000 cubic feet.

OSWESTRY.

(Population, 8,496; rateable value, £35,810.)

The installation here, which cost £6,000, is on the two-wire continuous direct-current system, and was first started in August, 1895. It supplies power sufficient to deal with 7,000 8 candle-power lamps, and meets a small demand for motors. A profit of £123 resulted from the last financial year's working, the working expenses being £348 and the revenue £471. The cost of the current is 6d. per unit, and no reduction in this price is anticipated. But considerably larger profits are expected, as experience has proved that once the light is used it is never discontinued and is appreciated far beyond any other.

PORTSMOUTH.

(Population, 180,000; rateable value, £621,495.)

Portsmouth, with a high-tension alternating system, which has been working since June, 1894, and cost £37,000, is supplied with power sufficient for some 32,000 8 candle-power lamps. The works last year produced the large profit of £2,324, the working expenses and revenue being respectively £11,950 and £14,274. The charge for current is 4½d. per unit, while gas costs 2s. 4d. per 1,000 cubic feet.

SOUTHPORT.

(Population, 47,243; rateable value, £299,831.)

An installation similar to that at Portsmouth is in working here. Its erection cost £47,000, and current has been available since November, 1894. Power equal to supplying 19,810 8 candle-power lamps is distributed, but none is used for motor purposes. Last year's results were as follows: Revenue, £4,423; working expenses, £4,827. This means a loss of £404, but a profit of at least £600 is anticipated during the present year, as the demand for electricity is increasing at a great rate. A reduction in charges, which are at present 7d. for the first hour, 4d. for the second, and 2d. for the third, is also expected. The cost of gas is 8s. per 1,000 cubic feet.

STAFFORD.

(Population, 21,000; rateable value, £61,356.)

In this town a three-wire continuous-current system has been adopted, and power equal to dealing with 7,500 8 candle-power lamps is supplied. The installation was completed in October, 1895, and cost £20,000. Motor-power is not used. The last financial year's working cost £1,516, while the revenue was £1,215—a loss of £301. Charges are made at the rate of 7d. for the first hour and 3d. for subsequent hours. The cost of gas in the town is 2s. 6d. per 1,000 cubic feet. It may be mentioned that the works were expected to pay their way this year.

TAUNTON.

(Population, 20,000; rateable value, £85,000.)

The system here is a high-tension one, with sub-stations. It cost £23,200, and has been working since October, 1890. The equivalent of 16,000 8 candle-power lamps is supplied, but no current is used in connection with motors. Revenue and expenditure last year totalled respectively £2,765 and

£2,980, but a profit is expected to accrue from the present year's working. The charge for gas in Taunton is 3s. 6d., while current during the first two hours costs 6d., and in subsequent hours 3d. per unit. No reduction is considered to be yet possible.

TUNBRIDGE WELLS.

(Population, 30,000; rateable value, £300,000.)

Power has been supplied in Tunbridge Wells since August, 1895. The cost of the installation, which is on the high-tension alternating system, was £85,000, and current equal to dealing with 16,000 8 candle-power lamps is now distributed. Motor-power is not used. The last financial year's revenue left a profit of £90, the charges being 6d. for the first one and a half hours and 4d. for the succeeding hours. It is both expected to be able to reduce these charges and to earn large profits in connection with the lighting, which is said to be thorough success and much appreciated. Gas is sold at 3s. per 1,000 cubic feet.

WALLASEY.

(Population, 41,000; rateable value, £215,000.)

The installation here is also on the high-tension alternating system, and is capable of dealing with 2,000 8 candle-power lamps. Its cost was £11,000, and the date of the first supply, February, 1897. Last year's revenue and working expenses were respectively £2,250 and £2,200 (a profit of £50), these figures resulting from a charge of 7d. and 5d., with an extra 1d. per unit for free wiring. The cost of gas in the town is 3s. per 1,000 cubic feet.

WALSALL.

(Population, 71,791; rateable value, £202,876.)

At Walsall a high-tension continuous-current system, with motor-generator transformers, has been in use since December, 1895, supplying the equivalent of 5,720 8 candle-power lamps. A sum of £19,000 was spent in its construction, but last year's working resulted in a loss of £445, the revenue being £1,568 and the expenditure £2,013. Current (none of which is used for motors) during the first one and a half hours costs 6d. per unit; subsequent hours are charged for at the rate of 2d. per unit. No reduction is anticipated, although profits are expected to result from future working. In this town gas costs 3s. 6d. per 1,000 cubic feet.

WHITEHAVEN.

(Population, 19,296; rateable value, £54,170.)

A three-wire continuous-current installation is working at Whitehaven, where the equivalent of 5,000 8 candle-power lamps is supplied. A sum of £18,500 was spent upon the works, which cost £18,500 to erect. Revenue and expenditure in the last financial year balanced equally at £2,791, this result being obtained from a charge of 6d. per unit. Gas in Whitehaven costs 3s. 6d. per 1,000 cubic feet. It might be stated that the above accounts were made to balance by including the cost of public lighting.

WORCESTER.

(Population, 44,000; rateable value, £174,000.)

In Worcester the electric lighting installation, which cost £62,000 to erect, is on the high-tension system, with substations, and has a capacity of 23,000 8 candle-power lamps. It has supplied current at a charge of 6d. per unit for the first hour and 2d. for succeeding hours since October, 1894. Power for motors is used. The works, however, sustained a loss of £1,617 on last year's working, the revenue and expenditure being respectively £1,757 and £3,374; but profits are expected. The price of gas per 1,000 cubic feet is 2s. 7d.

LAUNGESTON NEW SEWAGE DISPOSAL WORKS.

The mayor of Launceston on the 25th ult. formally opened the new sewage disposal works, which have been constructed by the Launceston Corporation from the designs, and under the superintendence of, Mr. A. P. I. Cotterell, M.I.C.E., of Bristol.

The system of purification adopted is said to embody some unique features. After passing the screens and mixing race (ferozone being the precipitant used), the sewage enters a vertical precipitation tank, passes by an iron pipe to the bottom, rises slowly to the surface, and then escapes through copper screens into the effluent channel. While thus rising the sewage is broken up by anaerobic micro-organisms, much of the solids in solution and suspension being liquefied, whilst the remainder falls to the bottom of the tank and gradually collects inside a conical base. The clarified liquid next passes on to biological filters, which contain layers of polarite. A novel feature in connection with the filters is that the liquid is discharged on to perforated corrugated galvanized-iron plates, and passing along them drips through the perforations on to the filtering material beneath. The effluent, it is stated, issues from the filters as clean water and in a high state of purity.

Business Announcement. Mr. John Parker, proprietor of Hassall's patent safety joint for sanitary pipes, and director of Hamblet's, Limited, has removed his offices from Brougham Chambers, Nottingham, to 16 Long-row, Nottingham.

ABERGAVENNY WATER SUPPLY.

On the 27th ult. the members of the Abergavenny Urban District Council paid a visit of inspection to their water works at Llywyda, where extension and improvements have been recently carried out from the plans of Mr. J. Haigh, engineer and surveyor to the council.

On arriving at the waterworks the members were received by Major Williams, the chairman of the Water Committee, who congratulated them upon the possession of such a supply. We append the following brief description of the works.

The supply is derived from mountain springs and received in small chambers of masonry. Up to the year 1886 no provision for storage had been made, consequently the night overflow went directly to waste in the open stream, and was of course unavailable for the town mains. Acting upon the advice of their engineer, the then Improvement Commissioners determined to construct an underground reservoir of 60,000 gallons capacity to receive the night overflow. This work was carried out in the year 1887, and proved to be a decided advantage, affording a constant supply under high pressure; but with the continued increase of population it was soon found that, even with the addition referred to, the arrangements were inadequate. The engineer therefore recommended the construction of a second underground reservoir of the same capacity as the first, to be fed from an adjoining stream. Drawings were prepared in 1896 and approved by the council. The works were executed in 1897, and have afforded an ample and constant supply to every house in the town during the whole of the dry summer of the present year.

The two reservoirs may be worked alternately, one filling while the other is feeding the main supply pipes. The work is in hard brick, Portland cement and White's Hy-gan rock composition giving a perfectly watertight result and security against contamination. In connection with the works there have been constructed some well-arranged filters and intercepting tanks, with the necessary by-passes, sluice valves, overflow pipes, wash-out valves and ventilators. In connection with the distribution the town has been divided into nine districts, for the purpose of waste detection by nine of Deacon's meters and outside stop-cocks on all services; and to make the system still more perfect, the council have recently adopted their engineer's scheme for constructing a high-level main which will connect with the extreme end of the existing main, making a complete circuit of the town, and by an arrangement of reducing valves the pressure over the whole distributing area will be made nearly equal. The ordinary working pressure will be maintained at about 90 lb. per square inch, but by means of sluices and by-passes the pressure for fire-extinguishing purposes can be increased to 175 lb. if required. The supply is by natural gravitation. The whole of the works mentioned have been designed by Mr. J. Haigh, the council's engineer, and executed in a substantial manner under his personal supervision, the cost being £2,800.

The council expressed great satisfaction upon what they had seen, both with regard to the design and manner of execution of the works and the ample and pure supply of water secured.

"THE IMMOVABLE LOCAL GOVERNMENT BOARD."

Under the above heading, *The Morning News*, on the 29th ult., published the following editorial note:—

A fortnight ago we drew attention to the stupidity and red-tapeism of the Local Government Board in refusing its sanction to the expenditure of £16 for the drainage of the park-keepers' lodges which the Salford Corporation propose to erect in Ordsall and Albert Parks. The ground of refusal was that the corporation had not carried out the requirements of the board in the matter of acquiring land for the purpose of sewage filtration. The council thereupon requested the three members for the borough to see Mr. Chaplin, president of the board, and bring before him the "unreasonable position taken up by the board" in this trumpery affair. One would have thought that the bluff commonsense of Mr. Chaplin would have settled the business in three seconds, but officialdom has been too strong for him. He has signed a long letter to Mr. Lees Knowles, M.P., in reply to the representations made to him. It is an historical survey of the position from the beginning, the inquiries and recommendations of the board, and the reports from the joint committee in regard to the character of the objection, and ends by saying that the board can not retreat from its position, and must refuse its sanction to the expenditure of £16. The lodges will not go without a trace, of course, but the obstinacy of the Local Government Board is surely without parallel in the annals of official red-tapeism. The first cost to Salford for interest and sinking fund for land filtration, even if suitable land was procurable in a convenient situation, would not be less than an increase on the rates of 3d. in the £1, and working expenses would probably be another 3d. But if the Local Government Board can block a small expenditure for drains of two houses, what is to be done for the 600 or 800 houses which are yearly being erected in Salford? The controversy between the Salford Corporation and the Local Government Board is a suggestive one as to the character and its solution will be interesting. The honours should remain with the corporation.

The Sanitary Institute.

THE SEVENTEENTH ANNUAL CONGRESS.—VII.

As mentioned in our last issue, we are now in a position to illustrate Mr. Scott-Moncrieff's interesting and valuable paper (see p. 572) on "The Biolysis of Sewage" by some very useful diagrams, to which he referred in the course of his remarks, and which are of material assistance in following the paper. The first diagram shown by Mr. Scott-Moncrieff included Figs. 1, 2, 3, 4, 5 and 6, illustrative of the apparatus used in his experiments, Fig. 1 being a plan, Fig. 2 a longitudinal and Fig. 3 a transverse section of what has been generally called a "cultivation tank." In describing the first apparatus of this kind, which was constructed in 1891 and is still in use, Mr. Scott-Moncrieff said: "It is about 2½ ft. wide, 10 ft. in length, and about 3 ft. deep at the deepest part. The entire sewage discharges and waste waters from a household of ten to twelve persons, with the exception of the grease—which is held back as far as possible by a grease trap—find their way into one end of this tank, at the point CC. The liquid portion rises through a perforated grating, E, and

fixed at the proper point to effect this movement, working upon supports fixed to the ends of the highest box. Over this column of boxes a large tank was fixed, into which the effluent was pumped after it came through the cultivation tank. The flow of the effluent was so regulated and measured that an estimate could at any moment be made of the rate

FIG. 3.

in terms of gallons per acre per twenty-four hours. Between each of the boxes there was an air space of about 2 in., and a receptacle was provided at the bottom which held about twelve hours' flow. By placing shallow dishes between the boxes samples could be taken simultaneously, and a complete set of analyses of the whole series of changes could be made consecutively."

Fig. 11 is a chart showing the changes which occur in successive stages of purification, the nitrogen lines being

then through a layer of flints till it reaches the level of the outflow pipe, JJ, which is about 2 in. below the level of the invert of the drain, AA. The depth of the filtering material is only about 14 in."

The arrangement of the trap is shown in Figs. 4, 5 and 6, as well as in Figs. 7, 8, 9 and 10. This apparatus was described as follows: "I constructed nine wooden boxes with perforated bottoms, each of them 2 ft. long by 7 in. wide by 7 in. deep, an allowance of ½ in. on each side being made so that each box had an effective area of 1 square foot, through which the effluent passed. These boxes I placed one above the other upon a framework, and filled them to a depth of 6 in. in each box with coke, broken so as to pass through a ring 1 in. diameter. Over the uppermost box I fixed two small tilting V-shaped trays, which automatically discharged their contents when the liquid reached a level that upset their equilibrium, as they were hung upon small transoms

FIG. 6.

specially indicated. Fig. 12 is also a chart showing changes in successive stages of purification. In regard to these Mr. Scott-Moncrieff said: "It occurred to me that the arrangement as described could be used to obtain graphic illustrations of the changes as they took place, and the nitrogen lines are shown upon Chart I. All the other changes can be graphically

FIG. 7.

FIG. 8.

shown in a similar manner, and when these are superimposed one upon the other a complete view is obtained of how they are related to each other. The lines of increase crossing the lines of decrease afford a practically perfect method of obtaining information as to what is going on, and a curious setting back of the lines of increase with a corresponding change in the line of oxygen consumed in the case of the 5th colony pointed to a critical state of the biological conditions at that part of the process; that is shown upon Chart No. 2."

We may appropriately supplement the papers dealing with sewage disposal, which we have given at more or less length, by an abstract of the long and interesting lecture, given before the congress by Dr. Christopher Childs, M.A., M.D., Oxon., D.P.H., lecturer on bacteriology in relation to hygiene, University College, London, who took for his subject the important question of river pollution.

**LECTURE TO THE CONGRESS.
THE PREVENTION OF POLLUTION OF OUR
STREAMS AND RIVERS.**

After some introductory remarks of a general character and a reference to recent contributions on the subject, Dr. Childs said that it was commonly admitted that the Rivers Pollution Act of 1876 had generally and persistently failed in the purpose for which it was intended, and that pollution had very generally continued and progressed unchecked in defiance of the law and of the many efforts made to reduce it. He then proceeded to refer to difficulties in the way of reform. The chief difficulties in the way of the much-desired reforms were the ignorance and indifference of the people; the great cost of sewage purification and the uncertainty with regard to the best means to be employed; and last, but not least, the defects in the law itself and the impotence of the measures provided for its administration. The ignorance was of different kinds and degrees, was common to all classes, and could only be dispelled by systematic, persistent, and widespread education in such matters as the laws of nature, the laws of health, the nature and causes of diseases which are conveyed through water, and of the ways in which such diseases are spread from man to his neighbour or to a large community. As to the cost and uncertainty of sewage purification methods, they might congratulate themselves that there was a definite prospect that these two difficulties would be reduced to a minimum. The researches and practical results obtained by the Massachusetts State Board of Health, St. oit-Monieriff, Dibdin, Dapry, Cameron and others, plainly demonstrated that the great difficulty, uncertainty and cost of purification which had blocked the way for so many years had been in a large measure due to our misconception of the true principles by which we should be guided in dealing with domestic sewage. We had persistently endeavoured to thwart and destroy the natural agents for the purification of foul matters, the liquefying and nitrifying bacteria, as if they were our greatest foes, instead of our best

and most indispensable allies. The discovery and practical application of the so-called biological methods of purification formed one of the greatest triumphs of modern sanitary science. Those methods had been on trial for sufficient time and on a sufficiently large scale to prove that they had to a great extent solved the clue to this most difficult and complicated problem. If they finally and completely succeeded they would remove the chief practical difficulties which blocked the way, and would save the country the annual expenditure of many millions.

OBJECTS AND MEANS OF PURIFICATION.

Dr. Childs then proceeded to consider the exact objects to be aimed at in the process of sewage purification and the means by which such purification might be obtained and secured. The chief object in the purification of sewage was to secure that the effluent, from any sewage, manufacturing process, or filth accumulation to any "stream" (as defined in Clause 29 of the Rivers Pollution Prevention Act, of 1876), shall be purified in such a way that it shall not cause the water of the stream to be poisonous or dangerous to the health of those who drink it, nor be detrimental to the manufactures for which it may be used, nor offensive to the sight or smell, nor destructive to fish, nor obstructive to the flow of the stream. Of these conditions, that which made the water poisonous or dangerous to the health of those who drank it was the most important for our consideration and the most difficult to define. Proceeding to define the term "poisonous" or "dangerous to health," Dr. Childs said that from the time when serious attention was given to the pollution of our streams by foul matters, culminating in the work of the Rivers Pollution Commission of 1868, great stress had rightly been laid upon the amount of effete organic matter in the effluents and in the water used for drinking purposes. The limits of the amount of organic matter to be allowed in any effluent, as gauged with the help of Frankland's method by the amount of organic carbon and organic nitrogen in a given quantity of the fluid effluent, were laid down in the well-known suggestions of the Rivers Pollution Commission. At that time, however, the germ theory of disease was hardly known, bacteria were not recognised as the active agents, the real cause of infectious diseases, and consequently the amount of organic matter in an effluent or in water became the recognised chief test of the danger or safety of those fluids. Now, although the amount of organic matter (and of certain inorganic compounds, such as chlorides) in a natural water was the most delicate test and indication of contamination with animal or vegetable matter, whilst in an effluent it was a measure of the putrescible matter which still remained to be oxidised, it could not be too much insisted upon that the amount of organic matter in an effluent or in water, as gauged by any of the recognised chemical methods (Frankland's, Wanklyn's, Tily's and others), was not a test of the actual poisonous character of those fluids. Proceeding to further elaborate the subject, Dr. Childs said

"It is generally accepted that water polluted by sewage

FIG. 9.

is always dangerous to health, and frequently the actual cause of outbreaks of cholera and typhoid fever. But it does not follow that the quantity or quality of organic matter which is dissolved in the water determines these outbreaks. In fact, water strongly contaminated with sewage may be drunk for an indefinite time without causing cholera or typhoid fever. It is necessary to lay stress upon these statements, because there is a tendency to regard a sewage effluent as "purified" when the putrescible matter contained in it is reduced down to a certain standard, whilst the idea, even in these days, seems to be prevalent that the actual poisonous or wholesome character of water for drinking may be decided simply by chemical analysis. It is only under certain conditions that water so polluted causes these diseases, those conditions being the introduction of the specific poisons of cholera or of typhoid fever under circumstances favourable for their development and convection. The poisons of cholera and typhoid fever, it has long been known, are contained in the excreta of patients suffering from those diseases, and according to the accepted teachings of bacteriology, those poisons consist of living bacteria, the *spirillum cholerae Asiaticum* of Koch, and the *bacillus typhosus* of Eberth and Gaffky. Water strongly contaminated with sewage, unless it contains the bacterium of cholera or typhoid, cannot cause cholera or typhoid fever, any more than grapes may be gathered from thorns or figs from thistles. Though the quantity and quality of organic matter in any water are of great importance as an index of the degree, kind and source of pollution, they are not a measure of danger or safety. The real factor which determines the danger or safety of water for drinking purposes is the presence or absence of living germs of disease, the "pathogenic bacteria."

Continuing, Dr. Childs said it must be admitted that but few diseases had definitely been proved to be due to drinking water contaminated with human excreta, for most authorities agreed that cholera and typhoid fever were the only diseases conveyed in this country by drinking water. It was probable, however, that diarrhoea and various ill-defined low states of health might be conveyed in the same way. As cholera was now practically banished from our shores, it followed that, having regard to the public health, the most important object in sewage purification was the destruction of those micro-organisms which were recognised as the cause of typhoid fever, the *bacilli typhosi* of Eberth and Gaffky. But the first step for the prevention of infection in our water supplies by the fever poison was not the purification of the sewage, but the destruction of the fever germs before they had escaped from the sick-room of the patient into the soil, the sewers or the drinking water. When the typhoid bacillus had been allowed to escape alive into the drain or cesspit, or other receptacle, it became most difficult to trace or detect it, or to destroy it effectively with germicidal agents. The first step for the prevention of the pollution of our water supplies began at the bedside of the typhoid fever patient, and thus a great responsibility lay with the nurse for the protection both of herself and of others. Disinfection in cases of typhoid fever was probably most imperfectly performed throughout the country. If complete disinfection were carried out in all cases of typhoid fever that disease would rapidly disappear, and the dangers resulting from sewage pollution of our water supplies would be greatly reduced. Dr. Childs then proceeded to consider the means available for the destruction of the typhoid bacilli and other pathogenic bacteria when they had once gained an entrance into sewage. He said:—

"There are no direct experimental proofs that the bacilli of typhoid fever are destroyed in sewage by any of the pro-

cesses of purification at present in use. Nor is there much prospect of obtaining such proof at present, owing to the great and special difficulty of detecting and verifying the presence of these bacilli in such fluids as sewage. This difficulty can only be fully realised by those who have had large experience in such investigations, and is due partly to the absence of any specific active properties peculiar to these bacilli (except, perhaps, in the "serum test"), partly to the strong resemblance between these bacilli and many others which almost invariably accompany them—notably those known as "the bacilli of the coli group." It is generally admitted that many of our best bacteriologists have been deceived by this resemblance, and that, though the presence of *bacilli typhosi* have frequently been reported in suspected waters, it is very doubtful whether the bacilli have actually been isolated and verified, even where the water has been contaminated by excreta of typhoid fever patients.

"The experiments of Laws and Andrews, it is true, indicate that sewage does not form a medium in which such, if any, growth is possible for the *bacilli typhosi* under natural conditions, and that their death is only the matter of a few days, or at most a few weeks (Report to London County Council, 1894). Until the results obtained by these observers have been corroborated by repeated experiments under similar and under varied conditions it would be inadvisable to form a final conclusion or to base any practical system upon them. An exhaustive investigation of the quality and quantity of micro-organisms to be found in the sewage effluents obtained by different processes at present in use is much to be desired. But such investigations are very difficult, can only be conducted by skilled bacteriologists of great

FIG. 10.

experience, and will require a long time for their completion. Similar information is needed with regard to the vitality of typhoid bacilli in various kinds of water."

Such experiments were being carried on in this country as well as on the Continent, and Dr. Childs made special reference to the work of Dr. Houston in making bacteriological analysis of the crude London sewage.

NATURAL AGENCIES.

Dr. Childs then went on to discuss the question, How far might we trust to natural agencies for the destruction of the *bacilli typhosi* when they have been conveyed by a sewage effluent into a large river, such as the Severn or the Thames? There, again, there was no experimental proof, owing to the difficulties already mentioned. It had been shown that these bacilli can live from one to three weeks in ordinary drinking water, but it was possible that they might live longer. From our general knowledge of them and by analogy we might infer that the chances were against their living very long in river water. They did not form spores, and were therefore not very resistant to adverse conditions. It had been shown that sunlight had a weakening and inhibitory effect upon them, and probably diminished their virulence. It was conceivable that before long some practical and economical method might

be devised for completely sterilising sewage effluents, so that no living organisms—pathogenic or non-pathogenic—might escape in them into the stream. Medical statistics and epidemiological facts supplied abundant evidence that the typhoid mortality in towns and cities supplied with water from upland surfaces did not seem to be less than that of towns and cities deriving their water supplies from rivers, provided that the river water is efficiently filtered. Such appeared to be the case on the Continent, in America, and in our own country. The evidence, however, was fragmentary and incomplete, and required most careful investigation before any final judgment could be formed from it. It was at present engaged in an inquiry with regard to the typhoid mortality of the chief towns and cities of the world in relation to their water supply, soil, drainage and other conditions, but it would be long before he would have sufficient evidence for the formation of a definite conclusion. If they could obtain sufficient evidence, extended over many years, with regard to the mortality from typhoid fever among several millions of people drinking water from a river which had been contaminated by sewage, and compared that mortality with the mortality of several millions supplied with water never so contaminated, other conditions being equal, we should have the conditions of an experiment on a vast scale, from which we might hope to form reliable conclusions.

Such conditions we had in the history of our great metropolis. According to the evidence brought before the Royal Commission on the Metropolitan Water Supply (1893), the typhoid mortality in London was exceptionally low. When compared with that of fourteen other great English towns "that have public water supplies which are not excrementally polluted" during the period 1881-90 it was found to be a very little higher than that of four of these large towns, and lower than that of the remaining ten. Moreover, all the medical, chemical and bacteriological experts examined by the commission stated unhesitatingly that they knew of no single instance in which the consumption of London water had caused disease. People were differently impressed by the significance of these facts. Some were convinced that water supplied under such conditions as obtained in London must be regarded as reasonably safe. Such was the opinion of the majority of the Royal Commission for the Prevention of the Pollution of Rivers of 1868 and the unanimous conviction of the Royal Commission previously referred to. Others, again, did not consider the water derived from the Thames and Lee could ever be used for drinking purposes with reasonable safety, even though the sewage effluents which entered those rivers be "purified to the highest extent known to science." Referring to the case of Altona, Dr. Child said that in the great cholera epidemic at Hamburg in the autumn of 1832 the contiguous town of Altona was comparatively free from the disease, although the source of the supply from the Elbe was far more polluted than that of Hamburg. The escape of Altona was generally attributed to the fact that the water supply was submitted to careful sand filtration, "whilst in Hamburg the Elbe water was distributed in its raw condition as taken from the river." Nevertheless a gross flaw in the Altona filters was suffered to pass unnoticed in the following December, and was detected only when too late by a sharp outbreak of disease among those supplied with water from the defective filter. "One of the filters which had been cleaned during the frost had become frozen over, and was in consequence not able to retain the bacteria," a fact which was subsequently proved by bacteriological examination of the water derived from this special filter. It was imperative that water supplied from any river or other source which had been polluted in the least degree by sewage or organic matter, after adequate storage and sedimentation, should be subjected to complete and carefully-managed sand filtration before being distributed into the water mains. Dr. Child's disclaimer any desire to plead on one side or the other, but felt compelled to adopt and uphold the following principles:—

"(1) That where a community is able to obtain a water supply free from the possibility of any contamination, instead of one liable to such contamination, that community is bound, for the sake of the safety and the welfare of its citizens, to procure the supply which is above suspicion. (2) That in cases where there is no alternative but to use the water of some adjoining river, or other source liable to pollution, no measures should be neglected whereby poisonous and noxious elements may be prevented from finding entrance into the water, and whereby the last traces of such poisonous elements, if they have found entrance, may with certainty be removed through the best means available."

Birmingham was to be congratulated on having acquired an unrivalled and magnificent watershed among the mountains of Wales, through which an ample and pure supply was secured for its growing population, the whole gathering

FIG. 11.

ground and every tributary and spring being the property and under the protection of the corporation. After a visit to the works he could bear evidence to the grandeur and completeness of this colossal triumph of engineering skill and human enterprise. To many towns and cities such irreproachable watersheds were impossible, and they had to rely upon neighbouring streams or rivers for their supply. Serious and complicated difficulties were felt owing to the competition for upland water supplies.

It would be seen that bacteriological and epidemiological evidence gave little or no help in deciding on "the best practicable and reasonably available means" for destroying the pathogenic bacteria in sewage. In the meantime they must be content with those means which are best for purifying an effluent to the extent that it will not cause putrefactive or other offensive processes in a stream. The difficulty of exactly defining this expression, "the best practical and available means," had proved one of the many obstacles to progress. The treatment by irrigation on land which had so generally been insisted upon (subsequent to filtration and

FIG. 12.

precipitation, or to both) had proved a heavy tax to many communities and a frequent obstacle to the adoption of any process of purification at all. In many cases either the high cost of land or its utter unsuitability for the purpose, or its position, had prevented it from being anything like available or practicable. But there was every reason for hoping that by the new biological methods recently established a way would be found by which the difficulties might be overcome; and though these methods might not altogether supplant that of irrigation, they would no doubt simplify the process in some cases, diminish the amount of land required, and in others do away with the necessity for land altogether. Whichever biological system proved the best, it had undoubtedly been shown that by withholding chemicals altogether, and by placing the countless hosts of bacteria which thronged every drop of domestic sewage under conditions favourable for their development and activity, the solid materials of sewage might be broken down and liquefied, and subsequently oxidised so as to form a clear and non-putrescible effluent. How far these methods would succeed in dealing with the manifold and complicated materials which were presented in sewage mixed with trade effluents remained to be seen. Almost every noxious and offensive trade effluent that existed was probably represented in Lancashire and West Riding, and as experiments had been for some time carried on at Leeds, Bradford and Sheffield, besides many other places, we should probably learn before long to what extent the biological processes were interfered with by these effluents, and also the means by which this interference might be checked or altogether counteracted.

In regard to standard effluents, Dr. Childs said that the conditions under which these standards had to be determined were so various, and there was so much difference of opinion with regard to them among authorities, that it seemed impossible to define them, although they would greatly facilitate the labours of all those who were concerned with the prevention of pollution. With regard to sewage, however, the principle on which a standard of purity should be formed might be defined—*viz.*, that the effluent shall be purified in such a way that it would not undergo offensive putrefaction either by itself or when mixed with the stream into which it flows. With regard to trade effluents it was to be hoped that the present Royal Commission would lay down some definite lines. Meanwhile the settlement of standards might be made in friendly conference between manufacturers and river committees, as had been done in some instances with satisfactory results.

Proceeding to consider the law for the prevention of pollution, Dr. Childs said the Rivers Pollution Act of 1876 was universally condemned as a dead letter, the failure having been due chiefly to the faulty and imperfect arrangements for the administration of the law and to certain defects and difficulties in the Act itself. "The powers for taking action against pollution were entrusted to the sanitary authorities, and were enabling, not compulsory. Now, considering that the sanitary authorities were too often the greatest polluters, and were constantly subjected to the influence of local and vested interests, and the incessant cry for the reduction of the rates, it was not to be wondered at that the administration of these Acts has not been attended with success."²⁸

COUNTY COUNCILS.

Great hopes were entertained that with the establishment of county councils by the Act of 1888 the indifference and opposition of interested or ignorant individuals and of the smaller local authorities would be overwhelmed and carried along by the larger and more powerful organisation. Unfortunately, the administration of the law for the prevention of pollution, which was still purely optional, was from its very nature unpopular and likely to be avoided. It could only be carried out thoroughly by men who would systematically devote much time and care to this duty, and would not be unduly influenced by local and vested interests, or by the clamour of short-sighted and parsimonious ratepayers. Several of the county councils no doubt had done and were doing much for the prevention of pollution. But all efforts for improvement must be hampered and curtailed by the defects and difficulties at present existing in the Act of 1876. These defects and difficulties were: (1) The vagueness and incompleteness of many of the terms, such as the definitions of polluting matters, liquid sewage, &c. (clauses 2 and 3); (2) The expense, delay and uncertainty involved in the restrictions imposed when any authority proposes to enforce the enactment for preventing pollution; (3) The absence of deterrent penalties; (4) The absence of power of entry.

These defects were a serious impediment to action, as the joint committees of the Mersey and Irwell and of the West Riding of Yorkshire soon discovered when they began seriously and systematically to deal with the overwhelming sources of pollution which prevailed in their respective districts. No time was lost by these committees in appealing to Parliament for special Acts "to make more effectual provision for prevention of pollution," on the ground that "the restrictions contained in the Act (of 1876) were such as to preclude effective action." Parliament acknowledged the justice and the reasonableness of the appeal by giving assent, and the necessary Acts were passed. And yet a private Bill

which embodied all these reforms had been before the House of Commons for years. This Bill, modelled on the Acts of the Mersey and Irwell Joint Committee and the West Riding Rivers Board, remedied the defects which he had mentioned. It defined and catalogued the various possible kinds of polluting effluents, granted powers of entry to authorities for the taking of samples, and, whilst it amply protected the manufacturer from undue embarrassment and expenditure, it provided for the proper administration of the law, and the infliction of appropriate penalties upon actual offenders with as little cost, delay and uncertainty as possible. It had been pointed out, however, that the Bill as it at present stood was weaker in several respects than either of the Acts upon which it was based. The following were some of the points left undecided by the present Bill: The settlement of the question of the right of a manufacturer to discharge his trade refuse into a public sewer, or of the right of a sanitary authority to refuse to allow him so to discharge it; the prohibition of the sluicing of mill dams; the power to cause obstruction to the flow of stream to be removed; the absolute prohibition of any new pollutions; and the proper supervision of the discharge of compensation water. Dr. Childs, however, strongly urged his hearers to support the passing of the Bill, even in its present form, either as a private Bill or as a Bill taken up by the Government. The amendment of the intrinsic defects in the Rivers Pollution Prevention Act would, without doubt, greatly facilitate and promote the abolition of much of the lawless and disreputable pollution which prevailed throughout the United Kingdom. On this subject Dr. Childs further remarked:—

"There still remains, however, the great difficulty of getting councils, boroughs and county boroughs to combine and insist that the law shall be duly observed throughout the whole watersheds in which they are situated. A borough or a county council may do its best to set its own house in order to prevent and abolish all pollution within its borders, but it is almost powerless to remove pollution—except when of the grossest and most intolerable kind—in parts of the stream and rivers which are higher up. The sources and tributaries of a river, for instance, which are above a given town or county may each contribute its share of pollution until the sum total of impurity in the main stream becomes intolerably offensive. Yet it will be very difficult to bring conviction home to the individual offenders.

"The solution of the difficulty lies in the formation of joint committees, who shall have the supervision and control over whole watersheds, or groups of streams and rivers; committees which shall be fairly representative of all the local interests concerned—of councils and water companies, manufacturers and industries—strong and extensive enough to resist the undue influence of local interests and local jealousies, and to overcome the *vis inertia* of ignorance and indifference; and whose sole business it shall be to administer the law promptly and without fear or favour for the protection of the waters within their district. This is no paper scheme based on theoretical considerations. The Act of 1888 provides for such an organisation in clause 81, whereby the formation of such joint committees is sanctioned and regulated.

"The idea of the watershed as a proper area for administration is not at all new, but has been advocated by many competent authorities. In April of this year Mr. Middleton read a very interesting paper to the Institute on the desirability of making watershed areas and sanitary district coterminous. This proposition, however commendable, involves such a revolution and such an intricate shifting and resetting of our whole social organisation that it is not likely to find much favour. But for the constitution of joint committees for the prevention of pollution no new authorities are required. The existing authorities, who have not sufficient time, and who for reasons previously mentioned are not well qualified to carry out the work thoroughly, will merely devote their office to an authority provided for and sanctioned by the existing statute."

The principal watershed areas in England and Wales differed greatly in size. In some cases a conjoint committee was evidently undesirable, and in various cases the county council would be the more suitable central authority, but in that case it would be desirable to depute the work to a special representative board. Fortunately there were a few joint committees in existence which in their constitution, methods of work and results produced presented excellent models for the whole kingdom. These were the Thames and Lee Conservancy Boards, the Mersey and Irwell Conjoint Committee.

Dr. Childs then proceeded to give some details of the constitution of these bodies, the methods employed, and the results obtained, after which reference was made to the responsibilities of waterworks companies and their relations to sanitary authorities, the conclusion arrived at being that under the existing state of the law the obligations laid on the companies are so insufficient that we have no ground for confidence in the power or desire of the companies to secure us against the introduction of poisonous material into the water with which they supply us. But after the disastrous epidemics of recent times the necessary reforms should be insisted upon at the earliest opportunity. The lecturer concluded as follows:—

"Parliament also appears to be ready for action, for although the clauses proposed by Mr. Chaplin last June, to

²⁸ "Waterborne Typhoid Fever," *Journal of the Sanitary Institute*, vol. xix., p. 215.

be added—with a view to protecting the consumers—to twenty-one private Water Bills were withdrawn, the withdrawal was urged upon technical grounds, and all who spoke on the subject appeared to be ready to support those clauses if introduced in a public Bill. On looking at these clauses of Mr. Chaplin's I am astounded to find that the provision which, in my mind, is by far the most important one has been entirely omitted—viz., the regular and constant inspection and supervision of all parts of the water supply—from source to distribution. Instead of that, the taking and examination of samples is entirely relied upon for the detection and prevention of pollution. Combined with thorough and regular inspection of the water supply, it is true, chemical and bacteriological analyses can be of great service, for they can give indication of pollution which could not be detected merely by inspection. If relied upon alone, they give a false sense of security. Even if the analyses were made daily, they would not enable us to prevent pollution; they can only detect the pollution after it has taken place.

"As a rule, water-borne outbreaks of typhoid fever occur with explosive violence; so that most of the victims have imbibed the poison before the alarm conveyed by the means of analysis can possibly save them from infection. It is to be hoped that these reforms will be carried out as soon as possible, and that the serious omission with regard to inspection will be remedied. I trust, however, that amidst the agitation which springs out of recent calamity and alarm the old-standing evil will not be forgotten; that the nation will awake to a sense of the disgrace, loss and danger which must always exist as long as this foul and illegal pollution of our streams is suffered to continue. If the idea of constituting joint committees to control whole watersheds or groups of streams, according to circumstances and convenience, be approved of, I appeal to the Institute, to this congress, to all concerned in the health and welfare of the nation, to do all that is possible to urge the Local Government Board that they shall give every facility and encouragement for the formation of such joint committees. But, above all, I hope and trust that you and all who are so concerned will give cordial support to the Rivers Pollution Prevention Bill, by which the defective Act of 1876 will be amended, and through which we may hope eventually for the total abolition of the pollution of our streams and rivers throughout the United Kingdom."

The closing meeting in connection with the congress took place on Thursday, in Birmingham, the lord mayor presiding. The report of the local officers stated that the congress had been successful in all respects. The number of tickets issued exceeded those of any previous year, and the attendances were in like proportion. The total number of tickets issued was 1,979, as compared with 1,531 at Leeds last year, 1,225 at Newcastle in 1896, and 1,214 in Liverpool in 1895. The number of visitors to the Health Exhibition this year was 85,212, and was 10,000 greater than had been previously attained. Councillor Martineau submitted the financial statement, which showed that the general expenses of the congress amounted to £1,463. The amount of the guarantee fund to be called up was £1,469 11s. 7d., which would necessitate a call of 11s. 9d. in the £1 being made upon the guarantors. The report was adopted, and a vote of thanks was passed to the hon. treasurer (Councillor Martineau) and to the hon. secretaries (Messrs. A. Bostock Hill, W. B. Marshall and J. E. Wilcox). The chairman, in replying to a vote of thanks, expressed satisfaction at the success which had attended the meetings. There was a feeling of reality about the congress which impressed him very much, and he felt that the city had benefited by their visit.

Burnham, Somerset.—It has been unanimously resolved by the district council to extend the new sea front from the pier further northwards to a point near Catherine-terrace, instead of to the church. This will involve a further outlay of £2,000, making in all £9,000. It has therefore been decided to petition the Local Government Board to grant the extended loan without holding a further public inquiry.

Tenders Wanted.—The Secretary of State for Foreign Affairs has received a despatch from her Majesty's Consul at Genoa stating that tenders are invited by the municipality of Spezia for the supply of 2,500 tons of gas-coal for the municipal gasworks. Sealed tenders must be received at the municipality of Spezia by 10 a.m. on the 10th inst. A copy and translation of the conditions of contract may be examined at the Commercial Department of the Foreign Office any day between the hours of 11 a.m. and 5 p.m. The Secretary of State has also received a despatch from her Majesty's Consul-General at Christiania, stating that tenders are invited by the town engineer of the port of Stavanger for the delivery of 1,800 water and drain pipes of different sizes. Tenders in sealed envelopes, marked "Arbud på Rør," should be addressed to "Stavanger-Stadsingeniørkontor, Stavanger," where they should be received by the 15th inst. In view of the short time given to the tenderers, persons desirous of obtaining further information with respect to the above tender are recommended to apply direct by telegraph to Mr. Vice-Consul Berntsen, at Stavanger.

THE TESTING OF CEMENT.

There is the promise of a useful enterprise in the Cement Users' Testing Association which has just been established in London which should satisfy a manifest want. As the promoters of the enterprise truly enough remark, upon the testing of no class of structural material the opinions differ so widely as upon cement. "A perusal of half-a-dozen different specifications (for the same class of work) reveals at once the absence of any agreed opinion among engineers, architects and surveyors as to the tensile and other standards which it is desirable to adopt. A few hours spent in watching various manipulators working at the mixing table shows a yet greater divergence in the practice of briquette-making. It is safe to say that at the present time there is not even an approximation to a standard specification of requirements, and, further, there is no standard method of mixing, so that a series of tests made by one experimenter will often not compare with the results obtained from the same cement by another. Most diverse and anomalous results are continually obtained, and, so far from affording a true gauge of the character of cement, many of the tests now made are entirely useless. There are two absolute ideas which must be banished by users of cement in constructional works:—

"(1) The fact of brickwork being 'in cement' or of concrete being made with 'Portland cement' is not any evidence *per se* of special excellence or durability in either material.

"(2) The fact of a cement standing a 350-lb. tensile strain per square inch seven days after mixing is not sufficient to prove that the work upon which it is used will prove a success; other tests are required, and by itself the tensile test is of little guidance.

"There is at present no material more important to the engineer or architect than cement, and no material in use on public works is so completely at the mercy of the individual idiosyncrasies of the experimenter. This must to some extent remain the case until the users of Portland cement are brought into line in drafting their specification, and adopt some definite method of mixing which will eliminate individuality in the manufacture of briquettes.

"The advantage of submitting cement to an expert is obvious. The ordinary individual who is in charge of construction has no plant or time for anything but the most simple tensile test, which has been shown to be unsatisfactory. For a comprehensive report it is useful to have before one—(1) Specific gravity; (2) tensile test on a large section; (3) transverse breaking weight; (4) fineness to which ground; (5) condition as to heating; (6) analysis. It is not, of course, essential to carry out the whole of the above tests every time a sample is taken; but to secure a thoroughly sound material the manufacturer should be made aware that his cement may at any moment be subjected to examination on all the above points."

The object of the Cement Users' Testing Association is to undertake the testing of Portland cement under standard conditions and on the most moderate terms. Users of cement are therefore saved from the necessity of setting up expensive plant and the expenditure of the time and trouble necessary to obtain a correct estimate of the value of the material. Full particulars as to the manner of making the tests, the analysis of samples, specifications, fees, &c., can be obtained on application to the general secretary of the association, Mr. Edmund S. Spencer, B.Sc., 136 Shaftesbury-avenue, W.C.

ARTESIAN WELL SUPPLIES.

On the 4th inst., at a meeting of the Rhondda Urban District Council, Mr. W. D. Wright, agent of the Pentre, Gelli and Tyn-y-bodw Collieries, submitted a scheme which he maintained would enable the council, by boring to the limestone strata at Treherbert, to obtain a supply of 50,000 gallons of water per hour. The depth of the boring would be about 1,500 ft. He had had much experience in the matter in a district where 300,000 population were supplied by water pumped out of five wells sunk to the limestone strata. The risk of speculating to obtain water from the limestone strata was insignificant, because they were thoroughly saturated. The cost would be small compared with the enormous expense which would have to be incurred in tunnelling at Llyn Fawr from Blaenrhondda and constructing a huge reservoir there. The water would rise to sea level, and the depth to that part was about 660 ft., where he proposed sinking at Treherbert. He estimated the cost of the whole of the plant, the pumping machinery included, at £10,000.

Indian Survey Report. We have to acknowledge the receipt from Major-General C. Strahan, R.E., Surveyor-General of India, of a copy of the general report of the Survey of India Department of 1896-97.

Jarrahdalo Jarrah.—The *Rail* has arrived at Hull with 792 loads and the *Day* at London with 512 loads of Jarrahdalo jarrah on board, to the order of the agent of the Jarrahdalo Jarrah Forests and Railways, Limited, Francis Chapman, 1 Fenchurch-avenue, London, E.C.

Auctioneers' Institute.

THE DRAINAGE OF BUILDINGS: THE RIGHTS AND LIABILITIES OF OWNERS.

On Tuesday evening Mr. Alexander Macmorran, q.c., read a paper before the Auctioneers' Institute on "The Effect of Recent Decisions on the Liabilities and Rights of Owners in Respect of the Drainage of Buildings." As the paper will no doubt interest a large majority of our readers we publish it in full.

Mr. MACMORRAN, in opening his remarks, said he did not propose in the course of the paper to lay before them an exhaustive summary of the law relating to sewers and drains, but rather to direct their attention to certain important points which had been the subject of recent decisions. But he hoped to do this in a connected way, indicating what the general law was as he went along. He also did not propose to deal with the law in so far as it related to the metropolis only. He had found that it would be impossible to do so in the course of a single paper, and, although he should have to refer to decisions in cases arising in London, he should do so only so far as they bore upon points which were common both to the country at large and to the metropolis.

Continuing, he said: The first point which it is necessary to emphasise is the distinction between a drain and a sewer. Under the Public Health Act, 1875, which applies to the whole country outside of the metropolis, a drain may be said to consist of a channel for the conveyance of drainage or sewage from one building, or from buildings within the same curtilage. I have made use of the expression

"CURTLAGE."

On the meaning of this word there have been two recent decisions. In the first of these (*Vestry of St. Martin-in-the-Fields v. Bird*, 1895, 1 Q.B., 128) it was held that the houses in the Lowther-arcade were not buildings in the same curtilage, although they all opened into a common passage, the ends of which were closed by gates at night and on Sundays. In the other (*Pillbrow v. Vestry of St. Leonard's, Shoreditch*, 1895, 1 Q.B., 433) two blocks of industrial buildings within the same enclosure, but separated by a causeway from which only one of them was entered, were held to be within the same curtilage. Both of these decisions relate to exceptional cases, which are not likely to recur. The Shoreditch case (in which, by the way, Lord Justice Rigby delivered a dissenting judgment) is not likely to be extended or followed except with reference to facts precisely similar. It may be said that a curtilage is the enclosure in which a house stands, or perhaps the space of ground which would pass by a simple conveyance of a house and its appurtenances. The drain, therefore, from a dwelling-house and the stables adjoining it, and contained within the same enclosure, would be a drain. A similar channel for drainage from the same house would be a sewer if the drains from the stables and adjoining premises were let into it. It would become a sewer, however, only from the point at which it received the drainage of the second building. So much for the distinction itself as contained in the interpretation clause of the statute. The importance of the distinction is obvious. The duty of repairing a drain and keeping it in good order, so as not to be a nuisance, is upon the owner or occupier of the premises drained. A sewer, on the other hand, belongs to, and is vested in, the local authority. The duty of repairing it, cleansing it, ventilating it, and keeping it so as not to be a nuisance, is imposed upon the local authority. Every owner of premises who can reach it without committing a trespass upon private land may lawfully connect the drains of his premises with it on the sole condition of giving notice to the local authority and complying with their regulations as to the manner in which the connection is to be made. He has this right even if the sewer discharges itself into a stream so as to be in contravention of the Rivers' Pollution Prevention Act, or otherwise causes a nuisance, for it is for the local authority to provide an outfall for the sewer which belongs to them. These are some of the more important points of distinction between a drain and a sewer, and they will be illustrated later in this paper.

WHAT IS A SEWER?

I proceed now to point out that a channel for receiving drainage—I use this expression because I know of no other which is quite neutral—if it receives such drainage from mere than one building is none the less a sewer vested in the local authority because it is laid in private ground. On this subject a case, decided in 1894, may be regarded as having opened the eyes at once of local authorities and of the public to the importance of the distinction already pointed out. The case is *Travis v. Utley*, 1894, 1 Q.B., 233. In that case there was a number of houses in a street belonging to one owner. These houses had been drained in groups of three. The drain began, say, at No. 1, passed through No. 1 into the collar of No. 2, where it received the soil and other pipes of the house, thence passed into No. 3, where it received similar pipes, and then was carried out through the front of No. 3 into the street, in which a main sewer was laid. The local authority had found defects in this common drain, and they had required the owner to abate the nuisance consequent upon such defects. The owner refused. The case came before the magistrates,

and through them to the High Court, and it was held that the common drain was a sewer vested in the local authority, which they were bound to repair, and consequently that the nuisance complained of was one which they were bound to abate. This decision is important and involves serious consequences alike to the local authority and the owner of the property. In the first place the local authority must accept their liability to repair a common drain of this kind, although it is laid in private ground or even under private houses. On the other hand the owner must give them free access to his premises at all times when it may be necessary for them to inspect, alter or otherwise deal with the common drain, and he may not himself interfere with or in any way deal with it except with the consent of the local authority. In an urban district he cannot lawfully build over it without such consent. In the course of his judgment upon the case Mr. Justice Wille made use of some expressions which seemed to imply that, in his opinion, the entire drain, in *Travis v. Utley*, from the first house to its termination in the street was a sewer. But the same learned judge had afterwards reason to reconsider this in the case of the *Beckenham Urban District Council v. Wood* (Q. J. P. 490), decided in 1896, which now establishes that a common drain such as this is only a sewer from the point at which it receives the drainage of the second house. This leads me naturally to bring to your notice a curious fact—namely, that in general while a local authority have ample authority over private persons with reference to the making of drains from private houses, they have little or none in respect of the making of sewers except under private streets. In a rural district there is nothing to prevent a private person from making a drain to receive the drainage of two or more houses and making it as he may think fit; yet, however badly it may be made, it will vest in the local authority and be repairable by them. There is no means by which such a person can be prevented from making it, or required to make it properly. This is undoubtedly the law in a rural district. It is also the law in an urban district, but with this important qualification—that with regard at least to a new house a district council may prescribe the manner in which that house is to be drained under sec. 25, and in this way may defeat the intention of an owner to make a combined system of drainage, with the result that the common drain would be a sewer of which they would have the burden of repair; but however it may be made, if it is ever allowed to be made, it vests in the local authority. There was at one time some doubt whether a secret or a wrongful connection made with what would otherwise be a drain would have the effect of converting the drain into a sewer. In such a case the owner of the original drain would probably have a remedy against the trespasser; but so far as the local authority were concerned, it is now well established that they must accept the *status quo*, and that, as between them and the private owners, the drain to which a secret or wrongful connection has been made is a sewer. The cases which establish this are, taking them in order of time: *Kershaw v. Taylor*, 1895 (2 Q. B. 208); *Holland v. Lazarus*, 1897 (66 L. J. Q. B. 285); and *Green v. Nevington Vestry*, 1898 (2 Q. B. 1). One other point worth dealing with the subject of what is a sewer, may be mentioned. It is that there may be a sewer which is not covered, and that the common expression, "open sewer," is one which is recognised in law as well as in common talk. Thus, where the sewage of a number of houses drained into a pipe, and thence into an open watercourse, which in its turn ran into a brook, it was held that under the circumstances the open watercourse was a sewer within the meaning of the definition, that the local authority were charged with the duty of keeping it in proper condition, and might therefore enter upon the land where it was for the purpose of piping it in and cleansing it. This was the case of *Wheatcroft v. Matlock Local Board* (52 L.T. [N. S.], p. 356). It has since been decided that even a natural stream may have its character so altered by the sending of drainage into it from a large number of houses that it becomes a sewer. Such was the decision in *Falconer v. South Shields* (11 T. L. R., 223). It is obvious, however, that with regard to a natural watercourse the question must always be one of degree. It would be absurd to say that a considerable river or stream became a sewer merely because several houses drained directly into it. The true rule would appear to be that the stream must have lost its character of a natural stream and become substantially, if not exclusively, a conduit for the drainage of buildings in a district. I may here point out, however, that a conduit or channel may be a sewer, although it does not convey sewage in the ordinary sense of the term. The definition says that the expression "sewer" includes sewers and drains of every description, with the single exception of drains as already defined, that is to say, drains receiving the drainage of one building or premises within one curtilage. It is manifest, therefore, that a pipe or channel may be a sewer within the meaning in this definition though it receives surface water only, and accordingly this was so decided. In a recent case, *Ferrand v. Hallas Land and Building Company*, 1893, (2 Q. B., 135), Lord Justice Smith made use of the following

language: "It will be noticed that a sewer need not necessarily convey sewage matter in order to constitute it a sewer. It would be none the less a sewer within the Act if it conveyed only rain or surface water." The draining off of rain or surface water collected from different premises or different feeders into one main drain would constitute that main drain a sewer within the meaning of the Act."

A SEWER MADE FOR PROFIT.

I have said that a sewer vests in the district council. Such is the general rule; but to this rule there are three statutory exceptions: (1) Sewers made by a person or company for his or their own profit; (2) sewers made for the purposes of land drainage or irrigation under a local Act; and (3) sewers under the authority of Commissioners of Sewers.

It is only to the first of these exceptions that attention need be drawn here. It was at one time thought that where a person made a sewer for the benefit of his own estate, with the intention of draining into it only such houses as he or his lessees or licensees might erect, the sewers so made were private property and came within the first exception. This notion has long been exploded. The first case was *Acton Local Board v. Batten* (28 Ch.D., 283), decided by Mr. Justice Kay. It has since been followed in a number of cases, among which I may mention *Ferrand v. Hallas Land and Building Company*, to which I have already referred, and *Foules v. Colmer*, 1895 (W.N., 42). In the last case the owners of a building estate, on one side of which was a roadway, constructed a sewer in the soil of that moiety of the roadway adjoining the boundary of their own estate, that is to say, in that part of the road of which presumably they were the owners. They made this sewer for the purpose of draining the houses which it was proposed to erect upon the building plots upon their estates, and as the plots were sold the purchasers in every case entered into agreement to pay a sum of money in respect of the right to connect with the sewer. The defendant was the owner of a house on the other side of the road, and he claimed the right to connect the drains of his house with the sewer without payment. It was held that he was so entitled; that the sewer could not be said to have been made by the plaintiffs for their own profit within the meaning of the section; and the true meaning of the exception seems, therefore, narrowed down to this: that a sewer made for profit is one which is made not merely for the purposes of disposing of drainage, but for the purpose of realising some profit beyond and independent of any sanitary purpose. The most recent illustration of what is meant by a sewer made for profit is to be found in the case of *Croysdale v. Sunbury District Council* (W.N., 1898, p. 70), decided by Mr. Justice Stirling in the present year. In that case the owner of a field adjoining a highway had laid a drain from a ditch by the side of the highway to a pond in his field, for the purpose of supplying water to his cattle. It was held that this drain was a sewer, but that it was made for profit, and therefore did not vest in the district council. The most important decision, however, on the subject of a sewer made for profit was that of Mr. Justice Romer in *Mishead Local Board v. Luttrill* (2 Ch., 179). In that case a landowner, for the purpose of draining a town, the greater part of which stood on his own land, made sewers, and for the use of those sewers he levied and was paid a sewer-rate by all persons whose houses were connected with his sewers. It was held that the sewers were made for profit and were not vested in the local authority. It is, however, difficult to now distinguish this case from the latter one, which I have already mentioned, and many doubts have been expressed as to whether it was correctly decided. This much may be said—the decision will probably be limited to facts exactly similar, and these are not likely again to recur.

SEWERS MADE FOR LAND DRAINAGE UNDER LOCAL ACT.

A recent case of some importance has been decided with reference to the second exception—*The London and North-Western Railway v. Runcorn Rural District Council*, 1898 (1 Ch., 34, 561). In that case the railway company had made sewers for the purpose of draining the land adjoining their line. These were made under powers contained in their local Acts. After they were made the rural district council had, without the knowledge of the company, connected houses with them. It was held that although they were sewers, yet they were made and used for the purpose of draining land under a local Act, and did not vest in the local authority. I have mentioned this decision in passing, but to the general public it is one of little importance. Up to this point I have dealt only with the question, "What is a drain, and what is a sewer?" I have now to point out what are

THE RIGHTS AND LIABILITIES OF LOCAL AUTHORITIES IN CONNECTION WITH SEWERS

admitted or determined to be such. Now, the first is that they are bound to keep them in repair, to keep them cleansed, ventilated, and in such a condition as not to be a nuisance or injurious to health. That duty is imposed in express terms. It becomes important to the owner of property in this way: he may have a notice served upon him to abate a nuisance consisting of an alleged defective drain, but if he can show that that drain is in fact a sewer he is clearly under no liability to comply with the notice, for the nuisance exists by reason of the act or default of the local authority in failing to perform their statutory duty. But this liability of the local authority may not be an unmixt benefit to the owner,

for, as I have already pointed out, the local authority have the right of access, and the existence of a sewer upon his land, with which he cannot interfere and over which he can not build, may be a serious drawback from the owner's point of view.

THE LIABILITY TO REPAIR.

however, brings me to the consideration of an attempt which has been made to amend the law in the Public Health Amendment Act, 1890, sec. 10. The consideration of this section is important, and I propose, therefore, to treat the exact terms of it. It provides that "where two or more houses belonging to different owners are connected with a public sewer by a single private drain an application may be made under sec. 41 of the Public Health Act, 1875, relating to complaints as to nuisances from drains, and the local authority may recover any expenses incurred by them in executing any works under the powers conferred on them by that section from the owners of houses, in such shares and proportions as shall be settled by their surveyor, or, in case of dispute, by a court of summary jurisdiction. For the purposes of this section the expression 'drain' includes a drain used for the drainage of more than one building."

There can be little doubt what the intention of the legislature was in enacting this section. It was intended to provide for cases where sewers had been laid by private persons in private land for their own purposes, to prevent an unnecessary and probably improper burden being cast upon the public purse; for, as I have already pointed out, once you can establish that a channel for drainage is a sewer the local authority must repair it. Such being the intention of the legislature, it is a little unfortunate that they did not employ some person in the drafting of the section who had some elementary acquaintance with the law of the subject. To begin with, the section applies only where there are two or more houses belonging to different owners. Why the section should not have applied to the case where two or more houses belong to the same owner I am unable to conceive. But the fact remains, for what it is worth, that the section with which I am now dealing may be put in force against the owners, say, of three houses draining into one common drain, while, if all three houses belonged to the same person, but the other circumstances were identically the same, the section would not apply. In the next place, the section makes use of two expressions which up to that time were quite unknown to the law. It deals with the case of "two or more houses connected with a public sewer by a single private drain." Now a sewer which is vested in the local authority is a public sewer, and all sewers are so vested, with the trifling exceptions to which I have already referred. But there is no such thing known to the law, or rather there was no such thing known to the law up to 1890, as a single private drain receiving the drainage of two or more houses, for such a drain was a sewer. But there the section is, and the Courts had to give some interpretation to it. After two somewhat unsatisfactory and, indeed, contradictory decisions—*Sell v. the Home Commissioners*, 1895 (1 Q.B., 685), and *Hill v. Hair*, 1895 (1 Q.B., 906)—a Divisional Court, consisting of the Lord Chief Justice and Mr. Justice Wills, have arrived at an interpretation of the section which is at least intelligible. They have decided in effect that the section is intended to apply to what would otherwise be a sewer draining two or more houses belonging to different owners but laid in private land, so that the public could not have access to it. This decision was in *Bradford v. the Mayor, &c., of St. Albans*, 1896 (2 Q.B., 205), and it has since been followed in *St. v. Menthys Tyddell*, 1897 (2 Q.B., 548). It must not, however, be imagined that the new enactment has transferred from the local authority to the owners of houses all liability in connection with what is referred to as the "single private drain." If I may again refer to the words of the section which I have already quoted, they merely enable the local authority to have recourse, in the case of such a drain, to the powers which they possess under sec. 41 of the Public Health Act, 1875, relating to nuisances in ordinary drains. Translated into intelligible language, their power is limited, as follows: There must be a written complaint from some person that the drain is a nuisance. The local authority must then authorise their officer to enter and examine the drain. If he reports it to be in bad condition the local authority may then give notice to the owners concerned to do the necessary work, and upon their default the local authority may do the work and recover the expenses. The amendment of the law effected by the Act of 1890 is therefore of a very limited character. In the restricted class of cases to which it applies it enables the local authority to compel the owners to bear the cost of repairs which, under the Act, they would themselves have to bear. But unless they follow the procedure which I have mentioned, liability in respect of the "single private drain" is exactly the same as if the Act had never passed. In other words, if a sewer which they are bound to repair, and which, if necessary, they can be compelled to repair. This was pointed out by the Court in the case of *Ross v. The Mayor, &c., of Hereford*, 1897 (1 Q.B., 36) where the local authority were held to be liable to repairs to a common drain, although had the appropriate procedure been adopted it is possible that the owners might have been compelled to do them. There is one important subject connected with all sewers which time will only now permit me to mention.

LIABILITY OF LOCAL AUTHORITY TO MAKE SEWERS FOR THE EFFECTUAL DRAINAGE OF DISTRICT.

One of the duties of a local authority imposed by the Public Health Act of 1875, sec. 15, is that of making such sewers as may be necessary for effectually draining their district for the purposes of the Act. A number of recent decisions relate to the liability of a local authority to carry out this obligation. They are cases of this character: Sewers are or have become insufficient to carry away the volume of drainage sent into them, particularly in cases of storm. The sewers become overcharged and flood the basements of premises which they ought to drain, occasioning in many cases much damage as well as discomfort to the occupiers. Claims have thereupon been made against local authorities for damages, and in some instances an attempt has been made to obtain a writ of mandamus to compel the local authority to enlarge their sewers, or to construct such additional sewers as are necessary to give the desired relief. Up to the present time the Court has dealt with such cases by applying to them a technical rule of law. The rule may be thus stated: Where a statute creates an obligation, and also provides a means of enforcing that obligation, no other remedy is open to a person aggrieved by the failure to perform that obligation. Now the Public Health Act, 1875, contains, in sec. 299, a provision enforcing the obligation of providing a district with sufficient sewers and of maintaining existing sewers. The procedure is by complaint to the Local Government Board, who, upon inquiry, makes an order limiting the time for the performance of the duty, and such order may be enforced by mandamus. Acting upon this rule, the Courts, including the House of Lords, have held that where persons are damaged by floods caused by the insufficiency of sewers to take away the drainage from a district they have no remedy in damages or by mandamus, and can only complain to the Local Government Board. I need only refer to the last of these cases, that, namely, in the House of Lords, which affirms the principle in all the others. It is *Passmore v. Oswaldtwistle Urban District Council*, 1898 (Appeal Case, 387). This is a very important limitation of the rights of private persons. But it is worthy of note that it cannot apply in the metropolis, where there is no section in force corresponding to sec. 299 of the Public Health Act, 1875. Closely connected with the point which I have just mentioned is another, which I shall mention in conclusion. It is this: Suppose an owner wishes to lay-out a building estate, what are the rights and liabilities of the owner on the one hand, the local authorities on the other, in respect of the provision of means of drainage, without which, of course, no estate can be successfully developed? That has been, I think, settled by the decision of the Court of Appeal in *Reg. v. Tyneworth Rural District Council*, 1896 (2 Q.B., 219). I may summarise what has been there decided. The local authority are under no obligation to bring their sewers up to the new estate for the purpose of enabling the owner to develop it for building. On the other hand, they cannot refuse to pass his plans because these do not disclose how the drainage of the streets and buildings he proposes to construct and erect will eventually be disposed of. They cannot, in other words, insist upon his showing on his plans a means of sewage disposal for the estate, once the buildings have been erected. What will happen is this: When the new streets are laid out the local authority will be in a position to require sewers to be laid in them, under sec. 150. These sewers, however, will only be sewers in the streets. As soon as connections are made with these sewers an outfall will have to be provided, but that duty will fall upon the local authority.

It is obvious that many difficult questions are likely to arise in connection with this branch of the law. Can an owner, in anticipation of his liability, lay sewers under his new streets, which end nowhere, and then, by connecting one or two of the houses with them force the local authority to find an outfall for him? Such a result might be very unreasonable in many cases. On the other hand, at what point of time can the duty of the local authority to provide an outfall be said to arise? Can they compel the owner for an indefinite time to drain house after house into cesspools, regardless of the fact that at some period or another these will have to be abolished and a system of sewers provided? I do not trust myself to speculate as to the liabilities on either side of these matters. In many cases, no doubt, such difficulties will disappear by mutual arrangement. Until they are fought and decided by the Courts I should hardly care to venture an opinion on the points to which I have referred. There are one or two important points connected with the subject of this paper which regard for your time and patience compels me at present to leave unnoticed. I can only trust that you have not, by reason of the disconnected character of my observations, found them tedious or uninteresting.

The Widening of Parliament-street.—At the Surveyors' Institution, on Thursday, an arbitration was held to determine the sum to be paid to the Government in respect of premises Nos. 11 and 13 King-street, Westminster, which are required in connection with the scheme of widening Parliament-street. The amount claimed was £4,643, while witness for the plaintiffs (Messrs. Lewin, Gregory & Anderson, the occupants of the premises) submitted detailed estimates varying from £1,175 to £1,486. The award was reserved.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

220. Underground Water Supplies and Well Sinking.—“L. L. B.” writes: I should be much obliged if you would inform me what books you recommend on underground water supplies and on wells and borings.

The best book on the subject of underground water supplies is “The Water Supply of England and Wales” (Price 21s. Stanford), by Chas. E. de Rance, C.E., F.R.S., secretary of the British Association Underground Water Committee. “The Modern Practice of Sinking and Boring Wells, with Geological Considerations and Examples of Wells,” by Ernest Spon, C.E. (Price 10s. 6d. E. & F. N. Spon), is, we believe, the best work on the subject of which it treats.

221. Designing Water Mains, Formula for.—“Assistant” writes: A town with a population of 4,000 is about to have a public water supply. The amount fixed per head is 20 gallons per day. By what formula or principles could the diameter of the supply main be ascertained, and what should be the maximum allowable velocity in the pipes?

In designing a scheme for water supply the mains should be of such a diameter as to allow for the total estimated daily supply being delivered in four hours. Thus in the case given the mains should be capable of delivering

$$\frac{4,000 \text{ population} \times 20 \text{ gallons}}{4} = 20,000 \text{ gallons per hour.}$$

Some engineers, however, prefer to allow for two-thirds of the estimated daily supply being delivered in eight hours, and if this were the basis then we should have

$$\frac{4,000 \times 20}{8} = 6,666 \text{ gallons per hour as the capacity for}$$

which the mains must be designed. In order to calculate the diameter of the main to supply this, or any other required quantity, the following formula should be used:—

$$D = \sqrt[5]{\frac{GL}{H}}$$

where

G = Number of gallons delivered per hour.

L = Length of pipe in yards.

H = Head of water in feet.

D = Diameter of pipe in inches.

But in order to work this formula it is necessary to know the length of main and its fall, as to which the querist has omitted to furnish us. The maximum velocity of water in the main should not exceed 3 ft. per second. Burton's “Water Supply of Towns” (Crosby Lockwood & Son, 25s.), Crimp & Bruges' “Tables for Designing Sewers and Water Mains” (Biggs & Co. 10s. 6d.), Molesworth's “Civil Engineer's Pocket-Book” (E. & F. Spon. 6s.), and Box's “Hydraulics” (5s.), will be found highly useful to the querist.

MARKET EXTENSIONS AT DEPTFORD.

We understood that, the City Corporation having obtained an Act of Parliament authorising them to considerably extend the foreign cattle market at Deptford, and connect it by means of a railway with the London, Brighton and South Coast Railway, the work, which will involve an expenditure of £100,000, will be carried out without delay. The services of Sir J. Wolfe Barry have been secured as engineer, and from a report he has made it would appear that the railway and tramway outside the market will cost £32,250. For the purpose of extending the market property in the near vicinity will be bought up, at a cost of £22,000. Increased accommodation will be also provided, in the shape of additional slaughter-houses, cooling-rooms, increased lairage and an extended river frontage. The estimated outlay on these works are as follows: Slaughter-houses (a first instalment), £5,000; lairage, £21,000; a junction of three jetties (providing a continuous river frontage of 880 ft.), £16,000; and property required, £22,000. The extension of the market has been rendered necessary owing to the great pressure which has been put upon the existing accommodation. The business increases every month, no fewer than 510,618 animals being slaughtered there during the last year. The financial position of the market is satisfactory, as, although the loan account at one time reached a total sum of £124,000, the amount outstanding at the close of last year was only £21,000.

Heckmondwike.—At a meeting of the district council on Monday week the chairman reported in reference to a visit last week to the sewage farm by Mr. Dibdin, the author of the bacterial system of sewage disposal. He stated that Mr. Dibdin had suggested a means by which the Heckmondwike scheme, which is one of land filtration, could be absolutely perfected by the outlay of an extra £2,000. The Drainage Committee would, no doubt, consider the suggestion in due course. The members of the committee were very much interested in the scientific explanations which had been made by Mr. Dibdin.

Municipal Work at Nottingham.

THE NEW BASFORD CEMETERY.

Park and cemetery competitions are, as a rule, conducted in such an unsatisfactory manner that it is a pleasant task to refer to a case in which the promoters showed laudable anxiety to place the awards beyond dispute, and in order to secure this result not only drew up conditions which were models in their way, but engaged experts of unquestionable authority in Messrs. Aston Webb and Ernest Milner to decide upon the respective merits of the schemes submitted. For this state of affairs the competitors were much indebted to the Nottingham Corporation and their city engineer, Mr. Arthur Brown. The designing of the cemetery was divided into sections—A, the laying-out of the ground, planting, &c.; and B, the chapels, crematorium, lodges, gates, &c. In section A, as we have already announced, the first premium was awarded to Mr. T. H. Mawson, the well-known park and garden architect, Windermere, the first premium in Section B going to Messrs. McEwan & Norton, architects, Birmingham.

In a special supplement plate we reproduce the general plan and the plan of the grave spaces as designed by Mr. Mawson. Some descriptive details will, no doubt, be of interest to our readers. The site chosen for the cemetery, which is about 30 acres in extent, is bounded on the north by Arnold-road and on the south by the Great Northern Railway. As will be seen by the levels, the ground is very undulating, that adjoining the railway embankment being, unfortunately, the lowest, thus making it very difficult to screen passing trains. Both soil and atmosphere are favourable to plant growth. The curves of the walks are for the most part suggested by the contour of the land, but the long straight avenue is raised for a part of its length considerably above the surrounding levels. This feature, however, will, it is expected, add considerably to the convenience and beauty of the cemetery when the limes have grown into character. This and other important details, however, are more particularly referred to in the following report, submitted by Mr. Mawson, together with his plans:

MR. MAWSON'S REPORT.

In preparing the accompanying design the author has adhered, so far as possible, to the suggested positions for chapels, crematorium, entrances and lodges, arranging the levels and positions of each in such a way as would be most likely to fall in with the schemes of architects competing under Section B. Some modification and readjustment is sure to be required, as it is quite impossible for the designers to plan their positions exactly alike. This scheme—i.e., so far as it refers to position of chapels—can be altered to suit any plan of chapels without in any way destroying the other portions of the scheme.

ENTRANCE AND DRIVE TO CHAPELS AND CREMATORIUM.

When mortuary chapels are grouped together, as in this scheme, it becomes necessary to prepare a wide drive, with entrance gates set well back from the road. The entrance from the centre of Arnold-road to the gates is shown as set back 50 ft., thus allowing of convenient turn-in. The width of drive to chapels is 30 ft. and the stance or turning circle is 120 ft. A circular shrubbery is arranged in the centre of the stance. This would prove a useful screen between the chapels.

RETAINING WALL.

It will be noticed that to obtain this large circular carriage turn a retaining wall would be required. This might be treated architecturally, and so add very considerably to the effect of the cemetery. The advantages gained by having this large gravelled space would far more than compensate for the cost of the wall and building.

CREMATORIUM.

The crematorium is arranged to the south side of the circle, so as to obtain a lower level for the various chambers required for furnaces, &c.

LANDSCAPE TREATMENT.

The author of the accompanying scheme is, wherever practicable, in favour of a more formal treatment which allows of economical division of grave spaces, but in this instance the contour of the ground would not allow of such a treatment without incurring the expenditure of a sum quite out of keeping with any advantages which could be gained.

The landscape or gardenesque style adopted recognises the contour of the land, and, so far as possible, adapts itself to it. This being so, the effect would be much more pleasing than the more expensive formal style. The only portion of the scheme to which the foregoing does not apply is the avenue, which is straight and of easy gradient. A straight road would, however, be very valuable, both in respect to convenience division of the ground for church and dissent. It would also help the architectural features, which finish each end—i.e., shelters and chapels. It would also give the most direct route for pedestrians entering from Arnold-road from the west corner. The avenue would at all times form a delightful promenade.

A glance at the plan will show that the portion of land lying between the chapels and the nursery could easily be laid out without disturbing the land to the west of the chapels

(excepting the portion adjacent to the Arnold-road, the excavation from which would be required for filling up the lower ground, as per sections A B. It would, however, add very considerably to the respectful aspect of the cemetery if the southern boundary could be planted at once, so as to screen the railway and reduce the noise of passing trains.

ARRANGEMENT OF WALKS AND DRIVES.

In designing the walks and roads provision has been made for the hearse taking the corpse to any part of the ground. This has proved a most convenient arrangement in other cemeteries. The roads over which the hearse may be allowed are all connected with the main avenue or other return roads. This allows of roads being much narrower than if the hearse had to turn round and return on some road.

A road is shown from an entrance west of the registrar's house to the crematorium, passing under the avenue. This is for the convenience of the crematorium. The whole of the walks would, so far as possible, follow the natural contour of the ground.

Owing to the dryness of the subsoil very little surface drainage would be required, but where the gradients were less than 1 in 14 the sides should be formed into cobbles-jarred channels, with grates and catchpits every 20 yards apart. This would prevent severe washing of roads in time of storm.

FORMATION.

Much depends upon the way in which the work of formation is carried out, and a foreman who has worked under the direction of some recognised professional landscape gardener should be engaged to carry out the work, otherwise an appreciative rendering of the designer's intention would not be obtained.

In executing the work three points would require careful consideration: (1) Good soil beds for the various plantations; (2) careful leveling of levels into the natural contour of the land, &c.; and (3) good pure grass seeds, carefully selected, and sown on well-prepared ground. The prescription for grass seeds which the author of this scheme recommends is as follows. The quantities are for an acre: Perennial Rye Grass, 20 lb.; Cynosurus Cristata, 4 lb.; Festuca duriensis 3 lb.; Festuca tenuifolia, 3 lb.; Poa Nemoralis Sempervirens 2 lb.; Poa Trivialis, 2 lb.; Trisetum flavescens, 3 lb.; Trefolium repens, 7 lb.; Trefolium minus, 3 lb.; total, 47 lb.

In arranging the plantations in a cemetery it is advisable to introduce as many flowering shrubs and trees as possible, especially those varieties which are sweet scented. A glance at the enlarged detail of a plantation will show that the authors of this scheme propose to make the fullest use of the large number of varieties which would succeed on this ground. These varieties would be largely composed of the following: Almond, double-flowered and single; Berberis, Darwinii and Vars; Genista, Pinnis, Andrea, &c.; Cerasus, of sorts; Dentzia Cronata and Seabra; Gleditsia rosea; Hypericum, Moseriana, &c.; Hydrangea Pinniculata and Grandiflora; Mezereum of sorts; Prunus Sinensis flora plena; Prunus Pissardi; Philadelphus Coronaria, &c.; Pyrus Malus floribunda; Ribes, Flowering Currants; Spiraea, shrubby varieties; Symplocarpus Racemosa; Syringa, of sorts; Weigelia Rosen and Amabilis, &c.; Rhododendron Caucasicum Alba and Wilsonia; Pernettya Mucronata and Hybrida; Erica Cinerea and Fragrans; Azalea Pontica; Diplappappus Chrysophylla; Gorse, Spanish.

Among the evergreen trees and shrubs which would succeed are the following: Aucuba Vera; Box Handsword and golden; Cotoneaster, Simmondii and Microphylla; Eucynonius Japonica; Hollies of all sorts; Laurels, Portugal Rotundifolia; Laurestinus floribunda; Lignstrum Ovalifolia and Japonica; Griselinia, littoralis; Mahonia Aquifolia; Quercus Sempervirens; Olearia Haastii; Osmanthus Illisifolia; Yew, common, Aldrea and Washington; Gaultheria Shaloon; Tree, Fries.

Among the conifers the following would succeed: Pinus, Gembra and Austriaca; Retinospora Plumosa, Aurea and Squarosa; Retinospora Obtusa and Filifera; Cedrus Atlantica, Deodora and Libani; Cupressus Macrocarpa; Cupressus Lawsoniana, Aurea and Argentea; Abies, Canadensis and Albertiana; Picea, Nobilis and Nordmanniana; Picea, Kestleri (Ghana); Thuja Lobbi; Juniperus chinensis; American Arborvitae; Taxodium Sempervirens.

The deciduous trees of larger growth would chiefly consist of the following: Ash, Mountain and also Golden-Leaved; Beech, Common, Purple and Fern-Leaved; Chestnut, Scarlet, Common and Spanish; Birch, Silver; Cherry, Common, Crab, Libanian and John Downie; Elms, Huntington and Welsh; Limes, Red Twisted; Maples, Norway and Silver-Bellissima; Oak, Turkeys and Scarlet; Poplar, New Golden and Lambardly; Sycamore, common and Cristophora; Thorns, Double Scarlet and Single Pink; Willows, Silver and Apple-Leaved.

The foregoing list might be considerably extended, but the author of this scheme strongly advises the planting of such sorts as are sure to grow. Far better do this than experiment with the whole list of names which are outside. Where suitable trees are shown, as in avenue, the best trees

procurable should be planted, and each tree should be planted in a properly prepared pit, with selected soil, so as to give it a good start.

ESTIMATE OF COST.

The following estimate is based upon an average of the actual cost of laying-out public parks and cemeteries designed by the author of this scheme. There works are situated in various parts of the country, and have cost nearly £100,000.

	£	s.	d.
Cost of landscape formation, including walks and drives to ballast level	3,868	0	0
Cost of roads and walks	1,511	5	0
Cost of preparing soil beds for plantations	634	0	0
Trees and shrubs	792	0	0
Specimen trees for avenues, &c.	61	5	0
Yews, &c., for hedges	41	16	0
Propagating houses and cemetery nursery	320	0	0
Total	£7,228	6	0

ELECTRIC LIGHTING AT LLANDUDNO.

INAUGURATION CEREMONY.

An informal inauguration of the electric light, which has been installed at Llandudno under the superintendence of Mr. A. H. Preece, took place on Saturday evening, the official ceremony being postponed until the spring, when the district council hope to secure the attendance of the president of the Local Government Board.

THE GENERATING STATION.

This has been erected contiguous to the gasworks, which are also the property of the town and yield a remunerative return. It will be combined with a refuse destructor, which was greatly needed in a seaside resort such as Llandudno. The plant consists of three Babcock-Wilcox boilers, two of which will be fired from Beaman & Deas' destructors, while the third will be hand-fired with coal or coke; the whole of the boilers may be fired with coal or coke if necessary. Apart from the "eternal fitness of things," the proximity of the electric light and gas departments, each a municipalised undertaking, combines convenience with economy in the matter of fuel. The refuse destructor is one of most modern approved construction. The same may be said of the engine-room, which is at present equipped with two 100-kilowatt steam dynamos and one 50-kilowatt steam dynamo, together with a motor generator for regulation and charging the batteries. The two principal generating sets are each capable of giving an output of 100 kilowatt at 440 to 500 volts. There is also a third generating set, capable of giving an output of 50 kilowatt at 600 volts. A balancer is provided, each armature capable of carrying a current of 100 amperes, and working at a voltage varying between 200 and 250 volts, so that it can transfer 25 kilowatt from one side of the three-wire system to the other.

STREET LIGHTING.

For street lighting there are altogether forty-eight arc lamps, erected on cast-iron pillars. The lamps along the front of the promenade, thirty in number, as well as those of important crossings, are fixed in carriers, protected from the weather by a canopy—an ornamental as well as useful appendage. The remaining eighteen lamps are all fixed along the kerb at the side of the road, suspended from overhanging brackets. The lamps are run in groups of eight in series, and are of the well-known Crompton-Pochin type. Fitted with opalescent globes, they are for single carbons, burning for eighteen hours without re-trimming. Each lamp is provided with an automatic "cut-out," which, in the event of the lamp "hanging-up" from any cause, immediately "short-circuits" it so that the other lamps in that particular circuit are not extinguished. The lamps on the sea front are fixed about 50 yards apart, those in the town at a slightly greater distance. The installation, the cost of which approximates £20,000, has been admirably carried out by Mr. Preece and his assistants, there not being a single hitch in the whole of the details.

Mr. T. T. MARKS, chairman of the district council, after switching on the current, touched upon the great progress Llandudno had made within late years. The utilisation of the light of the age afforded a further proof that Llandudno was determined upon keeping progress with the needs of the times. He was glad to see among those present Mr. Preece, c.e., the chief electrician of the General Post Office, whose sons had carried out the works so successfully. Mr. Preece, he need hardly remind the audience, had reached the highest profession and reputation, and, being a Carnarvonshire man and a resident in the county, had reflected lustre upon North Wales.

Mr. PREECE, in response, said there was no doubt that the electric light would prove a success at Llandudno. He strongly urged that the local authorities should turn their attention to the provision of electrical tramways.

Mr. W. A. Darbishire and other speakers followed, Mr. Marks remarking that Llandudno was much indebted to Mr. Darbishire for his liberal donation towards the building fund of the intermediate school.

LONDON WATER SUPPLY COMMISSION.

The sittings of the Royal Commission on the question of the London water supply were resumed on Monday, at the Westminster Guildhall, under the presidency of Lord Landaff.

The CHAIRMAN said he proposed to deal first with the separate question of inter-connection between the undertakings of the different companies.

Mr. POPE, Q.C., on behalf of the companies, said they were prepared to promote a Bill next session enabling them to consider what works were necessary to carry out inter-communication, and to submit proposals to the Local Government Board, who were to be empowered to approve, with or without modification, to authorise and order other works, and also to authorise any of the companies, in cases of emergency and for temporary purposes, to get more water from the Thames than they were now empowered to take. The expenditure under the Bill was to be deemed capital expenditure, and the issue of additional debenture stock authorised by the Local Government Board.

Mr. E. COLLINS, engineer to the New River Company, was, after some further discussion, examined. He said the connection of the systems of all the companies was practicable from an engineering point of view, but at the times of greatest pressure scarcely any of the companies had water to spare. At present the East London Company were receiving from other companies about 14,500,000 gallons per day. A scheme of inter-connection had been drawn up by the engineers of the different companies in October, 1897, but it would only meet the case of a temporary emergency, not of such a failure of supply as had occurred this summer. The witness expressed a larger scheme that would facilitate interchange, resting on the assumption that more water might be taken from the Thames.

Mr. W. BRYAN, engineer to the East London Company, examined, said he was not at present prepared to say on what conditions his company relied to ensure a proper supply next year in the event of another scarcity.

The commission met again on Tuesday, when Mr. J. HOLLAND, legal adviser to the associated water companies, gave further evidence on the scheme for connecting the systems of the different companies.

Sir H. KNIGHT, chairman of the Southwark and Vauxhall Company, who was next examined, gave a general approval of the scheme as practicable and as necessary to satisfy the public outcry, but was quite certain that if the works were carried out they would never or seldom be used. The present supply was quite sufficient to meet another drought. The connections already made between the different companies had not yet enabled the East London to resume a constant supply, because assistance was not available so early this year as it would be next year. He estimated that the companies, with their present powers and without any trouble whatever, had a surplus of 24,000,000 gallons per day which they might place at the disposal of the East London Company. It was not the East London Company which had broken down; the trouble was due to the ridiculous system of building houses without cisterns. He complained strongly of the opposition which the water companies met with from the London County Council.

Monday is the day fixed for the next sitting.

IMPROVEMENTS AT MIDDLETON.

Having procured powers for the monopoly of electric light supply, the Middleton Corporation are now considering a scheme of some magnitude, which has been presented to them by their advisers. Great extensions have been going on at the gasworks, and it is proposed that here the electric supply works should be erected. It is estimated that the necessary plant and buildings would cost £19,300. It is further proposed to erect a refuse destructor, at a cost of £3,500, and also to construct the plant as to make it suitable for the supply of power to the new tramways company if terms could be agreed upon. Altogether it is proposed to borrow £33,500 for the works.

Tramway Waiting-Rooms.—It has been suggested that waiting-rooms, similar to those erected at Bristol, should be provided near several of the recognised stopping-places on the routes taken by the tramways and omnibuses of the metropolis.

New Free Library for East Ham.—Mr. McKinnon Wood, the chairman of the London County Council, on Saturday afternoon laid the foundation-stone of the Passmore Edwards Free Library at Plashet. The new building, the cost of which will be defrayed by Mr. Passmore Edwards, is to be erected on a plot of the land set aside by the East Ham District Council as a recreation ground, at the western end of the parish. The architect is Mr. S. Trevail, F.R.I.B.A., who has designed a building to cost £4,000, without internal fittings, while the district council propose to put in the tower which is to be erected a clock, which will be bought by public subscriptions. All the departments for a good library will be provided on the ground floor, the upper floor being reserved for committee-rooms and apartments for the custodian.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XIX.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

ROAD MATERIALS AND CONSTRUCTION (continued).

Construction of French Roads.—Large boulders, 5 in. or 9 in. deep, are placed at the sides, as in Fig. 28, and a stone bottoming about 6 in. in depth is formed of rubble stone, upon which comes about 3 in. of small stone packing filling the interstices of the pitched foundation, making together a depth of about 7½ in. This is covered with a coating of hard metalling, broken to pass, 1½-in. rings, and well rolled in with sand as a "binding," aided by watering.

CONCRETE MACADAM.—This was introduced by Mr. Joseph Mitchell as an improvement upon ordinary macadamised roads in Edinburgh of the following proportions: Portland cement, one; broken stones, four; sand, one and a quarter.

"The stones were well screened and watered, and the whole turned over, thoroughly mixed, and spread to a thickness of 3 in. to 5 in., and allowed to harden, after which a second layer was spread, and so on, until the required thickness was obtained. A road thus formed need only be about one-half to two-thirds as thick as ordinary broken-stone roads. The great objection to roads thus formed is, that when the surface becomes worn the cost for repairing them will be considerably more than that of an ordinary road."* Also, where streets are liable to be frequently opened for sewer, gas, water or other pipe tracks, the trenching will be expensive and repairs difficult.

Mr. H. U. McKie, A.M.L.C.E., as a result of his inspection of the concrete macadam streets of Edinburgh in 1883, stated† that "the streets paved with concrete macadam were in fair order. The pavement is non-absorbent and could be readily washed quite clean, and the scavenging of such streets is

macadam for roads with less than 30,000 tons per yard of width per annum.

The work should always be constructed in the spring or winter months, as if done in the summer the heat of the sun draws the tar out of the pavement. Dry weather is essential, and considerable care and experience will be necessary for successful construction.

The precise methods of laying tar paving for footways and tar macadam for roadways necessarily vary somewhat in different districts, according to local circumstances, but the general method is as follows*—

The material used (in Leicester) is the blast-furnace cinder and limestone. For footways it is sorted by screening and sifting into four different sizes of 1½-in., 2-in., 4-in. and 1-in. gages, and for roadways to 2½-in., 1½-in. and 1-in. gages. The cinder and limestone are both heated on an iron floor under which the flues from a fire run. The material is then mixed in its heated state with a sufficient quantity of a mixture (also in a heated state) of pitch, tar and creosote, boiled until they form a tough and thick consistency,† when it is, after lying for a few days in heaps, ready for use. The quantity of tar, pitch, &c., depends on the qualities of these articles, and particularly of the tar, which varies very frequently. The quantities are also regulated to the character of the traffic expected on the roadway or footway on which the material is to be used, but the average quantities may be taken to be as follows: 12 gallons of tar, ½ cwt. of pitch, 2 gallons of creosote, 1 ton of stone.

The work is laid down in either two or three layers. For two-coat footway work 1-in. material is used for the bottom layer, 1 in. thick, and ½-in. material for the top, 1 in. thick, making 2½-in. total thickness.

FIG. 28.—CROSS-SECTION OF FRENCH ROAD.

brought to the minimum. The cement concrete macadam varied from 9 in. to 12 in. deep. Two modes of forming the streets have been adopted, namely:—

"(a) After the street has been excavated to the proper depth and properly formed, and the ground thoroughly beat down, the first coat is laid down with 2-in. macadam, and blinded and made compact to form required.

"The top coat is laid down with clean-riddled 2-in. macadam, which is grouted with carefully-prepared cement grout, varying in strength from one of cement to three of sharp sand, to one of cement and one of sand, carefully formed to the proper contour of the street.

"(b) The second method is to make a concrete of the broken stone and cement, sand and gravel, and lay it on the road in sections in such lengths that each section can be completed before the cement sets. All the broken stones used are of hard metal, whinstone, granite or porphyry, all hand-broken.

"This class of pavement requires great care in construction to make it a success and to prevent unequal settlement in the street after it is completed. It makes a good street, and the cost varies from 6s. to 9s. per square yard."

TAR MACADAM.—Tar macadamised or bituminous concrete roadways are adopted in many towns, and for light traffic are found to be a good substitute for ordinary macadam roads, being impervious to moisture, noiseless, more sanitary, and less muddy and dusty than macadam. Also, the cost of watering and scavenging is less, as well as the annual cost of maintenance.

This class of road is well adapted for use in the quiet quarters of large towns, in residential areas and the less busy thoroughfares of suburban districts. Mr. Denoon considered tar macadam roadways only suitable for roads having less traffic than 40,000 tons per yard of width per annum and

In three-coat footway work 1½-in. material is used, 1½ in. thick, for the first or bottom layer, 2 in. for the second, 1 in. thick, and ½ in. for the top covering, ½ in. thick, with the addition of Derbyshire spar sprinkled on the top covering in both cases, to give it a white or variegated appearance, making 3 in. in all. Each layer of material is separately well rolled with hand rollers weighing 13 cwt. each.

The tar macadam for roadways is laid down in three layers, the preparation of the material being the same as in the case of footways. The road bed and foundations are prepared similarly as for an ordinary macadamised roadway, and the tarred macadam is laid as follows: The first layer is 3 in. thick and of 2½-in. gauge, the second layer is of 1½-in. gauge and 2 in. thick, and the top coat is 1 in. thick of 1-in. gauge, and covered with cinder dust, sharp sand or grit, each layer being well rolled with a 15-ton steam roller.

As to the durability of this class of work, Mr. Gordon considered that the life of the roads may be fairly taken at about three years, at the end of which period they will in all probability require toping—that is, tracking over and recovering with the material used for the top coat—at a cost of from 9d. to 1s. per square yard.

The cost of the tar paving, laid as above described, exclusive of preparing the ground, for three-coat work averaged 1s. 6d. per square yard and for two-coat work 11d. per square yard.

The cost of tar macadam for roadways was from 2s. 6d. to 3s. per square yard, exclusive of preparation of the ground on special formation.

In old paved streets it only involves the removal of the stones and some few inches of ground, if the foundation is already good, or possibly the carting of a few loads of dry material to make up any apparent soft places in the foundation.

* As adopted by Mr. John Gordon, M.A.S.T.C.E., at Leicester—vide "Proceedings of the Association of Municipal and County Engineers," vol. vii. p. 30.
 † "Proceedings of the Association of Municipal and County Engineers," vol. x.
 ‡ Tar pavement has been called the "silent macadam" in Leicester.

In other cases, where a street is being formed on maiden ground, the formation of a foundation with from 9 in. to 12 in. of what is locally called "rammel" is necessary, and the covering of the same with furnace ashes, gravel or other suitable material to receive the tar macadam. This, with the necessary excavation, adds from one-third to one-sixth per square yard to the cost, but is requisite even for ordinary macadam roads. The cost of preparing the ground, where no such foundation is required, ranges from 3d. to 6d., the breaking up of the old macadam roads being the most costly, but to set against this there is the value of the old materials.

One important feature, Mr. Gordon further stated, is the rolling of the foundations before laying down the first layer of the tar macadam, and he considered a steam roller, of about 10 tons weight, to be necessary for success with such roadways.

Tar macadam is also sometimes laid by merely spreading a coating of broken stone, and, after consolidating it by means of a roller, a mixture of coal tar, pitch and creosote oil is poured over it, and upon this a layer of small stone is put down and well rolled in, the surface being finished as before with stone chippings and rolling.

The system of forming tar macadam roadways in Croydon is described† as follows by Mr. J. Walker, the borough engineer and surveyor:—

"The surface of the road was taken off to allow of an 8-in. coat of tar macadam. The bottom 5 in. consisted of the best of the old road material taken off, after it had been sifted, baked, and, while hot, well tarred. With the gas tar a little pitch was mixed, well boiled and used hot. The stones were turned over until all were well blacked. The material was then taken back to the road, laid on and well rolled. The top 3 in. were Kentish rag, baked and tarred similarly to the bottom coat, and well rolled with a heavy hand-roller; a day or two afterwards it was well rolled with the 10-ton steam roller. A little fine Kentish rag was used to bind it, having been previously baked and tarred as the other. The full cost was about 3s. 6d. per square yard. The old foundation was not disturbed, but if the foundation of a new road and new materials were required the cost would not be under 4s. per yard super."

The stones which have been used for tar macadam are granite, basalt, mountain limestone, Kentish rag and blast furnace slag. Hard limestone has been found to be preferable to the siliceous or igneous rocks, as it wears more evenly.

CORRESPONDENCE.

Shoreditch Combined Electric Light and Dust Destruction Scheme.—Mr. T. W. Baker, 7 Broad-street House, E.C., writes: "No one wishes for the success of the utilization of town's refuse for the generation of electricity more than myself, but let us not be led away by random generalisations and data unsupported by facts as to works' costs; and, inasmuch as the published accounts of the Shoreditch Vestry must be assumed to be correct, I await the promised figures for the year's working, although if the "initial expenditure that would not recur" were credited against the loss, as stated, the true working results would be apparent, and Mr. Kershaw and Dr. Mansfield Robinson have evidently missed this salient fact in their respective replies to my previous communication. But the aforesaid gentlemen having imported into the controversy deliberate personalities—such as "virgin experimentalist," "amateur adventurer," and guilty of "schoolboy carelessness"—these epithets call for some contradiction by me. I now give the facts that did occur. In June, 1893, I was requested by the vestry clerk, being a ratepayer, to give him some idea of how and at what cost I would propose to light the Shoreditch area. I did so, and handed him a report as a ratepayer, which I understood was of some value at this initial stage. In November, 1893, I was employed, and received payment for a design and scheme to bring in the then idle large property in Ivy-street for the purposes of a similar scheme, with baths and wash-houses, as now erected. In 1894 a representative of the contractors and designers of the present destructor called on me, and asked if I would grant my patent rights to them for the Shoreditch schemes and row in their boat," which on the terms mentioned I refused. In 1895, upon the request for competing schemes by the Shoreditch Vestry, I designed that special scheme, according to my patents, that was submitted by the eminent firm of Messrs. Daniel Adamson & Co., who were lowest in price, and whose guaranteed cost for labour for 20,000 tons of refuse per annum was £1,100, and I beg to subjoin Messrs. Kincaid, Waller & Manville's report thereon to the Shoreditch Vestry:—

Messrs. Daniel Adamson & Company, of Dukinfield.

"This firm is one of the highest reputation in the manufacture of steam-raising apparatus, and they have submitted a scheme which in many respects is different from the majority of those placed before you, and for which, if erected in accordance with the specification issued by you, the cost

will amount to £14,400. They propose to supply only ten cells in place of twelve, but these cells will be of larger area than the twelve stipulated for, and will therefore burn the requisite amount of refuse daily. The refuse furnaces, in place of being ranged alongside the boilers, are placed, as in Messrs. Fraser & Sons' scheme, under the boilers. This likewise involves the clinking floor being somewhat enclosed, since a second floor, in addition to the tipping floor, is provided opposite each row of furnaces, from which the boilers will be fired by coal, so far as that is required, and on which also the refuse may be screened to separate some of the cinder from it, should you adopt that portion of their scheme. The destructor furnaces are of a type that would enable the perfect combustion of the refuse and its gases to be relied upon, and the furnaces provided by them are arranged to both feed and clinker automatically. The amount of coal this firm considers necessary to obtain the necessary evaporation is extremely high—namely, 3 tons per day. We think, however, that this is probably only due to the fact that, as they have not heretofore erected a dust destructor, they have probably not attached sufficient importance to the calorific value of the refuse to be dealt with, and, in any case, the arrangement of their boilers and furnaces is such that the same evaporation could be relied upon as that suggested by other tenderers. They also estimate the cost of labour in working the plant at £1,100 per annum, but they do not make any statement as to the amount required to maintain the apparatus, merely stating that this would be very low. The scheme put forward is an extremely well worked-out one, and, considering the extra amount of work in the erection of the two extra floors which are included in their tender, is not by any means a dear one. They make an alternative tender at £13,150 if double-flued tubular boilers are provided by them in place of the water-tube boilers, and we have no objections to offer to this alternative, should you be prepared to consider their tender for recommendation. They also quote as extras for a screen and apparatus in connection therewith, and for other sundries, which you would probably not be prepared to consider at the present moment."

The Society of Engineers in 1894 awarded me their gold medal for my paper on "Utilisation of Town's Refuse for Generating Steam." Further comment is needless.

"GENESIS OF STREET MUD."

In reference to the articles which we published in our issues of October 21st and 28th, under the above title, *The Quarry* says:—

In our last issue we gave the results of experiments made by Prof. Elliott upon various samples of stone submitted to him by *The Western Mail*. We then stated that "physical tests are frequently extremely delusive," and an examination of the tests in question tends to confirm our opinion. We have carefully considered the numerous articles which have appeared in *The Western Mail*, based upon Prof. Elliott's report, and compared it with evidence in our possession, and, as a result, we were in no way surprised to hear that Prof. Elliott had found it necessary to make an important correction in his figures. This correction brings the whole of *The Western Mail's* castle to the ground and renders further argument quite unnecessary. Even taking Prof. Elliott's original figures, we cannot admit that *The Western Mail* has made out its case. The whole question has been most ably dealt with in an article in *THE SURVEYOR* of October 21st, and we have much pleasure in congratulating our contemporary upon the calm, painstaking and logical manner in which it has combated the double attack upon the Penlee Elvan stone and the Cardiff borough engineer. We should imagine that after this experiment *The Western Mail*, which is not a technical paper, will appreciate the maxim *No sutor ultra crepidam*.

INSTITUTION OF CIVIL ENGINEERS.

ORDINARY MEETING.

An ordinary meeting of the above Institution will be held on Tuesday, at 8 p.m., when a paper will be read by Mr. Wm. Beedie Esson, M.L.C.E., on "Electrical Transmission for Power in Mining." A discussion will follow the conclusion of the reading of the paper.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,

Solicitor of the Supremo Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

QUERIES AND REPLIES.

ENGINEER AND SURVEYOR TO RURAL DISTRICT COUNCIL.—"Assistant" writes: I shall be much obliged if you can tell me, through your valuable paper, whether a surveyor or a rural district council has a right to sign orders for materials required in his departments, or is it necessary that all such orders should be signed by the clerk? Are there any reliable books published setting forth the duties of a surveyor under a rural district council?

This depends upon the regulations of the council with regard to the point. "The Municipal and Sanitary Engineers' Hand-Book," by H. Percy Boninos, M.R.C.E. (third edition), is an excellent work on the subject of the duties of municipal and sanitary engineers.

BY-LAWS: ALTERATIONS TO BUILDING.—"Surveyor" writes: Plans have been submitted to the local authority for the erection of a new billiard-room over two living-rooms, which were 7 ft. 6 in. in height, and the conversion of the two living-rooms into a large dining-room, 42 ft. by 15 ft., to be used in connection with a café. It is proposed to make the dining-room 8 ft. 9 in. in height, but the local authority refuse to approve the plans unless such room is made 10 ft., as, in their opinion, a room used as a public dining-room should be not less than 10 ft. in height. The by-laws in force in the district (a copy of which I enclose), page 34, clause 64, states that a room used for human habitation shall not be less than 8 ft. in height. (1) Taking into consideration the use to which the large room is to be put, and may at times be full of people, can the local authority insist upon the room being made 10 ft.? (2) Would you consider the erection of the billiard-room and the alterations to the dining-room (the walls on the two sides of which have been pulled down to the ground floor) constituted a new building?

(1) I do not see how the authority can require a greater height than 8 ft. under By-Law 64. (2) This would be a question of fact for the magistrates to decide (*James v. Wyeell*, 51 L.T. [N.S.], 297).

PUBLIC HEALTH ACT, 1875, SEC. 159: INTERSECTIONS OF STREETS.—"P. H. G." writes: I enclose a sketch of two private streets ordered to be made and completed by the corporation. Can you inform me the legal way of apportioning

the costs of making the square piece at the junction of the two streets under the 1875 Act (1) when the work of making the two streets is carried out together, and (2) when only one street is completed and the other one left for, say, a year or two?

Under sec. 159 of the Public Health Act, 1875, the owners of premises fronting, adjoining or abutting on such parts of a street as may require to be paved, &c., are liable for the expense of making-up the street "according to the frontage of their respective premises." In my opinion the frontagers are not liable for the cost of paving, &c., the intersections. This view is strengthened by the fact that the corresponding section of the Metropolitan Management Act, 1862 (sec. 77), expressly makes the owners of houses and land in the street liable for the paving, &c., of intersections, and it is to be presumed that the omission of a similar provision from the 1875 Act was intentional. The question remains whether where the soil of an intersecting street is vested in a private owner he is liable as a frontager. In *Lord Northbrook v. Post Office Board of Works* (L.R. 7, Q.B., 180) the owner of an intersecting private street was held liable; but in that case the intersecting street had not been dedicated to the public. In a subsequent case where intersecting streets had been dedicated to the public it was held that the owners of the soil thereof were not liable as frontagers to contribute to the cost of paving, &c., the intersected street (*Plainsford Board of Works v. British Laid Company*, L.R. 10, Q.B., 260). These cases were, however, under the Metropolitan Act, under which (as already stated) frontagers are liable for the intersections, and it remains to be decided whether in an urban district the owners of the soil of a public street abutting on a street within this section (see, 150, Public Health Act, 1875) "can be charged with a proportion of the expense of paving, &c., the latter." (*Linsley's Public Health Acts*, fifth edition, p. 187.)

BY-LAWS: OPEN SPACE AT REAR OF BUILDING.—"W. D. H." writes: An question are continually arising upon the interpretation of clause No. 53 in our local by-laws with regard to air space, I should esteem it a favour if you would kindly give me your opinion upon the following case. The house shown upon the plan has been newly erected, and the occupier

wished to erect a shed X in the position shown. Would this, in your opinion, contravene By-Law No. 53? or, in other words, would line A B be produced to C and the 15 ft. measured from this line, or should the 15 ft. be measured from E F?

In my opinion the shed would contravene By-Law 53. That by-law provides (a) that the open space shall extend laterally throughout the entire width of the building, and (b) that the distance across the open space from every part of the building to the boundary of premises opposite or adjoining shall be as prescribed (varying according to the height of the building). It seems to me that the effect of these requirements is to preclude the erection of anything (except a water-closet, &c.) upon the open space. If a building were erected upon it, it would no longer be "an open space," and even if the distance to the boundary were measured from E. F. it could not be said to be "the distance across such open space."

HIGHWAY SURVEYOR: CLAIM FOR SALARY.—"Surveyor" writes: My late council in March last drew up a form of accounts to show in detail the expenditure on each road in the district, and it was passed that J, as their highway surveyor, should keep them from April 1st last. (I may say that these accounts did not have to be placed before the auditor, but were only for their private information.) Two years ago the clerk to the council wrote me saying that I was to do no new work of any kind without his written instruction, even if it had been passed by the rural district council. In the case of these books I received no instructions to commence them, so did nothing to them. Now, having left the council to take up duties here, they refuse to pay me a fortnight's salary, which is still owing to me, as they say in not doing these books I have not fulfilled my contract. I may say that I signed no contract or agreement as to my duties or the fulfilment of same, therefore I ask you can they legally keep back any money that is due to me?

Was the resolution of March last communicated to "Surveyor," and, if so, by whom? And did he thereupon, or at any time, communicate with the clerk and ask for instructions? How was the salary payable—quarterly, monthly or weekly? And when and under what circumstances did he leave the employ of the council? The law is that a servant engages to render any part of his service and to accept of it, and if he is discharged with the notice, and if the nature of such misconduct as to justify discharge has not been settled in any salary from the time of the last period of payment. The facts are not stated with sufficient fulness to enable me to express an opinion as to whether the omission to keep the accounts was such neglect as would have justified dismissal, but it seems to me strange that if "Surveyor" knew of the resolution he should not have taken some steps to see it at a clear understanding as to whether he was to do the work or not.

Pontefract. The purchase of Headland Hill from Messrs. Low & Shaw for £2,000, for market purposes, was discussed at a special meeting of the corporation last week. The chairman of the Market Committee proposed that the purchase be effected, but ultimately, after a long discussion, it was decided to leave the matter in the hands of the new council.

Municipal Work in Progress and Projected.

The paragraphs under the headings of Aston Manor, Ilaworth, Lever Beblington, Odey, Romford, Sutton-in-Ashfield, Withington, Chorley, Lincoln and Yarmouth contain the most important news of municipal works which have come to hand this week from the provinces. In the metropolis, however, no specially extensive works seem to have been mooted during the week.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

The report presented by the Housing of the Working Classes Committee in reference to the future housing policy of the county council was unquestionably the chief matter which came up for consideration at Spring-gardens on Tuesday. The presentation of the report was followed by a long discussion, in the course of which several of the principal speakers opposed the erection of dwellings by the council except under legal obligations or exceptional circumstances. Sir Arthur Arnold thought the better policy was for the council to develop the tramway system so that people could get into the suburbs. This was the opinion expressed by most of the speakers, and the report was therefore referred back with an instruction to report again in three weeks. Several other less important matters were also considered, particulars of which are given below.

Loans for Public Works.—Upon the recommendation of the Finance Committee, it was agreed to lend the Hampstead Vestry £10,490 for electric lighting purposes, the Islington Vestry, £6,780 for similar purposes, the St. Martin's Vestry £5,000 for sewerage works, and the St. Pancras Vestry £10,110 for paving works.

Maintenance of Small Open Spaces.—The Parks Committee recommended the council to call a conference of local authorities to determine the future policy to be adopted in the management of the 105 small open spaces in London. This was agreed to.

The Council's Housing Policy.—The Housing of the Working Classes Committee presented a report dealing with the question of an extension in the near future of the housing policy of the council, and recommended: "(a) That it be the policy of the council to proceed from time to time, as opportunity shall offer, with the acquisition, under Part III. of the Housing of the Working Classes Act, 1890, of sites available for the erection of working-class dwellings within the county of London; (b) that all clearances which involve rehousing be done at the sole cost of the council; (c) that housing accommodation should be provided for a number of persons equal to that of the working classes displaced by any scheme under the Housing of the Working Classes Act, 1890, or under the provisions of any Improvement Act; (d) that housing accommodation for persons displaced be provided within the county of London, but not necessarily in the immediate neighbourhood of the displacement, due consideration being given to the needs of those living on any particular area." After a long discussion, during which several members protested against the idea that it was the duty of the council to house the people of London, the recommendation was referred back to the committee with an instruction to report further in three weeks.

Proposed Purchase of Spitalfields Market.—On the 12th July the Parliamentary Committee were instructed by the council to consider the advisability of including in one of the Bills to be promoted by the council in the next session of Parliament a clause empowering them to acquire by agreement or compulsorily the freehold and other interests in Spitalfields Market. They now reported that they had carefully considered the matter, and had come to the conclusion that the best course to adopt was to insert a clause in the council's General Powers Bill enabling the council to acquire by agreement the freehold interests in the market. They had instructed the agent accordingly, and recommended the council to approve their action. The recommendation was adopted.

The Telephone Question.—The Highways Committee submitted a letter from the Postmaster-General in reply to the council's letter of the 14th ult., which has already been published in THE SURVEYOR, stating that the Government were considering the proposals of the Select Committee on Telephones, and that if the proposals were adopted Parliament would be asked to legislate on the subject. The committee stated that in their opinion there was urgent necessity for the establishment of a telephone service for the London district, in competition with the service provided by the National Telephone Company, and they thought that every endeavour should be made to expedite the matter. They accordingly recommended that the clerk should be instructed to address a letter to the Postmaster-General pointing out the extreme urgency of the matter and the desirability of a decision being promptly arrived at by the Government upon the question whether the Post Office should establish a competing service. The recommendation was adopted.

COURT OF COMMON COUNCIL.

At the usual meeting of the Court of Common Council on Thursday a petition was presented, on behalf of the Vestry

of St. Botolph Without, Bishopsgate, asking for inquiries to be made into the condition of Montague-court, Bishopsgate, with a view to it being declared an insanitary area, so that it might be dealt with accordingly. The petition was referred to the Sanitary Committee with power to confer with the Finance and Improvement Committees.—The court unanimously adopted a resolution that the Streets Committee should be instructed to consider the desirability of the corporation applying for a license to establish a telephone service, either solely or in conjunction with the county council or any other local authorities within the London telephone area.—The Streets Committee presented a report from the City solicitor on the recent findings of the Select Committee of the House of Commons on the telephone service. The officer in question advised that the necessary steps should be taken to urge upon her Majesty's Government the extreme desirability of action being forthwith taken to give due effect to the recommendations of the Select Committee. The report was adopted.—The Streets Committee, reporting on a recent petition from the Metropolitan Drinking Fountain and Cattle Trough Association, recommended that the association should be relieved of all further expenses in connection with the drinking fountains and troughs in the City, and that the structures should be taken over, maintained and provided with water by the corporation. The recommendation was adopted.—The town clerk read an application from the Metropolitan Electric Supply Company, Limited, asking for the formal consent of the corporation to their intended application to the Board of Trade for a provisional order for the supply of electricity within the City.—The Cattle Markets Committee submitted a report with reference to the extension of the foreign cattle market at Deptford and the construction of a short line from the market to the railway station of the London, Brighton and South Coast Railway. The report set forth the fact that Sir J. Wolfe Barry, K.C.B., had been appointed the engineer to the new works. Notices had been served for the acquisition of a considerable amount of property, the amount involved being estimated at £22,000. The extended accommodation meant additional slaughter-houses, cooling-rooms, lairage and river frontage. The estimate for the slaughter-houses (a first instalment) was £5,000; lairage, £21,000; a junction of the three jetties, £16,000; and railway and tramway works, £32,250, making, with other expenditure, a total outlay of £105,000. The report of the committee was adopted without discussion.

METROPOLITAN ASYLUMS BOARD.

A meeting of the managers was held on Saturday, under the presidency of Sir Edwin Galsworthy. Upon the recommendation of the *Ersmoth* Committee it was decided to accept the tender of Messrs. Clark & Stanfield for the provision of new water-storage tanks. The tender of Messrs. Taylor & Sons, of Marsden, Yorks., was also accepted for the supply of auto-stokers, with hoppers, counter-shafting and engine, at the sum of £195. The following clause regarding the rates of wages to be paid to workmen by contractors was recommended to be inserted in all future contracts entered into: "The contractor shall on all work executed for the managers pay the rates of wages and observe the hours of labour agreed upon by the association of employers and the representatives of the workmen; but in the case of any trade where no such agreement exists, then the rate of wages and the hours of labour must be those current in the district where the work is executed."

VESTRIES AND DISTRICT BOARDS.

Battersea.—The Finance Committee, at a meeting of the vestry on Wednesday, reported that they had considered the draft Bill prepared by Mr. H. S. Samuel, M.P., which provided that the Local Government Board may in cases of emergency require the water companies to supply water to each other by agreement or as the Local Government Board may prescribe. The committee recommended that Mr. Samuel should be informed that the vestry were in favour of the draft provisions of the Bill. After some discussion an amendment was adopted approving of the Bill, with the name of the London County Council being substituted for the Local Government Board.—The Highways Committee announced that they had received a report from Mr. J. T. Pilditch, the surveyor, on the condition of the whole of the gullies in the parish. The committee recommended that the work of reconstructing and repairing the gullies in some of the streets should be carried out as a matter of urgency, and this was agreed to. The total cost of the scheme was estimated at over £1,300, although, as the surveyor pointed out, other work might be discovered which would cause the amount to vary.—A report from the Health Committee was submitted recommending the erection of a new urinal in Nine Elms-lane. The report was, however, referred back to the committee, with a view to the erection of a chalet in the neighbourhood.—At the suggestion of the Works Committee it was decided to postpone until March the work of wood paving in Battersea Park-road, owing to the inadvisability of carrying out the work in the winter months.—With reference to the additional land recently acquired for the extension of the site of the proposed electric light station, the Lighting Committee

recommended that the land should be enveloped by a boundary wall with the necessary piers and gates. The recommendation was adopted.—The Lighting Committee also reported that notice had been given by Mr. Morse of the intention of the County of London and Brush Provincial Electric Lighting Company to apply for an electric lighting provisional order for Battersea in the ensuing session of Parliament.—It was decided to refer to the Health Committee a report by the surveyor of the flooding of many houses through the recent heavy storm.—A letter was read from the Lee District Board of Works on the subject of the Workmen's Compensation Act. The letter stated that in consequence of the expressions of opinion by other authorities that the risk was small, and the action of those authorities in the matter, it had been decided to postpone the proposed conference to consider the question.

Bermundsey.—At a meeting of the vestry, on Monday, the Sanitary Committee reported that they had again considered the question of providing underground conveniences. Though the Rotherhithe Vestry had declined to co-operate in the matter, the committee, in view of the urgent need of such accommodation, recommended that a convenience should be built near the junction of Galley Wall-road and Southwark Park-road. This was agreed to, and the question was referred to the committee for the selection of a site and the getting out of plans and estimates.—A letter was received from the Kensington Vestry in favour of the telephone service being in the hands of the Government, and stating that they had resolved to urge upon the Government the necessity of the Post Office establishing a more efficient telephone service in the metropolis. On the recommendation of the General Purposes Committee it was resolved to support the action of the Kensington Vestry.—The following tenders, which were opened, for the supply of slop vans were referred to committee for consideration and report: Auston Rendle, £43 10s. each; Alfred Parker, £42; Hora, Limited, £45; Stone & Son (informal), £45; Glover & Son (alternative tenders), £43 and £44; McDonald, £46; and Baker & Son, £38 6s.

Camberwell.—At a meeting of the vestry, on Wednesday last week, the Baths Committee reported that for some time past they had under consideration the provision of public baths and wash-houses in the Old Kent-road. They had viewed numerous sites, and had selected one which contained an area of 18,000 square feet, and which consisted of the five freehold houses, Nos. 525, 527, 529, 531 and 533 Old Kent-road and Nos. 2, 4, 6 and 8 Marlborough-road. This site the committee estimated would be sufficiently large to enable the vestry to erect first and second class swimming baths, public wash-houses and slipper baths. The agents of the freeholders had agreed to give the vestry a short option of purchase and to accept the sum of £6,500 for their entire freehold interest. The leases of all the property would expire within the next five years. The committee unanimously recommended that the vestry purchase the freehold interest in the property; that a cheque for £650 be drawn as a deposit, and that it be referred to the Finance Committee to negotiate and arrange a loan. After some discussion the recommendation of the committee was adopted.—The General Purposes Committee reported that the county council had not yet decided whether they would contribute towards the acquisition of the ground at the rear of 113A Summer-road as a recreation ground. The owner of the land, which was a third of an acre in extent, now stated that he had received an offer to let it for stables, at a ground rent of £50 per annum. It was therefore necessary that the vestry should decide at once. The committee were of opinion that it was most desirable that it should be acquired as a public garden, and they therefore recommended that the land be purchased by the vestry for the sum of £1,000. The recommendation was adopted.—On the recommendation of the Sewers and Sanitary Committee it was resolved that the surveyor be empowered to carry out the work of laying a pipe sewer on the west side of Peckham Rye, which was estimated to cost £1,200, with the vestry's own workmen, and also to engage a clerk of the works.—The Plant and Scavenging Committee reported that they had considered a letter from the London County Council giving the result of the council's inquiry, extending over nearly three weeks, as to dust collection in the parish. The council stated that there were accumulations of two weeks or over in 162 cases, and that many householders said they were still compelled to give the dustmen money in order to obtain a clean removal. The committee had referred the matter to the surveyor. The committee's action was approved. On the motion of Mr. Rogers the clerk was instructed to reply, informing the Islington Vestry that the Camberwell Vestry did not think it advisable to appoint delegates to attend another conference on London local government.

Islington.—At a meeting of the vestry, on Friday, a letter was read from the Limehouse District Board of Works drawing attention to the proposal of the London County Council to transfer the maintenance of the main roads to the local authorities, and suggesting that if this was done it would deprive the latter of the grant now made in regard to the maintenance of those thoroughfares. The board asked the vestry to appoint delegates to attend a conference of other local authorities to consider the question. It was decided to refer the matter to the Parliamentary Committee for report.—The vestry clerk submitted a communication from the

London County Council in regard to the by-laws made under the London Overhead Wires Act. The council asked the vestry whether they had appointed any inspectors under the Act, whether any steps had been taken to enforce the by-laws, and, in the event of this having been done, whether particulars would be furnished for the information of the Highways Committee. The letter was referred to the Works Committee, with power to act.—The vestry postponed the consideration of recommendations of the Works Committee in favour of the reconstruction of a 12-in. pipe sewer in Cambridge-terrace, at an estimated cost of £340, and the erection of greenhouses at the Finchley Cemetery, at a cost of £313.—The Public Health Committee submitted a report on the advisability of public abattoirs being established in London, and recommended that a copy of the report should be forwarded to the London County Council.—A report was presented by the Parliamentary Committee in respect to the draft Bill prepared by Mr. H. S. Samuel, M.P., dealing with the question of London water supply. As the vestry have previously passed a resolution declaring that the water supply should be vested in the county council, the committee recommended that no action should be taken in connection with the Bill, and that Mr. Samuel should be informed as to the vestry's views on the subject. The consideration of the question was postponed.—At the next meeting a resolution will be proposed by Mr. Stonelake to instruct the Electric Lighting Committee to report as to the cost of installing the electric light from Highbury-corner along Canonbury-road and the New North-road, in order that the installation may meet the electric lighting system now being carried out by the Shoreditch Vestry as far as the boundary of that parish.

Lee.—At the last meeting of the district board of works the General Purposes Committee reported that they had considered a recommendation from the London County Council in reference to the establishment of bacteriological laboratories in the board's district, and recommended that the clerk should be instructed to reply to the council stating that they considered the question to be one for the Government. This was agreed to.

Lewisham.—On Wednesday of last week, at a meeting of the district board of works, Mr. Carman moved that it be referred to the Works Committee to consider and report as to the desirability of substituting artificial stone or other paving for tar paving, at present generally used in the district. He said that at Sydenham and Forest Hill artificial stone had been found to be a great improvement. The proposal was unanimously agreed to.—The surveyor submitted a plan and estimate (£1,270) of the expenses of forming and paving part of the road at Honor Oak Park from Lessing-street to the railway station, together with an apportionment of such expenses on the several persons chargeable. It was resolved that such apportionment be made.

Mile End.—Last week the vestry resolved to request the London County Council to lower Victory Bridge (near Commercial gasworks), and the clerk was instructed to forward copies of the resolution to the councillors for Limehouse, Stepney and Mile End, and also to the Limehouse District Board of Works, asking for their active support.—On the recommendation of the Highways Committee, it was resolved to appoint four delegates to attend a conference on the subject of the recent action of the London County Council with regard to applying to Parliament for the transfer to the local authorities of the duty of maintaining main and distripped roads.

Newington.—The Electric Lighting Committee, at a meeting of the vestry on Wednesday, recommended that the first instalment of £10,000 of the electric lighting loan of £50,000 should be taken up from the London County Council and be repaid by thirty-nine annual instalments (the first in 1902) within the period of forty-two years, over which the loan is to be granted. This was agreed to. It was also decided to give an undertaking to the county council to set apart a sinking fund to meet the necessary maintenance charges on the electric light installation during the period of the loan, and not to include in any future loan any sum for the renewal of the machinery and plant to be provided by the present loan.—The General Purposes Committee asked the vestry to approve the Bill, to be introduced by Mr. Sam Woods, M.P., in favour of cheap trains being instituted for the working classes.

Rotherhithe.—At the last meeting of this vestry the General Purposes Committee recommended that the vestry agree with the whole of the resolutions passed at the Bermundsey conference on the subject of overcrowding and the housing of the working classes, with the exception of the one expressing the opinion that local authorities should not be compelled to repay the cost of the land out of the income from the dwellings. The committee's recommendations were adopted without discussion.—The vestry approved Mr. H. Samuel's Bill to amend the Metropolis Water Act, 1871. The Bill provides, *inter alia*, for the connection of the mains of the various water companies in cases of emergency.

St. Luke.—A letter from the clerk to the London County Council was read at last week's meeting of the vestry informing them that the council had agreed to contribute one-half of the net cost of carrying out the proposed improvement at the corner of Old-street and City-road.

St. Olave's.—At last week's meeting of the district board of works the clerk was instructed to inform Bernardsey Vestry that the board, while sympathising with all efforts for improving the housing of the working classes, were not, in the absence of any practical scheme, able to take any action in the matter.—On the motion of the chairman it was resolved that a deputation wait upon the Highways Committee of the London County Council to ask them to contribute towards the cost of widening Queen Elizabeth-street as a public improvement.

St. Pancras.—The Highways Committee, at the last meeting of the vestry, reported that they had received a letter from Messrs. Jackson & Son asking for the transfer of their contracts in relation to scavenging works and the supply of stone to Messrs. Snowdon, Hubbard & Co. On the recommendation of the committee it was resolved to accede to the request and to enter into fresh contracts with the latter company.—The vestry decided to grant the application of the East London Waterworks Company to lay a new 36-in. main in Camden-road, passing Little Randolph-street and St. Paul's-road, to York-road. The application was made because the company possessed no statutory powers outside the line of their existing mains passing through the parish, and in order to enable the company to obtain more water from their Thames works.—The Highways Committee announced that they had further considered the application of the National Telephone Company for permission to lay a branch line to establish communication between the exchange at King's Cross and the company's exchange in the West-End. The committee again recommended that the scheme should be sanctioned, but this was withdrawn in view of action being probably taken to establish a competitive system in the metropolis.—On the recommendation of the Electricity Committee it was resolved to sanction an expenditure of £2,225 on the lighting (by means of arc lamps) of Albany-street and four other thoroughfares.

PROVINCIAL AND GREATER LONDON COUNTY COUNCILS.

Middlesex.—A special meeting of the county council was held on Monday to consider a further report presented by the Kew Bridge Joint Committee of Surrey and Middlesex. The further report renewed the former recommendation that a Bill should be introduced to give fresh spending powers, as the cost of rebuilding would be more than £50,000 over Sir John Wolfe Barry's estimate, and it was impossible to reduce the price within the authorised limits. Mr. Littler, q.c., the chairman of the council, who is also chairman of the joint committee, in moving the adoption of the report said he had asked the council to meet that day out of courtesy to the Surrey Council, who were meeting on the following day. The county surveyors of the two counties had told the committee that the tendered price was very moderate, and in some cases decidedly low. Sir John Wolfe Barry had assured them that had the work been done at the time his estimate was given that estimate would probably have been nearly accurate; but the price of granite had gone up 100 per cent. since then. Mr. Peter Watson said that this matter was almost a scandal to the county council. He did not think they should have been called together again until after the meeting of the Surrey Council. He therefore moved that they adjourn until the 14th inst. This was seconded, and carried by twenty-one votes to thirteen. Mr. Littler said that he must ask the council to appoint another chairman of the joint committee, as in future he would have nothing to do with it in any shape or kind. The meeting then closed.

Surrey.—At their quarterly meeting, on Tuesday, the county council considered a report from the joint committee of Surrey and Middlesex similar in terms to that presented to the Middlesex Council on the previous day, stating that, after careful reconsideration, the committee were unable to recommend any further reduction in the revised estimate of £149,000 as the contract price for the rebuilding of Kew Bridge, and they repeated their recommendation that an Act should be obtained for fresh borrowing powers. Mr. Halsey, chairman of the council, in moving the adoption of the report, read a letter from Mr. Littler, chairman of the Middlesex Council, pointing out that, despite the action of his own council on the previous night postponing the matter, it was still open for the Surrey Council to go for an Act, leaving the Middlesex Council to confirm it at the adjourned meeting. Mr. J. Lawrence moved an amendment to refer the matter back to the committee; but this proposal was rejected by a large majority, and the recommendations to seal the contract and proceed with the Bill were adopted.

MUNICIPAL CORPORATIONS.

Brighton.—The General Purposes Committee of the corporation have approved plans by which a great improvement will be effected at the Brighton Aquarium. The property has been for a long time in the market, and at length it has been acquired by a syndicate, who propose to form a winter garden on the site. Negotiations have been in progress, and an agreement has been arrived at under which 5,000 superficial yards will pass into the possession of the town, enabling the Marine Parade to be widened by 20 ft. From the new pier to the site of the toll-houses of the old Chain Pier.

Cheltenham.—The town council have decided to apply to the Board of Trade for an amendment of the Cheltenham Electric Light Order, 1890, by extending the area of supply to the whole of the borough as may be determined.

Chorley.—At the last monthly meeting of the town council it was resolved that a refuse destructor should be provided on land adjoining Stamp-lane, and that tenders for the erection of the destructor be advertised for.—It was also resolved that on the 9th November an Electric Lighting Committee should be formed to take over the duties appertaining to the laying down of an electric lighting plant.—A letter was read from the Local Government Board sanctioning the borrowing of £6,500 for purposes of sewage disposal, but insisting on the necessity for passing the effluent of the sewage over land after being chemically treated.

Colchester.—The Duke of Cambridge last week laid the foundation-stone of the new town hall, which is being erected by the corporation at a cost, excluding private gifts, of about £35,000, from designs by Mr. John Belcher, F.R.I.B.A., of Hanover-square, W. A conspicuous feature of the building will be the Victoria Tower, with clock and chimes, costing £2,000, the gift of the mayor, Alderman James Paxman, J.P. After the conclusion of the ceremony the mayor entertained about 500 guests at the annual Oyster Feast in the adjoining Corn Exchange.

Derby.—The Parliamentary Committee of the corporation at a recent meeting entered into an agreement for the purchase of the tramways. The actual price to be paid will be made known shortly, and the tramways will probably come into the possession of the town at the beginning of the new year.

Gloucester.—The corporation recently accepted the tender of Messrs. John Gurney & Sons, Gloucester, at £7,676, for the construction of the electric light works. The tender was not the lowest, but it was accepted because the contractors were the only ones who guaranteed to complete the works in nine months. Mr. H. Forse's (Bristol) contract was £9,278, and that of Messrs. Stephens, Barstow & Co., Limited, £10,774.

Lincoln.—The city council have decided to apply to the Local Government Board for sanction to borrow the sum of £19,000 for the purpose of defraying the expenses of the extension of the electricity works, cables, &c., and other works.

Liverpool.—Major Cardew, on behalf of the Board of Trade, recently paid a special visit to Liverpool, for the purpose of inspecting the experimental line of electrical tramways which extends from South Castle-street to the Dingle. He was met by Mr. Holmes, corporation electrical engineer, and Mr. J. O'Neill, manager of tramways.

Manchester.—The committee of the corporation who have in their charge the municipalisation of the tramway system in Manchester are conducting negotiations with the various urban authorities into whose districts the lines extend. Arrangements have been made with the Heaton Norris, Levenshulme, Gorton, Denton, Ardenshaw, Droylsden and Failsforth urban district councils; but the councils which govern the affairs of Withington, Moss Side and Stretford are still in negotiation with the committee. In the case of the two former there seems to be nothing to prevent an adjustment of the difficulties which have presented themselves. With Stretford, however, the case is different. It is understood that this authority—no doubt for reasons which, in their opinion, are perfectly good—are holding out for terms which the committee cannot see their way to concede.

Rotherham.—The following resolution was adopted at a recent special meeting of the town council: That this corporation do join with the Sheffield Corporation in the promotion of a Bill in the ensuing session of Parliament for acquiring the waters, or a portion thereof, of the rivers Don and Ashop, subject to the detailed terms as between Sheffield and Rotherham being incorporated in an agreement and approved of by the present sub-committee.

Tynemouth.—The town council, at a special meeting on Monday, resolved: That the proposals made by the council for the North Shields Water Company, as contained in the terms of arrangement, dated October 19th, as to the price to be paid by the corporation to the company and Earl Percy for the purchase of the undertaking and the settlement of other matters, set forth in the terms of arrangement, for the sum of £75,000 be adopted and confirmed.

Yarmouth.—At a special meeting of the corporation, on Monday of last week, the question of establishing electric trams in the borough was considered. The borough surveyor had framed a scheme on the overhead principle, the total cost of which would be £100,000, but the Lands Committee had struck out some of the routes and reduced the scheme so that the total cost would be £40,000, including construction, rolling stock and equipment. The scheme was adopted by nineteen votes to one vote.

URBAN DISTRICT COUNCILS.

Fawcett.—On Tuesday of last week Mr. E. A. Suddford Fawcett, A.M.L.E., conducted an inquiry, on behalf of the Local Government Board, into an application of the district council for power to borrow £12,000 for sewerage works.

Kingsbridge, Devonshire.—At the last meeting of the council it was decided to apply for a provisional order to carry

out certain works of water supply. Messrs. Fredk. Beesley & Son, of Westminster, were appointed engineers for the work.

Lower Bebington.—Last week Colonel W. R. Slacke, R.E., held an inquiry, on behalf of the Local Government Board, regarding an application of the district council for power to borrow £10,000 for a sewerage scheme, £5,000 for new public offices, and £3,000 for a recreation ground.

Middlewich, Cheshire.—Magnificent technical schools and a free library, which were projected to commemorate the Queen's diamond jubilee, were opened on Saturday. The cost was £2,400, of which Sir John Brunner contributed £1,263. Lord Crewe, who performed the opening ceremony and made a speech, expressed his view that the popular vote for free libraries should be abolished, and local authorities be allowed to establish such institutions.

Otley.—A special meeting of the council was held on the 1st inst. to consider a report on the water supply. At present the supply is drawn from a bore-hole at Menston and other small sources, which yield a total of 240,000 gallons daily. This is sufficient for present requirements, but it is proposed to extend the supply so as to provide for the expected increase during the next twenty or thirty years. To do this it is proposed to construct a reservoir at a place called Bow Beck, on the north side of the river Wharfe, near Ilkley. It was mentioned that the cost of the scheme would be £35,000, and it would yield a supply sufficient for at least thirty years. Otley would also be able to supply other townships with water.

Romford.—On Friday Mr. Meade-King, a Local Government Board inspector, held an inquiry at Romford into an application of the council for permission to borrow £6,000 for the erection of public baths and £1,486 for the purchase of the lairs and stock-yards at Moore's yard and the erection of buildings thereon.

Southgate.—At a recent meeting of the district council a letter was read from the Local Government Board with reference to the council's application for power to borrow the sums of £4,500, £1,700 and £1,700 for purposes of sewerage, stating that before such application be acceded to a local inquiry would be held on the subject. With reference to the borrowing of an additional sum of £1,700 in respect of the sewer in the Green-lanes and Hoppers-road, for the construction of which a loan of £3,300 was sanctioned in October, the Local Government Board wished to be furnished with a revised estimate of the total cost on their own forms, and a detailed section of the proposed crossing under the New River in connection with the proposed construction of a new sewer from Tile Kiln-lane to Barrowel Green-corner, for which the sum of £1,500 was to be applied for. The clerk and the surveyor were instructed to supply the required information.

Sowerby Bridge.—An inspector of the Local Government Board held an inquiry last week with respect to an application of the district council for permission to borrow £800 for the purchase of land for storage purposes.

Sutton-in-Ashfield.—Mr. Frederick H. Tulloch, M.I.C.E., on Tuesday week held an inquiry, on behalf of the Local Government Board, in reference to an application of the district council for sanction to borrow £8,000 for water supply works. Messrs. F. W. & G. Hodson, the engineers of the proposed scheme, attended and submitted the plans for the works.

Swinton and Pendlebury.—In consequence of representations made to them, the Local Government Board recently sent Major Carey, one of their inspectors, to inspect the sewerage works of the council, with a view to reporting as to their capacity for the treatment of the sewerage of the district. The board recommended the council to take 125 acres of land for the treatment of their sewerage; but the council pointed out that they were already producing an effluent which satisfied the Morsey and Irwell Joint Committee, and when other improvements now being carried out at the works have been completed the works will be "second to none for efficiency in Lancashire." The council's farm consists of 37 acres.

Whitefield.—The district council have resolved to apply to the Local Government Board for power to borrow money for important street improvements.

Winsford.—Last week, at a meeting of the council, the question of lighting the district by means of electricity was discussed. It was reported that the first installation to light the whole of the main streets would cost £7,700. Notice was given by a member of his intention to move that application be made to the Board of Trade for an electric lighting provisional order.

Withington.—A Local Government Board inquiry has been held into an application of the council for sanction to borrow £4,720 for the improvement of various thoroughfares and £1,560 for sewerage purposes. The surveyor, Mr. Mountain, showed the necessity for the improvements, and there was no opposition.

RURAL DISTRICT COUNCILS.

Halifax.—The council are about to construct water tanks in Norland and Upper Greenland, for the purpose of improving their supply of water to these hilly-situated districts. The districts are within the area of supply of the Halifax Corporation.

Hemsworth.—Colonel W. Langton Cook and Dr. H. T.

Bultrude recently held an inquiry, on behalf of the Local Government Board, in reference to the application of the district council for sanction to a loan of £1,750 for the carrying out of the South Emsall and Moolthorpe sewerage scheme. The clerk to the council said that for some time the council had had great difficulty in obtaining a suitable site for the disposal works. Now all arrangements had been made with Major Allatt, who was going to sell 4½ acres of land at £140 per acre. A committee had inspected the septic tank system at work in Exeter, and recommended that system for adoption. In formulating the scheme the council had had regard to the wishes of the inhabitants, and all proposals had been approved by the parish councils of the two townships. Mr. T. H. Richardson, the surveyor, explained the plans, and said the surface water and drainage water would be dealt with separately. The only trade effluents which would enter the sewers were from two malt kilns at South Emsall. The sewers would lie on the average about 3 ft. below the surface. The area for irrigation purposes was 3 acres 1 rood, and the tanks were to be on the septic principle. Other evidence was given, and the inquiry closed.

Maldon.—Mr. F. St. George Mivart, an inspector of the Local Government Board, has held an inquiry into an application of the council for permission to borrow £1,800 for the purchase of a site and the erection thereon of an isolation hospital at Southminster.

Newton Abbot.—Plans and estimates have been adopted by the district council for the construction of a reservoir, to hold 60,000 gallons, and the laying of the necessary pipes to supply Kingskerswell with water. The estimated cost is £1,900.

Reigate.—It has been announced that the Local Government Board, having had under consideration a report of their inspector on a recent inquiry with reference to an application of the council for sanction to borrow £1,000 for works of sewerage and sewage disposal, were advised that the site acquired on lease for the treatment and disposal of sewage was not suitable for such purpose, owing to its position and character, its liability to floods, and its close proximity to a public road and occupied houses. The board understood that the owner of the site was willing to lease and grant to the council another site. Under these circumstances the board must request the council to consider the matter, with a view to the adoption of a more suitable site. The council went into committee on the question at the conclusion of the highway business, and it was understood that it had been decided to take steps to acquire compulsorily a certain other site which was suggested.

SCOTLAND AND IRELAND.

Larne.—A specially-convened meeting of the town commissioners was held on the 28th ult., to take into consideration, along with other matters, "the report received from Mr. J. Finlay Peddie in reference to the sewerage of Larne," which this gentleman had been deputed and employed by the members to undertake. Mr. Peddie was present and produced his plans. After discussion it was resolved that the report be printed and circulated among the principal ratepayers, as well as copies sent to the members of the board, and that a special meeting of the commissioners be summoned, at a time to be appointed at next monthly meeting, to consider the question.

Linthgow.—The police commissioners, who are at present considering the best method for disposal of the town's sewerage, have received a report from Messrs. Warren & Stuart, Glasgow, with reference to the bacteriological method of sewage disposal in preference to the system of chemical treatment by precipitation and filtration which had been recommended by them some years ago.

Motherwell.—At a recent special meeting the town council had under consideration the question of introducing an electric light installation in the burgh. A committee submitted a report by Prof. Alexander B. W. Kennedy, who has been retained by the burgh. The total capital expenditure is calculated to be over £23,000, the scheme providing for private lighting thirty arc lamps and 100 32 candle-power incandescent lamps for street purposes, and for power for mechanical purposes. After some discussion the report was adopted.

Port Glasgow. The formal completion of additional waterworks, designed by Mr. James Wilson, Edinburgh, took place recently at Parkhill, near Port Glasgow. The works consist of a pure water tank capable of holding 500,000 gallons, and two new filters of about 800 square yards, the cost being £4,000. The contractors were Messrs. D. Cunningham & Sons, Kilmarnock. The ceremony of formally laying the last copestone was performed by Provost Rodger. It is calculated that in this department the requirements of the burgh have been met for the next twenty years.

Ross and Cromarty.—The county council of Ross and Cromarty have agreed to construct a new road from Kyle to Balmuccra, in the vicinity of the terminus of the Dingwall and Skye railway, the length of which will be 3 miles, and the estimated cost £5,000. The existing road is of a circular nature, over 7 miles in length, besides being most dangerous. It was also decided to construct a new iron bridge at different points in the island of Lewis, at a cost of £1,211.

Personal.

Llandudno Urban District Council have decided upon the appointment of an electrical engineer.

Mr. Percy G. Beckley, of Brierley Hill, has been appointed deputy surveyor to the Brierley Hill Urban District Council, at a salary of £100 per annum.

Mr. Morgan Thomas, of Pentre, was on Thursday appointed surveyor to the Porthcawl Urban District Council. There were twelve applicants for the post.

Mr. Thomas Jenkins, who has been a district superintendent under the Lambeth Vestry for several years, has been appointed to a similar position at Marylebone.

At the last monthly meeting of the Leeds Association of Engineers a paper was read by Mr. F. Leslie Watson, A.M.I.C.E., on "The Designing and Construction of Refuse Destructors."

Warmley Rural District Council have adopted a motion recommending the appointment of Mr. H. W. Bennett as surveyor for the parishes of Bitton, Siston Oldland and Hanham Abotts.

Carlisle Town Council have approved the appointment of Mr. C. D. Burnet as resident electrical engineer, at a commencing salary of £250 per annum, with liberty to take not more than two pupils.

The successful candidate for the post of engineering assistant in the department of Mr. S. A. Pickering, borough surveyor of Oldham, is Mr. William Shackleton, of the borough surveyor's office, Nelson.

At last week's meeting of the St. George's (Southwark) Vestry Mr. R. H. Jeffes, at present engaged in the surveyor's department at Thames Ditton, was elected to the vacant position of assistant surveyor.

Mr. J. Willecks, surveyor to the Buckfastleigh Urban District Council, recently gave notice of his intention to resign his post. At the request of the council, however, he agreed to continue in office until Christmas.

Mr. Sydney Baynes, chief electrical engineer to the St. Pancras Vestry, has been voted an immediate increase in his remuneration of from £600 to £700 per annum, with two further increases of £50 each up to a maximum of £800 per annum.

Last week the Spalding Urban District Council appointed Mr. J. H. Helé, of Stoke-on-Trent, as assistant borough surveyor. This office, which was rendered vacant by the resignation of Mr. D. Crampton, carries with it a salary of £100 per annum. There were forty-three applicants.

A new surveyor to the Andenshaw Urban District Council has just been appointed, the previous official, Mr. J. H. Burton, having resigned after holding the position for over twenty years. There were forty-eight applicants, from whom Mr. J. S. Green, of Haslingden, was selected. His salary will commence at £180 yearly.

Upon the recommendation of the Sewage Committee, the Yeovil Town Council recently decided to appoint Mr. W. K. L. Armytage, the borough surveyor, as engineer for the corporation's sewage scheme, which was on the septic tank system. Mr. Armytage's remuneration will be as follows: £100 at the conclusion of the Local Government Board inquiry; £50 if and when the scheme is accepted and the loan granted; and £100 at the completion of the works.

On the 4th inst., at a meeting of the Ayr Town Council, a letter was read from Mr. John Eaglesham, burgh surveyor, resigning the appointments held by him under the town council and police commissioners. He stated that he had for some time been considering the advisability of resuming private practice. He desired to be relieved of the duties as soon as possible. Eventually a committee was appointed to approach Mr. Eaglesham with a view to get him to reconsider his decision.

At a smoking concert, held at the Midland Hotel, Birmingham, on Friday evening last, under the presidency of the city surveyor, Mr. A. W. Lee (deputy building surveyor) was presented with a cellorette and cabinet by the members of the Public Works Department on the occasion of his marriage. On the same evening Mr. Charles Grubb, who is retiring after forty-six years of active service as superintendent of sewer-men, and whose career was recently made the subject of an article in a London daily paper, was also presented with a handsome marble clock, suitably inscribed, and a purse of gold.

An interesting presentation has been made in Chester to Mr. William Holland, late surveyor to the Cheshire County Council. The presentation, which came from the foremen and workmen of Mr. Holland's district, consisted of a very handsome black marble clock, striking the hours and half-hours on a richly-toned cathedral gong. On a gilt plate on the clock was engraved the following inscription: "Presented to Mr. William Holland, district surveyor of the No. 1 district (Cheshire County Council) on his promotion, by the foremen and workmen of his district, as a mark of respect and esteem, 25th October, 1898."

The death occurred on Sunday night of Mr. Daniel Roberts, district surveyor to the Derbyshire County Council. The deceased, who had been ailing for some time, was sixty-six years of age. He was one of the first surveyors appointed when the county council took control of the main roads, having previously been employed in a similar capacity for the Bakewell Union. He leaves three sons and three daughters. Up to the last he was most active in the discharge of his duties, and enjoyed the respect, not only of the workmen whom he employed, but also of a wide circle of friends in Bakewell and the neighbourhood.

Last week, at the usual monthly meeting of the Folkestone Town Council, the mayor, speaking with deep feeling, moved a resolution of condolence, on behalf of his colleagues in the council, upon the sad occasion of the death of Mr. John White, the borough surveyor. It was a very painful duty to him, as he had known Mr. White for many years. His loss would be greatly felt, and he most sincerely offered the family his deepest sympathy. The chairman of the Highways Committee endorsed the remarks of the mayor and expressed the opinion that the council had lost a most estimable and valuable servant, who has carried out his duties in a most admirable manner. Other members spoke, and the resolution was passed in silence.

Salthorn Urban District Council have appointed Mr. G. S. Baynes, of Jarrow, as surveyor, at a commencing salary of £125 per annum. Two months ago Mr. R. A. Jackson resigned the office, but intimated that he was willing to continue to serve until the council appointed his successor. The council regretted to lose Mr. Jackson's services, but they had no alternative but to advertise the vacancy. This invitation attracted ninety-nine applications, coming from all sorts and conditions of people; and the sifting process brought the number down to three, who were asked to interview the council. Mr. Baynes has had a good deal of experience, having had charge of contracts in London, besides having been for some time the chief assistant to the borough engineer of Jarrow.

A limited competition was recently held for the erection of new municipal buildings at Godalming, on the site of the present town hall, which is to be incorporated in the new group of buildings, which will include a court-house, with rooms for the magistrate and officials, as well as parochial offices. The council chamber will be on the first floor, with committee-room and offices for the town clerk. The scheme also includes a fire-engine station and men's quarters. The limit of the outlay was £7,000. The choice has been made of the premiated designs from eight sets of plans submitted; but Mr. A. H. Titman, who was among the invited architects, did not prepare a plan. Messrs. Lanchester, Stewart & Rickards were awarded the first place, Mr. E. R. Robson, F.S.A., was awarded the second premium, and Messrs. Ardron & Dawson the third. Mr. E. W. Mountford acted as assessor.

On Monday evening Prof. Aitchison, B.A., delivered the opening address of the session to the members of the Royal Institute of British Architects. He congratulated his audience on the improvement that was taking place in the appearance of London. It was a great triumph for architects that they were converting a rather dull city, mostly composed of brick walls with holes in them, into a town almost as picturesque and varied as the old towns of France or Flanders. Architecture was the poetry of construction, and the noblest poetry was naturally found in buildings that were applied to the highest transcendental uses. A certain amount of comeliness was necessary to every building, except such buildings as were required to create fear, horror or a sense of ignominy, such as castles, gaols and pillories. Having dealt with the principal things which wait teaching when construction and the art of planning had been mastered, the professor said, as regarded the practice of some of the younger members, there was too much straining after effect, too much recourse to easy means of arresting attention, too much partiality for curious and incongruous forms; the sewer arch or water opening was too much adopted for entrance doorways and attic windows—anything for a novelty. In his opinion there was nothing like straight lines for dignity, and the rounded corners and bellied door and window heads mostly produced meanness. The simplicity, grace and restraint of Greek work could not be too much studied, and that profusion of ornament that was now so common was not only opposed to Greek practice, but to good taste. They wanted badly a well-designed large window. They might increase one incentive by insisting on being paid for their work, for they were not paid now, and the powers that be might make another incentive more common by bestowing honours on the profession, which was now hardly recognised. In conclusion, he urged that they should devote themselves to architecture, and spare no thought and no labour in perfecting their work, so that it might vie with the best Greek work in grace and with the Medieval in impressiveness. On the motion of Colonel Leux Prendergast, seconded by Prof. Roger Smith, a vote of thanks was passed to the president for his address.

BRADFORD WATER SUPPLY.

PROGRESS OF THE NIDD VALLEY WORKS.

The report of the Waterworks Committee of the Bradford Corporation for the municipal year just ended contains the following particulars in reference to the progress of the new water supply works in the Nidd valley:—

GOUTHWAITE RESERVOIR.

The building of the masonry wall, the gauge basin, river retaining walls and river channel works are all completed. The whole of the arches, fourteen in number, over the dam, for carrying the roadway, as well as the parapet walls on each side, are completed. The narrow trench on the west side of the masonry dam, for about 180 yards in length, has been excavated, and 9,700 cubic yards of concrete have been put into place. The new road diversion along the western side of the reservoir, to replace the existing public road, has been pushed forward during the year, and the two bridges carrying the road over Colthouse Beck and Burn Gill are practically completed.

THE NIDD AQUEDUCT.

The work on this contract has progressed fairly well during the past year, and but for the flooding by water of the middle section of the Greenhow tunnel on December 11, 1897, which prevented two of the faces being worked for a period of some months, the work would have been farther advanced. The masonry dam on the Nidd, which is being constructed to intercept the water of the Nidd for the supply of the city, is about one-third completed. The pipes, valves, &c., therefrom, which join up to the Rain Stang tunnel, are laid; the Rain Stang tunnel, 2,486 yards in length, has been driven for a length of 2,360 yards, and the main aqueduct, consisting of 36-in. pipes and cut and cover work, together with the branch aqueducts connected therewith, are completed to Burn tunnel. The Burn tunnel, 1,844 yards in length, is finished. The pipes, aqueduct, bridges, &c., from Burn tunnel to Greenhow tunnel are all completed. The Greenhow tunnel, which has been kept back, as notified above, has been driven to a length of 4,850 yards, out of a total length of 6,200 yards. From thence to Chellow Heights reservoir and filter-beds the main line aqueduct, pipes, valves, manways, bridges, &c., are practically completed. The 30-in. pipe line from the main aqueduct to Barden reservoir is two-thirds finished, and the intercepting dam on the Barden Beck is in progress. The whole of the pipes for the Nidd aqueduct have, with the exception of a few special pipes, been supplied.

CHELLOW HEIGHTS SERVICE RESERVOIR AND FILTER-BEDS.

This work has been pushed steadily forward during the past year. The walling encircling the reservoir is nearly finished and coped, the bottom of the reservoir for about one-third of its area has been puddled with 14-in. deep of clay puddle, and on the top of this a layer of concrete has been laid 14-in. thick. The masonry of the upstand outlet and superstructure is complete. Seventy-six per cent. of the walling, concreting and puddling of the reservoir is complete. Twenty-eight per cent. of the work in formation of the filter-beds, including walling, concreting and puddling, is completed. Fifty-two per cent. of the outlet valve wells of the filters is completed. Of the distributing canal 9 per cent. is done. Of the sand-trap 79 per cent. is completed. Of the pipe trenches and laying 73 per cent. is completed. In all 57.6 per cent. of this work is complete.

SEWER-FLUSHING APPARATUS.

The drought from which we have suffered during this year, and also the preceding years, has caused considerable anxiety to sanitary authorities on account of the want of water for sewer-flushing. During the long periods of drought the smaller street sewers gradually silt up and become almost choked with solid matter, which soon decomposes, liberating myriads of fever germs, which are soon carried into the atmosphere by breeze. Thus, at the very time when water is most scarce, sewer-flushing is most required. The ordinary mode of flushing, by pouring water down the sewers, is of little use, as it runs over the deposit and leaves things almost as bad as before, although requiring large quantities of water. A better system, however, was recently tested at Eccles, Lancs. where the local authority were in difficulty with the pipe sewers. A 12-in. pipe was opened and found to contain over 6 in. of solid matter, the flow of water over this being very small. In fact, there was every probability, in the event of a few weeks' longer drought, that the system would become entirely choked. Messrs. Merryweather, the hydraulic engineers, were consulted, and sent down their patent hydraulic sewer-flasher. Mr. A. C. Turley, the borough surveyor, and a number of the members of the town council were present at a test of this apparatus, and the work done was very satisfactory. In one case a length of 12-in. pipe, 120 ft. long and 12 in. in diameter, more than half choked with silt (10 ft. was thoroughly cleaned in forty-five minutes. Further experiments were understood, and to be carried out, and it is hoped that reliable data will be obtained in reference to the advantages or otherwise of the apparatus and in reference to its

economy compared with ordinary flushing. This data we hope to publish in due course. We are informed that the sewer in which the above-mentioned test was carried out could not have been cleaned by any ordinary process of flushing, as the silt it contained was very much consolidated and could only have been removed by opening out the whole sewer trench, taking up the pipes and cleansing them by hand labour. It will be seen, therefore, that immense advantage is obtained by using the apparatus in cases where the sewers are in a similar condition to the one mentioned above.

HULL NEW PUBLIC BATHS.

The new public baths which have been erected by the Hull Corporation in the eastern division of the city were recently formally opened. The building is a brick structure, situated in Holderness-road. The front elevation is of red brick and terra-cotta, harmonising with the adjoining Beckitt Library. There is a swimming bath, 96 ft. by 30 ft., with 3 ft. 9 in. to 6 ft. 6 in. of water; a boys' bath, 60 ft. by 30 ft., with 3 ft. 6 in. to 4 ft. 6 in. of water; nine ladies' slipper baths, and ten men's first-class baths and twelve men's second-class baths. The large swimming bath occupies a position at the back, and has a semi-circular roof of iron and glass. A gallery for spectators runs over the dressing-boxes, and provision has been made for turning the room into a meeting hall in the winter. The boys' bath, behind the library, is built on the same plan, only the dressing-rooms are open recesses. The boiler-house and laundry stand between the swimming baths, whilst the waiting-rooms face the slipper baths in the central corridor. The slipper baths are arranged in short corridors, and are all fitted up with hot and cold showers. The manager's house is over the front part of the building. The plans were prepared by the city engineer, Mr. A. White, and the assistant engineer, Mr. Bricknell, and under their supervision the work has been carried out, at a cost of about £15,000.

TYPHOID FEVER AT LEIGH.

Recently, at a meeting of the Leigh (Lancs.) Urban District Council, a member submitted a request for particulars in regard to the epidemic of typhoid fever in the town. It was, he thought, absolutely necessary that everything should be done to trace the source of the outbreak. Leigh obtained its water supply from Rivington, and he had noticed from the newspapers that there were one or two cases of pollution in that district in the neighbourhood of reservoirs.

The chairman of the Health Committee said the medical officer of health had found it impossible to trace the cause of the outbreak directly. There were many causes, one of the chief of which was the system of closets and ash-pits which the council permitted. It was a system which was fruitful of any kind of infectious diseases, and so long as the council allowed property owners to make ash-pits in the way they did at present the medical officer of health was strongly of opinion that they would always have intermittent epidemics of typhoid fever. In fact, they could not possibly be avoided.

APPOINTMENTS VACANT.

Official and all similar advertisements received later than this day evening are too late for classification and cannot therefore be included in these summaries. No advertisements received after 3 p.m. can be inserted until the following week.

HIGHWAY SURVEYOR.—November 11th.—Isle of Wight Rural District Council. £150.—Mr. H. Eldridge Stratton, clerk to the council, Pyle-street, Newport, I.W.

SECOND ASSISTANT.—November 12th.—County Borough of Hanley. £80.—Mr. Joseph Lobley, borough engineer and surveyor.

SUPERINTENDENT AT THE CORPORATION WHARF.—November 12th.—County Borough of Southampton. £200.—Mr. George B. Salder, town clerk.

SUPERINTENDING ARCHITECT.—November 14th.—London County Council. £1,500.—Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, S.W.

ASSISTANT SURVEYOR.—November 14th.—Wimbledon Urban District Council. £200.—Mr. W. H. Whitfield, clerk to the council.

CHIEF OFFICER OF TRAMWAYS.—November 14th.—London County Council. £1,500.—Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, S.W.

ROAD FOREMAN.—November 11th.—Corporation of Morley. £2 2s.—Mr. W. E. Putnam, A.M.I.C.E., borough engineer and surveyor.

ROAD FOREMAN.—November 14th.—Corporation of Baccup.—Mr. Francis Wood, A.M.I.C.E., borough engineer and surveyor.

ROAD FOREMAN.—November 16th.—Hendon and Isdworth Urban District Council. £2 10s.—Mr. W. A. Davies, A.M.I.C.E., engineer and surveyor to the council.

SURVEYOR OF HIGHWAYS AND INSPECTOR OF NUISANCES.—November 17th.—Tarvin Rural District Council. £130.—Mr. Edward Evans Lloyd, clerk to the council.

BUILDING INSPECTOR.—November 19th.—Corporation of Bury. £120.—Mr. J. Cartwright, borough engineer.

SEWAGE FARM MANAGER.—November 19th.—Longton Corporation. £150.—Mr. J. W. Wardle, borough surveyor.

ENGINEER.—November 19th.—The Cork, Blackrock and Passage Railway Company. £500.—Mr. R. J. Copping, secretary to the company, Cork.

GENERAL SURVEYOR'S ASSISTANT.—November 19th.—Bexhill Urban District Council. £75.—Mr. Fred. A. Langham, clerk to the council.

GENERAL SURVEYOR'S ASSISTANT.—November 21st.—Corporation of Maidenhead. £80.—Mr. Percy Johns, borough surveyor.

CLERK OF WORKS.—November 21st.—Corporation of Sunderland. £3 10s.—Mr. Fras. M. Bowey, town clerk.

FIRE BRIGADE ENGINEER.—November 26th.—Corporation of Coventry. £1 15s.—The City Engineer.

COMPETITIONS.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in these summaries. No advertisements received after 3 p.m. can be inserted until the following week.

ABERAVON.—December 1st.—Extension of the covered market, at a cost not to exceed £5,000. £21.—The Borough Surveyor.

CHRETSLEY.—December 23rd.—Sewerage and sewage disposal scheme for the No. 1 and 2 wards of the district. £90, £30 and £20.—Mr. T. E. Harland Chalklett, clerk to the council.

BRADFORD.—January 2nd.—Erection of a central fire brigade station. £100, £50 and £30.—Mr. George McGuire, town clerk.

MUNICIPAL CONTRACTS OPEN.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in these summaries. No advertisements received after 3 p.m. can be inserted until the following week.

NOFOLK.—November 11th.—Erection of steel and iron bridges at East Harling and Reelley, near Dereham, for the county council.—Mr. T. H. B. Heslop, M.I.C.E., county surveyor, Norwich.

ALTRICHAM.—November 11th.—Erection of new offices, council chamber, fire station, caretaker's house, &c., for the urban district council.—Mr. John Stokes, clerk to the council.

BIRMINGHAM.—November 11th.—Supply of certain goods for use in the general and Elan Valley supply departments for one year from January 1, 1899, for the corporation.—Mr. E. Antony Lees, secretary, Water Department, 4 Broad-street, Birmingham.

TALTON.—November 12th.—Supply of about 67 tons of 8-in. and 6-in. cast-iron spigot and socket bituminised water pipes.—Mr. George H. Kite, town clerk.

LAUNCESTON.—November 12th.—Construction of a new cattle, sheep and pig market.—The Town Clerk.

COVENTRY.—November 12th.—Erection of buildings at the proposed two new sewage pumping stations on the side of the main road from Coventry to Daventry.—Mr. Lewis Beard, town clerk.

DEWSBURY.—November 12th.—Paving, flagging, kerbing, channel-lieg, &c., works in Thornton-street.—Mr. Henry Dearden, borough surveyor.

LANGFELACH.—November 12th.—Construction of about 456 yards of 12-in. stoneware pipe sewer in Sterry-road and Mount-street, Goverton, for the rural district council.—Mr. J. Thomas, A.M.I.C.E., engineer and surveyor to the council, 32 Fisher-street, Swansea.

BARROW-IN-FEATHER.—November 14th.—Supply and erection of cast-iron lamp columns, arc and incandescent lamps, and automatic switches and fittings.—Mr. C. F. Preston, town clerk.

ANFIELD PLAIN.—November 14th.—Formation of the road and footpath in Victoria-terrace and other streets, for the urban district council.—Mr. T. J. Trowsdale, surveyor to the council.

BURTON-ON-TRENT.—November 14th.—Erection of public baths on land adjoining Livingstone-street and Prince-street.—Mr. Charles Brownridge, A.M.I.C.E., borough engineer and surveyor.

STOCKTON-ON-TRENT.—November 14th.—Execution of various private street improvement works.—Mr. M. H. Sykes, borough engineer.

LEWISHAM.—November 14th.—Kerbing, lac-paving, channelling and metalting works in Vancouver-road, for the district board of works.—The Surveyor to the Board.

BROMLEY.—November 15th.—Works of surface-water drainage in Plastow-lane, for the urban district council.—Mr. Fred. H. Norman, clerk to the council.

LONDON.—November 15th.—Erection of new public conveniences at Blackwall Tunnel (north side), for the county council.—The Clerk to the Council, County Hall, Spring-gardens, S.W.

LONDON.—November 15th.—Erection of a new coroner's court building at Manor-place, Paddington, for the county council.—The Clerk to the Council, County Hall, Spring-gardens, S.W.

HARLEY.—November 15th.—Erection of a fire-resisting structure.—Mr. J. Lobley, borough engineer.

ACTON.—November 15th.—Supply of a steam fire-engine, a 50-ft. fire-escape, and electric street alarm, fire calls, &c., for the urban district council.—Mr. D. J. Ebbetts, clerk to the council.

GARDIFAY.—November 15th.—Erection of fish market and offices at Blackwall Tunnel (north side), for the county council.—The Engineer.

TOTTENHAM.—November 15th.—Making-up of Chilmington-road and The Avenue, for the urban district council.—Mr. P. E. Murphy, engineer to the council.

DOVER.—November 15th.—Supply of about 1,600 tons of broken Gwersy granite, 500 tons of Gwersy granite screenings, and about 2,000 lineal feet of Gwersy granite kerbing, channelling and quadrant curbs.—Mr. E. Wollaston Knocker, town clerk.

TOTTENHAM.—November 15th.—Providing and laying of about 3,088 yards super. of 23-in. hard York paving on the east side of Green-lanes, for the urban district council.—Mr. P. E. Murphy, engineer to the council.

HETFORD.—November 15th.—Laying of about 160 yards of 9-in. and 60 yards of 12-in. glazed stoneware pipe sewers.—Mr. John H. Jevons, A.M.I.C.E., borough engineer and surveyor.

LINCOLN.—November 16th.—Supply of hard wood blocks for street paving.—Mr. R. A. Macbrin, city surveyor.

PLUMSTEAD.—November 16th.—Paving and making-up of part of Portmount-road and part of Old Mill-road, for the vestry.—Mr. W. C. Gow, surveyor to the vestry.

ATYLESBURY.—November 16th.—Construction of sewage disposal and other works, for the urban district council.—Mr. J. H. Radford, surveyor to the council.

WORTHING.—November 16th.—Supply of 2,500 ft. of 12-in. by 6-in granite curbs and a quantity of broken granite.—Mr. Frank Roberts, A.M.I.C.E., borough engineer and surveyor.

SOUTHAMPTON.—November 16th.—Supply of two engines and dynamo for the County Lunatic Asylum at Knowle, Fareham.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

RADCLIFFE.—November 16th.—Sewering of Market, Sead and Roscow streets, for the district council.—Mr. J. Sharples, clerk to the council.

BARNSLEY.—November 16th.—Drainage, paving, flagging and metalting of Beckett-street and Vernon-street.—Mr. J. Henry Taylor, borough engineer.

BASTLIGH.—November 17th.—Providing and fixing of a chain pump at the sewage pumping station at Chickenhall, for the urban district council.—Mr. Henry White, clerk to the council.

CARMARTHENSIRE.—November 18th.—Erection of a stone bridge of three arches over the river Towy at Drlyslwyn, for the county council.—Mr. Thomas Jones, clerk to the council, Llandovery.

BIRMINGHAM.—November 18th.—Supply of engine slack, cast-iron pipes, special castings, &c., at the various pumping stations and wharves during the year 1899.—Mr. E. Antony Lees, secretary to the Corporation Water Committee, 44 Broad-street, Birmingham.

ADRETTILLERY.—November 18th.—Construction of a new road from Abertillery to Aberbeg, a distance of about 2 miles, for the urban district council.—Mr. James McBean, engineer and surveyor to the council.

LEICESTER.—November 19th.—Supply and delivery of retorts and firebricks.—Mr. Alfred Colson, M.I.C.E., engineer and manager, Corporation Gasworks, Millstone-lane, Leicester.

ENFIELD.—November 19th.—Execution of protection works in the parishes of Sieringham and Beeston-Regis, for the rural district council.—Mr. Thos. Ling, clerk to the council, Northrepp, Norwich.

BOGNOR.—November 21st.—Construction of a new sea wall and esplanade, 487 ft. in length, for the urban district council.—Mr. O. A. Bridges, town surveyor.

DRAGLAW.—November 21st.—Construction of 607 lineal yards of 24-in. pipe sewer, 616 lineal yards of 18-in. pipe sewer and 343 lineal yards of 15-in. pipe sewer, for the urban district council.—Mr. W. Curry, engineer to the council.

STAFFORDSHIRE.—November 21st.—Laying of about 5,000 yards of 12-in., 9-in., 6-in. and 4-in. cast-iron and stoneware pipe sewers and surface-water drains at the County Lunatic Asylum, for the county council.—Mr. Walter H. Cheadle, county surveyor, Stafford.

ULVERSTON.—November 21st.—Various sewerage and drainage works, for the rural district council.—Mr. Chas. W. Dean, clerk to the council.

WEDNESBURY.—November 21st.—Widening of the bridge over the Birmingham Canal at the Holyhead-road, near Moxley.—Mr. E. Martin Scott, borough engineer and surveyor.

CAMBERWELL.—November 21st.—Supply of 2,650,000 Australian hardwood blocks, 3 in. by 9 in. by 5 in.; 2,650,000 creosoted deal blocks, 3 in. by 9 in. by 5 in.; and 3,200 loads of Australian hardwood in 6 in. by 3 in. planks, for the vestry.—Mr. W. Ostby, engineer and surveyor to the vestry.

LANCASTER.—November 21st.—Supply of about 1,560 lineal yards of 7-in. cast-iron pipes.—Mr. John Cook, A.M.I.C.E., water engineer, Town Hall, Lancaster.

STAFFORD.—November 21st.—Supply of a stone-breaking machine.—Mr. W. Blackley, borough engineer.

ASHTON-UNDER-LYNE.—November 21st.—Construction of precipitation tanks, artificial filters, land filters, subways, culverts, roads and other appurtenant works.—Mr. J. T. Earnshaw, A.M.I.C.E., borough surveyor.

SOUTHAMPTON.—November 22nd.—Supply and delivery of sluice valves, fire hydrants, air valves and surface covers required by the waterworks department during the ensuing three years, for the corporation.—Mr. W. Matthews, waterworks engineer.

GLASGOW.—November 22nd.—Supply of about 800 lineal feet of cast-iron pipes, 21 in. in diameter, and certain cast-iron pipes, 22 in. and 24 in. diameter, special castings, for the new electricity works at Port Dundas.—Mr. J. D. Marwick, town clerk.

NEWCASTLE-ON-TYNE.—November 22nd.—Supply during the twelve months ending December 31, 1899, of various materials, &c.—The City Engineer.

ELANTRON.—November 22nd.—Execution of about 5,252 ft. of 14-in. kerbing, about 4,095 ft. of 1-in. channelling, and about 3,048 ft. of crossings in Queen's-road, Station-road, Hyde-lane, Eldon-road, Hertford-road, Silver-street and Forc-street; about 3,111 yards super. of indurated sand paving in Queen's-road, Charnock-street, Station-road, Hyde-lane, Eldon-road, and about 1,667 yards super. of patent Victoria stone paving in Hertford-road and Forc-street; for the urban district council.—Mr. G. Keddes Rachus, M.I.C.E., surveyor to the council.

CASTLE DONNINGTON.—November 23rd.—Execution of various sewerage works for the rural district council.—Mr. Herbert Walker, A.M.I.C.E., Newcastle Chambers, Angitrow, Nottingham.

WYTHAM (ESSEX).—November 24th.—Supply of 300 tons of granite, for the urban district council.—Mr. Wm. Bindon Blood, clerk to the council.

BIRMINGHAM.—November 24th.—Construction of brick and pipe sewers in Church-street.—Mr. John Trigg, city engineer and surveyor.

BURTON-ON-TRENT.—November 24th.—Supply of fireclay retorts, bricks and clay required at the gasworks during the year 1899.—Mr. F. J. Rausden, manager and engineer, Corporation Gas and Electric Light Works, Burton-upon-Trent.

TARK.—November 25th.—Construction of stonewares and other sewers for the interception of the sewers of the town, together with the necessary manholes, inspection shafts, flushing tanks, outfall works and engine-house, for the urban district council.—Mr. Wm. Parker, clerk to the council.

EAST RETFORD.—November 25th.—Construction of about 20,000 lineal yards of stoneware and iron pipe sewers, with manholes, storm overflow, ventilators, ejector chamber and ejectors, cast-iron rising main and other works; also precipitation tanks, engine and boiler houses, chimney shaft, press-house, stores and offices, carriers, underdrainage and leveling land, roads, fencing and other works.—Mr. Samuel Jones, town clerk.

STOURBRIDGE.—November 28th.—Construction of 960 yards of 9-in. earthenware pipe sewer, for the main drainage board.—Mr. W. Fiddins, surveyor to the board, Town Hall, Stourbridge.

BACONSFORD.—November 28th.—Construction of stoneware pipe sewers comprised in the scheme of sewerage for the parish of Pedmore, for the rural district council.—Mr. H. D. Holloway, clerk to the council.

BIRMINGHAM.—November 29th.—Supply of about 6,500 lineal yards of kerb and about 820 tons of 4-in. cube sets, for the urban district council.—Mr. Herbert H. Humphreys, engineer and surveyor to the council.

BUCKLOW.—November 29th.—Reconstruction of the main sewers of the township of Hall, for the urban district council.—Mr. J. M'D. McKenzie, surveyor to the council, 7 Market-street, Altrincham.

WEST HARTLEPOOL.—November 29th.—Supply of various materials and goods required during the year ending December 31, 1898.—Mr. J. W. Brown, borough engineer.

MIDDLEBROUGH.—November 29th.—Supply and erection of various electric lighting plants, for the corporation.—Mr. Robert Hammond, consulting engineer, 64 Victoria-street, London, S.W.

SALFORD.—December 1st.—Supply and erection of certain electric plant.—Mr. Saml. Brown, town clerk.

JOHANNESBURG, S.A.—January 6th.—Supply of a complete carburetted water-gas plant, for the corporation.—Messrs. Robert Whyte & Co., 22 Bury-street, St. Mary Axe, London, E.C.

LEWISOX.—January 24th.—Construction of a tunnel for pedestrian traffic under the river Thames from Greenwich to Poplar, for the county council.—Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, S.W.

HOLKNEY.—Sale of manual fire engine, for the urban district council.—Mr. E. J. Lovegrove, engineer and surveyor to the council.

TENDERS.

*ACCEPTED.

CARDIFF.—For forming, metalling, paving, kerbing, channelling and sewerage works in Teilo-street, Gardens-lane North, Portnammoor-road and Spilot-lane.—Mr. W. Harpur, s.r.c.e., borough engineer:—

	Portnammoor-road	Spilot-lane	Teilo-street	Gardens-lane North
J. Rich, Cardiff ...	£1,020	415	437*2	421*

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

NOVEMBER.

- 11.—Sanitary Institute: Lecture to sanitary officers: Prof. T. Roger Smith, F.R.S.E., on "Sanitary Building Construction." 8 p.m.
- 12.—Sanitary Institute: Visit of sanitary officers to the Richmond main drainage works, Mortlake, under the guidance of Mr. W. W. Bentley, A.M.I.C.E. 3 p.m.
- 14.—Sanitary Institute: Lecture to sanitary officers: Dr. Geo. Reid, M.D., D.P.M., medical officer of health to the Staffordshire County Council, on "Sanitary Appliances." 8 p.m.
- 15.—Institution of Civil Engineers: Ordinary meeting: Mr. William Beedie Esson, M.I.C.E., on "Electrical Transmission of Power in Mining." 8 p.m.
- 16.—Sanitary Institute: Visit in the parish of St. George's (Hanover-square), under the guidance of Mr. Albert Taylor, chief sanitary inspector. 2 p.m.
- 16.—Sanitary Institute: Lecture to sanitary officers: Mr. J. Wright Clarke on "Details of Plumbers' Work." 8 p.m.
- 16.—Royal Institute of Public Health: Sir Richard Thorne Thorne, K.C.M.G., M.D., F.R.S., medical officer to the Local Government Board, on "The Administrative Control of Tuberculosis" (third Harben Lecture for 1898). 6 p.m.
- 17.—Association of Birmingham Students of the Institution of Civil Engineers: Ordinary meeting: Mr. J. G. Marshall, A.M.I.C.E., on "Light Railways and Rolling Stock." 7.30 p.m.
- 18.—Sanitary Institute: Lecture to sanitary officers: Mr. W. C. Tyndale, M.I.C.E., on "House Drainage." 8 p.m.

NOTICES.

THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER may be ordered direct, through any of Messrs. Smith & Son's book-stalls, or of any newsagent in the United Kingdom. Applications to the Offices for single copies by post must in all cases be accompanied by stamps.

The Prepaid Subscription (including postage) is as follows:

	Twelve Months.	Six Months.	Months.
United Kingdom ...	15s.	7s. 6d.	3s. 6d.
Continent, the Colonies, India, United States, &c. ...	19s.	9s. 6d.	4s. 9d.

The International News Company, 83 and 85 Duane-street, New York City; The Toronto News Company, Toronto; and The Montreal News Company, Montreal, have been appointed agents in the United States and Canada for the sale of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER. A thin paper edition is printed for circulation abroad.

APPOINTMENTS OPEN.

BEXHILL URBAN DISTRICT COUNCIL.
ASSISTANT SURVEYOR.

The Bexhill Urban District Council require a General Assistant in the Surveyor's Department.

Candidates must be neat draughtsmen, competent to take levels, prepare plans and detail drawings for works of sewerage, road-making, private street works and apportionments, and the general routine of a surveyor's office. Preference will be given to applicants having had previous experience in a municipal engineer's office. Salary, £75 per annum, payable monthly. Duties to commence on December 1, 1898.

Applications, stating age, with copies of not more than three recent testimonials (which will not be returned), to be forwarded to the undersigned not later than the 19th inst. Personal canvassing will disqualify.

FRED. A. LANGHAM,
Clerk.

Municipal Buildings, Bexhill.
November 8, 1898.

BOROUGH OF MAIDENHEAD.
SURVEYOR'S ASSISTANT.

The Town Council of the Borough of Maidenhead require the services of a General Assistant in the office of the Borough Surveyor, at a salary of £28 per annum.

Candidates must not be more than twenty-eight years of age and have received a thorough training in a municipal office. They should be competent to survey and level accurately, prepare plans and detail drawings for private street improvements and other works, have a knowledge of building construction, and generally be able to assist in the duties of a borough surveyor's department.

Applications, in the handwriting of the candidate, stating age and qualifications, accompanied by copies of not more than three testimonials, and endorsed "Surveyor's Assistant," must be sent in to me not later than Monday, the 21st day of November, 1898.

PERCY JOHNS,
Borough Surveyor.

Gnildhall, Maidenhead.
November 7, 1898.

COUNTY BOROUGH OF BURY. BUILDING INSPECTOR.

The Sewering, Paving and Streets Committee invite applications for the appointment of Building Inspector in the Borough Engineer's department.

Candidates must be thoroughly qualified persons, and will be required to undertake the inspection of new buildings and drains, to fix levels, and make surveys of all new houses, buildings and drains, and to keep the necessary records in connection therewith. The commencing salary will be £120 per annum, increasing by yearly increments of £10 to £160 as a maximum. A list of duties may be obtained on application.

Applications, in candidate's own handwriting, stating age (which must be between twenty-eight and thirty-five), accompanied by not more than three copies of recent testimonials, and endorsed "Building Inspector," to be sent to Mr. J. Cartwright, Borough Engineer, on or before Saturday, the 19th instant.

Canvassing will be considered a disqualification.
JOHN HASLAM,
Town Clerk.

COMPETITION.

CITY OF BRADFORD.

INTENDED CENTRAL FIRE BRIGADE STATION.

TO ARCHITECTS.

The Corporation of the City of Bradford are prepared to receive Competitive Designs for the Erection of a Central Fire Brigade Station. Three premiums are offered to competing architects—viz., £100, £50 and £30. Plan of the site, with printed instructions, may be had on application at the

City Surveyor's office on and after Monday, the 31st inst., on payment of 1 guinea, to be returned after receipt of design. The designs must be sent in not later than Monday, the 2nd of January, 1899.

(By order)

GEORGE MCGUIRE,
Town Clerk.

Town Clerk's Office, Bradford.
October 25, 1898.

TENDERS WANTED.

TANTON RURAL DISTRICT COUNCIL. ROAD-ROLLERS WANTED.

Wanted immediately, on Hire, at least two Road-rollers for 200 days' work in total.

The owner of such machines to provide a water-cart, with pump for each; also driver and boy, and all necessary oil, &c. Time of working only to be paid for, the council providing coal.

Tenders, stating price per day of at least eight hours, to be sent to me, the undersigned, on or before the 18th November instant.

(By order)

W. F. B. DAWE,
Clerk.

Tannton Rural District Council.
November 9, 1898.

HORNSEY URBAN DISTRICT COUNCIL. FIRE ENGINE FOR SALE.

The Hornsey Urban District Council invite offers for their Manual Fire Engine (London Brigade pattern), 6-in. pumps, in thorough condition, with spare set of wheels, improved pole crab and double-lever brake.

For permission to view and further particulars apply to Mr. E. J. Lovegrove, Engineer and Surveyor to the Council, at the Council's offices as below.

(By order)

**ERDINGTON URBAN DISTRICT COUNCIL.
TO QUARRY OWNERS.**

The Highways and Buildings Committee of the above Council are prepared to receive tenders for the supply and delivery of about 6,500 lineal yards of Kerb.

They are also prepared to receive tenders for the supply and delivery of about 820 tons of 4-in Cube Setts.

Specifications, forms of tender and all information may be obtained upon application at my office, Public Hall, Erdington, from Monday, the 14th inst., to Tuesday, the 20th inst., upon which latter day tenders, endorsed "Kerbing" or "Setts," must be delivered to me not later than 12 o'clock at noon.

The Council do not bind themselves to accept the lowest or any tender, and the tender of any firm paying less than the standard rate of wages current in their district will not be considered.

The work may be let in two or more contracts.

HERBERT H. HUMPHRIES,

District Engineer and Surveyor.

Public Hall, Erdington, Birmingham.

November 9, 1898.

**THAME DRAINAGE.
TO CONTRACTORS.**

The Urban District Council of Thame are prepared to receive tenders for the construction of Stoneware and other Sewers for the interception of the sewage of Thame, together with the necessary manholes, inspection shafts, flushing tanks, outfall works and engine-houses.

The works are to be in accordance with plans and specification prepared by Messrs. John Taylor, Sous & Santo Crimp, civil engineers, 27 Great George-street, Westminster, at whose office the plans may be inspected, and copies of the specification and bill of quantities obtained, upon depositing £5 (cheque only), which will be returned on receipt of a *bona-fide* tender.

Sealed tenders, endorsed "Thame Drainage," are to be delivered at my office before noon on the 28th day of November, 1898.

The Council do not bind themselves to accept the lowest or any tender.

WILLIAM PARKER,
Clerk to the Council.

2 High-street, Thame.
October 28, 1898.

CITY OF BIRMINGHAM.

The Public Works Committee invite tenders for the Re-construction of the Brick and Pipe Sewers in Church-street, in the city of Birmingham.

Drawings and specification may be seen, and sets of quantities and forms of tender obtained, by applying at this office on and after Tuesday, the 8th inst., upon depositing a cheque for 1 guinea, which will be returned on receipt of a *bona-fide* tender.

The contractor whose tender is accepted will be required to pay not less than the standard rate of wages current in the district.

Tenders, sealed and endorsed "Tender for Sewers in Church-street," to be delivered here not later than 10 a. m. on Thursday, November 24th.

The Committee do not pledge themselves to accept the lowest or any tender.

(By order)

JOHN PRICE,

City Engineer and Surveyor.

Council House, Birmingham.

November 1, 1898.

**VESTRY OF CAMBERWELL.
TO TIMBER MERCHANTS.**

The General Purposes Committee of this Vestry will meet at the Vestry Hall, Peckham-road, on Monday, November 21 1898, at 7 p.m., to receive alternative tenders for the supply of:—

2,050,000 Australian Hardwood Blocks, 3 in. by 9 in. by 5 in.;

2,050,000 Creosoted Deal Blocks, 3 in. by 9 in. by 5 in.;

3,260 loads Australian Hardwood, in 9-in. by 3-in. planks.

Specification and all particulars can be obtained on application to Mr. W. Oxtoby, Engineer and Surveyor, Vestry Hall, as above, on and after Thursday, 10th November, 1898.

The Vestry does not bind itself to accept the lowest or any tender.

Contractors or their agents must be in attendance at the time first above mentioned.

Persons tendering must comply with the conditions with regard to rates of wages and hours of labour as contained in the form of contract.

(By order)

C. WILLIAM TAGG,

Vestry Clerk.

November 8, 1898.

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

Easily and quickly laid by unskilled workmen.

Perfect alignment of invert secured.

Joint readily made absolutely watertight.

Cheapest Patent Joint in the market.

**BRITISH ELECTRIC TRACTION COMPANY.
GRANITE SETTS.**

12,000 tons required, 4 in. by 5 in.
The above-named Company is prepared to receive offers for the supply of the whole or any part of the above quantity during the ensuing twelve months.

Further particulars may be obtained of the Company's Permanent Way Engineer, Mr. Howard-Smith, Donington House, Norfolk-street, Strand.

GEO. STEVENS,
Secretary.

**BOROUGH OF LANCASTER.
TO PIPEFOUNDERS.**

The Water Committee are prepared to receive tenders for the supply and delivery of about 1,850 lineal yards of 7-in. Cast-Iron Pipes.

Specifications and forms of tender may be obtained on application to Mr. John Cook, A.M.I.C.E., Water Engineer, Town Hall, Lancaster.

Sealed tenders, endorsed "Tender for 7-in. Pipes," to be delivered to the undersigned on or before Monday, November 21st.

T. CANN HUGHES,
Town Clerk.

Town Hall, Lancaster.
November 7, 1898.

**URBAN DISTRICT OF ABERTILLERY.
TO CONTRACTORS.**

The above Council are prepared to receive tenders for the making of a New Road from Abertillery to Aberberg, a distance of about 2 miles.

They are also prepared to receive tenders for the Widening of an existing Highway between Aberberg and Crumlin, a distance of about 2½ miles.

Plans may be seen and specification, bill of quantities and form of tender obtained on application to Mr. James McBean, Engineer and Surveyor to the Council, at his office, No. 1 King-street, Abertillery.

A charge of £2 2s. will be made for each copy of the specification and bill of quantities, which will be returned on receipt of a *bona-fide* tender.

Sealed tenders, endorsed separately "New Road" or "Road Widening," as the case may be, to be sent to the undersigned on or before Saturday, the 19th day of November, 1898.

No tender will be entertained unless sent in on the prescribed form.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
(Signed) JNO. ALEX. SHEPARD,
Clerk to the Council.

IMPROVED DRAIN CLINOMETER.

THIS Drain Clinometer, which is a thoroughly well-made and reliable instrument, is intended for the use of Builders, Medical Officers of Health, Sanitary Inspectors and others for testing the slope of drain pipes.

The arc is fixed at the extreme end of the Clinometer so as to allow of a close reading and distinct graduation, and is divided on one edge to degrees and quarter degrees, and on the other edge to gradients of 1 in 20, 1 in 30, 1 in 40, 1 in 50, 1 in 60, 1 in 70 and 1 in 80.

The adjustment is by means of a nut and bolt, working against a spiral spring. The "Bubble" is ground and divided.

The Clinometer is made of teak and nicely finished, and measures 12½ x 2½ x 4½ in.

PRICE:—With Electrum Fittings, £1 7s. 6d.; With Brass Fittings, £2 2s. 6d.; With Magnetic Compass extra 2s. 6d.

Minutes of Proceedings.

Municipalities and Electric Tramways.—II.

Whatever may be the merits of systems other than electrical, and we have pointed out that there are certain distinct ones, it is extremely improbable that, for some time at least, they will be extended. Having regard to all things, it is impossible to avoid coming to the same conclusion as that arrived at by Mr. Baker—in the report to which we referred in our last issue—that in solving the problem of our tramways we must look to some form of electric traction. As the report points out, "with the great improvements that have been made during recent years in electrical appliances, the comparatively low cost at which electric energy can to-day be produced, the more perfect means of insulation and consequent greater safety and economy in transmitting the electric current to considerable distances by means of cables, there can be no doubt that the best and cheapest mode of tramway traction to-day is the electric." From the public point of view an electrical system bases its chief claim to favour on various grounds. That which affects the public most is the greater comfort provided by electric cars and the greater smoothness with which an electrically-propelled car runs; but what is of special importance, and this applies particularly to large towns having connections with suburban districts, is that a much greater average speed will be obtained on an electrical system as compared with any other form of mechanical traction or with horse traction. A special feature of an electric tramcar obtaining its energy from an external source, such as an overhead wire or a conduit, is that it will take the steepest gradient without diminution of speed. It must be remembered that such a vehicle is rendered more flexible in meeting varying conditions, either of track, gradients or of passengers, by the fact that it has almost unlimited power to draw upon from the main power-house, subject, of course, to what its electric motors can safely take. A general practice nowadays in equipping an electric tramcar is to provide electric motors which can, on emergency, develop 80 horse-power, and it will be seen at once how great an improvement that is upon other methods. Then the control and regulation of a tramcar is one of its greatest features: the modern car is so equipped that by means either of a hand or electric brake it is possible to stop it, when travelling at full speed, in almost its own length. There is little doubt that these points account in a great measure for the extraordinary rapidity with which electric traction has been adopted in the United States. The most important portions of Mr. Baker's report are those relating to figures of costs which he has collected. He deduced a general statement from these that the cost of operating horse traction is from 50 to 100 per cent. greater than by electricity. As an instance of the increased popularity of tramways, it is interesting to point out the experience in some of the North American

towns. We find that in Bridgeport the adoption of electricity on the existing tramlines resulted in an increase in traffic of 150 per cent., and exactly similar results were obtained in the case of New Orleans and Carleton. Washington increased its traffic by 80 per cent.; Pittsburg by 95 per cent.; Columbia and Brooklyn by some 100 per cent. No doubt the question of fares has a very great bearing on the popularity of a line, and perhaps one of the chief points of difference between the existing tramway systems in this country and those in America is the distance that can be travelled for a certain fare. Generally speaking, New York City charges a fare of 5 cents. Although this may be a comparatively heavy one for a short journey, it is possible in Brooklyn to travel for the same fare a total distance of 18 miles; in Chicago 15 miles; St. Louis, 15; and in no town is the distance less than 10 miles for a 5-cent. fare. It will be seen at once how different the conditions are in this country. We find from Mr. Baker's report that Glasgow, with its municipal tramways, charges 3d. for a little over 5 miles, while in Liverpool 5d. is charged for 6 miles; in Dublin 5d. for 8 miles, in Edinburgh 7d. for 8 miles; and in Manchester the fare is, generally speaking, 1d. per mile. It is true that in London a much better state of things prevails, for it is possible to travel from Wood Green to Moorgate-street and back again, a total distance of 7 miles, for 3d. Moreover, on the South London line a 3d. fare will carry a passenger from Blackfriars Bridge to Lower Tooting, a total distance of 6½ miles. It is probable that some modification of the American system will be generally applied in this country, and, as a matter of fact, it has been introduced in a modified form on the recently-opened electric lines of Middlesbrough and Stockton. The question, however, that mostly concerns municipalities at the present moment is, which is the best system to adopt? Even if they have decided that electrical methods are to be adopted, they are immediately confronted with four systems—the accumulator, the surface contact, the overhead wire with the trolley or side connections, and the underground conduit with connection by plough, shoe or trolley. Many engineers consider that the accumulator is the ideal system; but probably, because we never achieve ideals, it is quite unlikely that the accumulator system will receive much extension. It is quite true that continued improvements in accumulators may to some extent enable engineers to apply them on moving vehicles, but up to the present time experience has been entirely against them, and the most successful instances of the employment of accumulators have been when used in conjunction with the overhead trolley system in running cars over short sections of city lines where the overhead system would not be permitted. For practical purposes the accumulator may be dismissed. The surface contact may be considered to be the modern development of the underground conduit. It claims,

to some extent on good grounds, to obviate the disadvantages of the conduit system, and it also dispenses with the overhead wires and posts that are necessary in the trolley system. It overcomes those disadvantages, but at once introduces some of its own. All surface contact systems rely upon contact plates fixed to the surface of the road, making occasional contact with the cables conveying the current from the power-house. Contact with these studs is usually made by a skate or collector carried underneath the car, and the principle of operating the stud is that current can only pass out of the contact plate at the time when the car is passing over it, and that it is completely put out of action as soon as the car passes. It is obvious that such an operation calls for certain delicate mechanism, and, whether it be magnetic or mechanical, it is easy to see that troubles may constantly arise. Beyond a system that has existed in Paris for some time and one laid down at Monaco, there are practically no such systems in operation on a commercial scale. In other words, whatever position the surface contact system may occupy in the future it can be definitely said that there are no instances of sufficient importance to justify municipalities undertaking the responsibility of laying down such a system. It is perfectly true that many inventors are working on the subject, and recently two or three systems have been brought to prominent notice which may possess the advantages without the disadvantages previously noted in surface contact systems.

When we come to consider the trolley, there is probably no question of its practical utility. As Mr. Baker points out, there can be no doubt that the trolley has many advantages, that where in use it soon becomes very popular, and that the great rapidity with which it has been adopted in leading cities, not only in America but also on the Continent of Europe, and more recently in this country, is ample proof that the advantages are in the majority of cases considered to outweigh the disadvantages. There are, however, some cities, such as New York, Paris and Edinburgh, which, permitting and encouraging other forms of mechanical traction on their tramways, entirely refuse to permit the overhead trolley wires, while others, such as Brussels, Berlin, Dresden and Buda-Pesth, though permitting the overhead wires in the suburbs and less important streets, prohibit them in the public and more important thoroughfares, insisting that for such streets the electric accumulator or conduit system must be used. If, therefore, this or any other system can be made to compare favourably in price of construction and economy of working with the trolley, without its corresponding disadvantages and objections, it would be welcomed by all municipalities interested in street locomotion. It is hardly necessary to trace out in detail the operation of the overhead trolley system. Briefly, it embraces the erection of overhead wires, which are fed with electric energy from a central power-house, and the electric cars obtain their energy through the medium of a long trolley pole which keeps in permanent contact with the overhead wire. The chief objection urged by Mr. Baker is that of the disfigurement of streets. We need hardly combat that, because it is only necessary to point to Bristol, Glasgow, Liverpool, Coventry and other towns to show that there is probably less disfigurement than is generally supposed. When, however, Mr. Baker brings forward as an objection against this system that there is a certain loss of electric energy by utilising the rails for the return current, and a danger of electrolysis destroying gas and water pipes by stray currents, we think that he has overestimated both the danger and the defects. There is bound to be some slight loss of energy in all systems. No mechanical form of motor is free from a certain loss of efficiency. It is exactly the same with the overhead tramway system; but the only serious point is whether the loss of electrical energy in a tramway system is likely to cause trouble to anything else. The slight

loss will make absolutely no difference to the system, the only fear is whether it should cause electrolysis or interfere to any extent with the telephone service. But the Board of Trade have been alive to the dangers that may arise from stray currents of electricity, and they have not only formulated a somewhat rigid set of rules which limit the leakage from any tramway system, but insist that if leakage continues they may exercise their powers of stopping the working of the system. As a matter of fact, with the efficient methods of bonding at present used in this county it is extremely unlikely that electrolysis would be set up. The third objection raised is that of a certain danger arising from telegraph and telephone wires falling on the overhead wire. This is exaggerated on two grounds. The first is that most telephone lines are being gradually put underground, and telegraph wires cross electric lines at very rare intervals; as a matter of fact, telegraph lines and electric lines usually run parallel with each other. But wherever there has been a system of overhead wires erected in this county they have been completely protected from one end to the other of the system by guard wires. It is a little unfortunate for the trolley system that it has been necessary to guard against falling telephone and telegraph wires. The fourth reason given against the system relates to the sparking of the car wheels and the fact that this may frighten horses in the streets. As far as our experience goes, we know of no instance of a horse shying from sparking caused between the wheels and the tram; the sparking, as a matter of fact, is no more serious as far as horses are concerned than a person striking a match in the street. We venture to think that Mr. Baker is labouring under a misapprehension when he says that the Board of Trade rules relating to the operation of tramways "seem to some extent permissive in their application, and, even if complied with in the first instance, there is no certainty that compliance will not become more difficult or impossible as time goes on and deterioration sets in in the underground and inaccessible parts of the return current." So far from these rules being permissive, a Board of Trade inspector carefully tests the line before a system is permitted to run, and, moreover, every tramway system is compelled to employ a special switchboard, the sole purpose of which is to make tests in order to see that the Board of Trade rules are complied with. These are not casual tests—tests have to be made definitely every day, every week, every month, and every quarter. Records of these have to be sent to the Board of Trade, and the slightest departure from them will be immediately followed by vigorous action. It is apparent, however, that Mr. Baker, in unintentionally exaggerating the objections to the overhead trolley, is merely preparing the way for a favourable consideration of the conduit system, but it will be necessary to postpone our remarks and criticisms on this section of the subject, as well as on the article which has appeared in an American contemporary, and to which Mr. Baker, who kindly favours us with a copy of the article in question, refers in the communication published in another column.

* * *

Combined Drainage. If an apology were needed for returning once more to this perennial topic, it would be found in the fact that it formed the subject of a valuable and interesting paper read by Mr. Priestley at the recent Birmingham congress of the Sanitary Institute. After pointing out the tendency of the present state of the law to cause local authorities to look askance at all plans for combined drainage, and deprecating such an extreme view on sanitary grounds, Mr. Priestley proceeded to show the advantages, in the case of a row or terrace of houses, of a combined system of drainage, as against a separate drain and connection for each house, provided the number of houses to each combined drain were restricted to

six, or less. Turning to the legal aspect of the matter, the author of the paper referred to the case of *Appleyard v. Lambeth Vestry*. The effect of that case, it may be remembered, was to relegate to the category of sewers all combined drains in the metropolis constructed prior to 1848 (at which date the Metropolitan Commissioners of Sewers were constituted), whether with or without the approval of the authorities having jurisdiction at the time of their construction. Mr. Priestley characterised this decision as laying down the law very simply, and so, no doubt, it does so far as combined systems constructed before 1848 are concerned; but it, of course, leaves unaffected systems constructed after that date, which, as is well known, are drains if made with the approval of the sanitary authority, but otherwise are sewers. As to districts under the Public Health Act, 1875, reference was made to the definition of a sewer contained in that Act, and to the modification of that definition effected by sec. 49 of the Public Health Acts (Amendment) Act, 1890; although, if Mr. Priestley is correctly reported, he omitted any reference to the limitation of the latter section to cases of houses belonging to different owners, which is an important point. In the course of the discussion on the paper Mr. Lewis Angell (West Ham) referred to the efforts which had been made by his corporation to bring about an alteration in the law on this subject, and, although these efforts have not been successful so far as the general law of the land is concerned, he was able to point to a conspicuous success achieved as regards West Ham itself. The corporation in their Omnibus Bill of the present year inserted the following clause:—

In and for the purpose of sec. 41 of the Act of 1893 the word "drain" shall be deemed to include any sewer or drain, whether constructed before or after the passing of this Act, with which two or more houses or premises (whether belonging to the same or different owners) are at the date of the passing of this Act, or may at any time thereafter be, connected, or which is used or capable of being or intended to be used for the conveyance of the drainage of such houses or buildings directly, or by means of any other sewer or drain, to any public sewer situate under a street repairable by the inhabitants at large, but shall not include any sewer which has been constructed to the satisfaction of the corporation under sec. 152 of the Public Health Act, 1875, or any sewer which has been constructed by the corporation for the effectual drainage of the borough.

This comprehensive clause was passed ("whether Parliament was asleep or the Local Government Board was nodding," Mr. Angell could not say), and is now the law in the West Ham district, forming sec. 42 of the West Ham Corporation Act, 1898. We congratulate this "fighting corporation" (to again quote Mr. Angell) on having achieved this result, and we trust that the day is not far distant when a similar clause may be embodied in a public statute applicable to the entire country.

Surveyors' Institution: President's Address.

The surveyor's profession is a many-sided one. We are speaking at present of the surveyor in private practice as represented by the great majority of the members of that flourishing body, the Surveyor's Institution. Naturally the different aspects of the profession are reflected from year to year in the addresses of the president for the time being. On Monday Mr. Vigers dealt at more or less length with some topics of municipal interest, such as the growth of London, and the housing and street traffic problems which confront us in the metropolis. In referring to the housing question, he was evidently more impressed with the achievements of private enterprise as exemplified by the Peabody Trust than with those of municipalities. Certainly the latter sometimes go beyond their legitimate province, but they occasionally do the right thing. The appalling congestion of traffic in the central parts of the metropolis has long been a grievous and almost intolerable affliction to Londoners, and it would be well if the authorities could accelerate their present snail's pace in carrying

out those street-widening improvements which constitute the most obvious remedy. We are glad that Mr. Vigers hammered away at the subject. This question calls more urgently for the attention of the London County Council than does even that of electric traction for tramways. Until means of relieving the congestion of traffic have been found electric traction of any kind will be quite impossible in certain parts of the metropolis. In the latter part of his paper Mr. Vigers referred to the question of sewage disposal, a subject which does not often come up at the Surveyors' Institution. Here we have an indication of the attention which the new methods are attracting, for the president practically confined his remarks to the bacteriological developments, especially as exemplified by the septic tank. He did not, however, commit himself to much in the way of opinion. We observe with gratification that Sir John Wolfe Barry, in his address on Wednesday, as President of the Society of Arts, also attacked the great transit problem of the metropolis, but space compels us to hold over any further reference till next week.

The late Colonel George E. Waring.

Many municipal engineers and others connected with local Government in this country will bear with deep regret the death of Colonel George E. Waring, who achieved so signal a success as commissioner of street cleaning in New York during the reign of Mayor Strong, under whom also General Collis did so much good as commissioner of works, especially in connection with paving and other street operations. Details in regard to Colonel Waring's system and the peculiar efficiency with which it was carried out have appeared from time to time in our columns. It is not too much to say that he completely reformed and reorganised the street-cleaning department, of which he was placed in charge in 1895, and his compulsory retirement after Tammany's municipal victory was a notable illustration of the evils resulting from the municipal system prevailing in America, and especially the subordination of that system to politics and the changing of officials after a party victory at the polls. Colonel Waring was sent by President McKinley to examine into the sanitary condition of Havana and devise means for stamping out yellow fever. He returned to New York at the end of last month and a few days later he was dead.

Royal Commission on Sewage Disposal.

It may be remembered that in a recent issue we reprinted some correspondence which appeared in *The Times*, the opening communication having come from the chairman of the Commission, Lord Idlesleigh, who warned local authorities and manufacturers of the unwisdom of delaying schemes for the treatment of sewage and effluents until the report of the Commission had appeared. One of the letters elicited by the noble chairman's communication was signed "District Councillor," and was to the effect that a district council, after having decided to adopt a certain biological means for treating sewage, was "informed that no loan for the purpose would be sanctioned by the Local Government Board unless the process is recommended in the report of the Royal Commission now sitting." We questioned at the time whether such a statement was likely to come direct from the Local Government Board, as the probability was that the aforesaid district council had simply been "advised" by some more or less weighty authority to the effect indicated. Our surmise has now been corroborated officially, as "A Member of the Royal Commission," has sent to *The Times* a letter in which the following passage occurs:

This statement has been assumed by a number of persons to imply that this was a pronouncement of the Local Government Board, and hence I have made inquiry of that Board in the matter. The result is, as I anticipated, that the Local Government Board have pronounced no such opinion nor given any such decision.

Comparative Reports of General Practice.

XXX.—TRAMWAY TRACTION : WEST BROMWICH REPORT.—I.

In March, the Highway Committee of the West Bromwich Corporation appointed a sub-committee, consisting of the chairman, deputy chairman, the mayor, councillors Wilson and Baggott, and the borough surveyor, to obtain all information necessary to enable the committee to come to a decision as to the system of traction most suitable to adopt. The sub-committee decided to inspect for themselves the systems of mechanical traction most recently adopted, and in doing so visited the following towns in which a system of electric traction is in operation: Leeds, Bristol, Dover, Coventry, Wednesbury and Kidderminster (in all of which the overhead trolley system is in operation), Blackpool (underground conduit system), and Birmingham (cable and electric accumulator systems). The borough engineer, Mr. A. D. Greatorex, who accompanied the sub-committee throughout, also visited Prescot, where a system of underground conduit has been put down as an experimental line, and is described in the report.

THE EXISTING LINES.

Before describing the systems in the towns visited the report gives a brief history of the present South Staffordshire line. The company was formed in 1881, and the Provisional Order being obtained in August of the same year, the twenty-one years' lease will expire in August, 1892. The lines were constructed in 1882-83 and duly certified by the Board of Trade. Steam-power was used as the form of traction. In 1886 complaints were made respecting the undue emission of steam, excessive speed, &c., and these formed the subject of a Board of Trade inquiry. In November, 1888, the Highway Committee reported that the paving of the tramway had not been kept in such good repair as they would like, and about the same time the corporation were successful in taking legal steps to stop goods traffic, which the company had refused to discontinue. A conference of surrounding authorities was also held in Birmingham to consider the general question of nuisances in connection with steam traffic. Repeated ex-

tensions of time were granted to the company for the use of steam traction, always, however, on the understanding that some better system would be adopted. Previous to sanctioning a twelve months' extension from March 25, 1896, the Board of Trade deputed Major Marindin to inspect the tramways and report, which he did to the following effect:—

"The lines were laid in 1882-83, and there has been no relaying except for a length of one-quarter mile.

"The rails are very much worn, the check rail nearly throughout being higher than the top of the running rail.

"The points are in many places low and cannot be considered satisfactory, and the paving sets require adjustment over a considerable portion of the tramway. As, however, the lines ought to be relaid within two years, the extension ought not to exceed a period of twelve months from March 25, 1896."

Ultimately it was arranged in the beginning of the present year to hold a conference between an inspector of the Board of Trade and representatives of the various local authorities concerned. The conference was duly held on May 3rd, and was presided over by Sir Francis Marindin, K.E., C.M.C., of the Board of Trade. Representatives, including officials, were present on behalf of the following local authorities interested: West Bromwich, Handsworth, Dudley, Darlaston, Tipton and Wednesbury. As a result of the conference, Mr. Sellons, on behalf of the British Electric Traction Company, Limited, undertook to forward to the local authorities within a month a copy of the proposals of his companies in connection with the undertaking of the South Staffordshire Tramways Company. It should be mentioned that a provisional agreement had been entered into by the tramway company with the Electric Construction Company for the installation of a system of electric traction, but the latter company subsequently assigned their entire interest in the agreement to the British Electric Traction Company, Limited.

Various powers have been conferred upon the South

LEEDS CITY TRAMWAYS : CENTRE POLES IN BOAR-LANE.
(Trolley wires not in position.)

Staffordshire Company from time to time since 1882. In 1889 an order was obtained for incorporation and other purposes, and in 1894 an Act was obtained to empower the company to construct the tramways so as to use cable, electric or other mechanical traction. That Act, however, through lapse of time has become a dead letter, so the committee advised the insertion of many of the clauses in whatever Act should be promoted by the South Staffordshire

by horses, but lately by steam. In 1894 the concession of the company expired, when the council decided to purchase the entire undertaking. The transfer took place in February, 1894. The tramways, as they then stood, cost the corporation approximately as follows: Lines constructed by the corporation, £20,330; undertaking purchased from the company and cost of arbitration, £118,814; total, £139,144. After completing the negotiations and obtaining possession

LEEDS CITY TRAMWAYS: BRIGGATE.

Tramways Company or any other company. The following are the lengths of the lines in the various towns and districts: Handsworth (double track), 4 furlongs, 73 yards; West Bromwich (double), 5 miles, 179 yards; Tipton (single), 4 miles, 2 furlongs, 183 yards; Dudley (single), 5 furlongs, 73 yards; Cosley (single), 6 furlongs; Wednesbury (single), 2 miles, 1 furlong, 77 yards; Wednesbury (single, but not

of the lines, the corporation invited bids for the lease of the tramways, but none of the offers received were considered sufficiently advantageous. Meanwhile the working of the system was continued under the direction of the town council, who had retained most of the old staff. This arrangement had proved quite successful, and the result gave encouragement to the popular desire to have the system remain under

LEEDS CITY TRAMWAYS: ROUNDHAY-ROAD.

worked), 2 furlongs, 37 yards; Darlaston (single), 6 furlongs; the total being thus 14 miles, 1 furlong, 182 yards.

After this account of the existing lines the report is continued with description of systems in operation in towns visited by the sub-committee. These we may reproduce practically as given in the report.

LEEDS.

The tramways in Leeds were originally constructed in 1872, and extended in 1877, and the lines were originally worked

the direct control of the corporation. In November, 1890 the corporation decided to at once equip the line from Kirkstall to Roundhay.

The electric tramway, opened July 28, 1897, extends from a point opposite the entrance to Kirkstall Abbey, on the north-west outskirts of the city of Leeds, to the north-easterly end of Princes-avenue at Roundhay Park, a suburban resort in the north-eastern district. The route is not direct, but forms the two arms of what may be roughly termed a right-angle,

the centre of the city being at the apex, the total extent of the line being 7 miles and the length of track 14 miles. The gradients throughout the route are easy, and the steepest not exceeding 1 in 21. On most of the route the vehicular traffic is fairly heavy, while Boar-lane, Leeds, is one of the most crowded thoroughfares in the provinces. Altogether the conditions are such as will give a very thorough test of electric traction in city service.

Permanent Way.—The permanent way was designed and constructed under the supervision of Mr. Thomas Hewson, the city engineer. The rails weigh 100lb. per yard, of the usual grooved section, the gauge being 4 ft. 8½ in. The paving is of granite setts, except in Boar-lane and a part of Briggate, where wood paving is used.

Conducting System.—From Kirkstall Abbey to the Midland station in Wellington-street, and from North-street to Roundhay Park, the trolley wire is carried by single brackets attached to tubular steel poles placed at the side of the roadway. These poles are placed at an average interval of 120 ft., they measure 31 ft. in length, and are in two parts. In Boar-lane and Briggate centre poles with double brackets have been used, and they serve also to carry arc lamps for street lighting. All the poles have been manufactured by Messrs. James Russell & Sons, of Wednesbury.

There is a minimum width of roadway in Roundhay-road and Kirkstall-road of 32 ft., and in Briggate and Boar-lane the width is greater, and admits of a space of 5 ft. 6 in. for the centre poles between the tracks; there is thus plenty of space between the rails for the islands, and a clear way on either side of the road outside the tracks for vehicular traffic.

Rolling Stock.—The rolling stock consists of twenty-five four-wheel double-deck motor cars, six double-decked trailers and six single closed cars, and the committee were informed that the Tramway Committee contemplated purchasing an additional twelve trailer cars. This would make the total number of trailer cars twenty-five, one for each motor car. The bodies were built by Messrs. Milnes & Co., of Birkenhead, and are of the cantilever extension type, the trucks being from designs of the Peckham Motor and Wheel Company, New York. The bodies of the cars present a neat and attractive appearance. They are painted in blue, and decorated with gilt, the body panels bearing in the centre the coat of arms of the city of Leeds. Inside the motor cars there are seats for twenty-two passengers and outside for twenty-nine, making a total of fifty-one. The double-decked trailers carry twenty passengers in and twenty-four out, and the single cars twenty-two passengers. The cars are lighted by electricity, each being wired for ten lights of 16 candle-power each, connected five in series between the main conductor and the rails, and provided with switches, so that either or both groups of lights can be cut out. The trolley poles and supports are of the swivelling-arm type. The total weight of the car and track complete is about 7 tons. The cars travel at a speed of 8 miles per hour, there is a seven and a half minutes' service, and they stop when required, the charge being 1d. per mile.

Power Station.—The building for the power station is of brick and iron, was designed by the city engineer, and is close to the line and midway between the termini. The building is glazed with white bricks, and has a clean and neat appearance. The engines are two pairs of horizontal compound condensing-engines, supplied by Messrs. John Fowler & Co., of Leeds, and the dynamos are driven from the fly-wheel of the engine by fifteen ropes. The station can be enlarged as required. To house the cars and to provide the necessary repair shops and other offices the corporation have erected very extensive buildings of brick and iron in Kirkstall-road. They are designed for future requirements, and will hold nearly 200 cars.

General Notes.—The sub-committee wish to express their admiration of the thoroughly substantial and durable manner in which the work has been carried out. At present all systems used the same tracks—namely, horse cars, steam and electric—but the sub-committee were informed that it was the intention of the corporation to convert the entire system into the overhead system in course of time.

The committee rode on the cars inside and out, and found them very superior to the cars at Wednesbury. Since the committee visited Leeds the corporation of the latter city have decided to equip the following lines on the overhead system: The Headingley, Chapeltown, Innslet and Dewsbury routes.

Locomotives on Highways.—The Local Government Board announce that, with respect to the wheels of locomotives on highways, they have issued an amending order further varying the provisions of sub-sec. (4) of sec. 28 of the Act of 1878, by the substitution for the condition numbered 6 in the order of November 26, 1897, of the following condition: "No such wheel shall be used any block of which is so worn that any metal rim surrounding the block protrudes beyond the surface of the block." Circulars have been issued by the Board to the councils of counties and county boroughs, to boroughs other than county boroughs, and to urban and rural districts, calling attention to the Locomotives Act, 1898 (61 and 62 Vic., c. 29), by which important changes have been made in the law with respect to the use of locomotives on highways and to extraordinary traffic.

AN EXPERIMENT IN MUNICIPAL TRAMWAYS.

CO-OPERATION OF COMPANY AND MUNICIPAL AUTHORITY.

An interesting experiment in municipal enterprise is now being made in the Lancashire borough of St. Helens, whose extensive area and the contiguous district contain nearly 200,000 inhabitants. The experiment takes the form of an effort to place the workings of the tramway system under the joint proprietorship of the corporation and private enterprise. The corporation will generate and supply the electric power, the company will provide the vehicles and working staff, and it is hoped that this combination will prove advantageous to both parties, as well as to the public. The St. Helens Corporation, recognising that rapid and cheap locomotion is essential to their scattered industrial population, obtained Parliamentary powers to establish electric stations both for light and energy. They also obtained powers to lay down a complete network of rails through the whole district, to be worked by electricity. Instead of managing the tramways themselves, the council have preferred to delegate this duty to men with practical experience. They have therefore granted a lease for twenty-one years to a company, who will undertake to provide an efficient service of cars and to run at frequent intervals at cheap fares. On their side the corporation undertake to lay down rails of the most approved type, to equip the lines on the trolley system, and to supply electric energy at a fixed charge—namely, 2d. per unit for the first 400,000 units, and reducible to 1d. per unit when the full quantity of power is consumed. Some of the advantages claimed for the arrangement are that the corporation will be assured of a fair return on the capital they have invested and a profitable use of their electric plant, so that they will secure a good return to the ratepayers without incurring any responsibility for the actual working and conduct of the tramway business. The company, on their side, anticipate material advantage, because the charge for electric power under the lease will be far less than the cost of steam or horse haulage, which they now use. The future extension of the system, they also anticipate, will bring St. Helens into direct connection with Liverpool at lower fares than are now charged by the railway companies.

HARBOUR IMPROVEMENTS AT ABERDEEN.

AN EXTENSIVE SCHEME.

At a recent special meeting of the Aberdeen Harbour Board the Works Committee recommended that in the Bill for which the commissioners are to apply in the ensuing session power should be taken to borrow for the purposes of the harbour, including the reconstruction of the graving dock, the sum of £290,000. Among the works which Mr. Gardon Nicol, the engineer, considers it might be desirable to undertake during the next ten years are: Deepening the navigation channel to 30 ft. at high water of spring tides, including the removal of rock, £54,000; deepening the Albert Basin, tidal harbour, river Dee and dock, £9,000; improvement of Peera Harbour, £9,500; improvement of Point Law, £17,000; improvement of river Dee, £13,000; reconstruction of part of Provost Blaikie's quay, £12,000; reconstruction of part of Provost Matthews' quay, £2,500; reconstruction of goods sheds, new houses for officials, and extension of workshops, £4,500; strengthening the quays for steam haulage, £1,800; extension and renewal of rails, £16,000; causewaying of roads and quays, £12,000; hydraulic machinery for lock gates, £2,800; new cranes and steelyards, £5,500; electric light fittings for buildings and sheds, £1,100; additions to plaut, £14,000; contingent allowance for repairs to sea works, £6,000; engineering expenses, £7,000; new sca lock, £40,000; total amount, £227,700.

After a long discussion the report was adopted by twenty votes to two, and the Finance Committee were empowered to proceed with the Bill.

SOUND PROOFING.

What is known as the lino-lattice system of sound proofing for floors, partitions, &c., is claimed to be produced by means of a non-conducting and wood-preserving material and an entirely new method of fixing. It is pointed out that an absolute sound-proof system is impossible except in vacuum, but that the aim of the inventor has been to come as near as possible to such a system. By this system the pugging is laid on lattice work between the joists, combined with the use of non-conducting sound strips laid on the top of the joists or on the face of partition studs, and it is claimed that this ensures the almost complete non-conduction of sound. The non-conducting strips may be used alone. The system is also claimed to be an effective preventive of dry-rot, to be non-inflammable, and vermin and insect proof, and, in addition to non-conducting and preservative qualities, various advantages over other materials are claimed with respect to cost and weight. The manufacturers are the Lino-Lattice Company, Marsh Bridge, St. Philip's Marsh, Bristol, from whom full information can be obtained.

The Sanitary Institute.

THE SEVENTEENTH ANNUAL CONGRESS.—VIII.

HOUSE DRAINAGE AND SEWERAGE.

Several of the addresses contributed at the Birmingham Congress of the Sanitary Institute dealt with questions connected with house drains and with sewers.

TYPHOID AND CLOSETS.

In his paper on "Typhoid Fever," read before the Sanitary Science and Preventive Medicine section, Mr. PHILIP BOOBYER, M.B., the able medical officer of Nottingham, sought, by means of diagrams and statistics, to demonstrate the effects of privies and water-closets respectively in the spread of that disease. In Nottingham, during the last ten years, he said, the average rate of disease was one in every 120 houses fitted with pail-closets, one in thirty-seven houses fitted with privies, and one in every 555 houses fitted with water-closets.

Dr. COOPER PATIN (Norwich) expressed similar views from his experience of that city, and Dr. EUSTACE HILL, medical officer of health for the county of Durham, a son of Birmingham's medical officer, emphasised the fact that nowadays it was becoming recognised more generally in the profession that typhoid was spread by other means than in a defective water or milk supply. He quite agreed that endemic typhoid was encouraged by the conditions to which Dr. Boobyer had alluded, and, apart from soil pollution, thought that flies were frequently the means of carrying the germs of typhoid.

Dr. SCUFFIELD (Sunderland) added his testimony to that of Dr. Hill, and thought the conditions under which coliclers existed in the mining districts might be responsible for certain soil contamination.

Lieut.-General PHELPS, after agreeing with the observations of those who had preceded him, suggested that there was one more possible source which had not been considered, and which might possibly be the nidus from which the disease germ was diffused. He should "like to know whether it had been ascertained if the sources of vaccine lymph were free from contamination," an observation that was met with laughter. The general, however, insisted that vaccine lymph should be subjected to the same tests that Dr. Alfred Hill had proposed with regard to food preservatives.

Dr. A. WATERS (Southend) thought that after all they had heard about the causes of typhoid it would be well if someone would suggest a practical way of dealing with the matter.

Dr. CHARLES PORTER (Stockport) declared that General Phelps's suggestion that the typhoid germ might be carried in vaccine lymph was the most novel he had ever heard. It was, however, a remarkable fact, established by statistics he had compiled in Stockport, that the incidence of endemic typhoid was greater as the rateable value of the houses increased.

Mr. R. H. WILLIAMS (St. Austell) asked what means could be suggested to force local authorities, landlords and others to promote those sanitary measures beneficial to the preservation of health.

Dr. CLARE (Hanley) said his experience was that typhoid was more frequent where pail-closets existed.

Mr. BAKER (Maidstone) asked for information as to whether chemical analysis could be relied upon to protect a town from an epidemic of typhoid.

Dr. BOOBYER, having replied to the points raised in the discussion, the chairman (Dr. Alfred Hill) pointed out that no analysis of water would reveal the presence of typhoid poison. Bacteriology and chemistry might be made use of as far as possible, but in conjunction with these two methods it was necessary to look to the surroundings of the source of the supply.

INTERCEPTORS AND TRAPS.

In his opening address to the Engineering and Architectural section THE PRESIDENT (Mr. W. Honman, F.R.I.B.A.) sketched the evolution of domestic sanitation, and predicted that the day would come when all interceptors and traps would be abolished, and with them the sewer-gas which they retained about our dwellings. With good ventilation of house drains, air inlets to sewers, ample flushing, impervious and well-laid drains and sewers, all entrapped and free from obstruction, gas, he asserted, might become a thing of the past. Engineers had sinned deeply in the construction of sewers. Apart from their general design and the method of construction and gradients adopted, the work had too often been defective in execution, so that, instead of aiding the quick removal of solids by water carriage, they had acted as filters or separators, permitting the fluids to escape and soak into the ground, or to run off and leave the solids to fester and become offensive.

Major LANGROCK FLOWER proposed, and Mr. LEWIS ANGELL (West Ham), seconded, a vote of thanks for the address, the latter joining in Mr. Henman's condemnation of "interceptors."

Prof. A. BOSTOCK HILL, M.D., D.P.H., contributed to the Engineering and Architectural section a paper on the subject of

THE CONSTRUCTION AND VENTILATION OF HOUSE DRAINS.

In opening his paper Prof. BOSTOCK HILL remarked that it might at first sight be thought that a subject like this in the present stage of sanitary science had been definitely settled, but, as a matter of fact, we found that on some points authorities still held divergent views. The questions of amount of fall, materials of pipes, &c., no doubt were agreed upon; but certain other points gave rise to controversy on different forms of procedure in different districts. He had not the least intention to occupy their time by reiterating those parts of the subject upon which all were agreed, but he desired for a few moments to call attention to certain points, especially in connection with what were known as compound drains, more particularly as this subject had had of late a local interest. This question of the relation of house drains to so-called compound drains and sewers had been forced on public attention by certain well-known decisions of the High Court, decisions given mainly to settle the point, What is a drain and what is a sewer? The subject was of importance, because sewers, by sec. 13 of the Public Health Act, were vested in the local authority, while drains, of course, were the property of the private individual. Dr. Bostock Hill then proceeded as follows:—

In the past, at all events in the Midlands, it has been customary for the small contributory drains from a row of houses to join a larger one which connects with the public sewer. Most of the difficulties have arisen in cases of this kind. As regards the construction of these drains, the size and methods of disconnection and ventilation are the chief points to be considered. As to size of drains, the smallest which will convey the necessary quantity of liquid is certainly best for reasons of cleanliness. From a single house a 4-in. pipe is ample, yet I have been very surprised to find that in case of recently-erected cottages a 6-in. pipe has been insisted upon by some surveyors, and, as far as I can understand, the only reason urged for this is the less likelihood of the pipe becoming blocked. But even if this be true, which I take leave to doubt, there are many corresponding disadvantages. From small houses the boiled water chiefly comes down in gushes, the pipe itself, if it be as much as 6 in., is never nearly filled, but the sides get splashed, and they are in a very short time dirty and have on their surfaces matter in a state of putrefaction. Again, it is impossible to flush a pipe as large as 6 in., coming from a single small house; so that, although such a pipe may not become so frequently stopped up, still it is in a condition in which sanitary science has conclusively proved a house drain should not be.

DISCONNECTION AND VENTILATION.

It is, however, on the questions of disconnection and ventilation that the greatest differences occur. The by-laws in many towns state that every drain shall be cut off by an intercepting trap from the sewer. The judge has decided that a so-called compound drain on private property is a sewer. Therefore, say certain authorities, we must insist on the presence of an intercepting trap between each of the contributory drains and the common drain, which has become a sewer. Let us suppose, for the sake of argument, that legally a compound drain, though on private ground, is a sewer. As the by-laws were formulated some years previous to the legal decision, we may take it as at least doubtful whether the compound drain was intended by the sanitary advisers of those who framed the by-laws to be so considered; and we may also consider whether, though legally a sewer, it is desirable, from a sanitary point of view, to treat it as such as regards our methods of interception and ventilation. Let us consider this for a few moments. The object of a drain is to remove, as quickly as possible, from the neighbourhood of the dwelling foul water which has passed into it. The law here steps in, and those who choose to consider it binding insist that at each junction of the sub-drain with the compound drain (legally a sewer) there shall be a disconnecting trap between the house drain and the compound drain, so that in a row of six houses we shall have six intercepting traps between the various sub-drains and the compound drain. Each of these traps holds a considerable quantity of liquid and solid matter, and as a trap is an obstruction to the regular flow of the liquid passing through the drain, each of these syphons becomes for the time being a small depositing tank where solids in suspension precipitate themselves. The compound drain is treated in one of two ways: Either it is made to discharge into the street sewer without an intercepting trap at all, and connected with a ventilating shaft running up to the roof of one or more houses, or else an intercepting trap is put just where it enters the road, an air inlet as in the case of the other traps being provided, and the ventilating shaft being taken from it at or near its highest point. In the latter case we ventilate only that part of the sewer which is on private property. In the former case we utilize private property for the ventilation to some extent at least of the public sewer.

Under this system, which I regret to say is becoming common in many instances in the Midlands in new property, the following must of necessity occur. Each of the siphons on the branch drain holds foul water; in the case of the house having a water-closet, which is the rule at the present time, the trap holds fecal matter as well. The inlet, which is on the drain just on the house side of the interception trap and which, when no water is coming down, may act as such, becomes an outlet every time a flush of water is sent down, and the fouled air, which the length of house drain contained, coupled with the gas which has been given off by the fouled matters in the trap, is discharged into the air in close proximity (in some instances not more than 6 ft. or 7 ft.) to the back-doors of the houses.

My experience, then, is that from these so-called inlets, acting frequently as outlets, constant smells from foul gases arise, and I have had ample evidence that the tenants complain loudly of the existing state of things. The diagram which I have here shows an actual occurrence observed by a sanitary official in Birmingham, where it will be seen that the so-called inlet is being used as an outlet, while the flushing of the closet is performing the function of a bellows, and thus enabling the children of the cottages to amuse themselves by utilising the soiled air from the house drain for the purpose of blowing up their miniature bonfires.

In a close and crowded neighbourhood such a condition of things is undoubtedly bad, even if there be no specifically contaminated matter in the drains; but in the case, say, of typhoid fever existing in property drained in this way, it seems to me that, even if disinfection of stools had been carried out in the best-known possible way, there would be considerable risk of further dissemination of the disease. It is certainly undesirable to store the sewage, even for a short time, near premises; and I am strongly of opinion that the method which I have described, while no doubt complying with the letter of the law, induces a state of things, from the sanitary point of view, very much worse than the system which it superseded. I have known of instances where, to avoid the odours arising from these so-called inlets in front of the intercepting trap, tenants have on their own account stopped up the opening, and under the circumstances, in my opinion, they are quite justified in doing so.

VENTILATION OF DRAINS AND SEWERS.

Closely connected with this question is that of the ventilation of drains and sewers. I have been somewhat surprised to find that many surveyors at the present time are recommending the ventilation of sewers up houses on private ground. Such a proceeding is—and as, I believe, I have shown on other occasions—attended with considerable danger to health; and I wish to enter here a protest against a method which I believe to be utterly wrong in principle, and which tends to distract public attention from the real source of the nuisance, and which palliates an evil instead of removing it. It is common knowledge that nearly all newly-laid sewers on the separate system, if they be ventilated by ventilators at the crown of the road, are, when first put into operation, a nuisance to the public. It is equally well known, I believe, that the cause of this nuisance is the stagnation of sewage, the deposition of solids in some portion of the sewer, consequent putrefaction, and the production of offensive gases, so that when a sewer gives offence to the nose it is a sign that it is not doing what it was intended to do—*viz.*, carry fresh sewage, which in itself is always inoffensive. When this state of things occurs the public demands that the nuisance be abated. Owing to the very large number of schemes which have been completed of late in the smaller towns and rural districts these complaints have become quite common, and there has been a tendency, which I consider to be unscientific, to endeavour to remove the nuisance from the nose, instead of removing the cause which produces it.

THE MUNICIPAL ENGINEER AND THE MEDICAL OFFICER.

It is no part of my subject to-day to deal with this question, as it refers to public sewers, but I do wish to take this opportunity of entering my protest against some of the systems which are officially being carried out, and notably that which, instead of preventing the formation of noxious gases, tends to bottle them up and discharge them some few feet above the roofs of private houses. I have on a previous occasion shown instances where, I believe, a system similar to this has been productive of suffering and death, and I may say that, acting on my advice in a neighbouring town, for which I act as medical officer of health, all ventilators of sewers up private houses have been removed by the corporation.

It is to be regretted that in considering a question of this kind the matter should be treated as one belonging only to the department of the surveyor. In matters sanitary, as in other professional matters, no doubt there is a tendency at the present time to specialise unduly, but while it is the duty of the sanitary engineer to formulate and carry out a system for the removal of sewage and waste waters, it is no reason why the medical side of the question should be forgotten, and I maintain that this can only be definitely and properly settled by the harmonious working of medical and engineering experts. In this matter of ventilation of sewers it is no doubt comparatively easy to abate the nuisance as far as the nose is concerned, but I think in the past we have been too ready to forget the real meaning of the proverb that the remedy may be worse than the disease.

In the same section Dr. Joseph Priestley, B.A., M.D., D.P.H., read a paper entitled

COMBINED DRAINAGE: ITS PROS AND CONS.

In the course of his paper Mr. Priestley said that there had recently been such difficulty in connection with combined drains, which were "sewers" in the present state of the law, and for which the sanitary authority were liable as to repairing or relaying, owing to the combinations not having received at the time of construction the formal approval, sanction, order or direction of the sanitary authority concerned, that there was a tendency to-day to look askance at and refuse all plans of drainage showing a combined system. Of recent years, too, sanitary authorities had had to expend thousands and thousands of pounds upon combined drains, so that they felt justified in insisting upon a separate drain to each house or building. Such an extreme view was unwarranted, as all sanitarians were agreed that a first principle in drainage was to keep the drains as far as possible outside, so that, in the event of defects in connection with the drains, no harm should result to the occupiers by the escape of sewer or drain gas—a condition of things which might and did arise even in these days of expert drain-laying, farm settlements, &c.

Detached and semi-detached houses could have a separate drain to each house, the drains being kept easily outside. In the case of a row or terrace of houses a back line of drainages could be provided, discharging into a branch sewer in a side roadway, or be turned into the sewer in the roadway in front, either through an open uncovered passageway between two adjacent houses (and not less than 5 ft. for the width of such passageway) or by the side of one house, or even, where necessary, through and under one of the houses. By branching each house separately into this back line of drainages all drains were kept outside, or, at the most, one house only had a drain running under and through it; whereas, if a separate drain and separate connection into the main sewer was insisted upon, each house had to have a drain underneath and through it. How many houses ought to be allowed in a combined drain? In practice he would restrict the number to six (or less), and have the combined drain itself intercepted and ventilated separately; but with more than six houses the main drain might be regarded as a "sewer," and treated accordingly—each house drain being separately intercepted therefrom and ventilated. In the exceptional cases, where the combined drain had to pass under a house, great care must be taken in laying the same—*e.g.*, manhole back and front, joints absolutely air watertight, drain (if not iron) embedded in concrete, intercepted trap provided, &c.

THE LAW.

In the metropolis, with which he was concerned officially, the recent case of *Appleyard v. The Lambeth Vestry* had laid down the law very simply. Sec. 74 of the Metropolitan Local Management Act, 1855, allowed a combined system which had, previous to laying, received the formal order of the vestry or district board concerned; whilst sec. 17 of the Metropolitan Local Management Amendment Act of 1862 extended the powers of the previous Act beyond vestries and district boards (which were created in 1855) to metropolitan commissioners of sewers, who came into existence in 1848. Prior to that date all combined drains constructed were in London "sewers," repairable by the sanitary authorities—a very large order. The new Public Health (London) Act, 1891, gave no definition of drain. In districts served by the Public Health Act, 1875, a combined drain receiving the drainage of two or more houses was a "sewer," repairable by the sanitary authority, but the Public Health Acts Amendment Act, 1890 (sec. 19 of Part I), gave the sanitary authority power to deal with a combined system, and to recover the expenses incurred in dealing with such combination under sec. 41 of the 1875 Act. The 1890 Act was permissive.

His conclusions were: (1) Where a scheme of drainage was simplified and the drains kept outside by means of a combined system (or even in the rare case when the combined drain had to be taken through and under one house), it ought to be allowed, instead of insisting upon a separate drain and passing through and under each house—such a combined system being both hygienically, financially or otherwise. (2) When six (or less) houses were combined, the combined drain was to be intercepted and ventilated separately as a whole, but where more than six houses joined the main drain had better be treated as a "sewer," and each house separately intercepted therefrom and ventilated—the main drain itself not being intercepted, except in the rare instance where such main drain passed through and under a house or building.

DISCUSSION.

Mr. W. HENMAN, the president of the section, opened the discussion on the two foregoing papers. Those who were studying the question, he said, were realising the danger of multiplying traps and interceptors. They were a result of the "Model" By-Laws of the Local Government Board. He himself was afraid of anything "model," and, above all, of the Model By-Laws of the Local Government Board. He hoped that a very strong feeling would be raised at that congress to show the Local Government Board that these by-laws ought to be thrown into the fire or the waste-paper basket, and sensible and reasonable ones adopted in their place.

Mr. T. J. PERRY, chairman of the Sewers and Sanitary

Committee of the Camberwell (London) Vestry, ventured to differ from Dr. Priestley concerning the combined drainage question. He had presided over a conference on the subject of London medical officers, surveyors and others, and as a result did not advocate combined drains under houses. Back drainage, if it could be adopted, was a different thing. In practice intercepting traps and inspection chambers were lamentably bad. He would have liked to see a gentleman come forward at that meeting with a perfect system of ventilation of sewers (Hear, hear, and laughter). The president would have them do away with traps, but we would like to hear of a satisfactory alternative.

Mr. E. M. CLOSE (chairman of the Health Committee, St. Pancras) said he rose in response to Mr. Perry's challenge. He believed that our present system of drainage was wrong so far as outside traps were concerned. These should be abolished, but inside traps were necessary. The system of sewerage in London was different to that of smaller villages, of which he had no experience. In a sewer 4 ft. or 5 ft. high there must be a deposit and they must have gas, so it was absolutely necessary that those should be ventilated. But he would entirely abolish fresh-air inlets, and would put in ventilating pipes of 4 in. diameter, carried up the side of the building on the sewer side of the inspection trap. He would take away all gully traps from the foot of rain-water pipes, and would have a system of free ventilation throughout. He regretted the London vestries did not take up this matter when the London County Council were considering the question of new by-laws. He complained that architects had in the past entirely lost sight of the question of drainage.

Mr. T. LONGDIN (Warrington) was glad to hear the Local Government Board by-laws condemned, and he hoped the Association of Municipal and County Engineers would consider them, and, as practical men, send up suggestions for their improvement. The great thing was to have sewers giving self-cleansing velocities.

Councillor A. C. CAMPKIN (Cambridge) said he had found, as chairman of the Sewage Disposal Committee of his town, that ventilation by manholes in the crown of the road was an unmitigated nuisance, and he had endeavoured, but without success, to have them removed. Shafts carried up houses were successful in removing the smells, but the parties concerned complained of them. If these were condemned, where was the remedy? He doubted whether any ventilation of well-constructed sewers was necessary if they had proper gravitation and sufficient velocity. In the metropolis, however, where they had such large sewers, he could understand the necessity of ventilation.

Mr. LEWIS ANGELL (West Ham) said his corporation had circularised the authorities of the country, asking them to endeavour to get the new law as to combined drainage altered, but they had not succeeded in getting Parliament to do so. West Ham was a fighting corporation, and in their Omnibus Bill of this year they sought to introduce the old interpretation. Whether Parliament was asleep or the Local Government Board was nodding he could not say, but the West Ham clause had been passed, and that district had now succeeded in making for themselves a law under which private owners were responsible for combined drains. Moreover, the West Ham powers were retrospective.

Mr. S. R. LOWCOCK said he preferred "combined drain" to Prof. Bostock Hill's term "compound drain," because combined drainage used to mean the combination of rain water and sewage, in contradistinction to the separate system. He agreed with the suggestion that the Association of Municipal and County Engineers should give the Local Government Board the benefit of their advice as to by-laws, but what was wanted should first be settled, as at present there was great divergence of opinion. He also agreed with Dr. Bostock Hill that the multiplication of traps should be avoided; but they should not all be done away with, because of the difficulty of ventilating a sewer on account of the outlets at times becoming inlets. In his view the number of traps should be kept down, and some six or ten houses, according to local conditions, should be connected to a section of drain cut off from the main sewer. The sewer should be treated by itself and the section of drain by itself.

Mr. E. DAY (Worcester) thought they were all agreed that some outlet should be provided for sewer gases. Personally he favoured exhaust shafts, with a destroyer at the top to draw vitiated air from the sewer and destroy any microbes that might exist. For these shafts some arrangement might be devised for using the waste heat from gasworks or refuse destructor works.

Mr. W. HENMAN (Birmingham) said the real point was to prevent altogether the formation of sewer-gas. He knew that a complicated system of house drainage could be kept free from sewer-gas, and therefore engineers should be able to find a remedy for it in the sewers. Fresh sewage did not give off sewer-gas. But if there were traps, one to every house, there must be gallons and gallons of putrefying sewage water which at the next flushing was discharged into the sewers, and there was the material for making sewer-gas. It was true that there could not be found one perfectly model method for all towns. Each must have its own. All that had been said pointed to the fact that they were rather overriden by the law. He was not an advocate for uniting drains together where they had to go under houses. In Birmingham they did not know back passages, and, though they

were convenient for drainage purposes, he did not advocate them because of other evils connected with them. Mr. Lowcock advocated the ventilation of sewers as distinct from drains. Well, do away with traps and the distinction ended.

Dr. BOSTOCK HILL, in his reply, referred to the fact that there was at times a covert feeling of hostility between engineers and medical officers, but he was pleased to see it had not shown itself in that discussion. With what Dr. Priestley had said as to drainage under houses he absolutely disagreed. Under no conditions should a drain go under a house at all. He preferred to see the evils of, and he believed there were several that were creeping in through, compound drainage. The position as to ventilating shafts might be summed up in what the president of the section (Mr. Henman) had said as to fresh sewage having no smell. If sewers and drains could hold only fresh sewage, and not stale, then there would be no noxious gases which arose from putrefaction. The scientific method was not to close up gratings to hide smells, but to go to the root of the matter and see why there was a deposit in any particular drain, and remove the deposit. He was sorry Mr. Willcox, one of the best authorities in the Midlands, had not illumined the discussion. Mr. Day had suggested exhaust shafts and destructors for sewers. They had had many of these brought under their notice, but if they looked to the principle they would see such remedy was wrong. They could not in large towns, such as Birmingham, with hundreds of miles of sewers, possibly get such a draught as would consume all sewer gas and render it inoffensive. The expense would be prohibitive, nor would it be necessary. What was wanted was to so rearrange the sewers in large towns that offensive gases would not be generated. With reference to the question of "drain" and "sewer," he thought it was a mistake to quibble, because what everybody had thought to be a drain the judges had decided was a sewer. It had been suggested that it was unfair on ratepayers that they should be saddled with the cost of looking after drains that had become sewers. Well, in this age of socialism, he thought it was one of the best principles for all drains, whether private or not, to be looked after by the State, in the interests of the public health.

Dr. PRIESTLEY, in reply, said Dr. Bostock Hill had not made it clear that he (Dr. Priestley) did not advocate drains under houses. His contention was that they should only be so placed where necessary. With regard to Mr. Lewis Angell's remarks, he thought the West Ham Omnibus Bill would not override the general law of the land.

Dr. CHARLES PORTER, M.D., D.P.H., medical officer of health for the county borough of Stockport, also read an interesting paper in the Engineering and Architectural section, his subject being

THE QUANTITY OF WATER REQUIRED FOR DOMESTIC FLUSHING PURPOSES, AND THE INFLUENCE OF INTERCEPTING TRAPS THEREUPON.

In the course of his paper Dr. Porter said that the water-carriage system of refuse disposal, which was yearly becoming increasingly prevalent throughout the country, aimed at the cleanly and rapid removal, through drains, of excremental matter from the neighbourhood of dwellings. For its successful application and working adequate flushing of water-closets and house drains was absolutely essential, in order to prevent the latter from becoming "nothing better than elongated cesspools charged with foul, festering filth," as was shown to be the case at Maidstone. The recent Government report on the typhoid epidemic in that town told us that half its 6,000 odd houses had water-closets without any mechanical means of flushing, and that the sanitary authority's lamentable "failure of duty in this respect had led to the gravest consequences," a large number of the typhoid cases being officially ascribed to soil and air pollution from blocked and defective drains. In advocating conversion to water carriage we ought, therefore, to satisfy ourselves that the public health was protected from the results of such deficiencies; and with this object in view he was directed in April last by the Stockport Corporation to ascertain experimentally the quantity of water required to flush efficiently a water-closet with drain and intercepting trap. Dr. Porter then continued:—

Upwards of 120 experiments were shortly afterwards carried out on the lines adopted by the Sanitary Institute in 1893, the apparatus used being the following: (a) Duckett's wash-down closet, with 8 outgo, and afterwards a "Units" wash-out closet; (b) water waste-preventing cistern, graduated for 6, 4, 3, 3, 2, 2, and 1½ gallons, and connected to closet by 5 ft. of 1½-in. vertical lead piping; (c) 47 ft. of glazed earthenware 6-in. and 4-in. pipe drain, with puddle joints, and having a right-angled curve one pipe's length from closet outgo. In upper surface of each length of pipe was cut a slot 15 in. to 18 in. long and about 2 in. in width, for inspection purposes; (d) disconnecting traps (or "interceptors") of a good type, attached to end of drain, discharging over a weighted yall, and having glass windows inserted in the lowest part or "throat." Fecal matter and paper, from a "Rohdale Pail," filled by actual use at a mill, were used for charging the closets, 1 oz. to 6 oz. being employed in most cases, but 8 oz. and 12 oz. were used in a smaller number. In the Sanitary Institute experiments artificial material was used for this purpose.

The first series of trials (fifty in number) were made with

a 4-in. drain (fall 1 in 40) and 4-in. disconnecting trap. This trap was filled by 4 pints of water and at the lowest part measured 3½ in. transversely and 4 in. vertically. Flushes of 3, 2½, 2 and 1½ gallons were employed, the result being that 3 gallons invariably sufficed to thoroughly flush closet, drain and 4-in. trap; a 2½-gallon flush generally failed to clear the 4-in. trap; with 2 gallons the interceptor was not once cleared, and most of the solids were left in the trap. By repeated 2-gallon flushes in rapid succession, causing a head of water in the drain, the trap was eventually cleared with a rush, but this did not happen if one flush were allowed to trickle away before the next followed it. A 1½-gallon flush was found to be of little use. The drain was never cleared and became rapidly blocked.

The second series included twenty-one experiments, and was made with a 6-in. drain (fall 1 in 60) and 6-in. disconnecting trap, which, it is noteworthy, required 12 pints of water to fill it, and at its lowest part measured 5½ in. transversely and 5½ in. vertically. Flushes of 6, 4, 3½, 3 and 2½ gallons were used, and it is a remarkable fact that, though 3 gallons and upwards sufficed to clear the closet and drain each time, the 6-in. trap was cleared by a 6-gallon flush in only two out of four cases; 4 gallons cleared it in only one out of six cases, and anything less than 4 gallons altogether repeatedly failed to clear the trap.

The third series numbered twenty-two experiments with a 6-in. drain and a 4-in. intercepting trap. With a 3-gallon flush the closet, drain and trap were efficiently cleansed every time, but a flush of less than 3 gallons failed each time to clear the drain and to reach the trap.

The fourth series (eighteen trials) with a "Unitas" wash-out closet, 4-in. drain and 4-in. interceptor, flushes of 3, 2½ and 2 gallons being used; 3 gallons sufficed to clear the trap in two out of six cases. With smaller flushes the trap retained a portion of the charge in every case; in five cases the drain was not cleared, whilst in eight the closet trap was not cleared, due evidently to the inherent faults of the wash-out closet. I shall be pleased to supply fuller details of these results to anyone interested in the matter, and I venture to submit the following

CONCLUSIONS.

(1) That 3 gallons is the minimum amount that can be relied upon for efficient flushing—i.e., prompt carriage of dejecta through closet, drain and interceptor to sewer, even with a good form of wash-down closet well laid, 4-in. or 6-in. drain, and good 4-in. interceptor. (2) That if an inferior type of closet be used, or if the intercepting trap exceed 4 in. in diameter, 3 gallons is clearly not sufficient for effective flushing. The proper remedy then, however, is to correct such structural deficiencies rather than to increase the flush. (3) That if no intercepting trap be employed a flush of 2½ gallons is the minimum amount that can be relied upon to efficiently cleanse the closet trap and drain. (4) That the invariable employment of a disconnecting trap, as recommended by the model by-laws, is far from being an unmixed benefit, and, owing to the obstacle the disconnecting trap presents to the cleansing of house drains, its use should be strictly limited to those dwellings inside which a drain opening exists—e.g., in the cellar—and that if such drain openings inside houses were prohibited in new dwellings disconnecting traps might, with great advantage, be entirely dispensed with. There is much reason to believe that we have hitherto exaggerated the potency of sewer air; assuming, however, that it is noxious in its effects, the object of a disconnecting trap is wholly gone if we keep all drain openings outside our dwellings; and having done this, it is absurd to continue to insist on disconnecting traps, which only diminish the efficiency of the flush of water.

IN ECONOMY IN WATER EFFECTED BY THE USE OF WASTE-WATER-CLOSETS?

In order to elucidate this question two blocks of exactly similar houses were recently selected in Stockport. At the request and expense of the Sanitary Committee the water supplied to each block between 7 a.m. on October 28, 1896, and 7.30 a.m. on May 13, 1897, was metered by the water company, with the following results: Lot A.—Ten houses with waste-water-closets used 65,720 gallons, or 33.3 gallons per house per day. Lot B.—Fourteen houses with ordinary water-closets used 151,320 gallons, or 54.8 gallons per house per day, showing a saving of exactly 21.5 gallons per house per day in stop-water houses. In a similar and more recent experiment in Manchester the city surveyor, Mr. T. de Conroy Mende, M.C.E., has, curiously enough, obtained an exactly identical result.

New Mersey Docks.—The Mersey Docks and Harbour Board have accepted the tender—amounting to over £250,000—of Mr. C. J. Wills, of Manchester, for the construction of a new dock, &c., in connection with the Queen's dock, and the work will be commenced immediately.

Business Announcement.—Messrs. J. H. Sankey & Son, Iron Bridge and Essex Wharves, Canning Town, London, E., inform us that they have purchased the business of Messrs. A. Gregory & Co., lime, cement, brick and sanitary goods merchants, carried on by them at Plumstead, Woolwich Arsenal (South-Eastern Railway) Bexley Heath and Erith. Messrs. Gregory & Co. still, however, retain their brickfields at Wickham-lane.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

222. Building By-Laws: Wooden Bay Windows not Permissible.—"M. S. A." writes: In submitting plans for some houses with bay windows on ground and first floors it is proposed to put brick mullions at angles to ground floor, only the upper bay having no angle mullions, but simply the wood frame, and finished with moulding and gutter above. These were submitted to two different local authorities. One authority passed the plans as in accordance and complying with the by-laws; the other refused to pass them, as they contend that the upper bay does not comply with the by-law. The by-laws of each authority are alike, and state that the woodwork shall be 4-in. from the face of the wall. I consider that the woodwork of the upper bay is 4-in. from the face of the wall. Which authority is right?

The construction of bay windows formed of wood is contrary to the provisions of clause 24 of the by-laws which are in force in the district, and the local authority are entitled to refuse approval of the plans. The clause referred to requires that "every person who shall erect a new building shall cause all woodwork in any external wall of such building (except any bressumer, or any storey post under a bressumer, and any frame of a door or window of a shop) to be set back in reveal 4 in. at least from the outer face of such wall." The object of this clause, as pointed out in Knight's "Annotated Edition of the Model By-Laws," is to require window frames, &c., to be set back from the outer face of any external wall of a new building, in order that, in the event of fire, the burning of the woodwork referred to shall be less dangerous to adjacent property and less liable to interfere, by falling on or otherwise, with persons outside the building. For convenience of business, woodwork about any shop-front is exempted from the operation of the clause, and in the case of buildings of the warehouse class doors for the ingress or egress of merchandise are allowed by another part of clause 24 (not reproduced) to be nearly flush with the outer face of the wall. Bay windows formed of wood only cannot be erected to comply with the by-laws.

THE LONDON WATER SUPPLY COMMISSION.

The Commission held their thirty-fourth meeting at the Westminster Guildhall, on Monday, Lord Llandaff presiding.

Mr. W. B. BRYAN, chief engineer to the East London Water Company, was examined, and gave detailed statistics as to the supply of water in the company's district during the present scarcity. He asserted that there had been much waste from taps being kept continually running, and that the lack of storage in the district greatly aggravated the hardships of the drought, which really began about sixteen months ago, and had exceeded all previously recorded droughts. He estimated that in the event of the recurrence of a similar scarcity the company, with the assistance of 12,000,000 gallons daily from other companies, would be able to keep up a constant supply. They were taking measures for increasing their storage, and hoped to be independent of the other companies in two years.

In the course of cross-examination on Tuesday, Mr. BRYAN said the East London Water Company's supply of water from its own sources was in September last less by 17,343,000 gallons per day, and in October less by 18,640,000 gallons, than in the corresponding months of 1897.

Sir ALEXANDER BINNIE, engineer to the London County Council, recalled, gave it as his opinion that what had been done by the company this autumn was sufficient for present purposes. On the part of the county council he strongly objected to their being saddled, in the event of purchase, with an expenditure of £500,000, which the companies proposed to expend upon the intercommunication scheme. In the event of water having to be obtained from Wales hereafter, it was undesirable to have the scheme complicated by a system of intercommunication from the centre to the outside. In case of an amalgamation of the companies the intercommunication should be from the outside to the centre, and on this account he preferred what had been described as the No. 1 scheme. If it was an insurance, an intercommunication scheme, whilst increasing the debenture stock of the companies, might decrease their selling price. If the East London Water Company were bought now, they should buy them as a defaulting company, which they could not do if they were able to avail themselves of the intercommunication scheme.

Tenders Wanted.—The Secretary of State for Foreign Affairs, has received a despatch from her Majesty's representative at Rio de Janeiro, stating that tenders are invited by the Government of the State of Para for the purchase and working of the waterworks of the city of Belem (known as Para). Tenders must be received at the Treasury of Para by March 15, 1899. A copy of the conditions of the contract may be examined at the Commercial Department of the Foreign Office any day between the hours of 11 a.m. and 5 p.m.

The Surveyors' Institution.

PRESIDENT'S ADDRESS: GROWTH OF THE METROPOLIS: SEWAGE DISPOSAL.

On Monday evening Mr. Robert Vigers delivered his inaugural address as president of the Surveyors' Institution. In his opening remarks he said it was the wise policy of those who founded the institution to establish it on the broadest possible basis, so as to make it representative of every branch of their many-sided calling. The list of members now comprised nearly 3,000 names. He proposed to confine his observations very largely to matters connected with the great metropolis, which presented such an immense and unique field for professional activity. In dealing with this subject the president continued as follows:—

THE GROWTH OF LONDON.

"To begin with, the material growth of London during the fifty years covered by my personal experiences almost transcends belief. A comparison of a map of London in the forties with a map of our present London will show how rapid and complete has been the absorption of the open spaces which separated it at the earlier period from the surrounding hamlets and villages—spaces which have been taken possession of in the interval by the extra 2,000,000 persons for whom house accommodation has had to be provided.

"Take, by way of example, the parish of Kensington. The population of the parish was in 1856 54,000 persons, in 1896 it had risen to 170,000 persons—in other words, it had more than tripled. In 1856 the inhabited houses numbered 6,300, in 1896 22,580, or three and a half times as many as forty years previously. The roads under the control of the vestry measured 27 miles at the earlier date, in 1896 they measured 85 miles. The rateable value was £287,655 in 1856, and had risen to £2,200,000 in 1896. This amazing growth can no doubt be matched in other districts, but it may serve as a measure of the problem which awaits some of us, and certainly our successors, to conservation of the health and of the providing for the housing of a population expanding at this astonishing rate.

"I have given some statistics of the growth of a single London parish during the last forty years. Let me now take the wider area of what is known as the administrative county of London, which, subject to a slight correction, is co-extensive with the old Metropolitan Board of Works district as defined by the Act 18 and 19 Vic, cap. 120. The several areas on which the census for the years 1851, 1861, 1871, 1881 and 1891 were respectively based are difficult to reconcile, and I am indebted to the courtesy of the Registrar-General for a reduction of these areas to uniformity for the purposes of the following analysis. The population of the area now known as the administrative county of London, comprising 75,422 acres, was: In 1851, 2,363,274; 1861, 2,808,862; 1871, 3,266,987; 1881, 3,834,194; 1891, 4,232,118; or, putting it another way, about fifty-six persons to the acre. In the decade 1851-61 the population increased by 445,588 persons, or 18.85 per cent.; in the decade 1861-71 by 458,125 persons, or 16.31 per cent.; in the decade 1871-81 by 567,207 persons, or 17.36 per cent.; and in the decade 1881-91 by 397,924 persons, or 10.37 per cent. The number of inhabited houses was: In 1851, 306,064; 1861, 360,065; 1871, 419,642; 1881, 488,585; 1891, 548,315. But I should explain that an inhabited house is for census purposes a house or tenement in which one or more persons slept on the night of enumeration.

"I will not labour the point by setting out the figures in detail, but it is a fact worth observing that, while the ratio of the growth of the population showed in the first three decennial periods a tendency to exceed the ratio of increase in the number of houses in the last census decade, the growth of house accommodation exceeded the growth of population by about 2 per cent., and I think I am entitled to argue from this that the work done during the last twenty years in the demolition of overcrowded small neighbourhoods is beginning to bear fruit and to reveal itself in our statistics. The number of persons per house has fallen 0.30 per cent. in the last two decennial periods (the figure is now about 7.64 persons per house, compared with 7.94 in 1871), and my point is: that not only has the number per house fallen appreciably in the last twenty years (despite an increase of nearly 2,000,000 in the population), but that in an enormous number of cases the 7.64 persons per house are now living in far larger and healthier dwellings than the 7.94 persons per house of twenty years ago, and that, with improved dwellings, 7.64 persons per house is not by any means excessive."

Mr. Vigers then proceeded to refer to

THE HOUSING PROBLEM IN LONDON.

In regard to this he said:—

"I am not very conversant with the work done under the Housing of the Working Classes Acts, but it is stated that the value of sites for rehousing on the route of the Strand to Holborn improvement would involve a loss to the county council of £260 per person provided for, or for a family of seven persons an unremunerative expenditure of £1,820 for land only, if reinstated close to their former dwellings. This is in startling contrast to the experience of the Peabody Trustees; but then the philanthropy of the trustees is not of

so exalted an order as to induce them to select sites in expensive situations for the mere purpose of saving the persons to be benefited a quarter of an hour's journey to their work. There is the less necessity for this plan of rebuilding on the old sites, seeing the facilities in the way of cheap workmen's trains for rehousing the dispossessed persons in the far healthier atmosphere of the suburbs. Indeed, this system of workmen's trains is in some danger of abuse and of becoming a check to enterprise. There can be no doubt that the conditions in this respect imposed on the new railway beneath Oxford-street are oppressive in the highest degree, whatever may be their justification from the point of view of modern sociology.

"It will perhaps be remembered that Mr. Peabody's superb gift to the poor of London amounted in the aggregate to £500,000, to which had been added up to the end of last year over £720,000 in respect of rent and interest, bringing up the total fund to £1,220,446 on December 31, 1897. It will thus be seen that the trustees in their management of the fund have had due regard to the wishes of the donor that it should minister to the wants of 'future generations of the London poor' by making it reproductive, while at the same time rendering it a model for all future efforts to relieve the congestion of the poorer districts of this crowded city.

"I find that the capital expended on land and buildings to the end of the year 1897 was £1,250,390 10s. 6d.; that the artisan and labouring poor of London had been provided with 11,367 rooms, besides bath-rooms, landries and lavatories, and that these rooms were comprised in 5,121 separate dwellings, of which eighty-six were of four rooms, 1,781 of three rooms, 2,426 of two rooms and 828 of one room. The average weekly earnings of the head of each family was £1 3s. 2½d., while the average rent of each dwelling was 1s. 9½d. a week and of each room 2s. 2d. a week. The total number of persons in residences in December last was 19,741, giving a mean density of 725 per acre. I have already shown that the average density of the population of London is about 56 per acre, and it is therefore a significant circumstance that, notwithstanding that the number of persons in the Peabody Buildings represents a mean density nearly thirteen times as great as that of London as a whole, the death rate was 2.8 per 1,000 below the average of London, while the infant mortality (the most telling factor in the death rate) was actually 21.9 below that of London as a whole.

"To show the class of persons for whom accommodation has been provided I may set out the occupations principally represented: Carmen, 283; charwomen, 372; labourers, 673; letter carriers, 104; needlewomen, 267; packers, 136; police constables, 186; porters, 513; printers, 129; and warehouse labourers, 194. It will, I think, be agreed that no better example could be found of a charity administered in such a manner as to be entirely free from the familiar reproach of pauperising the beneficiaries, or of one in which the expenses of management bears such a small proportion to the total income as 2½ per cent."

THE TRANSIT PROBLEM IN LONDON.

The next subject taken up by the president was the important one of transit, in regard to which he said:—

"But the serious problem still confronts us how to provide a population increasing at the rate of about 500,000 in ten years with those means of internal communication necessary for the free movement of the vast traffic traversing the restricted area comprising the principal centres of business activity. Speaking broadly, it may be said that the bulk of the heavy commercial traffic of London (taking the area lying between Westminster and the Tower) is between north and south—that is, between the termini of the great railways on each side of the river, the Port of London, and the warehouses and manufactories of Southwark and Bermondsey.

"The opening up of new routes for vehicular traffic has done a good deal to relieve the pressure, and the effect was strikingly displayed in the case of the Tower Bridge. Most of us have had bitter experience of former blocks on London Bridge. I have not the latest figures before me, but I find from the report of the City engineer that within a year of the opening of the Tower Bridge London Bridge had been relieved of about 5,200 vehicles per day, Eastcheap of 2,200, and Fenchurch-street of about 3,000, whereas the traffic in the streets to which it was deflected by the new bridge was increased in the following ratios: The Minories by 2,200 vehicles daily, Liverpool-street by 900, Homdsditch by 700, and Bishopsgate-street by 600.

"The lighter traffic and the ebb and flow of the pedestrian tide is, on the other hand, mainly from east to west. Everyone must have been struck with the crowded condition of the footways along the main thoroughfares during the greater part of the day. A man who wishes to make his way rapidly between such points as Liverpool-street and St. Paul's, Moorgate-street and the Mansion House, or the bottom of Fleet-street and Charing Cross, finds his progress checked and at times absolutely arrested, by the double stream of people on the narrow pavement; he has to traverse, where the pace is set by the slowest walkers, who are frequently mere loiterers

or sightseers. It must have occurred to him to wonder what the state of things will be in this respect in twenty or thirty years' time. Yet practically no attempt has been made to mitigate this great and growing inconvenience.

"There is a lack of schemes for widening the roadways, but so far as I am aware, the equally serious consideration of facilitating the progress of the pedestrians by the provision of wider pavements has, except in a few instances, not been deemed worthy of attention. It is not sufficient to widen a street like the Strand from 53 ft. to 80 ft., as indicated by the setting-back at the corner of Wellington-street, unless the footways are also doubled in width, nor does it meet the case to provide parallel thoroughfares, for people will not quit the direct track from point to point, whatever the inconvenience may be of attempting to traverse it.

"The system of tube railways, now in its infancy, will probably absorb in time some of the foot traffic of the main thoroughfares, and may even result in a temporary diminution in the number of omnibuses, but the limits of the carrying capacity of these railways must soon be reached, and the provision of wider roads and pavements and new arteries for wheeled traffic will become imperative.

"One of my predecessors in this chair, the late Mr. C. J. Shoppe, put forward an ingenious suggestion for carrying the heavy north and south traffic *under* the Strand. This suggestion met with less attention than it deserved, and I should not be surprised if some enterprising engineer some day rediscovered the idea.

"No doubt there have been vast improvements in the means of external communication within the last few years. Without these increased facilities the more remote districts would have been inaccessible to those whose daily business lies in the great commercial centres; but these rather tend to increase than to diminish the congestion of the centres, by throwing a vast population into them within a limited period of the day.

"I am of opinion that the time is not far distant when the people of London will be called upon to incur an enormous expenditure in further widening streets like Oxford-street, Holborn, the Strand, Fleet-street and Ludgate-hill, originally laid out for a population one-tenth the present size, for what has hitherto been done in this direction is a mere tinkering with the problem of free locomotion."

After some remarks on the great rise in the value of land in the City, the president referred to the valuable report prepared by Mr. Percy J. Edwards, and published by Messrs. King, of Bridge-street, Westminster, dealing with metropolitan improvements. The report comprised a list of thirty new streets and street widenings effected between 1857 and 1885 inclusive, with their gross and nett costs, and the approximate area of building land absorbed in their execution. From a table which gave the results in a condensed form it appeared that the area of building land lost to the market by these improvements was 1,606,650 square feet, or nearly 37 acres. The president next referred briefly to dealings with property in connection with the new Central London Railway, and then said that a few words would not be considered out of place on the perennial subject of

SEWAGE DISPOSAL.

On this subject he spoke as follows: "A few words will not be considered out of place on the perennial subject of sewage disposal. Some of us are old enough to remember papers read before this institution thirty years ago, to prove not only that a way had been found of ridding our towns of what had even then become an intolerable nuisance, but promising fortunes to those who had the sense to utilise this good gift of Nature on the land. We were all thrilled with tales about 10 tons of rye grass to the acre and of crops stimulated to the almost visible growth of 4 in. per hour. We were reproached with our folly in depending for manure on the legacy left to us by the 'provident penguins' of by-gone centuries, and were assured that each man's excreta, properly applied, was sufficient to grow crops for his maintenance. Alas for human enthusiasm! This noble dream of a self-supporting community faded in the light of realities. There was no money in it beyond that which was put there. Nitrogen tables were forthcoming to any amount, but no balance sheets, and in a few years all that could be definitely predicated was this, that, under favourable conditions, a dry-weather flow of sewage could be dealt with on a sufficient area of land in a suitable situation, and that such heavy crops of rye grass could be grown that there was no market for them. So we were not much the wiser for all that had been said and done in the matter.

"Gradually it came to be recognised that sewage, so far from being of commercial value, was a nuisance to be got rid of, in the least expensive way, but at any rate got rid of. This more reasonable gospel now meets with general acceptance, and processes innumerable have been devised for dealing with crude sewage in such a way as to secure an effluent sufficiently innocuous for discharge into rivers and watercourses without danger to the public health. It must be admitted that local authorities have been placed in a cruel predicament between the demands of legislation, the resulting pressure of public departments, the necessity of getting rid of their sewage and the immaturity of the methods for so doing. The solution seemed at first to be exclusively in the hands of the surveyor and the agriculturist. Later on the engineer became enlisted, then the chemist; and now the bacteriologist,

assisted by a few bricklayers, appears intent on making the question his exclusive monopoly. For the moment it is that much-maligned creature, the micro-organism, that holds the field, and it is with its benignant aid that a way is to be found out of all our troubles. The annual report (1898) of the London County Council affords a measure of the immensity of the task of dealing with the sewage of a great city. The crude sewage treated at the two outfalls in the course of twelve months amounted to 77,103,364,000 gallons. The chemical precipitating agents employed were 15,500 tons of lime and 3,914 tons of proto-sulphate of iron, while the sludge produced weighed 2,136,683 tons. The disposal of this latter required the services of six sludge vessels (with a carrying capacity of 1,000 tons each), which made an aggregate of 2,124 passages for the purpose of depositing it at Barrow Deep, some 15 miles beyond the Nore, at a cost for maintenance of nearly £30,000 per annum.

"There is no attempt here, so far as I can gather, at anything more than the removal of the solid matter, and vast as is the expense involved, it is small in comparison with the cost that would be incurred in endeavouring to obtain the innocuous effluent so necessary where the outfall is situated on a non-tidal river. However, the subject is too great for treatment in any detail in this address, and I will therefore confine myself to a brief reference to two modern methods of sewage treatment that are for the moment attracting some attention.

THE SEPTIC SYSTEM.

"First, I may refer, as the more hopeful of the two, to the ingenious system invented by Mr. Cameron, the city surveyor of Exeter, which has recently formed the subject of a Local Government Board inquiry. Mr. Cameron maintains that all other systems show but poor results, that they all bear a strong family likeness, and have been adopted as mere makeshifts; that they all aim at merely clarifying the sewage by chemical means previously to turning the effluent on the land or passing it through an artificial filter; that this effluent is frequently found to undergo subsequent fermentation; and that the nuisance which results is often greater than if the crude sewage were put at once upon the land without previously undergoing these costly processes. He argues that the soluble organic matter passes away in the effluent, while the more solid matter still remains to be dealt with in the highly inconvenient form of unmarketable sludge, which has very little, if any, manurial value.

"He is under the impression (a very reasonable one) that the production of sewage has been going on in these islands from prehistoric times, and he naively remarks that, notwithstanding this fact, no difficulty has ever arisen as to its disposal until artificial means were resorted to for getting rid of it in some other than the time-honoured manner of turning it into the nearest stream, to be dealt with by natural oxidation—a somewhat odd reflection for a sanitary reformer. He does not, of course, advocate a return to so unscientific a system, but he contends that crude sewage, minus manufacturing refuse, is, when poured into the rivers, in most cases completely destroyed in a few hours; that this is done by a purely natural process, and that the true key to the problem is to imitate these natural processes with such facilitating means as science may afford. It is at this point that the bacteriologist appears upon the scene, with battalions of friendly microbes, doing their work of chemical metamorphosis under conditions favourable to their development and beneficent activity. His plan is simplicity itself. He passes the crude sewage into what he calls septic tanks, from which light and air (those foes of the microbe) are as much as possible excluded. He claims that on entering the still waters of the tanks the solid matters are disengaged, the heavier falling to the bottom and the lighter rising to the surface; that the organisms present in the sewage under these circumstances increase enormously and rapidly attack all the organic matters, converting them into simple compounds in a descending scale of complexity, and that the ultimate remaining products are merely ammonia, carbonic acid and other gases, with an almost inappreciable residuum of black earthy matter representing the burnt-out ash of the solids of the sewage. The principal points on which Mr. Cameron insists are that no refractory residuum remains in the shape of sludge, and that the effluent leaves the tanks clear and inoffensive and (most important of all) free from all liability to subsequent fermentation and decomposition. If this be so—and scientific evidence is forthcoming in support of the claim—it represents a very distinct advance, and the days of the claimant with a sentimental grievance over the propinquity of a sewage farm should be numbered.

"As a matter of fact, Mr. Cameron's so-called septic tank is a species of glorified cesspool, with this difference, that in a cesspool the septic changes constantly going on are uncontrolled and liable at any moment to invade the houses with which it is connected, whereas in the case of the septic tank all deleterious gases are cut off from the drains, and can be conducted away and dealt with without damage to human health. It is as well, however, not to be sanguine, or to forget that old fallacies under fresh names are apt sometimes to be hailed as new truths.

"Just a few words about another system. I will be very brief, as it has already been described in our "Transactions." I refer to what is called the "Electrozone Sterilising Process," carried on at Maidenhead. The liquid called electrozone is

described by our member, Mr. Henry Robinson, as produced by the electrolytic decomposition of sea water, resulting in the evolution of chlorine. One-fifth of a grain of chlorine per gallon of effluent is found, it is said, to be quite sufficient for the purposes of complete sterilisation. I do not gather that the system is primarily intended for the treatment of crude sewage, which is best dealt with by bacteric action, but rather as a means of absolutely sterilising the effluent for a time long enough for the processes of natural oxidation in the streams and rivers to check any tendency in it to generate morbid organisms. This also sounds promising, but the system has yet to stand the test of time and of those varying conditions which are so liable to upset the most confident predictions."

The concluding part of an interesting address was devoted to a discussion of various points in connection, first, with the ethics of practice especially as affecting the younger members of the profession in their desire to obtain business, and, secondly, with certain strictures which had been made in regard to the giving of

EXPERT EVIDENCE ON OATH.

In the course of his remarks on the latter subject, Mr. Vigers pointed out that the difference between the extreme valuations on the same side was just as great as that between the extreme valuations on the two sides. So long as the value of property remained a matter of opinion and speculation divergencies must arise. The surveyor for the claimant was bound, in view of potential changes affecting the value of property, always liable to occur in a densely-peopled country, to see that no contingent element of value was overlooked, however remote it might be; while the surveyor for the purchaser was equally bound to secure his client, if possible, against paying ready money in respect of any future element of value which was not certain to accrue sooner or later. It was necessary to consider what the position of the surveyor as a witness on oath. He has sworn to tell "the truth, the whole truth, and nothing but the truth." Now as this adjuration was much too precise and comprehensive for application to matters into which purely speculative opinion must, from the nature of things, largely enter, it followed that what in effect the witness swears was not that all he has to say is fact, but that what he had to say was his honest opinion. The critics were probably suffering from some confusion of mind, being apparently under the impression that because the witnesses on both sides were on their oath their valuations should practically agree, whereas it was not likely, in the nature of things, that they would even approximately agree in some cases, having regard to the different standpoints from which the respective parties approached the matter at issue. An opinion was one thing and a fact another thing altogether. The question, therefore, could not but suggest itself whether the examination of expert witnesses on oath was not a mistaken endeavour to apply to the region of opinion a procedure imported from the courts of law, and appertaining in principle to the region of pure fact. Might it not be contended, with some show of reason, that the position in which the surveyor should really be placed was that of a technical advocate for his side, a species of assessor to counsel, and that it should be left to a sworn umpire to settle, after hearing the witnesses on both sides, the degree to which the more speculative elements in the valuations should be allowed to prevail?"

THE INSTITUTION.

Mr. Vigers concluded an interesting address with the following remarks in regard to the institution:—

"The retrospect of the last thirty years should inspire us with a pardonable pride. No institution with which I am acquainted has ever achieved such a remarkable success in so brief a period of time, and, so far as it can be ascribed to any one circumstance, I think this has been due to the habits of caution, so characteristic of surveyors, which have governed our procedure. It has been the policy of your council, while availing themselves of every real opportunity of advancing the interests of the profession, to avoid that fussiness which some persons consider the first duty of a professional society. We have not sought to harry public departments on small pretences or on none at all, and, as a consequence, when we have approached them on questions of moment we have received attention and consideration at their hands, and have been able to usefully influence in this way the course of legislation and the tendency of departmental procedure. In the result the society is stronger to-day than at any period of its history, and whether regard be had to numbers, to financial position, to internal organisation, to the freedom of its constitution, or to the beautiful new home which it has provided for itself, and which will be completed early next year, it may challenge comparison with any other professional body in the kingdom. But the future is with the rising generation, not with that which is passing from the scene. You younger men cannot say that you are not entering into a goodly heritage, and it rests with you to decide whether you will dissipate and destroy it by indifference or even by mistaken activity, or whether you will hand it on unimpaired, and even extended, to your successors."

Hford.—The district council have decided to take steps to promote a Bill in Parliament with the object of acquiring the gasworks.

THE LOCAL GOVERNMENT BOARD AND "WATER-FINDING."

Mr. Leicester Gataker, of Bath, has forwarded us an extract from *The Leighton Buzzard Reporter* of November 6th, with reference to his "water-finding" proceedings in Bedfordshire. It will be remembered that Mr. Gataker was employed last year to "find" water by a district council, and that the district auditor refused to pass the account. (1) He disallowed the payment to Mr. Gataker on three grounds:—(1) That Mr. Gataker's claim to be able to discover subterranean sources of water was such a pretence as constituted an indictable offence, and that therefore the consideration for his employment was illegal and the contract void. (2) That in disregarding a certain geological report and employing Mr. Gataker the district council incurred expenditure without any sufficient ground and recklessly wasted the public money under their control. (3) That Mr. Gataker's claim to be able to discover subterranean sources of water was practically an attempt at imposition; and that, therefore, he was not a proper person for the district council to employ. However, the Local Government Board have now, according to the journal quoted, reversed the auditor's decision, and have written a letter on the subject to the following effect:—"As regards the auditor's first reason, the board do not consider that it has been proved that Mr. Gataker committed an indictable offence; or that, if he did so, the members of the district council were aware that his pretences were illegal. This being the case, the board are of opinion that it must be held that the first reason assigned by the auditor fails to support his decision. As regards his second reason, the board cannot but consider the action of the district council as unwise, but it does not appear to them, having regard to the recommendations the council received as to Mr. Gataker's capabilities, that the council can be considered as having acted with such recklessness that the disallowance and surcharge can be confirmed on this ground. In view of the above considerations respecting the auditor's first and second reasons, the objection taken by him in his third reason appears to this board to be insufficient to support his decision, and in the circumstances the board propose to reverse the disallowance and surcharge. An order will shortly be issued accordingly."

FIRE PROTECTION IN LONDON.

NEW STATIONS AT WOOLWICH AND LEWISHAM.

On Saturday afternoon Mr. A. M. Torrance, the chairman of the Fire Brigade Committee of the London County Council, laid the foundation-stones of two new fire stations at North Woolwich and Lewisham.

The station at the former place is rather a small affair, affording accommodation for only three married men. The district abuts on the borough of West Ham, but further protection for fire has been rendered necessary owing to the growth of the neighbourhood, which contains many large factories. The cost of the building will be something over £1,000.

At Lewisham a much larger station is in course of erection. The existing fire station at Catford has been found to be altogether below the wants of the district. The building itself contains accommodation for one officer only, the coachmen and firemen having to live some distance away. It is away from that part of Lewisham where most of the business premises were placed. Five years ago the Fire Brigade Committee recommended that a new station should be built. A site had been selected, having a frontage of 77 ft. to the High-street of Lewisham, next to St. Mary's Church. It contains an area of 6,100 square feet, and the station will cost £13,600 to build. It is hoped that the buildings will be completed by next summer. Accommodation will be provided for fourteen married men, four horses, one steamer, one hose-tender and escape, and one hose and ladder truck.

A large number of people gathered to witness the ceremony of laying the respective stones, after which Mr. Torrance and the party accompanying him paid a visit, during the afternoon, to several stations on the south side of the river.

Trade Catalogue.—Mr. A. G. Thornton, manufacturer of drawing and surveying instruments, St. Mary's-street, Manchester, has just issued a new edition of his illustrated catalogue. The new edition has not only been entirely rewritten and revised, but has been considerably enlarged. It comprises, indeed, nearly 200 pages, is profusely illustrated, and contains full particulars of new articles and improvements introduced since the issue of the last edition.

Bedworth Waterworks.—On Saturday, the 5th inst., the foundation-stone of the water tower, in connection with the above works, was laid by Mr. William Johnson, the chairman of the parish council. At the ceremony a silver trowel, suitably engraved, was presented by the engineer, Mr. H. Bertram Nichols, A.M.I.C.E., of Birmingham. Afterwards a luncheon was held in the central schools by the invitation of the chairman. The works are being carried out by Mr. Anos Jenkins, of Southwell, Notts, whose contract amounts to £19,700.

CORRESPONDENCE.

Tramway Traction in London: Mr. Baker's Report.—

Mr. J. Allen Baker writes: I note, from an issue of your paper, that on the 11th inst. you noticed at some length my report to the London County Council on some forms of mechanical tramway traction, and that your purpose continuing same in a later issue. I have just received from New York a very striking confirmation of my recommendation of the conduit system for London, in the form of an article in *The Street Railway Journal*. I considered this of so much importance that I immediately had it reprinted and circulated to the London County Council, and have pleasure in handing you herewith a copy of same. The experience of the Metropolitan Street Railway Company of New York (who have had the largest and best experience with the conduit system), and have installed the latest improved type of same) proves conclusively that the "conduit" is not only minus the disadvantages of the "trolley," but works satisfactorily in every way; and, further, and most important, this report has proved it to work with greater economy than any other system or installation that has come under my notice.

THE BRITISH GAS TRACTION COMPANY, Ltd., 22 Chancery-lane, E.C., write: We notice in your issue of the 11th inst. some abstracts from Mr. J. Allen Baker's report to the London County Council on mechanical traction and your comments on the subject. The line at Blackpool, running to St. Anne's and Lytham, to which allusion is made as having been very recently installed, has been in regular work since July, 1896, and the consumption of gas of 35 cubic feet per car mile, which includes that used in driving the compressing engines, represents a cost of less than 1d. per car mile. Comparison is made between this system and the overhead electric system, and the Dover Corporation is cited as having adopted the latter, after careful investigation of the merits of the two methods. We have reason to believe that the overhead electric system was adopted chiefly because of larger apparent profit shown on their estimate; and it should be noticed in this connection that the experience of the Dover Corporation has shown a consumption of electrical energy of 0.95 unit per car mile, for which they pay at the rate of 3d. per unit. Wherever horse traction is replaced by a mechanical system the receipts increase and the conditions become more favourable to economical working. There are, however, some grave errors in the further statements made on the subject of gas cars, which we beg your leave to correct. It is stated that "it is necessary that the gas motor shall be continually rotating . . . and therefore the car, whether at a standstill or running, is subject to almost the same vibration." The motors are most carefully balanced, and when the car is standing the speed is reduced. The amount of vibration then produced is less than $\frac{1}{10}$ in. movement; less, in fact, than that caused by a passenger when walking over a car. When running the vibration is no greater than, if as great as, that observable on an ordinary horse car. It is further stated, in reference to Blackpool, that "the laden cars have sometimes a difficulty in surmounting the gradients, and if stopped require to go back and recommence the ascent." This statement is probably founded on an observation made during the first few weeks the line was opened, when at a point where curve and gradient are combined the gauge was laid too tight; the cars are capable of starting from rest on the gradients, and do so when required. Smell is again raised as an objection to this system, but no mention is made of the special means that have been so successfully adopted to obviate this by ensuring more regular and efficient lubrication. Further remarks are also made, hinting that the storage of compressed gas on vehicles is a source of danger; the storage arrangements are identical with those employed on the majority of railway carriages for lighting, and in this connection no accident has occurred, with the exception of one on the Metropolitan Railway, which was directly traceable to outrage. The advantages of a self-contained system which does not involve expensive alterations to the permanent way has not been alluded to, nor is mention made of the difficulty of laying the conduit in our streets, which in many cases contain the loads of two or three electric lighting companies with their branches and feeders, gas, water and hydraulic power mains, telegraph and other wires, besides the sewers. The conduit system, with its very high first cost, though liable to complete stoppage in case of breakdown, would, however, probably pay better than the overhead electric with its disadvantages of greater losses of current and of damage done by electrolysis, which must ultimately be paid for.

Shoreditch Combined Electric Light and Dust Destruction Scheme.—Messrs. Manlove, Alliott & Co., Limited, Bloomsbury Works, Nottingham, contractors and designers of the Shoreditch destructor, write: We notice in your issue of the 11th inst. a letter, signed "T. W. Baker" which makes some statements with respect to ourselves which are absolutely contrary to fact. We observe that Mr. Baker appears to attach great value to our judgment with respect to his schemes, but, unfortunately, his memory in regard to this particular matter is entirely untrustworthy. It is not the fact that we ourselves, or any of our representatives, ever asked Mr. Baker if he would grant his patent rights to us either for the Shoreditch scheme or for any other. It is not

the fact that we ever asked Mr. Baker to "row in our boat." It is not the fact that we ever proposed any terms at all to Mr. Baker. And therefore, of course, it is not the fact that we ever proposed any terms which he refused. Mr. Baker appears to be very anxious to find fault with the arrangements at Shoreditch and with the figures—which are admittedly not complete—which have been put forward by the Shoreditch authorities. What can his object be in this correspondence? If it were simply to elicit or elucidate facts, that could be effected as thoroughly by a letter to a single paper as by identical letters to half-a-dozen, and probably it could be effected better still if, before he had entered into the correspondence at all, he had sought to understand the things which he states he cannot understand, while certainly correspondence would have been more likely to be valuable if based upon complete figures—known to be very shortly forthcoming—than when based upon figures admitted by himself to be incomplete. We have not cared to join in the correspondence upon figures, partly because the consulting engineers to the scheme (Messrs. Kincaid, Waller & Manville) and the authorities connected with it (that is, all these who have complete information concerning it) most fully admit that the results which we promised from the arrangement have been attained and much more than attained—and therefore we are not very much concerned with the discussion of the matter by people less fully informed—and partly because we have not wished to engage in correspondence, since to have done so might have looked like a wish to obtain a gratuitous advertisement. There is the further excellent reason that complete figures have not been as yet before the public. Mr. Baker's letter, however, attempts to give importance to his own plans by suggesting that we consider them better than ours, which of course is not the truth; and in attempting to give importance to himself and his arrangements he, by inference, depreciates our arrangements and our own capacity for dealing with the destruction of refuse. As we feel that these incorrect statements, which have been made not only in your journal but in so many others, ought not to pass without contradiction, we request that you will be good enough to insert this letter.

Mr. T. W. BAKER, 7 Broad-street House, E.C., writes: Referring to the recent controversy on this question, the items for the year June 24, 1897, to June 24, 1898, showing the income and expenditure, are now before me, and I find the following to be the correct reading of them as a joint scheme:—

Revenue Accounts for the Financial Year from June 24, 1897, to June 24, 1898.

(1) ELECTRICITY WORKS.

Dr.		Expenditure.			
To Coal (490 tons, £432 15s. 9d.), stores, water and insurance	£	1,328	10	9	
" Wages (562,167 units)	£	1,472	13	10	
" Engineers' salary (proportion) and expenses	£	4	9	10	9
" Parochial rates, £125 2s., and sub-station do., £33 10s. 3d.	£	158	12	3	
" Interest and redemption	£	2,641	13	1	
" Interest and redemption on temporary loan (overdraft from bank)	£	815	9	4	
" Balance carried down	£	1,707	16	0	
		£8,504		15	0
Cr.		Income.			
By Sales of current to consumers, &c.	£	3,254	2	1	
" Miscellaneous income	£	120	4	7	
" Sales of stores to other departments	£	130	8	4	
		£8,504		15	0

(2) DUST DESTROYER STATION.

Dr.					
To Wages (25,404 tons)	£	2,746	1	7	
" Engineers' salary (proportion)	£	83	6	8	
" Stores and charges	£	411	16	4	
" Cost of removing clinkers	£	612	10	5	
" Insurance	£	43	4	2	
" Interest and redemption	£	1,135	13	4	
" Interest and redemption on temporary loan (bank overdraft)	£	79	10	4	
" Balance carried down	£	344	9	2	
		£5,756		12	0
Cr.					
By Balance of income brought down	£	1,707	16	0	
" Destroying trade refuse	£	238	1	9	
" Amount of money saved by use of dust destructor instead of the old method of barging of the refuse (25,404 tons at 3s.)	£	3,810	14	3	
		£5,756		12	0

Balance of income over expenditure, £344 9s. 2d., exclusive of the following items and charges—*viz.*, depreciation and bad debts; also management charges, such as proportion of salaries of vestry clerk, accountants' department collectors, &c., estimated by the London County Council valuer to be at least £500 per annum (see official minutes). I note that these items do not emanate from the accountant of the vestry, but from the Electric Lighting Committee, although

individually I have reason to believe them to be correct. I will leave the results to the judgments of your readers to find where the profit occurs, of £2,000 and upwards, that has been claimed for this joint undertaking, and enlighten some other public authorities. I have taken the bank overdrafts as they occur at March, and assume them to be the same in Jano.

Municipal Officers' Association : Superannuation.—Mr. C. J. F. Carnell, hon. secretary of the Municipal Officers' Association, writes: I have the pleasure to announce that the Right Hon. the Lord Mayor (Sir John Voco Moore) has accepted the presidency of this association, which, as most of your readers are aware, is actively engaged on the question of superannuation for municipal officers, and its increasing membership shows, as its aims and objects become known, that the officers are appreciating more and more the efforts being made by it on their behalf. A number of town clerks, clerks to urban and rural district councils, medical officers of health, and municipal engineers and surveyors, have recently enrolled themselves as members, and the continued support of officers will do much to strengthen the organisation, which is absolutely necessary to ensure the success of the Superannuation Bill. If officers would join from every local authority throughout the country and appoint a correspondent it would enable the association to place all the latest information in the hands of its members. For years the poor law officers had been working to this end, and when Mr. Rutherglen took over the charge of the Poor Law Officers' Superannuation Bill he had behind him an organisation which had been plodding away for years on the superannuation question, but at last they reaped their reward. Municipal officers have now the opportunity of doing the same thing, and if they do not see their way to co-operate with the association, they might at least, I venture to suggest, send a contribution to the special superannuation conference fund. If officers wish the Superannuation Bill to become law they must be prepared to make some little sacrifice, either of time or money, or both, and I do most earnestly appeal to every officer to give active support to the movement, which must prove successful if persevered in. No one should feel discouraged because the Bill introduced last session was not successful, and it must be borne in mind that the poor law officers previously had a permissive statutory right. It will therefore be much more difficult to convince the local authorities of the justice of the measure, as they have not been in the habit of granting superannuation allowances.

SOME RECENT PUBLICATIONS.

SOME PERIODICALS.

In *The Architectural Review* for November there is an excellent coloured lithograph, the first of a series depicting the old inns of England. The chief articles, which are profusely illustrated, deal with the architecture of Michael Angelo, the work of G. F. Watts, romance in sculpture, and Greek bronzes. Both letterpress and illustrations maintain the high standard which the conductors have set themselves from the first.—In *Cassier's Magazine* this month there is an excellent portrait of Sir William Arrol, accompanying an interesting and readable biographical sketch of the great bridge-builder, written by Mr. A. S. Biggart, who was Sir William's engineer and manager during the construction of the Forth Bridge, and who has been his partner since its completion. The article is accompanied by some excellent illustrations of the three great bridges—Forth, Tay and Tower. In the discussion of current topics we note some interesting remarks in reference to the growth of open conduit electric street railways in America.—The Earl of Cottenham is the subject of the portrait and biographical sketch in *Baily's Magazine* this month. Among the subjects dealt with are jumping, sporting celebrities, spots on the cricket sun, diamas of to-day, saddles, judging at horse shows, the hunting season, and the usual sporting intelligence, comments, and reviews of the month.—Our American contemporary *The Sanitarian*, reprints a paper recently read by Dr. A. Campbell Munro, president of the Scottish branch of the Incorporated Society of Medical Officers of Health, the burden of the paper being the points of contrast and contact in the public health administration of England and Scotland. There is also an interesting article by Mr. William R. Hill, Syracuse, on early methods of collecting, storing and distributing water, and abstracts of some interesting contributions on sewage disposal, read at the recent conference of the American Public Health Association.—The last quarterly issue of *The Journal of the Sanitary Institute* is chiefly devoted to the proceedings of the Sanitary Congress at Birmingham, but there is, in addition, the usual miscellaneous information of an interesting character with regard to sanitation. *The Journal of State Medicine* contains a further instalment of papers read at the Dublin Congress of the Royal Institute of Public Health. There is a useful article on the bacteriological examination of water, abstracts from foreign journals, reports, reviews, and other information.—*Work* (Cassell & Co., Limited), has articles on acetylene gas, drawing for metal-plate work, the calculation of magnetic losses in structures, locomotives and railway waggons, and the construction of small-power water-motors.—The scientific articles in *Knowledge*

this month are remarkably varied and interesting.—In *The Quarry* there is the first instalment of a series of articles on the stone industry of the United Kingdom, and a continuation of the useful series on applied geology.—We have also to acknowledge the following monthlies: *The Iron Engineer*, *The Plumber and Decorator*, *The Sanitary Inspector's Journal*, *The Digest of Physical Tests and Laboratory Practice*, *The Journal of the Society of Estate Agents & Works*, *The Analyst*, *The Quiver* (Cassell & Co., Limited), and from A. W. Hall, Hutton-street, Whitefriars, *Great Thoughts*, *The Motorist* and *Helping Words*.

SUPERANNUATION CONFERENCE.

Mr. C. William Tagg, vestry clerk of Camberwell, presided over a largely attended meeting, convened by the Municipal Officers' Association, and held at 117 Holborn, E.C., on Monday. The hon. secretary reported as to the replies received from the associations and societies which had been invited to send delegates, and as to promises of financial support, and pointed out that it would be useless for him to continue to act as the hon. secretary unless the officers were prepared to give the movement more financial support, as it was quite impracticable to carry on an active campaign with the small amount subscribed during the last twelve months.

The chairman in his remarks dwelt upon the absolute necessity of unity among officers, and said that they must be prepared to find the necessary funds if they wished the Bill to become law. It was ultimately decided, in addition to asking the associations and societies sending delegates to the conference to make an appeal to officers throughout the country to subscribe to a special superannuation conference fund.

At the request of the chairman, a special committee was appointed to consider important proposals with regard to the Bill to be submitted in the next session of Parliament. The conference unanimously expressed its continued and unabated confidence in the chairman and the hon. secretary for their conduct of the Local Authorities Officers' Superannuation Bill.

Subscriptions to the Special Fund should sent to the hon. secretary (Mr. C. J. F. Carnell), 117 Holborn, London, E.C.

THE BRADFORD CAR ACCIDENT.

BOARD OF TRADE REPORT.

The report of Major Cardow to the Board of Trade on the fatal tramway accident which occurred at Bradford on September 19th last has just been issued. Major Cardow states that the accident was due to the car being run at an excessive speed, to the unfortunate combination of a driver with very little experience and a conductor with none at all, a slippery road, and extra pressure on traffic. The driver certainly used the brake-power in an injudicious manner, the conductor put on the hand brake, and thus deprived the driver of full control of the brake-power, and the conductor also caused the trolley to be disconnected, thus depriving the driver of the power of reversing, which might have prevented the accident. Although the accident was in great measure due to the inexperience and injudicious action of the driver and conductor, in his opinion they both did their duty to the full extent of their skill and ability. Major Cardow considers the brake-power ample, but says the fact is that, if a car be allowed to acquire such a speed as 20 miles an hour on such a steep gradient, no brake acting by friction on the running rails will stop it in a distance that can be considered safe. He insists that on this line the speed on the downward journey must not exceed 6 miles an hour. The tramways company considered the report on Wednesday, and decided to accept liability, and to see that a rate of 6 miles an hour was observed.

INSTITUTION OF CIVIL ENGINEERS.

STUDENTS' MEETING.

A meeting for students of the Institution will be held to-night, when a paper will be read by Mr. Cecil Lightfoot on "Liquid Air: A short description of its production and summary of its application to the chemical or other industries." The chair will be taken at 8 p.m. by Mr. W. H. Proctor, F.R.S., the president.

ORDINARY MEETING.

An ordinary meeting of the above Institution will be held on Tuesday, at 8 p.m., when the paper which was read at the last meeting by Mr. Wm. Beattie Esson, M.I.C.E., on "Electrical Transmission of Power in Mining," will be further discussed.

Sewerage Work in Birmingham. The Public Works Committee of the Birmingham Corporation have prepared a long report on the re drainage of Edgbaston and Harborne, which will be considered by the city council at their meeting on Tuesday. A few of the more important details of the report will be given in our next issue.

Municipal Work in Progress and Projected.

Owing to the annual municipal elections, very little news in reference to important engineering works has come to hand during the week. It will be seen, however, that the authorities at Accrington, Croydon, Birmingham, Bury St. Edmunds, Weston-super-Mare and Mountain Ash are not remaining idle.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

The large and expensive schemes which have lately occupied the attention of the county council so largely were on Tuesday conspicuous by their absence. The only matter which came up for consideration that seemed of any magnitude was the proposal of the Technical Education Board to spend £35,500 on the purchase of the lease of Oxford Mansions for the purpose of converting them into a Central School of Arts and Crafts. This proposal was, however, after considerable discussion, referred back, to enable the board to present a recommendation for acquiring the freehold of the premises. The most important matters which were disposed of are summarised below.

Loans for Public Works.—Upon the recommendation of the Finance Committee it was agreed to lend the Westminster Vestry £23,670 for street improvements, the Lambeth Vestry £3,920 for paving works, and the Islington Vestry £2,223 for street improvements.

Proposed Central School of Arts and Crafts.—The Technical Education Board presented a report recommending the council to authorise the expenditure of £35,750 for the purchase of the leasehold property known as Oxford Mansions, off Oxford-street, to provide permanent accommodation for the board's Central School of Arts and Crafts. The board, in their report, stated that the school was at present housed in temporary premises in Regent-street. The number of students had increased so that the capacity of these premises had been severely taxed, there having been 539 individual students on the books last session, of whom about 140 attended each night. Every room in the premises was now fully occupied, and there was no further room for the further extensions of the work which appeared desirable. After considerable discussion the report was referred back to the board, with the view to the purchase of the freehold of the property.

Housing of the Working Classes of Poplar.—A long discussion took place upon a proposal of the Housing of the Working Classes Committee to sell a piece of land, known as the Cotton-street site, Poplar, for the purpose of allowing the purchaser to rehouse 260 persons displaced by the Blackwall Tunnel scheme. The subject of the disposal of this land has already been before the council on several occasions, when it has been explained that it would be impossible for the council themselves to build on this land within the terms of the standing order, which requires that the erection of dwellings shall entail no charge upon the rates. Mr. Piggoit moved that the recommendation should be referred back, arguing that if it was possible for a private builder, who certainly would require a profit, to erect buildings on this land, it should be competent for the council's architect to devise some plans for buildings which would entail no loss to the council. After discussion the amendment was carried, upon a division, and the further consideration of the matter was adjourned.

Pensions for Employees.—The General Purposes Committee, in the course of a long report, recommended the council to adopt their view—that it was inexpedient to obtain power to pension the employees on a higher scale than was now possible under the existing powers of the council. This was agreed to.

Tramway By-Laws.—The Highways Committee recommended, and it was resolved, "that in view of the fact that the undertaking of the London Tramways Company will be transferred by agreement to the council at the end of the year 1898, the Board of Trade should be requested, in the exercise of the powers conferred upon them by sec. 7 of the London County Tramways Act, 1896, to re-enact the existing by-laws and regulations applicable to the undertaking, and prescribe the manner in which the council shall give notice of the making of the by-laws referred to."

Tenders.—The following tenders were opened by the chairman: (a) for the erection of conveniences at Blackwall Tunnel—Messrs. Doulton & Co., £1,891; and (b) for the erection of a corner's court at Paddington—Messrs. Marchand & Hirst, £3,869; Spencer, Santo & Co., Limited, £4,261; General Builders, Limited, £4,400; H. H. Sherwin, £4,698; J. Shillitoe & Son, £5,299; and H. C. Clifton, £5,527.

VESTRIES AND DISTRICT BOARDS.

Lambeth.—The Sanitary Committee presented to the vestry, at their last meeting, a report by the medical officer of health (Dr. J. Priestley) in regard to the smoke nuisance at the works of Sir Joseph Causton, Messrs. Clowes and the Electricity Supply Company. The medical officer had visited these works and inspected the boilers, and in consequence of the improvements being made in order to abate the evil he stated that he was unable to advise the vestry to take action before the magistrates for the present. The committee endorsed the report of the medical officer in regard to taking

no action. In a further report by the same committee reference was made to the proceedings taken by the London County Council against two firms in Lambeth without advising the vestry of intention to apply for a summons for smoke nuisance. The committee intended to submit a further report on the subject, and the present report, after a long discussion, was passed.—On the recommendation of the Sewers Committee the vestry sanctioned the reconstruction of a sewer in Commercial-road, at a cost of £487.—The Baths Committee stated that they had received a full report from Mr. Hessel Tiltman, architect, as to the extras in connection with the Kennington-road baths, but that further explanations were necessary before the matter could be properly placed before the vestry. It was hoped, however, to present a full report on the subject at the next meeting.—Messrs. Kellett, of Hammersmith, the contractors for the excavation on the extension of the City and South London Electric Railway, have applied to the Cemetery Committee for permission to tip earth from the railway tunnel on the land purchased for the Tooting cemetery. As the soil was suitable for the purpose and there was a considerable hollow in the land, the committee had arranged with Messrs. Kellett for the latter to pay a lump sum of £75 for the privilege.—The General Purposes Committee reported that the London Basalt Stone Company had submitted to them samples of basalt imported by the company. As the samples appeared to be good, and as the quotation was 12s. 6d. a yard along-side the wharf, as against 1s. 1d. for granite, the vestry decided to make a trial of the material, and to purchase three large loads, at a cost of about £150 per load of from 80 to 100 yards.—A letter was received from the Thames Conservancy Commissioners stating that, subject to certain conditions, the conservators would be prepared to grant permission to the vestry to construct an embankment, 105 ft. 6 in. long and extending 141 ft. into the river at the upper end and 138 ft. 6 in. at the lower end, at the wharf in Belvedere-road. The commissioners intimated that they would communicate further with the vestry on the subject.—Some discussion took place on the report of the Vestry Hall Committee in regard to the present office accommodation, to which reference has previously been made in THE SURVEYOR. It was pointed out that the only real remedy was the erection of municipal buildings. It was eventually decided to ask the churchwardens and overseers to meet the vestry to confer on the subject.

Marylebone.—The vestry, at their last meeting, considered as a matter of urgency a motion by Mr. Brooke-Hitching, on behalf of the Electric Lighting Committee, in reference to the position of the authority in regard to electric lighting in the parish. Mr. Hitching stated that the committee had received information from the best of sources that the Board of Trade, under the circumstances of the Select Committee of the House of Commons having refused last session to confirm the provisional order granted by the board, would not grant another order to the vestry. After a full consideration of the question the committee decided to recommend that the solicitors should be instructed to take all preliminary steps with a view to obtaining a private Act to authorise the vestry to supply electricity in the parish. After a long discussion the recommendation was adopted by forty votes to seven, and an expenditure of £50 was sanctioned for the insertion of the necessary official advertisements.—It was resolved to refer to the Works Committee three communications received from ratepayers suggesting the substitution of wood paving for the existing form of carriageway in certain thoroughfares.—The Parliamentary Committee submitted a recommendation in favour of simply acknowledging the receipt from the Battersea Vestry of a communication asking the authority to support them in requesting the London County Council to seek powers to authorise metropolitan vestries and district boards to erect dwellings under Part III. of the Housing of the Working Classes Act, 1890. An amendment was eventually adopted deciding to concur with the action of the Battersea Vestry.—On the motion of Mr. Garrould it was resolved to refer to the Works Committee to consider and report as to the desirability, in cases of renewal of lanterns on the public lamp columns, of substituting lanterns of a modern pattern.

Shoreditch.—A long time was occupied at the meeting of the vestry on Tuesday in discussing a report of the Lighting Committee submitting the accounts relating to the electric light undertaking and dust destructor for the year ended the 24th June last. The figures submitted in the case of the former showed that the excess of income over expenditure amounted to £5,826, and that after providing for interest and redemption of capital there remained a surplus of £3,184, which the committee regarded as a highly satisfactory result. In the opinion of the committee the charge for interest and redemption of capital was more than sufficient to provide for the depreciation of the undertaking. With regard to the dust destructor, the accounts for this part of the joint scheme exhibited a debit balance of £1,758, which the committee stated was represented by steam used in the lighting station and library. If to the credit balance on the electricity under-

taking was added the "saving on previous expenditure of barging refuse," amounting to £1,253, this made a total of £1,437, and deducting from this the debit balance on the destructor of £1,758, the net profit and saving, in the opinion of the committee, amounted to £2,679 for the year. The committee recommended that the report should be received, and that it should be referred back to them to allocate the disposal of the profits. During the severe criticism to which the trading accounts were subjected it was shown that there was no saving over the previous cost of barging the refuse, but that the expenses were now even greater. Several speakers declared that the accounts were logs, false, and a farce, but by thirty votes to eleven the recommendation of the committee was carried.—In connection with this subject the Lighting and Scavenging Committee reported that they had considered the question of the amount to be charged for destroying refuse in the destructor. Although the previous charge for barging was 3s. 1d. per ton, the committee thought the scavenging department should have the prior claim upon any profits from the combined scheme. On the recommendation of the joint committee it was resolved to make a fixed charge of 2s. per ton against the scavenging department for destroying refuse in the destructor. It was also decided to pay out of the general rate the charge for interest and repayment of capital, amounting to £1,435, in respect of the refuse destructor.—The Parliamentary Committee reported that they had considered the Bill prepared by Mr. H. S. Samuels, M.P., to amend the Metropolitan Water Act, 1871, and to make provision for the due supply of water in London. The committee recommended, and the vestry decided, to disagree with the Bill, as being insufficient to deal with the question satisfactorily.—A report was submitted by the Town Hall Committee referring to the proposed extensions of the town hall. It was decided to empower the committee to advertise for designs from architects in general competition.

St. Pancras.—At a meeting of the vestry on Wednesday the Parliamentary committee presented a report in reference to the tramways in Kenish Town-road. On the recommendation of the committee it was decided to inform the London County Council that it was desirable for the carriage-way of that road to be widened, so as to double the tramway along a portion of the thoroughfare, and that the improvement should be carried out by the county council.—The Health Committee announced that they had considered a communication from the Local Government Board with reference to the Brantome-place and Prospect-terrace areas. The board asked to be supplied with copies of the amended scheme and plans showing the additional lands proposed to be acquired for the purpose of rehousing displaced persons who would not be accommodated on the sites which were to be cleared and the number of persons who would thus be rehoused, and plans showing how it was proposed to lay out the areas, with a revised estimate of the cost of the schemes. In reference to this question the Health Committee stated that they had decided to view certain properties in the parish and to report further on the subject.—A special report was submitted by the Health Committee, covering reports by the medical officers of health of the London County Council, in reference to the sanitary condition and administration of St. Pancras. The council's assistant medical officer, Dr. Hamer, had inspected St. Pancras, and as a result he recommended the appointment of seven additional sanitary inspectors. This recommendation was supported by Dr. Shirley Murphy, the council's chief medical officer of health, and the county council asked for the vestry's observations on the subject. The chairman of the Health Committee in a lengthy speech moved the reception of the report. An amendment by Mr. Barnes was, however, adopted, appointing a special committee to inquire into and report upon the reorganisation of the Health Department, and deciding to inform the London County Council of the vestry's intention.—The Highways Committee recommended that a portion of Euston-road now paved with yellow deal blocks should be repaved with jarrah wood blocks, at an estimated cost of £2,500, to be defrayed by loan. On the recommendation of the committee it was decided to put the work in hand at once, although an amendment to adopt asphalt in place of wood was only rejected by a majority of five votes.—In reply to questions, Dr. Smith, chairman of the Electricity Committee, stated that the delay in the supply of electric light in the Brecknock-road was due to a peculiar state of affairs. The houses in the road were in St. Pancras, but the roadway was in Islington. The committee had approached the Islington Vestry to ascertain whether permission would be given for the main to be laid, but that authority contended that they had no power in the matter. The Electricity Committee had therefore decided to ask the Board of Trade for sanction to erect the conductors overhead.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Middlesex.—The county council held a special meeting on Monday to consider further the question of rebuilding New Bridge. In view of the fact that Surrey agreed, on Tuesday of last week, to accept Mr. Gibbs' tender and seek a fresh Bill, the Middlesex Council now resolved to do the same. A member expressed the opinion that the plans did not show a bridge of

sufficient width to meet the increasing traffic. The chairman concurred, but said that under the terms of the tender it would be open to require the contractor within six months to increase the width. The member then gave notice to move at the next meeting that it should be an instruction to the joint committee to increase the width to 50 ft.

Staffordshire.—At the last meeting of the county council the Sanitary Committee reported that they had considered a report of a sub-committee, and recommended that the council request them to require all local authorities within the administrative county to provide efficient isolation hospitals. The Earl of Lichfield said that the possession of isolation hospitals would contribute largely to the prolongation and saving of many lives, more especially among the poorer classes of the community. Hospitals could now be built at an estimated cost of £220 to £250 per bed, whereas three or four years ago the cost would have been £350 a bed. The recommendation was adopted.

Surrey.—It was recently recommended that, provided possession could be arranged for on reasonable terms, the Asylum Committee should be authorised to enter into a provisional contract for the purchase of Nethern House estate, at a cost of £10,000.

MUNICIPAL CORPORATIONS.

Accrington.—Last week, at the Accrington town hall, Mr. W. A. Ducat conducted an inquiry, on behalf of the Local Government Board, into an application of the council for sanction to borrow £14,200, for the purpose of street improvements. There was no opposition.

Birmingham.—The preparation of the scheme mooted a considerable time back for what amounts to practically a re-sewering of the Edgbaston district of the city, including Harborne, is being pushed forward in the city surveyor's department. Complaints of the nuisance arising from the present sewers have been loud and prolonged, and the Health Committee and Public Works Committee, in considering the matter, found that nothing short of a complete reconstruction of the sewers would meet the case. It is anticipated that the outlay will not fall short of £100,000.

Blackpool.—On Friday last Mr. W. A. Ducat, Local Government Board inspector, held an inquiry into an application of the corporation for sanction to borrow £5,100 for the purchase of property for the extension of the town hall. There was no opposition to the scheme.

Bridgwater.—A specially-convened meeting of the town council was held recently for the further consideration of the Parrett navigation improvement scheme, as recommended by Mr. Wheeler, at an estimated cost of £110,000. A resolution was carried approving the scheme and authorising the town clerk to take the necessary steps to apply for Parliamentary authorisation.

Bury St. Edmunds.—After a somewhat lengthy discussion the town council last week passed a resolution to adopt a modified scheme of electric lighting, at a cost of £16,000.

Chelmsford.—The corporation have instructed the town clerk to apply for an injunction to restrain the rural district council from polluting the river Cann with sewage.

Croydon.—On Friday, at the town hall, Croydon, Mr. W. O. E. Meade-King, one of the inspectors of the Local Government Board, held a public inquiry into the application of the corporation to borrow £5,000 for the provision of fire stations, £2,250 for the purchase of that portion of the undertaking of the Crystal Palace Electric Lighting Company, which is situated within the borough of Croydon, and £550 for electric lighting purposes (the erection of a sub-station in Upper Norwood).

Durham.—Last week a special meeting of the city council was held to consider the advisability of applying to the Board of Trade for a provisional order under the Electric Lighting Acts, 1882 to 1890, authorising the authority to supply electricity for any public or private purpose within their district. After the engineer's report was read and discussed it was decided to make the necessary application.

Hereford.—It has been decided to construct a new filter-bed at the waterworks, at a cost of £3,000.—An application will shortly be made by the council to borrow £8,000—part of the sum to be expended upon the city and county asylum.

Heywood.—Colonel A. G. Durnford, R.E., held an inquiry, on Tuesday, into an application of the town council for sanction to borrow £18,000 for street improvements and for the provision of a fire station, mortuary and depot in Hind Hill-street; £1,700 for the purchase of land as a site for a town hall, council house, justices' room and police station; and £120 for the provision of a steam road-roller. It was stated that there had been great inconvenience because the town had not a complete town's yard. Mr. J. A. Settle, the borough surveyor, gave evidence in support of the application. He stated that the central yard would include firemen's dwellings, fire stations, stables for the health and surveyor's yard, and yards and other buildings for these departments. The application for £1,700 for the site of a town hall, &c., was to pay for a plot of land recently acquired by the corporation to complete their town hall site in the centre of the town. The site had been all acquired with this ex-

ception. There was no objection to the applications, and at the close of the inquiry the inspector went to view the different places.

Hull.—A Local Government Board inquiry has been held in reference to an application of the city council for sanction to borrow £120,150 for street improvement purposes and the formation of new streets, £26,000 for electric lighting, £6,774 for the purchase of a site for a public library, and £4,103 for the purchase of a site for a refuse destructor in West Dock-road.—The Barial Committee of the corporation have accepted the tender of Mr. T. Goates, to erect a crematorium for £2,153. The engineer's estimate was £1,784.—The corporation have decided to obtain Parliamentary power to carry out the scheme for the construction of a new street from Whitefriagate to Drypool Bridge, for extending Brook-street to Anlaby-road, and for completing the Great Passage-street improvement and the widening of Holderness-road. They have also decided to take active measures for the opening of South Bridge.

Liverpool.—On the 3rd inst. Mr. Frederick H. Talloch, M.C.E., an inspector of the Local Government Board, held an inquiry respecting the application of the city council for sanction to borrow various sums of money for various purposes. It was explained that the town council had applied to the Local Government Board for sanction to borrow £30,638 for the provision of a refuse destructor in Penistone-road, £9,756 for additional works at the Lumley-street refuse destructor, and £12,000 for the completion of the town hall. Evidence was given by Mr. C. F. Wike, city surveyor, who produced plans and estimates of the work to be dealt with. No opposition was offered.

Madeley.—At the last meeting of the town council a committee reported that the water supply works at Hanington had been completed, and that the boring and testing had proved successful. Ample water was found, enough, in fact, to supply other districts. The boring and testing operations had cost £882 2s. 6d., £400 more than estimated, therefore £400 was required to be raised by a loan, which was decided upon. The engineer, Mr. Stroke, of Shrewsbury, said the water was described by Mr. Blunt, the analyst, as excellent, and of moderate hardness. The mayor proposed that the report be adopted, and said they could raise 1,000,000 gallons every twenty-four hours. The motion was carried. A sub-committee was appointed to proceed with the work, and the engineer was instructed to make out an estimate and provide a plant that would supply 250,000 gallons every twelve hours.

Manchester.—The following resolution has been passed by the Telephone Committee: "That a report be prepared in due form for presentation to the city council setting forth the recent communications with the Postmaster-General and embodying the general conclusion that, in view of the proposed action of her Majesty's Government in this matter in the next Parliamentary session, it is desirable not to proceed further with respect to the insertion of clauses in the Manchester General Powers Bill for conferring powers upon the corporation to provide and work telephones under license from the Post Office."

Margate.—The new municipal offices, which take the place of an old market, and which have been presented to the town by Mrs. Kendall, the widow of a late alderman of the council, were formally opened last week. A stone recording the gift was unveiled by the mayoress (Mrs. G. F. Brown), and the building itself was opened, on behalf of Mrs. Kendall, by Miss Wootton, daughter of Alderman Wootton, J.P. The new offices, which have been erected at a cost of £3,000, make a handsome adjunct to the town hall, which they adjoin and are connected with. They comprise magistrates' retiring and mayor's robing-room, together with offices for the various officials; the market stalls being under a glass-covered colonnade.

Norwich.—The town council having applied to the Local Government Board for sanction to borrow £1,316, for police station and fire brigade purposes, an inquiry was held on the 9th inst. by Mr. H. Percy Boulouis.

Preston.—On the recommendation of the Streets and Buildings Committee, the town council have decided to pave and flag Tinketh Brow from Pylde-road to the railway arches, at an estimated cost of £450.

Wolverhampton.—It is understood that the corporation purpose making a number of important improvements in regard to the sewerage of the borough in the near future. In some cases the sewers will be extended over an area which has not yet been brought in touch with the existing sewerage scheme. The expenditure will represent several thousand pounds.

URBAN DISTRICT COUNCILS.

Aston Manor.—At a meeting of the district council on the 1st inst. the Health Committee presented a detailed report and estimate in reference to the erection of the proposed new destructor cells and other works at the Chelsea-street wharf, and also for electrically lighting the works, yard and fire station, at an estimated cost of £11,500. The Highways Committee announced that they had had under consideration the application of the Birmingham and Aston Tramways Company for the sanction of the council to the using of steam

for traction purposes on their lines running through the district. The surveyor having reported that he had recently inspected the lines in question and had found that his requirements had been seen to, it was decided, on the recommendation of the committee, to grant the application of the company.—The same committee laid upon the table the final apportionment of the cost of making-up Priory-road, amounting to £890, with a recommendation that it be approved and that notice thereof be served upon the respective owners and occupiers liable in respect of the works.—The same committee also laid upon the table an agreement between the Birmingham Canal Company and the council relative to the laying of a sewer under the canal at Thimble Mill-lane and under the Bloomsbury wharf, and the construction of manholes in connection therewith, and recommended that it be approved and that the clerk be authorised to affix the seal of the council thereto.—The Baths Committee stated that they had instructed the surveyor to make arrangements with the Auto-Electro Feed-Water Purifier Company to fix one of their purifiers to the boilers at the baths on trial, free of cost to the council.

Bexhill.—Major-General H. Darley-Crozier, R.E., held an inquiry, on behalf of the Local Government Board, on Thursday, with reference to the application of the council for sanction to borrow the sum of £9,000 for the purposes of sewerage at Little Common. Both the clerk (Mr. F. A. Langham) and the surveyor (Mr. Ball) gave evidence during the inquiry.

Bredbury and Romiley.—On the 9th inst. an inquiry was held by Mr. Walter A. Ducat, inspector from the Local Government Board, into the application of the council to borrow a sum of £2,200 for the purpose of widening a bridge over the Peak Forest Canal. Opposition was offered on behalf of a number of ratepayers, on the ground that the land proposed to be purchased was not required and that the price fixed was too much. The improvement itself was not opposed.

Droylsden.—An inquiry has been held at Droylsden, by Mr. Walter S. Ducat, one of the engineering inspectors of the Local Government Board, into an application of the council for sanction to borrow the sum of £6,200 for works of street improvement. In the course of evidence it was stated that there was only one main road in the district—namely, that from Manchester to Ashton. The Local Government Board inspector, having promised that the decision of the Local Government Board would be forwarded in due course, proceeded to make a tour of the district.

Handsworth.—Colonel W. Langton Coke conducted an inquiry on Friday into an application of the council for sanction to borrow £3,000 for works of sewerage and sewage disposal.

Heage.—Last week, at a meeting of this council, a letter from the Local Government Board was read respecting the sewerage scheme, and in relation to a Government inquiry to be held by Colonel W. Langton Coke, M.C.E. The council had applied to the Local Government Board for consent to the application of £50, being part of the unexpended balance of a loan of £1,260, for the execution of certain works of sewerage which were not included in the estimate on which the loan was sanctioned.

Ithorn.—It was last week proposed and agreed that the Local Government Board be requested to give their sanction to the adoption of the septic tank system of sewage disposal in lieu of the system previously sanctioned. The council also accepted an offer of Messrs. Cameron, of Exeter, to provide a set of plans of the sewage disposal works for 10 guineas.

Matlock Bath.—A special meeting has been held to consider the question of applying next session for electric lighting powers. It was explained that as the site upon which electric supply works would in all probability be erected was that adjoining the gasworks, which were situated in the area of their neighbour, the Matlock District Council, it would be necessary to serve that body with notice before July 1st, as a preliminary to applying for a provisional order. Therefore, as the time for this had gone by, it would be impossible to obtain powers in the coming session. The meeting thereupon decided to leave the matter over until next year.

Mountain Ash.—Local Government Board sanction has been received to loans of £16,500 and £4,000 by the council for purposes of sewerage and sewage disposal. Negotiations had for some years been carried on between the Pontypridd and the Mountain Ash Councils with a view to the sewerage of the latter district being carried away by the Pontypridd and the Joint Sewerage Board sewers, but the terms of the Pontypridd Council were considered exorbitant, and the Mountain Ash Council decided to provide a sewage farm outside the Pontypridd district.

Wanstead.—The district council have refused to accept a contribution of 80 per cent. of the cost of main road improvements from the Essex County Council, and the matter will now be referred to arbitration.

Weston-Super-Mare.—An inquiry will shortly be held by the Local Government Board concerning an application of the district council for sanction to borrow £14,300 for the erection of a pavilion at Knightstone.—It has been resolved by the council to apply for sanction to borrow £30, the amount expended in excess of a loan granted for the erection of new offices.

THE TELEPHONE SERVICE.

A FEW WORDS FOR THE COMPANY.

The following letter has been addressed to *The Times* by Mr. Wm. E. L. Gaine, general manager of the National Telephone Company, Limited, in reference to the debate which took place in regard to the telephone service at the London County Council meeting last week, a report of which was published in the last issue of *THE SCYFFOR*:—

I have to ask you on behalf of the company to afford me the opportunity of placing a few facts before your readers. It is charged against the company that its service in London is inefficient and inadequate. My reply is that to whatever extent it may be so at this moment is entirely the fault of the London County Council.

In May, 1896, the company applied to the county council for the consent of that body, as required by the Telegraph Act, 1892, to enable the company to place its wires underground—the only solution of the serious difficulties which otherwise beset the company from the use of overhead wires.

Prolonged negotiations followed, and finally terms were agreed and embodied in a series of resolutions passed by the county council on June 1, 1897. Nothing further remained to be done but to prepare and execute a formal agreement to give effect to the bargain. These negotiations, it will be seen, occupied rather more than a year. It took the county council nearly seven more months to prepare the draft of the formal agreement, and this document was submitted to the company for consideration on January 29, 1898. It was then found that two additional conditions not forming part of the bargain had been inserted. These conditions were: (1) That the company should make a wayleave payment to the county council which would impose a burden upon the company amounting to several thousand pounds per annum, and (2) that the company should reduce its tariffs to an arbitrary scale as fixed by the county council, which would involve the company in an immediate loss of revenue of upwards of £10,000 per annum.

The company considered that the importation of these conditions after more than twelve months had been spent in concluding the bargain was not in accord with good faith. The company replied that, as it had agreed to make wayleave payments to a large number of provincial cities and towns, it was willing to do so in the case of London, but pointed out that, differing from the provincial cities, the county council was not the road authority, and that it could only do so if the county council indemnified the company against any claims which might be made by the road authorities in the metropolis, and, as regards tariffs, it respectfully declined to discuss the impossible proposition submitted to it, but offered to agree to fix the company's present tariffs as the maximum charges to be made, and to come under an obligation to supply all intending users equally and without undue preference.

On May 19, 1898, the county council broke off the negotiations. The position may therefore be summed up as follows: Twelve months occupied in negotiations finally resulting in a bargain being arrived at; further twelve months occupied in preparing a formal document to give effect to the bargain; finally resulting in the county council withdrawing from it.

On the 3rd inst. there were 992 people in London waiting to be joined up to the company's system. As regards the bulk of these they will have to wait an indefinite time, on account of the difficulties in the way of the company in physically connecting their premises with its exchanges, owing to the want of facilities which it is in the power of the county council to give.

Whether it is or is not desirable to import competition into such a service as that of the telephone appears to the company to afford no reason why the company should be denied facilities for doing its work. Even if competition is set up, it must, in the nature of the case, take years before it can meet fully public requirements, and in the meantime the public suffers and blames the company for not doing the impossible.

I see that it was stated in the course of the debate that the Highways Committee is prepared to recommend the requisite facilities being given to the company if the company will concede to London similar terms as to tariffs and wayleave payments as the company has given to Manchester, Liverpool and other towns.

The position of London is not comparable with that of any other town. It covers an area of 634 square miles. The working cost of a telephone system throughout this great area is nearly double what it is anywhere else, and the tariffs must therefore be proportionately higher. At the same time I may add that the company is considering whether it cannot meet the requirements of small users and those requiring a more limited service. It is the intention of the company to invite the county council to reopen negotiations, and it will not be the fault of the company if a proper arrangement is not come to.

Let me give one instance of the treatment to which the company is subjected. When the bargain was concluded with the county council on June 1, 1897, the company was allowed to go on with certain portions of underground work which were very urgently needed. Among the works authorised is a system of pipes for upwards of 6,000 miles of wires which the company has laid down in the districts governed by the Holborn Board of Works and the Vestry of St. Giles, all

centring upon a large exchange of the company situated at the corner of Holborn-viaduct and St. Andrew-street. These pipes are stopped close to the north-west corner of Holborn-viaduct, and for months they have been lying idle, and so far as can be seen are likely to remain so, because the company cannot obtain from the local authority the permission to carry them across one road and into the exchange.

In conclusion, I have only to say that it is not reasonable to blame the company for the deficiencies of its service if proper facilities are refused and every impediment and difficulty placed in its way.

MUNICIPAL ENTERPRISE AT YARMOUTH.

LOCAL GOVERNMENT BOARD INQUIRY.

At Yarmouth, on Tuesday of last week, Mr. H. Perry Boulnois, an inspector of the Local Government Board, conducted an inquiry with reference to an application of the corporation for sanction to loans of £25,000 for the erection of a shelter hall at Gorleston, of £3,000 for the extension of the sea waterworks, and of £850 for repairing a part of the market area.

In reference to the shelter hall at Gorleston, the borough surveyor stated that it would consist of a room 45 ft. by 90 ft. on the ground floor, with a gallery above at one end, providing seating accommodation for 750. A small stage would be provided, concerts would be given in the hall, and in wet weather the band would play therein. There would be a reading-room above and two refreshment-rooms, and a balcony round the outside of the building would afford fine sea views. It was stated that the hall was principally designed for visitors, of whom it was estimated there had been 200,000 during the past season. There was no opposition to this proposal, nor to the partial repavement of the market with granite sets, bedded in concrete, in substitution of the present cobbles. In reference to the sea waterworks extension, the borough surveyor explained that a new pumping station would be provided, and that fresh mains would be laid to meet the increased demand that had arisen for street watering, sewer flushing, &c. The pumps would be driven by electricity from the corporation's main.

LEICESTER WATER SUPPLY.

The Water Committee of the Leicester Town Council, on Monday, unanimously decided to recommend the corporation to promote a Bill in Parliament to acquire the water of the upper Derwent and the Ashop, at a cost of £1,500,000. It is proposed either to assume the entire responsibility for the vast undertaking and supply the Derbyshire authorities, or to form a joint board with Derby and Derbyshire. The water-sheds yield 50,000,000 gallons daily; but at first three reservoirs would be constructed, to yield 10,000,000 to 12,000,000 gallons daily, or sufficient for Derbyshire, and then to convey the water a distance of 66 miles to Leicester. The scheme is strongly recommended by eminent engineers and experts.

ELECTRIC TRACTION IN LIVERPOOL.

The first electric tramway cars commenced running on Monday on the Dingle line in Liverpool. The whole of the tramway system of the city has been acquired by the corporation, whose decision to adopt for electric tramways the overhead trolley system has been the topic of heated local discussion, mainly on the ground of the disfigurement of the streets by the posts and network of overhead wires. The new cars run in couples, one being reserved for smoking. They are ornamental in appearance, and appear to be well constructed. They have no outside seats. The Dingle line is nearly 3 miles long, and the fares are fixed at 2d. for the non-smoking and 1d. for the smoking cars. The cars run every four minutes. The inauguration attracted general attention. The working of the cars seemed to be satisfactory, both as regards speed and smoothness.

Received too late for classification.

VESTRY OF ST. MARY, ISLINGTON.

The Vestry is prepared to receive tenders for the supply of sixty-three Galvanised Wrought-Iron Single Bars, to be made in accordance with the specification and drawings to be seen on application to Mr. J. Patton Barber, Chief Surveyor, at the Vestry Hall, Upper-street, Islington, N., between the hours of 10 a.m. and 12 noon.

Sealed tenders, endorsed "Tender for Single Bars," must be delivered to the undersigned not later than 3 p.m. on Monday, November 28, 1898.

The Vestry does not bind itself to accept the lowest or any tender.

WM. F. DEWEY,
Vestry Clerk.

Vestry Hall, Upper-street, Islington, N.
November 16, 1898.

Personal.

Mr. Sloan, surveyor to the Linsdale Urban District Council, has resigned his position, owing to bad health.

Mr. David Edwards, of the borough engineer's office, Neath, has been appointed engineering assistant in the city engineer's office, Hull.

Mr. Edward Dobson, J.P., president of the Auctioneers' Institute, was last week elected an alderman of the borough of Bradford.

A gratuity of £25 has been granted Mr. F. E. G. Bradshaw, surveyor to the Trowbridge Urban District Council, for extra work performed by him.

The Saltburn Urban District Council have appointed Mr. G. S. Baynes, of Jarrow, to the vacant position of surveyor. There were ninety-nine applications for the position.

Messrs. Belfrage & Carfrae have been appointed engineers in connection with a new scheme of water supply which is being carried out by the burgh commissioners of St. Andrews.

Mr. Streater, the newly-elected surveyor to the Winton Urban District Council, has stated, in a letter to that body, that he will be able to enter upon his duties on the 26th inst.

Mr. F. H. Chaplin, of Portsmouth, has been appointed electrical engineer under the Southampton Corporation, at a salary of £250 per annum. There were sixty-six applicants for the post.

It is understood that Mr. John Eaglesham, burgh surveyor of Ayr, has, in spite of a request of the town council, declined to withdraw his resignation. Mr. Eaglesham is to resume private practice.

The death is announced of Mr. Joseph William Wilson, first principal of the Crystal Palace School of Practical Engineering. The funeral of the deceased, who was sixty-nine years of age, took place on the 9th inst.

Mr. A. D. Price has resigned his position as town surveyor of Bray, Ireland, having recently been selected to fill the surveyorship of Blackrock. The resignation was received with regret by the Bray Town Council at their meeting last week.

Southmolton Rural District Council have increased the salary of Mr. W. S. Gardiner, one of their surveyors, by £10 per annum. Mr. Gardiner, it was mentioned in the course of the discussion which ensued upon the matter, was a most efficient officer.

In a recent open competition for schemes of sewerage, sewage disposal and water supply for the district of Wivenhoe, Essex, the schemes submitted by Messrs. Sands & Walker, civil engineers, Nottingham, have been selected as the best and unanimously adopted.

Mr. T. Swaffham Brown delivered a lecture on "Ecclesiastical and Domestic Art Metalwork" at the ordinary monthly meeting of the Sheffield Society of Architects and Surveyors on Tuesday of last week. Mr. J. Smith, the vice-president of the association, occupied the chair.

In a limited competition for the erection of the proposed baths, &c., by the Leyton Urban District Council, the designs of Messrs. Harrop & Dunfield, of Queen-street, Cheapside, have been accepted. The cost, it is estimated, will be about £15,000. Mr. Rowland Plumbe was the assessor.

Mr. J. H. Hélé, who at present holds the position of assistant surveyor under the Stoke-on-Trent Corporation, has been appointed surveyor to the Spalding Urban District Council. By an inadvertence we last week stated that he had been appointed assistant surveyor to the latter authority.

A special meeting of the Diss Urban District Council was held last week for the purpose of appointing a surveyor. Originally there were twenty candidates, but at a recent meeting these were reduced to four. After an examination of these gentlemen it was decided to appoint Mr. Lait, of Diss, in the post, at a salary of £80 yearly.

Mr. A. Heesel Tiltman, of 6 John-street, Bedford-row, W.C., is to be invited by the St. Pancras Vestry to become the assessor to assist in the preparation of instructions and conditions for the guidance of architects competing for the new baths and wash-houses to be erected in the Prince of Wales-road, and to report on the designs submitted in the competition. The fee offered to the assessor is 100 guineas.

On the 12th inst. Mr. J. F. Thorold, engineer and surveyor to the Redditch Urban District Council, having made application for extra remuneration, the council unanimously resolved to vote him a substantial increase of salary from the 14th inst., as well as commission on extra works. Mr. Thorold has been seven years with this authority, and is now engaged in the preparation of plans, &c., for new municipal offices, baths and wash-houses, and workmen's dwellings.

Mr. Thomas Harris, the new surveyor to the Portmadoc Urban District Council, has commenced his duties under the latter authority, at the last meeting of which he was formally introduced to the members. Before leaving Bootle Mr.

Harris was presented by the officials of the corporation with a handsome American oak roll desk as a parting gift and as a small token of the esteem in which he was held. The ceremony was an interesting one, the town clerk of Bootle presiding over the proceedings, referring in most eulogistic terms to the work performed by Mr. Harris, who was described as a zealous and straightforward official.

On the 6th inst., Mr. William Cumming, the late burgh surveyor of Carnonstie, was the recipient of a public testimonial from the inhabitants. A member of the council, in making the presentation, dwelt on the many services Mr. Cumming had rendered the burgh, and asked him to accept a gold lever watch as an appreciation of his many good qualities. Mrs. Cumming was also made the recipient of a gold bracelet. Mr. Cumming replied in a very characteristic speech, assuring all that he had only tried to do his duty according to his knowledge. He has also, it might be mentioned, been presented by the corporation employees with a handsome umbrella, suitably inscribed, and a silver-mounted pipe.

Mr. Cecil R. W. Chapman, surveyor to the Swaffham (Norfolk) Urban District Council, was last week elected to the vacant position of engineer, surveyor and inspector of nuisances to the Wembley (Middlesex) Urban District Council, which carries with it a salary of £220 per annum. There were over 120 applicants for the post, six of whom were selected to appear before the council. Mr. Chapman was for three years in the sanitary department of the Norwich Corporation, seven years with Mr. T. H. B. Heslop, M.C.E., county surveyor of Norfolk, and subsequently an assistant under him. During his four years' service under the Swaffham Urban District Council Mr. Chapman has carried out a system of sewage precipitation and an extensive sewerage scheme. He is a member of the Incorporated Association of Municipal and County Engineers, and holds, among many others, the certificate of the Sanitary Institute.

The death has taken place, at his residence in Carrickfergus, of Mr. James McNeill, assistant surveyor of co. Antrim, Ireland. Although comparatively fresh and vigorous in appearance till within a few months back, Mr. McNeill had been in failing health for some time past, and latterly he succumbed rapidly to an affection of the liver. Mr. McNeill was one of the oldest county officials in Ireland, his period of servitude extending over forty-one years. He was one of the most conscientious and painstaking of officials, and spared no trouble to have the many public works of which he had the supervision under the county surveyor carried out in the most satisfactory manner possible. His genial disposition, the unaffected simplicity of his character, and his unvarying kindness of heart endeared him to all with whom he came in contact, both young and old, and his friends were many and spread over a very wide area. He leaves a widow and two sons.

At the Crown Hotel, Chertsey, recently, a hurriedly-convened gathering assembled for the purpose of bidding farewell to the late surveyor to the urban district council, Mr. A. W. Smith, who later that day departed to take up the duties of a new appointment. The real purpose of the meeting was to enable Captain F. B. Harrison to publicly present to Mr. Smith an extremely valuable theodolite. The instrument, which was enclosed in a handsome mahogany case, has quite unique historical associations, having been used by the world-famed firm of Brasse, Petó & Betta (in which Captain Harrison's father was a partner) in connection with their construction of the Mont Cenis tunnel. In responding to the toast of his health, proposed by Captain Harrison, Mr. Smith said he would value the present very highly, because of the giver, and also for its usefulness to him in his work, its intrinsic worth, and its historic associations. While he had been in Chertsey he had endeavoured to do his duty, although it had not always been a pleasant one. Public officials were often targets for mud-throwing, as he had occasionally experienced, but altogether his sojourn in Chertsey had been a happy one.

Mr. F. W. Richardson, city analyst of Bradford, on Monday last week delivered a lecture on "Microbes, the Friend of Man," in the course of which he said, referring to the bacteriological treatment of sewage, in which experiments are being made at the Bradford sewage works at Frizinghall, that it had been found that if sewage, particularly domestic sewage, was allowed to run over beds of coke, engine ashes, gravel or sand, the filters soon got into working order, and countless quadrillions of microbes got to work on the impurities, converting them first into ammonia, then into nitrites, and afterwards into nitrates, and finally splitting up the nitrogen and sending it back into the great aerial reservoir. The Bradford sewage was one of the worst kinds. It was contaminated with trade effluents from different works, the worst of all being from wool-combing establishments. This effluent contained a large quantity of grease, which got on the outer surface of the filtering media and choked it up. Until they got the sewage separated into two classes—domestic, which could undoubtedly be treated on this principle, and trade—he did not think that the bacteriological treatment would be very successful.

APPOINTMENTS VACANT.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

GENERAL SURVEYOR'S ASSISTANT.—November 21st.—Corporation of Maidenhead. £80.—Mr. Percy Johns, borough surveyor.

SURVEYOR OF HIGHWAYS.—November 21st.—Fylde Rural District Council. £120.—Mr. F. H. Brown, clerk to the council, Kirkham.

APPOINTMENTS OPEN.

COUNTY BOROUGH OF SUNDERLAND. ROAD SURVEYOR.

Wanted, by the Corporation of Sunderland, a Road Surveyor, to discharge all the duties of a surveyor of highways, subject to the Borough Surveyor as the Surveyor of Highways for the Borough. Salary, £130 per annum.

Candidates must have had a thoroughly practical experience in road making and maintenance, paving of all descriptions, flagging, &c., and the person appointed will be required to devote his whole time to the duties of the office.

Personal canvassing for the appointment will be a disqualification.

Applications, in the handwriting of the candidates, stating age, residence, and past and present occupation, accompanied by copies of not more than six testimonials of recent date, must be delivered to me, at the address undermentioned, not later than 4 p.m. on Wednesday, the 30th November instant, endorsed "Road Surveyor."

(By order)

FRAS. M. BOWEY,
Town Clerk.

Town Hall, Sunderland.

November 14, 1898.

BOROUGH OF MAIDENHEAD. SURVEYOR'S ASSISTANT.

The Town Council of the Borough of Maidenhead require the services of a General Assistant in the office of the Borough Surveyor, at a salary of £80 per annum.

Candidates must not be more than twenty-eight years of age and have received a thorough training in a municipal office. They should be competent to survey and level accurately, prepare plans and detail drawings for private street improvements and other works, have a knowledge of building construction, and generally be able to assist in the duties of a borough surveyor's department.

Applications, in the handwriting of the candidate, stating age and qualifications, accompanied by copies of not more than three testimonials, and endorsed "Surveyor's Assistant," must be sent in to me not later than Monday, the 21st day of November, 1898.

PERCY JOHNS,
Borough Surveyor.

Guildhall, Maidenhead.

November 7, 1898.

CORPORATION OF STOCKTON-ON-TEES.

The above-named Corporation invite applications for the appointment of a General Outdoor Foreman.

Candidates (whose age must be between thirty and forty-five years) must be thoroughly qualified persons, having had practical experience in the cleansing and maintenance of roads and streets and of the various materials used in their construction, and also in the management and control of workmen, horses and carts.

He must be able to set out work accurately and take all necessary measurements. He must also have had experience in the management and construction of sewers and drains.

HAYWARD BROTHERS & ECKSTEIN,
 ENGINEERS AND IRONFOUNDERS,
 LIMITED.

187 to 193 UNION STREET, BOROUGH, LONDON, S.E

He must devote the whole of his time to the service of the Council and under the direction of the Borough Engineer. He will be required to keep all necessary books in connection with his work.

Salary, £100 per annum, with house, coals, gas, rates, &c. List of duties and forms of application can be obtained from the Borough Engineer.

Applications, in candidate's own handwriting, stating age and qualifications, particulars of present and past employment, including copies of not more than three recent testimonials, must be sent to me before 10 a. m. on Monday, the 28th November, endorsed "General Foreman."

M. H. SYKES,
Borough Engineer.

Town Hall, Stockton-on-Tees.
November 14, 1898.

CITY OF BEDFORD.

APPOINTMENT OF A MAIN ROAD INSPECTOR.

The Highways and Bridges Committee of the Bedfordshire County Council are prepared to receive applications for the appointment of a Main Road Inspector, to act under the superintendence and directions of the County Surveyor.

Salary, £160 per annum, to include all travelling and other expenses, with the exception of stationery and postages.

The person appointed must have had experience in all branches of road-making and structural works connected therewith.

He will be required to devote the whole of his time to the service of the Council. A list of the duties of the office and all other information can be obtained from the undersigned.

Candidates must not be more than thirty-five years of age.

Applications, in candidate's own handwriting, accompanied by recent testimonials, not exceeding three in number, must be sent to the undersigned, marked "Main Road Inspector," not later than 3 o'clock on Thursday, the 1st day of December, 1898.

The engagement will commence on the 1st day of February, 1899, and the person appointed will be required to enter upon his duties on that day.

Candidates canvassing, either directly or indirectly, will be disqualified.

It is desirable that the Inspector should be a good cyclist.

W. W. MARKS,
Clerk to the County Council.

Shire Hall, Bedford.
November 15, 1898.

CITY OF SHEFFIELD.

BUILDING INSPECTOR.

The Highway and Sewerage Committee are prepared to receive applications for the post of Building Inspector in the City Surveyor's department.

Candidates must be thoroughly qualified persons, and will be required to undertake the inspection of new buildings and drains and other duties.

The salary is £120 per annum.

A list of duties and form of application, which must be returned by the 24th inst., may be obtained on application to the undersigned on and after Monday next, the 14th inst.

CHARLES F. WIKE,
City Surveyor.

City Surveyor's Office, Sheffield.
November 11, 1898.

THE KENSINGTON PATENT SYPHONIC CLOSET TRAPS AND CLOSETS

Embrace all the qualities of a First-Class Valve Closet at less than one-fifth the cost.
WHEN FIXED WILL LAST A LIFE-TIME.

Meeting with all the requirements of the London County Council.

ADVANTAGES.

It is fixed exactly as a common hopper and trap, with earthenware or lead outlets; or the trap may be had entirely of 10 lb. cast lead.

IT CANNOT GET OUT OF ORDER.

Only requires TWO gallons of water to properly flush it, and it has no puff pipes or other complicated parts.

It has a water service of 10 in. by 8 in., or more if required, an absolute water seal of 5 in., and cannot under any conditions be siphoned out.

W. EASSIE, Esq., C.E. (deceased), said it was preferable to any other closet. The trap can be adapted to the "Household," "Swift," "Sirex," "Iris," or any similar closet basin. The price enables it to be used in Cottage, Villa or Building, whilst it cannot be equalled for the best of Mansions. Special after-flush cisterns made to suit the closet.

May be obtained of all leading Lead and Sanitary Goods' Merchants.

Illustrated Price Lists may be had from

THE ANCHOR SANITARY POTTERIES, SWADLINCOTE.

TENDERS WANTED.

CORPORATION OF MANSFIELD.

The Town Council, acting as the urban sanitary authority for their district, are prepared to receive tenders from competent persons for the construction of about 1,650 yards of Brick Sewer and Storm (overflows, and 570 yards of Pipe Sewers, with all necessary lampholes, manholes, ventilators, flushing arrangements and works incidental thereto.

Plans and specifications of the works may be seen, and the form of tender and schedule of quantities obtained (on deposit of £10, at the office of Mr. R. Frank Vallance, C.E., F.S.I., Borough Surveyor, Mansfield, the Engineer for the works, on and after the 1st day of December next.

The deposit will be returned, after a contract has been entered into, to every person making a *bona-fide* tender and on the return of the documents entrusted to him.

In the event of a tender being withdrawn the deposit will be forfeited.

The successful contractor will be required to pay the standard rate of wages recognised in the district in the several trades.

Deputy Town Clerk.

BROMSGROVE RURAL DISTRICT COUNCIL.

PEDMORE SEWERAGE.

TO CONTRACTORS.

The above Council is prepared to receive tenders for the construction of the Stoneware Pipe Sewers comprised in the scheme of sewerage for the parish of Pedmore, together with manholes, lampholes, flushing chambers and other works in connection therewith.

Plans, sections and detail drawings may be seen, and specifications and bills of quantities obtained, at the office of the Engineer, Mr. E. B. Marten, M.I.C.E., Church-street Chambers, Stourbridge, on and after Wednesday, November 2nd, on payment of £5 5s., which will be returned after the receipt of a *bona-fide* tender, with the schedules duly filled in, and the return of all documents.

Sealed tenders, addressed to me, and endorsed "Tender for Pedmore Sewerage," are to be delivered at my office on or before Monday, the 28th day of November next.

The Council do not bind themselves to accept the lowest or any tender.

(By order)

H. D. HOLLOWAY,
Clerk to the Council.

Union Offices, Bromsgrove.
October 27, 1898.

COUNTY BOROUGH OF WEST HAM.

TO BUILDERS AND CONTRACTORS.

The Council hereby invite tenders for the Erection of Quarter Sessions Court, Police Cells and Mortuary, West Ham-lane, Stratford, E.

Plans may be seen, and specification, form of tender and further particulars obtained, on and after Monday, 28th November, 1898, at the office of Mr. Lewis Angell, Borough Engineer, Town Hall, Stratford, E., upon the deposit of a £5

Bank of England note, which will be returned upon receipt of a *bona-fide* tender.

Tenders, endorsed "Tender for Quarter Sessions Court, &c.," to be sent to my office not later than 4 o'clock on Tuesday, 13th December, 1898.

The Council do not bind themselves to accept the lowest or any tender. The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

As regards all work to be done at the site or elsewhere within a radius of 20 miles from Charing Cross, the contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

(By order of the Council)

FRED. E. HILLEARY,
Town Clerk.

Town Hall, West Ham, E.
November 15, 1898.

DROYLSDEN URBAN DISTRICT.

CONSTRUCTION OF SEWERS.

The above Council invite tenders for the construction of 607 lineal yards of 24-in. Pipe Sewer, 615 lineal yards of 18-in. Pipe Sewer, and 345 lineal yards of 15-in. Pipe Sewer, together with Manholes, Junctions, &c.—namely, from Manchester-road to Ashton Old-road, Fairfield, and from Copperas-lane to the "Barley Mow," Fairfield-road.

Particulars and specifications may be seen on application to Mr. W. Curry, F.I.S.E., the Engineer to the Council.

Quantities and forms of tender will be supplied to intending contractors on payment of 1 guinea, which will be returned on receipt of a *bona-fide* tender, together with all documents given to contractors.

Tenders, endorsed "Sewers," must be addressed Chairman, Sewage Committee, Council Offices, Droylsden, and sent in on or before the 30th inst.

The Council do not bind themselves to accept the lowest or any tender.

(By order)

JOHN RICHARDS,
Clerk of the Council.

Vol. XIV., No. 353. LONDON, NOVEMBER 25, 1898. Weekly, Price 3d.

Minutes of Proceedings.

Municipalities and Electric Tramways.—III.

The report on tramway traction, which we have already discussed at considerable length in the two last issues, concludes with the firmly-expressed opinion that the solution of the traction problem in London lies in the electric conduit. This is a very important declaration, coming from one who has so closely studied the question as Mr. Baker. It is not only of importance, however, as far as London is concerned, but it equally affects all towns and cities suffering from congestion of traffic. It will be as well, therefore, to consider some of the reasons that have led to the report being in favour of this system. We have already indicated in our previous remarks that if any system will give the advantages that accrue from electrical methods for propelling vehicles, without the necessity of erecting overhead wires and their requisite supports, a good deal will have been achieved in making the way easy for the general adoption of electricity in crowded thoroughfares. Fortunately, as far as this country is concerned, there is on the subject of conduits a good deal of experience and knowledge which may serve as a guide to some extent. At the same time it must not be forgotten that the conditions obtaining in London, and for the matter of that in the chief English cities, are totally at variance with those found either on the Continent or in America. It is apparent from the report that the conclusions expressed in favour of this form of traction are based upon systems which have been in existence in America for some years. Indeed, Mr. Baker almost admits that the examples on the Continent may be regarded as only a qualified success. Many of our readers are no doubt familiar with the fact that one of the first public systems of tramways operated by electricity was that of Blackpool, where the conduit was laid down in the middle of the rails. That system demonstrated beyond all question the economy of electrical working. It obviously had many defects, and, although it has continued almost to the present day, it is now being superseded by an overhead trolley. We admit at once that the partial failure at Blackpool must not be taken as an argument against the conduit. The chief conduit systems on the Continent are in Brussels, Buda-Pesth and Berlin. In the case of Buda-Pesth the slot is formed by two rails, and below them in a sort of tube are the conductors. Brussels and Berlin do not differ very materially from this, and the same remark applies to the system which has been erected at Dresden. Probably the most noted system in Europe is the one at Buda-Pesth, to which we have just alluded. This system had been chosen because local authorities would not permit the overhead wires to be erected in the streets. It is stated in Mr. Baker's report that wet weather does not affect the working, but in the same paragraph it is admitted that it may cause more leakage of current at the insulators, which is a very important point. We have already pointed out that

the conditions regarding the construction and working of electric tramways in this country are different to those which prevail either on the Continent or in America. Definite regulations have been laid down by the Board of Trade, and, in spite of the fact that these are considered in many quarters to be to some extent permissive, there is every reason to think that their transgression would be followed by some restriction. The question, therefore, that naturally arises is whether at any time there will be sufficient leakage from a conduit system to cause electrolytic troubles or inconvenience to telegraph and telephone services. It is interesting to quote at this point some remarks in the report, because they embody the arguments generally advanced to induce the London County Council to adopt the conduit system:—

The steady opposition of the city authorities, in both Washington and New York, to the overhead trolley wire has made it imperative upon the operating companies in those cities to find a substitute for this and the horse lines, which could be no longer tolerated. Accordingly, at much expense, the cable lines were laid down in Broadway, Lexington-avenue and other leading thoroughfares in New York, and similar lines were also installed in parts of Washington. These have worked with great success and economy, the operating expenses in New York being given at less than 50 per cent. of the gross earnings. Subsequently, in 1894, the first trial line on the electric conduit system was laid on Lenox-avenue, New York. This was a very expensive construction, having an unnecessarily deep conduit. It has worked, however, with great satisfaction and economy, and proved to the company that it possesses many advantages over the cable. In the succeeding year 2½ track miles of conduit line were laid down in Washington, with shallower conduit and less expensive construction than that laid down at Lenox-avenue line. The success of this installation induced the Metropolitan Traction Company in New York to extend their conduit system and lay down a further 5½ miles on Madison, Fourth, Eighth, Second and Amsterdam avenues. These are now working with entire success and great satisfaction to the public and the company, as manifested by largely-increasing receipts and the "stealing of traffic" from parallel cable lines. The latest development and the most striking proof of the perfect success and economical working of the conduit system is the fact that the Metropolitan Traction Company of New York have just applied to the New York State Railroad Commissioners for permission to convert their Broadway, Columbus-avenue and Lexington-avenue cable lines (their entire cable system) to the underground conduit electric, in spite of the fact that the Broadway cable had cost £200,000 per mile of double track so constructed. This is all the more striking when it is considered that the tramway traffic on Broadway is heavier than that of any other city in the world, cars running every ten to fifteen seconds. It was thought previously that no system of the cable could economically cope with such a service.

These are undoubtedly important facts, and should no doubt be very carefully considered by any municipality that is contemplating the adoption of some form of mechanical traction. At the same time it must be pointed out that the conduit was not adopted by the companies because they considered it better than the overhead wire, for it is noted in the report that Congress decreed that all overhead wires in Washington should be removed and be replaced by other forms of traction. Any local authority is, of course, justified in taking up such

a position, and we would not think of arguing that the conduit is at all impracticable; in fact, if a local authority conscientiously considers that the overhead wires are in any sense a disfigurement, then we admit without hesitation that it is desirable to adopt a conduit system. It is perfectly feasible to work a conduit system, and there is no reason why, if properly constructed, it should not in every respect conform to the Board of Trade regulations. There is distinct evidence adduced by the report that the system is mechanical and economical. It would be almost impossible to find an electrical man at the present time who would suggest that there were any mechanical difficulties in the way of working the conduit, but there must be some reason why there are so few systems at the present moment. It is somewhat strange that the municipalities of Glasgow, Liverpool, Dover, Sheffield and Manchester should have declared in favour of the overhead trolley when the information that Mr. Baker has so admirably set forth was quite open to them. Without, therefore, desiring to prejudice the minds of our readers against the conduit system, it is necessary to point out why this system has not been more largely adopted. The most careful investigations into all systems have been undertaken by various municipalities, and we cannot do better than quote the objections raised against the conduit by the deputation of the city of Sheffield. They are as follows:—

- (1) The great expense.
- (2) Prolonged interference with the streets during construction and repairs.
- (3) The difficulty in locating any defect of the underground part of the system.
- (4) The difficulty and expense of carrying out any sewerage works in streets in which there are conduits.
- (5) The danger to traffic through the presence of a slot in the street, varying in width from $\frac{1}{2}$ in. to 2 in.
- (6) The difficulty in keeping conduits clean and maintaining satisfactory insulation.
- (7) The liability to stoppage through storms.

There can be no question about the first objection raised by the Sheffield Committee. It has been stated by Messrs. Siemens & Halske, of Berlin, who have equipped more conduit lines than any other firm in Europe, that the conduit costs £4,000 to £5,000 more per mile of double line than the overhead. The tramway company in Berlin state that the price per mile of overhead electric is £2,400, and for exactly similar equipment the conduit system costs £6,450. The municipal engineer of Brussels states that the overhead electric line in that city costs £5,410 per mile and a mile of conduit single track £9,800. Mr. Baker shows in his report that the cost of the conduit in Washington and the electric installation of it, and repaving mostly with asphalt, was £7,000 per mile of single track, and this is considered to be a moderate figure. The question is whether the advantages provided by such a system are worth the very heavy initial outlay that must be incurred. On the point of prolonged interference with streets during construction and repairs there is equally clear evidence in existence. In the case of Buda-Pesth it is stated by the engineer that 1 kilometre (equal to $\frac{1}{6}$ of a mile) of conduit tramway could be laid in about a month, or, working three gangs, in a fortnight. In regard to Berlin, where a more modern system of conduit is in operation, the Sheffield report states that the inconvenience arising from the time occupied in the construction of the lines was so great that, although the police authorities prohibit overhead apparatus in the streets of Berlin, it has been decided not to allow the construction of any more conduit lines on account of the inconvenience arising in this way. It might be said with reason that if such towns as Washington and New York can withstand the inconvenience arising from such prolonged construction, there ought to be no difficulty in the way of London following in their footsteps; but we merely point out the objections, leaving the municipal authorities to consider them.

At this stage it is interesting to quote two or three opinions from a very eminent American engineer—Mr. Pearson—on the subject of the conduit, and these opinions are particularly interesting and instructive at the present moment, because this authority has been the consulting engineer for the very large conduit systems in New York to which Mr. Baker refers so fully. Mr. Pearson states that "it is useless to consider any cheap form of conduit, because it should be well built and capable of withstanding the excessive weights which pass over it." That, of course, is admitted. In considering the question of applying electric tramways to the streets of Liverpool, Mr. Pearson estimates that the cost of 1 mile of straight track for overhead trolley would be £5,822, but 1 mile of straight track slotted conduit would cost £9,648. But heavy charges do not cease when the system has been erected. It is in maintenance that the conduit is shown to be inferior to the overhead trolley. It was stated that under the street conditions prevailing in Liverpool the cost of cleaning the conduits per mile of track would probably amount to £40 per year, and as the cost of maintaining what is described as the special work would be very much greater in the case of the conduit than in the case of the overhead wire, the expense of maintenance would vary in the same ratio as the original cost, and would be at least three times as much for the underground system as for the overhead. According to Mr. Pearson, if there had been 70 miles of track in Liverpool used for electric tramways the special charges would amount to £60 per year per mile of track for the maintenance of the special work of the overhead trolley system, and £180 per year per mile of track for the maintenance of the special work for the underground conduit system. In other words, the total yearly cost of maintaining in efficient condition an underground conduit would amount to £12,500 per annum against £4,200 for the overhead. Put in another way, if 9,000,000 car miles were run annually the cost per car mile for the special work maintenance would be 11d. for the overhead trolley and 33d. for the underground conduit. These are some of the points that will have to be carefully considered by all authorities who are contemplating adopting a conduit system. It is argued by many authorities that the objection to the overhead is a sentimental one. The question is whether getting rid of this objection is worth the heavy cost in first construction, and the undoubtedly heavy charges for maintenance that would thus be entailed.

* * *

**A
Benighted
City.**

A smoke-nveloped and traffic-congested metropolis is the description that might appropriately be applied to London after a perusal of the daily papers during the past week or so. Mr. Vigers, in his opening address as president of the Surveyors' Institution, commented at some length on the congested state of the London streets and insisted on the necessity of widening improvements being carried out a little more vigorously and promptly. Then Sir John Wolfe Barry, at the Society of Arts, made London's traffic problem the subject of an entire address which had plenty of interest, and is given by us this week as fully as space will permit. It is to be feared, however, that the somewhat heroic remedies proposed by the eminent engineer will not meet with a great deal of support. It is the old question of ways and means, and we fear that Londoners must reconcile themselves to piecemeal improvements from time to time, while patiently awaiting the construction of further underground railways, the development of the motor car, and other improvements in our transit facilities. After the traffic problem comes the smoke problem—an appropriate enough subject of discussion in November, the fogs of which are often due as much to smoke as to purely atmospheric causes. Sir B. W. Richmond led off with a vigorous impeachment of vestries and district boards for their neglect in put-

ting into force the powers vested in them by sec. 23 of the Public Health Act, 1891. This artistic protest was followed next day by a letter which attracted more attention on account of the signature than by any exceptional originality or information. The initials were "C. T. R.," which easily reveal the identity of a member of the present Cabinet who had so much to do with the establishment of county councils, including the London one of that ilk. Mr. Ritchie simply pointed out that under sec. 100 of the Public Health (London) Act, 1891, the County Council, in the case of default by the sanitary authority in removing any nuisance, instituting proceedings, or enforcing any by-law, is empowered to take any action which the sanitary authority might have taken and recover the expenses from the defaulting body. Since Mr. Ritchie's contribution to the discussion there has been plenty of rather aimless talk in the columns of the daily papers, most of the writers being apparently under the impression that the clause in question has been lying buried and unknown since the passing of the Act in 1891. We have no intention of defending the vestries and district boards, for it is difficult to believe that many of them make any sincere effort to check the smoke nuisance, to say nothing of others, but it is not quite just to imply that the County Council do absolutely nothing, though there may be ground for contending that they do not act so vigorously as they might do. Those who have occasion to follow the proceedings of London local authorities know that the County Council do frequently intervene in regard to the smoke nuisance. At the meeting of the Council this week, as will be seen from our report, the Public Control Committee reported with regard to proceedings in default of the Vestry of Lambeth, penalties and costs being obtained in two cases. The committee admit, however, that this is the first time the intervention of the Council has gone the length of legal proceedings. Let us hope that they will not weary of well-doing, for a little persistence in this policy should have salutary results. The following paragraph from the report should be of interest to Sir B. W. Richmond, "C. T. R." the editor and leader writers of *The Times*, and one or two others:—

We have from time to time reported the steps we have taken for enforcing the provisions of the Public Health (London) Act, 1891, as to smoke prevention. In almost every instance either the sanitary authority has carried out its duties under the Act, or, as a consequence of the direct intervention of the council, the parties creating the nuisance have found means for abating it. Out of 228 premises from which serious and persistent nuisance was observed about July last, either by the police or the Council's officers, in over 200 cases means were found for abating the nuisance, although in some cases this was only after legal proceedings had been instituted by the sanitary authority.

* * *

Waste Strips Adjoining Highways. There is, we believe, some confusion of thought, to some extent even among those whose duties tend to familiarise them with matters appertaining to highways, and to a greater extent among landowners and others with regard to those strips of land which are so frequently found between the metalled portion of a country road and the boundaries of adjoining property. The idea so deeply ingrained in the English character, which finds expression in such sayings as "An Englishman's house is his castle" and "A man may do what he likes with his own," leads many to confuse the question of the "ownership" of the soil with the question of the rights of the public. If a landowner discovers, or thinks he discovers, that the plans on his title deeds include such strips, he is apt to jump to the conclusion that he can fence them in, utterly irrespective of the length of time that they may have been left unenclosed, or of any rule of law, or evidence of fact, which may curtail his rights. We have not to go far afield to find claims of this kind actually brought into court. In *Locke-King v. Woking Urban District Council* (noted at p. 696 of vol. xii.), the plaintiff produced a deed of conveyance upon which strips of this kind were

included as part of the land conveyed, and asked the Court to declare that he was entitled to enclose them. Mr. Justice Kekewich, before whom the case was tried, visited the spot, and found that the strips were remarkably irregular, being sometimes of considerable width and at other times running to a point, the boundary hedges themselves not being very regular in shape. He also found that there was nothing to render them impassable or to rebut the ordinary presumption of law in such cases, viz., that where there is a highway running between fences, unless there is something to show the contrary, the whole space between the fences, whether metalled or not, forms part of that highway and is subject to the right of the public to use it, be the soil vested in whom it may. The action therefore failed; not, be it observed, because the plaintiff was not the "owner" of the soil of the strips of land, but because, they having become part of the highway, his ownership was limited by and subject to the rights of the public. It must not, however, be assumed too hastily that such public rights exist in every case. There may be evidence to rebut the presumption referred to, and then it will be for the Court or the jury to decide whether the ground has been dedicated and become part of the highway. Through overlooking this aspect of the question, and taking the law into their own hands, highway authorities have sometimes got themselves into difficulties. In *Absalom v. Corporation of Norwich* (noted at p. 140 of vol. vi.), for example, the corporation were saddled with £20 damages and costs for pulling up some posts which the plaintiff had erected on a vacant piece of ground in front of his shop, they contending, unsuccessfully, that the ground formed part of the street. And, again, in *The Midway Lovers Navigation Company v. the Hollingbourne Rural Sanitary Authority* (noted at same page of vol. vi.) damages and costs were obtained against the defendants for taking forcible possession of a triangular piece of ground, which was alleged by them to form part of the highway, but which was found upon the evidence not to have been dedicated to the public. It is true that these cases had reference not precisely to such grassy strips as we have been considering, but in one instance to land adjoining a street and in the other to a triangular or corner plot of ground. But the same principle applies to all. Other cases might be quoted, but enough has been said to show that a question of this kind is always one of considerable nicety, depending upon the application of the principle mentioned to facts which are not always easy of ascertainment, and the elucidation of which may necessitate the sifting of conflicting evidence.

* * *

Another Lucrative Appointment. In the town of Penryn, the local authority must have very little work for officials, have very little money, or be remarkably parsimonious. They have recently advertised for a "person" to perform the duties of inspector of nuisances and surveyor, at a salary not less than £40 a year. On further perusal of the advertisement, however, one gathers that this magnificent sum represents only the remuneration on the sanitary inspector side, for candidates are further tempted by the announcement that "the person appointed will also be required to perform the duties of surveyor to the council, at a salary of £5 per annum." The discrepancy between the remuneration as inspector of nuisances and that given as surveyor is, we are all aware, due to the fact that when the appointment of an inspector of nuisances is made with the sanction of the Local Government Board half the salary is paid by that department. We trust, however, that before sanctioning this appointment the Local Government Board will carefully consider whether £15 a year is adequate remuneration for discharging the duties of inspector of nuisances and of surveyor, even in a place like Penryn.

Comparative Reports of General Practice.

XXX.—TRAMWAY TRACTION : WEST BROMWICH REPORT.—II.

BLACKPOOL (ELECTRIC CONDUIT SYSTEM).

The system in operation at Blackpool is known as the electric conduit system. In 1855 the corporation laid down the tramway and leased the running powers to a company for seven years. At the expiration of this period, in September, 1892, the corporation purchased the undertaking and plant for the sum of £15,587. In addition to this, they had expended £13,435 in the construction of the permanent way, making a total of £29,022. On the completion of the purchase it was found necessary to relay part of the conduit and to replace and repair part of the plant and machinery.

Permanent Way.—The electric tramways run through 5 miles of streets, 3 miles being single and 2 miles double. The gauge is 4 ft. 8½ in., and the rails are of the girder type, 92 lb. to 97 lb. per yard. The paving is generally of granite, but there is also some wood paving. The conduit is in the centre of the rails, the slot being ¾ in. and ½ in. The conductors are of pure copper tubing, insulated from the channel, the insulators being 9 ft. apart.

Rolling Stock.—The electric cars are of two sizes. There are four large ones, each capable of carrying eighty-two passengers—forty-four inside and thirty-eight outside. They weigh 11 tons 14 cwt., and are of the double-decked four-wheeled bogie type. The small cars are ten in number and carry fifty-four persons. They weigh 4½ tons each. All the cars are lighted by electricity, as at Leeds. The speed of the electric cars is 8 miles per hour, they stop when required, and the charge is 1d. over the entire distance in the winter and 2d. in the summer.

Power Station.—The power for the electric tramways is supplied from the general electric lighting station, which is about midway, the engines being 25 horse-power compound engines, coupled to two four-poled generators. The current is direct, no accumulators being used either in the station or on the cars. The deputation were very much struck with the class of engines in use for driving the generators, which, they were informed, were in use for the first time for electric works.

General Notes.—The capital invested in the electric lines is £55,372. The circumstances in Blackpool are very different to those in any large commercial town. Not only is the population subject to enormous fluctuations, but in the case of the conduit line the effects of the sea water and sand have to be contended with. The Blackpool Corporation had during the winters of 1894-96 to relay the whole of the conduit along the promenade on a new principle, at a net cost of £6,754. In spite of this large expenditure on the conduit, supplemented as it was by a further expenditure during the following years of £1,196 for repairs, &c., the trouble increased rather than decreased and the committee decided that a radical change in the system was necessary. They therefore, after consideration, recommended the corporation to abandon the conduit system and substitute for it the overhead trolley system. In a report of the sub-committee of the Blackpool Corporation the relative costs of maintaining the similar portions, exclusive of repairs to roadway, rails, motors, gearing, cars, &c., of the three systems—viz., overhead, conduit and accumulators—on the present Blackpool system is stated as follows: Overhead system (line, &c.) estimated, £600; conduit system (conduit, &c.) cost 1897 actual, £2,238; and accumulator system (accumulator, &c.) estimated, £2,789.

GAS TRAMS (BLACKPOOL TO LYTHAM).

Permanent Way.—The gas trams run between South Shore, Blackpool (where the line joins the electric conduit line) and St. Anne's and Lytham. The line is 7 miles long, and is single, with passing places, the gauge is also 4 ft. 8½ in. and the steepest gradient is 1 in 26. One mile of this line is within the borough boundary, and has been laid by the corporation and is leased to the company.

Rolling Stock.—The cars, of which there are sixteen, are smaller than those on the electric line. Four of the cars carry forty—sixteen inside and twenty-four out—and weigh about 7 tons. The remaining twelve cars carry fifty-two passengers—twenty-two in and thirty out—and weigh from 7½ to 8 tons. They are supplied with ordinary gas at the depot, one charge

BRISTOL ELECTRIC TRAMWAY : OLD MARKET-STREET TERMINUS.

being sufficient for 9 miles. The speed is 8 miles per hour, and the cars run at intervals of fifteen minutes in the borough and thirty to forty minutes outside. In the winter a twenty minutes' service to and from Lytham and Blackpool is maintained, and in the summer a ten minutes' service.

General Notes.—The advantages of this system are stated to be: (1) The low cost of traction; (2) the absence of the overhead apparatus or conduit. The disadvantages are: (1) The unpleasant smell; (2) the vibration; (3) the difficulty of ascending gradients; (4) the noise and rattle of machinery. This system has only been in operation about eighteen months, and is therefore still in the experimental stage, and as the track is quite local (with two exceptions) it is exceedingly doubtful whether the cars could mount the steep gradient at Holloway Bank. Your sub-committee are of opinion that, taking all the various conditions into consideration, this system would not be suitable for this district.

BRISTOL.

There are two systems of tramways in Bristol—viz., horse and overhead electric—both owned and worked by a company, the latter having been in use since 1895. The lease to the company was for twenty-one years, and it has still sixteen years to run.

Permanent Way.—The various lines, with the exception of one small length, were constructed by the company. The electric line commences at the western or city end of Old Market-street, where it joins two lines of horse cars. There is a double track for most of the route. The power station, which is in Beaconsfield-road, a turning south of main road close to St. George's Church, is about equi-distant from the extreme ends of the route. On leaving Old Market-street the line continues in an easterly direction, *via* Lawrence-hill and Redfield-road to Kingswood; there is also a branch line along Stapleton-road. The total distance of track is now about 6 miles, a total length measured in single track of 10 miles. The gradients vary from 1 in 15 (a length of 220 yards), and half a mile from Kingswood terminus it has an elevation of 300 ft. over the starting point in Old Market-street. The gauge is 4 ft. 8½ in., and the rails are of the girder pattern, 96 lb. per yard. The paving is generally granite, but wood paving is used in the centre of the city.

Conducting System.—The standards are of steel tubes in three lengths, which overlap, and are shrunk together whilst hot. The tube enters 6 ft. into the ground, and over it a cast-iron base is passed and bedded in concrete. They are placed at the edge of the footway on the south side of the road, except in Old Market-street and Lawrence-hill, where they are placed in the centre and have brackets on either side. The standards erected in the middle of Old Market-street are surmounted alternately by electric arc lamps, the wires being 22 ft. above the road.

Rolling Stock.—The rolling stock consists of twenty-one motor cars, each sufficiently powerful to draw an ordinary trailer car. The car bodies were built by Messrs. Milnes & Co., of Birkenhead, and are mounted on cantilever trucks made by the Peckham Motor Truck and Wheel Company of New York. The cars are all fitted with a bell arrangement on the top of the car, by which passengers on the top can easily and expeditiously communicate to the conductor their desire to get off. They will carry forty-four passengers—eighteen inside and twenty-six out—and weigh 5½ tons. Six new motor cars have lately been added, which are mounted on Peckham cantilever expansion trucks. They are larger than the earlier cars, and carry fifty-three passengers—twenty-four inside and twenty-nine out. Each car is provided with two motors of 15 horse-power; the weight of each motor is 19 cwt. The colours of the cars are different on each route, and at night different coloured lamps are also used, the arrangement contributing very much to public convenience and utility. There are two separate systems of lighting the cars, which are employed simultaneously. In both incandescent lamps are used, but the one system is from the main circuit, whilst the other is supplied from accumulators. On the trolley wire circuit are five lamps of 16 candle-power each. One is placed on a standard 4 ft. 6 in. high on the roof and four are placed inside the cars over the seats. The lamps served by the accumulators consist of one lamp on a standard on the roof, a coloured bull's-eye at either end of the car, and a head lamp on the hood over the driver. The employment of accumulators ensures that the car will always be adequately lighted, even though the current from the power station should be cut off, either by the trolley being disconnected from the trolley wire or by

stoppage of the generators at the station. The accumulators supply sufficient current to light the lamps for eight hours. The speed is 8 miles per hour, and the service is at intervals of six and twelve minutes, except on Saturdays, when it is every four and a half and nine minutes. Convenient stopping places have been established on the line of route, those positions being indicated by rings conspicuously painted round the poles, and the system is said to answer remarkably well, having many advantages. The line is divided into three 1d. stages, and the charge from end to end is 3d. Workmen's cars are run at certain hours, the first car being at 4.50 a.m., and the fare on them is 1d. for any distance. They are greatly appreciated and extensively patronised.

Power Station.—The power station and tramway sheds are situated midway on the route at St. George's. The boilers are four Lancashire boilers of Siemens-Martin steel, manufactured by Messrs. D. Adamson & Co., and are fitted with Green's fuel economisers and mechanical stokers. The engines are four of MacIntosh & Seymour's horizontal compound engines, with high-pressure cylinders, direct coupled to 150-kilowatt generators of the six-pole type. The engines are 250 horse-power each, and the station is the largest tram-

BRISTOL ELECTRIC TRAMWAY: CENTRE POLES AND BRACKETS.

way station in England, and this is the first instance of the use of engines of this class in England. The engine and boiler house is at the rear of the car shed, and there are fitting and paint shops attached for repairs, also a superintendent's house and general stores.

General Notes.—The tram company supply eight public lamps with electricity, each lamp being equipped with five incandescent glow lamps of 16 candle-power each, and these lamps are supplied by the company free of charge. No accidents have happened from falling wires, and very few through frightening horses, and none of a serious character. The total cost of the present installation, including conversion of lines, overhead work, power station and cars, was about £50,000. It is stated that the cost per car mile run with a seven and a half minutes' service is 5½d., as against 1½d. with horses, and the receipts have largely increased since the conversion. The cost per electrical unit is 1.66d.

Coole.—Local Government Board sanction has been refused in connection with an application of the council for sanction to borrow £1,000 for works of sewage disposal at Swinfield. A more expensive scheme will have to be provided.

THE VALUE OF STREET SWEEPINGS.

AN INTERESTING INVESTIGATION.

An investigation of much practical interest has been carried out by the United States Department of Agriculture concerning the fertilising or manurial value of street sweepings. Letters of inquiry were sent to the officials in charge of street-cleaning departments in the 354 cities and towns of the United States having 10,000 or more inhabitants. As the result, more or less complete data relating to the disposal of the street sweepings of 204 cities and towns were obtained. It appears, says *The Times*, that sixty of these succeeded in disposing of some portion of their street sweepings for agricultural purposes, seventy-four make no attempt to turn to account the fertilising value of the material, though some part of the latter is used for filling in low land, for reclaiming marsh land, &c., and the remaining seventy dump the material in streams or other bodies of water, or on land, without any systematic attempt at utilisation. In general terms it may

BRISTOL ELECTRIC TRAMWAY: SIDE POLE AND BRACKET.

be said that cities representing one-fourth of the entire urban population of the country make an effort to utilise the fertilising value of some portion of their street sweepings. Reasons are assigned for estimating the total quantity of street sweepings annually collected throughout the country at not far short of 3,000,000 tons, this being based upon a calculated average of 169 tons per 1,000 inhabitants per annum.

The fertilising value of the sweepings varies greatly with the nature of the pavements, being practically nothing in the case of material off macadamised roads, and approaching that of good stable manure in the case of material collected on the hand-swept and well paved streets of crowded cities. The regulations in different cities as to the nature of the substances which may be thrown into the alleys and streets, and thus find their way into the material collected by the sweepers, vary so widely that there is necessarily a corresponding difference in the cost of sorting and preparing the material for spreading on the land. It is believed that the rapidly increasing sentiment in favour of the careful separation and systematic utilisation of all kinds of city waste will tend to remove this difficulty, and thus increase the value of sweepings, particularly of such as are collected in alleys, where the percentage of miscellaneous rubbish is now often very great. In autumn the quantity, and in many cases the quality, of the street sweepings are much enhanced by the falling leaves. There appears to be a dearth of recent literature on the subject of the fertilising value of the material under notice.

In 1892 the *Landwirtschaftliche Presse* published an analysis of sweepings from the asphalt-paved streets of Berlin, which yielded the following percentages: Moisture, 38.89; ash, 37.67; organic matter, 22.44; total nitrogen, 0.479; ammoniacal nitrogen, 0.004; phosphorus pentoxide, 0.452; potash, 0.370; lime, 1.291; magnesia, 0.347. A sample representing the accumulations for four weeks of the sweepings from a street in Trenton, New Jersey, in 1895 yielded on analysis 0.18 per cent. of nitrogen, 0.3 per cent. of phosphorus pentoxide, and 0.19 per cent. of potash; this material was valued at 60 cents per ton. From the tabulated results of analysis of eighteen samples of sweepings obtained from the streets of Washington City we learn that the percentages of the substances named ranged between the following extremes: Organic matter, 35.5 and 10.2; nitrogen, 1.18 and 0.17; phosphorus pentoxide, 0.16 and 0.1; potash, 0.5 and 0.05.

An effort was made to supplement the analytical data with the results of practical tests made by farmers to determine the value of street sweepings as a source of plant food for field and garden crops, and as a source of the humus which is indispensable to the good mechanical condition of many soils. Evidence was forthcoming to show that well-selected and judiciously-used street sweepings possess considerable manurial value. Out of sixteen quoted letters, only four of which report unfavourable results, we may briefly notice two or three. A farmer who uses the sweepings from Atlanta, Georgia, finds 1 ton of them to be about equal to half a ton of mixed stable manure (two-thirds cow, one-third horse); he has used the sweepings for three years for maize, wheat, oats, rye and potatoes, broadcasting about 20 tons per acre, and his lands have greatly improved. At Norfolk, Virginia, a grower has been using street sweepings for several years, and with much profit, on spinach, cabbage, kale and potatoes; he finds that their effect on the land is much more lasting than that of stable manure. At Pittsburg, Pennsylvania, street sweepings are used very largely in the parks, with excellent results; the material is powerful and quick in its action, and gives a capital growth of grass, whilst its effect is more lasting than that of artificial manures. A Californian hop-grower puts the street sweepings of Sacramento direct on the hop hills.

The exact monetary value of street sweepings is, of course, not easy to determine. Using the very conservative estimate of 10 cents per pound for the nitrogen, and disregarding the phosphoric acid and the potash, Mr. Ervin Ewell, the chemist who has prepared the bulletin, calculates that the samples analysed would range in value between \$1.46 and \$4 cents per ton. The material, however, has its uses in addition to the fertilising value of the plant food it contains. Gardeners, for example, appreciate it on account of its improving the mechanical condition of stiff and badly-aerated soils. Sixteen cities reported the prices at which street sweepings are sold to farmers, and these prices vary from 15 cents, to \$2 per ton. It is hoped that the publication of this bulletin will result in improved methods for the collection of street sweepings and in the extension of their use for maintaining the productiveness of land.

Bakewell.—A Local Government Board inquiry has been held by Colonel A. J. Hepper with respect to an application of the council for sanction to borrow £1,120 for the carrying out of sewerage and sewage disposal works in the village of Longstone.

A Useful Russian Practice.—Prompted by a letter that recently appeared in *The Times* with reference to the difficulties cyclists had to contend with owing to the absence of any notification in England enabling them to discover the names of railway stations or of villages through which they pass, Mr. Francis H. E. Palmer writes to a contemporary that at the entrance and exit of every Russian village a notice board is placed upon which is inscribed, not only the name of the village and of the administrative district, but also the number of adult male and female inhabitants, and of the *isbas* that it contains. To this other information is often added, such as the area of the land in the hands of the peasants and of small local proprietors respectively, as well as the names of and distance to the nearest village or town. The village signboard also generally indicates where the nearest licensed country doctor can be found in case of accident.

The Traffic Problem in London.

THE VIEWS OF SIR JOHN WOLFE BARRY.

Sir John Wolfe Barry, F.R.S., is the now chairman of the council of the Society of Arts, and at the opening meeting of that body for the session, last week, he delivered the customary address, selecting as his subject "The Internal Traffic of London." The particular question he proposed to consider was, he said, that of the means of communication of London's inhabitants with each other by means of its streets and thoroughfares. This he took to be one of the pressing matters of the present time, not only in respect of the existing state of things, but still more in view of the future requirements of our ever-growing population; and if he could bring forward sufficient information and such a view of the questions involved as to induce some systematic consideration of that great subject he should feel his labour had not been thrown away. The first part of the paper was devoted to a discussion of the factors which have led to the enormous expansion of the traffic in London streets during the last thirty or forty years, and some interesting figures were produced showing the increase in the means of bringing traffic from the extremities to the central parts, and the movements of population to which, with other causes, their development is due. No one who had lived in London could, he said, doubt that the pressure on the streets was getting yearly heavier and heavier and becoming more and more unmanageable. Considering the new streets and widenings of streets effected in the last fifty years or so with the view of facilitating the constantly-growing streams of traffic, he remarked on the smallness of the mileage and capital expended as compared with the outlays of railway and tramway companies.

LONDON STREET IMPROVEMENTS.

In the matter of street improvements in London one could not but notice an almost entire absence of grasp of a large subject, and in the history of the past forty years we looked in vain for any new arterial thoroughfares traversing inner London from end to end and proportioned in width to the demands upon them at different parts of their route. On the contrary, we found in the new streets, as in the old, that the nearer they were to the heaviest of the traffic the narrower they were in absolute dimensions. Cheapside, Fleet-street, Piccadilly, the Strand, Marylebone and Euston roads remained very much as they were fifty years ago, when the traffic was a mere fraction of what it is now. He desired to speak with all respect of those who executed the idea of Regent-street, for Nash's wide Waterloo-place and Regent-street, with its circuits at Piccadilly and Oxford-street, was a work conceived in a large-minded way. But most at least of modern street improvements seemed piecemeal and patchwork enterprises, narrowed to the smallest dimensions that would pass muster, and without any but the most meagre provision for the future, or, except in the case of Regent-street, the slightest attempt at systematic artistic treatment. In fact, there had been and was now a hitherto incredible *petitesse* in dealing with such matters in London which was in great contrast to what we saw in foreign cities of far less importance and wealth. It was to be carefully borne in mind that the want of accommodation for traffic in London streets was not merely a question of grumbling from those that suffered from it, but involved many other considerations, such as loss of money in the delays to men of business, loss of time to vehicles and horses, the practical impossibility of introducing cheaper and more expeditious means of transit, like electric trams, and the great want of free circulation of air. His plea was that to meet the traffic of London it was not so much additional railways, underground or overground, traversing the town and connected with the suburbs that were wanted as wide arterial improvements of the streets themselves. Strictly urban railways, or rather trains that only traversed the town itself, though carrying immense numbers of passengers, had not dealt with the question and would not produce the desired result of relieving the streets; on the contrary, they tended to add to the congestion from the point of view of both urban movement and suburban influx.

SIR JOHN WOLFE BARRY'S SCHEME.

In his judgment street improvements in London should be considered as a whole and in a large-minded way, unless we were to be doomed to perpetual disappointment. A scheme of new main thoroughfares of adequate width for present and future traffic should be laid down and realised as time and finance permitted. There should be continuity of effort towards radical amelioration by the construction of great main lines of through communication as distinguished from merely local improvements, and all local improvements, as was the case in Paris and other foreign cities, should be devised so as to form parts of a harmonious whole. Apart from wide streets, a matter which had been too much lost sight of was the provision of means for allowing the north and south traffic to cross the east and west traffic with the least possible confusion. If some means could be devised for the crossing of north and south traffic over or under that going east and west at places like Hyde Park-corner, Piccadilly-circus, Ludgate-hill and Wellington-street, the relief to the main

thoroughfares at those points would be enormous. The results would be well worth the expenditure, heavy though it might be, and, having given some consideration to the subject at the points above mentioned, he could say there was nothing impracticable in the suggestion. After a few words on the thoroughfares of the south sides of the Thames, the speaker referred to what he recognised as of more importance and urgency—viz., the north bank and the three main lines of east and west communication. The Euston-road (with Præd-street and Chapel-street at the west and the Pentonville and City roads at the east), Oxford-street (including Uxbridge-road, Holborn and Cheapside), and the Strand (including Fleet-street, Ludgate-hill and Cannon-street) were all almost ludicrously inadequate. In the case of the Euston-road route, where shortcomings were the least glaring, the necessary widenings and improvements would involve less serious consequences than in the other thoroughfares. The Oxford-street route, with the exception of some narrow places near Notting Hill-gate station and the confused crossing at the Marble Arch, was fairly adequate as far east as Edgware-road, but from that point a radical improvement, either by means of important widenings or by a new street, was wanted, and should be carried through the City so as to connect at its eastern end with the Mile End-road. In the case of the Strand, Fleet-street and Piccadilly, it seemed to him that the only course was a systematic widening of all three thoroughfares, with a broad diagonal street from Piccadilly-circus, via Coventry-street, to join the widened Strand near Wellington-street. Another want that was beginning to be pressing was a route for bicycle traffic. One could not but recognise what an advantage it would be to the bulk of Londoners if they could travel safely at perhaps 5 miles or 10 miles an hour to and from their work. He did not suppose the present price of bicycles would last very long, and it did not seem to sanguine to expect that a few years hence they would be sold at about one-fourth their present price. When this took place were Londoners to be debarred from their use because the streets were so crowded with vehicular traffic as to be too dangerous for bicycles? That would seem hereafter to be as absurd a proposition as that foot passengers ought not now to be accommodated in the streets because of the requirements of vehicular traffic. If these views of future requirements were correct, he thought they wanted one new and spacious thoroughfare east and west, about 120 ft. wide—as wide, that was, as Whitehall opposite the Horse Guards. It might leave the Bayswater-road near Westbourne-terrace, follow the line of Wigmore-street to Russell-square behind the British Museum, and thence run to near Bread-street station. In addition, there should be two or three thoroughfares north and south, slightly less in width, which should be carried over the east and west route by bridges at the points of intersection; and all these new routes should have a raised or sunken road for bicycles, so that they should not mix either with vehicular or pedestrian traffic. The cost of such a work doubtless presented rather an alarming prospect, for a street 120 ft. wide and 4 or 5 miles long must mean many millions of money, though the recompense from the new frontages would be very important. Such, however, was the kind of undertaking required for London of the future.

WAYS AND MEANS.

In conclusion, he said he feared that in the street improvements he had sketched he would be thought to hold extravagant and Utopian views, but when he contemplated the vast sums spent by railway and public companies to bring traffic to London, and realised what had been done by Continental nations to improve their means of transit in their capitals and to embellish them, he could not see that Londoners should consider the cost of such measures in the metropolis of the kingdom (might he not say of the Greater Britain?) as prohibitory. The heavy expenditure should not frighten us, for it would be repaid by the increased facilities both for trade and pleasure. He could not but think that the relief of the present congestion of our streets by a well-considered enlargement of the arteries of London was a subject which must commend itself as of primary importance to the whole city—nay, more, to the whole nation. It was worthy of the fullest consideration by those who would devote themselves to the peddling treatment, but to such a large-minded plan of a remodelled town as was made by Wren in respect of the City of London after the great fire, and as had been so successfully carried out in Paris, where he supposed the cost of land and construction differed but little from similar values in London.

Redditch.—A Board of Trade inquiry was recently held by Lord Jersey and Colonel Boughby with respect to the proposed light railway for Redditch and District. Mr. Pritchett is the engineer of the scheme, which is estimated to cost £15,500. It is opposed by the district council on the ground that one of the streets through which the line would pass is but 16 ft. 10 in. wide at one point.

The Sanitary Institute.

THE SEVENTEENTH ANNUAL CONGRESS.—IX.

WATER SUPPLY.

In addition to several incidental references to the important question of water supply, four valuable papers, which dealt exclusively with one phase or other of the subject were read at the recent Sanitary Institute congress at Birmingham. We refer first to the contribution of Dr. J. SPOTTISWOODE CAMERON, medical officer of health for Leeds, on

THE PURCHASE OF THE CATCHMENT AREA AS A MEANS OF PROTECTING THE SOURCES OF A PUBLIC WATER SUPPLY.

In the opening of his paper Dr. CAMERON remarked that the duty of cleansing wells, the honour given to well-borers, the many lawsuits on account of the diversion of springs, all testified to the importance the community had always, in all countries, attached to the sufficiency and, so far as their knowledge went, to the purity of common water supplies. The impounding of river and surface waters, their storage in reservoirs and tanks—interfering, as it so frequently did, with private rights—was in this country almost impossible on any large scale except by the exercise of special powers only to be obtained by Act of Parliament. While public health law had conferred upon sanitary authorities the right to provide their district, or part of it, with a proper water supply by constructing waterworks, digging wells, leasing or hiring waterworks, or by contracting with other persons for a supply, the rights of private owners so continually interfered with the carrying out of such powers that it was usually necessary to obtain the sanction of Parliament for the construction of any important works. The writer then continued:—

WATERWORKS CLAUSES ACT, 1847.

All waterworks undertakers, whether sanitary authorities or others, are required by statute law to conform to certain conditions, and they have, on the other hand, certain powers of protecting the water supply given to them. The Waterworks Clauses Act of 1847 contains the more important of these powers. These clauses, it will be remembered, were the consolidation into an Act of provisions which it had been usual before that time to insert in private Acts. Certain of these clauses (18 to 27), restrictive in their nature and applicable to mines, are incorporated, with modifications, by the Public Health Act, 1875, Support of Sewers (Amendment Act), 1883, into the sanitary Acts incumbent upon all authorities. Other clauses of the 1847 Act require that the undertakers, whether a waterworks company or a sanitary authority, shall keep and provide in their pipes pure and wholesome water sufficient for the domestic use of all the inhabitants of the town or district within the limits of the special Act. But this section (35), while requiring them to keep this pure water in their pipes, does not confer any special powers for so doing. The sections of this 1847 Act, referring to protection of water, deal (54) with the providing of cisterns and cocks, enact penalties (55) on persons allowing such apparatus to get out of repair, give rights of repair and observation in regard to the structures, and protect the undertakers against waste.

More cognate, however, to the subject of this paper is sec. 61, which makes it penal for anyone (1) to bathe, or wash or throw an animal into a stream, reservoir, aqueduct or other works belonging to the undertakers; (2) to throw any rubbish into or do any kind of washing in such stream, &c.; (3) cause the water of any sink, sewer or drain, steam engine, boiler or other filthy water belonging to him or under his control to run or be brought into any stream, &c.; or do any other act whereby the water of the undertakers shall be fouled. The penalty for any offence against this section is limited to £5, but there is a recurring penalty of 20s. a day should the last-mentioned offence be continued. There are also other sections relating to protection against effluents from gasworks, which I need not remind you of.*

It is therefore principally sec. 61 of the 1847 Act that has to be relied upon by a waterworks authority as a means of protection against the fouling of the sources of supply. There are, it is true, certain powers in the Rivers Pollution Prevention Act, 1876, dealing specially with sewage pollutions and mining or manufacturing effluents. But this Act is hampered with such restrictions as to make it extremely difficult to administer against an old offender. With the exception of the ordinary public health powers for the abatement of nuisances, these are the essential powers possessed by water authorities for the protection of their supply, and the question naturally arises, Are they sufficient?

While sec. 61 practically prohibits personal bathing or washing of an animal, the washing of clothes, or skins, &c., or the throwing of dirt into a "watercourse," it does not say exactly what a watercourse is. In many of our inland districts a fairly pure water is collected from large areas of moor

*The further Act of 1863, dealing principally with the security of reservoirs, enabled the undertakers to cut off water supply where injury had been done and increased the strength of the law in regard to waste or the fouling through the pipes, but practically left the powers of protection much as in the Waterworks Clauses Act of 1847.

and pasture land. The whole surface of the hills sloping to its river basin is really part of the water catchment, but only certain habitual courses of water could be called streams. These hills are often steep, and practically anything put upon the land is liable to be carried down by the rain to the water-courses. The average farmer cannot be made to understand that the heap of manure from his stable, midden or byre, the liquid from which is allowed to trickle over his land, can be in any way objected to by a water authority; and yet he generally selects for the site of his manure heap, if not the actual bank of the stream, some steeply sloping ground, which would in heavy rain contribute surface water to the neighbouring runnels.

WHAT CONSTITUTES INFRINGEMENT?

The question then arises, Does he in any way infringe this section? He does not throw this rubbish into the stream, or reservoir or aqueduct. The rain which passes over the ground, carrying with it some of the filth, is not, he would contend, exactly filthy water belonging to him or under his control which he can be said to cause to run or be brought into the stream. He does not intentionally make a channel from his manure heap to the watercourse. On the other hand, in a sort of half-hearted way he will dig grips across the course of this liquid to keep it longer upon the land; and having done this he will consider that he has done all that can be required of him under the section.

The convenience attached to his horse is generally placed in the garden, a little away from the dwelling, but not infrequently it is on some high bank, the surface water from which gravitates towards the stream; but this place, he will tell you, has been so situated within the memory of man and he does not see how anybody can reasonably object to it. A wayside inn receiving travellers and fishermen, who are not always necessarily exempt from infective disease, has a convenience of the kind mentioned at the back, and the night-soil has to be removed from the immediate neighbourhood of the trout stream. The person who removes it is not as careful of it as if it were refined gold, and if a little escapes from his wheelbarrow as he takes it away he will regard such an accident as of trifling consequence. But possibly, with the march of civilisation and increasing visits of fishermen, the landlord places a water-closet for the convenience of his customers in an upper storey, and conducts the pipes into the drain or the cesspool bordering upon the stream.

His cesspool is not supposed to have an overflow, and is supposed to be emptied on to the land at some distance from the stream; but what guarantee has the water consumer that such is really the case. Such conditions as I have described are not imaginary, but are drawn from fact. What power has the waterworks authority, say the corporation of a neighbouring town, under the section to get rid of this nuisance. If they catch the man emptying his filth into the river they can go to the rural magistrates and ask to have him fined £5. If they find that he has made a distinct channel from his house to convey the slops to the stream they can do the same. In one instance, in the house attached to an almost disused flour mill, after remonstrance from the authority, the drain from a slop-sink at the front had been cut off from the stream, but it was afterwards found that a small gutter at the back had evidently been utilised instead for the conveyance of slops into the mill-lead, and thence of course into the stream. But who is to watch the family in this house, to see that they send no foul liquids into the back?

The authority have, I take it, no power to seal up these apertures and to say "Not only shall you not use them, but we shall take them away." A conviction could, of course, only be obtained against an offender by proving the actual commission of the offence. But the object of sanitary science surely is the prevention rather than the removal of nuisances; and I suggest that a water authority ought to have powers of entering upon premises and making alterations of such premises, at their own expense, of such a character as shall make it easier for the occupiers to use them in a cleanly than in a dirty manner.

It is not to be expected that a farmer living on the side of a stream which has been impounded for waterworks purposes should himself go the expense of rearranging the position of his midden, or of his stable, or of making a small sewage farm for the slops from his house, and carrying such slops carefully over land, so that they may be purified before reaching the stream, and of doing this, moreover, in such a way that a heavy rainfall shall not carry any of the unpurified effluent directly into the water catchment.

The expenditure of money for such purposes is evidently one for the water consumer who comes into the valley and takes the water. I say advisedly that the farmer does not intentionally foul the water, and that in many cases it would be difficult to convict him of so doing. *A fortiori*, it would be impossible to make him provide such necessary works that the lines of least resistance should be on the side of purity.

CONTROL OF CATCHMENT AREAS.

Many towns have experienced these difficulties, and the

increasing stress laid by health officers and engineers upon the importance of having the supply of a large town not only pure, but above suspicion, has driven many towns to seek to obtain not merely the right of catching comparatively poor water as it flows, but by acquiring the rights of a landlord to be able to make such structural alterations as may be necessary on the various farmsteads within their catchment area. Manchester, I believe, claims to be one of the first towns to have acquired the freehold of the catchment area of a new waterworks. I am told that they have done this around Thirlmero. They have also, I believe, acquired a strip of land along their Longendale areas. Birmingham, I understand, has acquired the absolute ownership of the basin feeding the Elan and Claerwen, and Liverpool has also acquired the ownership of such of the land as is not common land carrying the water to their reservoir at Vyrnwy.

Leeds, in the 1896-97 session of Parliament, applied for compulsory powers of purchase of a large portion of their catchment area in the Washburn Valley. The circumstances were a little unusual and may warrant a word or two about them. The Waterworks Committee had been aware for some time that there had been certain undesirable conditions in the farmsteads in the valley, and had made various endeavours, in the first instance through the local authorities and afterwards through the West Riding Rivers Board, to bring pressure to bear upon the various occupiers of these places to prevent possible pollution. In a great many cases by mutual consent a rearrangement of structure was made at the expense of the Leeds Corporation, but a few of the dangers were of such a nature that it was difficult to see how they could be averted without somewhat expensive alterations.

One of the worst of the cases was carefully gone into with a view of considering whether legal action should be taken under existing powers, and we were advised that it would be difficult to get a conviction before rural justices on such evidence as it was possible to furnish. About this time it was thought desirable to build some further reservoirs higher up the valley, and the waterworks engineer suggested that in going to Parliament for this purpose we should acquire the land necessary for the reservoirs and the ground feeding them, and at the same time that we should acquire compulsory powers of purchase of a wide margin along the side of all our streams tributary to the existing reservoirs.

The Act was prepared, but before it went through its final stages it was thought desirable to postpone the erection of these reservoirs and works, but the committee were unwilling to forego the occasion of seeking for powers of compulsory purchase of land; and I am told that the Leeds Act of 1897 has established a precedent, as it is the first Act in which compulsory powers of purchase of land for the protection of waterworks has been given apart from the construction of works. If this is so, it will probably make it easier in future for corporations having existing reservoirs to go to Parliament and ask for power to purchase the land around these reservoirs merely for the purpose of protecting the purity of their supply, and although they are not intending to erect upon them reservoirs or other structural works. It is, of course, evident that the owner of the land can insist upon his tenant conforming to such regulations for the protection of water as he may choose to make. If the tenant refuses he gets notice to quit. The advantages are so obvious that I need not detain the section by enlarging upon them.

DISCUSSION.

Mr. WM. WHITAKER (Croydon) could only find one fault with the paper—it viewed the subject from a Northern aspect. What would be easy to do in the North might be difficult in the South. In the North they had large populations, great wealth, and cheap land in the moorland districts. In the South they found large towns with well supplies. The land was very often valued as agricultural land, and consequently more expensive. On the other hand, they could perhaps deal with sewage more advantageously than in the North. He was dealing with the supply of a large town, which was fairly wealthy, and had a catchment area of pasture land, more or less, with occasional habitations. It would be impossible to buy the land; how could they protect it? He agreed with Dr. Cameron's suggestion that a water authority should have powers of entering upon premises and altering them. In Croydon they had made arrangements to take into their own sewerage system the sewage of other places. Each county must take its own line, without reference to a central authority, which, as a general rule, he thought should only come in when the councils failed to do their duty. This, he considered, they were not inclined to do. It would be good if the Local Government Board could be made to prevent damage to water supplies rather than to prevent water supplies doing damage.

The Rev. Dr. Cox (chairman of the Brixworth District Council) said Northampton, which had two-thirds of its catchment area in the Brixworth district, was anxious to get the latter authority to put their powers in action, and they found on farmer's premises defects which were not sufficiently grave to need taking into account if they had not been on a catchment area. The farmers felt that complaints would not have been made if the Northampton reservoir had not been there. He hoped Northampton would see their way to purchase the catchment area, and so to relieve the rural district council of their responsibility.

Mr. HENMAN having added a few remarks, Dr. CAMERON, in reply, said that he did not consider the question of the cost of land entered so much into account as Mr. Whitaker seemed to think. A corporation could borrow at some 2 per cent., and, as the land purchased did not lose its value after purchase, no loss need be made.

THE WATER SUPPLY OF RURAL DISTRICTS.

In his paper on some sanitary defects in rural districts Mr. G. H. SMITH, New Malden, Surrey, gave some space to the above subject, as follows:—

In the reports of the medical inspectors of the Local Government Board one of the most frequent matters complained of in rural districts is the water supply; and yet how terribly slow are the local authorities in taking action. The usual sources of dietic water in the country are three in number—viz., shallow wells, the rivers and the ponds. The shallow wells are perhaps the largest source of supply. They are usually sunk in the garden attached to the house, often without stoning, seldom provided with protection from surface pollution, and rarely cleaned out. The cesspool is generally in the same plot of land, and not unfrequently geologically above the well and within 50 ft. of it, and, of course, not watertight; in fact, the chief advantage of a cesspool in the eyes of a villager is that it seldom requires emptying. The dangers here are obvious to all of you, especially when dry seasons occur, when the action of the pump, where there is one, tends to draw in the soakage from the cesspool.

The rivers as they pass through the villages generally receive the drainage, directly or indirectly, from some houses, as well as the surface washings from the roads and cultivated lands; where they run through pastures the cattle are often to be found standing in them, and in the case of small streams dipping ponds for sheep-washing are frequently connected across them; yet, polluted as they are, they provide the sole source of potable water for many houses. Ponds are open to the same polluting sources as the rivers, and with more serious effects, there being no self-purifying action taking place with them, as is the case with rivers; the water is stagnant and affords a good breeding place for frogs and other reptiles.

These defects admit of only one remedy—proper supply of pure water from waterworks wherever the houses are sufficiently close together to render it possible, and in other cases deep wells ought to be sunk and carefully guarded against pollution. The question of cost has here to be faced. The Public Health Act, 1875, sec. 62, will not allow the water rate to exceed 2d. per week, and this limit raises great difficulties; but it would appear that the limit might well be raised to 3d., without causing any hardship, and then much could be done, as Mr. R. E. Middleton has shown in a paper read before the Surveyors' Institution in 1895. What is really wanted is a water supply judiciously designed, simple and inexpensive in working, providing about 10 or 12 gallons per head per day. We do not want in country districts a water supply for fire-extinguishing purposes; the present sources can do for that. Another difficulty, which is being increasingly felt, is the present arrangement of parishes and districts in curious interwoven boundaries. A rearrangement is needed on the lines of the natural watersheds. If such boundaries were adopted water supplies would be greatly facilitated and the pollution of rivers more easily prevented.

Rural authorities are proverbially slow in carrying out sanitary improvements, and it would appear desirable for the Local Government Board to have power to compel a district council to construct waterworks forthwith, after due public inquiry, on the complaint of their medical inspector.

RECENT PROGRESS IN THE METHODS OF WATER ANALYSIS.

In the Physics, Chemistry and Biology section a paper on the above subject was read by Mr. CLARENCE A. SEYLER, B.Sc., F.I.C., who classified the objects of hygienic water analysis under three heads: (1) To determine the general suitability of a new supply for drinking and domestic purposes; (2) to control the purity of a supply by periodic examination; (3) to determine the condition of a polluted water (effluent) and its suitability for discharge into a stream or river. A purely chemical side existed to the first of these problems in the action of water upon the metals used for storing it. The author, while admitting that apart from this the biological aspect was fundamentally the most important one in all these questions, drew attention to the failure of direct bacteriological methods to realise the exaggerated expectations formed of them. The enumeration of organisms he considered valueless in ground waters without a previous sterilisation of the well, which was usually impossible; while in surface waters it rarely afforded any fresh information. The actual detection of pathogenic organisms in polluted waters he regarded as a practically unsolved problem, and the importance attributed to the so-called *lacoccus coli communis*, much exaggerated. The true place of the method was in the control of artificial filtration, but all such methods were open to the objection that their results were only known after the mischief was irremediable. For the control of the condition of surface waters he recommended the determination of the colour by Tidy's or Lovibond's colorimeter, coupled with the use of Dübini's microfilter. In the case of ground waters the author considered that chemical methods were alone avail-

able, and discussed the basis on which the interpretation of the chemical results was founded.

METHODS OF WATER ANALYSIS.

The standard methods of water analysis were mostly of long standing, and had undergone little real improvement in recent times. These methods, though not ideal, served their purpose well enough. But the imperfections and difficulties in the processes for the determination of the dissolved oxygen and carbonic acid had delayed the recognition of the importance of these determinations. It was in respect to these two substances that recent progress in the methods of water analysis has been most marked. The gasometric methods, though now very satisfactory, were too laborious, and had the disadvantage of giving only the total carbonic acid, and not its various forms. Pettenkofer's well-known method for carbonic acid was open to the same objection, and was deficient in accuracy. The volumetric methods, for dissolved oxygen, such as Schutzenberger's, required very complicated apparatus, and as usually carried out were infected by an error due to diffusion which rendered the results nearly valueless. Recently, Thresh had proposed a method in which nitric oxide acted as an oxygen-carrier and liberated an equivalent of iodine, which could then be titrated. That method gave excellent results, but required an atmosphere of hydrogen or coal-gas, and was still somewhat complicated. The method which he strongly recommended was that of Ludwig Winkley (described by him in *The Chemical News* in 1894). In that method recently precipitated manganese hydrate acted as the carrier of oxygen, and the equivalent iodine was liberated and titrated as in Thresh's method. It was very accurate and of marvellous simplicity. No neutral atmosphere or special apparatus of any kind was necessary, and it could be carried out upon the spot if required. Among the results obtained by the use of this method was the fact that water can be supersaturated with oxygen and remain so. This fact had been proved by himself and Gill independently by saturating the water at a low temperature and raising its temperature, when the water remained supersaturated. He had also proved that if saturated under pressure the water remained largely supersaturated upon removal. He had found this condition of supersaturation not at all uncommon in surface waters. The oxygen available for bacteriolysis was not, therefore, limited to the solubility of the gas at the actual temperature of the water, and the degree of aeration must strictly be referred, not to the temperature, but to the ratio of oxygen to the dissolved nitrogen.

DETERMINATION OF CARBONIC ACID.

With regard to the carbonic acid, it had long been known that the fixed carbonates in water could be simply titrated with standard acids, and the use of methyl orange as an indicator had vastly simplified this process. Since Trillich, in 1890, showed that free carbonic acid could be accurately titrated by the use of standard sodium hydrate or carbonate with phenolphthalein as indicator a great advance had been possible. It had hitherto been doubted or disputed that natural waters contain calcium carbonate dissolved as bicarbonate. The use of Trillich's method, however, showed him that ground waters constantly contained an excess of carbonic acid over that required to form bicarbonates, and that the total carbonic acid in such cases was divisible into three parts: the free portion, which was acid to phenolphthalein, the fixed, which was combined with the lime, the remainder, which had no effect upon the indicator. By experiments upon artificial and natural water he showed, in 1894, that this remaining carbonic acid was equal to the fixed portion, and that the water therefore behaved analytically, exactly as though containing its lime and magnesia as bicarbonate. This assumption led to correct results for the total carbonic acid, and this was also proved simultaneously in Germany by Kippenberger. This was a very strong argument for the existence of calcium bicarbonate, a question which he was at present further investigating. In the case of potable waters, therefore, he might claim that the question of determining the carbonic acid in all its forms was now solved in a very simple and expeditious manner. He had found it of great value in characterising a ground water and showing the condition of surface waters, and also in investigating the action upon lead, iron and zinc. Recent experiments also enabled him to state that he had tested the methods upon waters deficient in carbonic acid, and therefore alkaline to phenolphthalein, such as sea and estuary waters, and found it gave accurate results. Dittmar, in the *Challenger* reports, strongly urged the search for such a method, which he predicted would have valuable results if systematically applied. He (the author) was at present engaged upon the applicability of the method to sewage and highly polluted effluents, in which case he feared that the presence of ammonia and organic acids, such as butyric acid, would interfere. He had succeeded in completely eliminating the effect of the butyrates, but in strong sewage the ammonia had, unfortunately, proved to interfere seriously. In dilutions such as are necessary to study the process of bacteriolysis in polluted waters he had, however, obtained very good results; and in any case, combined with Dittmar's so-called "vacuum process" he had found a method which he believed fully answered, in a simple way, the exigencies of the problem both as to accuracy and simplicity. The details of these inquiries he would leave for another occasion.

The PRESIDENT (Dr. G. Sims Woodhead), in the course of

the discussion that followed disagreed with the opinion expressed by Mr. Seyler, claiming that a bacteriological examination was very valuable.

WATER ANALYSIS.

In the same section Dr. SIDNEY BARWISE, M.D., D.P.H., read a paper, entitled "The Interpretation of Results of Water Analysis," in the course of which he said that he read it as a protest against the too-frequent practice of some analysts giving definite reports upon the suitability of samples of water for drinking water merely upon the results of single chemical analysis; and he wished to submit that it would be a much better practice for analysts to submit the results of their analyses, to be interpreted by some person who had a thorough knowledge of the pedigree of the water in question, derived from a careful inspection of its source. In the discussion which followed the importance of both biological and bacteriological analysis was laid down, and special stress was laid upon the importance of the samples being properly taken. Hearty votes of thanks were accorded to the readers of the papers.

One of the most interesting contributions to the proceedings of the congress was Mr. Mansergh's able paper on the Birmingham water scheme. This paper, which was illustrated by lantern views, will be given in our next issue, with illustrations.

ARBITRATIONS AND AWARDS.

At the Midland Hotel, Bradford, on the 5th inst., Mr. R. B. Brosser, Keighley, sat as arbitrator in a case in which Mr. Elias Heaton, dentist, Manningham-lane, Bradford, sought damages against the Ilkley Urban District Council for the construction of a sewer through his land at Ben Rhydding. Mr. J. J. Wright appeared for the plaintiff and Mr. Compton for the council. Witnesses for the plaintiff put the damages at £760. Mr. Charles Gatt, Mr. Armistead and Mr. Rhodes Calvert supported this view. For the council, Mr. John Wangh, Mr. W. B. Woodhead and Mr. Prest estimated the damage at £39.

The Southampton Corporation received, at their last meeting, the award of Mr. Gutteridge, architect of that borough, the arbitrator in reference to Tudor House, St. Michael's-square, which was compulsorily acquired in connection with a working classes housing scheme. The owners' claim was for over £300, and the sum awarded was £120.

A series of important arbitration cases was heard at Exeter last week. There were some nine cases dealt with under the recent Torquay Water Act, which gave the corporation power to acquire the whole of the watershed of their water supply, covering some 2,300 acres and seven farms. About one-fifth of this area has already been purchased by private agreement, but several owners have declined to treat in this manner. Hence arbitration became necessary. Mr. A. S. Rendell, of Newton Abbot, was the arbitrator on behalf of the Torquay Corporation in all the cases, and Messrs. A. C. Loveys, of Moreton, and Ellis and Drew, of Exeter, were the arbitrators for the respective vendors. Mr. Squire, land agent, was the agreed umpire, and Mr. Balfour Brown, Q.C., was retained on behalf of the corporation, whilst Mr. H. E. Duke represented the other side. About half the watershed was affected by these cases, and the total sum allowed under the Act for the purchase of the properties and laying-out the land was £40,000. Of this only about one-sixth has been so far expended. The witnesses included, for the claimants, Messrs. A. E. Ellis, F.S.I., Exeter; J. Bowerman, timber merchant, Bridgewater; Arthur C. Loveys, F.S.I., Moreton-hampstead; J. Bellamy, consulting water engineer to the Plymouth Corporation; E. Osmond, sen., land surveyor; and for the Torquay Corporation, A. S. Rendell, F.S.I.; Arthur Boddy, A.R.I.B.A., Plymouth; E. J. Sawdys, surveyor, Ashburton; J. Ingham, water engineer to the Torquay Corporation; and Mr. H. Hoskings.

SEWAGE DEPOSIT AS MANURE.

The following letter has been addressed by Mr. J. Garrett, J.P., to *The Yorkshire Post* in reference to the above subject:—
I have read with much interest the able articles on agriculture which appear weekly in *The Yorkshire Post*. I have been carrying out an experiment, for the last two or three years, which, I think, is worth recording. I have a quantity of rich grass land adjoining the Diley sewage works, and have made use of the deposit from the sewage works on this land with remarkable results. This year I mowed about 10 acres in June, a very heavy crop. At the end of September I again mowed the fog, a very good crop; and I have now a third very nice crop of fog. The result of my experiments has been to give such a demand for the sewage deposit that what a few years ago appeared to be likely to be a difficulty as to its removal is now readily disposed of, and many applicants for it. I am quite satisfied if the sewage deposit from our town could be easily removed and used on much of the poor land on the north side of the Wharfe the produce would be vastly increased. I strongly recommend any parties who have access to sewage systems to try the experiment.

CORRESPONDENCE.

Gas Traction for Tramways: An Experiment at Neath.

—Mr. D. M. Jenkins, A.M.I.C.E., borough surveyor, Neath, writes: With reference to your comments upon gas traction as applied to tramways, it may be of interest to some of your readers to know that the Neath Corporation have adopted this system on their tramways, and have, with the approval of the Board of Trade, leased the lines for a period of seven years to the British Gas Traction Company. The tramways have been recently reconstructed, and the necessary preparations are being made for commencing the working of the new system at an early date. The decision to discontinue horse traction and to adopt the gas system was arrived at after very careful consideration of the merits of the various mechanical systems and of horse traction in relation to the particular conditions involved. The length of route to be worked is about 4 miles; the gradients (excepting a short length of 1 in 22) and curves are easy, and the traffic variable during the day and week, not requiring a very frequent service of cars. These conditions suggested a self-contained in preference to a central power system, and the only form that has been successfully applied in this country being the gas system, this was adopted after an inspection of the installation at Blackpool and a comparison of first costs and working expenses. Further factors in the consideration of the matter were that the gasworks are owned by the corporation, that coal gas is certain to remain the illuminant for the town for many years to come, and that the supply required for traction purposes will be for the most part a day load, and will not involve a material increase of plant in manufacture. Many of the smaller towns in this country are, doubtless, very similarly situated, as to local conditions, to Neath; and for tramways in such towns I believe the compressed gas system to be the cheapest and best at present available. Under certain conditions, combining heavy gradients and a heavy and continuous traffic, no doubt the cable system is to be preferred to any other; but the present position of electric traction, it appears to me, is not such as to encourage its adoption except in special cases. The difficulties and objections that have been recently pointed out, the improvements suggested by Prof. Silvanus Thompson and others, the great diversity of expert opinion upon details, and the special works of construction involved, all these considerations suggest great caution in adopting electric traction at present. Having regard also to the heavy capital expenditure entailed upon plant and details of construction generally which may be out of date in a few years' time, some of the larger towns may do well to adopt a self-contained system which will not commit them for an unlimited time, which will not prevent their adopting electrical traction when a system or method with some measure of finality has been evolved, and which will not involve a heavy initial expenditure and cost of working. That electric traction is the system of the future for large towns, except in cases specially suitable for cable traction, I have no doubt, but that it has not yet realised expectations as to efficiency and cost of working is abundantly clear. Referring to the objections in detail to the gas system, stated in THE SCAVENOR of the 11th inst., I think that these have been fairly replied to by the British Gas Traction Company. I had an opportunity of inspecting the working of their system in September, 1896, and then formed the opinion that the odour (which was perceptible, though faint) and vibration, urged as objections to the system, were matters of detail that were not difficult of remedy. I have since seen a model of the improved motor car made for the firm to be placed on the Neath tramways, and having received independent information of the results I do not think the objections can now be sustained. As to the inability of a motor car to take a particular gradient, this surely, if there were no other explanation of the matter, is merely a matter of engine power and cannot be maintained as an objection to the system.

Professional Etiquette.—"An Expert Witness" writes: It is to be regretted that the old-world etiquette among professional men is slowly but surely dying out in these days of furious competition. The boundaries of the professions of architect, surveyor, and estate agent, nay, even the lawyer, are so poached upon in the race for self-advancement that the honourable rules and customs of many of the professional societies are perforce secretly ignored, and with the result that confidence in professional men is often talked of as a thing of the past. That this canker is entering into municipal life is very evident, and is doubtless tending to the destruction of that *esprit de corps* so necessary for carrying into effect the local government legislation of the country. To quote cases, Mr. Editor, would be to invite lawsuits innumerable; yet, suffice it to say that salaried officials are daily selling their birthrights, the knowledge of the intricacies and difficulties of their calling, yea, and even the severest criticism of works other than their own that they are able to propound, and all for a very thin veneer of gold. Men of high standing consider it compatible with their duties to play into the hands of wealthy gas and water companies, to the detriment of near-neighbouring authorities, whilst others have supported that enemy of sanitation, the jerry-builder, to the extent, in one instance that has come to my knowledge, of presenting a

written report, uninvited, to a local authority to the effect that their professional adviser's opinion was incorrect, doubtless with the sole object of starting a prosecution. Truly, money works wonders! Actions of this character do not add lustre to officialdom; whilst more than one authority, in consequence of this questionable form of neighbourliness, has found itself in a deadlock, and the health of the district under its charge seriously endangered. We are told there is a code of honour among thieves, and it is in the hope, Mr. Editor, with your kind assistance, of waking up one or other of the societies formed with the object of advancing the interests of local government to the unkind, not to say unfair, actions of their members that I have been induced to draw attention to acts that would appear to be unworthy the prestige of even the marauders above referred to.

THE BROOK HOSPITAL.

REPORT OF THE LOCAL GOVERNMENT BOARD INSPECTOR.

At a meeting of the Metropolitan Asylums Board on Saturday a letter was read from the Local Government Board enclosing a copy of the report of Mr. W. E. Knollys on the recent inquiry held by him, on behalf of the board, with reference to the Brook Hospital. In this it was stated that of the excess of £50,100 the managers, upon representations made to them, had assented to an expenditure of rather over £29,000, and it might be held that that expenditure, although not included in the original contracts, was practically necessary in connection with the erection of the hospital. There was a further expenditure in different items of somewhat £4,000 incurred with the consent, or, at any rate, with the knowledge of the Hospital Committee, but there remained an expenditure of at least £25,000, which was incurred on the architect's own responsibility without any consent or knowledge on the part of the managers or the Hospital Committee. This amount included the sum of £14,000 in connection with extra foundations, which were found to be necessary. He (the inspector) had been struck in the course of the inquiry by the view that seemed to be taken of the helplessness of public bodies to control expenditure. The continuing expenditure of public money, amounting, as in this case, to very large sums, must clearly not be left in the hands of a single individual. It was evident that the expenditure of the ratepayers' money had been considerably in excess of what would have been requisite if further time could have been given to the choice of a site; and that farther excess had been caused by the architect exercising his own discretion in his wish to provide a hospital in every respect the best obtainable, as he supposed, instead of one in accordance, as far as possible, with the contracts entered into by the managers.

The Local Government Board, commenting on this report in their letter, said it was admitted that Mr. Aldwinckle, the architect employed by the managers in connection with the hospital, under-estimated the cost of the building, &c., to a serious extent; that works which should have been included in the contracts were omitted; that as regarded foundations and the substitution of fireproof floors for others his reports were most misleading; and that he authorised deviations from and additions to the works specified in the contracts, involving a large expense, on his own responsibility and without any authority whatever from the Hospital Committee or the Board of Managers. The Board had not failed to consider the explanation offered by Mr. Aldwinckle, but they could not regard his proceedings as deserving of grave reprobation, and, in the opinion of the Board, he altogether failed to realise what was due to the committee of the hospital, and also to the managers, as the architect appointed by them. In their opinion there was not such supervision of the works by the committee as was desirable, while, with respect to the managers, they considered that the practice of drawing cheques for the amounts included in the certificates of the architect without any information being furnished to them by the architect or the Hospital Committee as to the works, &c., for which the certificates were given was open to serious objection.

The CHAIRMAN moved a resolution referring the letter and accompanying report to the Brook Hospital Committee, with instructions to consider and to report to the managers on the points dealt with in the letter—namely, the supervision of building works in progress and the payment of contractors upon architects' certificates.

After a long discussion the motion was adopted, it also being decided to forward a copy of the report and the Local Government Board's letter to Mr. Aldwinckle, the architect.

Northwich.—The new technical schools and free library, which were formally opened at the beginning of the month, were built from designs by Mr. E. T. Worth, A.M.I.C.E., until recently surveyor to the district council, who acted as honorary architect. The contractors were Messrs. Clarke & Sons, of Middlewich. The style adopted is English Renaissance, and the facings are of red Ruabon bricks with terra-cotta dressings, supplied by Mr. J. C. Edwards, of Rumbon.

Some Annual Municipal Engineering Records.

BUCKINGHAMSHIRE : WEST HAM.

In submitting his last annual report of the works of the Highways and Bridges Committee, Mr. R. J. Thomas, county surveyor of Buckinghamshire, draws the attention of the county council to the continued increase in the expenditure upon the main roads maintained by the council, and also upon those maintained by urban district councils. The payments towards contributory roads or district highways, he adds, slightly exceeded those of the previous year. The actual mileage of roads maintained directly by the council is 435 miles, 4 furlongs, 47 yards.

The total expenditure by the council on rural main roads and those in the newly-formed urban districts for the year ended March 31, 1898, was £22,388, compared with £23,152 for the previous year, £22,394 for the year ended March, 1896, £23,356 for 1895, and £25,642 for 1894. It will thus be seen that a reduction of £764 has been effected in the expenditure as compared with that of the previous year, although the mileage has been increased by 5½ miles. The cost per mile was £51 8s. 1d., compared with £53 17s. 7d. for the previous year, £52 8s. 7d. for 1895-96, £54 14s. for 1894-95 and £60 for 1893-94. The expenditure for the year ended March, 1893, was abnormally high, in consequence of the council deciding to increase the quantity of metalling above the ordinary requirements by 50 per cent., in order to improve the general character of roads and produce a more solid foundation for the effectual working of the steam rollers which were bought in the previous year.

Granite used on the rural main roads during the past year totalled 16,356 tons, the cost of this material, including cartage from stations and wharves, being £9,771. This gives an average of 11s. 11½d. per ton. In the year ended March, 1897, 16,631 tons of granite were used, the cost per ton averaging 12s. 0½d. For the present year 16,900 tons have been ordered. Of flint there was used some 11,730 cubic yards, the cost, including measuring and breaking, being £3,006. The accepted local custom (remarks Mr. Thomas) of adding two bushels to every yard of flints when measured after breaking, in order to allow for "shrinkage," dies hard, and quite recently it was necessary, in order to convince an irate contractor that there was no such "shrinkage" (and that therefore it was immaterial whether flints were measured through the box unbroken or broken), to have a yard measured in his presence before and after breaking. It is difficult to imagine (continues the county surveyor) how this erroneous idea came to be accepted by purchasers of flints in the past; but certain it is that the belief has been an expensive one to the ratepayers. Where hand-picked flints have not been obtainable, and railway stations have been too far away, it has been found necessary to use clean pit gravel, and, as the roads so repaired have but a moderate amount of traffic, this material has answered fairly well.

Gravel to the amount of 2,238 cubic yards, and costing £445, was also used during the year. The average per cubic yard works out at 3s. 11½d. Last year's figures were 1,501 cubic yards, at an average cost of 3s. 8½d. per cubic yard. From the foregoing figures it will be seen that the quantity of materials used has again been reduced. This is accounted for by the absence of frosts and their accompanying thaws during the past year, and to the consequent sounder condition of roads. The total cost of manual labour for the year, including measuring and breaking flints, repairs to paths, steam rolling, &c., and surfaces over county bridges, was £5,864, which, compared with £5,818 for the previous year, shows an increase of £46. The three 10-ton rollers owned by the council have continued to work effectively during the year, at a cost of £673, compared with £619 for the previous year. These figures include drivers and attendants and hire of horses and men for water-carts, in addition to fuel, oil, waste, &c., for the three. The sum of £338 was expended on the hire of rollers.

It is evident (the report continues) that the outlay upon footpaths, especially where they pass through non-urban towns and larger villages, must gradually increase, as numerous lengths of old pavements are in a more or less worn-out condition, calling for considerable outlay in the near future. The expenditure on main road footpaths during the year was £891, compared with £1,765 for the previous year and £1,476 for 1895-96. This great reduction in cost is accounted for by the fact that during the previous two years exceptionally large paving and improvement works were effected, towards which local contributions approximating one-half cost were received; but such contributions having, by direction of the Local Government Board and/or, to be paid into the county fund and not into the highways and bridges account, the latter has necessarily to show in its balance-sheets the gross total cost of such improvement works, and not the half. The cost of urban and rural main roads maintained by the council is now about £15 per mile less than it was when they were maintained by the various parishes; but Mr. Thomas thinks that to keep them up to their present standard, and to provide for reasonable alterations and improvements, it will be necessary to maintain the present expenditure of about £50 per mile;

otherwise a fatal mistake would be made, calculated to undo the work of the past nine years.

The last annual report of Mr. Lewis Angell, borough engineer of West Ham, states that the length of dedicated roads maintained by his corporation is approximately 100 miles—an increase of about 2½ miles on the previous year; new streets dedicated since the incorporation of the borough have a length of nearly 3½ miles. The area of the district is 7½ square miles. In connection with private streets, of which a length of nearly 2½ miles has been dedicated during the year, the report mentions that four contracts, amounting in all to about £12,830, have been let for works on twenty-four roads. Final apportionments have been made in twenty roads, in the sum of £5,351. Since the adoption, in 1895, of the Private Street Works Act, 1892, it may be mentioned, plans, specifications, estimates and provisional apportionments have been made for sixty-seven roads, at an aggregate cost of £47,101.

Public lamps have increased by forty-seven, and now number 2,704; their cost during the year has been £9,940. Some 1,242 plans have been deposited—an increase of 227, but 301 of these have been disapproved owing to non-compliance with the various Acts and by-laws. The building fees received have amounted to over £945, making a total of £13,625 since the introduction of the Local Board Act of 1882. Plans have been deposited for eight new estates, with roads of a length of 3½ miles. Since the date of the incorporation of the borough plans have been deposited for 13,557 new houses, 1,600 other buildings, and 1,503 works of alteration and extension. According to the report, the reconstruction of defective private drainage has been very expensive to the council; but the new West Ham Corporation Act (sec. 42) has now placed upon owners the obligation of maintaining drains situate on private premises. Progress is being made with the new pumping station at Abbey Mills, the boilers of which will also supply steam for the electric lighting station connected therewith. When the pumping station is completed, next year, the sewage of the town will be intercepted from the river and discharged by a 40-ft. lift into the metropolitan system, but the sewage discharged from other districts beyond West Ham will continue to foul the rivers which flow through the borough, become increasingly offensive. At this point it may be mentioned that the matter of the pollution of the Channelsea has since been the subject of inquiry at the hands of the Local Government Board.

The fire brigade continues to maintain a high state of efficiency. Its cost for the past year has been £4,608. Six stations are at present in use, employing twenty-five men and eight horses. Mr. Angell again calls attention to the large number of fires caused by the dangerous oil lamps in common use, by which seven persons have been injured, two dying. Eleven persons have been injured by fire from other causes, one dying.

Among the more important works which have engaged the attention of the borough surveyor during the year have been a lunatic asylum (contract No. 1, £10,130; contract No. 2, £6,000; and contract No. 3, £209,531), a new sewage pumping and electric lighting station (buildings, £35,430; and engines, boilers, &c., for the sewage pumping, £20,751), the Dagenham Hospital (£20,475), a recreation ground (£497), and pitching works in North Woolwich-road, Victoria Dock-road, and Church-street and Portway (£13,995, £11,992 and £9,502 respectively); while various private street works (£12,830) have also been advanced. In addition to the above, plans have been prepared for artisans' dwellings (£11,976), a police court extension (£4,440), mortuaries in West Ham and Canning Town (£1,580), fire brigade barracks at Canning Town (£16,000), town hall extension (£42,500), water scheme (£28,500), northern and southern sewers (£19,991), pitching of The Grove, Leytonstone, Leyton, Clobham and Major roads (£18,759), and private street works (£9,413) in addition to those mentioned above. With the addition of the general expenditure connected with the engineer's department on account of highways and the cost of jobbing, &c., the above works, it is interesting to note, represent work (either in execution or preparation) to the value of over £500,000. In conclusion, it may be stated that the number of workmen of all classes (excluding the stable department) in the direct employ of the council on March 25th was 449. The total number pensioned has been sixty-eight, the amounts of the pensions varying from 5s. to 10s. weekly. There are forty on the list at the present time, and the annual disbursement amounts to over £600.

Lasswade.—The commissioners have decided to take action against the Lothian Commissioners in order to put a stop to the nuisance caused by sewage matter from Lothian discharging through Lasswade. The clerk has been instructed to communicate with the Lothian Commissioners, and, as the sewage also affects the hardward district, it was agreed to communicate with the Lasswade District Committee of the Mid-Lothian County Council.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS. XX.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

THE CONSTRUCTION OF ROADS AND STREETS.

Cost of Construction of Macadamised Roadways.—The cost of constructing a macadamised roadway varies very widely, according to the locality, facility for obtaining road materials, the price of labour, and many other considerations.

For a first-class macadam roadway the following is a brief specification: Excavate to a depth of 16 in. below finished level of proposed road surface; level and properly consolidate surface formation to the required contour; lay in a bed of "hard core" of broken stone or brick, 12 in. in thickness, and consolidated to 9 in. by rolling with a 10-ton steam roller,

concentrated traffic, like Bull-street and High-street, the relative costs for macadam, wood and granite were*:

Material	First cost per sq. yd.		Average annual maintenance, including first cost, per sq. yd. for 5 years.		Conds.	Water-Req.			
	s.	d.	s.	d.					
Macadam	3	0	3	0	per square yard	1	3	35	
Wood	15	0	1	1 1/4	"	"	0	5	25
Granite	11	0	1	4	"	"	0	5	25

A macadamised street in Bristol, 718 yards long, 13 yards wide, cost per annum nearly £1,000 to repair and maintain, or 2s. 1 1/2d. per square yard £2 42s. per mile. It is also on record that Regent-street, when macadamised, cost 3s. 7d. per square yard per annum to maintain.

In Norwich the cost of constructing syenitic granite macadam, including gravel foundation, is 4s. 6d. per square yard; tarred macadam costs 6s. per square yard, including 2s. for gravel foundation. The tarred macadam requires re-facing once in five years, and with this attention has a life of about twenty years in the class of streets where it is suitable.

ROAD-ROLLING.

Some particulars of the history of the evolution of the practice of steam road-rolling have already been given, and need not again be referred to. The use of steam rollers in the consolidation of road metal has become general, both in urban districts and also upon county main roads.

The undoubted advantages of steam road-rolling over the former method of allowing road surfaces to be consolidated by the traffic are briefly as follows:—

- (1) Economy combined with efficiency; the roads are better made, and the necessity for such frequent sweeping and scraping is obviated. The saving effected is given as varying from 30 to 50 per cent. The road metal is economised, as a thinner coating can be used, the metal need not be broken so small, and there is less abrasion of the stones, there being only one surface exposed.
- (2) The cruelty inflicted upon animals passing over a newly-metalled unrolled road is avoided.
- (3) Road-making and repairs can be carried out at any time of the year, and the constant employment of men raking metal into the ruts is avoided.
- (4) The steam roller soon shows which is good and which is bad metal for the roads.
- (5) Steam-rolled streets are easier for the traffic, are harder, of a more even surface, and have also a better appearance.
- (6) The roller is oftentimes found useful for other work.

When thrown open to traffic an unrolled road presents a surface of stones without any mutual cohesion, and every wheel in passing over the loose stones acts somewhat like a plough, pressing down the stones over which it passes and raising up those on each side. This requires the stones to be constantly raked smooth, whereby fresh corners are presented for the next wheels to chip off, and ultimately the surface of the road is uneven, consisting of minute hills and valleys, as it were, which make it far more vulnerable to traffic than when perfectly smooth.

The interspaces in a layer of newly-broken stones occupy, when the stones are first loosely spread upon the road, about one-half the area covered by them, but only one-fourth the area after they have settled into the compactness of an ordinary road surface. This compactness has to be attained by compression or by wear, by a heavy roller, or by the traffic. In the former case the stones are driven into a prepared compressible bed, with their sharp ends downwards and their flat sides uppermost, and form a level, regular and solid pavement of interlocked angular stones; in the latter case they are rolled and kicked about by the traffic until at least one-third of the metalling is destroyed—ground into dust or mud—and removed as refuse by the sweepers; and when, with their angles rounded off, the stones are worn into the worst possible shape for consolidation they are stamped into place to form a road surface, which no mending, filling-up of hollows or other expensive attention will make smooth and durable, and over which the first dry weather of summer will again set the loose stones rolling.

The main difference between an unrolled and rolled road, at the outset, is that the first contains nearly three times more empty space than the latter. It is clear that a road would not be hard and strong until these spaces are filled up.

FIG. 29.—CROSS-SECTION OF A FIRST-CLASS MACADAM ROAD.

and make up all hollow places; spread a layer of Thames ballast or gravel, 5 in. thick, consolidated to 3 in. by rolling; lay down two 3 in. layers of 2-in. blue Guernsey granite, and roll in to a finished thickness of 4 in., sharp sand or fine gravel to be spread during the process and the surface well watered (see Fig. 29).

In London a road constructed after the above manner would cost about 6s. per square yard. A lighter section (Fig. 30) suitable for suburban roads, and consisting of 9 in.

FIG. 30.—SUBURBAN MACADAM ROAD.

of hard core covered with a 6-in. layer of broken granite and well rolled, would cost about 3s. 6d. per square yard.

The following are the approximate prices of road materials in the vicinity of London:—

	Per ton.
Blue Guernsey granite, broken to pass a 2-in. ring,	13s. 10d.
" " " " " 1 1/2-in. "	14s. 4d.
Alderney granite " " " 2-in. "	14s. 0d.
" " " " " 1 1/2-in. "	14s. 6d.
Quenast* (limestone) " " " 2-in. "	13s. 0d.
" " " " " 1 1/2-in. "	13s. 6d.
Flints (best Kentish chalk), from 7s. 6d. to 9s. per cubic yard.	
Double-screened ballast, from 5s. 6d. to 6s. 6d. per cubic yard.	
Hard core (broken stone or brick), about 2s. 6d. per cubic yard.	

The following are the particulars of the cost of materials used in road-making in Plymouth† (1895):—

Road metal, Elvan stone, unbroken, 5s. 5d. and 3s. 10d. per ton—	
" " " broken to pass through a 2-in. ring, 5s. and 5s. 5d. per ton.	
Limestone, for tar paving, 3s. per ton.	
First-class granite sets, 3 in. by 6 in. by 6 in. to 8 in. long,	22s. per ton.
" " " 3 in. to 5 in. by 6 in. to 8 in. long,	23s. per ton.
Second-class " 3 in. to 4 in. by 6 in. by 9 in. long,	18s. 9d. per ton.
Granite flagging, 10s. per square yard.	
Granite curb, bevelled, 12 in. by 8 in., 1s. 2d. per lineal foot.	
" " " 12 in. by 8 in., circular on plan, 1s. 6d. per lineal foot.	
Granite channel blocks, 12 in. by 6 in., 1s. per lineal foot.	
" " " 12 in. by 6 in. (circular), 1s. 3d. per lineal foot.	
" " " 15 in. by 8 in., 1s. 5d. per lineal foot.	
" " " 15 in. by 8 in. (circular), 2 1/2 in. thick, 1s. 9d. per lineal foot.	

Caitness flagging, laid complete, 6s. per square yard.
Coverack concrete slabs, 2 in. thick, laid complete, 6s. 3d. per square yard.
Limestone flagging, laid complete, 9s. 6d. per square yard.

In Birmingham the average cost per square yard per annum of cleansing, watering and macadamising the carriage-ways for 1880 was 5s. 1d.; the maximum cost for any one street for that year was 4s. 3 3/4d., whilst the first cost of making was about 2s. 3d. per square yard. In streets of heavy and

* Quenast is a limestone from Belgium, of brownish grey colour. At first sight looks like granite, but is softer, and does not wear so well.
† "Proceedings of the Association of Municipal and County Engineers," vol. xxi.

* "Proceedings of the Association of Municipal and County Engineers," vol. viii, p. 31.
† "Proceedings of the Association of Municipal and County Engineers," vol. xxi.

Without the use of rolling this can only be done by the particles ground by the traffic off the edges of the stones, by dirt and foul excrementitious matter. . . . The main causes of the longer duration afforded by the roller are, therefore: (1) That it diminishes the actual wear by the traffic; (2) the interlocking of the stones prevents the injurious action of mud, dirt and moisture; (3) that it allows thinner coatings to be used.

"One of the main advantages attending the rolling of roads by steam-power consists in the diminished proportion of mud or soluble matter which is then incorporated in the structure of the road surface. If the surface of an ordinary road that has not been rolled is broken up and the material washed it is found that as much as half of it is soluble matter—mud, dirt and very fine sand; the stones, having only been thrown loosely upon the road, have lain so long before becoming consolidated by the traffic, and have undergone in the meantime such extensive abrasion, that the proportion of mud, dirt and pulverised material in the metalling is increased to that extent, and the stones are really only stuck together by the mud. This accounts for the fact that although an unrolled macadamised road may, indeed, after long use have a surface that is pretty good and hard in dry weather, and may offer then a very slight resistance to traction, yet it will quickly become soft and muddy when there is any rain. By the employment, however, of a steam roller upon the newly-laid metalling of a macadamised road the stones are rolled in and well bedded at once, and the surface is thus consolidated into a sort of stone felt, capable of resisting most effectually the action of ordinary traffic and containing the smallest quantity of soluble matter to form mud in wet weather."

The disadvantages attending the use of steam rollers include the following:—

- (1) Risk of damage to gas and water mains and services.
- (2) Interference to traffic and the risk of frightening horses whilst the roller is in use.
- (3) Nuisance from noise and smoke, though the latter is reduced to a minimum by the use of wood and coke for fuel.
- (4) The road metal may be crushed instead of bedded, or the road foundation may be injured, if the roller used is too heavy.
- (5) The first cost is a difficulty in small districts which often delays the introduction of a steam roller.

A road-roller should not exceed about 12 tons in weight, or the road metal may be crushed and damage done to gas, water and other pipes, as well as to culverts or cellar arches under the roadway.

The following are the particulars of one of Messrs. Aveling & Porter's modern type 12-ton rollers, well suited to use on county roads:—

Weight, about 12 tons.

Bearing weight on road, 401·2 lb. per square inch.

Length over all, 18 ft. 6 in.

Width of roller surface, 6 ft. 5 in.

Height of top of frame from ground, 9 ft. 10 in.

Six horse-power nominal.

Driving wheels, 5 ft. 6 in. diameter, 1 ft. 5 in. wide.

Front rollers, 4 ft. diameter, 2 ft. wide.

Boiler made of special brand milled steel.

Plates flanged by hydraulic flanging press.

Large frame area and heating surface.

Gearing made of fine crucible cast steel.

Crank and intermediate shafts carried by patent steel brackets.

Sides of fire-box being intended to form brackets.

Constructed with feed pump and injector for filling.

The fire-box, being extended to form the brackets, allows the gear to be brought closer together, thus reducing the width of the roller, so that whilst narrow streets can be rolled easily the shape of the road is retained.

The Telephone Service.—The National Telephone Company intend to apply next session for an Act to dissolve the company and reincorporate the shareholders into a new company, empowered to maintain and extend the undertaking, and to possess such other powers, rights and privileges as may be necessary for the purpose of effectively providing telephonic communication throughout the United Kingdom, the Channel Islands and the Isle of Man.

Electric Traction on the Underground Railway.—The directors of the Metropolitan and District Railway Companies have decided to undertake a series of experiments prior to the introduction of electric traction on the inner circle lines. An electric installation is to be laid down between Earl's Court and High-street, Kensington, by which a train fully as heavy as those running at the busiest times of the day on the Metropolitan line will be run for several months without any interruption of the present locomotive steam traffic. The work will be under the direction of Sir John Wolfe Barry, consulting engineer to the Metropolitan Railway Company, and Mr. W. H. Freese.

* "Report on the Economy of Road Maintenance and Horse Draught through Steam Road-rolling, with special reference to the Metropolitan," by F. A. Paget, C.E. 1870.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

223. Sewage Sludge, Weight of: How ascertained.—"Regular Reader" writes: Would you furnish me with a formula for estimating the weight of sewage sludge when containing various percentages of moisture?

Sludge from any system of sewage disposal contains about ninety parts of water and ten parts of solid matter. As the sludge is dried its weight diminishes in a ratio which is defined by the following simple rule, devised by Prof. Henry Robinson, and given in his book, "Sewerage and Sewage Disposal" (E. & F. N. Spon. 12s. 6d.).

Let X = weight of sludge, to be ascertained.

S = weight of solids in the sludge (which is constant).

P = percentage of moisture in the sludge.

$$\text{Then } X = \frac{S \times 100}{100 - P}$$

Thus, to ascertain what weight 25 tons of sludge containing 90 per cent. of moisture would be reduced to when it is dried to 15 per cent. of moisture. Now, 25 tons of sludge with 90 per cent. of moisture contain 2·5 tons (i.e., 10 per cent. of 25 tons) of solids, and therefore applying the formula

$$X = \frac{2\frac{1}{2} \times 100}{100 - 15} = 2\frac{1}{2} \text{ tons.}$$

224. Building By-Laws and Regulations.—"J. W. M." writes: I send you herewith plans and particulars of a new building and drainage scheme, together with the by-laws, such plan having just been passed by the local authority. I shall esteem it a favour if you will give me your opinion upon the drainage system. My own opinion as a surveyor is that the drainage system is entirely wrong and not according to the aforementioned by-laws.

We are unable to advise properly with the information before us. The querist accompanies his letter with what appears to be a newspaper cutting showing a block plan of two houses and an outbuilding, whereon is shown the line of drainage, together with several extracts from the by-laws. Excepting that the disconnecting chamber appears to be a considerable distance from the sewer, and there appear to be no branch drains to take the waste from sinks and baths, the plan is not otherwise irregular. The querist has placed the information before us in a very imperfect manner. The newspaper cutting shows that his plan of drainage has been disapproved, yet he informs us it is approved. If the latter, why is he now taking exception to it?

225. Levelling, Book on, required.—"D. W." writes: Could you recommend me a good book on levelling. I have had some experience in levelling, but require a good textbook by means of which I can thoroughly master the subject.

Usill's "Practical Surveying," price 7s. 6d. (Crosby Lockwood & Son), will be found an excellent book for the purpose required.

226. Surveying, Cross-Section of River.—"Semper Eadem" writes: How would you obtain a cross-section of a river when there is neither a boat nor a raft available? The method must, I presume, be equally applicable to rivers whether 10 yards or 200 yards wide, as in this country a boat will be always available. I should be glad if you would give me a reasonable solution such as an engineer might adopt, as to my mind the question is a ridiculous one, for though I have thought out several methods I have not found one by means of which accurate results could be obtained. I may add that the question was set at a recent examination of the Municipal and County Engineers' Association.

If the querist has correctly copied the question we are bound to state that it is neither intelligibly nor fairly placed before the examinees. If the river is not more than 100 links in width the distance may be ascertained without difficulty, and by sending a man round by the nearest bridge to the point required with a staff the levels may also be ascertained so far as the banks and water-level are concerned. Where the river is a wide one the distance must be obtained by the formula for measuring inaccessible points, several formulae for the purpose being given in Molesworth's "Pocket-Book of Engineering Formulae" (E. & F. N. Spon. Price 7s. 6d.), and in Usill's "Practical Surveying" (Crosby Lockwood & Son. Price 6s.). The "Wells system of levelling" may often be adopted in such cases, and should be learnt. We gave a description of this system in reply to Query No. 60 in our issue of April 30, 1897. Further information may be obtained from the book "Hints on Levelling Operations as applied to the reading of distances by the law of perspective, and the saving thereby of chainmen in a level survey, &c.," by W. H. Wells (E. & F. N. Spon. Price 1s.).

Ormskirk.—Last week Colonel A. G. Durnford, R.E., one of the Local Government Board inspectors, held an inquiry respecting an application of the council for sanction to borrow £1,600 for the erection of a fire engine station, £250 for water supply, £220 for public offices, £80 for public walks and pleasure grounds, and £65 for a fire escape.

EXETER WATER SUPPLY.

APPLICATION TO BORROW £30,000.

Mr. G. W. Wilcocks, M.L.C.E., last week conducted an inquiry, on behalf of the Local Government Board, at Exeter, in reference to an application of the city council for permission to borrow £30,000 for water supply purposes. Among those who attended the inquiry were Mr. G. R. Shorto, town clerk, Dr. Woodman, medical officer of health, and Mr. D. Cameron, the city surveyor.

In the course of the evidence it was explained that under the Exeter Corporation Water Act of 1878 the parishes of St. Thomas, Heavitree, Alplington and Pinhoe, all outside the city, were included within the limits of supply, but St. Thomas also had a water supply of their own, although the Exeter supply was laid throughout the district. The St. Thomas supply provided for about 5,000, and Exeter had to make provision for about 55,000 in all. The present demand for water was about 1,750,000 gallons per day. The conduit from the intake would carry 2,250,000 gallons, and the rising main would carry all the water required for consumption, but only by an extravagant expenditure of power. The filtration was done by two filters only, with a combined area of 36,000 superficial feet. Their capacity was not sufficient, and the corporation would not have been satisfied with them during the last five years had there been any ground upon which they could have extended them. There was greater strain upon one filter when periodically the other had to be thrown out of work for cleansing. The water was taken from the Exe above the junction of the Culm, not by a direct flow but by filtration through a bed of gravel into a tank at the intake, which was 60 ft. long by 12 ft. wide. This provided for filtration at the intake. It was thence conveyed by a culvert of tiles of 2 ft. internal dimension to the city pumping station. This culvert had manholes at intervals, and it was found that roots of trees had penetrated these manholes, and through the gaps thus caused surface water obtained admission. The culvert, which was 7,652 ft. in length, was found to be very unsatisfactory from its insufficient size and on account of its construction, and was to be replaced. The water was conveyed in the conduit to the pumping wells at Pynes, where there were three turbines in use, and two more which were intended to be used. As an auxiliary power, when the water-power failed, there was a pumping engine of 48 horse-power, which would raise over 1,000,000 gallons a day, and there was also another temporary engine which would raise 270,000 gallons. The water was pumped through two mains, one of 10 in., and the other of 12 in. internal dimensions, and the velocity was at present a little over 3 ft. per second. They were obliged to keep up that rate to get enough water, and this was considered wasteful. The water was pumped from Pynes to Dane's Castle reservoir, a height of about 150 ft., above the pumping station at Pynes, where it was filtered and gravitated to the lower district, while what was required for the higher part of the city was pumped to Marypole Head reservoir. The increase of population and consequent increase of demand for water was on the higher level. The capacity of the Dane's Castle reservoir was 4,500,000 gallons, and Marypole Head 1,000,000. This was the present state of affairs, and the council considered it necessary to have (1) increased means of filtration, and (2) an increased supply, which involved an increased size of the conduit, increased pumping power of water and steam, increased capacity of the rising mains, and a diminution of unnecessary waste of power in unnecessary friction in the rising main, owing to its small size, by the formation of an intermediate level supply. The council now proposed to take the whole of the filter tanks out to Pynes, on land for the purchase of which a provisional agreement had been made with the Earl of Idlesleigh. It was intended to construct here two settling basins, each to contain 1,500,000 gallons. The water would then be lifted an average height of about 8 ft. from the settling tanks on to the filters to be constructed immediately alongside. These filters would be six in number, each of 12,000 ft. superficial area. Fixed filters would do all the work required for a largely-increased water supply, the five filtering 3,000,000 gallons daily, at the rate of 4 in. per hour under a head of 2 ft. The sixth filter would always be in reserve for cleansing or other purposes. The water would pass from the filters to the proposed suction wells. This was all the increased means of filtration. Another proposal was to improve in construction and increase the size of the present conduit by replacing the existing one by a 30-in. internal dimension cast-iron pipe without manholes. The power, both of water and steam, was to be increased, the council proposing to raise the depth of the water in the lead by 2 ft. The proposed works would increase the water-power by nearly one-fourth, so far as the existing machinery was concerned. Two new pumps would be provided to utilize the increased power. With the turbines and new works it would be possible to raise 3,000,000 gallons a day with the normal flow of the river. Coming to the steam, the existing machinery was to be increased by a new steam engine capable of raising to the level of Dane's Castle 96,000 gallons per hour, or 2,250,000 gallons per day. The Dane's Castle pumping station would be abandoned, and the steam engine at present there would be removed to Pynes, where it would be capable of raising 500,000 gallons a day to a proposed

intermediate level reservoir. The new means of propulsion were also explained. The present rising main between Pynes and Dane's Castle would be replaced by a larger one, and that between Dane's Castle and Marypole Head would be tapped for a new main to the proposed intermediate level reservoir. With this new reservoir and the turning of a filter-bed at Dane's Castle into a reservoir the storage for city water would be increased from 5,500,000 to 7,500,000 gallons. There was at present a waste of power through water being pumped up to Marypole Head when a lesser height would do for a large part of the service now supplied by the Marypole Head reservoir. The new reservoir to supply this intermediate service was to be provided at Pennsylvania, on land in a line with the terrace, to be purchased from the Freehold Land Society. The council had to purchase 2½ acres—the society would not sell less—at £1,325. Only half an acre would be required, and the remaining 2 acres would be sold. An increase of the estimate would be necessary in regard to this matter. The new reservoir would be circular in form, constructed of concrete or brickwork, 50 ft. in diameter, and with a capacity of 500,000 gallons.

The inspector subsequently visited the reservoirs and the waterworks, and will report in due season.

LONDON WATER SUPPLY.

COUNTY COUNCIL PROPOSALS.

The London County Council announce their intention of applying for leave to bring in a Bill empowering them to construct a storage and service reservoir at Borehamwood, Hertfordshire, "and aqueduct, conduit or line of pipes, to commence at the dam or embankment of a reservoir proposed to be made on the river Yrfon, in the county of Brecknock, and to terminate at the Borehamwood reservoir," and filter-beds near Edgware and Hendon, Middlesex. By other clauses the council will seek for powers to lay down, &c., conduits, &c.; to enter into and carry into effect contracts for the supply of water in bulk or otherwise within the counties mentioned in the notice; to enable them from time to time to raise money by stock or annuities, terminable or otherwise, to such amount as may be necessary for the purposes of the intended Act, or to use for those purposes, or any of them, money standing to the credit of the Consolidated Loans Fund; and to make such provisions as to the redemption of such stock or repayment of loans, and the payment of interest or dividend thereon, out of any water rates and charges and revenue derived by the council from the undertaking, or out of the Consolidated Loans Fund and county rate, and to include in their estimates and precepts for the purpose of the county rate such sums as may be requisite for those purposes. By other clauses provision will be made for defraying all costs and expenses of the council in the execution of the powers of the intended Act (except so far as they may be otherwise provided for) as payments for general county purposes within the meaning of the Local Government Act, 1888, and for the payment by the council in like manner of their costs, &c., "preliminary to, and of and incidental to, the preparing, applying for, obtaining and passing the intended Act." The Bill will also contain a clause providing for the keeping of separate accounts by the council in relation to expenditure and revenue in connection with the undertaking to be authorized under the intended Act.

NORTHAMPTON COUNTY BUILDINGS.

EXTENSIVE IMPROVEMENTS.

At a recent meeting of the Northamptonshire County Council the Building Committee recommended the adoption of plans, prepared by Mr. Aston Webb, for alterations and enlargements of the existing County Buildings at Northampton. By these plans such parts of the existing buildings as have any architectural or historical interest will not be altered, nor will the *facade* be touched except for the interchange of a doorway and window on the ground floor. The courts will remain as they are, and so will the walls of the main wing, which contain the grand jury-room, but the modern buildings at the back between the main buildings and the county council chamber will be pulled down. The main entrance will be removed to the western extremity of the wing. The alterations will provide more rooms and offices, all more conveniently placed, and better accommodation will be given to the police department. The roughly-estimated cost of the alterations will be £15,000, and the committee recommend that Messrs. Aston Webb and E. Ingress Bell be appointed architects for the erection of the buildings.

Cannock.—Letters were last week read from the Local Government Board and the county council with respect to the removal of house refuse, pointing out that it was essential that proper arrangements should be made for the removal of the refuse during the proper hours and in an efficient manner in the populous places. It was decided to write to the parish councils of Cheslyn Hay, Great Wyley, Essington, Brewell and Penkridge, asking for their observations on the matter, and calling the attention of the parish councils to the clauses

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,

Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a non de plume.

COMBINED DRAINAGE: NOTICE BY LOCAL AUTHORITY TO REPAIR: LIABILITY OF AUTHORITY.—The recent case of *North and Millhouse v. Walthamstow Urban District Council* (Queen's Bench Division, 27th October) is of interest as a further contribution to the precedents relating to the subject of combined drainage. It was an action by Miss Sarah Ellen North and Mr. Charles Millhouse to recover £35 for work done and materials supplied as a builder by the plaintiff Charles Millhouse to the plaintiff Sarah Ellen North, at the direction of the defendants. The facts were as follows: The plaintiff Miss North is the owner of seven houses, 22 to 34 (even numbers) Cambridge-road, Walthamstow. The plaintiff Mr. Millhouse, throughout the matters which led to the present action acted as Miss North's agent and builder. At the end of November, 1897, the sanitary inspector for the district complained of the state of the drain of No. 22 Cambridge-road, and served a notice in respect of that house in the form set out below. The ground was opened, when it was discovered that the drain drained more than one house. Subsequently the following notice was served on the plaintiffs in respect of all the houses 22 to 34 Cambridge-road. Both the above-mentioned notices were in the following form, the first being limited to No. 22: "Walthamstow Urban District Council. To Mr. Millhouse, of 13 Cassland-road. Notice is hereby given you to abate a nuisance at No. 22, 24, 26, 28, 30, 32 and 34 Cambridge-road, arising from defective drains, within seven days from the service of this notice, and for that purpose to take up and relay, properly trap, ventilate and provide means of access to drains. Dated this 27th day of November, 1897. Signature of officer of local authority, W. W. West, inspector of nuisances." The work was done in accordance with the notices and according to the instructions of the sanitary inspector as the work went on. The plaintiff Mr. Millhouse admitted that he believed that the pipe to which the repairs were done was a sewer, and that the plaintiffs were not liable to do the work, but he said that he believed he was obliged to do it after he received the notice. It was agreed by both sides that the pipe upon which the work was done was in fact a sewer. On behalf of the council it was contended that the notice was not given by them, but by the sanitary officer on his own responsibility, and the case of *Selge v. Hove Commissioners* (1895, 1 Q. B., 685, THE SURVEYOR, vol. vii., p. 203) was relied on. For the plaintiffs *Andrew v. St. Olave's Board of Works* (1898, 1 Q. B., 775, THE SURVEYOR, vol. xiv., p. 70) was cited, and it was argued that the notice constituted an implied request to the plaintiffs to do work which the council were legally bound to do. Mr. Justice Channell characterised (during the arguments) *Selge v. Hove Commissioners* as "about as unsatisfactory a decision as ever came into court," and in the course of his judgment in favour of the plaintiffs said: "In my opinion I ought to act upon the authority of the decision in *Andrew v. St. Olave's Board of Works*. I do not think it desirable to draw refined distinctions, and, further, I am inclined to think that *Andrew v. St. Olave's Board of Works* involves the same principles as the present case. Upon behalf of the defendants it was said that that case was distinguishable and inconsistent with *Selge v. Hove Commissioners*. That case is, no doubt, not an entirely satisfactory decision, but it is not necessary to discuss it further, as the present case is not governed by it. Upon behalf of the defendants it was conceded that the sections in the Public Health (London) Act, 1891 (54 and 55 Vic., esp. 76), upon which *Andrew v. St. Olave's Board of Works* was decided, were similar to the corresponding provisions in the Public Health Act, 1875. In that case the work had to be done at once; in the present case that is not so. It is admitted that it was the duty of the defendants to do the work. If any persons other than the plaintiffs had done the work it would have been a voluntary act, and they could not have recovered the cost of it from the defendants. The principle upon which the cost of doing the work is sought to be recovered by the plaintiffs in the present action is that if a person is compelled to do that which another person is legally liable to do a request is implied by the person who is so liable. The question is, What degree of compulsion is necessary to entitle the plaintiffs to recover? The compulsion need not be irresistible. It is not sufficient for the defendants to say that if the plaintiffs went before the magistrate they would have had a defence. If a public body comes to a person and either commences or threatens proceedings such person is no longer a volunteer. A person in such a position is under an obligation to do the work. It is immaterial whether the notice given to the plaintiffs was a statutory notice or not. The law implies practical compulsion. In the present case there was no legal compulsion, but a mere indirect compulsion is sufficient. It has been held in betting cases that a

mere threat to turn a man out of a club is sufficient to enable him to recover money paid by him to avoid being turned out. Where a man repaired a sea wall as a matter of practical necessity, which it was the duty of the commissioners to repair, he recovered the costs of the repairs. The fact that in the present case there was no actual statutory notice is immaterial.

QUERIES AND REPLIES.

SURVEYOR TO URBAN DISTRICT COUNCIL: PRIVATE PRACTICE.—"A. B." writes: Has an urban district council (having granted their surveyor permission to engage in private practice) power to revoke the same after a period of seventeen years without granting compensation, he (the surveyor) having during that time received a smaller salary in view of the accorded privilege?

In the absence of any agreement under seal binding the council to employ the surveyor for a fixed period, his engagement could be determined by the council "at their pleasure" (see sec. 180 of the Public Health Act, 1875; *Reg. v. Darlington School*, 6 Q. B., 682. In *re Teather*, 19 L.J., M.C., 70). It follows that they could revoke the permission to engage in private practice, since dismissal would doubtless follow any continuance of such practice subsequent to the revocation.

DUTIES OF BOROUGH SURVEYOR.—"Borough Surveyor" writes: I have filled my present position for three years, during which time a considerable amount of work has been carried out in the extension of water mains, sewers, new streets, &c. At the present a sewage scheme, estimated to cost about £2,000, is under consideration, for which I have prepared plans, estimate and report. A resolution was proposed that I be instructed to carry out the work without any extra remuneration. This I objected to, contending that I had fulfilled my obligations by the preparation of plans, &c. (see condition of appointment enclosed), at the same time I made application to be paid a commission on new works on contracts above £200 of 2½ per cent., I agreeing to provide at my own cost any extra assistance I may require. I shall be glad to know if, in your opinion, the conditions of appointment and salary include all work I may be requested to do.

Under clause 1 of the "Statement of Duties" the surveyor is to perform "all duties which may be imposed by the authority of the council," and under clause 24 he is to "devote his whole time to the duties of the office," while clause 23 specifies the salary he is to receive. Having regard to these clauses, I do not think "Borough Surveyor" has any legal claim for extra remuneration for carrying out the sewage scheme.

BUILDING LINE: PUBLIC HEALTH ACT, 1875, SECS. 154 AND 155; BUILDINGS IN STREETS ACT, 1888, SEC. 3.—"B. L." writes: Along the east side of a common within a rural district having urban powers there is a public footpath, bounded on the east by a ditch, and on the east of the ditch there is a field belonging to A, who proposes to fill up the ditch and build a row of six houses a few feet back from the ditch. At the southern extremity of A's field, and divided from it by an occupation road 8 yards wide, there is an old row of houses set back 18 ft. from the line of the ditch. The local authority require A to set back his new houses in a line with the old houses, and to give up sufficient land when added to the footpath to form a new street 36 ft. wide, under the authority of sec. 3 of the Buildings in Streets Act, 1888. (1) Can A be compelled to set back in this way? He is not, in my opinion, erecting his buildings in a street nor proposing to lay out a new street. (2) Can the local authority prescribe a building line and pay compensation for the land which A has to give up in order to conform to such building line?

(1) The word "street," as defined in sec. 4 of the Public Health Act, 1875, includes any highway (not being a turnpike road) and any lane, footway, &c., whether a thoroughfare or not. This definition is incorporated in the Public Health (Buildings in Streets) Act, 1888; consequently that Act would, in my opinion, apply to the public footpath in question if it were in an urban district. Whether the Act applies to this rural district depends upon the order conferring urban powers. Assuming the Act to be applicable, it would be a question of fact for the magistrates whether the new buildings were "in" the "street"; and also whether the old houses were sufficiently near to be on one side of the new buildings within the meaning of the Act (*Harver v. Mustard*, 61 L.J., M.C. 38). Another question that arises is whether (apart from the Act) A would, by the erection of the proposed buildings, be laying out, or commencing to lay out, the public footpath as a new street, so as to render applicable any by-law that may be in force in the district requiring new streets to be of a certain width. This also would be a question of fact for the magistrates (see reply to "Urus"). (2) Assuming that they possess the requisite urban powers, the authority could, by agreement with A, purchase part of his land for the purpose of widening the highway under sec. 164 of the Public Health Act, 1875, or they could (after obtaining a provisional order under sec. 176 of that Act) purchase the required land compulsorily. But they could not proceed under sec. 164, which only applies where a building has been taken down to be rebuilt or altered.

Municipal Work in Progress and Projected.

This week information of important undertakings will be found in connection with Canterbury, Douglas, Leicester, Loughborough, Marlborough and other towns. No doubt the recent heavy snowfalls and gales have taxed the energies of many a borough engineer's department.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

As many of our readers will be aware, complaints have recently been rife in regard to the smoke nuisance in London. It is therefore all the more satisfactory to learn that the county council have not been so ill, nor their efforts so unsuccessful, as many have supposed. But, as Mr. Crooks, the chairman of the Public Control Committee, remarked, the local sanitary authorities are diffident to move in the matter, and after their fashion read the special provisions of the Public Health (London) Act, 1891, in two or three different ways.

The Slaughter-House Question.—The adjourned report of the Public Health Committee, originally submitted on October 14th, was again brought up for consideration. The recommendations for discussion contained in the report were: (a) That, in the opinion of the council, it is desirable that, as a first step towards ensuring the proper inspection of meat, private slaughter-houses should cease to exist in London, and that butchers should, in substitution, be afforded such facilities as are necessary for the killing of animals in public slaughter-houses to be erected by the council; (b) that a copy of this report and of the council's resolutions thereon be sent to the Local Government Board, with an intimation that the council is prepared to accept such responsibilities as may be necessary to give effect in London to the recommendations of the Royal Commission on Tuberculosis, and that the board be asked whether they will include in any legislation introduced by them in connection with the Royal Commission's report the provisions which would be necessary for this purpose. Mr. Laughland, chairman of the committee, asked leave to withdraw the report until the architect and other officers had prepared plans and provided further information. This was agreed to.

Rehousing in Poplar.—The Housing of the Working Classes Committee submitted a report recommending the council to undertake the rehousing of 180 persons displaced by the Ann-street, Poplar, scheme. In 1896 the East-End Dwellings Company negotiated to purchase the cleared land, in order to provide the dwellings, but the plans deposited by the company were not approved by the Local Government Board, who intimated that single-room tenements could only be allowed if the council guaranteed that they would be occupied by childless married couples, two girls, or two elderly persons of the same sex. To these conditions the company objected. The committee reported that under these circumstances there was no likelihood of any agreement being arrived at with the company. The council had for three years been under a legal obligation to house these persons, and, as there was a great demand for accommodation in the neighbourhood, they thought there should be no further delay. They accordingly recommended that negotiations with the company should be terminated and the standing orders should be suspended, in order to enable the council themselves to erect forthwith dwellings on the cleared area. After a long discussion, the recommendation was agreed to, on a division, by sixty-nine votes to thirty.

The Smoke Nuisance.—The Public Control Committee presented a report in reference to the steps they had taken for enforcing the provisions of the Public Health (London) Act, 1891, as to smoke-prevention in London. The report stated that in almost every instance either the sanitary authority had carried out their duties under the Act, or, in consequence of the direct intervention of the council, the parties creating the nuisance had found means for abating it. The report concluded with a narrative of the events which led up to the council's taking proceedings in default of the Lambeth Vestry against two firms in the Lambeth district, which resulted in the maximum fine of £10 being imposed in each case. After some discussion the report was adopted.

The Telephone Service.—In reply to Mr. Boacheroff, who asked if it was the case that more than 900 persons were unable to take advantage of the telephone system in London because the council had declined to give their consent to the company carrying out certain works underground, Mr. Bann said that this was the case, and it was due to the fact that certain consents had been withheld by the council. That permission had not been granted because the National Telephone Company had not seen fit to concede terms to London similar to those conceded in other cities. Very shortly, however, a conference would be held between the company and the council, to see if these difficulties could not be overcome.

Tenders.—The following tenders were opened for the supply and erection of boilers and fittings at the western pumping station: Messrs B. Darks & Co., Limited, £2,775; R. Taylor & Sons, £2,880; J. & J. Horsfield, £3,250; W. Arnott, £3,120; J. Thompson, £3,500; J. Musgrave & Sons, Limited, £3,717.

COURT OF COMMON COUNCIL.

The lord mayor presided, for the first time, at a meeting of the Court of Common Council on Thursday. The town clerk read a letter from the vestry clerk of Hainbury asking for the use of the Guildhall for a proposed conference on the subject of trade obstructions and easterners' stalls on the highways. On the motion of Mr. Balleley the necessary permission was granted. Mr. Wallace was nominated to represent the corporation at a conference to be held by the London County Council with a view to formulating some general scheme for the maintenance of small open spaces in the county of London.—A letter was read from the clerk to the London County Council, enclosing copies of the report of the Water Committee and the resolutions passed by the council to promote in the ensuing session of Parliament a Bill for the purchase of the water companies' undertakings, and also a Bill for the introduction of a new water supply from Wales. The corporation were asked whether it was still their wish to assist the council under the agreement which was entered into between the two bodies some years ago. Mr. Cloddsley moved that the question should be referred to the County Purposes Committee for consideration. Mr. Wallace, however, moved an amendment, that the question should be referred to a committee of the whole court. Considerable discussion ensued, but on a show of hands the amendment was adopted by a sweeping majority.—Mr. Timbrell asked the chairman of the Streets Committee to make some inquiry into the condition of London Bridge. Its present muddy state was, he declared, disgraceful. The footpaths were kept clean, but so muddy and greasy was the roadway that a pedestrian could scarcely keep his foothold. Mr. Turner said he would make the necessary inquiries.—The Improvements and Finance Committee submitted a report relative to the petition of certain inhabitants of Crutched-friars and the neighbourhood directing attention to an opportunity for improving the means of communication between Crutched-friars and Penchurch street. The committee submitted for adoption an arrangement and plan for making a new street, 40 ft. wide, connecting the said thoroughfares, the corporation to construct the new thoroughfare with sewer, subways, vaults, &c., and the owners of the vacant site to contribute £6,000. The scheme was approved without discussion.—The same committee also submitted a plan for making Ladbury 50 ft. wide between Old Jewry and Prince's street, at an estimated cost of £42,000, together with a letter from the London County Council agreeing to contribute one-third of the net cost of the improvement, such contribution not to exceed £15,000. The committee recommended that the improvements should be carried out accordingly. The committee further recommended, relative to the proposed improvement at the western end of Chenside, that the leasehold and trade interest of Messrs. Dunn's trustees in 4A Chenside should be acquired for £3,750; and also that the ground needed to widen the public way in front of the premises, 39 and 40 Hatton-street, and 10 and 12 Primrose-hill, should be acquired for the sum of £240. The recommendations of the committee were approved. The Streets Committee presented a report relative to a letter from the Metropolitan Electric Supply Company, Limited, asking for the formal consent of the corporation to their intended application to the Board of Trade for a provisional order for the supply of electricity within the City. The committee recommended that the company should be informed that the corporation regretted that they were unable to give their consent to the application. After some discussion the recommendation was agreed to.—On the recommendation of the Streets Committee the court agreed that an application should be made for a license to establish a telephone service, in conjunction with the London County Council and other local authorities within the London telephone area.—Sir Albert Altman moved: "That it be referred to the Streets Committee to consider and report on the dangerous condition of Ludgate-hill station and the necessity of more accommodation being provided for passengers, with power to communicate with the Board of Trade on the subject." Sir Albert said that, owing to the enormous increase in the passenger traffic, Ludgate-hill station had become absolutely dangerous. The staircases were only 6 ft. wide, and in some places less than that. The entrance to the platforms was by means of a hole cut through them, and from it a passenger emerged like a Jack-in-the-box. To make matters even worse, there was a continual block on the staircase, owing to the passengers who had detained meeting those who were eager to catch a train. The station was built of wood many years ago, and if the station caught fire it would result in a fearful catastrophe. The motion was adopted with unanimity.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the above body was held on Saturday, Sir E. H. Galsworthy, Bart., the chairman, presiding. A letter was received from the Local Government Board enclosing a copy of the report of Mr. W. E. Knollys on the recent inquiry held by him with reference to the Broad Hospital. Full particulars of the board's letter and Mr

Kaolly's report are given in another column.—In a second communication the Local Government Board, advertising to the managers' application for an order authorising the borrowing of a further sum of £101,830 14s. 4d. in connection with the erection, &c., of the Brook Hospital, stated that under the circumstances they deemed it right to omit from the order the amount due to the architect in consideration of the extra works. As that amount appeared to be £375, the order would authorise the borrowing of the sum of £101,456 instead of £101,830. The Local Government Board further wrote enclosing copies of an order authorising the reconstruction of the North-Eastern Hospital and the erection of a water tower thereat, at a cost not exceeding the sum of £126,850, and the borrowing of the amount.

VESTRIES AND DISTRICT BOARDS.

Battersea.—The vestry on Wednesday received a deputation from the Butchers' Trade Society with reference to the proposals of the London County Council in connection with the abolition of private slaughter-houses and the establishment of public abattoirs. In the course of his arguments against the proposal Mr. Lindsay, the spokesman of the deputation, stated that the scheme, if carried into effect, would necessitate an expenditure of £1,500,000, and that someone would have to pay for it. In reply to questions, Mr. Lindsay stated that in consequence of representations made by his society and by agricultural societies the London County Council had the previous day postponed the consideration of the question until after Christmas, that making the fourth postponement of the matter. The vestry resolved to refer the subject to the Health Committee for consideration.—With reference to the proposal to erect a refreshment kiosk at the Morden cemetery, as sanctioned by the vestry in September last, the Cemetery Committee reported that they had deferred the consideration of the question until next March.—The Highways Committee announced that they had considered a report by the surveyor on the condition of the gullies throughout the parish, and that the total estimated cost of thoroughly carrying out the work amounted to £8,268. On the recommendation of the committee it was resolved to proceed with the work, the cost to be defrayed by loan.—A letter had been received by the Highways Committee from the manager of the South London Tramways Company concerning the lowering of the roadway under the West London Extension Railway bridge over Falcon-road. At the suggestion of the committee the vestry decided to give permission to the company to skim the present concrete and use a 5½-in. girder, instead of a 7-in. girder as at present laid, and to defer until the new year the paving works proposed to be carried out under all the bridges crossing Falcon-road.—The special committee appointed to consider the question of the steps to be taken to vest the water supply in the people of London reported that they had been in communication with the various vestries and district boards on the subject. It appeared from the replies received that twenty-two of the authorities were in favour of the water supply being vested in a public authority, six were in favour of the control of the water being placed in the hands of a public authority, and thirteen reserved their opinion until the issue of the report of the Royal Commission. With regard to the constitution of the authority, the Special Committee stated that only nine local authorities suggested the London County Council as that body. In a further report the committee stated that since instituting the above-mentioned inquiries the county council had adopted various resolutions on the water question. On the recommendation of the committee it was decided to approve generally of the conclusions arrived at by the county council.—A short time ago the Works Committee were instructed to consider the question of preparing a scheme for the unloading of barges, under which the barges would be discharged at the vestry's wharf and the material carted direct to where it was required, instead of being carted from the wharf to the various depots of the vestry. The committee found that in order to arrange a system for carrying out the barge-work upon the above lines additional wharfage accommodation would be required. The conclusion arrived at was that the Falcon and granite wharves in Lombard-road were the most suitable premises, and the committee recommended that negotiations should be entered into for the purchase of the premises. After considerable discussion the proposal of the committee was adopted by a large majority.—A long report was submitted by the Baths Committee notifying the consent of the Local Government Board to the borrowing of £34,370 for the erection of baths and £1,380 for the boring of artesian wells, the latter sum to be repaid in five years.

Bermondsey.—The vestry on Monday discussed a report of the Sanitary Committee in reference to letters received in connection with the proposals of the London County Council relative to the abolition of private slaughter-houses and the erection of public abattoirs. The committee, while not feeling competent to express an opinion on the subject, reported that the medical officer of health was of opinion that the establishment of abattoirs would be of considerable advantage to the public health and would largely facilitate the detection of diseased meat. Eventually the report was referred back to the committee for further consideration and for the reception of a deputation representing the butchering interests. The London County Council, in reference to the

visit of a deputation from the vestry in regard to the housing of the working classes in Bermondsey, had asked to be furnished with information as to any vacant site in the district which might be suitable for the erection of artisans' dwellings. In this connection the Sanitary Committee reported that they had investigated the subject, and submitted a list of sites likely to be suitable, a copy of which was directed to be forwarded to the council.—The Electric Lighting Committee stated that on attending the inquiry held by Major Cardew at the Board of Trade, consequent upon the appeal of the London Electric Supply Corporation against the vestry's disapproval of the laying of mains in certain streets, the company produced the written consent of the London County Council to the execution of the works objected to. This was the first intimation received of the approval of the council, and the committee expressed the opinion that before sanctioning works in the parish the council should first ask for the vestry's views thereon. On the recommendation of the committee it was resolved to inform the council to that effect.—A motion was proposed by Mr. Dumphy in favour of the surveyor being requested to prepare an estimate for the cleaning and redecoration of the town hall, board-room and offices, and that the estimate should be submitted for the immediate consideration of the General Purposes Committee.—The General Purposes Committee reported that they had considered the following tenders for the supply of slop vans: Bristol Wagon Company, £46 each; Glover & Sons, £44; E. & H. Horn, £45; A. Parker, £42; A. Randall, £43 10s.; and T. Baker & Son, £38 5s. Mr. A. Parker's tender was accepted.

Islington.—The vestry clerk at the last meeting read a letter from the solicitors to the North Metropolitan Tramways Company, intimating the intention of the company to apply to the Light Railway Commissioners for powers to construct a light railway from the county boundary in Archway-road through Finchley to Whetstone. The letter asked the vestry to urge the necessity of constructing a light railway from the Archway Tavern to the Archway, the boundary of the metropolitan area. It was decided to refer the letter to the Works Committee for consideration.—Messrs. Mills & Simons were appointed to represent the vestry at the conference to be held at the Islington Vestry Hall to-day (Friday) to consider the question of the reform of London local government. It was mentioned that many of the vestries and district boards had agreed to send delegates to the conference.—The Public Health Committee reported that they had reconsidered the communication from the London County Council inviting an expression of opinion on the proposal of the council to establish a bacteriological laboratory for London. On the recommendation of the committee it was resolved to take no action in the matter until further information on the subject had been obtained.—The committee also announced that they had considered a report from the medical officer of health on the subject of establishing public abattoirs in London. The medical officer expressed the opinion that the London County Council, who were proposing to take steps in the direction of providing public slaughter-houses, should be supported by the vestry. It was decided to approve the report and forward a copy to the county council.—The Parliamentary Committee submitted a report on the subject of the draft Water Bill proposed to be introduced by Mr. H. S. Samuel, M.P., and recommended that the author should be informed that the vestry were of opinion that the remedy sought to be effected by the Bill would be more satisfactorily attained by the whole of the undertakings of the various water companies being placed under the control of the county council. The recommendation was adopted without any discussion.—It was decided, at the suggestion of the Works Committee, to reconstruct the pipe sewer in Cambridge-terrace, at an estimated cost of £340; to repair a portion of Essex-road, at a cost of £200; and to expend £313 on the erection of greenhouses to keep the plants in at the Finchley cemetery.—With regard to the question of the maintenance of main roads, the Parliamentary Committee stated that they had considered the letter on the subject from the Limehouse Board of Works, who drew attention to the proposal of the London County Council to transfer the maintenance to the local authorities. The board pointed out that the effect of such transfer would be to deprive the local authorities of the contributions now received from the council towards the cost of the upkeep of those thoroughfares, and that it was proposed to convene a conference to consider the question. In view of the importance of the subject, the vestry decided to send four delegates to the conference.—A long discussion took place on the presentation of a report by the Electric Lighting Committee recommending the suspension of one of the by-laws in order to enable the committee to invite tenders from a selection of firms for the projected large extension of the electric light station. The committee were of opinion that, in order to avoid a repetition of past delays, it was desirable to invite building firms of the highest standing to tender privately, as experience had shown that many first-class firms would "not reply to advertisements for tenders in the public Press." An amendment was moved in favour of advertising for open tenders, and on a division this was adopted by thirty-six votes to thirty-one. Owing, however, to the operation of the by-laws the amendment could not be put as a substantive motion, and its further consideration was postponed to the next meeting.—A report was submitted by the Baths Committee announcing that they

had received and considered tenders for the extension of Horney-road baths. The committee recommended the acceptance, at £14,630, of the tender of Mr. H. L. Holloway, Union Works, Deptford. The report was deferred until the next meeting.

Lewisham.—Upon the receipt of a communication from the London Butchers' Trade Society, forwarding a copy of a petition presented to the London County Council in reference to the proposed closing of private slaughter-houses and the establishment in lieu thereof of public abattoirs, the board have decided that to do away with private slaughter-houses would not be in the interests of either producer or consumer, nor required in the interests of the public health. It was stated that the cost of establishing public abattoirs would be £1,000,000, and it might be £1,500,000.—The board have decided to take the necessary steps for the construction of an underground convenience in High-street, Lewisham, at an estimated cost of £1,800.

St. James, Westminster.—An important question, arising out of the proceedings of the Public Health Committee, was brought before the vestry at their last meeting by Mr. W. H. Watson. The speaker drew attention to the committee's recommendation in favour of the soil pipes at the new Carlton hotel being permitted to be placed inside the building. Quoting from the by-laws made by the London County Council under the Public Health (London) Act, 1891, Mr. Watson stated that under these regulations all soil pipes in the case of new buildings must be erected outside the structures, and that in existing buildings the pipes should, whenever practicable, also be placed outside. After a long discussion it was decided to refer the question to the Public Health and Works Committee for consideration and report.—The Public Health Committee reported that they had received a certificate from Mr. Monson, the surveyor, for the payment of £206 0s. to Messrs. Finch & Co. for fixing semi-circular back drains at the Piccadilly conveniences, in lieu of those existing. Having been informed by the surveyor that the work had been completed in a satisfactory manner, the vestry decided to refer the matter to the Finance Committee for payment.—The Works Committee recommended the rescission of a previous resolution declining to sanction the application of the London Hydraulic Power Company to lay mains in three streets unless the company agreed to pay an adequate rent for the privilege. The motion was, however, not carried, the voting being thirteen for and thirteen against rescission.—It was decided to refer to the Works Committee complaints made as to the alleged forcing of steam into the sewers in Carnaby-street from the premises of electric light company. In connection with this question the surveyor stated that he had not been able to ascertain that steam was turned into the sewers, but that the evils probably arose from hot water being passed out, from which steam was given off.—The Works Committee reported that they had invited tenders from six firms and by public advertisement for the supply of horses, carts and men for snow cartage during the winter. The only tenders received were from Messrs. Mead & Co., of Paddington, and Mr. J. Bolton, 11 Little James-street, Bedford-row, these being at a schedule of prices. On the recommendation of the committee it was decided to accept both tenders.

St. Marylebone.—At the last meeting of the vestry the surveyor was asked whether any of the district superintendents had been appointed. In reply, Mr. Waddington stated that the cleansing superintendent had been selected and was on the point of taking up his duties. In this connection Mr. White asked whether the Sanitary Committee had considered the question of applying to the London County Council for a moiety of the salaries of the staff. Mr. W. H. Garbutt, vestry clerk, replied that the authority had always stood outside of any such arrangement, preferring to pay their own salaries. On the motion of Mr. White it was decided to refer the consideration of the question to the Sanitary Committee, the proposer stating that the vestry were paying £1,700 a year, of which one-half should be contributed by the county council.—The Works Committee presented a report in regard to a previous suggestion that the renewal of the trellees in Oxford-street should be carried on both day and night. On the recommendation of the committee it was resolved not to adopt this course.—A motion stood in the name of Mr. G. B. Crook, proposing that the Electric Lighting Committee should be instructed to inquire and report whether the Metropolitan Electric Supply Company have power to sell that portion of their undertakings situated in Marylebone, and whether the vestry can legally purchase it; and that the committee should be authorised to employ experts to advise them on the subject. The consideration of the motion was postponed.—The Works Committee recommended the acceptance, at £127 10s., of the estimate of Mr. George Jennings for erecting a four-stall urinal in Aeneia-road, and that of the same firm, amounting to £158 10s., for a six-stall urinal in Market-place.

PROVINCIAL AND GREATER LONDON AUTHORITIES.

MUNICIPAL CORPORATIONS.

Bristol.—Colonel C. H. Lutal, R.E., Local Government Board inspector, conducted an inquiry on Friday in respect

of the proposed transfer by the corporation of certain consolidated stock and to the application of the proceeds of such transfer in purchasing certain land at Park Road for the improvement of the corporate estates, and certain land in Bodminster-down and Ash-ton gate as sites for power stations. Further, respecting the corporation's proposition to borrow £11,050 for purposes of streets improvement and £142,142 for the provision of a steam roller and other plant.

Burnley.—A Local Government Board inquiry was held on Thursday into an application of the town council for sanction to borrow £10,000 for electric lighting. It was stated that the works had been profitable from the start, yielding a surplus of £500 a year. A sum of £25,000 is already being spent in extending the works and engine-power, and now £10,000 is needed for new mains to meet the rapidly increasing demand.

Canterbury.—Colonel Durnford, R.E., an inspector of the Local Government Board, has conducted an inquiry into an application by the town council for sanction to loans of £5,050 and £1,150 respectively, for the provision of public baths and the erection of dwellings for the labourers employed on the sewage farm. The town clerk and city surveyor attended, on behalf of the council, in support of the application. This application is but a further item of the ambitious programme of the city council, who are glad to record are now going thoroughly ahead, determined to speedily bring themselves quite abreast of the times. Having completed the sanatorium, there is now being installed a combined electricity and refuse destructor plant, at an initial cost of about £30,000. These works are rapidly approaching completion, so that it is hoped the current may be switched on for shop lighting by Christmas. The question, so much combated at present, as to the real calorific value of town refuse will have excellent opportunity of being tested at these works. The refuse destructor plant is by Messrs. Bosman & Deas. The new public library and museum is also nearing completion. The chief works in immediate prospect include a lunatic asylum, new municipal buildings and extended main sewerage; also a central corporation depot and workmen's dwellings. During the last three years the city has been well nigh repaved throughout in all its principal streets, whilst now attention is being directed to the numerous by-lanes. The road surfacing is gradually undergoing a conversion from the old granite and flint macadam road into the more welcome surface, known as "tarred macadam." It is thus evident that Canterbury is by no means lagging in the forward movement.

Dorchester.—The town council have decided to apply to the Local Government Board for sanction to borrow £19,000 for purposes in connection with the extension of the municipal buildings.

Douglas.—The corporation are applying for powers to borrow £50,000 for the construction of a new reservoir in West Baldwin Valley. The present water supply, the source of which is at Onehan, is sufficient for all the probable demands that will be made upon it for some years, but, in view of the growth of Douglas and its position as a health resort, it is thought advisable to have two distinct watersheds and be able to meet almost any emergency. The two reservoirs now in use hold 73,000,000 gallons; the new reservoir is to have a capacity of 300,000,000. The cost will mean an increase in the rates of 3d. in the £1.

Hartlepool.—On Tuesday an inspector of the Local Government Board conducted an inquiry into an application of this authority for sanction to borrow £5,730 for the purchase of a refuse destructor. The mayor gave evidence bearing upon the sanitary aspect of the question, adding that the proposed site was, in his opinion, the best that could be selected. Its area consisted of 2,420 square yards, and its cost would be £700. The inquiry having closed, the inspector visited the *locus in quo*.

Hull.—The Electric Lighting Committee of the corporation on Tuesday accepted the tenders of Messrs. T. Parker & Co., Limited, for switchboards, transformers and motor generator at £3,630; Messrs. Siemens Brothers for cables, &c., at £10,655; and Messrs. Barker & Aspey (Hull) for pump condensers and steam-water pipes, at £915.

Ilkeston.—The town council are applying to the Board of Trade for two provisional orders authorizing the provision of electric tramways and the supply of electricity in the borough. The estimated cost is £80,000.

Ipswich.—At the last meeting of the corporation it was announced that Mr. T. H. Tacon, the present high sheriff of Suffolk, had offered to give to the town a drinking fountain and cattle trough, to be erected near the cattle market at the junction of Princes-street and Portman-road. The design, prepared for the donor by Mr. F. Wheeler, F.R.S.A., of 6 Staple-inn, E.C., showed an erection of Portland stone, with granite base and basin. The gift was accepted with hearty thanks.

Leicester.—The town council, at a large and protracted special meeting, held on Tuesday, unanimously approved of a scheme for bringing the water of the Upper Derwent and Ashop, a distance of 66 miles, to Leicester, at a cost of £4,250,000. The scheme drains the watershed of 31,000 acres, yielding over 50,000,000 gallons daily.

Lichfield.—An inspector of the Local Government Board has held an inquiry into an application of the city council for sanction to borrow £1,083 for the extension of the sewerage system of the city. Mr. C. J. Corrie, the city surveyor, explained the plans.

Loughborough.—A Local Government Board inquiry was held on the 11th inst. respecting an application of the town council for approval to the borrowing of £7,750 for various public works. The items making up this amount are alterations and additions to the town hall, £4,500; works of sewerage, £2,500; public walks and pleasure grounds, £550; and a depot in Dead-lane, £290. The surveyor, Mr. A. H. Walker, was present at the inquiry, at the termination of which the inspector made the usual inspection of the various sites.

Manchester.—In the course of his remarks on election as lord mayor, Mr. W. H. Yawdrey said that the electric light had been in every way a success. It had only been in operation five years, and there were over 200,000 8 candle-power lamps connected with the electric light stations. The charge for the current was one of the lowest in the kingdom, averaging 3½d. per unit. Everyone connected with the city deserved the greatest credit. He had no doubt their electric tramway system, when completed, would give every satisfaction to the citizens, and would also produce large annual profits in relief of the rates.

Marlborough.—At a special meeting of the town council, which was held last week, to consider matters affecting the main drainage scheme, a letter was read from the Local Government Board formally sanctioning the borrowing by the council of £7,400 for works of sewerage and sewage disposal.

Nelson.—The town council, having decided to apply for powers to construct a light railway from Nelson to Colne, have instructed the borough surveyor to prepare the necessary plans, sections, &c. The overhead electric system is proposed to be adopted.

Norwich.—The work of laying tramway lines through the central thoroughfares of the city has been in progress for some six months past. There will be termini on Earlham-road (near the cemetery), Dereham-road, Silver-road, Thorpe-road, Trowse railway bridge, Mousehold Heath, Aylsham-road, Newmarket-road and City-road, and all the lines will converge near the General Post Office. Electric power will be used for traction.

Okhampton.—Mr. G. W. Willcocks held an inquiry recently in regard to an application of the town council for sanction to borrow £150 for works of sewerage. There was no opposition.

Portsmouth.—By thirty-nine votes to three the town council on Tuesday decided to give twelve months' notice to the Provincial Tramways Company of their intention to purchase the local tramways, the question of price to be settled by arbitration. It is proposed, on taking over the system, to substitute electricity for horse traction. The precise kind of electrical traction has yet to be settled, and a deputation is to be sent to various towns in England and on the Continent to obtain information on the subject. The estimated cost of the purchase of the tramways and their equipment is about £245,000.

Sheffield.—We regret to state that a paragraph relating to a Local Government Board inquiry at Sheffield appeared in our "Municipal Works in Progress and Projected" column of our last issue under the heading of "Liverpool."

York.—On the recommendation of the city engineer, the city council have sanctioned the expenditure of £1,000 on the provision of experimental plant for the purification of the city sewage. The lime and aluminoferric process is now in operation, the resulting sludge being pressed in the ordinary manner into cakes, which are disposed of to farmers in the district.

URBAN DISTRICT COUNCILS.

Abergavenny.—On the 17th inst. Colonel C. H. Luard, R.E., held an inquiry, on behalf of the Local Government Board, respecting an application of the district council for sanction to borrow £1,640 for sewerage works, according to plans prepared by their engineer, Mr. J. Haigh. At the close of the inquiry the inspector visited the site of the proposed works, in company with Mr. E. Martin, the chairman of the council, and Major Williams, the chairman of the Sanitary Committee.

Barking.—An inquiry was held at the public offices on Thursday morning by Mr. Herbert H. Law, Local Government Board inspector, relative to an application made by the district council for sanction to borrow £6,500 for works of sewerage and sewage disposal and £3,150 for purposes of public walks and pleasure grounds.

Boxley.—The urban district council have instructed their surveyor, Mr. Tom Vickers, to prepare a scheme and submit the necessary plans for dealing with the sewage of the low-lying portion of the town. Mr. Vickers has already submitted a long detailed report dealing with a proposed scheme for the erection of electric lighting works in the district, and a resolution has been adopted by the council deciding upon an application for a provisional order. The surveyor was at the same time congratulated on his able report.

Bognor.—The district council recently advertised tenders for the construction of a new sea wall and esplanade, 457 ft. in length. Only one tender was, however, received, the tenderers being Messrs. Grounds & Newton, Bournemouth, who offered to carry out the work for £2,667. This amount being considerably above the surveyor's estimate, the council have decided to do the work themselves.

Brigg.—At a special meeting of the council, held recently, the following resolution was adopted: "That a Bill be promoted in the next session of Parliament by this council, authorising them to purchase the undertaking of the Brigg Gas Company, Limited, to manufacture and supply gas, and for other purposes, and that the costs and expenses attending the same shall be paid out of the general district rate, or other public funds or rates under the control of this council."

Gainsborough.—The council are about to promote a Bill in Parliament to authorise and empower them to acquire the gasworks of the town on such terms as may be agreed on between the council and the company, or, failing an agreement, by arbitration under the provisions of the Lands Clauses Acts. The initial cost will be heavy, but as the company are at present paying a good dividend there is no reason why the works should not be a source of revenue.

Gomersal.—A Local Government Board inquiry is to be held here on Tuesday next into certain applications of the council for sanction to borrow £10,000 for purchasing the undertaking of the Gomersal Waterworks Company and £8,000 for carrying out sewage works within the Birstall township.

Leyton.—On Friday last Mr. Robert H. Bicknell, an inspector of the Local Government Board, held an inquiry at the town hall, Leyton, with respect to applications made by the district council for sanction to borrow £3,230 for private street improvement and £4,965 for public street improvements. Mr. Dawson, the council's surveyor, explained the plans. There was no opposition.

Newport Pagnell.—Mr. E. A. Sandford Fawcett conducted an inquiry last week, on behalf of the Local Government Board, into an application of the urban district council for permission to borrow £9,000 for works of sewerage and sewage disposal. Messrs. D. Ralton & Sons, of London and Newcastle, are the engineers for the works, to which, it may be mentioned, considerable opposition is being made.

Uckfield.—A Local Government Board inquiry was held last week with regard to an application of the urban district council for sanction to a loan of £600 for sewerage extensions at the north end of the town. Mr. C. Thompson, the surveyor, explained the working of the scheme, to which no opposition was offered.

Walton-on-the-Haze.—The district council have adopted the scheme prepared by Messrs. Frederick Beesley & Son for the improvement of the drainage of the town, whereby the sewage will be conveyed to a point locally known as the Twizzle. Application is to be made for sanction to a loan of £6,000 to carry out the work.

Wath-upon-Dearne.—On the 16th inst. an inquiry was held by Mr. R. J. Reece, M.D., Local Government Board inspector, into an application of the Wath, Swinton, Greasborough and North Rotherham Joint Hospital Board for sanction to borrow a sum of £9,000 for the purpose of purchasing land and building an infectious diseases hospital for the district. Evidence was given by Mr. W. T. Campsall, architect to the board, and Mr. H. C. Poole, surveyor to the urban district council. No opposition was offered to the scheme.

Wilmslow.—On Thursday last Colonel Smith, an inspector of the Local Government Board, held a public inquiry at Wilmslow respecting the district council's application for sanction to borrow £2,000 for the purchase of land required for new public offices and street improvements. The council propose to remove old buildings near Swan-street, erect offices, and widen the Manchester and Alderley main road.

Withington.—A meeting of the council was held on Thursday. The proceedings of the Parliamentary Committee, which were adopted, included a resolution instructing the clerk to arrange for an interview with the Tramways Committee of the Manchester Corporation, with the view of discussing the terms upon which the corporation will be prepared to take a lease of the trams in the district; and providing that, in the event of an arrangement not being made, a Bill be promoted in the next session of Parliament empowering the council to work the tramways themselves.

RURAL DISTRICT COUNCILS.

Alnwick.—At a meeting of the council, held last week, it was resolved to apply to the Local Government Board for sanction to borrow £650 for additional works of water supply for Alnwick.

Brailes, Warwickshire.—The district council have instructed Mr. J. E. Willcox, of Birmingham, to report upon a question of water supply for the district of Little Compton.

Cwyrfai.—At a meeting of this body on Saturday a committee were appointed for the purpose of taking the preliminary steps to obtain an Act of Parliament to enable

them to secure the waters of the lake and tarns in their district which have not already been appropriated, for their own use, and to take over all the waterworks in their district. A letter was read from the Local Government Board sanctioning the borrowing of £2,000 for the construction of a waterworks at Portdinorwic, and it was resolved to proceed with the work forthwith.

LONDON WATER SUPPLY COMMISSION.

The Royal Commission on the subject of the London water supply held their thirty-fifth meeting at the Guildhall, Westminster, on Monday. The proceedings, however, were conducted in private. Another sitting was held on Tuesday.

Mr. REGINALD E. MIDDLETON, asked for his view as to the effect upon the consumer of the purchase of the water companies' undertakings, said there would be a loss to the consumer, and still more to the ratepayer, if the conditions of revenue spoken of by the witness of the London County Council were carried out; that was to say if the rates were reduced to one level for all London. Several of the costs now borne by the companies would in future be borne by the ratepayers, such as frosts and droughts. Then he did not think the purchase would be remunerative, because the price would be such as to prevent it from being remunerative at once; but no doubt it would be remunerative in time. He thought it was more fair to have differential rates than one rate for London, because it cost more to supply higher than lower districts. He thought that a company worked by a board who had been in existence for a great many years, and who were paid to do their duty, were more likely to be economical than one of a fleeting character, who were unpaid and who were unlikely to effect economies. Moreover, he thought municipal management did not, as a rule, effect economies. He did not believe in the necessity of going to Wales for an additional supply. If there was such a necessity there would be a deduction on that account from the cost of purchase. In his opinion it would be practicable for the county of London to purchase the whole existing supply and give the outside districts their present supplies with a margin, but it would be inconvenient and expensive. He was opposed to severance between London and the outside counties, because he thought it undesirable that there should be division of authorities.

The commission will meet again on Monday, when the examination of Mr. Reginald Middleton will be resumed.

LOCAL GOVERNMENT.

On Friday, at the London School of Economics and Political Science, London, Mr. H. Hobhouse, M.P., delivered a lecture upon "Devolution and the Limits of Local Government." He said that we had in this country a vast and complicated array of machinery for conducting our local government, but this machinery was somewhat imperfectly organised and lacked coherence amongst its various members. The existing local bodies were dependent on Parliament, either being the creatures of statute, or, if created by charter, being invested with statutory powers. Thus Parliament could at any time modify their constitution and their powers. But melancholy as was the subject subjection of all local authorities to Parliament, still more humiliating were their relations to the central executive. They were, as a rule, subject to a twofold control, administrative and financial. The relations of the local bodies to each other afforded still more room for reflection than their relations to the central executive; indeed, if Englishmen were not generally gifted with common sense and a prejudice in favour of low rates, it was appalling to think of the waste of money which might be caused by the present want of organisation. But the existing want of co-ordination would perhaps be tolerable, and might certainly be remedied if it were not for another element which greatly aggravated and complicated the situation—namely, the constant struggle of the minor local authorities for autonomy. He mentioned that local affairs were best administered locally, because local knowledge was essential to meet the varying circumstances of the district, and that decentralisation resulted in greater economy, more freedom from politics, and in the encouragement of local public spirit.

THE SANITARY INSTITUTE.

NEWCASTLE-UPON-TYNE EXAMINATIONS.

At an examination for inspectors of nuisances, held at Newcastle-upon-Tyne, by the Sanitary Institute, on the 11th and 12th inst., thirty-six candidates presented themselves, twenty-four of whom were certified as to their sanitary knowledge, competent to discharge the duties of inspectors of nuisances.

The following were the questions set for answer in writing: (1) What is the difference between a disinfectant, an antiseptic and a deodorant? Name the best means of disinfecting (a) dejecta, (b) bed linen, (c) mattresses and (d) rooms. (2) What statutory provisions exist for preventing the use of polluted well water for drinking purposes? (3) What is the

usual procedure adopted when an inspection of a well and its outlet exposed for sale? (4) What nuisances are likely to arise in the following trades: (a) Manufacture of kerosene, (b) the storage of cotton of calcium, (c) the manufacture of illuminating gas from crude petroleum, and (d) the distillation of spirits. (5) A nuisance arises from a foul accumulation of matter on private premises. What power of entry is given by the Public Health Acts, and how would you deal with the nuisance? (6) How would you proceed to test (a) new drains and (b) old drains? (7) Describe the various forms of sewers and lead traps in common use. Give the best show of the diameter of the traps and the positions in which they should be placed. (8) How long will it take to fill a cistern 5 ft. by 4 ft. by 3 ft. 6 in. through a pipe 1 in. diameter the rate of flow being 3 ft. per second.

INSTITUTION OF CIVIL ENGINEERS.

ORDINARY MEETING.

An ordinary meeting of the Institution of Civil Engineers will be held on Tuesday, at 8 p.m., when a paper will be read by Mr. Stanley Robert Kay, A.M.I.C.E., entitled "The Effect of Subsidence due to Coal Workings upon Bridges and other Structures." A discussion will follow the reading of the paper.

STUDENTS' MEETING.

A meeting for the students of the Institution will be held on Friday, at 8 p.m., Mr. T. Forster Brown, member of the council, in the chair. Mr. Charles Benjamin Sauer will read a paper on "The Sunlight Gold-bearing Reef, Lydenburg, Transvaal."

Self-propelled Traffic.—At the opening meeting of the Liverpool and district centre of the Self-propelled Traffic Association, held at Liverpool on Wednesday, Prof. Hele Shaw, one of the judges, gave a description of the different vehicles in the late competition. The report of the judges in the trials was also submitted and adopted. The report stated that the judges did not consider the motor vehicles could successfully compete for traffic with railways at reduced rates except under special circumstances, while greater maintenance and depreciation charges for common roads would be involved than were used in the judges' calculations. The limit of tare imposed by the Highway Act of 1896 tended to reduce seriously the strength of the working parts and prevented the construction of a really satisfactory motor vehicle. An increase in the limit from 3 tons to 4 tons would have no inconvenience, while a tare of 6 tons might be allowed in certain localities, but such increase should not be accompanied by new restrictions.

Electrical Transmission of Power.—On Wednesday, at the Society of Arts, Prof. George Forbes, F.R.S., read a paper on the "Long-Distance Transmission of Electric Power." In the course of the paper the lecturer remarked that, though long-distance transmission had been much talked about, little had been done, and there were few people who realised what a vast field there was in that way for investment of capital on a sound commercial basis. He proceeded to refer to some instances with which he had to deal in India, New Zealand and Egypt, in which long distances were concerned. Thus he found, when considering the utilisation of the Nile cataraets, that the electric lighting of Cairo could be done more cheaply by power generated at the first cataraet—100 miles distant as the crow flies—than by steam engines at Cairo, and he believed that if the gold mines in Rhodesia were really good it would pay handsomely to transmit electric energy 500 miles from the Victoria Falls of the Zambesi, provided the surveys showed the falls to be as satisfactory as they appeared by the photographs, and provided that fever was not an insurmountable obstacle.

Received too late for Classification.

**BOROUGH OF GUILDFORD.
SUPERINTENDENT OF OUTFALL SEWAGE WORKS.**

The Corporation of Guildford invite applications from persons competent to undertake the duties of Superintendent of the Outfall Sewage Works at Belfields, Stoke New Guildford.

The person appointed will be required to devote the whole of his time to the work and to reside in the house provided at the works, and he will act under the directions of the Borough Surveyor.

Candidates must have a thorough knowledge of steam engines, air compressor, and sludge-pressing plant, and to be able to work this machinery.

A schedule of the duties, and particulars of the salary if paid, can be obtained, after the 30th inst., on application at the Town Clerk's office.

Applications, with copies of not more than three testimonials of recent date, must be sent to me on or before the 10th December next.

FERDINAND SMALLWOOD

Town Clerk.

138 High Street, Guildford.

November 24, 1898.

THE PURIFICATION AND STERILISATION OF DRINKING WATER.

HOWATSON-BERGE SYSTEM.

The question of the purification and sterilisation of water has never attracted so much attention as at present. A few notes on the above-named system may therefore be of interest. It is a combination of the Howatson filter with a method of sterilisation devised by Profs. Henri and Albert Bergé, of Brussels. The germicide employed is chlorine peroxide (ClO_2), prepared by the action of sulphuric acid (specific gravity 1.711) on chlorate of potash, at a temperature of 15 deg. Centigrade, and used either in the gaseous condition or in the form of a standardised solution. It is claimed for the Bergé germicide that it possesses a greater oxidising energy than ozone, by virtue of which power it rapidly burns up (in the chemical sense) any organic matter with which it comes in contact; and, furthermore, that whilst fatal to bacteria and the germs of micro-organisms and microscopic plants generally, it is innocuous towards man, animals and the higher members of the vegetable kingdom, both fishes and ordinary plants thriving in water charged with an excess of the peroxide. The advantage of cheapness is also claimed for this reagent, the quantity required for ordinary natural waters in a relatively pure condition being 2 grammes per cubic metre of water, and the cost 1d. per 100 cubic metres (22,000 gallons). In the case of waters polluted by sewage the quantity has to be increased to about 5 grammes per cubic metre, in order to ensure the destruction of the micro-organisms present.

No inconvenience attends the employment of the peroxide—so far as risk of overloading the water with chlorine is concerned—since the amount of chlorine in 2 milligrammes is only 0.0004 grammes, whilst the town water of Brussels, which contains 0.011 grammes of chlorine per litre (i.e., twenty-seven times as much), is considered as very low in that constituent. The water treated by the Bergé method has an agreeable flavour, and is not subjected to any great modification in chemical composition, the only changes produced—viz., diminution of organic matter, increase of oxygen in solution, and complete destruction of micro-organisms—being quantitatively slight, though highly advantageous.

In the report issued by Messrs. E. André, chief inspector of waterworks to the Belgian Board of Works, and A. Vernaert, municipal engineer of Ostend, are detailed the results obtained by the Howatson-Bergé system in the purification of the water supply of the above-named seaside resort. The water is passed through a Howatson purifier, where it is freed from calcareous salts and most of the suspended organic matter, and is afterwards conducted through sand filters and a polarite filter. For the sterilisation process a small pneumatic pump is employed to force air, under a pressure of about two atmospheres, into a reservoir, for the purpose of washing out the generating apparatus producing the peroxide and for driving the gas into the solution vessels. The solution is drawn off into a lead-lined tank, fitted with a graduated tap leading to the conduit containing the water to be sterilised, and the mixture of germicide and water is allowed to run through a coiled pipe, in order to ensure a thorough admixture of the two before reaching the open air. A slight excess of the peroxide is necessary for the destruction of the organic matter, a condition which may be regarded as attained when the purified water gives a decided blue colouration to potassium iodide and starch.

The bacteriological examination of the water, both before and after purification, was performed by Profs. Van Ermenghem, De Molinari and Petermann, who report that of the various micro-organisms—including *Bacillus liquefaciens*, *Bacillus ramosus*, *Bacillus coli commune*, *Bacillus subtilis*, &c.—practically none survived the treatment. The engineers' report concludes with an expression of opinion very favourable to the process, on account of its rapidity and reliability.

In connection with the use of chlorine peroxide, however, it should not be forgotten that it is a very unstable gas, which decomposes on exposure to light, and at a temperature of about 50 deg. centigrade explodes with violence. This explosion is also liable to occur at low temperatures if the chlorate of potash used contains any potassium chloride.

The Parliament-street Improvement.—The First Commissioner of Works has, through the Hon. E. B. Brett, written to the vestry of St. Margaret and St. John, Westminster, stating that the remaining blocks of buildings between Parliament-street and King-street will very shortly be demolished, and the site between those streets entirely cleared. In these circumstances it is desirable, he states, that the new line of street adopted by the Government should be formed without delay, and it is suggested that steps should be taken as soon as possible to carry out the requisite alterations. The Works and General Purposes Committee of the vestry recommended that body, at their meeting on Wednesday, to inform her Majesty's Office of Works that the vestry concur in the desirability of the new line of street being formed without delay, but that it does not appear that the Act of Parliament under which the improvement is being carried out imposes any obligation upon the vestry in the matter.

SOME RECENT PUBLICATIONS.

Any of the Books noted below will be sent post free if the published price be forwarded to the offices of THE SURVEYOR.

- SHROPSHIRE, by Augustus J. C. Hare, with illustrations by the author; 7½ in. by 5½ in., 340 pp. George Allen. Price 7s. 6d.
- AN OLD ENGLISH HOME AND ITS DEPENDENCIES, by S. Baring Gould, with illustrations by F. Bigh Bond; 7½ in. by 5½ in., 336 pp. Methuen & Co. Price 6s.
- THE STORY OF THE FARM, Some Essays on Agricultural Economy by James Long; 7½ in. by 5 in., 158 pp. The Rural World Publishing Company. Price 1s.
- THE YOUNG ESTATE MANAGER'S GUIDE, by Richard Henderson, F.S.I., with an introduction by R. Patrick Wright, F.R.S.E.; 7½ in. by 5 in., 266 pp. William Blackwood & Sons. Price 6s.
- GENERAL REPORT OF THE OPERATIONS OF THE SURVEY OF INDIA DEPARTMENT, 1896-97, prepared under the direction of Major-General C. Strahan, R.E., Surveyor-General of India, with photo. etchings and numerous maps; 13 in. by 8½ in., 166 pp., office of the Superintendent of Government Printing, Calcutta. Price 3 rupees (8s. 6d.).
- LOWESTOFF IN OLDEN TIMES, by Francis D. Longo; 9 in. by 6 in., 103 pp. Simpkin, Marshall, Hamilton, Kent & Co., Limited. Price 1s. nett.
- APPLIED GEOLOGY, Part I, by J. V. Elsdon, B.S.C.LOND., with numerous illustrations; 8½ in. by 5½ in., 96 pp. The Quarry Publishing Company, Limited. Price 6s.
- BLACK'S GUIDE TO CANTERBURY AND THE WATERING-PLACES OF EAST KENT, edited by E. D. Jordan, B.A., with six maps and plans; 6½ in. by 1½ in., 128 pp. Adam & Charles Black. Price 1s.
- GAS AND PETROLEUM ENGINES (The Electro-Mechanical Series), translated and adapted from the French of Henry de Graffigny, and edited by A. G. Elliott, B.S.C., with illustrations; 7 in. by 5 in., 140 pp. Whitaker & Co. Price 2s. 6d.
- PHOTOGRAPHS OF 1898: A Pictorial and Literary Record of the Best Photographic Work of the Year, compiled by the editors and staff of *The Photogram*; 10 in. by 6½ in., 112 pp. Dawbarn & Ward, Limited. Price 1s. nett, or in cloth 2s. nett.
- DISINFECTION AND DISINFECTANTS, together with an Account of the Chemical Substances used as Antiseptics and Preservatives, by Samuel Ridal, B.S.C.LOND. (second edition), with diagrams; 9½ in. by 6½ in., 372 pp. The Sanitary Publishing Company, Limited. Price 12s. 6d.
- THE HOUSING OF THE WORKING CLASSES ACT, 1890, AND AMENDING ACTS, Annotated and Explained, together with Statutory Forms and Instructions, by Charles E. Allan, M.A., LL.B., assisted as to the Practice by Francis J. Allan, M.D., D.P.H.; 8½ in. by 5½ in., 186 pp. and index. Butterworth & Co. Price 7s. 6d.
- THE ARGUS GUIDE TO MUNICIPAL LONDON, for the Local Government Year, 1898-99, edited by Fredk. J. Higginbottom; 7½ in. by 4½ in., 263 pp. *The London Argus Office*. Price 1s.
- THE PROPERTY PROTECTION SOCIETY, Eighth Annual Report of the Council, 1897-98; 8½ in. by 5½ in., 8 pp. Offices of the Society, 45 Parliament-street, S.W.
- MODERN OFFICE-HOUSES AND THEATRES: Examples selected from Play-Houses recently erected in Europe, with numerous plates and illustrations, by Edwin O. Sachs, architect; three vols., 1898, 21 in. by 16 in. Price £15 nett.
- PROCEEDINGS OF THE ASSOCIATION OF ONTARIO LAND SURVEYORS, 1898.
- "THE INDIAN AND EASTERN ENGINEER" DIARY, 1899.
- Publications of the British Fire-prevention Committee, edited by E. O. Sachs, vol. i. Published by the Committee. Price 7s. 6d.

FOUNTAINS AND TROUGHS.

Among bodies that have done good work in their time is the Metropolitan Drinking Fountain and Cattle Trough Association. It is therefore a matter for regret to hear that, owing to the necessity for retrenchment, the association have deemed it desirable to close their works department and place the care of the fountains and troughs under the various vestries. For upwards of thirty years the work of the association at Clapham has been under the management of Mr. R. D. Gibbs, who has thus had a long and perhaps unique experience in the design and manufacture of fountains and cattle troughs, seeing that the first granite trough erected in the metropolis was not only designed by him, but manufactured and erected under his supervision. Since then about 1,000 fountains and troughs have been erected by him in the metropolis and its suburbs on behalf of the association. It has been suggested to Mr. Gibbs that he should continue to carry on the work as a private enterprise of his own, and we understand that he has decided to do so, and has succeeded in making arrangements with a good firm of granite quarry owners, who will supply the raw material on favourable terms. Mr. Gibbs will be found at 265 Clapham-road, S.W., and will be glad to submit to those interested estimates for fountains, cattle troughs, public memorials, and for the repair, inspection and cleaning of existing structures.

Personal.

Matlock Bath Urban District Council have granted their gas manager, Mr. W. Gaffrey, an increase of salary.

Mr. B. F. C. Costello, L.C.C., delivered a lecture on Saturday at Toynbee Hall on "The County Council of London."

Mr. Balfour, it is stated, will introduce and take charge of the London Municipalities Bill, which is to be brought forward in the next session of Parliament.

Mr. David Kayno Wright, 13 West-street, Stockton-on-Tees, has been appointed a drainage and building inspector under the Stockton-on-Tees Corporation.

Mr. Wm. Dixon, surveyor to the Lytham Urban District Council, has been appointed to the position of surveyor to the Lancaster Rural District Council.

The council of King's College, London, have appointed Mr. Ernest Wilson, M.I.E.E., professor of electrical engineering in succession to the late Dr. Hopkinson.

Mr. E. E. Hoadley, of the Worcester Corporation electricity works, has been appointed resident electrical engineer to the Barking Town Urban District Council.

At their usual meeting, on Thursday, the Court of Common Council decided, on the recommendation of the Streets Committee, to appoint four new inspectors of pavements, at salaries of £200 per annum.

A debate upon the question of "Municipal Control v. Companies Control" (with reference to the gas and water companies) was opened last night by Lord Monkswell, L.C.C., at the South-Western Polytechnic.

Messrs. Simpson & Harvey, engineers and surveyors, Leicester, have been instructed by the Lutterworth District Council to prepare a report on the best available method of disposing of the sewage of the town.

The burgh surveyor and electrical engineer of Aberdeen will accompany a committee of the town council on a visit to Glasgow on December 6th, for the purpose of making an inspection of the electric system of tramsways in that city.

Stretford Urban District Council have adopted the resolution of a sub-committee recommending the appointment of Mr. Reginald P. Wilson, of London, as engineer in connection with a scheme for the electric lighting of the town.

After considerable discussion the Gwyrfaï Rural District Council on Saturday adopted the resolution of a committee recommending the appointment of a surveyor of highways at an annual salary of £150 per annum. At present each parish has its own official.

At their meeting on Wednesday the Battersea Vestry decided, on the recommendation of their Lighting Committee, to appoint Mr. H. Riley, of 28 Victoria-street, Westminster, S.W., to prepare the bills of quantities in connection with the projected electric light station to be erected by the vestry.

In connection with a recent public baths competition at Wimbledon the first prize, of £50, has been awarded to Mr. Robert J. Thomson, a resident of the town; the second, of £25, to Mr. Francis J. Smith, of Victoria-street, Westminster; and the third, of £10, to Messrs. George A. Lansdowne and A. R. Jennit, also of Wimbledon.

In the recent open competition for schemes of sewerage and sewage disposal for the districts of Baildon Wood, Baildon Green, Lower Holme and Low Mill, the Baildon Urban District Council have, on the advice of Mr. G. Chatterton, M.I.C.E., the assessor, adopted the scheme submitted by Mr. H. Bertram Nichols, of Birmingham.

The appointment is announced of Mr. A. C. Richmond, surveyor to the Keynsham Rural District Council, and formerly surveyor to the Dulverton Rural District Council, to the position of surveyor to the Bridgwater Rural District Council, in succession to Mr. S. W. Ingram. Mr. Richmond is the son of a former surveyor to the Taunton Highway Board.

The first annual dinner of civil engineers, architects and surveyors of Newport was held recently at the Westgate Hotel. The toast of the evening—"The Professions of the Civil Engineers, Architects and Surveyors," was given by Mr. W. Lyndon Moore, and responded to by Mr. R. H. Haynes (the borough engineer of Newport), Mr. John Brain and Mr. John J. Swallow.

At the first meeting of the Institution of Electrical Engineers after the recess the president, in alluding to the loss sustained by the death of Dr. John Hopkinson, spoke of the sincere sorrow and great regret which the council felt, and said he thought it would be the wish of the members to unite in giving expression to that regret. A motion to this effect was subsequently adopted.

A special meeting of the Saffron Walden Town Council was held on Friday morning for the purpose of electing a borough surveyor in succession to Mr. G. W. Lacey, resigned. There were sixty applicants for the post, and in the end Mr. A. H. Forbes, who is at present under the Chesham (Bucks.) Urban District Council, was unanimously elected. Mr. Forbes commences his duties in January next, at a salary of £175 per annum.

At a recent meeting of the Badgeworth Highway Board consideration was given to the appointment of a surveyor to the late Mr. G. Govey in the surveyorship of the roads of the district. There were only eleven applicants and Mr. E. H. Atwater was eventually appointed. The position, it might be stated, is of a temporary character, as the county council take over the duties of the highway board at the end of March next.

Mr. R. Moffatt Ford, manager of the Motor Car Company, 93 and 94 Long-acre, W.C., has addressed a letter to *The Times* on the London traffic problem. The congestion in the streets would be diminished by one-half, the writer says, if the horses which supply its muscular motive force, and take up half the space of the traffic, could be eliminated. It rests with engineers to effect this reduction by the adaptation of the motor system, and ten years is given in the letter as the period in which the reform should be effected.

We regret to announce the death, which occurred at his residence in Tranmere, after a brief illness, of Mr. Peter Blair, one of the oldest officials of the Birkenhead Corporation. Mr. Blair was employed in the engineer's department at Woodside Ferry for many years, having been there under the old commissioners prior to incorporation twenty years ago. He was superintendent engineer at the ferry for a long period, and a few years ago, upon retiring from active work, was appointed consulting engineer. He was seventy-three years of age.

News was received in Durham on Saturday of the death, on the previous day, of Mr. James McGregor, recently of Durham, and for over a quarter of a century the surveyor under the now extinct Durham and Chester-le-Street Highway Board. Mr. McGregor, who spent his early life in Perthshire and Sterlingshire, came to Durham, when comparatively a young man, as surveyor of the Great North Road between Durham and Gateshead. He became well-known throughout the north of Durham, and retired in 1891, when, on the introduction of the Local Government Act, the Durham and Chester-le-Street Highway Board became absorbed in the Durham Rural District Council.

We recently mentioned that Mr. S. C. Eagles had entered upon private practice as a consulting sanitary engineer and surveyor at Clarendon Chambers, 1 and 2 Waterloo-street, Birmingham. Mr. Eagles began his professional career as a pupil under Mr. J. Edward Wilcox, and for ten years has had considerable experience in the various branches of sanitary engineering. For three years he was deputy surveyor to the Erlington Urban District Council, and in this capacity he had an opportunity of gaining experience in the different branches of municipal engineering work. Until recently Mr. Eagles was acting as engineering assistant to the city surveyor of Birmingham, being specially engaged in connection with the new sewerage scheme for Harborne and Edgbaston.

By the death of Sir John Fowler, Bart., at Bournemouth, on Sunday night, one of the most celebrated civil engineers is removed from our midst. Many of the railways in the kingdom bear the marks of his genius, and his association with the engineering history of our times is not confined to these islands. He had his share, for example, in the British assistance of Egypt, for he was consulting engineer for a time in the dominion of the Khedive. He was very early associated with railway engineering. His parents, Mr. and Mrs. John Fowler, of Wadsley Hall, Yorkshire, apprenticed him to Mr. J. T. Leather, a hydraulic engineer, and he was afterwards an assistant to Mr. Rastrick in the construction of the London and Brighton Railway. He was but twenty-seven years of age when he received, in 1844, the appointment of engineer for the construction of the Manchester, Sheffield and Lincolnshire Railway. He was engineer for the original underground railway of London, and he built the Severn Valley Railway, the Lameston and South Devon Railway, the Isle of Wight Railway, the Birmingham and Stourbridge Railway, and the Great Northern and Western of Ireland systems. With the docks and river improvements of the country, also, his name has been largely associated, but the engineering achievement with which Sir John Fowler's name is now mainly associated in the public mind is the Forth Bridge, which he and Sir Benjamin Baker designed for spanning the Firth of Forth at Queensferry. The Prince of Wales opened the bridge in 1890, and announced that the Queen had conferred a baronetcy upon the engineer. He had previously been made a K.C.M.G. for his work in Egypt, and the honorary degree of D.Sc. was conferred upon him by Edinburgh University in the year the Forth Bridge was opened. Sir John Fowler married, in 1850, Elizabeth, daughter of Mr. James Broadbent, Manchester. His son, who succeeded to the baronetcy, is married to Alice, daughter of Sir Edward Clive Huxley, K.C.S.I. Sir John Fowler, who was eighty-one years of age, had been in delicate health for some time at Bournemouth, but his death came unexpectedly. The funeral took place at Brompton cemetery yesterday afternoon, the first part of the service being held at St. Mary Abbots, Kensington.

THE SHOREDITCH DUST DESTRUCTOR AND ELECTRIC LIGHT UNDERTAKING.

THE FIRST YEAR'S WORKING.

In our last issue we referred to a report which had been presented to the Shoreditch Vestry by the Lighting Committee of that body, and which embodied the accounts for the year ended June 24, 1898, in connection with the combined electric light and dust destructor undertakings. In view of the attention and criticism which these schemes have attracted, our readers will no doubt be glad to have the full text of the report, which is as follows:—

I.—ELECTRIC LIGHT UNDERTAKING.

ACCOUNTS FOR YEAR ENDED JUNE 24, 1898.

Cr.	£	s.	d.
1897.			
Sep. quarter.—To sale of current to consumers	549	14	2
Dec. quarter.— " " " "	2,141	16	0
1898.			
March quarter.— " " " "	3,410	18	9
June quarter.— " " " "	2,151	13	2
	£8,254	2	1
To sale of current to dust destructor from June, 1897, to June, 1898	536	5	8
" miscellaneous receipts from June, 1897, to June, 1898	120	4	7
" sale of stores to other departments from June, 1897, to June, 1898	130	8	4
	£9,041	0	8
<i>Dr.</i>			
By coal	432	15	9
" water	217	11	3
" stores, &c.	362	12	6
" insurance	226	0	3
" wages	1,472	13	10
" engineer's salary, proportioned	145	16	8
" miscellaneous expenses	323	14	1
" rent, rates and taxes—principally on substations	33	10	3
	£3,214	14	7
" interest and redemption	2,641	16	2
" nett balance	3,184	9	11
	£9,041	0	8

Leaving a surplus for the year of £3,184 9s. 11d.

It will be seen from the above that the excess of income over expenditure of this part of the undertaking was £5,826 6s. 1d., and that, after providing for interest and redemption of capital on this account of £2,641 16s. 2d., it leaves a surplus balance (being profit) of £3,184 9s. 11d., which your committee cannot but regard as a very highly satisfactory result in view of the fact that in the first quarter a loss of about £500 was actually incurred, when the demand for electricity was small.

The charge for interest and redemption of capital is more than sufficient to provide for the depreciation on this undertaking, as it is really redeeming the cost of buildings and land, which will be a clear asset to the vestry in forty-two years; independent of which all charges for the up-keep and maintenance in full working order of the plant has been included in the expenditure items of the above accounts.

II.—DUST DESTRUCTOR UNDERTAKING.

ACCOUNTS FOR YEAR ENDED JUNE 24, 1898.

Cr.	£	s.	d.
By work done for electric lighting department	59	0	0
" trade refuse receipts	238	1	9
" charged to scavenging department, at 2s. per ton on 23,137 tons	2,313	14	0
" debit balance	1,758	14	6
	£4,369	10	3
<i>Dr.</i>			
To wages (including proportion of engineer's and clerical salaries)	2,829	8	3
" stores, &c.	130	8	1
" carting clinker	612	10	5
" insurance	43	4	2
" current for light and power used in destructor, 128,708 units at 1d.	535	5	8
" sundry expenses, including water and rates, &c.	217	13	8
	£4,369	10	3

Leaving a debit balance of £1,758 14s. 6d., against which is to be set off the cost of steam supplied to the lighting station and library.

It will be observed in the above accounts that your committee have agreed with the Scavenging Committee that a fixed charge of 2s. per ton should be made against that department for the cost of disposing refuse, which will result in

a saving to the vestry (on its previous expenditure of 3s. 1d. per ton) of a sum of £1,253 5s. 1d.

With regard to the debit balance of £1,758 14s. 6d., this is represented by steam used in the lighting station and library, &c. Even if this debit balance be charged against the surplus of the electricity undertaking, the following would be the nett result to the vestry of the combined scheme:—

	£	s.	d.
Credit balance on electricity undertaking	3,184	9	11
Add saving on previous expenditure of barging refuse	1,253	5	1
	£4,437	15	0
Deduct debit balance on destructor	1,758	14	6
Nett profit and saving	£2,679	0	6

In view of the high initial cost of disposal of clinker, and the sale of electricity being very small at the commencement of the year, your committee think the above result one upon which they can well congratulate themselves, and they are advised that no previous municipal electrical undertaking has ever yielded such a result in the first year of working. Moreover, it is manifest from the increased supply of electricity now being given and the reduced cost of disposal of clinker and the use of the exhaust steam for heating the baths, that the result for the second year's working should show an immense advance upon the above accounts, although it must be borne in mind that the prices have been reduced 25 per cent., which is the lowest charge in London, and compares favourably with any provincial station. In the above accounts all charges for repairing and maintaining the destructor, cells, balking, &c., have been included.

Your committee therefore recommend that the above report be received, and it be referred back to your committee to allocate the disposal of the profits.

A JOINT REPORT.

The Lighting and Scavenging Committees also presented the following joint report:—

Your committees have carefully considered the question of the amount to be charged for destroying refuse in the destructor, and although the previous charge for barging refuse was 3s. 1d. per ton, exclusive of redemption of interest and capital for wharf sheds, buildings, &c., your committees think that the scavenging department should have the prior claim upon any profits made from the combined scheme, and therefore recommend: (1) That a fixed charge of 2s. per ton be made against the scavenging department by the lighting department for destroying refuse in the destructor.

In order to maintain the same basis with regard to the dust destructor as exists with regard to the barging system, and in view of the fact that an amount of £2,641 16s. 2d. (which corresponds to depreciation) has been charged in the above accounts for redemption of capital, &c., whereas the valuer of the London County Council in rating the property estimated £800 per annum as sufficient to replace plant and machinery when worn out. Your committees recommend: (2) That the charge for interest and repayment of capital of £1,435 13s. 4d., in respect of the dust destructor, land and buildings, &c., should be paid out of the general rate.

As we stated last week all the recommendations were agreed to, in spite of some very hostile criticism.

ELECTRIC LIGHT AT RATHMINES.

£50,000 REQUIRED.

On Monday of last week Mr. Charles P. Cotton held an inquiry at Rathmines, on behalf of the Local Government Board, in reference to an application of the town commissioners, acting as the urban sanitary authority, for sanction to a loan of £50,000 for the purpose of lighting the district by electricity.

Mr. F. P. FAWCETT, secretary to the commissioners, said the commissioners had had the matter under consideration for some time. A good deal of pressure was put on them by the inhabitants to introduce electric lighting in the township. In 1895 the commissioners consulted the eminent electrical engineer, Mr. Robert Hammond, who submitted a report to them. Finally, by resolution, the commissioners determined to apply to the Board of Trade for an electric lighting order. A provisional order was made, and the Act confirming it obtained the Royal assent on July 20, 1896. Mr. Hammond had had a complete scheme before the commissioners, which they approved of. Land at the rear of the town hall had been obtained as the site for the power-house.

Mr. ROBERT HAMMOND, electrical engineer, gave evidence, explaining in detail the scheme which had been adopted by the commissioners. Under the provisional order, mains would have to be laid within two years of the commencement of the order. The total length of distributing mains proposed to be laid was 25,000 yards, or over 14 miles. He had advised the commissioners that they would be making an extremely good investment for the township by the erection of these electrical works. The total estimate was £35,000, and he estimated that the other small general expenses would total £50,000.

Mr. DIXON, township engineer, also gave evidence, and the inquiry closed.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

VOLUNTARY PASS EXAMINATION.

Notice is hereby given that the twenty-seventh examination for candidates for surveyorships under municipal corporations and district councils will be held at the Institution of Civil Engineers, Great George-street, Westminster, on Friday and Saturday, April 14 and 15, 1899.

The council reserve to themselves the right to hold a second examination in case the entries received exceed the limits of accommodation. Such second examination will be held as soon after the first as circumstances permit. Applications will therefore be accepted strictly in the order of priority.

Application forms, duly filled in by intending candidates, together with entrance fee of £2 2s, must be in my hands on or before the 5th of March, 1899.

THOMAS COLE, Secretary.

11 Victoria-street, Westminster, S.W.

THE SURVEYORS' INSTITUTION.

STUDENTS' PRELIMINARY EXAMINATION, 1899.

Those proposing to enter their names for the students' preliminary examination, to be held on the 18th and 19th of January next, must intimate their intention to the secretary before the last day of November. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London. Irish candidates will be examined in Dublin.

PROPOSED SPECIAL-CERTIFICATE EXAMINATIONS (FOR MEMBERS), 1899.

Notice is also given that the next special-certificate examinations in forestry, sanitary science and land surveying and levelling are proposed to be held on Tuesday, Wednesday and Thursday, the 13th, 14th and 15th of June. Particulars of these examinations can be obtained from the secretary.

- { 15. Ironmongery. }
16. Scavenging and other Brushes.

Forms of tender may be obtained by applying at my office, the Guildhall, on payment of 5s. each, which sum will be returned on receipt of a *bona-fide* tender, and providing such tender is not withdrawn.

Pattens and samples may be inspected at the Easterfoft Depot, London-road, Nottingham. The committee will not consider any tender except those on the authorised form of tender, which must be sent in to the Town Clerk on or before Thursday, 8th December, 1898. The lowest or any tender will not necessarily be accepted, and tenders will only be accepted from persons who conform to the conditions as regards paying the local standard rate of wages, &c.

(By order)
ARTHUR BROWN, M INST. C.E.,
 City Engineer.

The Guildhall.
 November 24, 1898.

CITY OF HULL.
TO QUARRY OWNERS AND OTHERS.

The Corporation are prepared to receive tenders for the supply of about 5,000 super. yards of the Best Hard Yorkshire 3 in. Teoled Flags, delivered at Hull during the ensuing four months.

Forms of tender may be obtained of the City Engineer, Hull. Tenders, endorsed "Tender for Flags," are to be addressed to the Chairman of the Works Committee, and to be delivered at the Town Clerk's office, Hull, before noon on Friday, December 2nd.

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

- Easily and quickly laid by unskilled workmen.
- Perfect alignment of invert secured.
- Joint readily made absolutely watertight.
- Cheapest Patent Joint in the market.

Prices and further particulars on application to **J. PLACE & SONS, Ltd., Darwen.**

URBAN DISTRICT OF FLEETWOOD, LANCASHIRE.

The Fleetwood Urban District Council are prepared to receive, on or before Monday, the 5th day of December next, at 12 o'clock noon, suggestions from engineers as to the best method of carrying out a Sewage Diversion Scheme or Schemes for the above-named district; the terms upon which a detailed report will be made, together with the charges for preparing all necessary plans, specifications, &c., and carrying out the scheme or schemes if adopted.

The area of the District is 2,848 acres, and the estimated population is 13,500.

(By order)
JOSEPH TILDSLEY,
Clerk and Accountant.

Town Hall, Fleetwood.
November 17, 1898.

CORPORATION OF MANSFIELD.

The Town Council, acting as the urban sanitary authority for their district, are prepared to receive tenders from competent persons for the construction of about 500 yards of 9-in. Pipe Sewer, with all the necessary lampholes, manholes, ventilators, flushing arrangements, and works incidental thereto.

Plans and specifications of the works may be seen, and the form of tender and schedule of quantities obtained (on deposit of £2), at the office of Mr. R. Frank Vallance, C.E., F.S.I., Borough Surveyor, Mansfield, the Engineer for the works, on and after the 1st day of December next.

The deposit will be returned, after a contract has been

entered into, to every person making a *bona fide* tender and on the return of the documents entrusted to him.

In the event of a tender being withdrawn, the deposit will be forfeited.

The successful contractor will be required to pay the standard rate of wages recognised in the district in the several trades.

Sealed tenders (on the form supplied), endorsed "Tender for Outfall Sewer, Littleworth," are to be delivered at the office of the undersigned, in the envelope provided for the purpose, on or before the 14th day of December, 1898, at noon. The Town Council will not be bound to accept the lowest or any tender.

Dated this 17th day of November, 1898.

J. HARROP WHITE,
Deputy Town Clerk.

SHANGHAI MUNICIPAL COUNCIL. TRAMWAY CONCESSION.

The following resolution in reference to proposed tramways in Shanghai was passed at the last annual meeting of the ratepayers of the Foreign Settlements at Shanghai, north of the Yang-king-pang.

"Resolution 10.—That the Council be and is hereby authorised to consider the expediency of the establishment of a system of tramways in the streets of the settlement, and in its discretion to formulate a scheme for ratification by the ratepayers by which the system be carried into effect."

In accordance with the above resolution, the Council hereby invite tenders for a concession for constructing and working about 23 miles of Electric Tramways on the "trolley system" in the streets of Shanghai.

The special attention of tenderers is drawn to the fact that the tender (if any) recommended by the Council will require ratification by the ratepayers.

Plans may be seen and particulars obtained on application to Messrs. John Pook & Co., 8 Jeffrey's-square, St. Mary Axe, London, E.C., on a Bank of England note for £100 (one hundred pounds sterling) being deposited with Messrs. Pook & Co., which sum will be retained by the Council and deemed to be forfeited unless a *bona fide* tender be made by the depositor.

Further information may be obtained on application to Mr. Charles Mayne, Municipal Engineer, Shanghai, China

IMPROVED DRAIN CLINOMETER.

THIS Drain Clinometer, which is a thoroughly well-made and reliable instrument, is intended for the use of Builders, Medical Officers of Health, Sanitary Inspectors and others for testing the slope of drain pipes. The arc is fixed at the extreme end of the Clinometer so as to allow of a close reading and distinct graduation, and is divided on one edge to degrees and quarter degrees, and on the other edge to gradients of 1 in 20, 1 in 30, 1 in 40, 1 in 50, 1 in 60, 1 in 70 and 1 in 80.
The adjustment is by means of a nut and bolt, working against a spiral spring. The "Bubble" is ground and divided.
The Clinometer is made of oak and nicely finished, and measures 12 1/2 x 1 1/2 in.

PRICE:— With Electro-m Fittings, £1 7s. 6d., With Brass Fittings, £1 2s. 6d.; With Magnetic Compass extra 2s. 6d.

Weekly, Price 3d.

Minutes of Proceedings.

Probably one of the most important statements ever issued as to cost of operating the various systems of tramway traction is that which has been recently published by *The Street Railway Journal* of New York. The figures are especially important to municipalities at the present moment, because, as far as cost of operating is concerned, they bear out the statements of Mr. J. Allen Baker. It must be understood, however, that they demonstrate the superiority of electric over cable and horse tramways rather than the superiority of any particular system of electrical working over another. The figures are chiefly valuable from the fact that they are made up from the cost-sheets and records of one company (the Metropolitan Street Railway Company of New York) employing all three systems, and thus enable a true comparison to be made of the relative costs of operating these distinct systems in one city and under practically the same conditions. They demonstrate beyond all question the great superiority of electricity over both horse and cable traction, not only in traffic-handling capacity, but in economy of operation. It was generally supposed that the cable system under conditions of great traffic density was the cheapest and best motive power in existence, and it was thought that the rapid disappearance of the cable system in America was due rather to a desire for unification of motive power or to the general popularity and earning capacity of electric cars. It was not generally supposed that electric cars, replacing cable cars on heavy traffic roads, could be operated at a less cost per car mile, but such a supposition has been completely established by the New York figures. It is not necessary to refer to the various details of construction of either the cable or electric line, as it will suffice to confine one's attention entirely to the figures. During the twelve months under review, which, by the way, is down to the end of June this year, the company operated 34.2 per cent. of its car mileage by the cable system, 20.2 per cent. by the electric system, and 45.6 per cent. by horse haulage. The proportions had to a considerable extent altered in the quarter ended September 30th of this year, the cable mileage being then only 27.4 per cent. of the total, and the horse system only 33.7 per cent., while the mileage of the electric system had risen to 39.1 per cent. The relative earnings during the last quarter were as follows: Cable system, £7,800 per mile of track and 16d. per car mile; electric system, £3,400 per mile of track and 13d. per car mile; and horse haulage, £1,600 per mile of track and 14d. per car mile. It will be seen how important the results are from an electrical standpoint when it is mentioned that the cost of operating a single car mile was: Cable, 8.21d.; horses, 8.93d.; and electricity, 5.11d. For the three months period to which we have alluded the

results are favourable to electric traction, probably on account of the greater popularity of the line. For the period in question the cable lines cost 8.77d. per car mile, the horse 8.93d., and the electric 5.03d. It is, however, when one considers the figures in detail that the great disparity is most clearly shown. For example, the maintenance of way in the cable system cost 1.72d. per car mile, in the electric 11d. per car mile, and in the horse system .80d. Even in regard to the maintenance of equipment, in which respect it would have been thought that the cable would have been able to show to great advantage, the respective costs are: .47d. per car mile for cable, .41d. for electricity, and .33d. for horse traction. The cost of power, under which is included repairs, wages, &c., works out as follows: Cable, 1.01d.; electricity, .85d.; and the horse, 1.97d. Perhaps the most remarkable feature is the production of power, for it has been found possible to operate heavy electric cars, which we understand vary from 22 ft. to 28 ft. in length, at a cost of 33 per cent. less than can be done in two cable-power stations which operate cables so heavily loaded as to make the proportion of live to dead weight greater probably than that of any cable railway system in the United States. It might be expected that the costs of repairs of the cable and electric conduit systems respectively would show a marked difference in favour of electric traction. Of course it must be admitted that the amount of moving mechanism in the cable system is very considerable, while in the electric there is none. It is probable, however, that as the electric lines are quite new certain charges which are exceedingly favourable at the present moment will be slightly enhanced, because in one respect electric traction is less favourable to track work than either cable or horse. Electric cars are heavier, and no doubt deliver a more severe hammer blow to the joints than is experienced with either horses or cable. At the same time, taking into consideration the various directions in which the electric portion of the system will show slightly increased expenditure, it is one of the most remarkable achievements on record that electricity should have been able to beat the cable on its own ground.

Combined Drains and Nuisances.

The unsatisfactory state of the law with regard to the combined drainage question has again been forcibly illustrated by the recent case of *Nock and Mellows v. W. District Council* (noted on page 676 *ante*), in which the Council have been adjudged liable to pay for the repair of what is to all intents and purposes a private drain (though legally a "sewer"), as well as the costs of the legal proceedings. As is frequently the case, the existence of this "sewer," situated on private ground, but "vested" by statute in the local authority, was unknown until discovered in the course of operations consequent upon a

nuisance having arisen in a portion of the combined system. Seven houses were, in fact, drained by the conduit in question, and as they all belonged to the same owner no question arose under sec. 19 of the Public Health Acts Amendment Act, 1890. Prior to the discovery of the combined drain the sanitary inspector served the usual form of nuisance notice on the owner in respect of the house in which the nuisance had occurred. When, the ground having been opened, it was found that all the seven houses were served by the one drain, the inspector served a second notice, in the same form, but mentioning all the houses, instead of only the one. The work specified in the notices was done by the owner's agent, who was also a builder, he being aware (as he told the Court) that the pipe was a sewer, for the repair of which the owner was not liable, but being, nevertheless, under the impression that he was obliged to do the work after receiving the notices. There seems to be some confusion of thought here, but however this may be, the agent, in conjunction with the owner, presumably sought legal advice, which resulted in the bringing of the action we are considering. The council were bound to admit that the combined drain was a sewer, but they nevertheless denied the plaintiff's legal right to be recouped the amount expended in remedying the nuisance. They relied upon the case of *Selge v. Hove Commissioners*, decided in 1895. In that case the local authority (who had adopted the Act of 1890) gave notice to the owner of one of two houses drained by a combined system to abate a nuisance by doing certain works, and threatening proceedings in case of default. The owner having complied with the notice, it was held that the latter was not such a request to do the work as would support the action, and that no such request could be implied, because the commissioners were not themselves liable for the repair of the drain. The action therefore failed. This was one of the earliest cases under the Act of 1890, and was decided before sec. 19 of that statute had been whittled away by the decision in *The Queen v. Mayor of Hastings*, which was not given until 1897. Apart from this, however, *Selge v. Hove Commissioners* is obviously distinguishable from the present case, to which the Act of 1890 was not applicable, the houses all belonging to the same owner. On the other hand, precedents in support of the owner's claim to reimbursement are to be found in *Florence v. Paddington Vestry*, decided in 1895 by Mr. Justice Chitty, and *Andrew v. St. Olave's Board of Works*, decided in March of the present year by Lord Russell of Killowen and Mr. Justice Mathew. The first of these cases does not seem to have been brought to the attention of the Court in the present action, but the second was referred to, and evidently influenced Mr. Justice Channell in his decision. It is significant to note, too, that (although not necessary for the purpose of the decision) the learned judge took occasion to express strong disapproval of *Selge v. Hove Commissioners*, and it may be doubted whether that decision can now be regarded as sound law. The present case does but emphasise the anomalous condition of affairs under which there must be hundreds of these secret "sewers" all over the country waiting for the touch of the enchanter's wand, in the shape of a "nuisance notice," to reveal their existence and claim the protection of their lawful but reluctant owners—the local authorities. An inspector of nuisances might well hesitate before serving one of these notices, lest he should thus involuntarily be the means of adding yet another hitherto unsuspected "sewer" to the local authority's possessions.

The London Water Supply Controversy.

The wordy warfare which has been raging in *The Times* between Lord Balfour of Burleigh, Lord Farver, Mr. Dickinson, &c., &c., the anonymous writer who signs himself "Thames," and one or two others, seems now to have burned

itself out, probably from sheer exhaustion. We cannot say that the controversy has cleared the air much or added to the knowledge and understanding of one of London's most serious problems. For one thing, the discussion partook a little too much of the "You're another" character to be particularly helpful. In other words, one of the combatants would make certain categorical assertions, and another would follow next day with equally categorical denials, little trouble being taken on either side to unfold reasons or adduce satisfactory proof. The broad question at issue between Lord Farver and his anonymous antagonist, "Thames," was whether there is any real necessity for going to Wales for a source of water supply to the metropolis. Lord Farver, of course, is an uncompromising advocate of the affirmative view, and "Thames" an equally uncompromising advocate of the negative one, the latter holding that storage in the Thames valley will supply all needs, at all events, until the time specified by the Balfour Commission, 1931. Lord Farver's objection to this view is that it is based on the average, instead of the minimum, flow, and in this interesting position the controversialists still seem to remain. One beneficial result of the discussion has been that attention has been drawn to the capacity of the stream chiefly relied upon in Sir Alexander Binnie's great scheme. "Thames" has asserted that it has recently been dry for a month, a statement that Lord Farver has denied, apparently on the strength of information received rather than from his own personal knowledge. Surely the capacity of the stream might easily be settled by reference to Sir Alexander Binnie, who would do well to publish some reliable data on the subject, if he has not already done so. The figures, if satisfactory, would be reassuring, and their publication would do no harm. Strangely enough, however, the controversialists seem to have quite overlooked the important fact pointed out by Mr. Dickinson at last week's meeting of the London County Council, that the success of Sir Alexander Binnie's scheme, like that of Mr. Mansergh's Birmingham scheme, depends not on the dry weather flow of the streams but on storage during winter and spring. This fact notwithstanding, the exact figures as to the flow of the chief stream might as well be published. Mr. Dickinson, by the way, is deserving of sympathy in having been fathered in some newspaper reports with the absurd remark that in the Welsh scheme reliance is placed not upon rivers but on springs. What he did say we have already indicated. Whether in the Thames valley or in Wales, the question is essentially one of storage. It is admitted by many by no means unfriendly critics of the Balfour Commission that the members were somewhat astray in their calculations; but accepting the 1931 hypothesis, what likelihood is there of any adequate watersheds being available in Wales for the needs of London thirty years hence?

Building By-Laws in Rural Districts.

Another question that has been attracting public attention in the columns of our *Printing House-square* contemporary is that of building by-laws, especially in rural districts. Opinions have been freely expressed that in such districts building by-laws generally cause unnecessary expense and inconvenience. The force and truth of much that has been written on the subject must be conceded, but there seems to be a general tendency to place the responsibility on the wrong shoulders. Rural district councils, of course, have no authority under any Act of Parliament to make by-laws, and before they can do anything in the matter application must be made for urban powers. If this system does not work, the most obvious explanation is that urban powers are granted by the Local Government Board to rural district councils on inadequate grounds. But this is not the only point in regard to which the policy of the Local Government Board is open to criticism. Urban powers having been obtained

in the usual way, a rural district council has little or no latitude in the framing of its by-laws, which must follow the code which the Local Government Board are pleased to describe as "model," and with which, generally speaking, they require a rigid compliance, irrespective of the particular needs of a district. It is true that modifications are occasionally allowed, but they are of too slight and trivial a character to do away with the objectionable features of the system. It is desirable that there should be some sort of building by-laws, even in rural districts, but that they should be practically the same as those in force in urban districts is absurd. There may also be some force in the argument that rural district councils should not be trusted to frame or adopt their own by-laws, but should have this work done for them by some higher authority; but the answer is that at present by-laws have to be approved by the Local Government Board, and if their working is not satisfactory and they are not adapted to local needs the responsibility should lie with that department. But the chief point is that the Local Government Board rigidly insist on their "model" code being followed in all cases, but it requires no demonstration that village houses with plenty of ground behind them and detached houses in rural districts generally do not call for such exacting requirements as houses crowded together in a town. The application of similar regulations must simply tend to veto building operations in rural districts, and thus be disastrous to the interests of the rural population. The absurdity of insisting on one practically uniform code of regulations, irrespective of special local needs and conditions, was forcibly pointed out by Mr. Pickering, surveyor to the Nuneaton Urban District Council, in his paper read at the recent Birmingham congress of the Sanitary Institute. In default of the initiation of a more enlightened policy at the Local Government Board, it is to be hoped that the question will receive some attention in Parliament.

The Housing Problem.

As our readers are aware, the Standing Orders of Parliament require that in any case in which it is proposed by a Bill in Parliament to authorise the taking in any urban sanitary district, or in any parish or part of a parish in a rural sanitary district, of ten or more houses, occupied either wholly or partially by persons of the labouring classes as tenants or lodgers there shall be deposited with the Local Government Board, as the central authority for England and Wales exclusive of the metropolis, as well as with the Clerk of the Parliaments and at the Private Bill office, on or before December 31st, a statement of the number, description and situation of such houses, the number (so far as it can be ascertained) of the persons residing in them and a plan of the buildings involved. During 1897 forty-three such statements were deposited, and from these it appeared that it was contemplated during the season of 1898, by means of thirty-eight railway and other Bills and five provisional orders under the Public Health Act, 1875, to obtain powers to acquire in England and Wales, exclusive of the metropolis, 5,139 houses wholly or partially occupied by persons of the labouring class. The number of persons residing in such houses was 27,115. In connection with applications for the approval of schemes for providing new dwellings for persons of the labouring class proposed to be displaced by the acquisition of their dwellings under powers conferred by local Acts and provisional orders, it is the rule of the Board to arrange for the holding of the local inquiries in the evening, so that the occupants of the houses in question may have an opportunity of being present. Printed notices, setting forth the nature of the application, are served at each house involved. Nine local inquiries of this character were held during the year. In Manchester last year improvements involved the disturbance of no fewer than 2,000 persons of the labouring class, and the

corporation proposed to provide substantial accommodation, at a cost of £75,000. Cardiff Corporation also required a loan of £25,000 for the provision of dwellings for 134 persons. The scheme of the Cardiff Corporation for the rehousing of 234 persons had to be amended so as to provide for a larger number of dwellings. Only two applications were made during the year under Part I of the Housing of the Working Classes Act, 1890, and these had reference to schemes framed by the Devonport and Sheffield Corporations.

The Maintenance of Roads.

In his annual report, to which we have already referred, being for the year-ended March 25, 1898, Mr. C. H. Lowe, surveyor to the Hampstead Vestry, remarks that the practice of the vestry in employing its own labour in the repair of the roads and footways is generally, if not universally, recognised as that which, on the whole, produces the best results. At the same time he takes occasion to point out that the standard of excellence which the cyclist has set up is scarcely possible of attainment, considering the wear and tear caused by the incessant heavy traffic over the main roads, and that to make special provision for cyclists is impracticable. Mr. Lowe surmises that had the speedy cycle been known to our forefathers main roads might have consisted at present of a carriageway, two footways, and a cycle track. The nearest available approach to the cyclist's ideal is the wood-paved carriageway, and now that the experimental stage in the use of garrah and similar hardwoods has been passed, Mr. Lowe is of opinion that the only thing standing in the way of their more general adoption for paving purposes is the initial cost. A reduction of cost may, however, be looked for through trade competition, and then Mr. Lowe anticipates that hardwood may be used on many important roads which are now coated with the best quality of broken granite. Mr. Lowe does not consider that the utility of the motor car is yet quite assured, but with so much attention devoted to it, with a view to perfecting the machine, the time for its common use in business may, he thinks, be nearer than is generally thought. The effect upon the roadways he sums up in the following words: "If ever the day does come when we shall see the highways taken possession of by the horseless carriage, that same day will witness the difficulty of maintaining a smooth surface surmounted, for every wheel will have a rubber tyre, and the decrease in the number of horses pounding the roads with their hoofs will be so marked that the destroying agents in the roadway will be reduced to a minimum."

The Smoke Question.

The discussion of the London smoke question has continued during the week with unabated vigour, and though it has been pointed out that the trouble is probably due in far greater degree to the accumulated effect of smoke from dwelling-houses than to emissions from works, most of the correspondents seem determined to attribute everything to the failure of the authorities to enforce their powers on offending owners of works. Sir W. B. Richmond's ambition is to form vigilance committees, whose function will be to apply the spur to local authorities. In the meantime various remedies are suggested for the domestic evil. By one authority we are told that the trouble is due to the use of grates unscientific in construction. Others see remedies in the universal adoption of gas for heating and cooking purposes, in the structural alteration of chimneys to prevent the creation of smoke, or in the general use of anthracite coal. Here, no doubt, we have possible remedies, but it is to be feared that there are serious practical difficulties in the way which will seriously impede the general adoption of any one of them in the immediate future at all events.

The Birmingham Water Scheme.—I.

By JAMES MANSERGH, M.INST.C.E.

CABAN DAM, BRECON CULVERT OUTLET, IN COURSE OF CONSTRUCTION (December, 1896).

These articles are practically a reproduction of the interesting and valuable address delivered by Mr. Mansergh before the Engineering and Architectural section of the recent congress of the Sanitary Institute at Birmingham. The interest of the paper was enhanced by a large number of lantern views. It has, of course, been necessary to eliminate the references to these, but through the courtesy of Mr. Mansergh and Mr. T. Barclay we reproduce a number of the illustrations. In the course of his address Mr. Mansergh said:—

The city of Birmingham has an area of 12,365 acres, and the Parliamentary limits within which the corporation are bound to supply water extend to 83,221 acres, or 130 square miles, an area 10 per cent. in excess of that of the county of London. This district varies considerably in elevation, being 270 ft. above sea level in the north-east corner, and rising to 800 ft. in the south-west. As compared with this, the highest part of Hampstead Heath, in the north-west of London, is 450 ft. The population within the limits at the time of census-taking in 1891 was 647,572, and is believed to be now over 700,000. The water is at present obtained from five local streams and from six wells sunk in the New Red Sandstone, which underlies the city and its neighbourhood.

MR. MANSERGH'S ADVICE.

In 1890 I was called in to investigate the whole question of the future of the water undertaking. My advice to the committee put shortly, was—

(1) That the water obtainable from the local streams, flowing as they do through populous districts, would go on constantly increasing in impurity, and that the greatest care would have to be exercised in order to ensure its safety for domestic use.

(2) That the addition to their resources by any impounding works which could be constructed on these streams, or by sinking more wells, would carry them on for only a comparatively few years, at the end of which time they would inevitably have to go much further afield, and the money they had spent would be practically lost.

(3) That the distant unpolluted sources, at sufficient elevation to supply Birmingham by gravitation, were comparatively

few, and that if their acquisition were delayed for even a few years the chances were that they would have been secured by some other community, possibly London.

This advice was accepted, the result being that a Bill was promoted in Parliament in the session of 1892, by which the corporation sought powers to utilise the waters of the rivers Elan and Claerwen, flowing from an area of 71 square miles in the counties of Radnor, Brecon and Cardigan. These rivers are tributaries of the Wye, which, passing through Radnor, Brecon, Hereford, Monmouth and Gloucester, joins the Severn near Chepstow.

PARLIAMENTARY PROCEEDINGS.

In order to obtain complete control of the drainage area, and thus secure the water from pollution, the corporation asked Parliament to allow them to acquire the whole of it by purchase, a proposition which induced the opposition of the landowners, the commoners and the Commons Preservation Society. Further, there was what I may call a national opposition. Gallant little Wales, full of fight, protested that this was Welsh water and should be reserved for Welshmen. Before the committees of both Houses the principality was represented by two doughty champions—the late Lord Swansea, better known as Sir Hussey Vivian, and Mr. Tom Ellis, the Liberal whip. They came before the hybrid committee of the House of Commons near the close of the case and fired off long patriotic speeches, which were listened to respectfully and patiently by Sir Campbell Bannerman, the chairman, and his colleagues, but without effect.

In the Lords they brought some professional evidence, with the hope of showing that the Elan watershed was the only one competent to supply Glamorganshire, with its great coal mining interests. This they essayed by pointing out that the colliery villages in the Rhondda and other districts were necessarily built high up on the hillsides, so as to be near the pits, and they fixed on a spot near Merthyr which was the lowest at which water, they said, must be delivered to meet their requirements, and stated that it was only from the Elan that that point could be reached. This specific allegation was fatal to their contention, for it was only necessary to try

MAP SHOWING WATERSHED, RESERVOIRS AND AQUEDUCT.

THE ROUTE OF CONDUIT IS SHOWN
THUS

out a line of aqueduct with a proper gradient from this point upwards to prove conclusively that it would cut the river Claveren so high up that only about 5,000 acres out of our 40,000 could be utilised, and only one reservoir out of six. For all practical purposes the Elan proper was too low. In the House of Lords I was able to show this to the committee by the model now on the table and the Glamorganshire case was gone in ten minutes. I was also able to prove to the satisfaction of the committee that for the future needs of South Wales 250,000,000 gallons a day could be obtained from the river Usk and tributaries of the Wye, and, as these are the sources now proposed to be utilised for London in Sir Alexander Binnie's scheme, there will no doubt be "ructions"

SECTIONS ON CENTRE LINES OF ELAN DAMS.

when the proposal comes before Parliament. In the second House, therefore, this opposition was also unavailing.

As a nation, therefore, the Welshmen failed, but the individual members of it, whose land we obtained powers to acquire for the works, have had their revenge. Radnorshire has "spoiled" Birmingham to the tune of scores of thousands, and during the last few years the ditty of my childhood has often recurred to my memory. It began "Taffy was a Welshman, Taffy was a thief," but perhaps I had better not carry this any further. The Bill was also opposed by a number of property owners upon the line of aqueduct, by a small section of Birmingham ratepayers, by the Corporation of Hereford, and by the London County Council, the ground of the last-mentioned opposition being that the source of supply was an exceptionally good one, that therefore the council might some day like to get hold of it, and that Birmingham ought to wait until London had made up its mind. We were most effectively assisted in conducting this opposition by Sir F. Bramwell. Sir Frederick had been engaged in

LONGITUDINAL SECTION OF ELAN RESERVOIRS.

the Liverpool fight twelve years previously, and was able to testify that a similar objection was made at the time by the Metropolitan Board of Works to the taking of the waters of the Vyrnwy to the great Lancashire export, and to show that the London question was no further advanced in 1882 than it was in 1880. This London contention was met by setting out in detail the many streams in the Welsh mountains which were available for the metropolis but too low for Birmingham, streams which when provided with proper storage reservoirs were competent to supply nearly 500,000,000 gallons a day without touching the Elan and Claveren. This was one of the main features of the scheme before referred to as Sir Alexander Binnie's.

COMPENSATION WATER.

In addition to these oppositions, we had, of course, to fight, as happens in all Water Bills of this class, the question of the

amount of compensation water to be paid to the river for the right to divert the water authorised to be taken for the supply of Birmingham. In the case of works established upon the rivers of Lancashire and Yorkshire, whose waters are utilised for manufacturing purposes nearly up to their sources, this is a serious question, but fortunately, in the whole course of the Wye and the Elan below the point of abstraction there is not a single case of such utilisation, even for driving the wheel of a corn mill. This did not, however, prevent most exorbitant claims being set up by

CABAN DAM, UP-STREAM FACE, BRECON END (February, 1898).

riparian owners on account of their fishing rights, not, however, by the net fishers in the lower reaches, who make their livelihood out of the fishing, but by sportsmen who handle a rod for diversion. In the Bill as deposited, we had proposed that the quantity of compensation water should be 22,500,000 gallons per day. The rod fishers demanded 40,000,000 gallons. They were assisted by the Wye Fishery Board, and in the background by the officials of the Board of Trade who administer the Salmon Fisheries Act, and ultimately a compromise was come to by which the quantity was fixed at 27,000,000 gallons per day. Since the works have been in course of construction we have had the opportunity of measuring the flow of the river at the spot where the 27,000,000 gallons will have to be discharged, and have found that in very dry weather it falls to something under 4,500,000 gallons, so that the quantity passing down will, so soon as any water is taken to Birmingham, be increased at such point six-fold. Of course the capability of so benefiting

CABAN DAM, BRECON CULVERT OUTLET (February, 1898).

the river is due to the storage of flood waters in the reservoirs to be constructed. Another incidental benefit arising out of this impounding will be the reduction in the volume and violence of destructive floods in the river below. The amount of compensation water in these cases is a fairly-well recognised proportion of the water collectable from the watershed area; that is to say, where the water is used for trade or manufacturing purposes the proportion is *one-third*, and where there are only ordinary riparian, including fishing, rights it is about *one-fourth*.

RAINFALL.

The quantity of water collectable is ascertained from the area of the gathering ground and the rainfall upon it, less the evaporation and the volume of water inevitably overflowing from the reservoirs in times of flood. Thus the area we are here dealing with was determined by accurately marking upon the plans the parting lines or watershed boundaries after careful examination, and in some cases instrumental levelling, upon the ground. By measurement from the plans the area was found to be 45,562 acres, the first factor in the calculation.

The rainfall might have been a much more difficult thing to determine than the area, but that, very fortunately, the lord of the manor, Mr. Robert Lewis Lloyd, and his father before him, had kept a rain gauge regularly from the year 1871 onwards at the family mansion of Nantgwilt, in the lower part of the Elan Valley, and at a spot on the watershed

area to be appropriated. So soon as it seemed probable that the matter would be proceeded with, several other rain gauges were erected at various points upon the shed with the assistance of Mr. Symons, the highest authority on British rainfall and the last and a most worthy recipient from the hands of H.R.H. the Prince of Wales of the gold medal of the Society of Arts. Then, by a comparison of these with the long term gauge at Nantgwilt and others in the surrounding country, it was decided that the mean annual fall of a long series of years upon the watershed might be taken at about 68 in., and the average of three consecutive dry years at 5 in.—this latter being the figure always used in these estimations—as first suggested by the veteran waterworks engineer and hydrologist, the late Mr. Hawksley. The greatest rainfall was in 1872—*viz.*, 93.86 in., and the least was in 1892—*viz.*, 43.44 in.

It is very usual to take 14 in. or 15 in. as the amount of evaporation, but, in order to be on the safe side and to allow amply for loss by overflow, 19 in. were deducted from the 55 in., leaving 36 in. as collectable by means of the reservoirs intended to be constructed. Taking the mean of three consecutive dry years, the rainfall in one year upon the watershed area would be equivalent to 252,495,491 tons of water, of which 63,950,823 would be lost by absorption or evaporation and 23,154,608 tons by overflow, leaving 165,390,060 tons as collectable in the reservoirs. In a year of maximum rain like 1872 the total quantity falling upon the watershed would be 431,116,756 tons, and the volume overflowing from the reser-

CABAN DAM, BRECON END, LOOKING NORTH (February, 1898).
(Showing Cyclopean Rubble.)

voirs into the river would be correspondingly increased. Further observations since the Bill was in Parliament have satisfied me that we may calculate on obtaining from the works 75,000,000 gallons a day for supply in addition to the 27,000,000 gallons for compensation.

THE DAMS AND RESERVOIRS.

Considered geologically, the whole of the watershed area consists of rocks of Lower Silurian age, principally inferior slates, but in parts of very hard grits and conglomerates. It is the presence of thick bands of the latter stretching across the Elan at a place called Caban Coch and resisting disintegration which has determined the position of the contraction in the sides of the valley and rendered it so eminently suitable for the location of a barrier dam. At this spot the bed of the river is 700 ft. above ordnance datum, the bottom of the valley being about 200 ft. wide, and at 120 ft. higher only 600 ft. Immediately above this contraction the valley widens

CAREG-DDU CULVERT EXCAVATION, LOOKING UP-STREAM
(July, 1896).

out into a broad "flat," and 1,540 yards higher up the river Cierwen joins the Elan on its right bank. These conditions pointed unmistakably to the Caban gorge as the site of the lowest dam, and consequently determined the area of gathering ground to be utilised.

The height of the wall to be built was, after much consideration, fixed at 122 ft. above the bed of the river, and the contents of the reservoir behind it will be nearly 8,000,000,000

gallons. As compared with the height of the wall above the river, the Vyrnwy (Liverpool works) is 85 ft. and the Thirlmere (Manchester works) 50 ft. The river Elna has in the part affected by this dam a rise of 30 ft. in a mile, so that the 122-ft. barrier backs the water up that valley 4 miles, and up the Claerwen, which is somewhat steeper, about 2½ miles.

The length of drought which it was deemed advisable to guard against was fixed at 180 days, and consequently the total storage to be provided was nearly 18,000,000,000 gallons, or 10,000,000,000 more than the Caban Coch reservoir would contain. For the purpose of selecting the positions of other reservoirs than the Caban higher up, the two valleys were levelled and closely contoured to above the highest possible site on each, and by this means the exact positions of five others were determined, giving the greatest impounding capacity with the least amount of structural work. There is to be a dam at Pen-y-Gareg, and another at Craig-yr-Allt (Goch), and on the Claerwen at Dol-y-Mynach, Cil Oerwynt and Pant-y-Ceddan.

THE SUBMERGED DAM.

A unique feature in the scheme is the provision of what has been called a *submerged dam*, to be built across the Caban

CAREG-DDU DAM, LOOKING UP STREAM, FROM ROAD (September, 1897).

Coch reservoir at a point nearly 1½ miles above the main wall, and called Careg-Ddu, its precise function being to hold the water up behind it high enough to charge the aqueduct conveying the water to Birmingham. It is described as submerged because until the water has been lowered 40 ft. it will be drowned and out of sight. The necessity for this device comes about in the following way—viz.—

At the Birmingham end of the aqueduct the water is to be delivered into a large service reservoir at Frankley, about 6 miles from the centre of the city, whose top water will be 603 ft. above ordnance datum. From the commencement of the aqueduct inside the Caban reservoir to Frankley is a distance of nearly 74 miles, and in this length the fall required to convey the water is in round figures 170 ft., so that the invert of the aqueduct at its inlet will be 770 ft. above ordnance datum, or 70 ft. higher than the bed of the river at Caban Coch. Now the water must of necessity never fall

CAREG-DDU DAM FROM SOUTH-WEST ASPECT (September, 1897).

below this inlet or the aqueduct could not be charged, and therefore the submerged dam is to have its crest at 782 ft. above ordnance datum, being high enough to fill the aqueduct, the cross-section of which will be described later on.

When the reservoir is full the layer of water between 822 and 782, 40 ft. thick, and having a surface area of 500 acres, contains 4,300,000,000 gallons. Now suppose no water were

coming down the rivers at all in a time of great drought, 27,000,000 gallons have still to be sent out for compensation every day, and dealing with the first instalment, another 27,000,000 have to go down the aqueduct to Birmingham, then this combined draught of 54,000,000 would draw down the water from 822 to 782 in eighty days. The quantity of water below 782, between Caban Coch dam and Careg Ddu dam, is 2,700,000,000 gallons, and will therefore suffice to pay

PEN-Y-GAREG DAM CULVERT OUTLET AND CHANNEL WALL (February, 1898).

the compensation water for another 100 days. In this way a drought of 180 days is provided for, the water for supply during the 100 days coming from the Pen-y-Gareg and Craig-Goch reservoirs higher up the Elna. They hold together 3,330,000,000 gallons, and are fully competent to ensure this. The water above the submerged dam and below 782 cannot, of course, be counted as effective storage, as it cannot be drawn down without leaving the aqueduct inlet high and dry, but it will, of course, be in no sense stagnant, because the quantity going to Birmingham must always be running through it.

When the second and following instalments are required for supply the reservoirs on the Claerwen will have to be made in succession as required, and the addition of the water obtainable from them will enable the 40-ft. slice between 822

CRAIG GOCH PIT, LOOKING UP STREAM (February, 1898).

and 782—which they will always be replenishing—to maintain the increased delivery by way of the aqueduct and the compensation as before, leaving the 2,700,000,000 below 782 for the last 100 days of the drought. In order to delay as long as possible the making of the Claerwen reservoirs, a tunnel 14 miles long is to be driven from the Dol-y-Mynach reservoir on that river to above the submerged dam, so that its *natural* unstored waters can be used for supply, the respective levels at each end admitting of this being done comfortably.

Tenders Wanted.—The Under Secretary of State for Foreign Affairs has received a despatch from Her Majesty's consul at Genoa stating that tenders are invited by the municipality of Spezzia for the supply of 1,300 tons of gas coal. Sealed tenders must be received at the municipality of Spezzia on the 28th inst. A copy of the conditions of contract may be examined at the Commercial Department of the Foreign Office any day between the hours of 11 a.m. and 5 p.m.

Private Bill Legislation.—Official notice has already been given of several electric lighting schemes for the ensuing session of Parliament. Among other authorities seeking powers in this direction are the Erith Urban District Council, the Lewisham District Board of Works, the Glassop Corporation, the Keighley Corporation, the Electric Works Company, Limited (for Walton-on-Thames and Weybridge), the Castleford Urban District Council, the Ilkerton Corporation, and the Mirfield (Yorkshire) and Mexborough Urban District Councils.

Comparative Reports of General Practice.

XXX.—TRAMWAY TRACTION : WEST BROMWICH REPORT.—III.

DOVER.

The rapid development of building operations and the advance of commercial enterprise made the construction of tramways in the town almost a necessity, particularly from the point of view of conveying the working population to and from their work and for the convenience of the general public. The corporation recognised the importance of these considerations and determined to avail themselves of a project which cannot fail to be a valuable property. A provisional order was obtained in 1896 and the lines constructed.

Permanent Way.—The tramways are single lines with passing places, the total length being 3.5 miles. The centre line of the tramway corresponds with the centre line of the road, except for a short length, where it was necessary to go to one side to pass round a sharp corner. The gauge is 3 ft. 6 in., and was decided by the narrowness of one or two streets through which the line passes. At the passing places, which are 3 chains in length, the distance between the centre of each pair of metals is 7 ft. 6 in. These are designed that

into an agreement with the Dover Electricity Supply Company to provide all the power required for working the tramways at a price of 3d. per Board of Trade unit, subject to reductions on a sliding scale as the consumption of energy increases.

Power Station.—The power station is situated about the centre of the system. The generating plant which the company installed consists of two 200 horse-power Babcock & Wilcox water-tube boilers, and two horizontal tandem compound engines, running at a speed of 235 revolutions per minute, and coupled direct to four-pole compound-wound railway generators, giving an output of 100 kilowatts at 500 volts. The tramways are divided into three sections, radiating from a central feeder pillar, and are further divided into half-mile sections at suitable switch pillars.

Rolling Stock.—The cars, which are capable of carrying forty-four passengers—twenty inside and twenty-four out—are carried on Peckham spring cantilever trucks, provided with two 25 horse-power motors. There are eight motors and two trailer cars; they are lighted by means of electric lamps. There are hand-bells in the cars for the use of passengers wishing to alight, and also covers for the outside seats in case of rain. Swivelling trolley poles are used, and the swing arms are fixed so as to be quite clear of the passengers. An important feature in the equipment of motor cars employed for the first time on the Dover cars is a recording meter, to check the consumption of energy used in driving the car. The meter is placed in a box on one of the platforms, and access to it is obtained by means of a door, opened from the outside of the platform, so that inspection can be quickly made. Two car-sheds have been erected, from the design of the borough engineer—one at Buckland and one at Maxton; one holds twelve cars and the other nine cars. The speed of the trams is 8 miles per hour, and there is a seven minutes' service, the charge being 1d. for the entire distance, and the cars stop whenever required. Both the drivers and conductors are provided with uniforms. No accidents of a serious nature have been recorded.

General Notes.—The cost of the undertaking has been £30,000, including laying lines, equipment, car-sheds, &c. Every attempt has been made to introduce an ornamental as well as thoroughly efficient system of tramway traction.

WEDNESBURY AND WALSALL.

The electric system in Wednesbury and Walsall forms part of the South Staffordshire system, and is about 9 miles long. The line starts from "The White Horse," Wednesbury, and proceeds to Walsall, Darlaston and Bloxwich.

Permanent Way.—Generally the line is single, with passing places, the gauge being 3 ft. 6 in., and the rails are 76 lb. to the yard; most of the route is along macadam roads, but in all cases the track is paved across and for 18 in. on each side of the rails.

Rolling Stock.—The cars, of which there are sixteen, are double decked, 22 ft. long, and built to carry forty passengers—twenty-two inside and eighteen out—and they weigh 8½ tons

DOVER CORPORATION ELECTRIC TRAMWAYS.

two or three cars may stand on one pair of metals while the same number of cars pass on the other. The reverse curves from the single to the double lines are 300 ft. radius, and allow the car to travel with great ease and with consequent comfort of the passengers and saving of wear and tear to the rolling stock. The steepest gradient on the lines is 1 in 25.69, and the sharpest curve is 45 ft. radius. The rails are of the girder type, weighing 87 lb. per yard, and the spaces between the rails and on each side are paved with granite.

Conducting System.—The overhead wires are carried on poles similar to those in Leeds and Bristol. Side poles are used throughout, except in King-street, Market-place and Biggin-street, where there is a double track. The poles are steel, 31 ft. long, the base has an ornamental cast-iron sleeve, and the top is fitted with a cast-iron terminal or lamp, as required. They are sunk into the ground and set in concrete, and are placed 40 yards apart where the line is straight. Side brackets are fixed to the poles when placed on the kerb, the lengths of the arms being adapted to the varying widths of the roads, and double brackets when the poles are placed between double lines. Steel guard-wires, with insulated supports, are fixed where necessary for the protection of telegraph and telephone wires. The wires are 21 ft. 6 in. above the road. Acting on the advice of their electrical adviser, Mr. Stephen Sellon, A.M.I.C.E., the corporation entered

SOUTH STAFFORDSHIRE ELECTRIC TRAMWAYS, WEDNESBURY.

The speed of the cars is 8 miles per hour, and they stop when required, but the end of each 1d. stage is a regular stopping place. The fare is generally a little less than a 1d. per mile, and the track is divided into 1d. stages.

Conducting System.—The trolley wire is suspended at a height of 21 ft. from the ground by insulators of usual design for electric street railways and attached to the end of tubular arms that screw into tees upon the street poles, a light guy rod, screwed at both ends, serving to keep the whole in proper tension. The poles are placed on the sides of the roads.

Power Station.—The generating plant at the central station,

which is situated between Walsall and Bloxwich, consists of three Lancashire boilers and three compound horizontal surface-condensing engines of 350 horse-power, and these serve to drive three Elwell-Parker dynamos. No accumulators are used either at the station or on the cars. The station presents a very neat and tidy appearance.

General Notes.—There have been no serious accidents on this line, and there has never been any stoppage through breakdown of machinery. Once or twice the trolley wires have broken in frosty weather. The sub-committee have ridden on the cars, and consider that there is too much oscillation, owing, they were informed, chiefly to the old rails being used, the lines not having been reconstructed; but the committee are of opinion it is partly due to the make of the cars not being up to date.

MANCHESTER MAIN DRAINAGE.

MR. OLIVE AND THE CORPORATION.

We have pleasure in publishing the correspondence given below. It will be remembered that in connection with what was freely described as the Manchester sewerage scandals there naturally appeared in the Press a good deal of criticism which might have been construed as reflecting upon the manner in which various corporation officials had discharged their duties. Rightly or wrongly, Mr. W. T. Olive, then resident engineer, has chosen to regard much of the criticism as directed at himself personally. In his evidence, given on commission during the hearing of the arbitration case in the beginning of the year before Sir Benjamin Baker, Mr. Olive showed that the pressure of work compelled him to leave the supervision of the contractor's work almost entirely to subordinates, and both the evidence at the arbitration and the arbitrator's award pointed to employees of the contractors as directly responsible for the defective work, the contractors also being censured for neglecting to exercise proper supervision over their servants. Not satisfied with this, however, Mr. Olive has come specially to England for the purpose of courting the fullest inquiry, but, as will be seen below, no one has seen fit to take up his challenge. The matter therefore can only be regarded as settled definitely in Mr. Olive's favour. The correspondence to which we have referred is as follows:—

TO THE EDITOR OF "THE MANCHESTER CITY NEWS."

SIR,—Having spent fifteen years of my life in the active and honourable service of the Manchester Corporation, I claim I am entitled to some consideration at the hands of *The City News* and the public. The former has, unconsciously, been the means of publishing a slander upon me in its issue of October 31, 1896, in a report of the council proceedings, and I desire that the enclosed correspondence may be made public, in order that the true state of matters may become known. I feel confident that *The City News'* sense of justice and fairplay will allow of its publication.

WILLIAM THOMAS OLIVE, M.L.C.E.,
Cape Town C.C.

Thackeray Hotel, London.

[COPY.]

Manchester, July 13, 1898.

To William H. Talbot, Esq.

DEAR SIR,—In reference to my call on Friday, I received your message. All I wish to intimate is that it was simply a call of courtesy, and I desire now to state that I shall be in Manchester for another week or ten days from this date, and will willingly meet any member of the Manchester Council, should they desire it, in regard to any matters in connection with the sewerage scheme of the city as designed by me, and about which so much ignorance prevails in certain quarters. —I remain, dear sir, yours faithfully,

(Signed) WM. THOMAS OLIVE, M.L.C.E.,
Cape Town.

Manchester, July 19, 1898.

To Sir Bosdin T. Leech, chairman of the Rivers Committee.
Manchester Drainage Scheme.

DEAR SIR BOSDIN,—Reflections have been made during my absence in Cape Town on the manner in which I have conducted these works; and not being able to answer these in person until now, although on hearing of the proceedings I wrote the town clerk offering to come to England, I am prepared and desire to attend any properly-constituted committee with a view to completely vindicate my conduct throughout or to attend a public inquiry should it be desired. Had I remained in England these statements dared not have been made. I have come here expressly with the above object at the earliest possible moment, and if prior to the middle of August be inconvenient to the committee or court of inquiry, I am prepared to come over from Cape Colony at any time on the payment of my bare expenses. My address in Cape Town is National Bank Chambers, St. George's-street. I reserve the right to give publicity to this correspondence. Awaiting an early reply, I remain, yours faithfully,

WM. THOMAS OLIVE.

[COPY.]

Manchester, July 21, 1898.

Mr. Alderman Joseph Thompson, J.L., the chairman of the Rivers Committee.

Alleged Defective Sewers.

SIR,—In reference to the remarks you made in the council as reported in *The City News* of October 31, 1896, page 4, column five: "A ratepayer had asked Mr. Mainwaring whether the defaulting officials were still in the employ of the corporation, and his reply was yes. That was not so. One of the officials left the employ of the corporation two years ago and the other seven months afterwards." I now formally ask you for an immediate answer as to whether you do or do not intend these remarks to apply to me.—I am, sir, yours truly,

WM. THOMAS OLIVE.

Booth Street, Manchester, August 2, 1898.

DEAR SIR,—Mr. W. T. Olive, of Cape Town, has consulted us as to the statements made to his detriment in the city council and elsewhere in connection with the recent investigation and litigation as to the defective sewers. Our client has returned from Cape Town expressly in order to have such statements investigated, and he has remained here for some time for that purpose. His communication to Mr. Alderman Thompson has not been replied to, although the alderman referred to Mr. Olive specifically in the council under the designation of a "defaulting official." No notice has been taken of our client's advertisement challenging an inquiry or investigation.

We desire to place upon record the fact that our client has returned to Manchester for the purpose of meeting any accusation made against him, and that, in spite of his challenge, none has been made. He has journeyed here at his own cost, and will return to his country at any time to attend any inquiry upon his bare travelling expenses being paid; but if any member of the corporation will now repeat in writing the statement of Mr. Alderman Thompson, our client will at once issue a writ against him for libel, so as to have the matter investigated, and will return to England at his own cost to pursue such action.—Yours truly,

BOOTE, EDGAR & CO.

W. H. Talbot, Esq.

[COPY.]

Town Hall, Manchester, August 3, 1898.

DEAR SIRS,—I beg to acknowledge the receipt of your letter of the 2nd inst., written on behalf of Mr. W. T. Olive.—Yours truly,

(Signed)
W. HENRY TALBOT, Town Clerk.

Messrs. Boote, Edgar & Co.

A SEWER EXPLOSION.

Some particulars have just been published by the Manchester Drainage Committee of the London County Council with regard to the explosion which took place a fortnight ago in the fifth-hoist over the northern low-level sewer at the old mill's Abbey Mills pumping station. The fifth-hoist was practically wrecked, the roof was blown off entirely, and the force of the concussion also broke a large number of plate-glass windows in the main engine-house. A strong smell of paraffin had been noticed during the early morning, and the explosion was, no doubt, due to the ignition of a mixture of petroleum vapour and atmospheric air. It is thought that the petroleum vapour proceeded from refuse from sills used in the process of redistilling petroleum spirit, and the committee find that several other explosions of varying intensity have taken place in the past in the neighbouring districts. Some difficulty is experienced in definitely ascertaining where these inflammable substances are discharged into the sewers, but, in view of the grave danger to life and property arising from such discharges, the committee consider that notices should be served at once upon all persons carrying on the process of distilling or redistilling petroleum calling upon them to cease discharging such refuse into the sewers. They also think that intercepting chambers should be constructed on their premises in such a manner as to render the discharge more difficult, and that this matter must, with due regard, be taken into consideration in connection with the granting of licenses under the Petroleum Acts. They accordingly recommend the council to make an order under their General Powers Act, 1894, prohibiting the discharge into a sewer of dangerous substances where the process of distilling or redistilling petroleum is carried on, and that copies of the order should be served on any persons carrying on the process.

Dublin.—On Wednesday of last week, while the men were end-avorting by the aid of a large number of men a leakage in a sewer pipe in Dublin, in the process of being repaired, resulted in a most serious explosion. They were hurled a considerable distance, and had to be taken for treatment to hospital.

Principal Features of Electric Lighting Systems.—IX.*

SYSTEMS OF DISTRIBUTION.

The various systems of electric lighting, which so far as the mere generation of electricity is concerned have already been described, depend for their economical working upon transmitting in an efficient manner the energy necessary to light the lamps. All conductors oppose a certain resistance to the passage of electric current, and it is the reducing of the losses that may arise from such resistance which constitutes one of the essential features of a well-designed distributing system. Resistance practically results in absorption of energy, and that obviously affects materially the running costs at the central station. The reduction of waste arising from the resistance opposed by conductors may be got rid of in two ways—(1) by increasing the size of the conductors, or (2) by increasing the pressure. It will be remembered that in the earlier articles in this series it was laid down that the question of electrical pressure did not affect the size of the conductors. It is clear that there must be some limit to the increase in the size of conductors, which constitutes a very material item in the capital expenditure. In proportioning the proper size of mains there are other considerations present in the mind of the electrical engineer besides the question of length. The further the main is from the power-house the greater will be the drop in pressure, and it is this that determines the brightness or otherwise of an incandescent lamp. It may therefore follow that lamps connected to the mains near the generating station are of considerable brightness while those at the most distant point are dim. It is the maintaining of the lamps throughout the distributing area at their maximum brightness which determines both the degree of pressure and the size of the mains. The three systems of generation which have been alluded to—the low-pressure continuous, the high-pressure continuous, and the high-pressure alternating—call in a sense for different methods of distribution. The first of these systems does not, in a sense necessitate great changes of pressure between the power station and the consumers' lamps, but both the other systems need some form of transforming device which will reduce the initial pressure from that in the mains connected to the power-house to the pressures in the mains connected to the consumers' houses.

THE TWO-WIRE SYSTEM.

Dealing first of all with the low-pressure system, the simplest example would be that of a two-wire distribution. Electrical energy would leave the generators at something a little higher than 100 or 200 volts, and by means of feeders would be carried to certain points of the district, from whence it would be distributed to the consumers' houses at practically the same voltage. The feeders are ordinary conductors which are of sufficient section or size to carry the whole supply of the district, from which branch mains are taken. Such a system of distribution, however, has decided limitations, and it is only in small areas and in some of the older systems that the method is employed. It is obvious that the loose connections and lamps on any system oppose considerable resistance to the passage of electricity, and therefore in order to maintain a lamp which is nominally rated for 100 volts it is necessary for electricity to leave the station at a higher pressure than that. The general practice with regard to variation of pressure in a consumer's lamps is that it should not fall below 96 volts or exceed 104 volts. Therefore in order to maintain the proper voltage throughout a district it is necessary to employ a certain size of conductor; and if the district were enlarged it would be necessary, in order to keep up the proper pressure in the lamps, to increase the size of the mains, and it is this one question which prevents any great extensions on the simple two-wire method.

THE THREE-WIRE SYSTEM.

The next step, however, in the low-pressure system is that known as the three-wire method of distribution, which implies the use of a dynamo running at something over 200 volts or two dynamos coupled together in such a manner that they will transmit to the lighting circuits an electrical pressure equivalent to that of the 200-volt machine. In other words, if two dynamos of 100 volts each are connected together in series and are connected to mains they will give an effective pressure of 200 volts. The important feature, however, in the three-wire system is that a middle wire is employed, and such a method gives practically two circuits having a common return. The practical result of such a system is that the current required to supply a certain number of lamps would be only half that required to supply the same number of lamps on the two-wire system. Therefore, in order to pass the same amount of current through the mains, a conductor half the size of that employed in the two-wire system would be necessary. Let us take a typical case which illustrates the merits of the two system. It may be said that the electricity produced in a three-wire system is not increased in quantity, but is raised to twice the pressure of the two-wire system. A little thought enables one to see the difference between the two, and if we take, say, two 100 ampere 100-volt dynamos, the difference may be illustrated by saying

that in parallel they will give 200 amperes of current and with 100-volt pressure, whereas arranged in series the combined outputs of the machines will be 200 volts pressure and 100 amperes of current. It must be assumed that the number of lamps which could be lit would in each case be the same, but their arrangement on the wires would be different. It is the current flowing along the mains that causes a loss of head or pressure. If the current is reduced to half and the pressure doubled the lamp-lighting power remains the same but the actual loss of pressure is halved, and since the pressure is double its former value, the percentage of loss of pressure is only a quarter of what it was previously. At the same time the cables may be reduced in size considerably if the loss be kept the same; and as it is this that forms the basis of all systems, it is as well to make it clear, and to bear in mind the *rationale* of the higher-tension supplies. In other words, the three-wire system makes use of this fact and practically doubles the distance to which electricity can be supplied with reasonable financial success. We obtain all the advantages of the two-wire system, and can, if desired, make use of the same dynamos still. The consumers are in no way affected, the economy is marked, and the three wires are smaller than would be two for a similar supply in quantity upon a two-wire method, while not only is less power wasted in the mains themselves, but the first cost of the underground network is less. Where a low-pressure system is to be adopted the three-wire method is practically the only one to adopt if a fairly good demand can be obtained in a dense area. At the present moment most low-pressure continuous-current systems are laid down on the three-wire method. The adoption of the 200 volt supply in houses has increased very markedly the area to which a system can be supplied, and it is now possible for the low-pressure continuous system to be adopted in districts where previously it would have been uneconomical to supply with any other system than the high-pressure alternating or the high-pressure continuous.

PROF. FORBES ON THE LOW-TENSION SYSTEM.

Some interesting remarks which were made some time ago by Prof. Forbes, in one of his Cantor lectures, on the low-tension system might with advantage be quoted here:—

"My own experience is that mains ought to cost on the low-tension system about half the capital of the company, about equally divided in distributing mains and feeders. I think that far more copper would be put down in mains if people realised the low rate of interest at which money could be raised in debentures on them. Experience is the best guide as to the proportion between feeders and network mains. The smaller the latter the more numerous must the former be. The distance that can be covered by a feeder depends on many things, but, firstly, on the variation in pressure allowed at the house connections. The Board of Trade, wisely I think, has given great latitude—4 volts either above or below the normal 100 volts (i.e., an 8 per cent. variation), but it is to be hoped that supply companies will find it to their interest to attain a higher standard. If the feeder point is kept at a constant pressure of 100 volts the 4 volts will be lost in 80 yards if the section of copper is based upon a current density of 1,000 amperes per square inch, or in 240 yards if 330 amperes per square inch is chosen; and I am glad to say that in this country a large section like this is recognised as the best design. If now we use a three-wire system we can go to twice the distance, or 180 yards, with a current density of 330 amperes, still with a maximum drop of 4 volts. If the pilot wires which indicate pressure be not at each feeding point, but half-way to the most distant lamps supplied by a feeder, the length of main which can be fed is again twice as great, or 960 yards, the lamps at the feeding points varying from 100 volts at times of small demand to 104 volts at the maximum, the lamps at the distant end varying from 100 volts at times of small demand to 96 volts at the maximum. If now the lamps at the feeding points be 104-volt lamps and those at the distant end 96-volt lamps, with graduated voltages at intermediate points, we can increase the length of main supplied by a feeder to 1,920 yards, and no lamp will have a greater variation than 4 volts above or below its normal value. Of course this result has never been attained in practice, because in most cases it is difficult to accomplish. I do not generally approve of using lamps of different voltage on a circuit. The only time I ever sanctioned it was when I settled what was to be done by the St. James's and Pall Mall Company. Here the district was so compact that I could see easily that we would not be bothered by the future extensions. There is also some trouble in putting the pilot wires in the place indicated. There is also some difficulty in arranging the feeders so that they all feed into the network at the required pressure. Some engineers are also afraid of the three-wire system, having had no experience of its use. And, again, in a badly-fitted station it is difficult to ensure that the engines are working

*The eighth article of this series appeared in our issue of November 11th.

quite uniformly, so that a 2 per cent. variation, up and down, may be all that can be calculated for in order to conform with the Board of Trade requirements. All these reasons may reduce the workable distance, even when the low-current density here assumed is taken, from the above 1,920 yards down to 240 yards. I wish to impress strongly on you the fact that there are four distinct methods of improving the distribution: (1) Increasing the regularity of the engines, (2) using the three-wire system, (3) putting the pilot-wire connections half-way between feeder points, and (4) varying the voltage of lamps according to the distance from a feeder point. The last is the only one which cannot be safely done in all cases, and each of these four remedies enables us to go to double the distance, the introduction of the three wires being the only one which increases the weight of copper a little; or, we may say, especially with relation to the position of the pilot wires and the voltage of lamps, that these remedies each halve the weight and cost of copper in the mains, and, combined, reduce it to one quarter. The practical objection to using lamps of different voltage is that generally the network is first laid down and the feeders added in greater number as the demand increases, hence the voltage of lamps in any house will be changed. But the improvement on existing methods which I have advocated, of putting the pilot wire attachment half-way between feeder points, saves half the copper and can always be applied."

INSULATION OF MAINS: THE BARE-WIRE SYSTEM.

In all systems of electric light mains it is necessary that they should be insulated from the earth. Insulation may take the form of india-rubber or gutta-percha, mechanically protected by special means. But there are instances in which the mains themselves are bare, but are insulated in such a way that they cannot possibly come into contact with the earth or set up any leakage between themselves and the ground. The system is known as the bare wire, and has been very extensively adopted in various low-pressure systems; and this particularly applies to the earlier installations laid down in this country. Generally speaking, bare wires are laid upon glass or porcelain insulators in a form of culvert. The chief advantage arising from such a method is that it is possible to a certain extent to increase the size of the conductor without increasing very materially the cost of insulation. Moreover, it is held, with some reason, that the depreciation on such materials must be very low, and, in addition, it is possible to make connections between the distributing mains and the houses at very little cost. At the same time it must be admitted that the construction of a culvert which will enable bare conductors to be laid with perfect safety must be considerable and occupies much more space than is usually given to electrical mains.

As this system, however, is still extensively employed in London, though it is in many cases being gradually superseded by ordinary insulated conductors, it may be as well to mention some of the features connected with it. The original form of bare-wire system was due to Mr. Crompton, who employed a concrete trench, usually built under the footway, and in this the conductors were laid upon glass insulators placed about 2½ yards apart. The insulators themselves were attached to oak cross-bars, which were built into the concrete in such a way that they cleared the bottom of the culvert. Usually the conductor consisted of a copper strip about 1 in. wide and ¼ in. thick, the size depending, of course, upon the amount of current to be transmitted; and these were laid in the recess on the top of the insulator. In order to contact one another that might occur between the insulators, special straining boxes were used at intervals, on each set screws were arranged and connected to the strip, so that it was possible by tightening these to strain the bars up to the necessary requirements. Other forms of bare copper strip are employed, but they do not differ in principle from that already named. In the St. Pancras system, where bare conductors were for a long time employed, in order to prevent the deposit of moisture upon the insulators, and also to keep the conductors dry, means of forcing dry air through the culverts or channels were provided. The most notable instance at the present time in which bare copper mains are employed is at Manchester; but as this is used in connection with a system that has some very special features, it will be necessary to consider it more in detail.

Proposed Electric Tramways.—The London United Tramways Company will make an application almost immediately, under the Light Railways Act, for permission to extend their system of electric tramways through Twickenham, Hampton, Hampton Court, Hampton Wick and Teddington. Last year the company obtained an Act authorising them to construct electric tramways from the London boundary at Hammersmith, through Chiswick, Brentford and Isleworth, to Hounslow. Arrangements are also in progress with the London County Council, under powers conferred by the same Act, by which the electric tramways will be continued within the London border to the terminal station of the Central London Electric Railway at Shepherd's Bush. Should the proposed extension southward be granted, electric tramcars will run direct from Shepherd's Bush to Bushey Park and Hampton Court, and to the nearer end of Kingston Bridge.

ARBITRATIONS AND AWARDS.

Mr. Alexander R. Stebbing, a member of the council of the Surveyors' Institution, recently sat at the Medical Examination Hall, Victoria-embankment, as arbitrator in the case of Gregory v. London Reservoirs Joint Committee—a claim for compensation in respect of the compulsory acquisition of land for the purposes of an easement through the estate known as Riverscourt, which adjoins the Thames at Staines. The joint committee are engaged in the construction of an aqueduct for conveying water from the Thames and the Colne brook to their extensive new reservoirs at Stanwell, belonging to the New River Company, the Grand Junction Company, and the West Middlesex Water Company. Mr. Freeman, Q.C., appeared for the claimant; while Mr. Baggally, Q.C., and Mr. Lewis Coward represented the joint committee. Mr. R. Vigers said he valued the land, which was 3 acres 3 roods 7 perches in extent, at £300 per acre, which, with 10 per cent. for compulsory sale, would amount to £1,251. The general damage to the estate, including the severance, he estimated at £3,000, and with £100 deducted from his valuation for the proposed bridge this left £4,151. He understood the joint committee had refused to restrict their right to take water from the Colne brook, and if they exercised their full rights they would injure the property as well as ruin the fishing. For this injury he claimed £500, making his total valuation £4,651. Mr. Daniel Watney gave evidence of a total valuation of £4,575, and Mr. Howard Martin estimated the value of the property proposed to be taken at £4,365. On behalf of the defendants, Mr. R. E. Middleton, the joint engineer of the scheme, gave details as to the sites and construction of the aqueduct through the claimant's estate. In his view the works would do no appreciable damage to the property. The width of land taken was 100 ft., but this had been done in case it should be necessary in the future to increase the number of aqueducts to four. They had power to take 100,000,000 gallons a day from the Thames, the Colne, the Wraysbury, and the other streams, so long as there was a flow of 265,000,000 gallons over Bell Weir. They had statutory powers to take the whole waters of the Colne, but there was no intention of doing so, and, indeed, he did not consider this feasible. Sir J. Whitaker Ellis, Mr. Edward Tewson and Mr. E. H. Bonsfield gave evidence as to the value of the estate. They agreed that the value of the easement should be £100, one-half the full value of the acre taken; the compensation for disturbance during the construction of the works they fixed at £100, £153 for the 2½ acres of meadow taken for the open aqueduct, and £500 for the general depreciation in the value of the estate. That total of £1,153 they considered a fair and equitable, and even a generous and liberal, compensation for the works. The umpire reserved his award.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.

SPECIAL GENERAL MEETING.

A special general meeting of the above Association will be held at the Westminster Palace Hotel, Victoria-street, London, S.W., on Saturday, the 10th inst., for the purposes mentioned below. The chair will be taken by the president, Mr. W. Matthews, M.L.C.E., at 10 o'clock precisely.

PROPOSED ALTERATION OF RULES.

In substitution of Rules 30 and 31:—

Subsequent Councils and Term of Office.

The council shall, after the above date, consist of the president, past-presidents (who are eligible for election as hereinafter provided), two vice-presidents, hon. secretary and treasurer, and ten ordinary members. The president, vice-presidents, hon. secretary and treasurer, and ten ordinary members shall go out of office each year, on the date fixed by the council for the annual general meeting, but shall be eligible for re-election. Voting papers, in a form to be determined by the council, shall be sent to each member by the secretary fourteen days before the half-yearly or winter general meeting, to be returned to the secretary at or before such meeting. Nominations for the vacant offices shall be sent to the secretary thirty-one days before the winter general meeting. Two scrutineers shall be appointed at the said winter meeting to examine and report upon the voting lists. The result of the voting shall, upon the report of the scrutineers, be declared by the chairman. Every past-president shall, at the expiration of five years from the termination of his presidency, go out of office, but shall be eligible for election to the council in the ordinary way.

GENERAL MEETING.

A general meeting will afterwards be held, at 11 o'clock precisely, when the chair will be taken by the president, Mr. W. Matthews, M.L.C.E. Mr. H. Bertram Nichols, M.L.C.E., will read a paper, entitled: "Water Supply from the Lower Greensand and Constructional Works connected therewith at Leighton Buzzard." A discussion will follow the reading of the paper. At this meeting there will be a ballot for election of members and associates whose proposals have been received and approved by the council.

Sewerage Work in Birmingham.

RECONSTRUCTION OF EDCBASTON AND HARBORNE SEWERS.

At a special meeting of the Birmingham Corporation, last week, the Public Works Committee presented a report on the proposed reconstruction of sewers in the Edgbaston and Harborne districts. For several years past the council have received complaints of the offensive smells arising from the sewers in different parts of the city, but particularly in the districts of Edgbaston and Harborne. Efforts were made to lessen the evil by the erection of ventilation shafts at certain points and by more frequent and thorough flushing, but in October, 1896, it was found desirable to instruct the city surveyor to make a thorough examination of the sewers in the district mentioned. Where the dimensions would permit the interior of the sewer was traversed, in other cases the condition of the sewer was ascertained from the various manholes, and where manholes did not exist or were not sufficiently numerous trial holes were sunk for the purpose. The details of this examination formed the subject of a report by the city surveyor, Mr. Price, in November, 1897.

THE CITY SURVEYOR'S REPORT.

In the city surveyor's report are given the results of the inspection in tabular form, the sewer in each street being briefly described, with its salient points and the condition in which it was found. The area reported upon comprised some 3,625 acres, with a population of 21,000. This area, with the exception of one portion, containing some 225 acres, with an estimated population of about 9,000, drains into the Rea main intercepting sewer above Balsall Heath-road, the small portion alluded to draining into the same sewer below this point. Into this branch of the Rea main intercepting sewer various areas of the King's Norton District Council's district are drained. These areas amount to an additional 2,715 acres, with an estimated population of over 20,000. The Rea main intercepting sewer receives the discharge from four principal branch intercepting sewers from Edgbaston and Harborne, which naturally divide the whole area into five drainage areas. It was also reported that an area of some 289 acres was then undrained, and would eventually have to be dealt with as a separate drainage area draining to the Rea main intercepting sewer. There are also five branch intercepting sewers conveying sewage from the King's Norton district into the Rea main intercepting sewer. On the subject of the drainage system generally the city surveyor said:—

"Generally speaking, the bulk of the sewers would seem to have been constructed between the years 1863 and 1879, and are therefore on principles which do not now obtain in sewer construction. At one time it was thought to be an advantage to have open joints in the soffit of the arch, with a view to admitting subsoil water, but now it is recognised that all foul-water sewers should be perfectly watertight, and that surface waters should be admitted only by properly trapped gullies or dealt with by separate surface-water drains.

"Very little advantage seems to have been taken of the natural facilities to deal with the surface waters by a separate system, although the area under consideration is one peculiarly adapted for such a system, being traversed by several brooks and watercourses, whilst the suburban character of the district is such that the surface waters should be of such a character as to be admitted into running streams without any danger of unduly fouling them.

"Certain of the branch sewers are giving trouble, owing to the fact that they have to carry both foul and surface waters, where the amount of surface waters is large in proportion to the foul waters, the result being that in dry weather the flow is insufficient to give the necessary velocity to keep them self-cleansing. Again, it must be remembered that until the storm overflows begin to act such surface waters pass down to the outfall at Saldley, causing difficulties there, of which the committee are no doubt quite aware."

The city surveyor strongly recommended that in this area the surface-waters generally should be dealt with by a separate system wherever possible, as that would do away with the necessity of reconstructing certain of the main sewers, which otherwise would have to be considerably enlarged. Mr. Price further remarked that, as might be expected, sewers which were constructed from twenty to forty years ago are not such as would be accepted nowadays, leaving out the fact of the ordinary wear and tear of that period. Thus they found miles of small brick sewers, 1 ft. 9 in. by 1 ft. 3 in. internal diameter, constructed half-brick in thickness, which would in more recent times consist of 12 in. and 15 in. stoneware pipes; and it was pointed out that such sewers, when the joints give way or the bricks perish, cannot be repaired, and that a new sewer has to be substituted in such cases. Mr. Price further remarked that it is almost impossible to construct sewers with a single brick ring of a durable character, a fact which would be strongly impressed on the Public Works Committee when they heard the detailed report on such of the larger brick sewers as could be inspected internally, and he felt that no sewer constructed in such a manner could be considered safe. In the case of a sewer which was cited as an illustration the joints in the brickwork were found open and an accumulation of black filth at the back of the brickwork; the pipes in the upper

length were badly jointed, open in places with the same result as before, the jointing material, if any, that had been used having generally disappeared. The sewer in question, it may be mentioned, has been entirely reconstructed. The report of the city surveyor continued as follows:—

"The manner in which connections for house drainage have been made in former years could scarcely be worse; in the brick sewers a hole has been broken through and a pipe pushed in, nothing more being done, the hole thus made being left to take care of itself. Where the sewer has consisted of pipes, precisely the same method has been pursued in some of the cases which have come under notice in this examination.

"Generally the gradients are fair, although it is evident on certain lines of sewers that, for the sake of economy, the gradient has been sacrificed, with the result that what might have been a self-cleansing sewer has thus been made a sewer of deposit.

"In some portions of the general system the sewers have been divided into lengths, for the purposes of ventilation; but in the case of reconstruction this system might be pursued to a much greater extent with advantage. Although many schemes of ventilation have been brought before the public from time to time by inventors, none have, so far, superseded the old system of open-air gratings, aided with ventilating shafts acting without any mechanical assistance.

"In some parts of the system, chiefly in Harborne, flushing chambers have been provided to assist sewers which evidently gave trouble through being badly constructed or not having self-cleansing gradients. Some of these chambers were found out of order, but instructions have been already given to have them put into order and regularly used.

"Some of the sewers, which are in fair condition, and for which reconstruction is not recommended, would be materially benefited by the addition of automatic flushing chambers. On all sewers reconstructed flushing manholes at regular distances apart should be provided."

Mr. Price also advised a considerable increase in the number of gullies, especially where it is not intended to provide a separate surface-water drain, as such a course, if proper attention were given to the cleansing out of such gullies, would prevent large quantities of detritus from getting into the sewers, from which it is very difficult to remove, and would also, in his opinion, relieve the outfall works at Saldley of a very large amount of the mud, which is now one of the great difficulties the Tame and Rea Drainage Board have to deal with.

MR. EDWARD PRITCHARD'S REPORT.

As the result of Mr. Price's investigation was practically to condemn nearly the whole of the sewers in the district, the committee deemed it advisable before proceeding further to have an independent examination made, and they therefore instructed Mr. Edward Pritchard, M.I.C.E., who combines with an extensive practice in the designing and construction of sewerage works a long and intimate acquaintance with Birmingham, to make an independent personal examination of the sewers. To enable Mr. Pritchard to make his investigations, excavations were made in thirty different places. The report was presented in February of the present year, and in it Mr. Pritchard stated that the result of his inspection proved the sewers inspected to be in an unsatisfactory condition. With one exception he found the brick sewers to be only $\frac{1}{2}$ in. in thickness. Mr. Pritchard added:—

"In places along the intercepting sewers the arches are 'crowning in,' and the shapes of the sewers in their cross-sections are distorted. In places the bricks in the arches have dropped considerably, and in others have fallen right through, showing danger of collapse. The inverts in places are also in bad condition, having been much worn by erosion. In many places there have been deposits formed on the inverts of the intercepting and subsidiary sewers to an enormous extent, probably due to the gradients not having been carried out as intended and as shown upon the original drawings; but my instructions not extending to a report upon the gradients or discharging capacity of the culverts, I did not check them by levelling. In fact, this would not be ascertained without baring the culverts to a much greater extent than has been done.

"The remarks generally as to the condition of the brick culverts of the intercepting sewers apply equally to the brick sewers comprising a portion of the subsidiary sewers. The jointing of the earthenware pipe sewers is faulty, and in many instances the spigot end of the pipe is not 'home,' thus permitting leakage to the subsoil. Where curved pipes should have been used straight ones have been substituted, with a result that it was impossible to make proper joints. In some instances the flow of the sewage is very sluggish; in fact, at such places the flow is so slight that it is imperceptible, with a result that there is a great deal of excrementitious deposit in the pipes, from which emanate exceedingly offensive sewer gases. These facts indicate that the gradients are not self-cleansing for the volume of sewage passing down."

After inspecting certain points at which the sewers (ignoring the imperfect private connections) appeared to be in a fairly good condition, Mr. Pritchard concluded his report by saying that the connections of the subsidiary sewers with the intercepting sewers, as well as the connections of the house drains with the sewers, generally were most imperfect, junction blocks and bends appearing to have been considered as quite unnecessary.

THE CITY SURVEYOR'S RECOMMENDATIONS.

The committee were convinced that nothing less than a scheme for the reconstruction of the whole of the sewerage system in the district would meet the requirements of the case, and they instructed the city surveyor to obtain the necessary levels, and to submit his recommendations for such a scheme. Accordingly, in July, Mr. Price presented a report embodying a scheme for dealing with both the foul and storm water sewers within the Edgbaston and Harborne district. The total area dealt with is 3,767 acres, with a population of about 26,500. Into the Ren main sewer is also drained an area of 2,535 acres, being a portion of King's Norton, which has an estimated population of 31,000. These figures give a total drainage area of 6,302 acres, and an estimated present population of 57,500. As a basis of calculation it was assumed that the period for which the sewers would have to be designed should be thirty years, having in view that such would be the period for which the Local Government Board would sanction a loan.

With regard to the area of King's Norton draining into the Ren main sewer, it has been assumed that in thirty years the present population of 31,000 would be doubled, and an allowance of 50 gallons per head per diem has been made, being 10 gallons per head in excess of the quantity which the corporation, under the terms of their agreement, are bound to provide for, the extra 10 gallons being allowed as a margin for special contingencies. The city surveyor finds, from inquiries which he has made, that a very rapid growth of population is taking place in certain parts of the King's Norton district, especially at Selly Oak, where the increase for the last seven years has been at the rate of 5 per cent. per annum.

For the sewers to be constructed within the city boundaries, each sub-drainage area has been dealt with separately, and a proportionate expansion has been allowed for. Thirty gallons per head per diem has been allowed for, and an addition for the surface and storm waters falling upon back roofs and yards of all houses, and also for the drainage of many of the larger houses, where the rainfall could not be economically separated from the foul waters, depending upon the character of the special area under consideration. The remainder of the rainfall will be carried off by a separate scheme of surface-water sewers having outfalls into the nearest watercourse. Two storm overflows are already provided in the Ren main sewer into the River, and these will be so arranged that 150 gallons per head per diem will pass down the Ren main sewer before any dilute sewage will pass into the river. Under the river Ren improvement scheme a new storm overflow will be provided in Edgbaston-road for the one which has to be abandoned. The heaviest rainfall recorded during the past five years amounted to $\frac{3}{4}$ in. in half an hour. The sewers would be constructed on lines that would make them practically self-cleansing. The following part of the report may be quoted in full:—

"At dead ends, where the only trouble is likely to arise owing to the small flow which must necessarily occur, automatic flushing chambers will be provided, to be supplied with town's water. On all sewers reconstructed flushing manholes at regular distances apart are provided for.

"The estimate allows for the doubling of the number of gullies at present provided in this area, with a view to keeping up as much road detritus as possible from getting into the sewers or surface-water drains, where the cost of removal is greatly increased.

"Wherever the gradients are good—and, fortunately, that obtains in many places all over the drainage area—valves will be provided for breaking up any tendency for a current to form and convey gases along the system of sewers, and with a view to limiting the area of ventilation at any one particular point. The city surveyor believes that if this is carried into effect it may enable him to entirely remove the ventilating columns which are at present erected at certain points in the Edgbaston district. The most practical authorities on the question of ventilation are of opinion that ventilation by means of open gratings placed in the centre of the roads is the best, and that where the roads are extremely narrow or where there are some peculiar circumstances which necessitate some other method of treatment, then ventilating shafts may be substituted, but not otherwise.

"In the new scheme it is intended that wherever possible the line of the existing sewer shall be followed, so that in excavating for the new sewer the existing one would be entirely removed; but in the larger trunk sewers this method is, unfortunately, impossible, owing to the large flow of water making the cost of construction in that way uneconomical. In such cases the new sewers will be laid as near to the line of the old sewer as possible, and the existing sewer, if not absolutely removed, will be cut off, cleaned and filled up where possible with gravel or some other clean substance.

"The whole system has been designed with a view to provide for the proper sewerage of the whole area, and conse-

quently certain lengths of sewer may not require to be constructed for some years to come. The Ren main intercepting sewer will be reconstructed for part of its length as a brick sewer, 3 ft. 4 in. by 2 ft. 6 in., the least suitable being 1 ft. 6 in. by 2 ft. 3 in., and for another length the sewer will be divided into 3 ft. by 2 ft. 3 in., and for a third length it will be a pipe sewer 21 in. by 18 in. The estimated cost of replacing this main sewer and the branch sewers connected therewith is estimated at £18,430."

Mr. Price then proceeded to deal with the various sub-drainage areas in detail. In one area, comprising 387 acres, the intercepting sewer is a 3-ft. 6-in. by 2-ft. 6-in. brick sewer, which requires repair and partial reconstruction, and it is estimated that the cost of this work together with the construction of the branch sewers draining into the intercepting sewer, will be £21,293. In another area, comprising 405 acres, it is estimated that branch sewers will require to be reconstructed, at a cost of £3,000. Dealing with two other areas, Mr. Price states that the reconstructed Chad Valley main sewer would consist of (1) a 3-ft. by 2-ft. 6-in. brick sewer, with a least gradient of 1 in 330 (the least gradient in the existing sewer for a considerable length is 1 in 920); (2) 21-in. and 21-in. pipes; 18-in. pipes at a gradient of 1 in 82, and, finally, 15-in. and 12-in. pipes instead of the existing 3-ft. 6-in. by 2-ft. 6-in. brick sewer. The cost of this work is estimated at £17,730. Various alterations are suggested in connection with the branch sewers discharging into the Chad Valley main, the cost of reconstructions being estimated at £29,812. There is also the area previously referred to as undrained. The cost of the proposed sewer and branches in this area is estimated at £5,237, and is included in the sum of £18,909 provided for the Ren main intercepting sewer. Mr. Price adds:—

"The total cost of the foul-water sewerage scheme, as set forth in this report, is estimated at £122,074, including a sum of £1,200 for flushing chambers; but, as already pointed out, it will probably not be necessary to construct for a few years sewers estimated to cost £9,000, the necessity for these depending upon the extension of building operations. After making this deduction the total amounts to £113,074.

"In estimating for the whole of the work I have allowed for the best workmanship and materials, and in all pipe sewers laid in valley lines, where bad ground is likely to be met with, Russell's patent double-lined pipes to be estimated for, as these make the best watertight joint to be obtained at the present day."

In devising the surface-water system the city surveyor states that every opportunity has been taken of utilising the various streams and watercourses, these having no less than twenty-three outfalls, which enables the system to be economically carried out. At the outfalls detritus chambers will be constructed, with a view to arresting any matter which may pass through the gullies, and which otherwise would pass into the watercourses, some of which have a very small flow. In the central and more populous portions, where the flow for the first few minutes would be to a certain extent foisted, it is intended to divert such flow into the foul-water sewer by means of a leap weir arrangement. The total cost, including the additional gullies previously referred to, is estimated at £30,000. It is estimated that the surface-water system will deal with about five-eighths of the rainfall which would otherwise reach the sewers. This, says the city surveyor, means that if the sewers of the foul-water system had to be constructed large enough to deal with the surface-water system it would entail a probable increased cost of £15,000, so that the actual saving of a combined system of sewers, as against a separate system, would only be £15,000 on the question of actual cost. Mr. Price concluded by pointing out the difficulty of estimating accurately what the saving would be at the outfall works, but gave some figures which would be of assistance in determining the value of the application of the separate system. He said:—

"Supposing that on the average 750,000 gallons per diem are diverted into the watercourses instead of passing into the sewage farm, then allowing that a proper sewage dressing day by day is 8,000 gallons per acre, it is clear that this quantity of sewage would represent a saving of 93 acres at the farm. Again, every acre at the farm, including tanks, roads, buildings, conduits, underdrainings, &c., represents an outlay of about £400; therefore 93 acres represents a sum of £37,500. The city surveyor is of opinion that the saving effected by the partially separate system proposed would not save less than 750,000 gallons; but it is probable that even a larger quantity than this may be diverted from the sewers, especially when the population increases in the area under consideration."

MR. MANSERGH'S REPORT.

The scheme thus projected by the city surveyor was duly approved by the corporation, but, having regard to the cost and importance of the work, it was considered desirable to obtain the opinion of an independent engineer of eminence. Mr. James Mansergh, who had in connection with the great water scheme obtained all details as to levels, &c., in the district, was therefore requested to consider the city surveyor's scheme and advise whether, in his opinion, it was the best for the purpose, and whether he would recommend any and what alterations in it, and also to consider whether the estimate of the cost of reconstruction was reasonable.

In the end of October Mr. Mansergh reported that the trial holes sunk on the present sewers have revealed a series of defects which justified the conclusion that sound, watertight sewers should be substituted for the present ones, and he pointed out that the levels of the districts are such that the engineering is of the simplest character. The main sewers are laid in the valleys, and the subsidiary branches are connected to the main sewers by the most direct lines, along the roads, and in some cases through private lands. Mr. Mansergh suggested a slight modification of the estimated increase of population in thirty years, and an increase in the estimated provision per head in regard to quantity. With these amendments he described the scheme as being based on the following lines:—

"The Chad Valley main sewer will drain 1,374 acres, on which a population of 31,030 is estimated to reside in thirty years time. The Hants Green and Rea main sewer will drain an area of 1,535 acres within the city, with a future population of 25,565, and 524 acres of the King's Norton district with a future population of 26,700. I regard these estimates as being reasonable and proper. The scheme is designed to admit into the sewers only that portion of the rainfall which comes off the back roofs and yards of the houses. This is a sound principle to work on in this case. By allowing for 500 gallons per head per day a provision will be made for carrying off nearly $\frac{1}{4}$ in. per hour from the back roofs and yards. In the case of the calculations for the Chad Valley I find that a total provision is made for 491 gallons per head per day, which is near enough for practical purposes."

Mr. Mansergh then went on to suggest some slight enlargements in the sizes of sewers, and concluded as follows:—

"The proposed surface-water drains call for little comment. For the present streets and roads, and also for some extension of them, the new drains will be sufficient, but as the district develops and additional streets are formed the system will require new outlets. These can very easily be obtained into the streams which intersect the areas."

"The estimated cost of the new sewers and drains will be increased slightly when the enlargements I have suggested are made, but substantially I approve of the city surveyor's estimate. The prices at which they are worked out are such as my experience confirms. It must be borne in mind, however, that in work of reconstruction like this the tendency is for the quantity of work to increase and for unexpected difficulties to reveal themselves. I do not think, therefore, that it would be a matter of surprise if the total cost, when finished, were 10, or even 20, per cent. in excess of that now estimated."

"In my view the committee may, with confidence, recommend the council to approve of the schemes with the small amendments I have named, for I regard them as well suited to the conditions of the areas they are designed to serve as well as to the sewerage system of the city as a whole."

FINAL REPORT FROM MR. PRICE.

Having perused Mr. Mansergh's report, the city surveyor submitted the following remarks:—

"The basis of 500 gallons per head per diem is equal to $\frac{1}{4}$ in. of rainfall from the back roofs and back yards, the front roofs and roads being dealt with by the separate surface-water system recommended. As a matter of fact the sewers will be able to discharge a heavier rainfall than $\frac{1}{4}$ in. in an hour, as it may be assumed that at the commencement of such a heavy fall the sewers will be discharging sewage, the maximum flow of which represents only one-tenth of the capacity of the sewers, thus leaving nine-tenths for the accommodation of the rainfall."

"The differences in sizes of the sewers recommended by Mr. Mansergh in his report, as against the sizes which were first proposed, are probably due to the fact that the calculations have been worked from different tables. The question is to what extent will their increases in size affect the estimates, and the city surveyor finds that the additional sum of £690 will be sufficient. This amount is small in proportion to the total estimated cost, especially bearing in mind that by using the larger sizes proposed the corporation will have in any case a greater safeguard against flooding; and the increase may, therefore, be accepted. The estimated cost of the sewers would therefore amount to £122,764, of which amount the sum of £9,000 is put down for sewers which may not be required for a few years, depending very much on the development which may take place in the area under consideration. The cost of the surface-water system is £30,000."

"This deals with the whole of the roads which are at present in existence; and, as development may take place, it may be necessary to provide for additional outfalls, although it may be presumed that the bulk of the surface-water drainage would be provided by the owners laying out the various estates."

"The city surveyor would suggest that a sum of £2,236 should be provided for the preparation of plans and other engineering expenses, bringing up the total cost of sewers and surface-water drainage to £155,000."

At the special meeting of the Birmingham Corporation held last week it was unanimously decided, on the motion of Alderman Sir James Smith, chairman of the Public Works Committee, seconded by Councillor Baldon, to carry out the proposed scheme of reconstruction, at the estimated cost of £155,000.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

227. The Construction and Working of Tramways, Book on.—"Candidate" writes: Will you or any of your readers kindly inform me where I can obtain sufficient reliable information on the construction and working of tramways for the questions frequently set at the Municipal and County Engineers' examinations, as there does not appear to be any work on the subject published?

The only book containing a reasonably comprehensive amount of information on this subject is "Tramways: Their Construction and Working," by D. Kinneer Clark, M.I.C.E. (Crosby Lockwood & Son. Price 28s.). This work embraces a comprehensive history of the system, with an exhaustive analysis of the various modes of traction, including horse-power, steam, cable traction, electric traction, &c.; a description of the varieties of rolling stock, and ample details of cost and working expenses, with 400 illustrations, 8vo., 780 pp. The following books on electric tramways are recommended, Reckenyann's "Electric Traction on Railways and Tramways," with 200 illustrations, 8vo., and 400 pp. text (Biggs & Co. Price 10s. 6d.), and Dawson's "Electric Tramway Construction, Equipment, &c.," 4to. (Batsford, 94 High Holborn, London, W.C. Price 42s. nett).

228. Osiers, Damage to, by Sewage Effluent.—"Surveyor" writes: Do you know of any case where the growth of osiers has been damaged by the effluent from sewage works passing through or over the ground? If so, can you give me particulars where compensation or damages has been awarded; also, if there is anyone who is an authority on the cultivation of osiers?

Correspondents should endeavour to give as many facts bearing on each query submitted to us as they possibly can consistent with due regard to conciseness. In the case now put before us it would have been helpful to know whether the osiers had been damaged, and if so how, by a sewage effluent, and what system, if any, of chemical precipitation was in use, and whether the osiers are being sewage by the effluent on land other than that of the local authority. These and other material facts should not have been withheld. If the sewage is precipitated with proto-sulphate of iron, in combination or otherwise with lime or other chemicals, an excess of the proto-sulphate of iron will have an injurious effect upon vegetation. We are unable to give an instance where osiers have been injured by the application of sewage, nor do we know of any case where damages have been obtained against a local authority under circumstances similar to those suggested by the querist. We do not know of anyone who is an authority on osier cultivation.

229. Reservoir Embankments, Pressure of Water on.—"A Student" writes: Would you furnish me with a reliable formula for estimating the pressure on reservoir embankments when full and, say, when two-thirds full?

The rule for calculating the total pressure of quiet water against and perpendicular to any surface is: Multiply together the area in square feet of the surface pressed, the vertical depth in feet of the centre of gravity below the surface of the water (which is equal to half the depth), and the constant number 62.5. The product will be the required pressure in pounds. *Example.*—What will be the total pressure on a wall 50 ft. long when the depth of water pressing against its vertical back is uniformly 20 ft.?
 $50 \times 10 \times 62.5 = 31,250$ lb., the total pressure. The same rule will apply to reservoirs when either full or two-thirds full, as the pressure is calculated from the actual height of water behind the wall.

Building By-Laws and Regulations.—We have received an interesting letter from Mr. A. R. Robinson, surveyor to the Clacton Urban District Council, with reference to Query 224, which appeared in our last issue, and shall have pleasure in publishing it next week.—[ED. THE SURVEYOR.]

LONDON LOCAL GOVERNMENT.

The Rev. Prebendary Barlow, chairman of the Islington Vestry, presided on Friday over a conference of local authorities, held at the Islington Vestry Hall, for the purpose of discussing the question of reform in the local government of the metropolis.

Following a short address by Mr. Lough, M.P., who was present, by invitation, to explain his Bill, the following resolution was, after some discussion, carried almost unanimously:—"That in the opinion of this conference, representing the vestries and district boards of the metropolis, no reform in London government will be satisfactory unless it deals simultaneously with the constitution of the local authorities in all parts of the county of London and secures a uniform system throughout London."

A motion was also adopted agreeing that it is desirable that the local authorities of the metropolis should possess the power to purchase property compulsorily for all purposes for which they had, or might obtain, powers to acquire property. The meeting shortly afterwards terminated with a vote of thanks to the chairman.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XXI.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

ROAD-ROLLING (continued).

Messrs. Aveling & Porter, in their pamphlet on "Steam Road-rolling," give the following general description of the manner in which the roller should be used—

"In the best practice the roadway is excavated, graded and properly formed to a depth of 11 in. from the level of the gutters, with a cross-section conforming to the cross-section of the road when finished, it is then thoroughly and repeatedly rolled with the steam roller, all depressions being carefully filled and rolled before the stone is put on.

"On the bed thus formed and consolidated a layer of stones, 8 in. thick, is set by hand, and rammed or settled to place by sledge hammers, all irregularities of surface being broken off and the interstices wedged with pieces of stone. The intermediate layer of broken stone, of a size not exceeding 3 in. in diameter, is then evenly spread to a depth of 4 in. and thoroughly rolled, and this is followed by rolling to ½ in. of sand. The surface layer of stone, broken to a size not larger than 2 in. diameter and to a form as nearly cubical as possible, is then put on to a depth of 3 in., thoroughly rolled, and

FIG. 31.

followed as before by sand, also rolled. Finally a binding, composed of clean, sharp sand, is then applied, well watered, and most thoroughly rolled with the steam roller, until the surface becomes firm, compact and smooth, the superfluous binding material being swept off and removed."

In "patching" a road by the aid of the steam roller the usual process is, as described by the county surveyor of Notts in a paper on "Steam Rolling," to thoroughly water the road surface before applying the new material, and then "opening the edge of the hole before covering with a patch, removing the fine detritus, applying the material of the gauge required, and covering the edges up with the removed detritus, blending, well watering, and finally well consolidating the whole with a roller."

As to the use of the roller in the repair of roads "when a road becomes so full of holes or so worn as to require coating throughout its entire length and width, it should be backed completely over and raked into a segmental form in its transverse section to remove irregularities, and so that the road may have a fall from the crown to the channel of not less than 1 in. to 1 yard. It should then be coated with stone broken as nearly cubical as possible and to a uniform gauge. When spread it should be slightly coated with gravel screenings, or the grit sweepings from the roads, which are equally suitable for the purpose when in proper condition. The road should then be watered and rolled, beginning with the road at the channels and ending at the crown of the road, until a smooth surface is obtained, more stones being added to fill up any inequalities that may exist until the whole is consolidated. By constantly sweeping the grit from the sides to the crown of the road as the roller passes over every stone is thoroughly grouted into its bed."

On the repair of roads the city surveyor of Gloucester observes: "The road should be thoroughly well lifted and the metalling spread in 3-in. layers evenly, and rolled once or twice before the gravel or other binding material is spread; then spread gravel or sand evenly and well watered with fine distribution until the stone is entirely covered and the sand does not adhere to the roller. Dam up the road channels to prevent water and sand running off into the sewers, and let men scoop up the water and throw it back on the road as it collects in the gutters."

The haunches of the road should always be rolled before the centre, so that when the roller passes over the crown of the road the weight, which will tend to spread the road metal toward the channels, will be resisted by the previously consolidated sides.

"Binding material," consisting of fine gravel, sand, chippings or road drift is essential in road-making with a roller, but should not be placed on the road until the roller has been at work for a short time, as its use is simply to bind the crust or surface of the road. Should too much binding material be used, it will be removed from the joints of the stones by heavy rains and the surface of the road will quickly go to pieces. Where the traffic is allowed to consolidate the newly-

laid metal the stones are already fitted each other so as to form sufficient binding material for themselves.

An experiment was tried at New York in a machine by rolling of road metal by adhering strictly to the method practised by Macdonald of excluding all binding material, but, although the bottom layer of stone could be conserved in this way, it was found impracticable to consolidate the top layer to a sufficiently firm surface to prevent the stones being displaced by the traffic. Increasing the weight of the roller produced the opposite effect to that intended, and the stones became rounded by excessive abrasion. It was thus shown that "broken stones of the ordinary size and of the very best quality for wear and durability, with the greatest care and attention to all the necessary conditions of rolling and compression, would not consolidate in the effectual manner required for the surface of a road while entirely isolated from and independent of other substances. The means of packing, compress and solidify them while in this condition after a certain limit had been reached were unavailing."

In regard to the rolling of country roads in America, the "Provincial Instructor in Road-making," Ontario, in his report for the year 1896, observes: "When the benefit to be derived from the use of rollers is better understood they will be more generally adopted." The advantages derived from their use are:—

- (1) "A good track is immediately obtained, and vehicles at once take the centre of the road.
- (2) "A dirt track is not made near the ditch, and by this means the side of the road is not cut up and made so uneven as to interfere with surface drainage.
- (3) "Traffic is not inconvenienced in fall by having to drive through loose gravel or crushed stone.
- (4) "The gravel or stone is not forced down into the subsoil by the wheels and feet of the horses, is not churned and mixed with the earth, and there is in this way a great saving in the amount of metal.
- (5) "There is a great saving in manual labour, and repairs are more easily and effectually made."

Cost of Steam Road-rolling.—The cost of steam rolling per square yard, including all charges, may be taken as being between 3d. and 1d.; but this and the amount of work done in a given time necessarily varies with the system of working and the principle of calculating chargeable expenses. Some surveyors take the daily cost as consisting of wages, coal and oil for the roller alone; others add a percentage on the cost of the machine to cover depreciation and interest; others, again, include the collateral expenses of watching, watering, and sweeping in the sand, &c., sometimes even adding the cost of the hoggin to the account.

Also, the statements of work done in a given time show equal disparity, as so much depends upon the thickness of metal to be rolled, the proportion of sand or hoggin rolled in with it, the quantity of water used in rolling, the gradients of the roads, the degree of consolidation required for the traffic, and the number and gravity of the interruptions met with.

Under efficient management, where the roller is kept continuously at work by having stretches of road always prepared in advance of it, the number of square yards rolled in a day by Messrs. Aveling & Porter's rollers is given at from 1,000 to 2,000, according to the weight of the machine and to the influence of the other conditions on the work. If the items constituting the cost of rolling be restricted to the wages of the driver, the bills for coke and oil and a sum of 10s. to 15s. to cover interest, wear and tear, the cost of rolling the above number of yards will average 22s. to 25s., i.e., from 3 to 8 square yards can be rolled and thoroughly consolidated for 1d.

In Edinburgh 10,000 tons of metal, covering an area of 100,000 super. yards of roadway, were consolidated at a cost, including all expenses, of 1d. per square yard. Two thousand five hundred super. yards of 3-in. or 4-in. metal have been consolidated in a day, but the mean surface rolled has been stated as 1,000 yards for town roads and 2,000 yards for country roads where there is no interruption to the working of the roller.

In Bournemouth 9,666 super. yards were rolled in 11½ days, at a cost varying from 1d. to 1½d. per yard super.; 4,800 super. yards were also picked up at a cost of from 1d. to 2½d. per yard super.

The cost per day of steam roller in Bristol was reported as follows: Driver, 5s. 6d., man with bar, 3s., coke and coal, 2s.; oil and sundries, 2s. interest, depreciation and repairs, 6s. 1d.; hire of water-cart, 8s.; total, 21 6s. 7d. An area of 2,013 yards super. of roadway was consolidated at a cost of

* "Roads, Streets and Pavements," by G. A. Coates.

rather more than 4d. per yard saper. Another example of 4,145 yards saper, cost 56d.

On the question of cost the following details, given by Mr. A. Greenwell, A.M.I.C.E. (Frome), in a paper on "Steam Road-rolling," will be of interest: "From careful experiments with blue limestone it has been found that to obtain consolidation with the usual coating of two stones in thickness (each cubic yard broken to 2½ in. gauge, and made to cover about 17 saper, yard of road) the steam roller must traverse a patch equal to its own width about thirty-five times. From this it appears that a cubic yard of broken stone requires 1½ ton-miles of rolling to produce consolidation.

"With regard to the use of binding material, the blue limestone in this district (Frome) cannot be consolidated without it. The best results appear to be obtained by the use of well-weathered road scrapings, spread over the surface, when consolidation has been nearly effected, in the proportion of one of road scrapings to twenty of broken stone. Careful observation has shown that at least 25 per cent. of the material is saved by steam road-rolling.

"The cost of steam road-rolling a patch of mountain limestone about two stones in thickness (1 cubic yard broken to 2½ in. gauge, to cover 17½ superficial yards), 1 mile in length and 21 ft. wide, is found to be £31 5s. 7d.

"The cost of this coating is £189 11s. 8d., and under ordinary circumstances, when consolidated by the traffic alone, will last seven years; making the cost per mile per annum £27 1s. 8d. Taking the saving in materials resulting from the use of the steam road-roller at 25 per cent., the additional cost (for steam road-rolling) per mile per annum would be £3 6s. 7d., but the saving in material would be £6 15s. 5d.; and, allowing 16s. 8d. for after-raking, the nett profit resulting from the use of the steam road-roller is £4 5s. 6d., or 15 per cent."

LONDON WATER SUPPLY COMMISSION.

On Monday, at the Westminster Guildhall, Lord Llandaff presided over the Royal Commission inquiring into the water supply of the metropolis.

Mr. REGINALD E. MIDDLETON was again examined on behalf of the water companies. In answer to the chairman, he said his general opinion was that to get the supply from Wales would be more costly than to get an equal supply from the Thames. He did not think it would be necessary to go to Wales within the next fifty years, but if it was necessary he would go there now. Suffering 400,000,000 gallons were taken from the Thames, there would still be sufficient water for sanitary purposes. It would be cheaper to take it from the Thames, as the Welsh water could not be distributed without first undergoing the process of filtration. In the Thames the watershed was obtained without being paid for. The London County Council's estimate of a supply from Wales of 123,500,000 gallons per day would be about £21,000,000, while the cost from the Thames storage reservoirs scheme to supply a like amount would be little more than £6,600,000, including £1,155,000 for additional mains. He suggested that the water drawn from the sources of supply should be managed by an amalgamated or joint board. Future Parliamentary powers should be granted, not to any one company, but to the whole of the companies in such proportions as the board should determine.

Mr. MIDDLETON, recalled at Tuesday's meeting, said the rainfall in Wales was 5½ in. to 69 in., and in the Thames about 28 in. With regard to the Thames scheme, he thought there would be a great deal of revenue over the ordinary expansion. The Welsh scheme would be unprofitable for a very long period. The great difficulty about the Welsh scheme was the large expenditure that would have to be made before there was any return whatever. It was not inevitable to go to Wales. There was enough water from the Thames watershed to supply a population of 18,000,000 people, and if we got beyond that we should have to go to Scotland and Cumberland. He had considered the cost of the Thirlmere scheme for Manchester, the Yvnyw scheme for Liverpool, and the proposed cost of the Elan Valley scheme for Birmingham. The cost per 1,000,000 gallons of supply from Thirlmere was £88,000, the Yvnyw £97,500, and the Elan Valley £89,333, and the average cost of these supplies was £91,611. The lengths of the several aqueducts were: Thirlmere, 96 miles; Yvnyw, 67 miles; and Elan Valley, 50 miles; or an average length of aqueducts of 81 miles. The Welsh scheme for London was 81 miles longer than the average length of the other three aqueducts. The estimated cost of the Welsh scheme to supply 123,500,000 gallons, when judged by the Manchester, Liverpool and Birmingham standards, would be £21,190,537; and at 215,000,000 gallons (the end of the first instalment from Wales) it was £33,297,251. He made the Welsh scheme five times that of Staines. The water from Wales required a great deal of filtration, because it contained so much peat. He thought the carrying out of the Welsh scheme would mean a financial deficit up to 1948, but could not say what the amount of it would be. Asked for his opinion as to the right of counties to the supply of water in their own district, he said he could not see how any county could claim that, because the water was merely passing

through and did not belong to them. London had exactly the same right to go into Kent as into Wales. The argument of the counties was that Parliament ought not to give the right, and he expected Wales would say the same thing.

NEW SOUTH LONDON INSTITUTE.

OPENING CEREMONY.

The Duke of Cambridge on Monday performed the opening ceremony in connection with a new public institute which has been erected in Tooley-street, Southwark, by the trustees of the United Charities of St. Olave and St. John, at a cost of £12,000. Besides adding to the beauty and importance of the neighbourhood, it is thought that the institute cannot fail to be of very great use, not only to the parishioners but to the public generally.

The buildings, which have been designed by Mr. Henry Stock, F.R.I.B.A., F.S.I., of London Bridge, occupy a very convenient position, and comprise a hall—to be used for meetings and entertainments—and a reading-room, together with a lending library, gymnasium, and rooms suitable for a small club, including a billiard-room. The gymnasium, with dressing-room, lockers and lavatory attached, a book store, club smoking-room and lavatory, and a boiler-room for the heating apparatus, are all in the basement. On the ground floor there is the principal entrance hall, which gives access to the billiard and private club-rooms. In addition to the staircase ascending to the hall, there is a separate one leading from Fair-street to the lending library, while from the open way on the south-east side the caretaker's apartments, the stairs down to the gymnasium and the exit stairs from the hall are approached. Iron spiral stairs give access to the smoking-room and book store in the basement. Ascending the stairs from the entrance, the large hall is reached on the first floor—wholly occupied by this chamber. The latter, owing to the peculiarity of the site, has of necessity had to assume a wedge-shaped form on the plan, without, however, in any way impairing its utility, the platform or small stage being placed at the narrow end, from which, it is expected, sound will emanate with good effect. A small staircase at the north-west angle gives access to a gallery for musicians on the main staircase, while in connection with the platform are retiring-rooms for ladies and gentlemen.

The hall itself, which has been constructed in accordance with the requirements of the county council, is about 78 ft. long on its central axis, with a width at the north-west end of about 55 ft., and at the south-east end of about 17 ft. It is about 25 ft. high to the ceiling, and will seat about 350 persons. The floor is laid with wood blocks on a fireproof foundation, composed of Stuart & Co.'s patent granolithic flooring; and the principal and exit staircases are also formed of this material. The lending library is of irregular shape, and contains bookcases and wallshelves capable of containing between 8,000 and 9,000 books. The bookcases and fittings have been supplied by Messrs. Wake & Dean. The several portions of the building to be used by the public are lighted by electric light, the installation and fittings having been executed by Mr. W. Mackie, of Turmill-street, S.E. The contractor for the erection of the institute was Mr. William Shepherd, of Bermondsey New-road, S.E.

THE HOUSING OF THE WORKING CLASSES.

Mr. H. M. Beacheroff, a member of the Housing of the Working Classes Committee of the London County Council, has forwarded to the members of the council some observations on the report and recommendations of that committee. He points out that the effect of the recommendations is to commit the council to three definite conclusions—namely, that in all clearance schemes accommodation shall be provided for as many persons as are displaced; that, independently of that, the council should proceed to buy land and build to meet the general wants of London; and that the council continue the policy of itself erecting dwellings. After pointing out the statutory obligations which bind the council when effecting clearances and the obstacles the council have had to meet in this work, Mr. Beacheroff suggests that the first duty of the council is to devise means by which, in the case of a clearance scheme, the neighbourhood can be secured from the curse of overcrowding. This, he believes, can be done by a judicious exercise of the powers which enable the council to buy land or hire houses for the accommodation of the people displaced. He thinks, however, that there should be a definition of the class of person to be included in the term "working classes." With regard to the proposal that the council shall build for the working classes generally, Mr. Beacheroff says that it is so startling that he is tempted to wonder whether it is meant seriously. The practical line for the council to take, as it seems to him, is to devote themselves to opening out communications between the suburbs and the most crowded districts. The most serious feature in the recommendation, he adds, is its deterrent effect on private enterprise. He contends that the time has come when the council should review its building policy and consider whether it is justified in continuing to build on existing lines.

* * * Proceedings of the Association of Municipal and County Engineers," vol. xx.

it would be a question whether they are covered under (1) law 2 (a) or (7), which would depend upon the facts. (3) It would have to comply with the terms of by-law 2 (7). In order to be within clause (7) it would have not to exceed in height 30 ft., and not to exceed in extent 125,000 cubic feet.

HOUSE DRAINS: PUBLIC HEALTH ACT, 1875, SECS. 18 AND 23.—"Rural" writes: The rural district council have intimated to the owner of the four houses shown on Fig. 1 that the drains, which are not at present in a proper sanitary condition, must be taken up and relaid. The houses are provided with closets which are not connected to the drains and

FIG. 1.

with slop-water gullies which are connected to the drains, but both gullies and connections are defective. The owner contends that the main line of pipes between A and B (Fig. 1) is a sewer, and as such is repairable by the district council. Is this line of pipes a drain or a sewer? If the line of pipes between A and B is a sewer and the property of the district council, have not the council power, under sec. 18 of the

FIG. 2.

Public Health Act, 1875, to close such sewer and compel the owner to drain the houses into the 9-in. sewer in the street by means of separate drains laid under the houses, as shown in Fig. 2? The sewer in the street is within 100 ft. of the houses, as required by sec. 23 of the Public Health Act, and the line of pipes between A and B was laid by the owner.

The line of pipes is, in my opinion, a "sewer." It is not stated whether the Public Health Act Amendment Act, 1890, has been adopted in the district, but as the houses belong to one owner this is not material. The council are empowered under sec. 18 of the Public Health Act, 1875, to close this sewer, if it has, in their opinion, become unnecessary, on condition of providing a sewer as effectual for the drainage of these houses, provided the closing is so done as not to create a nuisance. Whether the owner can be compelled to bear the expense of draining into the 9-in. sewer in the street by separate drains is rather a difficult question. If the actual "drains" of the houses (as distinguished from the combined drain or sewer, B, A) are at the present time not "sufficient for effectual drainage" of the houses, then sec. 23 would appear to be applicable; in which case the authority could first compel the owner to drain into the street sewer, and then proceed to close the sewer B, A, under sec. 18. But if it is the sewer B, A only that is defective, I do not think the owner can be compelled to alter his system of drainage at his own expense (see *Marghbone Vestry v. Vestry*, 31 L.J., M.C., 214). This was a case under the Metropolitan Management Act, 1855, sec. 75, whereof is somewhat similar in terms to sec. 23 of the Public Health Act, 1875. The vestry resolved that the drainage of several houses into an old sewer was insufficient, and that such sewer should be discontinued, and gave notice to the owners to drain into a new sewer. The magistrates refused to order the owners to bear the expense of new drains, and upon appeal the High Court held that there was nothing to show that the drains were insufficient, that the vestry could not, by their finding, conclusively bring the case within sec. 75, that it was competent for the magistrates to refuse the order on the ground that the case fell within sec. 49 (which is much to the effect of secs. 18 and 18 of the Public Health Act, 1875), and that his decision on the matter (which was a question partly of law and partly of fact) was right, as the facts showed that the new drains were rendered necessary by the draining into the new sewers, and not by the insufficiency of the old drains.

Dundee.—Mr. Baxter, the water engineer, at a meeting of the Water and Gas Committee, held recently, submitted a report suggesting the laying of new water mains along the proposed new tramway route to the east end of the town before the streets were prepared for the tramways. The cost of the work, which the committee eventually decided to recommend for execution, was estimated at £1,349.

SUBSIDENCE FROM COAL WORKINGS.

EFFECT UPON BRIDGES AND OTHER STRUCTURES.

At an ordinary meeting of the Institution of Civil Engineers, on Tuesday, Mr. S. R. Kay, A.M.I.C.E., read a paper on "The Effect of Subsidence due to Coal Workings upon Bridges and other Structures," in the course of which the author expressed the opinion that a period of two or three years at least after coal was extracted should elapse before commencing works, and more if possible in the case of deep mines. In building ordinary road or railway bridges, or viaducts, the form of the arch should be avoided and steel superstructure employed having the requisite elasticity to adapt itself to any slight movement subsequent to erection. Waterworks and reservoirs, where certain heights above sea level were to be maintained, should not be constructed in mining districts unless the suitability of the site outweighed the cost of protection. Where coal was worked underneath canals the banks must be puddled and raised to the extent of about two-thirds of the thickness of the excavation. Locks should, as a rule, be protected by pillows. In the case of bridges, where a succession of seams would probably be worked, it was necessary to consider whether the subsidence of level, and possible rebuilding of the bridge, or the purchase of the mines for support in an increasing descending ratio, was the more economical or preferable.

Bridges with strong well-bonded abutments and wings and steel superstructure were frequently worked under, and sustained little or no damage, especially in the case of deep mines. Where, therefore, they must be built over an area to be subsequently mined, the intention being not to purchase support, they should be built in the manner described and the girders should have a good bearing upon the beds. The subsidence to be expected, amounting to about two-thirds of the thickness excavated, should, if necessary, be provided for in the first height of the bridge; otherwise provision should be made for the eventual raising of the superstructure to its former level if required. Lofty viaducts should be protected by pillars, and lower structures should be built as indicated; the piers should be solid and should not be pierced by an arch. In all cases, if possible, the goaf under the above should, at the time of working, be tightly packed.

GAS SUPPLY IN MANCHESTER.

LOCAL GOVERNMENT BOARD INQUIRY.

At the Manchester Town Hall, on Tuesday, Mr. G. W. Willecks held an inquiry, on behalf of the Local Government Board, relative to an application of the corporation for sanction to borrow £500,000 for the purposes of their gas undertaking. Among those present were Mr. Charles Nickson (superintendent of the gas department), Mr. F. L. Price (deputy superintendent), and Mr. G. E. Stevenson (gas engineer to the corporation). The latter, in the course of his evidence, said the works at present were just sufficient to meet the demand. That demand, however, was growing. There was a great increase during the year ended March, 1897, not so large an increase during the following year, owing to the mildness of last winter, and so far this year the increase was considerable. Mr. Stevenson explained the additions it was proposed to make to the works. In addition, he said that they wanted £140,000 for new mains and £100,000 for new meters and stoves. They had already spent £70,000 on meters and stoves, the demand for which had been above their expectation.

CORRESPONDENCE.

Purification and Sterilisation of Drinking Water: The Howatson-Burgc System.—Mr. Andrew Howatson, 88 Avenue de Neuilly, Neuilly-sur-Seine, writes: I see in your last issue, p. 682, an article on the "Howatson-Burgc System for the Purification and Sterilisation of Drinking Water." I am sure you will allow me to offer an explanation concerning the last paragraph. Immediately the gas (ClO₂) is produced it is forced through a column of water, and it enters at once in solution. It is this solution which is used for the sterilisation of the water, and if placed in properly stoppered and coloured bottles it can be preserved for a long time. I am now making arrangements for an experimental plant to be put up in England. As soon as it is ready and at work the scientific world will have an opportunity of examining it and making such experiments as may be necessary to satisfy even the most sceptical.

THE SANITARY INSTITUTE.

SESSIONAL MEETING.

A sessional meeting of the above Institute will be held at the Parkes Museum, Margaret-street, W., on Wednesday, the 14th inst., at 8 p.m., when a discussion will be opened on "Some Prevalent Fallacies in Vital Statistics," by Edward F. Willoughby, M.D., LOND., D.P.H., LOND., AND CAMB. The chair will be taken by Prof. W. H. Corfield, M.A., M.D., OXON., F.R.C.P., LOND., vice-president of the Institute.

Municipal Work in Progress and Projected.

News of important municipal engineering works have this week reached us from Lambeth, Southport, Newcastle, Bury St. Edmunds, Sheffield, Wallasey, Truro, and several other places.

METROPOLITAN AUTHORITIES.

LONDON COUNTY COUNCIL.

The long and important report of the Housing of the Working Classes Committee, which was presented some weeks ago, came up for consideration at the council meeting on Tuesday. The recommendations of the committee, three in number, elicited considerable discussion, and consequently only two of them were disposed of, the consideration of the remaining one being adjourned. Particulars of the important appointment which was made by the council—namely, that of the new chief officer of tramways—will be found in our "Personal" column.

Loans for Public Works.—Upon the recommendation of the Finance Committee, it was agreed to lend the St. George's, Hanover-square, Vestry £5,250 for the purchase of land and erection of depot, and the St. George-the-Martyr Vestry £1,235 for the erection of buildings, and for paving and sewerage works.

The Council's Tramways.—In reply to Mr. Benchcroft, Mr. Bonn said he was unable to make any statement respecting the method of working the council's tramways until the Highways Committee had consulted with the newly-appointed chief officer of tramways. Replying to further questions, he said the draft agreement between the council and the London Tramways Company was now in the hands of the company, and would be considered by his committee the following day. He hoped to be able to present a report next week.

The Telephone Question.—Mr. Bonn, replying to Colonel Ford and Mr. Phillimore, said he believed that the Postmaster-General had granted power to the Huddersfield Corporation to establish a municipal telephone system, but had refused to give similar powers to Bedford. His grace had not yet replied to the council's communication.

Housing of the Working Classes.—A long report was presented by the Housing of the Working Classes Committee as to the course they desired the council to pursue in connection with the housing of the working classes. The report pointed out that hitherto the council, when acting under Part I. or Part II. of the Housing of the Working Classes Act, 1890, had in many cases felt themselves justified in securing the provision of dwellings for a number slightly in excess of half of those displaced. Having regard, however, to the need of dwellings so acutely felt at the present time, they thought the council should no longer be satisfied with this minimum, and recommended: "That housing accommodation should be provided for a number of persons equal to that of the working classes displaced by any scheme under the Housing of the Working Classes Act, 1890, or under the provisions of any Improvement Act, but not necessarily in the immediate neighbourhood of the displacement, due consideration being given to the needs of those living on any particular area." Mr. Bruce, in moving the adoption of the report, said the great difficulty which faced the council was the enormous cost of the buildings. The requirements of their medical officer of health reduced the number of rooms available, and the council could not compete with a private builder. Sir Arthur Arnold moved, as an amendment, to refer the recommendation back. Considerable discussion followed, but eventually the council divided and the amendment was rejected by ninety-two votes to sixteen. Lord Onslow then moved a further amendment, to defer the report until the committee had agreed upon a definition of the term "working classes." Further discussion followed, in the course of which Mr. Bruce pointed out that the definition of "working classes" had been framed by Parliament, and the council were, of course, bound by that. The amendment was rejected by seventy-one votes to thirty-one. Two other amendments having also been rejected, Mr. Crooks moved to add words to the effect that a register should be kept of all persons displaced, and, if possible, such persons should have the first offer of tenancy in the council's buildings. Another long discussion followed, but in the end the amendment was carried, and the recommendation as amended adopted. It was also agreed that all clearances under the Housing of the Working Classes Act, 1890, which involved re-housing be done at the sole cost of the council; and the debate on the remaining recommendation of the committee—namely, "that, apart from the re-housing required in connection with clearance or improvement schemes, the council do approve of action being taken, under Part III. of the Housing of the Working Classes Act, 1890, with a view to the purchase of land and the erection of dwellings thereon for the purpose of supplying housing accommodation," was then adjourned.

"Abby Mansions."—The Building Act Committee reported in reference to the above premises, which, it will be remembered, some time ago collapsed and caused the death of seven workmen, that the council summoned the persons responsible for the construction of the building, and sought to obtain a

conviction for an offence of the kind mentioned in the Act. The magistrates, however, advised that they were not empowered that as the buildings were erected under the provisions of the Act they were exempted from the operation of the Building Act. The Government have been asked to consider the conditional agreements made with the owners of the premises, and a magistrate had expressed his willingness to grant a certificate if the committee recommended that proceedings should be taken by the High Court. This was agreed to.

VESTRIES AND DISTRICT BOARDS.

Camberwell.—The usual meeting of the vestry of this authority was held on Wednesday evening. The Finance Committee reported that they had had under consideration the question of providing artificial wells at the Dalwich and Dulwich baths—a project which has been in the air for some time, and had received a report from the surveyor on the subject. The latter, after acknowledging the advantages of the project, especially from the financial point of view, proposed that a number of the best-known practical well engineers should be invited to submit estimates and specifications for the sinking of the wells. This was agreed to. On the recommendation of the same committee it was decided to carry out certain works of wood paving and tar paving at the Dalwich baths, at an estimated cost of £185.—The Finance Committee reported that they had given their consideration to a reference from the vestry of a report of a conference held in July with regard to the housing of the working classes, but it was decided to adjourn the further consideration of the matter until some proposals are introduced by Parliament dealing with London government. The General Purposes Committee reported that they had considered a circular letter from the Hammersmith Vestry dealing with the report of the House of Commons on the subject of electrical energy. The Hammersmith Vestry, it was stated, were of opinion that the local authority within an area of supply should have the power of deciding the route on which mains should be laid, as well as the power of breaking up and reinsulating streets, that the veto of local authorities as to the erection of overhead wires should be maintained; and that the provisions of the Electric Lighting Act, 1888, requiring the consent of the local authority as a condition precedent to the granting of a provisional order, should be preserved. The committee recommended and it was decided that the support of the vestry should be given in the matter. A report from the committee in regard to alterations in the vestry hall, which are estimated to cost £500, was ordered to stand over until the next meeting.—Approval was given to the action of the Plant and Scavenging (Public Health) Committee in empowering the surveyor to hire two motor cars from Messrs. Thornycroft for a period of one month. The results obtained were stated to be in every way satisfactory.—Among the communications received was one from the Clinical Research Association, Limited, with reference to the proposal of the London County Council to establish a bacteriological laboratory, pointing out that the association afforded equal facilities for bacteriological examination, and that it appeared probable that it would be more economical for local authorities to join the association than to pay a yearly subsidy to the support of a municipal laboratory.

Holborn.—At a meeting of the board of works, on Monday, a letter was read from the London County Council requesting the board to take over the maintenance of the Brook's Market open space. It was decided to comply with the request of the council.—The Works Committee reported that, in their opinion, the work of cleansing the streets could be done most effectively by a staff employed by the board, but, having regard to the statistics obtained by them, they did not recommend the taking of any action at present. They, however, recommended that an additional inspector should be appointed to supervise the work of the contractor. The report was adopted.

Lambeth.—The Sanitary Committee presented a long report at the last meeting of the vestry relating to the summonses taken out by the London County Council over the head of the vestry in respect of smoke nuisances in Lambeth. As a result of the convictions obtained by the council the committee stated that the decision of Mr. Studd, the magistrate, now renders the vestry's course in connection with black smoke an easy and straightforward one, "as it is and apparently need be had to the appliances in use for the prevention of smoke or the expenses incurred in fitting up such appliances, the existence or non-existence of a coal fire, or other like considerations. The law is that a smoke nuisance, such as in a nuisance, no expert evidence being required." After considerable discussion the report was adopted, and was also a further report recommending the appointment of a committee of inquiry to investigate the causes of the smoke. A letter and petition have been received by the Sanitary Committee from the London Sanitary Trades Association concerning the public abattoir question. The committee recommended that the letter should be acknowledged and that no action should be taken at present on any motion expressed on the question of private and public abattoirs.

houses. An amendment was, however, carried referring the report back to the committee for further consideration.—The Baths Committee announced that the clerk has received another offer for the purchase of the Ferndale-road baths. In connection with this matter the committee recommended that the property should be put up for auction if the local committee formed to purchase the buildings for the purpose of a polytechnic institute could not satisfy the vestry by the 1st January that the £4,000 required would be obtained. The recommendation was adopted in an amended form by the substitution of the 30th June as the date.—The General Purposes Committee reported that at their last meeting a plan was submitted showing the position of two refuges proposed to be erected at Kennington Cross. The committee had directed wooden models to be laid down, so as to give members an opportunity of making any suggestions before proceeding with the work.—In accordance with the directions of the committee, the surveyor, Mr. J. P. Norrington, had prepared estimates for paving Commercial-road and Effra-road with hard wood. The estimated cost was about £8,400, and, on the recommendation of the General Purposes Committee, the vestry resolved to carry out the work.—It was decided, at the suggestion of the committee, to purchase from the Municipal Appliances Company, of Bamber Bridge, Lancs., a pitch boiler, at a cost of £16, conveniently portable, for small wood paving repairs.—A letter was received notifying the intention of the County of London and Brush Provincial Electric Lighting Company to apply for a provisional order to supply electrical energy in that part of Lambeth lying to the north of Westminster Bridge-road, including so much of Westminster Bridge-road as is within the parish.—At a future meeting Mr. Candler proposes to move the appointment of a special committee to consider the provisions of the Workmen's Compensation Act in relation to the vestry's employees.

Poplar.—At last week's meeting of the board of works the medical officer of health was instructed to make an official representation to the London County Council, as provided by the Housing of the Working Classes Act, with regard to Harford's-court, Tucker's-court, Dingle-court and Dingle-lane, so that they may be dealt with by the council under the Act as insanitary areas.—The Works Committee recommended, and it was agreed, that consideration of the application of the National Telephone Company for permission to lay a number of underground telephone cables and wires in the district be deferred for six months.—It was decided to accept the tender of Mr. W. Johnson for the construction of the proposed underground convenience in Bow-road, by the Gladstone staite, at the sum of £1,700, and the meeting then adjourned.—At the adjourned meeting of the board, on Tuesday, it was resolved, on the recommendation of the General Purposes Committee, to appoint a deputation to wait upon the Bridges Committee of the London County Council in support of the suggested provision of some direct means of communication across the Thames between Rotherhithe and Wapping.—The General Purposes Committee recommended that the Islington Vestry be informed that the board approves the provision contained in the Metropolis Management Amendment (By Laws) Bill of last session proposing to authorise the London County Council to make by-laws "requiring persons about to construct, reconstruct or alter drains in connection with buildings, to deposit with the sanitary authorities of the district such plans, sections and particulars as may be necessary for the purpose of ascertaining whether such construction, reconstruction or alteration is in accordance with the statutory provisions relative thereto and with any by-laws under the said section."—The recommendation was agreed to.—The Works Committee recommended that the roadway in front of the board schools in Glangall-road (western end) be paved with jarruh wood blocks, at an estimated cost of £373, and that the following streets be rolled and metalled: Albert-street, at an estimated cost of £74; Bonelli-street, at £142; and Blair-street, at £113. The recommendations of the committee were adopted.—A report was presented by the Dust Destructor Committee with reference to the application of the forced draught apparatus at the refuse destructor, recommending that the offer received from Messrs. Goddard, Massey & Warner—viz., the contractors to provide and fit shafting, with roof, and all things necessary to make the driving gear complete, at the dust destructor to show they can deal with 100 tons of refuse per day of twenty-four hours, they being willing to take the shafting down again if required to do so, but if it is decided to retain it the board to pay for the same according to the price tendered for the work—viz., £229—be accepted without prejudice and an order be given to the contractors to proceed with the work. The report was, however, adjourned.

St. George-the-Martyr, Southwark.—A letter was, at a meeting of the vestry on Tuesday, read from the Union of Women's Liberal and Radical Associations, enclosing a copy of a resolution calling upon local authorities to provide free compartments in public conveniences for women.—The Clinical Research Association also wrote suggesting that it would be more economical for the vestry to join the association than to subscribe to the municipal laboratory which the London County Council propose establishing.—The Works Committee presented a report calling attention to the condition of the footway in Newington Butts, which is in a very

bad and worn state. A trench has recently been opened by the London Electric Supply Corporation, Limited, the cost of the reinstatement of which it is estimated would amount to £23 15s., and the committee think that it is an opportune time to thoroughly repair the whole footway. They therefore recommended that the footway be relaid with York paving, at a nett cost to the vestry, as estimated by the surveyor, of £132. The recommendation was approved.—The General Purposes, Trees and Open Spaces Committee reported that they had had under consideration a letter from the Bermondsey Vestry with regard to the housing of the working classes, asking for the vestry's support to the following resolutions: (a) That the London County Council be asked to exercise their power under Part III. of the Housing of the Working Classes Act to provide accommodation within the county of London where required; (b) that the London County Council be approached with a view to the insertion of a clause in their General Powers Bill for 1899 to enable metropolitan vestries and district boards to erect municipal dwellings under Part III. of the Housing of the Working Classes Act, 1890; (c) that the London County Council should contribute towards the cost of building dwellings for the working classes by local authorities in London, such contributions to be determined, in cases of dispute, by the Local Government Board; (d) that local authorities should be allowed to permanently retain and manage any dwellings for the working classes erected by them, and that the provision of sec. 12 (5) of the Housing of the Working Classes Act, 1890, requiring them to sell or dispose of such dwellings within ten years from the completion thereof unless the Local Government Board otherwise determine, should be repealed; and (e), that in view of the heavy cost of land in London and the fact that the value of such land is more likely to increase than decrease, that local authorities should not be compelled to repay the cost of such land out of the income from the dwellings, and that the period for borrowing for buildings should be extended to 100 years. They recommended the vestry to concur with resolutions (a), (d) and (e), but disagree with clauses (b) and (c). The recommendations of the committee were adopted.

St. Marylebone.—The vestry clerk, at the last meeting of the vestry, read a letter from the Metropolitan Electric Supply Company in reply to the vestry's inquiry as to whether the company would be prepared to sell that part of their undertaking situated in Marylebone. The letter stated that the vestry's communication had been placed before the directors, whose attention had at the same time been drawn to the advertisement of a Bill intended to be promoted by the local authority in the next session of Parliament. The company further said that the Bill would not only authorise the compulsory purchase of their undertaking, but, as an alternative, would sanction that power of competition which was refused in the last session. In these circumstances the company, though anxious to meet the wishes of the Marylebone ratepayers, thought they might fairly ask the vestry for further information as to the basis upon which it was proposed to proceed with the negotiations suggested in the above-mentioned letter of the vestry. It was decided, after some discussion, to refer the consideration of the question to the Electric Lighting Committee.—The London County Council wrote announcing that Dr. Young, one of the assistant medical officers of health, had been appointed to inquire into the question of cemetery accommodation in Marylebone, and asking for the assistance of the vestry in the matter. The letter was referred to the Burials Committee for attention.—As the vestry have decided to promote a private Bill to authorise the supply of electricity, the chairman of the Electric Lighting Committee withdrew a proposal, of which notice had been given a month previously, to apply for a provisional order for the same purpose.—On the recommendation of the Sanitary Committee it was resolved to inform the Butchers' Trade Society that the vestry were not in favour of the abolition of private slaughter-houses and the establishment of public abattoirs.—The tenders of Mr. G. Jennings, to which reference was made in the last issue of THE SURVEYOR, were accepted for the erection of two urinals, in Acacia-road and Market-place respectively.

St. Pancras.—On the motion for the adoption of the report of the Finance Committee, at a meeting of the vestry on Wednesday, Mr. Thornley asked whether all the money for which application had been made to the London County Council had been obtained for the electric light department. He stated that the vestry owed £40,000, upon which they were paying 4 per cent. Mr. Barrett, the vestry clerk, in reply, expressed the opinion that they ought to raise another loan.—The General Purposes Committee recommended that the attention of the London County Council should be called to the danger to life and inconvenience to traffic caused by the narrowness of Hampstead-road by Euston-road, and that the council should be requested to take into consideration the urgent necessity for steps being taken for widening that portion of the road. After some discussion the recommendation was adopted, and it was decided to ask the county council to receive a deputation on the subject.—With regard to the proposed new baths in Willes-road, the Baths Committee reported that it had been contemplated to clear the site on obtaining vacant possession at Christmas. As, however, the instructions for the guidance of competing architects
