The furnaces in use here is the "Beaman & Deas;" makers, The Beaman & Deas Syndicate, of Warrington. There are eight cells, but it has only been found necessary up to the present to work four of them, and these are worked continuously for five days per week. The furnaces have been at work since October, 1896, and cost £7,000, including the chimney stack, which is 150 ft. high and cost £1,100.

The town refuse destroyed weekly amounts to 195 tons, but 135 tons of pressed sewage sludge are also mixed with the refuse and burnt with it, the residue being a hard clinker 25 to 30 per cent. of the original bulk, which has all been sold up to the present time. The destructor has been erected at the sewage works, and is close to a large board school, and within 100 yards of a fever hospital for fifty patients, and 200 yards from other good properties.

We were informed by the borough surveyor, Mr. W. Dawson, that the authorities at the hospital used to complain of smells from the sewage works, owing to the pressed sludge being deposited near it; but since the erection of the destructor, and the burning therewith of the sewage sludge, these complaints have ceased and none have been made regarding the destructor itself. This is, so far as we have been able to discover, the only destructor in England burning pressed sludge, the sludge is mixed with the refuse on a platform above the cells, in the proportions indicated above, and each cell disposes of 15 to 17 tons per twenty-four hours.

The feeding is done at the top, down a sloping hearth to the grate. The outlet to the flues is at the opposite end to the feed opening, so that all the gases must pass over the hottest part of the fire. Forced draught from a fan is introduced under the grate and passes into the furnace between the bars, the heated gases pass from the furnace through a combustion chamber, in which a temperature of 2,000 deg. Fahr. is maintained.

The clinkering is done at the side, by which arrangement whatever cold air may rush into the furnace when the door

is opened passes over the hot fire and into the combustion chamber, instead of over the partially burnt materials on the feeding hearth. The heated gases are passed through two "Babcock & Wilcox" tubular boilers, each ninety-six horse-power nominal, and thence to the chimney stack, and the steam raised is utilised for driving dynamo, fans for air blast, pumps for sewage, sludge presses and mixing machinery. There is a 45 horse-power engine at the sewage works, and two 12 horse-power for the other operations carried on.

The water evaporated by the burning of the refuse is 3 lb. for every pound of the mixed refuse. Taking into account the fact that the furnace is burning sewage sludge (which is always in a wet, pasty condition) as well as domestic refuse, this we consider is a very satisfactory result. We were much struck with the cleanly condition of the works and plant, and the entire absence of offensive smells, even though the destructor and the sewage works were so closely connected with each other.

SHOREDITCH (Population 124,000).

We included this most interesting installation in our inspection, mainly on account of the fact that the waste heat is utilised for the supply of electricity to the district. The furnaces are of the "Fryer" type, with modifications under Wood & Brodie's patents; makers, Messrs. Manlove, Alliott & Co. There are twelve cells and six "Babcock & Wilcox" boilers (one boiler between each pair of cells). Forced-air draught is used, driven by powerful fans worked by an electric motor, the fumes from the refuse being drawn through the fan and sent through the hottest part of the fire. Steam draught is provided for, but has not been regularly used, the fan blast having been found more efficient.

The fine ash from the furnaces meets with a ready sale for making mortar, but no use is made of the clinker on the premises, and there is such a large quantity produced that the supply is much in excess of the demand, the district being practically all built over, no new streets are being laid out, and there is every likelihood of this becoming shortly a real difficulty; and this having been realised, steps are being taken to dispose of the clinker.

One hundred tons of refuse are destroyed daily, it being delivered at the ground level, and tipped into huge tanks which are raised in a lift when full to the level of the top of the furnaces, over which the tanks run on rails and discharge their contents as required into the cells. These appliances are known as "Boulnois & Brodie's" patent refuse storing and charging apparatus.

In addition to the cells, there is under each boiler a smaller furnace, the object of which we were able to observe. We fortunately happened to pay our visit to the works at the moment of the highest load at the electricity works, just as it was getting dark, when unaided the cells are not sufficient for raising the full quantity of steam. During the day the more inflammable parts of the refuse—paper, boards and other dry material—are kept back, and at the time of the highest load these are used in the furnaces under the boilers to raise steam rapidly for a short time; and while we were there everybody was at work at the highest tension to keep things going, and we were all the more grateful for the courteous manager, Mr. C. Newton Russell, for giving us so much of his time and taking such pains to give us detailed explanations of the whole process.

The chimney stack is 150 ft. high, and, although we visited the works at a time when everything was at the greatest strain, we could detect nothing proceeding from the chimney but a light brown smoke, which entirely disappeared within a few yards; and Mr. Russell told us there had been no complaints since the works started, seven months ago. The works are in the midst of a densely-populated part of London, and although the general surroundings are such as to lead one to suppose the inhabitants would not be very hypercritical, yet no doubt if there was any serious cause of complaint it would have been made before now.

The furnaces are worked continually, night and day, all the week round, and waste heat is all utilised for driving the electric light machinery, the system being high-tension direct-current on the Oxford transformer method. The refuse is not quite so coal to provide the whole of the power required, some coal having to be provided for Sundays, when the refuse runs short, and on other occasions during excessive demand; but the system demonstrates what valuable use can be made of the refuse in circumstances similar to Shoreditch, where there is a dense population on a small area, or, in other words, an enormous quantity of refuse to be disposed of and a confined area to be lighted.

CAMBRIDGE (Population 35,988).

Here the destructor is of the "Fryer" type, modified, as at Shoreditch, under Wood & Brodie's patents (Messrs. Manlove, Alliott & Co.), and consists of six cells, four of which are in use and two kept as reserve. The destructor was erected in 1894, but as it was included in the general contract for pumping station, which it adjoins, the cost cannot be given.

The refuse is brought up an inclined roadway and tipped into trucks, each having five compartments (each compartment holding just enough for one charge), and there are two charging trucks to each cell. This trucks run on rails on the top of the furnaces, and the compartments are successively brought over the charging opening of the furnace, and the contents fall into the cell. The truck system appears to work

very well indeed, and the manager, Mr. J. Mitten, strongly recommends it. It is a very cleanly method of storing and charging the refuse, but it has this objection, which, however, does not apply at Cambridge, that extra height must be allowed for the depth of the charging truck. This apparatus is the invention of Mr. H. Percy Boulnois, formerly city engineer of Liverpool.

Forced-air draught is provided, which is arranged to be practically noiseless and to which there can, as here applied, be no objection. The average temperature according to test obtained in the furnace is 1,600 deg. Fahr., but this has frequently been exceeded. Cast iron, we were told, had been melted in the furnaces, when the temperature must have been 2,400 deg.

The chimney stack is 175 ft. high. As the waste heat is utilised to supply engines for pumping the sewage from the outfall to the farm, 2 miles away, the furnaces have to be worked continuously and every day in the week. There are two engines, each of 80 horse-power nominal, but in an emergency enough steam can be generated with the four cells to give 170 indicated horse-power; 140 tons a week are disposed of in the four working cells; one man is sufficient to attend to the feeding, the truck system requiring very little manual labour, and two men are engaged in drawing out the clinker, which falls into a box at the front of the furnace, the advantage of this being that the heat of the clinker is retained within the furnace and the quantity reduced to 20 per cent.

The men work in twelve-hour shifts and did not appear to be overworked. The cost of burning is said to be from 7d. to 10d. per ton. The clinker is used for making roads, and some is sold at 1s. per load; most of it, however, is being used at the works, in filling up, levelling and forming new roads. The locality of the works is away from the city and in open country, but there was nothing coming from the chimney but a light, thin, almost imperceptible smoke or steam; indeed, considering that all the refuse of the city is brought here and the whole of the sewage is being pumped, the beautifully clean condition of the whole of the works is quite wonderful and the complete result excellent.

LOGGEBOROUGH (Population 20,000).

The destructor has been constructed by Messrs. Coltman & Sons, of Loughborough, and is the only one of its kind at present at work. It is erected at the sewage outfall, some distance outside the town, and as it is used for pumping it has to work continuously. The furnace consists of one cell only, having a reverberatory arch of fire-clay blocks, over which is set a boiler of the water-tube type. The cell is fed down a slope at the back, the clinkering doors being at the front, and there is a powerful steam and air draught driven by a fan.

This single cell disposes of 80 tons per week, and one man feeds and clinkers for eight hours, the furnace being worked in three shifts, each man being paid 21s. per week. The destructor is a compact arrangement, but it is considerably larger than we should require, and Mr. Coltman recommends a size capable of destroying 5 tons a day. The boiler supplies steam for driving sewage pumping plant, consisting of three centrifugal pumps, lifting the whole of the sewage of the town 25 ft., also for a small electric lighting plant for the works. The cost of the chimney stack, which is 80 ft. high, was £250, and the destructor plant, including boiler, £1,000.

As this plant is away in the open country no cause of nuisance arises, but we saw no reason why any such should happen even if it was erected in proximity to dwellings. A peculiar feature of this furnace consists in the bars of the grate, which are Perret's patent dust fuel bars, the bottom edges of which rest in a trough of water, the life of the bars being thereby prolonged, so that only six new bars have been required since the furnace was erected in September, 1896. Repairs and renewals have cost only £10 since commencing work.

BRADFORD (Population 230,000).

There are several refuse destructors in various parts of the town of Bradford. The one we visited is the one most recently erected, and the furnaces adopted are those of the "Dorsfall" type, the present installation having taken the place of furnaces of other makers which were in use up to five months ago. There are twelve cells in all, four of which we were able to inspect while in course of construction.

The cells are fixed back to back, and the firing apertures are at the top. The refuse first passes over a drying hearth at the back of the fire, which is so formed that the rubbish is gradually dried and falls on to the hearth, the gases passing from the refuse over the hottest part of the fire. The clinkering doors are at the front of the furnace, and a special feature of the furnace is the forced draught of steam and air, by means of which a high temperature is secured in the furnaces.

It appears from an exhaustive test (extending over six days) in October last by the manager, Mr. McTaggart, that the temperature of the gases in the main flue was 1,800 deg. (maximum 2,100 deg., minimum 1,700 deg.) Fahr., and at the foot of chimney, after (passing through the boiler) 900 deg. Fahr. and 725 lb. of water was evaporated per pound of refuse burnt, giving as a result 81 indicated horse-power hours per ton of refuse burnt. The percentage of clinker and ash was 30.3.

There is a novel provision in these furnaces for reducing the wear and tear on the sides of the furnaces. Iron side boxes are built in to the wall, and the steam draught is forced through these boxes and from thence into the ash-pit below the grate-bars. By this plan two useful objects are attained—the sides of the furnace are slightly cooled, and the steam and air draught is warmed before reaching the fires.

As the installation has only been at work here for a short period, we were not able to elicit any experience obtained on the subject of repairs. The chimney stack is 160 ft. high, and we could perceive no sign of anything obnoxious preceding therefrom. The troublesome question of the disposal of the old tins, &c., is here satisfactorily settled. They are sent away in truck loads to a firm of manufacturing chemists at Halifax.

The waste heat is utilised for driving mortar nicks and grinding the clinker, which is very hard, and is used for road foundations and making concrete, for all of which purposes the clinker is in great demand. The works are also lighted by electricity, and an artificial manure plant is driven by the heat of the furnaces. The refuse at Bradford is of a difficult kind to dispose of, being unsorted midden or privy refuse, mixed with ordinary household waste.

ROCHDALE (Population 73,000).

The furnaces in use here are of the "Meldrum" type. The grates are each 9 ft. wide and 5 ft. in depth, divided in their width in the ash-pit only by a division wall, on which rests a cast-iron division tee, with its thin edge level with the top of the fire-bars. This divides each grate into two, and as each portion contains its own blowers it is independent of the other, the object being that while one side of the fire is at a high temperature the other may be clinkered or fresh charged with fuel, the gases given off from the freshly-charged refuse being drawn over the hot part of the fire and cremated in the furnace itself. There is also a large combustion chamber immediately behind the furnace cells, the high temperature of which completes the cremation of the products of combustion.

Two Lancashire boilers, 30 ft. long by 8 ft. in diameter, are fixed one to each cell, and the steam pressure is 120 lb. per square inch. During a recent test by the manager, Mr. F. W. Brookman, the temperature in the combustion chamber was found to reach 1,988 deg. Fahr. The water evaporated per pound of refuse was 1.64 lb., with feed water at 52 deg. Fahr., and the percentage of clinker, &c., 36. A temperature much higher than that named has frequently been reached and maintained for long periods, when the copper test pieces of "Siemens" pyrometer have been quickly melted.

The feeding is done entirely from the front, the carts being tipped on to the floor of the destructor building. The cells are also clinkered at the front, and we considered that the two operations being carried on so close together rather tended to confusion. Except as to the point last mentioned, however, we cannot do other than acknowledge the good results obtained, the clinker being of a hard quality, and the combustion so far as we could discover was perfect. The steam jet blowers provided are not of the "silent" kind, though the noise was not enough to be objectionable.

The tub or pal system of collecting excreta is in use in Rochdale, and the quantity collected is about 10,000 tons a year, while 16,000 tons of ashes are burnt in the destructor. When the excreta arrives in special vans at the works it is first dried, and afterwards ground fine and sold for £5 10s. per ton, at which price the manure finds a ready sale. The waste heat from the destructor is utilised for driving mortar and clinker mills, for generating electricity for lighting the works and offices, chopping and crushing the food for forty-two horses, and for running the artificial manure plant.

FARNWORTH.

We visited this town to inspect a new type of destructor, known as the "Bennett-Pythian," but we found that, owing to an accident to the drainage, the furnaces were partially flooded and were not in working order. The special feature of this furnace is the movable grate. There are three cells side by side, and in these three cells are two travelling grates, each of which fills one cell, and are movable together from end to end of the furnace. When the furnace is in full work one of the cells is in the highest state of combustion, one end cell is empty and the other end cell is being clinkered, after which it is charged with fresh refuse and the grate moved over so that the last charged cell comes into the hot middle cell, while the late contents of that cell have been moved into the previously empty cell for clinkering.

The waste heat is utilised to raise steam in a water-tube boiler erected over the cells. Owing to the fact that we could not see this furnace in operation, we were unable to form any judgment on its merits. The destructor is the private property of the patentees, Messrs. Ham, Baker & Co., who are burning town refuse in it. It is the only one of its kind at present erected, but it has been adopted at Southampton, where a destructor of this type is now being built.

OLDBAM (Population 117,000).

The destructor is of the "Horsfall" type, six cells erected in 1891 in one series and four erected in 1895 in another, the whole having forced blast. That to the four cells is of the ordinary type and rather noisy, while the six older cells have been newly fitted with the "silent" blast, which works very satisfactorily. The general description of the furnaces is similar to

that at Bradford. The waste heat, passing through two Lancashire boilers, raises steam to a pressure of 140 lb., which is used for supplementing the power at the electric lighting station, for mortar grinding and driving machinery at the corporation workshops. The furnaces are fired by hand from behind. Both Mr. Pickering, the borough surveyor, and Mr. Jessop, the manager, prefer this to the hopper charging system, the refuse being more evenly distributed over the fire.

No repairs have up to the present been required to the four cells erected in 1895, but from the appearance of the crown of the furnaces we think such will soon be wanted. The chimney is 120 ft. high, but the day we visited the works the fog was very thick, and it was impossible to see whether anything was coming out of the top. The works are situate about 400 yards from a middle-class residential district, comprising houses rented at about £18 a year, and we were told no complaints had ever been received.

GENERAL CONCLUSIONS.

In the course of our inspection, the deputation say in conclusion, we have seen quite enough to convince us that the destructor is a cleanly and economical method for the disposal of household and other refuse, and we are unanimously of opinion that, properly worked, no nuisance need arise from it. As to the best type of furnace for the requirements of this town we cannot at present speak in such positive terms, most of those we saw possessing some feature of which we approved.

We would recommend that the following firms be invited to submit proposals and prices for the erection of a destructor suitable for the requirements of this town, and we shall then be able to weigh the relative advantages of the various types of furnaces with the prices submitted: The Beaman & Deas Syndicate, Messrs. Coltman & Son, Messrs. Goddard, Massey & Warner, the Horsfall Furnace Company and Messrs. Manlove, Alliott & Co.

We cannot, we think, more usefully close our report than by recapitulating in a condensed form the information we have detailed in the previous pages. The types we inspected were: The "Perfectus," at Bath and Horsey; the "Fryer," at Winchester, Shore ditch and Cambridge; the "Benman & Deas," at Leyton; the "Horsfall," at Bradford and Oldham; the "Bennett-Pythian," at Farnworth; the "Meldrum," at Rochdale; and the "Coltman," at Loughborough. We found forced draught in operation at every place except Horsey and at Bath, where there are very high chimneys. The effect of the forced draught is to increase the temperature, and enables the refuse to be disposed of more quickly with less possibility of complaint, but the wear and tear is no doubt greater.

The quantity of clinker produced varies from 25 per cent. to 35 per cent. in weight of the refuse burnt. The clinker is ground for mortar, and it is admirably adapted for making concrete or concrete slabs, which, if made under great pressure (as at Horsey), would be very valuable for paving. We found at each place we visited that the old tins were practically indestructible, and steps had to be taken to remove them. The waste heat was utilised at every place we visited for pumping, electric lighting, clinker crushing, mortar grinding or driving machinery.

On this point, while we strongly deprecate the extravagant ideas which have been industriously circulated in some quarters that there is such an enormous amount of energy lying dormant in town refuse, sufficient, for example, as to ensure enough power for the whole of the electric lighting of a town, we still consider that the power which may be reasonably expected from the burning refuse is a valuable item, and may be turned to extremely useful purpose if the system is adopted at Tiverton.

On the question of cost we cannot at present give exact particulars, but we estimate approximately that a destructor sufficient for Tiverton may be erected for £500; cost of chimney, say, 120 ft. high, £200; purchase of land, £200; buildings, which need not be of an expensive character, £300; machinery, boiler, &c., £200; contingencies, £100; total, £1,500.

We consider that two men in the daytime and one at night will be sufficient for three days a week to work the destructor and the machinery, which will amount to per annum, say, £80; interest and repayment of £1,500 in twenty years, £100; repairs, say, £30; total, £210. The value of power for mortar-grinding, stone-breaking, sale of clinker, or value of same if utilised for concrete slabs, may safely be taken at per annum, £100; leaving a balance of £110. From this should be deducted the present cost of carting away and burying the refuse after the ashes have been sifted from it, and the rent of refuse tips, say, £55. Leaving net cost to the borough of the destructor plant at £55 per year, which sum we consider is a small amount to pay for the undoubted advantages accruing to the public health of the town by the prompt destruction of the refuse.

Torquay.—A recommendation of the Roads Committee was last week adopted, giving permission to the National Telephone Company to place certain of their wires underground, on condition that the company pay a wire-leave of 1s. per sub. per annum, and provide and equip complete a number of fire alarms in various parts of the borough.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made, separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

205. Tar Boiling, Fumes from: Alleged Damage to Fruit Crops.—"T." writes: The occupier of a large garden adjoining a place used for mixing and preparing material for tar paving alleges that the fumes from the tar have destroyed his crop of fruit and generally damaged the vegetation. Will you please inform me whether the fumes from boiling tar have any ill-effect on vegetation, and whether complaints of the kind are common?

We do not remember having heard of a similar complaint to that put forward, wherein the fumes from boiling tar are alleged to have injuriously affected vegetation. We do not think such fumes given off are poisonous *per se*. There may, however, be local circumstances affecting the present case, such as very close proximity of the fruit trees to the tar-boiling apparatus, which are not present in most cases. We should be much obliged if those of our readers who have had similar experience will communicate with us on the subject for the benefit of other surveyors.

206. Sludge-pressing Machinery, Makers of.—"R. D." writes: Could you inform me the names and addresses of any firms you know of who make a speciality of sludge-pressing machinery? Also makers of a reliable lime-mixing machine?

The following firms are of well-known repute as manufacturers of sludge presses and lime-mixing machines: Goddard, Massey & Warner, Nottingham; Manlove, Alliott & Co., Limited, Nottingham; John Wolstenholme, Albert Works, Radcliffe, Manchester; and S. B. Johnson & Co., Stratford, London, E.

207. Civil Engineers, Examinations for.—"Darius" writes: I shall be pleased if you will inform me the difference in the meaning of the letters "A.M.L.C.E." and "M.L.C.E." Also I wish to know what steps I should have to take to obtain the letters "C.E." or any of the foregoing letters. Are there any examinations to pass, and, if so, what fees are to be paid?

The letters referred to designate the two classes of membership of the Institution of Civil Engineers, the former denoting "associate member" and the latter "member" of the institution. We described in our reply to Query 154, in our issue of February 25th last, the character of the examinations in connection with the institution, to which reply the querist should refer. The Incorporated Association of Municipal and County Engineers also hold examinations for young civil engineers under local authorities. Particulars of the subjects of these examinations may be obtained from the secretary, Mr. Thomas Cole, 11 Victoria-street, Westminster, S.W.

208. Books for Civil Engineers Recommended.—"Cor-taber" writes: I should esteem it a favour if you would recommend me the best works for civil engineers on the following subjects—viz., (1) Masonry, (2) brickwork, (3) quantities, (4) calculation of earthwork quantities, (5) construction of works in concrete, (6) tunnelling for sewers.

The following books are recommended as being thoroughly good in their several subjects—

(1) *Masonry*: Baker's "Masonry Construction" (American), (price 21s. nett, B. T. Batsford); Purchase's "Practical Masonry" (price 7s. 6d., Crosby Lockwood & Son).

(2) *Brickwork*: Hammond's "Radiments of Practical Bricklaying" (price 1s. 6d.); Walker's "Principles of Bricklaying, Cutting and Setting" (price 1s. 6d., both published by Crosby Lockwood & Son).

(3) *Quantities*: Banister Fletcher's "Quantities" (price 7s. 6d., B. T. Batsford); Dobson and Tarn's "Guide to Measuring and Valuing Artificer's Work" (price 7s. 6d., Crosby Lockwood & Son); Leaning's "Quantity Surveying" (price 15s., E. & F. N. Spou).

(4) *Calculation of Earthwork Quantities*: Bidder's "Tables showing the Contents of Excavations, Area of Slopes, &c." (price 3s. 6d., Vacher & Sons); Trautwine's "Method of Calculating Cubic Contents of Excavations and Embankments by the Aid of Diagrams" (price 8s. 6d., E. & F. N. Spou); Cunningham's "Earthwork Tables" (price 10s. 6d., E. & F. N. Spou).

(5) *Concrete*: Studdiffe's "Concrete: Its Nature and Use" (price 7s. 6d., Crosby Lockwood & Son); Potter's "Concrete: Its Use in Building" (2 vols., price 7s. 6d., B. T. Batsford); Newman's "Notes on Concrete and Works in Concrete" (price 6s., E. & F. N. Spou).

(6) *Tunnelling for Sewers*: Sium's "Practical Tunnelling: Explaining in Detail, Setting-out the Works, Shaft-sinking and Heading-driving, Ranging the Lines and Levelling Underground" (price 42s., Crosby Lockwood & Son).

Any of the books are obtainable at discount prices from Mr. B. T. Batsford, engineering and technical publisher and bookseller, 94 High Holborn, London, W.C.

209. Sewage Farming: Fungus from Subsoil Drains.—"Puzzled" writes: Three months ago about 15 acres of land were underdrained and laid out for sewage irrigation, the drain pipes being 4 in. in diameter, laid 3 ft. 6 in. below the surface of the ground, the drains being about 40 ft. apart.

The sewage, about 200,000 gallons per day, before it is put on the land is treated with limeferrous. The effluent from the drains at the outfall is quite clear, but we are greatly troubled with fungus growing in the pipes. This fungus is discharged at the outfall into a small brook, where it lodges and proves most objectionable. Can any surveyor who has had a similar experience suggest a remedy for this growth in the drain pipes and outfall pipes?

The difficulty experienced by the querist is a rather common one, and can only be effectually combated by the construction of filters of coke or burnt ballast at the outfall. These should be constructed so as to be used intermittently.

THE SANITARY INSTITUTE.

LIVERPOOL EXAMINATIONS.

At an examination in practical sanitary science, held at Liverpool on July 29th and 30th, five candidates presented themselves. Of these the following were granted certificates: Mr. H. E. Bellamy, Municipal Buildings, Truro; Mr. T. Graham, 20 Alfred-road, Birkenhead; and Mr. T. Summers, M.L.C.E., 32 Craigmillar Park, Edinburgh. The following were the questions set to be answered: (1) On what does the velocity of a liquid issuing from an orifice depend? What is the effect of bends and branches in pipes upon the flow of the liquid? (2) Define the terms "porosity," "capillarity," "absorptivity" and "permeability." (3) State in detail the method adopted by public water companies for the purification of water from springs, rivers, &c. Explain fully the action of such filter-beds, and how the water should be stored after filtration and before delivery. (4) Describe the method of coating cast-iron pipes for water supply with Dr. Angus Smith's composition. Give the proportions of materials used. (5) What do you understand by the terms "wetted perimeter" and "hydraulic mean depth"? What would be the flow in a rectangular aqueduct of brickwork, 10 ft. wide, flowing 5 ft. deep, with a fall of 9 in. per mile? (6) State what you know as to the proper construction of a furnace with boiler for steam raising, which has to consume the smoke produced from the combustible used in it. What are the different kinds of fuel used in steam boilers, and what are the main characteristics of each? (7) Describe the steps you would take, and the instruments you would use, to test the amount and regularity of the fall in a main drain. (8) Describe in detail the procedure for discovering and dealing with unsound food.

An examination for inspector of nuisances was held on the same day. Sixty-four candidates presented themselves, and thirty-seven will receive certificates. The questions set were as follows: (1) What is the best position for an underground soft-water cistern in a country house? How should it be constructed? Show by sketches how you would deal with the overflow therefrom. (2) Describe a good form of slop sink, stating the sizes of flush pipe and outlet, and the method of trapping the same. Under what conditions may the waste from a slop sink be connected to a vertical soil pipe? (3) Mention the various kinds of joints made in connecting lengths of lead soil pipe. State which variety you prefer, with the reasons for your selection. (4) Describe the conditions under which privies should be allowed, and give a sketch plan of one you would recommend. (5) State the statute law providing for the abatement of smoke nuisance. (6) A bedroom of about 3,000 cubic feet of area has been occupied by a patient suffering from small-pox. Describe in detail how the room and its contents may be efficiently disinfected. (7) Describe briefly the construction of three kinds of roof covering, and illustrate by sketches. State the advantages and disadvantages of each from a sanitary point of view. (8) What powers have sanitary authorities, and under what Acts, for dealing with milk alleged to be unwholesome or adulterated?

The True Function of the Sanitary Engineer in India.—

Judging from what Mr. Jones, the sanitary engineer to the Government of Madras, has been directed to do, the work of the sanitary engineer in this country should, says *Indian Engineering*, be confined to investigations, opinions and reports, conjoined with the preparation and submission of estimates and reports. That is, the functions of such an officer should be more "consultative" than executive. In other words, a sanitary engineer is not an executive engineer.

Manchester.—The Manchester Corporation have decided to borrow £6,000 for purposes of tramway extension in the city, and an application into the matter was held recently at the town hall by Sir Francis Marindin, an inspector of the Board of Trade. The application was not opposed. It was explained that the money asked for was to defray the cost of constructing tram lines in Cross-street, Chorlton-road, Ashton New-road, Moss-lane East (two lines), Wilmslow-road, Denmark-road and Greenheys-lane. These were found to be necessary additions for the convenience of the city. The amount originally borrowed on account of the tramways of the city was £169,362, and all this had been repaid with the exception of £21,907.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a *nom de plume*.

BETTERMENT: TOTTENHAM COURT-ROAD IMPROVEMENT.—A curious point arose in the principle of betterment was raised in *The Oxford (Limited) v. The London County Council* (Chancery Division, Mr. Justice North). Under one of the local Acts of last session applicable to the metropolis the Council have power to make certain improvements in the Tottenham Court-road, and the Act contains a "betterment" clause. The Oxford Music Hall has its principal entrance in Oxford-street some little distance from the Tottenham Court-road. The plaintiff company, however (the owners of the music hall), recently purchased a house, which when the improvements are carried out will front on to the Tottenham Court-road. This house communicates, by an entrance and an exit on the ground floor, with the hall. The council contended that the house had in effect thus become part and parcel of the music hall, and that the entire hall, as thus added to, must be considered as fronting on the road and liable to the contribution provided for by the "betterment" clauses. The company did not dispute that the house itself was liable to contribute, but contended that it should be treated as a separate building, and not as forming part of the hall. Mr. Justice North decided in favour of the council. He said the fallacy of the plaintiff's contention was that he treated the various properties that together went to make up the music hall separately. He (the learned judge) thought that the house, together with the building behind it, to which it gave entrance, must be taken as one message; and it was not disputed that the house did front on the Tottenham Court-road.

HIGHWAY: GREEN SWARD ADJOINING CARRIAGE ROAD: RIGHT OF OWNER OF SOIL TO ERECT POSTS.—An important question in connection with highway law was raised in the case of *Danson v. Heydon Urban District Council* (Chancery Division, Mr. Justice North). In front of Mill Hill Grammar School is a strip of green sward. On the grass, near the public carriage road, there is a row of very fine elms, between which and the road there is a post and rail fence that has existed as long as the memory of the oldest inhabitants. Traversing the green sward is a gravel path, used by the public, who have access to it at either end through openings in the post and rail fence. The space between the trees and the wall of the school premises is crossed by paths or roads giving access to the latter. The plaintiffs (who are the trustees of the school), in order to prevent the carts of tradesmen going to the school from spoiling the grass, have recently put up posts (four in one place, three in another) to keep such carts off the green sward. The council considered this an unlawful interference with the highway, and took the posts up. The plaintiffs reinstated them, whereupon the council again took them up and removed them to premises of their own. The plaintiffs then brought this action, asking for a mandatory injunction to the council to restore the posts and not to interfere with them when replaced. The present application was made upon motion for an interim injunction until the trial of the action. The plaintiffs contended that they were the absolute owners of the strip of land within the post and rail fence, subject only to a public right of way for foot passengers over the gravelled portion thereof. The council, on the other hand, claimed that the entire strip, green sward and all, was a highway. The Court declined to make an order on the motion, being of opinion that it was better for both parties that the posts should not be replaced until the questions between them shall be finally decided at the trial; but the council gave an undertaking to abide by any order the Court may make at the trial as to restoring the injured turf. The final decision will probably turn very largely on the nature of the evidence as to public use forthcoming at the trial.

EXTRAORDINARY TRAFFIC: HIGHWAYS AND LOCOMOTIVES (AMENDMENT) ACT, 1878, SEC. 23.—Another most important contribution to the decisions under the above section is afforded by the case of *Pethick and Others v. County Council of Dorset* (Court of Appeal, 28th July), in which the vexed question as to the meaning of the expression "person by whose order" extraordinary traffic is conducted was again the subject of judicial consideration. The traffic consisted in the hauling of building materials for the erection of the Dorset county lunatic asylum under the following circumstances. First of all, the Visiting Committee of the asylum entered into a contract with Messrs. Pethick for the erection by the latter of the asylum, for the sum of £52,000, by which contract they agreed to indemnify the committee from all claims in respect of extraordinary traffic. Messrs. Pethick then

entered into a sub-contract with one John Trenchard for the hauling of the materials, whereby Trenchard undertook to supply carts and horses as and when required by Pethick, to provide skilled workmen, to unload the materials from the railway trucks, and to haul them to such place on the works as should be pointed out by Pethick, receiving from the latter such assistance as should be necessary, and using only such roads as should be pointed out to him. The sub-contract also provided that Trenchard was not to employ any person to whom Pethick should object, and that no cart or traction engine should be used which Pethick or his foreman should certify to be improper for the service; and, further, that Trenchard should indemnify Pethick against all extraordinary traffic claims. Trenchard performed the hauling in accordance with this contract, and damage to the extent of £231 was thereby done to certain roads. The council summoned Pethick for this amount, and the magistrates made an order for payment against him. The Queen's Bench Divisional Court quashed the magistrates' order, and the council appealed to the Court of Appeal, but without success. Mr. Justice A. L. Smith said it was clear that Pethick gave no order to Trenchard other than was to be found in the sub-contract. Therefore, if that contract did not constitute an "order" within the meaning of the section Pethick could not be made liable. There had been a great amount of litigation on that section, and there were numerous authorities which showed a considerable conflict of opinion; but the House of Lords had put a construction upon the section, which was binding on this Court, in the case of *Kent County Council v. Lord Gerard* (1897, A.C., 633, THE SURVEYOR, vol. xi., p. 215). Now, by whose order had this extraordinary traffic been conducted? He had no doubt that it had been conducted by the order of Trenchard, and that he might have been made liable. But it was argued that even if that were so Pethick had ordered it to be conducted. It was said that power was reserved to Pethick under the contract to say what carts should be used. He was not satisfied that that was the meaning of the contract; but, even if it were so, if he merely had the power to give orders as to what carts should be used, but did not give such orders, he was not within the Act. Reliance was also laid on the clause providing that no cart or engine should be used which Pethick might think improper for the service. In his opinion those words referred to the fitness of any cart or engine for the work, and did not refer to the contingency of the roads being cut up. Lord Justice Lyby was of the same opinion. The House of Lords had laid it down that it was not sufficient to show that the traffic had been conducted at the instance of the person sought to be made liable, or for his benefit. He thought that the control which the contract gave Pethick over the work to be done was Pethick was much less than was suggested in argument. And the question was not whether orders might have been given by Pethick, but whether they were given. Lord Justice Vaughan Williams agreed, but he desired to base his judgment on this—that the case did not state sufficient to fix Pethick with liability. There was nothing to indicate how much of the damage was caused by excessive weight of particular parcels, or what was the nature of the extraordinary traffic in question. If it had been shown that the damage had been caused entirely by the total amount of the traffic carried, as distinguished from excessive weight of particular parcels, he should unhesitatingly say that the extraordinary traffic had been conducted by the order of Pethick. He thought that that would clearly follow from the case of *Kent County Council v. Lord Gerard* (1895, 1 Q.B., 418). But the facts of the case did not permit him to say that the extraordinary traffic which had caused the damage consisted solely and entirely of the total amount of the traffic. On this ground he thought that Pethick could not be held to be responsible.

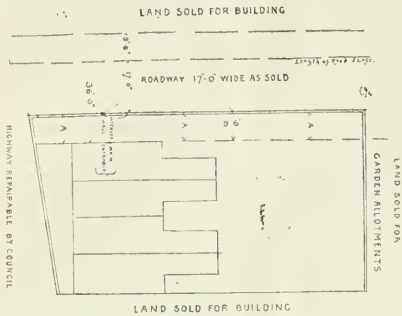

QUERIES AND REPLIES.

COMBINED DRAIN.—"J. T." writes: Referring to the answer given "H. M. F." in the "Queries and Replies" column of this week's SURVEYOR (p. 104) respecting the drainage of a row of labourers' houses, is not the drain a "drain" even beyond where the drainage of the second house enters it, seeing all the houses belong to the same owner, provided the local authority have adopted Part III. of the Public Health Act (Amendment Act), 1900? This being the case, is not the local authority acting within its rights in asking the owner to do all they have asked him? I shall be glad if you will kindly give me a reply. I find your paper a great help in studying municipal engineering, especially the "Law Notes."

See 1904 of the Public Health Act (Amendment Act), 1900, apply to two or more houses belonging to different owners. It is for the very

reason that these houses belong to the same owner that the combined system is a sewer, even if Part III. of the Act has been adopted. The premises are evidently not within the same curtilage, as it is clear from "H. M. F.'s" statement that each house has a separate yard.

BY-LAWS: NEW STREET.—"New Street" writes: Has a council power to compel an owner depositing plans for the erection of four houses, as per sketch, to set back and give up (not enclose) the area of land indicated by the letters A in order to make provision for a 36ft. road as required by the council's by-laws? This plan is the commencement of building operations on an estate recently sold with only a 17 ft. road to it, the front being called building land and the back allotments, and the person purchasing this particular plot does it with an expressed (verbal) condition that he can build up to the limit of such land. He, however, sets back his building-line, but intends to enclose the whole area. Can you give me recent decisions on such a point?

If a "new street" is being laid out the council can insist upon its being of the width required by the by-laws. The question whether or not a "new street" is being laid out is a question of fact for the magistrates to determine, and if there is any evidence upon which they can find that the street is a new street the High Court will not inquire into the sufficiency of the evidence. See our note of the case of *Allen v. Fulham Vestry* (p. 70 ante). In *Yaglor v. Metropolitan Board of Works* (L.R. 2, Q.B. 213), which is a leading case on this subject, Mr. Justice Blackburn said: "I do not think that if a person merely puts up a boarding or leaves the way without any fence, or leaves the old fence untouched while he is building, he can be said to have laid out the road, but as soon as he begins to put up fences, and marks out the boundary, which he intends to be the permanent boundary between his building and the road, then he may be said to have begun to lay out the road for the forming of the street; and this also is a question of fact for the magistrate." This and various other cases are noted in Lumley's "Public Health Acts," fifth edition, pp. 206 et seq.

SEWAGE DISPOSAL AT HYDE.

The Sewage Works Committee last week recommended that, having regard to the fact that the Local Government Board would not pass any scheme of artificial filtration unless it also embraced one of subsequent filtration through land, plans of a scheme for automatic filters and land filtration, at an estimated cost of £5,500, be adopted, and that the town clerk be instructed to make application to the Local Government Board for sanction to the loan. A member, in submitting the minutes for adoption, said the estimated expenditure included the purchase of automatic filters, the building of a filter-house, the erection of a pump for the washing-out of the filters, and the underdraining of 1½ acres of land, which was to be laid out in 1 acre plots for the purpose of land filtration. They intended to take the solid matter from the sewage by means of the automatic filters and then turn it upon the land, but he was not prepared to say that even then they would be able to give satisfaction to the Mersey and Irwell Committee. A lengthy discussion ensued, the opinion being expressed that, pending the report of the Royal Commission, the scheme should not be proceeded with. The mayor said that the matter had been forced forward owing to a ministerial order. Ultimately the resolution was referred back to the committee for further consideration.

Dundee.—On Thursday, at a meeting of the town council, a long discussion took place on a report prepared by the burgh engineer for the extension of the esplanade. In the report it was suggested that the sea wall should be extended westwards in a straight line, and it was pointed out that the result of this would be a reclamation from the foreshore of 132 acres. This, with the 31½ acres already reclaimed, would give a total of 163 acres. The works were estimated to cost £35,840. The proposals of the burgh engineer were criticised at some length by a member, who urged that the sea wall should be continued further westward than was proposed at present, and he indicated a scheme for the extension whereby the work could be undertaken for £17,000. The proposals were favourably considered by several other members, and it was eventually decided that both plans should be circulated among the members of the board and discussed at a meeting of the Works Committee, to which all the members of the council would be invited.

THE TELEPHONE SERVICE.

Mr. Haubury again occupied the chair at a meeting of the Select Committee, held on Thursday.

Sir WILLIAM HARCOURT, who first gave evidence, expressed surprise at a statement made by Mr. Lamb to the effect that he (Mr. Lamb) was able to say that both Mr. Goschen and himself (the speaker) were of opinion that if licenses were given to corporations it should be on condition that the corporations purchased the local system of the company. He took no direct part in the details of the arrangements about the telephones, but he found that in March, 1893, the question was discussed between the Postmaster-General, Mr. Arnold Morley, and himself, when certain proposals were put forward by the National Telephone Company. Those proposals appeared to have been two—first, the constitution of large areas, each comprising several towns; and secondly, an undertaking on the part of the Postmaster-General not to grant licenses to municipalities or other local authorities. After some discussion on the matter—which, he need hardly say, he did not bear in his memory, nor, even if he did, would he think it proper to state confidential communications between heads of departments—they came to a formal and deliberate decision, which was communicated to the telephone company. The result of the discussion of those two proposals between Mr. Arnold Morley and himself was contained in a letter addressed to the National Telephone Company and dated, he thought, March 13th, 1893, in which they expressed their determination to decline to accept either of those proposals, and stated distinctly that it was impossible to restrict the freedom of the Postmaster-General in any way to grant licenses—a question which they considered had been closed by the arrangement of August 11th, 1892. That letter certainly did not say anything about its being a condition for the working of licenses by corporations that they should purchase the local system of the National Telephone Company. The committee would, he supposed, obtain that letter from the Post Office, but the words which he had taken from that letter were that "it was impossible to restrict the freedom of the Postmaster-General in any way." What Mr. Lamb had stated as his opinion was not, in point of fact, his opinion. His opinion was set forth in the letter. He certainly did not think it necessary to impose such a condition. What he had stated was the conclusion they arrived at formally and officially on the matter.

Mr. GOSCHEN was examined with regard to Mr. Lamb's statement. What he believed happened, though his memory was not at all clear on the subject, was this. In the course of the debate he (the speaker) used some phrases which he thought had been before the committee with reference to municipalities being willing to undertake the telephone business themselves, and he said he saw nothing contrary to the Government policy in such a proposal. He understood that after the conclusion of the debate in the House of Commons the then Postmaster-General, Sir James Fergusson, expressed his surprise at what he had said, and that Mr. Lamb, who was sitting under the gallery at the time, also was impressed, because this had not formed the subject of discussion at all. He understood that he then said to Sir James Fergusson, "I presume that if municipalities are to undertake the business then they will have to pay for it." Sir James Fergusson's memory was clear upon that point and Mr. Lamb's also, perfectly clear. He certainly could not set his memory in the negative against it, and he assumed, therefore, that he said it.

Mr. LAMB, recalled, said he would like to make an apology—a very sincere and heartfelt apology—to Sir W. Harcourt and Mr. Goschen for bringing their names into the matter. He ought not to have mentioned a confidential communication. He thought he could offer a defence which would appeal to their generosity, if not to their judgment, but he preferred to leave it there, and to say how very sorry he was he should have mentioned a thing which they did not intend to be mentioned to the public. Mr. Lamb then proceeded to read the correspondence referred to which passed between the Post Office and the National Telephone Company previous to the agreement of 1896.

The committee met again on Friday to consider their report, and on Tuesday brought their deliberations to a close. They unanimously adopted, with some amendments, Mr. Haubury's draft, and at the outset expressed the opinion that the telephone service (1) was not at present of general benefit, either in the United Kingdom at large, or even in those limited portions of it where exchanges existed; (2) was not likely to become of general benefit, either in the country as a whole, or in existing or future exchange areas, so long as the present practical monopoly in the hands of a private company continued; and (3) as it had already become of much more general benefit in other countries, affording less scope for its development than was afforded by the greater density of population, and the greater wealth and commercial activity of the United Kingdom, so it was fitted to become in this country, if worked solely or mainly with a view to the public interest, a valuable instrument in further developing the trade and social life of the nation, towards which new means of communication had always hitherto so largely contributed.

Municipal Work in Progress and Projected.

Owing to the summer recess there is naturally a dearth of news in regard to municipal work on the part of metropolitan authorities. It will be seen, however, that there is plenty of information as to the doings of provincial authorities.

METROPOLITAN AUTHORITIES. VESTRIES AND DISTRICT BOARDS.

Fulham.—The vestry has decided to pave King's-road with wood, at an estimated cost of £5,880.

Greenwich.—At last week's meeting of the board of works the Greenwich Committee recommended, and it was agreed, that the engineer be authorised to expend a further sum of £100 in the execution of the work of relaying and making good a sewer in Dinsdale-road.—The St. Paul (Deptford) Committee recommended that so much of the granite cube paving forming the boundary of the Broadway, and extending from Church-street to the western boundary of the London and County Bank premises, as is repairable by the board be taken up and the stones redressed and relaid at an estimated cost of £200. This was agreed to. The tender of Messrs. Mowlan & Co. for £1,611, was accepted for paving as a new street that portion of Trandley's-road, Deptford, extending from Rolt-street to Neckar bridge.—A letter from the London County Council stated that, as the council were about to adjourn for the summer recess, the Bridges Committee were unable to fix an earlier date than September 28th, at 3 o'clock, when they would be prepared to receive a deputation from the board on the subject of a tunnel between Rotherhithe and Shadwell. The consideration of the matter was deferred until the next meeting of the board.

Islington.—The vestry, on the 5th inst., referred to the Public Health Committee for consideration a letter from the London County Council on the subject of establishing a bacteriological laboratory. It was decided to refer to the Works Committee for consideration and report a letter received from the Battersea Vestry on the subject of the powers of district surveyors, and the desirability of those gentlemen being in the direct employ of the county council.—Mr. W. F. Dewey, the vestry clerk, read a letter from the Battersea Vestry notifying the application made by the latter to the county council in favour of powers being conferred upon local authorities to erect artisans dwellings under part iii. of the Housing of the Working Classes Act. The vestry asked that Islington should take a similar step, but it was resolved to take no action in the matter.—The Vestry of St. Margaret and St. John, Westminster, wrote, in reference to the Workmen's Compensation Act, that, owing to the vacation the present was an inopportune time for holding the proposed conference to consider the question of a mutual scheme of insurance for the metropolitan local authorities. The letter was referred to the General Purposes Committee.—The vestry clerk reported the receipt of approval of the Treasury to the borrowing of £1,400 for the erection of a chapel at the cemetery.—In reply to Mr. Tomkins, Mr. Gordon, chairman of the Electric Lighting Committee, stated that smoke-consuming devices were being fixed at the electric light station, and that the committee had not ceased the contract for Welsh coal, but that the contractors gave notice as long ago as the beginning of April that they could not supply that class of coal, owing to the strike. On the presentation of the estimate for the lighting rate for the ensuing half-year, Mr. James submitted that a reduction should be made in the charge for public arc lighting, he contending that the electric light works did not in reality yield any profits, but that the apparently satisfactory position was due to the excessive sum of £40 per lamp per annum charged for public lighting. In reply, Mr. Feunbhead stated that the Electric Lighting Committee would, no doubt, lower the price at an early date. It was further mentioned that the question of a refuse destructor was under consideration of the committee.—On the recommendation of the Parliamentary Committee, it was decided to convene a conference in the autumn to consider the subject of the reform of the local government of the metropolis, and particularly the provisions of the Metropolitan Management Acts Amendment Bill introduced by Mr. Thomas Long, M.P. The committee further stated that in connection with the question of the suggested establishment of a fund against fire and other insurances, they had considered the advisability of insuring the whole of the several fire risks of the vestry with one of the leading fire insurance companies, with a view to the saving of trouble and expense, and that after considering the quotations of several of the leading offices, they had accepted that of the Commercial Union Assurance Company, which had undertaken the whole of the insurances at an annual premium of £283 1s. 9d., and had agreed to allow a commission of 15 per cent. on regularly appointed agent, thereby further lessening the cost to the vestry.—The Works Committee recommended that a portion of Holloway-road should be paved with hardwood, at a cost of £6,500. The Works Committee further reported having considered the Metropolitan Management Acts Amendment (By-Laws) Bill, introduced into the House of Lords by Lord Monkswell, presumably at the instigation of the London County Council, whereby it is proposed to extend the powers of the council,

under sec. 202 of the Metropolitan Management Act, 1865, to enable the council to make by-laws for the following purpose:—"Requiring persons about to construct, reconstruct, or alter drains in connection with buildings to deposit with the sanitary authority of the district such plans, sections and particulars as may be necessary for the purpose of ascertaining whether such construction, reconstruction, or alteration is in accordance with the statutory provisions relative thereto, and with any by-laws made under the said section." Whilst agreeing that powers to make such by-laws should be obtained, the Works Committee expressed the opinion that they should be granted to the local authorities rather than to the London County Council.—The following tenders were accepted for the supply of horse forage during August: Mr. Geo. Rose, Little Hallingbury, seven loads of hay, at 75s. per load, and twelve loads of straw, at 36s. per load; Messrs. Giggell, Son & Co., Whitechapel High-street, E., seven loads of clover, at 97s. per load, and seven loads of mixture, at 82s. per load; Messrs. Pattison & Co., 123 High-street, E., 140 quarters of oats, equal to sample No. 1, at 16s. 10d. per quarter; and Mr. G. W. Stemp, 58 New Corn Exchange, E.C., 1½ tons of mill bran, at 115s. per ton.

Lambeth.—At a meeting of the vestry on the 4th inst. Mr. Baldwin moved the appointment of a Special Committee, composed of the chairman of each Standing Committee and two members from each ward, to consider the advisability of erecting a town hall for the parish of Lambeth, to fix the site thereof, and to obtain designs and estimates for the same. An amendment to this motion, proposed on behalf of Mr. Corbin, was moved and eventually carried appointing a Special Committee to consider the possibility of increasing the vestry office accommodation on the present site, or the necessity of erecting a town hall for the parish.—A letter was read from Messrs. William Webb & Co. intimating that the application to the Light Railway Commissioners for an order authorising a light railway from Herne Hill to Farnborough would not be proceeded with.—It was resolved to forward to the county council a copy of a report of the Sanitary Committee, stating that the vestry did not consider it advisable to include street litter within the provisions of the council's by-laws, prescribing the hours of removal of offensive matter and the construction of the carts for conveying such material.—The surveyor had reported to the Sewers Committee the receipt from the county council of a plan and application by Messrs. Laphorne & Co., on behalf of Messrs. Atkinson & Co., for permission to erect a warehouse at Messrs. Atkinson & Co.'s premises, Aldington-street, to abut upon Sapphire-place at the rear. It appears that Sapphire-place is only 5 ft. wide, and it was proposed to erect buildings fronting it at a height of 27 ft. The vestry decided to ask the county council to disapprove the plan.—The Wharf and Cleansing Committee reported having considered the question of partially covering the dust-vans while engaged in the clearance of dust, and that they had directed the surveyor to inquire of the surveyors to the various metropolitan local authorities whether, in their opinion, it was advisable to fit the vans with revolving iron covers. The majority of the answers received were against the iron covers, and the committee therefore directed the surveyor to fit a van with circular iron stays, to which an ordinary canvas cover can be attached, so that one-half of the van may be covered while the men are filling the van from the side nearest the pavement. The committee inspected the van which had been fitted in accordance with their instructions, and they recommended the vestry to sanction the whole of the vans engaged in the removal of dust being so fitted, at a cost of about 30s. per van. This was agreed to.—Last February the vestry sanctioned the purchase of four news and distributors. In response to advertisements, the following tenders were received by the Wharf and Cleansing Committee, who, owing to the winter being practically over, allowed the matter to remain in abeyance: Four-wheel machines—W. Smith & Son, Barnard's Castle, £42 10s. each; Glover & Son, Warwick, £44; Wadsworth & Son, Halifax, £57 10s. and £50; Two-wheel machines—James Melling, New Broad-street, E.C., £29; W. Smith & Son, £30; Glover & Son, £32; Bristol Wagon Company, Bristol, £30; Wadsworth & Son, £42 10s. and £34 10s.—The Wharf Committee stated that they had again considered these tenders and tried to obtain sample machines from the makers for inspection, but were unsuccessful, and recommended the vestry to order one two-wheeled and distributor from Messrs. Glover & Co. (the makers of the machine now in use), at a price of £32. The committee further recommended that, if the machine gave satisfaction, the order for the other three machines should be given to the same company. These recommendations were adopted.—At the suggestion of the Wharf Committee, the vestry accepted the tender of Messrs. Guerrier, Marshall & Co., of 40 York-road, S.E., for the supply of 100 quarters of oats, to weigh not less than 88 lb. per imperial bushel, at 15s. 6d. per quarter of 54 lb. The other firms who tendered were: A. & W. Aste, Old Barge House Winif, Blackfriars, 15s. 3d. per quarter; C. & J. Deny, 57 Belvedere-road, 16s. 14d. per quarter; E. Rathbone & Son, 19 Newington-causeway, 16s. 6d. per quarter; J. Hnsbaid &

Co., Acorn Wharf, Wapping, 16s. 9d. per quarter; D. N. Howell & Co., Belvedere-road, S.E., 15s. 9d. per quarter; H. Passmore & Co., 33 Mark-lane, S.E., 16s. 3d. per quarter; A. Keevil, Brixton Granaries, S.W., 15s. 9d. per quarter; Gould Brothers, Stratford, 16s. 9d. per quarter; S. H. Wells & Son, 61 Millbank-street, S.W., 17s. per quarter; G. W. Stemp, 39 Seething-lane, 17s. 3d. per quarter; and W. A. Pattison & Co., 123 High-street, Borough, 16s. 8d. per quarter.

Marylebone.—At the meeting on the 4th inst. the surveyor was empowered to accept a tender for the ventilation of the wash-houses. A letter was read from the county council stating the proposal of the council to apply for Parliamentary powers to establish a bacteriological laboratory and appoint experts, or make arrangements whereby medical officers could obtain the examination by a competent bacteriologist of material from suspected cases of infectious disease, with a view to aiding in the diagnosis. As the council asked for the views of the vestry, it was resolved to refer the letter to the Sanitary Committee for consideration.—The question of wood paving was again brought forward, consequent upon the difficulty of obtaining early deliveries of both soft and hard wood blocks, and, on the suggestion of Mr. Dennis, the Works Committee were authorised to enter into contracts for supplies so as to be ready to commence the work in the spring. It was resolved, on the recommendation of the Sanitary Committee, to inform the Vestry of Clerkenwell, in reply to their letter in favour of drainage plans of new buildings being submitted to local authorities before the commencement of the work, that the practice is already in operation in Marylebone.—The same committee reported in regard to the reference as to the desirability and practicability of constructing an underground public convenience in Marylebone-road by Edgware-road, that the large number of gas and water mains on the site appeared to render the construction of a convenience impracticable.—On the motion of Mr. Morris, it was resolved to instruct the surveyor to prepare a report on the respective merits of hard and soft wood blocks for paving purposes.—It was decided to accept the tender of Mr. Frank Sanders for scraping down, preparing for and painting the public animals, externally and internally, with two coats of paint, for the sum of £34 17s. 6d.; that of Mr. George Smith, of 6 Henry-street, St. John's Wood, for painting railings of Paddington-street and St. John's Grounds, and the greenhouses and frames in St. John's Ground, for the sum of £108; and that of Messrs. Thorpe & Salter, amounting to £102, for the substitution of Maskeleyne automatic penny-in-the-slot locks for the existing registering locks to the water-closets at the public conveniences.

St. James, Westminster.—The Public Health Committee recommended that underground conveniences for both sexes should be built in Broad-street, and that the Health Committee should obtain plans and estimates for carrying out the work. The recommendation was adopted.—The Parliamentary Committee reported that they had considered a letter from the Vestry of Battersea, stating that they had decided to take action with a view to the water supply being vested in the people of London, and that, before deciding as to the steps to be taken in the matter, they would like to have the opinions of the various metropolitan local authorities on the subject. On the recommendation of the Parliamentary Committee, the vestry resolved to inform the Battersea Vestry that they were not prepared to express any opinion on the subject at the present time.—It was also decided to take no action in regard to the request of the Islington Vestry for an expression of opinion on the subject of the Metropolitan Management Acts Amendment (By-Laws) Bill, which proposes to authorise the county council to make by-laws relating to the construction and laying of drains.—The General Purposes Committee reported having considered a letter referred to them from the Vestry of Battersea, stating that they had addressed a letter to the London County Council, asking them to insert a clause in their next General Powers Bill, empowering the local authorities to erect dwellings under part iii. of the Housing of the Working Classes Act, 1890. On the recommendation of the committee it was resolved to inform the Battersea Vestry that the vestry concurred with their action.—A long discussion took place on the report of the Works Committee, in reference to the request of the National Telephone Company to place its wires underground. The committee recommended that, subject to the submission of an amended plan for laying its wires underground, and to the omission of a condition in regard to future extensions, the vestry should grant the application on the company agreeing to pay an annual rental of 7s. 6d. in lieu of the 5s. offered for each separate exchange subscriber's line. An amendment, moved by Mr. Cheney, was eventually carried by thirteen votes to seven votes, agreeing to call a conference of adjoining local authorities in order to discuss their respective action in the matter.—Among the letters received was one from the Vestry of Clerkenwell, drawing attention to the fact that, with respect to new buildings erected to plans approved by the district surveyor or the county council, application is frequently made to the vestry, after the building is up, to modify the by-laws relating to water-closets, soil pipes, &c., it being found difficult or impossible to comply with them. The Clerkenwell Vestry suggested that it might be advantageous if the attention of builders were drawn, through the county council, to the necessity of making application to the

local authority before commencing to build, submitting details as to proposed drains, &c., and asked the vestry to cooperate in the matter. The letter was referred to committee.—A communication was also received from the Battersea Vestry stating that they have had under consideration the recent serious accidents which have taken place on buildings in course of erection and alteration, and have informed the county council that they are of opinion (1) that all district surveyors should devote the whole of their time to the duties of district surveying, (2) that they should be paid a salary by the county council, and that all building fees (if continued) should be paid to the council direct, and (3), that an office should be provided for the district surveyor at the local vestry hall, so that he may be brought into closer touch with the local authorities.—The following tenders were opened for cleansing, painting and other work at the vestry hall: S. & S. Dunn, 31 Brewer-street, £430; H. & E. Lee, Warwick-street, £445; G. Fosley, King-street, Regent-street, £467; Johnson & Manners, Great Putney-street, £469 10s.; G. A. Row, York-street, St. James's-square, £485; C. W. Knight, Marlborough-mews, £493; R. & J. Shires, £496; H. Faulkner & Co., Jermyn-street, £497; and Bywaters, King-street, Regent-street, £545. The tender of Messrs. S. & S. Dunn was accepted.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Brighton.—The Pavilion Committee on Friday submitted tenders received for carrying out certain alterations and additions to the gentlemen's cloak-room and lavatory at the Pavilion, and recommended the acceptance of that of Mr. V. P. Freeman, of Kensington-street, Brighton, to perform the work for the sum of £320. The recommendation was adopted.

Cheshire.—Sanction was on Thursday given to the expenditure of £1,202 for the making of roads in connection with the extension of the county asylum at Upton. A statement showed that the complete extension would probably cost £90,197.—The medical officer, in a report on the alleged pollution of the river Weaver, stated that there could be no doubt of the river being polluted, or that it gave off an effluvia. A large amount of the pollution appeared to be brought in with the Leighton brook, which received much of its pollution from Crewe. The Nantwich urban district was still putting its sewage into the river Weaver. It was resolved to call the attention of the Town Council of Crewe and the Urban Council of Nantwich to the complaint, and to request them to prevent the pollution.

Northumberland.—The county surveyor, Mr. H. S. Kynnersly, has received a communication stating that the Earl of Tankerville has consented to make a gift of the land necessary for the improvement of Turvelay bridge.

Surrey.—The county lunatic asylum at Brookwood being overcrowded, the county council have authorised the extension of the building, so as to provide for 350 additional patients. The council have also authorised the purchase of the Netherne House estate, near Coulsden, containing 153 acres, as a site for another asylum. The new asylum will cost £250,000.

MUNICIPAL CORPORATIONS.

Bideford.—Colonel Durnford, R.E., recently held an inquiry, on behalf of the Local Government Board, relative to an application of the town council for power to borrow £1,050 for diverting and culverting a "hill" adjoining the town marshes, filling in the original trench and constructing a road across it, the improvement reclaiming about 4 or 5 acres of land for the use of the public. In 1896 permission was granted to borrow £1,500 for the culvert, but the lowest estimate was £1,836. It was considered best to proceed with the work, which with engineer's fees, &c., ran up to £2,112. There were, in addition, maintenance money £208, cost of roadway £200, and incidental £29, or a total of £2,550. Mr. G. E. Latham, representing Mr. Baldwin Latham, in explaining the proposals, said that the original contract was for a rubble stone culvert. There was some difficulty with regard to the stone; brick and concrete were substituted. Instead of a 12-in. stone culvert they had brick and concrete of 14 in., thus compensating for the change. Owing to the unsatisfactory nature of the ground, it was found necessary to increase the excavation and place a bed of concrete 1 ft. in depth and 8 ft. in width, which considerably enlarged the expense. At the conclusion of the inquiry the inspector paid a visit to the river bank and culvert.—The town clerk last week decided to apply to the Local Government Board for sanction to borrow £250 for removing some old boat steps at the end of the quay and sloping the face in unison with the remainder of the river bank. Plans for the alteration were submitted by the borough surveyor.—It was also decided to apply for a further sum of £200 to complete the filling of the Pill.

Bournemouth.—The council have decided to petition the county council to declare Wimborne, Holdenhurst, Queen's and Lansdowne roads main roads, and it is thought that in case of refusal the town council's case for making Bournemouth a county borough will be strengthened. The tender

of Messrs. Macfarlane has been accepted for electric light standards. The council have refused to take the drainage of a portion of the Branksome urban district, and have refused to entertain a proposal to make the fever hospital free.

Bristol.—The town council have adopted a recommendation of the Docks Committee in favour of going to Parliament for powers to construct a new lock and other works at Portishead dock, so as to provide accommodation for the largest classes of steamers afloat or building. The estimated outlay is £350,000. An amendment to the effect that the lockisation of the river Avon was the best scheme was defeated by forty-one votes to twenty-one.

Cardiff.—Mr. R. H. Bucknell, Local Government Board inspector, attended at the town hall, Cardiff, last week, for the purpose of inquiring into an application by the corporation for the sanction of the board for borrowing the sum of £14,500 for the purpose of establishing a fish market on the eastern side of Working-street, £6,220 for the alteration of Roath market, and £2,965 for street improvements in Glanfford road and Leckwith-road. Formal evidence was given for the corporation. There was no opposition, and the inspector will report the application in due course to the Local Government Board.

Cheltenham.—The following will shortly be discussed by the council: "That, whereas the present distribution of the fund available for technical instruction in Cheltenham secures quite inadequate results for the money spent, this council is of opinion that the time has arrived when steps should be taken to establish a school of technical instruction under the control of the Corporation of Cheltenham, and hereby requests the Technical Education Committee to forthwith consider and prepare a scheme for the establishment of such school."

Coventry.—The first instalment of the electric lamps which are to illuminate the principal streets of Coventry has been erected, and was for the first time lit up on the 20th ult. It is an arc light of 2,000 candle-power, and is fixed on an ornamental post in the centre of the crossing refuge which is being laid down at the corner of Eaton-road and Warwick-road. The light is 20 ft. from the ground, and the post is to be neatly painted, so that when completed the erection will add in some degree to the appearance of the road in question. It is the first of forty lights of the same power which are to be fixed in a line from the station to the top of Bishop-street, and from Fleet-street to Jordan Well, at distances of from 70 to 80 yards apart. The other parts will be of the same height as the one at the Eaton-road corner, but will be of an overhead type, the arc lamps being suspended from a curved bracket and hanging 2 ft. lower. The lights will be all of the same illuminating power.

Darlington.—It has been decided to proceed with Prof. Kennedy's scheme of electric lighting, at a cost of £25,000.

Douglas.—Prof. Fleming has, at the request of the corporation, presented a report with regard to the lighting of Douglas by electricity. His report is in favour of such lighting by the corporation, and he addresses the following grounds: The profits accruing go to the ratepayers, monopolies of the kind should be in the ratepayers' hands, private consumers will be sure of fair treatment, the prospects for electric lighting in Douglas are encouraging, and the extra expenditure produces a superior illumination, of which the public get the benefit. The estimated cost is in the neighbourhood of £30,000.

Gloucester.—At the last quarterly meeting of the city council, the chairman of the Markets Committee having referred to the suggestion that a wholesale fruit market should be established, it was resolved that a sub-committee be appointed to consider and report as to the advisability of establishing a market or auction for the sale of fruit and other agricultural produce.

Halifax.—The Improvements Committee have decided to recommend the corporation to consider the construction of a road 60 ft. wide, from Queen's-road, via Shropps-park, to Ovenden Cross, at an approximate cost of £130,000, conditional upon the free grant of the required land by all the owners, and that the borough engineer be instructed to prepare detailed plans and estimates.

Heywood.—Last week, at Heywood, Colonel Hepper, a Local Government Board inspector, held an inquiry relative to the application of the town council for powers to borrow £10,000 for the purposes of the gas undertaking. The money is required for land, new store-room and stables at the gasworks, and for new mains and penny-in-the-slot gas meters. It was explained that a large demand was anticipated for this kind of meter.

Hull.—The Works Committee, at a recent meeting, accepted the tender of Mr. Bramly Robinson, amounting to £656 9s. 5d., for the channelling and paving of Smeaton-street and Silvester-street. Mr. J. Sangwin's tender for the same work in connection with Beverley-road—namely, £147 and Elm-terrace, amounting to £363, were also accepted.

Leeds.—The following resolution has been adopted by the council: "That the corporation, in pursuance of sec. 59 of the Leeds Electric Supply Order, 1891, do give notice in writing to the Yorkshire Hoos-to-Hoos Electric Com-

pany, Limited (being the undertakers for the purpose of the said order), requiring them forthwith to sell to the corporation their undertaking upon the terms contained in sub-sec. 1 of the said sec. 59."

Liverpool.—The Insanitary Property Committee of the corporation met on the 29th ult. A resolution was adopted instructing the city surveyor to report as to the suitability of land belonging to the committee, situate between Dryden-street, Rachel-street and Virgil-street, for the erection thereon by the committee of dwellings suitable for the accommodation of persons who have been dispossessed through the demolition of insanitary property, the dwellings to be similar in character to those erected from the designs of the building surveyor in Gildart's-gardens and Fore-street. The surveyor was also instructed to report as to the probable cost of and income from such dwellings, and whether they should be erected by contractors or by the corporation. The committee further resolved to request the surveyor to make a report as to whether the committee had any land in the south end of the city suitable for similar houses.—At a recent meeting of the Tramways Committee a report of the manager, with respect to establishing a central belt omnibus route between Netherfield-road North and Princes-road, was approved, and the following resolution was passed: "That the question of continuing the present tramway service from Princes Park gates along existing lines in Princes-road, Catherine-street, Lece-street and Renshaw-street during the relaying of the lines in Upper Warwick-street, be referred to the chairman, Councillor Rotherford, the city engineer and the manager."

Ludlow.—At the last monthly meeting of the council a letter was read from the Local Government Board denying that they had sanctioned the borrowing of money by the Town Council of Exeter in respect of their scheme for treating the sewage of the city by the septic tank system alone, and repeating that so far as the Ludlow scheme was concerned the board would not be satisfied with the provision of less land than that which they were originally prepared to accept—P.S., 7 acres.

Ramsgate.—The following has been adopted: "That the council do offer three premiums—viz., £50, £20 and £10 for competitive designs for dealing with the surplus land belonging to the corporation under and in front of the Pargon Gardens."

Rotherham.—On the recommendation of the Gas Committee, the town council, at their last quarterly meeting, accepted the tender of Messrs. W. Thornton & Son, for £2,325, for the conversion of an existing gasholder tank into a tar and liquor storage well, and also for the putting in of foundations for new purifiers, &c., in connection with the gasworks extensions.

Salford.—The council, without discussion, last week passed a resolution authorising an application to borrow £38,500 for the purchase of the infantry barracks site in Regent road, and also adopted a proposal to apply for power to borrow £2,500 to cover the balance of the cost of completing the erection and fitting-up of the spinning and weaving department at the Royal Technical Institute.

Scarborough.—All hope of having the marine drive round Scarborough Castle Hill finished next year, according to contract, has been practically abandoned. One third of the wall is not yet completed, and it is doubtful whether half the length of foundation will be laid before the winter. In these circumstances the town council will apply to Parliament next session for a provisional order to extend their borrowing powers for twelve months to the 12th August next year.

Southend.—We hear that a plan for converting the unsightly mud foreshore at Southend into a sand parade has been submitted for approval. The proposal is to fill in the space which is at present useless for sea or land purposes—to above high-water mark, so as to be available at all times of the tide. It is stated there are no engineering difficulties to overcome, and little more than unskilled labour would be necessary, so that the cost would be small for making one of the finest seaside promenades in the kingdom.

St. Helens.—On Friday, at the St. Helens town hall, Colonel A. J. Hepper, D.S.O., R.E., held an inquiry, on behalf of the Local Government Board, into the application by the corporation for the sanction of the board to the borrowing of £2,500 for the construction of a storm-water overflow in Liverpool-road, £5,000 for the construction of a subway in Church-street and Ormskirk-street, and £900 for works of paving. At the close of the inquiry the town clerk thanked the inspector for his attention, after which the inspector proceeded to visit the sites of the works mentioned.

Swansea.—A singular condition of things has come to light respecting a decision of the corporation to enlarge one of their storm outlets on the foreshore. The enlargement was deemed necessary on account of the constant flooding during wet seasons of Wellington and other streets, but when the workmen engaged under the present contract were digging up the old pipes it was found that a wreck that occurred at the spot many years ago had dislodged one of them, with the result that the intervening space had become completely filled up with sand. Several copper bolts from the wreck have been picked up around the pipe.

Taunton.—Mr. H. H. Law, Local Government Board inspector, has held an inquiry with reference to an application from the town council for sanction to borrow £11,500 for purposes of electric lighting. Evidence in support of the application was given by the mayor and others, and opposition was offered by Mr. C. P. Clarke, for the gas company, Mr. C. Smith and Mr. J. Standfast.

Wolverhampton.—The Lighting Committee on Thursday recommended that the tender of Messrs. Callender's Construction and Cable Company, Limited, for the supply and laying of mains, at an estimated cost of £598 12s. 1d., and also that the tender of Messrs. Wilcock & Co., amounting to £379, for the construction of a new sub-station adjoining the Exchange Hall, be accepted. The recommendations were adopted.—In pursuance of a report presented to and adopted by the council on the 14th March last the Sewerage Committee were empowered to carry out the various sewerage works therein enumerated, at a total estimated cost of £4,567.

Worthing.—At the suggestion of the mayor the surveyor was last week requested to submit specifications and estimates for paving the carriageway in Chapel-road, adjoining the town hall, with wood blocks or cork pavement.

Wrexham.—On Thursday Mr. W. A. Ducat, Local Government Board inspector, held an inquiry at the Guildhall, Wrexham, respecting an application by the Wrexham Town Council for sanction to borrow £1,250 for the purposes of street improvement. Evidence in support of the application was given by the mayor, the borough surveyor, Mr. J. W. M. Smith, the assistant town clerk, Mr. J. W. Rogers and Mr. Connellor Charles Davies. Mr. Llewellyn Adams, clerk to the Denbighshire County Council, attended on behalf of that body to watch their interests, one of the streets proposed to be improved being a county main road. There was no opposition to the proposed loan.

URBAN DISTRICT COUNCILS.

Aldershot.—The district council have accepted the tender of Mr. Thomas Turner, of Blackwater, Hants, amounting to £1,306, for the making-up, &c., of St. Michael's-road, St. George's-road and St. Joseph's-road.

Corton.—The district council having purchased a plot of land for a cemetery for the district, the ceremony of cutting the first sod was performed on Thursday afternoon by Mr. W. T. Showell, chairman of the Cemetery Committee. In addition to the members of the council and a number of invited guests, there was a large gathering of residents of the district. The land, which is known as Waterhouse Farm, is 17 acres in extent, and has been purchased for £4,800.

Heaton Norris.—At a meeting of the district council recently it was unanimously decided to apply to the Board of Trade for a provisional order for the purpose of supplying and lighting the district with electricity. It was stated that an agreement had been come to with the Manchester Corporation for the supply at the same cost to consumers as it was used in Manchester.—Further complaints were made as to what was described as the horrible condition of Black brook, alleged to be polluted from the Reddish district, and to be so serious as to hourly menace the health of people living in the locality. The attention of the Reddish council had been repeatedly drawn to the matter, but nothing had been done, and the chief engineer to the Mersey and Irwell Joint Committee, replying to the Heaton Norris council's letter, now wrote that the pollution ought to have been stopped long ago. Numerous letters from householders, and a strong complaint from the medical officer, were read, and the council decided to take legal proceedings against the Reddish urban authority if steps were not immediately taken to remedy the nuisance.

Horsforth.—At a recent meeting of the district council a letter was read from Messrs. North & Son, solicitors to the waterworks company, informing the council that they were unwilling sellers, but they would sell at the terms sanctioned by Parliament and no other. They did not believe in the exclusion of 10 per cent. compensation for compulsory purchase. After a lengthy discussion it was proposed that the council should purchase the works on the company's terms. It would, it was urged, bring an end to these unseemly wrangles. The water company were now supplying better water than recently. When the motion was put no one voted against it, and the chairman declared it carried. The proposal is now to be placed before the ratepayers for them to vote upon it. The council consider that the purchase will be the best way out of a serious difficulty, but they expect strong opposition from the ratepayers when the time for the poll arrives.

Lovenshulme.—At the last monthly meeting of this body the proceedings of the General Purposes Committee, which were adopted, contained the following resolution: "That the clerk be and is hereby directed to write to the Local Government Board informing them that at recent inquiries held in this council's district manholes were not required on the surface drains, and, further, that the council cannot see the utility of placing manholes on the surface drains, and that if their present demands were insisted upon it would have the effect of preventing this council from carrying out private

street improvement."—On the recommendation of the General Purposes Committee the council passed a resolution to grant £50 to the Technical Instruction Committee of the district for technical instruction purposes during the coming winter session.—A Local Government Board inquiry was held on Wednesday week by Colonel A. J. Hepper, an inspector of the Local Government Board, into the subject-matter of an application by the council for permission to borrow £4,434 for main road improvements and to defray the cost of a recreation ground for the district.

Moss Side.—A Board of Trade inquiry was held on Thursday into the subject-matter of an application made by the district council for permission to borrow £13,000 to meet the cost of tramway extensions now in progress in the district. There was no opposition to the application. The £13,000 is needed to meet the cost of extensions of the tramway lines along the following roads in the district: Withington-road, Raby-street, Moss-lane East, Princess-road, Denmark-road and Upper Lloyd-street. The work is already in progress, and will be completed in about three months hence.

St. Anne's-on-the-Sea.—The council last week decided to assemble at an early date for the purpose of adopting a scheme for having the town lighted by electricity, Royal assent having been given to the provisional order.

Stretford.—The council at a recent special meeting decided by resolution that notice should be given to the Manchester Carriage and Tramways Company, that directly the statutory term of the lease of twenty-one years expired, it was the intention of the council to purchase the tramways in the district. A resolution was also passed proposing in the next session of Parliament to promote a Bill empowering the council to work the tramways by mechanical power, including electrical haulage, and that it was their intention to use the necessary cars and other plant. Also to give the council power to borrow money for relaying the lines and adapting them for electrical haulage, and work the system singly or in conjunction with other local authorities.

Swinton and Pendlebury.—Recent minutes of the General Purposes Committee, which were approved, stated that a communication had been received from the Local Government Board setting forth that with regard to the council's application for sanction to borrow the sum of £7,470 for works of private street improvements the board had considered the further representations of the council on the subject, but they adhered to the decision conveyed in their letter of May 6th last withholding their sanction until the council acquired more land for sewage purification purposes.—It has been announced that a report has been received from the Mersey and Irwell Joint Committee as to the effluents from the council's sewage works, classing the effluent from the Swinton works among "good effluents," and that from the Pendlebury works among "fair effluents."

Yeading.—At a meeting of the council on Wednesday week a letter was read from Messrs. Bond, Barwick & Peake, solicitors, stating that their clients, the Misses Stansfield, of Esholt Hall, would not sell the site of the present sewage works, nor would they on any account whatever allow a destructor to be erected there. The works had been such a constant nuisance, and were in such an unsuitable position, that the owners did not feel disposed to give any facilities for their extension, and reserved their rights to require them to be closed if the present condition of affairs continued. The letter went on to say that the Misses Stansfield were prepared to sell or lease 20 acres of land adjoining the river for disposal works, the price to be, if purchased, £250 per acre, and if leased £7 per acre, and they would grant an easement for the continuation of the sewer down to such land. It was resolved to hold a special meeting of the council in committee to discuss the proposals.

RURAL DISTRICT COUNCILS.

Orsett.—Colonel C. H. Luard, R.E., Local Government Board inspector, held an inquiry last week into an application of the council to borrow £6,000 for the improvement of the roads in Little Thnrrock and Chadwell St. Mary.

Pershore.—The General Purposes Committee last week recommended that an application should be made to the Local Government Board to postpone dealing with the question of the sewerage and water supply of Pershore until after the report of the Royal Commission. The minutes were adopted.

St. Faiths.—A letter has been received by the council from Mr. Collins, the city engineer of Norwich, intimating the city's willingness to accept the offer of the district council for the repair of Sandy-lane, Hellesdon, at a cost not exceeding £250, to be borne in equal shares.

Aberdeen.—At a recent meeting of the town council the Finance Committee reported that if the fish market wharf were extended into the waterway, along Market quay, for the extension of the market the additional cost would be about £6,500. The committee again recommended the adoption of the Market-street site as the most suitable. The matter was remitted back to the committee.

Personal.

Mr. James Arthur, inspector of cleansing to the Dundee Corporation, has had his salary increased to £300 per annum.

Crews Town Council have decided to raise the salary of Mr. George Eaton-Shore, the borough surveyor, from £300 to £350 per annum.

A proposal to increase the salary of the manager of the Barnhurst sewage works of the Wolverhampton Town Council to £150 has been approved.

Mr. William Higginson Schofield, senior district surveyor to the Lancashire County Council, has been appointed county surveyor under the same authority, at a salary of £500 a year, with travelling expenses.

A letter has been received by the Itchen Urban District Council from Mr. Collingwood, the newly-appointed surveyor, stating that he would be prepared to enter upon his duties on Wednesday next, the 17th inst.

At the last meeting of the SADBURY Town Council it was resolved that a substantial honorarium should be granted to the borough engineer, Mr. T. W. A. Hayward, for extra services rendered in connection with the waterworks.

Mr. H. P. Mayhew, surveyor to the Malvern Urban District Council, presided recently at a dinner given in connection with an outing of the town employees to Weston-super-Mare. The proceedings passed off very successfully.

Mr. H. M. Bairstow, late assistant and formerly articled pupil to Mr. Robert Hunter, of the Chester gasworks, has been appointed assistant manager at the corporation gasworks, Darwen, in succession to Mr. H. Davies, who has been appointed assistant at Colne.

Mr. D. M. Price, of Ferndale, who has for the past twelve months held the post of assistant surveyor and sanitary inspector at Blacuan Festiniog, has, out of the forty-nine applicants, been appointed sanitary inspector to the Upton-upon-Severn Rural District Council, Worcestershire.

At a special meeting of the Audenshaw Urban District Council, on the 3rd inst., the scheme designed by Mr. J. P. Wilkinson, A.M.I.C.E., of Arcade Chambers, St. Mary's Gate, Manchester, for the sewerage of the district, was unanimously approved and adopted. The estimated cost is £14,500.

The resignation is announced of Mr. J. E. Stewart, the electrical engineer for the borough of Derby. Mr. Stewart has obtained another appointment, and the Electric Lighting Committee recommend that a successor to him should be advertised for, at a salary of £350, with the right to take two pupils.

Wolverhampton Town Council have selected Mr. Charles E. C. Shawfield to fill the post of borough electrical engineer, at an annual salary of £200. The appointment, which was unanimously agreed to, was strongly urged, the sound character of Mr. Shawfield's past services being specially referred to.

The County Council of Lancashire on Thursday adopted the report of a Special Committee recommending the appointment, as county bridgeman, of Mr. William Harold Radford. Mr. Radford, who succeeds his father, will be allowed a salary of £1,000 per annum, with the addition of travelling expenses and staff.

On Thursday, at a meeting of the Cheshire County Council, Mr. William Holland, surveyor of the Wirral district of the council, was appointed as assistant county surveyor. The appointment was made chiefly for the purpose of supervising and verifying the work done on the main roads, which the various urban councils and municipal boroughs have retained in their own hands.

Some discussion was recently given by the Saddleworth (Yorks) Rural District Council to a proposal to advertise for a surveyor to supervise the roads, and take charge of all the main roads and parish highways in the district, to superintend the execution of repairs on the roads and highways under the direction of the council, and prepare such plans and estimates as might be required by the council.

At a meeting of the Neston and Parkgate Urban District Council, held on Wednesday of last week, Mr. J. Bourne was unanimously appointed to fill the office of surveyor and inspector of nuisances for the district, the present surveyor, Mr. H. W. Corrie, having accepted an appointment under the Lower Bebington District Council. Mr. Bourne resigning a similar position under the Little Woolton Council in favour of the Neston vacancy.

Mr. Frederick J. Wood, A.M.I.C.E., has been appointed county surveyor for East Sussex, in succession to Mr. Henry Card, and will take up his duties on October 1st. The salary is £100 per annum, with allowances for clerks, &c., and there were eighty-one candidates. These were reduced to four, who were interviewed by a sub-committee. Mr. Wood, the successful one of the four, is thirty-five years of age, and is at present a district surveyor under the Lancashire County Council.

The Waterworks Committee of Lincoln Corporation have resolved by a large majority to recommend the council to appoint Mr. J. H. Teague to the vacant post of waterworks engineer, at a salary of £250 per annum. The appointment has been confirmed by a meeting of the council in committee. Mr. Teague is a son of the late Mr. Teague, who filled the position worthily for a great many years. He has been superintending the department since his father's death. He has already been in the employment of the corporation for more than a quarter of a century, and he is practically acquainted with every branch of the work.

Preston Town Council, at a recent meeting, passed the following resolution: "That this council receives with very deep regret the announcement of the death of Mr. Hudson Reah, C.E., who for twenty years held the office of borough surveyor, and for seventeen years was engineer and steward to the corporation, during which time he ably carried out important works; and this council desires to place on record their high appreciation of the valuable services rendered by him, and that the mayor be requested to convey to Mrs. Reah this expression of the sincere sympathy and condolence of the council with her and her family in their bereavement."

Seventy-eight applications for the appointment of building inspector having been received by the Gloucester City Council, a sub-committee were recently appointed to consider the qualifications of the applicants and select not less than six for the consideration of the Improvement Committee. The six applicants subsequently attended before the committee, and were questioned as to their qualifications and experience. After throwing out all the applications except two—namely, Mr. Philip Lewis, of Gloucester, and Mr. E. A. Newton, of Clapham Junction—a show of hands was taken, which showed a majority in favour of Mr. Newton. The committee were recommended to appoint Mr. Newton, at a salary of £2 2s. a week, the appointment to be determinable by a month's notice on either side.

At a meeting of the St. Mary Church Urban District Council, held on Thursday, Mr. Wm. Stringfellow, A.M.I.C.E., surveyor to the Eastleigh (Hants) Urban District Council, was appointed to the vacant post of surveyor. Mr. Stringfellow, who holds the certificate of the Association of Municipal and County Engineers, has an excellent record. After serving four years in the office of the Southampton surveyor, he acted as chief assistant for three years to the borough surveyor and water engineer of Cheltenham, Mr. Joseph Hall, who was formerly surveyor of Torquay. Mr. Stringfellow successively acted as surveyor at East Stonehouse (the chairman of which, Mr. W. W. Blight, gives him an excellent testimonial), East Cotes, and Eastbizz, and from the latter place he came direct to St. Mary Church.

Mr. H. T. Wakelam, the newly-appointed county surveyor of Middlesex, received his professional training through the ordinary routine of pupillage with the late Mr. Benjamin Baker, borough engineer, of Wolverhampton, with whom he gained an excellent all-round experience. On the expiration of his articles in February, 1879, he was appointed assistant under Mr. Baker, holding that office about two years, and was then unanimously elected, from seventy-nine candidates, assistant borough surveyor of the seaport town of King's Lynn. During the seven years spent with Mr. Baker he was continually engaged in the preparation of plans, surveys, &c., and in the supervision of the works carried out. After his election by the Town Council of King's Lynn in February, 1881, he was appointed to superintend the new sewage scheme for that town under Mr. W. H. Wheeler, M.I.C.E., and he was also engaged upon the ordinary work of the borough, and in the supervision of the town hall and other buildings. As surveyor at King's Lynn he remained about two years, being then elected in May, 1883, from 110 candidates, borough and water engineer by the Town Council of Oswestry. During five years at Oswestry he was engaged in the management of the borough public buildings, markets, waterworks, &c., and in the latter part of his time there he acted as resident engineer of the new water storage reservoir. In 1888 he was elected, from 131 candidates, engineer and surveyor of the rapidly-increasing district of Garston, Liverpool. Mr. Wakelam left the Garston district in 1892 upon being appointed county surveyor by the Herefordshire County Council, which office he held prior to his appointment in Middlesex.

London Municipalities.—A meeting of the conference of representatives of the metropolitan vestries concurring in the proposal for the establishment of municipalities in London was held on Friday, at the Westminster Town Hall, to receive a report from the committee appointed by the conference on Monday, June 27th, upon the following reference: "That the draft Bill of Sir J. Blandell Maple, Bart., M.P., &c., and the Bill introduced by Mr. Thomas Lough, M.P., be referred to a committee for consideration, with authority to bring up a draft Bill embodying the best provisions of both, as also to introduce other provisions and to report to the conference; and that Sir Blandell Maple be invited to attend the meetings of the committee."

LAMBETH VESTRY AND THE KENNINGTON BATHS.

LETTER FROM THE ARCHITECT.

In a recent issue (see THE SURVEYOR, p. 157) reference was made to the notice of motion given by Mr. F. S. Price in favour of the appointment by the Vestry of Lambeth of a committee of five members to report generally upon the question of the new baths in Kennington-road, and particularly upon several points mentioned by Mr. Price. The attention of the architect (Mr. A. Hesseltilman) having been drawn to the matter, that gentleman has addressed the following letter to Mr. H. J. Smith, the vestry clerk:—

"It is the case that the estimate of £55,000 made in the commissioners' report of March 25th, 1895, correctly included my current estimate for the new baths in the Kennington-road. This estimate (as did every estimate submitted by me to the commissioners) included the approximate cost of boilers, machinery and fittings necessary for the working of the establishment, with the exception of the plant for the junction of the electric current for lighting purposes then contemplated to be taken from the adjoining company's supply.

"It is also a fact that when the tenders were invited for the ordinary builder's work, the boilers, machinery and general engineering work was not included in the specifications and quantities supplied. These, as they must necessarily be tendered for upon their own specification and quantities, were intentionally left out by me in accordance with my invariable practice for the past few years.

"This separation of tenders for two such differing classes of work is the only reasonable and fair way of dealing with such contracts, having regard to the interest of the rate-payers, and the increasing importance and cost of the various engineering installations involved. It was also more especially necessary, as within the last five or six years public authorities have almost universally determined to have the benefit of public competition for the engineering as well as for the structural portion of the work. Even the amounts of such engineering contracts could not be included as a provision in the main and structural contract, as this course would have involved the payment twice over for the quantities.

"There has been no intentional reticence or concealment in the matter. Until very recently I have been entirely under the impression that the commissioners know of the separation of tenders; but my letters, although showing clearly that this impression was in my mind, still do not convey in themselves sufficient knowledge of the intention of the commissioners, and I am confident from this and other incidents that they never so understood it."

On the motion of Mr. Price, the vestry last week decided to refer the letter to the Baths Committee for report.

NEW COUNTY HALL FOR DURHAM.

The members of the Durham County Council on the 25th ult. formally took possession of a new county hall, which will add to the architectural beauties of the city, while at the same time affording accommodation under one roof for the many departments of the council's work.

The structure, which occupies a site in Old Elvet, has cost a sum approaching £30,000. The facade is a handsome one, dominated by a domed tower over the main entrance, which is approached by an imposing flight of steps. The building is an exception among the other public edifices of the city, in the fact that Rubon red terra-cotta has been used instead of stone in the execution of the architect's designs. This course, though provoking some criticism, has effected a saving of about £3,000. Around the entire length of the hall, which has a frontage of over 200 ft., runs a splendid balustrade. In the centre is the main entrance, through an elaborately enriched archway, approached by a fine flight of Mansfield stone steps, some 30 ft. in width. The grille is richly wrought in hammered iron, after passing which is seen the grand staircase. Its steps are of marble, while the balustrade is of terra-cotta, and the supporting columns of polished white Parian. Upon the ground floor are the council chamber and committee-rooms and the offices of the county clerk. The council chamber is a handsome and convenient apartment. Around the walls are marble columns, panels and carving, and each of the windows is filled with stained glass, representing the arms of the county and of a number of the different boroughs in the Palatinate. Accommodation is provided for 100 members, in addition to the officers and press. The architects were Messrs. H. Barnes & F. Coates, of Sunderland and Hartlepool, and the contractors Messrs. D. & J. Ranken, Sunderland.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

BUILDING ASSISTANT FOR THE WORKS DEPARTMENT.—August 13th.—London County Council. £300.—Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, London, S.W.

QUANTITY TAKER FOR THE WORKS DEPARTMENT.—August 13th.—London County Council. £3 10s.—Mr. C. J. Stewart, county clerk, County Hall, Spring-gardens, London, S.W.

GENERAL FOREMAN OF WORKS.—August 15th.—Corporation of the City of Canterbury. £2 2s.—Mr. A. H. Campbell, city surveyor.

INSPECTOR OF NUISANCES.—August 15th.—Highworth and Swindon Rural District Council. £120.—Mr. John P. Kirby, clerk to the council.

SURVEYOR AND INSPECTOR OF NUISANCES.—August 17th.—South Hornsey Urban District Council. £250.—Mr. Edward B. Bennett, clerk to the council.

INSPECTOR OF SEWERS.—August 18th.—Corporation of Coventry. £2.—Mr. J. E. Swindlehurst, city engineer and surveyor.

SURVEYOR.—August 18th.—Carmarthen Town Council. £150.—Mr. J. H. Bodoel Roberts, town clerk.

QUANTITY SURVEYOR.—August 19th.—Aylesbury Urban District Council.—Mr. J. H. Bradford, surveyor to the council.

ARCHITECTURAL ASSISTANT.—August 19th.—Beckenham Urban District Council. £3 3s.—Mr. J. A. Angell, surveyor to the council.

SECOND ENGINEERING ASSISTANT.—August 22nd.—Edmonton Urban District Council.—Mr. Wm. Francis Payne.

CLERK OF WORKS.—August 22nd.—London County Council. £5 5s.—Mr. R. W. Partridge, clerk of the Asylums Committee.

CIVIL ENGINEERING ASSISTANT.—August 23rd.—Corporation of the City of Hull. £85.—Mr. A. E. White, city engineer.

ENGINEERING ASSISTANT.—August 27th.—Burton-upon-Trent Corporation.—Mr. George T. Lyman, borough engineer and surveyor.

ST. PANCRAS.—August 25th.—Erection of public baths and wash-houses.—Mr. G. H. J. Barrett, vestry clerk.

PLYMOUTH.—September 24th.—Erection of shops and dwelling-houses fronting Tavistock-street. £250.—Mr. J. H. Ellis, town clerk.

WIVENHOPE.—September 29th.—Works of drainage and water supply, for the urban district council.—Mr. C. W. Denton, clerk.

REIGATE.—October 6th.—Erection of municipal buildings, fire station, public offices, &c.—Mr. Clair J. Grece, town clerk.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

THORNHILL (Yorks).—August 13th.—Supply of flushing valves, manhole and lamphole covers, &c., for the urban district council.—Mr. S. W. Parker, surveyor to the council.

HUNSLLET.—August 13th.—Laying and jointing of about 6,150 yard of 3-in. cast-iron pipes, also fixing and walling-in of about twenty valves and hydrants for the Templenewasm and Thorpe Stapleton water supply, for the rural district council.—Mr. W. B. Pinder, clerk to the council.

DEWSBURY.—August 13th.—Excavators' work required in the construction of a tank at the gasworks, Savile Town.—Mr. H. Dearden, A.M.I.C.E., borough surveyor.

WARE.—August 13th.—Execution of sewerage works at Stanstead Abbots, for the rural district council.—Mr. G. H. Gisby, clerk.

SPENNYMOOR.—August 13th.—Kerbing, cement and tar paving, for the urban district council.—Mr. T. Baddock, clerk.

PENSTONE.—August 15th.—Sewerage, pier, road and other works.—Mr. William Sparks, 20 Park-row, Leeds.

WARRINGTON.—August 15th.—Supply of 500 yards of 2½-in. hose piping.—Mr. Thomas Longdon, borough surveyor.

BIRENHEAD.—August 15th.—Painting.—Mr. Alfred Gill, town clerk.

SHEFFIELD.—August 15th.—Extension of car sheds, consisting of two-span steel roof, cut rits, stores, boundary wall, latrines, foreman's house, &c., at Tinsley.—Mr. Charles F. Wike, city surveyor.

HASTINGS.—August 15th.—Supply of 120,000 9-in. by 3-in. by 4-in. jural wood paving blocks.—Mr. P. H. Palmer, M.I.C.E., borough engineer.

GLOUCESTER.—August 15th.—Erection of an infectious disease hospital at Over.—Mr. Geo. Sheffield Blakeway, town clerk.

SHROBURY.—August 15th.—Erection of a new battery room, boiler-house and extension of offices at the electricity supply station, Coronet-street.—Mr. H. Mansfield Robinson, vestry clerk.

BEKHLI.—August 15th.—Erection of boundary walls, the railing kerbing, paving and channelling of footpaths, and other works opposite the town hall, for the urban district council.—Mr. George Ball, A.M.I.C.E., surveyor to the council.

ROMSEY.—August 16th.—Erection of a concrete retaining wall in the Abbey.—The Borough Surveyor.

PEMBROKE.—August 16th.—Erection of buildings and foundations in connection with the township electric light works, for the commissioners.—Mr. Robert Hammond, 64 Victoria-street, London, S.W.

WOLVERHAMPTON.—August 15th.—Supply of cast-iron, wrought-iron and steel work required for structural and other purposes at the swimming bath and assembly hall to be erected in Bath-place.—Mr. J. W. Bradley, borough surveyor.

CROLEY.—August 16th.—Supply of gas meters.—Mr. J. Mills, town clerk.

SWINSON.—August 16th.—Erection of cells, A.C., and alterations to police office, for the county of Lancaster.—Mr. H. Litterer, architect, County Offices, Preston.

SOYLAO.—August 16th.—Supply of steel materials.—Mr. John Woodworth, surveyor.

HALIFAX.—August 16th.—Laying of about 800 yards super. of softing at King's Cross, for the rural district council.—Mr. F. Gardon, Clifton, Brighouse.

CROLEY.—August 16th.—Supply of cast-iron mains.—Mr. J. Mills, town clerk.

BRAKENHEAD.—August 17th.—Severing, kerbing and levelling Osborne-road.—Mr. Charles Brownridge, borough surveyor.

SHIPLEY.—August 17th.—Construction of sewerage works, for the urban district council.—Mr. M. Paterson, 35 Manor-road, Bradford.

LESTON.—August 18th.—Construction of a new filter-bed at the Little Hallam works.—Mr. H. J. Kilford, borough surveyor.

BARNSTAPLE.—August 18th.—Construction of concrete impounding sewer, for the urban district council.—Mr. Frank W. Chanter, engineer.

BIRKENHEAD.—August 19th.—Sinking a bore-hole in connection with ground pumping station.—Mr. W. A. Richardson, water engineer.

MANCHESTER.—August 19th.—Construction of seven public urinals.—The City Surveyor.

COSSLET.—August 20th.—Kerbing, channelling, cementing and macadamising works.—Mr. William N. Shell, surveyor to the urban district council.

TOWNLEIGH.—August 20th.—Supply of 1,000 tons of best quality 2 in. broken quartzite, Guernsey granite, &c.—Mr. A. H. Neve, junr, clerk to the urban district council.

RIGBY.—August 20th.—Works of street making and sewer construction, for the rural district council.—Mr. T. W. Willard, surveyor.

SOUTHBOURNE.—August 20th.—Street works, for the urban district council.—Mr. Philip Hannon, clerk.

HAMPTON.—August 20th.—Supply and delivery of a 10-ton steam roller, for the urban district council.—Mr. John Kemp, A.M.I.C.E., surveyor to the council.

OXFORD.—August 22nd.—Supply and laying of cast-iron and stone-ware pipe carriers, brick and concrete work in manholes and distributing chambers, hand drains, culverting, road making and other works on land adjoining the corporation sewage farm.—Mr. R. Bacon, town clerk.

TEDDINGTON.—August 22nd.—Making-up of Churence-road, for the urban district council.—Mr. M. Hainsworth, surveyor to the council.

STEVENAGE.—August 22nd.—Supply of 500 tons of 1 1/2 in. broken Guernsey, Leicester or other granite, for the urban district council.—Mr. William Owen Thoms, clerk to the council.

LITTLERLAND.—August 22nd.—Flagging works, for the urban district council.—Mr. W. B. Garton, surveyor.

GLASGOW.—August 22nd.—Supply of rails and fish-plates.—Mr. John Young, tramways manager.

WILMSLOW.—August 22nd.—Construction of about 1,300 yards of 15-in. 12-in. earthenware pipe sewers, &c., for the urban district council.—Mr. John Bowden, 14 Ridgfold, Manchester.

MILTON.—August 23rd.—Supply of road materials, for the urban district council.—Mr. A. B. Acworth, surveyor.

WALFRAMSTOW.—August 23rd.—Erection of public baths, for the urban district council.—Mr. E. J. Gowan, clerk to the council.

TORQUAY.—August 23rd.—Repair of the masonry apron and fore-shed at the Hutton breakwater.—Mr. Henry A. Garrett, A.M.I.C.E., harbour engineer.

TYNEMOUTH.—August 23rd.—Tying works.—Mr. John F. Smith, borough surveyor.

GOOLE.—August 23rd.—Paving with hard wood about 1,750 square yards of roadway, for the urban district council.—Mr. Geo. England, clerk.

BECKLOW.—August 23rd.—Works of levelling, paving, metalling, channelling and making good a street at Hale, for the rural district council.—Mr. J. McKenzie, surveyor.

CARSHALTON.—August 23rd.—Supply of 200 tons of broken 1-in. Quaker or Guernsey granite and 420 yards of hand-picked flint, for the urban district council.—Mr. W. W. Gale, A.M.I.C.E., surveyor to the council.

IPDON.—August 23rd.—Construction of an underground ltrine in The Broadway, for the urban district council.—Mr. Herbert Shaw, A.M.I.C.E., surveyor to the council.

ROTHESBAM.—August 23rd.—Construction of sewers, outfall works, and other works connected therewith, for the corporation.—Mr. R. E. W. Berrington, Bank Buildings, Wolverhampton.

CARSHALTON.—August 23rd.—Widening of High-street, for the urban district council.—Mr. W. W. Gale, A.M.I.C.E., surveyor to the council.

WORKING.—August 24th.—Supply of sludge-pressing machinery, steam engines and other apparatus, for the urban district council.—Mr. R. Mossop, clerk.

HALIFAX.—August 24th.—Excavation and formation of tramway track.—Mr. Edward R. S. Escott, borough engineer.

TORQUAY.—August 24th.—Fencing, paving and other works.—Mr. V. W. Lathwaie, surveyor to the urban district council.

HALIFAX.—August 24th.—Supply of steel rails, points, crossings, fish-plates, &c., for about 5 miles of tramway.—Mr. Edward R. S. Escott, borough engineer.

NELSON.—August 24th.—Supply of cast-iron pipes, special castings, valves, &c., for the Water Committee.—Mr. J. Hartley, waterworks manager.

SHOEBURGH.—August 24th.—Construction of about 333 lined feet of 15-in. pipe sewer in Biffham-street (City-road) for the vestry.—Mr. J. Rush Dixon, A.M.I.C.E., engineer and surveyor to the vestry.

CARSHALTON.—August 24th.—Laying of socket-jointed sewer pipe from Moorville to Knowledges Gates, for the rural district council.

HALIFAX.—August 24th.—Supply of best Portland cement for tramway works.—Mr. Edward R. S. Escott, borough engineer.

HULL.—August 26th.—Supply and erection of electric lighting plant.—Mr. A. S. Barnard, city electrical engineer.

HARVEY.—August 26th.—Supply and delivery of Portland cement required for works of wood paving.—Mr. James Lovegrove, chief surveyor.

TERRIDGE WELLS.—August 25th. Supply of edge kerling.—Mr. W. C. Clippis, town clerk.

SUNDELAND.—August 25th.—Erection of technical college at Green-terrace.—Mr. I. M. Lowry, town clerk.

TRAFALGAR.—August 25th.—Erection and construction of iron and steel buildings in connection with the destructor.—Mr. Charles Costeker, town clerk.

HAWORTH.—August 26th.—Construction of a 15-in. sewer at a fair and liquor tank, for the urban district council.—Mr. W. R. Roberts, town clerk.

MOLLEY.—August 26th.—Construction of brick culvert, together with manholes, storm-water overflow and other works.—Mr. W. E. Putman, borough engineer and surveyor.

WILMSLOW.—August 26th.—Severing, kerbing, metalling and channelling.—Mr. William Gilbert, town clerk.

MILNAY.—August 26th.—Manufacturing, delivery and erection of a steel roller bridge, to carry cast-iron pipes.—Mr. W. E. Putman, borough engineer and surveyor.

NELSON.—August 27th.—Supply of 40 lined yards of wrought-iron unclimbable fencing.—Mr. B. Ball, borough engineer.

ULKATON MOORS.—August 28th.—Providing and laying 3,000 sq. feet of asphalt at the Market place, for the urban district council.—Mr. R. Robertson, surveyor.

WINDSOR.—August 29th.—Supply of pipe work, for the urban district council.—Mr. A. H. Preece, 30 Victoria-street, S.W.

SHEFFIELD.—August 29th.—Construction and erection of additional building in connection with the destructor at Attercliffe.—Mr. Charles P. Wike, city surveyor.

BURTON-ON-TRENT.—August 31st.—Supply, construction and erection of foundations, arches, fire-brick work and furnace brickwork for retorts.—Mr. F. L. Ransden, manager and engineer.

NOAICH.—September 3rd.—Making-up of roads.—Mr. Arthur E. Collins, city engineer.

NOAICH.—September 3rd.—Making-up of Mansfield-street, Cavalry-street, Anchor-street, Watchdog-street and Tracey-road.—Mr. Arthur E. Collins, A.M.I.C.E., city engineer.

DEELEY.—September 5th.—Construction of a covered service reservoir at Littleover.—Mr. H. F. Galsbury, town clerk.

ROCHDALE.—September 6th.—Electric lighting plant.—Mr. James Leach, town clerk.

ALDERSTON.—September 6th.—Supply of 2,000 tons of granite (more or less), for the urban district council.—Mr. W. E. Foster, clerk.

ALDERSTON.—September 6th.—Supply and delivery of a Morrison's scarifier, for the urban district council.—Mr. W. E. Foster, clerk.

ALDERSTON.—September 7th.—Metalling Albert-street, West End, for the urban district council.—Mr. W. E. Foster, clerk.

BIRMINGHAM.—September 13th.—Construction of aqueduct.—Mr. E. O. Smith, town clerk.

MALDEN AND COOMBE.—Supply of road materials, for the urban district council.—Mr. Thomas V. H. Davison.

SWANAGE.—Main sewerage and works connected therewith.—Messrs. Newman & Coeks, 5 Thomas-street, Hyde.

TENDERS.

CARMARTHEN.—For the supply of 530 yards of 6-in. cast-iron pipes, six 2 1/2-in. fire hydrants and iron flanged and socketed junction pipes.—Mr. F. J. Finglah, borough surveyor.—

The Isca Foundry Company, Newport	4255
J. Mackenzie, Glasgow	4241
The Old Foundry Company, Carmarthen	219
J. Blakeborough & Sons, Bingham, Yorks	216
J. Davies, Carmarthen	208
T. Spittle, Limited, Newport	197
The Stanton Ironworks Company, Nottingham	147

ILFORD.—For the construction of a section of sewer to be laid in Hordale- and Natal-road, for the urban district council.—Mr. Herbert Shaw, A.M.I.C.E., surveyor to the council.—

W. Gibbs & Co., Hordale; G. Henry, Barking; D. T. Jackson, Barking; J. Jackson, Forest Gate; G. Bell, Tottenham; Wilson, Borden & Co., Canning Town; and J. Adams & Co.

LEICESTER.—For the extension of the borough lunatic asylum.—Mr. G. T. Hine, F.R.I.B.A., architect, Parliament-street, London.—

J. E. Johnson & Son, Leicester	471,894
J. C. Kallet & Son, Leicester	43,050
Parnell & Sons, Rugby	43,055
T. Herbert, Leicester	62,800
Moss & Son, Loughborough	58,716
Herbert & Sons, Leicester (withdrawn)	57,092

LEWES.—For the supply of 600 tons of 2 1/2-in. broken blue Guernsey, Cherbourg or Belgian granite, 400 tons of coarse granite screenings, 650 tons of broken surface-picked flints and 150 tons of Piddingham gravel.—Mr. Montague S. Baker, town clerk.—

H. L. Cooper, Mark-lane, E.C.—Monmouth granite, 11s. per ton; Monmouth screenings, 10s. 3d. per ton; Cherbourg granite, 11s. 6d. per ton; Cherbourg screenings, 11s. 3d. per ton; Penlee granite, 11s. 6d. per ton; Penlee screenings, 8s. 6d. per ton.

A. & T. Munnelle, London.—Guernsey granite, 12s. 7d. per ton; Guernsey screenings, 9s. 10d. per ton.

L. Sommerfeld, Great Tower-street, E.C.—Guernsey granite, 12s. 9d. per ton; Guernsey screenings, 9s. 9d. per ton.

W. Griffiths, London, E.C.—Guernsey granite, 12s. 10d. per ton; Guernsey screenings, 10s. 4d. per ton.

R. L. & J. Pennings, Wellington Chambers, S.E.—Blue Guernsey granite, 13s. 6d. per ton; Blue Guernsey screenings, 10s. 9d. per ton.

Fry Brothers, Greenwich.—Blue Guernsey granite, 12s. 9d. per ton; Blue Guernsey screenings, 10s. 4d. per ton.

J. Mowlen & Co., Westminster, S.W.—Guernsey granite, 11s. 11d. per ton; Guernsey screenings, 8s. 11d. per ton.*

E. Smith, Edenbridge.—Flint, 9s. per ton.

W. Hudson, Brighton.—Flint, 6s. 9d. per ton.

T. F. Smith, Lewes.—Flint, 7s. 6d. per ton.

R. Brown, Lewes.—Flint, 7s. 6d. per ton.* Delivered on streets as required.

SOUTH SHIELDS.—For building boundary walling, with palisading and entrance gates, at the North Marine Park.—Mr. S. E. Burgess, A.M.I.C.E., borough engineer.—

S. Sheriff, South Shields	4014
Thornthwaite & Co., South Shields	861
R. B. Farbridge, South Shields	478
J. Porter, South Shields	450

SOUTH SHIELDS.—For painting work at the North and South Marine Parks.—Mr. S. E. Burgess, A.M.I.C.E., borough engineer.—

W. Laidler, South Shields	418
---------------------------	-----

SOUTH SHIELDS.—For painting work at the West Park.—Mr. S. E. Burgess, A.M.I.C.E., borough engineer.—

C. Thornthwaite, South Shields	400
T. Dalton, junr., South Shields	400
W. Laidler, South Shields	400

SOUTH SHIELDS.—For the laying of 185 lined yards of double-line steel girder tramway, electrical bonding and paving thereto.—Mr. S. E. Burgess, A.M.L.C.E., borough engineer:—
 Laing, Wharton & Down, London £2,377
 Thornton & Co., Newcastle 1,313
 G. E. Simpson, Newcastle 1,001
 A. Branton & Son, Edinburgh* 650

SOUTH SHIELDS.—For repaving works at the Market-place.—Mr. S. E. Burgess, A.M.L.C.E., borough engineer:—
 Aberdeen, Norway.
 M. D. Young, Hexham £1,066 41,056
 G. E. Simpson, Newcastle 784 784
 Thornton & Co., South Shields* 732 716

SOUTH SHIELDS.—For wood paving works in St. Hilda's School-road.—Mr. S. E. Burgess, A.M.L.C.E., borough engineer:—
 M. D. Young, Hexham £160
 G. E. Simpson, Newcastle 115
 Thornton & Co., South Shields* 36

ST. GEORGE-IN-THE-EAST.—For the supply of 300 tons of 3-in. by 7-in. Aberdeen granite pitchings, and 30 tons of 5-in. by 7-in. Guernsey granite pitchings, for the vestry.—Mr. H. Thompson, clerk to the vestry:—

	Guernsey.	Aberdeen.

APPOINTMENTS OPEN.

CITY OF HULL.

The Corporation require a Civil Engineering Assistant in the City Engineer's office, at £85 per annum.

It is essential that candidates should be quick and neat draughtsmen.

Applications, stating age, experience and qualifications, are to be delivered to the undersigned on or before Tuesday, the 23rd August.

Testimonials need not be sent in the first instance.

(By order)

A. E. WHITE,
City Engineer.

Town Hall, Hull.
July 30, 1898.

BUCKLEY URBAN DISTRICT, FLINTSHIRE.

The Council of the above district are desirous of engaging an Engineer, to consult on the question of sewage and sewage disposal for the whole district, and to make a report to the Council thereon (excluding plans, details, &c.), for a fixed fee.

Applications should be sent at once to the undersigned.

G. H. SIMON,
Clerk to the Council.

August 9, 1898.

BOROUGH OF BURTON-UPON-TRENT.

Wanted, in the Borough Engineer's Office, for about twelve months, an Assistant accustomed to Main Sewerage Work. Salary at the rate of £130 per annum.

Applications, stating age, experience and how soon disengaged, accompanied by copies of three recent testimonials, must be lodged with me not later than Saturday, the 27th inst.

GEORGE G. LYNAM,
Borough Engineer and Surveyor.

Town Hall, Burton-on-Trent.
August 10, 1898.

LITTLE WOOLTON URBAN DISTRICT COUNCIL.

INSPECTOR OF NUISANCES AND SURVEYOR.

Applications are invited for the appointment of Inspector of Nuisances and Surveyor for the urban district of Little Woolton, which comprises an area of 1,387 acres, with a population at the last census of 1,131.

The appointment is an annual one, and will be subject to confirmation by the Local Government Board.

The person appointed must be between the ages of twenty-five and forty-five years, and will be required to reside in the district and to devote the whole of his time to the duties of the office.

As inspector he will be required to make thorough periodical inspections of the district, and to perform all duties prescribed by the Public Health and Sanitary Acts and by the Local Government Board; also to prepare all notices, and keep all necessary and usual books and accounts relating to the office.

As surveyor he must be well acquainted with the making of streets, roads and footpaths, the taking of levels and surveys, the management of a sewage farm, the construction and management of sewers and drains, the value of labour and materials (including measuring such materials), and the preparation of plans, specifications and estimates, including the keeping of all books and accounts prescribed by the Local Government Board, and he must generally carry out the instructions of the Council from time to time given.

Preference will be given to candidates holding the certificate of the Sanitary Institute.

The person appointed will be required to commence his duties on the 1st day of November next, and to find an approved guarantee, in the sum of £100, for the faithful discharge of his duties.

The salary will be £110 per annum, and will be apportioned as follows—viz., £50 per annum as Inspector and the residue as surveyor.

Sealed applications, in candidate's own handwriting, endorsed "Inspector," stating age, present and previous occupations, and accompanied by copies of not more than three recent testimonials, to be addressed to the undersigned at the undermentioned address, so as to be received not later than Tuesday, the 6th day of September instant.

Canvassing members of the Council, either directly or indirectly, will disqualify a candidate.

PERCY DOBELL,
Clerk to the Council.

5 Castle-street, Liverpool.
August 8, 1898.

CONTRACTORS FOR DRAINAGE AND WATER SUPPLY WORKS.

DISTRICT OF SOUTH HORNSEY. SURVEYOR AND INSPECTOR OF NUISANCES.

The District Council invite applications for the appointment of a Surveyor and Inspector of Nuisances. The district comprises an area of 230 acres, a population of 17,200 and about 2,430 houses, and is fully developed.

The duties will be those ordinarily required from a surveyor and inspector of nuisances to an urban sanitary authority.

All applicants must satisfy the Council that they are acquainted with the duties of those offices, and must hold the certificate of the Sanitary Institute.

The salary will be as Surveyor £175, per annum, with residence, and as Inspector of Nuisances, £75 per annum, making together £250 a year.

Applications, endorsed "Surveyorship," stating age and qualifications, with particulars of previous experience, and enclosing copies of not more than three recent testimonials, must be received here not later than 5 o'clock p.m. on the 17th of August next.

Personal canvassing will be deemed a disqualification.

EDWARD B. BENNETT,
Clerk to the District Council.

Offices, Milton-road, South Hornsey, London, N.
July 28, 1898.

EDMONTON URBAN DISTRICT COUNCIL. SECOND ENGINEERING ASSISTANT.

The Edmonton Urban District Council invite applications for the appointment of Second Engineering Assistant in the engineer's office.

The person appointed must have had previous experience in levelling and making surveys and other duties connected with a municipal engineer's office.

The salary will commence at £50 per annum, paid monthly. Applications, accompanied by not more than three testimonials, to be sent to G. Eedes Eachus, Esq., Town Hall, Edmonton, on or before Monday, August 22nd.

Canvassing will disqualify.

(By order)
WM. FRANCIS PAYNE, ^{Secy.}
Clerk.

Town Hall, Lower Edmonton.
August 10, 1898.

COUNTY BOROUGH OF WOLVERHAMPTON.

Wanted, at once, Private Street Works Assistant, experienced in sewerage and street construction, apportionments, &c. Salary, £2 per week, rising to £2 5s. at the expiration of six months' approved service.—Applications only, in the first instance, to the undersigned.

J. W. BRADLEY, C.E.,

Borough Engineer and Surveyor.

Town Hall, Wolverhampton.

August 4, 1898.

AYLESBURY URBAN DISTRICT COUNCIL. QUANTITY SURVEYOR.

Applications are invited for the position of Quantity Surveyor, for a few weeks, to assist in taking-off quantities for a sewage disposal scheme.

Candidates must be quick and accurate, and have had experience in similar work.

Applications, in candidate's own handwriting, stating age, experience, qualifications, salary required, and when at liberty, accompanied by not more than three copies of recent testimonials, must be received not later than 10 o'clock a.m. on Friday, August 19th inst., and endorsed "Quantity Surveyor."

J. H. BRADFORD,

Surveyor to the Council.

Surveyor's Offices, Aylesbury.

August 9, 1898.

COMPETITION.

BOROUGH OF REIGATE.

TO ARCHITECTS.

The Council of the Borough of Reigate invite Competitive Designs for the Erection of Municipal Buildings, Fire Station, Police Offices, &c.

Three premiums are offered, and the conditions of competition, together with a lithographed plan of the site, can be obtained on application to the Borough Surveyor.

All drawings to be addressed to the undersigned, and delivered at my office, 84 Station-road, Redhill, not later than Thursday, the 6th October next.

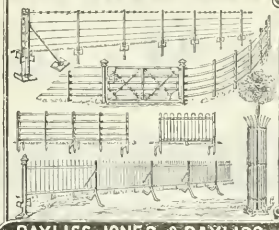

Given under my hand this 8th day of August, 1898.

(By order)

CLAIRE J. GRECE,
Town Clerk.

SWANAGE SEWERAGE.

Persons desirous of tendering for the Main Sewerage of Swanage, including the construction of about 221 yards of

27-in. iron outfall sewer, 976 yards of 27-in. and 30-in. rock concrete, and 3,932 yards of 9-in., 12-in. and 15-in. stoneware pipe sewers, with the requisite valve chambers, manholes, lampholes, ventilation shafts, ducting pipes, and works connected therewith, are requested to communicate with the Engineers, Messrs Francis Newman & Co., 5 St. Leonards-street, Ryde, who will supply information at a convenient time for tendering, &c.

Ryde.
August 10, 1898.

ALDERSHOT URBAN DISTRICT COUNCIL.
SCARIFIER.

The above Council are prepared to receive tenders for the supply and delivery at Aldershot of a Scarifier of the type known as Morrison's. The Scarifier must be capable of being attached to and worked by a 19-ton steam roller. A separate price is required for the work of fixing &c. to the steam rollers. The contractor must give a full description of the machine with his tenders. Full particulars may be obtained of the Surveyor.

Tenders, to be endorsed "Scarifier," are to be delivered at my office not later than the 6th day of September.

The Council do not bind themselves to accept the lowest or any tender.

The contractor must state when he will undertake the delivery. This is important.

(By order of the Council)
W. E. FOSTER
Clerk.

Aldershot.
August 5, 1898.

ALDERSHOT URBAN DISTRICT COUNCIL.

Tenders are hereby invited by the above named Council for a supply of 2,000 Tons of Granite (more or less) of approved quality, at per ton, in such quantities as the Council may direct.

Samples of the material to be used for, broken to pass through 1½-in. and 2-in. rings, must be forwarded to the Council's Surveyor, at the Council's Offices, Aldershot.

Tenders must state separate prices for the material's broken to the sizes named.

Further particulars may be obtained on application to the Council Surveyor, at the offices aforesaid.

Tenders, endorsed "Tenders for Granite," to be sent to me

August 5, 1898.

BIRMINGHAM CORPORATION WATER.

ELAN SUPPLY.—CONTRACT No. 12.—AQUEDUCT.

TO CONTRACTORS.

The Corporation of Birmingham are prepared to receive tenders from competent persons willing to enter into a contract for the construction of about 17½ miles of the Aqueduct from Cleobury Mortimer, in the county of Salop, to Hagley, in the county of Worcester. The contract consists principally of providing and laying two lines of cast-iron pipes and laying only two lines of steel pipes, 4½ in. in diameter.

The drawings may be seen, and specification and bills of quantities obtained, at the office of the Engineer, Mr. James Mansergh, 5 Victoria-street, Westminster, on and after the 15th inst., on the deposit of cheque or bank note for £20, which will be returned on receipt of a *bona-fide* tender with the bills of quantities fully priced out.

Early application for particulars is necessary, as only a limited number will be given out, and none after the 3rd day of September next.

The contractor will be required to undertake not to pay less than the minimum standard rate of wages current in the district in which the works are situate.

Sealed tenders, addressed to me, and endorsed "Tender for Aqueduct, Contract No. 12" are to be delivered at my office (post paid) at or before noon of Tuesday, the 13th day of September next.

The Corporation do not bind themselves to accept the lowest or any tender.

(Signed)

EDWARD ORFORD SMITH,
Town Clerk.

Town Clerk's Office,
Council House, Birmingham.
August, 1898.

BOROUGH OF DERBY.

DERBY CORPORATION WATERWORKS.

CONSTRUCTION OF COVERED SERVICE RESERVOIR.

The Corporation of Derby are prepared to receive tenders for the construction of a Covered Service Reservoir at Littleover, near Derby.

Drawings may be inspected, and copies of the specification and forms of tender may be obtained, on payment of £2 2s., to be returned if a *bona-fide* tender be made, on application at the office of the Borough Surveyor, Babington-lane, Derby, and at the office of Messrs. T. & C. Hawksley, civil engineers, 30 Great George-street, Westminster, S.W., on and after Monday, the 25th instant.

Tenders, on the prescribed form, must be delivered with the specification (enclosed in a sealed envelope, endorsed "Derby Corporation Waterworks—Contract No. 2—Tender for Covered Service Reservoir," and addressed to the undersigned), at the Town Hall, Derby, on or before 12 noon on Monday, the 5th day of September next.

The lowest or any tender will not necessarily be accepted.

H. F. GADSBY,
Town Clerk.

Combined Drainage.

It is a trite observation that the law relating to the subject of combined drainage is in anything but a satisfactory state. Nevertheless, at the risk of wearisome iteration, we venture (*à propos* of a recent contribution to the numerous cases which, like satellites, are grouped round the statutory definitions of a "drain" and a "sewer") to call attention to some of the anomalies which characterise this subject. To begin with, there is the illogical lack of uniformity in the several definitions applicable to the metropolitan area and to the rest of the kingdom. Under the Public Health Act, 1875, the term "drain" is applicable to a drain used for the drainage of one building only or premises within the same curtilage, and made for communicating with a cesspool, sewer, &c.; while the term "sewer" includes all sewers and drains except "drains" as previously defined, and except drains under the control of a road authority not being a local authority under the Act. Under the Metropolis Management Act, 1855, however, the definition of a "drain" is more extensive, including (in addition to drains as above defined) a drain for draining any group or block of houses by a combined operation under the order of any vestry or district board. Then there is the enigmatical sec. 19 of the Public Health Acts Amendment Act, 1890, extending the meaning of the term "drain" "for the purposes of this section" to a drain used for the drainage of two or more houses belonging to different owners. The purposes of the section are proceedings under sec. 41 of the 1875 Act, which can only be set on foot on the application of a person stating that a drain is a nuisance or injurious to health. And it has been held that, apart from any nuisance, the general liability of the authority to keep a combined drain in repair is not affected by this enactment. Thus it may be said that combined drains to which this section is applicable are "drains" for some purposes and "sewers" for others, which only makes the confusion more confounded. Among the many questions which have from time to time arisen in connection with these various definitions is one which was raised with reference to the drainage of some property at West Cowes—*viz.*, whether, where a sewer is intersected by a cesspool, the latter forms part of the sewer. The question arose under the following circumstances: A number of houses were built having drains leading into a line of 6-in. pipes, intersected by a pit or cesspool, whence the pipes passed under the land of a neighbouring owner. The latter cut off the pipes, with the result that the sewage flowed back and caused a nuisance. The local authority required the owner of the houses to abate the nuisance by cleansing the cesspool. He, however, contended that the cesspool was part of the line of pipes which admittedly constituted a "sewer," and that it was therefore vested in and repairable by the authority; and he brought an action for an injunction to restrain the authority

from causing the nuisance. It was held, however, that the cesspool formed no part of the sewer, and that therefore the action could not be maintained (*Meador v. West Cowes Local Board* [1892], 3 ch., 218). In that case be it noted it was the local authority who contended—and successfully—for the exclusion of the cesspool from the limits of the definition of a "sewer," although apparently it formed an integral part of the drainage system. In the more recent case previously alluded to, however, in which the facts were somewhat more complicated, we find the authority unsuccessfully contending for a contrary view. In this instance thirty-five houses at Tottenham were drained into a series of small cesspools, from which a conduit of stoneware pipes conducted the overflow into a larger cesspool 500 ft. distant. One of the by-laws of the district provided that a person constructing a cesspool should not construct it so that it should have, by drain or otherwise, any outlet into or means of communication with any sewer. The authority (very naturally, it must be admitted) considered that the line of pipes formed a "sewer," and that the owner of the houses had committed a breach of the by-law by connecting the small cesspools with it. It was held, however, that no breach of the by-law had been committed (*Bulton v. Tottenham Urban District Council*, noted at p. 571 of vol. xiii. of THE SURVEYOR). It will be seen at once that this decision goes far beyond that in the *West Cowes* case. The latter merely decided that a cesspool is no part of a sewer. The Tottenham case may be said in effect to decide that a drain which would otherwise, according to the definition, be a sewer is not a sewer when cesspools are interposed between it and the houses, the drainage of which it receives. This is a somewhat startling specimen of judicial "interpretation" of legislative enactments, amounting in fact to a very substantial addition to the definition of a drain and a corresponding curtailment of the definition of a sewer. The fact is that the legal distinction between a drain and a sewer is based upon a false principle. The test to be applied should be not whether the conduit receives the drainage of one or more than one house, but whether it is in fact an entirely private construction or a portion of the public system. Is there any reason in the nature of things why, if two houses are drained by one drain, it should be repaired at the expense of the ratepayers, whilst if drained by separate drains the owner should be liable for their repair? Again, why in the metropolis if a builder struggles in a combined drain without an order of the vestry, should it be a "sewer," whilst if constructed by order it is a "drain"? Much litigation, it may be observed, has arisen from this last provision in consequence of the difficulty that frequently occurs in the case of old drainage systems in showing whether or not any such order was obtained. The difficulties to which this false principle have given rise in practice have been to a certain extent recognised by the

legislature in sec. 19 of the 1890 Act, already referred to. But this enactment applies only in those districts in which Part iii. of the Act has been adopted—it has, as we have seen, been the subject of judicial decisions, tending to deprive it of any practical value, and, when all is said and done, it has no application to the numerous cases in which groups of houses belong to the same owner. It is surely time that these discredited definitions were repealed and fresh ones substituted based on sounder principles and practical experience.

* * *

**Fences
Adjoining
Highways.**

The owner of land adjoining a highway is not in general bound to fence it from the highway. But if he does erect a fence, is he bound to keep it in good repair? He must, no doubt, maintain it in such a condition that it will not be a nuisance to persons using the highway. But this answer is, after all, an inconclusive one, since the question remains, What amounts to a nuisance? Is it a nuisance if the fence (though perfectly stable while untouched) is so slight or so rotten that if a passenger, pausing to rest or to admire the view, leans against or sits upon it it gives away? In short, must the fence be substantial and sound enough, not only not to fall of its own accord but to serve for a seat or a support? Suppose, for instance, a child looks upon it as a suitable structure for the practice of gymnastics, and in the course of his evolutions it breaks down and the youthful gymnast is injured, is the landowner liable in damages? We imagine that there is not a landowner in the kingdom who would not until recently have received such a suggestion with a scornful smile. But the decision of the Court of Appeal in the recent case of *Harrold v. Watney* (noted in this issue) is one more instance of the surprises that the law has in store for the man who presumes to judge a legal question by his own intuitive notions of what is right and fitting. In that case a small boy of the tender age of four climbed a fence adjoining the highway, in order to look at some children playing on the other side. The fence broke, and the boy fell and was injured. Well, of course, the child had no business on the fence, which was not constructed to be climbed but to separate the defendant's land from the street. Moreover, not only was the climbing a purely voluntary act on his part (and *volenti non fit injuria*) but it was an act of trespass. All these considerations were urged on behalf of the landowner, but they were urged in vain, and he was mulcted in damages to the tune of £45. The Court held, in substance, that the fact of the fence breaking down was evidence of its being in such a condition as to be a nuisance. Lord Justice Vaughan Williams put it that the probability of such an accident ought to have been present to the mind of the defendant as the result of leaving the fence in a dangerous condition; that he ought, in fact, to have taken into account the well-known proclivities of children, who are just as much entitled to use a highway as their more staid and less agile elders. But Lord Justice Smith goes a step further than this, and lays it down that if a person passing along a highway feels tired and leans against a fence and it comes down he has a right of action.

In short, it is hardly going too far to say that, if this decision is to stand, a landowner must in future deliberately consider every possible use to which his fence may be put, whether by adults or by children passing along the highway, and must take care that it is so constructed as not to involve the risk of injury to persons so using it. How far this doctrine would be followed in every possible case that can be imagined may, indeed, be considered doubtful. Take, for instance, the case of a short-sighted man sitting down on the top of a wall on which broken glass has been fixed. Has he a right of action? Again, take the case of a fence which will sustain the weight of a single individual—or even, say, half

a dozen at a time—but which succumbs to the pressure of a crowd. Is the landowner liable then? This decision, it seems to us, goes a great deal further than any previous case in the direction of the liability of the landowner, and is hardly reconcilable with some earlier decisions. For example, in *Gibson v. Plumstead Burial Board* (noted in THE SURVEYOR, vol. xi., p. 425) the landowner had erected a spiked iron fence adjoining the highway, and the plaintiff's horse stumbled and fell on the spikes and was injured. Judgment having been entered for the defendant (the landowner), the Court of Appeal refused an application for a new trial. The plaintiff contended that the mere fact of the accident was evidence of a nuisance, but this contention was brushed aside by the Court as untenable, the Master of the Rolls giving it as his opinion that "no man of sense could say that this fence was a nuisance." It is difficult to see what evidence of nuisance there was in *Harrold v. Watney*, beyond the mere fact of the accident; and, in fact, the Court appear in that case to have adopted the very argument pronounced to be "untenable" in *Gibson v. Plumstead Burial Board*. We understand that the decision has caused quite a flutter in the dovecootes of the landowners, and we do not wonder at it.

* * *

**More
Rural
Sanitation.**

In the end of last year Dr. Reece was instructed by the Local Government Board to inquire into the sanitary circumstances of Aldbrough, in the jurisdiction of the Skirlaugh (Yorks) Rural District Council. The inspector's investigations left no room for doubt that the cases of enteric fever which had occurred were due to the water supply, which is derived from shallow wells, varying from 10 ft. to 20 ft. in depth and dry-steined. These wells are often placed near to the dwelling-houses, in proximity to privies and ash-pits. The inspector also notes that the order in which the houses were successively attacked followed the direction in which the underground water might be expected to travel from the first house invaded. The general sanitary needs of the village may be gauged from the inspector's recommendations. These may be briefly summarised. (1) Each house should be provided with an adequate water supply, and, pending that, the existing wells should be safeguarded from pollution, wells irremediably polluted being permanently closed. (2) The village should without delay be provided with efficient means of sewerage. (3) Attention should be given to the defective construction of the privies and ash-pits in the district. These should be so constructed and managed as to prevent the admission of rain or ground water and the leakage of filth into the surrounding soil. Dryness of contents, together with their frequent removal, are objects which should be kept in view in the alteration of all privies and the construction of new ones. (4) The district council are recommended to undertake without delay the duty of removing privy contents and house refuse at frequent and regular intervals, either by their own staff or by contractors, under sec. 42 of the Public Health Act, 1875. (5) Thorough and systematic inspection for the discovery of nuisances is also essential. And (6) the adoption and enforcement of a new series of by-laws, based upon the model series issued by the Local Government Board. Finally (7), the council are recommended seriously to consider the desirability of providing sufficient and proper hospital accommodation for infectious diseases occurring in the district. Similar authorities should observe that it is not necessary that the accommodation provided in the first instance should be on a large and costly scale, but that it is essential that it should be ready beforehand, in order that the first person attacked may be promptly isolated with a view to prevent the further spread of the disease.

An Appointment at Street.

In our issue of the 5th inst. we had to draw attention to a singular appointment made by the Erith Urban District Council. Before many days have elapsed we find ourselves confronted with a similar piece of jobbery on the part of the Street (Somerset) Urban District Council. The office of surveyor and inspector became vacant through the resignation of Mr. Collingwood, in regard to which event the chairman expressed the feeling of regret which the council felt at losing Mr. Collingwood's services, and thanked that gentleman for the efficient and courteous manner in which he had carried out his duties. For the vacancy there were twenty-four applicants, which were reduced to three, among whom was a local man, who was also an ex-councillor and a tradesman. These enlightened administrators of Street evidently felt themselves in something of a quandary in the matter, for they wrote to the Local Government Board and to a weekly paper to find out whether it was necessary that a member of the council, applying for the offices of surveyor and inspector, should first retire and pay the statutory fine. The paper in question considered that it was not necessary to retire, but the Local Government Board merely acknowledged the letter. This would seem to indicate disgust, and, if so, it is not surprising. The astute councillor who aspired to be an official solved the problem by resigning and paying the fine of £1 fixed by the council. This showed a pleasing confidence in the ultimate success of his candidature. The confidence was not misplaced, for he was elected by a large majority. The salary for the combined office is not a large one, but a district council would find it cheaper in the long run to pay more and get a properly trained and qualified official. This a tradesman cannot be. We observe that one of the councillors who voted for the local man bears the same Christian name. Are they relatives?

Leicester and Loughborough: A Question of Water Supply.

Many of our readers will read with keen attention the account we print in another column of certain negotiations—unfortunately so far abortive—which have recently taken place between the municipal authorities of Leicester and Loughborough in connection with water supply. Obviously the question is one of the utmost importance for the towns and districts involved, and next year it may produce one of the biggest Parliamentary fights of the session. The negotiations appear to resolve themselves into two stages, and in each stage the issues seem clearly enough defined. At first the question was whether Loughborough should retain possession of certain sources of supply and provide Leicester with a certain quantity of water on terms to be agreed upon, or whether the sources of supply should be surrendered to Leicester, the latter town then to supply the former with the quantity of water required on terms to be arranged. Loughborough, not unaturally, preferred the former course, and this brings us to what we may call the second stage of the negotiations—namely, the rate at which Loughborough should supply to Leicester the water required by that town. Leicester wanted it at 2½d. per 1,000 gallons, but the Loughborough sub-committee were not authorised to agree to less than 3d. The lower rate, however, was ultimately agreed to, but when the fact was communicated to the Leicester representatives a somewhat evasive answer was returned to the effect that they thought the first proposal was final and that they were negotiating for a supply from another source. It is not easy to resist the conclusion that the present position of the Leicester Corporation in the matter is somewhat capricious and illogical, but for the full facts our readers may be referred to the report in

another column and to the able statement of Councillor Cartwright.

Two Important Letters.

In our correspondence columns will be found two letters, important in themselves and dealing with important subjects. Last week a correspondent drew attention to certain difficulties in connection with fungoid growth in subsoil drains, and invited suggestions from other surveyors with some details of their experience. The letter of Mr. H. H. Humphreys, which appears this week, will be read with very great interest, for, as he remarks, the subject is of considerable importance to those who are concerned with sewage purification works. We join with Mr. Humphreys in hoping that others will contribute to the correspondence he has started, and thus give their brother officials the benefit of their experience and suggestions. Needless to say, our columns are at the service of those who may wish to make an effort to come to some definite conclusions on a subject which is none too clearly understood in some of its bearings. The second letter to which we have referred is that from Mr. Edward A. Harman, Corporation Gasworks, Huddersfield, on the subject of the flash point of petroleum as affecting gas authorities. The interest of the question for gas authorities is stated by Mr. Harman under two heads—(1) the number of gasworks enriching gas with petroleum, in some form or other, under regulations regarding petroleum an important consideration for gas authorities; and (2) the increase of carburetted water-gas plants has created a demand for petroleum which formerly did not exist. Mr. Harman also makes the noteworthy remark that the extension of the "penny-in-the-slot meters" for small consumers is perhaps the best competitor against petroleum lamps. We have no doubt that both letters will receive from our readers the attention they deserve.

* * *

The Cork Meeting: Next District Meeting.

We this week conclude our report of the interesting two day's meeting at Cork a fortnight ago. As will be seen, only the round of visits on Friday and Saturday remained to be dealt with, and our report will easily demonstrate what excellent material for such a meeting was afforded in Cork, Queenstown and the neighbourhood. The particulars of the Cork and Muskerry Light Railway will be read with interest. We are told that the future will find narrow-gauge railways running along country roads in England for the conveyance of both passengers and agricultural produce, but the prospect seems far from realisation. At Cork the locomotive on the roadside does not produce any unpleasant impression. We also give some interesting information respecting the Queenstown waterworks, together with a special supplement sheet of illustrations, and we have endeavoured to indicate the importance and advantages of the Cork and Queenstown harbour and the increasingly important part it will play in the future, especially in connection with Transatlantic mails and passengers. From the programme we give in another column it will be observed that a midland counties district meeting has been arranged at Bilston, where the chief features of interest will be the waterworks, the technical school and Spring Vale furnaces.

Association of Municipal and County Engineers.

IRISH DISTRICT MEETING AT CORK.—II.

QUEENSTOWN HARBOUR.

In our last issue we reported fully the greater part of the first day's proceedings of this highly-interesting two days' meeting. It will be remembered that we completed our report of all the papers and discussions, giving a number of illustrations. The remainder of the proceedings, both on Friday and Saturday, consisted of visits to various works and places of interest, and a few notes on these will be not unacceptable.

FIRST DAY'S PROCEEDINGS

(Friday, August 5th).

When the sitting in the Council Chamber concluded with the discussion of Mr. Derman's paper, the members adjourned to the Victoria Hotel at 2 o'clock, where they were entertained to an excellent luncheon, on the invitation of the mayor. Among others present, in addition to those who were present at the earlier sitting, were: Aldermen W. T. Hungerford, G. S. Crowley and P. J. Madden; Councillors E. Hall, R. M. Keatinge, A. O'Driscoll, W. H. Bible, Mr. A. McCarthy (town clerk), Mr. D. F. Giltinan (mayor's secretary) and Mr. R. K. Mills (manager Clyde Shipping Company). After luncheon, which was excellently served,

The MAYOR proposed the toast of the "Incorporated Association of Municipal and County Engineers," coupling with it the name of its distinguished president, Mr. Robson. The aim of the Association, which had on its roll nearly 1,000 members, scattered throughout the kingdom and the colonies, was to raise the tone of the great profession with which it was connected, and at the present time, when they saw such progress and improvement in sanitary science and engineering generally, it was peculiarly gratifying to welcome the Association to Cork.

The PRESIDENT, in responding, thanked his worship for the kind way in which he had proposed the health of the Association, and the gentlemen present for the reception they had given the toast. It had been a pleasure to all of them to visit this old city of Cork, and meet many of its genial and kind-hearted representatives, some of whom, perhaps, they had had the pleasure of meeting before. During their twenty-five years' existence he thought they had been most hospitably entertained by most of the towns of the kingdom, and he felt sure, from the programme that had been prepared for the present occasion, this visit to Cork would be one of the most happy reminiscences of their existence. The primary reason for the holding of these meetings was the diffusion of professional knowledge and the gaining of additional experience by intercommunication of ideas, the reading of papers and discussions such as they had that day, and by conversation at the tea table and elsewhere. During the past thirty years the duties of municipal engineers had enormously increased, and not alone did the health of the community depend upon municipal engineers, but also, what was of equal importance to many, the judicious expenditure of public money. The 900 members of their Association represented something like 16,000,000 people. They were very grateful to all who aided them in organising that meeting, and they thanked them very heartily for receiving them so hospitably in the city of Cork. Before returning his seat he proposed in felicitous terms the health of the Mayor and Municipality of Cork. He congratulated

the corporation upon Mr. Cutler's appointment by examination. In the old days these appointments were a question of interest and local influence, and merit often came second. Well, the city of Cork had taken a noteworthy initiative, and appointed the most capable man they could get to the position. In this way Cork virtue would have its own reward, and he hoped its example would be followed by many other towns.

The MAYOR, in reply, said he was very much obliged to the president of the Association for the way he had referred to him (the mayor) and his colleagues. He could do very little himself were it not for the almost priceless services of the officials. He joined with them in paying a tribute to their present city engineer, under whose able administration he was sure the city would prosper.

After luncheon the visitors drove, in those conveyances peculiar to Ireland, to the Cork Electric Tramway and Lighting Company's central station in Albert-street and other works in course of construction in the city. The secretary and resident engineer to the company is Mr. C. H. Merz. It will be remembered that the station and the tramways were described and illustrated in our last issue in connection with the paper of Mr. Beverley Griffin, who has been in special charge of the tramways. Needless to say, the works were examined by the visitors with the keenest interest. The inspection being over, they re-entered the cars in order to proceed to the terminus of the Cork and Muskerry Light Railway, where a special train was in waiting to convey them to St. Anne's. In addition to the mayor, the town clerk and some members of the council, the visitors were accompanied by the genial and courteous resident engineer, Mr. W. H. Hill, junr., and the traffic manager, Mr. Wilson. For part of this journey the party had an opportunity of gazing upon many points of interest, and of seeing a locomotive railway, albeit a narrow-gauge one, running along the side of a country road. Before following the wanderings of the visitors further we may give some particulars of this highly-interesting undertaking. For the information and other assistance we have to express our cordial thanks to Mr. Hill.

THE CORK AND MUSKERRY LIGHT RAILWAY COMPANY.

The Cork and Muskerry Light Railway was completed in 1888, and an extension to Donoughmore was subsequently constructed, the total length of the system being 27 miles. The railway is of the 3-ft. gauge, and for the first 4 miles from Cork the track has been formed at the south side of the Carrigrohane-road, where there is a considerable amount of vehicular traffic. The rails in the portion within the municipal boundary are flush with the surface of the road, and the space between them, as well as a margin 18 in. wide at each side, is paved with stone setts, so that the entire width of the road is available for ordinary traffic. The greater part of the tramway in the county has been formed on a tram track, raised about 8 in. over the level of the road. This is a good arrangement where the public road is sufficiently wide to admit of its adoption.

The permanent way consists of steel rails, 30-ft. lengths, weighing 50 lb. to the yard, and laid on transverse timber cross-sleepers, 6 ft. by 8 in. by 4 in., eleven sleepers being

set under each rail. In the straight portions of the line three sleepers are sole-plated for every rail, and every second sleeper is thus treated in some of the curved portions. The rail is secured with two manshroom-headed fang-bolts at each plated sleeper and with dog spikes elsewhere. Wrought-iron tie-rods have been used to keep the line to gauge on the curves, but sole-plates and fang-bolts make a more permanent job, and are now being used instead of tie-rods. The joints are made with heavy angle fish-plates, 18 in. long, secured to the rails with four bolts and nuts. The ruling gradient is 1 in 58 and the quickest curve about 5 chains. As regards station buildings, these are for the most part constructed of galvanised iron, supported upon timber framing,

VIEW ON THE CORK AND MUSKERRY LIGHT RAILWAY.
Transfer of Milk Cans to the Train for Cork.

and lined internally with timber sheeting, but the dwelling-houses have in all cases been formed of masonry with slate roofs. The station yard at the Cork terminus is reclaimed slob land, and some difficulty has been experienced with the foundations for some of the buildings, as the gravel stratum is at a great depth beneath the surface, and piling would be costly.

The station master's house is the only masonry structure in the Cork yard. It was built about two years ago under the supervision of Mr. W. H. Hill, junr., C.E., resident engineer. The footways have practically been constructed upon the surface of the ground, which has only been excavated sufficiently to give a horizontal leaning surface. They are formed of cement concrete, and are very wide at the base and bound together with old railway irons, which are well bonded at the corners.

On arriving at St. Anne's the visitors were met by the chairman of the Cork and Muskerry Light Railway Company, Mr. Richard Barter, J.P., who conducted them to his beautifully-situated residence, where they were entertained to tea and in every way hospitably received. Mr. Barter is a many-sided man, who interests himself in many things, and cultivates not a few elegant and cultured tastes. His guests could have spent much more time than was practicable in examining his valuable collection of historical antiquities,

RESIDENCE OF MR. R. BARTER, J.P.,
Chairman of the Cork and Muskerry Light Railway Co.

not the least interesting of which were those relating to Napoleon I., especially during his exile at St. Helena, where he was attended by Surgeon O'Meara, and where his relations with the governor, Sir Hudson Lowe, were so unfortunate. Mr. Barter is known far and wide in Ireland as a remarkably successful breeder of cattle and sheep, and ample evidence of this is forthcoming in the trophies and certificates innumerable with which some of the rooms in the house are adorned. He conducted his guests over the grounds of his model farm, when they had an opportunity of seeing the splendid herds for the breeding of which Mr. Barter is

so renowned. A man of Mr. Barter's calibre must be of value through the example he sets his neighbours. If the example does not bear fruit it ought to. In this case it is certainly not Mr. Barter's fault. An opportunity was also afforded of inspecting the well-known and beautifully appointed hydropathic establishment, which is the property of Mr. Barter, the baths attracting special attention. We may mention that this establishment was founded by Dr. Barter in 1843 and was the first in the United Kingdom. Mr. Barter is especially to be commended for the manner in which he utilises the water-power on his estate.

The party then re-entered the train and proceeded to Blarney in order to inspect the famous castle, grounds and the celebrated Blarney stone. This classic spot is known to every tourist, so we need not descant upon it further. It will be remembered that it was the subject of the celebrated lines—

Statues gracing this noble place in—
All heathen gods and nymphs so fair;
Bold Neptune, Cæsar and Nebuchadnezzar,
All standing naked in the open air.

When finished with Blarney Castle and its stone, the party returned to Cork, and at half past eight sat down to an excellent and well-served dinner in the Imperial Hotel, the

BLARNEY CASTLE.

proceedings being kept up with great heartiness until a late hour. Toasts were conspicuous by their absence, but not so songs and recitations.

SECOND DAY'S PROCEEDINGS

(Saturday, August 6th).

The second day's proceedings consisted solely of visits, and highly interesting and enjoyable they were, the chief points being Queenstown waterworks, the harbour, and the Cork, Blackrock and Passage Railway Extension to Crosshaven. Assembling at the Municipal Buildings, the members dove in brakes to Tibbstown, the site of the head works, being accompanied by the engineers for the scheme, Messrs. Kirkby & Doran, and by the resident engineer. We may here give a brief account of these works, which are illustrated in our special supplement.

QUEENSTOWN WATERWORKS.

In a special supplement sheet we give some diagrams illustrating the system of waterworks now in course of construction for Cork Town Commissioners. The catchment area from which the storage reservoir will be supplied is some 500 acres in extent, and is chiefly moorland and pasturage, very little being under cultivation at any time, so that there is no danger of the water being polluted from any source. There are very few inhabited houses in the district, and these are sufficiently remote not to affect the water within the catchment area. A sparkling stream of pure water rushes down the valley, and during rainy weather it swells up to a very respectable volume, owing to the quick declivity of the land, which scarcely retains 10 per cent. of the water that falls upon it. There are a great many springs within the valley coming through the Old Red Sandstone rock, which underlies the whole area.

The storage reservoir is being constructed to contain some 37,000,000 gallons of water, and with the filtration and clear water tanks occupies a space of 16 acres. This quantity of water represents 180 days' supply for the population of Queenstown and of Haulbowline and Spike Islands, for which

provision will also be made. The island of Haulbowline contains a very commodious floating basin and a splendid dry dock, in which H.M.S. *Hoive* and H.M.S. *Black Prince* were lately docked, and is now being provided with the necessary workshops and machinery for the building and repairing of vessels. The works on this island have been carried out by the Admiralty for the purpose of providing accommodation for her Majesty's vessels when they visit the harbour for shelter, stores or repairs. The Admiralty are negotiating

MR. S. A. KIRKBY, M.A.,
County Surveyor of Cork (South).

with the Town Commissioners for a copious supply of water to the islands for troops and dockyard, and the commissioners have made ample provision in their new system of water supply to meet the requirements.

The storage reservoir is some 7½ miles to the north of Queenstown and at an elevation of 110 ft. above the service reservoir at Carrignafoty, near Queenstown, into which it is delivered through a cast-iron main pipe of 9 in. in diameter. From the service reservoir the supply for Haulbowline will be conveyed in a special main, extending for a distance of 2 miles to the foreshore, where it is proposed to carry it upon the harbour bottom, for a distance of 550 yards, to the quay at Haulbowline, and thence to a large tank already constructed on the highest point of the island. As will be seen by the section showing the extensions to Haulbowline and Spike the depth at which this main will be laid will in some parts exceed 12 fathoms. The engineers propose using cast-iron pipes, with ball and socket joints of special design, for the submerged portion of this work, or flexible steel pipes. The reservoir at Tibbstown will be formed by a concrete masonry dam of some 400 ft. in length, extending across the valley, below which will be constructed the filtration and clear-water tanks as shown in our supplement. The water face of the dam will have an elevation of 37 ft. and a foundation of 16 ft., making a total height of 53 ft. The width of the dam at the bottom will be 37-1 ft. and at the top 8 ft. The elevation of the front will form an arcade of nineteen arches, which will

MR. C. G. DORAN,
Joint Engineer with Mr. Kirkby for the Queenstown Waterworks.

have rather a handsome effect when viewed from the road which leads up the valley. The trench for the foundation of the dam is excavated into the Old Red Sandstone for a depth of 9 ft. It was necessary to sink to this depth to secure an impervious rock to build the dam upon, as the portion through which the excavation was made, though sufficiently strong for the purpose of a foundation, was of a rather open description that would not resist percolation.

The cost of the whole of the works when carried out will not exceed £20,000. The amount of the contract at present

being proceeded with is £14,000. Mr. Michael Connors, Youghal, is the contractor.

The engineers for the works are Messrs. S. A. Kirkby, M.A., CANTAB, and C. G. Doran, Queenstown, and the resident engineer is Mr. H. V. Potter. Mr. Kirkby is a graduate of Cambridge and a Whitworth scholar, was assistant to Sir John Fowler, Bart., and obtained a county surveyorship in Ireland in open competition. He has constructed many large works, such as the Youghal bridge—the largest in Ireland—the Kinsale western bridge, both over wide tidal rivers, the sea wall at Youghal, the Kanturk railway, the Youghal and Middleton waterworks and other undertakings.

During the drive the beauty and variety of the scenery along the route afforded much pleasure to the visitors. The way lies partly along the river Lee for about 6 miles, and then quitting that pleasant stream winds gently upwards among some tree-clad hills for some 5 miles further, until it reaches the valley dividing the townlands of Tibbstown and Cloneen, where the storage reservoir, filtration and clear-water tanks are being constructed. Among other things which called forth the favourable comments of the visitors were the excellent selection of a site for the reservoir, the general planning of the scheme, the low cost, and the fine quality of the sand to be used for the filter-beds.

Leaving Tibbstown the visitors drove through a most attractive stretch of country to Queenstown, and at the Queen's Hotel were met by Mr. J. Long, chairman of the town commissioners; Mr. J. H. Campbell, J.P., town clerk, and Mr. A. McCarthy, town clerk, Cork, representing the mayor of that town. At the Queen's Hotel an excellent luncheon was provided by the local members of the Association, Mr. Kirkby occupying the chair and Mr. Dorman the vice-chair. When justice had been done to it Mr. Ronson, in proposing the health of Messrs. Kirkby, Cutler and Dorman, referred

MR. H. V. POTTER,
Resident Engineer, Queenstown Waterworks.

to the right royal welcome they had received both at Cork and at Queenstown. He dwelt upon the proverbial hospitality of the Irish people, and paid a warm tribute to the part taken in organising the meeting by Messrs. Cutler and Dorman, and thanked Mr. Kirkby for what he had shown them that morning in connection with the Tibbstown waterworks. The toasts were duly acknowledged, and then followed "Prosperity to Queenstown," coupled with the names of Mr. Long, chairman of the Town Commissioners, and Mr. J. H. Campbell town clerk.

After visits to some spots of interest in the immediate neighborhood, the visitors went on board the tender, *America*, at the deep-water quay to make a cruise round the harbour. Some details of this remarkable harbour may here be given.

QUEENSTOWN HARBOUR.

Queenstown harbour, which is practically Cork harbour, is an example of the successful treatment of a port by dredging alone without training walls. At present the principal engineering work is dredging, and the new plant in use for this work is a good example of modern practice in this direction. The harbour is one of the most capacious and secure in the British Islands, containing a vast water area, and affording safe anchorage and shelter for the largest class of vessels at all times. Nearer to New York by 350 miles than Southampton, it is easy of access and especially advantageous as a rendezvous for the fleet and for vessels of commerce. At Queenstown there are quays, landing piers, boat harbours and a deep-water quay immediately outside the terminus of the Great Southern and Western Railway, giving 24 ft. at low-water spring tides, with much deeper water a short distance from the quay. Here are found the largest Government transports for the embarkation and disembarkation of troops, and here also take place the landing and embarkation of the American mails and passengers. The large and commodious customs examining-room forms a part of the station buildings. Powerful tenders, luxuriously appointed and lighted by electricity, convey passengers to and from the

Transatlantic steamers, which call there regularly on their outward and homeward voyages.

There is a large Government dockyard in the harbour, capable of accommodating some of the largest vessels in her Majesty's navy, and further expenditure is being incurred. There is extensive dry dock accommodation and facilities for ship-building and ship-repairing on the river at Passage West and Rushbrook, and at Gridiron Works at Carrigaloe. A very large amount of money has been expended in deepening and improving the river channel from Horsehead to Cork, a distance of about 5½ miles, and in providing deep-water quays accommodation at Cork for vessels of a large draft of water. We have already referred to the dredging operations and the powerful plant provided. There is a depth of 14 ft. at low-water spring tides in the channel from Horsehead to Cork, with a rise at ordinary spring tides of 12½ ft. and 10 ft. at neap tides, affording a depth of nearly 27 ft. at ordinary high-water spring tides and 24 ft. at high-water neap tides. The work at present in progress will give an additional depth of 2 ft. for a width of 350 ft.

The quayage and wharfrage at Cork is considerable. At the Victoria Wharf there is 19 ft. 6 in. at low-water spring tides, and vessels with a draught of 23 ft. can lie afloat at all times of the tide at the South Deep Water Quay. At the north side of the river there is a deep water quay affording 19 ft. 6 in. of water at all states of the tide, and vessels lying thereat can discharge cargo by hydraulic machinery into the trucks of the Great Southern and Western Railway Company, thus enabling it to be transported rapidly direct from the vessel into the interior of the country. Owing to the increased facilities and accommodation afforded to shipping the trade of the port has for some years shown a substantial increase. Landing piers for passenger steamers have been erected and maintained by the commissioners at several places within their jurisdiction. Powerful cranes and other machinery, with a lifting power varying from 5 tons to 20 tons, have been provided within the port.

The most important matter in connection with the work of the Harbour Commissioners is the dredging of the river, and a comparison between the present state of the channel and what it was in former days is of interest. In 1824 there was practically no water in the channel at low tide, for in that year a contract was entered into to dredge it to the depth of 2 ft. at low water. In 1867 what was known as "the 11-ft. cut" was commenced, and that was completed in 1872. In 1874 the late engineer, Mr. Philip Barry, recommended the board to give a minimum depth of 14 ft. at low water spring tides, from Horsehead up to Cork quays, and at the same time to widen the channel to 300 ft., the width at the time being 180 ft. to 200 ft. The recommendation was adopted, and for the purpose a new dredger and two hopper barges were procured at a cost of £37,460. The work was begun in 1877, and, with the exception of some widening, was completed in 1883, when the plant purchased for the work was sold for £20,000.

In 1894 it was further decided, also on the recommendation of Mr. Barry, that in consequence of the increased size of the vessels coming up the river and using the deep water quays at Cork, the time had arrived for a further improvement in the depth and the width of the channel—in short, that it should not in any part be less than 350 ft. wide, and that there should be a uniform depth of 16 ft. at low-water spring tides. The commissioners obtained for the work a new and powerful dredger, at a cost of £16,500, and two 1,200-ton hopper barges, at a cost of £21,000 for the two, both dredger and hoppers being supplied by Messrs. Fleming & Ferguson, of Paisley. We understand that the machinery has proved in every way satisfactory, the dredger easily lifting 350 tons per hour, even under unfavourable conditions. In favourable ground it has sometimes lifted as much as 600 tons in an hour, and the hoppers have on several occasions taken as much as 1,300 to 1,400 tons of mud to sea in one trip. Mr. Jas. Price, M.E., the harbour engineer, in his report for the year ended July 31, 1897, also endorses the wisdom of purchasing the new dredging plant. It is expected that the work of dredging the fall depth and width now decided on the entire 5½ miles of channel between Passage and Cork will take about three to four years. The advantage will be a much wider channel, with a uniform depth of 29 ft. at high-water spring tides, which will enable the latest modern cargo steamers likely to be chartered for this port to come up to the deep-water quays at Cork, where they will be able to lie afloat even in low water.

To the particulars given above we may add that the Cork Harbour Commissioners are the port authority under a local statute passed in the reign of George IV. and under subsequent enactments. The city is about 16 miles distant by water from the seaward limits of the port—Roche's Point lighthouse at the entrance to the harbour. From that point to the entrance to Cork harbour both harbour and river are thoroughly well lighted by a series of landing lights. The value of the harbour is enhanced by the efficiency of the service between Queenstown and London via Holyhead for the conveyance of mails and passengers.

The tender made a brief stop at Haulbowline to admit of an inspection of the docks on the island, the basin constructed mainly by convict labour receiving special attention and ad-

miration, as did also the spacious outer dock. All the works and structures were inspected with evident interest and curiosity. Leaving Haulbowline, the tender steamed round the harbour and up the East Ferry river. Returning to the harbour the boat was steered towards Crosshaven. At that popular resort the party disembarked in order to visit, under the guidance of the engineer, Mr. Perry, the extension of the Cork, Blackrock and Passage Railway to Crosshaven. Cork was reached again in the evening, after a most enjoyable and instructive day. We cannot conclude without again expressing our sense of the credit due to those who had organised the meeting, and to the mayor and others who gave it such hearty support and the members so cordial a welcome.

TRADE EFFLUENTS AT RAVENSTHORPE.

At a recent meeting of the Ravensthorpe Urban District Council a deputation representing the manufacturers of the town waited upon the council to see what could be done in assisting them to deal with their trade effluents. Mr. Kaye said the manufacturers proposed to put down settling tanks and getting rid of the solids, and they asked whether the council could take the liquid sewage. It was pointed out that the interests of the manufacturers and those of the general community were identical, and that being so it was pleaded that the council ought to give them what assistance they could in the matter. Mr. Balme suggested that a better scheme would be to deliver the solids and everything on the council's sewage farm, and let the council deal with it; but it was mentioned that a preferable plan would be for each manufacturer to treat his own sewage and pass the effluent on to the council to treat. The chairman remarked that the council intended putting down a few settling tanks, and that the job would be a costly one; but it was replied that these were for the treatment of domestic sewage only. The difficulties of the question were discussed, and it was incidentally mentioned that the manufacturers in the Celce valley had declined to move in the matter, whereupon it was suggested that in that event it would be useless for the manufacturers of the Calder valley to do anything. The deputation were satisfied that the council's disposition was to favourably consider the question, and it was understood that expert advice would be taken as to the ways and means. The deputation then withdrew.

DERBY'S WATER SUPPLY.

An important report was recently presented to the Derby Town Council by the Waterworks Committee. It stated that, referring to previous orders authorising the expenditure of £33,700 on waterworks purposes, the committee had modified their proposals and at the same time extended them. Instead of providing permanent engines, for which £17,500 was previously voted, it had been decided that temporary engines should be provided, at a cost of £2,000, with connections, to cost a further £1,500. It was also decided that the construction of the filter tunnels, estimated to cost £31,900, should be proceeded with forthwith. The council were therefore recommended to grant £31,900 for this purpose, and to approve the proposals mentioned above, at a cost of £17,500. The committee had given their careful attention to the question of further water supply, and had come to the conclusion that the promotion of a Bill for the supply of Derby from the upper waters of the river Derwent could be no longer deferred. They had information that several other towns had decided to promote Bills with the object of securing the upper waters of the Derwent. They were strongly of opinion that any such action should be strenuously opposed, and such opinion was shared by the County Council of Derbyshire, with whom the committee had been in consultation on the subject, and where support in opposition to the schemes of other towns could be reckoned upon. The report and its recommendations, together with a resolution empowering the committee to promote a Bill in Parliament to enable the corporation to obtain an additional water supply from the upper waters of the Derwent, were eventually adopted.

Greenock.—At a recent private meeting of the Police Board a Sub-Committee on Electricity reported as to the best method of carrying out a scheme for the proposed installation of electric lighting. A deputation, it was stated, had visited Glasgow, Edinburgh and Leith, inspected the electric light stations and obtained information as to the procedure adopted, and the general system of electric lighting in the various places. At Edinburgh it was reported that the original capital expended was about £143,000, and that it had been arranged to proceed with the erection of a new electric lighting station in another part of the city, at a cost of about £200,000. The gasworks had not suffered from the competition; the Gas Trust had had a much larger surplus during the past year than in any previous year, and they were about to expend £500,000 in erecting an extension. At Leith they were proceeding with a station, to cost about £28,000, and at Glasgow the corporation, in view of the great demand for lighting and power, had resolved to erect new installations at Port Dundas and Old Pollokshaws-road.

Leicester Water Supply.

LOUGHBOROUGH AND THE BLACKBROOK.

At the monthly meeting of the Loughborough Town Council last week a special report was presented by the Water Committee on the negotiations with the Leicester Corporation with reference to the Blackbrook water supply. The report was as follows:—

"In November last your committee discussed the desirability of communicating with the Leicester Corporation with reference to the informal proposal which had been made that the question of a supplementary supply to Leicester from the Blackbrook watershed should be taken into consideration before settling the plans for the construction of the proposed new storage reservoir. A sub-committee was appointed to meet representatives of the Leicester Corporation to discuss the question, and, after being advised by their engineers (Messrs. G. & F. W. Hodson), met a sub-committee representing the Corporation of Leicester on the 3rd of February. The representatives of your committee were advised that if the whole of the works sanctioned by Parliament were carried out, including a reservoir having a capacity of 506,000,000 gallons, the Loughborough Corporation would for many years be able to spare at least one-half of the total available supply (2,000,000 gallons per day) from the Blackbrook watershed, and they offered to sell to the Leicester Water Committee, for a period of fifty years, the whole of such surplus water, the water to be delivered unfiltered through a meter, or meters, at Nantantan, from whence it could be gravitated on to the filters belonging to the Leicester Corporation at Switthland, and the price they asked was 4d. per 1,000 gallons. Alderman Wood, on behalf of his committee, made counter proposals:—

"(a) For the acquisition by Leicester of the Blackbrook rights, Loughborough to utilise its other sources of supply, and Leicester guaranteeing, after such utilisation, to supply at cost price all further requirements of Loughborough, if any; and

"(b) That Leicester should take over all the sources of water supply at present acquired by or available to Loughborough, Leicester to supply the Loughborough water area with filtered water to the full extent of its requirements at 4d. per 1,000 gallons.

Your committee did not feel justified in accepting either of these proposals, and "A further conference was held at Loughborough on the 4th of April, at which Alderman Wood raised a preliminary discussion as to the terms on which any offer of a price should be based, and it was mutually agreed that the supply should be on the basis of a guaranteed minimum supply by Loughborough of 1,000,000 gallons per day, with a minimum guaranteed take by Leicester of 1,250,000 gallons per day, if available, the supply to commence in 1905. Alderman Wood stated that, considering the cost to Leicester of the works which would be necessary to enable them to avail themselves of the supply to be afforded under the proposed arrangement, the maximum price per 1,000 gallons which his committee authorised him to offer was 2½d. per 1,000 gallons. This offer was not at the time accepted, and after considerable discussion further negotiations were deferred. Negotiations were resumed on the 5th of May by the chairman and vice-chairman of each Water Committee. No agreement as to price was then arrived at, but it was arranged that a formal communication from Loughborough should be sent to Leicester. On the 13th of May the chairman of your committee wrote to Alderman Wood, stating that the sub-committee would recommend the acceptance of 3d. per 1,000 gallons on the terms arranged—namely, Loughborough Corporation agree to supply Leicester Corporation, commencing in 1905, or somewhat earlier if preferred, either at Blackbrook or Nantantan, a guaranteed minimum quantity of 1,000,000 gallons per day, or 90,000,000 gallons per quarter, of unfiltered water (which, reckoning 16½ gallons per head per day, is equal to a supply for a population of 60,000 persons), such minimum to be guaranteed for a period of twenty years, and thereafter the whole of the surplus water for fifty years if desired, Leicester guaranteeing to take 1,250,000 gallons per day if and so long as that surplus quantity is available, and to have the right to terminate the agreement by notice as soon as such surplus water is less than 500,000 gallons per day. This offer was considered at a special meeting of the Leicester Water Committee on the 6th of June, and a reply was received to the effect that the committee had reluctantly come to the conclusion that they were unable to accept the offer.

"The sub-committee did not feel justified in accepting any less price before consulting the Water Committee, and on the 14th of June reported to the Water Committee the result of their negotiations up to that date. After a long discussion it was resolved, subject to the necessary confirmation of the council, that the sub-committee be authorised to accept 2½d. per 1,000 gallons for water on the terms and conditions set out in the letter addressed by the chairman (Councillor Cartwright) to Alderman Wood, dated the 13th of May. Councillor Cartwright at once communicated with Alderman Wood, intimating that his committee had resolved to recommend the acceptance of the offer which had been made on behalf of

the Leicester Water Committee to purchase at 2½d. per 1,000 gallons on the terms and conditions mentioned in his (Councillor Cartwright's) letter of the 13th of May, and asking for a letter confirming these terms, and suggesting whether, previous to reporting to their respective councils, it would not be better for their respective town clerks to settle a provisional agreement. On the 16th of June Alderman Wood acknowledged the receipt of this letter, and promised to report it to the Water Committee at their next meeting, to be held on the following Monday, the 21st of June, when it should have their careful consideration. In his letter Alderman Wood stated that his Water Committee at their last meeting, when they had the offer of 3d. per 1,000 gallons under consideration, deemed that a final offer, and had since entered into negotiations for another source of water, and were entirely free to treat elsewhere if they found it to their advantage to do so, the provisional offer of his sub-committee having been declined, but at the same time his committee would give the revised offer the consideration it deserved. On the 27th of July, no definite reply having been received, your committee communicated with the town clerk of Leicester, asking for the decision of the committee on the matter, to which Mr. Bell replied that his committee had entered into negotiations for another source of water supply, and had therefore not come to any resolution on the amended offer that the Loughborough Committee were good enough to submit, but of course they could not ask them (the Loughborough Water Committee) to remain bound by their offer. At the same time his committee instructed him to express their very high appreciation of the kindness and consideration that the Loughborough Water Committee had shown throughout the matter."

Councillor JAS. CARTWRIGHT, the chairman of the Water Committee, in moving the adoption of the report, said that it was not necessary to enter into more detail than was there given as to the efforts of the committee to arrive at an arrangement with the Corporation of Leicester for the sale of their surplus water. The committee had recognised the fact that it would be advantageous to Loughborough, by relieving the burgesses of some part of the initial burden of the expenditure on the proposed new reservoir, if arrangements could be made with Leicester which were equally advantageous to them. It would be observed by the report that the negotiations had not to the present terminated in such an arrangement being made, and they would have gathered from other sources that the Corporation of Leicester were proposing to take steps to obtain a supply from another watershed. At one time the negotiations certainly pointed to a mutually satisfactory arrangement being arrived at. Without taking the council through the details of the negotiations, they would have noticed that

THE ONLY DIFFERENCE

between the two committees was on the question of the price of the water to be taken. They would be in a position to supply Leicester before the time at which they desired Loughborough to be ready to supplement the present sources of supply, and the quantity they were prepared to absolutely guarantee would be equal to supplying an additional population of 60,000, reckoning 16½ gallons per head per diem, which was the amount recognised as necessary by Leicester. The terms were so arranged that it would have been to the advantage of Loughborough to make the best possible use of their resources to enable them to supply the Corporation of Leicester with as much surplus water as the watershed would produce. This would not be less than 1,250,000 gallons, and probably considerably more. Therefore it was clear that Leicester would obtain full advantage from this watershed under arrangement with Loughborough, subject to Loughborough's needs, as if they were to obtain possession of the property and the rights for which Loughborough had had to fight and pay. That was a great point between the two corporations. Was Loughborough to part with the absolute

POSSESSION OF THE PROPERTY

and allow Leicester to supply them, or were they to retain possession and supply Leicester? Acting on the feeling of the council in the past, and, he believed, now, the committee considered that they ought not to part with the possession of the property (Hear, hear). Their offer to Leicester, in short, was to sell them the whole surplus water for fifty years. On the question of price the committee had not looked at these negotiations otherwise than with the desire to arrive at arrangements that would be equitable to both sides. They had an article to sell which Leicester wanted to buy. Water, like many other articles, had a market value, and if they considered that value they found that, particularly in the Midlands, it was constantly increasing, and the committee felt justified in endeavouring to get from Leicester its full market value. As the cost of water went now, 2½d. per 1,000 gallons, which was the price at which it had been offered to Leicester, not only in the opinion of the water committee but of their professional advisers, was a very reasonable price. If they carried out the proposed works at

Blackbrook—and they would do so at an exceptionally low cost, cheaper than any other town could—and if they utilised every drop of water Blackbrook supplied, it would cost them within a decimal of 2d. per 1,000 gallons. Perhaps he would be expected to say a word about

ALDERMAN WOOD'S STATEMENT,

which appeared in *The Leicester Daily Post* on Friday last. At first that statement as to the price on which Loughborough were willing to sell appeared to be accurate, but he observed that Alderman Wood failed to add that he, on behalf of Leicester, was the first to name this price of 2½d. per 1,000. At that time the Loughborough sub-committee, who were acting with professional advice throughout, to whom the offer was made, were of opinion that without further instructions they could not take less than 3d. The Water Committee then authorised them to accept the offer of 2½d., and this was done at once, but a reply was received to the effect that the provisional offer of the sub-committee having been declined, negotiations had been entered into for another supply. It was, therefore, rather singular to read Alderman Wood's statement of the reasons against purchasing from Loughborough. The facts were known to the Leicester sub-committee, and had not altered. He did not think it devolved upon him to say what might be said on the assumed increase of population or the capital expenditure. But he would point out that against the so-called charge on the Revenue Department of £75,000 paid for water there would be receipts for the sale by the Corporation of Leicester of the water, when filtered, at a price of from 6d. to 10d. per 1,000 gallons. That water the corporation would buy from Loughborough unfiltered at 2½d. per 1,000 gallons, and the cost of filtration, on the amount quoted by Leicester, was less than 1d. per 1,000. The Water Committee throughout these negotiations had endeavoured to meet the Leicester authority in every possible way consistent with the protection of the interests of the Loughborough inhabitants, and that had been duly acknowledged at meetings between representatives of the two boroughs. The town clerk of Leicester had also received the instructions of his committee to express their appreciation of the consideration shown by the Loughborough committee throughout. At the last meeting of the Water Committee it was decided that it was absolutely necessary and desirable that they should now commence to carry out the works at Blackbrook, and they had given instructions for the matter to be brought before the council. He would present a report probably at the next meeting, and would be able then to justify, both to the council and the public, the step the committee proposed to take.

Councillor CLIFFORD seconded the adoption of the report, and it was agreed to without further discussion.

LOUGHBOROUGH BATHS.

OPENING CEREMONY.

On the 10th inst. the Marquis of Granby, in the presence of a large and representative gathering, performed the opening ceremony in connection with the new baths which have been presented to the town of Loughborough. The buildings occupy a commanding position at the end of the Queen's Jubilee Park, and have a south-east aspect. The building is faced externally with local red-pressed bricks, with Ruabon terra-cotta dressings, the roofs being covered with grey slates. The principal entrance is about the centre of the front elevation, through a vestibule having panolled ceiling and divided from the inner hall by a lead light glazed screen. From this hall access is obtained to the large swimming bath, corridors leading to the private slipper baths, the office being conveniently arranged on the left of entrance. The private slipper baths, nine in number—four first-class to the left and five second-class to the right—are arranged to the front of the building, the roof of which is a lean-to, abutting on the swimming bath outer wall. These baths are divided by pitch pine partitions, each having a separate window and ventilating Tobin tube box, the material of the baths being cast-iron white-glazed enamel. They are fitted with hot and cold water valves. At the end of the first-class baths is the laundry and ironing rooms, whilst at the end of the second-class is an emergency exit and a staircase leading to the spectators' gallery of the large bath.

THE SWIMMING BATH.

This has a water area of 80 ft. by 30 ft., with depth varying from 6 ft. to 3½ ft. It is surrounded by a cement concrete path, having coloured concrete kerb, and there are thirty dressing boxes of pitch pine, running the entire length of one side and end. The size of the hall is 94 ft. by 42 ft. The walls are lined with glazed bricks to form a dado, and coloured with darsago above, having an open pitch pine roof, supported by light iron principals, surmounted by a lantern light. The bath is lined throughout with white-glazed bricks, having at intervals lines of blue-glazed bricks. Access to the bath is obtained at either end by step-ladders. A large diving stage has been erected at the deep end, and at the other end, over the dressing boxes, is the gallery capable of accommodating 150 persons. At the east end of the swimming bath are the soap and spray baths, having dressing-room and lavatories, all of which are lined with glazed bricks,

and with similar concrete flooring to the large bath. To the rear is the boiler-house, which has an octagonal chimney stack of 60 ft.

The woodwork throughout the building is of specially-selected pitch pine, varnished; the walls are furnished in darsago, and the whole lighted by gas brackets and star pendants. The laundry has been fitted with three large wash-tubs, each having hot and cold water supply, connected direct with steam from the boiler. There is a large revolving washing machine, with wringer attached, and also a hydro extractor. There are sliding drying-houses in the ironing-room, of which five are provided with necessary heating and ventilating apparatus. Steam for the heating is generated by a 20-horse-power Cornish boiler, passed through an instrument attached to the circulating main, capable of displacing 10,000 gallons of water per hour. The boiler is also capable of heating the whole of the water in the baths (upwards of 75,000 gallons) to a uniform temperature of 75 deg. in ten hours. This is the time required to fill the bath from the 4-in. town water supply, which enters at the shallow end. The copper spray pipe at the shallow end is capable of sending a flow of cold water one-third the length of the bath, and will be used for clearing off the scum from the surface of the water, which will flow through the overflow gratings arranged for the purpose at the opposite end. The water supply for slipper baths is obtained from a 400-gallon cold and 300-gallon hot galvanised iron tanks fixed in the laundry. The water of the latter is circulated and heated under similar arrangements as described for the large bath.

GLASGOW SEWAGE SCHEME.

The sub-committee of the Glasgow Corporation appointed to visit different cities and towns in England, and inspect the arrangements in use for the treatment of sewage and the disposal, have issued their report. Among other places visited were London, Manchester and Salford. As an outcome of their investigations the deputation are impelled to the conclusion that in the design of the new sewage works at Dalnair and Braehead it is imperative to continue the use of methods where experience has proved practicable on a large scale, and there seems no room for doubt that chemical precipitation alone is the means to adopt, and the most economical and satisfactory method of disposing of the sewage is to send it to sea. While implying no disparagement to the efficiency of the methods in use at Dalnarnock—which are the only possible means available under the circumstances—the deputation are satisfied that these methods cannot be advantageously applied at Dalnair or at Braehead, where the volumes of sewage to be ultimately treated are so much larger that it would be hopeless to look for a market for any form of pressed sludge, no matter how high might be its estimation among agriculturists. The initial volume of sewage to be treated at Dalnair is estimated at 27,000,000 gallons of dry-weather flow per day, which will ultimately be increased to about 48,000,000. Supposing the works at Dalnair and Braehead to be in operation, the combined daily product of sewage would not for some time exceed 1,200 tons a day, the ultimate quantity being about 2,300 tons. Two barges would for years suffice for the removal of the whole sludge, though eventually a third would require to be added, and the sub-committee have little doubt that the sludge can be disposed of in this manner more economically than by pressing. The sub-committee think that no time should now be lost in commencing the undertaking.

NEW LUNATIC ASYLUM.

The foundation-stone of an asylum for the county borough of West Ham, which has a population of about 250,000, was laid by Alderman Ivey, the mayor, at Chadwell Heath, Essex, on the 3rd inst. The buildings, which will cover more than 10 acres, and have some 90 acres of surrounding land, will accommodate 800 patients in addition to the staff. The administration block is placed centrally, the front portion being occupied on the ground floor by the chief medical officer's, steward's and clerk's offices, board-room, dispensary, library, &c. The museum and laboratories and assistant medical officer's rooms are on the first floor. At the back are the waiting-room, matron's apartments, recreation hall, rooms for male and female attendants, kitchen, bakery, general stores, laundry, boiler, engine-house and workshops, &c. The foundations have been put in by Messrs. Greig & Son, of Stratford, at a cost of about £16,000. Messrs. Leslie & Co., of Kensington, have the contract for the superstructure—£210,000. In addition to the main buildings there will be a medical officer's residence, together with steward's, chief attendants' and married attendants' houses, isolation block, mortuary, lodges and chapel to accommodate 550 adults. The total cost is estimated at about £300,000. The architect is Mr. Lewis Angell, F.R.I.B.A., the borough engineer.

Porth.—A letter was read from Lord Rosebery, at a recent meeting of the town council, stating that he will visit Perth on October 26th, to open the Sandeman public library.

Institution of Mechanical Engineers.

MEETING AT DERBY.

Although primarily intended to promote the practice of mechanical engineering, and to facilitate the interchange of ideas relating to improvements in various branches of mechanical science, the meetings of the Institution of Mechanical Engineers, and especially the summer meetings, are by no means limited to these objects.

The session which has recently been held at Derby included social functions, which, no doubt, proved highly satisfactory not only to representatives of various branches of the engineering profession present, but also to those more directly representing municipal institutions.

Papers were read and discussed bearing on the subjects of aluminium manufacture, water softening, purification and narrow-gauge railways. The two latter subjects, possessing a distinct interest to those concerned in local government, will be again mentioned in dealing with visits made in connection with the meeting.

By the courtesy of the Midland Railway Company a special saloon train was placed at the disposal of members, so that they were enabled conveniently and comfortably to pay a large number of visits to neighbouring places of professional interest. The object of the following notes is not so much to enter into a chronological detailed description of the various works, as to place before our readers such facts and comments as may be likely to prove of interest.

WATER SOFTENING AND PURIFYING.

At the pumping station of the new waterworks of the Joint Water Committee of the Swadlincote and Asby Urban District Councils there is an extremely compact installation of the Archbutt-Deeley softening and purifying plant. The apparatus is very simple, and consists of four cast-iron tanks, each of 30,000 gallons, above which a chemical treating-house contains the necessary mixing apparatus. The process is expeditious and in every way under the most perfect control. Several novel features are incorporated in the apparatus, such as the use of injectors for mixing lime water, for mixing the lime water with water to be treated, and for stirring up previous deposit to aid clarification. The water is further clarified and its natural qualities are restored by an ingenious process of recarbonation. Drawn from the Trent gravel, the water contains not only lime and other salts, but a considerable quantity of iron, which renders it unfit for general distribution before treatment. The iron is completely removed, and general hardness reduced from 22 deg. to 8.5 deg., at an inclusive cost of 0s. 6d. per 1,000 gallons. At present the output is 540,000 gallons daily, but this could be readily increased if desired. Water on leaving the softening tanks is delivered into another tank, from whence it is pumped into a service reservoir at Woodville, having a capacity of 1,000,000 gallons, from which it is decanted into distributing pipes. It is somewhat unfortunate that the pumping machinery in the adjoining engine-house should have been laid down on so small a scale, as, owing to the popular demand, especially by manufacturers, for softened water, the maximum duty has already been very nearly reached. The whole of the machinery was furnished by Messrs. Tangy, of Birmingham, and the softening plant by Messrs. Mather & Platt, of Salford.

WATER SUPPLY OF DERBY, LEICESTER, &c.

PROPOSALS FOR A JOINT SCHEME.

Considerable attention is now being devoted to the question of water supply, not only in Derby and Leicester but elsewhere in the district. At Derby an organised system of water supply has existed since the year 1691, and these works remained without material alteration until 1848, when the first instalment of the present works was commenced at Little Eaton. Further additions have been made from time to time, the chief source of supply being the river Derwent. It has recently been recommended by the Waterworks Committee that further sums be expended in the provision of temporary engines and connections, in the extension of filter tunnels and in the enlargement of the service reservoir at Littleover. Beyond these recommendations the committee have come to the conclusion that the promotion of a Bill for the supply of Derby from the upper Derwent can no longer be deferred.

It happens that several other towns, including Leicester, Nottingham and Sheffield, would also like to participate in such a scheme, a wish which does not appear to meet with approval from the Derby Corporation. The claims of Sheffield particularly are strongly represented, because the watersheds of the Peak do not run towards Sheffield in any way. It seems probable that municipal and other authorities in the counties of Derby, Leicester and Nottingham may ultimately join their forces in promoting a suggested scheme, at a cost of some £3,000,000, for the supply of about 14,000,000 gallons of water daily. The upper Derwent water is most abundant and of excellent quality, and has an average hardness of about 2 deg. Such a scheme would be a great boon to many districts, but when it is borne in mind that the total distance to be traversed from the Derwent and Leicester is not less than

66 miles it will be seen that the co-operation of a large number of local councils will first have to be secured.

WATER SUPPLY OF LEICESTER.

By the authorities at Leicester the inauguration of such a scheme is recognised to be of paramount importance. For years past the population of the town has been rapidly increasing, and, in spite of extensions of the waterworks, scarcity of supplies have been experienced during the past five years. The construction of the Swithland reservoirs, recently opened, it was hoped would remove all anxiety for many years, but this belief has not been realised. We had an excellent opportunity of inspecting the new works at Swithland, which include a storage reservoir of 490,000,000 gallons, and six filter-beds, having a total area of 88,644 square feet, and a filtering capacity of about 2,750,000 gallons daily. The beds are furnished with modern type sand washers, constructed by Messrs. Hunter & English, of London. In the pumping station two 140 indicated horsepower triple-expansion pumping engines of marine type have been erected by Messrs. Easton, Anderson & Goolden, of Erith. From the filtered-water tank the water is pumped through a 20-in. main into the Hall Gates service reservoir, a distance of about 2½ miles. Speaking generally, the whole of the works have been excellently conceived and carried out, but it is open to question whether the depth of the storage reservoir might not with advantage be greater, so as to reduce proportionate loss by evaporation. Including the cost of land, &c., the outlay involved at Swithland was upwards of £317,000, and there are not wanting in Leicester those who regard with amazement the recent announcement that the town council contemplate a further source of water supply, at a cost expected to involve some £500,000.

A good deal of the disquietude and foreboding evinced is probably due to the fact that for reasons of policy the council thought it best to keep their intentions private until the matter came on for final decision and action. There is no doubt, however, that the progress of the town must be largely influenced by the abundance and quality of the water supply, and on the extent to which it complies with the special requirements of local industries. As usual, there are advocates of further temporary measures, who regard themselves as being under no debt to "posterity," but it is to be hoped the corporation will not be deterred from carrying through their bold and public-spirited scheme on the lines contemplated.

NARROW-GAUGE RAILWAYS.

Narrow-gauge railways are more or less in the same condition as motor vehicles; they are talked about but not extensively used. Comparatively few engineers realise either their capabilities or the saving that can be effected by their adoption. By the aid of these little railways materials may be carried with a minimum expenditure of power and money, and this fact is not only proved by results obtained at Festiniog, Daijering, Caen and elsewhere, but by the admirable experimental line, which, by the courtesy of Sir Arthur P. Heywood, was open to examination by members of the institution at Dalfield Bsnk, Derby. Here a branch line rises in one-third of a mile to a height of 80 ft., passing a two-third circle curve of 25 ft. radius, and having a 1 in 10 gradient. The main line, half a mile in length, is arranged in the form of a figure 8, so that runs of any length may be made for experimental purposes. Although the gauge is only 15 in., both the passenger, goods and mineral vehicles are roomy, and on the occasion of our visit about 120 persons were conveyed in one train. It has been also proved that an annual traffic of 50,000 tons of minerals may be dealt with on a single line 3 miles in length, with one locomotive. A similar system, 4½ miles in length, has been in successful operation for over two years to connect Eaton Hall with the Great Western Railway. In this case the traffic is about 7,000 tons annually, and, including interest on a total outlay of £5,893 and allowance for depreciation, the cost per ton mile is less than 1s., a charge which would be reduced by one-half if the traffic were four times increased.

SOME NOTES ON DERBY AND LEICESTER.

It would, perhaps, partake of the nature of exaggeration to say that the town of Derby is divided into two portions, the first being the Midland Railway works and offices, where the inhabitants work by day, and the second the houses where they rest at night. Nevertheless, it is a fact that the company's premises, covering an area of over 200 acres, resemble a fair-sized town, and noticeably in the arrangements for the supply of water, gas and electricity. Water used in the works and supplied to locomotives is pumped from the river Derwent and treated to the extent of 260,000 gallons daily by the Archbutt-Deeley process, which not only removes hardness but also precipitates foreign matter and about 98 per cent. of the bacteria present.

Gas is required on an extensive scale, and the old gasworks adjoining the locomotive works were purchased from the corporation in 1875, and have since been enlarged to meet

with increasing demands. In 1897 about 133,000,000 cubic feet of gas were made and supplied to stations, sidings and signals in the Derby neighbourhood. Oil gas for carriage lighting is also made at the Midland works from shale oil, by the Pintsch process; 1 gallon of oil will produce about 75 cubic feet of gas, which is used at a pressure of 150 lb., and has an illuminating power of 45 candle-power for 5 ft. consumption per hour. Similar processes are well known, but might be more generally used in rural districts than at present is the case.

The Midland Railway electric lighting station is of considerable extent. From it several large buildings are lighted, extending over an area of 1,560 ft. by 1,020 ft., and the total number of lamps in operation consists of 2,175 of 16 candle-power, 318 of 8 candle-power and a number of arc lights.

The streets of Derby are efficiently lighted by electricity, and supplies are also available to private consumers for light, power, cooking, &c. Designed by Messrs. Bramwell & Harris, of Westminster, the corporation electric light station was opened in 1893. In the engine-room are fourteen combined engines and dynamos, and another combined machine of 1,000 indicated horse-power is shortly to be in operation. There are also four engines and exciters. Twenty-two centres in the town are fitted with sub-distributing transformer boxes, where the current is transformed from 2,000 volts to 100 or 200 volts. Two independent mains are applied alternately to arc lamps used for street lighting.

Nottingham also possesses excellent arrangements for electric lighting, designed and carried out in 1894 under the supervision of Mr. H. Talbot, electrical engineer to the corporation. The number of lamps connected to the mains is equivalent to 40,000 of 8 candle-power, and there are upwards of 500 private consumers. Observant visitors from London cannot fail to notice with humiliation that even in second-rate provincial centres are more ready to adopt scientific and other improvements than the miscellaneous assortment of governing bodies controlling the welfare of the metropolis. Not only are the important subjects of water supply, lighting plant and means of locomotion more adequately considered, but such towns are apparently more mindful of educational responsibilities. For their size both Derby and Nottingham are well supplied with educational and other institutions. In Derby there is an excellent public library, museum and art gallery, and a municipal technical college, both being under control of the corporation.

Nottingham Castle, adapted by the corporation in 1878 as a public museum and art gallery, is well-known; and University College, opened in 1881, was erected at a cost of nearly £80,000, and is one of the finest piles of public buildings in the provinces. It comprises, in addition to the college, excellent technical schools and a natural history museum. The east block of the college is occupied by the central free public libraries and reading-rooms. During the meetings of the institution a large number of visits were made to engineering works, of which space forbids detailed mention. In conclusion, it may be mentioned that the Derby meeting has proved to be one of the most successful in the history of the Institution of Mechanical Engineers.

THE HOUSING PROBLEM IN BIRMINGHAM.

THE MILK-STREET SCHEME.

The Improvements Committee of the Birmingham City Council recently presented a report to the council, in which they state that the question of the erection of houses in Milk-street suitable for the labouring classes has been under consideration both by a sub-committee, formed of members of the Improvement and Health Committees, and by the two committees jointly. The action taken in the past by the Improvement Committee to provide dwellings, and also the course now being pursued by the Health Committee in the closing of the insanitary dwellings, were discussed, and it was recognised that as suitable houses were not erected by private enterprise in the place of those taken down, a duty had devolved upon the council to carry out the intention of the Acts of Parliament to provide some accommodation for the class of persons displaced in the interest of public health, and this view was strengthened by the scarcity of the class of building referred to. It was therefore decided to formulate a scheme for the erection of labourers' dwellings.

WORK IN OTHER TOWNS.

The Corporation of Liverpool having recently erected artisans' and labourers' dwellings of several types, the sub-committee visited that city. It was found that in 1885 and 1892 large blocks of flats were erected four and five storeys high, occupied chiefly by persons of the artisan class. In 1897 dual houses were erected; but the rents were hardly within the reach of the labouring classes. This fact was recognised by the authorities and experiments have just been made in "Gildart's Gardens" to provide dwellings for the labouring classes. These dwellings are erected at right angles to the street, in terraces 112 ft. in length, the distance between the fronts of the houses being 30 ft. The houses are arranged in blocks of three storeys in height, the ground-storey tenements being entered directly from the street level, and the upper tenements from a common balcony running along the rear of the houses at the level of the first

floor, a staircase being provided from such balcony for each pair of tenements on the third storey. The dwellings erected by the Corporation of Manchester, the Wharfedell dwellings, London, and several blocks of dwellings in Bristol have also been visited, but the sub-committee considered that none of the dwellings inspected were suitable for labourers' dwellings in Birmingham.

DETAILS OF CONSTRUCTION.

The manager was instructed to prepare and submit sketch plans of through houses, and also of several types of houses designed in two and three storeys. These plans were laid before the members of the joint committee, who came to the unanimous conclusion that the dwellings shown upon the plans will provide healthy and suitable dwellings for the class for which they are intended. The plans have been placed before the architect of the Local Government Board, who expresses the opinion that they could not be more economically designed, and that they comply with the requirements of his board. The Public Works Committee and the medical officer of health have also approved them. Representatives of the Trades Council have seen the plans and discussed the merits of them at a friendly conference, but, although no general agreement was arrived at, nothing took place to justify the altering of the plans or the committee's recommendations in regard to the same.

The tenements are arranged in four terraces, and comprise twenty-four, containing living-room, averaging 13 ft. by 14 ft., bed-room, averaging 12 ft. 2 in. by 9 ft.; and twenty-eight, comprising living-room, averaging 13 ft. 4 in. by 14 ft., bed-room, averaging 8 ft. 2 in. by 14 ft., bed-room, 9 ft. by 9 ft. The plans also provide on the ground floor one tenement, consisting of a shop, with living-room and two bed-rooms, and another with shop, living-room and one bed-room, and on the first floor two dwellings, each containing living-room, with three bed-rooms. Each tenement is provided with a water-closet, approached from a small verandah (open to the air) at the rear of the dwelling, and a scullery, containing copper, coal-bunk and sink. To use the site to the best advantage the design provides for five artisans' dwellings, each containing living-room, 14 ft. 6 in. by 12 ft. 4 in., bed-room, 11 ft. 2 in. by 12 ft. 6 in., bed-room, with a floor space of 84 ft. 9 in. Each house is provided with a water-closet and scullery accommodation.

THE FINANCIAL QUESTION.

The rent suggested to be charged is 1s. 6d. per week per living-room; or, for the first type of dwelling described, 3s. per week, for the second 4s. 6d., and for the through houses 5s. per week. These rents, after paying interest and sinking fund on the outlay now proposed, will leave a margin sufficient to pay a ground rent on the land of 2½d. per yard. The estimated cost of building, including paving, &c., is £8,975; road-making, £146; contingencies, £897; land, at 5s. per yard (4,039 yards), £1,007; total, £11,025. The estimated annual statement will be: Interest and sinking fund on £11,025, £414; estimated rental, £659 2s., from which must be deducted the outgoings, £219 14s., leaving a total of £439 8s. The cost of the Milk-street site was £6,000. Deducting the £1,007 charged to the houses from this sum leaves £4,993 to be provided for. The interest and sinking fund will amount to £199, and this annual payment from the rates must be considered as the city's payment for the sanitary improvements thus made. At the end of the period for which the money is borrowed the property, kept in good repair, will fall in unencumbered, and at present rents will yield a clear income of £400 for ever.

It is a matter of deep regret that many of the houses inhabited by the poorer classes are not in the state of repair they should be, and that infectious diseases claim the majority of their victims from those houses. The committee feel that the scheme submitted will be a step in the direction of lessening this loss of life, and safeguarding the health and lives of the community at large. They therefore urge that the temporary debit balance of the cost of the land can fairly be charged to the rate as a sanitary improvement, and trust that the council will see their way to approve the proposed scheme and to authorise them to make an application to the Local Government Board for their consent to the erection of the houses and the borrowing of £10,100 for the purpose.

West Bromwich.—The Sewerage Committee have recommended that tenders be obtained for the construction of bacterio-beds at the sewage farm. An application is to be made to the Local Government Board for sanction to borrow the necessary money—£1,500.

American Competition.—The Water Committee of the Glasgow Corporation, at a meeting on Monday, considered the new offers for 1,000 tons of cast-iron piping. It was reported that a Philadelphia firm was the lowest offerer and that a local firm came next, the total difference in the price being £60. It may be remembered that when the offers were opened on the first occasion there was a difference of between £600 and £700. The committee was pretty equally divided as to what firm should receive the contract, it being pointed out that it would be unfair to use the American tenders to bring down the prices of the home pipes. It was ultimately agreed to remit the matter for further consideration.

Comparative Reports of General Practice.

XXVI.—REFUSE DESTROYERS : TIVERTON REPORT.—II.

ASTON MANOR (Population 80,000).

Mr. H. Richardson has charge of the works at Aston Manor, where some 350 tons of refuse are disposed of weekly, at a cost of 1s. per ton. The destructor, which has eight cells, works every day, the percentage of clinker produced being from 20 to 30 per cent. It was erected in 1890, and its cells each destroy 8 tons of refuse in a day of twenty-four hours. The makers were Messrs. Manlove, Alliott & Co. The neighbourhood is both a residential and manufacturing one. The houses are 60 yards from the destructor works, which are situated in Chester-street. The chimney shaft is 140 ft. in height, and was erected at a cost of £1,200; £6,500 was spent on the erection of the works. No complaints of any kind have been received. Waste heat is used in connection with the forced draught.

BATH (Population 54,000).

At this town, where the works are managed by Mr. Joseph Barter, 240 tons of refuse are dealt with during a week; the number of working days is six, but seven are occasionally worked. The cost of working is 8d. per ton, there being eight cells to the destructor. Clinker is never weighed. Each cell of the destructor, which was put down by Messrs. Goddard, Massey & Warner in February, 1895, destroys from 5 to 8 tons of refuse daily. The neighbourhood is mainly residential, and several houses are on the site of the destructor; forty others are in course of erection within a distance of 300 yards. The destructor and chimney cost £5,426; the height of the latter is 165 ft. Complaints regarding the works have been received, but have been found to be groundless. A 20 horse-power engine, employed to drive a mortar mill, utilises the waste heat.

BATLEY (Population 30,000).

The engineer in charge here is Mr. J. Lindley. With the exception of Sunday, work is carried on every day and 110 tons of refuse are destroyed, at a cost of about 1s. 7d. per ton. The amount of clinker remaining averages 25 per cent. The cells of the destructor number six, and each destroys from 3 to 4 tons of matter daily. The works were laid down in 1888 by Messrs. Manlove, Alliott & Co. They are situated in a valley and at a distance of 200 yards from houses, which stand on both hillsides. The district is both a manufacturing and residential one. The costs of the destructor and chimney were respectively £2,230 and £416, the height of the chimney being 60 ft. What complaints have been received have been proved to be untrue. Waste heat is used for generating steam for pumping and for driving two mortar mills.

BIRMINGHAM (Population 505,772).

Mr. William Holt, engineer. The destructor is always at work, and destroys 1,878 tons of refuse weekly, at a cost of 11d. per ton; 30 per cent. of clinker remains. The cells, each of which deals with from 5 to 6 tons per twenty-four hours, number fifty. The destructor was built chiefly from Mr. Holt's own designs, and is situated in a manufacturing district from 50 to 100 yards distant from houses. There appear from the report to be three chimney stacks, one being 260 ft. and the others each 160 ft. high. No complaints have been received in regard to the working. The waste heat is utilised in the generation of steam.

BLACKBURN (Population 131,000).

Mr. William Stubbs is responsible for the works at Blackburn, where one-third of the refuse collected is destroyed. Work is carried on every day, and the clinker resulting amounts to 15 per cent. There are eight cells to the destructor, which was erected in 1891 by Messrs. Manlove, Alliott & Co., and each deals with 6 tons of refuse daily. The district is, of course, a manufacturing one, and the works are situated on the fringe of a populous district 100 yards away from houses; £2,600 was spent in erecting the chimney stack, which is 300 ft. in height. The cost of the destructor was £8,500. There have been no complaints. Waste heat is used for generating steam.

BLACKPOOL (Population 40,300).

The engineer in this case is Mr. A. Jasper Anderson. Some 600 tons of matter are weekly disposed of, work being done on every day with the exception of Sunday. The cost of working, it seems, is 2s. 1 2/4d. per ton, and the amount of clinker remaining averages 25 per cent. There are twelve cells to the destructor, which was laid down by the Horsfall Furnace Syndicate in 1893. Each cell is capable of destroying 10 tons of refuse per twenty-four hours. The works, which deal with the refuse of a residential population, are in the centre of the town, although 400 yards from houses. The chimney stack is 116 ft. in height. The works, including the stack, cost £5,572. Complaints have been made regarding the working of the destructor, although not lately. The waste heat is employed in working an engine, which provides the forced draught for the furnaces.

BOLTON (Population 121,433).

Engineer, Mr. W. H. Brockbank. The destructor does not work on Saturday afternoons and Sundays. It disposes of

264 tons of refuse weekly, and the cost of the working is covered by the mortar sales. Clinker to the amount of 33 per cent. usually remains. There are eight cells to the works, which were erected in 1880 by Messrs. Manlove, Alliott & Co. Each cell destroys 6 tons of refuse daily. The district is a manufacturing one, and the destructor works occupy a position in the centre of a populous district, houses being within 50 yards; £4,300 was expended on the erection of the buildings and chimney stack. The latter is 180 ft. in height. Only a few trivial complaints have been made regarding the working. Waste heat is utilised in the mortar making, already referred to.

BOURNEMOUTH (Population 54,798).

Mr. F. W. Lacey is responsible for the affairs of the destructor here. Some 225 tons of matter are destroyed weekly, the work being carried on every day. The cost, including labour and repairs, works out at 9d. per ton, and 25 per cent. of clinker generally remains. There are six cells to the destructor, which was erected in 1887 (enlarged in 1891) by Messrs. Manlove, Alliott & Co.; each cell deals with 5 tons of refuse daily. The district is a residential one, and the works are surrounded by houses. A sum of £3,171 was spent in connection with the buildings and chimney stack, the latter being 140 ft. high. No complaints have been made. The waste heat in this case is utilised for drying the stone used in tar paving.

BRADFORD (Population 230,000).

These works, which are controlled by Mr. J. H. Cox, destroy 322 tons of refuse every week, the period of working extending from Sunday midnight to Saturday noon. The clinker remaining totals 30.3 per cent. There are six cells to the destructor, which was erected in September, 1897, by the Horsfall Furnace Syndicate, and each cell deals with 9.13 tons of refuse every twenty-four hours. The district, according to the report, is a manufacturing one, and houses stand within 150 yards of the destructor works. The latter cost £1,200 to build and the chimney stack £850. The stack is 160 ft. in height. No complaints have been received. A mortar mill and crusher are driven by the waste heat.

BRISTOL (Population 318,000).

Mr. T. H. Yabbicom acts as engineer of these works. The latter deal with 686 tons of matter in a week of six days, at a cost of 1s. per ton. Clinker resulting amounts to 25 per cent. Each cell of the destructor (there are sixteen) deals with 7 1/2 tons of matter. The works were erected in 1892 by Messrs. Manlove, Alliott & Co., and are situated in a manufacturing part of the city, within 150 yards of houses. The district, it may be mentioned, is as much residential as manufacturing in character. A sum of £10,729 was spent in erecting the destructor buildings, while the chimney, which is 180 ft. in height, cost £1,689. Only two complaints regarding dust have been made, and for two years none other has been received. The waste heat drives a 40 horse-power tubular boiler, working a stone crusher, mortar pans and sawing machinery.

BURSLER (Population 360,000).

Mr. F. Bettamy is the manager at Burslem. Some 100 tons of refuse are weekly disposed of, at a cost of 1s. 5d. per ton, the works running every day with the exception of Sunday; 35 per cent. of clinker remains. There are four cells, each capable of dealing with 4 tons of refuse, attached to the destructor, which was laid down in 1889 by Messrs. Manlove, Alliott & Co. The district is a manufacturing one, although the works are situated in the open country, houses being 500 yards distant. A sum of £2,410 was expended upon the erection of the buildings. The chimney stack is 80 ft. high, but it was not built with the destructor. Nothing in the nature of a complaint has been received. Fans connected to cells are driven by the waste heat.

BURTON-UPON-TRENT (Population 50,000).

The engineer in charge at this town is Mr. George T. Lyman. The works, running every day except Sunday, destroy some 192 tons of refuse, at a cost of 1s. 8d. per ton, they leaving 40 per cent. of clinker. The cells number eight, and each deals with 8 tons of stuff daily. Messrs. Manlove, Alliott & Co. were the contractors for the works, which were erected in 1890. The buildings are situated in a manufacturing district only 100 yards from a large number of houses, and cost £4,800 to build; £600 was spent upon the chimney, which is 144 ft. high. One or two complaints have been made respecting the smell emanating from the works. These, however, were received at least two years ago. A hospital disinfector was formerly supplied with the waste heat from the destructor, but it is now utilised in connection with mortar mills.

CAMBRIDGE (Population 36,983).

Mr. E. Wareham Harry officiates at the Cambridge works, which at the present time destroy 145 tons of refuse weekly. There is no Sunday working. The work costs some 1s. 2d. per ton, and from 25 to 30 per cent. of clinker remains. The destructor was erected in 1895 by Messrs. Manlove, Alliott &

Co. (with Wood & Brodie's patents), and has six cells, each capable of dealing with from 10 to 12 tons of matter daily. Cambridge is a university town and has no manufactures. The works are situated by the river Cam, adjoining the gas-works, and 100 yards from any residence. Their cost was included in the main drainage scheme. The chimney, it may be stated, is 175 ft. in height. There have been no complaints. Sewage pumping is carried out with the waste heat, except on Sundays, when coal is used.

CHELTENHAM (Population 49,000).

The engineer at Cheltenham is Mr. Joseph Hall. Refuse consumed during the course of a week amounts to 200 tons, work being carried on every day. The cost is put down at 10d. per ton, but the percentage of clinker remaining is not known. Eight cells are attached to the destructor (erected in 1890), and each deals with $\frac{1}{2}$ tons per twenty-four hours. Messrs. Manlove, Alliott & Co. were the builders. The district is a residential one, and the nearest houses are a quarter of a mile distant from the works. The latter cost £5,700 to erect, £800 being spent on the chimney stack, which has a height of 160 ft. There have been no complaints. Electric lighting and disinfecting are carried on with the heat resulting from the works.

DERBY (Population 103,000).

Mr. W. H. Clarry, engineer. In a week of seven working days 280 tons of refuse are dealt with, 33 per cent. of clinker resulting. The works cost (apparently) £500 per annum to maintain, but this does not include repairs. Cells, to the number of six, each consume 7 tons of refuse every twenty-four hours. Messrs. Manlove, Alliott & Co. were also in this case the contractors, and carried out the work of erection in 1882. The refuse is that of a residential district, the works being situated 1 mile from the centre of the town and one quarter of a mile from any houses. One cottage, however, stands 700 ft. away. The destructor buildings cost £9,244, and the chimney stack, which is 160 ft. in height, £300. Occasionally complaints are received. The waste heat is utilised in working elevators, &c.

DEWSBURY (Population 30,000).

The engineer in charge here is Mr. Henry Doarden. Working every day, with the exception of Sunday, some 140 tons of refuse are destroyed, at a cost of 1s. 18 $\frac{3}{4}$ d. per ton. The clinker remaining amounts to 32 per cent. There are two cells to the destructor, which was erected in September, 1895, by Messrs. Bonman & Dens. The daily capacity of the works is 15 tons. Houses and business premises surround the buildings, which are situated in a manufacturing district. The chimney stack has a height of 90 ft. No complaints have been received. Forced draught and a feed-water pump are driven by the waste heat.

EASTBOURNE (Population 43,000).

Mr. R. M. Gloyne acts as engineer in this town, where the destructor, working every day, deals with 180 tons of refuse, at a cost of 1s. 4d. per ton, and leaving 27 per cent. of clinker. There are six cells in the works, which were laid down in 1891 by Messrs. Manlove, Alliott & Co., and each cell destroys 5 tons of matter every twenty-four hours. The neighbourhood wherein the works are placed is on the outskirts of the town (which itself is of a residential character) and 100 yards distant from houses. The buildings cost £3,584 to erect and the chimney £845. The latter is 140 ft. high. Complaints are not frequent and usually only received on the occasion of high winds. Steam for working sewer ejectors is generated from the waste heat.

HAMPSTEAD (Population 77,000).

Mr. Charles H. Lowe superintends the work of destruction at Hampstead, where from 250 to 300 tons of matter are dealt with, at a cost of 1s. 4d. per ton. Of clinker there remains 16 per cent. and of fine ash 8 per cent. Each cell destroys 6 tons daily. Messrs. Manlove, Alliott & Co. were the builders of the destructor works, which occupy a position on the Grand Junction canal in a residential neighbourhood. Some recently-built workmen's cottages adjoin the buildings, the nearest being 20 ft. away; £3,235 was expended on the erection of the works. The chimney stack is 120 ft. in height. No complaints have been made regarding the working. Waste steam is not utilised.

HANDSWORTH (Population 43,000).

Mr. S. Henworthy has charge of the Handsworth destructor works, which at present destroy 400 tons of refuse weekly. A new eight-cell destructor is now being erected by Messrs. Goddard, Massey & Warner, and each cell is expected to have a capacity of from 8 to 10 tons per day. The neighbourhood which the buildings will be situated in is of a residential character, the nearest house being 150 yards distant. A sum of £6,200 is being expended on the destructor and shaft. The latter will have a height of 200 ft. No complaints are anticipated.

Glasgow Corporation and the Telephone.—The Special Committee on Telephones appointed by the Glasgow Corporation met on Tuesday for the first time since the issue of the report of the House of Commons Select Committee. It was decided to renew the application to the Postmaster-General for a telephone license for the municipality, and to appoint a deputation to wait on the Duke of Norfolk and Mr. Hanbury at the earliest convenient date to press the application.

SEWAGE DISPOSAL AT SWINDON.

NEW TANKS.

On the 3rd inst. the new sewage tanks, which have been constructed at the Old Swindon District Council's sewage farm, were formally opened. The tanks have been built in order to deal more effectively with the sewage and to make the effluent as pure as possible before it enters the river Rye, the Thames Conservancy Board having forced the council to do this. The work of constructing the tanks was commenced last September, and was almost completed by the end of the year, but there has been delay owing to the scarcity of coke breeze—a large quantity of which was required. Each of the filters will hold 33,000 gallons of sewage and 100 tons of coke breeze. There are three of these tanks. The tanks are constructed of concrete, and the system adopted is really a modification of Didden's process—precipitation, biological treatment and broad irrigation.

The tanks have been constructed under the supervision of Mr. F. Redman, engineer, of Swindon, who worked out the idea of this system some thirteen years ago. In the filter-beds the water passes through automatic valves—quite a new invention. Mr. Redman does not think there is another system like it in the West of England. The work has been most satisfactorily carried out by Messrs. W. H. Smith & Son, contractors, of Clifton, Bristol. The cost has been £1,300, in addition to which a further sum of £800 has been spent on the construction of a storm-water overflow sewer.

ARBITRATIONS AND AWARDS.

The following report has been issued by the umpire appointed to determine the sum to be paid by the Southampton Corporation in respect of the borough tramways: "I award and determine that in case the Court shall be of opinion that the arbitrators and umpire appointed as aforesaid should treat the undertaking of the company as defined by the Act of 1897, as an undertaking which the tramways company only enjoyed subject to the contingency of being compelled to part therewith under the terms of sec. 43 of the Tramways Act, 1870, the price to be paid under the Act of 1897 as aforesaid, is the sum of £51,505. I award and determine that if the Court shall be of opinion that the said arbitrators and umpire should treat the undertaking of the company as defined as aforesaid as an undertaking which the tramways company enjoyed free from all obligations to part therewith, other than the obligation created by the Act of 1897 itself, the price to be paid under the Act of 1897, as aforesaid, is the sum of £109,963."

VAUXHALL TEMPORARY BRIDGE.

The temporary bridge which has been erected across the Thames, between Vauxhall and Pimlico, was to have been opened during the present week. It has been constructed to last ten years, for the first five of which it will take the place of the old Vauxhall bridge, which is to be knocked down and rebuilt, and during the remaining period it will be used for the traffic which will be diverted while Lambeth bridge is being reconstructed. It is not proposed to close Vauxhall bridge until next week, the officials of the London County Council being desirous of watching the working of the temporary bridge for at least a week, in order to be certain that it will be capable of taking the traffic of the old bridge. Providing no hitch occurs Vauxhall bridge will be closed on the 26th inst., and a fortnight later its demolition will be commenced. The new bridge crosses the Thames immediately in front of the Tate Gallery.

PARLIAMENTARY MEMORANDA.

On Friday in the House of Lords the Royal assent was given in the usual form to the Local Government (Ireland) Act.

Parliament, following the reading of the Queen's speech was declared duly prorogued until Saturday, the 29th of October next.

Local Government in Ireland.—The Queen's speech stated that her Majesty had seen with much gratification that an important measure for assimilating the local institutions of Ireland to those of England and Scotland had during the year been added to the statute-book. Her Majesty trusted that that valuable reform would tend to strengthen the bond which united the people of Great Britain and Ireland, and to strengthen their common affection to the fundamental institutions of the realm.

Worthing.—The town council have approved of the recommendation of the Electric Lighting Committee that Messrs. Barstall & Monkhouse prepare a complete electric lighting scheme and attend the Local Government Board inquiry, and afterwards supervise the carrying out of the undertaking if sanctioned.

CORRESPONDENCE.

Fungoid Growth in Subsoil Drains.—Mr. H. H. Humphreys, Willesden Green, writes: "The inquiry of 'Puzzled' on the above matter has opened a subject which is, I think, of some considerable importance to those of us who are interested in the success of sewage purification works. The description given by 'Puzzled' reminds me of an experience I had when engineer to one of the district councils on this side of London, an experience which, I may add, has since been supplemented in other districts. As the former case was the most pronounced I have ever seen of flocculent growth, it afforded ample opportunity for the study of the matter by experimental treatment. To enable me to give the conclusions arrived at, as to its prevention or elimination, it will be needful to briefly state the condition of the farm on which the growth took place. It must, however, be clearly understood that the conclusions I arrived at need a chemist's confirmation, being deduced entirely from my own observation, the authority I was then under regarding an analyst as a superfluous luxury. The purification works had been laid down some ten or twelve years prior to my appointment, and the land was divided into a series of beds approximately level on a longitudinal section, and with a slope of about 1 in 30 from the sides towards the centre. Under the centre of each bed there was a 4-in. agricultural drain pipe, about 700 ft. long and at a depth varying from 2 ft. to 3 ft. 6 in. The soil of the farm was heavy clay, with a small admixture of stone ballast, which, however, did not in any way tend to lighten the ground. Each end of the effluent pipe was sealed, the upper being simply a stant end in the ground, and at the outfall a tide flap was fixed, abortive for the purpose it was intended to serve, but effectual in preventing aeration of the pipe. Over the pipes 1 ft. or 18 in. of burnt ballast had been put and covered with clay and soil. From the effluent pipes large pieces of opaque floc were continually discharged into the river, rendering the appearance of the water milky, by their being broken up, but collecting together again on the first rough substance they met with in the river bottom and forming a long grey fur or floc. The Thames Conservancy was at the time I speak of bringing a steadily-increasing pressure to bear on the riparian authorities along the river, with a view to better purification being effected, and, after an adverse report by the conservators' inspector on our effluent, I was instructed to take whatever steps were possible to obtain a better result. I had the effluent drains opened out in places, the tide flaps removed and the upper ends of the drains aerated. Not only did this effect a general improvement in the effluent, but it diminished at once the quantity of floc, and led me to conclude that it was principally an anaerobic growth. This was further confirmed by stripping the ballast from the pipes, the interstices being full of fungus. Physically the fungus was of a sticky nature, and under a microscope showed practically no sign of a coherent structural growth, and had very little in common with the characteristic sewage fungus which is generally found in badly-ventilated sewers and manholes. I noted with much interest that when the river bed obtained no fresh supplies of fungus from the effluent pipes, that which had already collected on the gravel developed a green colour, showing itself capable of producing chlorophyll, which I have never heard of a real sewage fungus doing. Ultimately the floc on the river bed appeared to develop into silkworm, and it seems to me to be at least possible that both growths have a common origin, but that one is the protoplasmic and anaerobic from the other. I am by no means sure that the nature of a soil heavily charged with iron has not an appreciable effect on the growth. From a conversation I had recently with Prof. Kenwood it would appear that he holds this view too. I have noted that the growth is more pronounced in recently drained land, owing presumably to their being room in the interstices of the imperfectly filled trench for the growth to take place, as was the case with the burnt ballast filling mentioned above. It is certain that as the land becomes tightened down the growth becomes less. I do not think that it is possible to entirely do away with the fungus, and, as far as my observation has led me, I am of opinion that the subsoil drains should have very careful aeration, and that the better the trenches are filled over the drains the less the growth will be. I do not think that percolation through a horizontal filter of coke breeze is the best way of getting rid of the floc. This course presupposes that additional fall is available near the outfall, which is not usually the case. Further, I have found that a vertical sliding screen, covered either with cocoanut matting or perforated zinc (preferably the latter), and placed in the outfall carrier, is much better for the retention of the floc than is a coke or clinker filter, where the very nature of the floc chokes the pores and in a short time the filtering media are rendered inoperative. In venturing to write somewhat *in extenso* I am hoping that a correspondence may be started with a view to throw light on a subject which is imperfectly understood by many of us, and possibly we may, by comparing notes, arrive at a definite conclusion as to the harmfulness or otherwise of a familiar and at least suspicious component of effluents from newly undrained clay soils.

Gas Authorities and the Flash Point of Petroleum.—Mr. Edward A. Barnan, Corporation Gasworks, Hudders-

field, writes: Perhaps one of the most important questions with which the engineering world is intimately concerned at the present moment, directly or indirectly, is that relating to the control of the petroleum trade, concerning which the Select Committee on Petroleum have recently concluded their labours. The recommendations of the committee, as presented in the report to the House of Commons by the chairman, the Right Hon. Jesse Collings, have already been clearly set forth. The whole issue seems to turn upon the desirability or otherwise of increasing the flash point to 100 deg. (Abel close test). Such a large increase in the flash point as 37 per cent. must necessarily increase the cost of petroleum to the consumer very considerably. Proof is wanting that the flash point is the chief danger. Inferior lamp reservoirs and defective wicks are responsible for not a few of the accidents, if not actually for the bulk of them. The principal points requiring consideration are proper restrictions and regulations for the storage of petroleum. With so many gasworks enriching gas with petroleum in some form or other, regulations regarding petroleum have of course become an important consideration for gas authorities. The increase of carburetted water-gas plants has created a demand for petroleum which formerly did not exist. The extension of the "penny-in-slot" meters for small consumers, and the advantageous terms on which these are offered, is perhaps the best competitor for petroleum lamps. It is a question whether such dangerous articles as lamps have proved to be, in case of excitement, should be allowed to be available for regular use, except under restrictions. Undoubtedly the agitation for raising the flash point was commenced with a view of bestowing an equivalent to a bounty on Scotch oil, the trade of which has been on a downward course for years. When the subject is considered impartially on its merits and demerits, it is very doubtful whether the present flash point is undesirable. With the experiments in progress for the utilisation of liquid fuel for locomotives, &c., the question of reducing the facilities for obtaining it becomes a serious one. The public was recently agitated concerning the extensions of carburetted water-gas plants upon gasworks. This bogey has been practically disposed of, and probably in a few years' time the one alleging the various lamp explosions to the flash point will also disappear as many another has in the past. Increase the flash point to a maximum, and a drunken man in a fit of fury can at once neutralise all the provisions made for safety by using the lamp as a missile. The summary of the recommendations of the Select Committee on the subject as published appears to cover the whole of the important items involved.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper, in plain black-ink lines. Lettering or figures should be bold and plain.

210. Sewer Ventilation.—"Borough Surveyor" writes: There appears to be a difference of opinion by the inhabitants of this town, for which I am borough engineer and surveyor, as to the cause of typhoid fever. Of course, the idea held by many is that it is caused by bad water, which is a well-known cause; but may I ask if, in your opinion, typhoid fever may be caused by improper sewer ventilation, such as rain-water fall pipes being connected directly with the sewer, where the hopper heads or inlets from rain water from the roof are in close proximity with bed-room windows, which latter, for a great portion of the day, and, during summer months, all night, are left open?

There can be no doubt, in our opinion, that there is a close connection between the influence of sewer gas from ill-ventilated or improperly-constructed house drains and sewers and typhoid fever, and we are strongly of opinion that the conditions described by the querist are highly favourable to the development of typhoid in the inmates of houses where such improper methods of drainage and sewer ventilation exist, whilst it is now generally admitted that putrid gases from sewers and drains cannot be held to spontaneously generate typhoid fever, there is no doubt that sewer gas is a strongly-predisposing cause in that it lowers the vitality of the human system and renders it readily susceptible to the entrance of the specific germ which produces typhoid in the human being. Instances of outbreaks of enteric (or typhoid fever) arising from sewer gas poisoning are numerous, such as those at Worthing in 1865, at Croydon in 1875, at Melton Mowbray in 1880, and at York in 1884, and in the sporadic cases occurring from time to time in almost every sanitary district in the kingdom. It is a noteworthy fact that in almost every instance defects in house drainage and the entry of sewer gas or drain air into the dwellings, or otherwise defective sanitary construction, have been found. The subject is one which is open to considerable controversy, as there is much difference of opinion among the numerous observers, but the broad fact that insanitary conditions are a strongly-predisposing cause to outbreaks of typhoid fever should not be lost sight of. Rocchling's "Sewer Gas and its Influence upon Health" (Biggs & Co., 5s.) will be found useful to those who desire to further study the subject.

Some Recent Publications.

SOME SHORT NOTES.

ST. BOTOLPH, ALDGHATE: The Story of a City Parish Church, by A. G. B. Atkinson, M.A. (Grant Richards), is a more pretentious publication than either of those already noticed. The title-page states that it has been "compiled from the record-books and other ancient documents," and considerable care has evidently been bestowed on the production of an agreeably-written and valuable historical work. Want of space precludes us from referring to more than a few of the numerous interesting facts recorded of an important city parish, identified in mediæval times with the gate through which access to the city was obtained from the east. We find here mentioned that as early as the thirteenth century tolls for the repair of the roads were levied upon all vehicles entering and leaving the city, and that at a subsequent period the wealthy were exempted from payment; but the principal adjacent street was not paved until 1503, and the thoroughfares "without Aldgate, in the suburbs of London," were paved with stones, in accordance with Acts of Parliament passed in 1571 and 1581. In 1374 Aldgate had a notable tenant in the person of Geoffrey Chaucer, the father of English poetry, who obtained a lease for life from the city authorities of "the whole of the dwelling-house above the gate of Aldgate." The gate itself was demolished in 1606, when many Roman coins were found under it, and another built on the same site, at a cost of £4,000, was taken down in 1761 and the materials sold to Ebenezer Muscell for £117 7s. For full particulars of these and a multitude of equally-interesting events we must refer our readers to the detailed records interwoven in pleasant narrative form in a well-printed volume.

Uniform with the hand-books in "Bell's Cathedral Series," and similar in appearance, is a publication of the same firm, entitled **THE CHURCH OF ST. MARTIN, CANTERBURY:** An Illustrated Account of its History and Fabric, by the Rev. C. F. Rontledge, M.A., F.S.A., Hon. Canon of Canterbury. This attractive little volume refers to several historical incidents of absorbing interest, and contains numerous fine illustrations of the places and objects described. The text is well and carefully written. A judicious arrangement has been adopted with regard to the various subjects treated, and accuracy in matters of detail appears to be a predominant feature. Canon Rontledge quotes the words of an antiquarian authority, to the effect that "it is every day more true that people want history in guide-books." The tourist is a much better-informed person than he used to be, and desires to be still more so." St. Martin's church occupies a unique position as regards both its history and structure, and no more desirable companion than the work before us can be recommended to the intelligent visitor who wishes for full and reliable information respecting a venerable edifice that may be regarded as being the one remaining building that could certainly be associated with St. Augustine's preaching; the one spot that without doubt felt his personal presence, whatever we may think of the more or less strong claims put forth on behalf of Ebb's Fleet, Richborough Castle, the ruins of St. Pancras, or the site of Canterbury Cathedral.

THE CATHEDRAL CHURCH OF HEREFORD: A Description of its Fabric and a Brief History of the Episcopal See, by Hugh Fisher (G. Bell & Sons, Is. 6d.), is one of a series of monographs designed to supply visitors to the great English cathedrals with accurate and well-illustrated guide-books at popular prices. We are told by the editors, Messrs. Gleeson White and E. F. Strange, in the general preface, that the aim of each writer has been to produce a work compiled with sufficient knowledge and scholarship to be of value to the student of archeology and history, and yet not too technical, in language for the use of an ordinary visitor or tourist. A careful examination of the book convinces us that Mr. Fisher has accomplished this purpose in a very efficient manner, and the volume is handsome in appearance, choice printed on good paper, and copiously illustrated with excellent reproductions of photographs and artistic sketches.

THE HAND-BOOK OF EASTNORFOLK, published by the Chamber of Commerce in that town, is a handsomely-printed and beautifully-illustrated practical guide to a favourite watering place.

TRAVEL AND ENTERTAINMENT is the title of a small guide-book, containing the tariffs of the Midland Railway hotels, in addition to useful local information.

OLD ENGLISH LIFE.

LIFE IN AN OLD ENGLISH TOWN: A History of Coventry from the Earliest Times, by Mary Darnar Harris (Swann Sonnenschein & Co., Limited, 4s. 6d.), necessarily proceeds on somewhat different lines from the last-mentioned work. It forms a volume of the "Social England Series," which, we are told in the editorial preface, "rests upon the conviction that it is possible to make a successful attempt to give an account, not merely of politics and wars, but also of religion, commerce, art, literature, law, science, agriculture, and all that follows from their inclusion, and that without a due knowledge of the last we have no real explanation of any of the number." Surely not very intelligible writing for a writer who assumes a responsible position in developing new sources of enlightenment and instruction. If the main ob-

ject in compiling this book has been, "to describe some leading features of English social life," as exemplified in the local annals and municipal enactments of a historic town, on the author's own testimony the selection does not appear to be a happy one, for we read: "So far was Coventry from the great centres of the national life that there is little to connect the place in the early part of its history with the history of the kingdom." York, Winchester, Bristol or Chester would appear to offer superior advantages in this respect. We may question whether it is quite correct to affirm that "there is hardly any subject on which ordinary folk, especially members of large communities, are so ignorant as local government." Evidently, in the author's estimation, Coventry is an exceptional town, and possesses many novel features apart from the Gothic processions. In the concluding chapter, headed "Old Coventry of the Present Day," we see it stated that "Coventry is well worth a whole day's visit, though the day may be an easy one, as all the principal buildings lie very near together, and are practically always open," a course which is not without its risks, but is certainly of advantage to the visitor who has little time to waste on unenterprising sanctuaries or other caretakers. Again, it is stated that "either the powers that be have little leisure to think of tourists, or they must be men of singular enlightenment, for I know of no place which can be seen so freely and cheaply, where lingering over a charming effect, a boss, inscription or painted window may be done with such pleasure, because interruption is so rare." Yes, indeed, "this is a condition of things tourists ought to be thankful for," and no wonder that this piece of seasonable advice is added: "The sight-seer ought to have an opera (? glass)." The book, however, is full of interesting details.

THE METROPOLIS AND ITS INHABITANTS.

LONDON AND LONDONERS, by Rosalind Pritchard, professes to give adequate information as to "what to see, what to know, what to do, where to shop," in addition to "practical hints." We are informed that "in placing a new guide to London before the public the aim of the editor has been to enable the stranger visiting the metropolis for the first time, or the provincial making his annual and fleeting stay, to get at the root of the matter as speedily and with as little labour to himself as may be." We fear that the authoress is not at all times the best pioneer to the uninitiated visitor "who may be actuated by the laudable desire to probe the matter to the root," whatever that may mean. The twelve chapters devoted to "What to See" give a very superficial description of the ordinary London sights, and matters of detail are frequently treated in a most unsatisfactory manner; as, for instance, in the list given of the principal pictures in the National Gallery, only two of Turner's pictures are mentioned, and these not by any means the most important. The first chapter of "What to Know" commences with the announcement "that the Queen now rarely resides in London." Evidently the "stranger" in his first visit, or the "provincial" on his annual sojourn, are assumed to be unacquainted with *Truth*. We find the Royal College of Music described among the "Learned Societies," and Messrs. Mudie and W. H. Smith & Son mentioned among the "Public Libraries," and in doubtful connection with the word "free," "Macmillan and Blackwood" are omitted from the list of magazines, and *The Edinburgh and Church Quarterly* from the reviews. Lunatic asylums are not included with hospitals in the chapter headed "London Charities," but somewhat unaccountably introduced into that containing a list of the names of eminent medical men. The portion of the book comprised in "What to Do" is devoted to a description of the theatres, places of amusement and varieties of sport available. Here we see "Ascot Races," "Fourth of June at Eton" and "Henley Regatta" classed as "Red-Letter Days in London." Twenty-two pages are given up to an account of various pecks of hounds, and more space is allotted to the Romney Marsh Harriers or the Walthamton Beagles than to cycling or football; but then we are assured by the writer that "hunting is a favourite sport in England," and apparently a "Greenlander" is informed that "these hounds hunt the hare and it is usual to follow beagles on foot." The questionable proceedings of gun clubs are not recognised in this volume. The commercial element enters so largely into "Where to Shop" as to render criticism superfluous; and why the Royal Pier Hotel, Hyde, and the Hotel Metropole, Folkestone, should receive more notice than the Hotel Cecil or the Colberg is not very clear from a utilitarian point of view. We are compelled to omit reference to some debatable matters in the summary of the "London Way of Smart Society" and the information contained in "Practical Hints," but we note the significant announcement that, "as nothing is more evanescent than the passing whims of smart society, and the unwritten code by which the 'best people' steer their course, 'London and Londoners' will be carefully revised and brought up to date each year."

Jarraldale Jarrah.—The *Syde Jarrah*, with 952 loads, and the steamer *Brocks*, with 304 loads of Jarraldale jarrah on board, have arrived in London to the order of the agents of McLean Brothers & Riggs, Limited, 1 Fenchurch-avenue, E.C.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

HIGHWAY: DEFECTIVE FENCE: LIABILITY OF LANDOWNER FOR PERSONAL INJURY.—The case of *Harrold v. Watney* (Court of Appeal) is of more interest perhaps to landowners than to highway authorities. It is, nevertheless, indirectly interesting to the latter, and, moreover, the point decided is so novel and the decision so important that a brief note of the case will, we think, be acceptable to our readers. The defendant was the owner of a piece of waste land adjoining South-street, Wandsworth, and separated from the highway by a wooden fence belonging to him. The plaintiff, a boy of four years of age, was clambering up the fence (in order to look at some children playing on the other side) when the fence gave way, and the boy fell, sustaining considerable injuries. The action was tried before Mr. Justice Ridley and a jury. The jury assessed the damages at £45, but the learned judge, being of opinion that the defendant was not legally liable, entered judgment in his favour. That decision, however, has been reversed by the Court of Appeal. On behalf of the plaintiff it was contended that the defendant was bound to keep the fence in a safe condition; that its dangerous state amounted to a nuisance, for the consequences of which he was liable; and that it made no difference that the boy, in climbing the fence, was committing a trespass. For the defendant, on the other hand, it was argued that, in order to give a right of action for nuisance in such a case as this, it must be shown that the injuries were the result of an involuntary act on the part of the plaintiff, whereas the climbing of the fence was a purely voluntary act. Lord Justice Vaughan Williams, in the course of his judgment, said that the test of liability was this: Was that which the child did something which ought to have been present to the mind of the defendant as to the probable result of leaving the fence in a dangerous condition? If the defendant answered, "No grown-up person would have thought of climbing the fence," the reply was "The Queen's highway was not intended for grown-up people only, and a defective fence is very likely to cause injury to children using the highway." We think this decision will be rather a startling one to landowners.

SEWERAGE WORKS: APPLICATION FOR MANDAMUS; METROPOLIS MANAGEMENT ACT, 1855, SEC. 69; METROPOLIS MANAGEMENT ACT, 1862, SEC. 45.—The Court of Appeal have discharged a rule absolute for a mandamus granted by the Queen's Bench Divisional Court in the recent case of *Regina v. Vestry of St. Mary, Islington* (2nd August). The rule was made on the application of one James Williams, on behalf of the Midland, Great Eastern, and Tottenham and Hampstead Junction Railway Companies, and directed the vestry to prepare a scheme of such sewers, or such diversions or alterations of sewers and works, as it might be necessary to construct for effectually draining their parish or district, and to submit a plan of the proposed sewer or sewers to the County Council. The facts of the case are briefly as follows: Part of the railway of the Tottenham and Hampstead Junction Railway Company, which passed through a cutting between Hornsey-road station and Crouch Hill station, was frequently flooded. The overflow came from a sewer which had been originally built in 1865 by the Tottenham and Hampstead Junction Railway Company, but was now vested in the vestry, and which ran along and underneath the 6-ft. way of the railway for about half a mile. The sewer consisted of a brick culvert, with manholes and ventilation gratings, and in times of heavy rains the water flooded the line to the depth sometimes of 6 ft., thus stopping or delaying the traffic. The overflow from the sewer, which took place every year from 1888 down to the present time, was caused during heavy rains by the insufficiency of another sewer vested in the vestry (into which the sewer in question ran) to carry off the sewage, and this insufficiency was alleged to be due to the vestry allowing the Hornsey District Council to send their sewage into it, which damaged back the sewage coming from the sewer in question. In 1889 the vestry submitted a scheme for a new sewer to the London County Council, but the latter had not sanctioned the scheme. Lord Justice A. L. Smith, in the course of his judgment, referring to this scheme, said there was no suggestion that that was an improper plan, or that it was not made *bonâ fide*. But there was a difficulty in fitting in the plan with the main drainage scheme, and the facts showed that the vestry were not in a position to carry out a scheme for carrying off the overflow. A correspondence took place between the vestry and the London County Council, which had been going on ever since. It seemed to him to be clear on the facts that the vestry had done their best to carry out their statutory duties, and that on that ground a mandamus ought not to be granted. There was another ground on which he thought

their judgment might be based. A mandamus ought not to be granted unless there had been a demand and a refusal. No doubt there had been a demand of some sort here—a demand to construct a sewer—but he could not find that there had been a refusal of any demand which had been made. The mandamus, however, which was asked for, and for which a rule was granted, was a mandamus to prepare a scheme for effectually draining the district. He did not see the slightest evidence that a demand had ever been made on the vestry to prepare such a scheme. He thought that the appeal ought to be allowed. Lord Justice Riggby was of the same opinion. He did not think there was any ground for saying that the vestry had tried to evade their duty, but, on the contrary, he came to the conclusion that they had from the first been anxious to do their duty, and to do it in the right way, and that the plan which they had submitted was a reasonable plan. Further, he thought that the terms of the rule for a mandamus differed so much from the terms of the demand which had been made on the vestry that on that ground they ought to refuse to make the mandamus absolute. Lord Justice Vaughan Williams agreed in the result, but he did so reluctantly. He agreed because his brethren were of opinion on the evidence that the vestry had honestly applied themselves to the performance of their duty of draining their district. He would not disagree with that conclusion of fact. But he should be sorry to have to say that in his opinion the mandamus ought not to go because of any irregularity in the form of the application. The substance of the complaint of the railway companies was that the vestry had not properly performed their statutory duty of effectually draining their district. He desired to disavow basing his judgment on the ground that there had been no demand on the vestry to take the preliminary step of submitting plans to the County Council.

QUERIES AND REPLIES.

PRIVATE STREETS: PUBLIC HEALTH ACT, 1875, SEC. 150.—Mr. Fred. Rayner, Newhaven Urban District Council, writes: My council decided to make-up and take over a certain road, according to sec. 150 of Public Health Act, 1875, and to charge the separate owners with the cost. A question now arises as to who is liable for the passages marked A on rough

sketch herewith which are right-of-ways only to the back entrances of the houses, and are so mentioned in the deeds of conveyance. This road has only been opened about four years. I shall be glad to receive this information as to whether the frontages of these passages to the road should be paid by the original owner of the estate or by the various freeholders of the houses in the said road.

It was decided in *Jocett v. Idle Local Board* (57 L.T. [N.S.], 928) that the definition of a "street" contained in sec. 4 of the Act must be read into sec. 150. That definition includes any alley or passage, whether a thoroughfare or not. And in *Tytor v. Oldham Corporation* (L.R., 1 Ch., D. 305) it was held that the latter section extends to streets which are in all respects private and over which the public have no right. These passages are therefore "streets" within sec. 150, and the owners of the premises "fronting, adjoining or abutting" thereon (i.e., the various cottages and also the land at the backs of the passages) are liable for the cost of making them up.

HOARDINGS SET UP DURING THE PROGRESS OF BUILDINGS.—“C. S.” inquires: Under sec. 34 of the Public Health Acts Amendment Act, 1890, can the urban sanitary authority require notice to be given (at the office of their clerk or surveyor) by builders and others for leave to erect hoardings before erecting same? In other words, is the existence of any hoarding on the public highway illegal without the urban authority's consent has first been applied for and obtained? If not so, how is the machinery of the Act to be set in motion and applied? The giving of notice is not required in so many words, but inferentially is there not strong presumption of the necessity of such notice being required? If any cases decided upon this clause please quote.

In the metropolis a license from the vestry has to be obtained before a hoarding is erected, under sec. 122 of the Metropolitan Management Act, 1855. There is, however, no corresponding provision in the Public Health Acts Amendment Act, 1890, nor in the sections of the Towns Improvement Clauses Act, 1847, which are applicable to districts where the Act of 1890 has not been adopted. “A householder may put up hoardings temporarily during repairs, although they may to some extent obstruct the highway” (Glen's “Highways”). The authority given by Mr. Glen for this statement is the case of *Fisher v. Proove* (2 B. and S., 770). That case, however, was decided in 1857, and the district in which the Act of 1890 is in force, the principle deduced from the decision must be considered as subject to any modification or qualification effected by sec. 34 of that Act. The section provides that every person intending to build, or take down any building, or to alter or repair the outward part of any building, in any street or court, shall, before beginning the same, unless the urban authority otherwise consent in writing, cause close-boarded hoards or fences, to the satisfaction of the urban authority, to be put up. Although, therefore, there is nothing (apparently) in the compulsory nature of the section to give notice to the authority before erecting a hoarding, or to obtain their permission to erect it, he must obviously obtain their approval of the hoarding before beginning his building or alterations. “Incidentally I should think this might be the authority's chief concern, because, as a builder, to give notice to a builder to consult the authority beforehand as to the construction of the hoarding than to have to alter it to meet their views after he has put it up.

MATERIALS FOR REPAIR OF HIGHWAY: HIGHWAY ACT, 1835, SECS. 51 AND 53.—“Surveyor” writes: Is it necessary to give a month's notice to owners and occupiers of land adjoining brooks and rivers when they refuse permission to go through their lands to the brooks for the purpose of obtaining road material?

Sec. 51 of the Highway Act, 1835, empowers the surveyor of highways to take material for repairing the highway from any waste land or common ground, river or brook, so that he does not interrupt the course of the river, &c., or damage buildings, &c.; and likewise to gather stones lying upon any land without making satisfaction for the materials, but making satisfaction for damage; but no such stones are to be gathered without the consent of the owner of the lands or the lease of two justices. Sec. 53 provides that a surveyor is to take material from enclosed lands until he has given one month's written notice to the owner to appear before two justices to show cause why a license to take the material should not be granted. The term “enclosed lands” in this section includes all lands (whether actually fenced or not) in the exclusive occupation of one or more persons for agricultural purposes (4 and 5 Vic., c. 51). Sec. 51 appears to place rivers and brooks in the same category with waste land and commons. In the case of a river or brook flowing through private land, however, it would seem that sec. 53 must apply; but I have not been able to find any case dealing with this point, and the text-book writers (Prest and Glen) ignore it altogether, although they maintain the section's validity. If actual access by a stream to the river or brook in question, I think the surveyor would be justified in disregarding the owners' refusal and leaving them to raise the question. But if it is physically impossible or difficult to get through the lands without the owners' consent, the better plan would be to give notice under sec. 53.

HOUSE DRAINS: COMMUNICATION WITH SEWERS.—Mr. F. W. Mager, district surveyor to the Rural District Council of Walsall, writes: In preparing regulations under 38 and 39 Vic., cap. 55, it will be *ultra vires* to insert clauses: (a) Requiring cement joints throughout the whole length of drain proposed to be connected with the sewer; (b) requiring an inspection chamber in connection with the “interceptor”? These two clauses might be considered to come more properly under building by-laws, but are not expressly mentioned in the code as adopted in my district; but may it not be argued, as regards (a), infiltration of ground water (in my case a matter of extreme importance) is prevented, and (b) interceptors may be inspected if necessary and the “ventilation” difficulty reduced.

I presume sec. 21 of the Act is referred to, which empowers an owner to cause his drains to empty into the sewers, and gives no authority complying with the regulations of the authority “in respect of the mode in which the communications between such drains and sewers are to be made.” It seems to me that both the suggested clauses go somewhat beyond regulations as to the mode of communication, and would more properly be the subject of building by-laws.

Surveyor to District Council.—“Assistant” writes: Would you be so good as to inform me if a surveyor to an urban district council or rural district council has any legal power to act in connection with his duties without consulting his council, and, if so, by what enactment?

The surveyor is the servant of the council, and is bound to act under their directions. They can, of course, if they please, give him a general authority to act in regard to his ordinary duties without consulting them at every step, and they may (under sec. 180 of the Public Health Act, 1875) make “regulations with respect to the duties and conduct of their officers.” But their authority is paramount, and he has no independent power.

Building By-Laws.—“F. J. W.” writes: Where building by-laws have been recently adopted, do they apply to buildings incomplete at the date they come into force?

The power of making by-laws under the Public Health Act, 1875, applies only to new buildings. What is a “new building” within the meaning of the Act is a question of fact for the magistrates in each

case (*James v. Weyill*, 51 L.T. [N.S.], 237). A building in an advanced stage would be hardly likely to be held to be a new building, but one in a very early stage might perhaps be so considered.

BUILDING LINE.—“Lino” writes: Will you kindly inform me from what Act or Acts of Parliament the power to define building lines (frontage) for buildings about to be erected in district where by-laws are in force? And would there be any difference in these powers in a rural and urban district?

See the Public Health (Buildings in Streets) Act, 1884, sec. 3, which, however, only applies to urban districts.

ARBITRATIONS AND AWARDS.

On the 29th and the 30th ult., at the Westminster Palace Hotel, London, Mr. Samuel Jackson, F.R.S.T., sat as arbitrator in regard to a claim made by Sir John Ramsden against the Huddersfield Corporation, with reference to the compulsory purchase of land under the Corporation Act, 1897. It was stated that substantially the whole of Huddersfield belonged to Sir John Ramsden, and he now claimed for certain of his land being taken for sanitary purposes by the corporation, and also for certain other land of his which was injuriously affected by the corporation having power to build dust destructors and things of that kind. The whole area of the land to be taken, which was situated on both banks of the river Flne, was 31,000 square yards. It was very advantageously situate, being near to Huddersfield station, and the land adjacent was occupied by woollen mills, dye works, chemical and machine works, and so on, and that it was land that was very valuable for building sites. Coal had been worked in the neighbourhood, but Sir John's agents had borings taken, and it would be agreed that there was no coal now left, so that there would be no interference with building operations. For the corporation, Mr. Kenneth Findlater Campbell, the borough surveyor, said the land in question could certainly not be utilised for building purposes without an elevation of its level. In his opinion the land was admirably adapted for tipping purposes, and nothing else. The arbitrator reserved his award.

GLASGOW ELECTRIC LIGHTING.

The Electricity Committee of the corporation have considered certain recommendations by Mr. Chamen, the engineer, as to charges, and adopted the following: (1) That all consumers of current, whether for lighting or motive power, during the year which commenced on June 1st last, should have the option of continuing to be charged in accordance with the demand indicator system, which has been in operation for the last two years, or of being charged a fixed rate per annum of 8 candle-power lamp, or its equivalent, fitted up in the premises, spreading this charge uniformly over each month in the year, with an additional rate of so much per unit (over and above the fixed charge) for each unit consumed as recorded on the meter; (2) that in the case of the demand indicator system, the initial charge should remain at 6d. per unit for the first hour, with 2½d. per unit thereafter to the 100-volt consumers, and 2d. per unit thereafter to the 200 and 250 volt consumers; (3) that, under the alternative method of charging to be given to the consumers, the fixed rate should be 4s. 6d. per lamp per annum, with 2½d. per unit additional to the 100-volt consumers, and 2d. per unit to the 200 and 250 volt consumers; and (4) that, to all consumers who take a supply for more than the equivalent of seven hours each day at full load for twelve months, the initial charge in the case of the demand indicator system, and the fixed charge of 4s. 6d. per lamp in the case of the alternative system, should be remitted.

PROPOSED NEW BRIDGE OVER THE THAMES.

A movement is on foot in Twickenham and other places having for its object the erection of a new bridge across the Thames opposite that town. At present Twickenham is practically deprived of any enjoyment to be derived from walking alongside the Thames, as nearly all the river frontages are in private hands, and the Surrey shore opposite can only be reached by means of a ferry. It was proposed at first that a footbridge should be erected similar to the one at Teddington, the cost of which is estimated at about £2,500. It was proposed to carry this bridge over Eel Pie Island, where a large hotel is about to be built. Others, however, deemed this a half measure, holding that what was wanted was a stone bridge for horses and carriages, which would bring Kingston, the only market town in the neighbourhood, 11 miles nearer to Twickenham than it is at the present time. The movement has now assumed definite shape, as the Twickenham District Council have taken the matter in hand, and have appointed a committee to approach the Middlesex County Council, the Surrey County Council, the Earl of Dysart, and any other authorities or persons concerned, with a view of constructing a carriage-way bridge over the Thames at the point mentioned. Such a bridge, it is believed, would cost about £50,000.

Municipal Work in Progress and Projected.

This being the autumn recess, matters municipal are in the metropolis quiescent, but it is not so in the provinces, to judge from the information to hand in regard to Bristol, Bury, Halifax, Newcastle and other towns. The activity in connection with electric lighting and tramways continues in undiminished vigour.

METROPOLITAN AUTHORITIES. VESTRIES AND DISTRICT BOARDS.

Poplar.—The Local Government Board have received a petition objecting to the application of the vestry for sanction to borrow £9,000 for the establishment of baths, &c., on the Isle of Dogs.

Whitechapel.—It is stated, says a local contemporary, that the electric lighting question at Whitechapel has not been allowed to slumber. A meeting of the committee has been held, and it is probable that an effort will be made to induce Mr. Wright, the electrical engineer to the Brighton Corporation, who possesses perhaps the most successful municipal installation in the kingdom, to give part of his time to carrying out the Whitechapel installation, at a salary approaching £600 per annum.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Bucks.—Correspondence has taken place with the Middlesex County Council in reference to bridging the river Colne between Iver and West Drayton, which is partly in Bucks and partly in Middlesex, and the Middlesex County Council have intimated that they will be prepared to contribute a sum not exceeding £1,000, subject to the plans being approved by the Middlesex County Council and to a satisfactory arrangement being made as to its future maintenance. The Bucks County Council is requested to undertake also to provide a sum not exceeding £1,000, subject to the plans and the arrangements for future maintenance being approved by this council, and provided the remainder of the cost of the bridge and approaches can be raised locally. The Middlesex County Council estimate that a suitable bridge would cost £3,500.

East Riding.—The council will shortly give their consideration to the following resolution: "That a more convenient bridge, of modern structure, is desirable in the place of the existing dangerous and obsolete structure known as Hull bridge, which is totally unfit to meet the requirements of the present traffic, and that the county council be pleased to take into favourable consideration the erection in its place of a modern iron swing bridge, which would be more suitable both for the road and river traffic."—Upon the recommendation of a committee, it was last week decided to accept the plans of Mr. B. S. Jacobs, of Hull, for a new register office and additional accommodation for the clerk of the council, the inspector of weights and measures and the caretaker. The estimated cost of the work amounts to £3,826.

MUNICIPAL CORPORATIONS.

Birkenhead.—At a recent meeting of the town council a member, in moving the adoption of the minutes of the Gas, Water and Electrical Committee, referred to the report of the resident electrical engineer upon the proposed extension of the electric light supply to Birston and Noctonm. He gave two reasons for the preparation of the report—*viz.*, first, that the residents had memorialised the committee not once but several times, and that they had entered into an agreement to use the light if it was brought to them; secondly, the electric light could be extended in the district without any loss, or a very small loss, in the first year, and in subsequent years the profit would be very considerable. The minutes were passed.

Blackburn.—Eight designs and estimates for a new conservatory in Corporation Park, varying in price from £967 to £3,616, exclusive of mason's work and brickwork, have been under the consideration of the council. Two designs have been selected, and a final choice will shortly be made. The amounts of the selected designs amount to respectively £1,400 and £2,100.

Bournemouth.—The council have accepted tenders for carrying out a scheme for lighting the lower pleasure gardens, pier and winter gardens by electricity, and it was decided to hold a special meeting to consider the desirability of applying for a provisional order empowering the corporation to adopt a scheme for lighting the town generally. We understand that the accepted tenders were those of the Brush Electrical Engineering Company (£1,598) and Siemens Brothers & Co. (£1,135).

Bristol.—The town council have adopted a recommendation of the Docks Committee in favour of applying for powers to construct a new lock and other works at Portishead dock, so as to provide accommodation for the largest classes of steamers afloat or building. The estimated outlay is £350,000.

An amendment to the effect that the "dockisation" of the river Avon was the best scheme was defeated by forty-one votes to twenty-one votes.

Bury.—The Electric Lighting Committee last week recommended that the following tenders be accepted, subject to the approval of the Local Government Board being obtained to the proposed loan for electric lighting—*viz.*, Messrs. Davey Brothers, Sheffield, for the boilers, &c.; the Callendar Cable and Construction Company, for the mains, &c.; and Messrs. Fowler & Co., Leeds, for plant, &c. The tenders, with the cost of the engineer, clerk of the works, &c., amounted to £19,439 15s., exclusive of the cost of buildings, which is estimated at £2,500, making a total of £21,939 15s. The loan for which permission has been applied for is £20,000, making, with the sum of £2,500 in the hands of the gas company, £22,500, which will leave £500 for contingencies. The report was adopted.

Canterbury.—A Local Government Board inquiry, with regard to the application of the town council for power to borrow £70,000 for the purchase of the Stone House estate and the erection of a lunatic asylum, was held by Lieut.-Colonel Albert C. Smith, R.E., at the Guildhall, Canterbury, on Friday.

Deal.—The mayor of Deal has written a letter with a view to qualifying the somewhat exaggerated paragraphs appearing in some of the morning papers in regard to the encroachment of the sea. His worship says that about eight years back they spent some thousands of pounds in erecting a sea-defence wall at the north part of the town, and also decided to erect certain groynes during the present summer. They have asked the Local Government Board for the necessary powers, but as they have not succeeded in getting the requisite Government inquiry they are proceeding with the work without delay. The mayor points out that these measures are only precautionary, and there is not the slightest danger at this season of any inundation.

Derby.—Colonel W. R. Slacke, one of the Local Government Board inspectors, held an inquiry at the Town Hall, Derby, on Tuesday, for the purpose of considering the advisability of borrowing £310 for street improvements; £150 was required for the improvement of a portion of East-street and £160 for London-road. The necessity of these improvements had been already admitted by the board. The inspector intimated that he would report to the Local Government Board in due course.

Godalming.—The town council have resolved to purchase the Frith Hill, Godalming and Farncombe Water Company, and a committee have been formed to arrange all formalities, and, if necessary, to promote a Bill in Parliament for the acquisition of the undertaking. According to the terms agreed upon in the negotiations, the corporation's liability in purchasing the concern will be £67,257.

Halifax.—The town council are about to extend the electric tram system by constructing new lines, at an estimated cost of £31,000, and also to purchase four new tramcars, at a cost of about £500 each.

Hastings.—At the meeting of the town council on Friday the question of providing a lift to the East Hill will be discussed. The East Cliff is one of the chief beauties of Hastings, and leads to Ecclesbourne and Fairlight Glens, but many are deterred from visiting these spots on account of the wearisome climb to the summit of the hill.

Ilkeston.—In proposing the adoption of the General Works Committee's minutes last week, a member said that it was absolutely necessary to provide a duplicate engine at the water works, at a cost of £1,500 to £2,000, to prevent a water famine in case of a breakdown of the present engine; also a new filter-bed, at a cost of £600 or £700; and also a 12-in. main from Bath-street main to the Shipley reservoir, at a cost of £1,200 or £1,400. These works were absolutely imperative. The minutes were adopted.

Leeds.—Some little time, according to a Leeds journal, must elapse before Ecnop reservoir can fulfil its proper functions. Meanwhile, however, a fair amount of progress has been made with the task of filling it. The water, in fact, has reached a depth of 17 ft, without any leak being discernible. This was reported last week to the Leeds Corporation Waterworks Committee. The present storage of water in the corporation reservoirs, by the way, is equivalent to fifty-nine and a half days' supply, as compared with forty-seven and a half days' supply last year at this time. Another satisfactory statement made to the committee had reference to Harehills reservoir, which not only is now completed, but will in all probability be filled before the committee hold their next monthly meeting. It is expected to prove a very useful addition to the water supply of the growing districts of Northern Leeds. The work in connection with the Headingly pumping station is also advancing. A second engine is being taken down, and will shortly be replaced by one of a new and improved type. On the watershed, too, the committee are prosecuting a progressive policy. With a view to

avoiding all possibility of contamination, they recently secured an order for the closing of a graveyard at Fawcett, and now they are applying to the Ilmoe Office to close Holy Trinity churchyard at West End, Blubberhouses.

Leicester.—The scheme of the borough engineer, Mr. E. G. Mawbey, for the laying of 34 miles of new tributary sewers, has been adopted by the council. About 29 miles of these are to replace old brick sewers. The estimated cost of the whole scheme is £128,300, and the work is to be carried out in four sections, the first of which (estimated to cost £30,229) is to be proceeded with as soon as the sanction of the Local Government Board is obtained. The old sewers have been thoroughly examined by the sinking of no less than 1,436 trial holes.

Liverpool.—A contemporary states that the scheme whereby various parts of Liverpool are to be supplied with open air baths is progressing satisfactorily. The one at Gore-street is now practically completed, and will be opened within the next few days; and it is expected that the baths at Mansfield-street and Green-lane, the work of constructing which is to proceed at once, will be in readiness for next season.

Lowestoft.—A quarterly meeting of this body was held last week, when it was reported that at a meeting of the Joint Sanitary and General Purposes Committee the surveyor reported that he had examined No. 1 Smith's-marsh, with reference to providing a site for a destructor and electric light station, and had come across hard material about 4 ft. below the surface, and, generally speaking, the subsoil was very much better than at the site next Hervey-street, and he submitted plan of his proposed arrangement of the destructor buildings. It was moved that the committee recommend that the destructor and electric light station be erected on the north-west corner of No. 1 Smith's-marsh, as shown by the plan submitted by the surveyor. The report was adopted by the council.—The town clerk had formally announced to the members of the General Purposes Committee that the Bill confirming the provisional order granted by the Board of Trade for the electric lighting of the borough had received the Royal assent; and the committee recommended that "the order be put in operation by the council itself, and that it be referred to this committee to obtain a scheme for lighting the town by electricity, with all details, estimates and tenders, and report thereon to the council, with a view to an application being made to the Local Government Board for their sanction to a loan for carrying out the works." The report was formally adopted.

Nelson.—An inquiry will shortly be held by the Local Government Board respecting an application of the town council for sanction to borrow £20,000 for private street works.—To satisfy the requirements of the Ribbles Joint Committee, the sub-committee dealing with the matter have been given authority to make an extension of 4,000 yards of filtration area at the sewage works.

Newark.—On the 5th inst. the new waterworks at Farnsfield, which have been erected by the Newark Corporation, were formally opened by the mayor, Councillor Milthorpe. A special train ran from Newark at 12.30 p.m., conveying the members of the corporation and a number of burgesses. On arriving at the works, which adjoin the Midland line at Farnsfield, the party were shown over the works under the guidance of the engineer, Mr. Rofe. Proceeding to the engine-house, the mayor started one of the magnificent beam engines, Mr. Doubleday, chairman of the Waterworks Committee, starting the other, amidst cheers. The works are of an extensive character.

Newcastle.—The Newcastle Town Council on Friday sanctioned the expenditure of £84,000 as an instalment towards carrying out improvements on the quay. It is to cover the cost of erection of a range of sheds from the milk market to the Swirle, together with railways, cranes, lifts, &c., and the rebuilding of the quay at the Rotterdam and London wharves, and the 80-ton crane berth. This is part of a scheme, which has already been approved by the Finance Committee, to increase the width of the quay at the milk market, to provide double-tier sheds from the milk market to the Swirle and from the grain warehouse to the Ouseburn, with the necessary cranes, &c. The whole scheme is to cost £234,000. In the discussion it was pointed out that many large merchants had to have about 75 per cent. of their goods sent to Hull, Grimsby and Hartlepool, because there was not adequate facilities for the steamers to go to the Tyne.

Oldham.—A committee of the council recently reported: "That the council be recommended to authorise and direct this committee to take all the necessary proceedings to promote in the next session of Parliament a Bill for the purpose of authorising and enabling the corporation, subject to existing leases, to work any tramways for the time being belonging to them either by electric, animal or other power, and to place and run carriages thereon, and to take tolls, rates and charges in respect of the use of such carriages, or to lease the said tramways if the council should determine to do so; to construct and lay down additional tramways within the municipal borough, and in case any of the townships within the Parliamentary borough should desire the council so to do, to enable the corporation to enter into agree-

ments with the authorities thereof to lease, work and use any tramways for the time being situate or to be constructed in all or any of the townships, or to supply electric or other power to enable such authorities to work and use their respective tramways." The town clerk was instructed to write the authorities within the Parliamentary borough to obtain their views on the matters mentioned in the resolution referring to their respective districts.

Osett.—On the 8th inst. it was decided to carry out certain extensions of the drainage of the Gawthorn portion of the borough, in accordance with plans prepared by Mr. S. Wood. Application was ordered to be made to the Local Government Board for sanction to the borrowing of £4,000 for the purpose. Instructions were also given for the erection of stabling and sheds on a site in Bank-street, at a cost of £600, and an application to the Local Government Board for sanction to a loan for hospital purposes.

Richmond (Yorks).—The corporation have referred to a committee the consideration of the desirability of pulling down the existing town hall and of building a new and more adequate group of municipal buildings.

Scarborough.—At the town council meeting on Monday week the chairman of the Fire Brigade Committee announced, somewhat to the astonishment of his colleagues, that the fire-extinguishing appliances of Scarborough were only worthy of a village. Another councillor contradicted this with emphasis, declaring that all the sensation that had arisen had occurred through the unhappy Queen-street fire fatality.

Sunderland.—The special sub-committee appointed to consider the question of fire-extinguishing appliances intend to recommend the council to purchase two fire engines, one to discharge 450 gallons per minute through a 1½-in. jet, and the other to discharge 450 gallons per minute through a 1¼-in. jet; and also to purchase a 50 ft. fire escape.

Wolverhampton.—On Monday afternoon a meeting of the Building Committee of the proposed new free library for Wolverhampton was held at the town hall. Over twenty tenders for the erection of the building were received; but, on opening them, it was found that they were at "a somewhat larger sum than the committee anticipated." Several members of the committee were absent on their holidays, and it was decided to defer the consideration of the tenders.

URBAN DISTRICT COUNCILS.

Audenshaw.—The council have approved and adopted the proposals of Mr. J. P. Wilkinson, A.M.I.C.E., Manchester, for the sewerage of the district. The estimated cost is £14,500.

Castleford.—A formal resolution has been passed by the council sanctioning a loan of £2,000 for the purchase of land required for the enlargement of the cemetery, £1,550 to be borne by Castleford and £450 by Glass Houghton. A proposal to utilise the old water supply for flushing the sewers and watering the streets has been referred to the Special Water Committee for consideration.

Clacton.—Instructions have been given for the making-up of the East Marine Parade with a total frontage of 2,575 ft. The estimated cost is £2,300. The surveyor has reported that the sea-water mains have been laid, and that the whole scheme would probably be in working order shortly.

Hfracombe.—It has been resolved by the council to purchase a field, at a cost of £1,200, for purposes of a sports ground.—Alternative schemes of drainage, one costing £20,000 and the other £30,000, have been submitted by Mr. Mansergh, and will shortly be discussed by the council.

Knaresborough.—Application is shortly to be made by the council to the Local Government Board for power to obtain a loan of £2,000 for the erection of a new gas purifier-house, and to purchase a set of four purifiers and an exhanster.

Leigh.—On Tuesday of last week Mr. W. O. E. Monde-King, inspector of the Local Government Board, held an inquiry at the Town Hall, Leigh, into the application of the Leigh District Council for sanction to borrow £25,000 for gasworks extensions and £10,500 for purposes of electric lighting. In regard to electric lighting it was stated that it was proposed to erect works on the gasworks land, and they would save the cost of boilers and chimney stacks by using these for the gasworks extensions. They intend to put sufficient plant down to supply electrical energy for five years, and from a canvass taken in the district they anticipated making the electric works a paying concern even during the first year of their existence.

Llandudno.—Mr. Walter Ducat held an inquiry, on the 2nd inst., at Llandudno respecting an application by the district council to the Local Government Board to sanction loans of £2,350 for water undertaking, £1,100 for street improvements, £550 for the provision of shelters on the promenade, £250 for sewerage works and £225 for the erection of a fire station at Craigydun. The engineer, Mr. E. Paley Stephenson, in explaining the water extension, said that it was proposed to raise 20,000 gallons, the motive power being a gas engine. It would serve a district of 100 houses, but the scheme provided for 550. The capacity for the proposed reservoir would be 50,000 gallons. Mr. Humphreys, the surveyor of the Mostyn estate, said that he was present to give every facility for the carrying out of the scheme.

Mountain Ash.—Mr. Robert H. Bicknell recently held an inquiry, on behalf of the Local Government Board, into the application of the urban district council to borrow £20,700 for the purpose of carrying out a sewerage scheme for the Abercynon portion of the district.

Skipton.—The council have been in negotiation for some time past with the proprietors of the Skipton gasworks, with the view of purchasing the undertaking for the benefit of the town. At a private meeting of the gas company, a few days ago, the council's offer to buy was refused. The company, at the same meeting, decided to call up its capital and to exercise its borrowing powers under the Act of 1863.

Stourport.—At a meeting of this council, held on the 3rd inst., the Sanitary Committee reported that they had consulted Mr. J. E. Willcox, C.E., of Birmingham, on the question of dealing with part of the sewage of Upper Mitton. They recommended the council to instruct Mr. Willcox to prepare a complete scheme for the drainage of the part of the district referred to, such scheme to be so arranged as to form part of a future comprehensive scheme for the whole of the district. The report was adopted.

Teignmouth.—A recent report from the manager, Mr. C. Jones, stated that while during the last quarter 12 tons less coal had been carbonised than in the corresponding period of 1897, there had been an increase of 288,000 cubic feet in the sales of gas. This was attributed to the relaying of mains and the consequent reduction in leakage.—Sanction has been given to borrow £200 to complete the purchase of the ground for the erection of a new gasholder.—Application has been made to the Public Works Loan Board to obtain a loan of £3,820 for gas purposes.

Urmston.—It was last week reported that the Local Government Board sanction had been received to the borrowing of £4,400 for flagging and kerbing public footpaths in the district.

Wimbledon.—On the 3rd inst. a Local Government Board inquiry was held as to the establishment of a dust destructor at the electric lighting works, similar to that at Leyton, for erecting which a loan of £5,000 is to be raised. It was argued that to burn the sewage sludge, instead of putting it on the land, as at present, would be a waste; but the advocates of the scheme pointed out that £400 a year would be saved for coal to drive the dynamo.

Withington.—The Main Drainage Committee last week reported having received a letter from the farm manager, stating that recent bad effluents complained of by the Mersey and Irwell Joint Committee were probably due to the sinking of a short length of a 6-in. drain, which had allowed unfiltered sewage to get into the outfall.—The council have decided to purchase machinery, at a cost of £1,500, for the manufacture of concrete flags at the refuse destructor in Barlow Moor-road. It is expected that they will shortly be able to lay flags in the various highways of the district.

RURAL DISTRICT COUNCILS.

Chelmsford.—At a recent meeting of this authority Dr. Thresh stated that he had received a written complaint about the stench arising from the river Wid at Writtle Bridge. He found that the river there was in a really foul condition, and it appeared to be due to sewage entering from a ditch in Lawford-lane. No time should be lost in proceeding with the sewerage of the village, for the council were taking a serious responsibility by the delay. There were many grossly insanitary conditions in the village, which could only be remedied by laying down a system of sewers. Things were now getting so bad that the council could no longer afford to ignore them.

Chipping Sodbury (Glos.).—Having been instructed by the council to prepare a scheme for the sewerage and sewage disposal of the town, Mr. Walter L. le Maitre, of Victoria-street, Westminster, has submitted plans and estimates for the work, and they have been referred to the parish council for consideration.

Fecknam.—The council have instructed Mr. J. E. Willcox, C.E., of Birmingham, to report upon the question of sewage disposal and to prepare plans for filter-beds in connection with their existing sewage disposal works at Astwood Bank.

Howden (East Riding).—At the last monthly meeting of the council a novel application was made on behalf of the cyclists in the Howden district for permission to make, through the main street of that town, a cycle track. It was pointed out that, on account of the large boulders in the street—which is paved with the material known as "petrified kidneys"—cyclists found it very inconvenient in riding over them, and they had requested him to make that application in order that a small track might be made on the side of the road, they (the cyclists) giving an undertaking to pay the cost of laying and maintaining it. After some slight discussion the council unanimously agreed to the proposed innovation.

Richmond, Yorks.—The council have engaged Mr. H. W. Taylor, of St. Nicholas Chambers, Newcastle, and Birmingham, to report upon the best means of supplying the village of Middleton Tyns with water. In consequence of the prolonged drought most of the wells and springs are dry.

Stratford-on-Avon.—At the last meeting of the council Mr. J. E. Willcox, C.E., of Birmingham, attended and submitted a scheme for sewage disposal works at Snitterfield. The scheme was duly approved and instructions given to enter into negotiation for acquiring the necessary land.

Thrapston.—The council having applied to the Local Government Board for sanction to borrow £1,000 for the purpose of erecting a bridge over the Nene at Ringstead, Colonel Luard, C.E., attended at the Temperance Hall, Ringstead, on Thursday morning to hold an inquiry into the circumstances of the application. After formal evidence had been given the inquiry closed, the inspector having intimated that he had already visited the site of the bridge.

SCOTLAND AND IRELAND.

Aberdeen.—The Waterton and Dyce Sub-Committee of Aberdeen District Committee, appointed to carry out the new Parkhill waterworks, held yesterday their sixth, and probably final, visitation of the works prior to the formal turning on of the water. The committee expressed themselves perfectly satisfied with the works. Water from the new source has been supplied to Bucksburn during the past week or ten days.

Dumfries.—At a meeting of the Dumfries Town Council on Wednesday a letter was read from Mr. Andrew Carnegie offering £10,000 for the erection of a library, provided that the Free Libraries Act was adopted by Dumfries and Maxwelltown. Mr. and Miss McKie, of the Mote House, Dumfries, have given a free site for the purpose of the library building.

Dundalk.—A special meeting of the town commissioners was held recently for the purpose of considering the report of the committee appointed to arrange details of agreement with the Dundalk Electric Tramway Company, Limited, for lighting the town of Dundalk with electricity and for the handing over to them of powers under provisional order for electric lighting, on the basis that the company would recoup the commissioners the expense of obtaining same. After hearing the report of the committee, it was decided to approve of the draft deed of agreement as submitted, on condition that the tramway company complete the contract of agreement on or before the 5th of October next.

Johnstone.—A deputation from this authority who visited Rouen and Havre to witness the electric tramways at work, to guide them in their decision whether they should support the Electric Traction Company to put down a system from Johnstone to Glasgow, returned to town on Saturday week. It is reported that the system is perfectly applicable to Johnstone, and that the deputation are in favour of the scheme.

Stirling.—The Police Commissioners had before them last week a minute of the Lighting Committee, recommending that the negotiations in connection with the scheme for the electric lighting of the town by water power should cease. The minute was adopted, and it was remitted back to the committee to carry out their previous instructions in connection with Prof. Kennedy's steam-power scheme.

Stranraer.—The contract for the repairing of the principal streets of Stranraer with granite sets has been let to Mr. Charles Macandrew, Ayr, the cost of which will be £2,323.

ADVERTISEMENTS

Received too late for Classification.

WEYBRIDGE URBAN DISTRICT COUNCIL.

The above-named Council are prepared to receive tenders for the supply and delivery of the following Materials—viz—

- (1) Stoneware Pipes and Gulleys from the London, Leicestershire or Dorsetshire districts.
- (2) Bristol Blue Pennant Kerbing.
- (3) Prepared Limestone or Granite for Tar Paving.
- (4) Thames Ballast.
- (5) Portland Cement.
- (6) Gas Tar.

Particulars and form of tender can be obtained from Mr. John S. Crawshaw, Surveyor to the Council, on and after August 22, 1898, on a deposit of 10s. 6d., which will be returned on receipt of a *bona-fide* tender.

Tenders, duly sealed, and endorsed tender for _____, to be sent to the undersigned not later than 5 p.m. on September 7, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)

GEO. WHEELER,

Clerk to the Council.

Council Offices, Weybridge.
July 30, 1898.

CIVIL SERVICE COMMISSION.—Forthcoming Examination.—Building Assistant, under the Board of Agriculture (21-26), 30th September. The date specified is the latest at which applications can be received. They must be made on forms to be obtained, with particulars, from the Secretary, Civil Service Commission, London, S.W.

Personal.

Mr. Thomas Sopwith, M.I.C.E., has died at Lismore, N.B., from the result of an accident while out shooting.

Mr. W. H. Owen, surveyor to the Ellesmere Rural District Council, has had his salary increased by £10 per annum.

Cheltenham Town Council have raised the salary of Mr. Kilgar, the borough electrical engineer, from £300 to £350.

Mr. Herbert Vickers, of Bolton, has been appointed by the Wolverhampton Corporation as junior assistant to the borough electrical engineer.

The Aberdeen City Council have confirmed the appointment of Mr. J. A. Bell, as city electrical engineer, at a commencing salary of £225 per annum.

Mr. A. E. Freeman, of Uxbridge, was on Friday selected by the local authority of the latter town to fill the post of assistant surveyor and inspector of nuisances.

It is understood that Mr. R. L. Jones, surveyor to the Carnarvon Town Council, has resigned, and that a successor will be appointed at a salary of £180 per annum.

Mr. Thomas Smith, works manager on the granite and wood paving works, Wolverhampton, has been appointed works manager on the new tramway works, Norwich.

The death has taken place, at the age of sixty-seven, of Mr. John George Dawson, the surveyor to the Kingston Rural District Council. He was a member of the Surveyors' Institution.

Mr. Arthur Smith, who is at present surveyor to the Chortsey Urban District Council, has been appointed surveyor to the Yeading Rural District Council, at a salary of £250 per annum.

At a meeting of the Greenock Police Board, held recently it was agreed, on the recommendation of a sub-committee on electricity, to advertise for a resident electrical engineer, at a salary not exceeding £300 per annum.

At a meeting of the Finance Committee of Dundee Harbour Board, on Monday week, it was agreed to grant an increase of £100 to the salary of Mr. G. C. Buchanan, harbour engineer, thus raising it to £500.

Mr. Isaac Thomas Hawkins, the deputy-director of Public Works at Lagos, arrived at Liverpool last week on board one of the West African liners. Mr. Hawkins, it will be remembered, was formerly engineer and surveyor to the Langport (Somerset) Rural District Council.

Mr. R. Lindon, of Plymouth, who for two years has been an assistant surveyor under Mr. J. Patoa, borough engineer of Plymouth, was on Tuesday evening unanimously elected sanitary inspector and highway surveyor of Tavistock Urban District Council, at a salary of £100 a year. There were eighteen candidates.

The deputy-mayor of Wolverhampton, Mr. Alderman Craddock, J.P., Mr. Alderman Saunders, J.P., and the borough engineer, Mr. J. W. Bradley, are attending the Iron and Steel Institute congress at Stockholm. They will also visit Copenhagen, St. Petersburg, Moscow, Nizni Novgorod, Hamburg, Kiel and other German towns.

Out of about 100 candidates, Mr. R. O. Wynne-Roberts, borough surveyor and water engineer of Oswestry, has been selected to fill the post of city engineer of Cape Town. Mr. Wynne-Roberts' salary will commence at £800 per annum, and he will also be allowed first-class expenses. He will leave England in about three months' time.

The County Council of Bucks on Thursday adopted a report recommending the raising of the salary of Mr. R. J. Thomas, the county surveyor, from £500 to £600 per annum. The amount allowed to him for office and travelling expenses was also increased to £300 per annum, while it was further resolved to provide his office in the county hall rent free.

Mr. A. S. Barnard, the borough electrical engineer of Hull, was married on Wednesday, 10th inst., at Platt Chapel, Manchester, to Miss Muriel Marles-Thomas, B.A., youngest daughter of the late Rev. Wm. Thomas (Gwilym Marles) of Llandysul. The ceremony was performed by Rev. J. C. Stool, of Shrewsbury. The happy couple afterwards left for North Wales.

At Kirkham parish church recently the remains were interred of the late Mr. E. H. Hargreaves, who died on the previous Saturday at his residence, Poulton-street. He was sixty-five years of age. For a period he was surveyor to the Kirkham Urban Council, but retired on the grounds of ill health about two years ago. A widow, three sons and two daughters survive.

The Ambleside (Lake Windermere) Urban District Council have engaged Mr. Harry W. Taylor, A.M.I.C.E., of St. Nicholas Chambers, Newcastle-upon-Tyne and Birmingham, as their engineer for the preparation of a scheme of sewerage and sewage disposal for their district. Pumping will have to be resorted to to raise the sewage from the low-lying portions of the district.

The Sewerage, Water and Fire Brigade Committee of the Lymington Town Council, reporting on a proposal to appoint a water engineer, on Thursday submitted the following names, and recommended the selection of one of the gentlemen mentioned: Mr. T. Hawksley, Mr. Wm. Fox, Messrs. Taylor, Sons & Sinto Crump, Mr. James Mansergh, Mr. Baldwin Latham, Mr. Wm. Jeffery, Mr. S. H. Terry and Mr. J. M. Hood.

On the recommendation of the Parliamentary and Finance Committee the Matlock Urban District Council have sanctioned an honorarium of £25 to Mr. Albert M. Clarke, their surveyor, for additional work performed by him as engineer for the Matlock sewage scheme included in the Matlock Parliamentary Bill. Sir Edward Frankland, K.C.B., F.R.S., Reigate, Surrey, and Mr. George Chatterton, M.I.C.E., of Westminster, supported the scheme.

Mr. John Richmond, of Dunbar, has been appointed manager of the Kilkenny gasworks. Mr. Richmond was trained under his father, at the Whitburn gasworks, West Lothian, and he became manager there at the age of seventeen. Seven years afterwards he was appointed manager at Dunbar. The Dunbar Gas Commissioners offered Mr. Richmond an increase in salary of £20 to remain with them, and on the offer being declined they voted him an honorarium.

It is stated that it is not yet determined who is to succeed Mr. W. D. Bowden in the surveyorship to the St. Mary Church Urban District Council. As we last week stated, Mr. Stringfellow was selected to fill the post, but since the time of the appointment he has received from the Eastleigh Urban District Council an offer which has induced him to decline the St. Mary Church position. The council will, therefore, be called upon to select another of the candidates, who numbered about two dozen.

In our reference of last week to Mr. Henry T. Wakeham, the county surveyor of Herefordshire, we stated that he served his articles with Mr. Benjamin Baker, borough engineer of Wolverhampton. The latter gentleman, however, had no connection with Wolverhampton, but was the engineer and surveyor of the adjoining town of Willenhall, and architect to the local school board. Our information, we may mention, was derived from a local paper, which, we assumed, had verified its statements.

At a recent meeting of the Marylebone Vestry the duties of the superintendent of cleansing, superintendent of sewers and drains, and district superintendents, were approved of as follows: That the superintendent of cleansing be responsible to the surveyor as regards the whole parish for the washing and sweeping of roads and cleansing of footpaths, the removal of the dirt and slop therefrom, and for the street watering, as well as for the removal of snow. That for the whole parish the construction, maintenance and flushing of sewers and urinals, and the construction of drains, so far as laid by vestry, be allocated specially to the superintendent of sewers and drains, that officer to be responsible to the surveyor for those works; and that for the construction and maintenance of macadam, flint and paved carriageways and footways, and supervision of hoards, public lamps, &c., the parish be divided into three districts, and that the district superintendent for each shall have authority and responsibility, under the surveyor, for all such works and matters in his district.

We last week announced the appointment of a surveyor to the East Sussex County Council. Some particulars of the voting will be of interest as showing the closeness of the contest and the uncertainty attending such elections. The Roads and Bridges Committee interviewed the following four selected candidates: Mr. A. Dryland, A.M.I.C.E., assistant surveyor, county of Kent; Mr. C. Lawgreen, surveyor of Croydon Rural District Council; Mr. F. S. Morris, assistant-surveyor, county of Stafford; and Mr. F. J. Wood, A.M.I.C.E., assistant surveyor, county of Lancaster, there having been originally eighty-one candidates. The four gentlemen above-named were interviewed in the order given, and upon the names being put to the vote Mr. Dryland obtained ten and Mr. Wood ten, there being twenty members present. The chairman declined to decide the matter by giving a casting vote, but stated he had voted for Mr. Dryland, and if he did exercise his right would have to do so in his favour. He remained firm in his refusal to give a second vote, and after considerable discussion upon the merits of the respective candidates and upon the position caused by the equality of votes, it was resolved to try the effect of taking another vote, when Mr. Wood obtained eleven to Mr. Dryland's nine, and was therefore declared elected.

Edinburgh.—On the recommendation of the Lord Provost's Committee, it was recently resolved that the present contractors for the cabling of the tramways be employed to carry out the work of cabling the Portobello and Joppa section at the same rates as under their existing contracts.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

EXAMINATIONS.

The attention of candidates is drawn to the fact that the entrance fee is £2 2s, instead of £1 1s, and the sitting fee as before (£2 2s.), and that it is absolutely necessary that the prescribed form, duly filled up, should be deposited with the secretary, together with the entrance fee, on or before March 5th or September 5th, as the case may be.

MIDLAND DISTRICT MEETING AT BILSTON.

A meeting of the members of the midland district will be held on Saturday, September 17th, at Bilston. The following are the arrangements:—

- 11 a.m.—The members will be received in the council chamber, Town Hall, by the chairman (Councillor R. A. Harper, J.P.) and other members of the council. Minutes of Stafford and Rhyader meetings. Election of hon. district secretary.
- 11.30 a.m.—Leave for a visit to the Spring Vale furnaces, arriving about 11.40 a.m., where, by the kind permission of Sir Alfred Hickman, the process of steel manufacture will be witnessed. A short descriptive paper will be given.
- 12.30 p.m.—Leave in brakes, kindly provided by Councillor J. W. Sankey, chairman of the Water and Baths Committee, for a visit to the waterworks covered service reservoir (which will be specially emptied for the inspection of the members), arriving about 12.45.
- 1.15 p.m.—Leave in brakes for the Hinley Arms Hotel, arriving about 2 p.m., where a light luncheon will be provided by Councillor R. A. Harper, J.P., chairman of the council.
- 3 p.m.—Leave in brakes for a visit to the Bilston waterworks pumping station, arriving about 3.30 p.m.
- 4.15 p.m.—Leave in brakes for the Technical School, Bilston, arriving about 5 p.m.
- 6 p.m.—Dinner at the Technical School. Tickets, 3s. 6d. each (exclusive of wine).

Arrangements will be made for any members desirous of doing so to inspect the public baths and the public market.

Mr. C. L. N. Wilson, the water engineer and surveyor to the Bilston Council, will give a descriptive paper of the works. As the paper will be in the hands of members intimating their intention to attend some days before the meeting, it will be taken as read.

Among the hotels at Bilston may be mentioned the Pipe Hall, Globe and Great Western.

Wolverhampton is within 2½ miles and Birmingham 10½ miles, and there is a good service of trains from these towns. The Great Western station at Bilston is the nearest to the Town Hall.

Any member desirous of introducing a visitor (other than members of the public authority where the meeting is held) to the meeting must submit the name and address of such visitor to the president on the form to be obtained from the secretary. The ticket signed by the member introducing the visitor must be in the hands of the hon. district secretary at least four days before the date of the meeting, after which date no application can be entertained.

J. S. PICKERING, A.M.I.C.E., THOS. COLE, A.M.I.C.E.,
Hon. District Secretary. Secretary.
Council Office, Nuneaton.

NEW BATHS FOR GLASGOW.

After a short discussion the City Council of Glasgow last week adopted the report of their engineer on the nature and cost of the amended plans of the proposed Whitevale baths and wash-houses. The report was as follows: "The sketch plans now produced show two swimming ponds—one, 75 ft. by 40 ft., for males, and one, 50 ft. by 25 ft., for females—fourteen second-class hot baths for males on street floor, and thirty-one first-class hot baths for males on first floor; eight hot baths for females. Gymnasium in connection with large pond, 44 ft. by 24 ft. Turkish baths, to accommodate eight persons, with first and second hot-rooms, shampooing-room, plunge bath, cooling-room, &c. Wash-house, with accommodation for sixty-six washers, eight water-driven hydro-extractors, waiting-room, workshop, &c., wash-house entering from East John-street. Private wash-house for washing towels. Apartment for library, 50 ft. by 22 ft., on the first floor fronting Whitevale-street, with separate entrance. Superintendent's house on third floor, and entering by library stair. The front to East John-street has the boiler-house and wash-house entrances, with two floors above, containing six houses of two apartments. I have gone into the question of the probable cost of this establishment along with Mr. John G. Atchison, measurer, and beg to report that the building will cost about £23,000 and the necessary machinery about £5,000; from this there falls to be deducted the sum of £1,200 which has been allocated towards the expense of the reading-room from the Rankin bequest fund."

OPENING OF BARTON WATERWORKS.

Mr. W. H. Sissons on the 27th ult. performed the ceremony of opening the new waterworks which have been constructed at Barton. A large number of persons witnessed the proceedings. The works consist of a well, 120 ft. deep, with a bore which goes to a further depth of 25 ft. There is a set of double pumps, capable of pumping 12,000 gallons per hour, and the softening tank has a capacity of 23,000 gallons. The adoption of water softening for the treatment of waters derived from chalk, lime and sandstone formations is, in the opinion of Mr. E. T. Hildred, the engineer consulted by the contractors of the filtering and softening plant, becoming very general. At Barton, he thinks, the experiment is a signal success. Messrs. Atkins' system is the one selected. The storage tank, which has been newly concreted by Mr. J. W. Briggs, contractor, of Barton, is capable of holding 120,000 gallons. The rest of the buildings consist of boiler-house, engine, pumping and filtering houses, foreman's house, board-room and the necessary outbuildings. All the works have been inspected, tested and pronounced satisfactory by Mr. Hildred. The hardness of the water as it issues from the well is 23.6, and at the first test of softening this was reduced to 9.00, which at once makes it an ideal water for domestic use. The company, however, hope to still further reduce the hardness.

At a luncheon which followed the opening of the works Mr. Hildred, in responding to the health of "The Engineers," congratulated the company on their pluck in putting down at the outset such a splendid system of softening and filtering. The speaker then went on to speak of the advantages of soft water over hard, and showed how it was possible by the use of soft water to effect a great saving, both in the manufactory and in the house.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

QUANTITY SURVEYOR.—August 19th.—Aylesbury Urban District Council.—Mr. J. H. Bradford, surveyor to the council.

ARCHITECTURAL ASSISTANT.—August 19th.—Beckenham Urban District Council. £3 3s.—Mr. J. A. Angell, surveyor to the council.

SECOND ENGINEERING ASSISTANT.—August 22nd.—Edmonton Urban District Council.—Mr. Wm. Francis Payne.

CLERK OF WORKS.—August 22nd.—London County Council. £5 5s.—Mr. R. W. Partridge, clerk of the Asylums Committee.

DEPUTY SUPERINTENDENT.—August 22nd.—Corporation of Dewsbury.—Mr. G. Trevelyan, clerk.

CIVIL ENGINEERING ASSISTANT.—August 23rd.—Corporation of the City of Hull. £85.—Mr. A. E. White, city engineer.

ELECTRICAL ENGINEER.—August 24th.—Watford Urban District Council. £150.—Mr. H. Morten Turner, clerk.

ARCHITECTURAL ASSISTANT.—August 24th.—Corporation of Halifax. £3 3s.—The Borough Engineer.

CLERK OF WORKS.—August 25th.—Corporation of Leicester. £3 3s.—Mr. James Bell, town clerk.

SURVEYOR.—August 25th.—Aysgarth Rnrs District Council. £100.—Mr. W. E. M. Winn, clerk, Askrigg, R.S.O., Yorkshire.

DRAUGHTSMAN.—August 26th.—Corporation of Bacup. 30s.—Mr. Francis Wood, borough engineer.

CLERK OF WORKS.—August 27th.—Vestry of St. Matthew, Bethnal Green. £4 4s.—Mr. F. W. Barratt, surveyor.

ELECTRICAL ENGINEER.—August 27th.—Corporation of Ashton-under-Lyne. £250.—Chairman, Electricity Committee.

DISTRICT SURVEYOR.—August 29th.—Cheshire County Council. £200.—Mr. Reginald Potts, clerk.

SENIOR ASSISTANT.—August 30th.—West Hartlepool Corporation. £78.—Mr. J. W. Brown, borough engineer.

ELECTRICAL ENGINEER AND MANAGER.—August 31st.—Corporation of Derby. £350.—Mr. H. F. Gadsby, town clerk.

SURVEYOR OF HIGHWAYS.—August 31st.—Chesterfield Rural District Council. £160.—Mr. George Shaw, clerk.

BUILDING INSPECTOR.—September 2nd.—Southend-on-Sea Corporation. £125.—Mr. William H. Snow, clerk.

SUPERINTENDENT OF SEWERS AND DRAINS.—September 5th. Vestry of St. Marylebone. £150.—Mr. W. H. Garbutt, clerk.

SUPERINTENDENT OF CLEANSING.—September 5th.—Vestry of St. Marylebone. £180.—Mr. W. H. Garbutt, clerk.

DISTRICT SUPERINTENDENT.—September 5th.—Vestry of St. Marylebone. £150.—Mr. W. H. Garbutt, clerk.

INSPECTOR OF NUISANCES AND SURVEYOR.—September 6th.—Little Woolton Urban District Council. £110.—Mr. Percy Dobell, clerk to the council.

CLERK OF WORKS.—Metropolitan Asylums Board. £3 3s.—Offices, Norfolk House, Norfolk-street, Strand, W.C.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

- ST. PANCRAS.—August 25th.—Erection of public baths and wash-houses.—Mr. C. H. J. Barrett, vestry clerk.
- PLYMOUTH.—September 24th.—Erection of shops and dwelling-houses fronting Tavistock-street, 2290.—Mr. J. H. Ellis, town clerk.
- WYVENHOPE.—September 20th.—Works of drainage and water supply, for the urban district council.—Mr. C. W. Denton, clerk.
- REIGATE.—October 6th.—Erection of municipal buildings, fire station, public offices, &c.—Mr. Clair J. Grece, town clerk.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

- MANCHESTER.—August 19th.—Construction of seven public urinals.—The City Surveyor.
- KIRKBY.—August 19th.—Sinking a bore-hole in connection with proposed pumping station.—Mr. W. A. Richardson, water engineer.
- CONSETT.—August 20th.—Kerbing, channelling, cementing and macadamising works.—Mr. William S. Shell, surveyor to the urban district council.
- TONBRIDGE.—August 20th.—Supply of 1,000 tons of best quality 2 in. broken quartzite, Guernsey granite, &c.—Mr. A. H. Neve, junr., clerk to the urban district council.
- RUGBY.—August 20th.—Works of street making and sewer construction, for the rural district council.—Mr. T. W. Willard, surveyor.
- SOUTHAMPTON.—August 20th.—Street works, for the urban district council.—Mr. Philip Hanger, clerk.
- HANPTON.—August 20th.—Supply and delivery of a 10-ton steam roller, for the urban district council.—Mr. John Kemp, a.m.t.c.e., surveyor to the council.
- OXFORD.—August 22nd.—Supply and laying of cast-iron and stone-ware pipe carriers, brick and concrete works in manholes and distributing chambers, land drainage, embanking, road making and other works on land adjoining the corporation sewage farm.—Mr. R. Bacon, town clerk.
- TREDINGTON.—August 22nd.—Making-up of Clarence-road, for the urban district council.—Mr. M. Hainsworth, surveyor to the council.
- STURMEX.—August 22nd.—Supply of 500 tons of 1 1/2 in. broken Guernsey, Leicester or other granite, for the urban district council.—Mr. William Onslow Times, clerk to the council.
- LITTLERLAND.—August 22nd.—Flagging works, for the urban district council.—Mr. W. B. Garton, surveyor.
- GLASGOW.—August 22nd.—Supply of rails and fish-plates.—Mr. John Young, tramway's manager.
- ROCHFORD.—August 22nd.—Repairs and alterations in connection with the construction of a filter tank and outfall, for the rural district council.—Mr. Frederick Gregson, clerk, Alexandra-street, Southend.
- BLANDON AND BYSHOTTES.—August 22nd.—Supplying and fixing engine and pumping machinery, for the urban district council.—Mr. Richard Gardner, surveyor.
- WILMSLOW.—August 22nd.—Construction of about 1,300 yards of 15-in. and 12-in. earthenware pipe sewers, &c., for the urban district council.—Mr. John Howdon, 14 Ridgfield, Manchester.
- MILTON.—August 23rd.—Supply of road materials, for the urban district council.—Mr. A. B. Acworth, surveyor.
- WALTON.—August 23rd.—Erection of public baths, for the urban district council.—Mr. E. J. Gowen, clerk to the council.
- TOURNAI.—August 23rd.—Repair of the masonry apron and foreshore at the Haldon breakwater.—Mr. Henry A. Garrett, a.m.t.c.e., harbour engineer.
- TYNEMOUTH.—August 23rd.—Paving works.—Mr. John F. Smellie, borough surveyor.
- GOUDA.—August 23rd.—Paving with hard wood about 3,750 square yards of roadway, for the urban district council.—Mr. Geo. England, clerk.
- BECKLOW.—August 23rd.—Works of levelling, paving, metalling, channelling and making good a street at Hale, for the rural district council.—Mr. J. McKenzie, surveyor.
- BECKLOW.—August 23rd.—Levelling, paving, metalling, channelling, &c.—Mr. J. M. McKenzie, surveyor to the rural district council.
- CASHTON.—August 23rd.—Supply of 200 tons of broken 1-in. Queenst of Guernsey granite and 620 yards of hand-picked flints, for the urban district council.—Mr. W. W. Gale, a.m.t.c.e., surveyor to the council.
- LEFORD.—August 23rd.—Construction of an underground latrine in The Broadway, for the urban district council.—Mr. Herbert Shaw, a.m.t.c.e., surveyor to the council.
- PENSTON.—August 23rd.—Supply of new steam boiler, for the urban district council.—Mr. E. Shaul, gas manager.
- MIDDLEBROUGH.—August 23rd.—Work required in the erection of retort-house, &c., at the corporation gasworks.—Mr. David Terrace, gas manager.
- PORTSMOUTH.—August 23rd.—Construction of sewers, outfall works, and other works connected therewith, for the corporation.—Mr. R. E. W. Herrington, Bank Buildings, Wolverhampton.
- CASHTON.—August 23rd.—Widening of High-street, for the urban district council.—Mr. W. W. Gale, a.m.t.c.e., surveyor to the council.
- WOTING.—August 24th.—Supply of sludge-pressing machinery, steam engines and other apparatus, for the urban district council.—Mr. R. Mossop, clerk.
- HALIFAX.—August 24th.—Excavation and formation of tramway track.—Mr. Edward R. S. Escott, borough engineer.
- FEOSTON.—August 24th.—Flagging, paving and other works.—Mr. V. W. Lathwaite, surveyor to the urban district council.
- HALIFAX.—August 24th.—Supply of steel rails, points, crossings, fish-plates, &c., for about 5 miles of tramway.—Mr. Edward R. S. Escott, borough engineer.
- NELSON.—August 24th.—Supply of cast-iron pipes, special castings, valves, &c., for the Water Committee.—Mr. J. Hartley, waterworks manager.
- SHORECHURCH.—August 24th.—Construction of about 333 lineal feet of 15-in. pipe sewer in Brittain-street (City-road end), for the vestry.—Mr. J. Rush Dixon, a.m.t.c.e., engineer and surveyor to the vestry.
- CARLISLE.—August 24th.—Laying of socket-jointed sewer pipe from Moorville to Knowell's Gates, for the rural district council.
- HALIFAX.—August 24th.—Supply of best Portland cement for tramway works.—Mr. Edward R. S. Escott, borough engineer.
- HALIFAX.—August 24th.—Erection of various works in connection with certain additions to the borough hospital.—Mr. E. R. S. Escott, engineer.

- PALMERTON.—August 24th.—Construction of about 1 mile of sewer.—Mr. Paul Partington, clerk.
- HELIX.—August 25th.—Supply and erection of electric lighting plant.—Mr. S. B. Butler, city electrical engineer.
- HACKNEY.—August 25th.—Supply and delivery of Portland cement required for works of wood paving.—Mr. James Lavigne, chief surveyor.
- TONBRIDGE.—August 25th.—Supply of clare kerling.—Mr. W. C. Cripps, town clerk.
- SHERBORNE.—August 25th.—Erection of technical colleges at Green-terrace.—Mr. P. M. Bowry, town clerk.
- DARWIN.—August 25th.—Erection and construction of iron and steel buildings in connection with a refuse destructor.—Mr. Charles Gaskell, town clerk.
- MALDEN AND COOMBE.—August 26th.—Erection of proposed public buildings at New Malden, for the urban district council.—Mr. Thomas V. Herbert Davison, architect, New Malden.
- MALDEN.—August 26th.—Works of drainage.—Mr. John Kirk, town clerk.
- HAWORTH.—August 26th.—Conversion of stone gas-holder into a tar and lignor tank, for the urban district council.—Mr. W. Tolbertshaw, clerk.
- MOSLEY.—August 26th.—Construction of brick culverts, together with manholes, storm-water overflow and other works.—Mr. W. Putnam, borough engineer and surveyor.
- WILMSLOW.—August 26th.—Sewering, kerbing, metalling and channelling.—Mr. William Cobbett, town clerk.
- MOSLEY.—August 26th.—Manufacture, delivery and erection of a steel girder bridge, to carry cast-iron pipes.—Mr. W. E. Putnam, borough engineer and surveyor.
- HALIFAX.—August 27th.—Supply and erection of mortar-house fittings.—Mr. Thomas Holgate, gas engineer.
- BLACKPOOL.—August 27th.—Erection of three-lift gas-holder.—Mr. John Chew, engineer and manager.
- NELSON.—August 27th.—Supply of 55 lineal yards of wrought-iron unclimbable fence.—Mr. B. Ball, borough engineer.
- CREATOR MOOR.—August 28th.—Providing and laying 3,000 superficial yards of asphalt at the Market-place, for the urban district council.—Mr. R. Robertson, surveyor.
- EAST HAM.—August 29th.—Supply of about 6,000 ft. run 12-in. by 8-in. brick and concrete curb, for the urban district council.—Mr. C. E. Wilson, clerk.
- EAST HAM.—August 29th.—Supply of about 1,000 yards of best lime Guernsey and about 1,000 yards of other kinds of broken granite, for the urban district council.—Mr. C. E. Wilson, clerk.
- EAST HAM.—August 29th.—Supply of 10-ton steam roller and a water-tray, for the urban district council.—Mr. C. E. Wilson, clerk.
- WYDLINGBO.—August 28th.—Supply of pipe work, for the urban district council.—Mr. A. H. Peerce, 39 Victoria-street, S.W.
- SHEFFIELD.—August 29th.—Construction and erection of additional buildings in connection with the destructor at Attercliffe.—Mr. Charles F. Wike, city surveyor.
- SHEFFIELD.—August 29th.—Supply and delivery of granite blocks.—Mr. R. P. Hirst, borough surveyor.
- DKYNSIDE.—August 29th.—Erection of convenience at Northcote railway.—Mr. John F. Burns, borough surveyor.
- BARRET.—August 30th.—Construction of new sewers, for the urban district council.—Mr. H. W. Mansbridge, surveyor.
- WATFORD.—August 31st.—Supply and delivery of electricity meters and meter cut-outs, for the urban district council.—Mr. H. Morten Turner, clerk.
- KING'S LYNN.—August 31st.—Construction of sewers in the south drainage district of the borough.—Mr. E. J. Silcock, borough engineer.
- WILLSAY.—August 31st.—Supply of wrought-iron railings and gates, for the urban district council.—Mr. H. W. Cook, clerk.
- BRIGHTON-TOWN.—August 31st.—Supply, construction and erection of foundations, arches, brick-work and farrage brickwork for retorts.—Mr. P. L. Ramsden, manager and engineer.
- CHICHESTER.—September 1st.—Construction of a system of surface-water drainage, for the urban district council.—Mr. Thomas Hibbert, surveyor.
- WEST HAM.—September 2nd.—Erection of museum at Stratford.—Mr. Fred. E. Hillary, town clerk.
- WELLS.—September 3rd.—Erection of public hall and post office buildings.—Mr. R. L. Foster, town clerk.
- NOLWICH.—September 3rd.—Making-up of Monmouth-street, Cavalry-street, Anchor-street, Walsdale-street and Tracey-road.—Mr. Arthur E. Collins, a.m.t.c.e., city engineer.
- DEKBY.—September 5th.—Construction of a covered service reservoir at Littleover.—Mr. H. F. Gadsby, town clerk.
- DEVONPORT.—September 5th.—Construction of drainage culvert.—Mr. John F. Burns, borough surveyor.
- BUXTON.—September 6th.—Supply and erection of electric lighting plant, for the urban district council.—Clark.
- SHEFFIELD.—September 5th.—Extension of cow-shed.—Mr. Henry Sykes, town clerk.
- ROCHDALE.—September 6th.—Electric lighting plant.—Mr. James Leach, town clerk.
- ALDERBURY.—October 6th.—Supply of 2,000 tons of broken 1 1/2 in. or less, for the urban district council.—Mr. W. F. Foster, clerk.
- ALDERBURY.—September 6th.—Supply and delivery of a 10-ton steam sifter, for the urban district council.—Mr. W. E. Foster, clerk.
- ALDERBURY.—September 7th.—Metalling of Albert-street, West End, for the urban district council.—Mr. W. E. Foster, clerk.
- ENNERLEY.—September 7th.—Work in connection with public baths.—Mr. K. Morham, city superintendent of works.
- WYDLINGBO.—September 7th.—Supply and delivery of various materials, for the urban district council.—Mr. G. Wheeler, clerk.
- SOUTHAMPTON.—September 8th.—Making-up of roads.—Mr. William H. Snow, town clerk.
- BANGOR.—September 10th.—Supply and erection of electric lighting plant.—Mr. R. Hughes Pritchard, town clerk.
- BIRMINGHAM.—September 13th.—Construction of aqueduct.—Mr. E. O. Smith, town clerk.
- NORRINGTON.—September 17th.—Construction of new sewer, Mr. Arthur Brown, city engineer.
- EDMUNTON.—October 17th.—For various works in connection with gas-holder tank at Ganton.—Mr. James M'G. Jack, clerk to the corporation.
- HOLDSWORTH.—September 18th.—Sewering, levelling, paving, metalling, channelling and making good certain roads, for the urban district council.—Mr. F. D. Askey, clerk.
- CARRICKMACROSS.—Construction of waterworks, for the supply of gardeners, acting as the rural sanitary authority.—Mr. James Thoburn, clerk and surveyor.
- CRAYFORD.—Supplying and laying 1,800 superficial yards of tar paving in Stanton-road, for the urban district council.—Mr. Edward Waugh, clerk.

TENDERS.

*ACCEPTED.

ASHTON-IN-MAKERFIELD.—For the supply and delivery of 250 tons of 2-in. best hand-broken granite macadam and 50 tons of 3-in. clean sharp granite chippings, for the urban district council.—Mr. John W. Livesedge, surveyor to the council:—

	2-in. Macadam.	3-in. Chippings.

G. T. LYNAM,

Borough Engineer and Surveyor.

Town Hall, Burton-upon-Trent.

August 17, 1898.

BOROUGH OF SOUTHEND-ON-SEA.

BUILDINGS INSPECTOR.

The Corporation invite applications for the appointment of a Buildings Inspector, at a salary of £125 per annum.

The person appointed will be required to supervise the erection of new buildings, and to see that the by-laws in force within the borough with respect to new streets and buildings are complied with, and it is essential that he should be practically acquainted with building construction and have a thorough knowledge of the Model By-Laws of the Local Government Board, under the Public Health Act, 1875.

Applications to be made in writing, accompanied by copies of not more than three recent testimonials (which will not be returned), stating age, qualifications, experience and where at present engaged, to be delivered at my office before 10 o'clock a.m. on Friday, the 2nd September.

Canvassing members of the Town Council will be a disqualification.

(By order)

WILLIAM H. SNOW,

Town Clerk.

Southend-on-Sea.

August 16, 1898.

VESTRY OF ST. MARYLEBONE.

APPOINTMENT OF SUPERINTENDENT OF

SEWERS AND DRAINS.

Notice is hereby given that the Surveyor to the Vestry is authorised to engage the services of a person competent to superintend the construction, maintenance and cleansing of all public sewers and drains, and the construction of drains, so far as laid by the Vestry, within the parish of St. Marylebone.

When the duties of the office have been performed for a period of twelve months in a manner satisfactory to the Surveyor the person engaged will be submitted to the Vestry for appointment. He will be required to reside in the parish and to devote the whole of his time to the duties of the office.

The salary will be at the rate of £150 per annum, rising by annual increments of £10 to £200, the grant of such annual increments to be dependent upon the efficient and satisfactory discharge of the duties of the office, and the appointment will be made upon the understanding that no pension or retiring allowance will attach thereto.

Applications, in candidate's own handwriting, stating age (which must not be less than thirty nor more than forty-five years), with copies of three testimonials (only) of recent date, to be forwarded to J. Pagot Waddington, c/o Surveyor to the Vestry, at the Court House, Marylebone-lane, W., endorsed "Application for Superintendentship of Sewers and Drains," on or before Monday, September 5th proximo.

(By order)

W. H. GARBUIT,

Vestry Clerk.

August, 1898.

VESTRY OF ST. MARYLEBONE.

APPOINTMENT OF DISTRICT SUPER-

INTENDENTS.

Notice is hereby given that the Surveyor to the Vestry is authorised to engage the services of three persons (one for each of the three districts into which the parish is divided) competent to superintend the execution of all macadam, flint and paved carriageway and footway works, and to undertake the supervision of all hoardings, public lamps, &c., within the district to which each may be appointed. When the duties of the office have been performed for a period of twelve months in a manner satisfactory to the Surveyor each person engaged will be submitted to the Vestry for appointment. He will be required to reside in the parish and to devote the whole of his time to the duties of the office.

The salary will be at the rate of £150 per annum, rising by annual increments of £10 to £200, the grant of such annual increments to be dependent upon the efficient and satisfactory discharge of the duties of the office, and the appointment will be made upon the understanding that no pension or retiring allowances will attach thereto.

Applications, in candidate's own handwriting, stating age (which must not be less than thirty nor more than forty-five years), with copies of three testimonials (only) of recent date,

to be forwarded to J. Paget Waddington, c.e., Surveyor to the Vestry, at the Court House, Marylebone-lane, W., endorsed "Application for District Superintendentship," on or before Monday, September 5th proximo.

(By order)
W. H. GARBITT
Vestry Clerk.

August, 1898.

BOROUGH OF WEST HARTLEPOOL.
JUNIOR ASSISTANT.

Wanted, in the Borough Engineer's Department, a Junior Assistant, who has been thoroughly trained in the duties of a borough engineer's office. He must be a good draughtsman and surveyor, and have architectural ability. Salary, £78 per year.

Applications, stating age, present employment, and accompanied by copies of three recent testimonials, and addressed to the "Chairman of the Works Committee," endorsed "Junior Assistant," are to be delivered at this office on or before 4 p.m. on the 30th inst.

(By order)
J. W. BROWN,
Borough Engineer.

Borough Engineer's Office, West Hartlepool.
August 11, 1898.

VESTRY OF ST. MARYLEBONE.
APPOINTMENT OF SUPERINTENDENT OF
CLEANSING.

Notice is hereby given that the Surveyor to the Vestry is authorised to engage the services of a person competent to discharge the duties of superintending the street cleansing, washing, watering, snow removal, &c., of the parish of St. Marylebone. A horse and trap will be available for use by the person engaged, in order that he may be enabled to efficiently discharge the duties of the office. When such duties have been performed for a period of twelve months in a manner satisfactory to the Surveyor the person engaged will be submitted to the Vestry for appointment. He will be required to reside in the parish and to devote the whole of his time to the duties of the office.

The salary will be at the rate of £180 per annum, rising by annual increments of £10 to £230, the grant of such annual increments to be dependent upon the efficient and satisfactory discharge of the duties of the office, and the appointment will be made upon the understanding that no pension or retiring allowance will attach thereto.

Applications, in candidate's own handwriting, stating age (which must not be less than thirty nor more than forty-five years), with copies of three testimonials (only of recent date), to be forwarded to J. Paget Waddington, c.e., Surveyor to the Vestry, at the Court House, Marylebone-lane, W., endorsed "Application for Cleansing Superintendentship," on or before Monday, September 5th proximo.

(By order)
W. H. GARBITT,
Vestry Clerk.

August, 1898.

RURAL DISTRICT COUNCIL OF CHESTERFIELD.

This Council is prepared to receive applications for the office of a Surveyor of Highways for the northern district of their jurisdiction, the area of which is 32,921 acres, with a population in 1891 of about 36,589 people and about 126 miles of highways.

The salary to be paid will be after the rate of £100 per annum, rising £10 per annum until the sum of £200 is reached, which sum will include everything (stationery and postages excepted).

The person appointed must be competent to take levels, prepare plans, estimates and bills of quantities of any works required to be done, and must personally see to the carrying out of the same. He must also be competent to keep all books and accounts required under the Acts, obey all orders of the Council and other road authorities, and devote his whole time to the duties of his office.

The person appointed will be required to reside at Eckington or Staveley.

Security in the sum of £200, with an approved guarantee society, for the due performance of the duties will be required, and the appointment will be terminable by three calendar months' notice on either side.

Applications, stating age (which must not exceed forty-five) and previous occupation, accompanied by three testimonials of recent date, to be sent to me on or before the 31st instant.

Canvassing is strictly prohibited. Only third-class railway fare (return) will be allowed to selected candidates. No allowance for hotel or other expenses.

(By order)
GEORGE SHAW,
Clerk.

Union Offices, Chesterfield.

WRITE FOR TESTIMONIALS.

PATENT TRUINVERT PIPE.

To put it shortly, this pipe secures true alignment of invert, increased strength in the socket, three gas and water-tight connections at every joint, and, while allowing for a slight settlement when first laid, forms an absolutely rigid joint directly the cement sets.

POINTS :

- 1.—One and Water-Tight Joints easily made under water.
- 2.—True Alignment of Invert.
- 3.—Socket the strongest part of the pipe
- 4.—No special junctions required.

AA—Hole for pouring in cement or composition.
BB—Strengthened and Lengthened Socket.

CC—Inner Socket and Rest.
EE—Chamber for cement or composition.
FF—Standard Joint in new position.

OATES & GREEN, Ltd., Halifax

CITY OF HULL.

The Corporation require a Civil Engineering Assistant in the City Engineer's office, at £85 per annum.

It is essential that candidates should be quick and neat draughtsmen.

Applications, stating age, experience and qualifications, are to be delivered to the undersigned on or before Tuesday, the 23rd August.

Testimonials need not be sent in the first instance.

(By order)

A. E. WHITE,
City Engineer.

Town Hall, Hull.

TENDERS WANTED.**CITY OF NOTTINGHAM**

TO CONTRACTORS.

The Stoke Farm Committee of the City Council is prepared to receive tenders for the Construction of a new Sewer in Lenton Boulevard, together with all appurtenant works.

The works required consist of the construction of about:—
1,750 yards Brick and Concrete Main Sewer, 9 ft. wide and 7 ft. 3 in. high.

40 yards 4 ft. 6 in. diameter Brick Barrel Sewer.

16 yards 5 ft. diameter Brick Barrel Sewer.

146 yards 3 ft. 6 in. by 2 ft. 4 in. Egg-Shaped Brick Sewer.

55 yards 3 ft. by 2 ft. Egg-Shaped Brick Sewer.

24 yards 15 in. diameter Pipe Sewer.

550 yards 12 in. diameter Pipe Sewer.

80 yards 9 in. diameter Pipe Sewer and other appurtenant works.

Drawings may be seen, and specification, bills of quantities and forms of tender obtained, at my office, on payment of a deposit of 3 guineas, which will be returned on receipt of a *bona-fide* tender and the copy of the specification.

Sealed tenders, endorsed "New Sewer, Lenton Boulevard," are to be sent to the Town Clerk on or before Saturday, the 17th September, 1898.

The lowest or any tender will not necessarily be accepted, and tenders will only be accepted from persons who conform

to the conditions of contract as regards paying the local standard rate of wages, &c.

(By order)

ARTHUR BROWN, M.INST.C.E.,
City Engineer.

Guildhall, Nottingham.
August 16, 1898.

WALLASEY URBAN DISTRICT COUNCIL.

WROUGHT-IRON RAILINGS.

The Wallasey Urban District Council are prepared to receive tenders for the supply of Wrought-Iron Railings and Gates for the fencing-in of extended Cemetery.

Specification, forms of tender and further particulars may be obtained on application to Mr. W. H. Travers, District Engineer and Surveyor, Public Offices, Egremont, Cheshire, at which place tenders are to be delivered not later than Wednesday, the 31st instant, in sealed envelope, endorsed "Cemetery Railings," and addressed to the Chairman of the Health Committee.

The Council do not bind themselves to accept the lowest or any tender.

H. W. COOK,
Clerk to the Council.

Public Offices, Egremont, Cheshire.
August 16, 1898.

CARRICKMACROSS UNION.

NOTICE TO CONTRACTORS.

The Board of Guardians of the above Union, acting as the rural sanitary authority, will, at their meeting to be held at 2 o'clock p.m. on Tuesday, 6th September, 1898, be prepared to consider tenders for the construction of works to supply the town of Carrickmacross with water, in accordance with plans and specification prepared by P. F. Comber and the late W. G. Stryke, MEMBS. INST. C. E., 19 Lower Leeson-street, Dublin, which can be seen at the office of Mr. J. H. Blackader, solicitor, Carrickmacross, between the hours of 11 a.m. and 3 o'clock p.m. daily.

The works comprise the supply and laying of 102 tons or thereabouts of Cast-Iron Water Mains; the construction of a Pumping House, with duplicate sets of oil engines and three-throw gun-metal plunger force pumps, each set of pumping

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

Easily and quickly laid by unskilled workmen.
Perfect alignment of invert secured.
Joint readily made absolutely watertight.
Cheapest Patent Joint in the market.

JANDUS PATENT ELECTRIC ARC LAMP.

Gold Medal, Hull Exhibition, 1898.

It is claimed that the Master Patents held by the Jandus Arc Lamp and Electric Company, control the arrangements which are essential in every successful enclosed arc lamp.

The Only Lamp that is trimmed without moving the Globe. Cannot get Out of Order, as it has Only One Working Part. No other Carbons should be used in the Jandus Lamp except those supplied by the Firm, for which the Lamps sent out are adjusted.

Jandus Enclosed Arc Lamp.

Burns 150 to 200 Hours without re-trimming.

No hissing. No danger from falling particles of Carbon.

No skilled labor required. A steady light. A great saving in cost of Carbons. Gives the same useful light as the open arc lamp for the same expenditure of power.

No flimsy racks, clockwork, or flexible cords are used in this lamp. Burns singly on circuits of 90 to 200 volts, 2 in series on all voltages from 200 to 250, and 3 or more in series if fitted with automatic cutout.

THE ENCLOSED ARC LAMP. THE ENCLOSED ARC LAMP. THE ENCLOSED ARC LAMP.

The phenomenal success of the Jandus Lamp, which was the Pioneer in enclosed Arc Lamps, has brought a host of imitations. Users should not be put off with the cheaper lamps.

Sole Agents for the English Company:—MESSRS.

**EAST HAM URBAN DISTRICT COUNCIL.
SUPPLY OF BROKEN GRANITE.**

The above-named Council invite tenders for the supply of about 1,000 yards of Best Blue Granite and about 1,000 yards of other kinds of Broken Granite.

Particulars and form of tender may be obtained of Mr. W. H. Savage, the Council's Surveyor, at the Public Offices, East Ham.

Tenders to be sent in on or before 5 o'clock on Monday, August 29, 1898.

So far as is practicable in connection with this contract the person or persons whose tender is accepted will be required to pay such rates of wages and observe such hours of labour as are recognised by the trades unions, and also to supply the Council with the schedule rate of wages adopted by his or their firm.

C. E. WILSON.
Clerk to the Council.

Public Offices, East Ham, E.
August 17, 1898.

**EAST HAM URBAN DISTRICT COUNCIL.
SUPPLY OF GRANITE CURB.**

The above-named Council invite tenders for the supply of about 6,000 ft. run 12-in. by 8-in., also about 10,000 ft. run 12-in. by 6-in. Granite Curb.

Particulars and form of tender may be obtained of Mr. W. H. Savage, the Council's Surveyor, at the Public Offices, East Ham. Tenders to be sent in on or before 5 o'clock on Monday, August 29, 1898.

So far as it is practicable in connection with this contract

the person or persons whose tender is accepted will be required to pay such rates of wages and observe such hours of labour as are recognised by the trades unions, and also to supply the Council with the schedule rate of wages adopted by his or their firm.

Clerk to the Council.

Public Offices, East Ham, E.
August 17, 1898.

**HORNSEY URBAN DISTRICT COUNCIL.
TO ROAD AND SEWER CONTRACTORS.**

The Hornsey Urban District Council are prepared to receive tenders for Sewering, Levelling, Paving, Metalling, Channelling and Making-good the following Roads and Portions of Roads, all situate within the district of Hornsey—viz.,

- (1) Barrington-road (third section),
- (2) Harefield-road, and
- (3) Hampden-road (second section).

Plans and specifications may be seen, and forms of tender and all information obtained, on application to Mr. E. J. Lovegrove, Engineer to the Council, at the offices mentioned below, on any morning (on or after Monday, the 29th inst.) between the hours of 10 and 12 o'clock, on a sum of £2 being deposited with the Clerk to the Council, which sum will be retained by the Council and deemed to be forfeited if a *bona fide* tender is not made by the depositor.

If a tender is made which is not accepted the sum deposited will be returned, and if a tender is accepted such sum will be retained by the Council until the contract has been executed by the depositor, and will be forfeited in the event of his or his sureties failing or neglecting to execute such contract or the bond accompanying it within seven days after he or they respectively shall have been requested to execute them.

No tender will be considered except on the prescribed form. Sealed and endorsed tenders are to be deposited in the tender-box in my department not later than 4 o'clock p.m. on Monday, the 19th day of September next.

The Council reserve to themselves the right to decline all or any, or any portion, of the tenders so sent in.

Minutes of Proceedings.

Protection of Water Supplies.

Some time ago Dr. Bruce Low submitted a report to the Local Government Board with respect to complaints regarding the Bury water supply. The chief remedies indicated were the protection of the watersheds and filtration. Bury Corporation, however, were even then formulating a scheme, though it appears to have been at first considered that the prevention of pollution by the acquisition of the watersheds, which were the subject of complaint, would render filtration unnecessary. The question of the pollution of gathering grounds of water supply has given much anxiety to many local authorities, and the thriving and enterprising borough of Bury has certainly been perplexed by a water problem which has greatly taxed its energies and resources. During the session which has just come to a close a Bill aiming chiefly at the improvement of the water service of the borough has occupied the attention of both Houses of Parliament. In May last a committee of the House of Lords was engaged in the investigation of the merits of a scheme which was evidently matured after most careful inquiry on the part of highly competent experts. That House had to deal with very powerful opposition, and the petitions lodged in the House of Commons were in themselves evidence enough of the vigilance and activity of property owners and rival authorities, who conceived, rightly or wrongly, that their interests were menaced. The Bill itself was of what is known as the "omnibus" type—that is to say, it embraced other subjects than water. From Dr. Bruce Low's report it appears that the water supply of Bury is obtained from six gathering grounds, five of which are situated at distances varying from 2 to 10 miles from the borough, the sixth lying on the outskirts, though almost altogether within the boundary of the town. Dr. Low's communication to the Local Government Board dealt exhaustively with each of the gathering grounds, and showed the areas of collecting reservoirs and the capacity of the springs. As a matter of historical interest, we may remark that the waterworks, which now belong to the Bury Corporation, were originally the property of two companies—the Radcliffe and Bury Waterworks Company and the Haslingden and Rawtenstall Waterworks Company. As time went on Bury, the most important centre of that energetic manufacturing district, acquired predominance, and at various times powers were given for the construction of additional works. At the present time the gathering grounds of the Bury Corporation consist in great part of high-lying moorlands, sparsely populated except in some places. The collecting reservoirs have been constructed in most instances by throwing dams across valleys, the people resident upon the gathering grounds being chiefly occupied with agricultural pursuits. The water is not filtered before delivery to the consumers, but it passes through a copper-wire gauze screen, in some cases,

before entering the mains. The gathering grounds, which, as already stated, are six in number, are Calf Hey, 872 acres; Holden Wood, 1,313 acres; Hampton or Clow Bridge, 1,303 acres; Clough Bottom, 736 acres; Harden Clough or Shuttleworth, 206 acres; and Gin Hall, 202 acres. The Bury Corporation were of opinion that the carrying out of the regular and systematic flushing of the mains and gradual replacement of the old, encrusted and corroded pipes with modern ones, properly prepared against internal encrustation, would result in a total cessation of the complaints that have hitherto been frequent. The corporation were advised that the construction of filter-beds would entail an expenditure almost beyond their present resources without giving absolute security against water-borne disease. There can be no doubt that the corporation have done their very best to provide an ample and pure supply of water, but the difficulties with which they have had to contend have been of no ordinary magnitude. As would be observed from the reports we recently published of the Private Bill proceedings, the corporation decided not to rely upon the mere acquisition of watersheds for the prevention of pollution, but to adopt a system of filtration. They have certainly done well, not only in grappling promptly with the problem, but in making an effort to meet the requirements of the Local Government Board, though this involves considerable additional expenditure.

We regret to find ourselves provided this week with more than one cause for grumbling. One of those causes is found set forth in the paragraph elicited by the stupendous—and in the case of one clause offensive—list of duties drawn up in connection with the appointment of borough surveyor in a small Welsh town. Another cause will be found in connection with a list of questions sent to municipal engineers in order that they might supply gratuitous information to another borough. Now, we freely admit that this custom, within certain limits, has long been a recognised one, and has undoubtedly prevailed to a considerable extent. Municipal engineers have always been glad to help one another, and in no way is this more conclusively shown than in connection with the gratuitous work that is given in organising the district meetings of the Association and in the preparation of papers. Banded together, as the great majority of them undoubtedly are, especially those in the more prominent positions, in a strong Association, it is not to be expected that the spirit of co-operation will stop short at meetings of that Association. If a municipal engineer be suddenly called upon to carry out a new scheme in a branch of work in which professional practice varies considerably, it is obvious that the experience of other towns in the same direction must be of considerable assistance to him in framing a report on

the subject and in supporting such recommendations as he may decide to lay before his council. Such assistance is naturally most serviceable to the younger members of the profession; as they grow older and more experienced they become more and more able to dispense with it. But it does not follow that because municipal engineers are prepared to give a certain amount of gratuitous assistance to one another, from the strong feeling of *esprit de corps* that prevails among them, they should be called upon to dispense it to all and sundry, or, at all events, to other classes of officials. This, as we have before now had occasion to point out, is carrying altruism too far in these days, when competition is so severe and when professional knowledge and skill cannot always find remunerative scope for their exercise. When the method of obtaining knowledge by a circular of questions is resorted to among municipal engineers it is recognised as desirable to keep the questions within reasonable limits, both as to number and scope, so as not to trench too much on the time and attention of those to whom they are addressed. So far as concerns the list of questions we print this week in another column, this wise discretion seems to have been thrown to the winds, and we leave our readers to calculate for themselves the length of time that would be absorbed in giving adequate replies to such an interminable string of questions. The gravest feature of the case, however, in our opinion, is that the circular has been issued, not by a municipal engineer, but by a medical officer of health. Now, the erection of a refuse destructor is no doubt partly a sanitary question, but surely it is to a much greater extent an engineering question, and, whether or not it be combined with an electric lighting scheme, it lies much more within the province of the municipal engineer than of the medical officer of health. This is probably how the great majority of municipal engineers will look at the question, and for that and other reasons will very likely decline to act as so many consulting engineers without fee. Simply because they are generally prepared to stretch a point to assist a brother engineer, it does not follow that they should be called upon to do the same for all and sundry, especially when the application is the outcome of a clear invasion of the municipal engineer's province by another official.

* * *

Public Health Work in Edinburgh.

Municipal engineers who attended the recent annual meeting at Edinburgh, and those who followed our report of it, are familiar with the name of Baillie Pollard as one who has always taken an enlightened interest in public health work. He has now brought out a well-printed and illustrated pamphlet giving an historical sketch of the development of public health work in Edinburgh, and a description of its culminating achievement in the erection of the new hospital at Colinton Mains. In Edinburgh, as elsewhere, the growth of the movement was tardy and intermittent, and the energising effect of outbreaks of disease was apt to be temporary, even though the severity of the outbreak was aggravated by the peculiar construction of the high houses, a result of the walling in of the town. Baillie Pollard sketches the sanitary history of the city from the fifteenth century. Peculiarly interesting it is, and we regret that we cannot do more than make a passing reference to it here. Something may be said as to the water supply, as its imperfect nature had much to do with the former condition of the city. In 1621 the sunk wells were augmented by the introduction of a supply from the near Pentlands at Comiston. Powers were granted for the construction of a 3-in. pipe, but the supply continued very unsatisfactory until the completion of the reservoir on Castle Hill sixty years later. By means of this reservoir an equable—and except in times of great drought a fairly constant—supply was maintained. Further supplies from Comiston

were introduced in 1722, and again in 1785, while in 1790 the Swanston area was tapped, and in 1821 the Edinburgh Water Company introduced the Crawley water. No further increase was made till the Moorfoot scheme of 1870 gave the inhabitants the supply upon which they must subsist until the completion of the Talla scheme four or five years hence. But for the spread of the city beyond the city walls to the south and over the fields lying on the north side of the Nor' loch, an improved water supply would have availed little in the interest of public health. The dwellers in the lofty tenements in the Old Town, having to carry all their water, used as little as possible. About 100 years ago the city was considered one of the filthiest in the United Kingdom, and earned opprobrious words both from Smollett and from Samuel Johnson. Better conditions, however, gradually supervened; but the century was sixty years old before typhus was stamped out. A new municipal and sanitary era was inaugurated for Edinburgh by the appointment in 1863 of a medical officer of health in the person of Dr. (now Sir) Henry D. Littlejohn, who began his work by a remarkable report on the sanitary condition of Edinburgh. Not only describing the existing state of affairs, but suggesting improvements and remedies, he sharply awoke the citizens to a sense of their sanitary dangers and civic duties. A succession of able and conscientious lord provosts—especially Chambers and Russell—assisted in the work, and the result was the series of extensive improvement and other schemes of which we gave an account in connection with the recent annual meeting. One of the greatest of the works is the new hospital for infectious diseases, on which no less than £250,000 sterling will be spent. The main object of Baillie Pollard's excellent publication is to give a full description of this great work, and those who are interested in hospital construction should certainly procure a copy of the book, for it comprises an exhaustive series of plans. It is published by T. & A. Constable, Edinburgh University Press. We should mention that the architect of the new building is Mr. Robert Morham, superintendent of public works.

* * *

East London Water Supply.

A final settlement of this irritating question seems as far off as ever. As soon as a drought of more than average duration sets in the East-End is threatened with its periodical water famine, and the continuous supply is suddenly cut off. The contradictory statements that find their way into the Press require a considerable amount of sifting on the part of anyone who wishes to do justice to both sides. A few years ago the East London Water Company confidently asserted that if they were allowed to carry out certain works they would be able to cope with any emergency that might arise. Now comes a drought—bad enough to be sure, but by no means so severe as many that have been experienced in the past—and the company are quite unable to cope with it satisfactorily, from the consumer's point of view at all events. We are told that their calculations did not contemplate such a drought as this, and that they are now carrying out additional works for which powers were obtained last year. If the calculations were on too modest a scale, the company must accept the responsibility for the consequences. A six hours' supply is a peculiarly dangerous state of affairs in the East-End. There remains the point that only one company has been inconvenienced by the drought, and we are told that the East London Company suffers from the fact that another company has priority of claim upon the Lea water. This, in our opinion, is simply a condemnation of the source, and should make a good many people think again of Wales. There remains the question of supplementary supplies from other companies. On the one side we are told that the East London Company can draw in

times of necessity only upon the New River Company. On the other hand were are told that five companies can be drawn upon—by purchase. If so, we should certainly advise the company to be liberal in the matter. To our mind the only likely solution of the problem is the bringing of the whole water supply of the metropolis under proper public control.

Duties of a Borough Surveyor.

We have received a copy of a portentous list of duties which was drawn up recently for the behoof of candidates for an appointment as borough surveyor in a small Welsh town. Everyone knows, of course, that it is customary on these occasions for such a list of duties to be drawn up, but is it too much to expect that some glimmerings of a conscience should be shown in drafting the document? Here is a small Welsh town, and yet they want accomplishments in their borough surveyor which would stamp him as an engineer of very remarkable capabilities indeed. If it were an appointment to which a salary of something between £500 and £1,000 a year were attached there might be less to be said, but nothing like this salary is found in connection with the municipal surveyorship of an insignificant Welsh borough, even though a county town. As our readers have an opportunity of perusing the document for themselves, we need not refer to the clauses in detail. To this, however, we wish to make one exception. The phenomenal accomplishments which are expected in return for a trifling salary are bad enough, but one particular clause is so grossly offensive in its terms that no one could without loss of self-respect enter upon an office in which such a condition attached. We refer to clause 5, in which, after stating that the surveyor will be required to prepare all surveys, plans and estimates of new works and alterations (Parliamentary and otherwise) required by the corporation, the extraordinary condition is added that "should the surveyor be found incapable of properly doing any particular work required of him the council or any committee may employ another surveyor and deduct the cost from any salary that may be due to him, the council or committee to be the sole judge of any matter arising out of this clause." What next? We certainly sympathise with an official who is under agreement to accept the decision of people who can, apparently without blushing, draft or endorse a clause like this.

Typhoid in Camborne.

The sanitary condition of rural and semi-rural districts is evidently a source of no small tribulation to the medical department of the Local Government Board. One of the reports recently issued by the Local Government Board is that by Dr. R. Bruce Low on an outbreak of enteric fever in the Camborne urban district and in portions of the adjoining rural districts of Redruth and Helston. Briefly put, the matter is this. In December of last year a sudden outbreak of enteric fever appeared simultaneously in the three adjacent parishes of Camborne, Hlogan and Crowan, situate in three separate sanitary districts. Altogether 165 attacks, with twelve deaths, were recorded in about six weeks. The only condition common to the three localities was that of water supply, derived from the same source—the Camborne Water Company's waterworks. This company's supply immediately previous to the outbreak came from Boswyn, where some springs are piped to a service tank, and where, to augment the supply, water from a brook was piped to the same tank. Within the catchment area of this brook there occurred, in October and November, 1897, in a single cottage four cases of enteric fever, the discharges from which fouled a pond close to the dwelling. In wet

weather the pond in question overflows, and the water therefrom runs down the hill in a channel to the above-mentioned brook, entering it 160 yards above the pipe leading from the brook to the service tank. In mid-November the rainfall was excessive, and by the flood thus caused the fever poison emanating from the infected cottage was no doubt swept into the Boswyn supply. After the brook water was shut off from the service tank, and after the service tank had been scrubbed out and cleansed and the water mains well flushed, the outbreak came suddenly to an end. The inspector's final summing up is that the general sanitary condition of Camborne, as well as of parts of Crowan, is far from being satisfactory.

Death of Mr. Ashmead.

It is with deep regret that we record the death, on Tuesday, of Mr. Frederick Ashmead, formerly borough engineer of Bristol and a past-president of the Incorporated Association of Municipal and County Engineers. After serving his articles with the late Mr. Underwood, a civil engineer and architect, he was one of the resident engineers during the construction of the South Wales Railway, being in charge of the Neath section. Mr. Ashmead returned to Bristol in 1851, when he was appointed deputy borough engineer, Mr. Armstrong then filling the post of borough engineer. On the death of the latter Mr. Ashmead was appointed borough engineer, a post he held with credit to himself and benefit to his native city until 1894, when ill-health compelled him to retire, and he was appointed consulting engineer, being succeeded as borough engineer by Mr. T. H. Yabbicom. The main drainage works of Bristol, which are inseparably connected with Mr. Ashmead's name, were begun in 1855 and completed in 1874, at a cost of £163,000. The deceased gentleman was president of the Incorporated Association of Municipal and County Engineers in 1877-78, when the annual meeting was held at Bristol.

The Dublin Congress.

In another column we give some notes of the proceedings at the Health Congress at Dublin, which constituted the annual conference of the Royal Institute of Public Health. However interesting the papers and discussions may have been for medical officers and for those sanitarians who are accustomed to look at sanitary questions chiefly from the medical side, we cannot find that there was a great deal that was distinctly interesting to the municipal and sanitary engineer. In this respect the Sanitary Institute generally contrive to prepare a much better programme. There were some suggestive passages in the opening address of Sir Charles Cameron. In the engineering and building construction section papers were read on such subjects as the designing and construction of refuse destructors, hidden dangers in the sites of dwelling-houses and, the subsoil in relation to sites for dwellings. In the municipal and Parliamentary sections the topics of discussion included the housing of the working classes, and the municipalisation of tramways and public lighting. If likely to be of sufficient interest to our readers, we shall give abstracts of some of these.

PROFESSIONAL PROVERBS.

- For Members of Local Authorities:* Take care of the houses and the towns will take care of themselves.
- For a Householder:* When the workmen come in at the door comfort lies out of the window.
- For a Constructor of Roofs:* There's many a slip 'twixt rafter and hip.

Royal Institute of Public Health.

ANNUAL CONGRESS AT DUBLIN.—I.

The annual congress of the Royal Institute of Public Health, which this year was arranged to be held at Dublin, was formally opened on Thursday, when the delegates and visitors were received by the Lord Mayor of Dublin, the president of the congress and the executive committee, in the examination hall of Trinity College.

The proceeding were opened by Prof. William Smith, M.D., the president of the institute, who in a brief address introduced Sir Charles Cameron as the president of the congress. Sir Charles Cameron then delivered his

PRESIDENTIAL ADDRESS.

The President opened his address by expressing his warmest thanks to the institute for the honour which they had conferred upon him in selecting him to preside at the congress. He next welcomed, on behalf of the Reception Committee of the congress, the visitors who had come from England, Scotland, Wales and the Irish provinces to take part in the proceedings of the congress. Touching on the questions which would come under discussion at the conferences, the president referred to

HIGH DEATH RATES IN TOWNS.

The aggregation of a large number of people upon a limited area operates, he said, injuriously upon their health and lessens the mean duration of their lives. Many years ago Doctor—now Sir William—Gairdner, of Glasgow, pointed out that, whilst the death rate in England was 15 per 1,000 persons living on every square mile, it rose as the density of population increased until it became 27 and upwards when the population came to be 2,900 per square mile. The death rates in purely rural districts have not been very largely reduced since the beginning of the present century; in the towns the case has been different. Before the system of national registration of deaths was adopted there existed the means of closely approximating the death rates in towns. The causes which raise the urban death rates so much above the rural ones are numerous and perhaps not fully discovered. The causes of the enormous difference between the bills of mortality of the healthiest and least healthy of the towns have not been fully investigated. The contagion of the fevers must clearly be more readily conveyed from the sick to the sound in towns, owing to the closer contact of the people. The town atmosphere is less pure than the air of the country; its soils are generally contaminated with filth. In its narrow streets and courts the direct sunlight—so necessary to maintain the purity of the air—and thorough ventilation are wanting. The effete matter from dwellings and workshops and the sweepings of the streets are sometimes allowed to accumulate and to pollute the air by their noisome exhalations. Many of the occupations of the townspeople are of a more or less unhealthy nature, and the majority of them are sedentary. The outdoor life of the farmer and agricultural labourer is obviously more healthy than that of the town bakers, shoemakers, tailors, mill-workers, &c. The death rate in Ireland is for the whole country very low. In the ten years ended in 1896 it was only 18. In the same period the rate in Hungary was 35.6 and in Austria 30. The low rate in Ireland is largely due to the circumstance that by far the larger portion of the population reside in the open country. The urban bills of mortality are very high. In the decade ended in 1897 the death rate was 24.65 per 1,000 in the twenty-three largest towns. Their zymotic death rate was 2.64. There is therefore a great difference between town and country death rates in Ireland.

PUBLIC HEALTH IN DUBLIN.

As this congress is meeting in Dublin, it seems fitting that some account of the sanitary state of the city should be given to it. Thirty-two years ago the sanitary staff of Dublin consisted of one whole man (an inspector of nuisances) and a small part of another man (the secretary to the Markets Committee). At present the staff consists of a superintendent medical officer of health, who holds also the positions of public analyst and executive sanitary officer, fifteen district medical officers of health, who hold that position *ex-officio* as poor law medical officers, a sanitary engineer, a superintendent and assistant superintendent of sanitary sub-officers (i.e., nuisance inspectors), twenty-three sanitary sub-officers, three inspectors of dairies, three food inspectors, an inspector of slaughter-houses, two inspectors (one a lady), under the provisions of the Shop Hours Act, and about a dozen persons, exclusive of whitewashers and charwomen engaged in disinfection operations and the removal of fever patients to hospital. The disinfecting premises have recently been improved and enlarged at a cost of £2,000, and a large isolated house, the property of the corporation, has been fitted up, at a cost of £500, as a refuge for persons whose dwellings are undergoing disinfection. The estimated expense of the sanitary department, exclusive of the cost of making and maintaining sewers, was, in 1897, £23,607. Salaries and wages amounted to £9,065 10s.; £1,040 was, however, received as a Parliamentary grant in aid of the salaries of the sanitary officers,

and a considerable revenue is derived from the baths and wash-houses and other sources. Loans for the following purposes have been sanctioned, and all but a small portion obtained and expended: For clearing unhealthy areas (on which the Dublin Artisans' Dwellings Company have since erected houses), £54,200; artisans' and labourers' dwellings, £137,323; new streets, by which slums were cleared away, £116,000; public abattoir, £16,700; baths and wash-houses, £12,500; improvement in disinfection house, £2,000; a refuge for persons whose houses are being disinfected, £500; a mortuary, £200; open spaces, £2,900; offices for sanitary department and city laboratory, £10,000; underground sanitary accommodation, £2,200—£354,523. For the following purposes, which also tend to improve the public health, loans have been sanctioned and nearly altogether obtained: Sewers and works connected with them, £62,107; works in connection with public and domestic scavenging, £34,050; paving, flagging and concreting, £121,988; fish and vegetable markets, £98,800; "private improvement" expenses, £12,628. All these make a total of £384,096. For another great sanitary improvement—namely, the main drainage of the city—a loan of £350,000 has been sanctioned and is being expended. Lastly, if we add the cost of the improved supply of water to the city—namely, £720,000—we have a grand total of £2,054,096 expended on purposes all of which tend to improve the health and comfort of the citizens. When the main drainage and sewage precipitation scheme is completed—probably in about two years more—the Liffey will no longer be polluted, and the sewage, now impounded for many hours daily, will flow uninterruptedly through the sewers. He hardly ventured to claim that the large sum of money expended in sanitary works in Dublin and the exertions of the sanitary department of the corporation had been the chief means by which the reductions in the death rate had been effected. He had, however, no doubt that if the sanitary staff still consisted of only one individual and part of another there would be much more fever in Dublin than there had been for some years past.

HOUSING OF THE POOR.

The improvement in the viability of the working classes which has taken place within the last thirty years is to some extent due to the better dwellings provided for them. Owing to the benevolence of the late Mr. Peabody, Lord Iveagh and other philanthropists, a considerable number of healthful dwellings have been built for artisans and labourers. A still larger number have been erected by companies, some of which have been founded on semi-philanthropic semi-commercial lines. In this city and its suburbs the Dublin Artisans' Dwellings Company own dwellings occupied by 2,194 families, who pay from 1s. 9d. to 12s. per week. This company is now constructing 188 additional dwellings. The City and Suburban Artisans' Dwellings Company have provided dwellings for 284 families, who pay from 2s. 6d. to 6s. per week; the Industrial Tenement Company own a block of buildings in which there are forty-six separate tenements, let at from 2s. to 4s. per week. Many employers of labour, such as railway companies, brewers, distillers, &c., have erected improved dwellings for their employees. Fourteen years ago he suggested to the corporation the desirability of putting in force the provisions of the Housing of the Working Classes Act. The suggestion was acted upon, and at the present time the corporation have provided 375 separate dwellings. Whilst much has been accomplished in the way of providing proper dwellings for artisans and the better class of unskilled workers, practically nothing has been done to improve the miserable state of the homes of the very poor. It is in the wretched homes of these poorest of the poor that the seeds of fever are developed as in a hotbed. Their dwellings are a peril to the whole community, for their inmates carry contagious matter into the streets, shops, factories and other places. It is the dwellings of the very poor that demand nearly all the attention of the sanitary inspector. He finds it almost an impossibility to get their owners, who are nearly as poor as their tenants, to keep them in even moderately good condition. Since 1879 more than 3,000 houses have been tenanted and closed in Dublin on account of their insanitary condition; of these not one-half have been rebuilt or rendered fit for human occupation. He is convinced that the ordinary landlords of tenement houses, the majority of whom are leaseholders only or yearly tenants, cannot provide proper dwellings at from 1s to 2s. per week, the rent which the very poor can only afford. Dwellings so low rented can only be provided by the municipality or by philanthropic societies and individuals. An attempt is now being made to raise a sum of money sufficient to erect a block of tenements which it is proposed to let at from 1s. 6d. to 2s. per week.

MUNICIPAL AUTHORITIES AND LOANS FOR ARTISANS' DWELLINGS.

The borrowing powers of municipal authorities are limited to a sum equivalent to two years' valuation of the town for

ratesable purposes. Thus, if a town were valued at £1,000,000 its governing body would be empowered to borrow £2,000,000. When this restriction was placed upon civic authorities the money borrowed by them was expended nearly, if not altogether, on what might be termed unproductive works, such as the paving, sewerage and lighting of the thoroughfares, &c. It seemed to him to be unreasonable that the money expended by urban authorities in providing artisans' dwellings, baths and wash-houses, abattoirs and markets, from which revenues are derived, should be included in the amount authorised to be borrowed. Mortgages on these buildings as well as the security of the rates is required by the Treasury for loans granted in connection with them. It is evident that as the loans for the erection of artisans' dwellings are to be placed in the same category as loans for sewers and other non-revenue producing works, the power of municipal authorities to provide dwellings for the working classes must be extremely limited. It is to be hoped that this disability will soon be removed. The market value of the artisans' dwellings in the possession of the sanitary authorities should be ascertained, and the sum found added to the amount allowed to be borrowed on the two years' rateable valuation system. Thus, if a corporation could borrow £1,000,000 for unproductive purposes, and that it possessed artisans' dwellings valued at £100,000, then their borrowing powers should be extended to £1,000,000.

THE WATER CARRIAGE OF FILTH.

When, in 1879, the Department of Public Health was placed under his direction he commenced to wage a determined war against the system of storing filth in pits, which had prevailed in Dublin for centuries, exclusively in the poorer quarters of the city and partially in the other districts. To this storage of filth must be ascribed the polluted condition of the soil, which still has not yet been got rid of. It was no easy task to induce or compel the owners of houses to adopt the water-carriage system of filth removal, but the task has practically been accomplished. Unfortunately, the occupants of the tenement houses too often do not take proper care of the improved sanitary conveniences supplied for their use, and the landlords complain that they are constantly called upon to repair injuries to the sanitary arrangements due to the action or carelessness of their tenants. The Public Health Act provides that in the case of two or more houses having sanitary accommodation in common the tenants can be collectively proceeded against for the abuse of the sanitary arrangements. The law should be made to apply to single houses inhabited by two or more families. In this connection he would like to express his strong opinion that every separate dwelling should be supplied with sanitary arrangements for its exclusive use. Those which are used in common by several families will never be kept in proper order.

PREVALENCE OF TYPHOID FEVER IN DUBLIN.

The mortality caused by typhoid fever is greater in Dublin than in nearly every other town in the United Kingdom. In Ireland, Belfast alone has a higher death-rate from this disease. On the other hand, diphtheria is very much less fatal in Dublin than in the English towns. He had come to the conclusion that both diseases have, to a great extent, a telluric origin; they seem to be in some way intimately connected with the soil. If, then, they take both and regard them as semi-malarial, Dublin will not occupy a worse position than the English towns. The deaths from enteric fever and diphtheria combined were in 1887-96 in the ratio of 55 per 100,000 persons living in Dublin and 60 per 100,000 in London. In 1897 the rate was 54 in Dublin and 64 in London. In 1896 the mean diphtheria rate alone was 50 per 100,000 in London, Wales, Essex, Kent and Worcestershire; in Dublin diphtheria and enteric fever combined caused 44 deaths per 100,000 inhabitants. Dublin has a supply of water of great purity; its street sewers can compare favourably with those of other towns; and the plumbers' work in its houses is as good as it is in the great majority of towns. Why, then, should there be so much enteric fever in Dublin? He had long been of opinion that the micro-organisms of this disease have an abiding place in its soils, which for so long a period were polluted by leakage from the filth receptacles and defective sewers of former times. He believed that, under certain conditions to which he had often referred in papers and reports, these malignant organisms escape from the soil into the atmosphere, from which they pass through various media into the bodies of human beings. That there is a connection between enteric fever and the soil is shown by the results of observations of the distribution of more than 4,000 cases of the disease in Dublin. Where gravel forms the site of streets there is far more typhoid fever than in districts which rest upon the stiff boulder clay. This is clearly owing to the fact that the "bacillus typhosus," which is aerobian—that is, requires oxygen—can get it more freely in the loose gravels than in the stiff clays. In the gravel, too, there is a much greater space for the development and movement of the bacilli. It has long been assumed that the soil of Dublin lying nearest to the river was always waterlogged, and it was suggested that the drainage of this soil and its subsoil might lessen the prevalence of enteric fever. A few years ago he caused a number of wells to be sunk in the ground near the river and at the higher parts of the city. Long-continued observations

of the height of the ground, or subsoil water in those wells, proved that in the higher the water came to within 4 ft. or 5 ft. of the surface of the ground, whilst near the river the water remained at from 12 ft. to 18 ft. from the surface. It seems strange that the surface of that part of the city from 50 ft. to 70 ft. above the level of the river at high water should be only 4 ft. or 5 ft. above that continuous sheet of subterranean water termed subsoil or ground water, whilst the low-lying districts have from 12 ft. to 18 ft. of dry soil. The explanation is, after all, a simple one. The low-lying districts rest on gravel, which permits the rain to sink into it very deeply, whilst the high grounds are stiff clays, which retain the water. When a soil becomes infected by the *materies morbi* of typhoid fever it is difficult to eradicate it. The recent experiments of Dr. Sidney Martin, recorded in the supplement to the annual report of the English Local Government for 1896-97, show that typhoid bacilli put into soil multiply in it and ramify throughout it; at the expiration of 105 days they were quite lively. These experiments and the investigations of other scientists, especially of Dr. Porter, of Stockport, clearly prove that typhoid bacilli can live and multiply in soils containing organic matter. He felt satisfied that they are to be found in the soils of Dublin and other places. Now that the pollution of the soil in Dublin has almost ceased, we may expect that the *parvulum* of the typhoid organism will gradually be used up, with consequent diminution of the amount of enteric fever.

CONCLUSION.

The president then concluded his address, stating that, although a great improvement has taken place in the state of public health in these countries and most parts of Europe, a further improvement is required and is obtainable. So long as two or three out of every thousand of the population perish annually from diseases which are termed "preventable," so long must the efforts of the sanitary reformers and professors of preventive medicine be continued. They required, perhaps, some additions to and amendments of our sanitary laws, but what is most required is the thorough enforcement of the laws, such as they are, and they confer great powers upon the sanitary authorities. The notification of infective diseases and the laws relating to disinfection should be strictly enforced. The proper isolation of fever patients should be provided for. The speedy and complete removal of filth from houses and towns should be secured. Healthy dwellings and cheap baths and wash-houses for the most dependent classes of the community should be multiplied. The "unhealthy occupations" should be rendered innocuous, or, at least, less unhealthy. The injurious emanations from certain kinds of work should be prevented or reduced to a minimum. These are only some of the measures required in order to assimilate our towns as nearly as possible to that ideal City of Hygieia which Richardson has described.

Soon after the conclusion of the above address the Health Exhibition, which occupies the principal chambers of the Royal University Buildings, Earlsfort-terrace, was opened by his Excellency the Lord-Lieutenant. The ceremony was conducted in the ladies' waiting-room, and afterwards the Lord-Lieutenant and the other members of the viceregal party were conducted through the exhibition by Sir Charles Cameron and the members of the Exhibition Committee. Following this, the luncheon given by the high sheriff to the institute took place in the examination hall. Upwards of 600 persons partook of the lunch, during which the Royal Irish Constabulary band performed a selection of music. Among the toasts honoured were "Her Majesty the Queen," "The Members of and Delegates to the Congress," "The High Sheriff of the City of Dublin," and "The Lord Mayor and Members of the Dublin Corporation." The proceedings then terminated, and the remainder of the day was spent in inspecting the Health Exhibition.

The following day, Friday, was chiefly devoted to the meetings of the several sections of the congress, when the president of each respective section delivered his presidential address. In the afternoon, by the kind invitation of Sir Christopher and Lady Nixon, a large number of the members joined a garden party in the grounds of Roebuck Park, Clonskeagh, and in the evening a ball was given by the lord mayor at the Mansion House, when a very numerous and distinguished company attended.

On Saturday the various sections resumed their meetings, and in the afternoon a garden party was given by Alderman Meade and Mrs. Meade at St. Michael's, Ailesbury-road. This was followed in the evening by a banquet at the Royal College of Surgeons, at which the Lord-Lieutenant was present.

Monday was entirely devoted to excursions to different places of interest within a short distance of the city. A party of 150 travelled to Rathdrum, co. Wicklow, and from there drove to the historic and beautiful neighbourhood of Glendalough. On their return through Bray they, with many others, availed themselves of an invitation by Sir Henry and Lady Cochrane to a garden party. Another party travelled to Belfast, where they were received by the local committee of the congress, driven to various places of interest, and entertained at luncheon by the lord mayor. The party returned to Dublin by special train in the evening.

On Tuesday, the last day of the congress, the various sec-

tions concluded their meetings, after which a general meeting of the congress was held in the Examination Hall. In the afternoon visits were paid to Lucan and Maynooth, and in the evening the popular lecture to the congress was delivered in the theatre of the Royal Dublin Society by the Right Rev. Monsignor Malloy, D.D., D.Sc., on "Wireless Telegraphy," Signor Marconi's own and most recently perfected apparatus being kindly lent for the occasion.

Next week we will publish abstracts of some of the more important papers likely to interest our readers.

INFORMATION WANTED.

The following portentous list of questions was recently addressed by a medical officer to municipal engineers. We have some general remarks on the subject in our editorial column. The questions were:—

- (1) Name of city or town. (2) Population. (3) Rateable value. (4) Type of destructor and name of maker or patentee. (5) Area of land provided for destructor. (6) Total number of cells. (7) Number used at one time. (8) Is a fume cremator used? (9) Height of chimney in feet. (10) Total gross capital outlay—(a) land, (b) works, (c) appurtenances, (d) total. (11) Total working expenses—(a) fuel, (b) wages, (c) repairs and renewals, (d) any other expenses, (e) total. (12) What sum is written off annually as depreciation on plant? (13) Products of destructor. (14) Amount and value of (a) clinkers, (b) mortar, (c) of any other product. (15) What use is made of steam generated? (16) How are clinkers disposed of? (17) Cost of burning per annum. (18) Percentage of capital outlay and interest. (19) Working expenses and depreciation. (20) Total gross cost. (21) Less value of products. (22) Total net cost of burning. (23) Number of loads disposed of by destructor—(a) during day, (b) during night, (c) total annually. (24) Number of men required to work destructor—(a) by day, (b) by night. (25) Total cost per load of collecting refuse and carting it to destructor. (26) Nature of refuse carted. (27) Average weight of a load of refuse. (28) If all refuse is not disposed of by destructor, what is done with remainder? (29) At what intervals and on what system (daily, weekly, &c.) is refuse collected? (30) Do you burn in the destructor the following—(a) privy midden contents, (b) market refuse, (c) trade refuse. (31) Is any charge made for collecting the latter; if so, what? (32) What distance is destructor from centre of town? (33) Approximate distance of destructor from nearest group of houses. (34) Have complaints ever been received of the following nuisances in connection with the destructor?—(a) carting offensive refuse to it? (b) deposit of refuse at it? (c) fumes or smells? (d) dust from refuse or chimney? (e) depreciation of land, &c., in vicinity? (f) any other cause? (35) In the event of any complaints, what have been respectively the results of investigation and attempted remedies? (36) Do you consider that there are any genuine objections to the placing of a modern destructor in the central part of the town? (37) What do you estimate as the calorific value of your average refuse? (38) What horse-power per cell do you estimate you could obtain on an average by burning house refuse. (39) Have you an electric lighting installation—(a) combined with, (b) separate from, the refuse destructor? (40) Was your destructor combined with the electric lighting scheme from the commencement or has it been added since? (41) Is any fuel besides refuse used for generating steam for this purpose; if so, in what approximate quantities. (42) On what system (high or low tension) is your electric lighting worked? (43) Do you use accumulators or thermal storage in your system? If so, please state—(a) capital outlay, (b) working expenses, (c) depreciation. (44) What is the cost per ton of the most generally used steam coal in your town? (45) Can you state what the cost per unit is using coal as a fuel and what it is using house refuse as fuel? (46) Are you of opinion, that all things considered, the raising of steam for electric lighting purposes by burning house refuse is advisable. Were there any serious objections to the system that you are aware of?

THE DRAINAGE OF DORCHESTER.

The report of the Dorchester Town Council in committee on the surveyor's report relative to the borough drainage and extension schemes has been received. The committee are of opinion that Mr. Hunt's report, with the accompanying plans and sections, is of a most careful and complete character except in regard to the method of treatment to be adopted in dealing with the sewage at the outfall, which question, for good reasons, Mr. Hunt has reserved for further consideration, having regard to the scientific investigations upon the subject which are now taking place and the great difficulty of arriving at the present time at a satisfactory conclusion as to the method of treatment best adapted for Dorchester. The surveyor's scheme, so far as he has propounded it, both as regards the drainage and extension of the borough, appears to meet the requirements of the town, subject to a slight addition of area at the sewage outfall, which the committee have explained to the surveyor.

MARKET IMPROVEMENTS AT ILFRACOMBE

PROPOSED EXPENDITURE OF £5,000.

Mr. H. Percy Boulnois, M.I.C.E., recently conducted an inquiry, on behalf of the Local Government Board, with reference to an application of the Ilfracombe Urban District Council for sanction to borrow £5,000 for market purposes. The application was opposed by a number of owners of property included in the improvement.

Mr. FINCH, who appeared on behalf of the council, in opening the inquiry referred to the growth of Ilfracombe, which made the proposed work necessary. He related the circumstances connected with the exchange of sites with the Wesleyan trustees, one of the conditions upon which this was obtained being the making of a road 24 ft. wide on the west side of the market so far as the chapel extends. He referred to the purchase of the land for market extension in 1887 by the old local board, and remarked that the cost of the old market, erected in 1862, had been entirely met, but there was a balance of £1,094 due on the additional land purchased in 1887 for £1,400. The council intended making a 22-ft. road the entire length of the west side of the building, in accordance with sec. 166 of the Public Health Act, as an approach road. The entire cost would be about £5,000. It being mentioned that the council's by-laws insisted upon new roads being made 36 ft. wide, Mr. Finch stated that the road would not be a new road, strictly speaking, but only an approach to the market.

Mr. O. M. PROUSE, surveyor to the council, explained the plans in detail. He said that the area of the old market was 8,300 square feet, but it had been reduced to 5,800 ft. by the erection of the chapel on a portion of the site. The plans provided for a space of 14,000 ft., including 2,250 ft. in balcony accommodation. His total estimate was £5,014, which the council appeared to think excessive. The plans provided for lavatories, &c., and the building would be in two flats, instead of four as originally. The new buildings would be higher than the old, but he did not think that they would shut out light and air from the opposite property. Witness concluded by explaining the original agreement with the owners of the Wildersdale property as to making the road 36 ft. wide.

Mr. H. BRAUND, chairman of the council, stated that the exchange of sites was approved by the ratepayers and sanctioned by the Local Government Board. That involved the making of a road one-third of the distance, and the council thought it better to continue it the whole length. If the Wildersdale owners renewed their offer to give up 12 ft. of land the council might make the road the full width.

Several owners of property next gave evidence, opposing the scheme on various grounds, chiefly that of expense.

Mr. BRAUND, at the request of the inspector, was again called, and gave evidence as to the necessity of the new market during the summer months. He said that under existing circumstances it was impossible to widen Market-street, because of the position of the chapel. If they attempted it, all they could do would be to make a kind of "square," which would not be advantageous. The council considered that the approach road on the west side would relieve the traffic and thereby be beneficial to the Market-street property. He was sure the council had no wish to injure anybody and would willingly modify their scheme to meet any real grievance.

The inspector then closed the inquiry, remarking that he would report to the board in due course.

LONDON'S STREETS.

Past finding out are the ways of vestry paving committees. After all these years of experiment they have not yet decided upon one uniform kind of paving for London streets. The consequence is that in a comparatively short drive one may come upon wood, macadam, asphalt and granite sets. Nor do they seem able to agree upon a definite plan of campaign, so as to avoid having two parallel main thoroughfares "up" at the same time. At the present moment, when the Strand is absolutely impassable, half Holborn is in the hands of the excavators, and we should not be surprised if an excuse were found to dig up the Embankment also. To such vagaries we have grown accustomed. But at least it might have been expected that the Strand authorities, having decided to repave, would have chosen the most lasting wood for the purpose. Years ago a small portion of the roadway was laid with some species of Australian wood. The experiment answered admirably. Will it be believed then (asks *The Globe*) that the Strand Vestry has actually reverted to the use of the old crooked deal blocks, which under the wear and tear of skidded omnibus wheels cannot last more than a couple of years, when all the present discomfort will have to be repeated? There is no excuse for this reactionary measure, for there are now three or four large companies in London engaged in the supply of the durable Australian woods and able to furnish any quantity of the necessary blocks. One feels almost inclined to echo the witticism of Sydney Smith, and say if only the vestrymen would lay their heads together the thing would be done. Meanwhile we sincerely commend the action of the Strand to other paving authorities as an example of how not to do it.

Comparative Reports of General Practice.

XXVI.—REFUSE DESTRUCTORS : TIVERTON REPORT.—III.

HASTINGS (Population 58,000).

In the case of these works, which are under the superintendence of Mr. P. H. Palmer, no definite figure is supplied concerning the weekly capacity of the destructor. The latter, however, is working every day, refuse being destroyed at a cost of 1s. 6½d. per ton. Some 15 per cent. of clinker is produced by the cells, each of which deal with 9 tons of matter daily. Messrs. Manlove, Alliott & Co. were the builders of the works, which are situated in a residential neighbourhood a quarter of a mile from houses. The contract price was £4,000. The chimney stack is 130 ft. high. Complaints, it seems, are only received when the fame chambers are not working. Waste heat is used to pump water for street purposes, and also to drive sewage pumps; the coal bill of the latter previously amounted to £200 yearly.

HEREFORD (Population 22,000).

The destructor, which is to be under the superintendence of Mr. J. Parker, is expected to dispose of 50 tons of refuse weekly, 33 per cent. of clinker remaining. It will work daily. There will be four cells, which will each be capable of consuming 7 tons of matter in twenty-four hours. Messrs. Meldrum Brothers are the contractors for the work, which is being carried out in a residential neighbourhood, but half a mile from populous parts and adjoining the sewage outfall works. The chimney stack, which is 40 ft. in height, was erected with the sewage works. The works will cost £700, and it is proposed to generate steam to drive sewage pumps (which cost £200 annually in coal) with the waste heat.

HORNSEY (Population 70,000).

Mr. E. J. Lovegrove has charge of the destructor here. From 250 to 350 tons of refuse is dealt with every week, the works running every day. As to cost, the men are paid 1s. for every 25 cwt. burnt; clinker remaining amounts to 25 per cent. There are twelve cells attached to the destructor, six being erected in 1889 and six since. Each destroy 8 tons of matter daily. The contractors were Messrs. Goddard, Massey & Warner. The works are in a residential quarter, and in the midst of houses and a thickly-populated district. They are, it may be mentioned, very near the open filtering-beds of the New River Company; their cost was £9,828, that of the chimney stack (217 ft. in height) being £2,750. No complaints have been made in regard to the destructor, the waste heat from which is utilised in driving a mortar mill, sawing and drilling machinery, a clinker crusher and slab-making machinery.

HULL (Population 225,000).

The engineer managing the works at Hull is Mr. A. E. Whyte. Some 250 large loads of refuse are dealt with every week, at a cost of 1s. 12d. per ton; the destructor runs every day and leaves 33 per cent. of clinker. Fourteen tons of matter are consumed by each cell (there are six). The works were erected by Messrs. Manlove, Alliott & Co. in a manufacturing district and within built up area, 60 yards from houses. Their cost was £2,268; that of the chimney, which is 180 ft., was £932. Formerly there were complaints regarding charred paper coming from the works, but none have been made as to smell. Waste heat is not made use of.

HYDE (Population 32,000).

Mr. J. Mitchell is the engineer at Hyde. Working every day, with the exception of Sunday, over 130 tons of matter is dealt with at a cost of 2s. per ton. There are four cells to the destructor, which was erected in June, 1893, by Messrs. Goddard, Massey & Warner, and each cell destroys from 5 to 6 tons of matter daily. The town is of a manufacturing character, the works being situated near the centre, close to the sewage works and 250 yards from houses built since the erection of the destructor. A sum of £4,656 was spent upon the carrying out of the works. The cost of the chimney shaft was included with that of the buildings; the shaft has a height of 180 ft. No complaints have been made. Waste heat is used to drive a mortar mill.

LEYTON (Population 90,000).

At Leyton, where 190 tons of house refuse and 135 tons of pressed sludge are destroyed every week at a cost of 1s. 7d. per ton, Mr. William Dawson is engineer. Work is carried on for five days (of twenty-four hours) in the week, and from 25 to 30 per cent. of clinker, which is subsequently sold, remains. There are eight cells to the destructor, but only four work. Messrs. Benman & Dens were the builders of the works, which commenced working in October, 1896; each cell deals with from 15 to 17 tons per twenty-four hours. Leyton is a residential district, and the destructor is situated some 200 yards from good property. The sewage works, a large board school and a fever hospital also adjoin the buildings. The latter cost £7,000, and the chimney stack, which is 150 ft. high, £1,100. No complaints have been made. The waste heat in this case drives two 96 horse-power Babcock & Wilcox boilers, attached to a dynamo, fans, sewage pumps, sludge presses and mixing machinery.

LIVERPOOL.

The refuse destroyed here amounts to 630 tons weekly. The cost per ton is 1s. to 1s. 3d., and the clinker remaining usually amounts to 17 to 18 per cent. of clinker and from 8 to 9 per cent. of fine ash. There are thirty-two cells in the destructor, which was completed in 1893 by Messrs. Manlove, Alliott & Co. The district is a manufacturing one. The cost of the destructor and chimney shaft (which is 170 ft. in height) was £12,143.

LOUGHBOROUGH (Population 20,000).

Mr. O. A. Walker supervises the work of refuse destruction at Loughborough, where from 60 tons to 80 tons of matter are weekly dealt with, work being carried on every day. Labour in connection with the work is paid for at the rate of 9½d. per ton. Clinker remaining amounts to 24 per cent. There is one cell, which deals with from 15 tons to 20 tons of refuse daily; the buildings were put down in 1865 by Messrs. Colman & Sons. This town is also largely interested in manufactures. The destructor occupies a position adjoining the sowage farm—a mile from the town. Its erection cost £1,100; the chimney, the height of which is 80 ft., cost £203. It was only on the occasions of fish offal being destroyed that complaints were made; this particular refuse is now, however, only burnt at night. Sewage pumps are driven by the waste heat.

LONDON (Population 36,240).

The engineer here is Mr. J. W. Wardle. Two hundred and twenty tons of matter are weekly dealt with, at a cost of from 10d. to 11d. per ton, the works running every day, and from 25 to 30 per cent. of clinker usually remains. The destructor has six cells, each with a capacity of 6½ tons per twenty-four hours; the buildings were completed in 1896. Messrs. Manlove, Alliott & Co. and Messrs. Goddard, Massey & Warner were the contractors. The works are situated in a manufacturing district, the nearest houses being 150 ft. distant. A sum of £6,840 was spent upon their erection; the chimney stack cost £1,000 and is 150 ft. in height. Steam is generated by the waste heat, and used in connection with the forced draught and for driving a mortar mill.

NEWCASTLE-UPON-TYNE (Population 218,000).

Engineer, Mr. George Laws. Working every day, these works destroy 400 tons of refuse in a week at a cost of 8½d. per ton. The clinker resulting amounts to between 25 and 30 per cent. There are twelve cells (each having a capacity of 8 tons per twenty-four hours) to the destructor, which was constructed in the years 1886 and 1891 by respectively Messrs. Manlove, Alliott & Co. and Messrs. Goddard, Massey & Warner. The district is both manufacturing and residential in character, the works, on which £7,000 were spent, being situated in a quarter 100 yards from houses. Complaints concerning the working have been very few in number, and all without foundation. The chimney shaft in this case is 150 ft. high. Nothing is done with the waste heat.

NOTTINGHAM (Population 235,000).

The engineer here is Mr. Arthur Brown. Refuse destruction is carried on every day, and 200 tons are dealt with every week, 20 per cent. of clinker remaining. There are five cells to the works, which were erected in 1882 by Messrs. Manlove, Alliott & Co. Each cell has a capacity per twenty-four hours of 8 tons. The destructor buildings occupy a position 200 yards from houses, and in a district of both a residential and manufacturing character. Their cost was £6,000; that of the chimney, which is 160 ft. in height, being £1,401. There have been no complaints. The waste heat is employed in connection with electric lighting and for working an elevator and mortar mill.

OLDHAM (Population 147,000).

Mr. S. A. Pickering has charge at this town, where, working every day with the exception of Sunday, some 500 tons of matter is dealt with at a cost of 9½d. per ton. Clinker remaining usually amounts to 33 per cent. There are ten cells, each with a capacity of 8 tons. The works were erected in the years 1891 and 1895 by the Horsfall Furnace Syndicate. Oldham is a populous manufacturing town, and houses face the destructor buildings, which have cost £4,000 to erect. The chimney shaft, which is 120 ft. in height, cost £527. No complaints have been made regarding the works, the waste from which is used to generate steam for blast furnaces and for the electric light and workshops.

ROCHDALE (Population 73,000).

The engineer responsible for the work of destruction at Rochdale is Mr. F. W. Brookman. Refuse dealt with totals 500 tons weekly, work being carried on daily with the exception of Saturday afternoon and Sunday. The cost per ton is 10d., and 35 per cent. of clinker is left. There are two large cells to the destructor, and each has a capacity of 1 ton per hour. The works were erected in 1894 by Messrs. Meldrum Brothers, their position being close to the centre of the town which is a manufacturing one. The height of each, it is

said, is one of the healthiest in the borough, in spite of its low-lying character. A sum of £1,000 was spent upon the chimney shaft. Some complaints, it appears, have been made regarding the destruction of excreta, but they have not been very frequent. In the case of the ordinary refuse there have not been any. Waste heat is utilised in connection with a manure factory, mortar mills, electric light, &c.

ROYTON (Population 14,500).

At Royton Mr. Thomas Bleasdale has charge of the destructor. Working every day except Sunday, 78 tons of refuse is destroyed weekly, at a cost of 10½d. per ton. About 45 per cent. of clinker is left. Each cell of the destructor (there are four) consumes 43 tons of matter. The works were laid down in 1893 by Messrs. Goddard, Massey & Warner. They occupy a site a quarter of a mile from houses. The district is a manufacturing one; £4,500 was spent upon the buildings, while the chimney, which is 210 ft. in height, cost £900. No complaints have been received. Steam is raised from the waste heat to press sludge.

SHOREDITCH (Population 124,000).

Mr. J. Rush Dixon superintends the Shoreditch works, which deal with 450 tons of refuse weekly, working day and night. Clinker remaining amounts to 30 per cent. There are twelve cells, each with a capacity of 10 tons per twenty-four hours. Messrs. Manlove, Alliott & Co. were the contractors for the works, which are situated in the centre of a densely-populated manufacturing district and only 25 ft. from houses. The chimney stack is 150 ft. high and cost £2,700; the works cost £17,800. With the exception of some informal complaints in reference to dust caused by the removal of clinker, no trouble has been experienced. As is well known, electric lighting is carried on by means of the waste heat.

WARRINGTON (Population 62,000).

The works here are in the hands of Mr. James Deas, and destroy 250 tons of refuse every week. Work is carried on every day except Saturday and Sunday. The cost per ton is 7½d., and 25 per cent. of clinker remains from the working. There were originally three cells, each capable of dealing with 15 tons of refuse in a day of twenty-four hours, but two more were, at the time of the compilation of the report, in course of erection by Messrs. Beaman & Deas. The works stand 50 yards from houses and outside the borough, which deals largely with manufacture. They cost £3,964 to build, while £480 was spent upon the chimney stack, which is 120 ft. in height. There have been no complaints. The waste heat generates steam to drive fans and machinery for evaporating excreta. It is intended to shortly use it for the supply of electricity.

WHITECHAPEL (Population 78,676).

Mr. J. Paget Waddington has charge here. The works destroy 520 tons of refuse weekly, at a cost of 1s. 10d. per ton, and work every day with the exception of Saturday. They leave 25 per cent. of clinker. Sixteen cells are attached to the destructor, and each destroys from 6 tons to 8 tons daily. Eight were erected in 1886 and the remainder in 1893 by Messrs. Manlove, Alliott & Co. The neighbourhood is both a manufacturing and residential one, the works being in the centre of the town; £8,400 was spent upon the works and £2,000 upon the chimney, which is 180 ft. high. Some years ago there were some complaints regarding the dust from the shaft. Nothing is done with the heat from the destructor.

WINCHESTER (Population 20,000).

Mr. William Gamon, engineer. The works, running every day, deal with 180 tons of matter weekly, at a cost of 7d. per ton. Each cell, of which there are two, deals with ten loads. The contractors were Messrs. Manlove, Alliott & Co. and Messrs. Goddard, Massey & Co. The works were erected in the years 1885 and 1892. They adjoin the sewage pumping station. The district is a residential one; £745 was spent upon the works. There have been no complaints. Two Meldrum blowers and one Green's economiser are worked by the waste heat.

WOOLWICH (Population, 41,314).

Working every day with the exception of Sunday, the works in this district, where Mr. H. O. Thomas is engineer, deal with 180 tons of refuse weekly. Clinker remaining totals 25 per cent. There are six cells in the works, which were erected in 1893 by Messrs. Manlove, Alliott & Co., and are situated in a residential neighbourhood. The cost of erection was £5,000, the cost of the chimney, the height of which is 160 ft., being included in that sum. There have been no complaints. Heat is not utilised.

Limerick.—A special meeting of the corporation was held on Thursday week to consider a scheme for the laying down of a line of electric tramway. The scheme, subject to certain modifications, has met the requirements of the Board of Works, who, a few days since, sent down a special engineer to hold an inquiry into the project. Mr. H. D. Connor attended at the corporation and explained the details of the scheme, which was being promoted by a number of wealthy Dublin gentlemen. The cost of the line of tramways which it was now proposed to make was estimated at £67,000.

MACADAMISED TRAM ROADS AT SHEFFIELD.

A REPORT FROM THE CITY SURVEYOR.

The city surveyor of Sheffield has reported to the Tramways Committee on the question of using macadam on streets where tram rails are to be laid. He says:—

"In accordance with the request of your committee, I now give reasons for so strongly condemning the adoption of the system of constructing the tramways in suburban roads, either with a set on each side of the rail and macadam in the middle, or with macadam only as was suggested at the last committee. The chief advantages are: (1) The impossibility of keeping an even surface to the road where macadam and rails join. This is difficult in the case of macadam and sets, but it would be far worse if the sets were abandoned, because (a) the rails and macadam are of very different degrees of hardness, (b) it is scarcely possible to make a good joint between the two, (c) the vibration of the rails would soon shake the macadam loose. (2) The road would have to be constantly under repair, causing additional expense, as well as inconvenience to frontages along the route. (3) The macadam between the rails could not be satisfactorily rolled and would always be loose. It would be difficult to put down on account of the sets or rails. (4) It would soon wear hollow and hold water. (5) On gradients this hollow would in times of rain act as a watercourse and the macadam would gradually be washed away. (6) The track could not be properly cleaned, and it would be nearly impossible to keep the rails free from mud in wet weather. This is much more important with electric traction than with horses, and the rails would wear much quicker.

"Before giving my opinion to the committee I was quite conversant with the methods of construction adopted in nearly all the large towns of England, but I thought the members might like to have the opinions of the different surveyors. I have therefore written to them and obtained a large number of replies. Generally the replies are most unfavourable, and my opinion is unaltered. Many of the surveyors speak of macadam paving for tramways in the most unfavourable terms, and I feel certain if the system is adopted it will prove a costly failure. In view of the above facts, I feel bound to say I cannot take the responsibility of advising the committee to lay rails without paving of some description for the full distance between the rails and 18 in. beyond. In all cases where the roads are narrow I think it would be advisable and economical to pave them across from kerb to kerb. It is argued that when the electric trams are running they will practically monopolise the track. If this is the case the objections to paving on the grounds of slipperiness and noise practically disappear."

The report has been adopted.

MAIDSTONE WATER SUPPLY.

The mayor of Maidstone stated on Monday that he did not believe there was any cause for alarm in regard to the water supply of the town. Undoubtedly there was a scarcity of water, but there was no danger of anything like a water famine. It was only necessary that people should be economical. At the present time there were, he said, 3,000 persons outside the borough drinking water from one of the springs at Farleigh which were cut off during the typhoid epidemic last year on the recommendation of the medical officer of health. Ewell spring was not one of those which were proved to be contaminated, and the town council were about to consider the advisability of asking the water company to restore the supply derived from it. He was satisfied that the water company could not increase their supply by taking additional water from the Mid-Kent company. At present the Maidstone company could only get about 3,000 gallons per hour from their neighbours, or a total of 60,000 or 70,000 gallons per day, whereas they originally guaranteed 100,000 gallons per day. The manager of the Maidstone waterworks (Mr. Ware) states that the Ewell spring has been analysed fortnightly by Dr. Gregory, the company's analyst, during the past year, and it has maintained a uniform standard of purity. Barming lunatic asylum has been supplied from the spring throughout the year; also the inhabitants of Barming parish and East and West Farleigh.

The City Surveyor and the Highwayman.—A city surveyor has strange functions thrust upon him in Klondike and the adjacent territories. We quote the following from *The Vancouver World*: "Soapy" Smith, of Skagway, the confidence man who has been trying to terrify Skagwayians for a long time, has been shot by Frank Reid, city surveyor. Even a dead highwayman possesses a pecuniary value in the eyes of those who enter to the seekers for a new sensation. In proof of this G. O. Yenn and Herbert Savage, who are now in Victoria, purpose leaving for the north by the next steamer sailing, their mission being to obtain by purchase, if not otherwise, the body of "Soapy" Smith. A Victoria doctor accompanies the two prime movers in the enterprise, to superintend the embalming of the desperado's remains, and the plan is to exhibit the body in all the chief cities and towns of the West.

Municipal Work at Hexham.

Hexham is pleasantly situated on the south bank of the river Tyne, about a mile below the junction of the North and South Tyne, amidst beautiful scenery and surroundings of great interest. It is shut in by hills on three sides, the old abbey church, with its Roman tomb, recently removed from the foundations of the abbey, standing up above the houses with what appears to have been an old castle or keep, and the Moot Hall close by, whilst in the near neighbourhood are the Roman antiquities, such as the Roman road, part of the Roman wall, remains of Roman bridges, villas, baths, &c. There are also Dilston Castle, too, with its historical associations and connection with the unfortunate last Earl of Derwentwater, Queen Margaret's cave, which is said to have sheltered the unfortunate queen and her son, and many other places of historical note.

WATER SUPPLY.

It is not surprising that a town so pleasantly situated, so rich in historical associations, with its now excellent water supply and drainage, is so rapidly becoming a popular health resort. A few years ago it was a rarity to see a new building, but during the last three years streets have been laid out and terraces of semi-detached houses and villas rapidly pushed forward. During the past year, owing to the rapid extension in the west and south parts of the town on account of the development of new building estates, the urban district council and their surveyor have had an exceptionally busy time. The water supply to the town has been entirely divided into a "high and low service, to supply the high and low parts respectively. The water before the last alterations were completed was collected from the well-known Laidlo springs, at a distance of 8 miles, into Hexhamshire and delivered into a high-service reservoir, from whence it was delivered to the consumers, the water being of such purity that no filtration was necessary. This supply was obtained in 1888, and provisions to that the water had been collected from a gathering ground of uncertain yield and indifferer quality into a storage reservoir. It was then filtered and delivered from a service reservoir. These latter works had been well

Mr. R. J. SURTEES,
Surveyor to the Hexham Urban District Council.

constructed and are in excellent condition, but owing to the new service reservoir being at a considerable higher level they could not be utilised, whilst the severe strain on the fittings in the lower parts of the town was the cause of much waste. To remedy this, the council in 1896 decided to adopt the new high-service reservoir for the higher reaches only, and bring the old one into use to supply the lower parts of the town. This has necessitated the laying of several thousand yards of new water mains and extensive alterations to the reservoirs. Previous to this the original supply to the storage was cut off and the reservoir filled with the overflow coming from the springs. The chief difficulty in utilising the old reservoirs was to get the lower service filled and the overflow to pass from the high service into the storage for the use, if required, of the lower parts of the town, for any overflow from the low service means a waste of water. However, this was got over by a simple and novel automatic arrangement fixed to the main connecting the two reservoirs, and specially designed for the purpose by Mr. Surtees.

As soon as the lower reservoir is filled this comes into operation, closes the main valve, and causes the overflow to pass from the high reservoir into the storage. Altogether, the works carried out have reduced the pressure on the lower parts of the town to the extent of reducing the waste of water by 1,300 gallons per hour, whilst all parts of the town have now a constant supply. The new scheme was formally opened by Mr. Alderman Stainthorpe, who had been its chief advocate, and who spoke in high terms of the manner its engineering had been carried out. The old source of supply has

not been wasted, but has been brought down to the town for street watering, sewer flushing and trade purposes.

SEWERAGE AND OTHER WORKS.

Very extensive sewerage works have also been carried out, both in extensions, storm-water and relief sewers. The work of carrying the main outfall sewer along under the railway, which had to be tunnelled through what was virtually a quicksand, was both difficult and dangerous, and it speaks well for those employed on the works that no accident of any kind occurred during the progress of the works.

The cattle market has been cemented throughout, and the private streets improvements carried out in the west end of the town can only be fully appreciated by those who reside in that part. Pleasure grounds, too, have received attention, and the works carried out on the Seal and Tyne Green are a step in the right direction. The whole of the works have been carried out from plans prepared by the surveyor, Mr. R. T. Surtees, and several of the schemes have been completed without the aid of a contractor. Nor are the council yet finished, for it is only a short time since a Local Government Board inquiry was held to obtain borrowing powers for carrying out the repaving of several public and private streets, whilst works of sewage disposal and an infectious diseases hospital are in preparation, and sanction will shortly be asked for the erection of public slaughter-houses. The council appear therefore to be making great efforts to bring the town up to a high standard of sanitary efficiency.

Mr. Richard T. Surtees, who has recently been so busily engaged on these schemes of water supply, sewerage and private streets improvements in the district to which he is surveyor, received his education at Sir Arthur Middleton's school at Belsay, finishing at the Durham College of Science, Newcastle-on-Tyne. He served articles with his father, Mr. J. Surtees, at the expiration of which he was engaged in the Consett and Blackhill district, where he gained a valuable experience in sewerage, street works, &c. He was afterwards engaged at the construction of the Newcastle and Gateshead Water Company's new reservoirs at Hallington, at the conclusion of which he was appointed, out of eighty-six applicants, surveyor and inspector for the borough of Morpeth, and in May, 1894, he was appointed surveyor to the Hexham Local Board of Health out of seventy-three applicants.

THE POLLUTION OF THE RIVER LEA.

The deputation to the President of the Local Government Board, which was postponed from the 30th ult., has now been abandoned until after the holidays. The memorialists base their case on facts, that the condition of the river Lea, as it passes through Hackney, has for many years given rise to complaints, and that analyses have shown the water to be highly polluted. It is pointed out that the districts of Walthamstow and Leyton, with an estimated population of 120,000, send the whole of their sewage after treatment into the river. The same complaint, in a mitigated degree, applies to West Ham. The result is that from Tottenham to the Thames the Lea is little better than an open sewer. The Government inquired into the matter in 1886. The select committee then recommended that the sewage should be dealt with in the same way as it was in the case of the Thames by the Metropolitan Board of Works. The local authorities now ask that another committee be appointed, and that legislation should be initiated adequate to deal with the existing evils.

THE PROTECTION OF FORESHORES.

On Friday, at the usual meeting of the Hastings Town Council, a committee reported that their attention had been called to the fact that it was contemplated by the contractor for the new Crowhurst, Sidley and Bexhill Railway to remove beach for the purposes of the works from the foreshore at Glyn Gap, and that in view of the probable serious consequences which would be likely to result thereby they had given instructions for a communication to be addressed to the Board of Trade on the subject. A reply had since been received from the board stating that they would be prepared to consider an application from the council for the making and issuing of an order to prohibit the removal of the materials, and the committee therefore recommended the adoption of that course by the council. The report was approved.

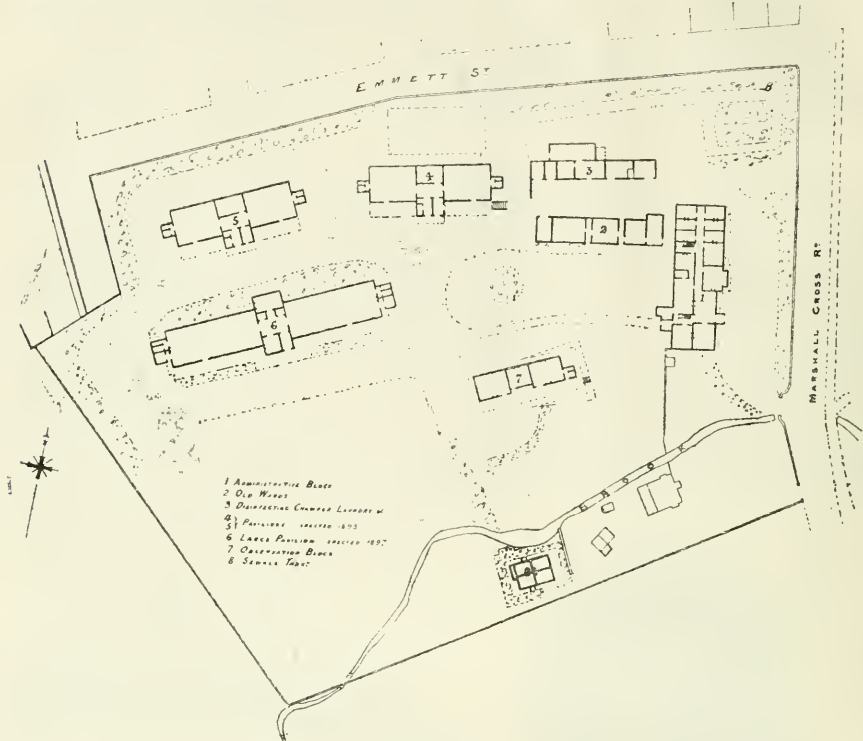

Morecambe.—At the last monthly meeting of the district council letters were read from the Local Government Board consenting to the council borrowing the sum of £3,540 for works of water supply. The board further wrote stating that, before deciding upon the application of the council to borrow £1,500 for street improvements, they would hold a public inquiry into the matter.

The St. Helens Borough Sanatorium.

AN EXTENSION OPENED.

An extension of the St. Helens borough sanatorium at Peasley Vale was some little time ago formally opened by the mayor, Alderman R. Pilkington, in the presence of a large company. Some fourteen years ago the institution was

this apartment a full view of each ward is obtained by means of a small window on either side provided for this purpose. An extra one-bed ward for acute cases also opens off the hall, the doors being of such a size as to allow a bed being wheel-

GENERAL PLAN.

wholly contained in an old house, consisting of seven rooms and a kitchen, standing on about 4 acres of land. At various subsequent periods it was found necessary to provide additional accommodation for patients, until at last in 1897 the council decided to proceed with the erection of a large pavilion and an observation block of two wards, with a kitchen to each pavilion. They also decided upon a large increase to the administrative block, adding fifteen additional bed-rooms, nurses' dining and sitting rooms, servants' dining-room, store-rooms and dispensary, and enlarging the laundry accommodation by erecting new drying-closets and ironing-room.

These buildings, which have just been completed, have been erected on the most modern principles. They are built of brick, with Rnabon terra-cotta facings throughout, and, although devoid of any elaborate ornamentations, are well constructed and of good appearance. Each pavilion is provided with a glass verandah in front, the floors of which are formed with Stuart's granolithic cement paving, the patients being thus enabled to sit outside in the warm weather. Internally they are plastered with Robinson's cement, all corners being rounded off, both on the floor and ceiling, in order to prevent accumulation of dust. All windows open at the top for ventilation, and each of the large wards is provided with one fireplace and two double stoves. The bath-rooms and water-closets are at the extreme end of each ward, and open into a passage which provides for through ventilation. They contain in separate rooms one bath, one water-closet and slop-water basin, and three wash hand-basins. The floors of all the wards, &c., are paved in oak with wood blocks. The entrance hall is lighted by means of a glass dome, and contains two small closets for coal and stores. It is paved with marble mosaic, with the St. Helens coat of arms, in colours, in the centre. The kitchen, opening out from the hall, is provided with hot and cold water, kitchen range and all necessary requisites. From

in from either of the wards. The observation block is fitted in all respects similarly to the large pavilion, the only difference being that no bath-room is provided, the bath being on wheels; it is kept outside and taken to the patient when required. The two large pavilion wards are each 72 ft. long by 26 ft. wide; each ward accommodates twelve beds, or a total of twenty-four beds; and these, together with the wards of the observation block, which provide four beds, have an area of 156 square feet per bed and a cubical air space of 2,029 ft

LARGE PAVILION.

per patient. The total number of patients that can now be accommodated in the hospital is about seventy.

The sewage of the whole of the wards is specially dealt with, being treated with aluminiferous, and conducted over the brook into tanks 12 ft. long, 8 ft. wide and 6 ft. deep. After lying in a stato of quiescence for about twelve hours it is then allowed to flow into filter-beds formed of coke breeze, 2 ft. deep, covered with gravel, 6 in. deep, after which

the effluent is allowed to run into the brook. The storm water is passed direct into the brook by separate drains.

The cost of the last contract has been £6,389, a wall in front and a porch being extras to the contract to the amount of £207. Thus the total amount spent upon the whole building up to the present time has been £14,120, including £2,654, the cost of the purchase of houses, land and sundry alterations. Of this amount the sum of £1,360 has been set aside and paid off out of sinking funds provided for that purpose. The contractors for the various works in the contract just completed were as follows: Erection of buildings, Messrs. Whitaker & Woods, St. Helens; stove in wards, Messrs. J. Cooper & Sons, Liverpool; wood block flooring, Messrs. Gentry, Walker & Co., London; mosaic pavement, Messrs. Diespcker & Co., London; furniture for wards, Mr. C. W. House, Crews. The whole of the works since 1884 have been designed and carried out by Mr. George J. C. Broom, M.A.C.E., the borough engineer. Mr. Henry Helms, Liverpool, was the clerk of works.

DUTIES OF A BOROUGH SURVEYOR.

AN EXTRAORDINARY DOCUMENT.

The following extraordinary list of duties was drawn up in connection with a recent vacancy in Curmarvon. The document is, we hope, unique, and deserves to be given in full:—

The borough surveyor is to devote the whole of his time to the execution of all duties usually and properly performed by a borough surveyor, including those falling under the undermentioned heads, and not at any time during his appointment to undertake private practice.

- (1) Surveyor of highways.
- (2) The construction, repair and maintenance of public roads, bridges, sewers, waterworks and appurtenant works, and such other works or buildings as may be required by the corporation.
- The repair and maintenance of the guildhall, markets, public slaughter-houses, institute, Anglesey ferry, park, and all other corporate buildings and property and appurtenant works.
- (3) The execution of private improvement works by order of the council, and apportionment of the cost thereof.
- (4) Advising committees on the requisite works of sewerage, road-making, town improvement, private improvement, sanitary improvement, and the like, and supervision of the execution of such works.
- (5) The making of all surveys, plans and estimates of new works and alterations (Parliamentary and otherwise) required by the corporation, structural gas plant excepted. Should the surveyor be found incapable of properly doing any particular work required of him, the council or any committee may employ another surveyor and deduct the cost from any salary which may be due to him. The council or committee to be the sole judge of any matter arising under this clause.
- (6) The examination of plans of new streets and buildings and other private works, and the supervision of such works, so as to secure compliance with by-laws, statutes and regulations.
- (7) To enforce the provisions of all borough by-laws and of the Public Health Acts, or of any Acts incorporated therewith, not included within the province of the inspector of nuisances' duties as set forth in the printed list.
- (8) Special reports of any proposed railway, tramway and similar works, and periodical reports on matters in progress.
- (9) The execution of the council's powers as to house numbering, street naming and similar matters.
- (10) To keep at the corporation office in an orderly manner duplicates of all plans of new streets, buildings or other works submitted for approval of committees, and make an index of same for ready reference.
- (11) To keep and index in a similar manner all other plans made for or belonging to the corporation.
- (12) To mark and show on one general plan of the borough all new streets, buildings, sewers, drains, water mains and services, as soon as such streets, buildings, &c., are completed.
- (13) The supervision of the watering of streets and the flushing of sewers. To keep a record of the last mentioned.
- (14) To attend all council meetings. To convene and attend the meetings, and transact the business (other than financial) of the following committees: The Highway and Town Improvement, Sanitary and Water, the Park, the Ferry and Aber Bridge, &c., and such other committees as may be required of him. To see that all orders of the said committees are carried out. To keep the minutes of the said committees, and see to the printing of same for monthly council meetings.
- (15) To attend daily at his office in the Guildhall from 8 to 10 a.m. and from 5 to 6 p.m.
- (16) To record all complaints received and report the action taken thereon. To keep all such books as may be necessary with regard to workmen, stores, works and plans; particularly to keep a book showing as to works ordered by committee to be carried out, the date of order, the estimated and the actual cost of work, and the date of completion of same.
- (17) To submit all his books from time to time to the committees, and to the borough accountant as required.

- (18) The personal supervision of workmen employed by the corporation (except the scavengers). To arrange and superintend their work so as to secure efficiency and economy, and to see that they commence and leave work at the proper time. With the approval of the committee having charge of the works, to appoint and discharge workmen. To suspend immediately any workman (artisan or labourer) who shall be seen to enter any public-house during working hours (except when on duty), and to report such suspension to committee.
- (19) The personal supervision of contractors, horses, carts, tools, implements and stores. To prepare contracts and contractor's bonds.
- (20) The surveyor shall from time to time submit to the proper committee for their sanction and approval a list of all materials or work which may be required in his department. In emergencies the same may be ordered upon the sanction of the chairman.
- (21) The proper fulfilment of contracts for works and materials. To give orders for all work and materials sanctioned, on the prescribed form, and see that invoices are received with goods supplied and for work done. To check, allocate, certify and hand over bills to the accountant as received, and attach invoices thereto. To see that all bills are passed through committee and handed over to the accountant within three months from completion of order.
- (22) To keep an accurate account in a book of all works executed for or materials supplied to private parties, and to hand the same weekly to the accountant. No work to be done or materials to be supplied except on written order given by the party requiring same.
- (23) To keep a stock-book, debiting value of goods received and crediting goods as and when given out. The stock-book to be balanced half-yearly and compared with actual stock in hand.
- (24) A separate inventory of horses, carts, tools and like articles to be kept and dealt with in the same manner.
- (25) To keep a list of streets, roads, and lanes repairable by the council.
- (26) To prepare annual estimates under the required heads, and lay the same before committees in the month of February in each year, preparatory to the making of rates, so far as such estimates may relate to matters under his charge.
- (27) To direct the workmen employed in his department to send in their weekly time-sheets made out in sufficient detail and receipted. To check and certify the correctness of the time-sheets, and hand same over to the accountant on Friday mornings, together with a properly allocated pay-sheet made up therefrom. To see that separate time-sheets of the prescribed form are sent in for work done on main roads, and to see that particulars of all materials supplied for main roads are given on the back thereof weekly.
- (28) To inspect and report monthly to the Finance Committee upon the water meters in use.
- (29) To be responsible for supplying punctually to the accountant information as to parties using water from town mains for various purposes (including domestic purposes) not already charged for such use.
- (30) To see that no connection with water main is made or renewed for any purpose (domestic purposes included) until an agreement to pay rent is signed by the party requiring the same. To inform such party that an agreement is necessary.
- (31) To attend and give evidence when and where required for and on behalf of the corporation in any action or legal proceedings.
- (32) Together with all subservient duties and any other or further duties imposed by statute or by the council.

NOTE.—The appointment to be terminable by one month's notice on either side.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper, in plain black-ink lines. Lettering or figures should be bold and plain.

211. Natural Philosophy: Engineers' Pocket-Book: Books Recommended.—"Inquirer" writes: Could you inform me if there is a (1) work published on natural philosophy suitable for civil engineering students? (2) Also, which engineers' pocket-book would you recommend?

(1) Ganot's "Physics," price 15s. (Longmans), and Ganot's "Natural Philosophy," price 7s. 6d. (Longmans), will be found to meet the requirements of the querist. (2) Tramm's "Civil Engineers' Pocket-Book," price 21s., is, in our opinion, although an American publication, the best of its kind. It is published by E. & F. N. Spon. Kempe's "Civil Engineers' Year-Book," price 8s. (Crosby Lockwood & Son) is also a useful book.

Suspension Bridges, made of iron chains, were first built in China 2,000 years ago.

Bricks.—Bricks, burnt, were used in the earliest times of human civilisation. They were introduced into England by the Romans. It has been calculated that ninety bricks per annum are used for each inhabitant of England.

The Telephone Inquiry.

THE COMMITTEE'S REPORT.

The report of the Select Committee on Telephones, which was published last week, is a lengthy one, as, no doubt, every one expected. We may, however, give a few extracts from it, especially those bearing upon the granting of licenses to local authorities. The principal questions the committee dealt with were:—

I. Is the telephone service now, or is it calculated to become, of general benefit? II. Is the Post Office in any way hindered by legal agreement or by good faith from competing itself or through licensees with the National Telephone Company in exchange areas. III. Ought competition to take place, and should municipal and other local authorities be empowered to undertake a telephone service; and, if so, upon what terms?

The report opens with a condemnation of the present system as not, nor likely to, become a general benefit either to the country as a whole or to the areas in which exchanges exist so long as the present monopoly should continue. It is considered, however, that under a different system, worked mainly with a view to the public interest, the telephone service might become a valuable instrument in further developing the trade and social life of the nation. The company's monopoly is emphatically condemned, and the right to competition is established. Then come the following interesting facts in connection with the granting of licenses to local authorities:—

MUNICIPAL COMPETITION.

The right to compete being thus made clear, we had next to consider whether competition was expedient; and, if so, whether local authorities should be empowered to undertake a telephone service.

Competition appears to be both expedient and necessary, in order, firstly, to extend and popularise the service, and, next, to avoid a danger which is by no means remote, if no alternative system is in operation, that a purchase of the company's undertaking at an inflated price may be forced upon the Government of the day.

Competition by a local authority must differ in many ways from competition by a private company, and requires special provision to meet the special conditions of the case.

In areas where the company have already an exchange, municipal competition, if permitted, should be conducted, so far as possible, on equal terms. It would be plainly unfair to concede to the new licensee a position of general advantage over that possessed by the older competitor.

The peculiar advantages, however, already possessed by the company themselves constitute the principal difficulty in the way of formulating such an equality of treatment. The duration of its license, the power to give preferential rates (a power which when exercised by the predecessor of the company is alleged to have driven the Post Office from the field at Plymouth), the absence of a maximum rate, the power to refuse service, and the consequent power to require concessions of overhead wayleaves, its numerous exchanges, and the power to make other areas pay for reduced rates in areas where competition exists; these are advantages which together outbalance the special advantage which would be possessed by a local authority as licensee—the right to give to itself and refuse to its rival permission to lay wires under its own public streets.

CONDITIONS FOR LOCAL AUTHORITIES.

A local authority must also submit to conditions to which the company is not subjected.

Among these conditions are the following:—

(1) The system (unlike that of the company) must be one of double wires, and be erected in accordance with the regulations of the Post Office. The Post Office should insist upon uniformity of system so far as the differing conditions of different localities may permit.

(2) A maximum rate should be imposed, and no opportunity be afforded to local authorities to carry on the service with a view to lighten the burden of local taxation.

(3) It must give a service to all alike on equal terms.

A royalty should be paid to the Post Office, which should be 10 per cent. on the gross receipts, and be the same in all respects as that paid by the company.

Although there appears no reason in equity why a new licensee should not be conceded a term equal to that originally conceded to the company, there may be reasons of public convenience why all licenses alike should lapse to the Post Office at the same date.

Where two systems compete in the same area, the first in the field has a further advantage. But your committee believe that, the areas being so large, in every area large sources of supply remain untapped. Under a more popular scheme of service this supply may be very considerable. The company is itself in vigorous competition in several areas with its licensor, the Post Office, which in almost every case was the first to occupy the ground. While the profits of the company in such areas are probably large, it is satisfactory

to learn that, in spite of the hampering restraints till lately imposed by the Treasury and of the necessity a public body is under to give no preferences, the local profits of the department have not been inconsiderable.

A difficulty arises in holding the balance equally between the local authority and the company from the fact that, while it seems generally admitted to be desirable in the public interest that all licenses should terminate in 1911, it is not possible to secure this and at the same time leave to the local authorities adequate time to recoup themselves for their outlay.

THE POST OFFICE AND LOCAL AUTHORITIES.

The opinion has been strongly urged that, as between the company and the local authorities, the most equitable course would be that the Post Office, in licensing a local authority, should undertake to buy its plant at a fair valuation in 1911, if the license were terminated at that date; but that, owing to the length of time which the company has had for recouping its outlay, it is not necessary to apply the same condition to it.

It has also been urged that it would be unfair to the company that the Post Office should agree to purchase the property of the local authority and remain in the future, as it is now, under no obligation to purchase that of the company in the same area.

It would be unjust to the taxpayer that the Post Office should undertake to purchase in 1911 two sets of plant and buildings, which might be to a great extent superfluous.

While, however, a portion of the plant and buildings of the two competitors may be superfluous or obsolete in 1911, much will probably be found useful and as good as the Post Office could purchase elsewhere.

On the whole, your committee think it would be fair as between its competing licensees that the Post Office should agree to take off their hands in 1911, at the then value, without any compensation for goodwill or future profits, so much of the plant and buildings as it might consider suitable for the actual requirements of its own local service. Should the total quantity so considered to be suitable exceeded the amount necessary for such requirements, due regard should be had, in purchasing the quantity actually required, to the fact that the local authority had been allowed a shorter period of license than the company in which to recoup its expenditure.

At the same time your committee are strongly of opinion that the Post Office should remain, as it is now, under no obligation to purchase any plant or buildings in any area where a local authority and the company are not in *bona fide* competition or are not working together under the sanction of the Post Office.

The possibility of amalgamation is then discussed as bearing upon equality of treatment and the ultimate transfer of an undertaking to the Post Office. Then come the following interesting remarks on

LICENSES AND FINANCE.

Your committee would recommend that, if licenses are to be granted to local authorities, the precedent of the Electric Lighting Act of 1882 should be followed, and provisional orders, containing borrowing powers, should be made by the Post Office for the installation of a telephone service, as they are now made by the Board of Trade where wayleaves and other powers are required for electric lighting purposes.

From the point of view of local finance your committee are of opinion that a telephone service would be as successful as has been the supply of gas, water, trams and electric light by local authorities. Much, of course, depends in this case, as in those, upon the cost of constructing the service, and in all cases the local authority is perhaps the best judge of what is likely to be successful or not. It seems clear to your committee that a local authority should be able to construct a system at a price below that which, from various causes, the company have spent upon theirs, and this opinion is confirmed by the fact that the probable cost of such a service in the hands of the Glasgow Corporation is based not upon estimates alone, but on tenders actually received.

So far, therefore, as the legal or equitable rights of the company or the financial or other interests of the locality are concerned, your committee see no reason why licenses should not be granted to local authorities.

Although, as stated in evidence by Mr. Gaine, 95 per cent. of the telephonic messages are local, yet a local telephone service must differ in some important respects from a local service for supplying gas, water or electric light. It is not, like them, purely local and isolated, but it forms part of a national system, the general efficiency of which largely depends upon its uniformity and the equal facilities afforded for communication everywhere. The council of the Association of Municipal Corporations by a small majority, and a conference of representatives of London local authorities unanimously, preferred the competition of the Post Office to that of local authorities. At the meeting of the council of

the Association of Municipal Corporations there were no representatives of Scotch municipalities, the two largest of which have applied for licenses.

The report concludes with some arguments in favour of
A POST OFFICE SERVICE.

A more general competition than the local authorities appear likely to undertake is a necessity:—

(1) Individual traders and others have a right to object to the service of a public necessity becoming a private monopoly where the monopolist has the power to distinguish between competitors in the same trade and the same district, a result which is not possible when the service is in public hands.

(2) A service so important to the trade of the country should not depend on the present precarious wayleave rights of the company; and the necessary general wayleave powers over the whole country can only be entrusted to a public department.

(3) The taxpayers have a right to be protected against purchasing as a monopoly a system which was never intended to become such, and as to which the most complete rights of competition were reserved; and more especially against being placed in a position in which they may be forced to purchase such a monopoly at a price still further inflated by the necessity of immediate purchase.

On reviewing the whole of the evidence, your committee is strongly of opinion that general, immediate and effective competition by either the Post Office or the local authority is necessary, and consider that a really efficient Post Office service affords the best means for securing such competition. We further consider that, when in an existing area in which there is an exchange the local authority demands a competing service, the Post Office ought either to start an efficient telephone system itself or grant a license to the local authority to do so.

With regard to areas in which there is no exchange and districts which are not areas, we think some provision should be made beyond what is now offered by the National Telephone Company for giving a service when there is a reasonable local demand. In such cases the Post Office should either start a service of its own, subject to proper regulations, or should grant licenses to the local authorities to do so.

Your committee, in thus recommending a Post Office service, assume that it will constitute a real and active competition, and that concessions to the company not required by the agreement will cease. Such a competition should, in their opinion, be carried on by a distinct and separate branch of the department, and in future be conducted under strictly businesslike conditions and by a staff specially qualified for such a duty.

MANCHESTER SEWAGE DISPOSAL.

THE CITY SURVEYOR'S REPORT.

The city surveyor of Manchester has submitted his annual report on the treatment of sewage. Details of expenditure for the year ending December 31st last are given in tabulated statements under the following headings: (1) Sewage precipitation, (2) sludge-pressing and disposal, (3) filtration, (4) coal supply, (5) sundries and incidental expenses, (6) summary of annual cost of treatment. The net cost of the work for the year has been £19,089 9s. 7d., as against £15,750 5s. 0½d. for the year 1895. These sums are exclusive of interest and repayment of capital, and are equivalent to £2 11s. 9d. and £2 14s. 3d. respectively per 1,000,000 gallons of sewage treated. A summary of the cost of treating the sewage for the year 1897 shows a reduction of 2s. 0½d. per 1,000,000 gallons on the cost of treatment for the year 1896.

PRECIPITATION.

The volume of sewage delivered and treated during the year was 7,373,917,000 gallons, as against 5,818,200,000 gallons for 1896, being an increase of 1,555,717,000, or 26·7 per cent. on the preceding year. The estimated population contributing to the sewerage system has increased from 400,360 on January 1st, 1897, to 512,560 on December 31st, 1897, being an increase of 112,110, or 28 per cent. The increase of population contributing to the sewerage system during the year 1897 has exceeded the increase during the year 1896 by 49,780, or 79·8 per cent. The daily average flow of sewage was 20,426,363 gallons, that for 1896 being 15,896,721 gallons, showing an increase at the rate of 4,529,642 gallons per day, or 28·5 per cent. The average daily flow of sewage treated per head has ranged from a minimum of 39·3 gallons per head for the month ending May 19th to 50 gallons per head for the month ending December 1st. The average amount of wet sludge precipitated has been 21·16 tons per 1,000,000 gallons, as against 21·81 tons for the previous year, yielding 7 tons 12 cwt. of pressed cake per 1,000,000 gallons, as compared with 7 tons 15 l cwt. for the year 1896.

SEWAGE PURIFICATION.

The proportion of chemicals used during the year was less than in the preceding year. When the sewage is diluted by large quantities of storm water it has been customary to sus-

pend treatment during the flush, as the chemicals have but little effect in increasing the purity of effluent at such times, owing to the rapidity with which the water passes through the tanks, and to the extremely attenuated condition of flocculent organic matter which it is the function of the precipitant to carry down. When it is necessary to allow a portion of the storm water to pass directly by way of the storm overflow into the canal, the addition of chemicals would only increase the amount of suspended matter in the sewage. Treatment was stopped on account of storm water on twenty-one occasions during the year for a total period of 128 hours.

RESULT OF CHEMICAL TREATMENT.

The result of chemical treatment and precipitation are shown in a series of tables containing the result of the analyses made at various times. On no occasion did the oxygen absorption come within the requirements of the Mersey and Irwell Joint Committee, and the albuminoid ammonia was below the grain per gallon in only a few instances.

FILTRATION.

Land filters have been at work as far as practicable during the year. Experiments have been continued with the coke and cinder filters which were constructed at the end of 1895 under the advice of Sir Henry Roscoe. As in 1896, the cinder filter has throughout given better results than the coke, both as regards the percentage reduction of impurity effected and in non-pretensibility. The results obtained from the experimental coal filters are equal to or even better than those obtained from the cinder filter. During the year an experimental red sand and a burnt clay filter have also been tried, and likewise an automatic self-cleansing filter.

MISCELLANEOUS EXPERIMENTS.

Various experiments have been made during the year in connection with the settlement of solids in suspension in the sewage without the addition of chemicals, the exposure of the effluent to the air and the passing of air through the effluent. Tests have also been made to ascertain the effect of the effluent on the water in the Ship canal and the effect of the admixture of acid and water with the effluent. In all cases the effluent contains the larger amount of impurity than the canal water, although in most cases, unless diluted by rain, the amount of impurity in the Ship canal above Barton locks is sufficient to cause putrefaction of inoculation. The putrefaction which takes place in a mixture of Ship canal water and tank effluent is generally greater in amount than in either taken separately. The experiments also showed that although it is possible to sterilise the effluent by the addition of a small quantity of acid, yet if a sterilised effluent be mixed with Ship canal water the effect of the acid is largely destroyed and putrefaction again occurs. If an acidified sample of tank effluent be mixed with tap water the sterilising effect of acid appears to be maintained. When the Ship canal water is largely diluted by rain putrefaction does not, as a rule, take place in the mixture of effluent and canal water. Sea salt has been added to samples of tank effluent, with the result that a large quantity is found to be necessary to prevent putrefaction taking place.

NEW CENTRAL SANITARY DEPOT FOR LEEDS.

The new central sanitary depot, upon which the Leeds Corporation are spending over £30,000, is nearing completion, and will be formally opened early next month. The situation of the premises is very convenient. The site is in Dock-street, to the south of Leeds bridge. Stabling accommodation is here provided for 168 horses. Commodious offices, store-rooms and sheds for the many vehicles that are used in the scavenging and water-cleansing department are also being built. At present the only stables the Sanitary Committee can call their own are a few wooden structures in Black Bull-street. Over 100 of the 150 horses belonging to the department have therefore to be sent to private stables. The land on which the new depot is built has cost about £20,000, whilst the buildings will necessitate an expenditure of about £13,000. The whole of the land, however, is not being used for the purposes of the depot. About 1,000 yards are being utilised to widen Dock-street and the other thoroughfares bounding the site. The Sanitary Committee are also credited with £8,000 for their old site at Crown Point, which has been demolished to make room for the electrical generating station. In addition, the committee have received £1,000 for their old buildings and appliances. It may be taken, therefore, that the net cost of the new depot and of the land which is being used for the widening of the adjoining streets does not greatly exceed £20,000. For this sum the committee obtain commodious offices for their clerical staff, stables for their horses, shelter for their vehicles, and a central centre for carrying on the important work which devolves upon the street cleansing and scavenging departments.

Euniskillen.—A proposal to erect artisans' dwellings on a plot of vacant land at Forthill is being considered by the Town Improvement Committee.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XVIII.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

ROAD MATERIALS AND CONSTRUCTION

(continued).

The *Higgate Archway-road*, about $1\frac{1}{2}$ miles in length, was originally made by a private company, at great expense, owing to the nature of the subsoil, which consisted of sand, clay and gravel. An unsuccessful attempt having been made to form a tunnel through the hill, open cutting was resorted to, and the roadway made by laying large quantities of gravel and sand upon the natural soil and thickly coating the same with broken flint and gravel. The result, however, not being satisfactory, the road was discarded by much of the traffic, and the company, being naturally anxious to improve its condition, among other schemes took up the road material and covered the subsoil with pieces of waste tin, upon which were placed gravel, flints and broken stone, but without attaining the desired success.

The road continued in a very bad state for some considerable time, as may be seen from Mr. Telford's annual reports to the Parliamentary Commissioners, until in 1829 an arrangement was made by the commissioners with the Higgate Archway Company for taking the road under their management; whereupon it was re-formed and put into proper repair. "In order to accomplish this," writes Sir Henry Parnell,* several experiments were tried, by draining the surface and subsoil, and by laying on a thick coating of broken granite; but from the wet and elastic nature of the subsoil the hardest stones were rapidly worn away by the wheels of carriages, but much more by the friction of the stones themselves against each other; for, in a very short time they were found to become as round and as smooth as gravel pebbles, even at the bottom of the whole mass of road materials. It was therefore evident that to form a perfect road, which might be kept in repair at a moderate expense, it was necessary to establish a dry and solid foundation for the surface broken stones; but as no stones could be obtained for making a foundation of pavement but at a very great expense, a composition of Roman cement and gravel was suggested by Mr. McNeill, and this on a trial was found to answer effectually.

The foundation was formed of concrete, consisting of

of that portion of the road north of the "Arch."[†] These blocks and slabs, and also faggots, it is stated by a very old resident, were used in the foundations upon soft and treacherous ground.

The foundation stone of the "Arch,"[‡] was laid on October 31, 1812, but it was not until the early part of 1830 that Mr. McNeill had completed the laying-in of his concrete foundation and other improvements, and the road thus brought into a satisfactory condition.

The road appears to have been liberally encumbered with "toll gates" from its formation to within a comparatively recent date. The old toll gate in the year 1825 was in the line with the then "Archway" tavern, but some years later was shifted northwards to a point between the "Archway" tavern and the Archway, just north of the Whittington almshouses. This gate finally disappeared in the year 1879 or 1880. The amount of the toll levied was 6d. for horses and 1d. for foot passengers. Another gate crossed the Archway-road, near the "Woodman" public-house, just north of Southwood-lane, and was removed some twenty-five years ago. Within the Hornsey district, opposite the Manor farm, a further gate existed, which, however, was removed in 1863.

As regards the present experience of the maintenance of this important highway, Mr. E. J. Lovegrove, A.M.I.C.E., engineer and surveyor to the Hornsey District Council, states that "speaking of the road generally, it is a difficult one to keep in repair, having regard to the peculiar class of traffic and also to the fact that there is a considerable amount of movement in the road itself."[§]

In an excellent paper, read at Blaydon-on-Tyne before the Association of Municipal and County Engineers, Mr. James Hall observes that "the only objection to a road formed with a concrete bottoming is its first cost, which precludes its general use. In towns, however, where it is considered desirable to have a broken-stone road, a better foundation could not be obtained; one of its great disadvantages is that, becoming a compact mass after setting, the weight is evenly distributed over the whole surface of the roadway, thus preventing, to a very large extent, an uneven surface, which is often found in roads where the traffic is heavy. Concrete

	Pinned Foundations.			Broken Stones.		Concrete.	
	Pinning.	Covering.	Metal.	Under.	Upper.	Concrete.	Metal, &c.
Country roads	6 in.	3 in.	4 in.	9 in.	4 in.	4 in.	3 in.
Suburban roads	9 in.	3 in.	5 in.	9 in.	6 in.	6 in.	5 in.
Town streets	9 in.	6 in.	5 in.	15 in.	6 in.	10 in.	5 in.

Roman cement, washed gravel and sand, mixed in the proportion of one cement to eight of gravel. In forming the bed of the road "there were four drains formed longitudinally, and there were secondary drains running from those to the side channel drains, and those again to drains outside the footpaths, covered with brick, and they all communicated with each other, and discharged the water into proper outlets."[¶] The cross drains occurred at intervals of 30 yards, and the intermediate small drains every 10 yards under the cement. Mr. McNeill also stated that this special drainage was rendered necessary through the nature of the ground—the road being cut through a clay soil, with high banks on each side, so that all the surface water descending from the slopes and Higgate Hill came down and rested in the hollows of the subsoil.

"On the prepared centre of 6 yards in width, after it had been properly levelled, the cement was laid on, mixing it first in a box with water, gravel and sand in certain proportions"^{¶¶} as above. The concrete, when in position, was found to have set in a quarter of an hour, and "in about four minutes after being laid a triangular piece of wood, sheeted with iron, was indented into it, so as to leave a track or channel of 4 in. for the broken stones to lie and fasten in."^{††} "This triangular indent had an inclination of fully 2 in. from the centre to the sides; so that if water came through the broken stones it ran off the cemented mass into the longitudinal drains."

Quite recently some concrete blocks about 12 in. by 6 in. by 4 in. were met with in the course of excavations in this road. They occurred at a depth of about 2 ft. 6 in., and are now to be seen in the museum of the Hornsey District Council—the authority now responsible for the maintenance

can be made both with lime, lias lime, and cement; the latter is preferable. When a concrete foundation is to be used, great judgment should be exercised in the proper time the metal should be spread. Some engineers say that the concrete must be allowed to get thoroughly set, then covered with a thin coating of fine gravel (pit gravel preferred), and the required thickness of metal then spread; while others consider it better to spread the metal upon a thin coating of gravel before the concrete is set, and roll the surface until the metal has partly embedded itself in the concrete. I am strongly of opinion that the latter plan is the better. The road, however, must not be open for traffic until the concrete is quite hard, and until after the first coating of metal has been covered with a thin coat of finely-broken material."^{§§}

The above thicknesses of foundation and metalling of broken-stone roads have also been suggested by Mr. Hall.

Kirkcaldy.—The scheme for the introduction of electric lighting and traction into Kirkcaldy has now assumed an aspect that points to a private company taking it in hand. It is stated on good authority that the town council will not take up the scheme, but they will be urgently requested to support the local company in preference to any outside combination. Several leading gentlemen in the district are doing their utmost to forward the movement and bring it to a successful issue.

* The portion below the Arch is in the Islington district.

† The Arch was of itself a substantial-looking stone structure, but disguised by a number of ugly brick arches, built across it for the purpose of conveying the Hornsey lane over the Archway-road cutting.

‡ I am also indebted to Mr. Lovegrove for the above particulars in reference to the toll gates and concrete blocks.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,

Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

OBSTRUCTION OF STREET BY LOCAL AUTHORITY UNDER STATUTORY POWERS: DAMAGE TO GOODWILL OF BUSINESS: LIABILITY: LONDON COUNTY COUNCIL ACTS, 1891 AND 1894.

—Rather a novel point was raised in the recent case of *Martin v. London County Council* (Queen's Bench Division, Mr. Justice Kennedy, July 30th and 31st and August 6th). The plaintiff was a greengrocer carrying on business in Wellington-street, Deptford. In 1897 the council, in exercise of their statutory powers, proceeded to construct a new road, cutting Wellington-street diagonally. The usual accompaniments of a work of this kind (in the shape of the blocking-up of Wellington-street and the adjacent thoroughfares and the general chaotic condition of the neighbourhood) had, according to the plaintiff's account, such a disastrous effect upon his business that, after incurring extra expense and labour in getting goods to his shop and thence to his customers, he had ultimately to relinquish the business and quit the premises. He therefore sought to recover damages against the council on two grounds—viz., (1) That they had obstructed the approaches to the street at more points and in a greater degree than was necessary; and (2) that there had been unreasonable delay in the conduct of the works. After somewhat lengthy arguments on both sides, judgment was given in favour of the council. The learned judge, after pointing out that the council were not only bound to enter on a portion of Wellington-street in order to carry out the works, but that they were invested with very large statutory powers, continued: They were a public body who had to carry out important works for the public good, and great discretion was entrusted to them with regard to stopping up particular streets and regulating and stopping traffic. It was at least arguable that, assuming that they did nothing in bad faith and that what was done was for the purposes of improvements, no action would lie for mere delay or for the extent to which the street was blocked. But there must always be the reservation that if they did certain classes of damage to the person or property through negligence or want of reasonable care they might in certain circumstances be held liable. For instance, if in the present case they had carelessly left heaps without lights, they would be answerable. But in the present case the complaint was that at a street called Wellington-street, at the other end of the street to that in which the plaintiff's house was, they blocked up more of the road than they need have. It was also said they were two months longer over the work than they ought to have been. The plaintiff said he was prepared to prove that he had suffered damage by reason of the loss of customers through foot passengers being disheartened in going down the street, and that although there was a roundabout way by which they could go to his shop they would not do so. It was not contended that the obstruction continued after the making of, or for other purpose than, the improvements. It was not like the case of *Wilkes v. Hungerford Market* (2 Biny., N.C. 281), where the hoarding was afterwards kept up unnecessarily. The plaintiff, who became the leaseholder of the shop after the passing of the Act of 1897, admitted that the most serious injury he suffered was from the destruction of certain premises for the purposes of improvement of a district from which he had previously drawn large custom. The fair result of the cases was that if a private person were injured by works of this description, if they were in the manner, or to the extent, unauthorised or unreasonable, the injured person would have a claim if, and only if, he proved that, by reason of that which was not authorised by the statute, he had been injured specially, directly and substantially. By specially was meant an injury not merely common to anyone living in that neighbourhood. That the injury must be direct was shown by the judgment of Mr. Justice Brett in the case of *Benjamin v. Storr*. The plaintiff must show an injury special to himself as distinct from the public generally. Was the loss of some custom by the plaintiff a direct injury within the definition? In his opinion it was not. The house itself was in no way obstructed. There was always access to the shop, although by a roundabout way. The house in itself was not rendered less commodious for trading or less healthy for occupation. The injury was not direct in a sense in which the cases had treated it. The case of *Wilkes v. Hungerford Market* could no longer be treated as an authority, having regard to the observations of Lord Chelmsford in *Bicket v. Metropolitan Railway Company* (L.R. 2, E. and L.A. 175), and Mr. Justice Willes in *Bicket v. Midland Railway Company* (L.R. 3, C.P. 97). The present case was not one under such circumstances as gave a right of action, and there must be judgment for the defendants, with costs, except the costs of the special jury.

HOUSE DRAINAGE: OPEN DITCH: NUISANCE.—"Surveyor" writes: The owner of some cottages a few years ago was allowed to discharge the sewage from the same into an open ditch at the side of the highway. This has become a nuisance. Will you kindly inform me in your next issue whether my

council can compel the owner to pipe and cover in the ditch, or disconnect and carry the sewage elsewhere. The accompanying diagram will explain. I may add that this case occurs in a village.

There are several points to be considered in connection with this case. First of all, the question arises whether the open ditch is (1) a drain, (2) a sewer, or (3) merely a watercourse. Unless the cottages are "premises within the same curtilage" it cannot be a "drain." Even if the cottages are within the same curtilage I do not think it would be held to be a drain, as it was evidently not "made merely for the purpose of communicating" from the premises with a cesspool or sewer (see the definition of a "drain," sec. 4, Public Health Act, 1875). But is it a sewer? In *Rep. v. Godmanchester Local Board* (L.R., 1 Q. B. 388) a stream supplied by the drainage—natural and artificial—of cultivated land and receiving the drainage of two or three houses was held not to be a sewer within the meaning of the Public Health Act, 1848. But in *Wheatcroft v. Moulton Local Board* (52 L.T. N.S., 356), where the sewage of certain houses drained into a sewer, and after passing through the sewer, was for a period of some years allowed to fall into an open watercourse, it was held that the watercourse was a "sewer." And in *Airbheaton Local Board v. Beumont* (52 J. P., 68) several houses drained into a road drain and the latter into a ditch in a field belonging to the owner of the houses which ditch became a nuisance. The owner, upon being summoned, contended that the ditch was a sewer vested in the local board and that it was their duty to cover it up; and the justices refused to make an order against him, as he was not the person by whose act, default or sufferance the nuisance arose. It was held, upon appeal, that the justices were right. The facts in that case are somewhat similar to those in the present case, except that in the latter the ditch is not on the houseowner's own land. I am inclined, therefore, to think that this ditch would be held to be a sewer, in which case the council could not compel the owner to pipe and cover it in. This could, however, proceed under sec. 24 of the Public Health Act, 1875. If the ditch is neither a drain nor a sewer, but only a watercourse, then sec. 69 of the same Act would apply.

WELLINGTON NEW SEWAGE SCHEME.

On Friday the sewage works, just completed at a cost of some thousands of pounds, at Admaston, for treating the sewage from Wellington, were utilised for the first time. The scheme is very comprehensive and obviates the causes of complaints which have been made from time to time by the inhabitants of the town as well as those living at Admaston, where the sewage matter formerly mingled in the water of a brook running close to the highway. After chemical treatment in a tank constructed on the level principle, the liquid elements separated from the grosser matter will run over a large area of land, and after irrigating it will pass purified into a brook. At the invitation of Mr. Clift, the members and officials partook of tea in a tent, and congratulatory speeches were made.

Paris and its Water Supply.—In addition to the inconveniences of the excessive heat, it is announced that unless rain falls heavily within a day or two the inhabitants of the French capital will be reduced to drinking Seine water. It appears that, notwithstanding the extremely large number of millions of francs which were spent some years ago to supply the city with the pure water of the Avre, in addition to that they already received from the Dhny and the Yonne, the reservoirs are almost empty.

Municipal Work in Progress and Projected.

This week we are able to publish particulars of several important schemes which are being carried out by local authorities, notably at Bristol, Cheltenham, Aberearn, Birkdale, Bredbury, Castle Donington, Armagh, Crews, Maidstone, Manchester, Newport (Mon.), Preston, Salford and South Shields. Electric supply schemes, it will be seen, are still engaging the attention of many of the authorities.

METROPOLITAN AUTHORITIES. VESTRIES AND DISTRICT BOARDS.

Hackney.—On Monday a special meeting of the General Purposes Committee of the vestry was held "to consider the action of the East London Waterworks Company in discontinuing the 'constant' supply system in favour of a daily service of six hours." Mr. W. Sheean, in the course of a prolonged discussion, moved that the clerk be instructed to write to the company stating that the vestry were determined to continue watering the roads and also to supply water to the inhabitants. He further suggested that a committee of five be appointed to carry out the necessary arrangements. The resolution having been seconded, the chairman advocated the formation of a sub-committee to approach the East London Waterworks Company with a view of securing a written promise that the directors would pay all expenses incurred in sending the water round the district in carts. It was eventually decided that a sub-committee should be formed to devise measures by which the supply of the East London Water Company could be appreciably augmented.

Hampstead.—The Hampstead Vestry at their last meeting received a letter from the London County Council suggesting that the positions of fire-alarms should be indicated by painting the nearest lamp-post a bright red colour. It so happens that the vestry had already adopted this colour for the lamp-post nearest to the 4-mile radius boundary, and in carrying out the suggestion of the council Mr. C. H. Lowe, the surveyor, had to give instructions for the colour of the radius lamp-posts to be altered. New Hampstead has lamp-posts of three distinct colours. Those nearest to fire-alarms are painted red, those nearest to the radius boundary blue, and the ordinary lamp-posts are painted white.

Stoke Newington.—The vestry have received notices from several electric lighting companies intimating their intention to apply to the Board of Trade for provisional orders for the supply of electric energy within the parish. The vestry have notified the companies to the effect that they are in possession of a provisional order, and that they are taking steps to exercise their powers, and will oppose the application of the companies.

Wandsworth.—Last week the General Purposes Committee reported to the board of works that, after taking time to consider their judgment, the Court of Appeal, consisting of the Master of the Rolls, Lord Justice Chitty and Lord Justice Collins, have unanimously reversed the decision of Mr. Justice Kekewich, who had granted an injunction, upon the application of the Southwark and Vauxhall Water Company, restraining the board from lowering the footpath in West Hill-road, Wandsworth, so as to make the water main there more liable to frost or to be otherwise prejudicially affected. As this is a matter of great importance to local authorities, the committee recommended that the judgment of the Court of Appeal be printed and a copy forwarded to each member of the board and to each vestry and district board in the metropolis. This was agreed to.

Whitechapel.—On the recommendation of the Electric Lighting Committee, the board of works decided, last week, to request the member of Parliament for the Whitechapel division to oppose the General Power Distributing Companies' Bill now before Parliament, and Bills of a similar nature which seek to give power to companies to supply electrical energy in bulk over large areas in parts of which provisional orders have already been granted to local authorities.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Kesteven.—At a meeting of the county council on the 10th inst., the Asylum Visiting Committee reported that the total cost of the new asylum was as follows: Cost of building, as estimated by architect, £92,000; cost of furnishing, £15,000; laying-out grounds, architect's and other commissions, &c., £18,000; total, £125,000. The Finance Committee recommended that application again be made to the Local Government Board for their sanction to the application of the sum of £4,963 18s. 10d., being the balance of capital moneys in the hands of the county council, towards the cost of the erection of the county asylum, and that the board be furnished with the Visiting Committee's estimate of the cost with the plans and sections of the new asylum, and any other information required by them. They further recommended that application be made for the Local Government

Board's sanction to the borrowing by the county council of a sum not exceeding £120,000 for the cost of the erection of the county asylum. The recommendations were adopted.

Wigtownshire.—A meeting of the road board of the county council was held at Stranraer last week. The meeting was convened for the purpose of considering the recommendations of the Upper District Committee with regard to the erection of new bridges over the Soleburn, on the main road between Stranraer and Kirkcubbin, and over the Pultanton at Greenfield, in the parish of Leswalt, near Stranraer. Plans were submitted by Mr. Tait, the road surveyor for the Upper District, for the construction of a new bridge over the Soleburn, and it was resolved to pull down the present structure, which has become dangerous for heavy traffic, and erect a bridge with stone abutments and wings and a brick arch, at an estimated cost of £340. It was also agreed to construct a new bridge over the Pultanton at Greenfield, with stone abutments and wing walls, spanning the water with steel and iron beams and girders, the cost estimated by the surveyor being £143.

MUNICIPAL CORPORATIONS.

Bath.—At last week's meeting of the Bath Surveying Committee it was agreed, on the request of the Baths Committee, to pay £500 towards the cost of the Abbey-avenue, which this committee had already paved with destructor blocks. The whole cost was £1,350.

Bournemouth.—A lively inquiry was held on Tuesday by Mr. A. E. Sandford Fawcett, Local Government Board inspector, respecting an application of the town council for sanction to borrow £1,000 to transform the course of the stream in the well-known lower pleasure gardens into an ornamental watercourse, with islet grottoes, fountains, weirs and a rustic bridge. The proposal is looked upon with great disfavour by many ratepayers, who offered strenuous opposition. The decision of the Local Government Board is awaited with considerable interest.—A special meeting of the town council is to be held shortly to consider the desirability of applying for a provisional order empowering them to adopt a scheme for lighting the town by electricity.

Bristol.—The sub-committee of the sanitary authority have received the report of Mr. Santo Crimp, Westminster, on the disposal of the sewage of the city. The scheme is very comprehensive, and deals with the whole question of sewage disposal. It provides for an outfall near Dunball Island, which has been chosen after a long series of experiments, and tanks constructed at Avonmouth for storage, so that the discharge may be effected at suitable states of the tide. A new sewer will be constructed following the course of the river on the Gloucestershire side, and a pumping station provided somewhere near the Cliff House estate, so as to lift the sewage into the outfall sewer, whence it will be conveyed to the Bristol Channel. It is contemplated to extend the sewer up the valley of the Avon, and it has been suggested that it might be utilised for accommodating outlying districts, if satisfactory arrangements can be concluded with the local authorities. The whole of the sewage now discharging into the Avon will be collected at a point near Cliff House, and lifted by pumps into the new outfall sewer. The cost of the scheme will be between £300,000 and £400,000, and in its conception allowance has been made for the growth of the population for many years to come.

Bury.—The town council have accepted tenders for electric light works amounting in the aggregate to £22,500, subject to the usual approval of the Local Government Board.

Carlisle.—It is reported that the profits of the corporation's gas and water undertakings for the past year amount to £9,088 and £6,056 respectively. The gas profits are £875 less than the previous year, owing chiefly to the increased price of coal, but the net amount to be handed over to the relief of the rates will be larger, owing to the falling in of the gas loan of 1887, in respect of which £1,225 was charged against the account last year. The net amounts which went in relief of rates last year were £5,757 on the gas account and £3,069 on the water account.

Carnarvon.—The town council have resolved to oppose an application, which is to be made by Edmondson's Electricity Supply Company, Limited, for a provisional order empowering them to supply electricity within the borough.

Cheltenham.—Colonel J. T. Marsh, R.E., Local Government Board inspector, held an inquiry at Cheltenham, on the 12th inst., into an application by the Cheltenham Town Council for sanction to borrow £13,410 for purposes of sewerage and sewage disposal, and for the appointment of an inspector to make an inquiry into the matter of certain works of sewerage and sewage disposal, which the said council propose to construct without the limits of the borough, and into certain objections which have been received thereto. Mr. Hall, borough surveyor, stated that in 1896 he reported on the state of the sewer from the Arle tank to the Barn farm. He found the pipes unjointed and the gradients irregular. Roots had penetrated the joints, reducing the carrying capacity

of the sewer by two-thirds. Complaints had been made by the tenant of the farm of the diminution in the supply of sewage, and compensation had been granted him. The improvements proposed would increase the carrying capacity to 1,350 gallons per minute. Similar facts were cited in connection with other parts of the scheme. The inspector afterwards visited the districts affected.

Crewes.—The provisional order applied for by the town council to provide a generating station and to supply the borough with electric light has been granted. The cost of the scheme is estimated at about £25,000. Prof. Hopkinson has been called into consultation, and has advised the corporation as to a suitable site for the electric lighting plant in the south ward.

Deal.—The Corporation of Deal have had under their consideration for some time the question of the sea encroachment, and they have now decided to proceed with new works of sea defence near Sandown Castle, at the north end of Deal. The surveyor to the corporation stated that unless those works of defence were undertaken at once the encroachment of the sea would undermine the existing wall and cause it to collapse. The urgency of the matter was also emphasised by the town clerk, who said that he had visited the spot, and the state of things so alarmed him that he had written to the Board of Trade pointing out that the whole of Deal was likely to be submerged if the wall went. The sea wall was much damaged by the heavy gale of several months ago, which carried away the shingle to such a depth as to leave the foundations exposed.

Derby.—Last week an inquiry was held by Colonel Slacks, on behalf of the Local Government Board, with reference to an application of the town council for sanction to borrow £310 for purposes of street improvements.

Dorchester.—The following has been adopted by the council: "That the surveyor be instructed to draw up a report on the water supply of the borough, dealing with the additional requirements through the proposed extension of the borough, the waste of water and necessary storage."

Falmouth.—A committee have presented a report to the town council in favour of purchasing both the gas and water undertakings, and a special meeting is to be called to consider the matter; meanwhile the committee have been asked to make a recommendation in regard to the employment of an expert.

Hastings.—The town council, at a meeting on Friday adopted the following resolution: "That this council, being of opinion that the erection of a lift to the East Hill should prove a much-needed public improvement and supply a greatly-felt public want, respectfully invites the Rev. W. Sayer-Milward to give his consent to the construction of the same by the corporation, if found practicable."—It was reported that the sanction of the Local Government Board had been received to the supplying of the parish of Ore with water.

Hyde.—The Sewage Works Committee recommended, at a recent meeting of the town council, that, having regard to the fact that the Local Government Board would not pass any scheme of artificial filtration unless it also embraced one of subsequent filtration through land, plans of a scheme for automatic filters and land filtration, at an estimated cost of £5,500, be adopted, and that the town clerk be instructed to make application to the Local Government Board for sanction to the loan. It was stated that the estimated expenditure included the purchase of automatic filters, the building of a filter-house, the erection of a pump for the washing out of the filters, and the under-draining of 1½ acres of land, which was to be laid out in 1-acre plots for the purpose of land filtration. The committee intended to take the solid matter from the sewage by means of the automatic filters, and then turn it upon the land, but they were not prepared to say that even then they would be able to give satisfaction to the Mersey and Irwell Committee. A lengthy discussion ensued, the opinion being expressed that, pending the report of the Royal Commission, the scheme should not be proceeded with. Ultimately the resolution was referred back to the committee for further consideration.

Liverpool.—The Tramways Committee of the corporation have adopted a resolution that the council be recommended to authorise the Tramways Committee to take steps to have plans, sections and estimates prepared to continue the overhead electric traction tramways from the termination of the experimental line at the Dingle to the end of Aigburth-road, and also for an extension of the experimental line from the Prince's Park gates along Croxteth-road to Lodge-lane, in accordance with the lines as authorised by the Tramways Provisional Order of this session.

Lowestoft.—On the recommendation of a committee, the town council have decided to proceed under its electric lighting provisional order, and have instructed the committee to have a scheme, with estimates, prepared, with a view to application being made to the Local Government Board for sanction to a loan for carrying out the works.

Maidstone.—Application will shortly be made by the Local Government Board for sanction to borrow £6,020 for the reconstruction of the old brick sewers in the borough in accordance with plans prepared by the surveyor.

Manchester.—An inquiry was held on Tuesday, at the Manchester Town Hall, to consider the application of the corporation for power to borrow £27,500 for the alteration and enlargement of Mousall hospital. Mr. W. W. E. Fletcher conducted the inquiry, on behalf of the Local Government Board. No opposition was offered, and the inspector hinted that there would probably be no difficulty in the matter. The great stumbling-block, at first sight, was the small-pox question, but if the corporation intended to provide separate accommodation elsewhere probably no difficulty would arise.

Mansfield.—At the last meeting of the town council (orders for the making-up and furling of Quarry-lane were considered from nine firms, and it was resolved that the tender of Mr. W. A. Vallance be accepted, at the sum of £1,219.

Newport.—On Thursday Mr. H. Percy Boulnois, Local Government Board inspector, held an inquiry at the Newport Guildhall respecting an application by the corporation for sanction to borrow £5,300 for the purposes of water supply. It was explained that the original loan was £10,000, which was increased to £12,000 without an inquiry. During the progress of the works it was found necessary to make certain alterations and additions, bringing the total estimated expenditure up to £20,291. Mr. Baldwin Latham produced a plan showing the works originally contemplated and the portions already executed. He stated that the Local Government Board insisted upon the source of supply being carried 2 miles further on. This entailed considerable increased cost, in consequence of the nature of the strata met with. Blasting had to be resorted to, and enormous quantities of water were met with, occasioning the use of as many as six to eight engines being employed in pumping. The work had been pushed on most expeditiously, but although the contract was first fixed to be carried out in nine months, then increased to twelve months, it had now been over two years in progress. So it would be seen how the extra cost arose.

North Shields.—On Wednesday of last week Mr. Robert H. Bicknell, Local Government Board inspector, held an inquiry at the town hall, North Shields, in reference to the application of the corporation for sanction to borrow £3,000 for the construction of the Northumberland Dock-road and £300 for the improvement of the Tiger stairs. It was explained that for many years the road had been out of repair, and it had been strongly urged upon the council that it should be reinstated and put in proper order. The road went from Hny Hle in a westerly direction for a distance of 1,400 yards to Howdon, close to the western boundary of the borough.

Portsmouth.—A singular mishap occurred in Portsmouth harbour on Wednesday. A working party are engaged in widening the entrance between basins No. 4 and 5, and in order to keep the water back a large dam has been erected. This yielded to the pressure of water and flooded the works, the men fortunately escaping. The undertaking will be considerably delayed, as some time must elapse before the dam can be reconstructed and the water pumped out.

Preston.—The town council are considering the offer of the Lancashire County Council to purchase, on certain conditions, a piece of land for £16,000 for the purpose of erecting a new sessions house for the Preston Quarter Sessional Division.

Salford.—A Local Government Board inquiry was held recently with respect to an application by the Salford Corporation for power to borrow £33,000 for purposes of electric lighting and £2,200 for the construction of storm water overflows on the main intercepting sewer at Hough-lane, Springfield-lane and Rezent-road. Mr. J. Corbett, the borough engineer, stated that on the intercepting sewer by which the sewage of the borough was carried to the sewage works at Made Wheel there are at present three storm overflows. The additional overflows now proposed to be constructed were for a part of the sewer that was in the most populous part of the borough. At that point there were 4½ miles of intercepting sewer without any overflow to the main sewer, although there were some small overflows to the individual sewers. Frequent complaint had been made about the flooding of the district, and it was felt that something ought to be done to remove all cause of complaint.

Southport.—At a recent meeting of the town council a resolution was proposed to the effect "that a first-class expert be engaged to report upon the gas estate, with instructions to recommend to the council any improvements which, in his opinion, would be likely to result in an increased profit." After some discussion the matter was referred to the Gas Committee for consideration.

South Shields.—At the last meeting of the town council Alderman Remondson moved the adoption of the Electric Lighting Committee's report, and stated that the demand for the light was still increasing. The committee had decided to go in for a further extension of the plant at the station, and asked the council to instruct the town clerk to apply to the Local Government Board for their sanction to the borrowing by the council of the sum of £20,000 for the purpose of providing the additional plant. The committee's report was adopted.

Stamford.—Another scheme for the sewerage of the

borough was recently laid before the town council in committee by Mr. J. B. Everard, of Leicester. The council resolved to have the report printed and circulated amongst the members and the local Press, but pledged themselves to no definite decision. The total cost of the proposed works would amount to about £47,000 and the annual expenditure to £540.

Stratford-upon-Avon.—The Gas Committee reported at the last meeting of the town council that the profit from the gas undertaking for the past year showed an increase of £352, as compared with the previous year, and that this sum had been handed over in reduction of the rates.

Tonbridge.—A considerable amount of consternation was caused in Tonbridge recently by the sudden plunging of the town into darkness just before 8 o'clock. The extinction of the gas occurred just when the streets were most busily thronged and the business of the town in full swing. For about six minutes the business portion of the town was in absolute darkness, and much inconvenience was caused at the station in connection with the working of the signals. The sudden defection of the gas was due either to an accident to a pipe in the gas-holder or to negligence in allowing a water syphon to become filled, thus shutting off the supply. With great promptitude the manager of the gasworks caused a fresh holder to be turned on, and in a short time the town was again in its normal condition.

URBAN DISTRICT COUNCILS.

Abercarn.—Colonel J. T. Marsh, R.E., recently held an inquiry, on behalf of the Local Government Board, relative to an application of the district council for sanction to borrow £8,150 for water supply purposes.

Acton.—A Local Government Board inquiry has been held respecting an application of the district council for sanction to borrow £1,161 for street improvements and £905 for public library purposes.

Belper.—During the past few months negotiations have been proceeding between the urban district council and Mr. J. B. Marsden-Smedley, J.P., proprietor of the Dethick estate, for the acquisition of a water supply. It will serve the villages of Holloway, Crich, South Wigfield, Pentrich, and probably others. The population is about 7,000, and provision has to be made for 60,000 to 70,000 gallons per day. Mr. Firth, C.E., of Baslow, is the engineer concerned, and he has gauged two springs on the Dethick estate, which yield about 200,000 gallons per diem. The agreement was laid before a special meeting of the Belper Council recently, and received the seal of the authority.

Birkdale.—Colonel Inard, Local Government Board inspector, held an inquiry on Saturday at the Birkdale town hall in respect to an application made by the urban district council for sanction to borrow £7,455 for the following works—*viz.*, street improvements, £4,250; sewer extension, £630; caretaker's lodge at the Victoria Park, £575; fire brigade station, £500, and gas mains extension, £1,500.—The plans and estimates were prepared by Mr. F. C. Hodgkinson, engineer and surveyor to the authority, and official sanction was received on Thursday.

Bolsover.—Under pressure from the Derbyshire County Council, this authority decided at a recent meeting to write to Mr. W. H. Wagstaffe, of Chesterfield, asking his terms for preparing a scheme for sewerage and sewage disposal for the district.

Bredbury and Romiley.—A Local Government Board inquiry was held on the 12th inst. by Mr. W. O. E. Meade-King with reference to an application of the council for sanction to borrow £7,250 for sewerage and sewage disposal works.

Chiswick.—During the past few weeks considerable improvements have been made at the pumping station. The roads leading to it, which were practically a mud pond, have been paved, and the ground surrounding the station has been tastefully laid-out in flower beds. The embankment facing the Thames has also been improved, and all that is wanted now are a few seats and permission to the public to use the embankment. The whole work reflects great credit on the surveyor, Mr. Arthur Ramsden, and also on those members of the council who have championed the improvement.

Colwyn Bay.—The inauguration of electrically lighting the new promenade took place here on Tuesday night. The promenade was opened on Jubilee Day; the drinking fountain presented to the town as a jubilee gift was subsequently dedicated to public use, and the council afterwards decided to install electric light. As an outcome, twenty-four arc lamps have been erected. Great interest was centered in the inauguration, the proceedings being preceded by a banquet, given by the contractors, at the Imperial Hotel. The company afterwards adjourned to the promenade, where the ceremony of switching on the electric light was performed by Mrs. Herbert Roberts, who was presented by the chairman with a silver key for the purpose, suitably engraved.

Failsforth.—The district council have decided to take steps to obtain powers for lighting the district with electricity. At present the district is lighted with gas supplied by the Oldham Corporation.

Farsley.—The contract for the construction of a sewerage system at Farsley, and of outfall work at Rodley, for the council, has been let to Mr. William Brigg, Shipley Fields, Frizinghall. The amount of the contract is about £12,000. The scheme will include three trunk sewers—*viz.*, the Old Road, New-street, and the Valley sewers, which will finally unite at Bagley, and thence proceed in one larger main trunk to the outfall works at Rodley. The works are to be completed by the end of September, 1899. A commencement has already been made with the work at Bagley.

Itchin.—The district council have decided to apply to the Local Government Board for sanction to a loan to cover the cost of purchasing 250 gas lamps. Mr. S. W. Dunkin, the manager of the Southampton Gas Company, attended the meeting of the committee appointed to consider the matter, and advised as to the mode of lighting to be adopted.

Longridge.—An application is to be made to the Local Government Board for sanction to borrow a further sum of £850 for the extension of the main sewer.

Maidstone.—The district council have received a communication from the gas company stating that the directors in the course of a few weeks, hope to be in a position to make a definite proposal for lighting the streets with incandescent lamps.

Tottenham.—Colonel Durnford recently held an inquiry, on behalf of the Local Government Board, relative to an application of the district council for permission to borrow £1,400 for paving work in Green-lanes and £300 for sewerage Fairview-road.

Wortley.—A Local Government Board inquiry was held last week respecting an application of the district council for sanction to borrow £4,500 for purposes of sewerage and sewage disposal at Pillely, in the township of Tankersley.

RURAL DISTRICT COUNCILS.

Castle Donington.—On the 17th inst. Colonel W. R. Slacke, R.E., one of the inspectors of the Local Government Board, held an inquiry at Castle Donington into an application by the rural district council for sanction to borrow £6,500 for works of sewerage and sewage disposal. At present there is no system whatever, and the raw sewage finds its way down open dykes and eventually into the Trent. The engineer, Mr. Herbert Walker, of Nottingham, explained the scheme, which consists of a system of gravitating sewers, a pumping station at the outfall works, "Cosham" precipitation tanks, and subsequent land treatment.

Keynsham.—A Local Government Board inquiry will shortly be held with reference to an application of the district council for sanction to borrow £450 for water supply works in the parish of Whitechurch.

Yeovil.—A letter was read last week from the Local Government Board with reference to an application by the district council to invest them with the powers of sec. 104 of the Public Health Act, 1875, in regard to the proposed new road between Norton and Stoke, and for sanction to borrow £250 for the purpose of carrying out the work. Before deciding the application the board stated that they would direct that a local inquiry should be held at as early a date as possible.

SCOTLAND AND IRELAND.

Armagh.—At a special meeting of the town commissioners, on the 18th inst., the town clerk submitted a copy of the provisional order which has been granted to the town commissioners, acting as the urban sanitary authority, in connection with the new system of sewerage which it is proposed to construct for the city at a cost of £12,000. The provisional order empowers the commissioners to enforce the provisions of the Land Clauses Act to enable them to acquire otherwise than by agreement the lands required for the purpose of the scheme. Three years have been allowed for carrying out the work.

Arbroath.—A report having at the instance of the Police Commission been submitted to the board by Mr. McCulloch, Edinburgh and Dundee, engineer on the Colt Loan extension works, on the position of the water supply, in which Mr. McCulloch recommended the commissioners to proceed with the present scheme until the first 200 yards adit is finished, and that future action should be determined by the result, the board have now agreed, by a majority of ten to seven, to continue the adit as against an amendment to abandon the work in favour of a gravitation scheme.

Glasgow.—The Special Committee on Telephones, appointed by the corporation, met on Tuesday week, for the first time since the issue of the report of the House of Commons Select Committee. It was decided to renew the application to the Postmaster-General for a telephone license for the municipality and to appoint a deputation to wait on the Duke of Norfolk and Mr. Hanbury at the earliest convenient date to press the application.

FOREIGN AND COLONIAL.

St. Helier's.—The municipality have accepted the tender of the Horsfall Furnace Syndicate, Limited, for a refuse destructor, with accessories complete for steam raising.

Personal.

Mr. W. J. Petch, surveyor to the Rawmarsh Urban District Council, has had his salary increased.

Greenock Town Council have adopted the report of a committee recommending the appointment of a resident electrical engineer, at a salary of £300 per annum.

Dorchester Town Council have approved the attendance of the borough surveyor, Mr. G. J. Hunt, at the forthcoming meeting of the Sanitary Institute at Birmingham.

It was last week proposed and agreed that the salary of Mr. Richard Whitbread, surveyor to the Urban District Council of Carlton, should be increased by £20 per annum.

After a short discussion, at their last week's meeting, the Wenlock Town Council decided to form a committee to report upon the question of appointing an assistant surveyor.

Bexley Heath Urban District Council have agreed, upon the recommendation of the General Purposes Committee, to appoint Mr. E. R. Boulter as assistant and consultative surveyor.

Ninety-nine applications have been received by the Belper Urban District Council for the post of working engineer to the waterworks department. A committee is at present preparing a selected list of names.

Mr. C. Heslop, son of Mr. Heslop, surveyor to the Anckland Rural District Council, has been appointed surveyor and inspector of nuisances to the Shildon Urban District Council. There were thirty applications for the post.

Mr. Clifton Land, who is at present surveyor to the Yeaton Urban District Council, has been selected to fill the post of surveyor to the Cleckheaton Urban District Council. His salary will commence at £150 per annum.

At a recent meeting of the Wareham Town Council a resolution was passed regretting the surveyor's determination to resign his office, and resolving to advertise for a successor to fill the vacancy. Mr. G. Hobbs is the present official.

On Tuesday, at a meeting of the Basford Rural District Council, Mr. S. Maylan was appointed inspector of nuisances and surveyor for the whole of the district, at a salary of £300 a year, and Mr. Windows was appointed his assistant, at £80 per annum.

We understand that about three weeks ago the Sudbury Corporation unanimously voted Mr. T. W. A. Hlayward, their borough engineer, an honorarium of 10 guineas and also presented him with a bicycle. We now learn that at their last meeting they further decided to increase his salary by £50 per annum.

At the last monthly meeting of the Chesterfield Town Council, Mr. Bosbridge, surveyor to the northern portion of the district, submitted his resignation and asked to be set at liberty by September 15th. The resignation was accepted, and it was decided to advertise at once and try and meet Mr. Bosbridge, though the council, it was remarked, were entitled to three months' notice.

We learn with regret of the death of Mr. Joseph Towers, surveyor to the Urban District Council of Thame, Oxfordshire, which took place, after a rather protracted illness, on Thursday week. Mr. Towers, who was fifty years of age, had held his office since April, 1845. The funeral took place on Saturday afternoon, at the parish churchyard. The council were represented by the chairman, Mr. E. G. Bryer.

Mr. J. E. Stewart, the borough electrical engineer of Derby, having resigned that position, a new engineer at £350 is to be appointed. Mr. Stewart has asked to be relieved of his duties in a few weeks' time, so that he may proceed to his new position, which is stated to be in America. The appointment was subject to three months' notice, but there seems to be a feeling in the council that he should be released if a new man can be appointed, so as to have a week or so with him before he leaves.

A committee of the Cheshire Town Council recently recommended the appointment of Mr. William Holland (at present surveyor of the Wirral district) to assist the county surveyor generally in the performance of his duties, and in particular in the inspection of the main roads in the municipal boroughs and urban districts, and of the work connected with the maintenance, repair and improvement thereof. It was recommended that he should be paid £275 per annum (his present salary), with allowance for travelling expenses. The report was adopted.

The Lewes Corporation's consulting engineer, Mr. F. J. Warden Stevens, has received further instructions in connection with the electric lighting of the borough, the provisional order now having been obtained. Mr. Stevens has also been requested to prepare a scheme of electric tramways for Port Louis, Mauritius. At Queenstown the scheme of electric lighting prepared by Mr. Stevens has been approved by the commissioners, while at Fleet, Hants, where a local company intend to establish works for the supply of electricity, Mr. Stevens has been retained as consulting engineer.

At a meeting of the Lodden and Clavering (Norfolk) Rural District Council, held in the early part of the week, consideration was given to the question of the appointment of a surveyor and inspector of nuisances for the Lodden district. The candidates in attendance were Mr. T. Jeffs, Birmingham; Mr. C. W. Pritchard, Sheffield; and Mr. W. J. Versey, South Lowestoft. The testimonials of each candidate were placed before the council, and ultimately Mr. Pritchard was elected by a unanimous vote. Mr. Pritchard thanked the council for the confidence they had placed in him, and agreed to commence his duties that day month.

At a recent meeting of the Weybridge Urban District Council the question of remunerating the surveyor, Mr. John S. Crawshaw, for extra services rendered by him in preparing plans and specifications for private street and other works, was taken into consideration, and it was resolved that a sum of 60 guineas be paid to Mr. Crawshaw for the work he had done up to the present time. A member, in moving the adoption of the report of the committee dealing with the matter, said, in the course of his remarks, that although he did not wish to lavish too much praise on the surveyor, he might say that what Mr. Crawshaw valued more than the money was the knowledge that he possessed the respect and confidence of his employees.

The Edinburgh and District Lunacy Board, after some consideration, recently appointed Mr. Hippolyto J. Blanc, R.S.A., to be architect for the new asylum at Bangour. They also awarded the following premiums: First premium (£250) to Messrs. M'Arthy & Watson, Edinburgh; second premium (£200), Mr. William Eaglesham, Ayr; third premium (£150), Messrs. Thomson & Sandilands, Glasgow; fourth premium (£100), Messrs. M'Gibbon & Ross, Edinburgh. Under the conditions and instructions to architects it was provided that whatever architect was placed first by the assessor should receive the appointment, and that among the other competitors there should be distributed in addition four money awards in the order of merit.

The report of a special committee appointed to consider the question of the salaries of the surveyors of highways to the Chesterfield Rural District Council was presented at the last monthly meeting of the latter body. It had been unanimously resolved by the committee to recommend the council to raise the salary of Mr. Robinson, the southern surveyor, from £150 to £160 per annum, and to give him a rise of £5 a year up to a maximum of £170. Mr. Bosbridge, the northern surveyor, having resigned, it had been decided to recommend that his successor should be offered £160 to start with. The council, however, eventually adopted an amendment that the surveyors, instead of working up to £170, should have their salaries raised to £200 per annum at yearly increases of £10.

A number of gentlemen, including several members of the town council, the town clerk, borough treasurer and electrical engineer, assembled on Tuesday at the Newport (Mon.) Town Hall, for the purpose of saying good-bye to Mr. A. Harrison, the assistant borough engineer, and presenting him with a handsome silver tea and coffee service, subscribed for by his brother officials, fifty in number. The presentation was duly made by the deputy mayor, while two other gentlemen each added a few phrases expressing their personal liking for the recipient and an earnest hope for his future welfare. Mr. Harrison, much touched at the evidence of cordiality and appreciation, briefly and simply thanked the contributors and the members of the corporation. Mr. Harrison leaves Uskside in a few days to take up his new duties.

A STEAM-PRESSURE REDUCING VALVE.

The "Foster" steam-pressure reducing valve has been introduced as an improvement for reducing and regulating steam pressures. If a demand for more steam be made upon it, the valve, we are told, instantly opens wider and supplies that demand, but maintains a uniform reduced pressure. It is added that it can also open full bore, if necessary, and yet prevent the reduced pressure rising above that at which the valve is adjusted. The following are represented as its chief features: (1) A compensating spring movement, exerting a uniform power on diaphragms, without regard to the opening of the valve; (2) unvarying tightness; (3) absence of friction; (4) absence of noise; (5) a patent balanced valve which ensures steam-tight seats regardless of pressure or temperature; (6) parts all metallic, without rubber, &c. and (7) absence of pistons, stuffing boxes and drip. The makers are Messrs. W. H. Bailey & Co., Limited, Albion Works, Salford, who claim that the valve can be fixed anywhere either on sea or land.

Crossall.—The district council at their next meeting will consider the question of widening the road near the Anchor Inn.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

VOLUNTARY PASS EXAMINATION.

Notice is hereby given that the twenty-sixth examination for candidates for the offices of engineer and surveyor to municipal corporations and district councils will be held at the Technical School, Princess-street, Manchester, on Friday and Saturday, September 30 and October 1, 1898. Application forms, duly filled in by intending candidates, together with entrance fee of £2 2s., must be in the hands of the secretary on or before the 5th September.

MIDLAND DISTRICT MEETING AT BILSTON.

A meeting of the members of the midland district will be held on Saturday, September 17th, at Bilston. The following are the arrangements:—

- 11 a.m.—The members will be received in the council chamber, Town Hall, by the chairman (Councillor R. A. Harper, J.P.) and other members of the council. Minutes of Stafford and Ryhyder meetings. Election of hon. district secretary.
- 11.30 a.m.—Leave in brakes, kindly provided by Councillor J. W. Sankey, chairman of the Water and Baths Committee, for a visit to the Spring Vale furnaces, arriving about 11.40 a.m., where, by the kind permission of Sir Alfred Hickman, the process of steel manufacture will be witnessed. A short descriptive paper will be given.
- 12.30 p.m.—Leave in brakes for a visit to the waterworks covered service reservoir (which will be specially emptied for the inspection of the members), arriving about 12.45.
- 1.15 p.m.—Leave in brakes for the Hinley Arms Hotel, arriving about 2 p.m., where a light luncheon will be provided by Councillor R. A. Harper, J.P., chairman of the council.
- 3 p.m.—Leave in brakes for a visit to the Bilston waterworks pumping station, arriving about 3.30 p.m.
- 4.15 p.m.—Leave in brakes for the Technical School, Bilston, arriving about 5 p.m.
- 6 p.m.—Dinner at the Technical School. Tickets, 3s. 6d. each (exclusive of wine).

Arrangements will be made for any members desirous of doing so to inspect the public baths and the public market.

Mr. C. L. N. Wilson, the water engineer and surveyor to the Bilston Council, will give a descriptive paper of the works. As the paper will be in the hands of members intimating their intention to attend some days before the meeting, it will be taken as read.

Among the hotels at Bilston may be mentioned the Pipe Hall, Globe and Great Western.

Wolverhampton is within 2½ miles and Birmingham 10½ miles, and there is a good service of trains from these towns. The Great Western station at Bilston is the nearest to the Town Hall.

J. S. PICKERING, A.M.I.C.E., THOS. COLE, A.M.I.C.E.,
Hon. District Secretary, Secretary,
Council Offices, Nuneaton. 11 Victoria-street, S.W.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

DRAUGHTSMAN.—August 26th.—Corporation of Bacup. 30s.—Mr. Francis Wood, borough engineer.

CLERK OF WORKS.—August 27th.—Vestry of St. Matthew, Bethnal Green. £4 4s.—Mr. F. W. Barratt, surveyor.

ELECTRICAL ENGINEER.—August 27th.—Corporation of Ashton-under-Lyne. £250.—Chairman, Electricity Committee.

DISTRICT SURVEYOR.—August 29th.—Cheshire County Council. £200.—Mr. Reginald Potts, clerk.

SENIOR ASSISTANT.—August 30th.—West Hartlepool Corporation. £78.—Mr. J. W. Brown, borough engineer.

Clasgow.—It is stated that the Statute Labour Committee have received a letter from Messrs. M'Clure, Naismith & Brodie, solicitors, on behalf of Messrs. Stewart & M'Donald, refusing the corporation's offer of £5,000 for ground for the proposed improvement of the corner of Buchanan-street and Argyle-street on the west side, the reason assigned being that the price was totally inadequate. The ground required consists of 70 yards, and Messrs. Stewart & M'Donald wanted £130 per yard.—A sub-committee of the Statute Labour Committee, appointed to consider complaints by shopkeepers occupying premises under and near to the Caledonian railway bridge crossing Argyle-street as to the annoyance and inconvenience caused by the noise of the traffic passing under the bridge, recommended that the portion of Argyle-street under the railway bridge and for 15 ft. on either side thereof be paved with wood, and that the material to be used be Jarrabdale—the probable cost to the Tramways Department being £233 and to the Statute Labour Department £260. The sub-committee further agreed to recommend that the remaining portion of said street east of the bridge to Jamacia-street, a length of 92 ft., be restored with granite. The minute was adopted.

NOTICES.

THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER may be ordered direct, through any of Messrs. Smith & Son's book-stalls, or of any newsagent in the United Kingdom. Applications to the Offices for single copies by post must in all cases be accompanied by stamps.

The Prepaid Subscription (including postage) is as follows:

APPOINTMENTS OPEN.

HERTFORDSHIRE COUNTY COUNCIL. DISTRICT MAIN ROAD SURVEYORS.

Applications are invited for District Main Road Surveyors in the county of Hertford. The persons appointed will act under the instructions of the County Surveyor, and will have charge of a district comprising about 120 miles of rural main roads. Applicants must be cyclists and not more than thirty-five years of age. Particulars of duties and terms of appointment, &c., may be obtained on applying by letter to the undersigned.

Applications to be sent in not later than Wednesday, the 31st inst.

URBAN A. SMITH, C.E.,
County Surveyor of Highways.

41 Parliament-street, Westminster, S.W.
August 22, 1898.

BOROUGH OF WEST HARTLEPOOL. JUNIOR ASSISTANT.

Wanted, in the Borough Engineer's Department, a Junior Assistant, who has been thoroughly trained in the duties of a borough engineer's office. He must be a good draughtsman and surveyor, and have architectural ability. Salary, £78 per year.

Applications, stating age, present employment, and accompanied by copies of three recent testimonials, and addressed to the "Chairman of the Works Committee," endorsed "Junior Assistant," are to be delivered at this office on or before 4 p.m. on the 30th inst.

(By order)

J. W. BROWN,
Borough Engineer.

Borough Engineer's Office, West Hartlepool.
August 11, 1898.

BOROUGH OF SOUTHEAD-ON-SEA. BUILDINGS INSPECTOR.

The Corporation invite applications for the appointment of a Buildings Inspector, at a salary of £125 per annum.

The person appointed will be required to supervise the erection of new buildings, and to see that the by-laws in force within the borough with respect to new streets and buildings are complied with, and it is essential that he should be practically acquainted with building construction and have a thorough knowledge of the Model By-Laws of the Local Government Board, under the Public Health Act, 1875.

Applications to be made in writing, accompanied by copies of not more than three recent testimonials (which will not be returned), stating age, qualifications, experience and where at present engaged, to be delivered at my office before 10 o'clock a.m. on Friday, the 2nd September.

Canvassing members of the Town Council will be a disqualification.

(By order)

WILLIAM H. SNOW,
Town Clerk.

Southend-on-Sea.
August 16, 1898.

VESTRY OF ST. MARYLEBONE. APPOINTMENT OF SUPERINTENDENT OF CLEANSING.

Notice is hereby given that the Surveyor to the Vestry is authorised to engage the services of a person competent to discharge the duties of superintending the street cleansing, washing, watering, snow removal, &c., of the parish of St. Marylebone. A horse and trap will be available for use by the person engaged, in order that he may be enabled to efficiently discharge the duties of the office. When such duties have been performed for a period of twelve months in a manner satisfactory to the Surveyor the person engaged will be submitted to the Vestry for appointment. He will be required to reside in the parish and to devote the whole of his time to the duties of the office.

The salary will be at the rate of £150 per annum, rising by annual increments of £10 to £230, the grant of such annual increments to be dependent upon the efficient and satisfactory discharge of the duties of the office, and the appointment will be made upon the understanding that no pension or retiring allowance will attach thereto.

Applications, in candidate's own handwriting, stating age (which must not be less than thirty nor more than forty-five years), with copies of three testimonials (only of recent date), to be forwarded to J. Paget Waddington, C.E., Surveyor to the Vestry, at the Court House, Marylebone-lane, W., endorsed "Application for Cleansing Superintendentship," or before Monday, September 5th proximo.

(By order)

W. H. GARBUTT,
Vestry Clerk.

August, 1898.

VESTRY OF ST. MARYLEBONE. APPOINTMENT OF DISTRICT SUPER- INTENDENTS.

Notice is hereby given that the Surveyor to the Vestry is authorised to engage the services of three persons (one for each of the three districts into which the parish is divided) competent to superintend the execution of all macadam, flint and paved carriage-way and footway works, and to undertake the supervision of all hoardings, public lamps, &c., within the district to which each may be appointed. When the duties of the office have been performed for a period of twelve months in a manner satisfactory to the Surveyor each person engaged will be submitted to the Vestry for appointment. He will be required to reside in the parish and to devote the whole of his time to the duties of the office.

The salary will be at the rate of £150 per annum, rising by annual increments of £10 to £200, the grant of such annual increments to be dependent upon the efficient and satisfactory discharge of the duties of the office, and the appointment will be made upon the understanding that no pension or retiring allowances will attach thereto.

Applications, in candidate's own handwriting, stating age (which must not be less than thirty nor more than forty-five years), with copies of three testimonials (only of recent date), to be forwarded to J. Paget Waddington, C.E., Surveyor to the Vestry, at the Court House, Marylebone-lane, W., endorsed "Application for District Superintendentship," on or before Monday, September 5th proximo.

(By order)

W. H. GARBUTT,
Vestry Clerk.

August, 1898.

VESTRY OF ST. MARYLEBONE. APPOINTMENT OF SUPERINTENDENT OF SEWERS AND DRAINS.

Notice is hereby given that the Surveyor to the Vestry is authorised to engage the services of a person competent to superintend the construction, maintenance and cleansing of all public sewers and urinals, and the construction of drains, so far as laid by the Vestry, within the parish of St. Marylebone. When the duties of the office have been performed for a period of twelve months in a manner satisfactory to the Surveyor the person engaged will be submitted to the Vestry for appointment. He will be required to reside in the parish and to devote the whole of his time to the duties of the office.

The salary will be at the rate of £150 per annum, rising by annual increments of £10 to £200, the grant of such annual increments to be dependent upon the efficient and satisfactory discharge of the duties of the office, and the appointment will be made upon the understanding that no pension or retiring allowance will attach thereto.

Applications, in candidate's own handwriting, stating age

(which must not be less than thirty nor more than forty-five years), with copies of three testimonials (only) of recent date, to be forwarded to J. Paget Wadlington, C.E., Surveyor to the Vestry, at the Court House, Marysham-lane, W., endorsed "Application for Superintendentship of Sewers and Drains," on or before Monday, September 5th proximo.

(By order)
W. H. GARBUTT,
Vestry Clerk.

August, 1898.

LOCAL GOVERNMENT OFFICIALS.

The British Electrical Traction Company, Limited, is prepared to appoint two or three additional District Superintendents. The essential qualifications are a knowledge of the district in which the candidates reside and ability to negotiate with local authorities. Some knowledge of tramway work is desirable but not absolutely necessary. Salary, £300 to £350 per annum, according to qualifications and position.

Applications (which will be treated confidentially) to be made in writing on foolscap paper, enclosed in an envelope endorsed "District Superintendent," and stating age, full particulars of past experience and the districts in which the applicants have influence, to be sent to the undersigned.

GEO. STEVENS,
Secretary.

Donington House, Norfolk-street,
Strand, W.C.

RURAL DISTRICT COUNCIL OF CHESTERFIELD.

This Council is prepared to receive applications for the office of a Surveyor of Highways for the northern district of their jurisdiction, the area of which is 32,921 acres, with a population in 1891 of about 36,589 people and about 126 miles of highways.

The salary to be paid will be after the rate of £160 per annum, rising £10 per annum until the sum of £200 is reached, which sum will include everything (stationery and postages excepted).

The person appointed must be competent to take levels, prepare plans, estimates and bills of quantities of any works required to be done, and must personally see to the carrying out of the same. He must also be competent to keep all books and accounts required under the Acts, obey all orders of the Council and other road authorities, and devote his whole time to the duties of his office.

The person appointed will be required to reside at Eekiegton or Staveley.

Security in the sum of £200, with an approved guarantee society, for the due performance of the duties will be required, and the appointment will be terminable by three calendar months' notice on either side.

Applications, stating age (which must not exceed forty-five)

and previous occupation, accompanied by three testimonials of recent date, to be sent to me on or before the 31st instant.

Canvassing is strictly prohibited. Only third-class railway fare (return) will be allowed to selected candidates. No allowance for hotel or other expenses.

(By order)
GEORGE SHAW,
Clerk.

Union Offices, Chesterfield.

August 17, 1898.

**BOROUGH OF OSWESTRY.
APPOINTMENT OF SURVEYOR AND SANITARY INSPECTOR.**

The Town Council of this borough require the services of a Surveyor and Sanitary Inspector, who must be thoroughly conversant with water and sewerage works, and who shall devote the whole of his time to the duties of his office. He will be permitted to take one pupil only.

Salary, £200 per annum.
Personal canvass will be deemed a disqualification.

Applications, accompanied with recent testimonials and endorsed "Surveyor," to be sent to me on or before 17th September next.

J. PARRY JONES,
Town Clerk.

Oswestry.

August 22, 1898.

**CHERTSEY URBAN DISTRICT COUNCIL.
APPOINTMENT OF SURVEYOR AND INSPECTOR OF NUISANCES.**

The Council invite applications for the appointment of Surveyor and Inspector of Nuisances for their district, at a combined salary of £160 per annum, payable monthly.

The person appointed must be between twenty-seven and forty years of age, will be required to devote his whole time to the duties of the office, and to reside in the district. He must be thoroughly competent and have had practical experience in a similar position.

The successful applicant will be required to take office in one month from date of appointment, which shall be determined by two months' notice on either side.

Sealed applications, endorsed "Surveyor and Inspector," stating the age, qualifications and experience, accompanied by copies of not more than three recent testimonials, must reach the undersigned by noon on Tuesday, the 6th day of September next.

Canvassing, directly or indirectly, will be a disqualification. A list of duties and further particulars may be obtained from me.

T. E. HARLAND CHALDECOTT,
Clerk to the Council.

ALDERSHOT URBAN DISTRICT COUNCIL. CLERK OF WORKS.

A temporary Clerk of Works is required in connection with new street works. Preference will be given to an applicant having a good knowledge of road work and concrete paving.

Applications, stating experience, salary required, and accompanied by three testimonials, to be delivered not later than Tuesday, the 6th day of September.

NELSON F. DENNIS, A.M.I.C.E.,
Surveyor.

Aldershot.

COMPETITION.

CHERTSEY URBAN DISTRICT COUNCIL.

COMPETITION FOR SEWERAGE SCHEMES.

TO ENGINEERS.

The Chertsey Urban District Council invite competitive plans for the Sewerage and Treatment of Sewage from the

Nos. 1 and 2 Wards of their district, showing separate and joint schemes for such wards.

The following premiums are offered: First, £50; second, £30; third, £20.

Plans, details and estimates of cost to be signed by a *nom-de-plume*.

The names and addresses of competitors to be sealed in an envelope endorsed with the *nom-de-plume* adopted.

Plans of the suggested areas may be seen and other particulars (printed or written) obtained, on application up to the 28th day of October next, from the Surveyor to the Council, Mr. Arthur W. Smith, Eastworth-road, Chertsey. Plans and other documents should be delivered free to the undersigned by the 23rd day of December next.

Competitors must not approach or consult members of the Council.

(By order)

T. E. HARLAND CHALDECOTT,
Clerk to the Council.

Chertsey.

August 26, 1898.

TENDERS WANTED.

ALDERSHOT URBAN DISTRICT COUNCIL.

Tenders are hereby invited by the above-named Council for a supply of 2,000 Tons of Granite (more or less) of approved quality, at per ton, in such quantities as the Council may direct.

Samples of the material tendered for, broken to pass through 1½-in. and 2-in. rings, must be forwarded to the Council's Surveyor, at the Council's Offices, Aldershot.

Tenders must state separate prices for the materials broken to the sizes named.

Further particulars may be obtained on application to the Council Surveyor, at the offices aforesaid.

Tenders, endorsed "Tenders for Granite," to be sent to me at the offices aforesaid not later than Tuesday, the 6th day of September, 1898.

The Council do not bind themselves to accept the lowest or any other tender.

CONTRACTORS FOR DRAINAGE AND WATER SUPPLY WORKS.

SWANAGE URBAN DISTRICT COUNCIL.
TO SEWERAGE CONTRACTORS.

The Urban District Council of Swanage, in the county of Dorset, are prepared to receive tenders for the completion of the Main Sewerage of the district, including about 221 yards of 27-in. Iron Outfall Sewer, 976 yards of 27-in. and 30-in., and 3,900 yards of 9-in., 12-in. and 15-in. Pipe Sewers, with requisite arrangements for flushing, inspection and ventilation.

Drawings and specification may be seen at the offices of the Council, Town Hall, Swanage, and of the Engineers, 5 St. Thomas-street, Ryde, of whom copies of the quantities may be obtained on the deposit of 1 guinea, to be returned on receipt of a *bona-fide* tender. The tenders to be delivered by noon on Monday, September 19, 1898.

FRANCIS NEWMAN & COCKS,
Engineers.

BOROUGH OF DERBY.

DERBY CORPORATION WATERWORKS.

CONSTRUCTION OF COVERED SERVICE RESERVOIR.

The Corporation of Derby are prepared to receive tenders for the construction of a Covered Service Reservoir at Little-over, near Derby.

Drawings may be inspected, and copies of the specification and forms of tender may be obtained, on payment of £2 2s., to be returned if a *bona-fide* tender be made, on application at the office of the Borough Surveyor, Babington-lane, Derby, and at the office of Messrs. T. & C. Hawksley, civil engineers, 30 Great George-street, Westminster, S.W., on and after Monday, the 25th instant.

Tenders, on the prescribed form, must be delivered with the specification (enclosed in a sealed envelope, endorsed "Derby Corporation Waterworks—Contract No. 2—Tender for Covered Service Reservoir," and addressed to the undersigned), at the Town Hall, Derby, on or before 12 noon on Monday, the 5th day of September next.

The lowest or any tender will not necessarily be accepted.

H. F. GADSBY,
Town Clerk.

Town Hall, Derby.
August 4, 1898.

ST. LUKE (MIDDLESEX) VESTRY.

BIRMINGHAM CORPORATION WATER.

ELAN SUPPLY.—CONTRACT No. 12.—AQUEDUCT.

TO CONTRACTORS.

The Corporation of Birmingham are prepared to receive tenders from competent persons willing to enter into a contract for the construction of about 17½ miles of the Aqueduct from Cleobury Mortimer, in the county of Salop, to Hagley, in the county of Worcester. The contract consists principally of providing and laying two lines of cast-iron pipes and laying only two lines of steel pipes, 41 in. in diameter.

The drawings may be seen, and specification and bills of quantities obtained, at the office of the Engineer, Mr. James Mansergh, 5 Victoria-street, Westminster, on and after the 15th inst., on the deposit of cheque or bank note for £20, which will be returned on receipt of a *bona-fide* tender with the bills of quantities fully priced out.

Early application for particulars is necessary, as only a limited number will be given out, and none after the 3rd day of September next.

The contractor will be required to undertake not to pay less than the minimum standard rate of wages current in the district in which the works are situate.

Sealed tenders, addressed to me, and endorsed "Tender for Aqueduct, Contract No. 12," are to be delivered at my office (post paid) at or before noon of Tuesday, the 13th day of September next.

The Corporation do not bind themselves to accept the lowest or any tender.

(Signed)
EDWARD ORFORD SMITH,
Town Clerk.

Town Clerk's Office,
Council House, Birmingham.

**URBAN DISTRICT COUNCIL OF LYTHAM.
SEWERAGE AND SEWAGE DISPOSAL.**

The Urban District Council of Lytham invite tenders for the construction of about 900 yards of 3-ft. diameter Brick Outfall Sewer, about 1,500 yards of 24-in. and 18-in. Pipe Sewers, the construction of Concrete Storage Tanks, together with sea embankment, roadway, and other contingent works.

Plans may be seen and specifications, quantities and forms of tender obtained at the office of the Engineers, Messrs. Newton, 17 Cooper-street, Manchester, on depositing £2,

which will be repaid on receipt of a *bona-fide* tender and the documents supplied.

The lowest or any tender will not necessarily be accepted. Sealed tenders, endorsed "Tender for Sewerage," to be delivered at these offices not later than noon on the 19th September, 1898.

CHAS. A. MYERS,
Clerk to the Council.

August 23, 1898.

CIRENCESTER SURFACE-WATER DRAINAGE WORKS.

The Cirencester Urban District Council are prepared to receive tenders for the construction of a system of Surface-Water Drains in a portion of their district.

The drawings and specifications may be seen at my office, where copies of the quantities and forms of tender can be obtained on payment of £1 ls., returnable if a *bona-fide* tender be made.

Sealed tenders, which must be on the proper form and endorsed "Tender for Surface-Water Drainage Works," must be delivered at my office on or before Thursday, the 1st day of September, 1898.

The Council do not bind themselves to accept the lowest or any tender.

August 22, 1898.

**BOROUGH OF SOUTHEND-ON-SEA.
TO ROAD CONTRACTORS AND OTHERS.**

The Corporation invite tenders for Street Works in the making-up of the following streets:—

Hadleigh-road.
Wickford-road.
Canewdon-road (eastern portion).

Plans, sections and specifications may be seen, and bills of quantities and forms of tender obtained, on and after Monday, August 22nd (on payment of £1 ls. in respect of each street, which will be returned on receipt of a *bona-fide* tender), upon application to Mr. Alfred Fidler, ASSOC. MINS. C.E., Borough Surveyor, Clarence-road, Southend.

No tender will be considered unless made on the prescribed form, and there must be a separate tender for each street.

Sealed tenders, endorsed with the name of the street, and marked "Tender for Private Street Works," to be delivered at my office before 10 o'clock in the morning of Thursday, September 8th.

The Corporation will not be bound to accept the lowest or any tender.

ALDERSHOT URBAN DISTRICT COUNCIL.
 SCARIFIER.

The above Council are prepared to receive tenders for the supply and delivery at Aldershot of a Scarifier of the type known as Morrison's. The scarifier must be capable of being attached to and worked by a 19-ton steam roller. A separate price is required for the work of fixing, &c., to the steam rollers. The contractor must give a full description of the machine with his tenders. Full particulars may be obtained of the Surveyor.

Tenders, to be endorsed "Scarifier," are to be delivered at my office not later than the 6th day of September.

The Council do not bind themselves to accept the lowest or any tender.

The contractor must state when he will undertake the delivery. This is important.

(By order of the Council)
 W. E. FOSTER,
 Clerk.

Aldershot.
 August 5, 1898.

CITY OF NOTTINGHAM.

TO CONTRACTORS.

The Stoke Farm Committee of the City Council is prepared to receive tenders for the Construction of a new Sewer in Lenton Boulevard, together with all appurtenant works.

The works required consist of the construction of about:—
 1,750 yards Brick and Concrete Main Sewer, 9 ft. wide and 7 ft. 3 in. high.

40 yards 4 ft. 6 in. diameter Brick Barrel Sewer.
 16 yards 5 ft. diameter Brick Barrel Sewer.
 146 yards 3 ft. 6 in. by 2 ft. 4 in. Egg-Shaped Brick Sewer.
 55 yards 3 ft. by 2 ft. Egg-Shaped Brick Sewer.
 24 yards 15 in. diameter Pipe Sewer.
 550 yards 12 in. diameter Pipe Sewer.
 80 yards 9 in. diameter Pipe Sewer and other appurtenant works.

Drawings may be seen, and specification, bills of quantities and forms of tender obtained, at my office, on payment of a deposit of 3 guineas, which will be returned on receipt of a *bona-fide* tender and the copy of the specification.

Sealed tenders, endorsed "New Sewer, Lenton Boulevard," are to be sent to the Town Clerk on or before Saturday, the 17th September, 1898.

The lowest or any tender will not necessarily be accepted, and tenders will only be accepted from persons who conform to the conditions of contract as regards paying the local standard rate of wages, &c.

(By order)
 ARTHUR BROWN, M.INST.C.E.,
 City Engineer.

Guildhall, Nottingham.
 August 16, 1898.

CARRICKMACROSS UNION.

NOTICE TO CONTRACTORS.

The Board of Guardians of the above Union, acting as the rural sanitary authority, will, at their meeting to be held at 2 o'clock p.m. on Tuesday, 6th September, 1898, be prepared to consider tenders for the construction of works to supply the town of Carrickmacross with water, in accordance with plans and specification prepared by P. F. Comer and the late W. G. Strype, MEMBS.INST.C.E., 19 Lower Leeson-street, Dublin, which can be seen at the office of Mr. J. H. Blackader, solicitor, Carrickmacross, between the hours of 11 a.m. and 3 o'clock p.m. daily.

The works comprise the supply and laying of 102 tons or thereabouts of Cast-Iron Water Mains; the construction of a Pumping House, with duplicate sets of oil engines and three-throw gun-metal plunger force pumps, each set of pumping plant being capable of delivering 90 gallons per minute to a height of 200 ft.; and the construction of a Service Reservoir, to contain 100,000 gallons or thereabouts.

The Maidstone Report.

The report of the Local Government Board inspectors who were appointed to inquire into the Maidstone typhoid epidemic of last year has been awaited with no small interest. It has now been issued, and it is not too much to say that it entirely confirms the conclusions to which the great majority of reasonable and thoughtful people who had no pet theory to bolster up had felt themselves bound to arrive. The inspectors were Mr. J. S. Davy, Dr. Theodore Thomson, and Mr. G. W. Willcocks, M.B.C.E., who opened their inquiry at Maidstone on January 31st, the proceedings lasting eight days. Much of the report is occupied by narrating in considerable detail the history of the epidemic, but to this we need only briefly refer, as we dealt with it fully at the time of the outbreak, and also in our account of the proceedings during the inquiry. It will be remembered that the epidemic began in September and lasted for about four months. Up to January 20, 1898, there had been a total of 1,681 cases in the borough, exclusive of 107 notifications by the Kent Lunatic Asylum at Barming. There were also twenty cases in the Maidstone Union Workhouse, which is situated outside the borough, while a number of persons were attacked in rural parishes which adjoin Maidstone and are supplied with water by the Maidstone Water Company. The most interesting part of the report is to be found in the concluding comments. Naturally the first question of importance is to ascertain the immediate cause of the outbreak. Here is the decision to which the inspectors have come:—

On a review of the whole of the epidemic, we have no hesitation in coming to the conclusion that the epidemic was caused by the pollution of the water supplied by the Maidstone Company from their Farleigh source. It is true that there is abundant testimony to show that grave sanitary defects exist in the construction of some of the sewers and of many house drains and water-closets within the borough; while one of the expert witnesses, Dr. Corfield, said that, in his opinion, these defects were sufficient to account for the epidemic. But the sudden and simultaneous outbreak of fever over a wide area, and the rapidity with which the epidemic grew, cannot be accounted for by the existence of defective conditions of sewerage and drainage. Further, the facts as to the local incidence of the disease are not consistent with the theory that these conditions had anything to do with its origin. The old brick barrel sewers are almost all in the lower part of the town, which was comparatively free from attack, and the hand-flushed and defective house drains are distributed pretty equally over the whole town, whereas the cases of typhoid fever were confined to the Farleigh area of water supply to an extent which quite precludes the possibility of more chance.

This delivrance does not lend much support to the abortive attempts that were made in certain quarters to explain to the public that the outbreak was due, not partially but *wholly*, to defects of drainage and sewerage. Our own point of view has more than once been placed before our readers without ambiguity. In our issue of the 19th inst. we expressed the opinion, in reply to a correspondent,

that "there is a close connection between the influence of sewer gas from ill-ventilated or improperly-constructed house drains and sewers and typhoid fever," but at the same time we pointed out that, "whilst it is now generally admitted that putrid gases from sewers and drains cannot be held to generate typhoid fever spontaneously, there is no doubt that sewer gas is a strongly predisposing cause, in that it lowers the vitality of the human system and renders it readily susceptible to the entrance of the specific germ which produces typhoid in the human being." We also added that "the broad fact that insanitary conditions are a strongly predisposing cause to outbreaks of typhoid fever should not be lost sight of." Were the sanitary defects of Maidstone so acute and so widely spread as to produce such a wholesale lowering of the vitality of the community that but for the existence of these evils there would have been no epidemic? The remarks of the inspectors in regard to the incidence of the outbreak should be a sufficient answer to such a contention, though it may readily be admitted that the sanitary defects intensified the disease. But however strongly exposure to the influence of sewer gas may predispose towards disease, it has not been proved that it is a medium for the transmission of the specific typhoid bacillus. On the other hand it has been proved with tolerable certainty that water is such a medium. On behalf of the water company it was objected that the evidence, strongly as it pointed to the pollution of the Farleigh water supply, was circumstantial and established grounds for suspicion only, but it was supplemented by other facts which appeared to the inspectors to leave no room for doubt. They, however, accept the contention of the company so far as regards a limited number of cases. They remark:—

We are of opinion that many of the typhoid cases in the borough were due to defects of drainage and sewerage, with consequent pollution of the soil underlying the town. The responsibility for the existence of these insanitary conditions lies with the town council, whose duty it was to take steps that would lead to effective remedy of these defects. This duty they have in large measure neglected, notwithstanding that for many years the medical officer of health has repeatedly warned them of the risk to which the inhabitants of the town were exposed by the continuance of these insanitary conditions.

Before concluding their report the inspectors draw attention to a very important point, so important, indeed, that we may be justified in quoting the whole passage:—

The history of the epidemic appears to us to raise the question as to how far the regulations of the Board relating to the duties of medical officers of health and the statutes which regulate the powers and obligations of private water companies are sufficient to ensure a reasonable amount of protection to the public health. The general order of the Board of 1891 prescribes that the medical officer of health "shall inform himself as far as may be practicable respecting all influences affecting or threatening to affect injuriously the public health within the district." This regulation might be held to make it the duty of the medical officer to visit and inspect the works of a private water company supplying

water to his district, even though the works were situate outside it, as is the case at Maidstone. This, however, was not the construction put upon the regulation by Mr. M. A. Adams, the medical officer for Maidstone, and as a matter of fact he had never seen the sources of the water supply furnished to the Farleigh area. He pointed out with considerable force that he had no legal right of access to the works, and as to taking samples of the water. Yet sec. 7 of the Public Health (Water) Act, 1878, imposes upon rural sanitary authorities the duty of taking such steps as may be necessary to ascertain the condition of the water supply within their district. It must be stated, however, that it did not appear that any application to inspect the works or to take samples of the springs separately was ever made to the directors of the water company by either of the sanitary authorities concerned.

The moral of the preceding paragraph is that the whole question of water supplies, whether controlled by local authorities or by private companies, requires attention from the Government, in order that it may be placed upon such a basis as will ensure freedom from gross pollution and a reasonable amount of protection to consumers. The last sentence of the paragraph indicates that responsibility was not monopolised by the company, but that a certain share is to be attributed to the sanitary authorities. When the epidemic began we had occasion to point out that the ratepayers were by no means free from blame, as they had vetoed the acquisition of the supply by the corporation when an excellent opportunity for purchasing had presented itself. We are waiting with considerable interest for some signs of a movement in favour of municipalisation. If there are any insuperable obstacles or serious objections we should be glad to hear of them.

* * *

Some Municipal Engineering Questions.

In the last annual report submitted to the Nuneaton and Chilvers Coton Urban District Council, Mr. Pickering, the engineer and surveyor to that body, discusses in a general and interesting way some of the more troublesome questions which confront municipal engineers. We observe that Mr. Pickering seems to be more fortunate than many of his brethren in connection with the inspection of new buildings and drains, inasmuch as he finds a general willingness on the part of builders to carry out the requirements of the council and to remedy any irregularities pointed out. In this connection we may mention that the council in March last adopted new regulations and instructions setting forth their requirements in regard to building and drainage operations. Mr. Pickering repeats the familiar warning against entrusting drainage work to incompetent workmen or unskilled labourers, and he suggests that no one should be allowed to carry out drainage work without a proper certificate of competency from the council or some other recognised authority. The necessity for such a provision, however, does not seem to be very great in Nuneaton, for the rare occurrence of blocked drains is cited as a proof of the care that is exercised in their construction. A more serious problem in Nuneaton is the removal and disposal of night-soil. The bulk of it has to be carted, at the expense of the council, a considerable distance from the town and deposited on agricultural land. The refuse from dry ash-pits is of no manurial value, and consequently there is no return against the expense of its removal. Mr. Pickering considers, however, that the refuse has some value as fuel for steam-raising, and that the question is almost ripe for consideration as to whether it could not be utilised for the purpose with advantage. It is surprising to find that so many loads of night-soil can be removed with so few complaints; but no matter how carefully the work is carried out, the privy system can never, in a town like Nuneaton, be otherwise than objectionable and insanitary, and the sooner a new system is substituted the better. In speaking of team labour Mr. Pickering incidentally condemns the hiring system, the chief of a number of disadvantages being that the drivers are not directly under the control of the council. At Nuneaton the main roads have for

six years been maintained under an agreement with the county council, and it is satisfactory to learn that the arrangement has worked to the advantage of both bodies, no complaints having been made by the county surveyor. In order to obtain control of the whole of the public roads, arrangements are made with the various railway companies for the council to repair the roads over their bridges at a fixed annual charge. In speaking of another vexed question, the ventilation of sewers, Mr. Pickering, after quoting the resolutions passed at the conference of metropolitan officials some time ago, remarks that the main point, upon which there appears to be a tolerably unanimous opinion, is that the openings to sewers for ventilation should be increased rather than diminished, the position of the openings and whether provided by pipes up houses or shafts in the streets to be decided according to circumstances. It is considered that in Nuneaton ventilating shafts have had the effect of checking the diseases attributable to emanations from sewers. The system is admitted to be by no means an ideal one; but while open to many objections, the provision of a sufficient number of shafts as outlets for foul air and openings for fresh air is considered to be the most efficacious system at present devised. Mr. Pickering also deals at some length with the questions of sewage disposal and water supply in the district. The extension of the sewage works is temporarily arrested, owing to the demands of the Local Government Board in regard to land. These the council are not prepared to meet, because of the unreasonable cost, while, in Mr. Pickering's opinion, artificial filtration would solve the difficulty. In connection with the water supply it should be noted that the service has now been municipalised.

* * *

Work of the Metropolitan Asylums Board.

The Metropolitan Asylums Board was created by the Metropolitan Poor Act of 1867 to provide accommodation for the imbecile and for those suffering from infectious diseases. Previously there was no adequate provision for these purposes. Those who wish to gain an idea of the nature and scope of the vast work that is now being done by this body can do so by glancing at the report of the Statistical Committee for 1897. The severely statistical character of such a report may repel many, but the volume has abundant interest for those who can interpret statistics intelligently. The Board now own and manage ten fever hospitals accommodating 4,000 patients, four imbecile asylums with 6,000 inmates, hospital ships and a convalescent hospital at Darent in the treatment of 1,500 small-pox cases, and there is an ambulance service for the whole of London. Among other activities of the Board are the training ship *Ernouth*, in which 600 boys from workhouses are educated and trained for the navy, the mercantile marine and the army, and schools for the teaching of 400 imbecile children. Since 1890 provision has been made in connection with infectious diseases for other than pauper patients, and diphtheria cases were first admitted in 1888. The total staff at the hospitals now number about 2,000, practically treble the number in 1890, a significant indication of the enormous expansion of the work of the board in recent years. The expenditure last year amounted to £665,393. In the report reference is made to the decision of the Local Government Board to give the Metropolitan Asylums Board charge of certain classes of Poor Law children. Our periodical reports of the meetings of the board give an idea of the vast amount of building and other contract work which has to be done by this important body. Particulars have already been given in our columns of the splendid block of offices which the Board have decided to erect on the Thames embankment. The report is supplemented by a number of maps showing the incidence of the various diseases and embodying other information.

Sanitary Work in Essex. The summary of the reports of the district medical officers of health presented annually by Dr. Thresh, county medical officer of Essex, always contains interesting and instructive matter. In the summary for last year he comments upon the fact that certain districts, Barking and Epping for example, have large death rates, 21.2 and 19.5 respectively, while others have an extremely low mortality, the rates in Leyton and Walthamstow, for instance, being 12.1 and 11.9 respectively; and there is little doubt that this is very largely due to the care taken in sanitary matters during the development of the districts in question, while the exercise of the same care in future cannot fail to ensure a continuance of satisfactory sanitary conditions. No one is likely to dispute the remark of Dr. Thresh that the prevention of overcrowding of houses on space, the provision of adequate sewerage, and efficient public scavenging, will ensure the preservation of the soil from such pollution as ultimately fosters disease; while the neglect of those precautions, on the other hand, must lead to soil pollution, the effect of which on the death rate must ultimately make itself felt. We observe that the mortality from typhoid and similar fevers continues to be excessive, especially in the urban districts, and more particularly in the districts bordering on the Thames. The recurrence of this phenomenon year after year in connection with the Thames district points undoubtedly to the existence of some condition favourable to the presence of typhoid fever. The discharge of London sewage into the river at Barking is mentioned as a possible cause, and others might be suggested, but Dr. Thresh considers that none are at present capable of proof. The section of the report referring to sanitary administration is extremely interesting. As might be expected, Dr. Thresh gives the necessary attention to water supply, especially in connection with an anticipated decrease below ordnance datum of the level of the water in the chalk wells. Some remarks on combined drainage, the working of the destructor at Leyton, and the taking of specimens of drinking water, sewage effluents, &c., for purposes of examination, will repay perusal.

* * *

Another "Appointment." It has been our painful duty of late to give some remarkable examples of the singular principles—or want of principles—which animate the members of many of the smaller local authorities in appointing officials, and especially surveyors. The cases of Erith and Street were bad enough, but they almost pale into insignificance in comparison with a recent appointment by a rural district council in Devonshire, the details of which have just reached us. Though we have every belief in the perfect good faith of our correspondent, the circumstances are so extraordinary and so difficult to credit that we hesitate to mention the name of the district. With this reservation we shall give the story as it reaches us. The rural district council in question advertised for a surveyor of highways, asking the applicants to name the salary they wanted. Three were selected, and out of these a youth, about twenty-three years of age, and a relative of a prominent member of the council, was appointed by a large majority, the unsuccessful candidates being informed noticeably by the chairman and other members that the successful man had paid a large sum to the retiring surveyor on the understanding that he should succeed him, and that this had great weight with the council. Why, O why? Apart from that and his extreme youth, is the successful candidate otherwise competent? The district in question, we may mention, has lately earned some notoriety through its insanitary condition, the result of ignoring the recommendations of the medical officer of health. It is possible that we may have occasion to return to the subject.

The East-End Water Question. The weather during the past week has certainly been variable, but there has been no rain to speak of and thus no relief from that quarter for the tension in the East-End of London. In fact, the company have been credited with the intention of still further reducing the supply—to be precise, of giving only a three hours' instead of a six hours' supply. This extreme step, however, has apparently been arrested by the intervention of the Local Government Board. Neither the company nor the Local Government Board have shown themselves capable of learning from past experience or of forecasting the necessities of the future in this particular matter. The officials of the company have been at considerable pains to reply to assertions that they could obtain sufficient water from five other companies if they were willing to pay for it. The contention is that the only company from which assistance can really be obtained is the New River Company, and that this source is being tapped to the fullest extent. It is not denied that there are connections with the systems of other companies, but we are asked to digest the explanation that the mains through which the supplementary water would have to pass are too small to take it. But surely this is quite a new defence, for has not the trouble arisen from the fact that there is not sufficient storage of water to pass a continuous supply through the mains? We fear that the company and their officials will have to try again.

* * *

Water Supply in New York. It is certainly an anomaly to find that the first city in the United States in population, commerce and manufactures should be the lowest of thirty of the principal cities in regard to an adequate water supply. The need of an additional water supply is pressing in Brooklyn, and is expected to become so in Manhattan. A recent writer on the subject says that what is wanted is a gravitation supply, which shall have an ample watershed free from pollution, with sufficient head to supply the highest buildings. It should be within the State of New York and duplicate existing sources, so that if one source failed it would be supplemented by the other. Such a supply, we are told, can be found in the Catskill Mountains, in the southern part of which there is a clear, cold trout-stream supply, from a sparsely-settled hardwood forest district known to every fisherman, with ample volume and an elevation to afford an adequate head to reach the highest buildings, at a distance and at a cost much less than in the case of the Adirondacks, or the Great Lakes, or any other available supply.

* * *

Dr. John Hopkinson. The Alps—that happy hunting ground of those who feel the irresistible fascination of mountaineering to such an extent as to despise its dangers—has claimed many victims, but seldom one so distinguished as Dr. John Hopkinson, equally eminent as a man of science and as a practical electrician. His tragic death, in company with two daughters and a son, will come as a shock to many municipal engineers, to whom he was well known in connection with some of the extensive municipal schemes of electric lighting and traction for which the deceased gentleman acted as engineer. The electric lighting of Manchester and the electric tramways at Leeds are only two among many such schemes. It is not too much to say that his career as a civil engineer was as brilliant and as completely successful as the academic distinction he achieved in early life. To all appearance he had many years of active work still before him, and his undisputed eminence, together with the tragic circumstances of his death, intensifies the feelings of regret with which the news of the event has been received.

The Designing and Construction of Refuse Destructors.

By FRANK LESLIE WATSON, ASSOC. M. INST. C. E.*

In the design and construction of a successful and economical refuse destructor plant the following are the principal points which must be borne in mind:—

A. It must never be forgotten that the primary object of a refuse destructor is, as its name implies, to destroy refuse, and to destroy that refuse as completely as possible and without the production of any description of nuisance. By the term to destroy refuse in this connection is implied a practically absolute chemical separation of the combustible portions of the refuse (such as the carbon, phosphates and nitrates which are found in cinders and in animal and vegetable matter) from the non-combustible portions (which are chiefly mineral), and includes the complete oxidation of the former class, and the fusion and agglomeration so far as is possible into hard clinker of the latter parts. It must be regretfully admitted that in a very large number of destructors these important objects are only attained to a very limited extent.

In order to insure a perfect result:—

(1) A high temperature must be attained; 1,300 deg. Fahr. is admissible, but 1,600 deg. to 1,800 deg. Fahr. is better. It is not sufficient to impart the desired temperature to the furnace gases after they leave the furnaces. Such devices as Mr. Jones's patent fume cremator (intended for this purpose) have done good service in their day in preventing the abominable emanations from the chimneys of old-fashioned low-temperature destructors; but at the best such a device as a fume cremator is only useful in securing perfect oxidation of the gases and vapours distilled from the refuse, while giving no assistance whatever towards completing the other and equally necessary part of the process—namely, the reduction to innocuous clinker of the solid refuse itself. For this purpose it is essential that a high temperature must be kept up in the furnace itself as well as in the flue.

(2) Having provided means for securing a high temperature in the furnaces and the flues, such arrangements must be made as will secure that the whole of the refuse and the whole of the products of combustion or distillation must be subjected to this high temperature, in presence of sufficient air and for a sufficient length of time to insure complete oxidation of all combustible substances.

(3) It is also necessary that the products of combustion passing up the chimney must be as free as possible from solid matter such as dust, which, although they may be so perfectly burnt as to be free from any taint of putrefaction, yet their mechanical effect upon the leaves of trees and plants, upon the lungs of persons and animals, and upon clothing and furniture, are such as to become an intolerable nuisance, and a nuisance which has been proved in more than one instance to be actionable at law.

B. The destructor must be so designed as to involve the least possible expense in its working. To this end the handling of the refuse should be reduced as much as possible, though it must be borne in mind that the adoption of cumbersome and complicated mechanical feeding arrangements has hitherto been found to give no relief in the matter of labour; in fact, it has even involved additional labour, while at the same time such machinery is frequently very costly both in construction and in upkeep and working charges. It must always be borne in mind that machinery working in the presence of large quantities of dusty and dirty material deteriorates very rapidly, and any machinery which is required about a destructor, particularly electrical machinery, must be so arranged as to be as nearly as possible boxed in and protected from dust. The author would mention as an instance the Shoreditch combined electrical lighting and destructor plant, where, according to the abstract of accounts published in *The Electrical Review* of May 27, 1898, a large proportion of the total current produced appears to have been used on the works in driving fans, lifting machinery, &c. The author believes that this excessive expenditure of energy is due in a large measure to the extra resistance caused by the impossibility of keeping switches, brushes, &c., in proper order in presence of dust and dirt. In order to ensure economy, the safest points to bear in mind are that the refuse should be brought in the collecting carts as near as possible to the charging holes of the furnaces, and the tipping arrangements should be such that a minimum of work is involved in properly charging the furnaces. It must also be remembered that considerable judgment is required in working a fire, and that judgment is not usually a faculty possessed by machinery. In order to obviate any difficulty in separating clinker from unburnt matter, and in order to insure as nearly as possible a continuous process in the furnaces, they should be fed at one end of the grate and clinkered at the other, and the arrangements at the clinkering end should again be such as to involve the least possible labour in removing the clinker and to avoid altogether the necessity for breaking it up in order to get it through small openings.

(C) In these days people are not content with getting rid of the refuse in an inoffensive manner. It has been demonstrated that large quantities of heat are available from the

combustion of refuse, and therefore it has become necessary that this heat should be utilised, and at present almost the only practicable method of utilising the heat is in the evaporation of water. When it has been shown that in practical use 8 tons of refuse will raise as much steam as 1 ton of good coal burnt under good conditions, and that it will raise that steam to the highest working pressures ordinarily adopted, there can be no doubt as to the advisability of providing sufficient boiler room and arranging a suitable use for the available power. In order to secure the best results the boilers must be placed near enough to the cells to prevent any important loss of heat by radiation, but they must not be placed near enough to interfere with perfect combustion of the gases, which is generally not completed until after they have left the furnaces and traversed a certain length of flue to insure proper mixing. It must be borne in mind that, even in boiler firing with coal, any contact of the gases with comparatively cool cross tubes, &c., before they are perfectly oxidised will check the combustion and cause smoke, and it is obviously useless to mix any further oxygen with such unburnt gases after they have dropped below their natural temperature of combustion or "flashing point." It may here be mentioned that water-tube boilers are the most readily adapted to the requirements of a destructor station, although very good results have been obtained with other types, particularly Lancashire boilers. The comparative safety of water-tube boilers from explosion, and their general handiness and convenience, render them particularly adapted for working where the labour employed is not of a highly cultivated order, and generally in connection with these plants it is best to remember that, whatever apparatus is provided, it will probably have to be worked by stokers.

(D) The solid matters resulting from the combustion of the refuse—*e.g.*, clinkers from off the grates and fine ashes from underneath them—must be made use of for two reasons. First, if they are not made use of they must be carted away and tipped to waste at a further cost. Second, they may be made a valuable source of revenue. It must not be forgotten that we have here another powerful argument in favour of high temperature destructors, the clinker from which will be completely fused, and will contain no combustible or putrescible matter, and will therefore be of a hard and sharp nature, in contra-distinction to the clinker from low temperature destructors, which is soft, friable and totally useless, and frequently even putrescible. It is no uncommon thing for such half-burnt clinker to take fire again after being tipped into a heap, and thus to occasion serious nuisance. Assuming, however, that the clinker is going to be of a hard and useful character, we shall require machines for breaking it up, grinding it, and mixing it with lime, &c., to form mortar, and these machines must be powerful, massive and durable. Having thus briefly sketched the requirements of a destructor plant, the author will proceed to give some details of the manner in which these objects have been attained in one or two plants in the design and construction of which he has been concerned.

This purpose will perhaps be best served by a brief description of the plants in question.

THE POWDERHALL DESTRUCTOR, EDINBURGH.

This is a ten-cell plant. It was originally of the Fryer type, having been constructed in the year 1893. The working of the destructor, however, gave rise to serious complaint from the neighbours, culminating in an action for nuisance by the proprietors of the neighbouring estates of Redbraes, on which were situated some nursery gardens. It was held by the High Court at Edinburgh that a serious nuisance had been established, and the corporation were condemned in damages and costs. The costs, owing to the very large number of expert witnesses called on both sides, were extremely heavy. The Court appointed Mr. Benjamin Hall Blyth, the eminent civil engineer of Edinburgh and Westminster, to confer with Prof. William Odling, of Oxford, and to report to the Court as to the practicability of remodelling the destructor in order to prevent a recurrence of the nuisance. Mr. Blyth inspected the most important destructors in England, and his report to the Court was to the effect that if the type of destructor in use at Oldham and at Leeds were adopted the nuisance would be abated. Thereupon the author's firm made an offer to the corporation to take upon their shoulders the whole responsibility of the alteration and to guarantee that all the causes of complaint should be removed. A formal contract was entered into, Mr. Hall Blyth being retained as referee, and the contractors bound themselves to fulfil all their obligations to his entire satisfaction. It so happened that the grates of the old furnace were of practically the same dimensions as those of the Horsfall standard cell, and therefore the furnaces were only pulled down to the level of the grate bars, the foundations and ash-pit walling being left in place. After the heavy expenses to which the corporation had already been put, there was a natural desire to economise as far as

* A paper read in the Engineering and Building Construction Section of the Congress of the Royal Institute of Public Health recently held at Dublin.

possible in the alterations, and therefore some of the old ironwork, including the clinkering doors, was made to do duty over again. These clinkering doors are of a somewhat awkward pattern. They swing upwards on hinges, and are provided with balance weights, working into recesses in the furnace fronts. The hinges give a good deal of trouble from sticking, and, although the doors have the advantage of providing an opening right across the grate for the removal of clinker, they have the great disadvantage that the amount of opening is fixed—that is to say, they must be either wide open or shut—and when they are wide open the hot baffle plate at the back of the door reflects great heat on to the arms, hands and faces of the workmen. With the exception of these and some other minor details the furnaces are reconstructed after the Horsfall standard pattern. They are built in a double row, back to back, five cells on each side. Each pair of cells communicates at the back with a feed hole 2 ft. square, common to the pair of cells. The feed hole has a flat table at the bottom, and the refuse is pushed over the edge of this table by means of a three-pronged fork. It falls down on to the sloping drying hearth of the furnace. The sides of the furnace flare out sideways from the feeding end down to the grate, so that when the refuse is once pushed over the edge of the table at the bottom of the feed hole it cannot possibly stick. In this manner somewhere about a cubic yard of refuse is fed in at one operation on to the drying hearth. The operation of feeding takes place a few minutes after the operation of clinkering, the red fire on the grate being given a short period to brighten up under the action of the blast before the fresh refuse is drawn on. The stoker on the clinkering floor pulls the refuse forward from the drying hearth on to the grate bars and spreads it evenly over the grate. It should be mentioned that the drying hearth is paved with fire-brick, and is kept hot by being in close proximity to the main flue. It is found that 6 ft. is the maximum length of grate which can be conveniently worked by the men. It is also found that making the grates 5 ft. wide insures the handiest and most economical disposition of the labour; therefore each grate is 5 ft. wide by 6 ft. long, or 30 square feet in area. The grate bars in the Edinburgh destructor are of wrought iron, rivetted together in slabs of four. Each bar is of a tapered section, $\frac{1}{2}$ in. thick at the top and $\frac{3}{8}$ in. at the bottom edge. The distance pieces or washers between the bars are cut from the bars themselves, and inverted so that the air space between the bars is $\frac{3}{8}$ in. wide. They are made in 6 ft. lengths. There is thus no joint in the middle of the grate for the firing tools to get caught in. Each furnace is provided with hollow cast-iron sides, having removable plates next to the fire. The air from the forced draught apparatus is introduced into these boxes, which communicate for that purpose with a blast flue common to each row of cells. The boxes are closed above the grate. They communicate with the ash-pit by openings controlled by valves. The valves are operated by handles placed below the clinkering door. These side boxes serve a double purpose—first, the air is heated, and, second, the brickwork of the furnaces is protected from the erosive action of the clinker, which in ordinary brick-lined furnaces adheres to the brickwork and brings away small particles of the same at every time of clinkering, so that the furnace sides become rapidly eaten away. Ordinary iron plates will not stand the heat, but this difficulty is completely avoided by the side-box arrangement alluded to. The blast flues are placed one on each side of the main flue, so that any heat which is given up by conduction from the sides of the main flue is communicated to the air, and finds its way back to the furnaces, to assist in promoting rapid combustion. Each blast flue communicates at its outer end with a vertical flue, in which is placed the forced draught apparatus. This consists of a large steam-jet blower of an improved and patented design, a row of adjustable flat steam jets being placed so as to introduce a powerful current of air in a cast-iron trumpet, also of a flat shape. The use of these steam jets saves a good deal of expense and trouble in keeping an engine and fan in running order, and they require no skill and attention, besides which the steam is of considerable assistance in raising the temperature in the cells. The flues are arranged according to Horsfall's well-known patent. The whole of the products of combustion pass out of the furnaces at the front end through openings in the arch immediately above the clinkering door. It will thus be observed that the gases pass away at the clinkering or hot end of the furnaces, in contra-distinction to the Fryer destructor, in which the gases pass away at the feeding or cold end of the furnaces. The front flue arrangement insures that any vapours given off by the green refuse in drying shall be mixed with the hot flames from the blazing refuse, and the furnace crown and cross flues are thus raised to a red or white heat, the bricks retaining their high temperature even after the fires are freshly charged, and thus ensuring that at all times and in all states of the fires the gases are perfectly consumed. The cross flues run back over the top of the cell, the two flues from each pair of cells meeting at a point over the centre of the main flue and communicating therewith by a vertical passage. On looking into the main flue of one of these destructors bright blue flames can always be seen descending through these passages. In order to be visible at that point the flame must be at least 25 ft. long, and persons who are familiar with furnace work will realise that the production of a bright flame

25 ft. long from ordinary house refuse, mixed with decaying fish and other matter of the most abominable description, is no mean achievement. It is found that when a considerable number, say six cells or more, are combined in one block the mixing of the gases from the various furnaces insures a very steady and very high temperature in the main flue, and it is therefore always found advisable to construct the furnaces in blocks in this manner rather than to divide them up and put boilers between them. At Edinburgh the main flue communicates immediately with a large dust-depositing chamber, circular in form, and of somewhat peculiar construction. The gases pass first into the outer cavity, swing round this, enter the inner cavity or well at the top, and leave it at the bottom. Various baffles are provided in the outer cavity. The swirling action thus produced causes any small quantity of dust which the gases may contain to be deposited within this chamber. The exigencies of space were the cause of the dust-catcher being placed between the cells and the boiler, which doubtless causes some loss of heat. The boiler is the original boiler belonging to the old destructor. It is of the multitubular type, and is not nearly large enough to use the whole of the heat from the cells. It, however, produces steam for forced draught apparatus and for driving a mortar mill and an electric light plant, which provides light for the destructor-house and a range of stables and superintendent's house belonging to the cleansing department.

The effect of the alterations carried out by the author's firm was that all causes of complaint were entirely removed to the satisfaction of the referee.

The tipping arrangements are as originally designed. There is a tipping-floor on each side of the row of cells, and the refuse is tipped from the carts on to the furnace top in close proximity to the feed-holes. To prevent stewing of the refuse on top of the cells, the charging floor is honeycombed with drain pipes, communicating with the forced draught apparatus, whereby fresh air is continually drawn through the pipes.

THE DESTRUCTOR AT BRADFORD.

We may now proceed to a brief description of the twelve-cell destructor at Hammerton-street, Bradford. In this case, as in the case last described, there was originally a Fryer destructor. It had, however, been fitted some years ago with Horsfall's forced-draught apparatus, and it worked with fair success until it was considered by the corporation to be worn out. The contract for reconstructing the furnaces was then entrusted to the author's firm. The destructor consisted of two blocks of six cells each, with a pair of multitubular boilers and a chimney between the two blocks. Each block of cells has a passage through one boiler and an alternative passage direct to the chimney. These cells were ordered by the corporation to be completely removed to the ground level, and the new cells were constructed entirely with new material and according to improved designs prepared under the immediate supervision of the author. The flues are arranged exactly as described in the case of the Edinburgh destructor, the dimensions of the cross flues being slightly enlarged, in the light of more recent experience. The dimensions of the charging holes and feeding table were also slightly altered for the same reasons, in order to insure a greater facility in charging. Observations having been made with regard to parts of the old destructor, which had failed after years of service, the new one was constructed with much heavier end walls and with far more massive stays. It is tied together by means of heavy rolled-steel joists 8 in. by 4 in. and tie rods $1\frac{1}{2}$ in. diameter, shelled to 1 in. to receive the nuts, and there are two steel channels, 12 in. by 3 in., running the whole length of the block of cells over each furnace front. It was found that the ordinary cast-iron washer blocks through which the tie rods pass and which hold the channels in position were liable to give way under expansion of the furnaces. Cast-steel washer blocks were therefore substituted, and very heavy spring steel washers were placed under the nuts, in order to allow a certain limited freedom of movement. These improvements have been quite effectual. The side boxes were also improved by placing the controlling valves in the neck of the boxes and cutting off the supply of air at the point of junction with the blast flue, the openings from the side boxes in the ash-pit being always left open. The blast is controlled by large swing valves placed in cast-iron boxes built into the arch of the blast flue and bolted up to the side boxes. The movable plates which close the front of the boxes are of an improved pattern, held in place with spring wedges and after nearly twelve months of continuous hard work not one of these plates has shown the smallest sign of either burning or cracking. The clinkering doors are also of an improved design. They are constructed similarly to the doors usually employed on plan-furnaces, being hollow castings with a space at the back, which is filled up with fire-bricks. The door is balanced by a solid cast balance weight provided with a handle, and is suspended by a wire rope running over two pulleys. Although the door weighs 5 cwt. and the balance weight the same, there is not the slightest difficulty in opening or closing it with one hand. The ash-pit doors and the doors are very carefully designed and fitted up, the faces of the doors and frames being planed and the pulleys are 12 in. in diameter in position, thus insuring a perfect run. They are held by lever catches working on well-shaped faces. The

boilers belonging to this plant were not disturbed, and they are, like the Edinburgh boilers, of the multitubular type and not half large enough to take up the whole of the heat. They supply steam, however, for the forced draught apparatus, which is of the same pattern as at Edinburgh, for a large quantity of clinker-grinding and mortar-mixing machinery, for the electric lighting of the works and manager's house and office, and for certain fish-drying pans belonging to a private enterprise. The corporation contemplate putting down more boilers and machinery, to utilise the heat from the destructor. The results of the building of the new cells have been as follows: The capacity of the destructor, which was formerly $7\frac{1}{2}$ tons per cell per twenty-four hours, has been increased up to 10 tons per cell per twenty-four hours, and since the men have been used to the cells a further increase up to 11 tons has taken place. This is without any increase in the number of men employed. The cost of labour has been reduced from 7d. to 8d. per ton under the old system to just over 5d. under the new system. This is by several pence the lowest authenticated cost of labour in the world. The temperature in the cells and flues has been very largely increased, and the smoke from the chimneys has been reduced to an absolutely inappreciable quantity; in fact, it requires a remarkably clear state of the atmosphere to be able to distinguish anything from the chimney top at all, although no dust-catcher is in use and the chimney is quite close to the cells. At Hammerton-street an ingenious arrangement of overhead railway, carrying a swinging track into which the clinkers are pulled direct from the furnaces, has been applied to both of the blocks of cells. This is the invention of Mr. Cox, the city engineer, and Mr. McTaggart, the superintendent of the cleansing department. Improved machinery for dealing with the clinker has also been introduced, and it is a fact that since the new cells were got to work there has not been the slightest difficulty in disposing of every ounce of clinker, fine ash and flue dust produced at a profit, either in the shape of mixed mortar or of ground ballast for making plaster, concrete, &c. At the present time machinery is on order for the manufacture of artificial stone from the clinker.

THE NORWICH DESTRUCTOR.

This is a two-cell plant, erected at the New Mills sewage pumping station of the Norwich Corporation. It was put down specifically for the purpose of raising steam, tenders having been invited upon the basis of specifying the quantity of steam to be raised instead of specifying the number of cells required. The destructor is of the single-row type, but is fed from the top, this design having been adopted to suit an existing building which it was desired to utilise. The boiler is of the Babcock & Wilcox type, of 735 square feet of heating surface. It is placed as close as possible to the pair of cells, and communicates directly with the chimney. It supplies steam for driving air compressors for Shone's patent sewage-lifting machinery. The working pressure is 120 lb. per square inch. The main features of the furnaces are precisely the same as those at Bradford. The feeding arrangements are somewhat different, there being no room to make an inclined approach roadway for carts to tip on to the top of the furnaces, as is the case at Edinburgh and Bradford. There is a pit provided below the ground level. In this pit several hopper waggons run on rails. They are brought up to the tipping beam and the carts tip into them. The bodies of the hopper waggons are then lifted off the wheels by a travelling crane and conveyed to the charging holes of the furnaces. The doors in the bottom are opened and the refuse dropped on to the drying hearth. These two furnaces, on their official trial by the city engineer of Norwich, were found to burn 30 tons of refuse per twenty-four hours, or 15 tons per cell per twenty-four hours. They evaporated over 2,400 lb. of water per hour from cold river feed to a steam pressure of 120 lb. per square inch. These results are largely in excess of the maker's guarantee. The general results obtained from this plant have been of a highly satisfactory character.*

At this point a brief description of the plant which is about to be erected for the Pembroke Township Commissioners, co. Dublin, in connection with their electric lighting station, may not be out of place. The general scheme of the plant has been arranged to suit the electric lighting plans of Mr. Robert Hammond, the consulting engineer of the commissioners. The destructor will consist of two cells of the same size as those at Norwich, and a Babcock & Wilcox boiler also of the same size. The boiler will be capable of withstanding a working pressure of 150 lb. per square inch, the proposed working pressure of the electric light boilers being 140 lb. The furnaces will be of the back-fed type, obviating the necessity of tipping the refuse on the top of the furnaces and saving 6 ft. in the height of tipping platform, and consequently reducing the slope of the inclined road. The tipping platform and building of the destructor are to be large enough for a plant of double the size, which will probably soon become necessary. When that time arrives all that will be required will be to add two cells and another boiler of the same size. For all this provision is made in the original scheme. The tipping platform is so arranged that the coal for the

electric light boilers will be tipped from it exactly where it is required, and the space under the tipping platform will form on one side coal bunkers and on the other side a cable store. The destructor, in addition to relieving the commissioners of a large quantity of objectionable refuse, will provide some 80 horse-power in aid of the electric light station and in reduction of the coal bill. This will be the first high-temperature destructor to be erected in Ireland, and it will also be the first destructor in Ireland combined with a public electric lighting plant. The Commissioners of Pembroke Township are therefore to be congratulated upon their foresight in becoming the pioneers of the sanitary disposal and economical utilisation of town refuse in Ireland.

ARBITRATIONS AND AWARDS.

The arbitration case of Yates v. The Leigh District Council has been concluded, before Mr. J. W. Fair, F.S.I., as arbitrator. The claim was for £11,500, for the acquisition by the council of the Market-street premises, trade interest, &c., of Mr. Yates, a pork butcher. Mr. Bradbury represented the council and Mr. Edward Boyle, Q.C., appeared for the plaintiff. Mr. Yates deposed that he did a large wholesale and country business by means of carts. The business profits were put down at £1,500 per year nett. Messrs. G. Needham & Brody, pork butchers, of Manchester, also gave evidence. For the council, Mr. J. H. Stephen valued the property at £2,683 12s., with one and a half years' purchase on the nett profits. Mr. John Cross, Manchester, valued the premises at £110 per annum, and deducting £8, or $7\frac{1}{2}$ per cent., for repairs and insurance, the nett annual value was £102, which at twenty-two years' purchase would produce £2,244. Adding £247 for fixtures and 10 per cent. for compulsory sale, or £249 2s., his total valuation for land, buildings and fixtures came to £2,740 2s. He did not consider the loss by trade disturbance a serious one, and one and a half years' purchase would be, in his opinion, full compensation on Mr. Yates' retail business. Other evidence having been given, the award was reserved.

Mr. Ambrose, Q.C., M.P., recently sat at Manchester as arbitrator in the case of Danby's Trustees v. The Leigh District Council. The claim was for £13,000, for the acquisition by the council of the shop and premises 24 Market-street for purposes of street improvement, the claim including the value of the land, buildings, stock-in-trade, goodwill, and damages for injury to trade by compulsory removal, &c. Mr. Edward Boyle, Q.C., and Mr. J. C. Calvert appeared for the claimants and Mr. J. K. Eradbury for the district council. Mr. W. Wilson, Manchester, was called on behalf of the claimants, and said he valued the land, buildings and fixtures at £7,973. The nett profits of the business were stated to be £1,200 per annum, although no account books had been kept, and the accountants on both sides had not been able to complete what examination they could make of the existing books. The stock was valued at £3,850, and witness considered a loss of 40 per cent. would accrue in realising it. Mr. T. T. Wainwright, Liverpool; Colonel Bridgeford, Manchester; and Mr. G. Heaton, Leigh and Wigan, also gave evidence, supporting the statements made by Mr. Wilson. On behalf of the district council, Mr. J. H. Stephen valued the land and buildings at £4,529, and considered that in addition one and a half years' purchase on the nett profits ought to be allowed for trade disturbance and any depreciation that might accrue in removing the stock. Mr. John Cross, F.S.I., fixed the nett annual value of the premises at £178 2s., and this at twenty-two years' purchase gave a total value of the freehold of £3,918 4s. Then he reckoned £389 13s. for the fixtures, and added 10 per cent. for forced sale (£430 15s.), making a total of £4,738 12s. Mr. Thomas R. Greenough, Leigh, said that he considered £8 per yard would be a fair price for the land on which Mr. Danby's property stood, and £188 3s. 6d. was a fair gross rental for the premises. He valued the property and fixtures at £4,760 8s. The case then closed, the award being reserved.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper, in plain black-ink lines. Lettering or figures should be bold and plain.

212. Institution of Civil Engineers' Examinations: Model Answers to Questions.—"Pupil" writes: Will you kindly inform me if there are any model questions and answers issued in connection with the students' examinations (Institution of Civil Engineers), and, if so, where can I obtain same?

We are not aware of any book having been published giving model answers to questions set at these examinations.

Tenders Wanted.—The Secretary of State for Foreign Affairs has received a dispatch from her Majesty's Consul-General at Hamburg stating that tenders are invited by the City of Hamburg for supplying 1,000,000 Kilog., or about 19,692 cwt., of Portland cement for the use of the Hamburg engineering department.

* It will be remembered that we published some illustrations of this destructor in our issue of June 17th, in connection with the recent meeting of the Association of Municipal and County Engineers at Norwich.—Ed. THE SURVEYOR.

Royal Institute of Public Health.

ANNUAL CONGRESS AT DUBLIN.—II.

In our last issue we gave a brief outline of the proceedings of this congress and the chief passages of Sir Charles Cameron's address. The remainder of our report will consist of a summary of the sectional proceedings. Some of the most important papers touching on municipal engineering will, however, be dealt with separately. It will be seen that in another column we give the paper on "Dust Destroyers" contributed by Mr. Watson to the Engineering and Building Section.

SECTION OF PREVENTIVE MEDICINE AND VITAL STATISTICS.

The business of this section, of which Dr. T. W. Grimshaw, C.B., the Registrar-General, was chairman, was opened by Dr. R. B. Mahon, F.R.C.S.E., Ballinrobe, who read a paper on the causes and management of outbreaks of typhus fever occurring in rural sanitary districts. This was followed by papers on "The Prevention of Measles in Rural Districts," by Dr. Patrick Lotters, Valentia Island; "The Control of Infectious Diseases, with special reference to Measles and Whooping Cough," by Dr. William Berry, J.P., Wigan; "The Notification of Measles," by Dr. J. Wright-Mason; "The Present Day Methods and Appliances for the Suppression of Scarletina, Small-Pox, Diphtheria, and Typhus Fever in Rural and Urban Sanitary Districts having populations of 5,000 and under," by Dr. J. T. Kelly, Enniscorthy; and "The Duties of the Community with regard to Tuberculosis," by Dr. Joseph O'Carroll. The section then adjourned till the following day.

On the members re-assembling on Saturday (the 20th ult.), the Registrar-General, president of the section, delivered an address on "The Relations between Preventive Medicine and Vital Statistics." The following papers were then read: "The Increase of Lunacy in Ireland," by Mr. Wm. Corbett, M.P.; "A Few Causes of the Increase of Insanity in Ireland," by Mr. J. W. Tait; and "The Treatment of Infectious Diseases in General Hospitals," by Sir Wm. Stokes. Papers having been read by Drs. T. Laffan, J. E. Storey, A. H. Jacob and J. Knox Denham, treating of puerperal fever, ophthalmia and bacteriology, the section again adjourned.

Re-assembling on the following Tuesday, Prof. Smith, president of the Royal Institute of Public Health, read a paper on "The Vital Statistics of Dublin in Comparison with those of London." A number of resolutions were then adopted, after which Dr. J. A. Morehead introduced a discussion on the subject of workhouse hospital reform. Miss Rose M. Barrett next read a paper on "Some Aspects of Child Life." At 12 o'clock the section concluded their meeting, the remaining papers on the programme being taken as read. These were as follows: "Defective Infant Life," by Mr. Walter Bernard, F.R.C.P.I.; "Popular Education in the Laws of Health," by Dr. Anthony Roche; "Administrative Aspect of the Marking of Meat," by Mr. R. Sydney Marsden, F.R.C.P.I., ENG.; "Defect in Door-Bin System," by Dr. G. B. White; "Real Improvement in Sanitation for the Working Classes," by Dr. T. Laffan; "Exhibition—Photographs in Omagh," by Dr. Walter Bernard; "Observations made in the Anthropological Laboratory of Trinity College, Dublin," by Prof. Cunningham, M.D., F.R.S., and Dr. Charles R. Browne; and "Slaughter-Houses," by Dr. C. E. Moore, M.D.

CHEMISTRY AND METEOROLOGY SECTION.

The section devoted to chemistry and meteorology met under the presidency of Dr. John Williams Moore, F.R.C.P.I. The President, in his opening address, dealt with the climatology of the city of Dublin and the scenery of the country. Dublin comprised an area with the municipal boundary of 3,733 acres, containing, in 1891, 25,704 inhabited houses and a population of 235,001. On these figures by no means represented what may be called "Greater Dublin," or the Dublin registration district. This consists not only of the city proper, but also of the populous suburban districts of Rathmines, Donnybrook, Blackrock, Kingstown, Clontarf, Howth, Coolock, Drumcondra, Finglas, Glasnevin, and Palmerston. The population of this "Greater Dublin" was, in 1891, 319,594; and its extent is 21,603 statute acres. At the present time a costly and extensive system of main drainage was in process of construction, and would, no doubt, have a highly beneficial effect upon the health of the city, especially in respect of the prevalence of and fatality from filth diseases. Dublin was a handsome and in parts a picturesque city, and it was well supplied with "lungs" in the splendid squares on both north and south sides of the Liffey. The grave defect, which does much to neutralise the beneficial effect of the situation and surroundings of the capital upon public health was the housing of the poorer classes. All sanitary reformers agreed that the housing of the poor was one of the most pressing questions of the day in Dublin. Much had been done of late years to abate the crying evil of the Dublin tenement-houses—witness the splendid work of the Dublin Artisans' Dwellings Company, of the Corporation of Dublin, and last, but not least, of the Guinness Trust, which had given living expression to the philanthropy and princely munificence of the

Right Hon. Lord Iveagh, K.P. A further movement was on foot at present to provide sanitary accommodation on very reasonable terms for even the very poor among the industrious and sober classes of the population. Having dealt with the mean temperature, the rainfall and relative humidity, the president said the climate of Dublin was in the fullest sense an insular one, free from extremes of heat and cold except on very rare occasions, and characterised by a moderate rainfall (about 28in.) annually. He concluded his address by describing some of the natural beauties of Ireland, which, he said, was in truth a land of poetry and romance.

KINGSTOWN AS A HEALTH RESORT.

Dr. J. BYRNE POWER, Kingstown, read a paper on "Kingstown as a Health Resort." The climate of that town was, he said, considerably milder than that of the Phoenix Park. This difference was remarkable, and showed the modifying influence of sea temperature upon places in immediate proximity to the coast. During the winter months the mean temperature of Kingstown was equal to that of Ventnor. The rainfall at Kingstown was very low, and during the winter months was considerably less than that at any station on the south coast of England, being little more than half that at Penzance. These comparisons showed the superiority of the climate of Kingstown in these respects to some of the most favoured English health resorts. As regards sanitary conditions of life in Kingstown, he had to state that the Vartry water supply was excellent in quality, and the sewerage of the township had gradually been extended. The central sewers were now good, and when the works at the West Pier outfall have been completed by the Drainage Board he thought that there would be little to complain of. Thus they found all that the physical and sanitary conditions of life at Kingstown were favourable. But the general death rate was very high for a place enjoying all the natural advantages of Kingstown, the rate for last year being 22.3, and the birth rate comparatively low, that for last year being 21.2. A statement of the following facts might be sufficient to prove the deplorable insanitary condition of the township up to the year 1866. In that year Kingstown was visited by an epidemic of cholera, which in about four months carried off 127 lives. In 1871 the pure Vartry water was turned on to the township, and from that time to the present Kingstown had been free from any serious epidemic, though frequently exposed to infection from the city. Then if they examined the annual zymotic death rate for the past eighteen years they would find that the average annual number of such deaths for the last ten years had diminished by nearly one half. Towards the close of 1886 the present system of domestic scavenging was first established, and in this alone could he attribute this most marked decrease in their zymotic death rate. He found that the average zymotic rate in Kingstown for the last five years was less than half that of the total for twenty-one of the principal towns in Ireland, excepting the large cities of Dublin and Belfast, and considerably below that for the adjoining townships of Blackrock and Rathmines. All this had been accomplished, although he had hitherto failed to induce the sanitary authority to adopt the Infectious Diseases Notification Act, or to provide the township with a small hospital for infectious diseases. If those two means were adopted he had no doubt that the zymotic death rate could be reduced as low as that at any English health resort.

One of the honorary secretaries then read a paper, by Mr. J. E. Callan, Valentia Observatory, on "The Climatology of Valentia Island." This was followed by papers on "Valentia as a Health Resort," by Dr. Patrick Lotters, and "Some Meteorological and other Statistics in Connection with the National Hospital for Consumption for Ireland," by Dr. B. H. Steeds, M.B., and the section adjourned.

Resuming business on Saturday, Prof. J. C. Thresh, M.D., medical officer of health to the Essex County Council, read a paper on "The Protection of Urban and Rural Water Supplies." This was followed by a paper by Dr. Edgar Flinn, entitled "Some Points in the Supply of Water to Villages in Ireland." Dr. Flinn maintained that sanitary authorities should be especially careful as to the manner in which the contracts for supplying villages with drinking water were carried out, as frequently, through inexperience or incompetence on the one hand or the part of a contractor, and from lack of skilled supervision on the other, the supply was often scanty and defective in every particular.

Mr. FRANCIS LYNNMAN, ASCLOUGH, read a paper on "The Commercial Production of Cold Sterilised Water." The process was described and illustrated in our issue of July 29th. In the course of the discussion which followed,

Prof. MACFARLANE said a great deal of false confidence in the purity of water was produced by the habit of relying on analyses of samples sent to experts living at a distance from the source of supply. He believed that nothing could compensate for the want of personal inspection of the source of supply by the expert. Samples taken from the Liffey, for

example, at one time of the twenty-four hours might differ very much from samples taken at another hour, and the condition of the weather at the time at which the sample was taken would also make a difference. The analysis should be made by an expert who had himself collected the sample at the source from which it was obtained, and who could judge the possibility of pollution to which the well or other source was exposed. He did not think it necessary to sterilise water for drinking purposes. The great object should be to keep pathogenic germs out of a water supply, and the only way to accomplish that was to select a collecting ground which would not be exposed to contamination from manure, sewage, &c.

The following resolution was, on the motion of Prof. Thresh, unanimously adopted: "That legislation is urgently needed for securing the supervision of all public water supplies, in order to ensure the provision of pure and wholesome water; and, further, that it is desirable that sanitary authorities should be empowered to make by-laws with reference to the construction and protection of private wells, and to enable them to close all wells yielding a water liable to dangerous pollution." It was resolved to send a copy of the foregoing resolution to the Local Government Board.

Dr. W. ADENEY, F.I.C., read a paper on "The Determination of the Polluting Power of Drainage Waters by Bacterio-Chemical Methods."

Prof. MACWEENEY read a paper entitled "A Plea for the More Complete Biological Examination of Water Supply." He began by pointing out the several advantages and drawbacks of the various methods of water analysis. Notwithstanding the high degree of accuracy to which chemical methods had been brought, they left us in the dark as to the origin and nature of polluting organic matters. Turning to the bacteriological analysis, he said it certainly gave expression to the extent and character of the water pollution in a most decisive manner. Great care had, however, to be exercised in collecting samples, and the analysis had to be proceeded with at once. The analysis required to be extended to the totality of the micro-organisms present. The expert should in every case visit the source of supply and collect personally, not only the water sample, but also specimens of the various gelatinous or filamentous growths or incrustations which might be found close to the water. Such growths presented the great advantage of representing the average condition of the water. The microscopic side of water analysis deserved more attention than had hitherto been paid to it. The determination of the degree to which contamination of a stream had taken place—whether by sewage or refuse water from factories—could be accurately estimated by this microscopic, or, as he preferred to call it, biological method. In conclusion, the author referred to a series of algae, fungi and protozoa which he had obtained from the River Liffey between O'Connell and Grattan bridges, and which afforded a capital illustration of the fauna and flora of a most gravely polluted river. He hoped soon to be in a position to publish lists of the several low forms of animal and vegetable life that characterised pure and variously contaminated waters, and hoped thereby to enable an estimate of the real character of such waters to be arrived at with greater accuracy than was heretofore possible.

Prof. TICHBORNE read a paper on "The Adulteration of Foods and Drugs," and the section adjourned until the Tuesday following.

Resuming on Tuesday, Mr. ROBERT J. DOWNS, president of the Pharmaceutical Society of Ireland, read a paper entitled "Legislation Relative to the Sale of Poisons." At the conclusion of the discussion which followed the president proposed that the recommendations embodied in Mr. Downs' paper should be forwarded to the general meeting of the congress. This was unanimously agreed to.

Mr. RICHARD M. BARRINGTON, M.A., LL.B., then submitted some meteorological tables embodying the results of observations taken at Fassnord, Bray, co. Wicklow, for thirty-four years (since 1864), and the proceedings of the section closed.

MUNICIPAL AND PARLIAMENTARY SECTION.

The above section conducted their deliberations under the presidency of the Right Hon. Alderman Meade.

Sir CHARLES CAMERON, as president of the congress, said that he had great pleasure in installing the Right Hon. Alderman Meade as president of that section. Alderman Meade was chairman of the Reception Committee, and for many months past he had taken an active part in making arrangements for receiving the members and delegates of the congress. He was sure that they were all prepared to listen to Alderman Meade's address.

Alderman MEADE then delivered his presidential address. He said it was with very great pleasure that he availed himself of the invitation of the Royal Institute of Public Health to open the municipal and Parliamentary section. Although the other departments of the congress devoted themselves to important points of the general question of public health, its establishment and safeguarding lay almost entirely in the hands of Parliament and the municipalities. Parliament could make laws for its maintenance, while to see them effectively carried out was one of the chief functions of the municipal and other corporate bodies. First in order in the programme of this section was placed the

HOUSING OF THE WORKING CLASSES,

but especially of the very poor members of these classes.

He was glad that a distinction had been drawn. Owing to the congested area of Dublin, this work was there surrounded with difficulties and expense unknown in modern centres of industry in England or Scotland. Might he be permitted to quote an instance being at present carried out by the corporation to illustrate the difficulties they had to contend with? In the month of August, 1893, the Public Health Committee reported to the council that a certain district, called the Bride's-alley area, should be acquired, the site cleared and dwellings erected, which the council approved. All necessary steps were taken, an inquiry held by the Local Government Board inspector, and the scheme approved and sanction given to the obtaining of a loan in February, 1896. The area of the site was 3 acres. Now, the cost so far—and they have not yet, after five years, got possession of the whole of the site—had been: Cost of site, £32,000; clearing and levelling site, £1,500; legal expenses and costs, £3,000—£36,500. This, he thought, would show that it was impossible for the corporation to clear sites and erect healthy dwellings without a serious loss to the corporate fund. But he was of opinion that such works were works of great practical utility and for the advancement and improvement of the public health, and should not be charged to the Artisans' Dwellings Act, but to the expenditure under the Public Health Act; and that when sites were cleared by the corporation they should be allowed to get the site valued as a building site and offered to private companies or individuals for building dwellings on same suitable for artisans or labourers, to be let at moderate rents, the plans to be submitted to and approved by the corporation, or that the corporation itself might be empowered to build, when he had no doubt but that a fair return would be obtained for the amount expended. But the housing of the very poor would require more enterprise and energy; there philanthropy, public or private, must come in. One great problem, then, which faced the promoters of public health was how were healthy dwellings to be provided for the very poor at 1s. or 1s. 3d. per week. Sir Charles Cameron, their distinguished officer of health, had started a scheme by which it was hoped it would be shown that, if a site be provided and no taxes charged, a block of dwellings could be erected, according to plans prepared by their city architect, Mr. J. C. McCarthy, providing comfortable dwellings which could be let at 1s. 3d. per week, pay for all maintenance, collection of rents, &c., and allow 2½ per cent. on the capital sunk. He earnestly commended the scheme to the philanthropic members of the congress. Now, in addition to the desirability of existing private benevolence in that vital matter, he thought the sanitary authority ought to be empowered, if it was not already, to provide for that work free sites and exemption from local taxes. That could not be considered a new burden on the ratepayers, for it was merely a better way of spending the rates. If the classes he was referring to were not helped in that way in the struggle to earn, and were kept in their present miserable and insanitary dwellings, where they were liable to be affected with disease and rendered unable to work, they must be supported in poor-houses, hospitals or refuges, or assisted by the many charitable organisations in the city at a much greater cost than if his recommendation were adopted, and their great object, public health, would be endangered. Now, if this provided for, the very poor among the working classes, and if the health authorities put in force the ample powers at their disposal to compel landlords receiving fair rents to keep their premises in order, the question of the housing of the working classes seemed within measurable distance of solution. While on that subject he alluded to the insufficient number of public libraries and technical schools in Dublin, and he expressed a hope that the corporation, under the new Local Government Bill, would provide at least four additional libraries, with proper equipments, reading and assembly rooms, and also proper technical schools, one at each side of the city, suitable to the public requirements as understood at present, and adequate for this city of 255,000 inhabitants. The next item of the programme was

THE MUNICIPALISATION OF TRAMWAYS AND PUBLIC LIGHTING.

There was no doubt as to the advisability of that; the provision of public wants should not be in the hands of private individuals. As to tramways, lighting, water supply, &c., one great reason for their being in the hands of the municipality was that there would be only one authority with power over the public streets. Now, in Dublin or any great city the divided authority results in the roadways being continually cut up. The corporation scarcely closed an opening for water or sewer purposes when the gas company open it for a supply from their mains. The city engineer had had scarcely time to finish his portion of the street and remove the debris when the tramway company bring on to the thoroughfare material for the purpose of repairing their portion, and at present many citizens complained of the divided authority that has several leading streets in an almost impassable condition. Public lighting as to gas would have been in the hands of the corporation many years since but that several leading citizens opposed the corporation of the day and prevented them getting power from Parliament to purchase from the gas company, and at such a price as would have before that paid off the capital required, paid the interest on the capital, and would now be contributing a large annual sum in aid of the rates. Electric lighting, he was

glad to say, was in the hands of the corporation, but at present, owing to the small area supplied, the price charged was high. Yet, as application was about to be made for a very extensive addition to the works and also for liberty to supply electricity for motive and other purposes than lighting, he had no doubt that in Dublin they would have the same result as in other large cities (Edinburgh, for example), and be able to supply the citizens with electric lighting and power at a very low price without any charge on the rates, and that that great source of revenue would be kept in trust for the people in the hands of their representatives. When tramways were first introduced into the city the corporation of the day thought it was a great advantage to secure cheap fares and easy travelling through the city, to have so many miles of the streets paved and maintained by the tramway company, and gave concessions and rights of way to the company almost amounting to a monopoly. At that time, of course, the value of the concession was not known, but now that the application of electricity to the haulage of these carriages had become a commercial success, the corporation being hampered by the rights conceded to the tramway company, had only been able to arrange with the company for a moderate rental for a term of years, when the lines and the right to use them would revert to the corporation. As a citizen of Dublin he could refer with pride to their unequalled supply of pure water, which was given, not only to their own citizens, but to the inhabitants of the surrounding townships (except Rathmines), and at the cheapest rate in the whole kingdom. The next item was hideous boardings, which subject would be treated by his friend, Dr. Drew. The latter would show the intimate connection between sanitation, or rather insanitation, and the terminable tenements in towns. It was obvious that those owners of house property whose leases were running out or about to expire would not, if they could avoid it, lay out money in the sanitation of what would shortly be other people's premises. Nowadays there was more necessity for providing harmless recreation for the people than formerly. There was a field for municipal work. In Glasgow, the second city of the empire in population and enterprise, the corporation owned and managed eight concert halls. In Manchester the swimming-baths were used during the winter months as gymnasia and concert halls. He hoped they would soon be able to boast that they had done something in that way in Dublin. The next item—the

EXTENSION OF TOWNS

as a means of promoting public health—was one that, as a public health reformer and member of a municipal body, interested him most. On the recommendations in very many cases, and with the approval of Parliament, the chief cities and towns in England and Scotland—in Ireland they had the case of Belfast—had been extended, and the outlying districts added to the towns. There in Dublin the city had provided for the artisan who worked inside and outside its boundaries dwellings and model lodging-houses, at a cost of over £200,000. All the hospitals except one were in the city, and their support was largely contributed out of the city rates. Technical schools, swimming-baths, public libraries, &c., were open to the residents of the townships and the working classes employed there, as well as to the city ratepayers. So glaring had been that injustice, that in 1879 a Royal Commission was held, and a unanimous recommendation was made to include the townships only separated by a few canal bridges from the city. But now, nearly twenty years after, they remained still cut off, enjoying all the benefits of the city, but congesting its population into the unparalleled and unhealthy overcrowding of sixty-four persons to the acre, a state of things unknown in any other city in the kingdom. How the city in such a condition preserved even its present moderate death rate would be a puzzle were they not acquainted with the efficient and vigilant working of the Public Health Department. It would, perhaps (continued the speaker), be interesting to review a part of what the corporation of Dublin had effected in the last half-century. The new corporation (so soon to be called the old) repaired the city, constructed the unrivalled waterworks, reconstructed and built many miles of main sewers, cleared spaces, erected artisans' dwellings, opened people's parks, swimming-baths, public libraries, electric power stations, and were at present constructing a great system of main drainage, all these costing not less than £2,000,000. He trusted their visitors would be enabled to see those works and judge of the manner of their execution. In concluding, he could not fail to express his belief that the progress of the congress and of their section would be productive of much good, that it would promote the interests of public health, especially in those matters in which Parliament and municipal action could be effective, and, not least of all, that by the happy combination of all creeds and classes, comprising many visitors from the sister isles, it would knit them all closer together in the common effort to make the public health better and life all round for all classes more useful and more pleasant.

Sir CHARLES CAMERON, in proposing a vote of thanks to Alderman Meade for the admirable address he had delivered, said he might divide sanitarians into two classes—first, critical sanitarians who never themselves did anything to further sanitation, but were always ready to criticise the action of those who were actively engaged in the work. Then

there were practical sanitarians, among whom he counted their friend, Alderman Meade. Alderman Meade had referred in his address to the very important subject of the housing of the poor. He (Sir Charles) claimed to have originated the term "housing of the very poor."

Mr. R. P. CARTER, Q.C., in seconding the resolution, said he had listened with very great interest to the thoroughly practical and able address that Alderman Meade had given. During his short experience as a divisional magistrate in Dublin the importance of the housing of the very poor had been brought home to him in a very special manner. Having regard to the mode of housing the very poor in Dublin, and their singular want of anything in the nature of amusements, there was very little alternative but the public-house. It was his opinion, based on his experience as a magistrate, that at the bottom of all misery, and at the bottom of nearly all crime, was this evil of drink. He hoped before the meeting of the section terminated that some practical suggestion would be made that would enable projects for the better housing of the poor to be carried out.

The resolution was carried unanimously.

Alderman MEADE returned thanks, and remarked that if the corporation decided to forego all taxes on houses devoted to the very poor it would go far to remove a difficulty in the way of constructing these houses. He hoped one of the first advantages to be derived under the new Bill would be to enable the corporation to devote funds for the purpose of providing proper houses for the very poor.

THE HOUSING OF THE WORKING CLASSES, INCLUDING THE VERY POOR.

Sir CHARLES CAMERON said that he had been invited to open the discussion on the housing of the working classes, including the very poor. As much of the subject had been dealt with in the presidential address, and as the president of the congress had gone largely into it on the previous day, very few observations were required from him now to initiate the discussion of the subject. He was altogether in sympathy with the workers in their desire to have decent, comfortable homes, but it would be borne in mind that the artisan who had from 35s. to 45s. a week was able to pay rent for a fairly decent cottage or tenement. He had never been very much in favour of providing out of the funds of public boards for dwellings for those who could pay 3s. 6d. or more a week. The people to be considered were those who could not pay more than 1s. to 2s. per week, and he thought that it was the duty of their members of Parliament to keep pressing on the legislature until it passed a law to provide decent dwellings for such people. That subject was, he thought, among the first problems in sanitation.

Sir WILLIAM PEARCE thought that the housing of the very poor required very careful consideration. It was an expensive matter, but one that should be tackled; and, on the other hand, they would make a saving in the cost of hospitals if they had healthy sanitary dwellings.

Sir T. W. RUSSELL, M.P., Parliamentary secretary to the Local Government Board, remarked that he knew the city of Dublin, and he had learnt a good deal on the question of the housing of the working classes in England on the Local Government Board. He thought that the city of Dublin differed largely from the circumstances of any other city in the three kingdoms. It was not alone that these tenement houses were of the worst and the poorest character, but to his own knowledge they were largely in the hands of small house-jobbers, who bought at the lowest rate possible and charged naturally the highest rent they could get. He confessed that he did not share Sir Charles Cameron's squeamishness in dealing with those gentlemen. They had gone into this business, they had made their investment deliberately, and he should be very much inclined to tell them when they bought this property they bought the responsibility, and he would strongly advise the corporation to insist upon those houses, so far as it was possible to do it, being put into habitable order. These were things that should be insisted upon. Dublin was blessed with a pure, abundant, wholesome water supply. Householders had no excuse on that ground, and therefore the corporation ought to insist upon their doing what was plainly their duty. As to the requirements of sanitation, he would say the same thing. He was delighted to know that the corporation after many years' struggle had at last tackled the main drainage question. He knew ratepayers' associations and municipal bodies rarely agreed. He was delighted that the Dublin Corporation had had at last the courage to get a thorough system of main drainage. Much had been done in recent years, but, as regards the drainage of the tenement-houses, the corporation should see that they were put into a sanitary condition. The people who had those houses were responsible for them in the ordinary way. English and Scottish representatives who were present there that day could have no idea of the difficulties that beset the local authorities of Dublin and other Irish cities. It was not the same question. The class of people were poorer; every thing was worse rather than better. So far as Dublin was concerned the position was different from any English city or town by the poverty of the people and by the want of work. The want of work was not due to strikes, but absolute want of work. In the country much had been done by the south and west, so far as the agricultural labourers' cottages were concerned. He hoped that the

Dublin Corporation would not be bothering their heads about the ratepayers' associations. He would advise the corporation to give these ratepayers' associations a wide berth, and he trusted that they would take up this question of the houses for the very poor of the city.

Alderman Sir ROBERT SEXTON thought there was no doubt that the housing of the extreme poor was the most important consideration that they had to deal with in the City of Dublin. He did not attach any importance to the question of return, but the corporation should do what it could to provide comfortable dwellings for those who could not afford more than 1s. to 2s. a week rent. He was strongly in favour of anything that could be done towards the carrying out of that work, but the difficulty that they had was the large number of tenement houses in the City of Dublin. He thought if they could raise sufficient money for the housing of the very poor it would be one of the greatest benefits that could be conferred on the sanitary arrangements of the City of Dublin. The corporation were in favour of carrying out the suggestions of the Public Health Department, but some things could not be done right away, and they should remember that this was a very large question. He hoped that one of the outcomes of that congress would be that this subject would be taken up energetically. If they got the corporation to make a grant of the site for this purpose, he thought that would be as much as they could ask them to do, for the corporation, they should remember, had recently carried out works that involved a large expenditure of money for the benefit of the citizens and the interests of the city generally. He hoped that the philanthropic public would be awakened to an interest in the matter.

Mr. JOHN BYRNE (Dublin) said that Sir Charles Cameron, under the auspices of the corporation, had made a beginning in the way of providing healthy dwellings for the very poor, having cleared a site on which to erect houses to be let at 1s. to 1s. 6d. a week. He had heard complaints from working men as to the uniformity of style in the new houses erected for them, and there were also complaints as to the distance these houses were from their work. It might be worth the while of the corporation to consider whether the corporation might not provide dwellings for the very poor by entering into possession of the houses where the very poor now lived, and putting them into sanitary repair, thus providing houses in the centre of the districts in which employment was to be found. Mr. Russell had made a sweeping charge against owners of tenement-houses. He (Mr. Byrne) was not a tenement-house owner, but he knew that several owners had gone to great expense in putting their houses in fair tenable repair, only to find in a very short time that the appliances were misused by the tenants, the water pipes broken, and the sewers blocked by foreign matter. The rent, in fact, was only a sort of insurance against the exorbitant sums they were called upon to pay for the repairs they were forced by the sanitary authorities to make.

Colonel WHITNEY (Liverpool) endorsed the views expressed by Sir Charles Cameron, but said they should be very careful how they carried out the idea, as he found from experience that many people who had no right to these houses were admitted as tenants. He believed in doing away with work-houses, as it was his opinion if they gave the very poor decent houses to live in and helped them with outdoor relief that the condition of the poor would be very greatly improved.

Baillie DICK, chairman of the Health Committee, Glasgow, described the work of the Glasgow Corporation in housing the poor, and said their great difficulty was how to provide accommodation for the poorest of the poor. The income from houses rented to such a class would not pay the outlay, and he was afraid the only way to overcome that was to make the ratepayers provide the deficit out of the rates.

Dr. Shelton DALY (Manchester), Mr. W. S. Brown, J.P. (Edinburgh), Dr. Niven (medical officer, Manchester), Mr. Batley (chairman of the Building Committee, Leeds), Mr. Henry A. Cutler (city engineer, Cork), Mr. John Lindsay (solicitor to the Glasgow Corporation), Mr. W. R. Cooney (Enniskillen), Mr. J. Howes, J.P. (St. Luke's, London), Mr. W. J. Robinson (Londonderry), and Mr. William Field, M.P., also added some remarks.

Alderman MEADE then reviewed the various points made by the speakers, and expressed the hope that the very interesting discussion might be productive of good by marking the inauguration of schemes for housing the very poor.

TERMINABLE LEASEHOLD SYSTEM.

Mr. WILLIAM FIELD, M.P., then read an interesting paper on "The Terminable Leasehold System in Regard to Municipal Sanitation," in the course of which he reviewed the relations existing between ground landlords and their tenants. As a rule, he said, the ground landlord took over absolutely the houses built by the tenant. The absence of security for the tenant was a direct incentive to carelessness in everything, particularly sanitation. The present system discouraged enterprise and thrift among working classes and prevented the operation of building societies. It encouraged jerry building and maintained badly-constructed houses. All the sanitary defects which the system gave rise to could be very easily changed if occupation meant ownership. The terminable leasehold system was the father of slums and the progenitor of disease. Rent was to the ground

landlord the prime necessity. Health and sanitation and human comfort were seldom considered in opposition to rent, and it was next to impossible to expect that a middleman or a house jobber, or an experimenting agent, or a holder of premises with a lease nearly expired, would lay out money for the benefit of the ground landlord, who seldom had any regard whatever for the health of the inhabitants.

Mr. J. S. BAXTER, barrister-at-law, Belfast, also read a paper on the same subject, and dealt with the legal aspect of the question.

Mr. JOHN BYRNE and Mr. LINSAY having spoken, the section then adjourned until the following day.

ELECTRIC LIGHTING AT KIRKCALDY.

The town clerk of Kirkcaldy has just issued the minutes of the joint committee of the town council and the promoters of the local company on the subject of tramways and electric light for the burgh. A long letter has also been issued by the clerk to the members of the council. The minutes contain a further interesting report from Prof. Kennedy recommending a limited tramway route. The length of the line is just under 3 miles, and the total cost of the whole undertaking is estimated at £60,000. The committee, after examining the figures, did not see their way to make any recommendation to the town council in regard to the proposed scheme, but resolved to lay before the town council an abstract of the figures. In his letter to the members of council the town clerk strongly recommends them not to take up at the present time a combined scheme of tramways and electric lighting, but to consent to private companies taking up the scheme. He further expresses the opinion that an application for a combined scheme of electric lighting and tramways is incompetent. In the first place, by the rules of Parliament powers for electric lighting can only be obtained by a provisional order under the Electric Lighting Act, and not by an Act of Parliament. In the second place, electric lighting and tramways are, by the public legislation of this country, two separate things, and a town council, as local authority, are entitled to purchase either scheme without purchasing the other. He, however, thinks it necessary for the town council, in the case of the electric lighting, to apply for powers at once, more especially seeing the Edmondson Company have already given the statutory notice that they intend to apply for such an order.

CYCLISTS AND THE ROADS.

Mr. Charles H. Lowe, surveyor to the Hampstead Vestry, says, in his annual report to that body: "The condition of the roads in Hampstead is good. The standard of excellence, however, which the cyclist has set up has not been attained, and, with the wear and tear caused by the incessant heavy traffic over the main roads, it is hardly possible for it to be, and to make special provision for bicyclists is impracticable. What it might have been had the machine been known to our forefathers can only be surmised. Probably a carriage-way, two footways and a cycle track would have formed the ordinary highway repairable by the inhabitants at large. The nearest approach to the ideal, from the cyclist's point of view, is the wood-paved carriageway, and, now that the experimental stage in the use of jarrah and other similar hard woods has been passed, the only thing standing in the way of their more general adoption for paving purposes is the initial cost. The supply of the material is practically unlimited, and with the cost reduced—and it is reasonable to expect that this will be effected by the competition in the trade—there is no reason why jarrah should not be used in paving the more important streets, such as are now coated with the best quality broken granite." Referring to motor cars, Mr. Lowe says: "If ever the day does come which shall see the highways taken possession of by the horseless carriage, that same day will witness the difficulty of maintaining a smooth surface surmounted, for every wheel will have a rubber tyre, and the decrease in the number of horses pounding the roads with their hoofs will be so marked that the destroying agents in the roadway will be reduced to a minimum."

London Tramways.—An extraordinary general meeting of The London Tramways Company, Limited, was held at the company's offices on Monday, when resolutions passed at a previous extraordinary general meeting were confirmed. The resolutions agreed to the sale of the company's undertaking to the London County Council for £850,000, apart from a short length of 2½ miles and the Lawson-street depot, for which they were to receive a further sum of £22,872.

Bursting of a Reservoir.—An alarming accident happened late on Monday night at Blackley, near Manchester. A large reservoir, covering an acre of ground and 20ft. deep, suddenly gave way, and in ten minutes the vast body of water had emptied itself. The roads were rendered impassable, and the gas and water mains were damaged, and the adjoining roadways washed away. Fortunately there were no lives lost. The water was carried in flood down the river Irk.

Comparative Reports of General Practice.

XXVIII.—TRAMWAY TRACTION : BLACKPOOL REPORT.—I.

On February 14, 1898, the members of the Blackpool Corporation Electric Lighting and Tramways Committee, together with Mr. Robert C. Quin, borough electrical and tramway engineer and Mr. John Lancaster, general manager of the corporation tramways, were instructed by resolution to visit the Continent in order to inspect the various systems of electric traction in operation, and they subsequently submitted a report.

The report begins by recounting the history of electric traction in Blackpool. In 1885 the corporation laid down a tramway from Cocker-street to the end of the Promenade at South Shore, and leased the running powers over the same for a period of seven years to the Blackpool Electric Tramways Company, Limited. At the expiration of this period—viz., in September, 1892—the corporation, having obtained Parliamentary powers in this behalf, purchased the company's undertaking and plant for the sum of £15,587, including expenses of purchase. In addition to this sum the corporation had expended £13,435 in the construction of the permanent way, upon which, of course, they received interest from the company during the continuance of the agreement.

It was found essential, however, on the completion of the purchase to relay part of the conduit, and to replace and repair part of the plant and machinery which had just been taken over, the cost of this work being placed against maintenance account. Notwithstanding further expenditure during 1893-94, the conduit still failed to give satisfaction, as also did the general plant, and the running of the cars continued to be very uncertain owing to breakdowns. The Electric Lighting and Tramways Committee therefore went very closely into the causes of the failure, and instructed their then engineer, Mr. John Hlesketh, to furnish a report on the various systems of electric traction in use in England and on the Continent. This report, dated November 17, 1893, gave full details of the conduit, overhead, accumulator and other systems then in use.

The committee, recognising the strong objection which would then be taken if a recommendation were made to adopt the overhead system, decided to make a strong effort to put the conduit and the whole of the plant in a condition likely to ensure satisfactory working. During the winters of 1894-96 the whole of the conduit along the promenade was therefore re-laid on a new principle, at a net cost of £6,754, and the eight old cars purchased from the company were repaired and repainted and the armatures rewound, at an additional expenditure of £1,721, all of which went to capital account. In spite of this large expenditure on the conduit, supplemented as it was by a further expenditure out of the maintenance account of £340 during 1895-96, and of £856 during 1896-97 for repairs, &c.—the trouble increased rather than decreased, and it was felt that some radical change in the system was necessary if the tramways were to be made reliable and popular and capable of yielding the handsome revenue which it was in their power to do.

The committee then instructed Mr. Quin, their borough electrical engineer, to take charge of the electrical portion of the tramways and to report on the position of affairs. On the 19th August, 1897, this report was submitted to and considered by the committee, who ultimately came to the decision that it was useless endeavouring any longer to patch up a system which the conditions obtaining in Blackpool conclusively proved to be unsuitable, and they thereupon recommended the council to abandon the conduit system and substitute for it the overhead trolley system.

The council by a majority accepted the committee's recommendations, and application was forthwith made to the Board of Trade for permission to convert the system and to borrow the moneys incidental thereto. The Board of Trade deputed Major Cardew, R.E., to hold an inquiry in the matter, and this took place on November 30, 1897. At the inquiry considerable opposition was manifested by a section of the townspeople to the corporation's proposals, unsightliness of the overhead line and danger from falling wires during gales, &c., being alleged.

On December 23, 1897, the corporation received a communication stating that the Board of Trade did not see their way to grant the permission asked for, and suggesting the use of accumulators instead of the overhead system. To this the corporation replied asking where accumulators were successfully used for traction purposes, and were referred to Hanover and Paris among other places on the Continent.

To thoroughly acquaint themselves with the various systems of electric traction, so that they might arrive at an irrevocable decision, the committee subsequently deemed it desirable that a visit should be made to the Continent to inspect the accumulator systems indicated by the Board of Trade, as has already been stated, and the council duly sanctioned this visit. The deputation accordingly left Blackpool on Wednesday morning, the 2nd February, and travelled via London, Queenborough and Flushing, to Hamburg, arriving at the latter city on the evening of the Thursday following.

HAMBURG.

The city of Hamburg is the Liverpool of the Continent, has a population of over 700,000, is generally flat, has wide well-laid streets, and an extensive system of canals and inland lakes. There are three tramway companies at work—viz., the Hamburger Strassen Eisenbahn Gesellschaft, Hamburger Altona and Hamburger Trambahn Gesellschaft. The first-named company possess 700 tram cars, the second fifty, and the third thirty-five.

The overhead system of electric traction is used throughout the city, being mostly upon what is known as the "span wire," that is to say, steel columns are erected on each side of the street and a steel wire is strung between the two carrying the overhead electrical conductor. At portions of the route, where the roads are wide, centre posts of ornamental construction are used. The general scheme is very similar for the whole of the companies—as a matter of fact, for a portion of the line all three companies run over the same route. Previous to the adoption of the overhead system, in March, 1894, horses to the number of 2,990 were used. With the exception of one or two smaller lines, horse traction has now been entirely superseded by overhead.

The first impression obtained of the working of these cars was decidedly favourable, and the deputation marvelled at the speed and the smooth travel which were everywhere apparent. There was no jolting over points or crossings, nothing to indicate that there was motion, but the hum of the wheels and the hum of the trolley as the car pursued its 14 miles per hour journey through the town.

The general appearance of the cars also is pleasing. They are throughout of the single-deck type, carrying from twenty-nine to thirty-nine passengers, lightly painted and brilliantly lit after dusk. Five 16 candle-power lamps are used inside each car, one on the rear platform and four on the roof, two being at each end, making ten lamps in all. The roof lights are placed in coloured lanterns, to indicate the route of the car. Generally these routes radiate from the Rathaus Markt, or Town Hall-square, and standing in this place the cars were timed and found to pass every half minute in the same direction. In fact, never less than six cars were in sight at one time.

The span-wire system of carrying the overhead conductor, though somewhat unsightly where junctions and corners occur, is one which certainly is suited to the city of Hamburg, as in wide thoroughfares trees are planted which almost hide from view the steel posts, and in narrow thoroughfares no posts are used, the wires being supported from rosettes attached to houses on each side of the street.

As the system of working by each of these companies is almost identical, the deputation confined their inquiries principally to the largest company—viz., the Hamburger Strassen Eisenbahn Gesellschaft. They were first conducted over the generating station, which supplies current both for the lighting of the town and for the cars of all three companies. This station was formerly the property of the municipality, but was some time ago transferred to a company distinct from any of the tramway companies.

At this central station are installed six engines, five of which are each coupled direct to two dynamos, the other engine to the largest dynamo. Each set is capable of generating 800 units per hour. Two of the sets work at a pressure of 250 to 300 volts for lighting, the other four sets working at a pressure of from 500 to 600 volts for traction purposes. Arrangements are made upon the switchboard, however, for placing the dynamos of the lighting sets in series with one another and using the whole of the plants for the power supply if necessary. During the daytime, the lighting load being small, it is taken by motor-driven dynamos from the tramway supply. The engines are of the triple expansion condensing type, running at a speed of 100 revolutions per minute, and working at a steam pressure of 160 lb. Welsh coal is used in the boilers.

From this station twenty-six feeders radiate to different points of the overhead line, at which points meters are placed for the registration of the current. The largest company take current to the extent of some 600,000 units per month, or, roughly, three times as many units as the Blackpool trams in one year. The tramway company pay 12 pence, or 1 lb. per unit, of which sum the lighting company pay 25 pence, or 3d., to the municipality. In addition to this indirect tax, the tramway company also pay a further sum of 1 penny for every ticket issued. This is probably the reason why they do not, as in some other cases, issue short stage tickets, but invariably issue the ticket for the whole journey.

At present this company have 120 miles of tram road, principally double track, working on the overhead system of traction. The gauge of the track is the usual standard, 1.435 metres or 4 ft. 8½ in. There are car depots at numerous points of the line. Their principal depot, at Falkenreid, is not only a car shed but also a manufactory.

Starting to build their own cars, they now construct cars

for other companies. At the present time their output of new cars averages ten per week, and when the deputation visited these premises the company were executing an order for 150 cars for Berlin. Not only are tram cars manufactured at these premises, but uniforms also for the drivers and conductors. The undertaking is certainly an example of remarkable enterprise and capable management, the arrangements being everything that could be desired.

The deputation were also interested in the museum attached to the works, which contained a remarkable historical collection of tramway roads and tramway appliances, commencing with the earliest form of tramroad in use in Hamburg in 1866 to the very latest pattern. The original consisted of a longitudinal wooden sleeper with a bogie rail spiked on; the latest pattern is a remarkably good sample of rolled-steel rail weighing 166 lb. per yard and having a tread of 2½ in. The joint of this rail is not of the usual butt type, but is a half-and-half lapped one, having a longitudinal cut 10 in. in length. The fish-plate on the outside of the rail extends halfway under the bottom flange, and is 2 ft. 10 in. in length, secured by six ¾ in. bolts. The gauge ties consist of an I section girder 4 in. deep, which passes under the rails and is fitted with two substantial and adjustable chairs. The rails are laid throughout on a concrete bed 10 in. deep.

Except at crossing points the depth of the groove is 1½ in., but at crossing points it gradually tapers up until its depth is ¾ in. This system of road construction accounts for the remarkably smooth working of the cars. The tread of the wheel is the same width as the tread of the rail. When the wheels are passing over a joint of the rails they do not sink into the cavity of a butt joint, but of necessity pass smoothly over, there being a continual surface. Again, the flange of the wheel, projecting approximately 1 in. beyond the tread of the wheel, does not touch the bottom of the groove except at crossing places. In such places the tread of the rail is not, of course, continuous, but the groove is necessarily so; hence the flange is made to ride in the groove of the rail, and thus smooth running is ensured.

From the public point of view, and also from the tramway company's, this system of road construction is greatly to be commended, seeing the great influence this smooth running must naturally have upon the comfort of the passengers and upon the upkeep of the cars and their equipment. A novel method of paving the road adjacent to the rails is also adopted. On each side of the tramway rail there are laid longitudinal sets 9 in. wide, 21 in. long and 6 in. deep. These sets are tapered on the side farthest from the rail, for ease in removing. This arrangement certainly appeared to wear well, and has the advantage that only one line of sets has to be removed when alterations or repairs are being made to the rail.

The general service during the early hours of the morning and the late hours of the night is maintained by the cars before mentioned carrying from twenty-nine to thirty-nine passengers, but during the busier portions of the day trailer cars are attached. These trailer cars are used for smokers. About 750,000 car miles are run by these motor cars, and about 400,000 by the trailer cars per month. The weight of the small motor car is approximately 6½ tons, and of the larger car 11 tons—the latter ones having bogie trucks and being somewhat more strongly constructed. These weights are inclusive of passengers. The motors and equipment generally are of the Thomson-Houston type, similar to those now being installed on our own cars. Although this system has been in use since 1894, there have been no accidents connected with the electrical part of the system.

Financially, as well as electrically, the system under notice is a highly successful one. The cost per car mile amounts to 1.526d., that is rather over 1½d., trailers being counted separately in these car miles. This figure includes the repair of trucks, motors and gearing, overhead line and cost of current. About 5 of a unit is taken per car mile. Accumulators are not now used in Hamburg for traction purposes. Some few years ago they were experimented with, but abandoned.

BERLIN.

The next place at which information was sought was the city of Berlin, the capital of Germany. In this city there are three companies working by means of electrical traction—viz, Grosse Berliner Pferde Eisenbahn Gesellschaft, Siemens & Halske (Behren Strasse-Treptow), and Berlin Charlottenburger Strassenbahn Gesellschaft.

The first named is the largest electric tramway company at work on the Continent, and possesses 250 miles of tramroad, mainly double. This is worked on the span wire and bracket system of overhead support, combined with accumulators. About 12½ miles of this line have no overhead conductors, but, with the exception of 1,100 yards of conduit system, the cars are propelled by storage batteries contained in them. The current is taken from the municipal lighting station, the charge for the same being 10 pfennigs, or 1.2d., per unit, until 2,000,000 units are consumed in one year, above 2,000,000 the charge is 9 pfennigs. Five hundred cars are equipped for working on the overhead and accumulator lines. They carry forty passengers, and weigh 10 tons complete. Another 500 cars have no batteries installed, being equipped for the overhead and conduit line solely. These carry thirty passengers, and weigh 7 tons. The equipment

of the cars and the overhead line was carried out by the Union Electricitäts Gesellschaft, Berlin (the German Thomson-Houston Company), and they started with 8 kilometres (5 miles) of line in the spring of 1896. The conduit system is of the usual rail-slot type, having two insulated conductors working at a difference of potential of 560 volts. The slot is nominally 3 centimetres, or 1¼ in., but at points and crossing places, as will be readily understood, it approaches nearly double this width. In one particular respect it resembles the Blackpool system—it had failed, and is now about to be abandoned.

The overhead conductor is 8 millimetres, or ⅜ in., in diameter. The trolley is of the Thomson-Houston type, and the working pressure of the line is nominally 500 volts, working up to 560 volts. There are fifty feeding points provided, and, what is of more moment, there have been no accidents due to the system. The energy taken per car mile is 5 of a unit. The gauge of the line is the usual standard one of 4 ft. 8½ in. The speed inside the city, including stoppages, is 7½ miles per hour, outside the city 12½ miles. The maximum gradient is 5 per cent, and is about 220 yards long. The accumulators in the cars arranged on this system are placed under the seats. They are charged while running from the overhead line. There are two types of battery at present in use—the Hagen and the Majert. The weight of accumulators on each car is 3 tons, and they cost £300 per car. The cost of the upkeep of these batteries was given to the deputation as rather more than ¾d. per car mile; but there is also a very considerable increase in the cost of maintenance of the cars and trucks due to the carrying of these accumulators. These items approximately work out to about £75 per car per annum. The life of the plates of the accumulators is given as not exceeding two years, and their efficiency—i.e., the percentage of energy returned by the cells—at about 65 per cent.

The deputation were introduced by the manager of the company to Herr Schmidt, the Continental agent of Hsenger Akkumulatoren Fabrik Gesellschaft, from whom much interesting information was obtained. With the object of securing a reliable statement, questions as to the cost, &c., of these batteries were put to him in writing, and answers similarly in writing were requested. At a further interview with Herr Schmidt the deputation were informed that these questions had been transmitted to his company's English house (The Tudor Accumulator Company, Limited, Manchester and London), who would give the replies. These questions and their answers will be dealt with in the conclusions.

The deputation next visited Messrs. Siemens & Halske, who are the proprietors of one of the tramway services and the constructors of the remaining one. The Behren Strasse-Treptow tramway system is combined overhead and conduit, ½ miles being overhead and 1½ miles conduit, and commenced working in 1896. The gauge is of the usual standard and the line double. The maximum speed inside the town is 6 miles and outside 10 miles. There are thirty-seven motor cars, carrying forty-two passengers each and weighing, exclusive of passengers, 9½ tons, together with forty-five trailer cars, carrying forty passengers, and weighing 4 tons each. The equipment is of the usual Siemens & Halske type.

The current in this case, as with the larger company, is taken from the municipal lighting station. The overhead system has the usual rail return, but in the case of the conduit both conductors are insulated and connected to the overhead system by means of what is known as a "one to one transformer." The slot of the conduit is placed in one of the rails, and the dimensions given above for the slot of the great Berlin tramway company's conduit apply equally to this. The conduit is similar in construction to that in use at Buda-Pesth, also put down by Siemens & Halske, but is not viewed with favour either by the municipal authorities or by those working it.

In connection with the fares charged by the two companies just mentioned, the deputation were informed that when the concessions to run into Berlin were under negotiation the municipality insisted on the companies charging the same fares in the city as in the environs. To this the companies objected, pointing out that the cost of running by the conduit or accumulator system, which the municipality desired, was considerably greater than the cost of running by the overhead system, so that they were not in a position to meet this request. The municipality agreeing to this statement, after assuring themselves of its accuracy, the fares were accordingly fixed at a rate of 25 per cent. higher in the city, where the conduit and accumulator system were used, than outside, where the overhead system was employed. The effect of this arrangement is that the two companies are practically subsidised by the municipality, so far as the city lines are concerned. This subsidy could doubtless be discontinued if a cheaper system of working were adopted.

The Berlin-Charlottenburg tramway service was opened on the 1st October, 1897. There are 6½ miles of track, the cars being worked entirely by accumulators, which are placed under the seats. These accumulators are of the "Schifer-Heinemann" type, manufactured by the Watt Akkumulatoren Werke. At present twenty-eight cars are in use, carrying forty-two passengers, and weighing complete 23 tons. Accumulators are charged at night at the Charlottenburg terminus, six hours being occupied in this operation. Each car runs its 75 miles journey daily with this charge. There are 180

cells, coupled in two series of ninety, and having thirteen plates each cell. The weight of the cells is approximately 6 tons, and the initial outlay £750 per car. The cost of upkeep was given as 1'15d. per car mile; but, in addition to this, the wear on the road is very great and quite apparent, though it is too early to estimate what this will cost. There has only been one accident up to the present, and, fortunately, that happened when the car was in the shed, although it may not always occur under these circumstances. It was due to a short circuit in the battery, and resulted in the burning of a portion of the seating.

In an interview with the deputation subsequently held with the makers of these cells the opinion was expressed by the makers that the weight of the Charlottenburg cars could be reduced by altering the construction of the cars to 16 tons, and that upon this basis the Blackpool cars with batteries would weigh 23 tons. This company would not enter into a contract for supplying accumulators on any but the system adopted at Charlottenburg—that is to say, not on the short journey charging principle—as they contended the life of cells was greatly affected thereby.

OVERSEAS.

From Berlin the deputation travelled to Dresden, and interviewed there the Dresdener Strassenbahn Gesellschaft. This company has altogether rather more than 134 miles of line, 5 of which are overhead entirely, 5 miles combined overhead and accumulators, and approximately 31 overhead and conduit. The gauge is standard, the track principally double, the speed inside the town about 6 or 8 miles, outside about 12 miles per hour. The maximum gradient is extremely slight, being only 2½ per cent. Current is taken from the municipal lighting station, for which a charge of 1'23d. per unit is made. Twenty cars are used for overhead only, each carrying thirty-six passengers and weighing complete 8 tons. Seventy cars, each weighing 10 tons, working on the combined overhead, conduit and accumulator systems. The equipment of the line is by Siemens & Halske.

The conduit system is somewhat similar to those already described, being of the slotted-rail type, having an opening 3 centimetres normal width, and working at a pressure of 500 volts, with two conductors, both insulated. It has been in operation for eighteen months, but is suffering from a complaint to which conduit systems appear to be liable—that of failure. The expression of opinion given by the tramway manager was far from favourable to conduit systems in general and his own in particular. The overhead conductor is supported by span wires, the gauge of the conductor 10 millimetres in diameter, working at the usual pressure of 500 volts. The energy taken per car mile is approximately three-quarters of a unit, and about 2,500,000 car miles are run yearly. On the combined accumulator and overhead systems each car is equipped with 200 Hagen cells, placed under the seats, each cell containing three plates, and 200 cells weigh 2 tons. The cost of installing these batteries amounted to £275 per car, and the makers have given a guarantee that the costs of repairs to the batteries themselves shall not exceed £45 per car per annum.

Although these cells have been in use only eighteen months, the deputation were informed that the greater part of the plates had already been replaced, and that it was expected that the whole of them would have been replaced within a period of two years from the commencement. The managing director also informed the deputation that from tests which had been taken of the efficiency of the cells it had been found that the amperes hour efficiency was 70 per cent.—i.e., neglecting the difference between charging and discharging pressure, the actual current value returned from the cells was 70 per cent. His opinion was strongly in favour of overhead, but the municipal authorities would not allow overhead construction in the centre of the town. The deputation were also informed that the overhead lines were owned by the municipality, the tramway company paying a rent for their use.

Spennymoor.—A Local Government Board inquiry has been held in an application of the district council for sanction to borrow £3,000 for the erection of an isolation hospital. After the plans and specifications of the scheme had been fully considered the inspector said that he thought that it would take nearly another £1,000 to complete the scheme. There was no opposition.

On the Value of Roads.—In his wonderfully suggestive discourse on "The Duty of Roads," Horace Bushnell elaborated the idea that roads are the best evidence of civilization. "If a people have no roads they are savages. Or, if you inquire after commerce, look at the roads; for roads are the ducts of trade. If you wish to know whether society is stagnant, learning scholastic, religion a dead formality, you may learn something by going into universities and libraries; something also by the work that is doing on cathedrals and churches or in them; but quite as much by looking at the roads. For if there is any motion in society, the road, which is the symbol of motion, will indicate the fact. . . . So if there is any kind of advancement going on, if new ideas are abroad, new hopes rising, then you will see it by the roads that are building. . . . Nothing makes an inroad without making a road. All creative action, whether in government, industry, thought or religion creates roads."

MAIDSTONE WATER SUPPLY.

At a meeting in committee of the Maidstone Town Council, last week, the question of supplementing the water supply of the borough was discussed at considerable length, a proposal being put forward to the effect that the water company should be asked to revert to the use of certain of their Farleigh springs, said to be capable of yielding some 2,000,000 gallons per week. In view of the fact that the typhoid epidemic of last year originated from the Farleigh water and that the whole of the springs were more or less condemned by experts, the proposal raised an angry protest, and the opinion was expressed that a riot would ensue if any portion of the suspected supply were restored. The opposition was strengthened by the report of Mr. M. A. Adams, medical officer of health, in regard to certain samples of the water now under examination. One of these samples he had no hesitation in saying was very bad. Looking to what occurred last year, and bearing in mind that the whole of the Farleigh water was derived from surface springs, it was impossible not to regard it with suspicion. Eventually a resolution was passed that the Ewell water should not again be turned on for the use of the town, a rider being added requesting the inhabitants of the borough to use their best endeavours to prevent any want of their present supply. One or two members of the council contended that the Maidstone Company could further augment the quantity of water at their command by entering into an agreement with the Mid-Kent Company, which up to the present they had declined to do. On behalf of the Maidstone Company it was pleaded that they were already taking all the water their neighbours could supply. Not being satisfied with this assurance, the council appointed a deputation to meet the chairman and directors of the Mid-Kent Company on the subject. The action of the corporation is generally approved by the townspeople.

The intermittent supply of water to the inhabitants within the area of the company was resumed on Saturday, and is likely to be continued for some time to come, owing to the small amount of water which the company are able to obtain in consequence of the serious drought. The present shortness of water, the company officials contend, has been greatly due to waste by consumers. They declare that they are able to meet every reasonable demand, but it is pointed out that the company cannot provide for watering lawns during the dry weather. The springs and watering beds are being examined daily, and while the hoppers are about all the sources of supply will be protected.

HALIFAX WATERWORKS.

THE WALSHAW DEAN SCHEME.

At a meeting of the Waterworks Committee of the Halifax Corporation, held on the 23rd ult., it was unanimously decided to recommend the council to proceed with the Walshaw Dean reservoir extensions. Therefore the time has now come for the corporation to decide whether they will or will not carry forward the great waterworks scheme which is to cost the town from £150,000 to £200,000.

The members of the council, on the occasion of a visit to the site of the proposed works last month, were informed that the bottom reservoir would have a top water area of 21 acres and a capacity of 120,000,000 gallons. The length of the embankment would be 230 yards, its greatest height 76 ft., and the greatest depth of water 70 ft. The quantity of material that would be used in the construction of the embankment was 110,000 cubic yards. The middle reservoir will have a top water area of 46 acres and a capacity of 350,000,000 gallons. The length of the embankment would be 340 yards, and its height 74 ft. The greatest depth of water would be 68 ft., and the quantity of material in the embankment 382,000 cubic yards. The upper reservoir would have a top water area of 27 acres and a capacity of 164,000,000 gallons. The length of the embankment would be 230 yards, its height 74 ft., the greatest depth of water 66 ft., and the quantity of material used in the construction of the embankment 200,000 cubic yards.

The total capacity would be almost equal to that of Widdop, and the amount of compensation would also be about the same. In the case of Walshaw Dean, however, the compensation would be continuous, at the rate of 1,450,000 gallons per day, leaving 2,500,000 gallons per day for distribution. The average rainfall was about 15 in. of this 10 in. goes for compensation, 17 in. is lost by absorption, evaporation and leakage, leaving 18 in. for the supply of Halifax for distribution.

Scottish Plumbers' Congress.—The ninth annual Scottish Congress of the Association for the National Registration of Plumbers opened in Glasgow on Thursday week, and its proceedings extended over the Friday and Saturday. The delegates, who numbered about 300, comprised representatives of employers and employed in the plumbing trade, as well as many members of municipalities and other public men interested in sanitary science.

Some Annual Municipal Engineering Records.

WARWICKSHIRE : NOTTINGHAM : ECCLES.

Mr. Willmot, county surveyor of Warwickshire, has recently submitted his seventh annual report of the work carried out in his department during the past year. The report is more than usually interesting and instructive, since it contains a table showing the working expenses of three steam rollers for a period of five years. The nett cost of the roads directly maintained by the council during 1897-98 has been £21,103 11s., as against an estimated expenditure of £21,000. About £406 has also been expended on improvements. When this sum is deducted, the average rate of expenditure per mile for ordinary maintenance has been 45s. 2s., "the lowest rate per mile since the first year the council undertook the direct control of the roads." The mileage of main roads under the direct control of the council is 457; the amount expended upon day labour, including inspectors' salaries, has been £5,563 8s. 8d., or deducting the amounts paid for railway fares and lodgings, £5,494 1s. 1d., which is equal to an average rate of wages of 15s. 6½d. per week, the average number of men working full time being 119. The cost of materials, including stone-breaking, has been £9,893 19s. 8d., or 46 per cent. of the total expenditure. The total quantity purchased was 30,351 tons, the average price being 6s. 5d. per ton. The council have had at work during the year three steam rollers, the nett cost of which, after deducting £3 15s. received for hire of rollers, has been £303 6s. 10d. In addition to the 14,950 tons of stone put down by the council's own rollers, a further quantity of 4,106 tons was consolidated by hired rollers, at a cost of £161 15s., or 9½d. per ton. This makes a total of 19,056 tons consolidated by steam rolling, which is practically the whole of the stone put on the roads during the year in the three districts in which the rollers have been at work. The three steam rollers have now been at work for five years, during which time careful accounts have been kept of the annual expense of working them and of the quantity of stone they have consolidated. These accounts have enabled Mr. Willmot to prepare a statement, which gives the cost of working them during that period, the quantity of stone consolidated, and other details. It is shown that on the average each of the three rollers has each year spent eight days in travelling and nineteen days in cleaning and repairs, has been stopped by frost fifteen days, has been in dock sixty days, and 211 days at work on roads. The total cost of working of each roller per year has been £120 16s. 6d., £63 0s. 6d., has been expended on engine-drivers' and flagmen's wages, and fuel and sundries are responsible for £38 19s. 9d. Each roller has used 33 cwt. of coal per day, at a cost of 2s. 7d. The repairs of each roller each year have cost £18 16s. 3d., and its average cost per day whilst at work has been 11s. Each roller has consolidated 5,660 tons of stone in each of the five years, or 27 tons per day, at a cost of 5½d. per ton. The cost of watering during the period covered by the return was £1,020, or 29d. per ton, and if this is added to the cost of rolling in the stone—namely, 5½d.—the total cost of consolidation has been 8d. per ton. The foregoing calculations are turned to good account by the fact of a comparison between them and those for District No. 4, which includes the Leamington and Wellesbourne road, the Stratford and Edgehill road, and the Warwick and Barbary road, where only horse rollers have been used. About 7,500 tons of stone have been consolidated by horse rollers, at a total cost of £375 0s. 5d., including watering, which gives an increase of 1½d. per ton as against 8d. per ton, the cost of steam rolling. "This shows," Mr. Willmot adds, "that horse rolling cannot be recommended on the score of economy."

The town council of Nottingham have received the report of the General Works and Highways Committee for the year. Expenditure in connection with public works, it appears, amounted to over £37,738. The number of new buildings passed during the last four years was: For the year ended March 31, 1895, 929; 1896, 1,051; 1897, 2,110; and 1898, 1,859. The buildings, plant, tools, &c., under the charge of the committee had been maintained in good repair. The number of loads of material weighed over the various public weighing machines during the last four years were: 1894-95, 52,421; 1895-96, 51,521; 1896-97, 53,755; and 1897-98, 56,528. During the past year 43,327 streets were scavenged, from which 26,844 loads of refuse were removed. The total mileage of streets scavenged was 6,751, or an average length per day of 18.49 miles, and the daily average of men employed on this work was 37.55. The street gulleys had been frequently emptied and the refuse carted away. During the year street watering was necessary on 148 days, and 20,437 loads of water were distributed over 23,555 streets. The streets in the busy parts of the city, and in some of the poorer districts, were disinfected during the hot weather by adding to the water used for watering a strong but non-poisonous disinfectant. The sanding of the principal streets of the city had been regularly carried out, and the following material was used for this purpose: Sand gravel, 1,168 tons 14 cwt. 1 qr.; boulder gravel and dust, 209 tons 11 cwt. 3 qr.;

and sand, fifty-nine loads. The public sewerage works had been maintained in good repair, the sewers had been flushed at frequent intervals, and the ventilation shafts cleaned and any repairs required executed. The report embodies a list of the streets flushed, cleaned and repaired, also those in which general repairs to paving and macadam had been carried out, those upon which the steam rollers had been used, and others where repairs to flagging, kerbing, brick paving and asphalt-ing had been executed.

During the year apportionments of the cost of new sewer-ing and paving works in twenty-nine streets had been made, necessitating the preparation and making of 147 separate apportionments for service on owners of property, agents and others. The total number of apportionments, old materials and other notices served in connection with private works during the year was 356. Various other works of kerbing, flagging, brick paving, concreting, granite paving, house drainage connections, and other sundry works, independently of the works done under the Public Health Act, by notice, had been carried out at the request and on the signature of 774 owners and others to pay the cost of the same. The repairs and reinstatements of paving, flagging, asphalt-ing, concreting, &c., disturbed by gas, water and electric lighting connections were carried out by the committee's workmen, and the costs charged to the respective committees, and during the year various repairs over 2,054 gas, 1,235 water and 139 electric tracks had been done. The amount of wages paid through the weekly wages sheets of the committee to men employed on private improvement and sundry works to be re-charged amounted to £12,444. The report also gives details of the various works carried out and the special works for other committees, including those consequent upon the new Great Central and Great Northern lines entering the city.

Much interesting information is contained in the last annual statement of Mr. Arthur C. Turley, the borough surveyor of Eccles, a large amount of useful and valuable work having apparently been carried out since the issue of the previous report. The area of the borough is 2,008 statute acres, while the roads have a total length of nearly 38 miles. Of main roads there are about 4½ miles, of secondary roads over 3½ miles, and of other roads about 30 miles. Proposed dwelling-houses, for which plans have been approved, numbered 296, and other buildings down for erection total sixty-nine. Of new streets seven were contemplated. Some 197 certificates of habitation were granted in respect of dwelling-houses, and the following inspections attended to: In connection with foundations, sixty-seven; damp-proof courses, ninety-seven; new drains, 240. Carefully-compiled statements of the sewer-ing, paving, kerbing and flagging of public and private streets are also included in Mr. Turley's report; in addition to which there is a short description of a 3-ft. by 2-ft. egg-shaped sewer, which has been completed and set to work. The sewer has throughout its entire length been constructed in tunnel, its invert being formed with Doulton's stoneware invert blocks. The sides are constructed with Staffordshire blue bricks, and the arch with a 4½-in. ring of pressed engineering bricks. At the summit an overflow weir has been fixed, and is so arranged that when the 18-in. shallow main from Eccles is flowing more than two-thirds full the excess flow can pass over the weir into the new sewer. This arrangement is expected to prevent the backing-up of sewage in the branch drains during floods.

Downham (Norfolk).—In consequence of a dispute between the district council and the local gas company, the town streets have lately been unlighted. The company demand 42s. per annum per street lamp, 16 lamps not to be lighted for five nights at each full moon. The council is willing to pay the price, but strike against the off nights.

Sutherland.—The county council met last week, when a communication was read from the Congested Districts Board intimating a grant of £6-0 towards the construction of the proposed pier at Droman on condition that the balance of £200 is locally contributed. Considerable discussion took place regarding the condition of Embo village, which was stated as disgraceful. The Congested Districts Board wrote that before considering any representation it was necessary they should know what the county council desired them to do and what had already been done or contemplated by the local authorities. The Local Government Board drew attention to the medical officer's report regarding the grossly insanitary condition of the village, and the sanitary inspector's statement that the inhabitants suffered to a greater extent last year than for a good many past seasons for want of a water supply. The committee replied that they had found it impossible to supply water within their statutory powers. The case required legislation or other exceptional treatment.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,

Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SCAVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

METROPOLIS LOCAL MANAGEMENT ACT, 1855, SEC. 98: POWERS OF VESTRY TO LOWER SURFACE OF STREET: LIABILITY AS TO PIPES OF WATER COMPANY.—The above section, it will be remembered, provides as follows: "It shall be lawful for every vestry and district board from time to time to cause all, or any, of the streets within their parish or district, or any part thereof respectively, to be paved or repaired when and as often, and in such form and manner, and with such materials as such vestry or board think fit, and to cause the ground or soil thereof to be raised or lowered, and the course of the channels running in, into, or through the same to be turned or altered, in such manner as they think proper, and to alter the position of any mains or pipes in or under such street, such alteration to be made subject to the approval of the engineer of the company to which such mains or pipes belong." Does this enactment impose an obligation on a vestry or district board, in the event of their lowering the surface of a street, to relay the pipes of a water company at a sufficient depth to prevent their being injured by traffic, frost, &c.? In the recent case of *Southwark and Vauxhall Water Company v. Wantwornth District Board* (Court of Appeal, 8th August), the board contemplated lowering certain footpaths to such an extent as to leave only a few inches of soil above the company's mains, and an injunction was granted by Mr. Justice Kekewich restraining the defendants from altering the position of such mains by placing them in a position in which they would be more liable to injury than they originally were. The Court of Appeal, however, have reversed that decision. The Master of the Rolls, after pointing out that the words of the section are "it shall be lawful," &c., that the board had not in any way disturbed or injured the pipes, and that the company had failed to show that the section imposed a duty on the board to lower the pipes, continued: "Underlying the plaintiffs' contention is the assumption that they are entitled to have a certain amount of soil over their pipes. I can find no warrant for this assumption; and, as the defendants are clearly empowered by sec. 98 to remove the soil above the pipes, I see no ground for saying that the additional powers conferred upon them of lowering the plaintiffs' pipes imposes the duty of lowering them in order to protect them from injury. The plaintiffs pay nothing for the privilege of laying their pipes down in a public path or road, and they run the risk of having it made higher or lower by the road authorities under their statutory powers. This conclusion is strengthened by sec. 61 of the Towns Improvement Act, 1847 (10 and 11 Vic., c. 34), which is *in pari materia*, and which empowers the Improvement Commissioners to raise or lower pipes 'if they deem it necessary so to do.' No duty to do so is cast upon them. Sec. 98 of the Metropolitan Management Act, although not quite so clearly worded, has in my opinion, the same meaning." Lord Justice Chitty said: "I am unable to find in the section any express or implied duty cast upon the road authority, when they exercise their power of altering the level of the road, whether by raising or lowering it, to exercise at their own expense their power of altering the position of the pipes for the benefit of the company owning the pipes, much less any duty to place the pipes at a depth below the new surface corresponding with the depth at which they stood below the old surface. I think that no such duty is imposed upon the appellants. The real question is on whom the expense of altering the position of the pipes is to fall. It appears to me that it falls on the company. They are under no statutory obligation as to the particular depth at which their pipes are to be placed from the surface of the road; it is for them to place them at such a depth as will protect the water from freezing. As between the road authority and the company, I think that the road authority is paramount. They are entrusted with the powers over the street, not for their own profit as a statutory body, but for the benefit of the public using the street as a highway. The statutory undertaking of the water company is vested in them with a view to their own profit as a company, and for the purpose of affording a supply of water to the consumers of water within their district. Where the road authority alters the level of the street sec. 98 does not afford any means of ascertaining the point at which the supposed duty of the road authority begins in reference to the distance from the surface at which the pipes are to be left, subject only to this qualification—that where the position of the pipes themselves is altered the approval of the company's engineer is required in relation to the position where the pipes are to be relaid." Lord Justice Collins read a judgment to the same effect. The following cases were referred to in the course of the arguments: *Julius v. Bishop of Oxford* (5 App. C., 214, see pp. 223 and 224); *The Gas Light and Coke Company v. Vestry of St.*

Mary Abbots (15 Q.B.D., 1); and *Geddis v. Proprietors of the Bann Reservoir* (3 App. C., 430).

ELECTRIC LIGHT AT NEWBURY.

Newbury Town Council, at a recent meeting, spent several hours discussing the comparative merits of gas and electricity. Notice had been given by the Great Western Electric Light and Power Company and the United Electric Light and Power Company of their intention to apply for provisional orders to supply the town, and Mr. Offer, of the Municipal Electric Supply Company, proposed to purchase the provisional order obtained eight years ago by the corporation, paying all the expenses which had been incurred, taking over the lighting of the town, and the option of purchase by the corporation at the end of ten years, plus 6s. 8d. in the £1. The charge suggested was £2 10s. to £3 10s. for public lamps, and private consumers at 2d. per unit after the first hour at 8d., equal to 2s. per 1,000 ft. of gas. The price in Newbury is now 4s. 2d. per 1,000 ft. The Gas Committee recommended the council to decline the offer and to instruct the town clerk to oppose all applications for power to supply electricity. The general opinion seemed to be that it would be suicidal to allow an electric lighting company to come as a competitor with the gas, although it was argued that electricity was much dearer, and that it could not be supplied at the price named. The mayor considered that if they could get for 2s. what now cost them 4s. it was their duty to get it. The council obtained their order eight years ago, and no steps have been taken to carry out its conditions, the reply being that no one has ever applied for electricity. It was, however, realised that if half a dozen burgesses did make application they must supply it, or allow someone else to do it. The council adopted the committee's recommendation.

SANITARY MANUFACTURES.

Messrs. Morrison, Ingram & Co., Limited, have just completed important additions, which have been in hand for nearly twelve months, at their Midway Pottery Works, Swadlincote, Derbyshire, and we understand that these extensions and the equipment of the works with up-to-date machinery will enable the firm to double this branch of their business. The patterns have been all practically remodelled and a great number of new designs added. Recent experiments have been made with the object of demonstrating that "Densitas" cane clay is well adapted for the manufacture of sanitary vessels. It is a clean, compact body of great strength and with a small degree of porosity, and the manufacturers are confident that it will occupy an important position in the future, owing to the fact that it forms a suitable substitute for iron in a variety of articles.

North-Eastern Sanitary Inspectors' Association.—The report of this body for the year ended June 30th last appears to be in every way satisfactory, the receipts to date now amounting to £25,800.

Nuneaton.—The district council have adopted the report of the Sewerage Committee recommending that application be made to the Local Government Board for sanction to borrow £1,000 for two precipitation tanks, two new sludge presses and rams, air compressors and other machinery, and the building of a new press-house.

Huntly.—On Wednesday of last week a new reservoir, which has been constructed at Craigland, about 2 miles from the town, was formally opened. The reservoir is 100 ft. long by 25 ft. wide and 10 ft. deep, and has a storage capacity of 220,000 gallons. The storage in the two reservoirs is now ample to ensure Huntly of an abundant supply of excellent water for many years to come. Having provided an additional reservoir, the commissioners have now turned their attention to laying additional piping between the reservoirs and the burgh to supplement the existing main, and a new main has been laid. The contractor, Mr. J. Hunter Clark, Elgin, has executed the undertaking in a manner entirely satisfactory to all concerned. The extension of the works, which has been carried out at a cost of somewhat under £2,000, was designed by Mr. James Barron, C.E., Aberdeen. The new supply was also turned on last week.

Some Recent Publications.

THE MUNICIPAL AND SANITARY ENGINEER'S VADE-MECUM.

There has just been issued the third edition, revised and enlarged, of the **MUNICIPAL AND SANITARY ENGINEERS' HAND-BOOK**, by Mr. H. Percy Boulnois, M.L.C.E. (E. & F. N. Spon, Limited, 125 Strand. Price, 15s.). The fact that a third edition has been called for speaks for itself, but it cannot be called surprising. Though no longer in office as a municipal engineer, Mr. Boulnois had reached the very summit of the profession when he resigned his Liverpool appointment, and there is probably no one whom municipal engineers would more readily accept as an authority on the work and details of their profession. The author's remark in his brief preface, that the book appears to be of some use, errs on the side of modesty, for it is not too much to say that the book has from the first been recognised as indispensable to municipal and sanitary engineers, and especially to young members of the profession, and to those preparing for the examinations of the Incorporated Association of Municipal and County Engineers and other bodies. The municipal engineer who was unacquainted with the book or of whose professional library it did not form a part would probably be regarded as a phenomenon, and it is sure to be included in any list of books recommended for certain examinations. Special text-books, of course, deal exhaustively with special subjects, but as a general hand-book for the municipal engineer this work stands alone. The exhaustion of the previous edition is not the only imperative reason that calls for a third edition. In no direction is there more rapid and effective advance than in municipal and sanitary engineering, and a hand-book which aims at being authoritative must from time to time incorporate new developments. In this new edition the author has "made such alterations and additions as appear to be necessary, owing to the growth of municipal engineering."

It seems to us that the work involved in bringing out the new addition is much more extensive than the quoted words would imply, and thus we need offer no excuse for glancing more or less fully at the contents of the volume. Nowadays the engineer has to specialise, like everyone else, and probably none more so than he. Municipal and sanitary engineering has long been a recognised department, and probably in no branch of engineering has the specialising tendency been so slightly marked. Owing to the multifarious nature of his duties and the variety of the qualifications demanded from him, the municipal engineer approaches most nearly to the idea conveyed by the term engineer as understood in former days. What his duties and qualifications can best be gleaned from Mr. Boulnois's book.

The first chapter deals with the position of the town surveyor generally. He came into existence practically with the Towns Improvement Clauses Act, 1847, though there had been similar previous appointments, notably in the case of Liverpool, where in 1842 surveyors had been appointed under the Liverpool Building Act. The office was confirmed under the Public Health Act, 1848, and the Public Health Act, 1875, but under the latter statutes surveyors may be removed at the pleasure and the discretion of the urban authority, which was not the case under the statute of 1847. Mr. Boulnois, in his first chapter, goes very fully into the whole question of the appointment of surveyors to local authorities as regulated by statute, and in the course of his remarks he has occasion to notice not a few anomalies. One of these is the use of the word surveyor when that of engineer would be much more appropriate. The one exception to this is the city of Liverpool, where special provision exists for the appointment of an engineer. An even more glaring anomaly, however, is the inadequate protection in regard to tenure of office which the surveyor enjoys as compared with the medical officer and sanitary inspector. This is an abuse against which we have long waged war in these columns and which we still hope to see rectified. Had space permitted we would gladly have quoted the remarkable list of duties as given in this work which a municipal surveyor may at any time be called upon to undertake. Mr. Boulnois also refers to the question of superannuation, and lays down clearly the broad principles by which it should be regulated. The second chapter deals with the customary procedure in connection with the actual appointment of a surveyor, and a typical example of a "list of duties" is quoted. How many men seeking appointments in private life are confronted with such a formidable document? The clear manner in which Mr. Boulnois discusses such questions as that of allowing the surveyor a limited amount of private practice, and the necessity of some adequate test of capability, will not escape attention. The morality or otherwise of canvassing is also referred to, and young members of the profession should read, mark and inwardly digest the hints to candidates which are set forth by so experienced a municipal engineer as the author of this standard hand-book. In the third chapter the duties of the town surveyor are discussed in further detail, and the author gives the remarkable table in which these duties are so vividly set forth.

In subsequent chapters the various branches of work are dealt with separately, street work, of course, occupying a

large share of attention. In the brief space at our disposal we cannot do more than make a passing reference to some of the more important matters and points dealt with. After a discussion on the general principles of traffic as regulated by the requirements of particular localities, separate chapters are devoted to macadamised roads, road metal and breaking, road-rolling, pitched pavements, wood paving, compressed asphalt roadways, footpaths, and curbing and channelling. The limitations of macadam and tar macadam roadways in urban and suburban districts are clearly pointed out, and then in discussing road metal and breaking, the superiority of hand over machine broken materials is pointed out, and Mr. Ellice-Clark's objection to binding materials are quoted. In his next chapter, however, Mr. Boulnois has occasion to discuss the use of road-rollers, and in doing so he makes it clear that a certain amount of some sort of binding material is absolutely necessary. From time to time we have published comparative reports on road-rolling, and these have shown conclusively that the great majority of surveyors are in favour of the practice. Mr. Boulnois describes it as a necessity at the present day. A chapter is devoted to the use of granite setts, which are regarded as often absolutely necessary for slow heavy traffic, though their objectionable features are fully recognised. The remarkable development of wood paving in recent years is traced in the chapter devoted to the subject. Undoubtedly the advantages of certain classes of wood paving far outweigh the disadvantages. "There is no doubt," says Mr. Boulnois, "that the best wood pavement is that which can be constructed in the simplest manner, as, for instance, jarrah or karri blocks, 4 in. or 5 in. deep, laid to a close joint upon a Portland cement concrete bed, the blocks being well grouted in with pitch or some description of bituminous mixture."

With the discussion of compressed asphalt roadways, the slipperiness of which is duly noted, Mr. Boulnois completes this branch of the subject, and then passes on to deal with footways, the various materials and methods being duly passed in review. A separate chapter, clearly illustrated, is devoted to curbing and channelling, and then the author proceeds to deal with such important matters as street lighting, street naming and numbering, the breaking up of streets and scavenging. In treating on street lighting Mr. Boulnois refers to the marked developments of recent years in connection with electric lighting and the incandescent gas burner, and gives a clear account of his experience in Liverpool. The chapter on the opening up of streets is one which municipal engineers could read only with sympathetic interest. Obstructions in streets, the improvement of private streets, and new streets and buildings are important subjects which all obtain adequate attention, the difficulty surrounding the definition of "a new building" receiving full discussion. In the chapter on scavenging reference is made to destructors, a subject which Mr. Boulnois has made his own, and then come chapters on sewerage and sewage disposal. That on sewerage is accompanied by some necessary illustrations, and in that on sewage disposal a wonderful amount of information on a difficult and much-debated question is given in a small space. Another subject which has excited a good deal of controversy is that of sewer ventilation, and Mr. Boulnois discusses it fully and impartially.

The remaining chapters deal respectively with public conveniences, artisans' and labourers' dwellings, defects in dwelling-houses, house drainage, public pleasure grounds and street trees, public abattoirs, markets, cemeteries and mortuaries, borrowing under the Local Government Board and contracts. We can only mention these subjects, but we have said enough to indicate the wonderful scope of the book. What is equally remarkable is the amount of compression that has been brought to bear without omitting any desirable information. The book thus becomes a veritable *multum in parvo*, in which the municipal engineer will find the essentials of the almost bewildering number of subjects he must master. The arrangement is admirable throughout, and the points are presented with great clearness and conciseness. The book gives one a good idea of what manner of man the municipal engineer is expected to be, and what qualifications are required of him. Mr. Boulnois has provided him with a model hand-book. We would suggest, however, that in future additional chapters might be added on water supply and tramway traction. These matters are often in the hands of specialists, but the municipal engineer is frequently called upon to deal with them. The information on dust destructors and on the bacterial methods of sewage disposal might also be somewhat amplified. In his brief preface Mr. Boulnois mentions that the various legal references have been scrutinised and revised by Mr. J. B. Reigner Conder, the able writer of the "Law Notes" in *THE SURVEYOR*, and that gentleman is thanked by Mr. Boulnois for the manner in which he has performed the task. It has certainly been admirably performed.

STAGE AND THEATRE CONSTRUCTION.

As a supplement to his monumental work, **MODERN OPERA HOUSES AND THEATRES**, which is being issued in instalments, Mr. Edwin O. Sachs, the well-known architect, has produced an interesting work, entitled **STAGE CONSTRUCTION**;

Examples of Modern Stages, selected from Playhouses recently erected in Europe, with Descriptive and Critical Text." The publisher is Mr. B. T. Batsford, Helborn. Stage mechanism, as now understood, is practically a development of the last twenty years, and Mr. Sachs had a clear field for the production of a standard technical work on the subject. It is obvious that he has seized his opportunity and has studied his subject with conscientious thoroughness and in exhaustive detail. The credit for initiating and carrying on the movement for the improvement of scenic representation by the development of mechanical appliances is practically monopolised by Austria and Germany, England having taken little or no part in the movement. This valuable work of Mr. Sachs, however, will no doubt give an impetus to the movement in this country. There is, no doubt, almost indefinite scope for improvements in stage mechanism, and a tendency in that direction is almost inevitable. It may be doubted, however, if elaborate mounting can have otherwise than a deleterious effect upon the spirit and genius of acting, for, after all, the play and its interpretations are the things. The work comprises ninety pages of text, grand folio size, interspersed with 170 valuable original illustrations, reproduced by the most improved and artistic processes from diagrams, drawings, sketches and photographs, for the most part specially prepared on the spot, together with six plates from engineers' working drawings to a large scale, the whole printed on fine paper.

The second volume of the great work on "Modern Opera Houses and Theatres" is divided into two parts, the first comprising examples from France, Italy, Monaco and Spain, and the second consisting of examples representing Austria, Germany, Great Britain, Greece, Holland, Roumania and Switzerland. Incidentally Mr. Sachs points out the difference in the sentiments with which the theatre is regarded in this country and those which prevail in some Continental countries. In England the theatre, despite the pathetic appeals of certain eminent actor-managers, is persistently regarded as a place simply and solely for entertainment, rather than for instruction. Amusement is looked upon as its *raison d'être*; to its elevating influence, of which we are occasionally told, the average playgoer is slyly indifferent. In Austria and Germany, again, the theatre is undoubtedly regarded as an educational institution, and until similar sentiments prevail in this country it will be, useless in our opinion, to talk of municipal or other subsidised theatres, over which a mild agitation occasionally arises. The prevailing sentiments of a country affect also the architectural features of its theatres. In England the indifference to architecture is sometimes painfully obvious in the exteriors of the theatres; in France, Austria and Germany the aim is to make them temples and palaces of art. This large-sized and beautifully-produced work will be indispensable to every student of the subject.

SOME SHORT NOTICES.

THE TOURIST GUIDE TO THE CONTINENT, by Percy Lindley, issued under the auspices of the Great Eastern Railway Company at the moderate price of 6d., is a carefully compiled and exceedingly well-illustrated hand-book, which will be found extremely useful to persons making brief visits to the various countries therein described. A pamphlet issued by the same company, entitled ROYAL MAIL ROADS TO HOLLAND, contains short practical notes of travel and some pretty coloured views of scenery.

LESSONS FROM FIRE AND PANIC forms No. 9 of the publications of the British Fire-prevention Committee. It is a reprint of the thoughtful paper contributed by Mr. Blashill to the proceedings of a meeting of the Surveyors' Institution, held at Manchester, the council of that body having courteously permitted its publication in this form. The substance of it was given in our columns at the time of the meeting, and we therefore need not further refer to it. The paper certainly deserves attention from all who are interested in the subject.

MY HOME AND HOUSEHOLD COMPENDIUM, by I. W. Jarvis and W. J. Woods (London: Simpkin, Marshall & Co.), is a book of 128 pages, on somewhat novel lines. It has practical chapters on hiring houses and apartments, fire, burglary, life and accident insurances, and the making of wills. But the larger portion of it consists of ruled pages, conveniently arranged for the easy making of an inventory of one's household effects, preceded by an explanation of how to make the inventory. The precise person who has sufficient industry to utilise the book will find it admirably adapted to its purpose.

An interesting and well-printed pamphlet has been issued from the office of the British Fire Prevention Committee, entitled "HOW TO BUILD 'FIREPROOF.'" It is written by Mr. Francis C. Moore, who is one of the leading insurance authorities on the subject in the United States and is prominently connected with the New York Building Department. In the pamphlet a summary is given of various suggestions as to methods of erecting "fireproof" buildings. This summary has been prepared in America, and the whole of the questions dealt with have particular reference to the constructional practice in the United States. This fact, however, in no way lessens the value of the pamphlet for the metropolis and the other great centres of the empire, for with slight modifications it applies equally to the buildings of all countries. Attention should be especially drawn to

the interesting remarks on the effect of rust on ironwork, and the advisability of making part of the coverings movable, to allow of periodical examination.

Messrs. Ward, Lock & Co., Limited, have issued an entirely new edition of their pictorial and descriptive GUIDE TO THE ISLE OF WIGHT. "That beautiful island, which he who once sees never forgets," as Sir Walter Scott wrote, is one of the most delightful holiday resorts in the kingdom, and with equal truth it may be said that every inch of it is so well worth traversing that the visitor with limited time may find its attractions embarrassing him by their number and claims. How shall he portion them out so as to compass the best of them? This hand-book is the reply. With its excursions can be made methodically, with the minimum of trouble and expense. With tradition and history ready for reference, with a map, over seventy illustrations and crisply-written descriptions, the guide is a remarkable shilling-worth. IFRACOMBIE, BARNSTABLE AND NORTH-WEST DEVON is the title of another of the same publishers' shilling series. Here, again, is a district of wonderful appeal to the invalid, the tired townsman, the lover of nature, the student of old-time places and folk-lore. In this hand-book it is admirably treated from all these points of view.

BELPER SEWERAGE SCHEME COMPETITION.

At a recent meeting of the Belper Urban District Council a report was presented by a committee appointed to examine the competitive plans received for the carrying out of a sewerage scheme. A premium had been offered, and the plans dealt with the sewage of outside and inside the district. Those dealing with the sewage in the former manner would be certain to raise strenuous opposition from both public bodies and private individuals. One of the competitors placed his works opposite to the new foundry of Mr. Smedley, but with this one exception the whole of the plans favoured land near the Belper ponds station and on the other side of the river Derwent. The committee felt that the proper place for dealing with the sewage was on the west side of the river. With regard to the treatment, it was felt that until there had been visits to other works, and the different processes had been seen in operation, it would not be wise to proceed, and it was felt that the results of the Royal Commission on Sewage Disposal would be to modify the present requirement of the Local Government Board with regard to the area of land needed for filtration purposes. It had been decided to ask Major Talloch, lately the chief inspector to the Local Government Board, to act as assessor, and he consented to do so on payment of 100 guineas and expenses. There will be no opposition from Mr. Strutt, who is the owner of the land proposed to be taken.

CORRESPONDENCE.

Municipal Engineers and Medical Officers of Health.— "A Borough Engineer" writes: "I quite agree with what you say in your last week's leader respecting the encroaching by medical officers upon work properly belonging to the municipal engineer. I have had experience of this objectionable practice myself, and I put my foot down on it at once, and I would strongly recommend all municipal engineers to do likewise. This officious interference with the department of the borough engineer is, I regret to say, at times attempted by other officials besides the medical officer of health—viz., by the town clerk, sanitary inspector, and even the borough accountant. Let the cobble stick to his last. Speaking for myself, I am fully occupied in looking properly after the work in my own department, and I take it that if the other officials named stuck to the legitimate duties of their own departments, as they should do, they would have no spare time to interfere with the work of a brother-official. My advice to municipal engineers is this: Don't answer queries sent by post upon any matter which comes within the scope of municipal engineering unless such queries come from a borough engineer. If this advice is taken all round the objectionable practice referred to will soon cease."

Threatening a Municipal Engineer.—The water engineer to the Bombay Municipality lately received a letter, ostensibly written by a Mahomedan, stating (according to *Indian Engineering*) that if the meter system is adopted he will be sent to pieces. The correspondent further states that the system is being forced on the city so that he (the water engineer) may obtain a big commission from some firm of manufacturers in England.

An Cutting.—Mr. W. P. Butterfield, of the Shipley galvanising tank and cistern works, gave his employees an outing to Southport on the 20th ult. Dinner was partaken of at the Houghton Arms Hotel, when about thirty sat down. Various places of interest were subsequently visited, and, following an excellent tea, which was served at 6 o'clock, a hearty vote of thanks was accorded Mr. Butterfield for his generosity.

Municipal Work in Progress and Projected.

Most of the metropolitan authorities are still in recess, and consequently there is very little news forthcoming with respect to projected works. From the provinces, too, comparatively little news has come to hand, but we have some information relative to extensive works which are being carried out at Epsom, Retford, Amptill, Bridgend, Garston, Leyton, Birkenhead and Barnley.

METROPOLITAN AUTHORITIES. VESTRIES AND DISTRICT BOARDS.

Hampstead.—At a recent meeting of the vestry a memorial was received from the Hampstead Art Society, signed by several prominent artists, urging the erection of an art gallery as an addition to the central public library in the Finchley-road. The matter was referred to the Public Libraries Committee. The Lighting Committee have just received a report from Mr. A. P. Johnson, the vestry clerk, on the electric lighting undertaking in the parish for the year ended Lady Day last. The total amount of capital expended up to that date was £100,176, of which £2,346 had been repaid. The ordinary expenditure had been much less than in any corresponding period, chiefly owing to the decreased amount of coal consumed and a drop in the expenditure for repairs of machinery. The report states that the policy initiated by the vestry at the opening of the central electric lighting station, and adhered to ever since, of laying mains wherever possible for private consumers, was bearing good fruit, and must continue to do so in the future to an ever-increasing amount. Nearly every street of importance had been wired, and the vestry were therefore able to face with confidence the threatened competition from outside companies, even if, as appears most doubtful, those companies obtain the powers which they seek. The total income for the twelve months was £15,930. The net profit, after meeting current expenses and interest and repaying a portion of the loan, was £3,905 3s. This represented 4 per cent. on the capital expended, but, assuming that as a private company the amount paid for repayment of principal of loans is equivalent to a contribution to a sinking fund, the dividend would have been declared on £6,885, or nearly 7 per cent. These figures must be welcome to the vestry's customers, as in the event of the net profit reaching 5 per cent. the price of the current must be reduced by the vestry under the terms of their provisional order.

St. Pancras.—The vestry have notified that the portion of Easton-road from Gover-street to Cardington-street, now paved with stone, will be closed for six weeks for the purpose of relaying it with wood.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Kent.—A committee recently reported that the asylum cemetery at Barming was full, and asked permission for steps being taken to enclose an additional 2 acres of asylum land adjoining the present cemetery. The committee also recommended that the tender of Messrs. Simpson & Co., of Pimlico, S.W., for £1,223, exclusive of builders' work, which would be carried out by the asylum staff, be accepted for the purpose of completing the heating on the male side of the old building, and for the heating of the whole of the male side of the additional building. In connection with the Carham extension, the committee had accepted the tender of Messrs. Saunders & Co., of Southampton, for £17,300. The report was adopted.

MUNICIPAL CORPORATIONS.

Aberavon.—A special meeting of the Markets Committee of the town council was held on Tuesday last week, to consider the advisability of extending the markets. The committee subsequently inspected the site of the proposed extension. Upon returning, two schemes were submitted: (1) Forming a portion of the cattle market into an arcade, running from Water-street to Church-street; (2) covering in the whole of the cattle market, and carrying it out on the principle of the present market. After considerable discussion it was moved that the whole of the cattle market be covered in, with the exception of the portion now occupied by the fire brigade station and the portion of land intervening between the station and Church-street to the width of the building. This was seconded and carried. It was agreed, on the motion of the mayor, that the cost not exceed £5,000.

Berwick.—A Local Government Board inquiry will shortly be held with respect to an application of the town council for sanction to borrow a sum of £5,000 for the erection of a new police station.

Birkenhead.—A Local Government Board inquiry was last week held by Colonel W. R. Slacke into an application of the town council for sanction to borrow £10,000 for the purposes of street improvements, £710 for widening Rock-lane railway bridge, and £280 for sewerage works.

Bootle.—Colonel W. R. Slacke, R.E., last week held an inquiry, on behalf of the Local Government Board, with reference to an application of the town council for permission to borrow £15,351 for the erection of a technical school.

Bradford.—At a meeting of the Watch and Fire Brigade Committee of the Bradford Corporation, on Tuesday, it was decided to recommend the council to purchase a site opposite St. James's Church, Nelson-street, for the purpose of erecting a new fire station. The site belongs to Messrs. Murgatroyd & Lister, and the price of the land is, it is stated, £2 10s. a yard, the total cost amounting to £11,000. It is estimated that the whole cost of the new station will be £20,000.

Brighton.—The Lighting Committee have resolved that an electricity main be laid in Harrington-road, at a cost of £150; in Elm-grove from the west end to Bonchurch-road and in Bonchurch-road, at a cost of £275; and that the fourteen street lamps on the route of the mains be lighted by electricity instead of gas.

Bristol.—At a recent town's meeting, held under the presidency of the mayor, a resolution was unanimously adopted in favour of the promotion of a Bill in the next session of Parliament to make provision for the prevention of floods in the city.

Burnley.—On Tuesday, on behalf of the Local Government Board, an inquiry was held at Burnley by Major-General Crozier into an application by the corporation for sanction to borrow £15,060. This comprised £5,250 for the construction of the two Yorkshire-street subways under the Leeds and Liverpool canal, £300 for the construction of a footpath along Springfield-road, £4,310 for purposes of public walks and pleasure grounds, £3,100 for the purchase of land for street improvements, and £1,300 for the purchase of land for slaughter-house purposes. With regard to the subways under the canal, the town clerk explained that the total cost was £7,242, but £2,000 of this sum had been previously sanctioned by the Local Government Board. The estimated cost was £5,600, but a subsidence of the embankment whilst the work was in operation, and the consequent delay of the canal traffic, had rendered the corporation liable for unexpected payments to the canal company by way of compensation. The subsidence at one time became so serious that it was feared the whole of the canal would break through the works, but happily this was avoided. There was no opposition to the application.

Canterbury.—The town council have asked the Local Government Board to sanction a loan of £70,000 for the provision of a lunatic asylum. In the course of the Local Government Board inquiry the medical superintendent of the Kent County Asylum at Chatham said that the increase of lunacy in Kent is about sixty cases a year, and it was also shown by statistics that in the county generally lunacy has increased nearly threefold in forty years.

Eccles.—Notice is given in Monday's *Gazette* that the corporation intend to make a lease, by way of supplemental lease, to the Manchester Carriage and Tramway Company of all the tramways within the borough of Eccles belonging to the corporation for the period from the 31st March, 1899, to the 27th April, 1901, at the annual rent of £900. A general description is given of the covenants and conditions contained in the original lease which by reference are incorporated in the proposed lease.

Crimsby.—The Public Lighting Committee on Friday week decided to recommend the town council to carry out an installation of the electric light in the town, including the supply of current to the tramway company for electric traction, at a total cost of about £40,000. The tramway company's present lease expires in two years' time, and to enable them to reconstruct their line and accept current from the corporation, they required an extended lease of twenty-one years. To this there was some objection, but eventually the whole of the recommendations were adopted.

Haslingden.—The town council have adopted the Lighting Committee's recommendation to select a site at the town's yard for the purpose of electric lighting works. The suggested area of supply has also been approved, and an electrical engineer will be engaged to advise upon the several matters connected with the application for a provisional order. The council will, of course, oppose the application for powers proposed to be made by the Electrical Power Distribution Company.

Haverfordwest.—The town council held a special meeting last week to decide as to whether a certain scheme for the supplying of water by gravitation should be proceeded with or abandoned. The exhaustive report of Mr. Horace B. Woodward, F.R.S., F.C.S., of London, who thoroughly examined the springs near Little Newcastle, was again considered. This report stated that "the area which contributes the water to the springs must be considerably over a quarter of a square mile; but estimating only of this amount of area taking the average amount of rainfall at 45 in., and allowing liberally for evaporation and absorption, making

allowance also for the Hotwells springs for the supply of the village, the stream might confidently be expected to yield on an average not less than 150,000 gallons of water per day. After discussion it was decided to abandon the scheme and proceed with another.

Huddersfield.—At the last meeting of the town council it was resolved to make an application to the Board of Trade for sanction to the borrowing of £7,454 for the construction of the Out-lane tramway.

Leominster.—Mr. Herbert H. Law, Local Government Board inspector, attended at the town hall on Friday to inquire into an application of the corporation to borrow £300 for depot purposes.

Lowestoft.—It was reported at last week's meeting of the town council that sanction had been received from the Local Government Board to the borrowing of the sum of £5,000 for works of sea defence for the south beach.

Manchester.—The lord mayor has convened a meeting of ratepayers for Tuesday, to adopt resolutions in reference to the promotion by the city council of a Bill to enable the corporation to work tramways in the districts adjoining the city, and to authorise the making of agreements with local authorities for the working of the tramways by animal, mechanical or other power.

Nelson.—At their last meeting the town council approved of the borough surveyor's plans, &c., for an extension of the filter-beds at the sewage works. The filters, which are to be on the bacteriological system, are 1 acre in extent, and are to be commenced at once.

Pwllheli.—The town council have resolved to consider the advisability of lighting the town by means of electricity rather than gas.

Retford.—It is understood that the Local Government Board have sanctioned the borrowing of £10,600 for the execution of drainage works in the town.

Richmond, Surrey.—The island opposite Petersham Meadows, known as "Glover's Island," is in the market. It is in the very centre of the beautiful landscape view from Richmond Hill, and the corporation are anxious that it should not pass into hands which might possibly use it as a gigantic advertising medium, or in some other way calculated to destroy the amenities of the district. The owner has given the corporation the option of purchase, prior to the day of sale on September 21st, at £4,000. The corporation do not feel justified in expending so large a sum on a somewhat unproductive purchase, but if a substantial contribution is obtained from the public the island will be acquired in the interest of the public. The mayor of Richmond appeals for subscriptions.

Scarborough.—Mr. Robert Bicknell, Local Government Board inspector, held an inquiry recently respecting an application of the town council for sanction to borrow £620 for the purchase of certain property for the purposes of a police station and £127 for the acquisition of land for the purposes of public walks and pleasure grounds.

Taunton.—On the 23rd inst., at a special meeting of the council, the Main Drainage Committee, with a view to remedying the flooding of Station-road, which takes place on the occasion of heavy storms, recommended the council to carry a 3-ft. sewer from the Royal Mail Inn to the present manhole in Jarvis's field, and also to have the storm overflow in Jarvis's field examined and cleaned out if necessary. A member proposed an alternative scheme in the shape of the extension of the storm overflow, and after considerable discussion the matter was adjourned to next month. The Emergency Committee recommended the acceptance of the tender of Mr. T. Moggridge for the erection of the new technical institute in Corporation-street, and this was adopted. The amount was £1,851. The meeting was marked by a series of very lively personalities.

Widnesbury.—The work of extinguishing the subterranean fire is now being carried on satisfactorily. Two pit shafts, 40 ft. deep, are being sunk, and it is proposed to make roads and remove the seam of burning coal, and to fill up the cavities with black sand.

URBAN DISTRICT COUNCILS.

Amphill.—A letter was recently read from the Local Government Board, stating with reference to the application of the Amphill Urban District Council for sanction to borrow the sum of £6,110 for purposes of sewage and sewage disposal, the Local Government Board proposed to cause an investigation to be made of the nature of the soil and the subsoil of the two alternative sites which had been proposed for the sewage farm as soon as the present crops were off the ground. The council were also requested to cause trial pipes to be sunk on each site as soon as the crops had been carted, and inform the board when this had been done.

Basford.—A letter last week was read from the Local Government Board as to the recent inquiry held at Gotham into the request of the council for permission to borrow £1,500 for waterworks at that place. The scheme was said to be generally satisfactory, but it was desirable that the reservoir should be situated below Woldon spring, in order to

avoid any possibility of subsidence through mining operations. A request was made that the plans should be amended in that respect.—The West Bridgford Urban District Council wrote intimating their intention to construct reservoir and surface works, and for that purpose to take land in the parish of Colwick, also in the city of Nottingham, and also in the parish of West Bridgford. It was decided to oppose the action of the council.

Bridgend.—At a meeting of the Urban District Council, last week, the clerk reported that notice had been received of an intended Local Government Board inquiry into the application of the Penybont Main Sewerage Board for a loan of £30,000 to cover the cost of the proposed sewerage scheme for the urban district of Bridgend and Newcastle Higher, Ynisawdre, and St. Bride's Minor, in the Penybont rural district. The inquiry will be held at the town hall, Bridgend, on September 1st.

Garston.—On behalf of the Local Government Board, Colonel W. H. Shacke, R.E., has held an inquiry into an application of the district council for sanction to borrow £25,000 for the erection of a refuse destructor and electric light station in Garston Old-road, Grassendale. Strong opposition was offered to the proposed site of the destructor, and the inquiry was adjourned.

Castleton.—At a special meeting of the Castleton District Council, on Tuesday evening, the draft order of the proposed light railway from Middleton to Rochdale was considered. The proposed line, if constructed, will pass through the village of Castleton. It was decided that the clerk should inform the Secretary of the Board of Trade of the clauses which were considered necessary for the protection of the interests of the village of Castleton.

Croston.—The Local Government Board last week granted permission for the raising of a loan for the purpose of executing a scheme of sewerage and sewage disposal prepared by Mr. W. Naylor, A.M.I.C.E., of Preston. The district is exceedingly flat, and the sewage is to be raised at various points by means of a compressed air system of lifting. The treatment at the outfall is by precipitation and filtration through land.

Heaton Norris.—The clerk, at the last monthly meeting of the district council, read a letter from the Local Government Board drawing attention to the proposal of the council to borrow £1,100 for the purchase of land for sewage disposal. The council were reminded that the board had not yet received plans and estimates and other information asked for in February last. The clerk said this was the fourth letter received since February, and the matter was becoming urgent. The chairman suggested that the clerk should write in reply, stating that the matter was in hand and would have immediate attention. The Local Government Board could not reasonably complain of the delay of the council. The council had had to wait a good deal for them in times gone by, and, indeed, they were waiting now.

Horsham. The district council have decided to apply to the Board of Trade for a provisional order authorising the council to undertake the electric light supply of the town, in accordance with the report and estimate prepared by Mr. Hawtyn.

Kirkburton.—The scheme of Mr. T. Aird Murray, of Sheffield, for the disposal of the town's sewage has been accepted by the council. They have also decided to appoint Mr. Murray to act as engineer in connection with the works.

Ledbury.—The council having applied to the Local Government Board for permission to borrow £3,200 for purposes of sewerage and sewage disposal, Mr. Herbert H. Law held an inquiry on the 18th ult. on behalf of the board. Mr. Bertrington, Wolverhampton, the engineer, and Mr. J. Ellis, surveyor to the urban council, were present at the inquiry. No opposition was raised to the scheme.

Leigh.—Authority was on Tuesday given for an application to be made to the Local Government Board for their sanction to the issue of leases of the surplus lands required under the street improvement scheme, upon which £57,000 is being spent. It was stated that the resolution was necessary, because if they did not get the sanction of the Local Government Board the lands would have to be sold outright.—The clerk announced that as the result of recent arbitrations in regard to the acquisition by the council of land required for street improvement, the trustees of Mr. Danby had been awarded £7,116; Mr. Yates, £6,482; Mr. C. Gnest, £907 6s. 3d.; total, £14,535 6s. 3d. It was resolved that application be made to the Local Government Board for sanction to borrow the money.

Leyton.—Last week, at the Leyton town hall, Colonel Albert C. Smith conducted a Local Government Board inquiry into the application of the council for sanction to borrow £5,000 for purposes of electric lighting, £1,000 for works of private street improvement, £680 for works of sewerage, and £110 for the provision of a urinal at the junction of Woodhouse and Harrow roads. There was no opposition to any of the proposals, and the proceedings were not of a lengthened character.

Maryport.—The district having for years past ineffec-

tually striven to prevent the pollution of the river Derwent, from which it draws its water supply, by sewerage from Keswick and other places. Mr. Ross, at a recent meeting of the council, raised the question of obtaining a pure supply. Workington and Cockermouth are considering the question of bringing down an additional supply from Crammock lake, and it is thought Maryport ought to consider whether they would not join these two authorities and obtain an unlimited supply of water from an absolutely unpolluted source. The question was referred to a committee of the whole council.

Oswaldtwistle.—The Local Government Board have sanctioned the borrowing by the district council of a sum of £2,276 for purposes connected with the gas undertaking.

Rhyl.—The district council are about completing the first section of the Western Promenade extension. The work is being undertaken in front of the old winter gardens, which are now laid out for building sites. The work, which will cost several thousands of pounds, is undertaken by the council without a contractor. Mr. Robert Hughes, the surveyor, being the engineer. The works consist of a sea defence wall, with a promenade, carriageway and parapet on the land side. At the completion of these works it is expected that the sea defences and the erection of a promenade at the Marine Drive will be undertaken, and for which the Local Government Board have sanctioned a loan. A Birmingham firm have applied to the council for permission to lay down an electric tramway from the Grand Pavilion along the sea front, a distance of 4 miles, to Prestatyn.

Romford.—At the next meeting of the district council a resolution will be submitted to the effect that the council apply to the Local Government Board for permission to borrow an additional £1,000 for the public baths.

Royston.—Local Government Board sanction has been received to the borrowing by the district council of £19,605 and £2,324 for purposes of sewerage and sewage disposal and £1,445 for the completion of the destructor.

Rugby.—At the last meeting of the district council a letter was read from Edmondson's Electricity Corporation, stating that they understood that the council had decided to obtain a provisional order for electric lighting, and then to lease their powers to some company if necessary. They expressed a willingness to take such a transfer instead of obtaining an order direct. The letter was referred to the General Purposes Committee. Mr. Seabroke formally gave notice that on that day six weeks he would move a resolution to the effect that the council take certain steps to obtain a provisional order for public lighting.

Skipton.—The district council on Thursday week received a report giving the conclusions of the sub-committee negotiating for the purchase of the Skipton Gas Company's undertaking. It appeared that the committee had called in Mr. John Wangh, of Bradford, to advise them generally as to the condition of the company's plant, and Mr. Wangh's report was appended, but its contents were not divulged. The price offered by the committee for the gasworks was £30,000, but this offer was refused, and the directors intimated that the company were unwilling sellers of their undertaking. The council decided to hold a special meeting to go into the whole question and determine what course to pursue.

Sowerby Bridge.—An inspector of the Local Government Board recently conducted an inquiry respecting an application of the district council for permission to borrow the sum of £8,500 for gasworks purposes and also for supplying gas to the Luddenfoot district.

Staines.—A committee of the council have recommended the institution of an application to the Local Government Board for sanction to borrow £2,560 to cover the cost of making-up certain roads.

Stroud.—Sir John Dorrington, Bart., M.P., has generously offered to present to the town a piece of land for the purpose of a recreation ground. At present the town lacks this necessary provision.

Sunbury.—Mr. Walter A. Ducat, an inspector of the Local Government Board, on the 19th ult. held an inquiry respecting an application of the district council for permission to borrow £4,000 for sewerage and sewage disposal works.

Tipton.—A Local Government Board inquiry was held on Tuesday respecting an application of the district council for sanction to borrow £4,500 for the laying-out of the new Victoria Park.

Tong.—The council's new sewage disposal works, which have been constructed from plans by Mr. John Drake, of Queensbury, are rapidly approaching completion. The contractor is Mr. F. Robinson, of Thornton. The cost of the works will be over £7,000.

Watford.—The district council have instructed the clerk to make an application to the Public Works Loan Commissioners for a loan of £21,000 in connection with the electric lighting works.

Wigston.—The district council have decided not to entertain the offer of the directors of the Great Wigston Gas Company to sell their undertaking to the council for £52,500.

Wirksworth.—A monthly meeting of the urban district

council was held on Monday night, when the surveyor reported that he had inspected a natural gorge situated on the north of Gilkin, which could be made into a storage reservoir capable of holding 3,000,000 gallons of water, and which could supply the low-level district in times of scarcity.

Workshop.—The Sanitary Committee presented a report at last week's meeting of the district council recommending that a provisional order should be applied for in connection with the Electric Lighting Bill. The chairman pointed out that now was the time to decide the question. If they decided upon applying for a provisional order they would have to spend £20,000, and probably £10,000 more on the electric lighting system. The report of the committee was carried, and a special meeting of the council will be called in a month's time to consider the whole question.

RURAL DISTRICT COUNCILS.

Barrow-on-Soar.—On the 18th ult. Colonel W. R. Slacks, R.E., held an inquiry, on behalf of the Local Government Board, into an application of the council for sanction to borrow £3,100 for purposes of sewerage and sewage disposal for the township of Barkby. No opposition was offered to the scheme, which was explained by Mr. W. H. Simpson.

East Crinestead.—The Roads and Bridges Committee at a recent meeting reported that the tender of Mr. P. Edwards for the erection of Harts-lane bridge, Hartfield, for £475, had been accepted, and that they had given instructions for the erection of a notice board diverting the traffic while the bridge was being constructed.

Epsom.—An inspector of the Local Government Board has held an inquiry respecting an application of the district council for sanction to borrow the sum of £22,000 for purposes of sewerage and sewage disposal.

Hendon.—A letter from the Metropolitan Drinking Fountain and Cattle Trough Association was read at a recent meeting of the district council, asking if the council would consent to undertake the maintenance of the Tooke memorial fountain in London-road, Pinner, as the association was in debt to the extent of £6,000. The clerk was instructed to write and ascertain the annual cost of maintenance.

Llanely.—At a meeting of the council on Thursday the clerk reported the receipt of fourteen tenders for laying pipes from Llanely reservoir to Llwynhenhy.

Ringstead.—An inquiry has been held, on behalf of the Local Government Board, respecting an application of the district council for sanction to borrow £1,000 to cover the cost of erecting a bridge over the river Nene.

SCOTLAND AND IRELAND.

Aberdeen.—An important event in the municipal history of Aberdeen took place on Friday, when the local tramways were taken over by the corporation, by whom they will in future be worked. The occasion was marked by an interesting celebration, in which the members of the town council and representatives of all the other public boards in the city took part.

Belfast.—Preparations are now being made for the formal opening of the new electric light station at the Albert bridge, which will be performed by Earl Cadogan, K.G., Lord Lieutenant of Ireland. The actual date of the ceremony has not yet been fixed, but it will take place about the 18th inst.

Glasgow.—At the last meeting of the corporation Bailie Maclay, in moving the approval of the minutes of the Electricity Committee, stated that they were now making rapid progress with the new works at Port Dundas. He was happy to say that all the plant, engines and dynamos under order were likely to be completed within the contract time. Their difficulty would now be in hurrying on the erection of the works to receive the plant. As regards the new works in Pollokshaw's-road, they hoped to begin operations there at a very early date.—The Tramways Committee have been in conference with Lanarkshire and Renfrewshire representatives on the question of extending the tramway system to Cambuslang and Rutherglen and to Paisley. It is understood that the proposals made by the committee have been favourably entertained.

Greenock.—At a recent meeting the police board considered the proposed erection of an electric lighting station. The minutes of the Law and Finance Committee contained the report of the deputation appointed by the Electric Lighting Committee to visit various towns in connection with the proposed electric lighting. The deputation visited Edinburgh, Leith and Glasgow, inspected the electric light stations, and, after carefully considering the information obtained and the advice given, they recommended that the board should appoint a resident engineer, who should prepare a design of the works and report thereon and on the area of supply. The sub-committee also considered the terms of the notice from the North British Electricity Supply Company, Limited, and recommended that the company should be informed that the board would oppose their application for a provisional order to supply electricity in Greenock, as the board were taking active steps to introduce the electric light. The report was adopted.

Personal.

Mr. J. A. Bell, the newly-appointed borough electrical engineer of Aberdeen, was formally installed in office on the 10th ult.

Mr. T. De Courcy Meade, the city surveyor of Manchester, is, we regret to hear, seriously ill. Mr. J. P. Wilkinson is acting during his absence.

Mr. J. E. Benton, of Sheffield, has been appointed an assistant in the Works Department of the London County Council, at a salary of £3 10s. per week.

The position of assistant to Mr. A. B. Monntain, the borough electrical engineer of Huddersfield, recently vacated by Mr. C. R. Brown, has been filled by the promotion of Mr. J. W. Turner.

A marriage took place on Wednesday of last week between Miss Miller, the youngest daughter of the late Mr. John Miller, of Reigate, and Mr. J. Herbert Norris, borough surveyor of Godalming.

Mr. F. J. Hopwood, surveyor and inspector of nuisances to the Shildon and East Throckley Urban District Council, has been appointed to the vacant position of highway and building surveyor, &c., to the Wealdstone Urban District Council.

On Monday of last week, at a meeting of the select committee dealing with the appointment of a surveyor for the Carnarvon Town Council, six of the fifty applicants for the position were selected to appear before the council at a future date.

The Holywell Rural District Council have appointed, out of seventeen applicants, Mr. John Meirion Williams, a son of Mr. David Williams, county surveyor of Flintshire, as surveyor of the roads in Holywell district, the post having become vacant by the resignation of Mr. Judd through ill-health.

At the forthcoming meeting of the British Association at Bristol Mr. W. M. Acworth, a member of the Metropolitan Asylums Board, will read a paper on "Rectification of Municipal Boundaries," while papers will be read on "Municipal Enterprise," by Mr. Cannan, and "Municipalities and Electric Supply," by Mr. George Pearson.

At a meeting of the Ilford Urban District Council, held last week, the Works Committee reported that they had interviewed four of the five selected candidates for the post of surveyor's assistant, and that they had unanimously resolved that Mr. Samuel Turner, of Birmingham, be appointed, at a salary of £120 per annum. Mr. Turner is understood to have commenced his duties on Monday.

For greater convenience in his private practice as a consulting civil and mechanical engineer, Mr. William Fairley, whose only offices were until recently at Mortlake, S.W., has now taken offices at 53 Victoria-street, Westminster, S.W. Communications may also be addressed to Mr. Fairley at the offices of the Main Sewerage Board, Mortlake. As our readers are aware, Mr. Fairley is engineer to that body.

The death has taken place at Annan, Dumfriesshire, of Mr. James Galletly, junr., road surveyor. Mr. Galletly suffered from an internal complaint, and had been in failing health for some time. He was in his early manhood, and of an active, genial disposition. He was a young man of considerable promise, and was very highly respected by those in the different districts of which he had charge. He leaves a widow and two children.

At the first general meeting of the Enfield Urban District Council since their adjournment Mr. R. Collins, the surveyor to the council, reported that Mr. Yates, the buildings inspector, was too ill to resume his duties. Mr. Collins asked that arrangements should be made for the efficient discharge of the inspector's duties. It was decided to give Mr. Yates a month's salary in lieu of notice, and to advertise for a building inspector at a salary of £150 rising to £200.

Consideration was given last week by the Cromer Protection Commissioners to the appointment of an engineer to superintend the construction of sea defence works. Out of a large number of applicants four were selected to meet the commissioners—viz., Mr. Webster, 39 Victoria-street, Westminster; Mr. Douglas, 15 Victoria-street, Westminster, son of Sir N. Douglas, and an engineer to the Board of Trade, Trinity House, and the Lifeboat Institution; Mr. Moore; and Mr. Mayo. Mr. Douglas was elected, the terms being 100 guineas for the preparation of Parliamentary work, to be merged into the 5 per cent. commission if the work was proceeded with.

On Thursday, at the monthly meeting of the Preston Town Council, a memorial addressed by certain ratepayers of the borough objecting to a recommendation of a special committee "that a sum of £500 be voted in recognition of the late borough surveyor's (Mr. Hudson Renk) services for the benefit of the widow and daughters" was read by the town clerk. The memorialists stated that they were advised that the granting of £500 or any other sum out of the public rates

would be illegal, and if any money were allocated for the purposes proposed they would reserve to themselves the right to adopt such legal proceedings as they might be advised. The memorial was received in silence. In a discussion which subsequently ensued the council adopted a suggestion that counsel's opinion should be taken on the matter.

At a meeting of the Barnstaple Town Council, held last week, a member of that body brought forward the question of appointing a full-time surveyor. They were really without a surveyor, and had been so for a very long time, and he ventured to say that the position of the town in that matter was unique, as he doubted whether they could find another corporation like Barnstaple without the assistance and aid of a recognised borough surveyor. It was a disgrace to the town, and the sooner a properly-qualified official was appointed the better. He had nothing to say against the present town officials, the foreman of works and sanitary inspector, but in the interests of a progressive town they required a perfectly competent surveyor, to whom they could appeal for advice and assistance in any matter which might be brought forward, and he would move that the usual steps be taken to carry this into effect. Eventually it was agreed that the matter should be considered at an early date by the council in committee.

A letter was, last week, received by the Chertsey Urban District Council from Mr. A. W. Smith, the surveyor, stating that, as he had been appointed to a more lucrative position in the Midlands, he desired to resign his present post under the council. Two or three members expressed their regret at Mr. Smith's resignation, and it was decided to discuss matters with him after the meeting. The council subsequently went into committee on the question, which they seriously considered. They recommended the council that, in consideration of the surveyor not leaving until October 31st, he be paid for such a period outside the usual month at the rate of £250 per annum, and that his resignation be accepted subject to this arrangement. They further recommended the council to at once advertise for a person to fill the joint offices of surveyor and inspector, the salary to be the same at which Mr. Smith commenced—namely, £160 per annum. On the committee resolving back into council the whole of the recommendations were approved. Particulars of the appointment will be found in our advertising columns.

The daily papers at the beginning of the week contained the announcement that Dr. John Hopkinson, the well-known electrician, of 5 Victoria-street, London, S.W., with a son and two daughters perished together on Saturday morning in one of the most terrible mountain accidents of recent times. Dr. Hopkinson was a practised mountaineer, having quite recently ascended the Matterhorn and the Dent Blanche with his son in a ton through Zermatt. It appears that he started with his son and two daughters from Arolla to ascend the Petite Dent de Veisivi, one of the striking points dominating Evolens, in the Val d'Hérens, running south from the Rhone Valley at Sion. As they started late they were not expected back till about 7 o'clock in the evening. The time for their return passed, and as they did not appear two search parties were despatched, and a third party early in the morning. At daybreak one of the search parties discovered Dr. Hopkinson and his children roped together and all dead on a moraine at the foot of the highest cliffs. Dr. Hopkinson was the eldest son of Alderman Hopkinson, an ex-mayor of Manchester, and was a brother of Prof. Alfred Hopkinson, who lately resigned his seat in Parliament for the Cricklade Division of Wilts to become principal of Owens College. Dr. Hopkinson was educated at Lindow-grove School and Queenwood College, and in his sixteenth year went to Owens College. He afterwards went up to Trinity College, Cambridge, and was Senior Wrangler and first Smith's prizeman in 1871, being appointed fellow and tutor of his college. While at Cambridge he obtained the D.Sc. of London University. He paid special attention to lighthouse machinery, in which he introduced many improvements, particularly the group flashing apparatus. After residing in Birmingham for some years as engineer to Messrs. Chance & Co., he removed to London and practised as an engineer. He took up electrical engineering, and was soon recognised as one of the foremost men in the profession. He presented valuable papers to the Royal Society on electrostatics and magnetism, and he also read papers on technical subjects before the Institutions of Civil Engineers and Electrical Engineers. In 1891 one of the Royal Society's medals was awarded to him, and he was also elected president of the Institution of Electrical Engineers. He was Professor of Electrical Engineering at King's College, London. Dr. Hopkinson has carried out extensive electric tramway schemes in Leeds and other northern towns, and for many years acted as consulting engineer to the Birmingham Corporation. On the 3rd September last he was also appointed consulting engineer for the electric tramways in course of construction at Liverpool. The experimental line ordered for construction under his superintendence is now nearly complete and will be opened in October.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

VOLUNTARY PASS EXAMINATION.

Notice is hereby given that the twenty-sixth examination for candidates for the offices of engineer and surveyor to municipal corporations and district councils will be held at the Technical School, Princess-street, Manchester, on Friday and Saturday, September 30 and October 1, 1898. Application forms, duly filled in by intending candidates, together with entrance fee of £2 2s., must be in the hands of the secretary on or before the 5th inst.

MIDLAND DISTRICT MEETING AT BILSTON.

A meeting of the members of the midland district will be held on Saturday, the 17th inst., at Bilston. The following are the arrangements:—

- 11 a.m.—The members will be received in the council chamber, Town Hall, by the chairman (Councillor R. A. Harper, J.P.) and other members of the council. Minutes of Stafford and Rhydar meetings. Election of hon. district secretary.
- 11.30 a.m.—Leave in brakes, kindly provided by Councillor J. W. Sankey, chairman of the Water and Baths Committee, for a visit to the Spring Vale furnaces, arriving about 11.40 a.m., where, by the kind permission of Sir Alfred Hickman, the process of steel manufacture will be witnessed. A short descriptive paper will be given.
- 12.30 p.m.—Leave in brakes for a visit to the waterworks covered service reservoir (which will be specially emptied for the inspection of the members), arriving about 12.45.
- 1.15 p.m.—Leave in brakes for the Hinley Arms Hotel, arriving about 2 p.m., where a light luncheon will be provided by Councillor R. A. Harper, J.P., chairman of the council.
- 3 p.m.—Leave in brakes for a visit to the Bilston waterworks pumping station, arriving about 3.30 p.m.
- 4.15 p.m.—Leave in brakes for the Technical School, Bilston, arriving about 5 p.m.
- 6 p.m.—Dinner at the Technical School. Tickets, 3s. 6d. each (exclusive of wine).

Arrangements will be made for any members desirous of doing so to inspect the public baths and the public market.

Mr. C. L. N. Wilson, the water engineer and surveyor to the Bilston Council, will give a descriptive paper of the works. As the paper will be in the hands of members intimating their intention to attend some days before the meeting, it will be taken as read.

Among the hotels at Bilston may be mentioned the Pipe Hall, Globe and Great Western.

Wolverhampton is within 2½ miles and Birmingham 10½ miles, and there is a good service of trains from these towns. The Great Western station at Bilston is the nearest to the Town Hall.

J. S. PICKERING, A.M.I.C.E., THOS. COLE, A.M.I.C.E.,
Hon. District Secretary, Secretary,
C council Offices, Nuneaton. 11 Victoria-street, S.W

SLOP-WATER CLOSETS.

DECISION OF THE LOCAL GOVERNMENT BOARD. IMPORTANT TEST CASE.

Some time ago the Lincoln Corporation gave notice to an owner of property to take out several Duckett's slop-water closets and to substitute closets which entailed the use of corporation water. It was alleged that the existing closets were not sufficient water-closets and insanitary. The owner declined to comply with the notice, and the corporation therefore carried out the work, charging £17 as the cost thereof, payment of which was refused by the owner, and an appeal was made by him to the Local Government Board. A local inquiry was held in March last, and evidence taken by the inspector. The decision of the Local Government Board has now been given, and an order made that the owner be not called upon to pay the charges of the corporation or any portion thereof, and that the corporation pay the Local Government Board's costs in the matter. The effect of this decision is that slop-water closets are recognised by the Local Government Board as being sufficient water-closets, and may therefore be used as such. We understand that the closets referred to were Duckett's well-known patent arrangement "B."

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

BUILDING INSPECTOR.—September 2nd.—Sonthend-on-Sea Corporation. £125.—Mr. William H. Snow, clerk.

CLERK FOR SURVEYOR'S DEPARTMENT.—September 3rd.—Staines Rural District Council. £62.—Mr. G. W. Manning, surveyor to the council.

ASSISTANT SANITARY INSPECTOR.—September 3rd.—Blaby Rural District Council. £1 10s.—Mr. R. A. Shires, clerk to the council, Alliance Chambers, Municipal-square, Leicester.

SUPERINTENDENT OF SEWERS AND DRAINS.—September 5th.—Vestry of St. Marylebone. £150.—Mr. W. H. Garbutt, clerk.

SUPERINTENDENT OF CLEANING.—September 5th.—Vestry of St. Marylebone. £180.—Mr. W. H. Garbutt, clerk.

DISTRICT SUPERINTENDENT.—September 5th.—Vestry of St. Marylebone. £150.—Mr. W. H. Garbutt, clerk.

INSPECTOR OF NUISANCES AND SURVEYOR.—September 6th.—Little Woolton Urban District Council. £110.—Mr. Percy Dobell, clerk to the council.

CLERK OF WORKS.—September 6th.—Aldershot Urban District Council.—Mr. Nelson P. Dennis, surveyor.

SURVEYOR AND INSPECTOR OF NUISANCES.—September 6th.—Chertsey Urban District Council. £160.—Mr. T. E. Harland Chaldecot, clerk to the council.

BUILDING INSPECTOR.—September 6th.—Enfield Urban District Council. £150.—Mr. T. W. Scott, clerk to the council.

CLERK OF WORKS.—September 6th.—Stoke-upon-Trent Corporation. £2 10s.—Mr. Wm. Bowen, borough engineer.

TEMPORARY ASSISTANT OF SEWERAGE WORKS.—September 8th.—Cannock Urban District Council. 30s.—Mr. W. Blackshaw, A.M.I.C.E., engineer and surveyor to the council.

INSPECTOR OF NUISANCES.—September 12th.—Northfleet Urban District Council. £80.—Messrs. Sharland & Hatten, clerks, Court House, Gravesend.

THIRD ASSISTANT TO ENGINEER AND SURVEYOR.—September 12th.—Leigh Urban District Council. £70.—Mr. Tom Hunter, engineer and surveyor to the council.

COMPETITION.

CHERTSEY URBAN DISTRICT COUNCIL.

COMPETITION FOR SEWERAGE SCHEMES.

TO ENGINEERS.

The Chertsey Urban District Council invite competitive plans for the Sewerage and Treatment of Sewage from the Nos. 1 and 2 Wards of their district, showing separate and joint schemes for such wards.

The following premiums are offered: First, £50; second, £30; third, £20.

Plans, details and estimates of cost to be signed by a *nom-de-plume*.

The names and addresses of competitors to be sealed in an envelope endorsed with the *nom-de-plume* adopted.

Plans of the suggested areas may be seen and other particulars (printed or written) obtained, on application up to the 28th day of October next, from the Surveyor to the Council, Mr. Arthur W. Smith, Eastworth-road, Chertsey. Plans and other documents should be delivered free to the undersigned by the 23rd day of December next.

Competitors must not approach or consult members of the Council.

(By order)
T. E. HARLAND CHALDECOTT,
Clerk to the Council.

Chertsey.
August 26, 1898.

TENDERS WANTED.

**STAINES URBAN DISTRICT COUNCIL.
TO ROAD CONTRACTORS.**

The above Council invite tenders for the making-up of the following streets—*viz.*—

- Sidney-road.
- Bremer-road.
- Farnell-road.
- Billet-road.

Plans and sections may be seen, and specifications, bills of quantities and forms of tender obtained (on payment of £1 ls. in respect of each street, which will be returned on receipt of a *bona-fide* tender), upon application to Mr. E. J. Barrett, ASSOC. M. INST. C. E., Surveyor, Town Hall, Staines, on and after Monday, 5th September, between the hours of 10 a.m. and 1 p.m.

No tender will be considered unless made on the prescribed form, and accompanied by the bill of quantities and schedule of prices properly filled in. A separate tender must be submitted for each street.

Sealed tenders, endorsed with the name of the street, to be delivered at my office not later than Saturday, 17th September.

The Council do not bind themselves to accept the lowest or any tender.

JOHN ANTHONY ENGALL,
Clerk to the Council.

Clarence-street, Staines.
August 31, 1898.

THE ILFORD URBAN DISTRICT COUNCIL

hereby give notice that they are prepared to receive tenders for the following works at Valentine's, Ilford, the site of the Public Park:—

For Cleansing, Levelling, &c., the Lake, Making Roads and Footpaths through Grounds (including getting gravel), Making Catch-Pit.

London, Grimsby, Glasgow, Ebchester, Hoylake, Johnstone, &c., &c., and many other towns in England, on the Continent, and the United States.

WRITE FOR TESTIMONIALS.

PATENT TRUINVERT PIPE.

To put it shortly, this pipe secures true alignment of invert, increased strength in the socket, three gas and water-tight connections at every joint, and, while allowing for a slight settlement when first laid, forms an absolutely rigid joint directly the cement sets.

POINTS:

- 1.—Gas and Water-Tight Joints easily made under water.
- 2.—True Alignment of Invert.
- 3.—Socket the strongest part of the pipe.
- 4.—No special junctions required.

AA—Holes for pouring in cement or composition.
BB—Strengthened and Lengthened Socket.

CC—Inner Socket and Rest.
EE—Chamber for cement or composition.
FF—Standard Joint in new position.

OATES & GREEN, Ltd., Halifax.

quired to pay wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Vestry's list (such rates of wages and hours of labour will be inserted in a schedule, and form part of the contract), and will also be required to enter into a formal contract and bond with two approved sureties for the due performance of the contract.

Plans may be seen, and form of tender, specification and approximate quantities, and lists of wages and hours of labour, may be obtained on application to Mr. W. C. Gow, C.E., Surveyor to the Vestry, on and after Monday, the 5th September, 1898, on deposit of £2, which sum will be returned on receipt of a *bona-fide* tender, provided such tender is not subsequently withdrawn.

The Vestry does not bind itself to accept the lowest or any tender.

Sealed tenders, properly filled in, must be sent to me at the Vestry Hall on or before Wednesday, the 14th September, not later than 4 p.m., in envelope, marked "Tender for Paving."

(By order)

EDWIN HUGHES,
Vestry Clerk.

Vestry Hall, Maxey-road, Plumstead.
August 29, 1898.

SWANAGE URBAN DISTRICT COUNCIL. TO SEWERAGE CONTRACTORS.

The Urban District Council of Swanage, in the county of Dorset, are prepared to receive tenders for the completion of the Main Sewerage of the district, including about 221 yards of 27-in. Iron Outfall Sewer, 976 yards of 27-in. and 30-in., and 3,900 yards of 9-in., 12-in. and 15-in. Pipe Sewers, with requisite arrangements for flushing, inspection and ventilation.

Drawings and specification may be seen at the offices of the Council, Town Hall, Swanage, and of the Engineers, 5 St. Thomas-street, Ryde, of whom copies of the quantities may be obtained on the deposit of 1 guinea, to be returned on receipt of a *bona-fide* tender. The tenders to be delivered by noon on Monday, September 19, 1898.

FRANCIS NEWMAN & COCKS,
Engineers.

ST. LUKE (MIDDLESEX) VESTRY. CONSTRUCTION OF UNDERGROUND SANITARY CONVENIENCE.

Tenders are invited for the construction of an Underground Sanitary Convenience in Old-street, near its intersection by City-road, in accordance with the plans, specification, &c., and bill of quantities prepared by the Surveyor to the Vestry and Mr. H. Williams Mellor, quantity surveyor, respectively.

These may be seen, and forms of tender and bill of quantities had, any day except Saturday from 11 to 5 o'clock, and on Saturdays from 11 to 1 o'clock, on application to the Surveyor's department.

Tenders must be upon the official form only, properly filled up and signed, and marked outside "Sanitary Convenience," and must be delivered before noon on 14th September next.

(By order)

GEORGE WHITEHEAD PRESTON,
Vestry Clerk.

Vestry Clerk's Office,
St. Luke's Vestry Hall, City-road, E.C.
August 20, 1898.

WITNEY RURAL DISTRICT COUNCIL. EYNSHAM MAIN DRAINAGE.

The Rural District Council are prepared to receive tenders, under the advice of their Engineer, from contractors for the execution of this work.

The plans and specifications can be seen, and information obtained, upon application to Mr. Nicholson Layley, F.R.S., Assoc. M. Inst. C.E., the Council's Engineer, at his chambers, 16 Great George-street, Westminster, between the hours of 10 and 4 o'clock on and after September 12th next.

Sealed tenders, endorsed "Eynsham Main Drainage," are to be delivered at my offices at Witney not later than 6 o'clock p.m. on Monday, September 28th.

The Council do not pledge themselves to accept the lowest or any tender.

A copy of the plans and specification are also deposited at the offices of Mr. W. George Eaton, Surveyor to the Council, Witney, and information can be obtained upon the dates and times before named.

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

Easily and quickly laid by unskilled workmen.
Perfect alignment of invert secured.
Joint readily made absolutely watertight.
Cheapest Patent Joint in the market.

Prices and further particulars on application to J. PLACE & SONS, Ltd., Darwen.

BEXLEY URBAN DISTRICT COUNCIL.
TENDERS FOR MATERIALS, STORES, CARTAGE,
TEAM LABOUR, REMOVAL OF DUST AND STEAM
ROLLING.

The General Purposes Committee invite tenders for the following works and materials, &c., within the Bexley district during twelve months ending September 30, 1899:—

- (A).—MATERIALS AND STORES.
- 1.—Broken granite, furnace slag, flints, rag stone, gravel, &c.
 - 2.—Granite and limestone curb, channelling and sett paving.
 - 3.—Lime, Portland cement, sand, and drain pipes, &c.
 - 4.—Pitch, illuminating oil, disinfectants, lamp glasses, lamp wick, brushes, castings, &c.

- (B).—TEAM LABOUR, DUSTING, &c.
- 1.—Collection of dust and house refuse.
 - 2.—Hire of horses, carts and drivers for cartage of materials, day cartage, slopping, horsing water vans, sewage-vans, &c.

(C).—STEAM ROAD-ROLLING.
The hire of a steam road-roller in the district, at per day. Specifications, conditions of contract and forms of tender, containing full particulars, may be obtained on application to Mr. Tom Vickers, C.E., Surveyor, Public Hall, Bexley Heath, on receipt of a stamped addressed foolscap envelope, such application stating the section—(a), (b) or (c)—required.

Tenders, distinctly endorsed on the outside cover "Tenders for ———," as the case may be, are to be addressed to me, the undersigned, not later than Monday, September 12, 1898.

The Council do not bind themselves to accept the lowest or any tender.

The Council reserve to themselves the right to accept a tender for a period of either six or twelve months.

THOS. G. BAYNES,
Clerk.

Council Offices, Bexley Heath.
August 23, 1898.

BOROUGH OF SOUTHEND-ON-SEA.
TO ROAD CONTRACTORS AND OTHERS.

The Corporation invite tenders for Street Works in the making-up of Claremont-road.

Plans, sections and specifications may be seen, and bills of quantities and forms of tender obtained, on and after Tuesday, the 30th August (on payment of £1 1s., which will be returned on receipt of a *bona-fide* tender), upon application to Mr. Alfred Fidler, Assoc.M.A.N.S.T.C.E., Borough Surveyor, Clarence-road, Southend.

No tender will be considered unless made on the prescribed form.

Sealed tenders, endorsed with the name of the street and marked "Tender for Private Street Works," to be delivered at my office before 10 o'clock in the morning of Thursday, the 8th September.

The Corporation will not be bound to accept the lowest or any tender.

(By order)
WILLIAM H. SNOW,
Town Clerk.

Southend-on-Sea.
August 26, 1898.

CARRICKMACROSS UNION.
NOTICE TO CONTRACTORS.

The Board of Guardians of the above Union, acting as the rural sanitary authority, will, at their meeting to be held at 2 o'clock p.m. on Tuesday, 6th September, 1898, be prepared to consider tenders for the construction of works to supply the town of Carrickmacross with water, in accordance with plans and specification prepared by P. F. Comer and the late W. G. Strype, MEMBRS. INST. C.E., 19 Lower Leeson-street, Dublin, which can be seen at the office of Mr. J. H. Blackader, solicitor, Carrickmacross, between the hours of 11 a.m. and 3 o'clock p.m. daily.

The works comprise the supply and laying of 102 tons or thereabouts of Cast-Iron Water Mains; the construction of a Pumping House, with duplicate sets of oil engines and three-throw gun-metal plunger force pumps, each set of pumping plant being capable of delivering 90 gallons per minute to a height of 200 ft.; and the construction of a Service Reservoir, to contain 100,000 gallons or thereabouts.

Printed copies of the specification and form of tender may be obtained from Mr. Blackader on payment of £2 sterling

BOROUGH OF LOUGHBOROUGH.

NANPANTAN RESERVOIR.

NEW FILTER-BED.

Persons desirous of tendering for the Construction of a new Filter-Bed, with appurtenant works, at Nanspantan are requested to send in their names and addresses to the undersigned.

Plans may be inspected and bills of quantities, &c., obtained as below on deposit of cheque for £3 3s., which will be refunded on receipt of a *bona-fide* tender and return of the documents.

Sealed tenders are to be sent in, endorsed "Tender for Filter-Bed," on the forms supplied, addressed to the Town Clerk, Town Hall, Loughborough, on or before 17th September, 1898.

Contractors tendering must guarantee to pay not less than the standard rate of wages.

The Corporation reserve the rights to accept or reject any tender.

Borough Engineer and Waterworks Manager.
Municipal Offices, Ashby-road, Loughborough.
August 30, 1898.

**BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.**

The Beckenham Urban District Council invite tenders for Widening Croydon-road and Elmers End-road. The works comprise the widening of Croydon-road for about 800 lineal feet and of Elmers End-road for 150 lineal feet, together with the formation of new footways. In connection therewith the following works are necessary—*viz.*, about 800 lineal feet 9-in. pipe sewer, 700 lineal feet 9-in. pipe surface-water

drain, with manholes, gullies, &c., 110 lineal feet concrete retaining wall about 4ft. high, 1,000 lineal feet curb and channelling, making-up roadways, &c.

Plans and sections may be seen, and bills of quantities, specifications and forms of tender obtained, on application to Mr. John A. Angell, Surveyor, on or after September 7th, on deposit of £1, which will be returned on receipt of a *bona-fide* tender.

A clause will be inserted in the contract providing that the contractor shall pay to the workmen engaged in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Tenders, duly sealed and endorsed "Tender for Widening Croydon and Elmers End Roads," to reach undersigned not later than 4 p.m., Monday, September 26, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
F. STEVENS,
Clerk to the Council.

August 30, 1898.

**BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.**

The Beckenham Urban District Council invite tenders for Erecting about 200 Cast-Iron Ventilating Columns, 13 ft. 6 in. high, on concrete beds, together with the laying of 9-in. Stoneware Pipe Connections to the main sewers, &c.

Plans and sections may be seen, and bills of quantities, specifications and forms of tenders obtained, on application to Mr. John A. Angell, Surveyor, on or after September 7th, on deposit of £1, which will be returned on the receipt of a *bona-fide* tender.

A clause will be inserted in the contract providing that the contractor shall pay to the workmen engaged in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Tenders, duly sealed and endorsed "Tender for Erection of Ventilating Columns," to reach undersigned not later than 4 p.m. Monday, September 26, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
F. STEVENS,
Clerk to the Council.

Minutes of Proceedings.

Carnarvon Water Supply.

A report from Dr. Wheaton on the water supply of Carnarvon has just been issued by the Local Government Board. From it we learn that for some years past the unsatisfactory nature of the supply, more particularly its liability to pollution by liquid refuse from a certain village, has been before the Board. Three years ago it was shown in a similar report that the water supply was subject to pollution, not only from this, but from other sources, including faecal matter from privies and liquid matter from cesspools pertaining to various dwellings in the upper part of the valley, from which the supply is derived. The offending village of Rhyd-ddu is situated in the districts of the Gwyrfaï and Glaslyn Rural Councils, who have in vain been urged to deal with the sewerage of the village so as to prevent the pollution of the river Gwyrfaï, and the Carnarvon Town Council contend that unless that is done they themselves can do nothing. It was under these conditions that Dr. Wheaton was instructed to make an inspection of the gathering ground and report on the conditions of the water supply generally. The supply is derived from the river Gwyrfaï, the valley of which is one of a number that run in a westerly direction from the Snowdonian range towards the Menai Straits. The valleys are nearly parallel, and each contains one or more lakes. On the north the Gwyrfaï valley is bounded by hills from 1,000 to 2,000 ft. in height and on the south by a range of nearly equal height. At the head of the valley the steep western slopes of Snowdon form a deep hollow and there is formed a sharply-defined watershed lying midway between the villages of Rhyd-ddu and Beddgelert, the head of the valley being about 3 miles wide. In the valley are two lakes, Llyn-y-Gader being situated about the middle and Llyn Quellyn at a lower level. From the upper lake the Gwyrfaï issues as a large stream, and after a course of nearly 3 miles passes the village of Rhyd-ddu and falls into Lake Quellyn, at which point the valley is not more than $1\frac{1}{2}$ miles in width, the lake being about 1 mile in length and $\frac{1}{2}$ mile at its greatest breadth. From it the Gwyrfaï issues as a fair-sized river, and after a course of about 12 miles falls into the sea at the southern extremity of the Menai Straits, 4 miles south of Carnarvon. The intake for the supply of the borough is $\frac{1}{2}$ mile below Lake Quellyn and about $6\frac{1}{2}$ miles from the town. At the intake a dam has been constructed across the stream, and the water thus held up flows through twelve copper gauze screens, or strainers, directly into an iron pipe, by which it is conveyed to a reservoir $2\frac{1}{2}$ miles from the town. This reservoir has a capacity of 2,780,000 gallons, and from it the town is supplied by gravitation. There is no filtration, and the supply is a constant one, there being few storage cisterns in the borough. In 1891 the population was 9,804 persons, living in 2,154 houses. There are no large manufactories or businesses re-

quiring a large quantity of water in the town, but during the summer months the supply has been at times inadequate, this being attributed in part to corrosion and consequent narrowing of the calibre of the smaller mains, in part to leakages from mains, and to waste from taps in dwellings and from stand-pipes in courts. The corporation have therefore decided to provide an increased storage, by means of an additional reservoir. The present water supply was inaugurated in 1865, when the town council were authorised by Act of Parliament to take water from the Gwyrfaï. At that time the water was obtained from the river at a point much nearer to Carnarvon than the present intake. Finding that the water was polluted by the drainage of a particular village, the corporation consulted Mr. Baldwin Larham, who advised the removal of the intake to its present position, and a provisional order for the purpose was obtained in 1879. The town council are in a more or less helpless condition, from the fact that they have absolutely no control over Lake Quellyn or any portion of the area from which the water is derived. The whole of the valley on both sides of the river above the intake, including Lake Quellyn and extending to a short distance above the upper end of that lake, is under the control of the Gwyrfaï Rural District Council. From that point the river forms the boundary between the two rural districts—Glaslyn on the north and Gwyrfaï on the south. The troublesome village of Rhyd-ddu stands on both sides of the river, about $\frac{3}{4}$ mile above Lake Quellyn, and is therefore partly in one rural district and partly in the other.

After a description of the watershed and the works, the report goes on to deal with the specific forms of pollution. The valley above the intake is occupied by farms, which are generally situated on streams falling into the Gwyrfaï, and these streams have a tendency to receive all sorts of refuse, liquid or solid, from the farm. We need not go into all the details of the definite instances of pollution, both of river and lake, given by Dr. Wheaton. Really serious danger exists in connection with a quarry on the shores of Lake Quellyn, as a very large number of men are there employed, and a case of enteric fever would entail no small risk to those consuming the water. The worst pollution, however, undoubtedly comes from the village of Rhyd-ddu, and this deserves some attention. The whole of the liquid refuse from this village, which consists of thirty-nine dwellings and has a population of about 150 persons, is discharged into the river either directly—the refuse being thrown from the dwellings on to the river banks—or indirectly, by means of rubble drains or surface channels on the roadside. The village is not sewered, and, though steps have lately been taken to prevent faecal matter being thrown into the stream, a certain amount undoubtedly does still find its way there, being thrown from the bucket privies which are in use in the village. The dwellings on the south of the stream

are without receptacles for storing refuse, which are consequently heaped on the banks of the river. "There can be no doubt," says the inspector, "that the sanitary circumstances of this village are such as to form a serious danger to the consumers of the water from the Gwyrfai river, and there would be grave risk to such consumers should enteric fever or cholera at any time break out in this village." All the circumstances point to a joint scheme of sewerage as the solution of the difficulty, so far as this village is concerned, and the two district councils are incurring a serious responsibility in thus neglecting their obvious duties in the matter. In comparison with the lower, the higher lake may be regarded as practically free from pollution, though not absolutely so. The inspector, in concluding his report, recognises that the work of preventing pollution of the Carnarvon water supply is by no means easy, involving as it does the exercise of constant vigilance over a very large area. He recommends the following steps for the purpose:—

(1) The thorough sewerage of the village of Rhyd-ddn, and the disposal of the sewage in such a manner as to avoid any risk of pollution of the river. (2) The scavenging of this village at frequent and regular intervals, in order to put an end to the throwing of the contents of pail closets, of privies, or of household refuse, into the stream. (3) Frequent inspection of all farms and dwellings upon the gathering ground. The disposition of all liquid refuse from dwellings, farmyards, manure heaps, and the like, in such fashion that these matters shall not foul streams. The prevention, as far as possible, of manuring of land in the immediate neighbourhood of the lakes and streams. (4) The provision of movable receptacle for fecal matter for all dwellings upon the gathering ground, in order to prevent the direct fouling of streams by fecal matter. Strict attention to be directed to the method of disposal of contents of such movable receptacles. (5) The diversion of all water passing through Glan-r-afon quarry from the river above the intake. (6) The diversion of all surface water from the main roads from the river.

It is pointed out that the last two measures would require engineering works of considerable difficulty. Filtration has also been recommended as a precautionary measure, but Dr. Wheaton doubts if filtration, as ordinarily carried out, could, in the present circumstances of the Carnarvon water supply, be trusted to secure a uniformly wholesome water. The case of Carnarvon is another addition to the already long list of cases which point to the necessity for more effective intervention on the part of the central government in connection with public water supplies.

* * * *

Charging for Electricity on the Brighton System.

There can be little doubt that the Brighton or Maximum Demand Indicator System more than any other, with the exception of the Manchester system, takes into consideration the peculiar conditions prevailing in the supply of electricity. Unfortunately, there is a difficulty in making the lay mind understand the principle of the system, and it is no exaggeration to say that comparatively few consumers on a municipal system have any practical appreciation of the value of the Demand Indicator from their point of view. The one predominant fact in the supply of electricity is that the cost of producing it depends rather upon the way in which it is supplied than upon the amount actually supplied. That is due mainly to the fact that storage of electricity on a large scale is not yet practicable. Consequently, if the consumer has to be supplied at any time, it is necessary to run a certain amount of plant which may not always be doing a fair amount of work. The chief cost of an electric lighting station is the standing-by costs, or those incurred in getting the plant ready to supply. As a matter of fact, the stand-by charges are almost three times as high as the running costs, which include coal, water, and stores, repairs, &c., and therefore any system which will reduce the standing-by costs provides at once a means of cheapening electricity. The Brighton system is based on this principle. It first charges

every consumer a certain proportion of the standing-by costs, and when these costs have been met the consumer obtains his electricity at the lowest possible price based upon the running charges. It follows that such a system would benefit a consumer who used a few lamps for a long period rather than a consumer who used a large number of lamps for a short period. The tendency of the system, therefore, is to prevent a consumer from being extravagant in the number of lamps he uses; in other words, it tends to diminish the burning of more lamps at one time than is actually required. The usual method is to charge a certain sum per unit for the first hour in which the lamps are in use. This figure varies in different towns, but in most cases it is 6d., and beyond the first hour or two hours, or whatever may be the time basis employed, the consumer obtains his electricity in many cases at 50 per cent. of the price charged during the first hour. The following tables, taken from a recent report by Mr. Rider, the borough electrical engineer of Plymouth, will probably make the economy of the system clear.

A consumer with 100 16 candle-power lamps fixed. Each 16 candle-power lamp consumes '06 units per hour. Meters at end of quarter indicate that 350 units have been used, and that the maximum number of lamps burning at any one time has been sixty.

Then sixty lamps x '06 unit x ninety-one hours per quarter = 327.6 units at 8d.	£	s.	d.
Balance of 22.4 units at 3d.	10	18	4
	0	5	7
	11	3	11

If this same consumer by careful management had never more than fifty lamps burning at one time, but had consumed the same total quantity, then his account would have been:—

Fifty lamps x '06 units x ninety-one hours per quarter = 273 units at 8d.	£	s.	d.
Balance of 77 units at 3d.	9	2	0
	0	19	3
	10	1	3

In other words, this is £1 2s. 8d. less for the same quantity of electricity, because the amount of plant called into use at the works to supply him was less in proportion.

* * *

The East-End Water Question.

We regret to have to record that our anticipation, expressed last week, that the interposition of the Local Government Board would prevent the further reduction of the intermittent supply from the East London Water Company has not been borne out. On the very morning after we went to press the announcement appeared that the company were compelled to further reduce the supply, that is to say, from six hours to four, two in the morning and two in the afternoon. We referred last week to the contention of the company and their officials that they could not take supplementary supplies from other companies, because the mains at Blackwall and elsewhere, through which the water would have to be taken, were too small to admit it. Hitherto it has always been thought to be a question of inadequate storage capacity and of mains without any water to pass through them except during certain hours of the day. The new contention certainly calls for some further elucidation. The suggestion from the Local Government Board as the result of Major-General Scott's investigation was that the New River Company should have a supply from another company with whose mains communication either existed or could be made, and that in this way the New River Company could spare more of the Lea water for the use of the East London Company. The limit of this assistance has now been reached, and it certainly does not amount to much. Another contention on the part of the company is that there must be excessive waste on the part of consumers, because even the restricted supply has been at the rate of 26 gallons per head. But how much of that goes to those who are supplied by meter for trade purposes and how much is left for the con-

summer either to consume or to waste? If one ventures to point out that other companies do not complain of waste, we are told that there are storage cisterns in the districts they supply. If there are no storage cisterns in the district supplied by the East London Water Company it is not the fault of the consumers and they have no right to suffer. But they will evidently suffer still more unless rain comes to their assistance and to that of the benighted company. In our opinion three conclusions are inevitable after this latest drought: (1) The company have so far failed to provide adequate storage; (2) the Lea can no longer be relied upon as a source of supply, at all events for two companies; and (3) public control cannot too soon be brought about. The morning papers of Wednesday announced that even the four hours' service, which began on Saturday, was in many parts of the district a dismal failure. The pressure was inadequate, the water was discoloured, and in many parts none could be obtained at all fit for use. Yesterday the outlook was worse than ever. In another column we quote a spirited letter addressed by the Shoreditch Vestry to the Local Government Board.

* * *

Free Electric Wiring.

We have at various times made some reference in these columns to the development of free wiring throughout the country, and it has been conclusively proved in Taunton, Blackpool, West Hartlepool, Worcester and St. Leonards that a judicious use of the system is a material aid in the development of an electrical supply business. Although the term "free wiring" is somewhat of a misnomer, the system provides an easy means of enabling the poorer classes of consumers to avail themselves of the benefits of electric lighting; but though the wiring and fittings are, so far as regards initial expenditure, free to the consumer, he has to pay a slightly enhanced price on the usual charges for electricity that prevail in the community. It has been pointed out that the system lends itself to some abuse in the fact that all free-wiring systems at the present time are introduced and carried out by companies who work in conjunction with the municipal authorities. In the course of a discussion at a recent meeting of the Portsmouth Town Council free wiring received a somewhat severe check, at all events so far as that town is concerned. There appears to have been a feeling that the system might to some extent interfere with the legitimate business of local tradesmen, and it was thought that it was scarcely the duty of a corporation to join hands with a company, even when certain advantages were offered to consumers. There may be something to be urged in favour of this view of the matter, but free wiring gives such unmistakable advantages that it would be regretted if the principle were entirely rejected. The easiest solution of the difficulty—and it applies as much to other towns as to Portsmouth—is for the municipality to undertake some hiring system of wiring and fittings much in the same manner that the Bradford corporation hire out electric motors. As far as the consumer is concerned, he would in all probability be treated better by a municipality than in the case of a company working in conjunction with a corporation. It cannot be too widely known, however, that in the towns to which allusion has been made a distinct success has followed the introduction of the free wiring system.

The Recent Dublin Congress.

As the proceedings of the recent congress went on it was seen that not a few of the papers and discussions possessed more direct interest for municipal engineers than one might have gathered from the opening proceedings and the special conferences, which seemed to be largely monopolised by medical officers of health and sani-

tary inspectors. This week we give the third instalment of our report, summarising those addresses, papers and discussions most likely to attract our readers. In our last issue there was some interesting matter in reference to such subjects as the housing of the working classes, the extension of towns, and the municipalisation of tramways, water supplies and public lighting. The discussion initiated by Sir Charles Cameron served a distinctly useful purpose in drawing attention to the class for whom municipal authorities should primarily, if not exclusively, provide housing accommodation. The subject is one we have frequently discussed in these columns, but we may again express the opinion that the provision of such accommodation by municipalities for classes who can afford to find it for themselves in the ordinary way is economically wrong, is likely to do more harm than good, and had much better be left to private enterprise; in short, it is to go beyond the legitimate limits of municipal activity and enter upon a policy of Socialism, the ultimate effects of which must undoubtedly be mischievous. On the other hand, an attempt to solve the problem of housing accommodation for the very poor is called for in the interests of the public health and general well-being of the community. In our continuation of the report this week there is further and more detailed discussion of the subjects referred to above. The section of the proceedings with which our readers are most concerned is that which was devoted to the discussion of engineering and building construction topics—of course as bearing upon the central idea of the public health. Some of the papers in this section we have, therefore, dealt with separately. The paper of Mr. Watson was a useful summary of the dust destructor question, and that of Mr. Kaye Parry, which appears this week, will be read with interest on account of its defence of Dr. Bailey Denton as a pioneer of sewage treatment on biological lines. We expect to finish our report of the proceedings in our next issue.

* * *

The British Association at Bristol.

The destruction of the fine Colston Hall caused no small inconvenience to the recent Trades Union Congress, and has compelled the members of the British Association to carry on their meeting this week in less commodious and suitable premises than they would otherwise have had. We may mention that this is the third meeting in Bristol, the first having been held in 1836, and the second forty years later—in 1875—when the office of president was filled by an eminent engineer in the person of the late Sir John Hawkshaw. On the present occasion the president is Sir William Crookes, one of the most distinguished of English chemists. The proceedings generally are expected to show no falling off in interest and value, and we observe that a larger number of papers than usual will have a special and direct interest for municipal engineers. Especially is this the case in section G. (mechanical science), over which, as our readers will observe with pleasure, Sir John Wolfe Barry presides. The following are among the papers to be read in this section: "The Hiring of Electric Motors to Local Authorities and to Small Industries as carried out at Bradford," by Mr. Gibbings, borough electrical engineer of Bradford; "Corrosion of Gas and Water Pipes by Earth Currents," by Prof. Fleming; "A Description of the Bristol Municipal Electrical Works," by Mr. Proctor, borough electrical engineer; "Scheme for Improvement of Severn Waterway to Birmingham," by Mr. Marten, chief engineer to the Severn Commissioners; and "The Conditions Necessary for the Successful Treatment of Sewage by Bacteria," by Mr. Dildin. In section F. (economical science and statistics) Mr. G. Cannon will read a paper on "Municipal Enterprise," and Mr. G. Pearson one on "Electrical Enterprise and Municipalities." To some of the papers mentioned we shall refer further in our next issue.

Royal Institute of Public Health.

ANNUAL CONGRESS AT DUBLIN.—III.

On the Saturday the discussion on the paper "The Terminable Leasehold System in regard to Municipal Sanitation" was resumed, in the Municipal and Parliamentary Section, by Mr. Alexander Bruce, of the Caithness County Council.

Alderman MFADE said that this was a question that ought to be dealt with, but it was yet hardly ripe. It was a large question which involved much consideration. The discussion was useful, and would tend to make the subject ripe for practical consideration.

This concluded the discussion.

TRAMWAYS, PUBLIC LIGHTING AND WATER SUPPLY.

The CHAIRMAN said he was certain that everybody would be interested in the subject which would be raised in the next paper. It was an important subject for consideration at the present time.

Mr. EDWARD CUMING, B.L., then read a paper on "The Municipalisation of Tramways, Public Lighting and Water Supply." Nothing in modern life, he said, differed so much from ancient and medieval times as the position taken up and the province filled by municipal authorities and organisations. What was it that came home to most people living in a town like Dublin, Glasgow or Belfast, or that effected their life and happiness most? First, their earnings and their food, but after those such matters as local bodies dealt with affecting the life and interests and well-being of the community. The legislature had of late given over to the local bodies a vast amount of power, and power involved duty. The water question came home to everyone. Artificial lighting had become a municipal question, and tramways soon would be. Without water in lavish abundance no modern drainage could be practically carried out effectively. It was impracticable for any public body to carry on any business that did not affect all the members of its community, and if it should attempt such a task, those favoured to the exclusion of others would be regarded as getting undue advantage. Water, gas and cheap tramways were important to everyone. Dublin was a case in point. For many reasons Dublin was a town that it would always be difficult to keep in good health. In Belfast the gas company were bought up by the town council, and that had been an admirable purchase. The constant complaints about the London water companies showed the danger of having the water supply in the hands of a private individual. The real advantage of having the supply of water, gas and the providing of tramways carried on by the local government of towns was that the governing body did not need to make a profit for a body of shareholders. The local authority would be satisfied with a moderate rate of interest, and with a small sinking fund to pay off the moneys invested in the construction; and having at their disposal the rates of the town, they could borrow money at a very low rate of interest. They could also for a time disregard profit altogether, and carry on part of the water, gas and tramways at an actual loss, if such a course were found beneficial to the general interests of the community. A trading company could not venture on doing that. But it was plain that many of the labouring classes in large towns now resided in most unhealthy places, in order to be near their work and the places where they were employed, and who could live farther away if they were provided with the means of cheap travelling backwards and forwards. They could be brought at a very small expense—such expense as would just keep the local government free from loss. Such fares would not pay a trading company at all. It would in many cases be more convenient for a governing body to incur a loss in the working of part of the tramway rather than take compulsorily the areas inhabited and crowded, and which should not be so used and crowded. The value of areas when they were to be taken seemed often to rise to a most alarming amount, and they had many instances of that even in Dublin.

Dr. CHARLES PORTER, medical officer of health to the County Borough of Stockport, read a paper on "The Supervision by Sanitary Authorities of Public Water Services in the Hands of Private Companies." He said the terrible power for evil of specifically polluted water as a vehicle of disease had been repeatedly demonstrated during the past half-century by the four cholera epidemics during that time, and the fearful visitation of Hamburg in 1892, as well as by the numerous outbreaks of enteric fever from Guildford and Terling in 1867 to the recent experiences of Worthing, the Tees Valley, Maidstone, King's Lynn and Camborne (Cornwall). It would, therefore, perhaps be scarcely credible to many who had not before had their attention directed to the fact that at the end of the nineteenth century, and in spite of their boasted advances in sanitary science, local authorities in England and Ireland, whose districts were served by private water companies, possessed no executive powers whatever for the protection of their water supply. They had no right of entry upon the gathering grounds or waterworks, no right to take samples for examination, and no right to satisfy themselves that the processes of purification adopted left no room for entry to the distributing mains of matters of a noxious

nature. Complaint to the central health authority when evil had resulted was oftentimes tedious and unsatisfactory in its results, and at best resembled the policy of locking the stable door when the horse was stolen. That defect in their sanitary legislation was the more remarkable inasmuch as the Public Health Acts conferred upon sanitary authorities and their officers adequate powers of entry and inspection as regards the premises and articles sold by vendors of bread, flesh, fish and other eatables; while, as regarded milk, the Infectious Diseases Prevention Act extended the right of inspection of dairies, cow-sheds, &c., possessed by the medical officer of health within his district to dairies, cow-sheds, &c., entirely outside his district where circumstances rendered desirable such inquiry. Much of the existing indifference and inattention to questions of purity of water supply and of proper watchful insistence that such supplies should be adequately guarded from pollution were due to the unfortunate fact that by the great majority of people all requirements of prudence were thought to have been met if in a sample of water taken from their taps a chemist failed to find evidence of pollution. Such a faith, however, ignored the fallibility of chemical methods as well as the fact that pollutions were frequently intermittent in their occurrence, and that polluted material was not necessarily diffused uniformly throughout the whole body of water which it entered. In other words, with an intermittent pollution a source of water supply that was innocuous now might be highly dangerous a few hours hence. In short, as the late Sir George Buchanan said, in his annual report for 1889, as medical officer of the Local Government Board, "unless the chemist is well acquainted with the origin and liabilities of the water he is examining he is not justified in speaking of a water as 'safe' or 'wholesome' if it contain any trace whatever of organic matter; hardly, indeed, if it contains none of such matter appreciable by his very delicate methods. The chemist can, in brief, tell us of impurity and hazard, but not of purity and safety. For information about these we must go, with the aid of what the chemist has been able to tell us, in search of the conditions surrounding watercourses and affecting water services." If pollutions of water were actually seen to occur, any form of examination was superfluous, and "as neither bacteriology nor chemistry can be depended upon to prove that a water is free from all dangerous pollutions, such examinations are, in many cases, quite useless." Bacteriology had, however, a most important application in regard to the filtration of water, as it afforded the only reliable method of gauging the efficient performance of that process. Under the Waterworks Clauses Act, 1847, the sum of £5 and a daily penalty of £1 for a continuing offence was forfeitable to the proprietors of a water undertaking by any person who bathed in, or caused any animal to enter, any stream, reservoir, aqueduct or other part of a waterworks, or who fouled the water thereof by washing in it clothes, wool or skins, or by allowing any water from a sink, drain, sewer or other foul source to enter therein. But too frequently these salutary provisions were not enforced by commercial companies, and it was therefore very necessary and important that, in addition to water companies, the sanitary authority of the district served should have power to recover in a summary manner much heavier penalties than those referred to. The powers required by sanitary authorities included the following: (1) To investigate the pedigree of their water supply—i.e., the cleanliness and purity of its sources; (2) to recover summarily deterrent penalties for causing or allowing pollutions; (3) to test and inquire as to the means and efficiency of the purification methods adopted—e.g., the action of each individual filter; and (4) to ascertain the state of the distributing mains under certain conditions—e.g., possibility of pollution through defective joints or pipes. In December, 1897, the Stockport Corporation resolved to petition the president of the Local Government Board to initiate legislation on the lines indicated above, and at the same time induced the influential Association of Municipal Corporations, as well as a number of other towns supplied by private water companies, to adopt and forward to Mr. Chaplin a similar resolution. Moreover, in November, 1897, Sir Richard Thorne Thorne, K.C.B., chief medical officer to the Local Government Board, publicly recorded his emphatic agreement "that the water companies should be held responsible for the quality of water they supplied." It was, therefore, not surprising that on June 23rd last Mr. Chaplin moved to make applicable to twenty-one Water Bills before the House certain clauses protecting consumers from shortcomings on the part of the water authorities: (1) By empowering an officer authorised by the local authority to enter, inquire and take samples on the premises of the water authority; (2) by allowing consumers, on a justice's order, and after reasonable notice to the water company, to take a similar course; and (3) by enacting heavy penalties for failure to fulfil existing obligations to provide a pure and wholesome supply of water. Mr. Chaplin also proposed: (4) To invest the water authorities with sufficient powers to protect themselves from pollution of the

sources from which they draw their supply. In asking the House to support him in the matter Mr. Chaplin truly said that it was a question directly affecting the public health, that there was nothing in the clauses to which reasonable objection could be taken, and that it had been impossible, owing to pressure of business, to introduce those clauses in a public Bill. The opposition offered to his proposals, *nominaly* on the ground that those alterations should be made by a public Bill applicable to the country at large, was, however, of such a nature that Mr. Chaplin had to withdraw them. Here the matter at present rested, except that Mr. Chaplin had since stated, in reply to Mr. Marks, M.P., that no decision had been arrived at as to the introduction next session of a public Bill embodying those proposals. It had recently been suggested—he believed by Dr. Thresh—that as water companies in the past stepped in and supplied a pressing public want, it was not altogether reasonable to maintain that their operations should now be subjected to supervision in the interests of public health. But even assuming that such undertakings, instead of being autocratic and highly remunerative monopolies, were purely philanthropic in origin and object, the frequent and repeated failure of their promoters to make a righteous choice between dividends and disease, with the resulting terrible epidemics of which they had recently heard so much, completely refuted such special pleading. "The need of this reform cannot be denied," were the words addressed by Mr. Chaplin to the House of Commons; and convinced that it was one of the most pressing sanitary questions of the day, he desired to enlist the sympathy and powerful influence of that institute towards its speedy and satisfactory solution, and ventured, with confidence, to invite the congress to strengthen the hands of the president of the Local Government Board in his enlightened desire to deal with it.

The above two papers were discussed together. Mr. JOHN BYRNE (Dublin) said nothing changed so much dissatisfaction or inconvenience as to have the roadways of the streets cut up by the tramways and gas companies. The people of Dublin had the experience of, say, the gas company tearing up the streets and turning them into muddy banks, inconveniencing the residents along the line of the excavation, and in a week afterwards, when the road was restored to its former state, they had the tramway coming in and excavating, and bringing the thoroughfare back to the same state in which the gas company had it. It involved much expenditure of the rates to put the roadways into the condition they ought to be, when first one company and again another were done with them. If there were no other reasons than that, he thought that there were strong reasons indeed for the public bodies having the charge of carrying out those undertakings. There were also other considerations. When the waterworks were first introduced the rate was 1s. 3d. in the £1, 1s. for water and 3d. for the fire brigade. That, consequent on the repayment of the loan, and the disappearance of the charge for interest and the extension of the water system, and the revenue derived from the use of the water supply by breweries and other big institutions, had been reduced to 6d. In a year or two it would be reduced to 4d., and again to 2d., and would eventually disappear. He thought that if the corporation had the control of the gas and the tramways they would be able in the same way to reduce the rates, and the revenue derived from the tramways would be applied to a reduction of the fares. Those two reasons were, he thought, very strong.

Alderman HIGHMARSH (Gateshead) said he was also in favour of the municipalisation of the several systems.

Mr. T. W. RUSSELL, M.P., thought a good deal might be said on both sides on the general question of the municipalisation of the interests mentioned. He agreed that it was very largely a matter for each locality. He held the view that there would be difficulties in the way of laying down a general principle. If they laid down a general principle, where were they to stop? They would, he thought, find localities where it would be of the highest importance for municipalities to have municipalisation of all these matters, but as regarded all districts, he thought that the public bodies should have the control and the administration of the water. On the general question he thought that the section should not arrive at a conclusion fixing a hard-and-fast rule. The municipalisation of water was a matter of the greatest importance in this country. Look at what happened at Maudstone, where hundreds of people died of an epidemic due to the defective water supply. Owing to that outbreak the president of the Local Government Board proposed to introduce clauses into twenty-one Bills before Parliament which would make the companies responsible for the condition of the water they supplied; but the companies were so powerful that in the House of Commons the Government proposals were defeated. He disregarded those private interests in Parliament, believing that the public interest should be supreme.

Alderman MEADE mentioned that Dr. Porter had handed him a resolution which he desired to propose. He thought the section were agreed as to the importance of the municipal control of the water supply, and he would at that stage submit to them Dr. Porter's resolution, which was as follows: "That this Congress of the Royal Institute of Public Health hereby records its warm appreciation of the enlightened efforts of the Right Hon. H. Chaplin, M.P., president of the Local Government Board, to protect the consumers of water

supplied by water companies, and venture to express the earnest hope that during the forthcoming session the Government will introduce a public Bill embodying the proposals submitted by Mr. Chaplin to the House of Commons on June 23rd last."

The resolution was unanimously adopted.

Mr. WORMSLKY, chairman of the Sanitary Committee of the Leeds Town Council, advocated the municipalisation of tramways and gas. The citizens should not, he said, allow the highways to be taken over and profit made out of them by a private company. He thought that all municipalities should take the tramways into their own hands, and in that way they would help the rates and have lower tram fares. An important consideration was that areas would be acquired cheaply outside for the erection of cottages for workmen, who could be brought to the city for their work at a cheap rate.

Mr. R. JONES, of the Dublin Town Council, said they were not so backward in Dublin as some of their English friends might suppose. They had the water supply in their hands, and if they had not the gas they had the electric light, which was a more valuable asset than the gas company, and now, owing to the provisions for electric traction, they had been able to exact terms from the tramway company for a year of the streets. They were getting a rent of £10,000 a year for way-leave, and they had also gained a good deal in taxes, because the taxation on the property of the tramway company had gone up. A main drainage scheme was also in progress.

After Mr. J. Howes, of St. Luke's Vestry; Mr. Taylor, of Barnsley; Mr. Whitney, of Liverpool; and Mr. Batley, of Leeds, had also spoken.

Alderman MEADE said that he took it that the congress agreed as to the advisability of the municipalisation of tramways and public lighting. They had heard that the Leeds Corporation had the gas supply in their hands, and were able to supply the gas at 2s. 2d. per 1,000 cubic feet, and made a profit of £250,000, which went to the rates. In Dublin they had to pay 3s. 5d. per 1,000 cubic feet for gas, and got nothing to relieve the rates. Figures like that he regarded as more important than any amount of discussion. In Belfast, where the gasworks were under the corporation, the price was 2s. 4d. per 1,000 cubic feet for the same quality of gas as they were getting in Dublin, and there was, in addition, a large revenue in relief of the rates. Mr. Jones had told them very fairly the situation in Dublin as regarded the tramways. But the Dublin Corporation embraced a large number of members, for whom he might speak, whose opinion was that the management of the tramways, public lighting and water supply ought to lie in the hands of the corporation, in the interests of all classes of inhabitants. He took it that the congress was in favour of the municipalisation of the tramways and public lighting, as well as the water supply.

HIDEOUS HOARDINGS.

Mr. R. P. CARTON, Q.C., read a paper on "The Prevention of Hideous Hoardings and Structures in the Streets." He said that the advertising stations were one of the most hideous and objectionable institutions of the time. It prevailed to a great extent in Dublin, and the advertising station, whether boarding or otherwise, was unsightly in itself. He thought that the corporation should be empowered to exercise supervision over advertising.

After some discussion, Alderman MEADE said he hoped that the corporation would have control over public bill posting, so that they might exercise the same supervision as was exercised over pictures in shop windows. In regard to newspaper placards in the streets, they had appealed to the chief commissioner of police to prosecute in some cases, but that gentleman replied that he had no power. The corporation were now taking steps to obtain such power through the Privy Council.

THE EXTENSION OF TOWNS.

Mr. RICHARD JONES, of the Dublin Town Council, read a paper entitled "The Extension of Towns in Connection with the Public Health." He said the subject which he had been requested to bring before the congress was suggested by the recent movement in that city to provide dwellings for the very poor. One of the most difficult problems presented to those having charge of the public health of great cities was the overcrowding of the poorest of the population within very limited areas, and under conditions which rendered it almost impossible to provide for proper sanitation. There was no city in the empire which had felt this difficulty more keenly than Dublin, and yet, in spite of a combination of circumstances well calculated to daunt even the most courageous, more had been done during the latter quarter of this century in Dublin (having regard to its resources) to ameliorate that great evil than in any other municipality of the kingdom. The natural tendency of the labouring population to drift into the towns during periods of agricultural depression was felt more or less in every centre of industry. There the conditions were chronic. There had been for several decades a steady influx into the city of unskilled labourers in search of employment, who, having come so far, had no means to go farther, and so settled down to face a precarious existence with hundreds of others who had preceded them in the same path. Dublin was a very old city, and was formerly a very gay one. Its area was within very circumscribed limits, and

its population was crowded together in a manner wholly unknown in any other city of the kingdom. All around its limits it was completely surrounded by a number of growing townships which had themselves unlimited areas for expansion, and at the same time, under present conditions, completely blocked any expansion of the city. The municipality during the past twenty years had cleared, at the public expense, congested areas, some of which they had in turn rented to an artisan dwelling company, who had provided at moderate rents suitable dwellings for their working classes—other sites they had built upon themselves—but the number of new dwellings fell far short of providing homes for the dispossessed, and the fact remained that whilst some quarters of the city had been improved and relieved the remaining portions were in a still worse condition than formerly. Their municipal council now found themselves in face of a nearly depleted exchequer, the limits of their borrowing power being almost reached; and being prevented from going outside their own limits to find sites for working men's dwellings, their efforts to further the advancement of sanitation were seriously hampered. Within the city the vast population was composed of the working classes, the poor and the destitute, whose taxable capacity had long been reached, and who were cramped within narrow limits which they dared not pass. Outside the city resided the wealthy merchants, the manufacturers and the public officials, who drew their wealth and their large salaries from the toiling masses of the municipality, who escaped a large portion of their responsibilities by living beyond its limits, and who by their very situation as dwellers in independent townships not only contributed to the poverty of the city, but actually offered effectual barriers to any great scheme for its improvement. It might seem a sweeping statement, but he was convinced that nearly all the dangers from which the public health of Dublin had suffered might be traced to the insanitary conditions under which a great portion of the people were obliged to live. He said obliged—for the fact was those people would gladly welcome the opportunity of removing to more healthy houses were such provided for them. The rents they at present paid were usually exorbitant, and it was not too much to say that to its owners the tenement property of Dublin was the most lucrative in the city. The extension of Dublin to its natural expansive area would at once place the local authority in a position to grapple with that great problem in an effectual manner. In cities where development was accompanied by expansive growth much moral evil was avoided, and every possibility was afforded for the advancement of the science of modern hygiene. Drainage could be undertaken and carried out more completely, and streets made wide and spacious to permit of the enjoyment of light and air. Open spaces could be provided, and playgrounds for the children, and sites upon which dwellings suitable to the requirements and the dignity of the working classes could be erected. The care and advancement of the public health was a noble work; it meant, especially for those who were unable to live apart from the scene of their daily work, the making of life more worth living for. It brought immediate relief to thousands who had not the power of themselves to alter the conditions which surrounded them, and gave added security to the lives of those who were better able to take care of themselves. To considerations of such paramount importance all artificial restrictions must give way. Men and women, to be strong and healthy, required pure air and the light of heaven. Cities to be clean and healthy must have room to grow.

Some discussion followed, in the course of which a delegate inquired what were the difficulties in the way of the extension of the Dublin city boundaries.

Alderman MEADE said they had been trying to extend the boundaries and take in the wealthy and prosperous townships, which were divided only by a canal from the city. It was a monetary difficulty that stood in the way.

Mr. CHATTERTON, consulting engineer to the Dublin Corporation, said the corporation had gone to great expense over the main drainage system, which they expected to have completed within two years' time. It was a dangerous thing to predict, but he had no hesitation in saying that when the drainage system was carried out, the salt water would come up as far as O'Connell Bridge, the Liffey in Dublin would be totally transformed. Rathmines and Pembroke had already carried out a system of drainage which was excellent. The difficulty would be to provide drainage for Drumcondra and Clontarf. The corporation in designing their system were fully alive to that, and they would be able to intercept the sewage in those districts, whether they were part of the borough or not.

Sir ROBERT SEXTON said that unless the corporation extended their boundaries he did not see how they would be able to carry out sanitary improvements properly or provide for the housing of the working classes.

Mr. JOHN BYRNE said that circumstances had hitherto prevented the townships from receiving this amalgamation scheme with favour, but he thought that under the new Local Government Act, which would bring into operation new constituencies and new sets of representatives for every one of those townships and for Dublin, things might lead to an accommodation of circumstances between the two bodies which would effect everything desired.

Alderman MEADE pointed out that the question had been

dealt with in England and Scotland in the way suggested in the paper. That system had been taken as a matter of course in the large cities throughout England and Scotland, and if there were small bodies outside those cities they were brought in on fair terms. In Dublin there had been no extension of the city during the past fifty years. The boundaries fifty years ago were the boundaries to-day. During those fifty years the townships had grown up and were built up to the city borders. If those townships were brought into the area of Dublin, one government for the whole district would be more economical, and would afford more time and more means for attending to the interests of public health in providing for the needs of a larger area. In inaugurating their great system of main drainage they were providing for such an area as could take the drainage of all the townships into it. There were two townships which had provided drainage for themselves. That was a system which was in force twenty-five years ago, while the corporation had adopted a system of precipitation, and would discharge nothing into the estuary of the river except clarified water. The whole of the river within the city up to Kingsbridge would be a clear stream. As a member of the corporation, he wished to state that it was their intention, at the earliest possible moment they considered it prudent, to go for the extension of the boundaries of the City of Dublin, not only in the interests of the city, but in the interests of the surrounding townships.

Mr. JOHN BYRNE read a paper entitled "Is Reform of the Work-House System in Ireland Desirable?" A long discussion followed, and the conference adjourned until the following Tuesday.

On Tuesday the meeting was opened by Prof. Carroll, of the Royal Albert Model Farm, Glasnevin, who read a paper on "The Milk Supply of Towns."

Mrs. TOLLERTON, secretary to the Philanthropic Reform Association and the Police-aided Children's Clothing Society, Dublin, read a paper on "Dublin Tenement Houses," in the course of which she said that statistics obtained by the Police-aided Children's Clothing Society showed that over 75 per cent. of tenement occupants lived in one room. Some time ago she was in a room in which the space was partitioned out as follows: The woman who rented it had a small bed at the end opposite to the fireplace. Along the wall to her right were two beds, with the heads close together, occupied by permanent lodgers—four people—viz., two of each sex. In one corner was a ragged mattress and correspondingly ragged heap of bed-clothes that served at night as the sleeping place of a man, his wife and three children, who were temporary lodgers. That corner was a Cave of Adullam, where those in distress and debt and in arrears of rent found a temporary refuge. The lodgers paid the room-keeper 4s. a week, and she cooked for them. The "irregulars" paid 6d. a night, always in advance. If the money was not forthcoming admittance was rigorously denied, and the ragged mattress was exchanged for a hall or landing. These social conditions were so common as to be accepted as a matter of course. A room and small closet would be regularly occupied by seven or eight persons of different sex and family; a front drawing-room would house three families, a small back kitchen two—with several individuals in each family. She would ask serious consideration for one remedy for this—namely, inducing the well-to-do artisan to live in the suburbs. Side by side with overcrowding was the indescribably dirty condition in which tenement houses were kept. The children had a form of sore eyes that was the direct result of dirt. The habits of the people were very discouraging to landlords. She was certain many of the evils she was familiar with could be prevented if well-to-do citizens fully recognised their duty to the shuns and did it. No doubt areas had been cleared and numbers of houses detenanted. But where did the people go that were turned out? Some went as lodgers into rooms already crowded, others to tenements as bad as those from which they had been evicted. New buildings should have separate entrances to each dwelling.

At 12 o'clock the conference closed, and the following papers, which were included in the programme, were taken as read: "The Existing Sanitary Law; its Possibilities," by Mr. R. J. Kelly, barrister-at-law; "A Few Remarks on Real Sanitation," by Mr. T. Laffan, chairman of the urban sanitary authority, Cashel; "The Necessity for Municipal Ambulances for Removing Accident Cases and Cases of Sudden Illness for the Streets of Dublin," by Mr. G. Jameson Johnston, M.A., M.B., F.R.C.S.I.; and "Public Health Acts (Ireland), 1878, from an Engineering Standpoint," by Mr. R. W. Walsh, township surveyor, Dalkey.

The Forthcoming Congress at Birmingham.—The Sanitary Institute have issued a programme of the arrangements of the annual autumn congress, which this year is to be held at Birmingham from the 27th September to the 1st October. A full list of the arrangements has already appeared in our columns, so it is unnecessary to give them again. We may mention, however, that a very useful map of the centre of Birmingham is presented with the programme, which gives a list of public buildings (including the congress buildings), hotels, clubs, restaurants, &c. This information should be especially useful to those persons who intend to be present at the congress and who are unacquainted with the ins and outs of the city.

Notes on the Design and Erection of Architectural Ironwork.

By HENRY A. CUTLER, A.M.I.C.E., City Engineer, Cork.*

During the last few decades considerable changes have taken place, not only in the design but in the details of construction of public buildings and business premises. The changes have no doubt been principally brought about by the enormous value of land in cities and towns, the increased demand for window space, and the necessity for so-called fire-proof construction. The great prices demanded for building sites make it incumbent upon architects to provide the largest amount of accommodation in the smallest possible space, which means increasing the height of buildings and diminishing the walls and piers to the smallest possible limits.

The demand for window space considerably diminishes the area of the external walls of buildings, and necessitates the use of other material than brick and stone to ensure stability. The demand is brought about partly by the close packing of buildings and their increased height, partly because the buildings principally referred to are used for business purposes only (in which case abundance of light is necessary), and partly by the requirements of sanitary science. The demand for fireproof construction makes it necessary to use non-inflammable material wherever possible, and in many cases calls forth considerable ingenuity of design to prevent the spread of fire from one part of the building to another.

The great development which has taken place in the manufacture of iron, and the consequent lowering of its cost, has made possible the many changes in construction necessitated by the changes in design, and has left the architect free and untrammelled by the want of a suitable material. Many of the most important buildings of to-day are virtually iron structures clothed with brick, stone or other building material, and not only require architectural skill in their design but the scientific knowledge of the engineer to construct the framework on which the design is hung. The materials principally used for the framework of buildings are cast iron, wrought iron and steel, the determination of which material to use in any particular case depending upon the skill of the designer, the cost, and other circumstances of the particular case under consideration. As a general rule it may be taken that cast iron is not the most suitable material where it would be subject to transverse stress or tension, but that it is the most suitable material in direct compression within certain limits. Wrought iron and steel may be used under any kind of stress, but where strength only is to be considered it is possible to use lighter sections, with steel on account of its greater strength. In using girders of small depth in proportion to the span the flexibility as well as the strength must be determined; and there may occur cases where very little advantage would be obtained by the use of steel, as a heavier section might have to be used than required for strength to prevent undue deflection. The ultimate strength of iron and steel varies considerably, but the figures in the following table may be taken in ordinary practice:—

	Tensile Strength. Per square inch.	Crushing Strength. Per square inch.	Clearing Strength.
Cast iron ...	7 tons	36 tons	8 tons
Wrought iron ...	22 "	16 "	20 "
Steel ...	32 "	30 "	21 "

The working stresses should in no case exceed one-fourth of the ultimate strength, and in the case of stanchions for warehouses or supporting machinery, or where shocks may be expected, a larger factor of safety should be used. The safe bearing stress to which materials may be subjected may be taken as follows:—

	Per square inch.
Cast iron ...	8 tons
Wrought iron ...	5 "
Steel ...	7½ "
Brickwork in mortar ...	½ cwt.
Brickwork in cement ...	¾ cwt.

The most general sections for pillars are the hollow circular column. The hollow square column, the "H" section and modifications of the same, the cruciform section, the solid circular section, and the solid square section, all of which can be manufactured in either cast iron, wrought iron or steel. In designing pillars the form of section is not always of moment, and it becomes a question which section will be the most economical. To save preliminary calculations in such cases, the author has calculated the strength of a hollow column 10 in. in diameter with metal 1 in. thick, and compared the same with the calculated strength of pillars of the sections previously mentioned, designing them with the same length, area of section and (except in the case of the solid round and square sections), the same thickness of metal, so that the weight of metal would be the same in each case. The results of the investigation are given in the following table of relative strengths, the calculations being made on the assumption that the pillars are of cast iron rounded at both ends. The arbitrary value of 100 was given

to the hollow column, to which the values for other sections are related according to their strength.

Section.	Relative Strength.	Section.	Relative Strength.
○	100	— —	25
□	85	●	23.3
⊥	51	■	23

If the pillars were of wrought iron or steel, the relative strengths would be in the same order as for cast iron, and would vary but little from the values given in the tables for cast iron. Although the hollow round and hollow square columns prove to give a far more economical distribution of metal than any other section, it must not be forgotten that it is impossible to properly calibrate the thickness of metal in castings of such sections, that they may be badly cored in their manufacture, giving more metal on one side than another, and that the unequal thickness considerably lessens the strength of the column.

The author is of opinion that a considerably larger factor of safety should be used with castings which it is impossible to measure and examine in every part than would be necessary with other sections. Pillars may fail by the crushing of the material of which they are made, which occurs with pillars that are short compared with their radius of gyration, by flexure, which occurs with long pillars, or by a combination of both; but no hard-and-fast line can be drawn between failure by crushing and failure by flexure. With short pillars the material which has the greatest unit-crushing strength will give the most economical results as regards weight, but in pillars failing by flexure the strength depends upon the modulus of elasticity of the material.

From the foregoing remarks it will be seen that the length of a pillar may have a great deal to do with the selection of the material of which it should be made, for which purpose the following table may be of assistance, as it gives the different material in order of strength for different proportions of pillars. As an instance of the use of the table for a pillar, the length of which divided by the radius of gyration is between the limits of 1 and 50, the greatest unit strength would be obtained from cast iron, steel coming second, and wrought iron third.

PILLARS WITH ENDS ROUNDED.

Length divided by radius of gyration.	Materials in order of Strength.		
1 to 50	Cast Iron	Steel	Wrought Iron
50 to 60	Steel	Cast Iron	Wrought Iron
60 to 300	Steel	Wrought Iron	Cast Iron

PILLARS WITH ENDS FIXED.

Length divided by radius of Gyration.	Materials in order of Strength.		
1 to 80	Cast Iron	Steel	Wrought Iron
80 to 100	Steel	Cast Iron	Wrought Iron
100 to 300	Steel	Wrought Iron	Cast Iron

When pillars carry girders mistakes are often made in designing the seats, and it cannot be too strongly urged that the loads transmitted to pillars should be carried as near the centre of gravity of the section as possible. The provision of girder seats far too large for the weight to be carried is a common error, and frequently is a source of danger, because the deflection of the girders carried cause all the weight to be thrown on the outside of the seat, and removes the centre of gravity of the load considerably away from the centre of the pillar, a condition for which it has never been calculated. In designing the seat for a girder it is only necessary to have sufficient bearing area to prevent the safe bearing stress of the material of which the girder or the seat is made being exceeded, calculating, of course, on the safe bearing stress for the weaker material.

In the erection of ironwork care should be taken that girders are properly secured to stanchions or other girders which they intersect, and in most cases it is better to make use of the ends of the girders for fastening rather than securing the flanges to their seats. It is also better practice to depend upon the clearing strength of bolts and rivets than to put them in direct tension and allow the load to be suspended from heads and nuts. In designing the ironwork for a building it is also a matter for consideration as to what extent the framing will be required to brace the structure besides supporting vertical loads, because where lateral security is required it will be necessary to properly anchor the bases of the pillars, and in some cases make use of diagonal bracing.

In fixing the sizes of bolts to be used in securing one pillar above another and securing girders to cast-iron pillars it is

* A paper read in the Engineering and Building Construction Section at the Dublin Congress of the Royal Institute of Public Health.

better to err on the side of safety, and it may be laid down as a rule that $1\frac{1}{2}$ -in. bolts are the smallest that should be used, except with small girders or in special cases. In bedding girders on iron seating a strip of lead may be used, but where a girder or pillar is supported upon a stone template the safe unit stress is small in comparison, and some material with considerably less resistance to crushing should be used between the surfaces. As the strength of a stanchion largely depends upon the way in which it is fixed, a doubt often exists in the mind of the designer as to what assumption shall be made in calculating its strength; that is to say, whether he shall consider both ends to be rounded, one end fixed and one rounded, or both ends fixed, the relative strength of pillars fixed in the ways described being one, two and three respectively. Even when one is warranted in assuming fixity of one end or both, careless workmanship will often upset all his calculations.

In calculating pillars with flat bases, but supporting other stanchions or girders subject to a variable load, the author assumes one end to be fixed and the other rounded, but stanchions carried on others he assumes to have both ends rounded. The only cases in which he would consider both ends to be fixed are where both ends of the pillar are flat, and where the load supported is constant and evenly distributed. For bedding a pillar the best plan, perhaps, is to make the vertical distances between the stone template and the load which the pillar is to support about $1\frac{1}{2}$ in. greater than the length of the pillar. Then wedge the pillar up to its position by driving iron wedges between the template and the base of the pillar, grouting the space with neat cement. If pillars are bedded in the way described it is unnecessary to machine-face the base, but holes about 2 in. in diameter should be left in the base plate as near to the centre of the pillar as possible, so that the grout which is poured in from the outside between a raised mound of clay and the base will rise in the grout holes and indicate when the space is properly filled. The top of a cast-iron pillar supporting another should be machined-faced.

Wherever ironwork is used in a building it should be covered with fire-resisting material, so as to protect the supporting framework of the structure as long as possible from the influences of heat. Many kinds of fireproof flooring are in the market, but the author would give preference to floors where the whole of the ironwork is properly protected from fire by some suitable covering.

CREMATION OF SEWAGE.

The following letter from the Archdeacon of Gloucester on the above subject appeared in Friday's issue of *The Times*:-

"The profane were wont to call the ex-Parliamentary the 'silly season'; not a very appropriate term, unless all wisdom be concentrated on politics and none on the social welfare of the country. Let me ask your help in promoting such welfare in one momentous direction—the disposal of sewage. There are few evils, in my opinion, more pressing or even scandalous than the pollution of rivers. Water is one of God's most precious gifts (poor East London will testify to this). To turn a fair river into a foul drain seems to me not only a hideous blunder but a hideous crime. Will you let me open a correspondence on the cremation of sewage, for our pest may thus be turned even to our advantage? I plead for the erection of huge furnaces at the outfalls of our drains. No doubt they would require lofty chimneys and chemical ingredients to neutralise the noxious gases; but this, surely, cannot be beyond the reach of science. In these furnaces the solid matter would be burnt and form artificial manure; the liquids, being properly filtered and deodorised, might then be allowed to flow away. Let us sum up our present position. Our beautiful West Riding rivers are only awaiting their time for being turned into foul channels of manufacturing centres. 'Sabrina fair' is rapidly becoming 'Sabrina foul,' to the great discomfort of the salmon. Limpid Thames is condemned to bear the ignoble burden of London sewage. Have we not heard of a huge sewage island being piled up on the borders of Essex? Have not the oyster sellers been half ruined by sewers disgorging themselves near the oysterbeds of Kent? Have we not heard of the 'Ealing Styx'—the Brent? Fifty-seven years ago my father had his kitchen garden surrounded by that pretty river at Ilanwell. I am now staying on the coast of South Hampshire. A nice little trout stream empties itself past the village into the sea. Up the stream trout are caught abundantly, below the houses large fish are caught, but ought not to be eaten, for a disgusting freight of sewage is carried to the sea, and Oceana has to dispose of accumulated poison as best he may. Shame to say, it is the same story for all our watering-places. Could the Chancellor of the Exchequer use a cool million better than to establish by grants (repayable, if you will) crematories for all our great towns and cities? Now, what are the palliatives on which we place our reliance? Miserable subterfuges indeed—sewage farms. At first we heard much of the enrichment, now we hear of the poisoning, of the soil. At best it is the spread of noxious exhalations over fair fields instead of fair rivers. I do not envy the olfactory senses of the man who walks anywhere near the sewage farm. The huge sewage marsh at Salfley, near Birmingham,

had to be thickly covered by masses of sand and gravel, I suppose to be in their turn as much poisoned as the stratum which lies below them. No doubt we must come to cremation sooner or later; but why not sooner than later? I throw out this suggestion, to be taken up, I trust, by practical and scientific men. I am sure he will be a public benefactor who can turn a curse into a blessing."

THE HOUSING OF THE WORKING CLASSES.

AN EXTENSIVE SCHEME.

The largest scheme for the provision of working-class dwellings as yet undertaken by the London County Council, known as the Boundary-street, Whitechapel, scheme, is now nearing completion. There will be in all twenty-three separate blocks of buildings on the area, the first of which was commenced in 1894. The number of persons displaced from the area was 5,719. The council was required by the scheme to provide accommodation for not fewer than 4,700 persons, of which number 144 were to be accommodated on the Goldsmith-row site, acquired for that purpose. On the Boundary-street area, however, dwelling accommodation has been planned for 5,380 persons, which, with the 144 rehoused on the other site, makes a total of 5,524 persons rehoused, or only 195 fewer than the number displaced and 824 more than the scheme requires. In addition to this, eighteen shops and seventy-seven workshops have been provided. The 5,524 persons will be rehoused in 1,069 tenements, making an average of 5.168 persons per tenement. There are 601 tenements entirely self-contained. In the first half of the area the living-rooms average 144 square feet and the bed-rooms 96 square feet, while in the latter buildings these sizes were increased to 160 and 110 square feet respectively. Every habitable room on the area is provided with a 45° angle of light horizontally and vertically, and the buildings are so arranged that nearly every room commands an open outlook. The entrance avenue and the circus are 60 ft. wide and the principal streets 50 ft. There are on the area three public gardens, well laid out, of an aggregate area of nearly three-quarters of an acre. There is clothes-washing accommodation in two blocks only, it being provided in a well-equipped central laundry, behind which is a small annexe containing twelve hot and cold slipper baths and a cold shower bath, and over the laundry are two club-rooms for the use of the tenants. A bakery and an estate workshop are now in course of construction. The buildings as a whole have been designed within the financial requirements of the Treasury, the interest on the capital being calculated at 3 per cent., and the sinking fund for land and buildings for terms varying from fifty-two to sixty years. The rents charged are somewhat higher than those charged by the Peabody and Guinness trustees.

A NEW BATH FOR LIVERPOOL.

The mayor of Liverpool, on the 26th ult., performed the opening ceremony in connection with a new open-air bath which the corporation have erected in a thoroughfare known as Gore-street. The bath, situated immediately behind St. Matthew's church, Hill-street, occupies the site of about fifty dwelling-houses which were demolished some time ago as insanitary. Together with the gymnasium it covers an area of about 1,100 square yards. The gymnasium, which will be provided with the usual youths' gymnastic apparatus, is 44 ft. long, with an average width of 40 ft. Adjoining is a small bath, 6 ft. by 5 ft., supplied with hot and cold water, in which the lads may wash before entering the bath or using the gymnasium. Around the bath, which is only 3 ft. 6 in. deep at the greatest depth, are situated covered dressing-sheds. The water in the bath is fresh water from the mains, and there is a drinking fountain for the use of the children. All the buildings are structures of red brick with terra-cotta dressings. Mr. W. R. Court, the engineer and superintendent of the baths, designed the buildings. Messrs. L. Marr & Son, Liverpool, were the contractors.

Classes for Engineers, Surveyors, &c.—We have received from King's College, London, and the City of London College syllabuses of their classes for engineering, architecture, building construction, &c., for the 1898-99 session. Full particulars of these and other classes can be obtained upon application at the respective colleges.

Pneumatic Street-cleaning Machines.—Pneumatic street-cleaning machines have now been in use in Indianapolis for several years, says *The Engineering Record*, and have recently done much work in Columbus. It has been found that one machine, with driver and operator and one or two two-horse waggons to haul away the sweepings, can clean 6 miles of 40-ft. paved street in ten hours. Both the mayor and the Board of Public Works of Indianapolis have commended the character of the work in their annual reports, and one particular advantage of this system of cleaning which experience has demonstrated is its efficiency in cold weather, when sprinkling is impracticable.

Progress in Sewage Purification.

By W. KAYE PARRY, M.A., A.M.I.C.E.*

From time to time the world is startled by the announcement that some wonderful discovery has been made which is calculated to revolutionise existing methods of manufacture, to open up new industries, or to afford facilities hitherto unobtainable for achieving some desirable result. It often happens, after the first burst of applause has died away, some critic comes forward to question either the value or the originality of the alleged discovery. While we should be careful not to disparage the labours of those who have achieved success in a field of research in which others have toiled without any apparent result, we are quite entitled to satisfy ourselves that if praise be accorded it is well merited, and that the alleged discovery is really a step in advance which will promote the cause of science or the well-being of the community. We have heard a great deal within the last year or two about the advances which have been made in sewage purification, and it is, therefore, well worth considering in what these advances really consist, and by whose labours and researches they have been brought about.

PRINCIPLE OF THE DORTMUND TANKS.

At the congress of the Sanitary Institute at Leeds, in 1867, one of the papers read on the subject of sewage purification included a description of the circular deep tanks in use in Dortmund, in Germany, and the author of the paper distributed lithographed copies of the drawing of these tanks to the audience, apparently under the impression that they were a novelty. All engineers who are conversant with the literature of sewage purification were aware that these tanks had been fully described in Mr. Santo Crimp's admirable work on sewage disposal works, published in 1890, and that they were no longer a novelty; but comparatively few persons are aware that even before these tanks had been either designed or constructed the same principle had been applied to the clarification of sewage.

In May, 1895, Mr. W. H. Hartland, of Glasgow, took out a patent for the purification of water and sewage, which embraces among other features a type of tank which embodies the same principle as the Dortmund tank. In the words of the patentee: "The process consists mainly of settlement, but under somewhat peculiar conditions, or what I will term equilibrium subsidence under which the full effect of the laws of gravity may be obtained in freeing a liquid from suspended impurity."

The form of tank which Mr. Hartland patented differs from that used at Dortmund. He used a rectangular tank, sunk to a considerable depth below the level of the sewer invert. This tank was provided with two vertical shafts or pipes, fixed at the opposite ends and carried up to the level of the sewer invert. The tank was worked continuously, and, owing to the depth to which it was sunk, the liquid in it was under pressure resulting from the head of water in the vertical pipes.

The sewage flowed down one of the vertical pipes into the tank, and after passing along its entire length it again flowed up to the surface by the second pipe, passing out of the tank at the same level as it entered it, while the sludge was periodically drawn off from the bottom. But in both the Hartland and the Dortmund tanks the principle is identical—that is to say, the liquid containing the suspended matter is first made to flow in a downward direction to a considerable depth, and before it can escape it is compelled to rise again to the original level, leaving behind it the finely-divided particles of suspended matter which will not rise with the liquid.

In the year 1887 the author of this paper made the acquaintance of Mr. Hartland, and by arrangement with the latter a trial apparatus, having model tanks constructed in accordance with Hartland's patents, was erected in Kingstown, co. Dublin, and a series of practical tests was undertaken by the author. These experiments were described in a paper read before the Institution of Civil Engineers of Ireland, on December 5, 1888, and the paper will be found in the "Transactions" of the Institution.

When the author read the description of the Dortmund tanks in Mr. Santo Crimp's work he at once recognised their value from his own experience of the results arrived at by the Hartland tanks, and as the form of tank used at Dortmund was somewhat more simple than that adopted by Hartland, while the principle of both was identical. The author constructed Dortmund tanks for the sewage purification works at Dundrum, which were designed in 1891, and described at the congress of the Royal Institute of Public Health held in Dublin, in 1892. The paper will be found in *The Journal of State Medicine*, vol. 1, October, 1892. When, therefore, in 1897 this principle was put forward as a new departure in sewage treatment it was, as a matter of fact, more than twelve years old.

THE WORK OF MR. BAILEY DENTON.

It would be wise for all those who take up the question of sewage purification to make themselves conversant with its history. If they were to do so they would find that there were clever chemists and able engineers engaged upon this problem when many of us were still in our cradles, and that,

although they did not recognise the labours of aerobic organisms or give us a true explanation of the action which takes place in a filter, they had a very practical acquaintance, not only with the difficulties of the sewage question, but with the lines upon which it would be possible to deal with it successfully. Take, for example, the valuable series of reports published by the late Dr. Angus Smith, how many of our more modern chemists take the trouble to peruse them or to study his experiments on aeration?

But in the present short paper the writer desires to allude more particularly to the labours and the writings of the late Mr. Bailey Denton, whose first work on land drainage was published in the year 1854, and who from that time until his death contributed a series of most valuable additions to the literature of sewage treatment. Nor were his exertions confined to literary productions, for, as all engineers know, he designed and carried out a great number of extensive sewage disposal works, to the principles underlying which the writer desires particularly to draw attention. In 1880 a brochure appeared from the pen of Mr. Bailey Denton, entitled "Ten Years' Experience in Works of Intermittent Downward Filtration." This little book is worthy of more attention than it has received at the hands of some recent writers.

At present we are expected to accept the so-called bacterial filters as the real solution of the sewage problem. We cannot take up a professional journal without hearing something about them, and about those who are trumpeting forth their virtues and who claim credit for having originated them. Time alone can show whether these filters really constitute the best and most economical means of purifying sewage. Into this controversy the writer does not at present intend to enter, but it is worth while to stop and ask whether these bacterial filters are really new, and in what respect do they differ essentially from the land filters the use of which Mr. Bailey Denton advocated?

The latter selected land of an open, porous character, he prepared the surface carefully and divided it up into a number of plots, each plot was surrounded by a bank, and was as level as a croquet ground or a lawn tennis court. These plots were all carefully and thoroughly underdrained to a depth of 6 ft. by a series of herring-bone drains, connected with a central drain by which the filtrate was conveyed away. The sewage was turned on to each plot alternately, and it was allowed to filter through the porous land until it reached the under drains, each plot was allowed an interval of rest after it had been working for a certain number of hours. According to Mr. Bailey Denton's own words, the process was one of filtration in a downward direction carried on intermittently. It is most important to remember that he lays the greatest stress on the absolute necessity for the intervals of rest. His words are as follows: "In speaking of intermittent filtration . . . I refer to the concentration of sewage, at regular intervals, on a few acres of land as will absorb and cleanse it without preventing the production of vegetation."

In the process just described, the land, after being levelled, was ploughed, so as to make a series of ridges and furrows; the sewage flowed along the furrows and the crops were planted in the ridges. All these works were the outcome of the researches of Dr. Frankland, who had reported that "an acre of suitably-constituted soil, well and deeply underdrained, with its surface levelled and divided into four equal plots, each of which in succession would receive the sewage of six hours, would cleanse the sewage of 3,300 persons." These words were written in 1870, and Mr. Bailey Denton promptly put these theories to the test, and in 1880 he was able to give the world his experience and to show that substantially Dr. Frankland was absolutely correct, for although, as a matter of precaution, he very wisely kept on the safe side by preparing land enough to enable him to allow an acre of land to every 1,100 persons, instead of 3,300, yet he states distinctly "although he had acted thus cautiously in designing the first work of the kind, there was no intention to discredit the conclusions come to by the Rivers Pollution Commissioners as to the cleansing capability of suitably-constituted soil," and the evidence submitted in his book fully bears out Dr. Frankland's views. Thus, in 1870, although bacteriology as applied to sewage treatment was an unborn science, and no one had ever heard of the benevolent bacillus, yet sewage was successfully purified on exactly the same lines as those the merits of which are now so loudly proclaimed.

In 1887 the author, following Mr. Bailey Denton, laid out 3 acres of land on Dr. Frankland's principles for the purification of the sewage of the Rathdown Union Workhouse, at Loughlinstown, co. Dublin. These plans were approved of by the chief engineering inspector of the Local Government Board for Ireland, Mr. Charles P. Cotton, who is now presiding over this section. These works were described by the writer at a meeting of the Institution of Civil Engineers of Ireland, in April, 1892. The land was divided into plots,

* A paper read at the recent Dublin congress of the Royal Institute of Public Health.

levelled and underdrained, as recommended by Dr. Frankland, and the sewage of the workhouse has been filtered through these land filters ever since.

These filters have been in use for the last ten years, so that the writer can now adopt Mr. Bailey Denton's language, and write of his ten years' experience of intermittent downward filtration, and from a recent visit he is pleased to be able to state that they are still giving satisfaction and producing an effluent which can safely be discharged into the river. No doubt modern artificial filters are capable of dealing with a larger volume of sewage than the land filters, but on the other hand, they will not grow crops, whereas Mr. Bailey Denton aimed at "cleansing the sewage without preventing the production of vegetation."

THE QUESTION OF COST.

As regards the relative cost, Mr. Dibdin tells us that the cost of making a burnt-clay filter at Sutton, with an area of one-tenth of an acre, was "less than £100." So that the cost of preparing an acre of land for the purpose would in this case have been about £1,000, exclusive of the purchase of the land. But Mr. Santo Crimp informs us in his paper on the main drainage of London that the bacterial filter, about an acre in extent, constructed at Barking, cost about £2,000, the breeze and cinders being acquired on exceptionally favourable forms.

Mr. de Courcy Meade tells us that he estimates that the cost of constructing bacterial filters for Manchester would be at the rate of £5,500 per acre, exclusive of the purchase of the land. Mr. Bailey Denton states that the total cost of preparing 40 acres of land at Merthyr Tydfil for intermittent downward filtration, including under drains, surface formation, construction of tanks and conduits, distributing chambers, roads, fencing, engineer's fees and clerk of works, was £3,300, which is equal to £82 10s. per acre.

Now, according to Dr. Frankland, an acre of suitable land thus prepared would take the sewage of 3,300 persons, and this may be put down at 132,000 gallons a day, whereas, according to Mr. Dibdin, the artificial filter of 1 acre would deal successfully with 1,000,000 gallons per day, but Mr. de Courcy Meade only allowed 600,000 gallons to the acre. That is to say, following Mr. Dibdin's figures, an artificial filter of 1 acre is more effective than a land filter in the ratio of 1 to 7.57. If therefore we multiply £82 10s. by 7.57, we find that the cost of preparing land enough to deal with 1,000,000 gallons a day would be £624 10s. 6d., against £1,000 for an acre of artificial filter according to Mr. Dibdin's figures for Sutton, or £2,000 according to Mr. Santo Crimp's figures for Barking, or £9,166 according to Mr. de Courcy Meade's estimate for Manchester. These figures are instructive, and throw a side light on the progress of sewage purification since 1870.

But if sewage purification by filtration be not a novelty, the writer ventures to state that successful sewage purification without filtration either through land or artificial filters is absolutely a new departure, and those who have any doubt as to the practicability of these methods are invited to visit the criminal lunatic asylum at Dundrum, co. Dublin, or the metropolitan police barracks, Chapelizod, co. Dublin.

TELEPHONE WIRES.

KENSINGTON VESTRY REGULATIONS.

In his report on the work carried out by his department during the year ended March last Mr. William Weaver, surveyor to the Vestry of St. Mary Abbots, Kensington, refers to an application of the National Telephone Company for permission to lay underground wires in a large number of streets in the parish. The application was referred to Mr. Weaver, and he subsequently reported that he was of opinion that the laying of telephone mains in the streets of the metropolis should be dealt with by Parliament, in order that the rights and duties of the company and of the local authorities respectively should be settled by statute. On the other hand (continued Mr. Weaver), if the vestry were inclined to give the assent applied for, it should only be accorded under a formal agreement embodying certain conditions. The vestry, after considerable debate and after taking legal advice, granted the application subject to an agreement being entered into containing the following provisions:—

(a) That one month's notice be given to the vestry by the company prior to the commencement of work in any street, and that such notice be accompanied by a plan showing the position in the roadway or footpath of the proposed pipe and the position of all inspection or other boxes.

(b) That detail drawings of all boxes be submitted for the approval of the vestry prior to their insertion in the public way.

(c) That three days' notice of the actual commencement of work in any street in accordance with the plans to be approved as aforesaid be given to the vestry's surveyor.

(d) That the pipes be laid in such positions and at such depths as the vestry's surveyor may direct, and that the public way be reinstated to his satisfaction, the surfaces being made good by the vestry at the cost of the company, the charges for such work being at the same rates as are levied upon the gas and water companies.

(e) That the vestry be under no liability for damage, other than wilful damage, to the property of the company arising from the execution by the vestry or their contractors of any work in the roads or footpaths, and the company to indemnify the vestry against any claims which may be made in consequence of the execution of the company's works or the abandonment of their trenches.

(f) That the company do alter the position of any pipe or box, free of cost, at the request of the vestry.

(g) That the company do pay to the vestry all costs and expenses entailed by the examination of the plans of the company by the vestry's surveyor, or by the supervision of their work and of the restoration and repair of the highways.

(h) That the company do pay to the vestry a rental of 1s. per annum in respect of each 100 lineal yards of pipe laid, such rental to be irrespective of any rating or assessment to the parochial rates.

(i) That the company do pay the vestry's solicitor's charges for the preparation of an agreement embodying the foregoing conditions.

SANITARY WORK IN MANCHESTER.

A YEAR'S RECORD.

The report of the Sanitary Committee of the Manchester Corporation for the year states that the large number of 42,806 complaints of nuisances have been dealt with, and the twenty-eight district and four smoke nuisance inspectors have made 73,539 inspections of various kinds, and have applied smoke and water tests with the view of discovering any defects which might exist in the drainage at 2,266 houses. The notices which have been served for the abatement of nuisances of various kinds number 12,888, and 427 magistrates' summonses have been issued under the direction of the committee for non-observance of such notices. There are 1,396 lodging-houses registered under the by-laws made under sec. 90 of the Public Health Act, and in the course of the year 1,864 day and 413 night visits were made to these houses, with the result that fifty-six persons were reported to the committee for infringements. Great efforts have been made to mitigate the nuisance arising from the emission of black smoke from the chimneys of works, &c., and special attention has been given to the works in the newly-incorporated districts, with the result that a very great diminution of the nuisance has been effected. The new underground lavatories have been opened—one in South-street and the other in Great Bridgewater-street—which will supply a much-felt need in those neighbourhoods. Two House Drainage Department have re-joined no fewer than 5,905 dwelling-houses and 274 business premises, public buildings, &c., during the year. The cost of this work amounted to £29,359.

STOCKPORT WATER SUPPLY.

PROPOSED MUNICIPALISATION.

At a special meeting of the Stockport Town Council, Mr. Alderman Lees, the chairman of the Finance Committee, formally moved a resolution suggesting the desirability of acquiring the undertaking of the Stockport District Waterworks Company. The subject (continued Alderman Lees) had been before the corporation on various occasions during the last forty years, the financial question having up to now debarred them from acquiring the works. He had no hesitation, having given the matter great consideration for several years, in asking the council to take it up earnestly with a view to purchase. The object of giving municipal corporations more control was to promote the health, good government and well-being of the people, and it could not be denied that water was one of the first necessities of life. From a sanitary point of view it was important that a corporation should have control of the water supply, and Government were now most favourable to the transfer of these water undertakings to the municipal authority. Other members spoke in support of the motion, the vice-chairman of the committee remarking that with the example of Maidstone before them—the epidemic there being attributed to the quality of the water—they had to remember that their first duty was to preserve as far as possible the health of the people. The resolution was passed unanimously, and a committee were subsequently appointed to open negotiations with the company.

Illinois Roads.—If, as Bushnell the philosopher says, roads are indicative of a people, what is indicated by the roads of Illinois? The Arkansas traveller's roof is suggested, says *Good Roads*. In fair weather it needed no repairs; in foul weather it could get none.

A Lioness in a Sewer.—When a young African lioness, just arrived from abroad, was being taken to the Union Fair at Birmingham it suddenly escaped from its van. Finally it ran into a main sewer (says *The Rambler*), but as it could not be found the panic in the neighbourhood was extraordinary. The people looked themselves in their houses, and men went about with pitchforks, revolvers and guns till the animal was traced to its lair.

Comparative Reports of General Practice.

XXVIII.—TRAMWAY TRACTION : BLACKPOOL REPORT.—II.

LEIPZIG.

The deputation next visited the tramway system of the Grossa Leipziger Strassenbahn Gesellschaft, which was opened at the end of 1896. It is throughout on the overhead span-wire system, the track being of standard gauge and double, 74 miles in length. The maximum gradient is 3 per cent., and the sharpest curve 50 ft. radius. One hundred and eighty-five cars are in use of the single-deck type, each carrying thirty passengers. The only batteries in use are at the central station. The usual pressure is 500 volts, and there are installed four dynamos of a total capacity of 1,450 kilowatts.

The system is a remarkably good one, and in many respects is similar to that in Hamburg; but in the construction of the track, or rather of the curves, there is one feature which is worthy of imitation. The curve at the corner of a street, instead of being at one uniform radius, really consists of two short curves, with a straight portion of line connecting them. This straight portion approaches within 2 ft. of the corner, the obvious advantage for tramway purposes being that one bogie is always on the straight, and therefore the tendency to leave the line is very slight.

HANOVER.

Hanover being one of the places mentioned by the Board of Trade, the deputation were especially interested in the system in operation there; the more so that they had been advised from other sources that workers were working very satisfactorily in Hanover.

The tramway system is worked by the Hannoverische Strassenbahn Gesellschaft. There are in all 147 miles of tramroad, principally double and of standard gauge. The speed inside the town is about 7½ miles per hour and outside about 15 miles. There are no gradients worth speaking of. A little over a mile on the outskirts of the town is worked by the overhead system only, there being nine cars used in this service, each carrying thirty-two passengers and weighing 5½ tons. There are, in addition, 216 cars fitted for the overhead and accumulator system; sixteen of these carry thirty-two passengers, and weigh 8½ tons; 100 carry thirty-six, and weigh 10 tons; the remainder carry thirty-six, and weigh 11½ tons, it having been found advisable to strengthen the trucks on account of the extra weight. Approximately 63 miles are overhead line and 84 miles are worked by accumulators. About 10 miles of this latter route are worked by cars which do not run along the portion of track fed by the overhead line, but are charged at two stations *en route*.

The accumulators are placed beneath the seats, and each car is fitted with 208 cells of the Hagen type, having three plates in each cell. The weight of these cells is approximately 2 tons, and the cost per car £200. On the question of the life of these cells no very definite information could be obtained. The deputation were informed that a good plate might last two years, a bad plate would probably go in a month; but the average life ought to be taken as anything between one and two years. Although this type of battery has been in use for a period of three years, the company could not give the cost of its upkeep. There have been three or four accidents due to the short circuiting of the batteries, but no personal injuries resulted therefrom. One piece of information, however, regarding the efficiency of the cells was obtainable—viz., the energy taken from the dynamos to drive the different classes of cars 1 mile, and they are as follows: Without accumulators 68 units, with accumulators 137 units with light cars and 150 units with heavy cars.

On the car route worked solely by accumulators there are placed two charging stations, at one of which a twenty-five minutes' charge is given, at the other a six to eight minutes' charge. The total length of the journey is a little short of 10 miles, and occupies about forty-five minutes, while the period of charging, as will be seen, occupies from thirty-one to thirty-three minutes. This of necessity increases the number of cars essential to maintain the service, as at each station there are cars always charging. The overhead system is chiefly on the span-wire principle, but there are in places side brackets and centre posts. These posts are of lattice girder construction, and did not appear to the deputation as ornamental. The gauge of the trolley wire is 8 millimetres. The overhead line and car equipments were originally constructed by Siemens & Halske some six years since, but this class of work is now almost entirely done by the tramway company themselves. There have been several accidents due to the breakage of the wire, resulting in the death of five or six horses, but there has been no loss of human life. The trolley is the usual under-running bar of Siemens & Halske, very similar to that in use on the Isle of Man tramways.

COLOGNE.

From Hanover the deputation journeyed to Paris, breaking the journey to Cologne. They were struck by the narrowness of the streets in which double lines of tramways were laid, and by the steep gradients up which the cars run apparently with great ease. The wires invariably are supported by span wires attached to the houses, as also are the

arc lamps for lighting the streets. Time limits and the lateness of the hour did not permit of further investigation, the deputation continuing their journey by the night train to Paris.

PARIS.

The first tramway system visited was that belonging to the Compagnie de Tramway de Paris du Département de la Seine. It was one of the very latest construction, having, in fact, been only opened for service on the Saturday preceding the deputation's visit.

There are two lines of tramway, one of which, running from Assevillers to Place de la République, has approximately a mile of overhead conductor and 3½ miles of track worked by accumulators. The other line runs from Pantin to Place de la République, and has approximately a mile of overhead line and about 3 miles worked by accumulators. About 500 yards of the track is single, the rest double. The whole is of the standard gauge. The speed inside the town is about 8½ miles per hour, and about 16 miles outside. The maximum gradient is 3¼ per cent., and is only of short length. There are thirty trams of the double-deck type, carrying fifty-five passengers, and weighing complete 14 tons. This is the first tramway company as yet met on the Continent having double-decked cars. The accumulators are placed in an iron containing case along underneath the cars between the bogies. The cells are made by the Société Anonyme pour le Travail Electrique des Metaux, and each car has 224 cells, each containing seven plates. The weight of the cells, exclusive of containing case, is 4 tons, and the cost £275. They are partly charged from the overhead trolley when running, and completely re-charged at night. The overhead line is on the span-wire system, the gauge of the conductors 5 millimetres, the trolley of the Thomson-Houston type, and the working pressure 500 volts.

The second system is one also belonging to the Compagnie de Tramway de Paris du Département de la Seine, and runs from the Madeleine to the Pont de Neuilly, a distance of 3¼ miles. It is entirely on the accumulator system, and the track is double throughout. The heaviest gradient is about ¼ per cent., and the length about 120 yards. The speed in the centre of the town is about 8 miles and outside about 11 miles. It was opened in 1892, and was then equipped with Laurent-Cely cells. At the end of last year Hugen cells were installed. There are thirty-eight cars in use of the double-deck type, carrying fifty-two passengers each. The weight of car, motors and passengers is 14 tons, of accumulators 3½ tons. There are 200 cells, each having five plates, and are fixed under the seats. The cells are charged at a feeding point (Puteaux), at which place a fifteen minutes' charge is given. The cost of the batteries per car is given as about £300, and a double journey is run with one charge; and the cost of repairs to the batteries at about 32d. per car mile.

BRUSSELS.

The next stopping-place of the deputation was Brussels. The tramway system in this city is worked by the Compagnie des Tramways Bruxellois. The electrical network comprises the following lines—the line round the upper Boulevards, which is 3 miles long, and a double track, was opened on 1st May, 1894. The line from Place Stephanie to Uccle, 2½ miles, double track, was opened at the same time. The line from Gare du Midi to Uccle, 2½ miles long, double track, was opened on the 29th October, 1896. All these lines are on the overhead trolley system. The line from l'Impasse du Parc to Bois de la Cambre through the street called la Loi and the Boulevard Militaire was opened in May, 1897. This line is about 4 miles long, double track, part of it (1½ miles) is fitted with an underground conduit and the remainder with overhead wires. The line from Schaarbeek to Bois de la Cambre has a total length of 5 miles, double track, and is equipped throughout on the conduit system, being opened in September, 1897. The whole of the electrical network now in use in Brussels is about 17½ miles of double track.

The electricity is taken from the company's own station in Rue Bregiez. The generating plant originally installed consisted of three Babcock & Wilcox boilers, five tandem compound engines by McIntosh & Seymour, each of 180 horse-power, working at a pressure of 130 lb., and five belt-driven dynamos of Brown's "Orlikon" type, each of 100 kilowatts capacity. In 1897 two more boilers of similar make and size and two tandem compound steam engines (Corliss-Bonjour) of 750 horse-power, running at 150 revolutions per minute were installed. These machines are coupled direct to two special 400 kilowatts dynamos of the Thomson-Houston type. There are also two steam engines of the same type as last of 100 horse-power, coupled direct to two Thomson-Houston dynamos of 225 kilowatts each. The later engines are of the condensing type, condensing water being brought from La Senne by an underground aqueduct 330 yards long at a mean depth of about 22 ft. below the ground. The switchboard is of the usual panel type, the feed to the conduit being entirely separate from that to the overhead lines.

The feeding cables are of the lead-covered type, the overhead lines Thomson-Houston pattern, partly bracket posts and partly span-wire system. This overhead line is divided into sections of about 550 yards, each section being joined to the feeding cables. The lines of the underground system of traction are provided with conduits of the Berlin type, laid down by the German Thomson-Houston Company. The cost of the conduit per mile of single track complete was stated to be £12,800 (200,000 frs. per kilometre), as against £3,200 the cost of the overhead line, including permanent way. The conduit is placed under one of the rails; the groove for the plough is 1 1/2 in. normally, and is formed by the space between two Haarmann rails of about 5 1/2 lb. per yard. The depth of the conduit from the ground level is 25 in. The skeleton of the conduit is made up of frames 4 ft. apart, the intervening space being filled up by concrete or brickwork. Sumps and syphon outlets to the sewers are placed about every 45 yards. The conduit contains two insulated conductors of I-shaped iron weighing 19 lb. per yard. These conducting irons are supported at about every 5 yards by insulators, and the electrical circuit is completed at the junctions of the irons by copper bonds. The cost of working the conduit is said to be about 4d. per car mile more than the overhead. This, of course, does not take into account the additional cost of the installation.

The are 100 cars fitted for electrical working, weighing from 6 1/2 to 7 tons each and carrying twenty-eight to thirty passengers. The equipment is of the usual Thomson-Houston type. The average speed, including stoppages, is 7 1/2 miles per hour. The gradients are extremely heavy, being in some instances as much as 1 in 16 and for a length of 1,100 yards. The cars are fitted with Westinghouse air brakes.

OSTEND.

The deputation next visited Ostend. Here experiments are being made in accumulator traction by la Societe Anonyme de Railways Economiques de Liège-Tersing et Extensions. The length of track is 3 1/2 miles, double, of metre gauge, and the general car equipment other than batteries was by the Westinghouse Electrical Company. At present only five single-deck cars are fitted. The cars carry forty passengers and weigh 10 1/2 tons. They are equipped with 108 new type Julien cells, 3 1/2 tons weight, placed under the seats. Each car runs five hours with one charge. They are partially re-charged at the end of every one or two journeys, and are completely re-charged at night, from two to three hours being so occupied. They were installed last July, and worked for four months. No electrical tramcars are run in the winter in Ostend. The cost of these cells was about £250 per car, and the life of the cells is given by the makers, as from two to three years. The cost of the repairs of the cells per car mile was given at about 8d. The deputation were also much interested in viewing the remains of three other different types of accumulators which have been experimented with on this line within the last year. The condition of these cells was extremely bad.

GENERAL.

Before advancing to the conclusions, the deputation would like to record the great impression made upon their minds by the conditions under which electric tramways are worked on the Continent. Instead of being, as in England, looked upon with suspicion, if not disfavour, they are allowed great latitude, and their progress is fostered by the authorities, so that the public appear to have found electric tramways essential to their welfare by reason of the ease and expedition transit from place to place, without discomfort or noise. Stopping places are declared and cars stop at these places only, resulting in a punctual and prompt service. The outcome of these conditions, then, is that tramways serve the cities on the Continent just as railways serve the districts in England; or, in other words, they are street railways rather than tramways.

DARTFORD ROADS.

URBAN DISTRICT COUNCIL REPORT.

Mr. William Harston, surveyor to the Dartford Urban District Council, has, in accordance with a request of the latter authority, submitted a report dealing with the cost of maintaining the highways (other than main roads) of his district. The local taxation returns, published by the Local Government Board, did not, it seems, contain any statement as to the cost of maintaining such roads in urban districts, and Mr. Harston has been unable to find that any figures are published upon which a comparison could be based, a fact which he suggests might possibly be due to the difference in the incidence of account in urban and rural districts. In the absence of any published information on the subject, Mr. Harston has therefore submitted to the surveyors of several corporate and urban authorities a series of queries with reference thereto. In comparing the expense involved in one district with another, Mr. Harston thinks it is necessary that the circumstances obtaining in each particular case should be taken into consideration, as the varying cost of materials, the expense of horse and manual labour, and the nature and extent of the traffic in each district are important factors, without which no proper comparison can be made.

In Dartford they laboured under an initial disadvantage

arising from the absence of any quarries in the locality yielding stone suitable for road maintenance. With the exception of flints, which were used for roads subjected to heavy traffic, the whole of the material required was imported into the district, and, owing to the expense of railway carriage, it was found more economical to utilise Guernsey granite than to obtain a somewhat inferior English stone which might otherwise serve the purpose. The cost of manual labour in the district, too, exceeded that in the majority of corporate towns and urban districts further remote from London. This could be seen from the return which was lately laid before the council when the subject of sick pay was under their consideration. The traffic also was quite exceptional for a town of the size; but it should be borne in mind that it was a busy and rapidly-increasing industrial centre, and that, although its population was but 14,000, it was distant only 15 miles from the metropolis, and was in close proximity to Erith, Woolwich and Plumstead, and adjoined the urban district of Bexley. Then at Stone, Crayford, Swanscombe and other so-called rural parishes in its vicinity important manufacturing industries were pursued; indeed, Dartford might be said to be one of the links in the long chain of manufacturing towns extending from the metropolis along the banks of the Thames. Further, it should not be forgotten that the cartage of supplies to the City of London Asylum at Stone and the Metropolitan Asylums Board's institutions at Darenth helped in an appreciable degree to increase the weight of traffic passing over the district roads.

TRAFFIC.

Another exceptional source of traffic arose from the fact that the produce of the market gardens and fruit farms in that part of Kent was almost exclusively forwarded to Covent Garden by road, while the cartage of manure from the wharves on Dartford Creek to the agricultural parishes in the neighbourhood and of raw materials and manufactured articles to and from the numerous factories situated in the town and its vicinity was very considerable. The extensive building operations now in progress in Dartford and the adjacent parishes also added largely to the wear and tear to which the roads were subjected, and when it was remembered how extensively traction engines were now employed in and around the district it was easy to understand that the traffic was very heavy, not only on the main roads, but on those which had to be maintained exclusively at the expense of the general district ratepayers. As an instance of the nature of repairs which were now necessary as compared with that requisite in former years, Mr. Harston points out that it has been found expedient to use granite for the repair of several thoroughfares all of which until a few years ago were entirely repaired with flints. In conclusion, the report states that, deducting the expense of sweeping, to say nothing of the cost of slopping, the average cost of maintaining the highways under the control of the council was about £46 per mile. That compared very favourably with the returns alluded to in the report, but any thorough comparison was difficult, owing to the fact that the larger proportion of the engineers to whom communications had been addressed had been unable to supply any information as to the cost per mile involved.

BURY ELECTRIC LIGHTING.

The minutes of the Electric Lighting Committee of the Bury Town Council last week contained a report of the borough engineer and the electrical engineer as to the manner in which the electric light works had increased their scope. The report showed that, whilst in March, 1897, forty-one consumers used 2,481 lamps, in August, 1898, 101 consumers used 6,788 lamps. To the latter figures must be added a further 1,725 for which applications have already been received, making a total of 8,513, leaving a balance of 1,487 to make up the full complement of 10,000 8 candle-power lamps, the estimated total capacity of the present plant. The borrowing powers, £30,000, were almost exhausted, as there had been expended up to the end of July last over £28,000, while authority had been given to spend another £4,000 on mains. The committee resolved that plans and estimates for an extension of the plant at the electricity works be prepared, and that the town clerk make application to the Local Government Board for power to borrow the sum of £20,000 to carry out the necessary works; and, further, that are lamps be substituted for the present gas lamps in Moss-street, Market-street, Silver-street, Broad-street, Bolton-street, Haymarket-street, Fleet-street, Rock-street, Stanley-street, and Water-street to the Swan Hotel. The council confirmed these minutes.

National Registration of Plumbers.—A public meeting will be held in the Mayor's Parlour, Manchester, on the 19th inst., at which the lord mayor will distribute the prizes, certificates and bronze medal of the Plumbers' Company awarded in connection with the recent exhibition of plumbers' work at Manchester. The meeting will be a large and influential one, and several prominent men are expected to be present. The programme will include a lecture on "The Registration of Plumbers and Domestic Sanitation," by Dr. Mansel-Howe, of London.

Some Annual Municipal Engineering Records.

JOHANNESBURG.

From the last annual report of Mr. Charles Aburrow relating to the Public Works Department of the Stadsraad, Johannesburg, we learn that at the end of last year the total area controlled by the municipal authorities was 456 English square miles, the length of roads and streets being over 130 miles, an increase of about 4 miles on the previous year. Some 9,376 lineal yards of macadam were laid in various thoroughfares, while re-metalling to the amount of 4,305 lineal yards was carried out. The stone and binding used totalled respectively 107,971 and 18,609 loads. In Johannesburg there are 14,707 lineal yards of kerb, and of gutters: Freestone (2 ft. 6 in. wide), 908 lineal yards; asphalt (2 ft. 11 in. wide), 9,702 lineal yards; freestone (4 ft. wide), 1,261 lineal yards; and asphalt (4 ft. 5 in. wide), 4,144 lineal yards. There are 926 superficial yards of freestone and 6,637 superficial yards of asphalt crossings, while there are 37 superficial yards of freestone cart entrances. Of asphalt entrances there are 1,669 superficial yards. The number of loads of material used in the construction of tar macadam crossings (of which there are 2,012 superficial yards) was 841, or 498 cubic yards; of footpaths, some 9,360 lineal yards were formed.

In connection with drainage it might be mentioned that at the end of the year there were 133 catchpits. Stone crushing is carried on, but the stone from the crushers is irregular in shape and often requires sorting before being taken on to the roads. Two new steam road-rollers, supplied by Messrs. J. Fowler & Co., of Leeds, England, commenced work early in September, after having been passed by the Government boiler inspector, and have both given satisfaction. The total length of tramways within the jurisdiction of the council at the end of 1896 was 10 miles. A sum of £74,196 was derived from the working of the system, the mileage run being 474,711. For purposes of street watering about 35,815,760 gallons of water were used. Some 5½ miles of gas mains and branches were laid in various streets during the year, so that the total length of mains is now nearly 25 miles; 225,000 cubic feet of gas can be stored, the two gas-holders having a capacity of 160,000 and 65,000 cubic feet respectively. The quantity manufactured was 31,220,700 cubic feet, the average price charged being a fraction over 1s. 8½d. per 1,000 ft. Over 53 miles of overhead wires were fixed, out of which Messrs. Siemens & Halske erected 26 miles.

The total length of streets containing electric mains is now nearly 25½ miles, representing about 87 miles of wires. There are approximately 21,000 8 candle-power lamps connected, in addition to eight arc lamps for the use of private consumers. The number of units generated was 639,602, being an increase of 234,230 over the previous year, and the current was distributed as follows: Private consumers, 353,111; public lighting, 91,754; public lighting (Doomfontein), 4,767; used on works, 26,416; unaccounted for, being the difference between station meters and consumers' meters, by transformer losses and loss in mains, &c., 131,514. During 1897 the average price per unit obtained was a fraction under 1s. 5d. Of public lamps there are forty-two arc lamps of 2,000 nominal candle-power; 130 incandescent lamps of 35 candle-power; 131 incandescent lamps of (mostly) 16 candle-power, three gas lamps of three lights and 146 others of one light. Lamps therefore total 752. The following additional plant, &c., has been put down during the year: One 45-kilowatt alternator, with switchboard; one overhead travelling crane in old engine-house; four 100 horse-power "Sterling" water-tube boilers, and a "Worthington" feed-pump; one wrought-iron chimney, 150 ft. high and 6 ft. 6 in. diameter; two 200 horse-power "Tanner" compound horizontal condensing engines; two 120-kilowatt "Three-phase" generators (self-excited), with switchboards complete; one switchboard, 36 ft. long, containing generator and circuit boards for the three-phase plant, with instruments and synchronising gear; one new wood and iron engine-house, 60 ft. 6 in. by 47 ft.; extension to boiler-house, 60 ft. 6 in. by 36 ft.; and one small electrical testing-room.

In connection with rainfall, the report states that in January the amount recorded in Jonbert's Park amounted to 9.71 in., and at Doomfontein, 8.87 in. Rain fell on seventeen days. During the whole of the year there was rain on eighty days, the total amount registered in Jonbert's Park being 28.98 in. and at Doomfontein 27.825 in. The average for eight years has been 28.867 in., the average number of days on which rain fell during the same period being eighty-three.

Mention is also made in the report of the erection, at a cost of £13,167, of a "compound" for the sanitary department. The contract included the provision of offices (six rooms, with overhanging verandah); men's quarters (twenty-two rooms, reading-room, dining-room, kitchen, pantry, scullery, three bath-rooms and verandah); workshops (harness maker's rooms, wheelwright and carpenter's shop, farriery, shed for shoeing mules, smithy, cart-shed and tinsmith's room); general store, 100 ft. by 30 ft.; forage store, 116 ft. by 40 ft., which includes mealie store, engine-room and shed; four

blocks of stabling for mules (400), each measuring 192 ft. by 32 ft. 6 in.; stabling for twenty horses, harness-room, stable boys'-room, clothing-room and general harness-room; kaffir compounds for day and night boys, consisting of forty-four sleeping compartments, each 24 ft. by 14 ft., two kitchens, two wash-houses and latrines, &c.; water trough, 109 ft. long, sentry-box and sanitary arrangements for white men. The whole of the ground was fenced in with corrugated-iron fencing, 8 ft. high, secured to wooden uprights and rails, with two pairs of sliding gates. A similar fence was also fixed, 5 ft. high, within the enclosure for the purpose of forming a paddock. The buildings were completed and handed over by the contractors at the end of May. In April tenders were invited for a 6 brake horse-power petroleum engine, for driving the pumps at the two bore-holes. The accepted tender was for £160, exclusive of the cost of gearing, &c., which was arranged by the Sanitary Department.

Slop-pumping, with the exception of the irrigation works at the outfall site, is carried out by the Public Works Department. The scheme consists of two "aprons," constructed of freestones bedded on concrete, with strong iron gratings and catch-pits, over which the slop waggons discharge their contents. From the pits the slop water passes through iron gratings into duplicate tanks, each capable of holding 5,000 gallons. The tanks are constructed of brickwork in cement, with a cement-rendered face; the bottoms are formed with cement concrete with rendered surface, while the top of the tanks are finished off with stono coping. Strong wire screens are fixed across the centre of each tank and round the sumps, for preventing other than liquid matter going into the suction pipe. The slop water from the tanks is lifted by means of two 14-in. by 6½-in. by 10-in. "Worthington" duplex steam pumps, through 11,937 ft. of 6-in. and 4,806 ft. of 5-in. wrought-iron piping, with a vertical lift of 160 ft., and is discharged on to a portion of the farm Waterfall, which adjoins the ground used for a depositing site. It is lifted through the 6-in. piping only, and then allowed to run on the ground through the 5-in. pipes by gravitation.

In September and October advertisements were issued inviting tenders for the erection of refuse destructors, and twenty offers were received. The merits of each offer were thoroughly gone into; four of them were selected as most suitable for the requirements of the town, and letters were sent to each of those chosen asking for further particulars with regard to the working, &c. Upon receipt of these particulars, and after further consideration by the council, it was decided not to accept any of the tenders, but to wait until a suitable piece of ground had been selected, so that each tenderer could go into the question on a sound basis. This conclusion was arrived at chiefly on account of the great difference in the estimation and cost of foundations, &c.

The usual printed conditions relating to cellar openings under footpaths had to be altered, in consequence of the owners of property making use of the cellar openings for purposes other than lighting and handing in of goods, so that this clause in the conditions now reads: "No openings will be allowed under a public footpath unless the whole of the outer wall running parallel with the street is built with a battens of one horizontal to three vertical, and no excavation under a footpath will be permitted of a greater aggregate length than one-half the frontage of the building. All plans for new buildings must in future show the correct ground levels of the stand as well as the street level adjoining same, also full particulars of all columns, post and girders or bressamers, giving calculations of the different weights they are to carry." The paving of public footpaths is not done at the expense of the Stadsraad, but a fair amount of this work has been done by private owners of property. In the case of verandahs, balconies and other projections over a public footpath the paving is compulsory, as well as in cases of cellar openings under a footpath. Several kinds of paving have been laid in the town—viz., tar macadam, asphalt, granolithic, concrete, slate, tiles, &c. During 1897 about 5,300 lineal yards of granolithic paving was laid in public footpaths. In most cases the kerbing is of freest one, but as a trial this department has allowed some kerbing to be formed with a granolithic composition.

For five months, from 1st June to the end of October, Mr. Aburrow was absent on leave, during which time he visited a number of large towns in England, and also several towns in Germany, Holland and France, inspecting refuse destructors, different sewerage systems and sewage disposal works, road paving and construction, and the various tramway systems. He wishes to place on record his best thanks to the different engineers and representatives of the municipalities or companies who afforded him the above opportunities; and, in conclusion, he has also much pleasure in expressing his satisfaction with the manner in which his staff generally carried out their duties. He especially wishes to record his appreciation of the services of his chief assistant, Mr. Andrew, who acted very ably during his absence.

Municipal Work at Brentford.

THE NEW VESTRY HALL AND FIRE STATION.

In the Supplement we publish this week will be found a reproduction of a perspective drawing of the

NEW VESTRY HALL

which the Brentford Urban District Council propose to erect on the corner piece of land facing St. Paul's-road and the Half Acre. The designs have been prepared by Mr. Howell Parr, the surveyor to the council, and the hall, when erected, will undoubtedly prove an ornament to the district and a striking feature in the thoroughfare.

The accommodation provided in the building will be as follows: Basement plan—soup kitchen, 20 ft. by 30 ft., lift, heating-chamber, strong-room, stores, water-closets and lavatory, and necessary passages. Ground plan—large hall, 83 ft. by 35 ft. with platform, four retiring-rooms, offices, &c., and a separate entrance to platform, vestry-room, 32 ft. by 20 ft., collectors' office, overseers' office, staircase and corridors. First-floor plan—committee-room, 32 ft. by 20 ft., clerk's office, overseer's office, and two rooms for the caretaker. The upper portion of the hall has a balcony, two retiring-rooms, lavatory, &c.

In describing the external features of the building we should say that the main feature was the tower. This tower is a stately structure, well proportioned and elegant in its simplicity. It rises square for two storeys, with window openings to the collector's-room on the ground floor and the clerk's office on the first floor, with the Middlesex arms modelled above. From the second storey it breaks out to an octagon, the corners or spandrels being filled in with ornamental scrolls and projecting angle pilasters. The octagon contains eight small openings and is roofed with a small lead-covered dome, terminated with a suitable circular spirelet.

The elevation to Half Acre is set back from the present line of frontage a distance of 15 ft. on the south corner and 10 ft. at the principal entrance. This entrance has a semi-circular arch with projecting voussoirs and keystone, with modelled spandrels, and filled in with ornamental wrought-iron gates. There are double pilasters, at the sides with cornices and large fascia and with a panel inscribed "Vestry Hall." Above is a window, with pilasters and circular pediment in character with the design. The principal part of this elevation slightly projects from the other part of the building, and has octagonal corner ornaments from the plinth to the terminal. The centre portion has a massive semi-circular arch window to the lower storey, with projecting voussoirs and keystone, &c., in character with the principal entrance; surmounting this is a deep-moulded string and modelled panelling, with three segmental gauged arch windows to the upper storey; above this is an ornamental gable with the Middlesex arms modelled between two coffin-shaped pilasters, the whole surmounted by circular pediment with bossed terminal.

The elevation to the St. Paul's-road, again, is extremely simple yet most effective. At the side of the corner tower is the side entrance to the main corridor, with three-stepped staircase, windows and ornamental parapet above. The end elevation to the large hall faces the St. Paul's-road, and is treated in a suitable manner to harmonise with the rest of the design. The main feature is an ornamental gable with projecting octagonal features on the angles. The centre has a long, large window, with a semi-circular head as before, with a very effective deep-moulded string with scrolls—the gable, as with the others, is surmounted with a circular pediment and terminal.

The material proposed to be used in the construction of the edifice is best pressed red bricks, with red Mansfield stone or dark terra-cotta dressings. The estimated cost of the building is £7,000.

In the supplement will also be found a reproduction of a photo of another welcome addition to the public buildings of Brentford.

THE NEW FIRE STATION.

This building was opened on the 22nd February by Mr. J. Dorey, J.P., chairman of the district council, who was duly presented with a silver key by Mr. Nowell Parr, the surveyor to the council and architect of the building. The occasion was marked by much ceremony, a procession, comprising representatives from all the neighbouring fire services (each contingent being accompanied with the fire engine from their district), being the chief feature of the day's function. Of course the usual banquet took place in the evening to celebrate the opening of the station.

Most of our readers would be interested with a description of the building, so we publish the following official description: The front elevation is surmounted by two gables filled in with ornamental Patra bricks, and separated from the middle storey by moulded string courses. This middle storey composes three windows, lighting the firemen's recreation-room, which have deep moulded reveals and semi-circular arches, with projecting voussoirs and four label mouldings. These openings are filled in with moulded wooden frames, following the arch lines, and glazed with ornamental ob-

scured glass, two of the windows have octagonal oriels with ornamental wrought-iron railings, the tail of the oriels terminating in the keystone of the large arches spanning the opening to the engine-house. These arches have likewise projecting voussoirs and label mouldings. The sides of these openings have moulded projecting pilasters with caps and bases; a moulded plinth runs round the entire building. These openings are filled in with patent doors hung fourfold, fitted with Messrs. Shand, Mason & Co.'s quick opening and closing gear. On the east side is provided a large drill yard, with an escape projection and hose tower. The material employed in facing is red pressed bricks and red terra-cotta, the latter supplied by Messrs. Doulton & Co., of Lambeth. The accommodation provided is as follows: Large engine-room, 31 ft. by 25 ft.; workshop, cellar, watch-room; firemen's recreation-room, 31 ft. by 18 ft.; officers' room and store-room, &c. Caretaker's apartments consist of living-room, kitchen, and two bed-rooms, &c. The fire-alarms, fire-hall and other electrical apparatus have been fitted by Messrs. Stuart & Moore, of Ealing.

On the occasion of the opening of the fire station a local paper published the following remarks about Mr. Nowell Parr, the town surveyor: "To enlarge upon the qualifications of Mr. Parr for the task he has so successfully undertaken is unnecessary. Mr. Parr's professional abilities have been long adequately recognised in Brentford. In accomplishing the material realisation of his ideas of the necessities of the town for a new fire station Mr. Parr has added yet another laurel to the wreath of public approval which he had already acquired by the skilful works designed and carried out in the course of his duties in Brentford and elsewhere. Mr. Parr's connection with the town began when he had achieved professional distinction, and his career in Brentford has fully justified the judicious selection of the council in making him the man of their choice. The handsome public baths, the new mortuary, and the less striking, but not less useful, series of works in connection with the drainage of the town form a fitting prelude to his latest architectural achievement—the new fire station—which we trust will by no means be the last service he is to render to the town."

PLYMOUTH WATERWORKS.

THE BURRATOR RESERVOIR.

On the 21st inst. the Corporation of Plymouth celebrate their annual "Fyshyng Feaste" and the completion of the Burrator reservoir. This reservoir has been constructed by the corporation. Its main embankment is the third largest stone dam in the country, and is the only one constructed of granite. The engineers for the scheme are Mr. James Mansergh, engineer, of Victoria-street, and Mr. Edward Sandeman, of Plymouth. The waterworks of the Plymouth Corporation are believed to be the oldest waterworks established by a municipality which have been continuously in the ownership and under the control of the municipality since their inception. London, as a municipality, undertook the construction of waterworks before Plymouth, but London has parted with its waterworks undertakings as a municipality, and is now supplied entirely by companies. The Plymouth waterworks have the further additional interest in that they were constructed by Sir Francis Drake, the great navigator, under powers obtained in the reign of Queen Elizabeth, the Act of Parliament showing on its face that they were designed at that day not merely for a local but also for an imperial purpose—viz., "the deepening of the Plymouth harbour, supplying her Majesty's ships of war, and also for the purpose of extinguishing fires in the town occasioned by the assaults of foreign Powers." The Fyshyng Feaste is an ancient ceremony, which has been continuously observed for upwards of three centuries, and the only two toasts then drunk, and these being drunk in silence, are: (1) "To the pious memory of Sir Francis Drake" (this is drunk in water taken from the works); and (2) "May the descendants of him who brought us water never want wine." On this occasion, in celebration of the construction of the great dam, there will be, in addition to the usual Fyshyng Feaste, a banquet in the Guildhall after the event, to which most of the notables in Devon and the adjoining county will be invited. The last stone of the dam will be laid on the 21st inst.

Peterborough.—The new electric light works for the town have been started, so far as the foundations are concerned, on a site in the Albert-place Meadow, adjoining both the river Nene and the Great Northern Railway. At present, however, the full plans for the superstructure, by Mr. J. C. Gill, the borough electrical engineer, are not quite completed. The scheme, nevertheless, having been generally approved by the Local Government Board, it only remains for the engineer's plans to be passed by the corporation and the construction thrown open to competition by tender.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,

Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts, or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

QUERIES AND REPLIES.

COMBINED DRAIN.—"Rilong" writes: A is an unoccupied house, and the water-closet from B is connected to drain A, passing through hall of B. B was lately sold, and is to be pulled down shortly. The sanitary state of A has been condemned. Can the sanitary authority insist on the owner of A making a new piped drain to connect from his water-closet

into street sewer, the house being unoccupied and for sale; and can the owner of A prevent the sewage from B's water-closet passing through his (A's) drain. A and B were lately the property of the same owner.

As the drain is used for the drainage of two houses it is a "sewer" vested in the authority, subject to the qualification effected by sec. 19 of the Public Health Acts (Amendment) Act, 1890, if part iii. of that Act has been adopted in the district. That section, however, has been held not to relieve local authorities of their general liability to repair combined drains, the powers thereby conferred being only applicable where there is an actual nuisance (*The Queen v. Mayor of Hastings, THE SURVEYOR*, vol. xi., p. 297). Apparently there is an actual nuisance in this case, but it is not stated whether part iii. of the Act has been adopted, nor when the houses ceased to be the property of the same owner. Assuming either that part iii. of the Act has not been adopted or (if it has been adopted) that the houses belonged to the same owner at the passing of the Act, the authority cannot, in my opinion, compel the owner of A to make a new drain, nor can A prevent sewage from B passing through the drain. It has never been decided whether the section applies where two houses belonged to the same owner at the time of the passing of the Act and the ownership has since been severed. But in a case under the Metropolitan Management Acts it was held that when a drain which originally drained two houses was disconnected from one of them, it nevertheless remained a sewer, on the principle once a sewer always a sewer" (*Frost v. St. Leonard, Shoreditch v. London, THE SURVEYOR*, vol. xi., p. 285). On the same principle it would seem that if two houses belonged to the same owner at the passing of the Act of 1890, the "sewer" would not cease to be such on the severance of the ownership.

DRINKING TROUGHS IN STREETS.—"Dacio" writes: In the urban district of X there are placed on the sides of some of the principal streets opposite public-houses drinking troughs for horses. These troughs are placed by, and are the property of, and maintained by, the owners of these houses, the idea being an attraction for custom to houses. The water from these troughs either leaks from or runs over on to the highway and causes a continual stream, being a nuisance to foot passengers and damage to highway. Can the urban district council demand the removal of these troughs or what steps can they take?

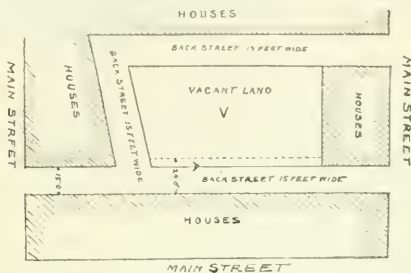

This is rather a difficult question. Under sec. 72 of the Highway Act, 1835, penalties are imposed on any person wilfully destroying or injuring the surface of any highway, or suffering any filth or other offensive matter to flow thereon. But it has been held that rain drippings from a railway bridge are not, within this section, and it is doubtful whether it is applicable to the case stated in the query. Anything, however, which obstructs the passage of a highway, or renders it less commodious is an indictable offence at common law, and the offender is liable to fine or imprisonment, or both, and the nuisance, if continuing, is to be abated. The owners of these troughs might therefore, it is presumed, be indicted for the nuisance caused by the overflow of the water. As regards the removal of the troughs, however, the question would arise whether they were erected before or after the dedication of the highway. In the former case it would seem that they could not be removed.

BREAKING-UP STREETS.—HOARDINGS.—Mr. Frederick J. Rayner, town surveyor, Newhaven, writes:—(1) What powers have any council to make builders and others pay a deposit before opening up a road for drainage, &c., such sum to be

repaid when road is made up to the satisfaction of the surveyor? (2) What powers have any council to make a like charge for hoardings, &c., on footpaths, or charge a fee, not to be returned, while the hoardings and scaffoldings, &c., are on the footways?

There appears to be no express powers for either of these purposes in any of the Public Health Acts, but such powers are frequently inserted in local improvement Acts. As regards (1), sec. 149 of the Public Health Act, 1875, prohibits the breaking-up of streets without the consent of the urban authority, but it is doubtful whether this section applies to opening the road for drainage or other legitimate purpose, the words used being "wilfully displaces or takes up or . . . injures." Assuming, however, that it does so apply, it is presumed that the authority could legally make their consent conditional upon the payment of a deposit. At all events I believe in practice this is very frequently done. As regards (2), the hoarding has to be erected to the satisfaction of the authority (*see Towns Improvement Clauses Act, 1817, sec. 8*), and Public Health Acts Amendment Act, 1890, sec. 31). This would seem to give the authority power indirectly to require a fee, as in the case of a person who objected to pay a fee they would probably not expedite matters very much, and their "satisfaction" would not be very readily obtained.

BY-LAWS: NEW STREET.—"Surveyor" writes: V shows a piece of vacant land abutting upon three back streets, 15 ft. wide, but these back streets have been dedicated to the public. Our by-laws state every person who shall lay out a new street which shall be intended for use otherwise than as a carriage road and shall not exceed in length 100 ft. shall so lay out such street that the width thereof shall be 24 ft. at

least. Question. As these streets were laid out before the local board was formed, but paved and dedicated after the formation of the local board, can houses be built on the vacant land to come to the line of the back street marked A, or must they be sent back to 24 ft. according to the by-law?

It will be a question of fact for the magistrates to decide, when building commences, whether "new streets" are being formed; and, if there is any evidence to justify them in finding such to be the case, the High Court will not inquire into its sufficiency. (*Reg. v. Shaw, 50 L.T. (N.S.), 590*). Inasmuch as there are already houses on one side of each street (and as to two of them on both sides), I think it is very doubtful whether the building of houses on the vacant land would be held to be the laying-out of a new street.

BIRKENHEAD ELECTRICAL EXTENSIONS.

Mr. William Bates, the electrical engineer to the Birkenhead Corporation, recently drew attention to the lack of reserve power at the central electrical generating station, and was requested by the Electrical Committee to prepare a report on the plant threat and as to further extensions which may be necessary. In the report since presented he suggests that tenders for the supply and erection of a further 150-unit steam dynamo should be asked for at the earliest possible date. As to the proposed extension, provision is made to meet all demands for the next two years, at a cost of £13,343. A list of thirty-two streets is given for the laying of distributing mains, and it is recommended that provision should be made for service cables, &c., for 150 fresh consumers. The borrowing powers of the corporation for electricity supply are £41,500. At present there is an excess over that authorised outlay on the cost of the existing works of £1,512 2s. 9d. In order to cover this excess and carry out the proposed extension, the committee have resolved to apply to the Local Government Board for power to borrow a sum of £15,000.

Thakeham.—Local Government Board sanction is reported to have been received to a loan of £300 for the construction of the Hardham Arch.

THE ADMISSION OF DAYLIGHT TO BUILDINGS.

When daylight enters a room through ordinary glass, only a portion of it is available for the purpose of lighting up the room. This is, of course, due to refraction, and it is with this object of properly utilising this principle that the "Luxfer" prisms have been designed. They consist of plates of glass having the outer surface plain and the inner surface moulded into semi-prisms. The object kept consistently in view is that in passing through the prisms the natural light would be so refracted as to travel horizontally into the interior of a room, diffusing light to every part of it.

FIG. 1.—PRISM LIGHT.

To accomplish this under the varied conditions where windows open on a wide or a narrow street, facing low or lofty buildings, a variety of prisms are necessary, and success in getting desired results depends on the proper calculation of the degree of refraction needed and the proper installation of a prism having a corresponding refracting angle. This, of course, implies scientific treatment, and we understand that the necessary data were obtained only after a long series of careful and expensive experiments.

The practical utilisation of these prisms has been worked out in connection with a system of electro-glazing, the ordinary lead glazing not being considered strong enough to support prisms in a window where the action of the wind and weather would affect them. The prisms, after being ground to a templet, are laid in a frame with a small ribbon of

FIG. 2.—PRISM FOR SIDEWALK.

copper surrounding each prism. The whole sheet is immersed in an electric bath, and cemented together with a deposit of copper by a new patent electrolytic process. The object is to make a window strong and elastic, water and weather tight, and the whole construction durable, strong and neat, the metal network being so very small as to shut out a minimum amount of light. The completed frame of prism lights is commonly inserted in the transom frame or window sash in place of the sheet of plate-glass. Where the window frame is set under a deep reveal, or where the light from the sky is obstructed by very high buildings opposite the premises to be lighted, it may be necessary to set the

prism lights in an independent frame set flush with the building line or in an iron frame extending out over the window opening similar to a canopy.

To light a basement, the ceiling of which is on a level with the street, the light will, of course, be taken through the footway of the street. The prisms for this purpose must necessarily be extremely heavy, so that when fixed in iron frames or cement they will be capable of carrying any load that a footway can reasonably be expected to bear. The prisms are cut with reflecting angles on the pendant prisms, so that the light striking the surface of the footway is refracted into the basement. In lighting basements in which the light requires to be carried a considerable distance to reach the rear of the apartment, a curtain, consisting of prisms of various angles glazed together, is used, and this receives the light from the sidewalk prisms and refracts it in the proper direction so as to diffuse it throughout the basement. The first of our two illustrations represents a prism light for ordinary windows, or for fixing as outside canopies. The second illustration shows the prism light for footways in connection with the lighting of basements. In this country these prisms have been fixed among other places at St. George's Cathedral, Southwark, and the new Birkbeck Bank, while orders are in hand for a number of banks and private houses. Originating in America they had, of course, been used in a large number of places both in Canada and the United States. Having been fitted in the engine-room of the new municipal buildings at Toronto, the architect found them very satisfactory in diffusing light. The address of the company is the British Luxfer Prism Syndicate, Limited, 16 Hill-street, Finsbury, E.C., where an admirable show of prisms is on view.

A MUNICIPAL FAMILY HOME AT GLASGOW.

AN INTERESTING EXPERIMENT.

The proposal of the Glasgow Corporation to provide a good home and tender parental care for the widowed and fatherless was much laughed at when it was put forward; but the municipal philanthropists had their way, and the home has been open for over two years. The latest accounts of the Improvement Trust have just been issued, says a correspondent of *The Pall Mall Gazette*, and it is possible to estimate the value of the work which has been done. The home was built to accommodate widowers of the labouring class who had been left with young children, and widows similarly burdened; and the aim of the promoters was to protect the children and see them properly cared for rather than to help the adults. The home was built on part of a slum area which had been cleared, and provides 160 rooms, each of which is intended to accommodate one adult and three children. At present it is only a little more than half full, and under these circumstances it does not pay. The home is not open to all comers; applicants for rooms must submit to an official investigation of their character, and if they do not satisfy the committee that they are perfectly well-behaved persons they cannot enjoy the advantages of the system or obtain them for their children. The home therefore does not meet the worst cases of child neglect, and the least-fortunate children are denied the benefit of its care.

The home is well built, but it is too large, and its size adds to the difficulties in the way of good management. Each woman pays 3s. 6d. for her room, men pay 1s. more, and the rent is increased in ratio to the number of children. The children are fed and looked after at the rate of 1s. 10d. per week for one, and 4s. for three; and the adults are able to obtain good and substantial meals at low prices—2½d. for breakfast, 4d. for dinner, and 3d. for tea. The servants clean the men's rooms, and the women must look after their own; but while they are out at work their children are taken care of by the staff. Those of school age are sent to school; the infants are tended in the nursery, and those able to run about are provided for in recreation-rooms. The adults have a big dining-room, and a recreation and smoke room, where they may read the papers and play dominoes and draughts; and the home is heated throughout with steam pipes, is lighted by electricity, and is even provided with lifts. Its first cost was £13,000. In the last financial year the revenue was £1,607, including £737 for rent, £308 for the board of children, and £561 for food sold; the expenditure was £2,108, leaving a deficit of £501.

The amiable experiment is not intended as a charity, but last year the tenants did not repay the city for the advantages they received. The housing of the two sexes under one roof, though on separate floors, is productive of difficulties occasionally; and, though entertainments are provided for the tenants and they are not allowed to take spirituous liquors into the home, some of them have had to be turned out for bad conduct. Moreover, the promoters made no allowances for sickness, and were rather perplexed when an outbreak of measles came to add to their troubles. In short, this illustration of municipal philanthropy is losing money, and it is questionable whether the benefits it offers to a very small number of citizens are adequate return for the outlay and the risks. Municipal Socialists can hardly be encouraged by the result to venture much further in this direction.

Some Recent Publications.

A TEXT-BOOK ON MAGNETISM AND ELECTRICITY.

THE FIRST PRINCIPLES OF ELECTRICITY AND MAGNETISM, by Mr. C. H. W. Biggs, editor of *The Electrical Engineer* (London: Biggs & Co.), is a book which has aroused a good deal of opposition, and has been subjected to much criticism by those who follow the orthodox school of thought. It is somewhat difficult to deal with it quite fairly, because, while much that it contains is useful and valuable, Mr. Biggs so often goes out of his way to invite slashing criticism by the contentions matter so freely introduced. If one were to proceed on a basis of comparison with existing works, the book before us might suffer in a way it hardly deserves, and it is best to take it alone and by itself. When we bear in mind that there has been published a library of books that cover almost exactly the same ground, it will be evident that the reviewer is in rather a different position to the teacher or lecturer who may be asked by a student to recommend a work for study. In the former case we have a specific book before us, in the latter a suitable selection has to be made, bearing in mind the mental capacity of the student, his object in study, and the amount he is prepared to expend in literature. We have often been tempted to write at length on this latter question, for as lecturer and as practising engineer the present writer has had frequently to name a work for students' use. From this point of view there is much to be said in favour of Mr. Biggs' book. It is couched in simple language, indeed it is a reprint of a series of written lectures to elementary students which appeared in *The Electrical Engineer*, commencing in the issue for September 7, 1894, under the title of "City and Guilds of London Institute. Electric Lighting and Power Transmission. Preliminary Examination. Lecture I. (Specially contributed)."

We have here the key to the position; the style, scope and intention of the book are readily understood from this. The preface states that "this book is intended for beginners in practical work," but the title is misleading, inasmuch as the City and Guilds examinations are technical and "Electricity and Magnetism" is a science subject under the Science and Art Departmental examinations. We see, therefore, that Mr. Biggs has revised and corrected, as well as extended, matter which was prepared for beginners in applied electrical science, intending to proceed to an examination in which success would come to those who had most carefully followed a published syllabus. If it be admitted that such a book—as that must be which is useful to the student with this intent—can be prepared and fairly reviewed, then we think that Mr. Biggs has succeeded. The preliminary grade student ought to face his paper without any qualms if he has read the book before us; and having said this, we have little more to say. Few writers have set themselves the same limited task. To understand Mr. Biggs' position we cannot do better than turn to one of his earlier ventures—his "First Principles of Electrical Engineering." We read in the preface that he "did not know, nor much care, if there was a want to supply," although the formula of most writers is that their productions supply a want. His "Notes," to use a well-defined theological term, were the *circuits*—inductive, conductive and magnetic—and getting "rid of abstract mathematical jargon which seldom leads anywhere," putting in its place "physical conceptions which may be handled without much fear of getting off the track." The value of the book before us and of the one we have cited lies in the first of these two points—that the student who realises that all effects proceed from causes by action through a medium, and that such actions are cyclic, has got something worth buying from a book, even if Philistines may cavil at the manner of expression and reviewers of the orthodox school brand the author as unorthodox, or even heretodox. We must confess that the second point is inadequately met by Mr. Biggs in his latest work. Examples might be multiplied almost indefinitely, but we will take one which is of most importance. In dealing with resistance it is stated that "Prof. Ohm proved . . . with steady continuous currents not only that $C = \frac{E}{R}$, but that $C = \frac{E}{R}$, and this connection between current pressure and resistance is known as Ohm's law." To find this corollary of Ohm's law given as Ohm's law is disappointing after all the work of the British Association Committee on Ohm's law and all Prof. Oliver J. Lodge has said on the subject. Ohm arrived on the scene at a time when physicists were unacquainted with the conception of "resistance" as a physical entity. Take friction. We know that air friction varies with velocity, being proportional to velocity for low values and increasing faster than proportionality would indicate with rising magnitudes for velocity. One cannot therefore write a *simple law* in simple terms. What Ohm did was to prove and to define the general law that resistance was independent of the current in the conductor having such resistance. That is, that $R = \frac{E}{C}$ and R is constant for all values of C, provided the physical state of the conductor remain unchanged. Here is a "physical conception" which should have been made quite clear. Unfortunately, it is left wrapped up in a corollary which is not the general law Ohm so magnificently elaborated,

Immediately following this section is one on "Resistance or Capacity," suggesting the use of *impedance* as the reciprocal of resistance and attributing the term to Mr. Sprague. "If Mr. Sprague's suggestion ever takes root, the term 'conductivity' might be used instead of capacity." Lord Kelvin has done much to popularise the use of this conception of the reciprocal of resistance, but his term "mho" never found favour generally outside of Glasgow University and White's workshop. Suppose it did, one ought to talk of "resistance" and "conductance," leaving "resistivity" and "conductivity" for the specific values of it and $\frac{1}{R}$.

Those of our readers who are anxious to begin the study of applied electricity and have time to work out numerical examples would find Mr. Biggs' book useful. General readers or students of electricity and magnetism have abundant choice of works better suited to their respective requirements.

SOME PERIODICALS.

The *Architectural Review* is making quite a feature of special supplement illustrations. In the September issue we observe, in the form of a tasteful photogravure plate, the second of a series of illustrations entitled "Coming-down London." The subject is Holywell-street, Strand, otherwise known to fame as "Booksellers'-row," to say nothing of a more questionable title to fame, or rather notoriety. This thoroughfare is certainly one of the most familiar landmarks in London, but there is no question, from the point of view of street improvements, of the expediency and necessity of the removal of the block of buildings which form its southern side. These photogravure plates are exceedingly pleasing to the eye. There is also a double supplement plate representing Stowell Park, designed by John Belcher for the Earl of Eldon. The work of this architect is the subject of an appreciative article by Charles G. Harper, and Esther Wood writes on "The Work of Edgar Wilson." Those interested in architecture, either professionally or otherwise, cannot fail to find both letterpress and illustrations to their taste, so we need not refer specially to the other contents, which certainly show no falling away either in variety or in merit.—In *The Engineering Magazine* for September it is not surprising to find at least two articles on naval subjects by well-known authorities. After recent events such contributions will be plentiful for time to come. The number, however, has more than one article which might be attentively read by municipal engineers. We naturally mention first that entitled "Bacterial Processes of Sewage Purification," by the well-known American civil engineer, Mr. Rudolph Hering, but we shall refer to this separately in our next issue. Among the other contents are the following articles: "European and American Bridge Construction" reviewing the extension of modern methods and materials to wide spans; "The Comparative Cost of Steam and Water Power," "The Underground Railways of London," an account of the development of rapid transit in the metropolis; and "The Application of Alternating Currents to Electric Traction," a comparison of local power stations with distant natural sources. There is the usual engineering index in addition to the review of the *engineer's press*.—With three exceptions all the articles in *Cassier's Magazine* for September relate to naval subjects. Of the three exceptions one article deals with diamond-mining in South Africa, another with the cyanide process of treating gold ores, and the third is entitled "General Distribution from Electric Central Stations by Alternating Currents," and constitutes a review of alternating current applications.—*The American Monthly Review of Reviews* is naturally this month, as for some time past, largely monopolised by the Spanish-American war. In normal times our contemporary has always shown a deep interest in matters municipal, as might be expected in a periodical edited by Dr. Albert Shaw. No doubt we shall now, "when the war is over," see a return to this commendable policy.—That genuine sportsman and accomplished writer, Sir Herbert Maxwell, is the subject of the portrait and biographical sketch in this month's *Baldy*. Articles on characters, the revised laws of billiards, cricket centuries, public school cricket and other subjects will suit the tastes of the many readers of our green-covered contemporary. In connection with the article on characters there is a tasteful portrait of Lord Roberts on his Arab charger. The serial by Major Arthur Griffiths is continued.—From Cassell & Co., Limited, we have received *Waves and Changes*. In the former we observe useful information on artistic ironwork, dynamo and electric motor design, processes for determining the hardness of water, and other matters.—*Knowledge* is almost exclusively occupied with natural history, astronomy and botany. There is a pleasant literary flavour about the article on "The Astronomy of the 'Canterbury Tales.'" We have also to acknowledge the *Quarterly, The Indian Engineer and The Engineer*.

Oban.—The new municipal buildings in Oban are to be formally opened next week by Lord Strathcarron and Mount Royal. The function will include a luncheon, to which a number of local notabilities will be invited.

Municipal Work in Progress and Projected.

The paragraphs relating to Berwick, Bolton, Nelson, Cardiff, Salford, Guiseley, Redditch, Ashford, Bridgend and Ilford comprise the chief news that has come to hand this week relative to the progress of municipal works in the provinces. It will be observed that one or two of the vestries have resumed their deliberations.

METROPOLITAN AUTHORITIES. VESTRIES AND DISTRICT BOARDS.

Rotherhithe.—The vestry, at a meeting on Tuesday, discussed a resolution passed by the Battersea Vestry in favour of metropolitan vestries and district boards having the power of erecting dwellings for the working classes, and asking the London County Council to insert a clause giving this power in their next General Powers Bill. Mr. Beasley said it was agreed at the Bermondsey conference that it was necessary in some cases and advisable in all that local authorities should possess this power, and he moved that the vestry concur with the Battersea resolution. Mr. Brown seconded. Mr. Mortimer moved as an amendment that no action should be taken, and said it was very undesirable that local authorities should saddle themselves with the enormous expenditure which the erection of workmen's dwelling would involve. This was a matter for the London County Council. Mr. Moss seconded the amendment, which was agreed to.—At the next meeting of the vestry Mr. R. L. Stuart will move that application be made to the Local Government Board for the transfer to the vestry of the powers, duties and liabilities of the Commissioners for Baths and Wash-houses and the Commissioners for Public Libraries.

St. George-the-Martyr.—At the meeting of the vestry on Tuesday, a letter was read from the Chief Commissioner of Police stating that the whole of the metropolitan vestries and local authorities were being approached with a view of obtaining their co-operation to lessen the present congested state of the traffic in the streets of the metropolis. The owners of the omnibuses and the great carrying companies were desirous of facilitating this object, and wished their vehicles to keep as nearly as possible to the near-side; but they pointed out that, owing to the watering of the roads, horses driven at the sides were liable to slip. It had been suggested that to get over this difficulty the streets might be cleaned and watered at night, and the opinions of the vestries were asked as to this. It was hoped that all the arrangements would be made, and the experiments as to the value of the various methods to lessen the congestion of the traffic tried before the commencement of the next London season. The matter was referred to a committee to report.

St. Pancras.—The vestry on Wednesday voted £1,000 towards the purchase of the Golden's Hill estate as an addition to Hampstead Heath. It is stated that between £2,000 and £3,000 has yet to be raised.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Montgomeryshire.—The county council have decided to carry out certain alterations to the police stations at Welspool, Montgomery and Llanfyllin.

MUNICIPAL CORPORATIONS.

Barnsley.—The Local Government Board have sanctioned the borrowing by the town council of £350 towards the cost of repairing Sheffield-road between the Griffin Inn and Beechfield.

Barrow.—A letter has been received from the Local Government Board in reference to the council's application for sanction to borrow £5,000 for purposes of sewage disposal at Syston. The board are of opinion that a storage tank should be provided at the pumping station for the night flow of sewage, instead of pumping it both day and night, as proposed; further, that an additional filter should be provided, so as to bring the rate of filtration to a maximum of 300 gallons per square yard.

Berwick.—On the 30th ult. an inspector of the Local Government Board held an inquiry relative to an application of the town council for sanction to borrow £8,000 for the erection of a police station and lock-up.

Bishop's Castle.—An inspector of the Local Government Board last week held an inquiry respecting an application of the corporation for sanction to a loan of £1,600 for lining a reservoir at Maes Gwyn, in Shropshire, as it had developed such numerous leaks as to become useless. Mr. E. S. Cobbold, consulting engineer to the corporation, stated that it was proposed to line the reservoir with a layer of cement concrete 6 in. thick, with a core of Callender's pure bitumen sheeting. He considered it hopeless, in such fissured strata, to expect a watertight reservoir unless it was lined throughout, and after careful consideration he had decided to adopt concrete, with a bitumen core, as being the most simple, economical and efficient method of carrying out the work. There was no opposition to the application.

Bolton.—A discussion took place at Wednesday's meeting of the town council in reference to the purchase of land by the Electricity Committee for the extension of the works in Spa-road. The extension has been rendered necessary in view of the proposal to run the trams by electricity, and for the purpose of laying down the necessary plant to supply the areas recently added to the borough, borrowing powers for this purpose having been acquired to the extent of £250,000.—The council sanctioned a proposal by the Sanitary Committee to borrow £20,000 for the purpose of removing insanitary and obstructive dwellings.

Bradford.—The mayor of Bradford recently formally opened the new line of electric tramways at Great Horton, and at a luncheon, held subsequently at the town hall, Mr. C. R. Hindley proposed the health of the city surveyor (Mr. J. H. Cox), the city electrical engineer (Mr. Gibbins), the deputy surveyor (Mr. Dawson), and the deputy electrical engineer (Mr. Dalton).

Brighton.—At a further outlay of nearly £100,000, the corporation have recently acquired and developed the water-works at Aldington and Shoreham, and Brighton now not only supplies water to the 30,000 inhabitants of the sister town of Hove, but at a reduced rate to an extended district stretching along the coast for about 12 miles from Shoreham to Rottingdean. The results of last year's working, published in an agenda of the town council, show net profits to the amount of over £8,500, almost all of which is to be allotted to the relief of the rates. The sum transferred is equivalent to a rate of fully 3d. in the £1.

Bury.—The monthly meeting of the town council was held on Thursday. On the Health Committee's minutes another discussion took place on the abattoir question. The Abattoirs Sub-Committee reported an interview with the representatives of the Bury Co-operative Society, who are constructing an abattoir of their own, for the purpose of trying to arrange some method of avoiding the threatened difficulty, but no arrangement was come to. The Co-operative Society had subsequently resolved, at a crowded meeting of members, to proceed with their own abattoir, and had formally applied to the Health Committee for a licence. This the Health Committee had refused to grant, in face of the fact that the corporation themselves intended erecting public abattoirs in which all the slaughtering of animals must be done. It was at this stage that the council considered the matter on Thursday, and although an amendment was proposed that the question of the licence be referred back, the amendment was lost, the minutes being carried by twenty-one votes to seven.

Cardiff.—Mr. H. Percy Bulnois held an inquiry at the town hall, Cardiff, on Saturday morning, on behalf of the Local Government Board, regarding an application made by the town council for the loan of £34,200 for the purpose of paving Bute-terrace, Adam-street and part of the Penarth-road with hard wood, and also a number of streets, crossings, and the re-laying of footways of certain streets. Evidence in support of the application was given by the mayor and the deputy borough engineer. There was no objection, and Mr. Bulnois stated that he would report the matter in due course, after which the town clerk would receive a communication.

Colchester.—The work of laying the cables for the electric light at Colchester by the contractors (Messrs. Siemens Brothers, of London) is proceeding apace, and already over half of the area proposed to be lighted has been attended to. It is anticipated that the work will be completed by the 29th inst., when the laying of the cables connecting the business establishments and houses requiring the light with the mains will be commenced. It is stated that up to the present there have been numerous applications for the light, every day seeing a fresh batch of orders.

Crewe.—The borough surveyor on Wednesday reported that on the 3rd August, on account of a heavy rainfall, the sewers became overcharged, causing damage to both outfalls and flooding the banks of the Valley and Leighton brooks. The lake in the Queen's Park became full of storm water mixed with the contents of the sewer, and there was a thick yellow scum on the surface, destructive of all vegetable substances coming in contact with it.

Deal.—At a recent meeting of the town council the town clerk stated that the Board of Trade had given the corporation permission to proceed at once with the sea defence works at North Deal. The town clerk added that he had written an urgent letter to the Board of Trade, in which he stated that the council could not allow the north part of Deal to be washed away, and that they proposed to proceed with the work on Monday. A Board of Trade inquiry with reference to the proposed works was to have been held this week.

Eccles.—Some discussion arose on Monday respecting the desirability of adopting a resolution of the General Purposes Committee wherein the opinion was expressed that it is inexpedient at present to carry out the scheme of improvement of the area bounded by Church-street, Barton-street and

St. James-street. The minutes were at length approved by eleven votes to nine.

Halifax.—On Wednesday, at the usual meeting of the town council, the Waterworks Committee presented a minute proposing that after the close of the present municipal year one water-closet and one bath in dwelling-houses should be supplied free of charge; also that no charge should be made for service pipes for the supply of water to dwelling-houses, and that water for warming apparatus in churches and chapels should be supplied free of charge.

Keighley.—At last week's meeting of the town council the Gasworks Committee reported that they had requested the town clerk to give the necessary one month's notice for a special meeting of the council, to be held on the 27th inst., to consider and determine upon the expediency of an application to the Board of Trade on or before the 21st December next for a provisional order authorising the council to put down an installation and supply electricity for public and private purposes within the borough; they further asked the council to authorise them (if such application is determined upon) to take such steps and call in such advice as they may deem necessary in connection with the obtaining of such order. The necessary powers were given.

Littlehampton.—Application will shortly be made to the Local Government Board for sanction to a loan of £1,250 for works of auxiliary water supply.

Liverpool.—At a recent meeting of the Finance Committee of the corporation a report from the city surveyor as to the condition of the roof of the large ball-room at the town hall was approved, and it was decided, if necessary, to have the roof and ceiling reconstructed, at a cost not exceeding £3,000. It is understood that a serious development of dry rot was discovered in the roof, though, unfortunately, this was not ascertained until the work of redecorating the present ceiling was well in hand. The extra outlay is in addition to the £8,000 already voted for certain alterations and redecoration of the town hall. It was hoped that the work originally sanctioned would be completed at the beginning of September, but the reconstruction of the ball-room ceiling will keep the place in the hands of the workmen for some two or three months longer.

Manchester.—At a meeting of the Rivers Committee of the Manchester Corporation, on Monday, a letter was read from Mr. F. J. Willis, the secretary of the Royal Commission on Sewage Disposal, who desired to know whether the committee would permit some members of the commission to visit the Davyhulme works on the 4th of October next. The request was at once acceded to. So far as could be gathered, it does not appear that the members of the commission will hold anything in the nature of a formal inquiry. They only desire to see for themselves what method the Manchester Corporation have adopted in the treatment of their sewage.

Nelson.—On Wednesday of last week a Local Government Board inquiry was held by Major-General Crozier into the application of the town council for sanction to a loan of £40,000 for the extension of the gasworks and gas mains and £20,000 for the purpose of private street improvements. The inspector, accompanied by the borough surveyor, afterwards visited the gasworks, the sewage disposal works, and the streets included in the application.

Ramsgate.—The corporation have decided to widen the Elms in accordance with the plans and specifications prepared by the borough surveyor, at an estimated cost of £430.

Rawtenstall.—A local newspaper states that at a recent meeting of the General Purposes Committee of the town council it was decided to promote a Bill in Parliament to empower them to provide a new water supply for the borough.

Salford.—The Local Government Board have given their sanction to the borrowing of £33,000 by the Salford Corporation for electric lighting purposes. Of the sum named £23,000 is for the establishment of three battery sub-stations and £10,000 for the hood for new generating stations. The board have also signified their approval of the use of the basement of the Pendleton town hall and the subways around the women's second-class baths at Broughton for the purposes of the Salford Electric Lighting Order, 1890.

Southsea.—Some time ago complaint was made by Government authorities that the electric light cables interfered with the working of the service of the telephone in the neighbourhood, and it was apprehended that considerable alterations would have to be made in the system of lighting. It has transpired, however, after a long delay, that a Government expert has reported that the fault rests with the telephone and not with the electric light apparatus.

Torquay.—At last week's meeting of the town council the Harbour Committee submitted a couple of recommendations respecting the repair of the Haldon pier, which they requested to be allowed to carry out, in consequence of the excessive amount of the tenders. The recommendations were then adopted, and the Harbour Committee afterwards met to arrange for the work being undertaken forthwith.

Warrington.—Tuesday's minutes of the Rivers Committee stated that the borough surveyor had been instructed to report upon the condition of the channel in the Mersey, which

the Manchester Ship Canal Company were required to dredge and to keep dredged. A member pointed out that this had been done in consequence of complaints that the dredging of the river was not being maintained as it ought to be. The committee wished to have these complaints verified by the borough surveyor before moving in the matter.

URBAN DISTRICT COUNCILS.

Altrincham.—In reference to a complaint of the Mursey and Irwell Joint Committee as to the unsatisfactory quality of the effluent from the sewage farm at Sinderland, it was on Tuesday stated that the escape of sewage into the effluent pipes had arisen through some pipes giving way in the land recently levelled and drained, and the clerk was instructed to write the Joint Committee accordingly.

Ashford.—An inquiry was recently held by an inspector of the Local Government Board concerning an application of the council for sanction to borrow a sum of £14,000 for the purposes of alterations, extensions and improvements at the gasworks. The present works, it was stated, were hardly large enough for the size of the town. The maximum output was 220,000 cubic feet of gas a day, which was only equal to the consumption at the present time. The consumers last winter complained that the pressure was not high enough. The new works would comprise a new retort-house, forty-eight new retorts with regenerative furnaces, and a telescopic gas-holder capable of storing 140,000 cubic feet of gas. The works, if these alterations and extensions were carried out, could then produce 330,000 cubic feet a day. An application to borrow £2,755 for the purchase of a recreation ground was also made the subject of inquiry. Mr. W. Terrill, the surveyor to the council, gave evidence respecting the position of the land.

Balby.—The district council have instructed their surveyor to prepare plans as soon as possible for the improvement of Queen-street, Carr-hill and St. John's-road.

Bridgend.—The inquiry, instituted by the Local Government Board into the application of the Penybont Main Sewerage Board for leave to borrow £30,000 for the purpose of carrying out a drainage scheme for Bridgend and the surrounding district, was held at the town hall, Bridgend, on Thursday, the inspector being Mr. H. Percy Boulnois. The scheme, it was stated, provided for the outfall sewer to be 1,400 yards below low water-mark. At a certain point the line of pipes went into the parish of Coity Lower, which was not to be drained by this scheme. Precautions had been taken at various points in the pipes to intercept rags, &c. Allowance had been made for an increase of the population of the district in thirty years of 12,000. The only sewer water which would get into the sewers would be rain water and slop water. About 915,000 gallons of sewage per day would pass through the pipes.

Brierley Hill.—The district council have under consideration the desirability of carrying out deep drainage works, embracing the construction of 7 miles of mains, outfall works, &c. If they join with other outlying districts it is estimated that the works will take several years to complete.—The council on Monday decided to erect a fire station, stores, stables, &c., including a caretaker's house, at a cost of £600. The site of the proposed buildings is being purchased at the rate of 9s. 1½d. per yard.

Denton.—A letter was, on Monday, read from the Board of Trade, stating that they had extended the time for the completion of the Oldham, Ashton and Hyde electric tramways to the 12th February, 1899, and that the company had made out a case for a single "decker" car. It was resolved, that, whilst having no further observation to offer on the subject, the committee were of opinion that cars with outside seats were best adapted for the requirements of the district, and the clerk was instructed to ask the Hyde Corporation, the Ashton Corporation and the Audenshaw District Council what action they were taking.

Epping.—A Local Government Board inquiry was held on Wednesday of last week respecting an application of the town council for sanction to borrow a sum of £6,000 for the execution of certain works of sewerage and sewage disposal.

Guisley.—On Wednesday of last week a deputation from the Yendon Urban District Council asked to be allowed to have the New Scarborough sewerage connected with the Guisley disposal works forthwith. The council said they could not accede to the request without the sanction of the Local Government Board, but promised to push the matter forward. Mr. Johnson (Messrs. Preston & Johnson) submitted plans of proposed alterations and additions to the disposal works, also of several new sewers in different parts of Guisley. The cost, including land, he estimated at £5,230, and he advised the council to ask for borrowing powers for £5,500. This was agreed to.

Iford.—On Tuesday of last week Colonel Coke, an inspector of the Local Government Board, held an inquiry into the application of the council for permission to borrow £16,000 for a public park and recreation ground, £750 for the purchase of a steam roller and stone-crushing machine, and £500 for the fixing of hydrants. The proceedings were of a formal character.

Newmarket.—A letter was, last week, read from the Board of Trade with reference to the proposed laying down of an electric light installation. A letter was also received from an electric lighting company giving notice of their intention to lay mains for the distribution of energy in several thoroughfares.

Portishead.—There was last week presented to the council a report on the Portishead sewerage works, stating that during the past month most satisfactory progress had been made. Owing to unfavourable weather the outfall was not finished, although some additional work had been done. It was hoped that the outfall would be finished in a few days. The water and gas pipes had been laid to the engine-house. The machinery had been erected and put in working order, and it was expected that the whole of the machinery would be shortly finished. The whole of the compressed-air pipes, valves and other fittings had been subjected to the prescribed test for leakage, and a few small leaks were discovered, but a second test showed that the leaks were insignificant.

Redditch.—On Wednesday of last week Mr. R. H. Bicknell, Local Government Board inspector, held an inquiry at the district council offices into the proposal of the council to borrow £14,200 for the purposes of the recently-adopted electric lighting scheme and other public improvements, including £11,000 for electric lighting, £700 for street improvements, and £2,500 for purchasing land for electric lighting works and other purposes.

Shipley.—The council have decided, upon the recommendation of the Electric Lighting Committee, to accept the tender of Messrs. Cole, Marchant & Morley, of Bradford, for the supply of a 45 horse-power engine, dynamo, motor and pumps for £1,225 10s., for the pumping station at the sewerage works. A special meeting of the council is to be held on October 4th, to consider the question of electric lighting for the district, with the view of applying for a provisional order.

RURAL DISTRICT COUNCILS.

Belper.—It is reported that the council have issued a circular suggesting a conference of representatives from all the councils in Derbyshire, with a view to the formation of a Derbyshire District Councils' Association, to confer with some or all the authorities which may promote Bills for obtaining water from the Peak district of Derbyshire in the ensuing or subsequent sessions of Parliament.

Chard.—A committee has been instructed by the district council to visit the Sutton sewage works, with the view of acquiring information concerning the septic tank system of sewage treatment.

Darlington.—On Monday, at a meeting of this authority, the Hurworth Parish Council complained of the pollution of the Tees at Croft by the Corporation of Darlington fouling the Skerne, which emptied into the Tees, by sewage. It was decided to ask the county council to take action.—The surveyor reported the finding of a water supply at Aycliffe.

East Ashford.—It was recently reported that the engineer's estimate for the provision of a constant house-to-house water supply at Willesborough and for the drainage of the parish amounted to £16,800, this estimate being based on a supply of water for a population of 10,000 persons. It was further reported that the engineer had been requested to modify his figures on a calculation for a population of 5,000, and that the parish council were considering the advisability of a private company being formed to provide a supply of water. The Ashford Urban District Council had been asked if they could supply water to the houses on the freehold estate and at South Willesborough. The reply to the latter request was to the effect that at Ashford there was barely sufficient water for the requirements of the town at present.

Great Ouseburn, Yorks.—The council have instructed Messrs. Fairbank & Son, of York and Westminster, to prepare a scheme of sewerage and sewage disposal for Aldborough and Boroughbridge in their union. They have also instructed the same engineers to inspect the sewerage and sewage disposal works of Acomb, York, and to report on the best method of disposing of the sewage of that place.

Hollingborne.—Mr. W. O. E. Meade-King, Local Government Board inspector, held an inquiry at the public hall, Sutton Valence, with reference to the application of the rural district council for power to borrow £500 for the purpose of extending the Sutton Valence waterworks. It is now proposed to increase the present supply by lengthening the headings. It is also proposed to raise the reservoir and extend the mains.

Market Bosworth.—The Finance Committee have decided to recommend the district council to apply to the Local Government Board for sanction to an additional loan of £843 for the Ilstock sewerage scheme.

Mutford and Lotheringland.—On the 24th ult. an inquiry was held by Mr. Samuel Walter Wheaton, M.D., an inspector of the Local Government Board, into an application of the council for powers to borrow £2,700 for the purpose of constructing an isolation hospital for the district. Mr. A. Smith, surveyor, and Mr. Clarke, architect, were among those present.

Pontefract.—At a recent meeting of this authority a

letter was read from Mr. Waugh, engineer to the Ferry-bridge and Brotherton proposed drainage scheme, stating that the Local Government Board were pressing for some progress to be reported, and adding that they would not countenance the septic system without the acquisition of land. The clerk said he would write and ask for the matter to be pressed forward. The clerk read a further letter from the Local Government Board stating that all property owners within the statutory distance of the public sewers were liable to be required to connect with the drains at their own expense.

SCOTLAND AND IRELAND.

Aberdeen.—At a meeting of the Gas Committee of the town council, held on the 30th ult., it was resolved to recommend that the price of gas be reduced 1d. per 1,000 cubic feet—namely, from 3s. 2d. to 3s. 1d.—The committee considered the statement of accounts—already published—very satisfactory, and although the estimates showed a large surplus, which would admit of a further reduction than that proposed, they resolved to adopt the suggestion of the convener not to make the reduction more than 1d. meantime.

Dundee.—The Gas Committee of the town council last week resolved to recommend the council to extend the electric lighting plant, at a cost of some £3,000, with the object of making a further demand for current.

Glasgow.—The Water Committee of the Glasgow Corporation met on Monday and decided to accept the offer of Messrs. Robert MacLaren & Co., Glasgow, for the supply of 995 tons of cast-iron water pipes. It will be remembered that at first six tenders were received for the supply of 1,000 tons of piping, the two lowest—£4,282 and £4,965—being from America, and the lowest local tender being £5,641. It was afterwards found, however, that the American offers were for pipes in 12 ft. lengths, in place of 9 ft. as advertised, and it was agreed to re-issue new specifications. This resulted in Messrs. R. D. Wood & Co., Philadelphia, offering to supply 995 tons for £4,892 1s., while the tender of Messrs. R. MacLaren & Co. was £4,958 7s. 4d., a difference of £66 7s. 4d. in favour of the former, or 1s. 4d. per ton less. On the engineer stating that in view of the slight difference it was not worth while placing the order out of the country, the committee accepted the offer of the local firm.

Leith.—The ceremony of laying the last brick on the top of the new chimney in connection with the electric lighting station, now in course of erection at Junction-street was performed on Friday week by Bailey Manclark, convener of the Electrical Lighting Committee of the town council. Among those present were Mr. W. Bryson, electrical engineer for the corporation, and Mr. H. Simpson, architect. Bailie Manclark was presented, on behalf of the builders, Messrs. Kinnear, Moodie & Co., with a silver trowel. The chimney is 155 ft. in height, 18 ft. in diameter at the base, and 12 ft. in diameter at the top, with an internal diameter of 8 ft. 3 in. at the bottom and 9 ft. 3 in. at the top. There is an internal shaft of firebrick to the height of 100 ft., built entirely independent of the outer walls of the chimney, having a space of 10 ft. all round.

Naas.—An inquiry was held recently by Mr. Charles P. Cotton, chief engineering inspector to the Local Government Board, into the necessity for a water supply for the town of Naas, the Naas Board of Guardians, acting as the rural sanitary authority, having applied for a loan of £4,000 for the purposes of the scheme. Among those present was Mr. Francis Bergin, E.M.E., engineer to the board. Evidence was given by Dr. Smyth as to the necessity of a proper water supply to the town, as the present means of supply by public pumps—two of which were condemned—was dangerous to public health. The source for the proposed supply is an historic well near the town which had been closed for many years, but was reopened two years ago. Other evidence was submitted by Mr. Bergin, who said the supply from the well would be abundant and good, and that seventeen fountains would be erected in the town, and the inquiry closed.

Paisley.—In connection with the proposals by the British Electric Traction Company to establish a system of electric traction for a tramway car service throughout Paisley, the town council have met in conference with representatives of the company and had their scheme definitely detailed. This has created a favourable impression. Meantime the council have agreed to meet with Glasgow Corporation Tramways Committee, to learn what they would propose doing in the same direction. Thereafter Paisley Council will come to a decision as to which scheme to support.

FOREIGN AND COLONIAL.

New York.—A contemporary states that some consternation has been caused by a rumour that the safety of the Brooklyn bridge is imperilled by the tremendously increased strain that it has had to bear since the trolley cars have been permitted to cross it. A careful examination shows that, owing to the huckling of a steel truss, the bridge has sagged sufficiently to justify some anxiety. The accident has caused the huge structure to groan and vibrate unpleasantly, but it is believed that there is no actual danger.

Personal.

Mr. Benjamin Milnes, of Wakefield, has been appointed junior assistant in the office of Mr. J. W. Brown, the borough engineer of West Hartlepool.

Blackpool Town Council have adopted a resolution of the Tramways Committee recommending the increasing of the salary of the tramway manager from £156 to £180 per annum.

Eleven applications have been received for the post of surveyor and inspector of nuisances to the Yeadon Urban District Council, and the following three have been asked to meet the council next Wednesday: Mr. W. A. Sharnan, Pontefract; Mr. N. Houlden, Yeadon; and Mr. J. W. Horsfield, Leeds.

We are informed that Mr. F. J. Edge, chief engineering assistant to the city surveyor of Manchester, is performing the duties of the latter gentleman during his (the city surveyor's) absence through illness. Our paragraph of last week mentioning Mr. J. P. Wilkinson as being in charge was therefore incorrect.

At last week's meeting of the Torquay Town Council, on the recommendation of the Water Committee, Mr. A. S. Rendell, of Newton Abbot, was appointed the corporation's arbitrator to settle the disputed compensation respecting the purchase of parts of Middle Westcott and Bullaton farms, in connection with the acquisition of the watershed.

At Tuesday's meeting of the Carnarvan Town Council it was reported that there were thirty-one applications for the post of borough surveyor, and voting took place upon the three candidates selected: Messrs. R. W. Davies, Newtown; E. Hall, Pwllheli; and D. R. Parry, Carnarvan. Upon a division, a majority was found for Mr. Hall.

We learn that Mr. Edgar A. Ashcroft, having severed his connection with the Sulphide Corporation (Ashcroft's process), Limited, is now open to be consulted on all matters connected with metallurgy, mines and minerals, electrical, chemical and general engineering. Mr. Ashcroft is, for the present, occupying offices at 13 Victoria-street, Westminster, S.W.

Consideration was, at the last meeting of the Dublin City Council, given to the appointment of an assistant superintendent of cleansing. The candidates were as follows: Messrs. John J. Gahan, Matthew Rigney, Francis Purcell, Daniel Kavanagh and Francis Richard. In the final poll Mr. Purcell received thirty-two votes and Mr. Gahan sixteen. Mr. Purcell was therefore declared elected.

The Tramways Committee of the Devonport Town Council have appointed Mr. C. H. Chadwell to act as engineer to undertake the preparation of plans and sections, and do all the work necessary for obtaining Parliamentary powers for tramways from the existing borough boundary near Camel's Head bridge to the London and South-Western Railway station at St. Budeaux, for a fee of 4 per cent. on the estimated cost of the work, inclusive of all travelling and other expenses.

On Thursday morning several members of the Edinburgh and Leith Gas Commission and Mr. Herring, engineer, left by the East Coast express for Harwich and the Continent. These gentlemen constitute a deputation from the commission who are to visit a number of the chief towns on the Continent to inspect the gasworks, in view of the erection of new gasworks for Edinburgh and Leith at Granton. They were to cross on Thursday night from Harwich to Amsterdam, and among other cities it is proposed to visit are Copenhagen, Berlin, Vienna, Paris and Brussels.

The South Hornsey Urban District Council proceeded on Wednesday to fill up the office of surveyor and inspector of nuisances, rendered vacant by the appointment of Mr. W. Jameson, the late surveyor, to Whitechapel. There were seventy-two applicants for the post, of which the following were selected to attend before the council: Mr. W. T. Brown (Willesdon), Mr. H. Hille (Shoreditch), Mr. W. Loveday (Mile End), Mr. J. Smith (Islington), Mr. E. F. Spurrell (St. Giles). The final selection was between Mr. Loveday and Mr. Spurrell, and the former gentleman was ultimately appointed. Mr. Loveday has been for many years assistant surveyor at Mile End.

On Monday, at the monthly meeting of the Carmarston Town Council, the clerk submitted a letter from Mr. William Cumming resigning his appointments of borough surveyor and sanitary inspector, he having accepted another situation at a higher salary. Mr. Cumming thanked the members of commission for the uniform courtesy and consideration he had received from all during the five years he had served them. Provost Colquhoun expressed his regret at Mr. Cumming's departure, but in view of the considerable advantage Mr. Cumming was to receive he was sure that, speaking for the commissioners, they had pleasure in hearing of his success. It was decided to advertise for a successor to Mr. Cumming at a salary of £100 per year.

Minutes of the Town Hall Committee of the Manchester Corporation, submitted at Wednesday's meeting of the coun-

cil, referred to the resignation of Mr. Gibbons, chief architect in the city surveyor's department. The lord mayor stated that he and Sir John Harwood had seen Mr. Gibbons and endeavoured to dissuade him from persisting in his resignation, but Mr. Gibbons was still determined to resign his position. That being so, he did not think that anything more could be said in the matter. Sir John Harwood, remarked Mr. Gibbons had been in the town hall for twenty-two years, and during that time he had been under various surveyors. Mr. Gibbons had given every satisfaction. He was a very civil, obliging, and capable man—qualities which did not always go together. He was very sorry indeed that a man who had spent the best days of his life in their service should wish to leave them.

The funeral of Dr. John Hopkinson and his three children, who, as we announced in our last issue, lost their lives on the Dent Veisivi, was held on Friday morning at Territet. The four bodies were brought to Territet on Thursday night and placed in the English church. The coffins were covered with flowers, and many of the wreaths had been sent from England. One was forwarded by the Institute of Electrical Engineers, and the British Vice-Consul at Lausanne sent another. At a special meeting of the council of the Institution of Electrical Engineers, held on the 31st ult., the following resolution was passed unanimously: "That the council of the Institution of Electrical Engineers do hereby place on record this expression of their sincere sorrow and deep regret for the great and irreparable loss sustained by the institute through the untimely and calamitous death of Dr. John Hopkinson, F.R.S., past-president of the Institution of Electrical Engineers, major commanding the Corps of Electrical Engineers, Royal Engineers (Volunteers), and Professor of Electrical Engineering in King's College, London." It was further decided that, subject to its being consonant with the wish of the family, the members of the council should attend the funeral as representatives of the institution, but owing to the alteration in the arrangements it was impossible for them to do so.

The members of the Birmingham and Manchester Association of Students of the Institution of Civil Engineers, accompanied by Mr. T. C. Vaudrey, president of the Birmingham association, paid a highly-successful visit on Friday and Saturday to the Elan Valley, to inspect the waterworks of the Birmingham Corporation, which are now in progress of construction. The journey to this remote spot in Mid-Wales is a tedious one, but it was made in comfort, as the Great Western Railway kindly ran a special saloon through for the party. Mr. James Mansergh, the engineer, who is a vice-president of the Institution of Civil Engineers, personally conducted the party by a special train about 10 miles up the valley as far as the top reservoir, and explained all the details of this vast scheme in a very lucid and interesting manner to the students. On the return journey Mr. Mansergh generously provided luncheon in the offices near the model village, which, with its public buildings, was afterwards visited under the guidance of the village superintendent. The men having just stopped work, the municipal canteen was seen in full working order. The weather throughout was glorious, and, thanks to the kindness of Mr. Mansergh, Mr. Yorndi, resident engineer, and other assistants, who met the party at the various points of interest, the visit proved a most enjoyable and instructive one. The respective honorary secretaries, Messrs. Henry C. Adams, city surveyor's office, Birmingham, and P. F. Story, city surveyor's office, Manchester, had charge of the organisation of the trip, and Mr. Fisher, Lion Hotel, Rhayader, entered for the party.

SUNDERLAND TRAMWAYS.

Mr. J. F. C. Snell, the borough electrical engineer of Sunderland, in concluding a report upon the question of electric traction, says: "I strongly recommend the adoption of the overhead trolley wire system, on the ground that it is the cheapest in construction and working expenses, and affords the best facilities to the public and rat-payers as regards minimum fares with quick and reliable service. A certain amount of opposition may arise from the alleged unsightliness of the overhead wires, but past experience proves that this opposition is entirely removed as soon as the increased advantages of this system are brought home to the public. The corporation have their own electric lighting station, and it must be borne in mind that the same station, with certain additions of plant, will serve both for lighting and traction, reducing the cost of management and wages in a materially helping in the reduction of the general engineering costs of both concerns, and the combination of the two systems will materially increase the prosperity of not only the tramways scheme, but also the electric light undertaking."

Epsom.—Local Government Board sanction have been received by the council to borrow £410 for sewerage extensions in Mill and Bridge roads.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

NEW MEMBERS.

At a meeting of the council, held on Saturday, the following gentlemen were elected

As Members:—

Eugene O'Neill Clarke, county surveyor, Leitrim.
Ernest Charles Cooper, surveyor to Urban District Council, Shanklin, Isle of Wight.
R. P. Hirst, borough surveyor, Southport.
Sydney Howard, surveyor to Urban District Council, Bradford-on-Avon.
Charles Booth Jones, county surveyor, Sligo.
C. J. Mulvany, county surveyor, Roscommon.
A. H. Walker, borough surveyor, Loughborough.
Messrs. Reginald Brown, vestry surveyor, Stoke Newington, and James H. Norris, borough surveyor, Godalming, were transferred to the class of "Members."

THOMAS COLE,
Secretary.

11 Victoria-street,
Westminster, S.W.

MIDLAND DISTRICT MEETING AT BILSTON.

A meeting of the members of the midland district will be held on Saturday, the 17th inst., at Bilston. The following are the arrangements:—

- 11 a.m.—The members will be received in the council chamber, Town Hall, by the chairman (Councillor R. A. Harper, J.P.) and other members of the council. Minutes of Stafford and Rhyader meetings. Election of hon. district secretary.
- 11.30 a.m.—Leave in brakes, kindly provided by Councillor J. W. Sankey, chairman of the Water and Baths Committee, for a visit to the Spring Vale furnaces, arriving about 11.40 a.m., where, by the kind permission of Sir Alfred Hickman, the process of steel manufacture will be witnessed. A short descriptive paper will be given.
- 12.30 p.m.—Leave in brakes for a visit to the waterworks covered service reservoir (which will be specially emptied for the inspection of the members), arriving about 12.45.
- 1.15 p.m.—Leave in brakes for the Hinley Arms Hotel, arriving about 2 p.m., where a light luncheon will be provided by Councillor R. A. Harper, J.P., chairman of the council.
- 3 p.m.—Leave in brakes for a visit to the Bilston waterworks pumping station, arriving about 3.30 p.m.
- 4.15 p.m.—Leave in brakes for the Technical School, Bilston, arriving about 5 p.m.
- 6 p.m.—Dinner at the Technical School. Tickets, 3s. 6d. each (exclusive of wine).

Arrangements will be made for any members desirous of doing so to inspect the public baths and the public market.

Mr. C. L. N. Wilson, the water engineer and surveyor to the Bilston Council, will give a descriptive paper of the works. As the paper will be in the hands of members intimating their intention to attend some days before the meeting, it will be taken as read.

Among the hotels at Bilston may be mentioned the Pipe Hall, Globe and Great Western.

Wolverhampton is within 2½ miles and Birmingham 10½ miles, and there is a good service of trains from these towns. The Great Western station at Bilston is the nearest to the Town Hall.

J. S. PICKERING, A.M.I.C.E., THOS. COLE, A.M.I.C.E.,
Hon. District Secretary, Secretary,
Conc. Offices, Nineaton. 11 Victoria-street, S.W.

EAST LONDON WATER SUPPLY.

SHOREDITCH VESTRY AND THE LOCAL GOVERNMENT BOARD.

On Wednesday, in accordance with the decision of the Shoreditch Vestry, Mr. H. M. Robinson, the vestry clerk, forwarded a reply to the secretary of the Local Government Board, Sir Hugh Owen, with regard to the communication of the board in which it was alleged that a great deal of waste of water by residents was going on. The letter, after stating that the board's communication has been considered, continues: "This vestry emphatically declines to insult the intelligence of the water consumers of this district by urging them, as suggested, not to waste water which they do not get for twenty hours out of the twenty-four, or to assist your board in thus trying to shift some of the blame on to the wretched victims of it. The only waste of water known to this vestry is that caused by the leaky and defective pipes and mains of the company, which was animadverted upon by a metropolitan police magistrate on the recent occasion of the flooding of Commercial-road. To assume, because the company allege that they pump so many gallons of water to each consumer into their mains, that such a quantity ever reaches such consumer to be wasted by him is to confess a faith in the condition of the company's mains that would be

rudely shaken if your board would cause a test to be made of them by raising the pressure therein to 100 lb. per square inch, as provided by the New River Company. The vestry also desire to take this opportunity of informing you that public opinion in this district is beginning, after contemplation of the history of the water question, to have very considerable doubts as to the disinterestedness or intelligence of the Government in their dealings with this matter." After referring to evidence given as to the storage capacity and resources of the water company to some length, the letter concludes: "The storage reservoirs referred to have now been constructed, but the famine continues, and appears this year likely to be worse than any heretofore, and such a result has shaken public confidence in this district in the authorities who have so far dealt with this question, as in the case of the telephone monopoly. The vestry propose, therefore, as a last resource, to appeal to the Railway and Canal Commissioners for a fresh consideration of the circumstances by them."

WATER SUPPLY IN ABERDEENSHIRE.

NEW WORKS AT WATERTON.

The new waterworks for the supply of Dyce, Buckeburn, Bankhead and Stoneywood, or what is known as the Waterton district, have now been completed, and will be formally opened to-morrow. The new scheme owes its origin to the scarcity of water both in Waterton and Dyce. To remedy this the Aberdeen District Committee resolved to introduce, if possible, a new water supply, which would be adequate not only for the present wants of these villages, but also for the requirements of future years. Mr. J. D. Watson, the county engineer, was accordingly instructed to report on this question; and his report was submitted to the committee in the autumn of 1896. In the spring of 1897 the District Committee adopted the plans, which have since been carried into effect.

The source of the new supply is a spring near the kennels at Parkhill House; but, with a view to future requirements, two other springs, also on the Parkhill property, one situated at Aryburn and another at Toddhill, have also been acquired. These, however, will not be requisitioned for many a long year to come; and in the meantime the water of the spring situated near the kennels, which by analysis has been shown to be of excellent quality, and from its softness suitable for drinking, cooking and washing purposes, will be collected in an intake cistern. In the driest season of the year the yield from this spring is 200,000 gallons every twenty-four hours; and, allowing 20 gallons per day to every one of the 5,000 inhabitants of the district supplied, it will thus be seen that the spring will be sufficient until the present population of the district has been doubled. The water is brought from the intake through a 7-in. cast-iron pipe to a point on the Goyal burn near Parkhill railway station, whence it is pumped by a pair of horizontal double-acting pumps driven by two vortex turbine wheels up to a high-level cistern about 200 ft. higher than the pumping station, and nearly 2 miles distant. The cistern into which all the water is pumped is near the Dyce quarries, and from this point it gravitates to the Standing Stones reservoir in a 6-in. cast-iron pipe, nearly 1 mile in length, for the supply of Bucksburn and Bankhead. The Dyce water supply is also carried from the high-level cistern to Dyce reservoir in a pipe 3 in. in diameter.

March.—The Local Government Board have sanctioned the application of the district council for permission to borrow £2,600 for the provision of additional market accommodation. The buildings will comprise a corn exchange, offices and a clock tower, and will be erected in the Market-place.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

INSPECTOR OF NUISANCES.—September 12th.—Northfleet Urban District Council. £80.—Messrs. Sharland & Hatten, clerks, Court House, Gravesend.

THIRD ASSISTANT TO ENGINEER AND SURVEYOR.—September 12th.—Leigh Urban District Council. £70.—Mr. Tom Hunter, engineer and surveyor to the council.

CLERK OF WORKS.—September 13th.—Wetherby Rural District Council.—Mr. E. H. Coates, clerk to the council.

CHIEF ENGINEERING AND SURVEYING ASSISTANT.—September 16th.—Leyton Urban District Council. £130.—Mr. William Dawson, M.I.C.E., engineer and surveyor to the council.

BOROUGH SURVEYOR AND SANITARY INSPECTOR.—September 17th.—Borough of Oswestry. £200.—Mr. J. Parry Jones, town clerk.

ENGINEERING ASSISTANT.—September 17th.—Iffracombe Urban District Council.—Mr. O. M. Prouse, engineer and surveyor to the council.

ELECTRICAL ENGINEER.—September 20th.—Willesden Urban District Council. £400.—Mr. O. Claude Robson, M.I.C.E., engineer and surveyor to the council.

TEMPORARY ASSISTANT.—September 20th.—Llantrisant and Llanwit Fndre Rural District Council.—Mr. Gomer S. Morgan, surveyor to the council, Pontyclun.

SECRETARY AND CITY MANAGER.—September 21st.—York Waterworks Company. £300 with house.—The Directors of the Company, Lendal Hill, York.

DISTRICT SUPERINTENDENTS (TWO OR THREE).—The British Electric Traction Company. £300 to £350.—Mr. G. Stevens, secretary to the company.

CLERK OF WORKS.—Metropolitan Asylums Board. £3 3s.—Offices, Norfolk House, Norfolk-street, Strand, W.C.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

PLYMOUTH.—September 21th.—Erection of shops and dwelling-houses fronting Tavistock-road. £250.—Mr. J. H. Ellis, town clerk.

WIVERTON.—September 22th.—Works of drainage and water supply, for the urban district council.—Mr. C. W. Denton, clerk.

REVELEY.—October 6th.—Erection of municipal buildings, fire station, public offices, &c.—Mr. Chas. J. Grace, town clerk.

ABERVOY.—December 1st.—Extension of the covered market, at a cost not to exceed £5,000. £21.—The Borough Surveyor.

CHERTSEY.—December 31st.—Sewerage and sewage disposal scheme for the No. 1 and 2 wards of the district. £50, £30 and £20.—Mr. T. E. Harland Chubbuck, clerk to the council.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

LANCASHIRE.—September 9th.—Erection of a highway bridge over the river Coln at Pontbrenthall ford, near Pimpsant, for the rural district council.—The Clerk to the Council.

ROMNEY.—September 10th.—Erection of a public convenience, with accommodation for both sexes, on the sea front, for the urban district council.—Mr. P. Scott, surveyor to the council.

NOTTINGHAM.—September 10th.—Sinking of two bore-holes, each 32 in. diameter, in the parish of Broughton.—Sir Samuel G. Johnson, town clerk.

LANCASHIRE.—September 10th.—Repair of Road old bridge crossing the Salden Brook in the townships of Whalley and Read, for the county council.—Mr. W. Harold Radford, county bridge-master, 19 Brazenose-street, Manchester.

WIMBLEDON.—September 10th.—Supply of forage for the six months ending March 31, 1899, for the urban district council.—Mr. W. H. Whitfield, clerk to the council.

BURY ST. EDMUNDS.—September 10th.—Erection of buildings, chimney shaft, &c., for the electric light station.—Mr. J. Campbell Smith, borough surveyor.

RAMSGATE.—September 10th.—Erection of buildings to be used as offices for the gas and water department.—Mr. W. A. Hubbard, town clerk.

BAGBOR.—September 10th.—Supply and erection of electric lighting plant.—Mr. R. Hughes Pritchard, town clerk.

CAKDFRY.—September 12th.—Erection of three new pavilions, lodge and contingent works in connection with the extension of the sanatorium.—Mr. W. Harpur, M.L.C.E., borough engineer.

GLASGOW.—September 12th.—Erection of a bridge over the river Kelvin, opposite Montgomery-street, North Kelvinaide.—Mr. John Lindsay, interim clerk, City Chambers, Glasgow.

BLACKBURN.—September 12th.—Alteration of the slaughter-houses.—Mr. William Stubbs, A.M.L.C.E., borough and water engineer.

ST. PANCRAS.—September 12th.—Supply of about 140,000 (barr) or kerri wood paving blocks for repaving Guildford-street and Milland-road, for the vestry.—Mr. Wm. N. Blair, engineer and surveyor to the vestry.

BEXLEY.—September 12th.—Supply of materials, stores, cartage, team labour, removal of dust and soot rolling, for the urban district council.—Mr. Tom Vickers, surveyor to the council.

LEWIS.—September 12th.—Various works at Valentine's, the site of the public park, for the urban district council.—Mr. H. Shaw, A.M.L.C.E., surveyor to the council.

TORQUAY.—September 13th.—Supply of about 300 tons of Portland cement.—Mr. Henry A. Garrett, A.M.L.C.E., borough surveyor.

ITNEY.—September 13th.—Construction of about 170 yards of main outlet sewer at the sewage farm, New Bilton, for the urban district council.—Mr. R. G. Macdonald, A.M.L.C.E., surveyor to the council.

NORTH RIDING.—September 13th.—Rebuilding, &c., of Tanton bridge, near Stokesley.—Mr. Walter Stead, M.L.C.E., county surveyor, North-Allerton.

BIRMINGHAM.—September 13th.—Construction of aqueduct.—Mr. E. O. Smith, town clerk.

PANEG.—September 13th.—Erection of offices, &c., at Pontymole, Pontypool, for the urban district council.—Mr. Thomas Williams, clerk to the council, Abigon-road, Pontypool.

HEBBERN.—September 13th.—Painting, &c., work at the waterworks pumping station at Wynnaton and at the isolation hospital, for the urban district council.—Mr. W. B. Madin, town surveyor.

HASTINGS.—September 13th.—Supply of about 1,707 tons of 16-in., 169 tons of 18-in. and 84 tons of 6-in. cast-iron water pipes and about 35 tons of iron valves.—Mr. H. Palmer, M.L.C.E., borough engineer.

DOVER.—September 13th.—Erection at a workshop, &c., adjoining the car sheds at Maxton.—Mr. Henry E. Stiles, A.M.L.C.E., borough engineer.

WESTON-SUPER-MARE.—September 13th.—Alterations and additions to the Knightstone baths, for the urban district council.—Mr. Sydney C. Smith, clerk to the council.

ECLES.—September 13th.—Supply of various provender during the half year ending 25th March, 1899.—Mr. Geo. Wm. Bailey, town clerk.

GLASGOW.—September 14th.—Supply of corn, straw and fodder, for the district board of works.—Mr. J. Spencer, clerk to the board.

ST. LEUK.—September 14th.—Construction of an underground sanitary convenience in Old-street, for the vestry.—The Surveyor to the Vestry.

GREENWICH.—September 14th.—Footway paving works in Duntford-street, Ferguson-street and a portion of Gibson-street, for the district board of works.—Mr. J. Spencer, clerk to the board.

GREENWICH.—September 14th.—Demolition of Nos. 50 and 50A Douglas-street, Deptford, for the district board of works.—Mr. J. Spencer, clerk to the board.

ST. LEUK.—September 14th.—Paving of Golden-lane and part of Banner-street with jarrah wood and part of Lawrence-street with granite, for the vestry.—The Surveyor to the Vestry.

EPFING.—September 14th.—Erection of a new ward at the isolation hospital at Theyclon Garton, for the rural district council.—Mr. R. D. Triller, clerk to the council.

HALLIFAX.—September 14th.—Supply of 1,980 tons of 6-in. granite setts, 2,000 tons of 6-in. Lancashire setts and 2,500 yards of wood blocks.—Mr. Edward R. S. Escott, borough engineer.

PULCRATAN.—September 14th.—Paving works in White Hart-lane, for the vestry.—Mr. W. C. Gow, surveyor to the vestry.

GLASGOW.—September 15th.—Various alterations at Strathbungo police station.—Mr. John Lindsay, clerk, City Chambers, Glasgow.

NEWTON-IN-MAREFIELD.—September 14th.—Supply of various road materials for one year commencing 1st October, for the urban district council.—Mr. W. W. Shirley, clerk to the council.

WHITLEY.—September 16th.—Widening of the road from Marine-avenue to St. Paul's church and the road from Park-road, Front-street, to the south end of Whitley-road, for the urban district council.—Mr. J. P. Spencer, Newcastle-on-Tyne.

DALTON-IN-FEMES.—September 16th.—Sewering works in parts of Victoria-street and Back Uverston-road, for the urban district council.—Mr. J. Tyson, clerk to the council.

ROTHWAY.—September 17th.—Supply of a 12-ton steam roller, one sleeping-van and one water-cart, for the rural district council.—Mr. James Wood, surveyor to the council.

EVESHAM.—September 17th.—Building of a new bridge, altering course of brook, and other works connected therewith, at the boundary of Badsey parishes, for the urban district council.—Mr. Edward Williams, clerk to the council.

NOTTINGHAM.—September 17th.—Construction of new sewer.—Mr. Arthur Brown, city engineer.

ABERDEEN.—September 17th.—Supply for one year of electricity meters, house fuse-boxes and house service cables.—Mr. J. Alex. Bell, city electrical engineer.

STAINES.—September 17th.—Making-up of Sidney-road, Bremer-road, Farnell-road and Bilet-road, for the urban district council.—Mr. E. J. Barrett, A.M.L.C.E., surveyor to the council.

STAINES.—September 17th.—Supply and delivery of about 200 tons of 1 1/2-in. broken Glycerine granite, for the urban district council.—Mr. E. J. Barrett, A.M.L.C.E., surveyor to the council.

DOWNPATRICK.—September 17th.—Improvement of the storage reservoir at Tantraghmore.—The County Surveyor, Downpatrick.

LOGHBOUGH.—September 17th.—Construction of a new filter-bed at Nanpantan.—Mr. A. H. Walker, A.M.L.C.E., borough engineer and waterworks manager.

WIMBORNE-ON-NOE.—September 17th.—Sewering, curbing, channeling, paving and installing works in Station-road, for the urban district council.—Mr. H. W. Gladwell, surveyor to the council.

WIMBLEDON.—September 18th.—Making-up of Ashley-road, Caxton-road, Clarence-road, Edith-road, Effra-road (section 4) and Hamilton-road, for the urban district council.—Mr. W. H. Whitfield, clerk to the council.

BURNHAM-ON-CROOK.—September 17th.—Public lighting of the town for one year from 29th September, for the urban district council.—Mr. E. Dillwyn, clerk to the council.

CAMBERWELL.—September 19th.—Painting of the exteriors of Camberwell and Delwich houses, for the vestry.—The Clerk to the Vestry.

WEST RIDDLE.—September 19th.—Erection of a farm residence at the asylum at Nunston.—Mr. J. Vickers Edwards, county surveyor, County Hall, Wakefield.

GLoucester.—September 19th.—Erection of new electricity works.—Mr. George Sheffeld Blackway, town clerk.

BORNESEY.—September 19th.—Sewering, leveling, paving, installing, channeling and making good certain roads, for the urban district council.—Mr. F. D. Askey, clerk.

HULL.—September 19th.—Construction of engine foundations and setting of economiser and four boilers at the Springhead pumping station.—Mr. F. J. Bancroft, water and gas engineer, Town Hall, Hull.

SWANAGE.—September 19th.—Completion of the main sewerage of the district, for the urban district council.—Messrs. Francis Newman & Co., 5 St. Thomas-street, Ryde.

LYFRAM.—September 19th.—Construction of about 900 yards of 3-ft. diameter brick sewer, about 1,500 yards of 24-in. and 18-in. pipe sewer, and engine and storage tanks, together with sea culvert, roadway and other contingent works, for the urban district council.—Messrs. Newton, 17 Cooper-street, Manchester.

WAKEFIELD.—September 19th.—Construction of a cast-iron water-tank, to hold 15,000 gallons, at Woolley-edge in the township of Criggleston, for the rural district council.—Mr. Frank Massee, A.M.L.C.E., engineer and surveyor to the council.

PADDINGTON.—September 19th.—Supply of about 800 cubic yards of fine crushed Thames shingle, for the vestry.—Mr. Frank Debridge, surveyor to the vestry.

ABLEE.—September 19th.—Supply of 100 tons of broken whinstone, for the urban district council.—Mr. W. Gibson, surveyor to the council.

TORQUAY.—September 19th.—Supply of meters and arc lamp carbons for twelve months from 1st October.—Mr. F. Storey, borough electrical engineer.

LIVERPOOL.—September 20th.—Alterations at the Noble-street public wash-house, for the corporation.—Mr. W. R. Court, engineer and chief superintendent, Cornhill-street Baths, Liverpool.

LONDON.—September 20th.—Construction of underground conveniences at Queenbith.—The City Engineer, Guildhall, E.C.

LEEDS.—September 20th.—Supply of (a) poles and (b) trolley wire and attachments in connection with the extension of the electric tramway systems.—The City Engineer.

ABLEE.—September 20th.—Excavating, leveling and paving works in Albert-street Back-lane and Middleton-street Back-lane, for the urban district council.—Mr. W. Gibson, surveyor to the council.

RECKLOW.—September 20th.—Re-tying of certain hoistler pavements and channels in the section, Parlington and Warboston, for the rural district council.—Mr. Joseph Burgess, highway surveyor, Tabley, Knutsford.

GOSFORD AND ALBERTSKEKE.—September 20th.—Supply of various materials during the year ending 30th September, 1898, for the urban district council.—Mr. H. Frost, surveyor to the council.

HARTING TOWN.—September 20th.—Supply of a 6 or 10-ton steam road-roller adapted to the section, for the urban district council.—Mr. E. H. Lister, clerk to the council.

BRADFORD.—September 21st.—Supply of about 150,000 (barr) or kerri wood paving blocks.—Mr. J. H. Cox, borough engineer.

KASTINGTON.—September 21st.—Water supply works for Wingate Mill, Wingate-lane and High Whentley Hill, for the rural district council.—Messrs. D. Bulford & Son, 3 St. Nicholas-building, Newcastle-on-Tyne.

LEEK.—September 21st.—Erection of a science and art school and county silk school, for the urban district council.—Mr. Chas. Henshaw, clerk to the council.

HULL.—September 21st.—Supply of steel roofs and sundry iron and steel work for the tramway power station.—Mr. A. E. White, city engineer.

HOTLAND.—September 22nd.—Construction of about 73 yards of 15-in., 1,600 yards of 12-in. and 1,960 yards of 9-in. pipe sewers, in connection with the King-street and Plaits Common sewerage, for the urban district council.—Mr. William Farrington, A.M.I.C.E., engineer and surveyor to the council.

BLAYDON-ON-TYNE.—September 22nd.—Erection of new public offices and a technical school, for the urban district council.—Mr. H. Dalton, clerk to the council.

EAST SUSSEX.—September 23rd.—Erection of two temporary buildings for 100 patients at the county lunatic asylum.—Mr. Henry Card, county surveyor, County Hall, Lewes.

WILLEXHILL.—September 24th.—Supply of various stores and materials during the six months ending March 31, 1899, for the urban district council.—Mr. Chas. J. Jenkin, town surveyor.

BECKENHAM.—September 26th.—Widening of Croydon-road and East End-road, for the urban district council.—Mr. John A. Angell, surveyor to the council.

BECKENHAM.—September 26th.—Erection of about 200 cast-iron ventilating columns, 13 ft. 6 in. high, on concrete beds, together with the laying of 9-in. stoneware pipe connections to the main sewers, &c., for the urban district council.—Mr. John A. Angell, surveyor to the council.

WITNEY.—September 26th.—Main drainage of Eynsham, for the rural district council.—Mr. Nicholas Lauley, A.M.I.C.E., 16 Great George-street, London, S.W.

HASTINGS.—September 27th.—Excavating and steining two wells, about 270 ft. deep, at Brade.—Mr. D. H. Palmer, M.I.C.E., borough engineer.

HASTINGS.—September 27th.—Construction of two covered service reservoirs (each 1,500,000 gallons capacity) at Ore.—Mr. P. H. Palmer, M.I.C.E., borough engineer.

BEXHILL.—September 28th.—Supply of various electric light plant, for the urban district council.—Mr. A. H. Preece, A.M.I.C.E., 30 Victoria-street, London, S.W.

HULL.—September 30th.—Supply of forty-five electric motor cars, twenty trail cars, two sprinkler cars and two traversing platforms.—Mr. A. E. White, city engineer.

RAMSGATE.—October 5th.—Erection of a refuse destructor.—Mr. T. G. Taylor, borough surveyor.

SOUTHAMPTON.—October 11th.—Supply and fixing of three high-pressure Lancashire boilers, economisers, calorifiers, radiators, steam and hot-water mains, and all necessary pumps, valves, &c., required for the extension of the heat and power generating plant at the county lunatic asylum at Knowle, Fareham.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

EDINBURGH.—October 17th.—Various works in connection with gasholder tank at Granton.—Mr. James M'G. Jack, clerk to the commissioners.

TENDERS.

*ACCEPTED.

BIRKENHEAD.—For the sinking of a bore-hole in connection with proposed pumping station.—Mr. W. A. Richardson, water engineer; E. Timmins & Sons, Runcorn; J. Wilson, Runcorn; J. Smalley, Hall; P. Matthews, Manchester; J. Wilding, Parbold, Wigan; Chapman, Salford.*

DARWEN.—Accepted for the erection and construction of iron and steel buildings in connection with a refusa destructor.—Mr. Charles Coateker, town clerk.—
E. Wood & Co., Limited, Manchester.

FARNHAM.—For the supply of forage for twelve months from September 12th, for the urban district council.—Mr. L. W. Cass, surveyor to the council:—
W. Hall, near Alton*... .. 452

NELSON.—Accepted for the supply of 550 lineal yards of wrought-iron unchimbable fencing.—Mr. B. Ball, borough engineer.—
W. Walton, Newtown Iron Warehouse, Bromley.

SOUTHBOROUGH.—For various street works, for the urban district council.—Mr. Philip Hamner, clerk:—
W. A. Locke, High Brooms £3,057
J. Jarvis, Tunbridge Wells 2,900
W. Wadley, Stoke Newington 2,700
W. H. Wheeler, Southwark 2,429
T. Hallett, Tunbridge Wells 2,367
T. Free & Sons, Maidenhead* 2,365

TONBRIDGE.—Accepted for the supply of 1,000 tons of best quality 2-in. broken quartzite, Guernsey granite, &c.—Mr. A. H. Neve, junr., clerk to the urban district council:—
C. M. Manuelle, 12 Lime-street, E.C., 13s. 6d. per ton.

MEETINGS.

SEPTEMBER.

19.—Plumbers' Company: Public meeting at Manchester, for the distribution of prizes awarded in connection with the recent exhibition of plumbers' work at Manchester.

EXAMINATIONS, 1899.

PRELIMINARY EXAMINATION.

Notice is given that the Preliminary Examination for the admission of Students will be held on the 18th and 19th of January next.

It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London.

Irish candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS.

Notice is also given that the Annual Professional Examinations for Land Agents, Valuers and Building Surveyors (held

under the provisions of the Charter), qualifying for the Fellowship and Association of the Institution, will commence on the 20th of March next.

English candidates for the Professional Examinations will be examined in London.

Irish candidates will be examined in Dublin.

Particulars as to subjects, course of examination, prizes and scholarships can be obtained of the Secretary.

All applications for the Professional Examinations, Divs. II., III., IV., and V., must be sent in before the 31st of October, and applications for the Students' Preliminary Examination before the 30th of November. The necessary entry forms for the various Examinations can be obtained of the Secretary.

APPOINTMENTS OPEN.

ILFRACOMBE URBAN DISTRICT COUNCIL. WANTED IMMEDIATELY.

Engineering Assistant (fully qualified), to devote the whole of his time for a period of not less than three months. Must have had varied experience in the construction of sewers, and in the preparation of plans, estimates, specifications, &c., in connection with the same. State salary required, which will be paid monthly.

Apply, by letter, on or before Saturday, September 17, 1898, stating experience and enclosing copies of recent testimonials to

O. M. PROUSE,
Engineer and Surveyor.

Town Hall, Ilfracombe,
September 6, 1898.

WILLESDEN DISTRICT COUNCIL. ELECTRICAL ENGINEER.

The Willesden District Council require the services of an Electrical Engineer for the design of an electric lighting installation, and the ultimate management and maintenance of the same after completion.

He shall be resident in the district, and shall devote the whole of his time to the duties of his office. The salary will be £400 per annum, with office, assistants and supply of all office materials.

All further particulars may be obtained upon application to Mr. O. Claude Robson, M.I.N.S.T.C.E., Engineer to the Council, Public Offices, Dyne-road, Kilburn, N.W., on and after September 6, 1898.

CONTRACTORS FOR DRAINAGE AND WATER SUPPLY WORKS.

Applications, endorsed "Electric Lighting Engineer," stating age and enclosing not more than three recent testimonials (copies only, which will not be returned), to be addressed to the undersigned, and delivered not later than p.m. on September 20, 1898.

Personal canvassing is strictly prohibited and will disqualify the candidate.

(By order)

STANLEY W. BALL,
Clerk to the Council.

Public Offices, Dyne-road, Kilburn, N.W.
September 1, 1898.

LEYTON URBAN DISTRICT COUNCIL.

The Council invite applications for the appointment of Chief Engineering and Surveying Assistant. He must be an accurate and expeditious draughtsman, surveyor and leveller, and possess a good knowledge of drainage and sewerage works, designing and building construction; be capable of preparing estimates, and must be conversant with the Model By-Laws of the Local Government Board. Salary, commencing at £130 per annum, rising by yearly increments of £10 to a maximum of £200 per annum.

Applications, giving full particulars as to experience, age, present and previous occupation, &c., and accompanied by copies of four recent testimonials, to be addressed to Mr. William Dawson, M.INST.C.E., Town Hall, Leyton, not later than Friday, the 16th inst.

Canvassing members of the Council will disqualify any candidate.

(By order)

R. VINCENT,
Clerk.

September 6, 1898.

LEIGH URBAN DISTRICT COUNCIL.

Wanted, a Third Assistant in the office of the Engineer and Surveyor. Must be a good draughtsman, surveyor and leveller, and have been trained in a municipal office. Salary, £70 per annum.

Applications, stating age and qualifications, together with copies of three recent testimonials, will be received by the undersigned up to 12th September, 1898.

TOM HUNTER,
Engineer and Surveyor.

Leigh, Lancashire.

LANTRISANT AND LLANTWIT FARDRE RURAL DISTRICT COUNCIL.

Wanted, at once, as Temporary Assistant in Surveyor's office, a man who has had experience in the preparation of plans for water and sewerage.

Applications (accompanied by copies of three recent testimonials), stating age, qualifications and salary required, to be sent to the undersigned on or before Tuesday, the 20th inst.
GOMER S. MORGAN.

Surveyor's Office, Pontyclun.

TO PARENTS AND GUARDIANS. CIVIL ENGINEERING PUPIL.

The Borough Engineer and Surveyor of the County Borough of Brighton has a vacancy for an Articled Pupil.—Apply to Mr. Francis J. C. May, M.INST.C.E., F.S.I., Town Hall, Brighton.

YORK WATERWORKS COMPANY.

Wanted, a Secretary and City Manager. One having had previous experience in a waterworks office preferred. Salary, £300 a year with house.

Application, with not more than three testimonials, to be forwarded by the 21st September instant, addressed to the Directors of the York Waterworks Company, Lendal Hill, York.

ARCHITECTURAL ASSISTANT.

Required, immediately, in a District Surveyor's office, adjacent to London, a thoroughly competent Architectural Assistant, capable of preparing designs for public buildings from sketches, working drawings and specifications. Weekly salary, 3½ guineas.—Qualifications, stating age, together with testimonials, to be sent to "X" office of THE SURVEYOR, 24 Bride-lane, Fleet-street, London, E.C.

TENDERS WANTED.

CITY OF LONDONDERRY, TO WIT.

The Corporation of Londonderry invite proposals for the Purchase of their Steam Road-roller, which can be inspected, at any time up to date of tendering, in the shed in Victoria Market.

The Corporation also invite tenders for Supplying a New 10-ton Compound Steam Road-roller. Contractors to set out in tender a full description of roller to be tendered for, with date at which it is proposed to be delivered in Londonderry.

Tenders, endorsed "Tender for Steam Roller," to be lodged with me at my office, situate in the Guildhall, Londonderry, not later than Saturday, the 24th day of September instant. Dated this 6th day of September, 1898.

(By order of the Corporation)
R. NEWMAN CHAMBERS, KNT.,
Town Clerk.

WILLENHALL URBAN DISTRICT COUNCIL.

The above Council desire tenders for the undermentioned Supplies during the six months ending March 31, 1899:—

- | | |
|---------------------------|--------------------------------|
| Portland Cement. | Lime. |
| 2½-in. Basalt or Granite. | 4-in. cubes Basalt or Granite. |
| Cast Iron Work. | Disinfecting Powders. |
| Disinfecting Fluids. | Machine Oil. |
| Cylinder Oil (Marine). | Lamp Oil. |
| Petroleum Jelly. | Aluminoferrous Cake. |
| Stoneware Pipes. | Coal. |
| Coke. | Gas Tar. |
| Cotton Waste. | Scavenger Brooms. |
| Paving Bricks. | Steel Picks. |
| Steel Shovels. | 8 vo. Printed Notices. |

Drawing Materials.

Specification may be seen and form of tender and further particulars as to minimum quantity, &c., may be obtained on application at the Town Surveyor's office.

Sealed tenders, endorsed "Supplies," together with samples where required, to be sent to me on or before Saturday, September 24, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(Signed) CHAS. J. JENKIN, C.E.,
Town Surveyor.

Council Offices, Willenhall.
September 7, 1898.

COUNTY BOROUGH OF HALIFAX.

The Tramways Committee of the Halifax Corporation are prepared to receive tenders for the Supply of 1,000 tons of 6-in. Granite Setts, 2,000 tons of 6-in. Lancashire Setts, and 2,500 yards of Wood Blocks.

Specifications may be seen and forms of tender obtained on application to Mr. Edward R. S. Escott, C.E., Borough Engineer, Town Hall, Halifax.

Tenders, properly endorsed, must be sent to the under signed on or before Wednesday, 14th September, 1898.

The person whose tender is accepted will be required to observe the fair contracts clauses adopted by the Corporation. The Committee do not bind themselves to accept the lowest or any tender.

(By order)
KEIGHLEY WALTON,
Town Clerk.

CITY OF GLOUCESTER.

NEW BUILDINGS FOR ELECTRICITY WORKS.

TO BUILDERS AND CONTRACTORS.

The Corporation of Gloucester invite tenders for the Erection of the New Buildings in connection with the above.

Plans and specification may be seen at the office of Mr. Harry A. Dancy, 26 Clarence-street, Gloucester, between 10 a.m. and 5 p.m., after Monday, 5th September next.

The quantities are being prepared by Mr. Dancy, and may be obtained from him on payment of a charge of £2 2s., which will be returned on receipt of a bond *pro rata* tender.

The Committee do not pledge themselves to accept the lowest or any tender.

Tenders, endorsed "Tender for Electricity Works," to be delivered at the Town Clerk's office, Guildhall, Gloucester, before 11 o'clock on Monday, the 19th September, 1898.

(By order)
GEO. SHEFFIELD BLAKEWAY,
Town Clerk.

Guildhall, Gloucester.
August 30, 1898.

ROTHBURY RURAL DISTRICT COUNCIL.

The above Council invite tenders for the supply and delivery of a 12-ton Steam Roller at Rothbury, Northumberland; also for a Sleeping-Van, with furniture and bedding for three men; also one Water-Cart, to hold 200 gallons, with pump and spreaders all complete.

Tenders, including specification and other particulars, to be sent to the undersigned not later than Saturday, the 17th day of September, 1898.

JAMES WOOD,
Surveyor.

COUNTY OF SOUTHAMPTON.

COUNTY LUNATIC ASYLUM, KNOWLE, NEAR FAREHAM.

EXTENSIONS, &c.—CONTRACT No. 3.

TO STEAM AND HOT-WATER ENGINEERS.

Persons desirous of tendering for the supply and fixing of three high-pressure Lancashire Boilers, Economisers, Calorifiers, Radiators, Steam and Hot-Water Mains, together with all the necessary Pumps, Valves, &c., required in the centralisation and increase of the heat and power generating plant at the County Lunatic Asylum, Knowle, Fareham, may obtain copies of plans and specification of the scheme and any other information on application at the office of Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on and after September 12th, between the hours of 9 a.m. and 5 p.m., Saturdays between 9 a.m. and 1 p.m. A deposit of one £10 Bank of England note will be required for each set of plans and specification. The deposit will be refunded on the return of the plans and specification together with a *bona-fide* tender.

Tenders, strictly in accordance with forms supplied by the County Surveyor, to be delivered to me on or before October 11th next.

The Committee of Visitors do not bind themselves to accept the lowest or any tender.

JOHN R. WYATT,
Clerk to the Committee of Visitors.

Knowle.
August 31, 1898.

BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.

The Beckenham Urban District Council invite tenders for Widening Croydon-road and Elmers End-road. The works comprise the widening of Croydon-road for about 800 lineal feet and of Elmers End-road for 150 lineal feet, together with the formation of new footways. In connection therewith the following works are necessary—*viz.*, about 800 lineal feet 9-in. pipe sewer, 700 lineal feet 9-in. pipe surface-water drain, with manholes, gullies, &c., 110 lineal feet concrete re-

taining wall about 4ft. high, 1,000 lineal feet curb and channelling, making-up roadways, &c.

Plans and sections may be seen, and bills of quantities, specifications and forms of tender obtained, on application to Mr. John A. Angell, Surveyor, on or after September 7th, on deposit of £1, which will be returned on receipt of a *bona-fide* tender.

A clause will be inserted in the contract providing that the contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Tenders, duly sealed and endorsed "Tender for Widening Croydon and Elmers End Roads," to reach undersigned not later than 4 p.m., Monday, September 26, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
F. STEVENS,
Clerk to the Council.

August 30, 1898.

BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.

The Beckenham Urban District Council invite tenders for Erecting about 200 Cast-Iron Ventilating Columns, 13 ft. 6 in. high, on concrete beds, together with the laying of 9-in. Stoneware Pipe Connections to the main sewers, &c.

Plans and sections may be seen, and bills of quantities, specifications and forms of tenders obtained, on application to Mr. John A. Angell, Surveyor, on or after September 7th, on deposit of £1, which will be returned on the receipt of a *bona-fide* tender.

A clause will be inserted in the contract providing that the contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Tenders, duly sealed and endorsed "Tender for Erection of Ventilating Columns," to reach undersigned not later than 4 p.m. Monday, September 26, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
F. STEVENS,
Clerk to the Council.

Minutes of Proceedings.

The Bacteriology of Crude Sewage.

It is possible that within a very few years we shall be able, by the aid of bacteriology, to arrive at a fairly reliable estimation of the character of and of the part played by bacteria in sewage, and to classify these organisms in the same manner as we do other, but larger, organisms in the animal and vegetable kingdoms. The report on the bacteriological examination of London crude sewage recently presented to the County Council by Dr. Frank Clowes, chemist to the Council, advances our knowledge in considerable measure in this respect. It appears that the Council decided, several months ago, to construct experimental filters of coke for the treatment of crude sewage, and appointed Dr. Hostonas a bacteriologist to co-operate with Dr. Clowes in an investigation into bacterial filtration. Although the London County Council are somewhat belated in their experiments in the construction of crude sewage bacteria filters—numerous smaller authorities having successfully adopted such filters long before the Council arrived at a determination to do so, and in one case, that of Sutton, Surrey, such a filter was constructed as early, we believe, as November, 1896—nevertheless the council's experiments will be followed with considerable interest by engineers and chemists from a scientific point of view. Smaller authorities, with remarkably few exceptions, are unable to maintain a staff of chemists and bacteriologists, and although sufficient is known to prove that the bacteria filter destroys the sludge by the action of aerobic organisms, and that in like manner by the aid of anaerobic organisms, sludge is liquefied in the equally well-known septic tank process, yet the *rationale* of the process in either case has not yet been demonstrated to such a degree as to satisfy the scientific mind of the engineer. For the reason that the investigations will be conducted under such conditions and by men of such high repute in their profession, the results will be, when published, most welcome and valuable. Some remarkably good work in the study of bacteria in sewage, chiefly as regards their presence and characteristics, has been carried out by Mr. Jordan, and is embodied in the report of the State Board of Health of Massachusetts (1888-90, Part II.); by Sir Henry Roscoe and Mr. Lund, published in "The Transactions of the Royal Society, 1892"; and by Mr. J. Parry Laws and Dr. Andrewes for the London County Council, published as a separate report in 1894, under the title of "Micro-Organisms of Sewage"; but apart from these, little systematic work has been done. Moreover, that which has been published is not sufficient from a practical point of view.

The present report by Dr. Clowes is preliminary, we learn, to a bacteriological study of the filter itself and of "the filtrates," or filtered sewage, which discharged as an effluent from the coke filter, and really a bacteriological study of the raw sewage as to gain a knowledge of the number and kind

of bacteria therein. The new coke filter had been in action up to June last, when this report was presented, for about seven weeks, and was considered to be rapidly maturing or arriving at a period when it furnishes its best results. The methods employed in the examination of the sewage as described in the report certainly deserve notice, but to the ordinary reader it may be of greater interest to learn that Barking sewage contains on an average nearly 4,000,000 and Crossness sewage 3,500,000 bacteria per cubic centimetre (= 00176 pint), and that waste matters from manufactories, which are discharged in large quantities into the London sewers and yet may be regarded as foreign to sewage, do not inhibit the growth of the sewage bacteria to any marked extent. We should have been glad to have had some information as to the extent to which sewage when first discharged into the sewers is charged with bacteria, but are disappointed to be told that such is not known; in other words, we conclude that experiments have not been conducted to ascertain their presence and condition. It cannot therefore be said, we learn, that there is either an increase or decrease in the number of spores during the passage of the sewage to the outfalls. It is possible that the original spores germinate into cells in the sewers, but as the struggle for existence between the different species increases they possibly again form spores. In future reports it is anticipated that it will be possible to explain whether the conditions prevailing in the biological filters lead to an increase or a decrease in the number of spores. Some bacteriologists hold that bacteria proceed to sporulation chiefly or solely when the cells have attained their highest development, while others assert, we learn, that bacteria change from a transitory "growth form" to a "persistent spore form," in order to avoid extinction when the conditions for their growth are unfavourable. Some particulars are given as to the number of liquefying bacteria found in the sewage, these being always very great. The rapidity with which they multiply may be gathered from the statement that the multiplication is so rapid as to liquefy the gelatine and "flood" a plate before it is ready for counting.

Aerobic putrefaction is at work, we gather, on the sewage in transit through the sewers, and this is accompanied and followed by a decomposition produced by facultative anaerobes. As to the volatile products evolved during the process of aerobic putrefaction, these are carbonic acid, ammonia, &c., while the gases which are given off during the anaerobic decomposition of organic matter are hydrogen, marsh gas, sulphuretted hydrogen, &c. "Speaking generally," Dr. Clowes writes, "it may be said that there is less nuisance, and perhaps less danger, attending aerobic than anaerobic putrefaction, and if the two processes are equally efficacious in splitting up the various and complex kinds of organic matter present in the sewage into their elementary and innocuous

constituents, then preference must be given to the aerobic process." The report is illustrated with photographs of some of the bacteria found in London crude sewage, and contains a lengthy table showing the results of the bacteriological examinations. Speaking generally, we believe that the report will be found of considerable value, and will assist to a better understanding of the life history of bacteria and of the part which they play in the changes which sewage undergoes. We shall, however, await with interest the promised further report on the subject.

* * *

An American Engineer on Bacterial Sewage Purification.

In the September number of *The Engineering Magazine* Mr. Rudolph Hering, the well-known American civil engineer, has an article on "Bacterial Processes of Sewage Purification." So far as regards the septic tank and the Dibdin experiments at Sutton the article is merely a repetition of information that has long been familiar to those who follow the subject in this country. Mr. Hering quotes from the reports of Mr. Dibdin and from a description of the Sutton experiments which has been given by Mr. C. Chambers Smith, the engineer and surveyor to the Sutton Urban District Council. In connection with the septic tank Mr. Hering quotes from a French periodical an account which appeared about seventeen years ago of a contrivance that certainly seems like an anticipation of the principle of the septic tank—that is to say, the liquefaction of crude sewage by the operation of anaerobic organisms. Mr. Hering's conclusions will be of interest to many of our readers. He considers that the bacterial process will be satisfactory if the sewage is previously freed from suspended matters, and if there is not enough poisonous matter in the sewage to destroy the useful bacteria. The difficulties which he anticipates in the Sutton process lie in the possible gradual filling up of the filters with slowly-oxidisable vegetable matter not strained out by the screens, on the ground that it is difficult to operate economically a strainer fine enough to keep out fibrous vegetable material. Mr. Hering goes on to say that at Leeds it was found that the sludging up of the beds was one of the chief difficulties, and that a permanent relation between the length of time during which the retained fibrous sewage matter is removed by oxidation and the amount of sewage that can be permanently filtered per square yard of filter area has not yet been discovered. He does not find that the cost of construction and of annual operation has been definitely determined, and he considers that sufficient time has not elapsed to give results which can be permanently relied upon. His general position is eminently cautious. While admitting that the Exeter and Sutton experiments are not only interesting, but promise to improve the present methods of sewage disposal where suitable land for slow filtration is not available, he considers it judicious to remark that the improvement may not be so great as the promoters anticipate. The following passage is worth quoting:—

It appears that with a limited amount of land permanent success in purifying sewage can be accomplished only by a prior separation of the suspended and dissolved organic matter. Organic matter in solution can be thoroughly purified by aerobic bacteria, and in large quantities per acre in properly-devised filters of sand, coke breeze, or similar porous and permanent material, operated intermittently. Undoubtedly, also, some fine fibrous or globular nitrogenous matter may also be removed by this relatively rapid process. But the organic matter in suspension requires a preliminary separate treatment, either, first, by a system of chemical precipitation, or, secondly, by a system of liquefaction as accomplished in the septic tank, by which the quantity of sludge is at least very greatly reduced, or, thirdly, by a preliminary very fine screening, with a subsequent liquefaction of the remaining suspended matter in a so-called bacteria tank. Whether the first, second or third method will prevail in the future depends largely on the question of cost of

obtaining satisfactory results, which may be ascertained from the experience now being gained.

* * *

Hampstead Vestry Electricity Accounts.

The recently published accounts of the electric lighting department of the Vestry of St. John, Hampstead, reveal a very interesting state of affairs, and it is evident that the works now form a most important branch of the administration of the vestry. In considering these accounts there is one very important point to be remembered, and that is that the expenditure on mains when compared with the cost of other portions of the system is exceedingly high; but the vestry very early adopted the course of laying electric lighting mains in almost every road in the parish. This policy, which was initiated at the opening of the station, is now bearing fruit, and future consumers will be connected up to the existing mains without much additional expense. As evidence of the increase in the number of consumers, it is only necessary to mention that the outlay on their meters is very much in excess of the two preceding fifteen months. The capital expenditure for the year is £16,845, which now brings the total capital expenditure to £100,176. In a sense there is a difficulty in comparing the results of the past year's accounts with what has gone before, because the two previous accounts each cover a period of fifteen months. In spite of that fact, however, the receipts for the past twelve months stand at the substantial figure of £8,081, as against £5,257, being an increase of £2,823, or nearly 54 per cent. Another way of comparing the figures is to take the average income per quarter, and this during the fifteen months ended March, 1897, was £2,685, while the average income per quarter during the twelve months ended March, 1898, was £3,982. Notwithstanding the considerable addition to income, the expenditure during the past twelve months does not differ very materially from that incurred during the previous fifteen months. The coal bill, which usually forms the heaviest item of expenditure, amounts to £3,330, as against £3,100 for the preceding fifteen months, and this, considering the output, is a highly satisfactory figure. The real interest in these electricity accounts, however, is the nett profit on the undertaking after discharging the interest and principal of loans and providing for all debts. After making due credit for these items the nett profit is no less than £3,905—a most gratifying result. There is one statement in the accounts that we cannot agree with, although it is one that has been accepted occasionally in the conduct of municipal electricity works. It is held that repayment of the principal of loans is equivalent to a contribution to a sinking fund; but although this might be a fair way of looking at the matter when comparing the economy of the undertaking with that of a private company, it is to be hoped that the vestry will not act upon that assumption when dealing with future profits. We hold the strongest possible opinion that a sinking fund or a reserve fund should be built up out of the early profits of an undertaking, in order to meet the improvements in electrical machinery that might take place almost at any period. The following table illustrates the rate of progress made by the undertaking since 1895:—

Items of Income and Expenditures.	Fifteen months to Christmas, 1895.	Fifteen months to Lady Day, 1897.	Twelve months to Lady Day, 1898.
Sale of current ...	£3,432	£11,583	£14,238
Public lighting ...	1,030	1,470	1,145
Rental of meters ...	142	365	531
Sundry receipts ...	3	8	16
	£4,607	£13,426	£15,930

In order to cope with the development of the undertaking, the vestry have been for some time negotiating for a loan of £51,500, which, it is expected, will more than meet the expenditure to Lady Day. From that we may conclude that in the

natural expansion of the business fresh capital will very shortly be necessary.

The British Association Meeting.

As we anticipated, the proceedings at this year's meeting of direct interest to our readers were practically confined to the papers indicated in our last issue as set down for reading in the sections devoted respectively to Mechanical Science and to Economic Science and Statistics. In the former the president, Sir John Wolfe Barry, delivered an able address of general engineering interest but with comparatively little reference to municipal work. On Thursday, in this section, a paper was contributed by Messrs. Dibdin and Thudichum on the conditions necessary for the successful treatment of sewage bacteria, and this we shall deal with separately. On Monday Mr. Alfred Gibbings, president of the Municipal Electrical Association, discoursed on the application of the electric motor to small industrial purposes; Mr. H. Faraday Proctor, city electrical engineer, described the Bristol electric lighting undertaking; and Prof. Sylvanus Thompson and Mr. Miles contributed a paper on electric traction by surface contacts. On Tuesday, practically the closing day of the sectional proceedings, Prof. Fleming called attention to the electrolytic corrosion of gas and water pipes by the earth currents from electric railways and tramways. Of even greater interest from a municipal point of view were Monday's proceedings in the Economic Science and Statistics section. The important question of the legitimate scope of municipal undertakings received opportune discussion. In these columns we have in general favoured the municipalisation of those great public services which are of the nature of a monopoly; but we have pointed out that in the case of the telephone, for example, the conditions call rather for State than for municipal control. Mr. Pearson's paper on "Municipalities as Traders" we are printing separately in full, and a selection of other papers will be found summarised in a general report.

Restrictions upon Officials.

It would be hard to say where the placing of harassing and tyrannical restrictions upon local government officials would end if some people had their way. It can scarcely be believed, however, that a proposal such as that of which we hear from Lambeth would be adopted by any body of reasonable men, but it has, rightly enough, been taken seriously by the various metropolitan local government employees' associations, who are watching results with a view to taking such action as may be deemed necessary and desirable. It is said that a member of the Lambeth Board of Guardians proposes to bring forward resolutions with the amiable object of abolishing the present system of granting testimonials. He desires to provide that the heads of departments should not give testimonials to their subordinates, and that the board should not grant testimonials to officers and servants seeking other situations while still in the employment of the guardians. This gentleman, however, is agreeable that in such cases letters, signed by the chairman and countersigned by the clerk, might be sent to the authority filling a vacancy. It will at once be obvious how unjust the working of such a system might be to many applicants; but the chief feature of the proposals is that they appear so needless. As we have said, we should be surprised if they were adopted either at Lambeth or elsewhere; but when proposals, even if objectionable, are adopted by one authority other bodies show a tendency to take them up. The matter should therefore be watched in the interests of local government officials, who have quite enough burdens to

bear. We may have occasion to say something when it is actually brought up, and when we have perused the text of the resolutions, the arguments by which they are supposed to be supported, and the objections raised to the present system.

Threatened Litigation in Electric Lighting.

The officials of many corporations employing an alternating current system of electric lighting have been recently somewhat perturbed by threats of proceedings in regard to transformers. The facts may be briefly stated. A syndicate, headed by Mr. Martin Rucker, has purchased some old transformer patents of Zipernowski and Deri, and it is apparently the amiable intention of this syndicate to levy a tax upon a portion of the electrical industry. The extraordinary feature of this threatened attack is that the patents upon which the actions are based have been in existence for over thirteen years, and up to the present time no attempt whatever has been made to demonstrate the validity of the alleged inventions. It is quite true that the existence of the patents was well known to most electrical engineers, but it was never expected that action would have been taken, because it was generally felt that anticipation could be easily set up. The most important of the patents owned by Mr. Rucker is dated March 16th, and the second April 27th, of the year 1885, and in a few months the expiration of the patents is due. It is hardly necessary at the present moment to go into the patent question in any detail, but it is satisfactory to find that the municipalities using transformers are combining together with a view to resist the claims of the transformer syndicate, and it will be interesting to watch developments.

The Bilston Meeting.

Midland Counties district meetings are invariably successful, whether in regard to numbers or to general interest, and we have every reason to believe that to-morrow's meeting will be no exception to the rule. Mr. Pickering, the district secretary, and Mr. Wilson, the water engineer and surveyor to the council, have been very energetic in making arrangements well in advance, and the result is a strong and interesting programme. The comprehensive and profusely illustrated paper to be contributed by Mr. Wilson will probably be found to cover practically the whole field of municipal engineering work in the district, not only in regard to those numerous undertakings for which Mr. Wilson has been directly responsible, but also in connection with those works for which Mr. Baldwin Latham is acting as consulting engineer. The water supply works will figure prominently in both paper and visits. The municipal activity of Bilston is nothing new to our readers, descriptions and illustrations having previously appeared in our columns in connection with the baths, the technical school and other works. Only good weather should be wanted to make the meeting a complete success.

York.—At a recent meeting of the shareholders of the City of York Tramways Company, the chairman, Mr. J. Kincaid, said that the directors were a little disappointed that the negotiations with the corporation in regard to the adoption of electric power on the tramways had not yet resulted in anything definite. He attended a meeting of the committee of the corporation some months ago, and had a long conversation with them with reference to the carrying out of the power that Parliament had granted to the company for applying electric traction, but up to the present time nothing had been done, and the company did not know what the ideas of the corporation on the matter were. That was unfortunate for the company, and certainly it was unfortunate for the public, because the better the tramway service the better the public were satisfied. The company were at present unable to make any change, but if they knew the plans of the corporation they would be able to carry out the traffic better and also the repairs to the road.

Royal Institute of Public Health.

ANNUAL CONGRESS AT DUBLIN.—IV.

As the proceedings of the Engineering and Building Construction Section are of special interest to our readers, we have given some of the most important papers separately. The proceedings opened with an excellent address by Mr. Charles P. Cotton, M.I.C.E., chief engineering inspector of the Local Government Board for Ireland. As it constitutes a review of sanitary legislation, we give it at some length.

SANITARY LEGISLATION IN IRELAND.

The PRESIDENT said he proposed to take for the subject of his address the effect and result of recent sanitary legislation in Ireland. In talking of recent sanitary legislation he meant to refer to the period since the passing of the Public Health Act, 1875, followed by the Public Health (Ireland) Act, 1878. Before that time there were various sanitary Acts in existence, but they dealt more with the removal of nuisances and the prevention of diseases than with the necessity of, and provisions for, the efficient carrying out of sanitary structural works. The Public Health (Ireland) Act, 1874, effected a considerable change in sanitary law, but it was left for the Public Health (Ireland) Act, 1878, to sweep away all existing legislation on the subject in that country, and to make a fresh start by re-enacting the most useful parts of the previous Acts, with amendments and considerable additions. Since then several Acts relating to the same subject matters had been passed, to which he would allude so far as they dealt with sanitary engineering and building construction. The most important of those Acts were the Public Health Acts Amendment Act, 1890, the Housing of the Working Classes Act, 1890, the Labourers' (Ireland) Acts, and the Public Health (Ireland) Act, 1896.

THE IRISH ACT OF 1878

followed very closely the lines of the English Act of 1875, but in some respects there were differences between them, to which he proposed to direct their attention. The most important point in which the Irish Act differed from the Act of 1875 was the power given to every sanitary authority by the section dealing with the "Power to Purchase Lands" to acquire compulsorily sources of water supply and water rights for the purpose of supplying their district with water for drinking and domestic purposes. This was effected by the provision in the section dealing with "Regulations as to Purchase of Land," that, under the term "Lands," there should be included "any land covered with water, or any water, or right to take or convey water." This enabled a provisional order to be made, giving compulsory power of purchase of streams, springs and lakes, but it should be noted that it was only operative for obtaining a supply of water for "drinking and domestic purposes." Such power could not, he believed, be given by a provisional order in England when the acquisition of water rights, otherwise than by agreement, could only be got by a private Act. Local Water Acts had been obtained in some few cases in Ireland, but, generally speaking, sanitary authorities hesitated to incur the responsibility and risk of proceeding for a private Act, whereas they had largely availed themselves of the cheaper procedure by provisional orders. In connection with the acquisition of property for sanitary purposes, and the putting in force of the powers of the Lands Clauses Acts with respect to the purchase and taking of land otherwise than by agreement, he mentioned the great simplification in procedure which had been recently effected by the Public Health (Ireland) Act, 1896, sec. 8 of which enacts that for the purpose of taking lands compulsorily by purchase under the Public Health (Ireland) Acts, 1878 to 1890, the provisions of the Lands Clauses Acts shall be amended by the provisions of the second schedule of the Housing of the Working Classes Act, 1890. The practical result of this was, he said, that on the lodgment of plans, &c., with the Local Government Board an arbitrator was appointed, who held one sitting to hear and examine into claims, and then made his award, which was final. To anyone who had had experience of the cumbersome and costly process of putting the Lands Clauses Acts into operation it would be at once clear how short, sharp and decisive the new procedure was. He might appear to dwell unnecessarily on that technical detail, but he deemed it of great importance that it should be generally understood by sanitary authorities in Ireland how much less expensive and less uncertain, and at the same time more speedy and economical, was the new process of obtaining, compulsorily, property required for carrying out the purposes of the Public Health Acts. The power to make by-laws respecting new buildings, &c., was in England confined to urban authorities, but by sec. 41 of the Irish Act such by-laws could also be made by any rural sanitary authority. The importance of that was evident when it was considered how many towns in Ireland were, as regards sanitary matters, under the jurisdiction of rural authorities—e.g., Tipperary, with a population of 7,000, Omagh, Strabane, Dungannon, Castlebar, Mullingar, and many others. He regretted that that most useful provision was not more availed of by the rural authorities; indeed, he doubted if many of them were aware

that they possessed any such power. Another and rather important difference between the two Acts was connected with the areas and incidence of taxation for "special expenses" incurred for sanitary purposes by rural sanitary authorities. In England the contributory place on which such expenses were charged was the parish where there was no special drainage district. The contributory area in Ireland might be an electoral division, a dispensary district, a townland, or (with the consent and by order of the Local Government Board) a portion of a townland. In England the rate to meet special expenses was payable by the occupier, but in Ireland it was levied "as part of the poor rate." Subsequent to 1878 several Acts had been passed dealing with matters relating to public health; but not having reference to works of construction, he therefore passed them by. The Public Health Acts Amendment Act, 1890, contained some useful additional provisions as to sewers, house drains, public conveniences, building-by-laws, &c. Two years ago the Public Health (Ireland) Act, 1896, was passed. This Act contained some important provisions, supplementing previous Acts. Among them he might mention the power of the Local Government Board to invest a rural authority with urban powers for any particular purpose of the Public Health Acts. Power was also given to a certain number of ratepayers to require water rates to be levied for water taken into the house, which relieved to a certain extent the general rates. Also increased powers were given as to markets. In dealing with a defaulting sanitary authority the Local Government Board were given power, if necessary, to carry out works to remedy the default, at the cost of the sanitary authority. Power was also given to sanitary authorities to combine together for the purpose of executing and maintaining any works that might be for the benefit of their respective districts. The Open Spaces Act, 1887, gave great facilities to sanitary authorities to provide open spaces for the use of the inhabitants of the respective sanitary districts for "exercise and recreation."

THE WORK OF SANITARY AUTHORITIES.

From the enactments for purposes of public health Mr. Cotton turned to what had been done in that country since the passing of the Act of 1878, and was now being done, by their sanitary authorities. He said that in the year 1879, the year in which he became first engineering inspector of the Local Government Board for Ireland, loans to the amount of £124,454 were sanctioned under the Public Health Act. In the year 1897 loans were sanctioned to the amount of £293,386, of which £12,840 was for dwellings for the working classes in municipal towns.* The total amount of sanitary loans sanctioned in Ireland had been £3,858,452, exclusive of Labourers (Ireland) Acts loans, or inclusive of those loans, £5,767,763. Of course sanction to many loans had been sought for, which had had to be refused, principally on account of non-compliance with legal requirements, for dispensing with which the Local Government Board had absolutely no power. Such cases occurred in proposed sewage works which would involve the pollution of rivers and insufficiency of the available margin of borrowing powers. The Labourers (Ireland) Acts for providing improved house accommodation for the labouring classes had been in operation since 1884. The number of houses definitely authorised since that time had been 15,748, and loans to the amount of £1,909,311 had been sanctioned for their erection, and over 13,000 had been completed and were tenanted. At least three rooms—a living-room and two bed-rooms—were required in each house, and proper sanitary accommodation, the average rent being 1s. per week for the house and half acre of land. There could be no doubt as to the good effected by the erection of those houses in educating the class for whom they were provided in habits of neatness and comfort in their surroundings, before almost unknown to them, and the improved dwellings must also be attended with a general improvement in health.

WATER SUPPLIES.

Previous to 1878 waterworks for the supply of the larger districts—Dublin, Belfast, Londonderry, Cork, Limerick and Waterford—had been constructed under local Acts, but since that time it had been found necessary to increase those supplies, not so much from increase of population (except in the case of Belfast) as from increased consumption per head. The Varty works, which supplied Dublin and its suburban townships (except Rathmines), had been fully described in the "Transactions of the Institution of Civil Engineers." Quite recently a supplemental reservoir of 1,200,000,000 gallons capacity, and the duplication of the mines to the service reservoirs at Stillorgan, had been undertaken. The Belfast water supply, for a population of over 300,000 persons, had been about 11,333,000 gallons daily, and was now being increased by water to be taken from the Moorne mountains,

* The loans to municipal authorities for this purpose up to 1890 were administered by the Commissioners of Public Works. Since that date they have been under the control of the Local Government Board.

45 miles away, so that an additional quantity of, at first, 10,000,000 gallons daily might be got, to be ultimately increased to 30,000,000. These works were estimated to cost £1,500,000. The new additional reservoirs near Newcastle would contain 3,000,000 gallons. The Londonderry supply, which in 1878 was given by a reservoir containing only 85,000,000 gallons, was added to in 1883 by a second reservoir of 50,000,000 gallons, and last year the construction of a third reservoir, to hold over 80,000,000, had been authorised. Limerick, which in 1878 depended wholly on small works of a private company, had now a copious supply pumped up by turbines from the river Shannon at Doonass Falls, 10 miles above the city. Others of the larger towns, which twenty years ago depended on surface wells, unprotected streams or canals, had now been provided with new and good supplies—the property rights having been compulsorily acquired, and the works having been carried out under the Public Health Act—e.g., Athlone, Ballymena, Bangor, Carlow, Clonmel, Cavan, Dungarvan, Fermoy, Larne, Lisburn, Lurgan, Maryborough, Queenstown, Sligo, Tipperary and Youngbally. In country districts great benefits had been conferred on isolated places by the rural authorities providing small but pure supplies of water where nothing of the kind was previously available. This applied especially to cases in which national schools had been established without any regard to a supply of good drinking water being available. Before passing away from the subject of waterworks it might be interesting to mention the construction of the service tanks at Athlone and Tipperary, both of which were circular in form and constructed of steel plates. The Athlone tank was 45 ft. in diameter and 24 ft. high, holding over 235,000 gallons. The Tipperary tank was 55 ft. in diameter and 22 ft. high, holding 325,000 gallons. In both cases they were economical as to first cost, and in the case of Athlone the adoption of that form of tank was attended with an increase to the working head, an addition which was most desirable. The tanks were from the designs of the late Mr. Strype and Mr. Coucher, but the idea was taken from numerous service tanks of a similar design constructed by his friend, Mr. Cecil West Darley, municipal and harbour engineer-in-chief of Sydney, New South Wales, who had put up some of these tanks of a capacity of 1,500,000 gallons. Water mains, although coated with Dr. Angus Smith's composition, were subject to incrustation resulting from corrosion or the deposit of peaty matter. That was now frequently removed by scraping. The water main from the reservoir to the town of Omagh was an interesting example. That main got so filled with a deposit of peaty matter that its delivery was reduced to one-third what it should be, and no supply was given to the higher parts of the town. A loan was applied for, in order to lay a second and larger main at considerable cost (about £3,000). The sanitary authority, however, were induced to have scraping tried, and at a comparatively trifling cost (£53) the main was thoroughly cleaned and its original delivering power fully restored.*

SEWERAGE.

A sewerage scheme of considerable magnitude was now being carried out in that city (Dublin). Hitherto the internal drainage was all discharged into the river Liffey, along its entire length through the city. The corporation were now carrying an intercepting sewer along each side of the river, the contents of which will be taken to precipitation tanks at the Pigeon House Fort, whence the sludge will be taken by specially-constructed vessels to be discharged at sea. In Belfast a similar intercepting system had been carried out. The contents were pumped up into a reservoir, where the sewage was stored until such time as the tide current was setting to the north-east, when it was discharged and at once carried out to sea. That that had been successful was evident from the fact that recently salmon trout had been caught in the Lagan. Owing to the fact that the large towns in Ireland were situated on tidal rivers, the discharge of their sewage had been direct into the tideway, and no schemes of sewage disposal otherwise had been carried out except on a very small scale. Recently the local authorities of the city of Armagh and the town of Lisburn had arranged for the purchase of land for sewage disposal works, but the particular plan to be adopted had not in either case been yet definitely settled on. No doubt other towns would be forced to follow suit. As they were aware, a Royal Commission had been appointed to inquire and report: "(1) What method or methods of treating and disposing of sewage (including any liquid from any factory or manufacturing process) may properly be adopted consistently with due regard for the requirements of the existing law, for the protection of the public health, and for the economical and efficient discharge of the duties of local authorities; and if more than one method may be adopted, by what rules, in relation to the nature or volume of sewage, or the population to be served, or other varying circumstances or requirements, should the particular method of treatment and the disposal to be adopted be determined; and (2) to make any recommendations which may be deemed desirable with reference to the treatment and disposal of sewage." The Royal Commission held sittings in July and August, and would resume them after the holidays. With such a wide

reference the final result could not be expected for some considerable time. Under the Public Health Acts many structural works were authorised which were not so directly connected with the question of health as were those of sewerage and water supply. Such were street paving, gas works and electric lighting, public clocks, slaughter-houses, mortuaries, burial grounds, scavenging plant, baths and wash-houses, rubbish depots, hospitals, disinfecting chambers, street improvements, public sanitary conveniences, &c. He need not go into these in detail, but he would like to direct attention to one item, which he thought might be attended with considerable benefit to the health of inhabitants, especially of the children resident in the poorer parts, the courts and alleys of towns. He referred to the replacing of footpaths of gravel, or more often of mud, by neat concrete footways which let the rain water run off and became dry at once. The cost was small, quite incommensurate with the benefit.

THE HOUSING OF THE WORKING CLASSES ACT, 1890.

like its Public Health predecessors, swept away all previous legislation on its subject and replaced them with a concise code dealing with the clearing of unhealthy areas in a town, the removal of unhealthy houses, and the erection of dwelling-houses for the working classes. Part I, practically a re-enactment with amendments of the Artisans Dwellings Act, 1875, enabled an urban authority to apply for compulsory powers of purchase and clearance of areas which had been represented by the medical officer of health to be unfit for habitation, or dangerous or injurious to the health of the inhabitants. The repealed Act of 1875 had been put in force by the urban authorities of Cork, Dublin and Belfast, but owing to the cumbersome machinery of the Lands Clauses Act, to which he had already alluded, the result financially was far different from what was anticipated. He supposed this was found generally to be the case, as for the purposes of that part of the Act there was then provided the much more simple, more speedy and more economic procedure of the "second schedule," which he had already referred to as being now so happily applied to the Public Health (Ireland) Acts generally. That part of the Act had recently been put in force in Dublin, Belfast, Limerick and Lurgan. Part II. had not, as far as he knew, been yet acted upon by any sanitary authority in Ireland. Part III. enabled any urban sanitary authority to erect dwellings for the working classes on any land which they might acquire for the purpose, or (with the consent of the Treasury) on any land already in their possession. The operation of that part of the Act was restricted in Ireland to urban authorities, because the same object was achieved in rural districts in a more workable manner by the Laborers (Ireland) Acts. It also applied to municipal authorities who were not sanitary authorities. The provisions of the Public Health Act applied to loans for the purpose of that part of the Act, as also do the provisions for the compulsory acquisition of land. Urban authorities had erected, or were erecting, dwellings under that part of the Act in Cashel, Dublin, Waterford, Wicklow, Thurles, Kells, Kilkenny, Limerick, Newry, Pembroke township and Wexford, and the town commissioners of Longford, Middleton, Mullingar, and other town commissioners who were not sanitary authorities, had also availed themselves of their powers under that Act. Intimately connected with the carrying out of sanitary works was

THE PROVISION OF WAYS AND MEANS.

When sanitary authorities got sanction to borrow it was open to them to do so from any source that offered. In Ireland, with but one or two exceptions, recourse was, until recently, always had to the Commissioners of Public Works in Ireland, who, acting with the consent of the Treasury, had power to lend, up to a limit of fifty years for repayment, money to carry out purposes of the Public Health (Ireland) Acts. Until recently the minimum rate of interest charged by the Board of Works was 3½ per cent. for a term of thirty-five years, and more for periods of forty and fifty years. By the Public Health Acts Amendment Act, 1890, power was given to urban authorities, with the consent of the Local Government Board, to consolidate their sanitary debts, and to effect future borrowing for sanitary purposes by the issue of stock. That had been availed of by many towns with considerable relief to the present ratepayers. Be it *post hoc* only, or perhaps *propter hoc*, the Treasury rates of interest had been recently greatly reduced and loans for sanitary purposes were now advanced by the Board of Works at rates of 2½ per cent. for thirty years and under, 3 per cent. up to forty years, and 3½ per cent. up to the limit of fifty years. A great deal of sanitary improvement in Ireland depended on the consent of the ratepayers of the area of rural sanitary districts to be charged with the expenses thereof. In villages and small towns the cost of sewers and of a proper supply of water would be beyond the resources of the inhabitants, and therefore the expense had to be charged on a larger area than that which was built on. That was not so unfair as it might at first sight appear to be, for the people of the country district within a certain distance of a town who frequent and use it for its shops, markets, fairs, schools and places of worship, could not, or at all events should not, be indifferent to its sanitation and the avoidance of epidemics. It might not be always right that the taxation should be equal throughout the area, and the Public Health Act provided for differ-

* See paper by Mr. J. H. H. Swinney, M.I.C.E., "Transactions of the Institution of Civil Engineers of Ireland, 1887."

ential rating being fixed for different portions of the area of charge in such proportions as the sanitary authority might think fit, subject to appeal to the Local Government Board. He might, perhaps, be expected to say something of the new order of things, in connection with public health, under the Local Government (Ireland) Act, 1898, when it comes into operation. He had not closely studied the measure, but he understood that beyond the changes of designation and constitutions of the local authorities there would be absolutely no alteration in the procedure for carrying out structural works under the sanitary laws.

Mr. W. KAYE PARRY proposed a vote of thanks to Mr. Cotton for his address. He said that the most important Royal Commission that had sat for a long time, as far as civil engineers were concerned, was the commission dealing with the question of sewage purification. They were gratified to have Mr. Cotton as their representative on that commission. They knew that his presence would be an element of strength, justice and impartiality on the commission.

The motion was carried.

Mr. FRANK LESLIE WATSON, A.M.L.C.E., read a paper on "The Designing and Construction of Refuse Destructors," which we published in full in our issue of the 2nd inst.

SITES AND SOILS.

Mr. EDWARD MAGENNIS, M.D., read a paper on "Hidden Dangers in the Sites of Dwelling-Houses." In the course of the paper he stated that the houses in many of their towns, especially in their large towns and cities, were erected upon sites that were simply the hiding places of sewers, upon mounds that contained the remains of their ancestors, on locations that had been the reservoirs of all filth, decaying animal and vegetable matter, street sweepings, and other most objectionable materials. In winter the heat of the building and the aspirating action of fires must tend to draw noxious gases in large quantities through the surface of the soil, and thus engender disease if preventive measures be not adopted. They knew that among the many evils attributed to insanitary sites were reckoned typhoid, cholera, yellow fever, dysentery, rheumatism, and the numerous respiratory diseases so common in their climate. England in twenty-two years of continuous war lost 79,700 lives; in one year of cholera, one of the most preventable diseases, the death roll number was 144,860. He considered that, as conservators of the public health, it was their duty to combat these preventable diseases. In the sites of their dwelling-houses the subtle enemies might be everywhere; they must be sought out, assailed and conquered, and for that purpose he would suggest the use of three weapons. The first was effective drainage, the second was that the entire site of the house within the external walls should be covered with an impervious layer, and the third that an horizontal damp-proof course should be inserted in the walls slightly above the level of the ground adjoining. In concluding, he said that it was scarcely too bold to assert that if, with the means which science had placed at their disposal, they had a thoroughly organised action and a generous measure of Governmental support, death would be no longer the grim spectre that smote the young and old indiscriminately, but rather the gradual decay of the forces of nature, and disease, its shadow, would brood less frequently over the land.

Mr. JAMES DILLON, past-president of the Institution of Civil Engineers of Ireland, read a paper, entitled "The Subsoil in Relation to Sites for Dwellings." Mr. Dillon opened his paper by giving the general character of subsoils and their present conditions on which the majority of the dwellings and towns in Ireland were built, and the nature of the works best calculated to improve their present conditions, and the order in which such works should be carried out. He then proceeded to indicate some of the principles to be observed when selecting or trying to improve proposed sites for towns and dwellings, and concluded by stating that the Local Government Board for Ireland and their able officers, including their president, had rendered valuable services to the people of that country, pointing out to them their present defective sanitary conditions, while at the same time assisting them to obtain loans on easy terms for sanitary work. Parliament having sanctioned that year a new Local Government Act for Ireland, they must all hope that each district council and county council would try without delay to carry out the suggestions of the Local Government Board in the directions he indicated, as they would have ample legal powers to do so.

The section then adjourned until the following day.

SEWAGE DISPOSAL IN TROPICAL CLIMATES.

On resuming business on the Saturday, Mr. J. Desmond McCarthy, M.P., formerly administrator of the Gold Coast, read a paper on "The Disposal of Sewage in Tropical Climates." The paper dealt principally with the district of Lagos and the Gold Coast. Referring to the former place, he said that a great danger was created by the storage of sewage matter in house pits and down in the loose sand. That system contributed largely to the high death rate which prevailed. Water was contained in wells, from which the people drew their drinking supply, but these wells became contaminated by the passage of sewage matter through the soil. He made an analysis of the contents of twelve of these wells, and found the water seriously contaminated. Having

given the matter a good deal of consideration, he recommended that in order to get rid of the dangers arising from that contamination that the soil should be cleansed by abolishing the numerous house pits; and with regard to the wells he suggested that every well sunk should be allowed a drainage area of 100 yards; that instead of deep wells covered pump wells should be provided, that they should be prevented from leakage by the use of cement, and that a space around each of them should be bricked and cemented. The improvements, however, were not carried out, and the wells were still in an unprotected state. With regard to the proposed abolition of the house pits, the natives had an insuperable objection to such a measure. Some details were then given with regard to drainage matters and water supply in the Gold Coast district, which, it was stated, were in an unsatisfactory condition. Among the sources of nuisance which he mentioned as characteristic of the towns of this region was the wandering through the streets of thousands of swine. This constituted an objectionable feature, and was a continuous source of nuisance.

Mr. J. C. BRETLAND, city engineer of Belfast, read a paper entitled "Descriptive Notes on the Albert Bridge, Belfast." The paper was one which Mr. Bretland read in October, 1896, before the Belfast Mechanical and Engineering Association.

Mr. W. KAYE PARRY read a paper on "Progress in Sewage Purification," which we published in our last issue.

STREET MAKING AND HYGIENE.

Mr. EDWARD GLOVER next read a paper on "The Hygienic Aspects of Street-making." In the course of the paper he said that in slums they found "matter out of place" in all degrees of saturation, age and pulverisation. In most of the ancient laneways they travelled, as on a switchback, over various catchment areas and land-locked lakelets, unable to discharge themselves into some misplaced lazy gully, which, like a tank overflow, rose high and dry above water-level. In places not under the charge of the corporation or other authority they found the slums repeated, while as regards the new streets or roads of enterprising builders many of them were only jerry-made, mere "dirt" roads, which involved reconstruction in the future. No private owner should be allowed to make a street and then hand it over to a public authority. The authority should do the work, and the cost be assessed on the proper area or individuals. Streets served as open spaces as well as for lines of communication, and in the case of new ones their location, alignment and minimum width should be carefully considered. From the traffic point of view the travelling surface of a street should be as clean and smooth as possible. Omitting altogether the kind of materials used in forming a surface, it was therefore evident that (1) it should be impossible for water to lodge on the top or at the bottom of the crust, and (2) the crust should be watertight and of sufficient strength. Street surfaces not kept clean, or which held lodgments of even clean water, wore away very quickly under traffic, while any crust which allowed water to leak through became bumpy, irregular and uneven, in spite of the greatest care in maintenance. Water close underneath the crust was, as a general rule, a greater enemy to a road surface than water lodging on top. In producing and maintaining a proper carriageway along their streets they easily saw that the requirements for health and traffic were the same. Surface cleanliness was necessary for both, and it was hard to say whether scavenging conducted more to longevity for human life or road life. The same might be said in relation to ground water-level in the subsoil. It was known how great a factor the soil was in the spread of many diseases, and nothing influenced the ground in that way more than water. So, too, a wet subsoil made a good street surface impossible. Although a certain amount of moisture was necessary for street surfaces, yet over 90 per cent. of their wear and tear was due to the influence of water. He did not know if street-making and maintenance were included in the curriculum for sanitary or health officers; if not, they should be, and with as much reason as ventilation, light and allied subjects. Drainage for the efficiency and conservation of a street surface, of whatever materials constructed, should not only prevent water lodging, but also make it flow off quickly. Surface water should be compelled to remove itself automatically by proper grading and levels into gullies in the water tables or side channels. Even upon the flattest ground there should be no difficulty in obtaining the necessary falls, cross and longitudinal, because they could be worked out of the thickness of the crust itself. To prevent too much winding or distortion of the surface, and too great a height of footpath kerbing, the position and number of the gullies required accurate consideration. As regards subsoil drainage, they had to consider it in two aspects—(1) as regards water coming from an area outside the ground covered by the street, and (2) as regards local water percolating down through a leaky crust. In the former case the water to travel laterally underground should be under pressure as coming from higher ground, or else the street should be over or upon an underground basin whose lowest point of discharge was too high. Ordinary intercepting drains outside the street area, or lowering the overflow of the basin, would prevent a wet subsoil and lower the line of saturation to any required level in those cases. Secondly, as regards water percolating through a leaky crust, they should see that intercepting drains or

lowering an overflow would not cure it. Of course frequent minor intermediate drains would tend towards a cure, but they were practically impossible in street work. Local water travelled at a very small lateral angle, and it was therefore hard to catch it. There could be no doubt that local water leaking into the soil was the chief factor in raising the "ground water-level" in most places. Water tight street surfaces would prevent much mischief, considering how large was the area of a town in which its streets occupy. All houses should have convex gutters discharging into drains, and footpaths should have a good fall to the channels and be watertight also. Those necessities were evident if they examined the weeping and damp-sodden walls of basements and areas, which were only too common. He had two cases in his mind where basements became unsanable from water oozing through the walls from near ceiling level to the floor. Several remedies were tried and failed until the footpath was made watertight, when the evil disappeared. A footpath should act as an external damp-course, extending beyond wall face at ground level to save the yard below. Much could be said about the materials employed in street-making, as well as their undoubted influence on public health, apart from proper workmanship. But probably it was not necessary in a general review to enter into such details. The choice of materials for any particular street was chiefly a question of first cost, and the public should be educated to pay for the proper article. In the near future, however, they might afford, at small expense, to have clean, smooth and noiseless streets. Electricity, motor cars and rubber tyres seemed to point that way. If so, the new era would add to the span of human life.

The meeting then adjourned until the following Tuesday. At the commencement of the meeting on the Tuesday the chairman called upon Dr. McElligott to read his paper on "An Improved Method of Exhausting the Steam and Fumes from Wash-Houses, Sculleries, &c."

THE SEPTIC TANK SYSTEM.

Mr. R. H. DORMAN, M.C.E.E., town surveyor of Armagh, read a paper on "Some Experiments with the Septic Tank System of Sewage Treatment." After the first publication of Mr. Donald Cameron's experiments, Mr. Dorman said, he himself put down a small tank and filter-bed on his own premises, and, following on Mr. Cameron's lines, he found he was able to get a clear, bright effluent. He then advised the Portadown Commissioners to construct experimental filters in connection with an existing covered tank, and two small filters were constructed. With a filtering material only 3ft. 3in. deep, and with only a fall of 4ft. between the tank overflow and the winter level of the river Corran, into which the filtrate discharged, satisfactory results were obtained, and had continued for some time. After some early defects had been remedied, the sewage passed through the tank normally, only requiring to be regulated occasionally by the town sergeant. No choking had taken place recently, the action being precisely that proceeding in the tank at Exeter, and no trouble being experienced in the working of it. The sewage due to a population of about 3,000 persons passed through the tank, but the water supply being limited, not more than about 18,000 gallons of sewage passed through per day. Occasionally the tank got congested, but it was easily rectified by diverting the sewage into a by-channel for a few days, when the tank returned to its normal state of activity. The filtrate was, as a rule, faintly coloured and had a slight smell on discharge. Nevertheless, the results obtained by this simple and inexpensive process were regarded as wonderful. Nearly all the solid matter in the crude sewage was thrown into solution in the septic tank, and only occasional particles of solid matter were apparent to the eye as the effluent passed down the trough to the filter beds. After passing through these all colour had almost entirely disappeared and only a few very small particles remained in the filtrate. The author of the paper was convinced by these results that if the filters at Portadown had been of the same dimensions as those at Exeter equally good results would have been obtained. They could not obtain a depth of 5ft. at Portadown, but it was proposed to extend the number of filters by adding a series of secondary filters composed of fine clinker, and experiments already made in this direction entitled them to anticipate the best results. For the reasons stated the filtrate at Portadown and the degree of purification there obtained would hardly compare with the results at Exeter, or with those obtainable with good chemical processes, but from these experiments the author had arrived at the following conclusions: (1) That the cost of installation compared favourably with the cost of any other system yet known; (2) the working expenses were small, and by adopting Mr. Cameron's alternating gear they could be reduced to a minimum; (3) no sludge was left to be dealt with, and the small quantity of deposit that accumulated at the bottom of the tank only needed to be removed about once in twelve months; and (4) there appeared to be no secondary decomposition set up after the filtrate was discharged into the river. It was, he thought, difficult to decide between the septic tank system and the Sutton (Diddin's) process for dealing with sewage, but for the treatment of ordinary domestic sewage, or that from any district not overloaded with chemicals, he knew of no system of chemical treatment yet applied which would com-

pare favourably with this and the other two or three processes. Some forms of sewage might perhaps be too strong for the organisms found in the septic tanks dealt with. The author had had no practical experience with the septic treatment of sewage overloaded with chemicals, such as that resulting from Manchester, Wolverhampton, Walsleybury and similar places, and he would like to hear an expression of opinion from any one who had tried to treat sewage of that character by this or the Sutton process. But it appeared to him that Mr. D. Cameron availed himself to the fullest extent of the anaerobic as well as of the aerobic micro-organisms he had more power at his disposal than was obtained by the Sutton process.

The reading of the paper was followed by a long discussion, and the conference then closed, the remaining papers on the programme being taken as read—viz., "Sanitary Work of the Romans in Lincoln," by Dr. W. O'Neill, M.B.E.P., London, &c., and "Notes on the Design and Erection of Architectural Ironwork," by Mr. H. A. Cutler, city engineer, Cork. The last-named paper, it will be remembered, was published in full in our last issue. A paper, entitled "The Laying and Jointing of Sewer Pipes," by Mr. R. H. Dorman, town surveyor, Armagh, which was also included in the programme, was read before the conference of Sanitary Inspectors. This concludes our report of the proceedings of the conference. Certain special conferences, such as those of municipal representatives, medical officers and sanitary inspectors, together with a variety of other functions incidental to such occasions, were held, but do not call for any lengthy report in our columns. More than one of the papers we have given in abbreviated form were well worth printing in full, but space and other considerations rendered this impracticable.

THE SEWERAGE OF DOUGLAS.

The report of Mr. Mansergh on the above question was circulated among the members of the Douglas Town Council last week. Mr. Mansergh states that he has been furnished with reports on the sewerage of the town by Mr. Stevenson (the engineer carrying out the work), Mr. Fox, Mr. Taylor, and Mr. Cregeen. From a discussion which has taken place with the Drainage Committee, it was evident there were many opinions on the schemes before them; and the effect of these reports and opinions on the mind is confusing. He is not surprised that the members of the corporation had a difficulty in deciding which advice was right. But the problem presented is really not serious. It is only necessary to realise one or two simple physical facts—the elevations of the town and the levels of the tide. Speaking broadly, the low-lying lands are as fully built on as they are likely to be; but there are several basements which are at much lower levels than the surface of the streets. If these basements are drained directly into the sewers a gravitation system would cause them to be flooded periodically. The proper method is to divide the town into the high and low level system of sewers—as is being done by Mr. Stevenson. There are no special circumstances to justify the council in departing from this obvious and natural method. The manner in which the low-lying basements are drained is, indeed, a sorry state of things, but to transfer the onus of dealing with the basements from the public authority to the householder would be a serious mistake. It would be possible to sewer the low-level area by gravitation if a tank were provided and a separate outfall made. On the score of expense this method could not be entertained. Regarding the method of lifting the sewage from the low-level into the high-level, he thinks that an automatic apparatus, for which the power is generated at a distance from the pump, is well suited to Douglas. The "lift" proposed to be used for this purpose is a new invention, but seems to Mr. Mansergh well suited for the conditions of Douglas. It was therefore apparent that the plans of Mr. Stevenson commended themselves to him, as they are laid out on the lines he had indicated. As to the cost of the work, Mr. Mansergh says it "will exceed what was at first contemplated, yet it must be faced. I do not see how the cost is to be reduced if the work is to be thoroughly done, and it is false economy to do less than is really required by the conditions."

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper, in plain black-ink lines. Lettering or figures should be bold and plain.

213. Velocity and Discharge of Sewers, Book on "Kutterite" writes: Can you inform me if there is published any comprehensive table of sewer discharges and velocities for both circular and egg-shaped sewers flowing at different depths, similar to those in Latham's "Sanitary Engineering," but worked out by Kutter's formula. I have previously considered that Crimp's formula is as reliable as Kutter's. One of the best and most reliable works on Civil and Bridge's "Tables and Diagrams for use in Designing Sewer and Water Main" (Price 10s. 6d., George & Co.). This table gives results approximately very close to those resulting from Kutter's formula, and the formula used is in our opinion, quite as reliable as Kutter's.

The British Association.

SOME PAPERS ON MUNICIPAL WORK.

The greatest congress of the year so far as science is concerned opened on Wednesday of last week and continued well into the present week. We have elsewhere indicated the scope of the proceedings so far as municipal work, and especially municipal engineering, is concerned. Two of the papers—those of Mr. Diddin and Mr. Pearson—we are giving separately, and therefore all that remains for us to do here is to summarise some of the other papers likely to interest our readers. It would, of course, be impracticable to print them in full. On Monday the papers and discussions in the

ECONOMIC SCIENCE AND STATISTICS SECTION.

were devoted almost exclusively to municipal matters, which, though not directly relating to engineering, touched upon it closely enough to call for some notice. Mr. Pearson led off with the paper on "Municipal Trading," which we print elsewhere.

A PROFIT IN AID OF RATES.

Mr. EDWIN CANNAN, M.A., followed with a paper, entitled "Ought Municipal Enterprises to yield a Profit in Aid of Rates?" Municipalities, he said, had been likened by an ex-Cabinet Minister, who had had a unique municipal experience, to joint-stock companies, the ratepayers being the shareholders. If the parallel were exact, there could scarcely be any question about the propriety of municipal enterprises yielding a profit, since to make a profit was the object of the existence of a joint-stock company. How far, then, did a municipality resemble a joint-stock company? In form the two bodies were very much alike, the management of both being committed to an elected council or directorate, and the ordinary members only interfering on rare occasions directly, though the citizens or burgesses exercised far more influence on the decisions of the representatives than the shareholders. But the basis of membership was very different. In the company it was ownership of a fraction of the homogeneous capital of the company, each fraction being exactly the same as every other fraction of the same magnitude. In the municipality it was connection with particular objects which had for the most part an individuality of their own, which were not in the possession of the municipality, but only subject to its claim for rates, and which were re-valued from time to time, so that they need not continue to bear the same proportion to the whole of the rateable property. The business of both the company and the municipality was economic work for the benefit of their members, but the company performed services for outsiders and distributed profits in money dividends to its shareholders, while in performing its ordinary functions the municipality provided commodities or services for its members directly, and consequently had no opportunity of making profits to be divided among them in money dividends. As far as municipal enterprises were concerned, however, the position of the municipality resembled that of the company much more nearly. Municipal enterprise was distinguished from ordinary municipal work by the fact that the commodities or services which it provided were supposed not to accrue to the citizens approximately in proportion to the rateable value of the property with which they were connected, so that it was considered necessary to charge for them by methods and standards different from those which regulated the levying of rates. By hypothesis, then, the business was no longer a merely "mutual" one, in which each member received direct benefit in proportion to his share, but a business like that of an ordinary company. The municipality ought to be allowed to make a profit, for the same reasons as a company is allowed—(a) in order that it may have some inducement to undertake the enterprise, which it would not have if it must take all risk of loss and no chance of gain; (b) in order to secure efficient management; and (c) in order that the economic proportion in the production of different commodities might not be disturbed. The arguments against profit-making in municipal enterprises seemed to be founded on an antiquated socialism or on a false analogy, either from co-operative institutions or from ordinary municipal work. That there might be cases in which it was not economically desirable that the highest possible profit should be made was probable, but these cases were far less frequent than was supposed, and since, when they occurred, the damage must be much greater to the locality than to the country in general, and also be tolerably obvious, there seemed no need to restrict the freedom of the locality.

RECTIFICATION OF MUNICIPAL FRONTIERS.

Mr. W. M. ACWORTH next read a paper on the "Rectification of Municipal Frontiers." The title, he said, was intended to apply not literally but metaphorically, and he had no idea of expressing or encouraging others to express opinions on the abstract question of municipal socialism *versus* private enterprise. His only object was to invite consideration of certain recent developments in the life of our great towns, which must, as it seemed to him, tend in the long run to an important readjustment of frontier between

private and municipal enterprise. Gas and water supply had long been regarded, on the ground of their general necessity, as natural subjects for municipal ownership. Oddly enough, however, it was reserved for a commercial company—the South Metropolitan—to make gas really available in the poorest house, by the adoption of the penny-in-the-slot system. But with the rapid advance of rival methods of lighting, petroleum, electricity, and now perhaps acetylene, coal-gas was much less a general necessity of life than it was. Simultaneously there had been a rapid advance in the use of coal-gas as a source of power. In America they were building gas engines of 700 and, he believed, of as much as 1,000 horse-power. Now it would hardly be argued that the supply of gas as a source of power on a wholesale scale was a natural function of the municipality. There was no special reason why the credits of the ratepayers should be pledged to enable a capitalist to procure the power for his mills at a cheaper rate. Now, putting the matter from another point of view, would it be contended that municipal management, with its inevitable rapidity and elowness of methods, was better fitted than private enterprise to supply gas-power in competition with power derived from other sources. On the advantages of a municipal supply of gas for lighting purposes there was no need to dwell. But even here it must be admitted that there had been found a corresponding disadvantage in the natural reluctance of corporations already possessing profitable gas undertakings to admit electric light, either in their own hands or in the hands of private promoters, to compete with their own gas supply. The supply of water was a natural subject for public ownership. Even in America, where, in well-justified despair of municipal management, the great city of Philadelphia had recently sold its gasworks to a trading company, no one suggested that public water supply should be placed on a commercial basis. Nor need the question be argued here. For all that, the question of delimitation of frontier, not between private and municipal ownership, but between the rights of different local authorities, arose in this matter also, and seemed likely to become more pressing in the near future. But it was not by water that the boundaries of municipal enterprise were likely to be undermined. Their process would be rather one which their friends in the adjacent Physics section were accustomed to term electrolysis. Let him notice in the first place a possible new extension of municipal functions. A House of Commons Committee had just reported that competition in telephone service was desirable in the public interest, and that they saw no reason why, in any place where the Post Office did not compete with the National Telephone Company, licenses should not be granted to the local authority. They further expressed the opinion that "from the point of view of local finance a telephone service would be as successful as had been the supply of gas, water, tramways and electric light by local authorities." So, as the Corporations of Edinburgh and Glasgow had already applied for telephone licenses, and as the Post Office was hardly likely to incur the odium of entering into competition with the National Telephone Company merely in order to keep the corporations out, we should probably see the experiment of municipal telephones tried on a considerable scale ere long. Electric lighting, he pointed out, had from the outset been a mixed service, in the hands here of a company and there of a municipal corporation, subject to this—that the corporation had always been given the refusal before the company was admitted. Theoretically, competition was contemplated almost from the outset, for the Electric Lighting Act of 1888 expressly provided that "the grant of authority to any undertaker to supply electricity within any area by license or provisional order shall not in any way hinder or restrict the granting of a license or provisional order to the local authority, or to any company or person within the same area." But in practice what competition there had been had been of companies *inter se*. Last session, however, saw a change. Two local authorities sought, and one of them obtained, statutory power to compete within their district with companies in possession of the field. He pointed out that the accepted tramway policy of the country was also rapidly being dissolved by electrolytic action. This policy, now nearly thirty years old, provided that, while the veto of the local authority on construction by a company was paramount, any municipality could lay down, and of late years could also work, tramways of its own. In conclusion, he submitted that the ever-increasing complication of civilisation, and the ever-increasing specialisation of science, coupled with the ever-increasing inter-dependence of independently-organised local government districts, all tended towards a re-adjustment of the boundaries of direct municipal activity, and that the re-adjustment was likely to be on the whole in the direction of extending, rather than restricting, the public functions allotted within the municipal area to commercial enterprise.

All three papers were discussed together, the discussion being opened by

Mr. MACDONALD, who said that information on these subjects which had come to them from America should be received with caution. With regard to Mr. Cannan's paper, what he felt was that a clear line should be drawn between municipal undertakings and municipal enterprise, and he ventured to suggest that an approach towards such a distinction should be attempted. He did not know that it would be an altogether successful attempt to divide municipal antipathies into two great divisions, the first to correspond with the enterprise in which the individual use was still a more permanent feature than social activities. It had been suggested that an attempt should be made to divide the activities into those in which the individual use was still paramount, and consequently ought to be charged. It was distinctly his view that a charge upon private enterprise could legitimately be made. The other division was that in which social use or social efficiency was the more prominent feature than individual use. He was glad that Mr. Acworth had referred to the telephone system, because he was assured that they were all agreed that municipal telephone services would be a great mistake.

Mr. GEORGE ILES (of Montreal), describing electrical traction in that city, said that experience proved that the larger the receipts were, point to point, the larger was the proportion of the taxes paid on the gross receipts. It might be instructing to them to know, as a matter of comparison, that the receipts from the Bristol tramway lines, he was told, amounted to about £250 per day, whereas the receipts in Montreal, with a population one-sixth the size of Bristol, ran to no less than \$4,000, or about £800, a day, and that notwithstanding a long and severe winter. He was absolutely sure that municipal government would never be anything like so efficient, intelligent and safe a system as that which prevailed in Montreal at the present moment, at least not in his country.

Major CRAIGIE (of the Board of Agriculture) could not agree with Mr. Cannan's analysis of a joint-stock company and a municipal corporation. He failed, indeed, to see any analogy at all, and for this reason: He became a member of a joint-stock company because it pleased him to do so, and because he bought stock, but he did not become a sufferer from the rates in a municipality by any action of his own, at least he need not necessarily do so.

Mr. SCOTT, of Toronto, expressed concurrence with the distinction between work of common benefit and that of which the use was in the discretion of individuals. In Canada they had adopted the principle of private enterprise subject to comprehensive municipal control. The telephones were made, like the tramways, to contribute to the rates, though disputes had arisen, and the municipalities declined to undertake any burden in respect of them. On the whole, municipal management had been found less satisfactory than that of commercial companies. In New York and elsewhere the underground trolley was found the most effective, and was displacing the cable, and it was felt that the overground system was doomed.

Mr. F. THOMPSON said that at Croydon they had water and electric lighting in the hands of the municipality, and expected to make a profit by the latter.

Mr. R. A. HOOVER suggested there should be a limit of profit to be made by municipal enterprise. The profit should be as low as possible, because if they made it too large the consumer of the commodity would be to some extent damaged. For instance, if in the case of water he paid for it on too great a scale he paid too much and a margin went to the alleviation of those who did not use water at all by reason of having their own private wells.

Mr. CHARLES THOMAS (deputy-chairman of the Midland Railway Company) said that in his view there was much to be desired in the supervision of labour under the municipalities, and contended that those employed in municipal work were allowed to waste their time, and were of nothing like the same value as similar employees who served private contractors. If municipalities were to become great manufacturers or great employers of labour, the difficulty connected with labour would be inevitably increased.

Mr. R. C. MILLAR observed that the subject was a very wide one, and it seemed to him that it would be very difficult to deduce general propositions applicable to all the questions raised. Gas, water, telephones and electrical traction all interfered with streets, and no doubt one of the most important reasons why municipalities wished to have these matters in their own hands was that if they had one department looking after the streets, that department could more effectually control the up-keep of the streets, if central organisation also had to do with the things that used the streets. Then he agreed that water was a proper subject for municipal monopoly, mainly because the whole community derived advantage from the use of water. The community suffered if the individual did not use the water. The growth of municipal debts proved the progress municipalities had made in England.

Mr. PEARSON, in replying on the discussion, said that in the matter of large enterprises, where it became a question of company v. corporation, the side which had the most credit would get the money cheapest. For instance, if the corporation had promoted the tramways at Bristol it could have raised the money at 2½, 2 or 3 per cent., whereas the

cost to the company was 4 or 5 per cent. When he heard one of his colleagues in the reading of the papers say that the corporation had not the command or ability which a company possessed, he naturally asked himself who was wrong, viz. the Bristol Corporation in its clear real undertaking. He claimed that, man for man, the employees of the corporation were equal to the employees of any company. Speaking from a considerable experience, he denied that there was anything to fear from the action of the working classes in bringing pressure to bear upon corporations to raise the rate of wages of the employees, and he heard with amazement that councillors had been compelled to wink at the shirking of work. People who shirked their work would very soon hear of it. When it was suggested that employees of the Bristol Corporation should have their wages increased to £1 a week he had no hesitation in voting for the proposal. Now, in his view, they had more to fear from the combinations of the masters than from the combinations of working men. The question which corporations had specially to consider was the cheapest way of getting an article they wanted the people to have into the hands of the public.

Mr. CANNAN and Mr. ACWORTH also replied on the discussion.

ECONOMIC AND SOCIAL INFLUENCES OF ELECTRIC TRACTION.

Prof. S. P. THOMPSON read a paper on this subject. He said that no one could doubt that important effects were being produced upon the prosperity and habits of those communities who had adopted electric tramways, by reason of the cheap and rapid conveyance which had been secured. Even the introduction of horse tramways thirty years ago produced marked social and economic effects, and much more was this true of the better organised and more expeditious mode of travelling when electric power was used for propulsion. He first realised the importance of these effects in 1843, when travelling in the United States, and when revisiting Pittsburgh he found what changes the introduction of electric tramways had wrought in that city. Formerly the vast bodies of artisans lived near the factories, crowded together in tenement houses in narrow streets. The advent of the electric cars changed all this, and the outlying districts became populous with delightful rows of little semi-detached workmen's villas. The uniform charge for riding was 3 cents (2½d.), but now men purchased tickets for several rides at a cheaper rate. The fare might seem high to us, but it was not considered so in Pittsburgh, and it must be considered that while in the engineering circles men worked harder and for somewhat longer hours, the wages, whether for skilled or unskilled labour, was about double those paid in England. Pittsburgh was no solitary example, for in every large American and Canadian town something of the same kind was going on. In the city of Boston electric cars had long superseded horse cars; indeed, if a return were made, 29,000 horses would be required to do the work at present done by electricity. The gain in the cleanliness of the streets and public health in the absence of these 29,000 horses must be very great. The reader gave a detailed description of the system as it obtains in Toronto, and went on to say that the Province of Ontario had already over 900 miles of electric tramways, while in all Europe there was a total of only 700 miles. When he visited Toronto in 1884 it had a very complete system of horse tramways; in 1897 he saw no horse tramways, but a fine network of electric tramways on the most modern lines. It was found in Toronto that electric transit prevented the congestion of the population in certain districts and the creation of slums. It enabled working people and others of small means to find good and cheap house accommodation in open suburban districts, with rapid conveyance to and from their work at a reasonable cost. It tended to develop the departmental store system and concentrate the retail sale in the business centre, at the expense of smaller storekeepers. It largely increased the value of real estate in the suburban and outlying districts, and consequently detracted from that of house property in the immediate region. Under strict municipal control it ensured fair wages and just treatment to a large class of working men. On the whole it conduced greatly to the advantage of Toronto as a place of residence, and the physical and moral well-being of the population. Among interesting developments of the electric car system he might mention the open cars in summer, and cars in winter electrically lighted.

The Right Hon. G. SHAW-LEFFRYE thanked Prof. SYLVANUS THOMPSON for his extremely able paper. It showed how very much we were behind in these matters in the old country as compared with Canada and many parts of America. He hoped that the principle of electric traction would some day, and sooner rather than later, be introduced into some cities in England. At all events the experiment might very well be made. The reader of the paper did not say whether the electric tramways were the property of the city or of the companies. He presumed they had been constructed by the different companies—(Prof. Thompson: That is so)—and he supposed the author quoted that for the purpose of demonstrating the expediency of such enterprises. If so undertaken by the corporation, but he (Mr. Leffrye) was rather in favour of the municipalisation of such concerns. In the case of London he had himself advised this—that where the county council took over the tramways they should, for a

period at all events, be left for management in the hands of the companies. He was afraid there was no chance of the principle of electric traction being applied in London for some time, but he thought the results obtained elsewhere had shown them that it would prove a factor in settling the problem of the housing of the working classes.

Mr. SCOTT thanked Mr. Thompson for the manner in which he had treated the city of Toronto. He was amazed at the accurate and full information which Mr. Thompson possessed on the subject.

Mr. ACWORTH thought the paper should be read at the market cross of every corporation in the kingdom. He thought, however, it would be difficult to adopt the principle in England, because of the speed at which the cars travelled and of the fares charged. England would be handicapped in such a competition.

Mr. R. C. MILLAR would like to be informed wherein lay the superiority of electricity over the cable system.

Mr. ILES (Toronto) also thanked Prof. Thompson for his address, and Mr. Thompson briefly replied on the discussion.

This concludes the proceedings of the section so far as they are within our scope. Next week we shall deal in a similar way with certain papers read in the Mechanical Science section, including that of Mr. Dibdin, which we expect to give at considerable length. Only in the two sections in question were papers read to which we can appropriately refer.

THE DISPOSAL OF SEWAGE.

CONFERENCE AT SALFORD.

On Monday, at the Salford Town Hall, a meeting of representatives of local authorities in the Irwell watershed was held to consider the question of sewage disposal by land treatment. The meeting, which was attended by a large number of representatives of various bodies, was called by the River Irwell Conservancy Committee of the Salford Corporation. The Mayor of Salford presided.

At the opening of the proceedings a letter was read from the town clerk of Manchester tendering the thanks of the Rivers Committee of his corporation for the invitation to attend the conference, and adding: "They, however, feel that Manchester is in a somewhat exceptional position, as they have already given an undertaking in reference to the subject which renders it undesirable at the present time for them to take part in the meeting which you have convened."

After a statement in regard to the business of the meeting, the following resolution was moved: "That this conference of local authorities in the Irwell watershed gladly recognises the great advance made during recent years in efficient and economical means of sewage disposal, affording methods alternative to that of filtration through vast areas of costly land plus artificial filters, &c., demanded by the Local Government Board, and is of opinion that not only are the board's requirements needlessly expensive and embarrassing to most sanitary authorities, but to some are economically and to others physically impossible." A brief discussion ensued upon the motion, which was subsequently put to the meeting and carried. The following was then adopted: "That it be recommended that an association be formed of the local authorities within the Irwell watershed, to be composed of two representatives of each authority, to fully consider and report upon the following matters—namely: (a) The requirements of the Local Government Board with respect to filtration of sewage effluent through land. (b) The rights of manufacturers to turn trade liquids and refuse into the public sewers. (c) The standard of purity of effluent required by the Mersey and Irwell Joint Committee. And that each authority be required to contribute towards the incidental expenses *pro rata* according to population."

Mr. Brown, the town clerk of Salford, expressed astonishment at certain remarks which had been made in the course of the meeting. It had been said, for example, that in certain places the Local Government Board had refused to sanction loans for other purposes because the local authorities declined to carry out their wishes in regard to land filtration. The thing was preposterous. But they had no power to do it, and they could be compelled by mandamus to cease withholding their sanction. Another matter he desired to mention was this—that in certain circumstances they had no need to go to the Local Government Board for power to borrow money for sewage purposes. All authorities who had "land, works, or other property for the purposes of the disposal of sewage," had no need to go to the Local Government Board—that board had nothing to do with the matter in any shape or form. Such authorities might borrow to the extent of two-thirds of the annual assessable value of their districts, and that was more than any local authority would ever want. The Local Government Board admitted that he was right in this contention, and Mr. Fletcher Moulton, although he hesitated at first, also accepted his view. The Bank of England, through their solicitors, had also looked into the matter, and were lending money to the corporation in the full conviction that his view was correct.

A vote of thanks to the mayor for presiding and to the Salford authorities for calling the meeting brought the proceedings to an end.

CREMATION OF SEWAGE.

The letter of the Archdeacon of Gloucester on the cremation of sewage published in our last issue has elicited the following from a correspondent of *The Times*—

"Archdeacon Sheringham, in his letter, hits the nail on the head when he says that the turning of fair streams into foul drains is 'not only a hideous blunder but a hideous crime,' and he drives it home when he calls attention to the 'miserable subterfuges' called sewage farms, which 'at their best result in the spread of noisome exhalations over fair fields instead of fair rivers,'"

"Let me take an example in the archdeacon's own county—viz., the town of Cheltenham—in which I reside. By means of its sewage Cheltenham has partially surrounded itself with hundreds of acres of land which has become simply rotten through excessive saturations with foul liquid, and the various brooks running ultimately into the Severn (of the state of which the archdeacon complains) are nothing more or less than open sewers. Various landowners and farmers, for the sake of individual gain, have from time to time either sold their land to the Cheltenham Corporation or allowed it to be used for irrigation purposes, whilst their neighbours, and especially the poorer classes, have, without compensation, had the air which they breathe polluted, and in some cases their water supply contaminated. And this, forsooth, is done by the sanitary authority of a town calling itself a health resort! There are, no doubt, other towns worse than Cheltenham, and it seems certain that, if Parliament made longer allows corporations and manufacturers to go on acquiring as it were prescriptive rights to pollute the fields and streams of England, the evil will have grown beyond control. In the meantime Archdeacon Sheringham has done a public service by calling the attention of our legislators to it."

"There are many of us who would prefer that the attention of Parliament should be directed more to the social welfare of the people and less to political quackery."

A CLEVER SURVEYING INSTRUMENT.

The Ziegler-Hager tachograph is a clever surveying instrument to which the attention of our readers may be drawn, for though it has been in use for several years on the Continent, it does not seem to be so well known here as its merits entitle it to be. It is remarkably simple, both in theory and manipulation. It is the universal tachograph of Victor von Ziegler, a well-known writer on geodesy, and of C. Hager, scientific instrument maker, Luxemburg. The instrument, which is constructed in various forms for special purposes, belongs to the class of plane table theodolites. Its chief merits are that horizontal distances and vertical heights are read off at the same time, that there are no calculations, that the instrument checks itself, and that the operations require very little time and skill.

The three levelling screws of the table fit into grooves of the tripod stand, which is of the new usual construction, both firm and light, and provided with a screw and with a strong spiral spring, by which means the table is secured to the tripod. The instrument is neatly and carefully finished, and there appears to be no delicate parts likely to get out of order. The staff is made of triangular section, and is hinged in the middle, so that it can be folded up to form a prismatic bar. The centimetre divisions will then be on the inside faces, and thus not exposed to any wear. These instruments have found great favour with surveyors and mining engineers in Luxemburg, France and Germany, as being both accurate and convenient. Our surveying and engineering readers who desire further information on the subject will find it in an illustrated article in our contemporary, *Engineering*, for May 6, 1898.

PROPOSED HARBOUR AT LOWESTOFT.

The East Anglian Daily Times states that, with a view to avoiding, if possible, the great outlay for protection works on the Denes at Lowestoft, a suggestion which was made some sixty years ago has been revived at Lowestoft—namely, the making of a harbour of refuge on the Denes, and the provision of wharves, docks, warehouses, &c. Lowestoft boat-owners, in common with the residents generally, have realised with serious concern the denuding of their beaches and the possible permanent flooding of the Denes. Now, after a lapse of sixty years, a suggestion has been made that the Denes belonging to the corporation south of the model yacht pond should be offered to a railway or other company, with a view to the construction of a new harbour, with docks, wharves, &c. A memorial on the subject has been prepared for presentation to the town council.

Irish Local Authorities.—The Local Government Board for Ireland have intimated to several public bodies in the south of Ireland that they are not disposed to sanction the carrying out of new works until the new Local Government Act for that country comes into operation next March.

Municipalities as Traders.

By G. A. PEARSON*

In writing this paper I have felt that this meeting does not require from me a long explanation of my own municipal dogmas, but would prefer that I should review the present position of municipalities as traders and the progress made in municipal trading; and I am inclined to think that that course will best serve as a peg on which to hang the discussion to-day. We are long distant from the so-called "good old times," when it could be said "if each man swept his own doorstep the village would be clean."

Individual performances of cleansing duties such as these, to say nothing of the still more important duty of sewage disposal, has long since ceased to be possible, and, further, the days when citizens "paid their cot and bore their lot" have also long passed, and the performance of duties at the public expense which were formerly looked upon as the duties of the private individual has been accepted as reasonable and proper; and, proceeding one step further, the public provision of a water supply, and also of the supply of light, and, lastly, of a cheap, frequent and regular mode of locomotion, has become so common as to cease to surprise, and now the suggestion of a dweller in any city providing his own separate system of cleansing, sewage disposal, water supply or light would be regarded as a stupid waste of a private energy.

MUNICIPAL ACTIVITIES.

Drainage was first recognised as a public duty forced on municipalities by the density of the population, to be followed by a public system of cleansing; but, at a comparatively recent date, a municipal water supply was looked upon as a first step in a downward course leading to the pit of socialism; but few at the present time regard it in this light. The provision of light at a more recent date stood in the same position, but the advocates of the purchase of the gas and electric light undertakings form a majority of municipal councils at the present time; but to-day the man who publicly advocates the provision of a tram system by a corporation is called "very advanced" in his views, to say the least, and by the older members of the corporation he would be looked upon as really a dangerous man, leading a confiding public to the abyss of municipal socialism. Personally I have no dread of a name, and any scheme bearing on the face of it the impress of common sense would not be rejected by me because its opponents called it by a disagreeable title, and to bear a scheme in which I am interested called "socialistic" has no terrors for me.

Let us consider for one moment the growth of municipal trading, which will be best seen from the growth of municipal indebtedness, by means of which municipal trading has been rendered financially possible. The loans to municipalities outstanding in the year 1875 amounted to £92,820,100. These outstanding loans had grown in the year 1895 to £235,335,049, an increase of £142,514,949, being an increase at the rate of 153.5 per cent. in the twenty years. The National Debt was in the year 1875 £768,945,757, and it had decreased in the year 1895 to £656,998,941, or a decrease of £111,946,816 in the twenty years. It will be seen from these figures that the increase of local indebtedness exceeds the decrease in the national indebtedness by £30,568,133. Local indebtedness represents loans due in respect of—

Waterworks	£43,970,490
Harbours, piers, docks and quays	32,777,992
Highways, street improvements and turnpike roads	30,143,979
Sewage and sewage disposal	23,734,738
Schools	22,970,555
Gas works	16,931,943
Poor law purposes	7,773,504
Markets	5,775,076
Parks, pleasure grounds, commons and open spaces	5,051,092
Public buildings	4,958,954
Artisans' dwellings, improvements	4,351,532

There is also a long list of loans in respect of other public works, in respect of each of which a debt approaching £4,000,000 now exists, the list being too long for quotation here. The figures I have read show the extent to which public funds have been used by local authorities in municipal trading. Taking gas, water, dock works, as three of the largest classes of municipal trading concerns, we find that the debt now existing (not the sum originally raised, which would, of course, be much larger, the present reduced figures being brought about by the operation of the sinking fund arrangement made in respect of each of these loans) shows the indebtedness at £93,680,425, being about £860,325 more than the total local indebtedness in the year 1875.

The foregoing figures show the great growth in municipal trading, by showing in some degree the growth of the municipal capital invested in it during the last twenty years; and these figures do not remain stationary. I have been unable to obtain the report of the Local Government Board for this year, but I have, by the courtesy of the secretary of the Local Government Board, obtained the figures of the national

and local indebtedness for the year ending 1896. The National Debt has sunk to £648,474,143, as against £656,998,941 in the year 1895, a decrease of about £8,000,000 in the year, while the local indebtedness has grown to £243,269,862 as against £235,335,049 in the year 1895, being an increase of about the same amount.

The electric light figures are very instructive, and show the growth of municipal trading in electric current. Up to the year ended March, 1895, £1,378,815 only had been invested in these undertakings by local authorities, whilst I find, from the tables published in *Lightning*, that fifty local authorities own their electrical undertakings, and from the figures there given I estimate the capital invested up to the year ended March, 1897, at £1,000,000, and think by this time this sum must have grown to nearly £6,000,000.

EXTENSION OF MUNICIPAL TRADING.

Having shown the growth of municipal trading as evidenced by the growth of the capital account, let us consider for one moment the extent to which it may be extended to the advantage of the public. I think that municipal trading should be confined to the provision of those necessities of civilisation which are so large as to be beyond the power of individual effort to supply and which do not form part of any Government department. The effort of the individual will generally produce more economically than either a company or local authority, but as between a company and a local authority there is, economically speaking, very little to choose and corporations can claim to be free from the misappropriations of capital which appear to be incident to the formation of so many of the companies which from time to time come under our notice; and therefore the cheapness of the price of money when raised on the credit of a local authority as against the dearthness of money when raised by a company must always enable a local authority to trade on a smaller gross profit than a company, and therefore requires less to be abstracted from the pocket of the consumer to secure success to the undertaking, whatever it may be. I am therefore of opinion that the supply of water, gas, electrical energy and trams should be in the hands of the local authority. Cleansing, sewing and watering should also be done without the aid of a contractor; but I would not suggest, except under exceptional circumstances, that all municipal works, such as erection of buildings and other matters of that kind, should be undertaken by the municipality, but where for any reason whatever, and there are many reasons I know, there is a lack of outside competition, then these works can be done generally more economically and always better than by a contractor.

There is another point which has to be considered—viz., the formation of "rings" and "trusts" formed with the object of keeping up prices to artificial levels. The only way to meet combinations such as these is for local authorities to face the position and do the work themselves. On the other side of this question is to be found the question of labour. Local authorities popularly elected are liable to pressure from without, to which the directors of public companies and private individuals are relatively free. Working men have votes, and will use them to serve their own ends precisely to the same extent as other people, and labour questions raised just before a November election put the independence of a candidate for a seat in the council to a severe test; but this, in my opinion, is a "nettle to be grasped" by a straight refusal on the part of the candidate. It is seldom, when this is done, that the labour combination is successful.

I cannot claim a very long experience in the management of large bodies of men, having only had a few years' experience as a member of the Sanitary Committee of Bristol. This department pays about £2,000 per week in wages; but the experience I have had as a member of that committee shows me that a position of absolute neutrality in respect of all trade combinations, and the acceptance of the services of any competent workman, whether unionist or not, extorts a respect even from those who may be violent partisans either on the one side or the other.

THE TELEPHONE AND MUNICIPAL TRADING.

There remains one other enterprise which appears likely to be placed within the reach of any enterprising municipality. I refer to the telephone. The recent report appears to contemplate municipalities undertaking this work. Personally I would rather be without it. I have no more faith in a municipal telephone than a municipal telegraph or municipal post office. In my opinion telephonic communication should be provided by the Imperial Government and not by the municipalities. If this is done, we can do without the competition in telephonic supply, of which we have lately heard so much, and the sooner this is done the better. If it is long delayed it will have developed into a large undertaking, with a large goodwill built upon the basis of the grants made by municipalities of the use of the public street at a nominal

* A paper read before Section F (Economic Science and Statistics) of the British Association.

cost, or, perhaps, at no cost at all to the company. If we are to have the nuisance of underground telephone wires, and the still greater nuisance of overhead wires, the quicker the better it will be for the Government to secure from that nuisance some profit for the public who have to submit to it. The longer the present companies live the tighter will they fix themselves on the public shoulders, and the more expensive it will be to remove them, as removed they must be, sooner or later, at any costs.

There is one other question now being prominently raised, and it is discussed in the recently-issued report of the Telephone Committee—*viz.*, ought municipalities to trade for a profit. In my opinion they ought. Speaking as a municipal man, I should have very little inducement to trade at all but for the hope of success with its usual accompaniment profit. Birmingham trades, Manchester and other towns trade, at a profit, and I fail to see why they should not—subject only to the condition that they do so on the same lines as ordinary individuals and companies, and that they do not secure a profit by charging at a higher rate than would be charged by a company. Take the case of Bristol as an example, and I think ours is a fair sample of the average of cases of the kind. We have in Bristol 60,000 ratepayers and under 1,000 users of the electric light. The luxury of private lighting to the few is rendered possible by pledging the credit of the many, and why should not the many reap some benefit from the risk they run, to say nothing of the actual loss which attended the early years of our undertaking, which was paid out of the rates levied upon them. I think Parliament will be wise not to put such restriction as to profit-making as are shadowed forth by the report of the Telephone Committee. They may well leave the question of the amount of the profit to be settled by the natural law of supply and demand. The moment a municipality charges more for an article than it is worth will be the moment the public refuse it.

If we review the result of municipal trading, I think its advocates (of which I am one) have little to fear. Birmingham, Manchester, Glasgow and other large towns have shown a very good lead, which it remains for others only to follow. Failures are very seldom reported, and, having regard to the "ferce light" which surrounds all municipal trading, I think the fact that few failures are reported is caused by the fact that there are few failures to report. There is one other risk which it is impossible to omit to notice. There may be dishonesty in the official, or, still worse, there may be dishonesty in the council, but I think the risk is small in each case. So far as officials are concerned, business-like regulation may be made which, if powerless to actually prevent fraud, will most assuredly detect it, and I think the personal character and position of the members of the various representative bodies, coupled with the fact that more than one or two must be "in it" to secure success, will prevent any serious malpractices by the representatives, even if they were so minded.

THE PRINCIPLE OF THE SEPTIC TANK.

In our editorial columns this week we refer to an interesting article on "The Bacterial Processes of Sewage Purification," by Mr. Rudolph Hering, the well-known American civil engineer, which appears in the current issue of *The Engineering Magazine*. In the course of our remarks we mention that Mr. Hering quotes from a French periodical an account of a contrivance that seems to him to be an anticipation of the principle of the septic tank, which hostile critics have described as being merely the principle of the cesspool. We here publish that part of the article referred to in full, as no doubt it will be of considerable interest to many of our readers:—

In a French periodical, *Cosmos-les Mondes* (December, 1881, p. 622, and January, 1882, p. 97), there is an article on the Mouras automatic scavenger, which is described as being a "mysterious contrivance" that has been used for twenty years. It consists of a vault, hermetically closed by a hydraulic seal. "By a mysterious operation, and one which reveals an entirely novel principle, it rapidly transforms all the excrementitious matter which "it receives into a homogeneous fluid, only slightly turbid, and holding all the solid matters in suspension in the form of scarcely-visible filaments." The vault is self-emptying and continuous in its working. "The liquid which escapes while it contains all the organic and inorganic elements of the feces, is almost devoid of smell, and can be received into a watering-cart for horticultural purposes, or may pass away into the sewer for use in irrigation."

Passing on to the theory of the action, it is then said: "May not the unseen agents be those vibrations or anaerobes which, according to Pasteur, are destroyed by oxygen, and only manifest their activity in vessels from which the air is excluded?" Daily observations conducted with a glass model showed that "fecal matters introduced on the 29th August were entirely dissolved on the 16th September." "Even kitchen refuse, onion peelings, &c., which at first floated on the surface, descended after a time to the bottom of the vessel and awaited decomposition. Everything capable of being dissolved acted in a similar way, and oven paper wholly disappeared."

It is further said: "The principles on which M. Mouras bases the action of this machine is that the animal dejecta contain within themselves all the principles of fermentation or of dissolution necessary and sufficient to liquefy them, and to render them immediately useful in their return to the soil, and without appreciable loss."

In a later article of the *Cosmos-les Mondes* (January, 1883, p. 110), entitled "Theory and Accurate Working of the Automatic Scavenger," and written by Abbé F. Moigno, certain additional information is given, by which the proper dimensions of such a tank may be ascertained. M. Mouras is reported to have made the following statements. For the complete solution of the floating matter a period of thirty days should be allowed. The superficial area of the tank should be $\frac{1}{2}$ metre per person. The thickness of the top layer of undissolved solid matter should not exceed 0.75 metre (say 3 in.). The depth of the deposit is assumed as 0.02 metre (say 1 in.). The depth of the submerged portion of the outflow pipe below the surface should be 0.18 metre (say 7 in.).

If we assume:—
 v = daily volume of excreta per person,
 n = number of persons,
 a = area of tank,
 d = depth of tank, which be at least 1 metre, if only excreta entered it,
 s = thickness of floating layer of undecomposed solids,
 c = thickness of layer of deposited detritus,
 then the size of the necessary tank may be ascertained from the following formula:—

$$a = \frac{30 vn}{s}$$

$$d = 1 \text{ metre} + nc$$

From the description of this interesting contrivance, continues the article, it will be seen that the process of anaerobic decomposition was practically applied many years ago. It does not seem to have been suggested, however, as a method to be adopted on a large scale until it was introduced at Exeter, England, in 1896, by Mr. Donald Cameron, city engineer.

ALTERATIONS AT THE GUILDHALL, NEWCASTLE-ON-TYNE.

The interior of the old Guildhall at Newcastle-on-Tyne has been completely transformed by the alterations recently effected within it, and, according to a contemporary, the "New Exchange" was opened for the transaction of business on the 30th ult.

In the work of alteration the ten heavy stone piers carrying the arches which supported the north wall and floor of the Guildhall have been removed, the superstructure now being carried on steel girders resting on four steel stanchions. The work of demolishing the old interior and substituting the new, was one in which the greatest care was necessary, the mere so as the Exchange business had all the time to be carried on in the floor above. Under the new scheme the Exchange proper covers an area of 3,800 square feet, with a cubical space of 77,000 ft., and it has entrances, on the north from the Sandhill and on the south from the Quayside. On the left of the Sandhill entrance are the porter's, reading and manager's rooms, with retiring accommodation. Adjoining the entrance from the Quayside are the writing-room, accommodation for the Chamber of Commerce, telegraph and telephone rooms and smoking-room. These apartments, all well lighted, are separated from the exchange proper by glazed screens. The reading-room occupies the eastern end of the building.

In the Exchange increased height has been effected by lowering the old floor 2 ft. 4 in., giving a height to the Exchange of 20 ft. 6 in. The windows have been increased in size, and now have a lighting area of 645 square feet, as against 370 square feet formerly. The floors are covered with wood-block flooring, supplied and fixed by Messrs. Greary & Walker, of London. The heating is by hot water on the low-pressure system. The ventilation is effected by the introduction of fresh air on the Tobins tube principle, the foul air being extracted by a large Blackman's fan, worked by an electric motor, and supplied by Messrs. Henry Walker & Son, of Newcastle. The decorative fibrous plaster work has been modelled and carried out by Mr. W. R. Dodds, of Jarrow, the general contractor being Mr. Thomas Lumdsen, of Jarrow. The supporting steel stanchions are encased in fibrous plaster columns, and finished in Ionic caps below the girders, which are also encased in plaster, moulded, the cross beams resting at the walls on pilasters treated in a similar way to the columns. Messrs. Armstrong & Knowles, of 33 Grainger-street West, Newcastle, are the architects.

Norwich.—On the 6th inst., at a meeting of the council, the City Committee asked for a further sum of £115, making £423 to be expended on the renovation of the sessions court, lobby and entrance to the guildhall; and also recommended that the tender of Messrs. Downing & Sons to undertake the work for £423, be accepted. The recommendation was agreed to.

London Local Authorities and the Water Companies.

THE QUESTION OF MAINS AND PIPES AND THE LOWERING OF ROADS AND FOOTPATHS.

The recent lawsuit between the Southwark and Vauxhall Water Company and the Board of Works for the Wandsworth district has more than a local interest, so far as the metropolis is concerned, and therefore an accurate report of the main points of the proceedings will be of interest. When the case was first heard a decision was given against the local authority, but, as will be seen, this was subsequently upset on appeal. We may mention that the surveyor for the Wandsworth district, in which the difficulty arose, is Mr. P. Dodd. The preliminary facts of the case may be briefly stated, after which the judgment on appeal will be quoted in full.

The Board of Works for the Wandsworth district having resolved, in June, 1898, to pave West Hill-road, Wandsworth, as a new street, under sec. 105 of 18 and 19 Viet., cap. 120, it was found necessary, in order to form the road and footpaths to a proper level and inclination, to lower the footpath at one place 10½ in. The footpath in question was laid out over thirty years ago, and at the place in question it was apparently made up to a higher level, in order to facilitate entrance to the forecourt of a house erected there. A water main was laid under the footpath, about thirty years ago, to supply each house. This main was laid so as to follow generally the contour of the footpath, which was made up to a very irregular inclination. The depth of the main below the footpath averaged about 1ft. 7in. At the place where the footpath was proposed to be lowered the minimum depth of the main was 14½ in. The lowering of the footpath 10½ in. would therefore leave a thickness of only 4in. of soil above the top of the main. The old footpath was made up with gravel. The new footpath was to be of tar paving 3in. thick.

At the place in question the water main was frozen in the severe winter of 1894-95. The water company then took up one length of pipe (which had burst), and laid a new pipe in lieu thereof at the same depth.

Upon the water company observing the paving works which were being executed by the board in June, 1898, the engineer of the company requested the board, before lowering the footpath, to agree to the company lowering the water main at the cost of the board, the company stating that the lowering of the footpath would render the main more likely to be frozen. This the board declined to do, being of opinion that if the main required lowering the cost should fall upon the company. The company thereupon applied for an injunction. Upon the hearing of the application, on July 8, 1898, Mr. Justice Kekewich granted an injunction restraining the board from "lowering the surface of the streets and footways in their district whereunder the pipes and mains of the plaintiffs are laid in any manner which will leave such pipes or mains without a sufficient covering of soil or other material to protect them from injury from frost, or otherwise without first altering the position of the said pipes and mains, by placing them at such depth below the proposed new surface of such streets or footways as will not expose them to greater danger from frost or otherwise than they are at present."

The board appealed. The appeal was heard on the 27th and 28th July, 1898, and the following judgment was delivered on the 8th of August, 1898:—

JUDGMENT.

THE MASTER OF THE ROLLS: This is an appeal from an order of Mr. Justice Kekewich, by which he restrained the defendants, the Wandsworth District Board of Works, until after judgment or further order from lowering the surface of the streets and footways in their district whereunder the pipes and mains of the plaintiffs are laid in any manner which will leave such pipes or mains without a sufficient covering of soil or other material to protect them from injury by frost or otherwise, without first altering the position of the said pipes and mains, by placing them at such depths below the proposed new surface of such streets or footways as will not expose them to greater danger from frost or otherwise than they are at present.

The injunction was granted under these circumstances. It appears that the Wandsworth District Board of Works have, pursuant and in the exercise of powers conferred upon them, which I will refer to presently, by the Metropolitan Management Act, 1855, lowered the surface of a certain public footpath under which there are some pipes of the plaintiffs, the Southwark and Vauxhall Water Company. The defendants have not touched the pipes, but the water company say by lowering the path the defendants have exposed those pipes to the action of frost, and that is their complaint.

Now, the section under which the defendants have lowered the surface of this street is sec. 98 of the Metropolitan Local Management Act, 18 and 19 Viet., chap. 120. It runs as follows: "It shall be lawful for every vestry and district board from time to time" (and the defendants are exercising these statutory powers) "to cause all or any of the streets within their parish or district, or any part thereof respectively, to be paved or repaired when, and as often, and in such form and manner, and with such materials, as such vestry or board think fit, and to cause the ground or soil

thereof to be raised or lowered, and the course of the channels running in, into or through the same to be turned or altered, in such manner as they think proper, and to alter the position of any mains or pipes in or under such street, such alteration to be made subject to the approval of the engineer of the company to which such mains or pipes belong."

Now, the defendants do not want to move those pipes, but there is a controversy between them and the water company. The water company say, "You must move and drop the pipes down, so as to protect them from frost, and not have them exposed or nearly exposed as it is proposed to do." That is the controversy.

Now, sec. 98 of the Act which I have just read simply in its terms confers a power; its language imposes no duty. The words are "it shall be lawful, &c." These words may, no doubt, under certain circumstances impose a duty as well as confer a power, but it is for those who contend that they do both to make good their contention.

Nothing can be clearer on this point than the judgment of Lord Cairns in *Julius v. The Bishop of Oxford*, which will be found in 5 Appeal Cases, p. 214, and see p. 223 and 224.

The defendants have not touched or disturbed the plaintiffs' pipes. They have in no way injured them, and this circumstance distinguishes the case from the *Gas Light and Coke Company v. The Vestry of St. Mary Abbots*, Law Reports, 15, Queen's Bench Division, p. 1, in which the steam rollers used by the defendants broke the plaintiffs' gas pipes.

The same circumstances—namely, the non-interference with the plaintiffs' property—distinguishes this case from *Geddis v. The Proprietors of the Dunn Reservoir*, which is reported in 3 Appeal Cases, p. 430, where the defendants flooded the plaintiffs' land and said, in effect, that they could not help it. The answer was that they could help it if they kept a stream into which they poured water free from obstruction by mud, which they could do if they chose. Lord Blackburn's remarks on p. 456, on which the plaintiffs mainly relied, had reference to that state of things, and do not show what the plaintiffs must show—namely, that sec. 98 imposes a duty on the defendants to lower the plaintiffs' pipes, although the defendants do not want to do so for their own purposes. Underlying the plaintiffs' contention is the assumption that they are entitled to have a certain amount of soil over their pipes. I can find no warrant for this assumption; and as the defendants are clearly empowered by sec. 98 to remove the soil above the pipes, I see no ground for saying that the additional power conferred upon them of lowering the plaintiffs' pipes imposes the duty of lowering them in order to protect them from injury. The plaintiffs pay nothing for the privilege of laying their pipes down in a public path or road, and they run the risk of having it made higher or lower by the road authorities under their statutory powers.

This conclusion is strengthened by sec. 61 of the Towns Improvement Act, 1847, 10 and 11 Viet., ch. 31, which is *in pari materia*, and which empowers the Improvement Commissioners to raise or lower pipes "if they deem it necessary" so to do. No duty to do so is cast upon them. Sec. 98 of the Metropolitan Local Management Act, although not quite so clearly worded, has, in my opinion, the same meaning.

The appeal motion having by consent been treated as an appeal from a final judgment in the action, the order appealed from must be discharged and judgment be entered for the defendants with costs here and below, and the costs below must be taxed as between solicitor and client, pursuant to the Act of 56 and 57 Viet., ch. 61, sec. 1, which we have just dealt with in the previous judgment.

LORD JUSTICE CHITTY: I am of the same opinion. The case is one of some importance; the decision will affect not only water companies, but gas and other like companies who have the like statutory privileges of laying pipes under the public streets in the metropolis. For these privileges they make no payment. The case turns on sec. 98 of the Metropolitan Local Management Act of 1855. That section confers powers on the road authority to pave and repair the streets when and so often as, and in such manner as, that authority think fit, and to raise or lower the ground or soil in such manner as they think proper. This is the principal power; it is discretionary. Then they have power to alter the position of mains and pipes in or under the street. This is a supplemental or subsidiary power; if it is exercised the alteration of the position of the mains or pipes is subject to the approval of the engineer of the company to which the mains or pipes belong. In this case the road authority have not altered the position of the pipes, nor have they in any way disturbed or interfered with them. The effect of their works, which have been lawfully executed under their principal power, is to bring the surface of the street nearer to the pipes, which remain as they are. The consequence is that the water in the pipes, being but a few inches from the surface, is more exposed to frost. In exercising the power the road authority has not been guilty of any negligence. I am unable to find in the section any express or implied duty cast upon the road authority when they exer-

case the power of altering the level of the road, whether by raising or lowering it, to exercise at their own expense their power of altering the position of the pipes for the benefit of the company owning the pipes, much less any duty to place the pipes at a depth below the new surface corresponding with the depth at which they stood below the old surface. I think that no such duty is imposed upon the appellants.

The real question is on whom the expense of altering the position of the pipes is to fall. It appears to me that it falls on the company. They are under no statutory obligation as to the particular depth at which their pipes are to be placed from the surface of the road; it is for them to place them at such a depth as will protect the water from freezing. As between the road authority and the company, I think that the road authority are paramount. They are entrusted with the powers over the street, not for their own profit as a statutory body, but for the benefit of the public using the streets as a highway. The statutory undertaking of the water company is vested in them with a view to their own profit as a company and for the purpose of affording a supply of water to the consumers of water within their district. When the road authority alter the level of the street, sec. 98 does not afford any means of ascertaining the point at which the supposed duty of the road authority begins in reference to the distance from the surface at which the pipes are to be left—subject only to this qualification, that where the position of the pipes themselves is altered the approval of the company's engineer is required in relation to the position where the pipes are to be re-laid.

In regard to the authorities cited, I think they are distinguishable, as stated by the Master of the Rolls, and I agree with Lord Justice Collins (whose judgment I have had an opportunity of reading) in his statement of the general principles of law derived from the authorities in reference to the exercise of statutory powers.

Lord Justice COLLINS: I am of the same opinion, but I will add a few words on the point, based on the dictum of Lord Blackburn in *Geddis v. The Proprietors of the Bann Reservoir*:—

The point urged is that the plaintiffs have suffered damage by the exercise by the defendants of their statutory powers; that the defendants were armed by the same statute with other powers, which, if used, would have mitigated the damage, and that therefore they were bound to use them. I think it is quite clear, as pointed out by the Master of the Rolls, that the power to move the pipes is merely ancillary to the powers of levelling the highway, and that there is no statutory duty on the defendants to exercise it, unless they require it for the performance of their primary obligation. But it is not on the assertion of such a statutory duty that the argument for the defendants' liability is or must be based, but on the broader proposition—that being possessed of a power of mitigating damage arising from their proceedings under the statute they are bound to exercise it. So stated, it is merely an assertion of the proposition so frequently affirmed that where statutory rights impinge upon what, but for the statute, would be the rights of other persons, they must be exercised reasonably, so as to do as little mischief as possible. The public are not compelled to suffer inconvenience which is not reasonably incident to the exercise of statutory powers. The railway spark cases are instances of this principle. See *Vaughan v. The Taft Vale Railway Company*, 5 Thurlstone and Norman, p. 679; *Brand v. The Hammer-smith Railway Company*, Law Reports, 4 House of Lords, p. 171, and see *Coates v. The Clarence Railway Company*, 1 Russell and Mylne. Lord Blackburn was dealing with a case in which the rights of adjoining owners had been in fact invaded, the statute under which the defendants acted not enabling them to flood the plaintiffs' lands when such flooding might have been avoided by dredging, as the defendants had power to do, the channel by which they sought to pass their compensation water back to the river. They were under a duty to pass the water down to the river, and they were given powers to make and maintain channels for this purpose, and where they had not exercised these powers they could not say that the damage to the adjoining proprietors was a necessary incident of the exercise of their statutory right. The statutory power which Lord Blackburn thought them bound to exercise was one without which their duty of passing the water on could not be properly carried out. Here the levelling of the road could be, and was, effectively carried out without in any way disturbing the plaintiffs' pipes or infringing any of their rights. I think the dictum of Lord Blackburn must be read with reference to the case he was dealing with, and cannot be pressed to cover this one. But it must be admitted that the defendants are bound to exercise their statutory powers with reasonable regard for the rights of other persons. I think, when it is once clear that the main purpose of the defendants could be completely carried out without recourse to the power of moving the pipes, the obligation of the statutory body must be tried by the same standard of duty as is applicable to private persons. Of course, being merely a creature of statute, they cannot exercise powers if they are bound to use them because they possess them, any more than a private person would be. They merely fall under the general principle *sic utere tuo ut alienum non laedas*. Here the plaintiffs have no right to any particular thickness

of soil above their pipes. They are subordinate in this respect to the duties of the road authority, see *Gas Light and Coke Company v. St. Mary Abbots*, 15 Queen's Bench Division, p. 4. But they are not trespassers. Their pipes are lawfully in the road, and the defendants' acts have undoubtedly damaged if they have not injured them. I think they can have no higher claim to consideration at the hands of the defendants than the owner of a house for which no right of support from the adjoining house had been acquired would be entitled to claim against the adjoining owner, who, in pulling his own house down, withdrew support to which his neighbour is not entitled. I think it is clear in such case that, though the pulling-down owner must be careful to interfere as little as possible with the adjoining house, he is certainly not called upon to take active steps for its protection, as for instance by shoring it up. There is a broad distinction between exercising a right with reasonable care so as not to do avoidable damage and taking active measures to ensure the continuance of something that is not a right in the adjoining owner.

Shadwick v. Trower, 3 Bingham new cases, pp. 354 and 6 Bingham new cases, p. 1 (which goes perhaps further than any other case in the plaintiffs' favour) merely decides that supposing there is a duty upon a person pulling down his own house to take care not to injure his neighbour's vault in so doing, where he knows of its existence, though it has acquired no right to support, there can be no such duty where he does not know of it. And it cannot be the law that the pulling-down owner is bound to find a substitute or equivalent for the support which he has a right to remove. That he has such right is clear, see *Angus v. Dalton*, 6 Appeal Cases, p. 740.

I think the result is that, though the person pulling down is bound to do no unnecessary damage, he is not fixed with any obligation to take active steps to mitigate a mischief which follows inevitably upon the reasonable exercise of his own rights.

I think, therefore, the only obligation on the defendants was to use reasonable care to do no unnecessary damage to the plaintiffs, and I think the existence of the power to move the pipes, and the fact that it was unused, would afford no evidence of want of such reasonable care, and that therefore the judgment ought to be for the defendants.

Mr. Renshaw, Q.C., and Mr. Lytleton Chubb were for the appellants; Mr. Warrington, Q.C., and Mr. Gore Brown were for the respondents. Solicitors, W. W. Young and Lanfear, Tanner & Lanfear.

DUST DESTRUCTION AT LEYTON.

THE WORKING OF THE DESTRUCTOR.

In his annual summary of the reports of the district medical officers of health, Dr. Thresh, county medical officer of health, quotes from the Leyton report some interesting remarks on the subjects of (1) the dust destructor and (2) combined drainage. These remarks will be sufficiently interesting to our readers to bear reproduction. We are told that the destructor has now been working the whole of the year, and that the results have been most satisfactory. The conclusions of experts by whom the destructor was thoroughly tested are given as follows:—

(1) The destructor is capable of consuming wet sewage cake and house refuse of poor character in a complete and satisfactory manner; (2) the oxidation of the combustible matter in the material fed into the destructor is complete, and the gaseous products of combustion are inoffensive; (3) the gaseous products of combustion are sensibly free from any suspended matter by the time they pass into the flue in the chimney; (4) the clinker is well burnt and free from offensive half-charred carbonaceous matter. Even when working with a wet sewage cake and poor house refuse the destructor generates more heat than can be used with the present plant at Leyton. We examined one of the cells in its cold condition, and were unable to discover any signs of wear or abrasion. We therefore consider that your destructor provides an efficient and economical method of destroying the refuse of towns without injury to the neighbourhood. So far as we are aware, it is the only form of furnace yet adopted capable of burning a considerable proportion of sewage sludge, even when containing, as in this case, a high percentage of moisture.

WATER DIVINATION.

A FURTHER SURCHARGE.

Last year the Portcawl Urban District Council were surcharged by the Government auditor the amount of fees paid to wielders of hazel sticks in efforts to reach a supply of water by "divining." At this year's audit, held on Saturday, Mr. Dolby further surcharged the council £248, spent in sinking a well on a "diviner's" advice, thus differentiating Portcawl from other places, where the fees have been disallowed but subsequently the expenditure has been passed. The council appealed against last year's surcharge to the Local Government Board, but the matter is not yet decided.

MUNICIPAL WORK IN SOUTHAMPTON.

A NEW LODGING-HOUSE.

In our supplement this week we publish the plans of the new lodging-house which is being erected by the Southampton Corporation, and the foundation-stone of which was laid by the mayor some little time ago.

The new building will be four storeys high, with a basement at the lower end. It is simple in design, and will be built of red bricks with stone facings, and the roofs covered with red tiles, which have been taken from the old buildings demolished on the first of the areas now cleared. The building will have a frontage of 65 ft. 2 in. to Pepper-alley, and a depth of 129 ft. 6 in., extending to within a few feet of the ancient town wall, which has been thrown open to view by the removal of many old buildings formerly abutting upon it. It will be rectangular on plan, covering a superficial area of 940 yards, 40 ft. high to the eaves in front and 53 ft. at the back. The narrow roadway of Pepper-alley has been widened to 40 ft., and the building will be put back some 10 ft. further. The main entrance is from Pepper-alley and will open into a vestibule, beyond which, on the left side, is an office, situated to give the attendants control of a central corridor, which extends from the entrance to the rear of the building. The foundation-stone, laid by the mayor, is on the left side of the entrance. The manager's quarters are situated in the south-east corner, and comprise two bed-rooms, sitting-room, kitchen, bath-room and coal store. All these rooms are well lighted from the front and side of the building and from the yard, which also furnishes a supplementary light to the corridor at this end. On the right-hand side, and entered from the corridor, is the recreation and reading room, 51 ft. 6 in. long by 25 ft. wide. This will be excellently lighted from the front and the open space on the north side. Part of this space is reserved for the artisans' dwellings about to be erected facing Simnel-street, which is also to be widened. An open yard will be left over 50 ft. wide between the two blocks of buildings.

Near the recreation-room and adjoining the dining-room is a provision shop, 25 ft. 6 in. long by 7 ft. 3 in. wide, lighted from the yard and Blue Anchor-lane. It is provided with serving windows to the dining-room and the corridor, and communicates with a store of similar dimensions in the basement. Beyond the shop is a central hall, 14 ft. by 14 ft., in which are situated the stairs to the dormitories above and also to the basement. On the left of the hall is the dining-room, 51 ft. 6 in. long by 25 ft. 6 in. wide. It is well lighted by windows on the north side. At the end of the dining-room, and in communication with the same, is the lodgers' kitchen, which is well lighted on the south and west sides and provided with cooking stoves and washing troughs for the use of lodgers. A lift communicates with this kitchen, the dining-room and the administrative kitchen in the basement. The lavatory, which is entered from the central hall, is provided with twenty-three enamelled fire-clay basins. Leading from the lavatory, the urinals eight in number, and seven water-closets are situated, beyond which is the feet washing-room and three bath-rooms. These offices are well lighted and ventilated from the sides, also to an open area. Hot and cold water supply is provided for this and all offices of the building. A work-room is provided, 11 ft. 6 in. by 10 ft. 6 in., at the end of the corridor, from which it is entered on the right side. The situation of this room enables an attendant to have full observation over the lavatory, water-closets, baths and urinals, as a door communicates with the central passage of the same. Leading out of this on the opposite side is a porter's store.

The lodgers' changing and locker room is approached by a separate passage in continuation of the corridor. It is 20 ft. by 12 ft., and provision is made for nearly 200 lockers. At the end of this passage is an external staircase giving access to the administrative portion of the basement below, and this is continued up to each floor above as an emergency exit. In the basement there is an administrative kitchen, 20 ft. by 15 ft., with a scullery and wash-house, 25 ft. 6 in. by 18 ft. 6 in., and drying chambers, ironing-room, stores, staff mess-room, sleeping-room, lodgers' box-room and a laundry. The whole of these apartments are lighted and approached by passages 5 ft. wide. Independent lavatory and water-closets are provided for the staff. The dormitories are designed in three separate pavilions, 30 ft. apart, approached from the central staircase by open corridors. The partitions of the cubicles will be composed of coke-breeze concrete on iron framing. Each cubicle has a separate window and also a ventilator under the bed. Each floor contains sixty-three cubicles, giving accommodation for 189 lodgers. It is proposed that the charge per head per night shall be 6d., and it is calculated that this will be sufficient to bring in a revenue to the corporation.

Messrs. Dyer & Sons are the contractors. The amount of their tender was £10,798, to which must be added £1,000 for the laundry and kitchen fittings, hot and cold water supply, boilers, furniture, &c., and £500 for contingencies, making the total cost £12,298.

The scheme has been worked out by the borough engineer, Mr. W. B. G. Bennett, and the medical officer of health, Dr. A. Wellesley Harris, both of whom have inspected nearly all

similar buildings erected by other authorities. The drawings have been prepared by Mr. C. J. Hair, the architectural assistant appointed by the corporation for the purpose.

MUNICIPALITIES AND CONTRACTORS.

As another instance of the terms that are being imposed on persons tendering for municipal work, a firm of contractors have addressed a letter to *The Times*, enclosing the following verbatim copy of the general conditions attaching to a certain undertaking for one of the largest corporations in the country. The stipulations, in the opinion of the writers, are such as no firm of free individuals should agree to—

"General Conditions.—The contractor shall to the (sic) at all times during the continuance of this contract abide by, perform, observe, fulfil and keep all and singular the stipulations following—that is to say:

"Wages of Workmen.—The contractor shall pay every workman employed by him, whether in or about the execution of this contract, or otherwise, wages and wages for overtime respectively and at the rate not less than that recognised in the district where the work or any part of it is being done as the standard rate of wages in such workmen's trade.

"Hours of Labour.—The contractor shall observe, and cause to be observed by each workman, hours of labour not greater than the hours of labour (other than that union men only be employed) usually observed in the trade of such workmen in such district.

"Lock-Out.—The foregoing conditions shall not apply to any trade, or trades, during the existence of a general lock-out in such trade or trades. The corporation shall be sole judges as to whether such a lock-out exists.

"Underletting of Contract.—The contractor shall not transfer, assign or underlet, directly or indirectly, this contract, or any part of it, share or interest therein, without the written consent of the corporation under the hand of the town clerk, which consent may either be withheld or given, subject to the terms such as the corporation may determine, and particularly that the person to whom such contract may, or any part of it, share or interest therein may be transferred, assigned, or underlet, shall abide by, perform, observe, fulfil and keep the stipulations on the part of the contractor herein contained.

"Book-keeping.—The contractor shall, to the satisfaction of the council, provide and keep proper books, in which shall be entered from time to time the names of the wages paid to, and the hours of labour observed by, all workmen employed by him, whether in or about the execution of this contract or otherwise, and shall from time to time, when required by notice under the hand of the town clerk, produce the same, or any of them, to him or the deputy town clerk, who shall be at liberty to inspect and take copies or extracts therefrom.

"Breach of Contract.—In case of any breach of the contract or by any person to whom this contract, or any part of it, may be transferred, assigned, or underlet, of any one or more of the stipulations in this clause contained, it shall be lawful for the council to determine this contract in the same manner and to the same extent as they have power so to do under clause 5 in the events therein specified, and if the contract shall be determined under the present power, then all the provisions of that clause shall apply as if the contract had been determined under that clause.

"Tenders to be suitably endorsed, and addressed to the Chairman of the Gas Committee, Municipal Buildings."

AMERICAN COMPETITION.

A meeting of the Glasgow Corporation Waterworks Committee has just been held to consider offers for 1,000 tons of pipes required by the department. Four tenders had been received. The lowest of these was from Messrs. R. D. Wood & Co., Philadelphia, who offered to supply the pipes in 12-ft. lengths, the total amount of the contract being £4,892 Is. The second lowest offer was made by Messrs. Robert Maclaren & Co., Glasgow, who offered to supply the pipes in 9-ft. lengths for £4,958 8s. 4d. The average price of the pipes was thus £4 18s. 4d. per ton in the case of the Philadelphia firm and £4 19s. 8d. in the case of the Glasgow firm, a difference of 1s. 4d. per ton. After the matter had been discussed a motion was made to accept the offer of the Philadelphia firm. An amendment was proposed, to divide the contract, giving £2,075 of it to the Philadelphia firm and the balance to the Glasgow firm. Six members voted on each side, and the chairman gave his casting vote in favour of the motion, so that the recommendation to the town council is that the offer of the Philadelphia firm be accepted.

Scarborough.—In consequence of the slow progress being made with the construction of the new road round the Castle Hill, the sub-committee have passed a resolution regretting any unnecessary delay on the part of the contractor as not expediting the work, and calling upon them to make the necessary arrangements for commencing operations at the south, or east pier, end without delay.

Comparative Reports of General Practice.

XXVIII.—TRAMWAY TRACTION : BLACKPOOL REPORT.—III.

CONCLUSIONS.

As the result of their inquiry, the deputation found, as has been set forth at length, that Continental tramway practice, like English and American, tended mainly towards the adoption of the overhead system of electric traction. In those cases where conduit and accumulator systems were at work the fact was distinctly stated that those systems were costly, and were only maintained to meet the aesthetic wishes of the various municipalities. Where the overhead system was installed the records show that the system was efficient and reliable, that it gave popular satisfaction, and that it was decidedly remunerative. But the main object of the deputation's visit was to inquire into the advantages, disadvantages and cost of the accumulator system, so as to be able to form a definite opinion upon the Board of Trade's recommendation to adopt this system.

They have found, as a consequence, that the accumulator system has undoubted advantages peculiar to itself. Each car is to all intents and purposes an independent installation. If one car fails the traffic arrangements are not deranged to the same extent as with the failure of an overhead or conduit system, inasmuch as the whole of the cars on service on the latter systems depend upon the maintenance of the supply of electricity from generators to motor; while in the case of accumulators, one car failing simply puts that car out of service without interfering with the others. The disadvantages, too, which have been urged against accumulators carried on cars on account of the smell of the acid, the injury to the car body and the clothing of passengers arising from spilt acid, were found by the deputation to be almost negligible. With modern equipped cars, such as are to be seen on the Continent, these disadvantages with old type car-carried accumulators have been overcome; the deputation having discovered only the faintest odour of acid, and no trace whatever of the effect of acid upon the car body. The opinion was formed that the accumulator system was an ideal one, if the question of cost were left entirely out of consideration. Accumulator traction is free from all possible objections on the score of unsightliness of overhead wire or of the existence of a slot in the roadway, and is certainly satisfactory from a public point of view.

But the Blackpool tramways, unlike the tramways the deputation inspected, are owned and operated by the municipality, and the public rightly demand that they shall not only be satisfactory as regards punctuality and reliability of service, but successful financially. Unfortunately for the adoption of this system, the cost of installing accumulators is, at the present time at all events, excessive; the life of the cells is short and their upkeep heavy; and the fact that no type of cell has been sufficiently long in use to demonstrate its efficiency and economy, and that one type of cell is being constantly displaced by a newer type, which in turn is again displaced, taken in conjunction with the fact that—with short-lived cells—extra cars are required to run a given service on account of the time occupied in charging the cells, effectually places the system out of consideration if a remunerative return is to be expected from the corporation's tramway undertaking.

As bearing upon the capital and maintenance cost of accumulators, the correspondence with the Tudor Accumulator Company, Limited (the English manufacturers of the Tudor cell, known on the Continent as the Hagen cell, and used at Berlin, Paris, Dresden, Hanover and elsewhere), already referred to, is given below. The questions and the answers were as follows:—

- (1) What weight of accumulators would be required to drive a double-deck tramcar weighing 11 tons, together with its load of eighty-six passengers, a distance of 5 miles with one charge? 5 tons + cwt. complete with acid.
- (2) The same running 75 miles with one charge? A discharge of this duration is not practicable with our system of rapid charging. The battery would be of such weight that it would scarcely be able to propel itself.
- (3) What space would be occupied—see No. 1? 68 cubic feet.
- (4) What space would be occupied—see No. 2? See answer No. 2.
- (5) At what maximum speed? About 12 miles.
- (6) What is the ampere hour efficiency you would guarantee? 75 per cent.
- (7) At what price per car mile would you be prepared to maintain the cells for a period of ten years? 1'6d. per car mile.
- (8) At what price would you be prepared to fit up each car with accumulators? £370, including erection and delivery; but not the case in which the cells are contained. The case would form part of the car body.
- (9) How long will the batteries require charging at the maximum rate at the end of the 5 miles journey? Ten to fifteen minutes.
- (10) Are you prepared to enter into a contract on the above terms? Yes.

To a subsequent question as to the weights upon which these figures were based the following answer was received: "We have based our reply upon the following weights: Weight of car and equipment, 11 tons; weight of passengers, 6 tons; weight of battery, 5½ tons; total, 22½ tons."

From these particulars it will be seen that the weight of cells is given for one of our largest cars, carrying eighty-six passengers. But we have ten small cars carrying an average of fifty passengers each, so that the weights given will have to be reduced *pro rata*. These small cars weigh with equipment 7½ tons, the passengers approximately 3½ tons, and the batteries, taken as above, 3½ tons, making a total car weight of 14½ tons. Still proceeding on the same scale as for the larger cars, the cost of batteries for each of these smaller cars would be £247. Summarised, the estimated capital cost works out as follows:—

Batteries for six large cars at £370	£2,220
" " ten small cars at £247	2,470
	£4,690
Plus, containing cases for sixteen cars at, say, £15	240
	£4,930

Considering, for the sake of comparison, the cost of installing the overhead system, it would be well to turn to the tenders received. These amounted to £3,377, and were for overhead line and insulators, posts and brackets, trolleys, and that portion of feeding mains which would not be required with an accumulator system. It will be remembered in this connection that the posts were intended to be used both for electrically lighting the promenade and streets and suspending the tramway trolley wire, and that a portion of their cost should therefore be chargeable to the public lighting fund, which would reduce the gross cost accordingly. Taken as a capital item, consequently the accumulator system compares unfavourably with the overhead.

Another point requiring emphasis is the fact that a loan on capital account would probably not be sanctioned for a longer period than ten years, nor would it be advisable to ask for an extension of this period in view of the short life of the cells; whereas for an overhead system the general practice is to sanction a loan for repayment in twenty-five years, thus relieving the annual charges on the capital account.

Passing on now to the consideration as to the effect of the adoption of accumulators would have upon the annual balance sheet of the tramway undertaking, it is necessary to find the annual cost of maintaining the accumulators, carrying them, and supplying electrical energy to them. The Tudor Accumulator Company, Limited, gave the cost of maintaining the cells at 1'6d. per car mile for the large cars; and the cost for the small cars, taken *pro rata*, may be estimated at 1'07d. per car mile. The mileage of the corporation tram cars at the present time is about 200,000, or, with the addition of the two large cars now being built, say 228,640 per year, being an average of 14,290 per car. Every car, for the present purpose, may be assumed to run the same number of miles. Thus the cost of maintaining the whole of the cells contained in the cars would be:—

Ten small cars, 142,900 miles at 1'07d.	say £687
Six large cars, 85,740 miles at 1'6d.	572
	£1,259

To this, however, should be added an extra sum for increased supply of electricity, due in the first place to the additional weight carried, and in the second place to the inefficiency of the cells. As regards the increased weight, every ton of dead weight carried a mile on a given tramway track requires the same expenditure of energy to carry it, whether it be in the shape of car, passengers or battery; and it has been seen that the large cars would have to be increased in weight from 17 tons loaded to 22½ tons, or 31 per cent., and with the small cars the increase would be from 11½ to 14½ tons, or 32 per cent. The energy taken per car mile at present is an average of 9 of a unit, and the large cars running approximately 85,740 miles would take 77,166 units. But with 5½ tons added by way of batteries to each car the total energy required to run the cars the same number of miles would be 101,087 units, or an increase of 23,921 units. For the small cars, taken on the same basis, the energy would be, without cells, 128,610; with weight of cells, 169,765 units, or an increase of 41,154 units.

As regards the inefficiency of the cells, it will be seen from the reply No. 6 of the Tudor Accumulator Company, Limited, that the guaranteed ampere hour efficiency is 75 per cent.; but it should not be forgotten that the cells have to be charged at a higher pressure than they discharge at, and that this difference of pressure amounts to some 20 per cent., making the real efficiency of the cells about 55 per cent. In the present calculations, however, it has been assumed that 60 per cent. is returned. Now, the units given above as

requisite to drive the cars refer entirely to the energy given to the motors. Seeing, therefore, that only 60 per cent. of the energy put into the cells is given to the motors, there is a further increase of energy on this account, and the gross increase would be equal to some 245,000 units per annum. Bringing the units together, the following result is arrived at:

	Units.
Current used per annum for six large cars, without cells...	77,108
Current used per annum for ten small cars, without cells...	128,610
	205,776
Plus extra energy required through loss in cells and additional weight...	245,600
Total	451,376

If we assume the cost of current to the corporation themselves to be at the low figure of 1d. per unit, the cost of the additional current per annum would be about £1,023 if cells were used. Put in another way, the estimated annual maintenance account would be—

WITH ACCUMULATORS.

Interest and sinking fund on a capital of £4,930 at 11½ per cent. (repayable in ten years)...	£ 567
Cost of upkeep of cells	1,209
Additional cost of current to supply cells, due to inefficiency and extra weight carried	1,023
	£2,799

Compared with this, the cost of the upkeep of the present conduit amounted last year to £2,238, though probably it will be rather less this year, and the estimated annual cost of the upkeep of that portion of the overhead system comparable with the accumulator system would be a sum not exceeding £600, including interest and sinking fund charges on a twenty-five years loan. Hence the relative costs of maintaining the similar portions—exclusive of repairs to roadway, rails, motors, gearing, cars, &c.—of the three systems are:—

Overhead system (line, &c.)	£ 600
Conduit system (conduit, &c.), cost, 1897	2,238
Accumulator system (accumulators, &c., as per statement)	2,799

But even were there no increase in the cost brought about by the installation of accumulators, the deputation are advised that it is the very definite opinion of the borough electrical and tramway engineer (Mr. Quin) and the general manager of the tramways (Mr. Lancaster) that in the event of the accumulator system being adopted it would be necessary to practically relay the present permanent way, owing to the additional load carried, and that the wear and tear of the road would be excessive, due to the accumulators, the extent and cost of which increased wear and tear would be difficult to estimate.

From the evidence brought before them, and from the result of their investigations, the deputation have unanimously come to the conclusion that the overhead trolley wire system is the only system of traction which can be made both successful and remunerative in Blackpool. If the council are prepared to incur what may probably be an annual loss for years to come on the tramway undertaking, then the deputation are not indisposed to the adoption of the accumulator system. But they believe that such an opportunity of relieving the rates by means of the profits which can be derived from their tramways by the adoption of an efficient and economical system should not be lost, and this fact alone leads them to strongly advise the adoption of the overhead trolley wire system. They are also of the opinion that the alleged danger of the overhead system, when properly installed and in conformity with latest electrical practice, is not justifiable; and that the overhead wires, if properly supported, would not appreciably detract from the appearance of the promenade and streets of Blackpool.

One point, however, the deputation wish to emphasise is, that no system, whether overhead or accumulator, can be reasonably expected to work to its highest success until the promenade widening is accomplished and a double track laid, and they respectfully urge the Promenade Widening Sub-Committee to expedite matters in this direction. At the same time the deputation are fully of opinion that a change of system must take place immediately.

Finally, the deputation had the utmost confidence in recommending the council to ask the Board of Trade to receive a deputation from the corporation, to put before the board the evidence which has been obtained and the experience gained, and to press for the board's permission to replace the conduit system, at present in use in Blackpool, by the overhead trolley wire system, in accordance with the resolution of the Electric Lighting and Tramways Committee of August 26, 1897, confirmed by the council on September 7, 1897.

The report is signed by Councillor Joseph Brodie, chairman of the committee; Alderman James Cnudwell; Councillors James Ward, Thos. Bickerstaffe, Jno. Grime and T. H. Smith; by Mr. Robert C. Quin, borough electrical and tramway engineer, and by Mr. John Lancaster, general manager of tramways.

COMBINED DRAINAGE.

The medical officer to the Leyton Urban District Council, in a recent report, has expressed the opinion that the system of combined drainage so often used in the houses being erected in the district is open to considerable doubt. In discussing the problem the following points appear to him to be of great importance:—

(1) The difficulty of investigating and abating of nuisances. In some cases many owners are implicated, and being willing to rectify the defects, and a neighbour refusing to assist in the matter. This necessitates stringent measures, which, unfortunately, cannot legally be carried out without considerable delay, the nuisance in the meanwhile being a source of danger to the health of the inmates of the house. Moreover, this investigation by the sanitary staff does not only apply to the nuisance, but also is directed to determine the ownership of the various houses whose drains are combined; a matter of considerable delay, and really a necessary proceeding to be gone through before any legal process can be taken.

(2) As the law now stands it is distinctly advisable to have a separate drain to each house. This throws the responsibility upon the proper party, and makes the rectification of sanitary defects a much quicker process. I am certainly of opinion that these single drains, laid in accordance with your by-laws and those of the Local Government Board, being properly supervised by your officers, being intercepted from the sewer, and having proper air inlets and outlets, make it absolutely impossible for any danger to arise to the health of the inmates.

(3) In instances of combined drainage, when the drains have not been properly laid, cases of infectious diseases may occur (and I allude especially to typhoid fever), and prove a great danger to the health of the inmates in a *typical* houses.

The following remarks by the Walthamstow medical officer may also be quoted as supplementary to those made above:—

The question of combined drainage has been before your Sanitary Committee several times during the year. I would therefore like to draw attention to the decision in the case of Seal v. Merthyr Tydfil District Council, heard on July 10, 1897, before Mr. Justice Cave and Mr. Justice Ridley. The decision is a common-sense one, and to my mind fairly represents the meaning of the Public Health Acts relating to this subject.

Mr. Justice Cave said, by the Public Health Act, 1875, all sewers were vested in the local authorities, and sewers were defined as drains draining more than one house. This was found to create some difficulty, for when one man built two houses on his own land and drained them the drain became vested in the local authority and had to be paid for by them. That was one difficulty, but it was got over by holding that the Act did not apply to the houses in the same curtilage, and that the drain, until it came out of the private property into public property, could not be said to be a sewer. When houses belonging to different owners drained into a sewer, whereby they connected with a public sewer, in that case it was held that the public should have to pay for what was in fact a private drain. Sec. 19 of the Act of 1890 was therefore passed.

The definition of "private drain" included a drain used for the drainage of more than one house. What, then, was a "private drain?" In the opinion of the judge the term applied to a drain constructed in private grounds to which the public had no access. The intention was to relieve the public from paying for that which they were not allowed to use.

LIVERPOOL ART GALLERY.

PROPOSED EXTENSIONS.

A proposal to extend the Walker Art Gallery buildings, the plans in connection with which, prepared by Mr. Dyall, provide for a considerable addition at the rear of the existing buildings, was considered at the last meeting of the Library Committee of the Liverpool Corporation. The city surveyor reported that the scheme was an admirable one, but the addition would be equal to 87 per cent. of the old buildings, and would cost £229,000. The area of the present buildings was 16,000 square feet, and the addition proposed would occupy 14,000 ft. It was agreed that the city surveyor should submit plans within a month for an extension which would involve an expenditure of about £8,000, it being understood that the addition should be designed on such lines that a further extension could be made at some future date.

A Valuable Find in a Dust-Cart.—A purse containing four diamond rings has been taken away among some rubbish in a dust-cart from Roslyn House, New Cross Gate. Only a short time ago, says *London*, a fire replaced worth, it is said, over £100, was found by a South London dustman, who honestly restored the valuable ornaments to its owner. He was offered 5s. for his trouble, and upon mentioning that was threatened with police proceedings. Several very similar cases are reported; but Mr. Layman, the owner of the missing diamond rings, has offered a reward of £30 for the recovery of his property.

Some Annual Municipal Engineering Records.

NUNEATON AND CHILVERS COTON : ST. PANCRAS : NEWARK.

In his last annual report to the Nuneaton and Chilvers Coton Urban District Council, Mr. J. S. Pickering, the engineer and surveyor, first refers to the number of newly-erected buildings. These have totalled 272, and have been much in excess of previous years. The removal of night-soil is a matter which has resolved itself into a most important question, and during the year 5,324 cart-loads of this particular refuse were collected from wet ash-pits and privies. From dry ash-pits there were taken 1,524 loads. In the maintenance of roads the quantity of macadam used from the council's quarry has been 3,172 tons and 568 tons of chippings, against 2,750 tons and 360 tons respectively during the previous year. In addition to this, 248 tons of macadam and 782 tons of chippings have been purchased from local quarries, against 650 tons and 1,360 tons respectively during the year 1896. A further loan has been obtained for general footpath paving, making a total of £4,000. More than half this amount has been expended during the year, and the work is proceeding as rapidly as the delivery of bricks will allow. The new pavements which have been laid in various parts of the district are much appreciated, and add considerably to the appearance of the streets and to the comfort and convenience of pedestrians.

New streets of a total length of about 750 yards (against 850 yards in the previous year) have been completed or are in course of construction by the owners of building land, while a sum of £1,150 has been expended out of current rates on the construction of sewers at Stockingford, the Local Government Board having refused to sanction a loan for that purpose. It has also been decided to spend about £750 yearly out of the current rates on the extension of sewers so long as the Local Government Board refuse their sanction to a loan. The Local Government Board have sanctioned a loan of £1,300 for additional pumping machinery, which will be erected during the present year. The pumping plant will then be capable of raising 120,000 gallons of sewage per hour, and will meet the requirements of the town for many years to come. The quantity of sewage received at the out-fall works during the year has been 192,884,000 gallons, against 180,000,000 gallons in the previous year, showing an increase of 12,884,000 gallons.

In five years the sewage has increased by nearly 39 per cent. The quantity turned back into the sewers for re-treatment has been gradually diminishing, and last year none was dealt with. Mr. Pickering thinks that this is undoubtedly due to the increasing care exercised by manufacturers in the treatment of their waste liquors before discharging them into the sewers and to the better clarification of the sewage since the conversion of the tanks to the Cosham system. But, continues Mr. Pickering, while recognising the general improvement in the waste liquors from factories, it must still be pointed out that frequently they are discharged into the sewers with apparently little or no treatment. During the year 17,435 tons of sewage sludge have been received and pressed into 3,487 tons of solid manure, against 16,000 tons and 3,212 tons respectively during the previous year, showing an increase of about 8 per cent. This gives an average of 48 tons of sewage sludge received daily including Sundays, and 56 tons excluding Sundays, or 94 tons and 11 tons respectively of pressed cake. There has been no difficulty in disposing of the whole of the manure to farmers. The chemical account is still a heavy item, amounting in 1897 to over £440. The lime purchased for sludge-pressing cost nearly £60.

Upon the council acquiring the undertaking, Mr. Pickering presented a detailed report of the works to the Waterworks Committee, pointing out the insecurity and unsatisfactory nature of the present supplies, and urging the necessity of a new and increased supply from one source. A new reservoir of a capacity of 500,000 gallons, was, at the time of the preparation of the report, in course of construction, at a cost of about £3,100. New pumping machinery, commenced by the water company to replace the temporary sinking pumps, has recently been fixed in the deeper well at the pumping station. This has enabled the cost of pumping to be reduced to a minimum, only two men being now permanently employed at these works.

Some interesting details of matters which have lately occupied the attention of the department of works of St. Pancras Vestry are contained in the last report prepared by the chairman of the Highways, Sewers and Public Works Committee. In the introductory paragraphs following a reference to the rates levied during the year the opinion is expressed that if the general rate could be kept nearly at an equable figure without increase it was about as favourable a result of careful management as could reasonably be expected in the face of the constant demands for the extension of the wood paving system. Although it does not strictly appertain to the subject of the report, yet it was thought that it would be interesting to reprint a statement showing the "indebtedness" of the metropolis. This was as follows: London

County Council, £19,105,942; School Board for London, £9,271,131; Metropolitan Asylums Board, £1,918,225; Metropolitan Police (proportion), £298,337; vestries, City Commissioners of Sewers and district board of works, £4,469,479; board of guardians, £2,699,597; other local authorities, £321,518. Of the total—£38,684,223—the "indebtedness" of St. Pancras for local purposes is £644,893, divided thus: Vestry, £414,153 (including electricity, £149,887); guardians, £230,740.

The vestry apparently have long held an objection to overhead wires, and therefore they have hailed with satisfaction an application from the National Telephone Company for leave to lay several hundred miles of wires underground. The company proposed to commence by a line extending from Pentonville-road to Portland-road, and permission has been unanimously granted on condition that the work of making good the ground shall be executed by the vestry's workmen at the cost of the company. Consideration has also been given to a further application for permission to lay three pipes down the south side of Tottenham Court-road, along Grafton-street and Huntley-street, to connect with pipes already laid in St. Giles; but having regard to the course adopted by the vestry in dealing with a previous application, the committee had felt constrained to advise that the further consideration of the matter should be deferred until after the decision of the conference of vestries on the subject of telephone communication of the metropolis.

After a year's anxious work in connection with the refuse destructor, the vestry have thought it better to constitute a separate department to supervise it in connection with the removal of dust. When the vestry placed the control in the hands of the Works Committee they were not consulted in the matter, and it came as an addition to an already over-worked department without any increase in the staff beyond a managing foreman six months after. As the committee did not seek the change, they have nothing to regret at being relieved of an unpleasant function, but while it remained in their hands they did what they could to improve the working; and the new committee have continued on these lines rather than enter on the responsibility of advising reconstruction, as was suggested (in part), after observing the effects of another mode of construction at Leyton. Mr. W. N. Blair, M.R.C.E., as is well known, is engineer and surveyor at St. Pancras, and his services are duly acknowledged in the report.

* * *

Mr. Tom Vickers, the surveyor to the Newark Rural District Council, has furnished his second annual report to that body. The district comprises about 109 miles of highways and twenty-five parishes. Of first-class roads there are 55½ miles, of second-class roads 394 miles, third-class roads 11½ miles, and grass lanes 3 miles. The majority have a very poor subsoil and entail a heavy expenditure for manual labour. Of a total sum of £1,713 spent during the twelve months ended March last, £773 was devoted to materials, £685 to manual labour for ordinary repairs, £209 to team labour, and £45 to smaller repairs. Each mile of road in the district therefore costs about £15 14s. 6d. to maintain. In 1897 the expenditure per mile was £18 6s., and in 1896 £15 18s. The total cost of maintenance for the years 1896 and 1897 was £1,725 and £1,994 respectively. Roads of the first class, it may be stated, lie adjacent to the borough of Newark and receive an ever-increasing amount of the heavy traffic of that town. The quantity of stone actually used upon the roads was 2,296 tons, against 3,121 tons in the preceding year, being a decrease of 825 tons. There are 25 miles of footpaths in the district, and £60 was spent upon their maintenance, against £75 in the preceding year. The total expenditure of all works was £1,927.

Eastbourne.—At the last meeting of the council a letter was read from the Local Government Board stating that they were unable to supply any sketch plans of common lodging-houses. It was resolved that the council be recommended to sanction a scheme for the erection of a model common lodging-house, at a cost not to exceed £3,500. This does not include the cost of the site and furniture, the total cost including which would not exceed £5,000.

Dewsbury.—We understand from a contemporary that the town council, on Tuesday of last week, discussed the question of so altering the by-laws as to allow of the erection of back-to-back houses in blocks of four, a committee, after considering the cost in comparison with single through cottages, having reported against such alteration. The report gave rise to a spirited discussion. Mr. Denton moved an amendment referring the minute back to the committee, his object being to get official sanction to the erection of back-to-back houses in blocks of four, with side light and ventilation. This amendment was, however, rejected by a small majority, and the committee's report was adopted.

Municipal Work in Progress and Projected.

Nothing unusual is contemplated in the metropolis at present, although the majority of the local authorities have resumed their deliberations. In the provinces, however, several extensive schemes are projected or in progress, notably at Bradford, Harrogate, Ipswich, Retford, Selby, Walsall and other places.

METROPOLITAN AUTHORITIES. METROPOLITAN ASYLUMS BOARD.

Sir E. H. Galsworthy presided on Saturday at the first meeting of this authority since the recess. A letter was read from the Local Government Board, enclosing an order authorising the expenditure of an additional sum of £149 in the erection of workshops and store-rooms at the Eastern Hospital. The communication also contained the board's sanction to the erection of an isolation pavilion, at a cost not exceeding £2,316, and the borrowing of the necessary money. In another letter to the managers the Local Government Board stated that they had directed their chief general inspector, Mr. W. E. Knollys, C.B., to hold, after the vacation, an inquiry into the causes of the excess of cost over the tenders received for the creation of the Brook Hospital, the architect's responsibility, and the supervision exercised by the committee and the managers as regarded expenditure. The letter was referred to the General Purposes Committee, with power to take such action as they might think necessary.

VESTRIES AND DISTRICT BOARDS.

Battersea.—The vestry, on Wednesday, resolved to be represented at the conference to be held next month, at the instance of the Lee District Board of Works, to consider the question of the Workmen's Compensation Act in relation to the employes of the local authorities throughout the metropolis.—The Finance and Law Committee reported, in reference to the injunction granted against the County of London and Brush Electric Lighting Company, that the company had applied to the Court for a further suspension of the injunction in regard to the laying of electric light mains in Trinity-road until the hearing of the company's appeal. The case came recently before Mr. Justice Stirling, when, although opposed by the vestry, the application was granted, but the company was ordered to pay all costs in the matter.—The Health Committee announced that they had considered a letter from the Clerkenwell Vestry drawing attention to the fact that new buildings were erected to plans approved by the district surveyor or the London County Council without the plans being submitted to the vestry, many persons being under the impression that when the plans had passed the district surveyor the sanitary arrangements had received the sanction of the council, and resenting the subsequent action of the local authority. In this connection the Clerkenwell Vestry suggested that the county council should instruct the district surveyors to draw the attention of builders to the necessity for making application to the local authority before commencing to build and submitting details as to the proposed drainage arrangements. The Clerkenwell Vestry asked for co-operation in the matter, and, on the motion of the Health Committee, the vestry resolved to concur with the action of the former authority.—With reference to the views sought by the county council on the proposal to establish a bacteriological laboratory for the whole of the metropolis, the Health Committee recommended that no action should be taken. The recommendation was adopted.—The Works Committee reported the receipt of a letter from the county council, stating that the council had refused to consent to the application and plan submitted by Mr. W. D. Goodwin for the erection of blocks of residential flats, with projecting bays on the west side of Albert Bridge-road.—A letter was read from the Local Government Board stating that the board would direct an inquiry into the application made by the vestry for sanction to borrow £36,878 for the purchase of land and the erection of public baths and wash-houses in Battersea Park-road. On the motion of the Health Committee, it was decided to procure vans and receptacles for the collection and removal of fish offal throughout the district.

Limhouse.—Attention was last week called to the congested condition of Narrow-street, Broad-street and Three Colt-street, and it was said that it was a notorious fact that there was a very great congestion of traffic in these streets, and it was of importance that something should be done to improve the present state of affairs. It was moved that, in view of the injury to business and trade, not only to this district, but to the port of London, owing to the insufficient width of the streets referred to, a special committee be appointed to consider the advisability of taking action thereon. The motion was carried.

Marylobone.—The vestry are at present seeking a site on which to erect a new town hall in lieu of the present inadequate court house, which was rebuilt in 1825.

Rotherhithe.—The public gallery in the town hall, which has been the subject of numerous complaints, has now been ventilated and otherwise improved. The vestry have

farther decided to construct an open balustrade instead of the present plain front, and a tender, amounting to £50 10s., has been accepted for this purpose. Other improvements are in contemplation.—At last week's meeting a letter was received from the Local Government Board asking to be furnished with the observations of the vestry upon a letter received by the board from the London County Council relative to the Fulford-street and Braddon-street, Rotherhithe, improvement scheme.—It was decided to support certain resolutions passed by the Wandsworth Board of Works in favour of the telephone service being exclusively exercised by the Government, and not undertaken by the London County Council and the other local authorities; and of the undertaking and property of the National Telephone Company being taken over by the Post Office.

Shoreditch.—At the last meeting of the vestry it was decided to apply to the Public Works Loan Commissioners for a loan of £11,653 for works at the baths and wash-houses.—The Town Hall Committee reported having considered plans for the proposed alterations to the town hall and the adaptation for other purposes of adjoining premises recently acquired by the vestry. The committee recommended that tenders should be invited for the carrying out of the work, at a cost of £4,450.—It was resolved to authorise the Housing Committee to obtain tenders for the erection of a shelter and tool-shed at the Charles-square recreation ground.—The following tenders were considered for the supply of new boilers for the electric light station: R. Taylor & Sons (accepted), £3,410; E. Danks & Co., £3,900; J. Fraser & Son, £4,236; Fleming & Ferguson, Limited, £4,400; Tinklers, Limited, £4,750; S. Hodge & Sons, Limited, £5,150; Davey, Pixman & Co., Limited, £5,173; J. Jones & Sons, £5,300.—Tenders as under were dealt with for the supply of transformers: The General Electric Company, Limited, £2,010; The Electric Construction Company, Limited (accepted), £2,747; Thomas Parker, Limited, £2,800; Fuller West Electric Manufacturing Company, Limited, £2,805.—For the extension of the buildings at the electric light station the following firms tendered: Merredew & Wort, £2,855; C. Gray Hill (accepted), £3,069; J. Dolman & Co., £3,330; H. G. Evans, £1,040.—It was decided to accept the tender of J. Bellamy for the supply of Alexander patent cisterns of 800 gallons capacity at the price of £21 10s. each, of 750 gallons at £20 10s., and of 500 gallons capacity at £16 10s. each. The other firms who tendered, and at higher prices, were: W. B. Bawn & Co., and F. Braby & Co., Limited.—The following tenders were opened and referred to committee for consideration: For the construction of an underground convenience in Hoxton-street—Dolman & Co, Poplar, £2,686; George Jennings, £2,025; and Doulton & Co., Lambeth, £2,150; for the construction of a sewer in Britannia-street—W. Manders, £414; T. Adams, £557; Robert Jackson, £409; J. Jackson, £612; Williamsom & Son, £562; and Killingback & Co., £416.

St. Pancras.—At their last meeting the vestry decided to have lithographed the plan approved by the county council showing the line of buildings of the proposed new baths in the Prince of Wales road.—It was also decided to attach the seal of the vestry to the Chapel-grove and Easton-place improvement schemes, and to forthwith take all necessary steps to carry them into effect, under Part II. of the Housing of the Working Classes Act.—The Electricity and Public Lighting Committee reported that, as the extensions in progress at the Regent's Park central station were not sufficiently advanced to enable the additional plant to be fixed and in working order to meet the demand for the electric light during the coming winter, they had had to consider the question of hiring temporary plant to tide over the difficulty. As the matter was of urgency the committee asked for and obtained permission to make arrangements to cope with the demand.—On the recommendation of the same committee the vestry resolved to charge all consumers in future requiring a combined day and night supply on the maximum demand indicator system.—The Health Committee reported that they had considered a letter from the Clerkenwell Vestry drawing attention to the fact that new buildings are erected to plans approved by the district surveyor or the county council, and that after the building is in position application is frequently made to the vestry to modify the by-laws relating to water-closets, soil pipes, &c., owing to the difficulty of complying with them. The Clerkenwell Vestry suggested that it might be advantageous for the county council to instruct the district surveyors to draw the attention of builders to the necessity for making application to the local authority before commencing to build and to submit details of the drains and sanitary conveniences. The Clerkenwell Vestry had resolved to forward suggestions to that effect to the county council, and on the recommendation of the Health Committee the vestry decided to support the former's action in this respect. It was further resolved to inform the county council that the vestry were in favour of the establishment of a central bacteriological laboratory, and that such an institution could be provided by the Metropolitan Asylums Board in the new premises now being built for the latter on the Victoria-embankment.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Westmoreland.—The Light Railways Committee reported, at the last meeting of the county council, that the advisability of constructing a light railway from Kendal to Arkholms had been considered by them and the Kendal Corporation, and they recommended the council to vote £100 towards the cost of a survey of the district, Kendal Corporation contributing a like sum. The recommendation was agreed to.

MUNICIPAL CORPORATIONS.

Banbury.—A Local Government Board inquiry was held on the 1st inst. respecting an application of the town council to borrow £1,000 for the improvement of the baths. There was no opposition to the application.

Bournemouth.—The town council have adopted a resolution, with one dissentient, to make application to the Board of Trade for a provisional order to authorise the council to supply electricity for any public or private purposes within the borough.

Bradford.—A new fire station is about to be erected by the corporation opposite St. James's church, Nelson-street, at a cost of £10,000, exclusive of the outlay on the purchase of the site, which is £11,000.

Brighton.—A revised scheme was recently submitted to the council by the Works Committee relative to the provision of conveniences in the northern part of the town. It was recommended that one at the north end of the level should be rebuilt near Union-road, at an estimated cost of £221; that the one in Lewes-road should be enlarged and improved, at a cost of £55; that a new one should be constructed in Oxford-street, at a cost of £150, in lieu of the proposed underground convenience; and that another should be erected in the public road at the north end of Queen's Park, at a cost of £140. The committee added that they hoped to report, at an early date, with a plan and an estimate for the erection of an underground convenience in the neighbourhood of the Clock Tower at the south end of Queen's-road.—The Waterworks Committee have decided to accept an offer from Mr. A. E. Nunn, of Tenntenden, Kent, to drive headings in the wells at Mile Oak, Portslade, at a depth of 140 ft., for the sum of 37s. per lineal foot.

Bristol.—At last week's meeting of the Sanitary Committee, the report of Messrs. John Taylor, Sons & Sinto Cimp on the Bristol main drainage scheme was presented. The scheme provides for an outfall at the north-east of Dunball Island, Avonmouth, the estimated cost of which is £379,700. The report states that in the opinion of the engineers such a scheme if properly designed would be sanctioned by Parliament. No decision was arrived at by the committee.

Devonport.—On the recommendation of the Water Committee, the town council, at a special meeting on Tuesday of last week, decided to apply for Parliamentary powers to acquire the undertaking of the Devonport Waterworks Company.

Dorchester.—Negotiations are to be opened with the Dorchester Gas Company by the town council with a view to the purchase of the undertaking. It was pointed out that the present was a desirable opportunity for moving in the matter, in view of the extension of the borough and the greatly increased lighting area.

Dover.—At the town council meeting, on Tuesday afternoon, it was officially reported that the first year's working of the corporation's electric tramways, after allowing for payment of interest and instalments of the loans, had resulted in a profit of £1,300 being earned. A total of 1,794,903 persons have been carried, at the universal fare of 1d.

Gateshead.—The Parliamentary Committee of the town council have decided to take steps to obtain expert evidence as to the cost of laying down plant for the overhead electric traction system on the tramways, the probable cost of buying out the present company at the end of the term, and the advantage to be gained by working the trams and supplying electric light from one generating station.

Glossop.—A petition is being signed at Glossop against a proposal, carried by a narrow majority of the council, to introduce electric light into the borough. The opposition is based on the belief that the installation will prove unremunerative; and in this connection the petition points out that the fact that the price of gas has been reduced by the Glossop Gas Company will have a considerable effect in the way of diminishing the number of probable consumers of the electric light.

Halifax.—The municipality is about to begin the work of extending its tramways system, being now assured that it will prove a paying concern. The two sections now working are the railway station to King's Cross and to High-road Well. During eight weeks' running the weather has been fine, the result being that they averaged £300 per week during the last four weeks, but this can hardly be expected to continue.

Harrogate.—Mr. F. H. Talloch, M.L.C.E., on Tuesday of last week, held an inquiry, on behalf of the Local Government Board, respecting an application of the town council for sanction to borrow £5,500 for surface-water drainage works, £580 for sewerage works, £500 for the purchase of a steam roller and a road scarifier, and £450 for the construction of a public convenience in High Harrogate.

Ipswich.—A Local Government Board inquiry was held on Friday by Mr. E. A. Sandford Fawcett respecting an application of the corporation for sanction to borrow £4,400 for the erection of a fire station, £4,000 for works of sewerage, £3,070 for works of street improvement, £000 for market purposes, and £450 for purposes of public walks and pleasure grounds.

Liverpool.—At the last monthly meeting of the council the Estate Committee recommended that the town clerk be authorised to give notice to the Mersey Docks and Harbour Board, in pursuance of the provisions of the Corporation Act, 1895, that the council intended to purchase a certain indicated portion of the land now occupied by the George's dock. The recommendation was passed.—The tender of Messrs. Waring & Sons, of West Kirby, has been accepted, at £2,635, for the erection of an electric sub-station in Lodge-lane.—The Tramway Committee having asked if the Lighting Committee could utilise for lighting purposes the poles being erected in connection with the electric tram lines, the matter has been referred to Mr. A. B. Holmes, city electrical engineer, and Mr. Charles R. Bellamy, superintendent of street lighting, for a report. It is understood that they will make experiments as to the most suitable lamp that can be used. An extension of mains in several thoroughfares has been resolved upon.

Manchester.—The Lord mayor recently opened a new park in Bellott-street, Cheetham, which has just been presented to the city. It has an area of 7,500 superficial yards. Part of it is laid out for games of bowls and tennis, a second part is covered with grass and will form a children's playground, while the remainder is planted with one or more specimens, all labelled, of almost every indigenous tree or shrub, besides some that are not natives of Britain, the variety being greater than in any other of the thirty-eight parks and open spaces in Manchester.—A report has been drawn up, at the instance of the Rivers Committee, with reference to certain allegations of "errors and omissions connected with the erection of catch-pits at Davyhulme sewage works." The report is now in the hands of the Town Hall Committee.

Oldham.—In the minutes of the Gas Committee submitted to the meeting of the town council on Wednesday week it was stated that the gas manager, acting on instructions given to him, had made inquiries at a number of towns using carburetted water-gas, and that they all expressed themselves satisfied with that gas as an auxiliary to coal-gas. The Gas Committee had, however, decided to defer action in the matter until the Home Office Committee had made its report.

Retford.—The formal sanction of the Local Government Board to the borrowing of £40,000 for carrying out a scheme of sewerage has been received by the town council.

Richmond, Surrey.—A special meeting of the town council, on Tuesday, unanimously decided not to accept the option of purchasing Glover's island for £4,000. A special committee, who had considered the whole subject of its acquisition as a means of preserving from undesirable encroachment the view from Richmond Hill, and also the price, reported adversely, and this report the council adopted. The island had been entrusted by the owner to the mayor for sale by public auction on September 23rd, and the mayor meantime secured the refusal of the purchase at the reserve price of £4,000 for the public. A fund which was opened in the town to raise the £4,000 had only scanty support, and now the committee denounced the whole project. Although the mayor desired to join in the discussion on the committee's report, the council declined to hear him, and, in adopting the report, passed another resolution calling on the Thames Conservancy to introduce a Bill to prevent abuses of advertising on the river banks and islands.

Salford.—The town council last week decided to accept tenders as follows: De Bergne & Co. for the erection of purifying and oxide floors at the Liverpool-street gasworks; Bale & Co. for the supply of 100 tons of natural oxide of iron on the basis of 40 per cent. of moisture; Muller & Co. for the supply of 500 tons of natural oxide of iron, on the basis of 25 per cent. of moisture; and J. & J. Braddock for the supply of wet and dry pre-payment meters.

Stockport.—An effort is about to be made by the corporation to acquire the property of the waterworks company which supplies Stockport and the surrounding district, in which the total population is over 200,000.

Stockton.—At a meeting of the Stockton Town Council, on the 6th inst., the town clerk reported that he had received the sanction of the Local Government Board to the borrowing of £25,482 for the electric lighting of the town and also the approval of the board to the use of certain lands for the erection of the plant.

Wells.—Tenders for the erection of a new town hall and post office were opened at last week's meeting of the city council. There were six tenders, the highest being £10,696 and the lowest £9,192. The architect's estimate was £4,550, so that the prices read out caused very great surprise. None of the tenders were accepted, and the whole question was referred to a special meeting of the General Purposes Committee.

Wolverhampton.—A letter was on Monday received from the Local Government Board, stating that, with reference to the application of the council for sanction to borrow £1,855, for the formation of an open space and for paving over the vaults of the Exchange Hall, they had deferred their consideration of the matter until they were informed that the town council had definitely decided to adopt the scheme which formed the subject of the inspector's inquiry.—The following resolution was adopted without discussion: "That in pursuance of the provisions of the Tramways Act, 1870, and the Tramways Orders Confirmation Act, 1877, the mayor, aldermen and burgesses of the borough of Wolverhampton, acting by the council as the local authority under the said Tramways Act, 1870, do hereby resolve that, subject to the approval of the Board of Trade, notice in writing, under the corporate common seal of the said local authority, be given to the Wolverhampton Tramways Company, Limited, requiring them to sell to the council of this borough, as such local authority as aforesaid, so much of the undertaking of the said company as is within the borough of Wolverhampton, and as was authorised by the Wolverhampton Tramways Order, 1877, as confirmed by the Tramways Orders Confirmation Act, 1877."

URBAN DISTRICT COUNCILS.

Brandon and Byshtotes, Durham.—The contract for the pumping machinery required by the council for pumping water to Brandon village has been placed with Messrs. Robert Stephenson & Co., Limited, engineers, Newcastle, who are to supply a "Rocket" oil engine and a treble-run pump for the duty.

Buckley.—On the 7th inst., at a meeting of this authority, it was reported that the council's offer to purchase the local gasworks for £3,500 had not been accepted, the gas company offering to sell for £4,750. A resolution to obtain a provisional order for lighting the district by electricity was unanimously carried, and it was resolved to engage the services of an electrical engineer. Tenders for electric lighting had been received from the Sandycroft Engineering Company and Messrs. Mather & Platt, Manchester.

Chortsey.—At the meeting of a committee of the council, held on the 5th inst., consideration was given to a draft prepared by the surveyor of particulars to be furnished to the competing engineers in connection with the proposed main drainage scheme. These were gone through *seriatim*, and were approved, as was also a plan drawn by the surveyor on a large scale, showing the areas which it is suggested shall be sewered.

Haworth.—The Water and Fire Brigade Committee last week brought forward a recommendation that the council should take into consideration the desirability of concreting the bottom of the Hough reservoir, and also inquire into the condition of the water supply generally in the district. It was decided to discuss the question in committee.

Ilkley.—On Thursday, at the offices of the council, Mr. F. H. Tulloch, one of the Local Government Board inspectors, inquired into an application by the local authority for sanction to borrow £175, being half the estimated cost of forming new streets on the south and east sides of the proposed public offices, and to be known as Chantry-drive and Back-road. Details of the proposed works were then given, and the inquiry closed, the inspector subsequently visiting the *locus in quo*, and afterwards the sewage disposal works.

Morecambe.—At a meeting of the council, on Monday afternoon, the question was considered of constructing a marine lake on the foreshore fronting the Victoria Esplanade at the east end. This has recently been completed, and the council are now engaged in fixing arc lamps to complete the electric lighting of the whole of the sea frontage. It was resolved unanimously that the council considered it advisable to construct a marine lake, and that a special council meeting be called at an early date to consider the matter fully and in detail. From inquiry it has been estimated that the probable cost will be £10,000. This, in conjunction with the electric light undertaking, the proposed new sewage scheme and refuse destructor and street improvement works now in hand, is expected to place Morecambe in the forefront of pleasure resorts.

Northwich.—At last week's meeting of the council it was unanimously resolved to invite all local architects to prepare competitive plans for the erection of an isolation hospital on land at Shurlach, at a cost of £3,000.

Selby.—Lieut.-Colonel A. C. Smith, an inspector of the Local Government Board, held an inquiry on Friday in respect to an application of the council for sanction to borrow £5,400 for gasworks extensions, &c. The gas manager (Mr. W. J. Scott) stated that at nightfall there was a great draw, and they were sometimes unable to keep up with the demand. Last winter, on one or two occasions, the manager had to

reserve the pressure and otherwise restrict the supply. Then the council were under a very great obligation to the North-Eastern Railway Company, inasmuch as all their signals at the station, which is a very important junction, were lit by gas, and any interruption in the supply to them might be disastrous.

Swinton and Pendlebury.—It was on Monday stated that the Local Government Board had, after a long delay, given their sanction to the council contracting a loan of £1,190 for works of street surface-water drainage and to the borrowing of two sums of £875 for works of sewage disposal. In a further communication from the Board it was stated that no recommendation was necessary in reference to the loan of £5,910 for works of street improvement.

Taignton.—The district council have adopted plans, prepared by Mr. Jones, their surveyor, for an enlargement of the isolation hospital, by which the number of beds will be increased from three to twelve, and the building will be doubled in size. The estimated outlay is £5,600.

Wallsend.—A Local Government Board inquiry was held on the 2nd inst. respecting an application of the district council for sanction to borrow about £5,000 for the formation of a new road and quay on the east side of the township, £3,855 for works of public and private street improvements, and £5,000 for the purpose of public walks and pleasure grounds. The clerk to the council said that the reason the council had resolved to take steps to put the improvements named into effect was due exclusively to the extraordinary development of the town consequent upon the shipbuilding and engineering industries and the recent re-opening of the coalfields in the immediate neighbourhood. No less than 48,000 tons of shipping had been set afloat in 1897 by the firm of Messrs. C. S. Swan & Hunter, or about one-fourth of the shipping launched on the Tyne that year. The population in 1861 was 2,371; in 1871, 1,159; in 1881, 6,139; and in 1891, 11,620. The present population was 18,192. No fewer than 425 houses were at the moment in course of erection, 375 of which were on the "bat" principle. The immense rush of working men to the district necessitated enlarged household accommodation, the buildings at present in course of erection being sufficient to house some 2,000 workmen and their families.

Withington.—On the 7th inst. Colonel J. G. Marsh, on behalf of the Local Government Board, heard an application, at the Withington Town Hall, for permission on the part of the district council to borrow a sum of £4,497 for sewage works, and a further sum of £608 to be spent upon private street improvements.

RURAL DISTRICT COUNCILS.

Bingham.—The clerk has been directed, in replying to a recent communication from the Local Government Board inquiring what had been done in connection with the scheme of sewerage, to state that the council had instructed Messrs. Sands & Walker, civil and sanitary engineers, Nottingham, to prepare plans and an estimate for submission to the board, and that the plans were now ready, but the engineers were unable to complete their estimate until they heard from the clerk with respect to the land required for disposal purposes.

Chocroton.—An inquiry has been held by Mr. E. A. Sandford, on behalf of the Local Government Board, concerning an application of the rural district council for sanction to borrow £5,000 for works of sewerage and sewage disposal.

Flaxton.—In response to an application by the rural district council to the Local Government Board for sanction to borrow £250 for the improvement of a main road in the township of Strensall, an inquiry was held by Lieut.-Colonel Albert C. Smith, R.E., Local Government Board inspector, in the St. Mary's Hall, Strensall, on Thursday. Mr. L. Dennis-Smith addressed the inspector on the need of the improvement and on the proposed scheme, and the road and new route were afterwards inspected. Lieut.-Colonel Smith remarked that the improvement was absolutely necessary, and if his report should be favourable work will be commenced soon after its receipt. There was no opposition.

Goole.—Lieut.-Colonel A. C. Smith, R.E., an inspector of the Local Government Board, held an inquiry at Swinefleet last week into the subject matter of an application from the Goole Rural District Council to borrow £1,000 for purposes of sewerage for the parish of Swinefleet. Mr. G. England, clerk to the district council, appeared on their behalf, and said it was their intention to re-lay the drains from Reedness to Swinefleet with pipes, and erect a flushing tank capable of holding 900 gallons of water. He said some of them were without pipes and sewage was deposited into manholes and afterwards taken away by scavengers.

Sleaford.—The rural district council having applied for power to borrow £900 for a water supply for Great Hale, the usual inquiry was held on Tuesday by Mr. B. Percy Boulnois at Hale. The council were represented by Mr. Clare, district surveyor, and Mr. C. Clements, clerk. Mr. Chro reported that the present supply was obtained from shallow wells, and was declared by Dr. Atby's analysis to be wholly unfit for domestic purposes. The council had therefore decided to bore, the necessary site having been purchased. There was no opposition.

Personal.

The salary of Mr. J. Smith, gas manager to the Corporation of Bangor, was last week increased by £20 per annum.

Mr. Edward Hall, borough surveyor of Pwllheli, was on Tuesday of last week appointed borough surveyor of Carnarvon.

Messrs. Samson & Cottam have been awarded the first premium of £100 for their designs for the proposed new town hall at Taunton.

Mr. M. Tutin, buildings inspector to the Stockton-on-Tees Corporation, has been appointed to a similar position under the Southend-on-Sea Corporation.

Messrs. Walker & Sons have been appointed architects of the new free public library which the Gloucester Corporation propose to erect, at a cost of £6,000.

Mr. Leonard Harvey Combe has been selected by the Eccles Town Council to fill the position of borough electrical engineer, at a commencing salary of £150 per annum.

Mr. John Henry Teague, of Lincoln, son of the late engineer (Mr. Henry Teague, deceased), was appointed waterworks engineer to the Lincoln Corporation on Tuesday of last week.

Mr. W. A. Boothroyd, of Barry, has been appointed engineering assistant in charge on the sewage scheme now being carried out by the Coventry Corporation, at a salary of £3 3s. per week.

Mr. Alfred H. Dunkin, of Colne, was on Monday appointed by the General Works Committee of the Bacup Town Council to the position of assistant in the office of Mr. Francis Wood, borough engineer.

Mr. J. Frecham Stow, surveyor to the Bridlington Urban District Council, was on Tuesday selected to fill the position of surveyor to the Chertsey Urban District Council. Five other gentlemen came up for interview.

The Electric Lighting Committee of the Derby Corporation have reduced the applications for the post of borough electrical engineer and manager to three—namely, Messrs. J. T. Baron, London; E. A. Lancaster, Birmingham; and T. P. Wiltschurst, Halifax.

Mr. H. L. Taylor, of Blackburn, was unanimously appointed assistant engineer and surveyor to the Sudbry Corporation. Mr. Taylor has had considerable experience as a mechanical engineer, which will be of great service in his present appointment as assistant water engineer.

With some dissentients the Manchester City Council last week adopted a resolution asking Mr. Callison, the superintendent of the Cleansing Department, to resign. On Monday Mr. Callison handed in his resignation, and Mr. George Plant, outdoor superintendent, was appointed to take charge of the duties.

Mr. Corbett Woodall, an expert in gas manufacture, has been appointed by the Corporation of Southport to make an examination of the gas estate and report us to the best methods by which an improvement can be effected in the profits accruing from the same. The results have for some years past been unsatisfactory.

An interesting ceremony took place at Darwen, on Thursday, the occasion being the marriage of Mr. H. B. Longley, chief assistant in the city engineer's department, Coventry, to Miss Ada Beet, eldest daughter of Mr. J. Beet, of Darwen. Mr. J. Ainsworth Settle, borough engineer of Heywood, officiated as best man. The happy couple spend the honeymoon at Llandudno and Barmouth.

The result of the competition in connection with the proposed new town hall of Singapore, India, has been announced. The first prize of £200 has been awarded to Messrs. Francis Sills & Frauchen, of Norfolk-street, Strand, London, and the second prize of £100 to Mr. William A. Tunstall, of Colombo, Ceylon. Plans submitted by Messrs. Swan & Maclaren, of Singapore, and Messrs. Sevcnoaks & Lavelle, of Bangalore, have been commended.

At the first meeting of the St. George's (Southwark) Vestry after the recess, on Tuesday of last week, a member spoke in highly eulogistic terms of Mr. Winter, the late surveyor, and moved that an honourarium of 25 guineas be granted to Mr. Winter in consideration of the extra work performed by him and the able manner in which that work had been carried out. Other members endorsed the praise of Mr. Winter's services, and the motion was unanimously carried.

A special meeting of the Llandudno District Council was held on the 6th inst. for the purpose of presenting the surveyor, Mr. Paley Stevenson, with a handsome marble time-piece, on the occasion of his marriage, which took place on the day following at Ashbourne, in Derbyshire. The chairman (Mr. T. P. Marks), who presided, remarked upon the unanimity and cordiality which had characterised the movement for making this testimonial to the surveyor. Other members spoke, and the surveyor acknowledged in suitable terms the kind feeling which had prompted the presentation.

We regret to announce the death, which took place suddenly on Friday morning, of Mr. John Tate, the surveyor to the Pickering (Yorks) Rural District Council. The deceased was well known and much respected, and a very large company attended the funeral, which took place on Sunday. At a meeting of the council, on Monday, the chairman moved, and the vice-chairman seconded, a resolution of sympathy and condolence with the widow and family of the deceased, both speaking in high terms of the good services rendered by him in the management of the highways for a period extending over nearly thirty years. Other members added to the tribute of respect. A meeting of the council will be held on the 26th inst. to consider the question of the appointment of a surveyor in succession to the late Mr. John Tate. Mr. T. Tate, the deceased's son, has agreed to carry out the duties in the meantime.

On the 5th inst. the Oswestry Town Council were recommended to adopt a resolution of the General Purposes Committee accepting the resignation of Mr. R. O. Wynne Roberts, the borough surveyor, who would, it was stated, shortly take up the post of city engineer of Cape Town. The motion also proposed the granting of a testimonial and a sum of £75 as remuneration for past services. The mayor, in seconding the motion, said he did so with pleasure, not unmixed with feelings of regret. Mr. Wynne Roberts had earned for himself their respect and good feeling, and they wished him every possible success in his new sphere of labour. He was sure that what would be a great loss to them would prove a great acquisition to Cape Town. A councillor, in the course of a highly complimentary speech, expressed his appreciation of the manner in which Mr. Wynne Roberts had discharged his duties as borough surveyor, and said that although it was their privilege to differ frequently with each other, as well as with their officials, as to the methods and manner of doing their work, no one would deny that he (Mr. Wynne Roberts) had worked like a slave on their behalf. The motion was eventually adopted, and the mayor, in a brief address to Mr. Wynne Roberts, remarked that the council had parted with no officer with greater feelings of regret than they would part with him. Mr. Wynne Roberts then replied, saying that words failed to express his gratitude for the kind way in which he had been treated during the past four years. He had always endeavoured to do his duty, and he was glad that his efforts on their behalf had been appreciated.

A FOUNTAIN POLLUTED BY SEWAGE.

REMARKABLE CASE AT HALSTEAD.

In his summary of the reports of the district medical officers of health for 1897, Dr. Thresh, medical officer of health for the county of Essex, refers to a somewhat remarkable case of the pollution of a public fountain at Halstead by sewage from the isolation hospital. A subsequent outbreak of typhoid fever in the district was attributed to the drinking of water from the fountain in question. The chief features of the case were summed up in the following way by the medical officer of health to the Halstead Urban District Council: We have therefore this remarkable chain of evidence, from which no link is wanting, to prove that the isolation hospital was the *origo mali*.

(i.) Initial case of typhoid being treated in isolation hospital.

(ii.) Untreated excreta from which were being frequently put down drain.

(iii.) Although the hospital drains are perfect, the main sewer pipes are only pugged at points, with defective flanges, and one cracked pipe.

(iv.) Spring water led across the road and sewers in tops and bottoms minus joints or any means to prevent pollution.

(v.) Twenty yards lower down, catch-pit, badly constructed, from which drinking fountain is supplied.

This evidence appears overwhelming, the only thing against the theory being that there were no signs of sewage pollution round the defective sewer, the light, sandy soil being, when opened, dry and nowhere discoloured; but, be it remembered, water may be teeming with typhoid bacilli and yet quite clear, and yet a few drops of such a solution would be ample to pollute the well and cause the mischief. It is most probable that the pollution occurred after the heavy falls of rain, which data from the Halstead climatological station prove to have fallen during the first ten days of the year, when the sewer was full of surface water from higher up the hill, the pressure of which would force the water through joints which at ordinary times would be nearly watertight. At such a time, also, the sewage would be dilute, and unlikely to discolour the surrounding soil.

Tunbridge Wells.—It has been decided to open the new baths, which have been erected by the corporation, on September 5th next.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

MIDLAND DISTRICT MEETING AT BILSTON.

A meeting of the members of the midland district will be held to-morrow at Bilston. The following are the arrangements:—

- 11 a.m.—The members will be received in the council chamber, Town Hall, by the chairman (Councillor R. A. Harper, J.P.) and other members of the council. Minutes of Stafford and Rhynher meetings. Election of hon. district secretary.
- 11.30 a.m.—Leave in brakes, kindly provided by Councillor J. W. Sankey, chairman of the Water and Baths Committee, for a visit to the Spring Vale furnaces, arriving about 11.40 a.m., where, by the kind permission of Sir Alfred Hickman, the process of steel manufacture will be witnessed. A short descriptive paper will be given.
- 12.30 p.m.—Leave in brakes for a visit to the waterworks covered service reservoir (which will be specially emptied for the inspection of the members), arriving about 12.45.
- 1.15 p.m.—Leave in brakes for the Binley Arms Hotel, arriving about 2 p.m., where a light luncheon will be provided by Councillor R. A. Harper, J.P., chairman of the council.
- 3 p.m.—Leave in brakes for a visit to the Bilston water-works pumping station, arriving about 3.30 p.m.
- 4.15 p.m.—Leave in brakes for the Technical School, Bilston, arriving about 5 p.m.
- 6 p.m.—Dinner at the Technical School. Tickets, 3s. 6d. each (exclusive of wine).

Arrangements will be made for any members desirous of doing so to inspect the public baths and the public market.

Mr. C. L. N. Wilson, the water engineer and surveyor to the Bilston Council, will give a descriptive paper of the works. As the paper will be in the hands of members intimating their intention to attend some days before the meeting, it will be taken as read.

Among the hotels at Bilston may be mentioned the Pipe Hill, Globe and Great Western.

Wolverhampton is within 2½ miles and Birmingham 10½ miles, and there is a good service of trains from these towns. The Great Western station at Bilston is the nearest to the Town Hall.

J. S. PICKERING, A.M.I.C.E., THOS. COLE, A.M.I.C.E.,
Hon. District Secretary, Secretary,
Council Offices, Nuneaton. 11 Victoria-street, S.W.

WISHAW WATER SCHEME.

A special meeting of the Wishaw Town Commissioners was held recently to consider a report of Mr. James Tait, the engineer, as to the probable cost of a new water supply for the burgh. The report contained the cost of constructing a compensation reservoir, and bringing in a supply of water to the present burgh reservoirs in the parish of Carluke from the streams of Potrail, Potricnick and Redin, in the parish of Crawford, in terms of the Wishaw Water Act, 1893. The probable estimates were made with piping in four different diameters. The cost of carrying out the works, including land, wayleaves and surface damages, was as follows: Reservoir, with 18-in. pipe line (delivering 2,200,000 gallons of water per day), £93,000; 16-in. pipe line (1,640,000 gallons), £81,000; 15-in. pipe line (1,400,000 gallons), £78,000; 12-in. pipe line (780,000 gallons), £67,000. Attached to the report was a certificate, signed by Mr. R. Copland, C.E., Glasgow, saying he had examined the estimates on which the report was based, and he considered the sums sufficient. After discussion it was unanimously agreed to adopt the 18-in. size of pipe, at a cost of £93,000, and the engineer was instructed to prepare specifications and schedules.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

BOROUGH SURVEYOR AND SANITARY INSPECTOR.—September 17th.—Borough of Oswestry. £200.—Mr. J. Parry Jones, town clerk.

ENGINEERING ASSISTANT.—September 17th.—Ilfracombe Urban District Council.—Mr. O. M. Prouse, engineer and surveyor to the council.

ELECTRICAL ENGINEER.—September 20th.—Willesden Urban District Council. £400.—Mr. O. Claude Robson, M.I.C.E., engineer and surveyor to the council.

TEMPORARY ASSISTANT.—September 20th.—Llantrisant and Llantwit Fudro Rural District Council.—Mr. Comor S. Morgan, surveyor to the council, Pontyclun.

SECRETARY AND CITY MANAGER.—September 21st.—York Waterworks Company. £300 with house.—The Directors of the Company, Lendal Hill, York.

BURGH AND ROAD SURVEYOR, SANITARY INSPECTOR, &c.—September 23rd.—Commissioners of the Burgh of Carnoustie. £100.—Mr. William Caesar, town clerk.

SANITARY INSPECTORS (Two).—September 29th.—Chelsea Vestry. £120.—Mr. Thomas Holland, clerk to the vestry.

GENERAL ASSISTANT FOR BOROUGH ENGINEER'S DEPARTMENT.—October 1st.—Corporation of Plymouth. £100.—Mr. James Paton, borough engineer and surveyor.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

PLYMOUTH.—September 24th.—Erection of shops and dwelling-houses fronting Tavistock-road. £250.—Mr. J. H. Ellis, town clerk.

WIVENHOPE.—September 29th.—Works of drainage and water supply, for the urban district council.—Mr. C. W. Deuton, clerk.

REGIATE.—October 6th.—Erection of municipal buildings, fire station, public office, &c.—Mr. Clair J. Green, town clerk.

ABBEYDON.—December 1st.—Extension of the covered market, at a cost not to exceed £3,000. £21.—The Borough Surveyor.

CURRYSTON.—December 23rd.—Sewerage and sewage disposal scheme for the No. 1 and 2 wards of the district. £50, £90 and £20.—Mr. T. E. Harland Childsfoot, clerk to the council.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

ROTHBURY.—September 17th.—Supply of a 12-ton steam roller, one sleeping-van and one water-cart, for the rural district council.—Mr. James Wood, surveyor to the council.

EXETER.—September 17th.—Building of a new bridge, altering course of brook, and other works connected therewith, at the boundary of Bugeworthy and Badsey parishes, for the urban district council.—Mr. Edward Wadams, clerk to the council.

NOTTINGHAM.—September 17th.—Construction of new sewer.—Mr. Arthur Brown, city engineer.

ANDREWS.—September 17th.—Supply for one year of electricity meters, house fuse-boxes and house service cables.—Mr. J. Alex. Bell, city electrical engineer.

STAINES.—September 17th.—Making-up of Sidney-road, Bremer-road, Farnell-road and Billet-road, for the urban district council.—Mr. E. J. Barrett, A.M.I.C.E., surveyor to the council.

STAINES.—September 17th.—Supply and delivery of about 200 tons of 1½-in. hand-broken Guernsey granite, for the urban district council.—Mr. E. J. Barrett, A.M.I.C.E., surveyor to the council.

EXAMINATIONS, 1899.

PRELIMINARY EXAMINATION.

Notice is given that the Preliminary Examination for the admission of Students will be held on the 18th and 19th of January next.

It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London.

Irish candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS.

Notice is also given that the Annual Professional Examinations for Land Agents, Valuers and Building Surveyors (held under the provisions of the Charter), qualifying for the Fellowship and Associateship of the Institution, will commence on the 20th of March next.

English candidates for the Professional Examinations will be examined in London.

Irish candidates will be examined in Dublin.

Particulars as to subjects, course of examination, prizes and scholarships can be obtained of the Secretary.

All applications for the Professional Examinations, Divs. II, III, IV, and V, must be sent in before the 31st of October, and applications for the Students' Preliminary Examination before the 30th of November. The necessary entry forms for the various Examinations can be obtained of the Secretary.

APPOINTMENTS OPEN.

BOROUGH OF PLYMOUTH.

The Corporation is prepared to receive applications for the position of General Assistant in the Borough Engineer's department.

Candidates must be neat and expeditious draughtsmen, competent to survey and level accurately, prepare plans, sections and detail drawings for works of sewerage, road-making and other works incidental to a borough engineer's department; also competent to take out quantities and measure up works.

Preference will be given to applicants having had previous experience in a borough engineer's department.

Salary, £100 per annum, increasing by annual increments of £10 to £130. The engagement to be terminable by a month's notice from either side.

Applicant's age must be between twenty-two and thirty.

Applications, in candidate's own handwriting, accompanied by copies of not more than three recent testimonials only, which will not be returned, to be forwarded to me not later than Saturday, October 1st, endorsed "General Assistant."

Canvassing members of the Council, either directly or indirectly, will be deemed a disqualification.

JAMES PATON,

Borough Engineer and Surveyor.

Municipal Offices.

September 13, 1898.

YORK WATERWORKS COMPANY.

Wanted, a Secretary and City Manager. One having had previous experience in a waterworks office preferred. Salary, £300 a year with house.

Application, with not more than three testimonials, to be forwarded by the 21st September instant, addressed to the Directors of the York Waterworks Company, Lendal Hill, York.

TENDERS WANTED.

BUXTON URBAN DISTRICT COUNCIL.
TO CONTRACTORS.

The above Council invite tenders for (1) the Rebuilding of the Otterhole Bridge, St. John's-road; (2) the Building of Stabling, &c., in the cattle market.

Plans may be seen at the office of Mr. W. H. Grieves, Town Surveyor, Town Hall, Buxton, where specifications and forms of tender may be obtained for a deposit of £1 ls., which will be returned on receipt of a bona fide tender.

Tenders, endorsed "Otterhole Bridge" or "Stabling," as the case may be, to be sent in not later than Monday, the 26th inst.

The Council do not bind themselves to accept the lowest or any tender.

(By order of the Council)

JOSIAH TAYLOR,

Clrk.

Town Hall, Buxton.

September 8, 1898.

CITY OF BIRMINGHAM.

The Public Works Committee invite tenders for the Reconstruction of the Sewer in Needless-alley, New-street; also the Construction of New Pipe Sewers in a portion of Wentworth-road, &c., Harborne.

Drawings and specifications may be seen, and bills of quantities, schedules of prices and forms of tender obtained, on application to this office on and after Wednesday next, the 21st instant, upon deposit of a cheque, value 2 guineas, for each set of quantities. The cheque will be returned in each case upon receipt by the Public Works Committee of a bona fide tender with prices filled in as required.

The contractor whose tender is accepted (in each case) will be required to pay not less than the minimum standard rate of wages current in the district.

Tenders, sealed and endorsed "Tender for Sewer, Needless-alley," and "Tender for Sewers, Wentworth-road, &c.", to be delivered here not later than 10 a.m. on Saturday, the 1st of October.

The Committee do not pledge themselves to accept the lowest or any tender.

(By order)

JOHN PRICE,

City Engineer and Surveyor.

The Council House, Birmingham.

September 15, 1898.

COUNTY BOROUGH OF WOLVERHAMPTON NEW STREET WORKS.

The Public Works Committee invite tenders for Forming, Levelling, Sewering, &c., of Hilton-street.

Plans can be seen, and specifications, with bill of quantities and form of tender obtained, on application at the office of the undersigned. Sealed tenders, addressed to the Chairman of the Public Works Committee, and endorsed "Tender for New Street Works," to be delivered at the Town Clerk's office not later than Saturday, October 1, 1898.

The Contractor will be required to enter into an undertaking to pay not less than the minimum standard rate of wages of the district, and to observe certain hours of labour in accordance with the resolution of the Town Council.

The Committee do not bind themselves to accept the lowest or any tender.

J. W. BRADLEY, C.E.,
Borough Engineer and Surveyor.

Town Hall, Wolverhampton.
September 13, 1898.

BOROUGH OF DARWEN. TO ENGINEERS AND ELECTRICIANS.

The Corporation are prepared to receive tenders for a 10-ton Overhead Travelling Crane, to be fixed in the generating-room of the new Electric Works, and for a Lightning Conductor to the chimney of their refuse destructor, to be erected adjoining the said works, at Robin Bank, Darwen.

General conditions and specification, with forms of tender, can be obtained from the Borough Engineers, Darwen.

Tenders, properly endorsed, to be delivered to me before 10 a.m. on Monday, the 26th September.

No tender necessarily accepted.

(By order)

CHAS. COSTEKER,
Town Clerk.

Town Clerk's Office, Darwen.

MALVERN URBAN DISTRICT COUNCIL.

The Council is prepared to receive tenders for the following:—

Steam Road-Roller.—Weight, 10 tons, Compound High and Low Pressure Cylinders, Steam Jacketted. Tenders must set out a full description of roller tendered for.

Scarifier.—With all necessary fittings and set of tyres complete. To be attached to steam roller. Tenders must set out a full description of scarifier tendered for.

Stone-Breaker.—"Patent Improved Blake." To be a fixed machine, fitted with hammered-steel eccentric shaft, drawback motion, steel toggle grooves, reversible clamping jaws, with faced backs. Tenders must set out a full description of stone-breaker tendered for.

Sleeping-Van.—To accommodate three men, to be fitted with boxes, lockers, bunks, bedding, vice bench, vice, stove and piping, &c. Tenders must set out a full description of van tendered for.

Further particulars may be obtained at the office of Mr. H. P. Maybury, Town Surveyor, Council Offices, Malvern.

Sealed tenders, endorsed "Tender for Steam Roller, &c.," to be sent to me not later than 5 o'clock in the afternoon of Saturday, the 24th day of September, 1898.

The lowest or any tender will not necessarily be accepted.

H. P. MAYBURY,
Surveyor.

Council Offices, Malvern.
September 12, 1898.

SHEERNESS URBAN DISTRICT COUNCIL. ROAD MATERIALS.

The above Council invite tenders for the supply of Road Materials, as specified hereunder:—

About 300 tons of Quartzite or Granite;
" 300 " Clean Pit Flints; and
" 200 " Hogging or Aylesford Gravel.

The above quantities are not guaranteed.

The Quartzite or Granite and Flints must be broken to pass through a 2-in. ring, and the whole must be delivered into store (free of all dues) either at Mile Town or at West Minster, as directed, within a month, dating from the receipt of the order from the Surveyor to the Council (Mr. C. A. Copland), and to his entire satisfaction. The quantities will be ascertained by means of the weighbridge at the council's yard in Trinity-road, and be paid for accordingly.

Tenders, endorsed outside "Road Material," which must state price per ton, should be delivered or sent to the undersigned, and samples of the respective materials to the surveyor, before noon on the 27th day of September, 1898.

(By order)

VINCENT H. STALLON,
Clerk to the Council.

Council Offices, Trinity-road, Sheerness.
September 12, 1898.

London, Grimsby, Glasgow, Ebchester, Hoylake, Johnstone, &c., &c., and many other towns in England, on the Continent, and the United States.

WRITE FOR TESTIMONIALS.

PATENT TRUINVERT PIPE.

To put it shortly, this pipe secures true alignment of invert, increased strength in the socket, three gas and water-tight connections at every joint, and, while allowing for a slight settlement when first laid, forms an absolutely rigid joint directly the cement sets

POINTS:

- 1.—Gas and Water-Tight Joints easily made under water.
- 2.—True Alignment of Invert.
- 3.—Socket the strongest part of the pipe.
- 4.—No special junctions required.

AA—Holes for pouring in cement or composition.
BB—Screened and Lengthened Socket.

CC—Inner Socket and Rest.
EE—Chamber for cement or composition.
FF—Standard Joint in new position.

OATES & GREEN, Ltd., Halifax

COUNTY BOROUGH OF SOUTH SHIELDS.
UNDERGROUND SANITARY CONVENIENCE.

TO SANITARY ENGINEERS.

The Town Council invite tenders for the whole of the works required in the Construction and Completion of an Underground Public Convenience at the Market-place, South Shields.

Specifications and forms of tender, with a blue print of contract plan, may be obtained from Mr. S. E. Burgess, A.M.T.C.E., Borough Engineer, Chapter-row, upon payment of a deposit of £2, which will be returned on receipt of a *bona-fide* tender. Remittances to be made payable to Mr. W. Anderson, Borough Accountant.

Tenders, sealed and endorsed "Tender for Underground Convenience," must be sent in to the undersigned by 12 noon on Wednesday, the 28th September next.

The Corporation do not bind themselves to accept the lowest or any tender.

(By order)
 J. MOORE HAYTON,
 Town Clerk.

Court Buildings, South Shields.
 September 12, 1898.

TAMWORTH RURAL DISTRICT COUNCIL.
CONTRACT No. 1.

The Rural District Council of Tamworth are prepared to receive tenders for about 8½ miles of Cast-Iron Pipes from 4 in. to 3 in. in diameter, and other castings to be made in accordance with the specification of their engineer.

Persons desirous of tendering may obtain a copy of the specification by application to me, at my offices, in Tamworth, on and after the 14th inst., and on payment of 1 guinea, to be returned in the event of a *bona-fide* tender being received.

Tenders, addressed to me, endorsed "Tenders for Cast-Iron Pipes," to be sent in on or before Friday, the 23rd day of September, 1898.

The Council do not bind themselves to accept the lowest or any tender.

HENRY J. CLARSON, C.E.

Tamworth.
 September 12, 1898.

CITY OF GLOUCESTER.

NEW BUILDINGS FOR ELECTRICITY WORKS.

TO BUILDERS AND CONTRACTORS.

The Corporation of Gloucester invite tenders for the Erection of the New Buildings in connection with the above Plans and specification may be seen at the office of Mr Harry A. Dincey, 26 Clarence-street, Gloucester, between 10 a.m. and 5 p.m., after Monday, 5th 8 p.m. or next.

The quantities are being prepared by Mr. Dincey, and may be obtained from him on payment of a charge of £2 2s., which will be returned on receipt of a *bona-fide* tender.

The Committee do not pledge themselves to accept the lowest or any tender.

Tenders, endorsed "Tender for Electricity Works," to be delivered at the Town Clerk's office, Guildhall, Gloucester, before 11 o'clock on Monday, the 14th September, 1898.

(By order)
 GEO. SHEFFIELD BLAKEWAY,
 Town Clerk.

Guildhall, Gloucester.
 August 30, 1898.

WILLESDEN DISTRICT COUNCIL.
TO CONTRACTORS.

The Willesden District Council are prepared to receive tenders for the execution of certain Paving Works in Baker-passage, Ilrlesden, and Newton-News, Kilburn.

Plans and specification may be seen, and all further particulars obtained, on and after Monday, September 19, 1898, upon application to Mr. O. Claude Robson, M.A.S.T.C.E., Engineer to the Council, Public Offices, Dyne-road, Kilburn, N.W.

The tenders, upon printed forms and endorsed "Private Streets," to be delivered at the offices of the Council not later than 4 p.m. on Tuesday, September 27, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
 STANLEY W. BALL,
 Clerk to the Council.

Public Offices, Dyne-road, Kilburn, N.W.
 September 14, 1898.

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

- Easily and quickly laid by unskilled workmen.
- Perfect alignment of invert secured.
- Joint readily made absolutely watertight.
- Cheapest Patent Joint in the market.

Prices and further particulars on application to J. PLACE & SONS, Ltd., Darwen.

ARTHUR KOPPEL, 96 Leadenhall St., LONDON, E.C.

**BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.**

The Beckenham Urban District Council invite tenders for Erecting about 200 Cast-Iron Ventilating Columns, 13 ft. 6 in. high, on concrete beds, together with the laying of 9-in. Stoneware Pipe Connections to the main sewers, &c.

Plans and sections may be seen, and bills of quantities, specifications and forms of tenders obtained, on application to Mr. John A. Angell, Surveyor, on or after September 7th, on deposit of £1, which will be returned on the receipt of a *bona-fide* tender.

A clause will be inserted in the contract providing that the contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Tenders, duly sealed and endorsed "Tender for Erection of Ventilating Columns," to reach undersigned not later than 4 p.m. Monday, September 26, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)

F. STEVENS,
Clerk to the Council.

August 30, 1898.

**BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.**

The Beckenham Urban District Council invite tenders for Widening Croydon-road and Elmers End-road. The works comprise the widening of Croydon-road for about 800 lineal feet and of Elmers End-road for 150 lineal feet, together with the formation of new footways. In connection therewith the following works are necessary—*viz.*, about 800 lineal feet 9-in. pipe sewer, 700 lineal feet 9-in. pipe surface-water drain, with manholes, gullies, &c., 110 lineal feet concrete retaining wall about 4 ft. high, 1,000 lineal feet curb and channelling, making-up roadways, &c.

Plans and sections may be seen, and bills of quantities, specifications and forms of tender obtained, on application to Mr. John A. Angell, Surveyor, on or after September 7th, on deposit of £1, which will be returned on receipt of a *bona-fide* tender.

A clause will be inserted in the contract providing that the contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Tenders, duly sealed and endorsed "Tender for Widening Croydon and Elmers End Roads," to reach undersigned not later than 4 p.m., Monday, September 26, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)

F. STEVENS,
Clerk to the Council.

August 30, 1898.

**WITNEY RURAL DISTRICT COUNCIL.
EYNESHAM MAIN DRAINAGE.**

The Rural District Council are prepared to receive tenders, under the advice of their Engineer, from contractors for the execution of this work.

The plans and specifications can be seen, and information obtained, upon application to Mr. Nicholson Lailey, F.R.S., ASSOC. M. INST. C.E., the Council's Engineer, at his chambers, 16 Great George-street, Westminster, between the hours of 10 and 4 o'clock on and after September 12th next.

Sealed tenders, endorsed "Eynesham Main Drainage," are to be delivered at my offices at Witney not later than 6 o'clock p.m. on Monday, September 26th.

The Council do not pledge themselves to accept the lowest or any tender.

A copy of the plans and specification are also deposited at the offices of Mr. W. George Eaton, Surveyor to the Council, Witney, and information can be obtained upon the dates and times before named.

The Engineer will give due notice to persons proposing to tender of the date and time that he or his chief assistant will attend at Eynesham in order to explain the nature of the proposed undertaking.

(By order)

Minutes of Proceedings.

Sanitary Condition of Alwrick.

In December, 1897, the Local Government Board received representations from the Northumberland County Council concerning the sanitary condition of Alwrick, an urban district with an estimated population of 6,700. The alleged defects had reference chiefly to the faulty arrangement and construction of certain dwellings of the poorer classes. Attention had been drawn to the matter last year by the county medical officer, whereupon the district council instructed their own medical officer to report, possibly in the expectation that the statements of the county medical officer would be contradicted. If so, disappointment was the result, for in material particulars the second report only served to confirm the first. For many years past medical officers have been drawing attention to the unhealthy condition of some of the poorer-class habitations, but there is nothing to show that any effective action has ever been taken by the sanitary authority. Hence came Dr. Buchanan's inquiry, the report of which is to hand. As far back as 1849 Sir Robert Rawlinson reported to the General Board of Health that a variety of unwholesome conditions existed in the district. These conditions comprised unhealthy, damp and overcrowded dwellings, packed away in narrow courts and alleys behind the main thoroughfares, abundance of privy and midden nuisances, unpaved or badly-paved yards, no public water supply, and no system of sewerage. Between 1852 and 1854 a large improvement scheme was carried out by the newly-appointed Alwrick and Canongate Local Board. The town was sewered, under Rawlinson's direction, privies were abolished and water-closets provided, and a public water supply was obtained. Unfortunately, these improvements were not followed by a diminution in the general mortality, and the late Sir George Buchanan, father of the inspector who now reports, and then at the head of the Medical Department of the Privy Council, pointed out that the construction of the courts and dwellings occupied by the poorer classes in Alwrick remained as unwholesome as before, and that the provision of sewers had effected no drying of the subsoil. The subsequent action of the sanitary authority is not altogether satisfactory; in fact, the inspector describes it as conspicuously lax, though certain useful public works, such as the erection of public slaughter-houses and the laying of additional sewers, had been carried out, and in scavenging and a few other matters the administration was considered efficient. No attempt, however, had been made to remedy a multiplicity of serious sanitary defects, especially in connection with the courts and dwellings of the poorer classes, where overcrowding was actually on the increase.

In dealing with the present sanitary condition of the town Dr. Buchanan points out that the dwellings occupied by the poorer classes are to be found huddled on small areas, behind the main

thoroughfares, and that this close aggregation of dwellings, which has long been a characteristic feature of Alwrick, must in part be attributed to the enclosure of the town in former centuries by walls, but to a greater extent is the outcome of later conditions. Dr. Buchanan gives an interesting account of the form which this overcrowding of buildings takes. Open spaces at the backs of buildings are conspicuous by their absence, for the simple reason that they have invariably been built upon. The following passage may be quoted:—

The commonest example is where a property first consisted of a single dwelling in a row abutting on the main street, having at the back a long strip of garden or yard, the width of which is no greater than the breadth of the house to which it belongs. Buildings have subsequently been packed on this strip of back yard, and access to the "court" so formed is had by a narrow "entry," driven through the ground floor of the house in the main street. Going through an entry into a court of this kind, one finds a passage, some 4 ft. to 6 ft. wide, extending the length of the property, sometimes terminating blindly, sometimes leading, by a second "entry" at its far end, into a neighboring street or court. Along one side of the passage is a high wall, which forms the back of structures in the adjoining "property;" along the other side is a row of buildings, most of them two-story dwelling-houses, out-houses, stables or cow-sheds. Here and there an irregularly-shaped common yard is met with, surrounded by buildings of a similar sort. Dwellings in these courts have thick walls, rudely constructed out of the local stone. Some habitations appear to have originally been stables or out-houses. As a rule, the only windows and doors are those facing the passage or common yard. These dwellings are thus without thorough ventilation, and commonly they receive insufficient light. Windows are frequently small, and often can be opened only to a trifling extent. Standing on a wet soil, constructed of porous stone, and unprovided with damp-proof course, these houses are conspicuously damp. In places the wall of the dwelling has been built against the hill-side, and here dampness is increased. In a few cases an additional source of wetness arises where eaves-gutters and down-spouting are wanting or are deficient.

Needless to say, these dwellings are generally more or less dilapidated and dirty. The courts are unlighted, and either unpaved or irregularly paved. Each is drained to a sewer in the main street by means of a gully or gulleys placed in the yard or passage. Open gulleys, designed to convey to these gulleys rain water and slop water from the dwellings, have often been constructed in rudimentary fashion. Liquid refuse thrown into the gutters or on to the surface of the yard is thus apt to accumulate in pools in front of the houses. To the unhealthiness produced by the crowding together of insanitary dwellings upon area has to be added the evils attending overcrowding of persons, and the state of affairs can then be readily realised.

The sanitary circumstances of the town in other respects may be briefly summarised. Natural drainage and surface water from the principal roadways finds its way to the Aln, partly by open gutters and partly by rude, covered channels laid just beneath the surface. The greater part of the town was sewered by 1854, and until recently a main outfall sewer discharged unpurified contents into the river

about a mile below Alnwick Castle, the chief seat of the Duke of Northumberland. A new main outfall sewer, however, has been laid at a higher level, the contents being delivered to disposal works, where the sewage is treated by "aluminoferric," and then passes to 5 acres of land laid out in irrigation plots, the effluent finally passing into the river. Some sewers through low ground to the west of the Castle are connected to a separate outfall sewer. A precipitant (sulphate of iron) is added in the sewer, and the sewage is then received in small covered catch-pits, the overflow from which passes, without further treatment, into the river. The council have undertaken to give this matter their attention. A separate plot of land will be secured, as levels do not permit of the sewage being taken by gravitation to the new works. The gradients of the sewers render artificial flushing for the most part unnecessary, but their ventilation apparently leaves something to be desired. That part of the water supply which is derived from springs is fairly satisfactory, but the same cannot be said of the supply from the natural drainage of the high ground in the neighbourhood, as the land is mostly agricultural. Formerly, even the water from the springs was much exposed to pollution, owing to offensive matter of various kinds finding its way into the small open streams contributing to the supply. Improvements, however, have been effected in recent years, chiefly with a view to the exclusion of surface water. The water is conveyed by gravitation to a service reservoir on high ground above Alnwick, but the storage capacity represents little more than twenty-four hours' supply. Mr. Wilson, the surveyor, is preparing a scheme to utilise the water from certain additional springs. Of this official the inspector remarks that he "appears to perform with thoroughness a multiplicity of duties attaching to the office." But it is not to such matters as water supply and sewerage that the heavy mortality to which Dr. Buchanan draws attention is to be ascribed. Improvements have been made in many directions in recent years, and the district council has a somewhat better record than the local board had. "But," says the inspector, "in the matter of dealing . . . with some of the gravest insanitary conditions of Alnwick, and, above all, with its notoriously unhealthy courts and dwellings and with the overcrowding of persons therein, local board and district council alike must be held to have seriously neglected their duty." They have been reluctant to make demands upon property owners—or increase the rate. "Wherever individual interests have to be opposed," said a previous report, "or seemingly opposed, sanitary administration has been paralysed." In many cases the only possible remedy is wholesale demolition, and it is some satisfaction to learn that, as a result of the publicity which has been given to the matter, the urban district council show a disposition to grapple more seriously with the evil.

* * *

**Sewer
Ventilation.**

In the report of the surveyor to the Kensington Vestry for the year ended March 25th reference is made to the subject of sewer ventilation. In Kensington the number of pipe ventilators for sewers has been increased during the year, in accordance with the instructions of the vestry. In consequence of complaints made in the end of 1897, Mr. Weaver presented a lengthy report, which led to the passing of the following resolutions by the vestry:—

- (1) That offensive street gullies be efficiently trapped.
- (2) That all new gullies constructed in the parish be pan gullies with syphon-trapped outlets.
- (3) That the London County Council be requested to trap with syphon traps all offensive gullies on the main line sewers.

Mr. Weaver then goes on to refer to the conference on the subject of sewer ventilation which the surveyors to the various metropolitan sanitary authorities held with Sir Alexander Binnie in his capacity of chief engineer to the London County

Council. The idea of the conference, it is worth noting, originated with Mr. Weaver, who in the report referred to above suggested that the London County Council should be requested to convene such a conference. Our readers will no doubt remember that the metropolitan officers of health also participated in the proceedings; but whether this was part of Mr. Weaver's original suggestion does not appear. As the meeting was private, we were unable to report it beyond giving the mere text of the resolutions that were ultimately adopted. Mr. Weaver, however, informs us that the fixing of interceptors on the main house drains was generally condemned by the conference as being bad from an engineering point of view, antagonistic to sanitation, and responsible for the offensive smells complained of in connection with the surface sewer-ventilators. This condemnation was not specifically recorded in the resolutions adopted, but it will be remembered that the second resolution recommended that in all cases where an intercepting trap is fixed on the main house drain a ventilating pipe should be carried up the premises on the outlet or sewer side of the interceptor. Mr. Weaver recalls that in 1885, when intercepted house drains were coming into vogue, he obtained little support in his opposition to syphon interceptors, and he naturally feels some gratification in finding that there has been a considerable change of opinion in the interval among those best able to arrive at a sound practical judgment on the subject. Mr. Weaver further remarks that the surveyors who attended the conference are not abstract theorists, but practical men responsible for the supervision of all the drainage work of the metropolis. Whatever the value of the resolutions may have been, the fact remains that nothing further has been heard of them or of any steps being taken to give effect to them. In this respect they are in the same interesting position as the proposed by-laws by means of which the London County Council intended to secure uniformity among the metropolitan sanitary authorities. Like legislation on the subject of combined drainage, these questions seem to hang fire indefinitely. We observe that, in concluding his report, Mr. Weaver almost apologises for any occasional deviation into subjects of a controversial nature, his rule being to confine himself in his annual reports as much as possible to statements of work. Such a view of the function of an annual report is not one that we can bring ourselves to support. A report confined to mere statements of work must of necessity be dry, bald and unhelpful. The discussion of some of the more difficult problems and recent developments of municipal engineering must obviously add greatly to the interest and value of these periodical statements. Of course it should be remembered that the larger questions confronting a local authority are dealt with from time to time in special reports.

* * *

**The
Bilston
Meeting.**

As we ventured to predict in our last issue, the Bilston meeting proved thoroughly successful in regard alike to attendance, weather, and the general interest of the proceedings. Generally speaking, the meeting was a profitable one, as providing an excellent object-lesson in municipal work as found in a comparatively small town in the Black Country; and, so far as that is concerned, Bilston has no reason to fear comparison with districts more favoured in other respects. There is no lack of civic spirit and intelligence, either in the inhabitants generally or in those to whom they trust the local administration. So long as the town can command the services of public-spirited men like Councillor Harper, chairman of the council, Councillor Sankey, chairman of the Water and Baths Committee, Councillor Jordan, chairman of the Technical Education Committee, and others, the municipal prospects of the district must always be hopeful. From the engineering point of view

the great work of the council has been that of water supply, in regard to which there is plenty of information in Mr. Wilson's able and comprehensive paper, with the accompanying illustrations. It is an axiom of municipal and sanitary engineering that the provision of an abundant supply of pure water is more important than, and should take precedence of, a system of sewerage; and that should be sufficient to justify the Bilston Urban District Council in replying to critics who find fault with them for delay in carrying out a thorough scheme of sewerage and sewage disposal. In a town with the population and rateable value of Bilston the carrying out of two such schemes simultaneously would have been out of the question. Municipal representatives are in the position of stewards, and must never lose sight of the question of ways and means. Hasten slowly is a good motto in their case, if they do not wish the ratepayers to call them to account. Undue delay in sanitary matters cannot be too strongly condemned, but the financial position and rate-paying capacity of a community must be carefully considered. No doubt when municipal engineers next visit Bilston they will find as much to commend in connection with sewerage and sewage disposal as on Saturday they found in connection with the water supply and the technical school. For a small town these problems have been attacked with remarkable pluck, enterprise and intelligence. In regard to the technical school, Mr. Wilson tells us that the total cost of the building and fittings is equal to about one-seventh of the total rateable value of the township; and yet it was built by public subscriptions and grants from the Staffordshire County Council and the South Kensington authorities, without putting a penny on the town rates. When we consider the great progress in technical education of our German commercial rivals, Mr. Wilson might well say, "In this respect Bilston can show the whole of Great Britain a noble example." He also reminds us of the prominent part taken in this work by Councillor Sankey, who has done so much for the town, not only by his labours as a municipal representative, but by the important industrial undertaking he has established in Bilston. The work of Mr. Wilson is evidently appreciated in the town, and it was pleasant to note the unstinted acknowledgment of it which fell from the chairman of the council and from Councillor Sankey. In conclusion, a word should be said in praise of the hearty hospitality extended to the visitors. Mr. Wilson evidently co-operated vigorously with Mr. Pickering in arranging all the details of the meeting, and especially in taking time by the forelock. General satisfaction was expressed with the issue of the paper several days in advance to those intending to be present. Mr. Wilson's paper contained sufficient to justify a visit to Bilston, without the members of the association in any way humbling themselves, as the chairman of the council seemed to fear they were doing.

The Applications of Small Electric Motors.

That municipal electricity works may do much for the community besides supplying it with a healthy light is shown in the case of Bradford, where the use of electricity for small power purposes has been developed to a remarkable extent. It is hardly necessary to enumerate the trades which have been beneficially affected in the town by the use of the electric motor, but that they are numerous is instanced in the paper which Mr. Gibbings, the city electrical engineer of Bradford, recently brought before the Mechanical section of the British Association. There is not much doubt that the use of electric motors on public supply circuits is extending very rapidly, and the extension is not confined to large industrial centres, such as Manchester and Bradford, for a comparatively non-industrial town, such as Edinburgh, can claim to have 167 motors, aggregating 343 horse-power. The chief drawback against the adoption of

electric motors, especially among small power-users, is that of initial expense in purchasing the necessary electrical plant, especially when it may mean the discarding of other plant which is in fair condition. To meet that objection the Bradford Corporation have adopted a bold course, which is nothing less than the hiring-out of electric motors. It is an interesting experiment, because it was felt in many quarters that municipalities could not legally undertake such work. No doubt the success achieved at Bradford will influence local authorities to insert the necessary clauses in future Parliamentary Bills. The scheme of hiring-out motors was adopted by the Corporation of Bradford at the end of 1896, and, while it was taken up somewhat slowly at first, it was not long before consumers began to appreciate the idea. There have been forty-eight new motors added to the mains during this year, and of these forty-two are let on hire by the corporation. Indications are not wanting, however, that the supply of electricity for motor purposes will not be restricted to small power-users, for it is becoming generally accepted that a municipal supply can give economies over large private installations.

The Bristol Electricity Works.

The paper recently read before the British Association by Mr. Proctor, the city electrical engineer of Bristol, though mainly relating to auxiliary plant, was nevertheless of great importance, because it clearly demonstrated the chief direction in which losses are likely to arise in electricity works. It may interest those concerned in the growth of municipal electrical systems to note the extent of the plant which is now in use at Bristol. There are twelve Lancashire boilers, which are all fitted with such labour-saving devices as coaling, stoking, coal elevators and conveyors. The aggregate horse-power of the engines and dynamos is 3,700 horse-power, while there are 130 miles of cable laid underground. It affords an indication of the wide area which is fed by the Bristol Electricity Works when it is mentioned that there are no fewer than thirty-eight sub-stations, at which points the high-pressure current is transformed down to a pressure suitable for distribution. Returning for a moment, however, to the question of auxiliary plant, with which Mr. Proctor mainly dealt in his paper, it is to be regretted that such useful adjuncts to central station equipment as feed-pumps should be so extremely inefficient. Pump makers have, as a rule, exhibited marked indifference to the efficiency of their machines, but it is hardly likely, when so much publicity is brought to bear upon them, that they will not endeavour to improve them. That electric motors when applied to driving pumps will show considerable saving over steam-driven pumps is evidenced by the fact that at Bristol a steam-driven centrifugal pump takes 905 lb. of steam per brake horse-power while an electric motor pump took 48.26 lb. per brake horse-power. It was almost generally accepted at the recent annual meeting of the Municipal Electrical Engineers that it was distinct economy to drive as much as possible of the auxiliary machinery by electric motors.

Two Colonial Appointments.

Within a short period two important colonial vacancies have been filled up. It was a coincidence that the vacancies should have occurred about the same time and in the same colony, that the salary should be the same in each case, and that the appointments will remove from England two well-known members of the Association of Municipal and County Engineers. The appointment of Mr. Wynne Roberts, Oswestry, as municipal engineer of Cape Town has now been followed by the appointment of Mr. G. B. Lafan, Twickenham, to a similar office at Pietermaritzburg. Both will depart with best wishes for a successful career in South Africa.

Association of Municipal and County Engineers.

MIDLAND DISTRICT MEETING AT BILSTON.—I.

BILSTON: THE TOWN HALL.

The district meeting, which had been so carefully arranged at Bilston, took place on Saturday, and proved both highly interesting and thoroughly successful. The attendance was satisfactory, the weather was good, and there was much of a profitable character both to be seen and heard. Those who have never visited the Black Country, and who have gathered some vague ideas from word pictures of the lurid and gloomy order, such as those of Dickens in "The Old Curiosity Shop," are no doubt often tempted to think that it is a very undesirable land indeed. The reality, however, is very far from being as dreadful as the pre-conceived notions. This so-called Black Country is in many respects the heart of industrial England, and it was inevitable that it could have become so within the compass of a single century without the face of the country being affected for the worse and acquiring a somewhat grimy complexion. Like some dust-stained and perspiring toiler, the Black Country, appropriately enough, shows signs of the strenuous and incessant labour, extending over so many years, which have given it such industrial pre-eminence. Vast development industrially must involve loss of advantages in other directions. In this part of England the loss from the æsthetic point of view cannot be ignored, but it is a price that must be paid for the great material progress achieved. Apart from the industrial question, however, there are qualities of the best kind which find expression here in as marked a form as anywhere in England. Here are to be found intelligence, civic spirit, and a strong desire for improvement. As one of the speakers remarked at the banquet on Saturday, there are brains in the the Black Country. In municipal matters the Midlands is well to the fore, and on Saturday the visitors found that Bilston was no exception. From the engineering point of view the great work is the water supply scheme, of which a full account will be found in Mr. Wilson's paper, in connection with which we have reproduced some extremely interesting plans. Works of less magnitude, but no less significant when their social effect is remembered, are the technical school and the baths. By the former the intelligence of the younger members of the community will be cultivated and industry fostered; by the latter something is done to alleviate the discomfort of the conditions under which the inhabitants labour. For a town of the size and population of Bilston the enterprise shown in connection with the technical school is probably unique, and it is gratifying to learn that there is every promise of complete success, and that the benefits to be conferred by such an institution are appreciated by those for whom they were intended.

Bilston is an interesting example of a town which owes its prosperity to the iron and allied trades; but of the history

and development of the town itself it is unnecessary to say anything here, owing to the fulness with which Mr. Wilson has dealt with the subject in his paper. We therefore proceed with our account of the meeting.

AT THE TOWN HALL.

At 11 o'clock the members assembled at the Town Hall, and were received by the chairman of the urban district council, Councillor R. A. Harper, J.P., and other members of the council. Among those present were the following:—

PAST PRESIDENT: Mr. J. T. Eayrs, Birmingham.

MEMBERS OF COUNCIL: Messrs. J. S. Pickering, Nuneaton, and J. Price, Birmingham.

MEMBERS: Messrs. J. Baker, Slough; H. J. Charson, Tamworth; A. T. Davis, Shrewsbury; N. H. Dawson, Banbury; E. J. Elford, Portland; J. Gammage, Dudley; A. D. Greatorex, West Bromwich; A. Greenwood, Todmorden; J. Haigh, Abergavenny; W. T. House, Hinckley; C. F. Marston, Sutton Coldfield; J. Mortimer, Tettenhall; J. Myatt, Leek; B. Perriis, Halesowen; H. Richardson, Aston Manor; C. W. Shackleton, Coseley; T. R. Smith, Kettering; C. D. M. Trinder, Claypole; G. M. Whitehead, Cannock; C. L. N. Wilson, Bilston; and J. Wilson, Bacup.

GRADUATES: Messrs. W. S. Bissell, Wolverhampton; S. S. Gettings, West Bromwich; A. J. Price, Worcester; D. S. Sutherland, Walsall; and J. J. Topping, West Bromwich.

VISITORS: Messrs. A. E. N. Aldridge, Bilston; E. H. Bailey, Leamington; T. R. Bailey, M.D., Bilston; J. P. Baker, Willenhall; C. H. W. Biggs, London; A. Bulyer, M.R.C.S., Ettinghall; J. Bundley, Wolverhampton; C. A. H. Clarry, Sutton Coldfield; T. W. Eayrs, Birmingham; S. Haddock, Ettinghall; J. Harper, J.P., Bilston; J. Howarth, Sedgley; E. J. Jansen, Birmingham; W. Jordan, Bilston; G. J. Ketteringham, Handswoth; J. E. Mawdesley, Bacup; J. T. Parker, Bilston; W. Paton, London; T. R. Phipps, Worcester; F. W. Plant, Bilston; W. Preston, Bilston; W. H. Reynolds, Birmingham; J. W. Sankey, Bilston; F. W. Shephard, Wolverhampton; W. Small, Birmingham; G. H. Smith, Birmingham; J. E. Wilkes, Nuneaton; and V. Wilson, Bilston.

The CHAIRMAN, in opening the proceedings, said he had great pleasure in welcoming the members of that Association to Bilston, and added that he hoped their visit would not only enhance the importance of Bilston but would be a source of instruction to the visitors. The town had a population of 24,000, and he was inclined to think that the members of the Association would not go away dissatisfied.

Councillor SANKEY, in endorsing the chairman's welcome, said he was very pleased indeed to be associated with the chairman in extending a hearty welcome to the members of

the Incorporated Association of Municipal and County Engineers. He regarded it as a great honour that the association should have decided to come to Bilston. Ten years ago they could not have expected that such a body would have made Bilston the scene of one of their visits. But during the last seven years they had obtained claims to consideration, and to-day there were in the district one or two matters of considerable interest to such an association. Nothing was more important than water supply, and at Bilston they had an installation that was unique in its way. They had a satisfactory plant and a supply that was practically inexhaustible. They

Mr. R. A. HARPER, J.P.,
Chairman of the Council.

had to congratulate themselves on the arrangement they had been able to make with Wolverhampton a few years ago, for if the old arrangement had continued both Wolverhampton and Bilston might now be in a very uncomfortable position owing to scarcity of water. Bilston was only a Black Country town, but he thought that what would be seen that day would leave upon their minds the impression that Bilston was well supplied with water, though the town had a rateable value of only £64,000. There was another matter in regard to which they were entitled to credit, and that was the technical school, which was superior to anything in the country in proportion to population and rateable value, and was abundantly

Mr. J. W. SANKEY,
Chairman of the Water and Baths Committee.

appreciated in the town. Last year, which was the first session, there were 22,000 attendances, or 835 per week, at the classes, and the report of the examiners was most satisfactory. The school had started under the happiest auspices in the work of technical education in the district. He had read with great interest the excellent paper prepared by Mr. Wilson, their engineer and surveyor. In his paper he told them many things they did not know, among others that the name Bilston meant the "village of the snail." The sun would continue to shine upon Bilston if the inhabitants showed the same interest in the affairs of the town and if the work of the council was done as heartily and cordially as during the last few years. He was glad that Bilston had a claim upon the consideration of their visitors and that they had honoured the town with their presence.

Mr. J. T. EAYES (Past-President) now took the chair in the absence of the president, Mr. O. Claude Robson, who found it impossible to attend. They knew, the chairman remarked, that engineers and surveyors to large districts had many claims upon their time, and were often obliged to put away any personal matters of their own in order to carry out their public duties, and he was sure the members of the Bilston Council appreciated their self-denying efforts in that respect. He wished to point out that municipal engineers and surveyors derived great benefit from attending these meetings,

and he hoped the various councils would give them facilities for so doing. Bilston was different from a great many towns, being a purely industrial town and situated in the heart of the Black Country. It was a town in which great energy had been shown in sanitary matters, and in such towns that was much needed. Where the population of a town was entirely industrial, greater attention to sanitary matters was required than in more-favourably situated places, such as Cheltenham and Leamington. They were glad to be able to inspect the unique undertaking of the Bilston waterworks. He had resided in the district for a quarter of a century and remembered the difficulties with the Wolverhampton Corporation and the troubles in regard to the old connection. He was glad that they had surmounted these difficulties and had obtained a water supply sufficient for all future needs.

Mr. PICKERING then read the minutes of the Stafford and Rhyader meetings, and these were unanimously adopted. Letters of apology for absence were read from Mr. Pritchard, who is recovering from illness, from Messrs. Parker (Holford), Bradley (Wolverhampton), Lobley (Hanley), Cartwright (Bary), and others.

Mr. GREATorex (West Bromwich) proposed the resolution of Mr. Pickering as honorary district secretary for the Midlands, referring in eulogistic terms to the excellence of the arrangements in connection with the Stafford and Rhyader meetings, and also the meeting that day. Special reference was made to the fact of the paper being printed and circulated well in advance of the meeting and to the manner in which it was illustrated.

Mr. MARSTON (Sutton Coldfield) said that Mr. Pickering had fulfilled all the promises made on his behalf, and they could not do better than leave the work in his hands.

The CHAIRMAN expressed his personal gratification at the way in which Mr. Pickering had carried out his duties as honorary district secretary.

The motion having been unanimously adopted, Mr. PICKERING, who was received with cheers, thanked the members for the honour they had conferred upon him by electing him to the office, an honour that he greatly appreciated. It was at all times a pleasure to work on behalf of the Association. As in the past, so in the future; he would endeavour to make the meetings of the Association thoroughly successful.

This concluded the purely business part of the meeting, and, as arranged in the programme, the members at once entered the brakes that were in waiting at the Town Hall in order to proceed on the round of visits to various works, beginning with the Spring Vale furnaces. Of course, Mr. C. L. N. Wilson, water engineer and surveyor to the urban district council, had prepared a long and valuable paper on the municipal works of the district. As the paper had been sent several days before the meeting to those who had intimated their intention to be present, it was arranged that it should be taken as read. The paper, however, may appropriately be given at this point, before proceeding with our account of the visits and other functions. It was as follows:—

SEVEN YEARS IN A BLACK COUNTRY TOWN.

By C. L. N. WILSON, ASSOC. INST. C.E.,
Bilston.

[Mr. C. L. N. Wilson, A.M.I.C.E., &c., the water engineer and surveyor of Bilston, was born in Blackburn, and was educated at the Methodist Pleasant Wesleyan schools, at the Collegiate Grammar School, Salford, and at Owen's College, Manchester, where he came out third in the first class in civil engineering. In April, 1888, he passed the examination of the Association of Municipal and County Engineers and Surveyors. He served his articles under his father (Mr. John Wilson, then borough engineer of Baccup) and was assistant borough engineer there for over five years. In March, 1893, he won the first prize in an open competition under section 1, 1893 for the Baccup public baths, and he also acted as the surveyor, planter, sectioner and designer for the Baccup street sewerage scheme and outfall works. In March, 1894, he was appointed town surveyor of Bilston. He was one of the first to be selected to go to Jamaica, and he stayed there for 18 months. He was appointed town surveyor of George Town, Barbadoes, in 1895, and he acted as district engineer there. He was selected for Bilston, because he had done the best work there. While he has been in Bilston he has prepared plans for and carried out several streets improvements, the erection of public schools and offices in the new Baccup town, and the carrying out of the Baccup outfall, the Baccup new public baths, the Baccup new public baths, the Baccup new public baths, the Baccup new public baths, the Baccup new public baths, besides acting as resident engineer under Mr.

Baldwin Latham, M.R.C.E., &c. on the Bilston water scheme from 1893 to its completion at the end of 1897. He has at present in hand the extension of the cemetery, the division of the water area into districts for the detection of waste water, extension of the water mains, water-works manager's house, new stables, and numerous other works. Mr. Wilson is a captain of the 3rd V.B.S. Staffordshire Regiment, and a lieutenant in the Army Reserve of officers, a Freemason, and a member of the Oddfellows, Free Gardeners and Buffaloes Friendly Societies. Needless to say, his services are thoroughly appreciated by the council, who would probably be very loth to part with him.]

Bilston, Bilson, Bylston, Bylstone, Bileston and Bilsone, as it has been spelt at various times, but from whence it was derived has not been clearly ascertained. It has been supposed that it took its name from its stone quarries, so famous for grind-

BILSTON: INTERIOR OF THE MARKET

stones for edge tools, &c.; but this is certainly wrong, because it had its name years before its quarries were known. Dr. Oliver, a learned writer, tells us in his "History of Wolverhampton Collegiate Church" that Bilston is derived from "Bel," the principal male divinity of Ancient Britain, who was none other than Ilu, or the sun; the Apollo, in fact, of classical mythology, who was worshipped by the Druids, and in whose honour the midsummer-eve festival of "Bel-tan" was celebrated. Dr. Oliver does not give any evidence in support of his supposition, yet a little examination serves to confirm his opinion. In the first place, we have the name written by Sigere "Belstona," in which form the name of the god appears distinctly; in the second place, there are evidences extant of the existence of a Saxon temple founded by Oswy, King of Mercia, on the occasion of his victory over the army of Penda, King of Northumberland, at Bilston, dedicated to the "Sun," and afterwards given to the see of Lichfield. Bilston was situated in the very heart of the Druidical retreats, only 6 miles from Great Barr and Aldridge, the summer residence of the Arch Druid; and within $\frac{1}{2}$ miles of Beacon Hill, anciently called "Druid's Hill," on whose summit the Druids are traditionally believed to have offered up their sacrifices. There therefore seems no better etymology of Bilston than the Gaelic "Beal-tyran," the fire of Bel, Bael, or Bil, the great Gaelic god, the termination of the word "ton," or "ton," being an abbreviation of the Saxon word "tyran," a town or dwelling-place. Bilston, then, *fire*, becomes a name full of strange significance, calling up pictures of antiquity of absorbing interest, for it literally means the "Village of the Sun."

During the time of Alfred the Great a measure was passed for the dividing of the kingdom into counties, hundreds and tithings, and Bilston was one of these tithings. It is first mentioned in Lady Wulfrana's charter, which she granted to the church at Wolverhampton in the year A.D. 994 or 996. Bilston is also mentioned in Domesday-Book, and also the manor of Stowheath and the manor of Bradley. A curious coincidence is that at one time the manor of Bradley was held by the Lord of Wombourn, who derived his name and title from Wombourn, the district to which the council went to obtain a water supply for Bilston, and the site selected being a portion of a farm left to the living of St. Leonard's, Bilston. It is mentioned in Edward III.'s charter, and in those of Henry III. and IV., Henry VI., and so on.

Sir Richard Pype, who built a mansion near the present Pipe Hall Hotel, and who was born in Bilston and spent the

greater part of his time here, was elected a councillor for the ward of Bishopsgate, and in 1570 he was elected an alderman. In the year 1572 he became sheriff, and had the honour of representing the City before Elizabeth, when business or policy induced the city council to appeal to the Queen. In 1578 he became lord mayor of London, and it was during his term of office that a dispute arose respecting the boundaries of Aldgate and Bishopsgate wards, Sir Richard Pype being for his own ward of Bishopsgate and Sir Richard Rowland for Aldgate, the result being that Sir Richard Pype secured the houses for his own ward. And in recent times the late Bishop Fraser, if not born here, spent the greater portion of his youth here. Bilston is situated upon the Hollyhead to London main road, and the area is just over 1,845 acres.

This slight history of Bilston would not be complete unless reference was made to the cholera visitation of 1832, which was the most terrible and fateful event connected with the town. So near was this visitation to the town, that on March 8, 1832, a meeting of the inhabitants was held at the school-house, pursuant to public notice thereof given in the chapel on the Sunday previous by W. Salter, parish clerk, and by notices fixed to the gates of the chapels of St. Leonard's and St. Mary's on the same day, in the following words: "I hereby give notice that a meeting of the inhabitants will be held at the school-house on Thursday next, at 10 o'clock in the forenoon, to take into consideration the necessity of forming a board of health in this township, in consequence of the grievous disease with which it has pleased Almighty God to visit various parts of the kingdom."

At this meeting it was unanimously resolved:—

"That it appears to this meeting that the general health of the township is so good that there is no necessity for establishing a board of health, at least under the present circumstances.

"That the medical gentlemen of the township be requested to give the earliest information to the chairman of this meeting should the cholera unhappily present itself in this place or neighbourhood, and that he is hereby authorised and empowered to call a public meeting of the inhabitants by handbill immediately after the receipt of such information.

"That a copy of the above resolution be forwarded by the vestry clerk to each of the medical practitioners within the township.

"That the surveyors of the turnpike roads and highways, and all other public officers of the township, be earnestly requested to use their utmost endeavours to remove filth and all other nuisances which may come under their notice.

(Signed) Rev. W. LEIGH, Chairman."

"How history does repeat itself!"

On July 23rd the cholera attacked Tipton, and on August 3rd

BILSTON: THE PUBLIC BATHS.

reached Bilston, the first victim being a woman in Temple-street. On the 5th a meeting was held and a board of health appointed, subject to the approval of His Majesty's Privy Council, and on August 7th a letter confirming it was received; on the same day the board held its first meeting. To give all the particulars of the various meetings, &c., would be too long, and would also be outside the scope of this paper, but I purpose giving a few statistics in connection with the visitation.

In 1847 the cholera again visited Bilston, which retained its title of the "epidemic centre of the Midland coalfields," and in about the same time as in 1832 there were 730 deaths, but this time the lessons learnt at such a cost failed not in the object, and steps were immediately taken to improve the township.

The author offers no apology for giving these statistics, but hopes they may help some of his professional brethren to hurry up their connoils to improve their respective districts by carrying out all those things needful to make them sanitary, healthy and clean, and also to point out to any lagging authority the awful responsibility they incur, and the vast amount of suffering they entail upon innocent children, and adults also, by neglecting to carry out these necessary sanitary schemes.

IMPROVEMENT BILL.

In 1850 a Bill was presented to Parliament "for paving, lighting, cleansing and improving the township of Bilston; for improving the market for supplying the town with water, and for providing a cemetery." This Public Improvement Bill was one of the first, if not the first, Bill obtained in England, and, as is usual on these occasions, met with a great opposition, and at a town's meeting a poll was demanded. This was granted, and the poll opened on June 3rd, but on the same day the opposition was withdrawn, and the Bill in due time became law. Under this Act the improvement commissioners had a system of sewerage and sewage disposal scheme designed, but only for a portion of the district, at a cost of about £13,000. The outfall was into the river Tame, the system adopted being very rough precipitation—and it is very rough indeed; in fact, almost useless. So had was the effluent that it had to be taken out of the river Tame, and, by permission of the Birmingham Canal Navigation Company, it was turned into their canal, the commissioners having to pay for the dredging of the canal from time to time. But so bad has this effluent become that in the early part of this year notice was served upon the present council to discontinue putting the effluent into the canal, and the council have in hand a scheme for a main sewer and outfall works, at an estimated cost of about £26,000. The sewage here is a very peculiar one, containing a large percentage of iron salts, which varies greatly in quantity. A number of experiments have been and are being carried out, and the

BILSTON: THE BRIDGE OVER THE RIVER TAME.

author hopes to publish them in due course. Besides the £13,000 spent by the commissioners under their Act of 1850, about £7,000 has also been spent on sewers by their successors up to the present time.

MARKET.

On May 17, 1825, it was represented to Parliament that Bilston was one of the largest villages in England, having a population of nearly 14,000 souls, and yet it had no market in which they might sell their wares; and the petitioners humbly prayed that they might be permitted to hold a weekly market in a place appointed for that purpose, believing that it would conduce to the prosperity of the town. The Royal assent was accordingly given. This Act also empowered the

BILSTON: THE FOUNTAIN IN THE CEMETERY.

trustees to erect a town hall and other public offices, as soon as the receipts were sufficiently large to enable them to do so. Before the granting of this Act the market was held in Church-street, near to the old church. When the Improvement Act of 1850 was obtained power was taken to purchase the property of the market for £7,000. In 1890 this market was not considered suitable for its purpose, and the commissioners had designs got out for a new covered market, and in 1891 a contract was entered into for the walls and roof. After this was finished, for reasons which need not be stated here, the author was called upon to put in the floor, design the shops, stalls and fittings, and also to superintend the putting in of the electric light. This market was among the first, and the author is of opinion that it was the first, public market in England to be so lighted; it was opened on Tuesday, August 9, 1892. In 1893 the lighting, about which there had been great complaints, had to be reconsidered, and the author was then instructed to get out a scheme for improving the lighting, but to use the then existing plant as far as it would go. He therefore decided to use the Brush dynamo for the arc lamps alone, and to put down a new compound wound dynamo for the incandescent lighting, and this was accordingly done. Since then complaints have ceased. The cost of lighting the market-house in this manner works out at per unit 2 $\frac{1}{10}$ d. It was also decided not to use accumulators on account of cost, but to drive direct; the light has not failed once for over three years. The plant consists of two locomotive type boilers, to work at 90 lb. pressure; two Robey 37 indicated horse-power engines, working at 250 and 350 revolutions; and one 12 and one 15 unit dynamo at 110 volts, the dynamos being by the Brush Company and Paterson & Cooper respectively. There are 120 32 nominal candle-power, ten 16 nominal candle-power and two 100 nominal candle-power incandescent lamps and sixteen 10 ampere arc lamps 2,000 nominal candle-power, twelve Brush, two Brockie Pell and two Toyco. The dynamos were originally belt-driven, but it was found necessary to alter them, and they have for over three years been rope-driven, without any trouble whatever.

The site of the present market was purchased in the first place from the then lords of the manor, the Duke of Sutherland and the ancestors of W. G. Giffard, of Codsall. The old market was opened on July 26, 1825, and the last instalment of the £7,000 was paid off in 1884.

The new market is 300 ft. long and 65 ft. wide, the front being of best red bricks, with terra-cotta ornaments. The architects were Horton & Co., of Wednesbury, and the contractors Dorse & Co. After the completion of this work it was handed over to the author, who designed and carried out the work before mentioned, at a total cost of about £3,500. The floor is of granolithic, the vestibule floors being of marble mosaic; the stalls are 140 in number, comprising eleven butchers, eight fishmongers, twenty-six general shops and ninety-five general stalls; the woodwork is pitch and yellow

pine, the butchers' stalls are fitted with iron bars and sliding hooks; the fish stalls are constructed with white enamel brick fronts, marble slab tops, enamelled channel in centre, and fresh water is also laid on to each. Messrs. Morrell Brothers, of Bilston, were the contractors, and it may be mentioned that the extras on the author's portion of the work, £3,500, came to 4s. 6d.; the total cost of the market up to the present being close upon £10,000.

PUBLIC BATHS.

In 1853 public baths and wash-houses were erected at a cost of £2,700, but turned out a failure, and in 1870 they were offered to the commissioners, who bought them and put them into order at a total cost of £1,100. They continued to be used until 1890, when a new boiler was required, but the building was in a very bad state, and it was thought best to go in for a complete new building, and designs were got in for new baths at a cost of £7,000. This was more than the commissioners were prepared to spend. In the early part of 1892 the roof fell in, after which the author was instructed to prepare plans for enlarging the swimming bath, providing extra dressing-boxes, new boiler, engine and laundry plant. This was done, and in 1893 an inquiry was held by the Local Government Board for their sanction to a loan of £2,500 for this purpose. The loan was sanctioned, but nothing was done until 1895, when the costs of the alterations, instead of being £2,500, were £3,500. The alterations consisted of taking down the south wall and setting it back 6 ft., providing ten new pitch pine dressing-boxes, providing a new roof, relining swimming bath, providing twelve new slipper baths, a soap bath, new floors and new boiler, engines and dynamo, and laundry and electric light fittings complete. The roof over swimming bath is elliptical in shape, with wrought-iron principals, and so constructed that the bath can be used as a gymnasium if required; the glazing is Hleywood's patent. The whole building consists of one soap bath, one swimming bath, two ladies' and five gentlemen's first-class slipper baths; and four ladies' and thirteen gentlemen's second-class slipper baths, office, caretaker's-house, boiler-house, engine-room and laundry. The water is heated and circulated by means of a Bradford's patent calorifer; the boiler is a Cornish boiler, 18 ft. long and 5 ft. 6 in. diameter, flue 2 ft. 6 in. diameter, working pressure 60 lb. on the square inch; the laundry engine is a $\frac{1}{2}$ nominal horse-power vertical engine, 7-in. cylinder and 9-in. stroke. The laundry also contains a Bradford's A 7 vowel washing and wringing machine, one of Bradford's No. 22 wringing and mangling machines, and a drying closet, containing six drying horses, 5 ft. 6 in. by 1 ft. 3 in. The electric lighting plant consists of a Robey 50 indicated horse-power inverted cylinder engine, running at 300 revolutions, one 18-unit dynamo at 110 volts, by the Electric Construction Company, to the author's specification, and is, like the dynamos at the market, rope-driven; there are sixty 32 nominal candle-power, eighty-seven 16 nominal candle-power and two 100

BILSTON: THE TECHNICAL SCHOOL.

nominal candle-power lamps; this plant also drives the sixty-five 16 nominal candle-power lamps in the town hall; no accumulators are used, the plant being driven direct. The cost per unit for this installation is 1/15d, and there has not been the slightest trouble with it from the day it started. The whole of the oil from the engines and dynamos is collected and passed through Turner's patent oil filters, and re-used time after time. These filters do their work very well indeed, and without any trouble; valvoline oil is used, and it does not seem to suffer from being filtered in this way. Messrs. Merrell Brothers were the contractors for the

whole of the work, the engineering being done by Messrs Bradford & Co., of Salford, and the electric light installation by the Universal Electric Light Co., of Liverpool. The total cost of the alterations was £3,500, of which the engineering cost £1,000 and the electric lighting £2,500.

CEMETERY.

The cemetery was opened in 1855, the area being 9 acres 2 roods and 23 poles. The chapels are built with best blue bricks, with Bath stone dressings, the style being Gothic; the total cost was £5,000. It is about to be extended. It contains a rustic fountain and a Bath stone monument to the

BILSTON: THE MUSEUM AT THE TECHNICAL SCHOOL.

memory of the late John Etheridge, who gave away with his own hands 10,000 Bibles, 41,000 prayer books, 15,000 Testaments and 100,000 religious tracts, and was followed to the grave by 15,000 people of all grades; but I am sorry to say that the monument is in a very bad state of repair.

TOWN HALL.

The town hall is a stone building in the Italian style of architecture, and was erected in 1871 and enlarged in 1880. It contains the usual public offices, council chamber and committee-rooms, a large assembly hall, a news-room, a free library and a reference library, both of which are well stocked with books. The architect was the late Mr. Bidlaker, and the total cost was £7,500.

NEW ROADS.

During the past seven years the council have, under the author's supervision and with their own workmen, cut two new roads and erected two bridges, at a cost of about £5,000. The main road (a portion of the Great Holyhead to London main road) is beautifully planted with trees, and there are very few towns with a better approach than the one coming into Bilston from Wolverhampton; there is a straight length of over half a mile, planted with trees on each side. Last year the Willenhall-road and one or two smaller streets were also planted, and I think it is the intention to plant more this year.

The tramways are owned by the Wolverhampton Tramways Company, and run from Moxley through Wolverhampton to Tettenhall, with a junction from Wolverhampton to Willenhall.

TECHNICAL SCHOOL.

The technical school is a large building situated on the Willenhall-road. It is built of bricks, the front being Doulton's best red bricks, with Doulton's terra-cotta quoins, pilasters, jambs, heads, &c., the rest of the building being common red bricks. The building is Italian in style. It contains engineering and metal-working room, 54 ft. by 20 ft., fitted with gas engine, lathe, drilling machine, four smiths' hearths, &c.; a wood-working-room, 30 ft. by 20 ft.; a cooking-room, 20 ft. by 24 ft., fitted with a good range, a cottager's range and a gas stove, sink, &c.; a large modelling and casting-room, 30 ft. by 30 ft.; elementary art-room, 30 ft. by 20 ft.; antique-room, 24 ft. by 20 ft.; advanced drawing-room, 24 ft. by 20 ft., and a masters' room, 12 ft. by 16 ft.; three classrooms, each 20 ft. by 20 ft.; ladies' and gentlemen's cloak-rooms; a large examination hall, 40 ft. by 20 ft., with a stained-glass window; a chemical laboratory, 30 ft. by 24 ft., fitted with three double benches for thirty-six students, gas and water being laid on for each student, and also a down-draught chamber, five fume chambers, two chemical cupboards and stands, sinks, &c.; a chemical balance-room, 8 ft. by 24 ft.; master's preparation-room, 10 ft. by 24 ft., fitted with desk, working table, waggon, sink and fume chambers; and a chemical lecture-room, with a master's working table, with gas and water laid on to each end, two mercury trays, down-draught extractors, and a large water tank with plate-glass front for experimental purposes, sliding black-boards,

fume chambers, diagram frames and lantern sheet, the room being 20 ft. by 30 ft.

A museum, 45 ft. by 15 ft., is also provided; and a large entrance hall, containing a piece of sculpture from the Shrewsbury collection, of Raphaelle (gazing at a picture of the Transfiguration), by Ceccarini, and a secretary's office. The museum is filled with a large number of curios, &c., collected by Mr. James Dangerfield during his travels round the world; and in the entrance hall and examination hall are a number of valuable oil paintings, given or loaned by Messrs. Phoenix, Kelly, Sankey & Kirkland. The building is heated on the low-pressure system, by means of radiators, and is lighted by gas. The building was erected from the author's designs and under his supervision, the contractors being, for the building, Mr. Thomas Tildesley, amount £5,087, the extras being £10 0s. 8d.; the heating by C. D. Harris, at a cost of £363 15s.; the chemical laboratory fittings, by the Midland Educational Company, at a cost of £418 5s. 4d. The whole of the fittings in the chemical department were designed by the author. In this respect Bilston can show the whole of Great Britain a noble example. The total cost of the buildings and fittings is equal to about one-seventh of the total rateable value of the township, and yet it was built by public subscriptions, and grants from the Staffordshire County Council and the South Kensington authorities, without putting a penny on the town rates. It was not too much to say that Mr. J. W. Sankey, the chairman of the Water and Baths Committee, is entitled to all the credit of this undertaking; and, to show how much the people value it, it is only necessary to state that during the last session, out of a population of about 25,000, there was an average weekly attendance of over 800 students.

FOUNTAINS.

There are three drinking fountains in the town, given by the late John Mason, and last year another one was erected by public subscription, in memory of the late Walter Hughes, who for a great number of years was nuisance inspector, and died August, 1896. This latter also forms a horse drinking-trough, with small basins for dogs, &c. In this respect the author thinks Bilston stands alone—i.e., that a town official received a public memorial.

LIGHTING.

There are 400 lamps in the district, and the total cost of street lighting for the year 1897 was £1,041 17s. 1d.

	£	s.	d.

* This has since been reduced to 2s. 6d. per 1,000 cubic feet.

The gasworks belong to the Bilston Gas Light and Coke Company.

MAIN AND TOWN ROADS.

There are about 5½ miles of main roads, and the traffic is very heavy. They cost in 1897 £1,070 2s. 8d. for repairs, including about £200 for footpaths, or the sum of £230 18s. 8d. per mile per annum. The town roads repairable by the council are about 22 miles in length, and cost for the year ended March 31, 1897, £2,537 17s. 1d., or £115 7s. 2d. per mile per annum. The price of materials used in the repair of the roads is:—

- 10-in. by 5-in. by 2½-in. plain blue paving bricks, being 50s. per 1,000 delivered.
- Rowley rag,* 3½-in., hand broken, 7s. 6d. per ton.
- Hopton wood edging, 10 in. by 5 in., 2s. 1d. per lineal yard, dressed.
- Lancashire (Leo quarries) edging, 10 in. by 6 in., 2s. 7d. per lineal yard, dressed.
- Lancashire (Leo quarries), channels, 10 in. by 6 in., 2s. 8d. per lineal yard, dressed and machine faced.
- Lancashire (Leo quarries), 12 in. by 8 in., bull-nose-1, machined faced and dressed, 4s. 1d. per lineal yard.
- Lancashire (Leo quarries), ditto circular, 5s. 8d. per lineal yard.
- Lancashire (Leo quarries), 12 in. by 6 in., channels, 3s. per lineal yard.
- Sand, 3s. 6d. per ton delivered.
- Hopton wood setts, 6 in. by 4 in., 18s. 6d. per ton.
- Rowley rag setts, 6 in. by 4 in., 17s. 6d. per ton.

BILSTON: THE KEY USED AT THE OPENING OF THE TECHNICAL SCHOOL.

The bulk of the town roads are coated and repaired with broken slag, which costs from 1s. 6d. to 2s. 6d. per yard cube. OFFICE STAFF, &c.

The whole of the work in the water engineer and surveyor's department is carried out by the author, with the aid of a pupil.

The rateable value of Bilston for 1897 was £64,778, the

* The author has found it better to buy Rowley rag in the lump and have it broken in the council's yard by their own workmen. Lancashire flagging, 3 in. thick, costs 6s. 6d. per square yard, including foundation and dressing, and Nelson & Co.'s patent granolithic flagging, about the same.

poor rate for 1897 was 3s. in the £1, and the improvement rate for the same was 3s. 9d. in the £1. Below is a summary

We regret that, owing to the pressure of other matter on our space this week, we are compelled to hold over the balance of our report, including the continuation of Mr. Wilson's paper. This portion of the paper deals exclusively with the waterworks and will be given next week, together with the rest of our report and additional plans and other illustrations.

HOUSING OF THE WORKING CLASSES AT NOTTINGHAM.

In connection with a scheme for making a new thoroughfare at Nottingham, involving in its course the utilisation of the site of an old coal, an important point has arisen as to the conditions under which the corporation should be required to erect dwelling-houses for the accommodation of those who might be dispossessed of their previously existing tenements. The matter has on several occasions engaged the attention of the corporation, it being suggested that the municipal authorities should be allowed to put up the vacant land by auction, with a view to it being leased for a period of ninety-nine years, under conditions as to the erection of buildings which would be in accordance with the requirements of the Local Government Board. The latter authority declined to allow the arrangement, directing that the corporation should themselves undertake the work of erecting the dwellings. Recently a deputation waited, by appointment, upon Mr. Adrian, one of the assistant secretaries of the Local Government Board, and urged reasons in favour of the course originally suggested by the corporation. They pointed out that in the interests of the municipality the best purpose would be served by the land being leased, as proposed. The interview was of a prolonged character, and Mr. Adrian promised that the whole matter should be carefully reviewed, and an answer given in due course.

The British Association.

SOME PAPERS ON ELECTRICAL WORK.

Last week we pointed out that, of the papers read at the recent meeting of the British Association at Bristol, those which came within our scope were practically, though not exclusively, confined to the Mechanical Science section, and the Economic Science and Statistics section. With the proceedings of the latter section we have already dealt. In the former section some interesting papers on electrical subjects were given, and abstracts of these will, no doubt, be welcome to our readers.

TRANSMISSION OF POWER BY ELECTRICITY.

Mr. ALEXANDER SIEMENS read an extremely valuable paper on "The Transmission of Power by Electricity." The greatest achievement, he remarked, of the century which now approached its close was the intimate connection which had been established between science and practice, the effects of which were noticeable in every feature of modern civilisation, and in none more so than in electrical engineering. Among the solution of problems the transmission of power promised to become one of the most important. He reviewed the developments of science in this direction. In the case of the transmission of power there were three factors common to all systems which determined the cost of the motive power at the place where it was utilised, and thereby indicated what was the proper system to use. The first factor was the source of the energy to be used. The second was the means of transmitting; and the third the apparatus for utilising the energy. With their present experience there was no need to dwell on the advantages of electric traction in the streets of towns and suburbs, and there was little doubt that in the near future horse and steam tramways would disappear everywhere. The great success on tramways had naturally led to attempts to move trains on the railways by means of electric locomotives on all existing railways by electric motors, as the feasibility of such changes depended ultimately only on economical considerations. The changes might be technically possible, but an alteration could only be produced if a saving of expense was thereby effected. In spite of one or two drawbacks, electric transmission of power was applicable in a great many cases on account of the unquestionable superiority of the means of distributing electricity over the means of dealing with any other form of energy. The ease with which the current could be carried over a long distance, the certainty with which the losses could be determined beforehand, and the flexibility of the conductors, constituted advantages which no other system presented, while the inevitable loss of the double conversion, added to the losses in the conductor, militated against the application of electricity in cases where the source of power and the apparatus for utilising the same could be brought close together. He described the installation of electric plant at the works of Siemens Brothers & Co., at Charlton, and entered into figures, with a view to indicating the total cost of motive power during the year 1897—viz., £9,900, or 2d. per Board of Trade unit, and 171d. per brake-horse-power per hour exerted by the motors. It was not pretended that these results were the best obtainable. They might, however, be utilised for drawing some general conclusions which applied to transmission of power by electricity generally. An obvious solution of the problem how to obtain cheap fuel was evidently to erect the plant for generating electricity close to a coal mine, and to distribute power to the various works which were usually found in the neighbourhood. Such an installation had been erected at Brakpan, in the Transvaal, and he gave a description of the plant. In the month of July, 1895, the works at Brakpan were commenced, and on January 27, 1897, the first dynamo commenced working. Since then the works had been steadily added to, but the data as to cost could obviously not be taken as a guide for other cases, as the regular working of the full plant had not yet settled down properly. A somewhat similar system of distributing power over a district had been in operation near Waldenburg, in Silesia, for the last two years. It was characteristic for this country that these examples of transmission of power by electricity over a large district had to be taken from foreign practice. However enterprising and progressive the individual Englishman was, when a novelty could be introduced only by the co-operation of a municipality, of a county council, or, worst of all, of Parliament, everybody appeared to consider it a patriotic duty to throw obstacles in its way, and in most cases it was quite impossible to find out who benefitted by such action. After awhile the public discovered that the introduction of the novelty would be a great convenience, and an agitation was set on foot to remove the obstacles, which were, in many cases, introduced only to satisfy prejudices.

ELECTRIC MOTORS AND SMALL INDUSTRIES.

Mr. ALFRED H. GIBBINGS, M.I.E.E., president of the Municipal Electrical Association, city electrical engineer, Bradford, read an important paper on "The Application of the Electric Motor to Small Industrial Purposes and its Effects on Trade and on the Community generally." He remarked that the

electric motor was rapidly becoming the most favoured medium for the transmission of energy for all industrial operations, whether on a large or small scale. This was due to the paramount advantages it possessed over any other method of utilising potential energy. These advantages were well known to electrical engineers, but indifferently appreciated by a large number of mechanical engineers, and almost unknown by the general manufacturer and tradesman. The paper went on to consider the reason why the application of the electric motor up to the present time had been confined to a few special trades and manufactures. The

PRINCIPAL OBSTACLES

to its adoption were: (1) The extreme aversion to innovations which characterised the industrial world, in this country especially. (2) The existence of other motors in good working condition. (3) The unsuitability of alternating currents of electricity for motors where the power required exceeded 2 horse-power or 3 horse-power. (4) The want of capital to lay out in new machinery. And (5) the want of confidence in the electric motor by the non-technical manufacturer. The chief obstacle to the more rapid adoption of electric motive power, especially in the case of small tradesmen, throughout the country was undoubtedly the want of capital to purchase the necessary motor; but where the power to purchase existed the buyer would probably have little or no experience or knowledge of electrical matters to guide him in his purchase; if his means were at all limited he would be tempted to venture on a cheap line and become the dupe of those who simply made to sell. The solution of these difficulties was that the owners of electricity supply undertakings, whether a public company, municipality or other local authority, should themselves purchase good, reliable motors and let them out on hire. Antecedently this scheme might appear a sort of parental régime, but it was suited to present circumstances, at any rate, and experience proved it to work well. Unfortunately, all local authorities had not got powers to borrow money for this purpose, although it appeared from the Electric Lighting and Public Health Acts that borrowing powers might be granted by the Local Government Board for works of a permanent nature. Electric motors did not yet come within that category, although gas stores did, a legal decision having been given in their case. All future municipal Parliamentary Bills should therefore contain clauses which would confer such powers and secure freedom of action in this respect. He did not propose to run into elaborate details, but he might say that in Bradford they had found a rental charge of 10 per cent. upon the initial cost of each motor to be amply sufficient. That was made up of 3 per cent. for interest, 3 per cent. for sinking fund, and 4 per cent. for depreciation and contingent expenses. After giving some further details of the Bradford scheme, Mr. Gibbings gave the accompanying interesting table, which had been compiled from replies to an inquiry which he had recently made of each municipal electrical engineer where the continuous current system had been adopted. From it might be gathered

THE EXTENT

to which electric motors driven from electric lighting mains had been employed. The figures given are up to the end of 1897. The table was as follows:—

Town.	Population.	Number of Motors Supplied.	Total Horse-Power of Motors.
Aberdeen	140,000	14	65
Bradford	231,260	119	470
Brighton	122,310	100	Not given
Belfast	320,000	Not given	165
Birkenhead	110,030	4	15
Bury	63,000	5	12
Blackpool	40,000	7	7
Burnley	90,000	8	32
Chester	37,100	20	70
Dewsbury	29,847	4	16½
Dundee	169,000	15	20
Edinburgh	295,000	167	343
Glasgow	750,000	37	131
Hull	213,000	14	46
Lancaster	38,224	28	80
Liverpool	641,063	57	152
Manchester	505,368	257	696
Norwich	101,000	61	120
Nottingham	213,877	18	50
Oldham	148,000	11	60
Southampton	90,000	18	23
Shoreditch	124,000	31	434
Sanderland	147,000	23	240
Wolverhampton	92,000	2	3
Whitehaven	20,000	—	—
Walsall	72,000	7	13½

In closing his paper the author referred to the beneficial effects of the motor upon the trade and productions of the country, and the hygienic and social effect on the community

generally. The effect of hiring-out was mutually advantageous, and its natural tendency was to create fresh demands; in fact, the municipality which included this scheme in its electric light undertakings offered a great inducement to the influx and establishment of new industries within its area. With a more complete return to a municipality of industrial operations there might also revive some neglected trades—such as those which had passed from us to other countries, and which now formed our imports. From an hygienic point of view the electric motor was far and away the best; it was cleanly in its working, gave off no deleterious gases, and displaced the boiler and smoky chimney. One of the ultimate results must also be the raising of the status of the working part of the community. By becoming his own master the artisan gained self-respect, became more resourceful, and therefore a more important member of society; and the more intelligent interest which he would display in his business must appreciably affect the general welfare of the country.

ELECTRIC POWER ON THE THREE-PHASE SYSTEM.

Mr. W. GIEFEL read an interesting paper on "Electric Power and its Application on the Three-Phase System to the Bristol Wagon and Carriage Works." The author remarked that while there had been several papers read in this country before engineering societies on the application of electric power in works, yet this subject did not appear to have been brought prominently before the members of the British Association. The author's main object was to localise the causes of the present enormous waste of coal in the case of our important workshops and factories, and to discuss how this might best be obviated by the use of electricity. Other objects which he had in view, however, were the attainment of the maximum output of machine tools, which could only be obtained by driving the tools at a steady maximum speed and the greatest economy in labour, and otherwise in producing the driving power. The advantages and economy obtained by substituting electric power in works using scattered engines were probably more distinct than in the case of works using a single large engine. One of those works alone would use as much energy as was demanded by an average provincial town for its electric lighting. The Bristol Wagon and Carriage Works, for example, used 710,000 horse-power hours per annum, that was the equivalent of over 400,000 Board of Trade units of electric energy, and was considerably more than last year's electricity supply in such towns as Aberdeen, Belfast, Cardiff or Dover. The directions in which improvement might be looked for were chiefly the following: Saving of coal, saving of water and stores, saving of labour and attention, reduction of loss in shafting and gearing, increased output owing to steady speed of machinery, and facility of extending by adding extra motors. The author gave details under these heads, and proceeded to a consideration of the application of electricity to the Bristol Wagon and Carriage Works, and various tests which had been made at the works. Full consideration was given to the merits and demerits of the direct-current and three-phase systems, and the directors of the Bristol Wagon Works took the opportunity of seeing both systems in practical work under conditions analogous to those in their own works. The first cost of the two systems was approximately the same, but several advantages of the three-phase system appealed to the Bristol Wagon Works—namely, (1) The absence of commutators on both the generator and motors, and the fact that the current passed direct through clamped terminals from the generator to the motors. (2) The more mechanical design and construction of the generator and motors, the windings of the latter being entirely enclosed by the iron frame of the machine, protecting them from accidental damage. (3) The fact that the three-phase motors could be left running for long periods without any attention, even when considerably overloaded, which was not advisable in the case of the direct-current motors. (4) The freedom from possibility of breakdown as compared with the direct-current system.

DISCUSSION.

The three papers summarised above were discussed together.

Prof. SILVANUS THOMPSON observed that he must seriously differ from Mr. Siemens in his statement that in most cases the distributions of continuous currents were perfect. Prof. Thompson also complained of the one-sided set of figures submitted by Mr. Gibbins, who had actually suppressed all the data on the other side. It astonished him, after what he had seen in other countries, and particularly in Switzerland, which was ten years ahead of England in this matter, that electrical engineers should stick to the old idea of the continuous-current instead of adopting more freely the modern alternate-current motors. There was one fact of special interest to Leicester and Bristol, where the boot and shoe industry still flourished. A Swiss boot factory four years ago struggled for existence, but having got rid of its steam machinery and adopted the alternate-current system it could now compete successfully with Bristol and Leicester.

Mr. PARKER, with many years of experience at Wolverhampton, spoke in favour of the continuous method, and claimed for it superiority over the alternate system.

Mr. BAILEY joined with Prof. Thompson in his condemna-

tion of British firms in refusing to favour the three-phase and alternate system.

Mr. W. H. PREECE said the General Post Office was a great user of motive power, and all its new buildings in the provincial centres were fully equipped with motors, which were used for almost all kinds of work. These were found not only economical as regarded cost, &c., but as regarded human labour. With regard to the adoption of electric traction on the inner circle of the Metropolitan Railway, he might say that the directors had decided to go most thoroughly into this matter. They would not be prejudiced by any single system or manufacture, but would give to each every possible opportunity to lay their individual schemes before them, and, whether the three-phased or continued current, the best in their consideration would be adopted. In Bristol there had been a great question as to whether the current should be supplied to the tramways company from the city mains, or whether the tramways company should supply from their own works their own current. Unfortunately, the tramways company and their interests were too powerful, and they succeeded in inducing the local authority to agree that they should erect their own works. If the company could have come to terms with the Bristol authorities to supply the energy at the same price which the company could have done it for themselves, then the corporation would have been enabled to reduce the price of the power 1d. per unit, which was one of the most economical questions which local authorities could take into consideration, because it meant that the ratepayers and the users of the electric light would benefit by the introduction of motive power.

BRISTOL ELECTRIC LIGHTING.

Mr. H. FARADAY PROCTOR, A.M.I.C.E., M.I.E.E., city electrical engineer, Bristol, submitted a practical paper, giving an outline of the electric lighting undertaking at Bristol, and the results of the working of some of the auxiliary plant. The author described the generating station, boilers, engines and dynamos, switch-houses, cables, and he also gave the results of trials made with sundry of the auxiliary plant. The conclusions arrived at were: (1) The motor feed-pump would work with from 27 per cent. of the steam consumption of the steam pump; (2) the output of a motor pump should be controlled by regulating the speed of the pump, the employment of by-pass cocks resulting in the loss of much energy; (3) with a motor driver feed-pump, where the motor runs at 580 revolutions per minute and the pump at 45, an efficiency of 67 per cent. could be obtained.

Mr. PARKER, in the course of some discussion, said that, seeing the enormous loss by steam, he looked forward to the time when they would see electrically-driven pumps more in use. The information given by Mr. Proctor was the first data which had been supplied to the section on the subject, and would be very valuable.

Mr. W. H. PREECE mentioned that the electric light station at Bristol was five years old, and there were now 51,700 lamps affixed to the system. In addition to that, the price, which was originally 6d., had been reduced to 5d., and at the same time the price of gas had been forced down by the introduction of the electric light from 2s. 10d. to 2s. 2d. During the five years of the existence of the station there had never been one breakdown. There had been occasional breakdowns at dinner parties, when fuses went, but as regarded the central station not a single mishap had occurred, which was a great credit to Mr. Proctor.

OVERHEAD ELECTRIC WIRES.

Prof. SILVANUS THOMPSON submitted and discussed the details of his method, in association with Mr. Miles Walker, of electric traction by surface contact, with the object of getting rid of overhead wires. Prof. Thompson also detailed other systems to effect the same purpose. The subject was illustrated by diagrams thrown on the screen. At the close of the paper a brief discussion ensued, and the author was thanked.

STANDARDS OF PURITY FOR SEWAGE EFFLUENTS.

In one or two isolated cases papers of some interest to our readers were read in other sections. In the Chemistry section, for example, Dr. S. RIDEAL made a communication on "Standards of Purity for Sewage Effluents." For some time it had occurred to him and others that they had been in difficulty as to recording or interpreting the results of examining sewage and water. Various figures had been put forward by different authorities as standards, and he thought there was a consensus of opinion that these standards should be done away with and others substituted. All existing standards were liable to give erroneous conclusions, inasmuch as the purity of an effluent depended upon the ratio of the amount of organic matter which had been oxidised and the amount left. Thus it was found that in most cases a considerable quantity of the organic matter disappeared in the form of nitrogen gas; and this loss could be expressed in the form of a ratio to the amount of chlorine or salt which remained in such a liquid and was not so dissipated. Secondly, with regard to the organic matter left, that similarly could be expressed in the form of a ratio showing the amount of matter which had undergone oxidation, and the amount which had not. Lastly, he drew attention to the fact that when standards have been put forward no attention has been paid to the volume of the river into which the effluents were

to be discharged. This was a most important factor. He therefore suggested a formula which gave the relation between the quality of an effluent and the volume of the river.

Mr. DOUGLAS ARCHIBALD, in the course of the discussion that followed, expressed the hope that the Royal Commission which had been appointed would adopt some such formula as those suggested for effluents discharged into rivers. If anything like a definite way of measuring the standard could be adopted it would be of great use.

Mr. F. W. STODDART remarked that what was wanted in ideal sewage treatment was an effluent of constant quality, to which no possible objection could be taken. He was interested in a system, of which he was not at liberty to give a full description, which did produce an effluent of this character; and he hoped to see it very generally adopted. The effluent contained practically no saline ammonia, the quantity being .025 per gallon, the oxygen absorbed in four hours being '3.

Mr. ARCHIBALD admitted that this was a very high standard of purity, much higher than any of the river boards required.

Mr. STODDART: But we have proved it to be attainable.

CORROSION OF GAS AND WATER PIPES.

In the course of the proceedings in the Mathematical and Physical Science section

Prof. FLEMING called attention to the electrolytic corrosion of gas and water pipes by the earth currents from electric railways and tramways. He stated that in the case of street railways with an uninsulated return circuit no amount of bonding of the rails would entirely prevent earth currents, which might be gathered by gas or water pipes. The danger of corrosion of such pipes would generally be greatest when they extended for some distance parallel with the rails, and the current must pass from the pipe into the surrounding soil. In rapidity of destruction a new clean pipe might possibly succumb even sooner than an old one protected by a dense coating of oxide, but when actual perforation of the pipe did not occur there might be an ageing action that shortened its life.

Prof. S. P. THOMPSON pointed out that by the use of alternating currents all disturbances could be entirely obliterated, whether magnetic or electrolytic. Even with continuous currents, if the third rail were on or below ground and between the other two, the trouble from both magnetic and chemical effect was very slight. He contended that they were fighting a phantom.

Prof. RUCKER objected to the statement of Prof. Thompson. Whatever be the future arrangements of electric tramway systems, they had in the past to fight against actual proposals of electrical engineers and to legislate against threatened dangers.

This concludes our notes of the papers and discussions at the recent meeting, with the exception of the paper contributed by Messrs. Dibdin and Thudichum, which, as will be seen, we are dealing with separately. Sir John Wolfe Barry's address as president of the Mechanical Science section was excellent in many ways, but as we are pressed for space, and as the paper had very little reference to municipal work, we have not reproduced it either in whole or in part.

ROTHERHAM GASWORKS EXTENSIONS.

OPENING CEREMONY.

On the 12th inst. an interesting opening ceremony took place in connection with the extensions of the gasworks of the Rotherham Corporation. The works have been erected on an old fair ground, and the road leading thereto has been enclosed for the purpose. The new inclined retort-house is fitted with all the latest improvements for the automatic handling of coal and for the economical consumption of coke in the furnaces where the coal is handled for carbonising processes. Upon the coal being tipped up by the carters in the shed it is passed through a crusher, which crushes the coal into suitable size for passing through other apparatus. After crushing the coal is lifted by buckets upon an endless chain worked by a gas engine. From the elevator, which is 60 ft. high, the coal is conveyed to the bunkers, each of which is capable of holding about 40 tons, and from thence dropped through shoots into the retorts. The coke used for heating the retorts is about 10 per cent. of the coke used for heating in the old system the quantity ranged from 25 to 30 per cent., thus throwing the remainder upon the market for sale, and becoming a means of considerable saving to the corporation. The labour on the inclined retorts is unskilled, any man being able to work the system without previous training, and for the same quantity of coal carbonised one man will be able to do the work of nine under the old system, and the whole charging of the retorts is done in about a quarter of the time. The cost of the retort-house as at present completed ranges up to £14,000, but the retort-house is only half-filled. There are six benches of nine retorts each bench, and the contracts have been let for the setting of six more benches of nine retorts each bench, which will double the present capacity of

the works. The production of gas in the new retort-house will then be 1,300,000 cubic feet, and with the old retorts the total capacity of the works will be 3,000,000 of cubic feet of gas per day. The contractors for the work have been Messrs. Chadwick & Co., Rotherham, and for the ironwork and retort settings, Messrs. R. & J. Dempster, Manchester. Mr. G. Winstanley, of Coventry, is the consulting engineer, and Mr. F. A. Winstanley the resident engineer of the corporation gasworks.

SANITATION NEAR MARGATE.

THE CONDITIONS OF VILLAGE LIFE.

A Press representative, who has been inquiring into a serious outbreak of typhoid which has broken out in Garlinge, a village contiguous to Margate and Westgate-on-Sea, and only 3 miles from Ramsgate, has obtained some rather startling information. The enteric fever, he learns, has extended into some neighbouring villages, where investigation has revealed a condition of things which, at the close of the nineteenth century, is simply astounding. Garlinge is stated to contain some 300 inhabitants, who for the greater part are composed of the labouring classes, and mainly work in Ramsgate and Margate.

A gentleman living near the infected village described to the Press representative the sanitary, or rather insanitary, arrangements of the place. The village, he said, was absolutely undrained. All the slop water, &c., was thrown down a sink, which drained into a cesspool. These cesspools were emptied every ten or twelve years, when they got full. He estimated that it would cost £8,000 or £10,000 to drain the place; and the people were too poor to pay it. An addition of 1d. in the £1, he said, would not produce more than £5 per annum. In conclusion, he said: "Do not mention my name, or they would set fire to my house." Subsequently the pressman visited several of the fever-stricken cottages in Crow Hill. In one of these lay a patient who could not be moved because the hospital was full. There was only one small room downstairs, 6 ft. 6 in. in height, and a pantry and two bedrooms. There were no means of ventilation except through the door, and although the place was very clean and tidy, the odour was not agreeable. The slops and foul water had to go down a "sink" close to the door in the back-yard, which flows into a cesspool common to three cottages.

The gravity of the situation has become more acute in consequence of the hospital being full, as there are no other means of isolation. Up to the 9th inst. there had been fifteen cases of typhoid fever and three deaths, and two fresh cases were reported on Sunday. The district council are adopting active measures to check the progress of the disease. Under the advice of the medical officer disinfectants are being liberally distributed, and an extra staff of men has been engaged to remove the dry ash-pails with regularity every morning. The council have decided to build a new infectious diseases hospital, at a cost of £30,000, on a site near the present hospital, which is insufficient to meet the requirements of the times.

The question of sewerage Westgate-on-Sea has been the subject of discussion for several years, and now the council have bowed to the pressure brought to bear by the rate-payers, and a scheme of drainage will be carried out at a cost of £15,000. The work will be commenced early next month, and will be completed by the end of March. The council are also going to drain Birchington. There seems no fault to be found with the water supply. Dr. Robinson has prepared a report on the outbreak, which will be submitted to an early meeting of the district council, and then forwarded to the Local Government Board, who will, no doubt, send down one of the medical inspectors to confer with the local authorities as to the best means of checking the epidemic.

STRATFORD'S POLLUTED RIVER.

An inquiry, on behalf of the Local Government Board, was held on Wednesday into complaints lodged by the inhabitants of Stratford regarding the polluted state of the Channelsea river, which communicates with the Lea. It was alleged that an outbreak of diphtheria had resulted in Stratford from this pollution, which was caused by the system of sewage disposal. A week ago the Channelsea was almost dried up.

Mr. CORNELL, for the Lea River Conservators, said they were anxious to establish a system of drainage which would run from Hertford to the outfall, a distance of 27 miles, and a conference with the local authorities would be held next month.

Mr. GRAY, M.P. for West Ham, said the local authorities were squabbling, and the Local Government Board ought to decide which is responsible for the purity of the Channelsea, as that river is of the greatest importance to Stratford.

Mr. ANGLE, borough engineer, West Ham, stated that his corporation were spending £50,000 to open up connection between West Ham sewage works and the metropolitan sewers.

The inspector, before closing his inquiry, stated that he would inspect the area complained of.

Conditions Necessary for the Successful Purification of Sewage by Bacteria.

By W. J. DIBDIN, F.L.C., F.C.S., &c., and GEORGE THUDICHUM, F.R.S., &c.*

INTRODUCTION.

HISTORY OF BACTERIAL PROCESSES.

The recognition of the fact that the natural destruction of waste organic material is effected solely through the agency of living organisms is quite modern. Although casually observed or referred to by various authors, the first and practical attempt to apply such knowledge was in 1884, when the late Metropolitan Board of Works, on the initiative of its scientific advisers, resolved to adopt a system of sewage purification which would produce an effluent readily assimilable by oxidising microbes; and also recognised and acted upon the principle that sterilising or destruction of the germs was wrong, and that on the contrary they should be encouraged. This led to the chloride of lime versus manganate controversy, which lasted until 1887, when a return to attempted sterilising proved finally disastrous and the upholders of the microbe theory were vindicated. The contention of the latter, which was actually the first step taken towards solving the problems indicated in the title of this paper, was that for the purposes of deodorising sewage an agent should be employed which would oxidise and destroy the putrescent matters which gave rise to nuisance, but should itself be destroyed in so doing, in order that no antiseptic element should be introduced which could interfere with the action of the oxidising bacteria. In a report made by one of the authors to the Metropolitan Board of Works in January, 1887, and in a paper read before the Institution of Civil Engineers in the same month, this proposition was clearly laid down, and remains now the basis of all bacterial treatment.

The next great step in advance was made by the authorities of the State of Massachusetts, under whose directions elaborate experiments were carried out at Lawrence. This result was to demonstrate absolutely that, given certain specified conditions, practically the whole of the organic matters of sewage could be removed by microbial action in artificial filters. The conclusion arrived at has been quoted, but is of such importance historically that it may well be mentioned here. The mechanical separation of any part of the sewage by straining through sand is but an accident, which under some conditions favourably modifies the result; but the essential conditions are very slow motions of very thin films of liquid over the surface of particles having spaces between them sufficient to allow air to be continually in contact with the films of liquid. With these conditions it is essential that certain bacteria should be present to aid in the process of nitrification. These, we have found, come in the sewage at all times of the year, and the conditions just mentioned appear to be most favourable for their efficient action, and at the same time most destructive to them and to all kinds of bacteria that are in the sewage. The work done at the Lawrence station, however, although of the greatest possible importance from a theoretical point of view, failed to indicate the conditions necessary for the practical application of the knowledge which had been gained, the quantity of sewage (60,000 gallons per diem) which could be treated on an acre of filter-bed being so small that the cost of an installation was quite prohibitive. Acting on the advice of one of the authors, the Main Drainage Committee of the London County Council instituted a series of experiments at the outfall works at Barking creek; and the result, which is now too well known to be gone into in detail, was to demonstrate the practicability of purifying large quantities of sewage effluent on an area of filter, which would make the adoption of the method possible from the economic point of view. The consideration of various data in connection with these experiments led to the belief that the crude sewage itself might be similarly treated, and experiments in this direction soon showed that such a belief was well founded.

In the meantime others had not been idle. Mr. Cameron, the city surveyor of Exeter, had been elaborating his ideas with regard to the preliminary treatment of crude sewage by means of anaerobic organisms, and had successfully demonstrated the possibility of such use being applied practically. Lowcock, also in this country, had been trying to purify sewage effluents by means of air forced by artificial means into a filter through which the effluent was constantly running; and Waring, in America, was perfecting a method whereby the solid residue retained in a filter, after the passage of a quantity of crude sewage, was oxidised by bacterial agency, aeration being obtained by a blast of air. Colonel Ducat also devised a filter in which the constant aeration was supposed to be kept up by natural means consequent on the method of construction. Others have also experimented, chiefly in the direction of ascertaining the most suitable material for filling the filter-beds, the general method followed being that laid down as a result of the work at Barking creek.

* A paper read in Section G (Mechanical Science) of the British Association.

GENERAL CONDITIONS.

Speaking generally, the following are the points which the authors have found to be most noteworthy of the conditions which must be observed to ensure success—viz.,—

- (1) Air supply, or its absence in the case of the septic tank.
- (2) Temperature.
- (3) Admission or exclusion of light.
- (4) Reaction to test paper of the sewage to be purified.
- (5) Time of contact.
- (6) Nature of bed material.
- (7) Depth of bed.

(1) AIR SUPPLY.

This question must be considered from two distinct points of view, according to the method of preliminary purification to be adopted. In either case the final treatment is the same. Acting in the presence of a free supply of atmospheric oxygen, the aerobic organisms present in a bacterial filter-bed are able to liquefy, break down and oxidise the solid organic matters suspended in sewage, without such decomposition being accompanied by any of the ordinary phenomena of putrefaction. To such an extent is this action carried under favourable circumstances, that within two hours an effluent is produced which contains considerable quantities of nitric acid, 0.5 grains of nitric nitrogen, and in which nitrification is afterwards continued at an extremely rapid rate. In order to attain these results the bed which receives the crude sewage must be kept very open, the interstices being large. In practice the bed material, whether burnt ballast, coke or stone, has been found most efficacious when of a size varying from $\frac{1}{4}$ in. diameter at the smallest to 4 in. or 5 in. at the largest. Smaller material than that which is rejected by a sieve having a mesh of $\frac{1}{4}$ in. square does not leave the bed sufficiently open, not only because the air has not free admission, but also because the solid particles held in suspension in the sewage are unable to work their way into the body of the bed.

This necessity for full aeration has been recognised by all who have attempted to utilise the aerobic organisms. In Colonel Ducat's filter it is intended to gain the object sought for by building the containing walls of drain pipes, in order that air shall have free access from all sides. Lowcock proposes to arrive at the same condition by pumping air into the body of the filter-bed, allowing the same effluent, which in his case is alone employed, to pass continuously. Waring, in America, runs crude sewage through the filter until the latter is fully charged with sludge, which is then oxidised and destroyed by forcing a current of air through it. In the method adopted at Sutton the object is attained by emptying the bed completely after each charge, when, as the water leaves the air necessarily enters.

In all these cases it is clear that a free air supply enters largely into the success of the operations; in the case of the anaerobic processes the conditions are not so plain. The septic tank, as worked at Belloisle, Exeter, is covered in with brickwork and cement; yet, on the authority of Dr. Sims Woodhead, the aerobic organisms increase during the passage of the sewage through the tank in a greater proportion than the anaerobic, a fact which would tend to show that air is not absolutely excluded. The same anaerobic action may also be effected in tanks which are open to the air, or even in a flowing river, as was the case with the Thames in 1884-87, when the foul condition of the water was undoubtedly due to the action of organisms working with an insufficient air supply. It is therefore a question whether sewage, if left to itself, without artificial aids or protection of any kind, will not always effect the first stage of its purification with the aid of anaerobic, or, at all events, of mixed organisms; whilst if the aerobic action is to preponderate some artificial assistance must be given. Regarding the greater desirability of the one method as compared with the other, the authors are not prepared at present to express an opinion; experience alone can solve this question. The fact remains that both systems effect the result aimed at.

(2) TEMPERATURE.

The greater number of micro-organisms can only flourish within a very small thermometric range—namely, from about 50 deg. Fahr. to 100 deg. Fahr. Some there are which can exercise their life functions at the temperature at which water freezes, whilst others can exist when the thermometer registers as high as 150 deg. Fahr., and are killed at relatively high temperatures. The bulk, however, flourish at the degree of warmth first indicated. It will be seen at once how important this factor is, in view of the fact that artificial warming of a sewage purification plant is practically impossible, owing to the great expense involved. The effect of the seasons upon the process going on in a bacteria-bed or a septic tank forms a most interesting study. The experiments made by the Massachusetts authorities first showed

that organic matter was stored in the filter-bed in the winter months and destroyed by nitrification, as the atmospheric temperature increased with the coming spring. The authors have shown how, in the case of the septic tank, the amount of free ammonia is increased in cold weather, owing to the inability of the organisms to carry the process further; whilst in summer, in spite of the destruction of the suspended organic impurities, the free ammonia is reduced in quantity.

The problem of keeping the temperature of the beds well above the freezing point is partly solved by the sewage itself being in the winter time considerably warmer than the external air. The action taking place in the body of the bacteria-bed will also tend in the right direction. A further point, at all events so far as the Sutton system is concerned, is the short time during which the sewage must be submitted to bacterial influences. Since the whole process occupies only some three or four hours in each bed, there is no time for such a bulk of sewage to cool down appreciably. Effluent from the septic tank at Exeter, entering the bacteria-beds at a temperature of 47.3 deg. Fahr. on an average, escaped at 45 deg. Fahr. This was in the earlier part of April, 1897, the weather being very cold, with frequent snowstorms. Judging from the experience gained in the Massachusetts trials, and at Barking, Sutton and Exeter, it does not appear that there is danger of the temperature of bacteria-beds in this country falling to a point sufficiently low to destroy the vitality of the organisms. Thus in the case of Massachusetts, although there was ice over the surface of the filters during a considerable period, yet a good effluent was constantly produced. The chief effect observed was the non-production of nitric acid, which, however, was again formed when the warm weather returned, the nitrogenous matters having remained in great part stored in the filter. At Barking, during the severe frost of February, 1895, similar results were obtained, the filter continuing its work, although for six weeks it was covered with a sheet of ice.

In this connection it may be well to point out a danger that may arise from too careful distribution of the sewage over the surface of a bed. In such a case the incoming sewage itself may be frozen and fail to penetrate the bed at all, as was actually the case with an experimental filter on another plan at Sutton, even during the extremely mild winter of 1897-98.

(3) LIGHT.

The following series of experiments will prove interesting, as showing that the organisms chiefly concerned in the aerobic purification of sewage seem to be unaffected by conditions of light or darkness. Two vessels were taken, of similar shape and size, and fitted with broken glass as a bed material; the one was left bare and fully exposed to the light, whilst the other was covered all over with black light-proof paper and fitted with a cap of similar material. Both being used as bacteria-beds, all the conditions except the exclusion of light being precisely the same, the following were the results:—

No. of Filling.	Light.		Dark.		Oxygen absorbed in Four Hours.
	Free.	Albuminoid.	Free.	Albuminoid.	
25	—	—	0.82	—	0.76
29	—	—	0.71	—	0.60
33	—	—	1.03	—	1.08
37	1.64	0.06	0.65	1.47	0.05 0.55
41	1.23	0.056	—	1.23	0.056 —
58	1.47	0.056	0.91	1.47	0.056 0.91
62	1.68	0.07	1.24	1.89	0.08 1.24
66	1.68	0.07	0.75	1.68	0.06 0.75
70	1.47	0.06	0.76	1.39	0.06 0.76
Average	1.53	0.062	0.86	1.52	0.06 0.83

It will be seen that equally good results were obtained by either method.

(4) REACTION.

The most favourable condition of the sewage for bacterial activity is that of very slight alkalinity, a condition which occurs naturally in ordinary domestic sewage. Occasional variations, even though relatively large, appear to exert but little prejudicial influence, but a continuance of excess of either acid or alkali will put a bacteria bed out of action for a time. Sewage containing the highly acid liquor obtained from the preliminary treatment of iron for galvanising will yield to a very considerable extent to bacterial influences; but if its use be continuous the purification effected becomes gradually less, and the bed requires a prolonged period of rest. Very alkaline effluents, such as those produced by the use of lime in excessive quantities, are very liable to patrefy instead of becoming purified by oxidising organisms. The oxidation of iron is, of course, effected by direct combination with the oxygen of the atmosphere, the bacteria playing but a small part, if any, in this process. In the case of the dilution of either acid or alkaline sewage a considerable number of reactions are brought into play, with the result of more or less neutralising the deleterious action of the original crude liquor, and thus rendering it more susceptible to bacterial influences.

(5) TIME OF CONTACT.

This point constitutes the main difference between the

system now known as the "Sutton" and the former method of intermittent downward filtration. It was found necessary for the sewage to be subjected to the action of microbes under proper conditions for a certain period of time. If this were not allowed the purification was incomplete; when it was greatly exceeded the aeration and consequent recuperation of the bed was affected disadvantageously. For this reason the bacteria-beds are locked, and the sewage kept in them for a period of about two hours; the effluent being then allowed to escape, the organic matter held in the bed is vigorously attacked by the organisms under the most favourable circumstances of combined dampness and air supply, and the bed is thus prepared for a further charge. The necessity for the locking has been proved by numerous experiments, from which also the most suitable time limit has been arrived at.

The work done during the empty period can be well demonstrated by taking samples of the drainings at intervals, and estimating the amount of oxygen absorbed from permanganate and the quantity of nitric acid present. It will be found that the former factor steadily diminishes whilst the latter increases. For example, five minutes after opening the valve the following results were obtained:—

Albuminoid ammonia	0.100
Oxygen absorbed in four hours	0.280
Nitrogen as nitrites	0.224
Nitrogen as nitrates	0.290

One hour after practically empty:—

Albuminoid ammonia	0.070
Oxygen absorbed in four hours	0.112
Nitrogen as nitrites	0.326
Nitrogen as nitrates	0.499

The falling of the oxygen absorbed figure is well shown in the following table:—

Oxygen absorbed from Permanganate in four hours by Samples taken at various periods during Filter Discharge at Belleisle, Exeter.

(6) NATURE OF BED MATERIAL.

Many experiments have been made with a view to ascertaining the best material with which to construct bacteria-beds. It is clear that in many cases the local conditions would render the use of one or other special substance very advantageous from the point of view of original cost of installation; burnt ballast when the land is clay, broken slate in some districts, gravel in others, and so forth. The general experience of the authors is that coarsely-broken coke or burnt ballast indifferently may be used for the first treatment by "coarse grain beds;" whilst for "fine grain beds" the best material is undoubtedly coke, or pan breeze or cinder. This was first indicated at Barking Creek in 1892, where the degree of purification effected by various substances was as follows:—

Burnt ballast	43.3 per cent.
Sand	46.6 "
Pea ballast	52.3 "
Coke (pan) breeze	62.2 "

At Sutton in 1894 the following degrees of purification were indicated:—

Sand	36.5 per cent.
Coke breeze	41.5 "
and in April, 1895:—	
Sand	62.1 per cent.
Coke breeze	74.1 "

The average purification effected by the 1-acre bed at Barking Creek was 75 per cent. to 80 per cent.

The authors have recently made a special series of experiments with coke, coal and glass, with a view to ascertaining not only the purification effected by each, but also the water capacity of the beds, this being a matter of great importance as determining the area of bed required to deal with a given volume of sewage. The three beds were similar in shape and size, and the materials were riddled through the same mesh, the sewage effluent placed on them being also the same for all three at each charging. From the following table it will be seen that the results obtained from the use of coke breeze were greatly superior to those produced by coal or glass:—

70	0.630	0.970	0.760
Mean	0.660	1.060	1.090

Figures represent grains per gallon.

Taking the impurity in the coke breeze effluent as unity, the following ratios are arrived at—

Free ammonia	...	1.00	1.55	1.75
Albuminoid ammonia	...	1.00	1.72	2.06
Oxygen absorbed	...	1.00	1.60	1.65

In this series the superiority of the coke breeze is plainly demonstrated, every possible care having been taken to ensure exactly similar conditions for all three beds.

The experiments regarding water capacity also placed coke first, the positions of glass and coal, however, being reversed from those shown in the table of quality. After many measurements, extending over seventy-two fillings of each bed, the water capacities were found to be as follows:—

Coke	...	40.4	per cent. of total cubic contents.
Glass	...	39.0	"
Coal	...	29.9	"

In these experiments, therefore, the coke did not only produce a better result, but with the same total volume of bed purified more sewage, as follows:—

Sewage purified by coke being taken at 100; then sewage purified by glass equals 96; and sewage purified by coal equals 74.1

Put into other words, 4 acres of coal filter of a given depth would be required to treat the sewage which could be dealt with by 3 acres of coke breeze of the same depth.

Experiments on a larger scale have been tried, using as materials for coarse grain beds broken granite, chalk and slate.

In each case considerable purification was effected, but the results did not compare favourably with those obtained from burnt ballast. The main object, however, the removal and destruction of the sludge, was accomplished, and the purification could be satisfactorily completed by the fine bed.

Having regard to these various results, it is evident that the question of efficiency of a material resolves itself into the character of its surface; thus coal, &c., presents a minimum surface per unit acre, whilst coke may be taken as affording a maximum surface for the same area.

(7) DEPTH OF BED.

With regard to this point it is difficult to speak with any certainty. Experience of working on a large scale has led

the authors to believe that the maximum limit of depth for the best results to be obtained is about 3 ft. to 3 ft. 6 in. Beds have worked well at a depth of 4 ft. to 5 ft. but the alteration of a bed from 3 ft. 6 in. to 5 ft. was accompanied by some reduction in the quality of the effluent produced. On the other hand, a laboratory experiment with a bed 1.5 ft. in depth appears to show that such increase is an advantage, samples drawn at each foot down exhibit a steadily-increasing degree of purification.

Oxygen Absorbed in Four Hours.

Figures are grains per gallon. Abbreviations: T, Trace; HT, heavy trace; ST, slight trace.

In this special matter of depth, however, it is difficult to produce in a laboratory conditions comparable with those obtaining outside, owing to the necessarily small diameter of the bed, and the therefore abnormally large proportion of side to body of filter. It may be, therefore, that the experiment, if repeated on working lines, would yield a very different result. The above table is put forward to show what was obtained, but must not at present be taken as expressing the authors' views on the matter.

THE NATIONAL REGISTRATION OF PLUMBERS.

MEETING IN MANCHESTER.

Mr. Lees Knowles, M.P., who has charge of the Plumbers' Registration Bill in the House of Commons, speaking on Monday, at Manchester, on the occasion of the distribution of prizes by the Lord Mayor of Manchester, in connection with the competition and exhibition of plumbers' work in April last, held under the auspices of the council for Manchester and district for the National Registration of Plumbers, said that all parties in the House were committed to the principle of the Bill, the main object of which was to afford additional safeguards to the public health by enabling persons employing plumbers to select, when they desired to do so, those who had given evidence of their qualification for plumbers' work. There were some opponents to the Bill, but when it was explained that it was not in any way intended to create a monopoly they withdrew their opposition. The Bill conferred, as it were, a degree upon plumbers, and what they wanted was that this degree of registered plumbers should be recognised by the law. They had numerous illustrations of registration. Solicitors were registered in 1843, chemists in 1852, the general medical council in 1858, dentists in 1878, and veterinary surgeons in 1881, and he could not help but think that this subject was worthy of consideration. He was speaking without experience. He had steered five Bills through the House, and he advised them to get representative meetings such as that. What they should do was to submit a representation to the Government, and say that a Bill for the registration of plumbers was not merely an advantage for them but for the country. He was asked to take up the Bill in 1891, and in 1892 a select committee was appointed. A blue-book was published, and valuable information could be got from it.

Glasgow.—At a meeting of the Telephone Committee of the corporation, held on Thursday, a letter was presented from the Postmaster-General, in reply to the city's renewed application for a corporation telephone license, stating that the Government had under their serious consideration the report of the Select Committee on Municipal Telephones, and that it was unnecessary meantime to receive any deputation from the corporation. The committee instructed a reply to this communication to the effect that, as the time was very near when notice would require to be given for powers for the corporation to work the telephone system, it was highly desirable that the Postmaster-General should at once give Glasgow a license or assurance that a license will be given.—Recent minutes of the Parks Committee contained a reference to the anonymous offer of a gift of £12,000 towards the erection of new public halls for the Springburn and Cowcarr district and a winter garden in the Springburn Park.

Some Annual Municipal Engineering Records.

STOCKPORT : KENSINGTON : GLOUCESTER.

Judging from the report of the borough surveyor (Mr. John Atkinson), the past municipal year at Stockport has again been an extremely busy one. The report, which covers some eighty pages, contains much information of an interesting character. It is, as usual, exceedingly well arranged. At present the population of Southport stands at 81,000, the number of inhabited houses being about 18,006; the rateable value is £234,150. The borough has an area of 2,200 acres, the number of people to the acre being estimated at 36·8; in 1897 the death rate was 21·6 per 1,000. The average rateable value per head of the population is £3 10s. 1d. Parks and other open spaces extend over 62 acres. There are now 1,907 lamps erected and kept lighted within the borough, thirty-six having been added this year. As 54 miles of public highways and about 12 miles of streets and roads are provided for, the average distance apart throughout the entire borough is about 62 yards. Within recent years, however, the lamps have been placed at an average distance of 40 yards. The cost per lamp fixed averages about £4 10s. The Gas Committee charge £2 15s. 3d. per lamp per annum for lighting, cleaning and maintenance. An inquiry, it may be mentioned, was held on April 1, 1897, and another on May 4th of the same year, by an inspector of the Local Government Board into an application for sanction to borrow £124,882 for sewage, street, gas and public building purposes.

The highways account for the year exceeded £24,215, the work of this department, including an expenditure of £13,394 on private works, totalling over £37,600. Public highways—that is to say, those repairable by the inhabitants at large—had at the time of the publishing of the report a length of over 56½ miles. As private streets have an extent of nearly 21 miles, the length of roads in the borough is thus about 77½ miles.

Under the heading of "private street works" we find that forty streets, having been completed, have been declared highways and transferred to the Sanitary Committee for cleansing and scavenging. Their length is 2½ miles. Thirty-six streets and passages, having a length of about 2 miles, have also been completed, measured off, and the cost (less asphalt paving) apportioned upon the property owners. The average cost per lineal yard of frontage to owners amounts to about 42s., but as the value of grouting paving with boiling pitch is defrayed by the corporation, the total per yard of frontage equals 45s. 6d., and the full value of the works executed amounts to £10,827, after adding £946, the cost of asphalt paving. The average cost per lineal yard of frontage for paving, &c., passages 9ft. wide amounts to about 11s. 3d.

The materials generally used on the footpaths are fine machine-faced Haslingden flags and 5-in. edgings, and on the carriageways best Haslingden setts racked with limestone chippings and grouted with boiling pitch. At the end of the year under review there were nineteen streets and passages in progress, their total length being slightly over 5 furlongs. On carriageways the pavements are principally composed of Lancashire and Derbyshire grit setts, while Welsh and Dalbeattie granite are laid in places on the important thoroughfares and main roads. The macadamised roads of the borough are of comparatively small extent; they, however, measure over 6 miles. There are only some small sections of boulder paving on public highways, altogether amounting to about 6,926 yards in length and 8,651 superficial yards in area.

The principle of assisting the ventilation of the sewage system of the town (originally designed to be supplied with fresh air through surface gradings only) by the erection of tall shaft ventilators at the upper extremities of the various sewers has been continued, and the absence of complaint as to sewer gas rising into the atmosphere at the surface of the streets, or other places in the districts already provided with shafts, is quoted as evidence that the provision of the latter is of considerable benefit. The shafts, when the report was issued, numbered eighty-one, while the total number of flushing tanks was eight. The tanks are not used in rainy seasons.

A scheme of subsidiary sewerage has, according to the report, been occupying the attention of the borough surveyor, and plans and sections have been prepared for the reversion of the drainage from the river of the properties lying between the new intercepting sewers and the river. These subsidiary sewers have become necessary owing to the great depths at which the new intercepting sewer has had to be laid.

From the last annual report of Mr. William Weaver, the surveyor to the Vestry of Kensington, we find that the total length of sewers cleaned during the year by manual labour was 34 miles 559 yards. In addition to the brick sewers cleaned as aforesaid, 1½ miles of pipe sewers were flushed with water. The cost of water used for this purpose amounted to £124. The contract for jobbing drain work was retained by Messrs. B. Nowell & Co. on similar terms as in the preceding year—viz., 5 per cent. above a schedule of prices. During the year 143 drains under public roads were laid by this firm, at a cost of £626.

The vestry made the following rule as regards the testing of soil pipes and ventilating pipes: "Builders and others when constructing house drains shall test the soil pipes and ventilating pipes with smoke, in the presence of the vestry's surveyor or other authorised representative, before such drains are passed as sound." In carrying out this rule considerable difficulty was in many cases encountered in getting builders to supply the required smoke-testing rockets. Upon this difficulty being reported to the Works Committee it was ordered that the matter should be left in Mr. Weaver's hands to deal with. Mr. Weaver subsequently gave instructions for smoke-rockets to be supplied at the vestry's expense where required, and this instruction has been acted on for the past five months.

Five new streets, of a total length of 430 yards, were made up during the year, while masons' and paviors' jobbing work, costing £1,597, was also executed. Further work of the latter description, costing £5,835, was carried out under contract. The roads in the charge of the vestry now total 85½ miles, and the following materials were used on their maintenance during the year: Granite, 8,661 yards; flint, 3,021 yards; and gravel, 673 yards. The granite was supplied by Messrs. A. & F. Manuelle, 101 Ladenall-street; Mr. C. M. Manuelle, 12 Lime-street, E.C.; and the Kensington Board of Guardians; the flints by Messrs. Eastwood & Co., Belvedere-road, Lambeth, and the gravel by Messrs. W. & J. Studds, Iver, Bucks. Some 4,215 trenches, representing 11,571 superficial yards of surface, were opened by the gas and water companies and the postal authorities. These were afterwards made good, and the expenses (£1,633) charged to the various bodies.

During the past municipal year the expenditure of the General Purposes Committee of the Gloucester County Council on manual and team labour, bridges, footpaths, stocks and stores, the central offices, steam rollers and other matters, has, according to the ninth annual report of the chairman of the committee, amounted to over £68,320. This, however, was considerably under the sum allowed for in the estimate of Mr. Robert Phillips, the county surveyor. Superintendence has cost the following percentage on the total outlay: Central offices, 90 per cent.; salaries of clerks and surveyors 2 61 per cent., and county surveyor's salary (including buildings and bridges) 87 per cent. The council have now fourteen steam rollers, but have had to hire four others for short periods. For the urban road maintenance during the year (including contributions) the sum of £10,205 has been paid, together with a sum of £732 towards pavements, improvements and interest on loans.

Owing to the extension of the Bristol City boundaries, the Urban Districts of St. George and Stapleton, and part of the Urban District of Horfield, have been transferred from the county to the city. The committee have to report that there are now four authorities that do not contract. Failing agreement with these, arbitration must ensue, as provided by the Local Government Act. In the urban districts there is a marked tendency to increased expenditure; in some cases, it is considered, this is justified by an increasing population and increasing rateable value, in others this justification cannot be pleaded, and in such districts the expenditure requires to be very carefully scrutinised.

Two bridges have been rebuilt during the year—one at Preston, near Ledbury, and the other at Ampney Crocus, near Cirencester. On rural main roads £4,504 has been expended, while a sum of £732 has been contributed towards improvements and footways on urban roads.

Accompanying the committee's report, we may mention, is the county surveyor's estimate of the main roads expenditure for the forthcoming year. Last year's estimates and actual expenditure are also shown.

St. Andrews.—At a recent special meeting of the burgh commissioners consideration was given to the report of Messrs. Belfrage & Carfrae, Edinburgh, with reference to the proposed additions to the water supply. They state that the dry-weather flow of the present sources is 150,000 gallons daily over and above the storage capacity of the reservoir, which is 33,250,000 gallons. They recommend that an additional reservoir, in connection with the present supply in the glen to the west of North Lambielethan, be constructed to hold 10,000,000 gallons. The engineers further recommend that the water from the catchment area of Kinaldy burn should be utilised. The dry-weather flow of this stream is 160,000 gallons daily, and they suggest the construction of a reservoir capable of holding 35,000,000 gallons. The estimated cost of the extension of the present scheme is £3,000, and of the new scheme £15,000, exclusive of compensation, way-leave, &c. The meeting called to consider the question met in committee, and after a long discussion resolved to appoint a committee to confer with Mr. Purvis, Kinaldy.

CREMATION OF SEWAGE.

In view of its highly interesting nature, we are reprinting a second communication, signed "Non-Pollution," received by *The Times* as a result of the Archdeacon of Gloucester's letter, published in our issue of the 9th inst. on this subject. "Non-Pollution" writes:—

Your correspondent, Archdeacon T. W. Sheringham, Canon of Gloucester, calls attention to the failure of our present methods of sewage disposal in England and the scandalous pollution of our rivers and sea coast, and pleads for "the erection of huge furnaces at the outfalls of our drains" and the cremation of sewage. No one who travels in England can fail to agree with Archdeacon Sheringham as to the disgraceful state of things at present, or withhold sympathy with him in his desire to render the rivers and sewage farms more pure and less offensive. But the improvement of these matters is not a simple problem, but one calling for much study and special knowledge, as will at once be apparent from a consideration of the circumstances under which the existing conditions of our rivers and sewage farms have grown up. So far back as 1875, when the Public Health Act of that year was passed, the disposal of the sewage of our towns was sufficiently important to call for legislative action, and in the following year the Rivers Pollution Prevention Act of 1876 was passed, under which Act no one, neither a sanitary authority dealing with the sewage of a district nor a private manufacturer dealing with the trade waste of his business, was allowed to discharge any polluting matter into a stream unless he could show that he was using the "best-known and available means of rendering such polluting matter harmless." Here we find an authoritative admission of the difficulty to be overcome, and a loophole of escape for an offender which has naturally been made the most of during the past twenty odd years. But the Government of that day, recognising how real were the difficulties to be overcome, appointed a special committee to investigate the subject and assist with advice, which they did in a report issued in 1881. In that report, the commission having ascertained the very great intricacy of the problem and the insufficiency of our scientific knowledge at that time to deal satisfactorily with it, declined to fix any definite standard of purity which should be legally considered unpolluting, and uncertainty and considerable variability on that point exists to this day. The only practical result arrived at by that commission was that no treatment of sewage by chemical precipitation and filtration was good enough to give an effluent sufficiently pure to be discharged into a stream, but that the safest method of purifying sewage was to irrigate land with it, trusting to the nitrifying action of the micro-organisms in the soil to dispose of the nitrogenous organic putrescible matter in the sewage. This rather vague and uncertain finding of that commission has formed the basis of what may now be considered as the law in England—*viz.*, that all sewage shall be treated on land before it can be allowed to flow into a stream; hence the universality of the sewage farm. At the time this ruling of the special commission was published the action of the bacteria in different soils had not been carefully or sufficiently studied. It had not been considered how slow this action is under natural conditions at different seasons of the year, even in suitable soils, and how practically useless such treatment is on many soils.

The elements of failure by land treatment are too numerous and too important ever to make this method a safe and satisfactory process of sewage disposal. The unsuitability of the soil, the great difficulty of proper and even distribution of the sewage, the fall of the temperature below 37 deg. Fahr., when bacterial action is practically suspended, all these are elements of failure which are more than sufficient to account for the state of our sewage farms, which, as Archdeacon Sheringham points out, are in most cases "a miserable subterfuge." Though the sewage farm, in ninety-nine cases out of 100, may be admitted to be a failure, we see there was some good reason for its adoption, and in principle it is sound. Can as much be said for Archdeacon Sheringham's suggestion of huge furnaces in which to cremate liquid sewage, and is such treatment likely to effect the object sought for—*viz.*, the purification of our rivers? Anyone who has had experience of the evaporation of sewage, or even the burning of dry-pressed sewage sludge, knows what fearful offence is caused. Such works can be felt for half a mile at least. The nuisance could, no doubt, be minimised by the construction of lofty chimneys and the use of chemical ingredients as suggested, and the introduction of scientific and costly destructors, but will not the great cost of such treatment prevent its being used or enforced.

To hang a man for sheep-stealing is not the readiest way to put an end to the stealing of sheep, but would in these days only make it impossible to get a conviction; and, in the same way, to make the cost of sewage purification practically prohibitive would make it impossible to put pressure on an offender.

The difficulty of enforcing the law would seem to be great enough now, when our large cities, like Manchester, Salford, Leeds, Bradford and others, are allowed to continue to pollute because the sums of money involved in purification are so great and the influence brought to bear to avoid such heavy

outlay is so powerful. I fear the only effect of Archdeacon Sheringham's suggestion would be that, while the water of our rivers and the land of our sewage farms remained polluted much as at present, we should in addition foul our air as well.

To put a stop to the scandalous pollution of our rivers is perfectly feasible, and to do this at such a trifling cost as shall afford no excuse for non-performance of their duty on the part of any sanitary authority, or the non-enforcement of the law on the part of any county council or river authority, is also within easy reach and it is to be hoped that the Royal Commission now sitting to consider this very important subject will, in the light of the knowledge of to-day, give a more certain sound than could be obtained in 1881. The principle laid down by the commission in 1881 was correct. Sewage can practically only be purified by means of micro-organisms as proved and designed by Nature; but to suppose that men may convert millions of gallons of pure water, stored and collected for the use of crowded communities, into foul sewage, and then, on whatever land may be within reach, reconvert this into pure water again, is to expect too much. The requirements of civilised man have created certain artificial conditions which can only be met by corresponding artificial treatment, but the law of nature need not be transgressed or departed from. In the working of Nature it will be found that the purification of sewage on land is effected only in the upper few inches of the soil, where air in the necessary quantities can penetrate, and that the land itself must be open and porous, and under such conditions the area of land required must be large and the distribution of the sewage on it must be regular and even.

Now, if an artificial filter be prepared in which the interstices in the filtering medium be sufficiently open to allow a free passage of air, and the sides of the filter be made porous, so that air can enter throughout the entire depth of the filter, we have the same condition as Nature works with, only the operation, instead of being confined to the top few inches, can be continued through a depth of many feet, thus enabling the area of treatment to be greatly curtailed, whereby accurate distribution of the sewage can be effected at little expense, artificially warmed air can be supplied in winter and all the conditions of nature can be complied with.

The operation of such an aerated bacterial filter as above described has been tested for a considerable time at the sewage farm at Hendon on the Brent, within an hour's drive of London, and should be seen by all those interested in the non-pollution of our rivers.*

EAST-END WATER SUPPLY.

There has as yet been no rain to speak of, so that the East London Company's reservoirs are still in a state of depletion. The cooler weather, however, has brought sensible relief to the inhabitants of the waterless district, and connection has at last been made with the Southwark and Vauxhall system. Not a few people maintain that it might have been made long ago, while others maintain the contrary.

Full flow of water through the 20-in. pipes in the Tower Subway is now giving at least an additional 10,000,000 gallons per day to the thirsty East-Enders. Connection with the Southwark and Vauxhall system is made in Bernersley-street, and with the East London mains in Leman-street, Whitechapel, Dock-street and Hooper-square. There existing pipes are 12 in. and 9 in., but Leman street is partly "up," and the new main is being laid on to Osborne-street, where it will join another 20-in. pipe. Distribution is at present going on through Whitechapel, Bethnal Green, Shoreditch, Limehouse, and low-lying districts where the pressure from the other side should be sufficient to send water up to the highest stores. The East London Company, thus relieved, should be able to give somewhat improved service to the higher localities.

AN UNSAFE BUILDING IN WESTMINSTER.

The London County Council, acting on the advice of their building surveyor, on Wednesday condemned the Abbey Mansions, which have frontages to Victoria-street and Orchard-street, Westminster, as unsafe and dangerous to the public. Five months ago, it will be remembered, the concrete roof of the building fell and brought all the flooring with it. Seven workmen were killed and about twenty were more or less seriously injured. Since then workmen have been engaged putting on a new roof and shoring up the cracked tiers of bay windows and walls. On Wednesday it was found that the foundations were giving way, hence the condemnation. All vehicular traffic from Victoria station to Westminster was immediately diverted, as the authorities feared that the vibration might cause the collapse of the building. A cordon of policemen was placed round it, and later in the evening pedestrians were not allowed to approach the building. The street is east 29, 1881.

* The article on this subject in the issue of the 16th inst. will be found on page 385, and a further account of the same in the issue of the 23rd inst. on page 399.

Municipal Work in Progress and Projected.

The most important news received this week respecting extensive municipal works in progress or projected in the provinces will be found in the paragraphs relating to Turro, Bradford, Bursley, Colchester, Heywood, King's Lynn, Scarborough, Stockport, Walthamstow and Bath. Among the metropolitan authorities, Camberwell, St. Pancras, Newington and Shoreditch are all contemplating more or less extensive undertakings.

METROPOLITAN AUTHORITIES. VESTRIES AND DISTRICT BOARDS.

Bermondsey.—The vestry, on Monday, considered a lengthy report of the Electric Lighting Committee in regard to the vestry's electric lighting provisional order, the Bill to confirm which was read a third time in the House of Commons last session, and was read once in the House of Lords. Owing to a sessional order of the latter House the Bill could not be read a second time, and all attempts made by the Board of Trade to induce Lord Morley, chairman of committees, to move for the suspension of the order were unsuccessful. It was also sought to get the Bill suspended, so that it might be allowed to proceed next session at the same stage as it stood in the last, as in the case of the General Power Distributing Company's Bill, but Lord Morley said that that course was impossible, and had only been done in that case because the Bill had been referred to a joint committee of both Houses. As a result, should the vestry desire to obtain a provisional order, the Electric Lighting Committee stated that it would again be necessary to apply to the Board of Trade for electric lighting powers. The committee accordingly recommended that a provisional order should be applied for, and that a special meeting should be held to pass a resolution to that effect, in conformity with the Electric Lighting Acts. Mr. Cox, chairman of the committee, formally moved the adoption of the recommendations, which were unanimously carried. In connection with this matter the Electric Lighting Committee reported the receipt of notice from the London Electric Supply Corporation of intention to lay high and low pressure mains in Bermondsey New-road and join other thoroughfares. The committee recommended that the proposed works should be disapproved, as so far as they related to the low-tension distributing mains and to the laying of mains on both sides of the streets, and that the company should be informed of the vestry's decision to apply to the Board of Trade for a provisional order. The recommendations were adopted.—It was resolved, on the suggestion of the Works Committee, to increase the rate of pay to masons and paviors from 9d. to 9½d. per hour, in accordance with the request of the Footway Masons' and Carriage Paviors' Trade Protection Society.—The vestry decided to take similar action to the Clerkenwell Vestry in requesting the county council to instruct the district surveyors to draw the attention of builders to the necessity for making application to the local authorities before commencing building operations, in order that the drains and sanitary conveniences may be made to comply with the local by-laws without unnecessary trouble to the builders after the structures are up.—It was also resolved to suggest to the county council, in support of the action of the Battersea Vestry, (1) that all district surveyors should devote the whole of their time to the duties of district surveying; (2) that they should be paid a salary by the London County Council, and that all building fees (if continued) should be paid by the council direct; and (3) that an office be provided for the district surveyor at the local vestry hall or offices, so that he may be brought into closer touch with the local authorities.—The Baths Committee reported on the following tenders, received for various works at the laundry: E. Mills, £64; W. Mills, £72; G. F. Morgan (accepted), £44; R. Athey, £65; Leaf & Co., £70; Stewart & Co., £87. The tender of E. Mills was stated to have been accepted, at £193, for sanitary work at the laundry, the only other offer received being from W. Mills, for the sum of £195.

Camberwell.—The vestry on Wednesday decided to inform the Lee District Board of Works that they were willing to take part in the conference to be convened by the latter authority to consider the question as to the desirability of establishing a system of mutual insurance against liabilities under the Workmen's Compensation Act.—It was resolved, on the recommendation of the Finance Committee, to apply to the London County Council for a loan of £11,800 for wood paving works in Hill-street and Peckham Park-road.—The General Purposes Committee recommended that tenders should be invited for the supply of wood blocks for the paving of Church-street and other thoroughfares, and that a clerk of works should be engaged by the surveyor to superintend the work.—The Sanitary Committee recommended that the London County Council should be approached with a view to the erection of a public convenience on Peckham lye.—It was suggested by the Libraries Committee that tenders should be invited for painting the outside of the central library.—The following tenders were received for furnishing rooms at the vestry hall: R. Pearson, £39 5s.; Airey & Co. (accepted), £2 3s.; Tarn & Co., £18 7s. 4d.; Silk & Son, £53 8s.; and Seale & Sons, £51 11s. 6d.

Greenwich.—On Wednesday of last week, at a meeting of the district board of works, the tender of Messrs. Mowlem & Co., £908, for paving a new street Fergus-street, Greenwich, was accepted.—Tenders for paving Dentford-street were referred to the Greenwich Committee.—The Board had again before them a letter from the London County Council, stating that their Bridges Committee, in consequence of the summer recess, were unable to fix an earlier day than Wednesday, the 28th inst., at 3 o'clock p.m., when they would be prepared to receive a deputation from the board on the subject of the construction of a tunnel between Rotherhithe and Shadwell. A reply was ordered to be sent, stating that having received no answer from the Rotherhithe Vestry, the board were not prepared to take action in the matter.—A suggestion of the London County Council, that in cases where a street lamp was within a few feet of a fire alarm the lamp-post should be painted a bright red, was referred to the District Committee.

Lambeth.—A circular-letter was last week received from the Battersea Vestry asking Lambeth to join in seeking powers for local authorities to erect dwellings for the working classes under Part III. of the Working Classes Act. It was decided, after a short discussion, to join in the movement.

Newington.—On Wednesday of last week, at a special meeting of the vestry, a resolution suggesting an application to the London County Council for sanction to borrow £50,000 for electric lighting purposes was adopted by a large majority of the members. The Electric Lighting Committee reported that under the power vested in them they had during the recess accepted the tender of the British Insulated Wire Company for the insulated electric mains, conduits, junction boxes, &c., at £9,051 19s. 6d; the tender of the General Electric Company, Limited, at £1,457, for the main switchboard and instruments; and the tender of Messrs. Pritchetts & Gold, for £900, for the battery of accumulators and accessories, which now covered the whole of the work to be let under contract. The following was a summary of the contracts—namely: The station, £12,928; supply and fixing engines, generators and public lighting plant, £8,975; and erection of boilers, £9,348; electric mains, conduits, &c., £9,082; main switchboard and instruments, £1,457; accumulators and accessories, £900.

Shoreditch.—The vestry, on Tuesday, received a report from the Law sub-Parliamentary Committee stating that they had acknowledged a communication from the St. James (Westminster) Vestry relating to the interruption in the telephone service attributed to the recent fire in Heddons-street.—Mr. Chant presented a report of the Parliamentary Committee referring to the letter received from the Battersea Vestry asking for assistance in opposing the General Power Distribution Company's Bill, and Bills of a similar nature which sought to empower companies to supply electrical energy in bulk over large areas in districts where provisional orders had already been granted to local authorities. The committee stated that if those Bills were passed an absolute monopoly would be established, as the companies would not be constituted under the Electric Lighting Acts. On the recommendation of the committee it was unanimously decided to ask the local members of Parliament to strenuously oppose the Bills.—It was reported that Mr. Newton Russell, the chief electrical engineer, had written to the Lighting Committee asking for a reconsideration of the question of his salary. The committee had, however, resolved to refer the subject to the vestry. After some discussion the consideration of the question was referred to the Officers' Committee.—The Works Committee reported that they had considered the estimates prepared by Mr. Rush Dixon, the surveyor, for repaving Old-street and Great Eastern-street with sets and hard wood, at a cost of about £9,000 and £8,600 respectively. The committee recommended that the repaving of the portion of Old-street from Great Eastern-street to Hoxton-street should for the present be deferred, that the rest of the paving should be proceeded with in hard wood, and that advertisements should be issued inviting tenders for carrying out the work. After some discussion an amendment was carried, by thirty-nine votes to eight, postponing the consideration of the question for twelve months.—The Works Committee reported that they had considered the following tenders for the construction of an underground convenience in Hoxton-street: George Jennings (accepted), £2,025; Doulton & Co., £2,150; J. Dolman & Co., £2,666. The committee had also had under consideration the following tenders for the construction of a new pipe sewer in Britannia-street: W. Manders, £414 18s. 6d.; C. W. Killingback & Co., £416; Robert Jackson, £494 8s. 3d.; John Jackson, £512; Thomas Adams, £557 16s. 3d.; Williamson & Son, £562 13s. 2d. As the surveyor's estimate was only £404, and as the vestry had means for carrying out the work by direct labour, the committee recommended that the work should be executed without the intervention of a contractor. After considerable discussion the recommendation was adopted.

St. Luke.—The Wharf Committee of the vestry have deferred the question of buying three of the three-wheeled type

of barrows, though these are urgently needed. The present contract for horse-hire expires at the end of this month, but the committee have decided to allow the existing arrangement to continue for a period of three months. Additional orderly street-bins are to be fixed throughout the parish. A Bernard Smith's rotary machine, taken by the vendor as a bad debt, is to be acquired at a cost of £25.—The Public Health Committee have approved of various applications for house drains, &c.—The vestry are informing the London County Council that they are not in favour of the proposal to establish a bacteriological laboratory.—The Works Committee are to construct some ten sewer manholes. Tenders were opened for the execution of paving works in the parish. The amounts were: Linnier Asphaltic Company, £3,236 17s. 6d. (amount allowed for old material, £55 17s. 6d.); French Asphaltic Paving Company, £3,332 7s. 6d. (£103 2s. 6d.); and Val de Travers Asphaltic Paving Company, £3,166 16s. 9d. (£66 5d.). The tender of the Val de Travers Company has been accepted. For wood paving the following tenders were received: Acme Wood Flooring Company, £3,998; Improved Wood Pavement Company, £3,640; William Griffiths, £3,389; and Mowlem & Co., £3,864. The tender of Mr. Griffiths has been accepted. For the construction of an underground convenience in Old-street, by City-road, the following tenders were received: George Jennings, £2,505; B. Finch & Co., £2,895; George B. Davis, £2,375; and William Sharman, £2,772. The tender of Mr. Jennings has been accepted. It has also been decided to construct an underground convenience in Golden-lane, by Old-street, at an estimated cost of £2,700.

St. Pancras.—At a meeting of the vestry on Wednesday the Finance Committee recommended and it was decided to apply to the Local Government Board for permission to borrow £6,557 for the construction of underground conveniences in Mansfield-road, Fortess-road and Camden-broadway.—It was also resolved to apply to the London County Council for a loan of £10,836 for wood and asphaltic paving purposes.—The Highways Committee recommended the expenditure of £1,450 on further work of wood paving in Easton-road, and this was agreed to.—Tenders as under were submitted by the Highways Committee for the supply of 140,000 jarrah or karri wood blocks, 5 in. by 3 in. by 9 in., required for the repaving of a portion of Guilford-street and Midland-road: For jarrah—W. Griffiths, £11 2s. 6d. per 1,000; Acme Wood Flooring Company, £11 15s.; Jarraldale Jarrah Forests, Limited, £11 6s. 3d.; Miller's Karri and Jarrah Forests, Limited, £11 5s.; Palfreman, Foster & Co., £10 10s. 6d.; and B. G. Elliott, £12 6s. 8d. For the supply of karri—W. Griffiths, £11 per 1,000; Acme Wood Flooring Company, £10 17s. 6d.; and Miller's Karri and Jarrah Forests, Limited, £11 2s. 6d. The tender of Messrs. Palfreman, Foster & Co. to supply jarrah at £10 19s. 6d. per 1,000 was accepted. The following tenders were considered for the erection of a boundary fence at Finchley cemetery: N. C. Topping, junr., High-road, £65; Joyce & Co., High-road, £61 2s.; and W. Luck & Sons, High-road (accepted), £57.

PROVINCIAL AND GREATER LONDON COUNTY COUNCILS.

Cumberland.—The county council are at present finishing a skew bridge in the Penrith district at Sickerhill, between Kirkoewall and Renwick. The structure has a span of 25 ft. Another bridge will also shortly be completed in the Brampton district, at Walton Mill. It is being erected across the Camp beck, with a 35-ft. square span. In the spring a bridge, having a span of 25 ft. square, will be erected across the Ellen at Ireby, in the Wigton district.

Worcestershire.—The county council last week resolved to purchase, for £10,534, Bundy's farm, near Malvern, as a site for the proposed isolation hospital.

MUNICIPAL CORPORATIONS.

Bath.—Mr. Robert H. Bicknell, inspector of the Local Government Board, conducted an inquiry on the 15th inst. into an application of the corporation for sanction to borrow a sum of £15,000 for the purposes of street improvements.

Birmingham.—The corporation water department have found it necessary to issue a notice warning consumers of the necessity of exercising economy in the use of water. The danger of a water famine in the district is by no means unreal, and very shortly an intermittent and restricted supply must be resorted to unless the drought should break or a very material reduction in the consumption be effected. At a conference between the city surveyor and the secretary of the department it has been deemed necessary to discontinue entirely for the present the watering of all roads in suburban districts except main roads on which the traffic is very heavy.

Blackburn.—The designs of Messrs. Lockerbie & Wilkinson, Limited, of Birmingham, have, together with their tender of £1,495, been accepted by the corporation for the erection of a new palm-house and conservatories in the public park.

Bradford.—The Gas and Electricity Supply Committee of the corporation propose to borrow £10,000 for the extension of the electricity cables in the city.—Owing, it is thought, to the slippery state of the lines, one of the cars on the corpo-

ration system of electric tramways, in descending a steep hill on Monday with a large number of passengers, went beyond the control of the driver and dashed with tremendous force into the boundary wall of a church at the foot of the slope. Fifteen persons sustained serious injuries and one died an hour after the accident. The Board of Trade have appointed Major Carlew, R.E., to open an inquiry on Monday.

Burnley.—Application is to be made to the Local Government Board by the Gas and Electric Lighting Committee of the corporation for sanction to the borrowing of £5,000 for mains, £3,000 for stoves, and £1,500 for lamps.

Calne.—An inquiry was held at the Town Hall, Calne, last week, relative to an application by the town council to the Local Government Board for permission to borrow £695 for the improvement of certain main road footpaths, and £575 for the construction of works for the purpose of obtaining water for sewer-flushing and street-watering.

Canterbury.—One of the inspectors of the Local Government Board recently conducted an inquiry with reference to an application of the town council for sanction to borrow an additional £3,000 for the infectious diseases hospital.

Carlisle.—Local Government Board sanction will shortly be sought in connection with a proposal to borrow £2,830 for the erection of artisans' dwellings in Willow Holme.

Colchester.—The sanction of the Local Government Board to the proposed loan of £36,000 for the erection of the new town hall has been granted, with the exception of £1,424, the estimated cost of the portion of the new structure to be used as a police station. The mayor, Alderman J. N. Puxman, will lay the stone of the new building on the day of the annual oyster feast in October. The architect is Mr. John Belcher, of London, whose design was selected in competition.

Coventry.—At the fortnightly meeting of the city council on Thursday it was decided, on the recommendation of the Works Committee, to pave Cross Cheaping and Burgess-street with granite setts, at an estimated cost of £1,000.

Dewsbury.—Consideration was last week given to a resolution of the Gas and Electricity Committee suggesting that, for the purpose of relieving the present overloaded condition of the existing feeding mains and distributors, the principle of increasing the voltage from 220 volts to 110 volts should be adopted in preference to that of duplicating the mains, the estimated cost of such increase being £2,232.

Durham.—The city council have resolved to take initial steps towards improving the banks of the river Wear. They have agreed to invite tenders for carrying out a small portion of the work between Framwellgate bridge and the site of the proposed shire school in accordance with plans prepared by Mr. Jones.

Exeter.—The Local Government Board have sanctioned the application of the town council for leave to borrow £7,000 for electric lighting purposes.

Falmouth.—The corporation on Thursday adopted a resolution recommending the purchase of certain land, known as the Gyllyngune estate, for £13,000.

Codalming.—As a result of negotiations between the corporation and the directors of the Frith Hill, Godalming and Farncombe Water Company, an extraordinary meeting of shareholders was held recently, at which a resolution was proposed agreeing to the acquisition of the waterworks by the council for the sum of £51,000. Although there was a majority in favour of the municipalisation of the undertaking, there was not a three-fourths majority, as legally required, and the resolution was rendered abortive. Mr. J. C. Collier, chairman of the meeting, resigned his position as director in consequence.

Haslingden.—The town council recently decided to apply for an electric light provisional order.

Herne Bay.—The serious landslip which has just occurred has again brought prominently to the fore the question of commencing the permanent sea-wall to take the place of that which was destroyed in the heavy gales last year, and was temporarily repaired for this season. The plans, &c., for the new wall have been prepared, and it is felt in the town that the building of a solid wall should not longer be delayed, as anything like a heavy gale might produce serious effects.

Heywood.—The manager of the sewage works has been instructed by the town council to obtain an estimate for the electric lighting of the works and also for the infectious diseases hospital.—Local Government Board sanction has been received by the corporation to the borrowing of £8,000 for gasworks purposes. Of this amount £1,500 is required for land, £2,000 for prospective new mains, £3,000 for stoves and prepayment meters, £500 for a coke-breaking machine, and £900 for new buildings for stores, &c.

Norsham.—The council's engineer, in accordance with a request of the Local Government Board, is now preparing a detailed estimate of the cost of the proposed sewerage works, plans of the land involved in the scheme, and detailed drawings of the outfall works, &c. Sanction to borrow £3,000 to carry out the improvement has already been applied for.

Hyde.—At Monday's meeting of the town council the Highways Committee reported that they had considered a

communication from the Oldham, Ashton and Hyde Electric Tramways Company, Limited, asking why they had been prevented from laying cables under the footpaths. The committee had resolved that consent should be given to the execution of the work on condition that the company contributed a further sum of £500, in addition to a similar amount already promised, towards the cost of widening the roads at various points along the tramway route.

King's Lynn.—Mr. Sandford Fawcett, A.M.I.C.E., on the 7th inst. held an inquiry, on behalf of the Local Government Board, with reference to an application of the town council for sanction to borrow £30,000 for electric lighting purposes. Particulars relative to the provisional order, &c., were given by the town clerk, and Prof. Robinson, who is acting as consulting engineer, explained that he had been authorised to obtain tenders and make plans, &c., for the various works. The mayor and other members of the council attended to support the scheme, but Alderman Pridgeon opposed, on the ground that the ratepayers did not want the installation. He thought it curious to advertise for tenders, &c., before the Local Government Board had given their sanction.

Lincoln.—The price of gas in Lincoln will in future be 2s. 1d. per 1,000 feet.

Lowestoft.—The Sanitary Committee last week reported that the surveyor had submitted the revised plans and estimate of the Horsfall Company for erecting a refuse destructor and mortar mill on Smith's Marsh, their tender for the whole work being £1,700. The committee recommended that the tender be accepted, and that application be made to the Local Government Board for their sanction to the borrowing of the necessary money. This was carried.

Maidstone.—The town council on Wednesday decided to promote a Bill in the next session of Parliament for the compulsory acquisition of the waterworks company and the extension of the present sources of supply. The undertaking, it is stated, will cost the town about £120,000.

Middlesbrough.—The corporation's electric lighting order has received the Royal assent, and the committee, in consultation with Mr. Hammond, electrical engineer to the corporation, have decided that the station be erected on the land belonging to the Gas Committee at the corner of Snowdon-road and Washington-street, on condition that the Gas Committee agree thereto and subject to the sanction of the Local Government Board. Mr. Hammond has been instructed to prepare specifications and estimates for lighting the compulsory area. These will be submitted to a future meeting of the corporation.

Newcastle.—A meeting of the joint committee of the Newcastle and Gateshead Corporations was held on Friday afternoon, in the Town Hall, Newcastle, to consider the reports of the engineers on the proposed new bridge across the Tyne. In pursuance of a resolution adopted by the two committees, it was agreed that the bridge should cross from Pilgrim-street to High-street, but there was found to be a little difference of opinion between the engineers as to the exact point of landing in High-street. It was therefore resolved that the two borough engineers, along with Messrs. Moncrieff and Sandiman, should further consider and determine the most satisfactory point on the Gateshead side; and also that they should present a report at the next meeting of the committee, a month hence.

Ramsgate.—At last week's meeting of the town council the General Purposes Committee and Parliamentary Committee recommended that an agreement be entered into with Messrs. Tomson & Wotton, Limited, to purchase the Queen's Head Inn, with vacant possession, for the sum of £4,000, the corporation taking the tenant's fixtures and trade effects at a valuation. The report was adopted without opposition. The last item on the agenda was: "To consider the subject of widening the road between the Elms and Grove-road, and to take the necessary steps to purchase for the purpose a piece of land on the north side of that road for the sum of £200 and a piece of land on the south side for the sum of £50. The whole cost of the improvement is estimated at £450." This also was adopted.

Richmond, Surrey.—The highest bid made at Wednesday's attempt to sell Glover's Island was £200—£3, 00 short of the sum at which it had been offered to the corporation. The auction, which was held at Tokenhouse yard, was very largely attended.

Rotherham.—An important enlargement of the corporation gasworks was inaugurated last week, when a new retort-house was opened. The extension scheme practically means the doubling of the facilities for the manufacture of gas, and an expenditure of £30,000. The new retort-house represents an addition of 650,000 cubic feet per day, and the whole plant will be capable of yielding 2,000,000 ft. In the system the newest methods for the automatic handling of the coal and for the economical consumption of coke in the furnaces have been adopted. Mr. C. Winstanley, of Coventry, has been the engineer.

Scarborough.—A Local Government Board inquiry is to be held on Monday relative to an application of the corporation for permission to borrow £33,575 for the purchase of the St. Nicholas House estate, which it is proposed to lay out as a park, the house at present being used as a town hall.

Southampton.—A letter was, last week, read from the Local Government Board advertising to an application of the council to borrow £10,076 for the purposes of a new road, quay and wharf, and stating that the board had been informed that the Board of Trade would be prepared to approve, so far as the interests of navigation were concerned. The board went on to state that they approved generally of the scheme, but that, as it was proposed to use corporate land for the purposes of the scheme, the town council should make formal application by memorial under seal for approval of the appropriation of the land for such purposes.

Stockport.—The borrowing of £28,482 by the town council for electric lighting purposes has been sanctioned by the Local Government Board.

Sunderland.—Powers to work the local tramways will shortly be applied for by the corporation. It was on Wednesday decided to establish the overhead trolley wire system in the place of horse haulage.

Taunton.—At a meeting of the town council on the 13th inst. the Main Drainage Committee presented the surveyor's report containing a scheme for the alleviation of the floods in North Town. The scheme provided for the laying of a separate sewer along Station-road, to carry off the storm water, and the committee recommended the council to have it carried out at once, at a cost of £275.—Alderman Spiller, chairman of the committee, said that the scheme would not effectively do away with the flooding in that part of the town, but would greatly lessen it, and that was all they could hope to do until they had received the sanction of the Local Government Board to proceed with the high-level scheme, which they hoped would permanently stop the flooding. In the discussion it was urged that, as there was a possibility of receiving the sanction of the Local Government Board very shortly to the high-level scheme, it would do no harm to postpone this scheme for a time. This course was adopted, and the mayor and town clerk were authorised to proceed to London to have an interview with the secretary of the Local Government Board with regard to various loans that had recently been applied for by the council for works which were urgently needed.

Walsall.—At the last monthly meeting of the council the Electric Lighting Committee recommended that with a view to encourage the use of electric motors, and so endeavour to secure a day load for the generating plant, a special charge of 2½d. per unit be made for current supplied for motor purposes only. The committee had also instructed the engineer to reply that they did not see their way clear at present to recommend the extension of the cable to Lichfield-road, as they had been requested to do. The committee's report was adopted.

Widnes.—The corporation have decided to apply to the Local Government Board for permission to borrow £2,000 for alterations and extensions at the gasworks.

Wolverhampton.—The town council have given notice to the tramways company to purchase their undertaking.

Yarmouth.—It is intended to purchase a 10-ton steam roller and a scarifier, at a cost of £450.

URBAN DISTRICT COUNCILS.

Aylesbury.—On Saturday week the district council were fined £5 and costs for polluting a tributary of the river Thames by sending into it sewage matter which had not been properly treated.

Barnoldswick.—An inquiry was held last week, on behalf of the Local Government Board, respecting an application of the district council for power to borrow £2,000 for the purpose of erecting an infectious diseases hospital upon a site at Banks-hill.

Burnley-in-Wharfedale.—Mr. F. H. Tulloch, M.I.C.E., held an inquiry on the 5th inst., on behalf of the Local Government Board, relative to an application of the district council for sanction to a loan of £200 for water supply works and £150 for gasworks.

Chadderton.—The new sewage purification works at Chadderton, constructed from the designs of Mr. James Diggle, of Heywood, were formally opened on Saturday by the chairman of the Sewage Committee. The site, situated at Slacks Valley, contains 15 statute acres, and the total cost of the disposal works and the sewage scheme has been £80,000, of which £50,000 has been expended on sewerage.

Clacton.—The council have decided to make an application to the Local Government Board for sanction to borrow a sum of £1,660 for making a path on the cliffs, providing a mortuary, and erecting a town yard and fire station.

Cleethorpes.—The surveyor, Mr. E. Rushton, last week submitted his estimate of the cost of widening a portion of Grimsby-road. This amounted to £2,715. It was decided to consider the matter at a future meeting.

Hucknall Huthwaite.—At the last monthly meeting of the district council, Mr. H. Silcock, surveyor to the Blackwell Rural District Council, presented plans of the tanks and filters in connection with the sewerage farm in Pit-lane, and estimated the cost to carry out the work at £180. The scheme, he said, was on the same lines as at Tibshelf, where

the works were going on very satisfactorily. It was decided to proceed with the works at once.

Ilford.—The medical officer of health reported, at a recent meeting of the district council, that he was afraid the elements of a wide-spread epidemic of typhoid, as the river water, which was now dreadfully polluted with sewage, flowed over some of the watercross, and made it dangerous to eat. He suggested that if the council had no power to prohibit the sale of the cress, they might buy up the crop, so as to prevent the public having it. The surveyor was instructed to inspect and report. The council also decided to give notice of intention to the gas company to purchase their undertaking.

Llandudno.—An important meeting of the Electric Lighting Committee was held last week, at which Mr. Procco reported that current would be definitely available from this date. The erection of the chimney at the generating station had now been completed, and consequently the chief cause of delay removed. Some discussion ensued as to getting a demonstration to celebrate the switching on of the light. The arrangements were delegated to a sub-committee.

Moss Side.—At the last monthly meeting of the council a communication was read from the town clerk of Salford referring to and enclosing copies of the resolutions passed at the late conference of authorities in the watershed of the Irwell on the treatment of sewage. The letter called special attention to the second resolution, which proposed the formation of an association of local authorities in the Mersey and Irwell watershed, on which each authority should have two representatives, for the purpose of reporting on the treatment of sewage problems by the Local Government Board and the Mersey and Irwell Joint Committee. The election of two representatives, as suggested, was eventually decided upon by the council.

Newmarket.—The council have adopted the following resolutions: "In the event of no feasible agreement with the Barwell Fen Commissioners being arrived at, that the main drainage alternative scheme be divided into two parts, to be called (a) the Newmarket scheme, and (b) the Exning scheme. (2) That the Newmarket scheme, as explained by Mr. Beesley and Mr. Metcalf, shall be carried out on the present sewage farm, the area of which the surveyor considers sufficient to effectually treat by bacteria-beds the sewage of the old urban area and added parts, with the exception of Exning proper, which shall be dealt with by the Exning scheme; and that permission be sought to raise a loan to carry out the sewerage of Cheveley-road immediately. (3) That the Local Government Board be requested to hold a public inquiry for the purpose of sanctioning the urban district council raising loans to carry out the Newmarket scheme of drainage, and to fix an early date for that purpose, as it is urgent. (4) That, if possible, the Exning scheme be considered at the same time."

Redditch.—On the 13th inst., at a special meeting of this district council, it was stated that at a meeting of the Public Works Committee, held earlier in the evening, the question of the best means of adapting the present police station in Evesham street, which was recently purchased by the council for council meetings and other purposes, had been considered. The surveyor had presented a plan for the adaptation of the buildings. It appeared that the cost of a swimming bath would be £2,500, and the committee were of opinion that that portion of the scheme should stand over for the present. It was resolved, after considerable discussion, to recommend the council to accept the proposed plans, with the exception of that dealing with the swimming bath. The report of the committee was adopted. A sub-committee were subsequently appointed to confer with the surveyor as to the preparation of modified plans for the required alteration, to be submitted at the next meeting of the Public Works Committee.

Rhyl.—It was reported, at last week's meeting of the district council, that a committee had had under consideration draft schemes for supplying certain parts of the town with electric light, and also for laying down a tramway from near the entrance to the Grand Pavilion to Prestatyn. Plans had been submitted by the engineers, Messrs. Alfred Dickinson & Co., and, without plodding the council to them, the committee who inspected them expressed approval of them, and requested Messrs. Dickinson to submit a detailed scheme for consideration. It was resolved that the members should in a body visit some of the Lancashire seaside towns, including Southport, Blackpool, Morecambe and Fleetwood, to inspect similar works carried out there.

Ruskington.—A largely-attended public inquiry was held at Ruskington, near Slanford, last week by Mr. H. Percy Boulnois, Local Government Board inspector, respecting the borrowing of £1,900 by the council for waterworks, ordered to be constructed by the Local Government Board, in answer to a petition signed by the late Earl of Winchester and forty other leading parishioners. Mr. J. Clare, the engineer, stated that he expected to find water at a depth of 130 ft.—probably 40,000 gallons daily.

Skipton.—The council on Thursday unanimously resolved to promote a Bill in the next session of Parliament empowering them to acquire the works of the Skipton Gas Company

upon such terms as may be agreed upon or determined by arbitration. The council recently made an offer to the Gas Company to purchase the undertaking for £3,000. In refusing to accept this sum the company intimated that if they sold the works their price would be £50,000 but that they were not at all desirous of relinquishing the undertaking at any price. The feeling of the ratepayers on the question of compulsory powers will be gauged at a forthcoming public meeting, which is being called at the request of twenty-eight property owners and ratepayers.

Walthamstow.—Local Government Board sanction will shortly be applied for by the council in connection with a proposed loan of £16,000 for the provision of public baths.

Waterloo.—It has been reported that at a meeting of the Tramway Committee the surveyor presented a detailed estimate of the cost of constructing the tramway track and maintaining and working the tramways. After being duly considered it was resolved that before coming to any decision as to the desirability of maintaining and working the tramways further inquiries be made with reference to the cost and other matters relating thereto, for the guidance of the council, and the council authorized the committee to make such inquiries.

Wombwell.—A committee has been appointed by the district council to consider the question of providing a recreation ground for the town.

RURAL DISTRICT COUNCILS.

Chapel-en-le-Frith.—It has been decided by the council to purchase a steam roller and a water-cart, at a cost of £380.

Kiveton Park.—On Thursday Mr. H. Percy Boulnois held an inquiry, on behalf of the Local Government Board, respecting a scheme of sewerage and sewage-outfall works for the districts of North and South Anston, prepared by the surveyor, Mr. William Atkinson.

Newbury.—The Thames Conservancy on Thursday presented the district council for polluting a tributary stream of the Thames in the parish of Doddington. Mr. Bunting, for the conservancy, explained that the proceedings had become absolutely necessary in consequence of the great delay on the part of the local authority in carrying out a proper system of drainage for the village of Doddington. In defence, Mr. Pinniger said the district council had been doing their best to remedy the evil, but had been met with a number of obstacles. They had been unable to obtain a site for a pumping station, and it seemed likely they would be driven to put compulsory powers into force. The justices said they were of opinion that the complainants had made out their case, and therefore the district council must pay a penalty of £3 and 5s costs.

Sculcoates.—At last week's meeting of this council a letter was read from Messrs. A. M. Jackson & Co., solicitors, stating that certain gentlemen had in contemplation a scheme for the construction of an electric tramway from Hlesse to connect with the new system at Hall. All they wanted was the consent of the authorities concerned, and if the scheme was to go through it would be necessary to apply for a provisional order early next session. On the motion of the chairman it was resolved to appoint a committee from the council to meet the promoters and discuss the scheme.

Slanford.—Mr. H. Percy Boulnois conducted an inquiry on the 13th inst., on behalf of the Local Government Board, with reference to an application of the district council for permission to borrow £300 for the water supply of Great Hale. Mr. Clare, the surveyor to the council, said that the present supply was obtained from shallow wells, and was declared by Dr. Ashby's analysis to be wholly unfit for domestic purposes. The council had therefore decided to bore, the necessary site having been purchased. There was no opposition to the application.

Tamworth.—At a recent meeting of the district council a letter was read from the Local Government Board sanctioning the proposed scheme of water supply for the parish of Kingsbury. The council instructed their surveyor, Mr. H. J. Clarson, to proceed with the work at once. This scheme, which will involve the expenditure of about £1,100, is greatly needed to supply the wants of the mining districts in that parish.

Truro.—The district council have resolved to apply to the Local Government Board for sanction to borrow 4,500 for carrying out a water supply scheme for St. Agnes, from plans prepared by Mr. Worth.

Yardley.—Local Government Board sanction has been received to the borrowing by the council of a sum of 2,000 for the purchase of land for the purposes of a depot, and for the erection of a fire station and a mortuary. The board, however, have refused to sanction a loan of 400 for the purchase of a site for proposed public offices at Stockhill.

SCOTLAND AND IRELAND.

Aberdeen.—The town council have addressed the Finance Committee to consult Mr. R. G. Wilson, architect, and to obtain from him plans for extending the fish market along Market-street, and, alternately, along Commercial-street.

Inverness.—A reduction in the price of gas from 3s. 9d. to 3s. 4d. per 1,000 cubic feet has been resolved on by the town council. This resolution was the outcome of a recommendation made by the engineer, Mr. J. Thomson, who pointed out that there was a surplus of £1,886 on last year's working. Since Mr. Thomson took charge of the works, over twenty-two years ago, the price has been reduced 5s. per 1,000 cubic feet.

A CLOSET DEODORISER.

We illustrate a little apparatus for use in water-closet cisterns. The object of the apparatus is to leave a portion of the deodoriser in the pan every time it is flushed, and thus decompose and render innocuous any sewer-gas which may

rise up the waste pipe. The *modus operandi* is to place a quarter or half an ounce of permanganate of potash in the vessel, which is then placed in any unoccupied corner of the closet cistern, so as to be under water when the cistern is full. The theory is that every time the closet cistern is emptied a portion of the deodoriser comes down with the final rush of water; that it is therefore not immediately washed away down the drain, but remains in the pan performing its sanitary duties until flushed away with the next emptying of the cistern. It is considered that one charge of the permanganate of soda will last a month or more, according to the frequency of use of the closet, and that thus a few pence will cover the cost for a whole year. Assuming that the arrangement works all right, a good deal might by its means be effected in keeping water-closets in good condition. The apparatus is sold at the moderate price of 2s. 6d., Messrs. Underwood, 13 Granville-street, Birmingham, being the sole patentees and manufacturers.

works all right, a good deal might by its means be effected in keeping water-closets in good condition. The apparatus is sold at the moderate price of 2s. 6d., Messrs. Underwood, 13 Granville-street, Birmingham, being the sole patentees and manufacturers.

THE SANITARY INSTITUTE CONGRESS AT BIRMINGHAM.

THE MUNICIPAL ENGINEERS' CONFERENCE.

In connection with the conference of municipal and county engineers, on Wednesday, at the annual autumn congress of the Sanitary Institute, the following arrangements have been made:—

- 10 a.m.—The President will deliver his address, and the following papers will then be read and discussed: (1) "Precautions to be Observed in the Ventilation of Sewers and Drains," by Mr. T. J. Moss-Flower, A.M.I.C.E.; (2) "By-Laws Relating to New Streets and Buildings," by Mr. J. S. Pickering, A.M.I.C.E., surveyor to the Nuneaton Urban District Council; (3) "Some Sanitary and Allied Advantages Attending the Introduction and Use of Motor Vehicles," by Mr. Shrapnell Smith.
- 1 p.m.—Adjournment for lunch.
- 2.15 p.m.—Visit Public Convenience in course of construction in the Bull Ring.
- 3.40 p.m.—Visit Salkey, to inspect the diversion of the Rea main sewer (7 ft. diameter), now in progress.
- 3.30 p.m.—Visit Edwinstrey depot, which is now approaching completion.
- 4.15 p.m.—Visit the River Rea improvement works, recently commenced.
- 5.0 p.m.—Visit the Queen's Ride.
- 6.0 p.m.—Return to Birmingham.
- Tickets for the brakes (price 2s. 6d.) and for lunch (price 3s.) should be secured from the secretaries of the confer-

ence (Messrs. H. Ashton Hill, A.M.I.C.E., Birmingham, and A. D. Greaterox, A.M.I.C.E., West Bromwich) between 9.30 a.m. and 10 a.m., who will attend at the conference meeting for this purpose.

On Thursday afternoon, at 2.15 p.m., a party will leave Birmingham on a visit to the Croft Granite, Brick and Concrete Works, near Leicester, by kind permission of the directors of the company. The company will provide saloon carriages free of charge, and also invite the party to tea at the works at 4.30 p.m. The party will return to Birmingham about 6.50 p.m.

The following, we may mention, are the officers of the conference:—

PRESIDENT: Mr. T. de Courcy Meade, M.I.C.E., city surveyor, Manchester.

VICE-PRESIDENTS: Messrs. W. B. G. Bennett, A.M.I.C.E., borough engineer, Southampton; R. E. W. Berringer, A.M.I.C.E., Wolverhampton; W. Blackshaw, A.M.I.C.E., borough engineer, Stafford; A. T. Davis, A.M.I.C.E., county surveyor, Salop; J. T. Eayts, M.I.C.E., F.S.I., Birmingham; E. Purnell Hooley, A.M.I.C.E., county surveyor, Nottingham; F. J. C. May, M.I.C.E., F.S.I., borough engineer, Brighton; J. Price, M.I.C.E., city surveyor, Birmingham; J. Willmet, county surveyor, Warwick; J. E. Worth, M.I.C.E., district engineer, London County Council; T. H. Yabbicom, A.M.I.C.E., city engineer, Bristol.

ADVERTISEMENTS

Received too late for Classification.

BOROUGH OF SOUTHEND-ON-SEA. TO ROAD CONTRACTORS AND OTHERS.

The Corporation invite tenders for the Kerbing, Channelling and Paving of High-street.

Plans, sections and specifications may be seen, and bills of quantities and forms of tender obtained, on and after Monday, the 26th September (on payment of £1 ls., which will be returned on receipt of a *bona-fide* tender), upon application to Mr. Alfred Fidler, ASSOC.M.INST.C.E., Borough Surveyor, Clarence-road, Southend.

No tender will be considered unless made on the prescribed form.

Scaled tenders, marked "Tender for Paving High-street," to be delivered at my office before 10 o'clock in the morning of Thursday, the 6th October.

The Corporation will not be bound to accept the lowest or any tender.

(By order)

WILLIAM H. SNOW,
Town Clerk.

Southend-on-Sea.
September 21, 1898.

BOROUGH OF SOUTHEND-ON-SEA. TO ROAD CONTRACTORS AND OTHERS.

The Corporation invite tenders for the Laying-out of Darlow's Green, and for the Making-up of the Esplanade and Roads adjacent thereto, also for the Construction of a short length of Sea-Wall.

Plans, sections and specifications may be seen, and bills of quantities and forms of tender obtained, on and after Monday, the 26th September (on payment of £1 ls., which will be returned on receipt of a *bona-fide* tender), upon application to Mr. Alfred Fidler, ASSOC.M.INST.C.E., Borough Surveyor, Clarence-road, Southend.

No tender will be considered unless made on the prescribed form.

Scaled tenders, marked "Darlow's Green," to be delivered at my office before 10 o'clock in the morning of Thursday, the 6th October.

The Corporation will not be bound to accept the lowest or any tender.

(By order)

WILLIAM H. SNOW,
Town Clerk.

Southend-on-Sea.
September 21, 1898.

BOROUGH OF RICHMOND (SURREY).

SURVEYOR'S DEPARTMENT.

JUNIOR CLERK WANTED,

In the Borough Surveyor's office, Richmond (Surrey); good writing and thorough knowledge of shorthand indispensable; speed to be not less than 100 words per minute.

Salary, 24s. per week, rising, by annual increments of 2s., to a maximum salary of 30s. per week.

Personal application to members of the Council is strictly prohibited, and will disqualify the candidate.

Applications, accompanied by copies of not more than three testimonials of recent date, stating age and present occupation, are to be sent to me not later than noon on Monday, the 3rd of October, 1898, marked "Junior Clerk, Borough Surveyor's Department.

J. H. BRIERLEY,

Borough Surveyor.

Town Hall, Richmond, Surrey.
September 22, 1898.

Personal.

Mr. H. Mence, of St. Albans, has been appointed surveyor to the St. Albans Rural District Council.

Mr. J. Walker Smith, chief assistant on the sewerage works of the Barton Corporation, has had his salary advanced to £130 per annum.

We hear that Mr. William Cumming, borough surveyor of Carnonistic, has received an appointment as manager for a large contracting firm in Hull.

The chief assistant in the electricity department of the Stafford Corporation has had his salary increased from £120 per annum to £150 per annum.

The Bournemouth Town Council have appointed Mr. F. Dawkins, at present engaged by the Thames Conservancy Board, to the post of assistant buildings inspector.

Mr. G. B. Laffan, of Twickenham, has been selected to fill the post of borough engineer of Pietermaritzburg, South Africa. Mr. Laffan's salary will commence at £800 per annum.

The salary of Mr. F. Latham, assistant surveyor to the Margate Town Council, has, on the recommendation of the General Purposes Committee of that body, been increased to £150 per annum.

Mr. H. T. Chapman, district council offices, Chapel-en-le-Frith, and Mr. L. D. Thompson, district council offices, Haydock, Lancs., have been elected district surveyors under the Lancashire County Council.

Much sympathy is felt in Lambeth with Mr. W. Macintosh, the former surveyor of the parish, who has recently lost his wife. The vestry feelingly expressed their condolences in a resolution passed on Thursday evening.

We are glad to hear that Mr. Edward Pritchard, M.C.E., of London and Birmingham, the well-known past-president of the Association of Municipal and County Engineers, who has been seriously ill during the last four weeks, is now recovering.

On Tuesday of last week the employees of the Hammer-smith Vestry's electricity department presented Mr. P. C. Day, one of the engineers in charge, with a handsome marble timepiece, on the occasion of his marriage, and as a mark of their respect and esteem.

The names of the following firms of engineers have been placed before the Hackney Vestry, who are considering a combined scheme of electric lighting and dust destruction: Messrs. Burstall & Monkhouse, Mr. Robert Hammond, and Messrs. Kincaid, Waller & Manville.

Mr. Henry Masterion, surveyor to the Devonshire County Council, died at Barnstaple on Sunday, from cancer of the liver. He was very highly regarded in North Devon. At Plymouth he was connected with some of the recent large engineering work, and it was his skill which supplied Saltash with water from the Plymouth source carried on the bed of the Tamar. The interment will be in London.

A presentation was, on Thursday, made at the town hall, Grimsby, to Mr. R. S. F. Dring, of the borough surveyor's office, by the staff, on the occasion of his leaving the town for a Government appointment as assistant surveyor at Accra, Gold Coast, Africa. A supper was provided in honour of the occasion, the surveyor, Mr. M. Petree, presiding. The presentation took the form of a solid silver cigarette case. Mr. Dring suitably responded.

The Harrogate Corporation, at their meeting on Monday of last week, passed without comment the following recommendation of the Wells and Baths Committee: "That advertisements be inserted inviting competitive designs for a new Royal pump-room, and that £50, £30 and £20 be offered for first, second and third prizes; also that competitive designs be invited for alterations to the present building to increase the accommodation, and £30, £20 and £10 be offered as prizes."

Mr. Walter Percival, of the borough surveyor's office, Wolverhampton, has been appointed assistant architect for outposts under her Majesty's Lords of the Admiralty. The borough surveyor of Wolverhampton, Mr. J. W. Bradley, in presenting to him numerous tokens of the esteem in which he is held, spoke highly of his work and expressed the general regret which was felt at his approaching departure. Mr. Percival is a Gussell prizeman and a gold medalist of the Royal Institution of British Architects.

At the last monthly meeting of the Chesterfield Town Council the Finance Committee of that body reported that they had considered the qualifications of the applicants for the post of surveyor to the northern district and had selected six for interview. There were originally forty-three. Mr. C. Thorpe, who has represented the district of Calow on the council for many years, was eventually elected by a large majority, and in returning thanks said he hoped he would be able to so carry out the duties of the office as to merit a continuance of the members' confidence in him.

At last week's meeting of the Blackek Commission consideration was given to the appointment of a surveyor. For this position there were originally twenty candidates. The names were afterwards submitted to a committee of the whole board, by which only three were sent forward. These were Messrs. Price, Grey and Going. After the first ballot Mr. Going fell out, and a long discussion followed on various matters connected with the appointment. Eventually a division was taken, when Mr. Price and Mr. Grey received eight votes each. The chairman gave his casting vote in favour of Mr. Price, who was thereupon declared elected.

An interesting gathering of officials of the Vestry of St. George-the-Martyr, Southwark, is reported to have taken place on Friday, at the Tower Tavern, Westminster Bridge-road, where, during the course of a smoking concert held in his honour, Mr. Oliver Winter, the late surveyor, was presented with a handsome American writing-desk bearing a suitable inscription. Mr. A. Johnson, the vestry clerk, made the presentation, and paid a warm tribute of praise to Mr. Winter, both as a surveyor and a man. Mr. Winter, in the course of returning thanks, introduced his successor, Mr. Harrison, who met with a hearty welcome. The testimonial, it is understood, was subscribed to by 125 subscribers, representing every department of the vestry's work.

As we last week mentioned, the number of candidates for the post of borough electrical engineer of Derby were reduced to three. There were originally sixty-two applicants. The names of those selected were, on Wednesday of last week, submitted to the town council, and Mr. T. P. Wilmshurst, chief of the Halifax Corporation's electric lighting works, was then appointed to the vacant post. The appointment is worth £350 a year, with the privilege of taking two pupils. The principal points in Mr. Wilmshurst's favour were that the same system of electric lighting is in vogue in Derby as in Halifax, and that he had laid down the electric tramway there. This work is contemplated in Derby. Mr. Wilmshurst secured fifty-two votes out of fifty-five, the number of members present.

The announcement, says a contemporary, of the impending retirement of Mr. Stewart from the position of electrical engineer-in-chief of the corporation electricity supply works, Derby, with which he has been connected from their inception, was received with much regret by the whole of the staff employed under him; and it was felt by all that this was a fitting opportunity of showing their esteem for him and their appreciation of the many kindnesses received from him during his tenure of the office of engineer and manager of the works. An appeal for subscriptions was generously responded to, and as a result a walnut cabinet of desert knives and forks was, in the name of the whole staff, presented to him on Friday afternoon, September 9th. Mr. Stewart, in returning thanks on behalf of Mrs. Stewart and himself, said that both of them, whilst highly valuing the gift, would especially value the kindly thought which prompted it.

On Wednesday, at a meeting of the St. Pancras Vestry, the Baths Committee reported that thirty-six applications had been received from architects willing to submit designs for the erection of the proposed new baths and wash-houses in the Prince of Wales-road. The following six gentlemen were chosen by the committee as possessing the best qualifications for this class of work: T. W. Ahlwinckle, 1 Victoria-street, S.W.; R. Stephen Ayling, Parliament Mansions, Victoria-street, S.W.; Harnor & Pinches, 5 John-street, W.C.; P'Anson & Co., 7 Lawrence Pountney-hill, E.C.; F. T. Smith, Parliament Mansions, Victoria-street, S.W.; and Spalding & Cross, 15 Queen-street, E.C. The committee recommended that the foregoing architects should be invited to compete for the new baths and wash-houses, and that the president of the Royal Institute of British Architects should be invited to communicate the names of three gentlemen competent to advise the vestry on baths architecture, for the selection of one as assessor, to advise and report on the designs sent in. The recommendations were adopted.

BACTERIOLOGICAL EXAMINATION.

The London County Council a short time ago addressed a communication to each of the vestries and district boards throughout the metropolis, asking them whether they would be in favour of the council applying for Parliamentary powers to establish a bacteriological laboratory. The idea is to appoint an expert or experts in connection with the projected institution, or otherwise to make arrangements whereby medical officers of health and medical practitioners in London could obtain, at the expense of the county, the examination by a competent bacteriologist of material from suspected cases of infectious disease, with a view to making in the future. Among those authorities which have already pronounced in favour of the project are the vestries of St. Andrew and St. Pancras.

PREPAYMENT ELECTRICITY METERS.

As various corporations in the country have evinced considerable interest in the system of prepayment meters, and as one or two have practically decided to adopt such an arrangement, it will be interesting to describe a practical form of it at present on the market. It is known as the Bastian prepayment meter, and is the result of numerous experiments from various forms. This prepayment arrangement does not imply a special form of meter, for the device

FIG. 1.

can be attached to any of the well-known types of meter. The illustrations by which we shall endeavour to explain the working of the instrument show the prepayment mechanism applied to a Thomson watt-meter. The operation of the instrument, by means of a coin, is an interesting and ingenious one. Until a coin is inserted the handle, which projects from the cover, is free to move; a coin, when pressed through the slot, falls into a groove, and forms a rigid connection between the handle and the interior mechanism, and a turn of the handle switches on the current. The arrangement of the meter will be better appreciated by referring to the detailed parts. Fig. 1 shows the meter and prepayment attachment entirely enclosed, the form in which the

FIG. 2.

mechanism will be usually sold. Fig. 2 is the front view of the meter, the only features to be noticed here being the coin receiver or shoot shown at O and the pointers N, N, the exact function of which will be referred to subsequently. Fig. 3 gives a detailed view of the prepayment mechanism seen from the back of the meter.

We will now follow the action of the apparatus. Upon the insertion of the coin at B, which makes a mechanical connection, the handle, H, is turned. One result of this is to operate on the pivoted end of the switch, T, which is depressed into the mercury cups, M, thus completing the cir-

cuit through the meter. The switch is held in the mercury cups, against the tension of a spring, by means of a clutch, D. The turning of the handle does more than merely put the switch on. In fact, the operation that we are about to describe is probably the most important in the complete action of the mechanism. Above the dials of the meter (Fig. 2) will be observed two pointers, and the relation of these to one another is very important. The handle, H, being in connection with a rod, G, its movement will cause a partial revolution of the pulleys, L₁ and L₂. These pulleys are connected together by means of a miniature raw-hide belt. Pulley L₁ is mounted on an axle which carries one of the pointers already alluded to. It will be seen therefore that when the handle is turned one of the needles, through the medium of the pulleys, is moved away from the other pointer, the exact distance of its movement being predetermined. The second pointer is geared to the train wheels of the meter, and when the switch has been put on by the agency of a coin the meter commences to run and the second pointer travels slowly after the first one. The exact distance it has to traverse before it overtakes the first pointer is a measure of the current consumed; in fact, the first pointer is caught up by the second pointer in a time inversely proportionate to the amount of current flowing through the meter. The distance that the first is separated from the second is determined by the gear wheels, which are proportioned according to the price per unit and the value of the coin with which the mechanism is intended to be operated.

The more coins that are dropped in up to a certain limit the further the first pointer will be separated from the

FIG. 3.

second, and they will be a proportionately longer time in coming together. One side of the first pointer is insulated, so that it can come in contact with one side of the second pointer with impunity. The other side, however, carries a platinum contact, and when the second overtakes it and comes into actual contact a current of electricity at once flows round the electro-magnet, E, whose armature is immediately raised and pulls the clutch, D, away from the switch, F, which immediately flies into the off position. From observations we have made the action of the meter seems to be certain, and the instrument ought to meet with considerable success. It is manufactured and sold by the Penny-in-the-Slot Electric Supply Syndicate, Limited, 41 and 42 Parliament-street, S.W.

ARBITRATIONS AND AWARDS.

Mr. W. Ambrose, Q.C., who acted as arbitrator in the hearing of the claim of the executors of the late T. Danby against the Leigh District Council (see p. 302 ante), has issued his award. The claim was for £13,000 for the acquisition, by the council of the shop and premises, 24 Market-street, Leigh, for the purposes of street improvement. It included the value of the land, buildings, stock-in-trade, goodwill and damages for injury to trade by compulsory removal, &c. Witnesses on behalf of the claimants gave the value of the freehold, interest and fixtures as £7,975, and estimated that the premises would let on lease at £250. On behalf of the council, however, witnesses valued the property at £4,574. The arbitrator's award is £7,142.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

VOLUNTARY PASS EXAMINATION.

Candidates whose names have been entered for the above examination must attend at the Technical School, Princess-street, Manchester, on Friday, the 30th September, at a quarter before 10 a.m., and the following day at 8.15 a.m.

Candidates will only require to take with them a small pocket set of drawing instruments.

Intending candidates for these examinations will greatly facilitate the work of the secretary by enclosing an addressed postal wrapper when asking for a copy of the syllabus.

11 Victoria-street,
London, S.W.

THOMAS COLE,
Secretary.

THE WEST RIDING RIVERS BOARD AND TRADE REFUSE.

Major-General Crozier, R.E., on the 11th inst. conducted two inquiries at Diggle, on behalf of the Local Government Board, with reference to applications made by the West Riding Rivers Board for power to take proceedings against Messrs. A. W. Lawton & Sons, of Cant Mill, Diggle, and Messrs. Jonathan Chambley, Sons & Co., of S one Bottom Mills, Dohersoy, respectively, for having introduced their trade effluent, without any purifying treatment whatever, into the Bran clough and the Diggle brook respectively, both tributaries of the Thame.

Mr. A. Lawton, on behalf of Messrs. Lawton & Sons, admitted the pollution, but stated that his firm were merely yearly tenants of the mill, and contended that it was the duty of the landlord to provide works of purification. The inspector pointed out that the Act did not give the rivers board any power over the landlord. He added that he supposed there were other mills to be got.

Mr. E. Rowbotham, of Oldham, appeared for Messrs. Chambley, and urged that it was for the local sanitary authority, to whom they paid a considerable amount each year in rates, to receive the trade effluents into their sewers. The authority had been asked to do so, but had refused.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

BURGH AND ROAD SURVEYOR, SANITARY INSPECTOR, &c.—September 23rd.—Commissioners of the Burgh of Carnoustie. £100.—Mr. William Cosar, town clerk.

SURVEYOR—September 24th.—Stone (Staffs.) Rural District Council. £200.—Mr. J. Buckley Norris, clerk to the council.

INSPECTOR OF NUISANCES—September 26th.—Highworth and Swindon Rural District Council. £120.—Mr. John P. Kirby, clerk to the council.

SANITARY INSPECTOR—September 26th.—Vestry of St. George-the-Martyr, Southwark. £120.—Mr. J. A. Johnson, clerk to the vestry.

SURVEYOR—September 27th.—Bridlington Urban District Council. £160.—Mr. Chas. Gray, clerk to the council.

CLERK OF WORKS—September 27th.—Corporation of Guildford. £2.—Mr. Ferdinand Smallpiece, town clerk.

HIGHWAY SURVEYOR—September 27th.—Tendring (Essex) Rural District Council. £175.—Mr. A. J. H. Ward, clerk to the council, 12 Church-street, Harwich.

ASSISTANT INSPECTOR OF NUISANCES—September 29th.—Corporation of Leicester. 30s.—Mr. James Bell, town clerk.

SANITARY INSPECTORS (Two)—September 29th.—Chelms Vestry. £120.—Mr. Thomas Holland, clerk to the vestry.

FOREMAN OF STREET GAS LIGHTING—October 1st.—Corporation of Plymouth. £2 5s.—Mr. James Paton, borough engineer and surveyor.

GENERAL ASSISTANT FOR BOROUGH ENGINEER'S DEPARTMENT—October 1st.—Corporation of Plymouth. £100.—Mr. James Paton, borough engineer and surveyor.

SURVEYOR AND INSPECTOR OF NUISANCES—October 3rd.—Arlecdon and Frizington Urban District Council. £120.—Mr. John Bowly, clerk to the council, Council Offices, Frizington.

ENGINEER AND MANAGER OF SEWAGE WORKS—October 5th.—Hampton Urban District Council. £3.—Mr. John Kemp, engineer and surveyor to the council.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

WYVERN—September 20th.—Works of drainage and water supply, for the urban district council.—Mr. C. W. Denton, clerk.

REGATE—October 6th.—Erection of municipal buildings, fire station, public offices, &c.—Mr. Clair J. Grace, town clerk.

ABERVOX—December 1st.—Extension of the covered market, at a cost not to exceed £5,000. £21.—The Borough Surveyor.

CHERTSEY—December 23rd.—Sewerage and drainage system for the No. 1 and 2 wards of the district. £90, £90 and £50.—Mr. T. E. Hurland Chaldecott, clerk to the council.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

EAST SUSSEX—September 23rd.—Erection of two temporary buildings for 100 patients at the county tubercle asylum.—Mr. Henry Card, county surveyor, County Hall, Lewes.

NELSON—September 24th.—Construction of about 1000 sq. yd. of culverting over the river Wulverfen, alongside the wall of the gas-works in Bradley.—Mr. B. Ball, M.A.C.E., borough engineer and surveyor.

MALVERN—September 24th.—Supply of a 10-ton steam road-roller, scardier, stone-breaker and sleeping-van, for the urban district council.—Mr. H. P. Maybury, surveyor to the council.

BATH—September 24th.—Construction of a steam destructor house at the refuse destructor works, Upper Bristol-road.—Mr. Chas. H. Forth, city surveyor.

EXMOUTH—September 24th.—Erection of a cartshed at the town yard, for the urban district council.—Mr. Walter D. Harding, surveyor to the council.

DOVER—September 24th.—Supply of coal for the year ending September 30, 1898.—Mr. H. Symonds, town clerk.

WILLESMAIL—September 24th.—Supply of various articles and materials during the six months ending March 31, 1899, for the urban district council.—Mr. Chas. J. Jenkin, town surveyor.

BRECKENHAM—September 24th.—Widening of Croydon-road and East End-road, for the urban district council.—Mr. John A. Arzeli, surveyor to the council.

BECKENHAM—September 26th.—Erection of about 200 cast-iron ventilating columns, 13 ft. 6 in. high, on concrete bases, together with the laying of 3-in. stoneware pipe connections to the main sewers, &c., for the urban district council.—Mr. John A. Arzeli, surveyor to the council.

LONDON—September 26th.—Erection of a cliff pile sink boundary fence at Brockwell Park, for the county council.—Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, London, S.W.

DAVENRY—September 26th.—Supply and fixing of a 10-ton overhead travelling crane in the recording-room of the new electricity works.—Mr. Chas. Costeker, town clerk.

ST. MARYLEBONE—September 26th.—Supply of 500,000 Australian jarrah wood paving blocks, for the vestry.—Mr. W. H. Garbutt, clerk to the vestry.

DIVOTON—September 26th.—Rebuilding of the Otterhole bridge, St. John's-road, and the erection of stabling, &c., in the cattle market, for the urban district council.—The Town Surveyor.

BILLEKICKAY—September 26th.—Sinking of a well at Little Waley, for the rural district council.—Mr. C. Edgar Lewis, clerk to the council, Brehmwood.

WYVERN—September 26th.—Main drainage of Eynsham, for the rural district council.—Mr. Nicholas Lailey, M.A.C.E., 16 Great George-street, London, S.W.

ROMFORD—September 27th.—Supply of 1,500 tons of blue Gurnsey granite, 400 yards of gravel and 300 yards of huggin, for the urban district council.—Mr. George Bailey, clerk to the council.

LEAMINGTON—September 27th.—Construction of a concrete wall in the river walk.—Mr. W. de Normannville, borough surveyor.

WILLESDEAN—September 27th.—Paving works in Baker-passage, Harlesden, and Newton-news, Kilburn, for the urban district council.—Mr. O. Claude Reason, M.A.C.E., engineer to the council.

SURREYS—September 27th.—Supply of about 350 tons of quartzite or granite, 300 tons of clean pit timber, and 200 tons of huggin or Aylesford gravel, for the urban district council.—Mr. C. A. Copland, surveyor to the council.

LEAMINGTON—September 27th.—Erection of a refreshment arbour in Jephson-gardens.—Mr. H. Consett Passmore, town clerk.

LONDON—September 27th.—Erect on of a new body and alterations to the conveniences at Parliament Hill, and the erection of a new cartshed, bushy office, &c., at Southwark Park, for the county council.—Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, London, S.W.

LEAMINGTON—September 27th.—Prevaling and fixing of various wrought-iron fencing.—Mr. W. de Normannville, borough engineer.

HASTINGS—September 27th.—Excavating and steining two wells, about 270 ft. deep, at Brede.—Mr. D. H. Palmer, M.A.C.E., borough engineer.

EDMONTON—September 27th.—Supply of Portland cement from September 30, 1898, to September 30, 1899, for the urban district council.—Mr. G. Rodes Raston, engineer to the council.

POSTWICK—September 27th.—Supply of various materials, &c., for the six months ending March 31, 1899, for the urban district council.—Mr. H. H. Haden, clerk to the council.

BOROUGH OF PLYMOUTH.

The Corporation is prepared to receive applications from suitable persons for the position of Foreman, who will be required to take charge of the street gas lighting of the borough under the direction of the Borough Engineer.

The person appointed must be competent to test all burners and governors and the illuminating power of the gas by means of the photometer.

Applicants in applying must state their age and full particulars of past experience and present employment.

Applications, accompanied by copies of not more than three recent testimonials, to be forwarded to me not later than the 1st October, endorsed "Foreman."

Canvassing members of the Council, either directly or indirectly, will be deemed a disqualification.

The salary will be £2 5s. per week.

JAMES PATON,
Borough Engineer and Surveyor.

Municipal Offices,
September 20, 1898.

BOROUGH OF PLYMOUTH.

The Corporation is prepared to receive applications for the position of General Assistant in the Borough Engineer's department.

Candidates must be neat and expeditious draughtsmen, competent to survey and level accurately, prepare plans, sections and detail drawings for works of sewerage, road-making and other works incidental to a Borough Engineer's department; also competent to take out quantities and measure-up works.

Preference will be given to applicants having had previous experience in a Borough Engineer's department.

Salary, £100 per annum, increasing by annual increments of £10 to £130. The engagement to be terminable by a month's notice from either side.

Applicant's age must be between twenty-two and thirty.

Applications, in candidate's own handwriting, accompanied by copies of not more than three recent testimonials only, which will not be returned, to be forwarded to me not later than Saturday, October 1st, endorsed "General Assistant."

Canvassing members of the Council, either directly or indirectly, will be deemed a disqualification.

TENDERS WANTED.

THE BRIDGEWATER TRUSTEES invite tenders for the Wiring, Supply of Fittings, Lamps, &c. for the electric lighting of Bridgewater House Picture Gallery, St. James's Park, S.W.

Copies of the specification may be obtained and plans seen at the offices of Messrs. O'Gorman & Cozens-Hardy, Consulting Engineers, 66 Victoria-street, S.W., on and after September 27th, on deposit of 1 guinea.

URBAN DISTRICT COUNCIL OF DARTFORD.

TO CONTRACTORS AND OTHERS.

The Council invite tenders for laying a Surface-Water Drain and for Paving the Footways, Crossing and Channeling in Fulwich-road, within their district, in accordance with plans, sections and specification prepared by their Surveyor, Mr. W. Harston, A.M.I.C.E., and which may be inspected at his office, High-street, Dartford.

Tenders, in envelopes endorsed "Tender for Works in Fulwich road," and addressed "The Chairman, General Purposes Committee, Session's House, Dartford, Kent," must be sent in not later than 5 o'clock, p.m., on Thursday, 6th October prox.

Forms of tender may be obtained of the Council's Surveyor on payment of £10, which will be returned to the person whose tender is accepted on execution of a contract and bond for ensuring the due carrying out of the works and to the persons whose tenders are not accepted upon acceptance of the successful tender.

The person whose tender is accepted will also be required to provide two sureties to the bond, to be approved by the Council.

The contract will contain a clause providing that the wages paid to the workmen employed in the execution of the works shall be those generally accepted as current for competent workmen for similar work in the district.

The Council do not bind themselves to accept the lowest or any tender.

Minutes of Proceedings.

Sanitarians in Congress.

From our point of view it must be confessed that the president's address to the Sanitary Institute Congress was disappointing. Coming, as it did, from Sir Joseph Fayrer, it could not have been other than able, but one looked in vain to it for pregnant suggestions for the future, or even for new presentations of facts which have become familiar to us in the past. With the history of the Sanitary Institute most people who take any sort of interest in matters of public health are now familiar, with the familiarity that breeds respect. In its twenty-second year of existence, and on the occasion of its seventeenth annual congress, one may be permitted again to congratulate it on its magnificent work, and it is satisfactory to find that it has reaped its reward in a well-deserved increase of prosperity, which means increased powers of influence for good in the years to come. When its first congress was held, in 1877, it had 150 members and an income of £240. In 1897 its members were 2,028, and its income £6,000. In the former year five candidates were examined for its now coveted certificates; in 1896 that number had risen to 521. All its great work, Sir Joseph Fayrer tellingly pointed out, has been effected entirely by private enterprise, unaided by any subsidy either from Government or other public authority; and he would have been justified in adding that no little of its influence and prosperity has been due to the marked ability of its secretary, Mr. E. White Wallis. It was not news to the president's audience to hear how, within the past quarter of a century, public opinion has been educated up to bringing pressure to bear upon legislators, in tangible witness whereof has come a crop of sanitary statutes. Unfortunately, however, we can feebly agree with Sir Joseph that, as some of these are permissive and others utterly neglected, much of the benefit they might confer is lost. In spite of the popular belief that public authorities have neither souls to be saved nor bodies to be kicked, Parliament has been too prone to credit municipal boards with consciences. And the result? The association of ideas is not exactly the president's, but his is the allegation that tainted water is still drunk, as was illustrated by the condition of Maidstone and King's Lynn last year; that chimneys still vomit forth their smoke and chemical fumes; that rivers are still polluted; that cesspools and imperfect drains, badly-constructed and ill-ventilated houses still defy alike sanitary law and common sense. One could turn back to records of past congresses and point to the same complaints in similar definite words. Year after year these, and a dozen other sources of death and disease, claim their scores and hundreds of victims; year after year sanitarians clamour for the stern, systematic and scientific enforcement of remedies. We may point with satisfaction, as does Sir Joseph Fayrer, to our great advances since Elizabethan days; but, God knows, our latter-day progress, in proportion to our in-

creased knowledge and resources, has been criminally slow. "It will, perhaps, not be," says Sir Joseph, "until the more complete organisation of the public health administration under a Minister of Public Health be effected, that the full benefits of sanitary legislation will be realised and the people attain to that standard of health and duration of life for which they have a right to hope." We can only re-echo "Perhaps!"

To his reference to tainted water, smoky chimneys and other cherished ills Sir Joseph later adds the careful preservation in their streets by the metropolitan vestries of the fermenting filth that is allowed to accumulate over the day that comes between the Saturday and Monday, and to the practice of those bodies in collecting refuse at all hours of the day. Here, again, is an evil hoary with age and gloriously victorious over opprobrium. They nourish it with antiquarian zest in the heart of London. As in the insanitary days of our forefathers, the citizens of our capital daily place their matutinal muck out on the public ways in all sorts of improvised receptacles; the prowlers of the streets rake it over and distribute much of it to the four winds of heaven, and at their leisure the refuse carts of the first city of the world, foul and uncovered, wind in and out of the heavy traffic "collecting." It is these, and even more petty, anachronisms that we must watch and eradicate. Many forms of death-dealing disease we have either secured immunity from, or at least have reduced from epidemic proportions. But Sir Joseph warns us that our vigilance must never be relaxed. Small-pox must "gang its gait," at least for the five years during which "conscience" is to have full play; enteric fever, the president hopes, is to become less prevalent with improved drainage, the removal of excretal filth and the supply of pure water; cholera is to be similarly influenced; scarlet fever is satisfactorily decreasing, but with regard to diphtheria it would seem that sanitary arrangements as such have had little or no effect upon the sustained prevalence of the disease. We must wait, so far as Sir Joseph carries us, for more knowledge of the behaviour of the micro-organism of the scourge. As to malarial diseases, we may include them, says the president, among those that have become all but extinct in England, though they are still the prominent cause of death in our Eastern empire; but when he turns to tuberculous disease the record is not so satisfactory. It is true that sanitation has in this connection done good by attending to ill-ventilated and crowded dwellings, damp and waterlogged soil, impure water and noxious trades. "We have witnessed," says Dr. James Pollock, "an enormous decrease of deaths from phthisis, and a decided lengthening of its duration. Fewer die of it, and are slower to die when affected." As yet no agents are known which can be applied locally to the interior of the body for the destruction of bacilli or septic material. In this direction we may look with eager hope to the further researches of bacteri-

ologists; in the meantime one misses from the inaugural address the suggestion for compulsory isolation, which we hope some day may be made and acted upon.

From the fullness of his intimate knowledge of India Sir Joseph drew a hopeful picture of the beneficial results of sanitary work there during the last half-century. From 1800 to 1830 the ordinary death rate of the British soldier stood at 84·6; in 1895 it was 15·26, and it has been even as low as 10 per 1,000. The death rate of the native army does not show so great a diminution, but here, too, there is an improvement. So, also, is there with the jail population, though 27·61 per 1,000 was the mortality in 1895. As regards the vast civil population, the president points out that not only have there to be dealt with epidemics, famine and long-established modes of living, which obstruct improvement, but also ignorance, prejudice and religious scruples, which tend to make the people doggedly resist all measures taken for the amelioration of their condition. Yet the published mortality returns during the period between 1882 and 1895 have oscillated between 23 and 33 per 1,000—not, after all, says Sir Joseph, a very high death rate considering the circumstances, but one which is susceptible of diminution. The interest of sanitarians the world over has of late been centred upon the plague which has appeared in India within the last two years, and one notes with relief the optimistic opinion of so high an authority as the president, that already it has been shown to be amenable to sanitary laws, like other epidemics, and that there is a hope that it may be ultimately controlled and got rid of altogether, though there is reason to fear that this will not take place for some time to come.

Returning, finally, to the more general observations in the inaugural address, there are some sentences which come early in the paper but which may fitly close these passing comments. "In some parts of England, where health is the main object considered, it (the death rate) has been as low as 9 per 1,000; in others, where the chief objects are manufacture, trade or money-making, it has been 30 per 1,000. The death rate is susceptible of considerable modification, and we know how it may be increased or diminished; it behoves the nation to exert its power and stand credited with the lowest figure. In fact, it is, within certain limits, at our own control, and whether the people shall die at the rate of 13 or 23 per 1,000 depends on how we recognise our responsibility and put in force sanitary regulations. It is mainly a question of finance. Our sanitarians can say how it is to be done, and are perpetually saying it; but more money, more faith, more energy are needed to deal with this question satisfactorily." One of the first and most practical steps, we venture to add, should be a simple codification of existing sanitary statutes; a second, their more complete, universal and impartial enforcement.

The Opening of Streets.

In his annual report submitted to the Teddington Urban District Council for the year ended June 30th the surveyor, Mr. Marshall Hainsworth, refers to one or two interesting points of practice. About a year ago the Grand Junction Waterworks Company decided to cast upon all persons seeking a supply of water the statutory duty of making good and maintaining the surface of roadways over trenches cut for that purpose, and in consequence of this decision the council undertook the responsibility of repairing this damage on certain terms. The disturbance of the surface of a public highway is only allowed after a license or permit for the purpose has been obtained from the council, and thus a record of and supervision over these operations is obtained, the work being facili-

tated by the courtesy of the water company in submitting regular notifications of the applications made to them for a supply of water. Very few of the parish roads escaped damage from opening during the past year, and Mr. Hainsworth takes particular exception to the clumsy method of opening down to the water mains for the purpose of cutting off the services in cases of non-payment of water rates, a process that is obviated by other companies in various ways. The opinion of the borough engineer of Birkenhead is quoted, to the effect that replacement is not reinstatement, trenches being often closed without any serious attempt to consolidate the loose excavations, that are often indiscriminately composed of road materials and soil obtained in the cutting of the trench. The consequence of these operations is that the road surface is never made good until the road is re-coated or re-formed. Further difficulties have been experienced, owing to the failure of the water company to submit prior to the execution of the work plans showing the position of the new mains to be laid, the result being that they are often laid in very undesirable positions in the roadways. Inferior foundation for plug boxes has also been a cause of unevenness in the road surfaces, but it is expected that the introduction of concrete as a foundation will remove this factor of dis-repair. The experience of the year confirms Mr. Hainsworth in the opinion previously formed that the responsibilities of the maintenance of all public highways should vest solely in one authority—the urban district council acting as the highway authority. He therefore concludes by recommending that the excavation of trenches in public highways for the laying of house drain connections, or gas or water services, be undertaken by the council for the various companies and owners of property upon a schedule of prices based upon the net cost of similar work, as he is convinced that any loss that might accrue from such an arrangement would be more than compensated by the proper reinstatement of the roadways and footways.

Manchester Corporation Electricity Regulations.

The city electrical engineer of Manchester has recently issued a revised set of regulations in connection with the supply of electrical energy which will repay some consideration. Comprising, as they do, some thirty-three pages, the rules may appear to be a little alarming from the consumer's point of view, but, seeing that they are really intended to safeguard the interests of the consumer, few objections ought to be raised. The special feature of the Manchester system of supply—*viz.*, the five-wire arrangement—enables the corporation in many streets to give a supply of electrical energy at a different voltage, ranging from 100 to 400 volts, which is a matter of some importance to many consumers. The majority of the regulations do not differ from those usually adopted by municipalities and companies. The most striking alterations are those relating to wiring and fittings, and the innovation proposed by the city electrical engineer is somewhat startling. Practically all wiring, electrical fittings and appliances of every description situated on any premises intended to be used for the supply of electrical energy from the corporation mains must be approved by the city electrical engineer before the installation is connected. In other words, every detail of an installation has to be submitted to the city engineer before they will be permitted to be erected. Hitherto it has usually been felt that if the consumer's wiring and fittings were reasonably safe, that is if the electrical test applied was moderately satisfactory, current was then supplied without demur. It was generally felt that the test applied was of a somewhat perfunctory nature, and certainly could not reveal much of the inferior work that might exist. It was merely a test of the insulation which might alter from day to day. Mr. Worthingham, the Manchester engineer, proposes to

sweep all this away, and the changes coming upon what have undoubtedly lax methods may cause some perturbation. From a consumer's point of view it does appear to be somewhat parental to insist that all fittings should be submitted to the city engineer before they can be used. It is putting an obstacle in the way of pushing the electric light, and might have the effect of deterring some householders or shopkeepers from having their premises wired if they are compelled to go through the formula prescribed by the city electrical engineer. If the articles were to be submitted only by a contractor, we think there is a good deal to be said for the regulation, but it will never do to make it difficult for the consumer to obtain electric light.

An Appointment at Axminster.

Our readers will find in our issue of September 2nd a reference to the circumstances of an appointment by a rural district council in Devonshire. The details were so extraordinary that but for the fact that we knew our correspondent to be thoroughly reliable we should have hesitated to credit them. We have been at pains, however, to make some inquiries, and find that the story is only too true. We did not previously mention the name of the place, but we shall do so now. It is Axminster. The facts of the case may be briefly given. Last month a special adjourned meeting was held to consider applications for the appointment of a highway surveyor, and select three candidates to attend the next meeting of the council. There were a large number of applicants, and it was stipulated that each candidate should state the salary he would require. One of the selected three was the assistant, or "partner," as he is sometimes called, of the late surveyor, and this candidate, who, we understand, is only twenty-three years of age, was ultimately appointed in preference to more experienced men, at a salary of £150 a year, a higher figure, we believe, than was asked by the other selected candidates. Before the election was made it was thought that the local candidate stood very little chance. One of our correspondents relates a peculiar story in connection with the proceedings. Prior to the final selection the question arose as to whether certain plans of roads under the jurisdiction of the council were the property of that body or not. These plans were then in the possession of, and claimed by, the outgoing surveyor. The council decided that, though the plans were prepared by their surveyor during his term of office, they could not or would not claim them, and the retiring surveyor having given the council to understand that the plans would be at the disposal of his successor if he were elected, elected he accordingly was. Another correspondent informs us that, while the appointment has caused some dissatisfaction in the district on account of the youth and inexperience of the new surveyor, the majority of the members excuse themselves on the ground that he is a near relative of the chairman, and that a year or two ago he paid a large sum of money to the retiring surveyor to become his partner and ultimate successor. These seem to us to be two very good reasons why he should not have been elected.

* * *

An Appointment at Bridlington.

In another column we give some details of the resignation of Mr. Stow, the surveyor to the Bridlington Urban District Council, in consequence of his appointment to Chertsey. At the meeting of the council there was unanimity in praising the work of Mr. Stow, but a disposition to complain because he had not applied for an increase of salary instead of a new situation, the implication evidently being that he might have had the former for the asking. It does not

seem to have occurred to the members that if they thought their surveyor's services were worth more than they were paying it would have been more graceful on their part to have raised his salary spontaneously without waiting for an application. It would also have been more in accordance with the moral fitness of things, for it is the sheerest sophistry to say that anything can justify employers in accepting underpaid work, which is simply a case of taking something for which nothing is given in return. It must be rather annoying to the retiring surveyor to know that, after the admitted excellence of his work, a successor is to be appointed at an increased salary, but he undoubtedly did the right thing in finding another situation in preference to throwing himself on the tender mercies of the Bridlington Urban District Council, however much they may now profess to value his services. We observe that during the discussion at the council meeting a member objected to the salary proposed to be given to the new surveyor, the objection being based on the ground that many tradesmen at the present time were not earning as much. We shall not attempt to analyse the peculiar beauty and subtlety of this argument. There was some compensation, however, in coming across a remark on the part of another member to the effect that a surveyor should be remunerated so that he would be above influence in the discharge of his duties.

* * *

The Bradford Tramway Accident.

Without in any way desiring to anticipate the result of the inquiry that is being held into the lamentable disaster on the recently-opened tramway system at Bradford, the accident ought to have very little bearing upon the subject of electrical working, because it was evident from the very outset that whatever the motive power may have been a similar catastrophe might have occurred. Many of our readers will remember the terrible calamity that occurred on the Huddersfield municipal steam lines some years ago, when one of the steam cars got beyond the driver's control and was capsized at the bottom of a steep gradient in a manner very similar to what happened at Bradford. It may be shown at Bradford that slightly different handling of the controlling apparatus might have averted the danger, but the same may be said of practically every railway accident that occurs. Although the matter seems to be clearly explainable, it will be regrettable if the accident influences any corporation when deciding upon the merits of electrical and other tramway methods, as appears to be the case in Newcastle, where, to judge from the local agitation that is rife, the occurrence at Bradford is likely to have considerable weight. In order to show that the question of gradients is not wholly responsible for the Bradford accident, it may be pointed out that at Bristol and Halifax much more severe gradients are being constantly traversed by electric cars.

* * *

Stratford's Polluted River.

In our last issue we gave a brief report of a Local Government Board inquiry which was held last week respecting complaints lodged by the inhabitants of Stratford as to the polluted state of the Channelsea river, which communicates with the Lea. Among other things it was alleged that an outbreak of diphtheria in Stratford had resulted from the pollution. As the brevity of the report may create an incorrect impression, we print in another column a report on the subject recently presented by the borough engineer of West Ham, Mr. Lewis Angell. There seems to be no evidence that the cases of diphtheria are attributable to the state of the river, and the general health of the district is continuously very good. Cases of diphtheria occur in other parts of the district.

Association of Municipal and County Engineers.

MIDLAND DISTRICT MEETING AT BILSTON.—II.

BILSTON: VIEW OF WELLINGTON-ROAD.

We now conclude our report of this meeting. It will be remembered that before giving an account of the visits and other functions we reproduced Mr. Wilson's long and valuable paper, but were compelled to hold over the latter part, which dealt exclusively with the waterworks. This concluding part of the paper is as follows:—

SEVEN YEARS IN A BLACK COUNTRY TOWN (continued),

By C. L. N. WILSON, ASSOC. M. INST. C. E.
WATERWORKS.

Under the 1850 Act the commissioners obtained powers to construct waterworks and to supply the town with water, and they commenced to pump water from the mines by the Sandy gay engine direct into the water mains, but, as might have been expected, this did not prove satisfactory. About the same time that our Act was obtained the Wolverhampton Waterworks Company was established, and took power to supply Bilston, and then, in a few years after, the South Staffordshire Waterworks Company also took power to supply Bilston, and the Wolverhampton Waterworks Company actually commenced to supply water in the town. The then commissioners made a bargain with the Wolverhampton Waterworks Company for them to supply the town with water in bulk, and the company to withdraw from supplying the township in detail, the charge to the commissioners being 6d. per 1,000 gallons, and the commissioners to do the distribution themselves. At the end of this term the commissioners negotiated with the South Staffordshire Waterworks Company for their price to supply Bilston, but whilst these negotiations were going on the South Staffordshire Waterworks Company, without the knowledge of the Bilston commissioners, entered into an agreement with the Wolverhampton Waterworks Company by which the South Staffordshire Waterworks Company were prohibited from supplying Bilston with water under a penalty of £5,000. Therefore the commissioners entered into a second agreement for a further term of twenty-one years, the water to be taken in bulk, and the price to be 5d. per 1,000 gallons, the commissioners to pay for not less than 220,000 gallons per day, and any excess over the 220,000 gallons per day to be paid for at the same rate. In 1868 the Wolverhampton Corporation proposed to purchase the undertaking of the Wolverhampton Waterworks Company, and promoted a Bill in Parliament to which was scheduled for confirmation by Parliament the before-mentioned agreement between the South Staffordshire Waterworks Company and the Wolverhampton Waterworks Company. The Bilston Township Commissioners opposed this

Bill, on the ground that it would place them in the hands of the Wolverhampton Waterworks Company, and would prohibit them obtaining water from the South Staffordshire Waterworks Company. The result of this opposition was that the agreement between the commissioners and the Wolverhampton Waterworks Company was made perpetual as between the Wolverhampton Corporation and the Bilston Commissioners, subject to a revision in price every twenty-one years. The first term of twenty-one years expired in 1889, and the Wolverhampton Corporation gave notice for an advance from 5d. to 6d. per 1,000 gallons; the Bilston Township Commissioners gave notice for a reduction from 5d. to 4d. per 1,000 gallons. An arbitration followed, Mr. Baldwin Latham being the engineering adviser for the Township Commissioners, and he advised that 3d. per 1,000 gallons was the outside price the Wolverhampton Corporation ought to charge, and that it would be better and cheaper for the Bilston Township Commissioners to construct their own waterworks and become independent of Wolverhampton. He further advised that within 6 or 7 miles of Bilston it would be possible to obtain a good and plentiful supply of water, and, acting upon his advice, the Township Commissioners determined to construct their own waterworks. To do this Parliamentary powers were required, to get rid of the agreement with the Wolverhampton Corporation, which had been made perpetual. The commissioners, however, first of all sought the advice of the Local Government Board, who advised that it appeared to them that the Township Commissioners were only bound to the Wolverhampton Corporation for 220,000 gallons per day, and that the Township Commissioners might construct works for the supply required beyond that. They then applied for a loan for this purpose, whereupon the Wolverhampton Corporation gave them notice that unless they abandoned their purpose they (the corporation) would move for an injunction in the Supreme Court to restrain them. The commissioners refused to abandon their proposal, and the application of the Wolverhampton Corporation for an interlocutory injunction was refused. The Township Commissioners were then advised to promote a Bill in Parliament, so that there was a Chancery suit and Parliamentary proceedings running at the same time. The Bill came before a committee of the House of Commons, who took evidence, but ultimately decided not to pass the Bill, having regard to the Chancery proceedings. The action commenced by the Wolverhampton Corporation for an injunction came on soon after, when the First Court held that the agreement held the Bilston Township Commissioners to the Wolverhampton Corporation for all the water they required.

From this decision the Bilston Township Commissioners appealed, and on this occasion the Court was divided: two judges held that the Bilston Township Commissioners were bound to take all the water they required from the Wolverhampton Corporation, and the other judge held that they were only bound for 220,000 gallons per day. The Township Commissioners were strongly advised to appeal to the House of Lords against this decision, and the appeal was in the list for hearing. At this stage in the proceedings negotiations were entered into by the two authorities, which ended in the Bilston Commissioners agreeing to pay the Wolverhampton Corporation the sum of £9,000 to be released from the terms of the agreement, and also to promote a Bill in Parliament for powers to supply the township of Bilston with water, and to construct their own waterworks; the Wolverhampton Corporation agreeing to help the commissioners to obtain their Bill. The commissioners, in accordance with this agreement, promoted a Bill which became law in 1893 after some slight opposition. In 1895 another agreement was entered into between the two authorities, under which Bilston agreed to pay Wolverhampton the sum of £7,750 for the right to supply such portion of the Cosely District Council as is in the Wolverhampton area of supply; and also for certain mains, valves, hydrants, &c., in this district, and along the Parkfield-road and other roads from the corporation's pumping station at Goldthorn Hill, to the boundary of the Bilston Urban District Council on the Willenhall-road and this was incorporated in the Bilston Improvement Act of 1896; and, after some slight opposition from the Seisdon Rural District Council, was approved, subject to certain concessions to this council. The water area for supply consists now of the township of Bilston, such portion of the Cosely area as was in the Wolverhampton area of supply, and the parishes of Himley, Wombonon, Swidoon, Trysull and Woodford in the Seisdon rural district.

The average daily amount of water pumped is about 840,000 gallons, or about 26 gallons per head per day for all purposes; of this about 5 gallons per head per day is for trade purposes. The water rate is practically 7 per cent. per annum upon the rateable value; nothing is charged for the first water-closet, but a charge of 10s. is made for every water-closet beyond the first per annum, and the sum of 8s. for every bath.

DESCRIPTION OF THE WORKS.

The whole of the works were designed by Mr. Baldwin Latham, M.I.C.E., &c., of Westminster, and the author acted as resident engineer. In June, 1892, a test bore-hole was put down, 4 in. in diameter and 66 ft. deep; and the first come of water was met with at a depth of 30 ft. below the surface. After this bore-hole had been put in a 3-in. pump with 7-in. stroke was lowered into the well, and a steam engine and boiler obtained to drive it; this pump lifted 16 gallons per minute. Below is a table showing the effect of two and a quarter hours' pumping—viz.:

	ft. in.
After 30 minutes pumping water 7 0 below top of bore-holes.	
" 45 "	9 0 "
" 60 "	10 0 "
" 75 "	10 0 "
" 90 "	10 0 "
" 105 "	10 4 "
" 120 "	10 4 "
" 135 "	10 0 "

After the pump was stopped it took forty-seven minutes for the water to rise in the bore-hole until it just overflowed; on no occasion afterwards were we able to lower the water in the bore-hole to a greater depth than 10 ft. from the surface.

In October, 1893, a contract was entered into with Messrs. H. Hughes & Sons to sink the well and drive the adits, and they commenced work on Monday, January 15, 1894. On February 6th the well was sunk 34 ft., and the hand-pumps and pulsometer were beaten, and a 10-in. steam pump was then put to work. On March 22nd the shaft was down 65 ft., and the come of water was 7,363 gallons per hour. On April 11th the shaft was down 91 ft. 8 in., and the come of water was 13,748 gallons per hour. On April 18th the large steam pump was beaten; the water then rose to within 1 ft. 10 1/2 in. from the surface when the bore-hole was plugged, but when the water was overflowing from the bore-hole, in fifteen minutes it fell to 2 ft. 2 in. below the surface and remained constant at that level. The sandstone in the well was tested, when dry, and broken up into sand; 1,061 grains taken; of this, 1,054 grains went through a 2,500-mesh sieve, and 1,047 grains of this passed through a 1,900-mesh sieve. A second 10-in. steam pump was then obtained, and on June 13th the well was down 134 ft., and the come of water was 801,700 gallons in twenty-four hours. From then up to August 8th the water could not be got out, and Messrs. H. Hughes & Sons threw up the contract; from that time Mr. John Hughes, their surety, carried on the sinking of the shaft, and on September 3rd a third pump was got to work, and the men commenced sinking again on September 10th, and went on until September 17th, when the pit was down 142 ft.; at this point the pumps were beaten again. The men got to work again on October 9th, but failed again on October 15th, with the well only 149 ft. deep. It was then decided to sink a second shaft and connect the two by means of headings, and after this was done he still could not go on with the sinking, and it was found necessary to put down our permanent pumps

and allow the contractor to use them in addition to his own: by this means the wells were got down to their full depth and the headings driven for a short distance, and the brickwork finished in December, 1897, as it at present stands. It was decided not to put down the bore-hole in No. 1 well or to drive the headings any further. For the last sixty-seven days, upon which it was necessary to pump from the bottom of the shaft whilst the cast-iron tubing, the oak curbs, and the lower portion of the brickwork were got into position, 101,444,942 gallons of water was raised, or an average of 1,514,444 gallons per day, or 251 gallons per minute. The shafts are both sunk in a trough in what are known as the bunter beds, the particular bed being the upper soft red sandstone, which at this point is about 160 ft. thick, and overlies the pebble beds, which are probably 350 ft. thick. This rock is well known as a good water-bearing strata. The shafts are two in number, one 150 ft. deep and 8 ft. 6 in. in diameter, the other 149 ft. deep only. They are connected by a heading, 6 ft. by 4 ft. and 45 ft. long. The steining in each case consists of the best Staffordshire blue bricks, built in cement mortar, the upper 15 ft. being 14-in. work and the remaining portion 3-in.; the water is carried down behind the walls by means of perforated cast-iron pipes packed round with gravel. The adits are driven the following distances only—viz., north adit, 43 ft. instead of 132 ft.; south adit, 32 ft. instead of 258 ft.; east adit, 79 ft. instead of 343 ft.; and the west adit, 84 ft. instead of 99 ft. The whole of the cement, bricks, &c., were tested on the ground before using.

The original contract was £3,281 10 5
The cost of work, including pumping, was 6,822 0 1

Of this latter sum no less than £2,208 9s. 10d. represents money paid for extra pumping alone. In connection with this contract a wharf, 90 ft. long, was constructed on the side of the canal, and a small brick bridge overflow drain, measuring chamber and a length of roadway, at a cost of £376 12s. 3d.

During the whole of the time the works were in progress the whole of the wells in the district were carefully measured

BILSTON: THE METRE-HOUSE.

every week, the water passing down the stream gauged daily, and the amount of rainfall was also taken daily, and a register of the whole kept for reference. The level of the ground round well is 258.5 ft. above ordnance datum, the bottom of the tank is 252.5 ft. above ordnance datum, the surface of the stream 252.5 ft. above ordnance datum, and the surface of the water in canal 256 ft. above ordnance datum.

The reservoir is situated at Goldthorn Hill, a distance of 6,617 yards from the pumping station at the Bratch; the bottom of the reservoir is 395 ft. above ordnance datum; the inlet from the rising main being 397 ft. above ordnance datum, the outlet to Bilston 305.33 ft. above ordnance datum, the top water level 607 ft. above ordnance datum, and the surface of the ground on the top is 611.75 ft. above ordnance datum. It is a concrete service reservoir only, constructed entirely of cement concrete with a floated finish; it is 116 ft. 9 in. by 106 ft., divided into nine compartments by eight cross walls, 2 ft. thick, and covered with semicircular arches,

BILSTON WATERWORKS: VIEW OF THE SERVICE RESERVOIR.

the cross walls themselves being each pierced with ten suitable openings; the drains run in the cross walls, and are all collected and connecting to the cleansing pond; twenty-seven Cregeens air-inlets are provided, and a by-pass, so that the water can be pumped direct into the mains whilst the reservoir is being cleaned out, &c. The bottom is 2 ft. thick, and the sides end taper from 3 ft. 6 in. at the bottom to 2 ft. at the top; an overflow and draw-off pipe is also fixed and connected to the cleansing pond, and the necessary manholes, ladders and valve chambers are also fixed. The concrete used consisted of six parts by measure of mixed stone and sand to one of cement, the cement being fresh burnt finely ground Portland, weighing 116 lb. per struck bushel when filled from a hopper with a fall of not more than 1 ft., and to stand 350 lb. to the square inch when tested on a section of 2½ square inches after seven days' immersion in water, and not more than 10 per cent. residuum left in a 2,500-mesh sieve; the stone dressings for gates, &c., are "Pennant." Before the contract was advertised two trial holes were sunk, and it was found that the site was sand and gravel; in fact, the contractor found all the sand and gravel he required on the job. The sand required washing, however, before being used, and the concrete was carefully placed in position; strips of iron, No. 16 B.W.G. and 1½ in. wide, were also put in the concrete work, and after the shutters had been drawn the whole of the inside of the work and the top of the arches outside were floated at two different times with coats of mortar ¾ in. in thickness, and composed of one of cement and one of sand. The work is very well done, and is perfectly watertight, the contractor being Henry Hill, of Maidenhead, and the amount of contract £3,601 17s., the actual cost being £3,574 12s. 9d.

The rising main is 6,617 yards in length, of 14-in. cast-iron pipes, properly tested at the foundry and on the ground to the following tests—viz.,—

Diameter of Pipes.	Description and Mark.	Thickness of Metal.		Length of Pipe in Work.		Depth of Socket.	Thickness of Joint.		Weight of Pipe.	Deviation allowed.	Head of Water in ft.
		in.	ft.	in.	ft.		in.	ft.

14	" D	1	3	3½	7½	—	—	—	466	23	500

The joints are made entirely of lead, cold rings of drawn lead being driven into the socket first until they were half full, and then filled with molten lead and well caulked. Every length of pipe was tested by a force pump to a pressure of 200 ft. above the working head at its upper end, the force pump being fixed at the lower end for all the tests. The hydrants are extra strong, of the loose valve screw-down type for bayonet-joint connection, 2½ in. in diameter; the air valves are of the single self-acting type, 3¼ in. in diameter, with floating ball and leather diaphragm; the stop-cocks are also on the screw-down principle, with loose valves and stuffing boxes, and tested for 300 lb. pressure, of the following weights: ½ in., 10 oz., ¾ in., 20 oz., 1 in., 26 oz., 1 in. 31 oz. metal, 14 lb. copper, 1½ lb. lead and 1 lb. block tin. Morris & Penny's ferrules are used for house connections with cone joints, and their patent apparatus for tapping mains under pressure are used for fixing them. The rising main is laid at a uniform depth to bottom of sockets of 4 ft. 7 in. below the surface of the roadway. This work was also well carried out by the contractor, Mr. Herbert Holloway, of Wolverhampton; not one single joint had to be re-run, and very few wanted setting up a second time. The contract price was £7,154 2s. 4d., and the actual cost £7,115 3s. 7d.

The pumping station is very prettily situated at the Bratch, Wombourn, and consists of a noble castle-like red (Ruabon) pressed-brick building, with Hollington stone dressing, window heads, &c. The building has a Gothic feeling, and the principal portion has four turrets, one at each corner, and embattled parapets. The building consists of area and pump-room, engine-house, well-house, and a small fitting shop, boiler-house and coal store. The pump-house is in the basement, and the walls are constructed of concrete; the remaining walls, both inside and out, are built with red Ruabon pressed bricks. The stack is also built of red Ruabon bricks, and it is 90 ft. in height, surmounted with a cast-iron ornamental railing 3 ft. high, a weathercock and vane; and, to prevent a pollution, Moule's patent earth-closet, with galvanised iron pails, is provided. The contractors for this portion of the work were Messrs. H. Willcock & Co., of Wolverhampton. The contract price was £5,718 6s. 6d., and the actual cost £6,133 6s. 9d.

ENGINES, PUMPS AND BOILERS.

This contract was let in the first place to Messrs. Jas. Watt & Co., of Soho Works, Birmingham, under conditions to be hereinafter stated; but, unfortunately, this old-established firm came to grief before they had half completed their contract, but what work they had finished was very well done indeed, and the author is very glad that the old name of Watt in connection with steam engine works in Birmingham is not to die out. Messrs. Avey's, who purchased the works, having given notice of their intention to trade under the old name of James Watt & Co., Limited. I have also given the same particulars with regard to the tenders of Messrs. Thornhill &

BILSTON: GENERAL VIEW OF THE PUMPING STATION.

Warham, of Burton-on-Trent, who have successfully completed this portion of the work.

On these figures James Watt & Co.'s tender for the engines and pumps, with Hornsby's boilers and Green's economiser, was accepted. The engines are of the verticle triplo-expansion type, and surface condensing, with the three force pumps placed directly underneath the crank shaft, and two well pumps driven from a pin in a disc at the end of the crank shaft, connected by a pitman of pitch pine to a pair of rocking bobs placed over the well, the pumps being about 140 ft. from the surface of the well.

Each engine has a high-pressure, intermediate-pressure and low-pressure cylinder, the internal diameters of which are 16 in., 26 in. and 49 in. respectively. These cylinders were all tested hydraulically to a pressure of 320 lb. on the square inch before leaving the maker's works, have a 3-ft. stroke, and are fitted with valve chests, indicator cocks, escape valves, auxiliary starting valves, cylinder drain cocks, jacket drain cocks, and the necessary gear for working them. The cylinders are lagged and covered, with planished steel and brass bands and screws; each cylinder is fitted with main and expansion valves, the latter ranging from nine to three. The whole of the valve gear is of the Corliss trip type.

The pistons are fitted with Bieckle's improved metallic packing. The piston rods are 5-in. diameter, of forged scrap steel. The crank shaft is set at angles of 120 deg. with each other, the sequence of the cranks being H.P., L.P., I.P. The disc on fly-wheel is set to give a stroke of 3 ft.; the fly-wheels are six-armed, 13 ft. diameter, and weigh 7½ tons; square holes are cut on the face, for barring round. Boiler feed pumps and auxiliary feed pumps are provided; a single air pump, 13½ in. diameter with a 3-ft. stroke, is driven from a disc on the outside fly-wheel.

The condensers contain 600 square feet of cooling surface each; the tubes are solid-drawn brass, 1½ in. inside diameter

and 22 B.W.G. in thickness, fastened to tube-plates with screwed ferrules and packed with asbestos. The force pumps are 11 in. in diameter; the poles are connected to cross-heads under the crank shaft, and worked by side rods; the suction and delivery valves are double-beat and made of gun metal. The air vessels are 3 ft. 9 in. diameter and from the centre of discharge from force pumps to the top of the dome is 12 ft. 6 in.; these air vessels were tested to 800 ft. A Westinghouse air compressor is fixed on the west side of engine-house, for charging the air vessels.

The well pumps are 14 in. diameter, with a 3-ft. stroke, and are suspended by means of two wrought-iron suspension rods 2½ in. diameter, and a 15-in. rising main from specially strong cast-iron girders over the top of the well, the ladders being fixed on the top of these girders; each pump has a Babbitt's metal double-beat valve. The quadrants are of wrought-iron; and the spear rods are pitch pine, 7 in. by 5 in., fitted with strapping plates and bolts.

The materials used had to stand the following tests:—

TEST.	TENSILE.		Percentage of Contracted Area.
	Tons.	Sq. in.	
Bars and rods under 4 in. in sectional area	24	40	
Bars and rods over 4 in. in sectional area	24	30	
Plates	21	10	
Channel, angle and tee iron	22	20	
STEEL.			
Plates, bars, rods, angles and tees	27 to 30	40	

Overhead travelling cranes are provided both in engine and well houses and fitting-shop. The fitting-shop contains one of Thornewill & Warham's horizontal steam engines; one 10-in. by 12-ft. box gap bed, self-acting, sliding, surfacing and screw-cutting lathe; one 6-in. by 6-ft. gap bed, self-

BILSTON: THE PUMPING STATION.

acting, sliding, surfacing and screw-cutting lathe; one 6-in. stroke shaping machine; one planing machine, and one 30-in. double-gear drilling machine; one 2-ft. grindstone, and a bench with vice. There is also a portable smith's hearth outside.

The boilers are Hornsby's water-tube boilers, with about 1,426 square feet of heating space and about 26 square feet of grate space. The tubes are 4 in. internal diameter and about 18 ft. long; the steam and water drum is 3 ft. 6 in. diameter and 23 ft. 7 in. long. They are tested to 200 lb. pressure, and the working pressure is 145 lb. on the square inch. They are fitted with safety valves to blow off at 150 lb. pressure. At first considerable difficulty was experienced with these boilers, said to be caused from the large amount of oil passing from the cylinders through the condensers into the boilers; for the past twelve months, however, they have worked very well, and now that a double feed-water filter (Reeves') has been fixed, there does not appear to be any reason why they should not continue to do so. The economiser is one of Green's, of Wakefield, the heating surface being about 784 square feet; it was tested hydraulically to 300 lb. pressure, and is provided with a safety valve to blow off at 150 lb. pressure.

A number of tests were made by the author on January 26, 1897, when, with an average piston speed of 141 ft. per minute, the average indicated horse-power was 139.2725, and the coal consumption 1.7232 lb. of coal per indicated horse-power per hour. On February 10, 1897, another test for coal consumption alone was made, and came out at 1.79 lb. of coal per indicated horse-power per hour; the contractor's speed was 150 ft. per minute. Thornewill & Warham's contract to complete the work was £8,622 10s. 6d.

The water mains in Wombourne, Trysulland Soisdon, containing several miles of 2-in., 3-in., and 4-in. pipes, with hydrants, sluice valves and air valves, were laid by Mr. Hy. Roberts, of West Bromwich. These water mains have to carry an average pressure of, say, 160 lb. on the square inch, and the pipes had to be made extra strong on that account. The joint used was the same as the one on the pumping mains—i.e., it was all of lead. The pipes had to undergo the following tests at the works and on the ground—viz.,—

Diameter of Pipe.	Thickness of Metal.	Length of Pipe.	Depth of Socket.	Thickness of Joint.	Weight of Pipe.	Deviation Allowed.	Head of Water.
in.	in.	ft.	in.	in.	lb.	ft.	ft.
2	3/16	6	2 1/2	3/16	67	2	900
3	1/4	9	2 1/2	3/16	168	4	900
4	5/16	9	2 1/2	3/16	213	6	900

For testing the joints the full working pressure from the reservoir was used, the pipes being laid from the rising main outwards, so that this could be done before the lengths were filled in; the hydrants and air valves were the same as those on the rising main. Where the pipes are less than 3 ft. from the surface of the ground they are surrounded with slag wool and wood covers screwed together; where the pipes

cross canal or other bridges they are covered with slag wool and then cased in wrought-iron casing bolted together, the internal diameter of the wrought-iron covering being 9 in. The cost of this portion of the work was £3,533 12s. 6d.

For the prevention and detection of waste of water the author has divided the whole water area into eight separate districts, each district being controlled either by a Demarc, or Siemens's, or a Kennedy water meter fitted with a clock and clockwork arrangements for taking diagrams. The districts themselves are divided into streets and sections by means of sluice valves, and by this means it is possible to find the street or sub-section in which the waste is going on, and by means of the stop taps on each service to find the house, and by means of inspection from service to service to exactly locate the leak, either on the service pipe or the main itself. In addition to this, before any water can pass to the town from the reservoir it can be passed through three Kennedy's water meters, two 8-in. and one 6-in.; these meters are also fitted with clockwork arrangements for taking diagrams. When the whole of these meters are fixed and in working order the author hopes to get down the water consumption to about 750,000 gallons per day. The cost of this work is about £900.

To complete the scheme the commissioners in the Bilston Improvement Act, 1896, took power to lay down a telephone from the author's office to the pumping station, and a water-level indicator to indicate the depth of water in the reservoir; this indicator to be connected to instruments at either end—i.e., one in the author's office at Bilston, and the other at the Bratch. This telephone line, &c., is also part of Mr. Latham's scheme. The sanction of the Local Government Board has just been given to a loan for the erection of a manager's house, and the question of enlarging and extending the water mains in the township is now under consideration.

Total	£60,561	18	10			

With the engineer's charges, the manager's house and

several other items, the total cost will not be much under £70,000. Last year supplied by Wolverhampton Corporation, April 1, 1895, to March 31, 1896. Paid Wolverhampton £3,353 0s. 8d. for 160,945,300 gallons, at 5d. per 1,000 gallons. The cost of distribution was £650 6s. 6d., or say, 1d. per 1,000 gallons. Making a total cost of 6d. per 1,000 gallons. Gallons per day 440,672, or gallons per head per day 19.16, cost first twelve months in our own hands. Total cost, including nothing for loan charges, £3,493 16s. 9d.; water pumped, 307,970,000, or 2 1/2 d. per 1,000 gallons; loan charges, 1d. per 1,000 gallons; and distribution, 1d. per 1,000 gallons: this equals 4 1/2 d. per 1,000 gallons. Gallons per day, 842,657; gallons per head per day, 27.18. The second year's working will be much less than this, but the returns are not complete yet, but I hope to send them in for insertion in the "Proceedings." In the year 1896 about 4 gallons per head per day trade purposes. In 1897 about 5 gallons per head per day trade purposes.

The author begs to thank Mr. Wassell, the town clerk of Bilston, for the assistance given to him in preparing this paper, Mr. Baldwin Latham for allowing him the use of the drawings in connection with the water scheme, and Mr. George T. Lawley, the author of the "History of Bilston."

THE ROUND OF VISITS.

When the formal business was concluded at the Town Hall the company left in brakes, which had been kindly provided by Councillor Sankey, in order to visit the Spring Vale furnaces, where, by the courtesy of Sir Alfred Hickman, the process of steel manufacture was watched. Mr. W. Moore, manager of the works, conducted the members over the

works and explained the various processes, including the heating, rolling and shaping of ingots, and the sawing and shearing of bars and plates, all of which was followed with the closest interest and attention. As Mr. Greatorex subsequently remarked at luncheon, the heat was rather greater than most of them were generally accustomed to, and on account of the thick white dust they could have wished that the dust-cart had preceded them, but it was an undeniable boon to have an opportunity of visiting works of the kind, which are among the largest in the country, and in which over 1,000 men are employed.

Having re-entered the brakes, the company proceeded on their way, the next stoppage being made for the purpose of a brief inspection of the covered service reservoir, which has been so fully dealt with by Mr. Wilson in his paper that no further reference need be made to it. One of the special supplements in our last issue consisted of a reproduction of the plans of the reservoir, and in this issue we give a view of the interior.

The drive was then resumed through a most attractive district just outside the Black Country, the destination being the Himley Arms Hotel, where a very pleasing function took place in the shape of a luncheon, provided by Councillor Harper, chairman of the council. A number of toasts were proposed, and the various sentiments expressed deserve some record.

Mr. A. T. DAVIS (Shropshire) proposed the health of the "founder of the feast," to whom a hearty vote of thanks should be accorded for his hospitable treatment, thanks being also due to the council for their kind reception, for the use of the council chamber and the technical school for the purposes of the meeting and for arranging the visits to the various places of interest. Under such favourable circumstances they would be very pleased to come into the Black Country again.

Mr. GAMMAGE (Dudley), in seconding the vote of thanks, testified to the instruction to be derived from the visit.

Councillor HARPER, in replying, expressed pleasure in receiving a visit from such a body of men. He hoped they would have no cause to be disappointed with their visit. They were about to see one of the finest waterworks in the country, overhead a magnificent building, underneath the best water procurable. Bilston had a history of which few towns could boast. Not only did it possess its iron works and its various manufactories, but they had here a stone quarry which brought to light some of the finest grindstones obtainable. The town was notable for its Japan work, and was some time back extremely rich in its minerals. This industry, however, was dying away, owing to the first layer of coal having been got and it being impossible to get at it lower down because of the enormous floods of water. He thought that the works of Councillor Sankey might have been included among the places to be visited, as the visit would certainly have been profitable.

Mr. PRICE (Birmingham) moved a vote of thanks to Councillor Sankey for providing the conveyances. The cordial reception they had met with proved the kindly feelings that existed in the Black Country. Staffordshire, as he had himself experienced, was noted for hospitality and other good qualities, and Bilston was evidently no exception. The people of Staffordshire had a large share of local patriotism.

Mr. A. T. DAVIS, having seconded, and the vote having been carried with acclamation,

Councillor SANKEY, in reply, said that such a meeting being held at Bilston gave a fresh status to the town, and he regarded it as an interesting epoch in the town's history. He was pleased that they had works in the town worthy of being visited, and he hoped the Bilston meeting would be remembered by them and that many of them would gain instruction by the visit. He also felt very strongly that when he had the power to make their engineer and surveyor, Mr. Wilson, better known it was his duty to do so, for he knew that he had devoted himself almost night and day for the past seven years to the good work of the town. Bilston, he continued, had been very fortunate in receiving the services it had from Mr. Wilson during these years.

Mr. A. D. GREATOREX (West Bromwich) moved a vote of thanks to Sir Alfred Hickman for granting them permission to visit the Spring Vale works, and to Mr. Moore, the manager of the works, for so kindly and courteously showing them round and explaining the processes.

Mr. MOORE having briefly acknowledged the vote of thanks,

Mr. CLARSON (Tamworth) proposed that a hearty vote of thanks be accorded to the author of the paper which had been submitted. Mr. Wilson had evidently devoted a great deal of time, thought and trouble in producing so able and comprehensive a paper, from which the members could gather information of great interest and profit. It was a great advantage to secure the paper prior to the meeting, and thus acquaint themselves with its contents and prepare themselves better for discussing it. He hoped it would not be their last visit to Bilston.

Mr. PRICE said he had pleasure in seconding the vote of thanks, which was carried unanimously.

Mr. WILSON in acknowledging the vote of thanks said he would be sufficiently repaid if any members were able to gather from his paper information which would be useful to them.

When this interchange of courtesies had been concluded the party resumed their drive, the destination now being the Bilston waterworks pumping station at the Bratch, Wombourne. As our readers will observe, the station has been fully described and illustrated in connection with Mr. Wilson's paper. After going through the ordeal of being photographed, the visitors were conducted through the building, in four sections, by Messrs. Sankey, Wilson, Sutherland and Carne (works manager). They then assembled in front of the building, and a brief discussion ensued.

DISCUSSION OF MR. WILSON'S PAPER.

The CHAIRMAN having invited remarks on the paper,

Mr. MORTIMER (Tettenhall) pointed out that under the Rivers Pollution Act a canal was defined as a river or stream, and he was curious to know why they were allowed to run the effluent into this canal for so long.

Mr. PICKERING (Nuneaton) wished to refer to one matter. As the work was carried out by so able an engineer as Mr. Baldwin Latham, he would like to know whether the idea as to the size of the reservoir was Mr. Latham's. In most waterworks schemes the storage capacity was for three days, and certainly not less than two. Here there was only storage capacity for one day.

Mr. PRICE (Birmingham) pointed out that the net total cost of pumping worked out at 2½d. per 1,000 gallons. The water seemed pretty hard, and if that was a permanent condition he was surprised that the authorities did not go in for a softening process. They had not yet seen the technical school, but judging from the plans and photographs, Mr. Wilson was to be congratulated on a very simple and effective elevation. The district council had been successful in obtaining a fairly good building at a reasonable cost.

Mr. CLARSON also referred to the cost of pumping, and cited a case in his own experience in which the cost was only a little over 1d. per 1,000 gallons. There was the same depth, 150 ft., and the same rising main. Coal was delivered at 6s. 6d. per ton. Mr. Wilson was to be congratulated on his elaborate figures. They were glad to have the papers in advance, so that they could come prepared for discussion.

Mr. DAWSON (Banbury) said that in constructing a concrete floor for the swimming bath Mr. Wilson had put iron bars the whole length, 12 in. apart. As he was about to construct a swimming bath, he would like to know whether that was desirable. He proposed to put down 10 in. of Portland cement concrete, and cover with 2 in. thick of cement rendering.

Mr. SMITH (Kettering) referred to the amounts which had been expended on the baths, and wished to know if there was any likelihood of the baths being a paying concern. His council would go in for baths if they did not require to sacrifice more than £300 a year. He would like some particulars as to the number of persons and the revenue.

Mr. PRICE (Worcester) referred to the height to which the water was pumped, which ought to be taken into consideration in connection with the cost per 1,000 gallons. The great pressure must prove a drawback after a time, and must lead to a great waste unless reducing valves were used. He did not think that mains less than 3 in. in diameter were advisable, and in towns of any size they should not be less than 4 in. At Bilston there was a very great pressure and a good supply of water. Generally speaking, 3-in. mains had to be taken out after a time. The district council should congratulate themselves on the cheap rate at which the concrete had been obtained.

Mr. GREATOREX (West Bromwich) congratulated Mr. Wilson on his excellent paper, for which a great deal of credit was due. The council had had their work done in a very cheap manner, especially as Mr. Wilson had only had the assistance of one pupil. Considering the amount of work that had been carried out in a very short space of time, he thought the surveyor should have been provided with a better staff.

Mr. MYATT (Leek) inquired as to whether steam fire-engines would not be of service.

Councillor SANKEY said it was not fair to judge of the capacity of the plant by the work of the first twelve months, and from the initial cost. They aimed at reaching 1d. per 1,000 gallons, and they would probably reach it. He had started with only one engine, and, in addition to delays and other difficulties, they had also to pay schedule prices for engines and others.

Mr. EAVES, after a reference to the difficulties under which Bilston had started in connection with the water supply, said that Mr. Wilson was to be congratulated on the way in which his contracts were carried out. On page 8 it was mentioned that in connection with a contract of £3,500 the extras amounted to only 4s. 6d. As a rule, extras formed a large item in contracts, and in the majority of cases were unavoidable. The cost of the electric lighting in the baths and the markets was exceedingly low, and if it could be produced at this rate in a small installation its substitution for the dearer gas was worth consideration. In connection with the technical schools he noted that the extras were only £10 in a £5,000 contract, and he would like to know if Mr. Wilson could give the cost of management and say whether the grants covered expenses, or had to be supplemented by a rate or contribution. The attendance was certainly exceedingly good. A point that was new to him was the jointing of water pipes entirely with lead and without using yarn. He thought it was a good idea to get rid of the yarn difficulty in the

way Mr. Wilson had done. They were also told that where the pipes were less than 3 ft. from the surface of the ground they were covered with slag wool. That, as they were aware, was probably to counteract the effects of frost, and it seemed to him quite a new departure. The particulars of cost given in the latter part of the paper were exceedingly valuable and interesting, as showing the details of each item. They could then form a good opinion as to the economy effected. The total cost told them nothing, but when they had the prices of bricks and other materials they could judge better than when figures were lumped together. He would like to know if Mr. Wilson could supplement the details given by a few figures as to the cost of laying and jointing the mains.

Mr. WILSON, in replying, referred first to the question of Mr. Mortimer in regard to the canal. As pointed out in the paper, only the effluent was discharged into the canal. The canals in the Black Country were not so pure as elsewhere. The canal company wanted water, and were glad to take the effluent. A scheme was now being considered to deal with the difficulty, but it was not completed. If desired he could give all the particulars. He had tried all experiments, including the new bacteriological craze. Mr. Pickering had referred to the size of the reservoir. Originally the scheme was for Bilston alone, and they had a supply for two days. They had subsequently taken in a large outlying district, and thus it came that they had only one day's supply. He agreed with Mr. Pickering in regard to the question of capacity. Mr. Price had referred to the cost of 24d. per 1,000 gallons, but, as Councillor Sankey had pointed out, it was not fair to assume that the price would be always 24d. After referring to some of the causes which had led to the heavy cost at first, Mr. Wilson said that Mr. Price had recommended a softening process, but that gentleman was evidently not in the brewing trade, or he would have known the advantage of having the water hard. The employment of the bars of iron to which Mr. Dawson had referred had given good results, and he had no cause to regret it. Dealing with the remarks of Mr. Smith (Kettering), Mr. Wilson pointed out that the baths had originally been built only as wash-basins and slipper baths, at a cost of £2,750, and had been bought for £1,100. Since then the town had spent £3,500, including the laundry and the electric lighting, part being borrowed for thirty years and part for ten years. He could, if necessary, give the number of bathers from the time the baths were started. Baths would neither pay working expenses nor interest on capital, and he did not think this should be taken into account in providing baths in such a district, in which they were a great boon to the labouring class. In reply to Mr. Price (Worcester), Mr. Wilson said he did not believe in reducing values. So far they had found very little loss. He quite agreed with what had been said as to the size of mains, but, when they found that at a distance of about a mile they had only one house to supply, they found with the pressure available that a 2-in. pipe was sufficient. In low-lying parts the mains were not less than 3 in. in diameter. In connection with the price of concrete they should note that the material excavated—sand and gravel—was afterwards used for the composition of the concrete. In reply to Mr. Myatt, Mr. Wilson said that steam fire-engines were not thought necessary. Referring finally to the points raised by Mr. Eays, Mr. Wilson reminded them that in connection with the electric light the same plant was used for the heating and for supplying power to the laundry. The technical schools did not pay for themselves, the town being rated to the extent of 1d., while the county council made a similar grant. This year the schools would be even more successful than last year. In regard to the jointing of the pipes with lead, he pointed out that the water found its way through when yarn was used, while with lead there was no such risk. He would, if desired, supply the cost of jointing and other particulars desired by Mr. Eays.

As soon as the discussion had closed the members of the party proceeded to drive back to Bilston, the destination being the technical school. After an examination of this interesting building, which reflects so much credit on a town of the population and rateable value of Bilston, a goodly number assembled there later to do justice to an excellent dinner provided by Mr. J. S. Hiffe, of the Pipe Hall Hotel, Bilston. Various toasts formed the text of excellent speeches, and thus ended an interesting and instructive visit to a Black Country town.

THE EAST LONDON WATER FAMINE.

DEPUTATION TO MR. CHAPLIN.

On Saturday afternoon Mr. Chaplin, the President of the Local Government Board, received a deputation from members of the East-End health authorities, organised by the Social Democratic Federation, with reference to the water famine and the London water question generally.

Mr. HAYDNAM having formally introduced the deputation, Mr. GEORGE LANSBURY said the deputation had been put together by the people of the East-End at various public meetings, and they wanted to assure the Government that there was a feeling of indignation at a water famine occurring again in two years. He submitted the following resolution, which was passed at a mass meeting held at Victoria Park,

West Ham and Trafalgar: "That the mass meeting of London citizens protests against the infamous conduct of the East London Water Company in cutting off the water supply of East London twenty hours each day, and calls upon the Government to use such pressure as is necessary to compel the companies responsible for the water supply of the metropolis to connect their mains, and so allow all classes to be treated alike; further, to call upon the Government to summon an autumn session, to place the whole water supply under public ownership and control; and, further, to urge the people not to pay for what they did not get."

Miss KENNISON, a member of the West Ham Board of Guardians, described the sanitary condition of the East-End district. The drains, she said, had not been flushed for a long time, and the smell was indescribable. The deaths from diarrhoea had increased very much in the past two weeks. In fact, there was great danger of an epidemic if the supply of water was not increased.

Mr. H. R. TAYLOR having also spoken, Mr. CHAPLIN, in the course of his reply, admitted the force of many of the representations that had been made, was quite sensible of the serious nature of the calamity, and was not surprised at the demand that this state of things should be permanently remedied. Before discussing the question of the permanent remedy, he would consider what had been, and being and could be done to relieve the strain of the immediate emergency. After citing the testimony of a medical inspector that the scarcity of water had not yet had an appreciable effect in increasing disease in East London, he proceeded to enumerate the various connections already effected and in process of being carried out by the water company, which would increase their available supply by 12,000,000 gallons a day. He had proposals from the company which, if carried out, would add 16,500,000 gallons a day to their normal supply before the next dry season. The cause of the scarcity in East London was primarily the exceptional dryness of the last sixteen months, and, secondly, the circumstance that the East London Company depended mainly for their supply on the river Lea, after the requirements of the New River Company had first been met. An obvious remedy for that state of things was that a connection should be made between the mains of all the water companies in London. He had always entertained that opinion himself, and when the Royal Commission was appointed last year that was one of the matters on which it was instructed to inquire and report. The chairman of the commission had written to him expressing a hope that they might be able to make an early interim report on the subject. In reference to the policy of transferring the whole water supply, it was one on which his mind was perfectly open; but there would be great difficulty in carrying out such a policy, because there was a large area now supplied by the London water companies which was outside the jurisdiction of the London County Council, and the ratepayers of which strongly objected to their water supply being under the control of the council. After reviewing the action of his department, to show that there was no foundation for the charges of neglect and incapacity brought against it, and explaining his attitude on the subject of waste water, Mr. Chaplin doubted whether, even if Parliament were summoned for an autumn session, the object of the deputation would be forwarded in the least. He closed by promising that the representations made to him should be submitted to his colleagues in the Government.

Mr. HAYDNAM thanked the right hon. gentleman for his courtesy, and the deputation then withdrew.

INVERNESS AND ELECTRIC LIGHTING.

At a meeting of the Electric Light Committee of Inverness Town Council, on Thursday, a report was submitted by a southern expert on the question of introducing electric light into Inverness under municipal auspices. It was favourable to a scheme whereby the water of the Caledonian canal could be utilised, it being calculated that a fall of 30 ft. can be obtained within a short distance of the town. He recommends the provision of 500 horse-power to begin with, which he thinks could maintain 5,000 lamps of 16 candle-power each. There is little doubt, he adds, that the Caledonian Canal Commissioners would sanction the use of a much larger water-power at any future time if it was desired to extend the light, and that without producing an undue velocity of water in the canal, the latter point being one which has given rise to considerable discussion among local experts. It is estimated that for an annual payment of £600 water to produce 500 horse-power can be obtained from the canal. The committee considered the latter estimate rather high, but agreed to defer consideration of the whole scheme until a future meeting.

The New Penny Magazine is the title of Messrs. Cassell & Co.'s new weekly periodical, of which the first number is to appear on October 19th. The publishers inform us that it will provide a greater amount of readable matter and illustrations than has been hitherto given for a penny in any magazine. Each issue is a continuation of the four volumes, fully illustrated.

The Sanitary Institute.

THE SEVENTEENTH ANNUAL CONGRESS.—I.

It is not necessary to detail here the aims and objects of the Sanitary Institute. They are already widely known and upheld. Summarised, they are the promotion of the advancement of sanitary science in all or any of its branches, and to diffuse knowledge relating thereto. That they have attained a very full measure of success is evidenced by the fact that the Institute has been in existence for twenty-two years, and that its seventeenth annual congress this year finds it numerically stronger than ever in membership, with an increasing income, more influential as an educational body and yet full of the vigour of youth.

Its congress of this year was opened on Tuesday, in Birmingham, and in its earliest stages everything pointed to a success which will undoubtedly compare favourably with any of the previous gatherings in its history. Something of this is due to the admirable arrangements made by the Institute's executive; much of it is due to the splendid facilities offered for such a meeting by a city with a central position and such fine public buildings as Birmingham possesses. Nor is the enterprising city to be outdone in the hospitality it extends to its officially-recognised visitors, albeit we have it on the authority of the Lord Mayor that the visits of learned societies have of late assumed the proportions of an epidemic. Social functions, general and sectional meetings, and the early days of the Health Exhibition, which is a feature of the congress, all passed off with those satisfactory signs of success which are marked by full attendances and sustained interest.

OFFICIAL RECEPTION OF MEMBERS.

Altogether the number of the visitors totalled up to some 1,800, of whom 800 are delegates sent by about 400 authorities scattered throughout the country. The majority of them met on Tuesday in the Council House, where they were formally received by the Lord Mayor (Councillor C. G. Beale), who was accompanied by the Lady Mayoress.

The LORD MAYOR cordially welcomed the members and delegates. Whether the present gathering was destined to be a success or not, he said, no one could doubt that the Sanitary Institute's congress was entitled to rank with the highest of the important gatherings of the kind which had been held in Birmingham. There they stood practically upon the backbone of England, within a few miles of the ridge which divided the watershed of the Severn from that of the Trent. As a consequence, the corporation was called upon to deliver a large amount of water for domestic supply, at an altitude approaching something like 700 ft., a physical difficulty with which few cities had to contend. It followed, also, that they had no great river running through their midst. If they had possibly their forefathers' fault, in all innocence, have turned it into a common sewer. Apart from these physical conditions, every community had artificial ones of its own creation. There was one in Birmingham which, to his mind, played no unimportant part in its difficulties. Probably no large city was so considerably built upon the leasehold system—a system under which the landlord laid down conditions of building, under which it was assumed that the conditions were to be permanently suitable. They knew with what result. Probably no city had a finer residential suburb. That was due to the fact that the whole parish was in the hands of one landowner, who could dictate the type of residence. The fine street of which the Council House formed one end, and the Great Western Railway station the other, was a remarkable instance of the beneficial co-operation between the landowner and the municipality. The landowner gave up his frontage, and the municipality spent the money in laying it out, and the buildings had a character and uniformity which could not exist if a large number of small owners had to be consulted. The corporation had developed that great Corporation-street without incurring the expenses of buildings, and ultimately would become the owner of the whole property down that street. That was the beneficial view of the leasehold system, but within a stone's throw there were blocks of small properties laid out on plans which eighty years ago seemed all sufficient, and upon which at the present time no one interested spent a farthing, and the Health Committee were face to face with insanitary property. This matter seemed to have a direct local bearing on the great question of the housing of the working classes. In conclusion, his lordship said that upon these and all kindred questions the congress would find no lack of interest in Birmingham.

Sir DOUGLAS GALTON (chairman of the council of the Institute) cordially acknowledged the Lord Mayor's welcome to the members. They hailed, he said, the opportunity of coming to Birmingham, for the municipality of Birmingham stood pre-eminent in the efforts which it had made to advance both education and sanitation. It had spent thousands in endeavouring to solve the problem of dealing with the sewage of inland towns. It was now seeking to bring pure water from the Welsh mountains. Birmingham had solved some of those problems in municipal life which the larger metropolis of London was still in the throes of debating. The

Institute, therefore, thanked the corporation for giving them an opportunity of closely studying their work.

Major LAMOROCK FLOWER and Sir JOSEPH EWART also tendered their thanks on behalf of the members and delegates.

THE PUBLIC LUNCHEON.

Subsequently the members and delegates lunched together at the Grand Hotel, under the presidency of the Lord Mayor. Among others present were Earl Beauchamp, Sir William Pink and Sir Arthur Hodgson. After the customary loyal toast, the LORD MAYOR proposed "The Sanitary Institute," expressing admiration of the great national work it was accomplishing. The public relied on the Institute to guarantee the efficiency of the men to whom they looked to carry out the Sanitary Acts, and the value attached to that guarantee was evidenced by the fact that that week there were present at the congress some 800 representatives of authorities who were sufficiently interested to meet together and compare notes on subjects of sanitation.

Sir DOUGLAS GALTON, whose name was coupled with the toast, responded. The Institute watched over, as far as it could, the legislation of Parliament; but he was sorry that in last year's legislation they had to lament that Government took the view that vaccination might be relaxed. He was not one of those who would say that vaccination could not be relaxed, but he said it could not possibly be relaxed under the conditions which the Government had sanctioned (loud applause). It could be relaxed if the Leicester system of isolation were introduced everywhere, but without that safeguard it was absolutely wrong to have made any change.

Sir JOSEPH FAYREER gave the toast of "The Lord Mayor and Corporation of the City of Birmingham," referring to the many suggestive object lessons which Birmingham presented to sanitarians; and Alderman COOK, whose name was associated with the toast, mentioned that, after a good deal of experience in Birmingham, he knew that very much remained to be done there in sanitary matters, and he hoped the visit of the Institute would prove mutually stimulating.

THE PRESIDENT'S INAUGURAL ADDRESS.

The inaugural address was delivered in the large lecture theatre of the Midland Institute, before an imposing audience. Having been introduced by Sir Douglas Galton, who said that Sir Joseph Fayreer's experience in Indian and general sanitation distinguished him as the most worthy representative whom they could select to preside over the congress, the president then read an address, in which he did not deal with any special branch of preventive medicine or hygiene, but took a general survey of progress during recent times. By way of preface he detailed the steps which led to the formation in 1876 of the Sanitary Institute, and the good work by which it has since steadily developed its purpose of diffusing practical sanitary knowledge throughout the country and has attained its present influential position. The story is now a familiar one to our readers. What the scope of the Institute's work is may be gathered from such facts as these—that in 1897 it organised in London forty sectional meetings and lectures, thirty-six practical demonstrations, four examinations, and 138 classes at the Parkes Museum. This last, by the way, was visited by some 17,600 persons. In the provinces eight examinations were held; while at the Leeds congress there were seventeen sectional and other meetings, and a health exhibition which was visited by 75,790 persons. All this is effected entirely by private enterprise, unaided by any subsidy either from Government or other public authority.

But in addition to the Sanitary Institute there are now, Sir Joseph Fayreer pointed out, many other sources of instruction in matters relating to hygiene and preventive or State medicine. Half a century ago the great mass of the population lived and died under conditions which violated all the now well-known principles on which health depends; now, were all the existing official provisions enforced, little would remain to be desired on the part of the executive Government. Still, the death rate is susceptible of further diminution, expectancy of life may be enhanced, and the general conditions of living and exemption from certain forms of disease are by no means as perfect as they might be. It will, perhaps, not be until the more complete organisation of the public health administration under a Minister of Public Health be effected that the full benefits of sanitary legislation will be realised and the people attain to that standard of health and duration of life for which they have a right to hope.

Although Birmingham could not be ranked by the president of the congress with the great cities which have reduced their death rates, it was hopefully shown that such a process had been going on elsewhere. When the last quinquennium was compared with the preceding decennium it was found that Blackburn and Huddersfield had reduced their death rate by 4, Halifax and Cardiff by 3.8, Oldham by 3.7, Preston by 3.4 and Manchester by 3.3 per 1,000, while Birmingham had been practically at a standstill. If its death rate is to be reduced, thinks its eminent health officer, it is essential that there

should be a continuation of the improvements which had such a good effect some years ago. *A propos* of London, Sir Joseph pointed to, as blots, the action of a certain vestry in leaving dead cats, dirty papers and various kinds of offal unswept from the streets from Saturdays to Mondays, and "the abominable and insanitary practice" of sending out the vestry dust-carts to remove house refuse at all times of the day. The question of pure water supply should also be settled.

A contrast between the present sanitary state of our country and that of the Elizabethan era brought Sir Thomas to congratulations that many of the forms of disease of those days had disappeared, and others had been mitigated. But he was afraid we could not feel confident this immunity would continue, though he showed that some well-known diseases have become less severe in their incidence, if not less frequent in their recurrence.

About a third of the president's address was devoted to the beneficial results of sanitary work in India during the last half-century, a subject upon which no one is better qualified to speak than Sir Thomas Fyfe.

Earl BRATCHAMP, in moving a vote of thanks to the president, said the reference which it contained to the question of vaccination appealed to them all. It was difficult to find words sufficiently strong in which to condemn the action of the Government (loud applause). His only fear was that such a state of things afforded little hope for the future, even if there were a Ministry of Health. He also wished that from that Institute they might get a wave of feeling as to the criminal action of the water companies which refused to supply water to the East-End of London (Applause). That such monopolies should exist in their present form was something more than a local question, for it must ultimately affect the health of the whole nation, and, unless they were prepared to approach the question in the future, they might find that there would be a *fiasco* such as had occurred in connection with the vaccination question.

Councillor MARTINEAU having seconded the vote of thanks, it was carried by acclamation.

THE HEALTH EXHIBITION.

In the evening the Health Exhibition, which has been promoted by the Sanitary Institute, was formally opened by the Right Hon. the Lord Mayor. Mr. HENRY LAW, M.L.C.E., chairman of the Judges' Committee, contrasted the exhibition with the first held, seventeen years ago, observing that it clearly indicated the immense strides that had been made in sanitary knowledge and appliances. The congress all through its history had done its best to encourage improvements in sanitary appliances, and each year it offered awards in competition. Their main object was, however, the education of the general public. He bore testimony to the zeal displayed by the local committee, and to the excellent manner in which they had carried out the whole of the arrangements. Mr. Law, on concluding his speech, presented a handsome bouquet to the Lady Mayoress, who was wearing her right arm in a sling.

The LORD MAYOR said various kinds of exhibitions had been held in Bingley Hall, but the present exhibition, he thought, appealed to every class. But even if it did nothing more than instruct builders and architects, upon whose advice they so much depended in arranging sanitary matters, then it offered a great benefit upon the community.

His lordship then declared the exhibition open.

A vote of thanks was passed to him on the motion of Prof. LANE NOTTER, seconded by Prof. BAILING, and, in acknowledging it, the LORD MAYOR said he had attended exhibitions and exhibitions, but he had never before seen one which was so complete and ready for opening.

In later issues of THE SCRYVYER we shall, as usual, devote considerable attention to the exhibits, many of which mark important advances in sanitary appliances. In the meantime it may be explained that these exhibits are classified in four divisions: (1) Science in relation to hygiene; (2) hygiene of special classes, trades and professions; (3) construction and sanitary appliances, which include building materials, construction and machinery, water supply and sewerage, and heating, lighting and ventilating; and (4) personal and domestic hygiene. Bingley Hall is most admirably adapted to the purposes of such an exhibition, and the exhibits are more numerous than on previous occasions. As usual, Mr. A. T. Thompson is indefatigable in attending to the comfort of exhibitors and others who have to spend considerable time at the hall.

The judges of the exhibition are: Messrs. A. Wynter Blyth, H. Percy Boulnois, T. W. Cutler, Rogers Field, E. T. Hall, H. Law, A. Newsholme, J. Lane Notter, Louis C. Parkes, G. Reid, J. Osborne Smith and W. C. Tyndale. Their first award is as follows:—

We append the first List of Awards:—

Silver Medals.

Jaeger Woollen Underclothing.—Allport's, 21 and 23 Colmore-row, Birmingham.

Case for Water Analysis, and Chemicals in Solids for Water Analysis.—Burroughs, Wellcome & Co., Snow-hill Buildings, London, E.C.

Compressed Chemical Substances.—Burroughs, Wellcome & Co., Snow-hill Buildings, London, E.C.

Products of Coal Tar and Ammoniacal Liquid.—Burt, Boulton & Hayward, Limited, 64 Cannon-street, London, E.C.

Cocoa.—Cadbury Brothers, Bonnville, near Birmingham.
 Pure Carbolic Acid.—F. C. Calvert & Co., Bradford, Manchester.
 Enamelled Cast Iron.—The Cannon Hollow Ware Company Bilston, Staffs.
 Pasteur Chamberland Filter.—J. Dofries & Sons, Limited, 147 Houndsditch, London, E.C.
 Pure Cocoa.—J. S. Fry & Sons, Limited, Union-street, Bristol.
 Brougham Ambulance.—Wilson & Stockall, County Ambulance Works, Bury, Lancashire.
 Accident Ambulance.—Wilson & Stockall, County Ambulance Works, Bury, Lancashire.

Bronze Medals.

Method of Aerating Water by Means of Compressed Carbon-dioxide.—Aerators, Limited, Broad-street-avenue, London, E.C.
 Simplex Cinder-sifter.—Arkininstall Brothers, Milk-street, Birmingham.
 Liquid Sulphur Dioxide for Disinfection.—A. Bonke, Roberts & Co., Limited, Stratford, London, E.
 Petanelle Fabrics.—Briion, Pate, Burke & Co., 15 Walbrook, London, E.C.
 Whitehead's Automatic Taps, for Drawing Off Liquids.—Clark's "Optimus" Coffee Company, Limited, Queen's-road, South Lambeth, S.W.
 Jackson's Self-feeding Water Boiler.—Eclipse Brass and Copper Company, Limited, Harrison-road Works, Halifax.
 The "Helliwell" System of Glazing.—Farrer, Barber & Co., 36 Cannon street, Birmingham.
 Combined Sink and Lavatory.—Farrer, Barber & Co., 36 Cannon-street, Birmingham.
 Hutchings's Food-steamers.—G. J. Hutchings, 94 Clerkenwell-road, London, E.C.
 Jeyes' Fluid.—Jeyes' Sanitary Compounds Company, Limited, 64 Cannon-street, London, E.C.
 Chinosol.—Bernard Kuhn, 36 St. Mary-at-Hill, London, E.C.
 Mellin's Food for Invalids.—Mellin's Food Company, Limited, Peckham, London, S.E.
 Salt-glazed Wash-Tub and Rubber Combined.—Oates & Green, Limited, Halifax.
 Dr. Quine's Ash-Bin.—Pendleton Sanitary Engineering Company, Leaf-square, Pendleton, Manchester.
 Thermometer for Hospital Wards.—W. W. Rolston, 120 Poppe-street, Albion-street, Birmingham.
 Aerated Waters prepared from Distilled Water.—Southall Brothers & Barclay, Lower Priory, Birmingham.
 Triple Vegetable Sink.—Twyfords, Limited, Hanley.
 "Ideal" Sink in Two Compartments.—Twyfords, Limited, Hanley.
 Chlorox.—United Alkali Company, Limited, Gaskell and Deacon Works, Widnes.
 Concentrated Vimbos.—Vimbos, Limited, 130 Queen Victoria-street, E.C.

CONFERENCES.

On Wednesday conferences were held at the Mason University College.

Of the municipal representatives, Alderman J. Cook, J.P., chairman of the Health Committee of the Birmingham City Council, was president; and there was a strong list of vice-presidents, which included Earl Beauchamp (chairman of the Health Committee of Worcester), the Lord Mayors of Liverpool and Leeds, the Mayor of Brighton, Sir William Pink (chairman of the Sanitary Committee, Portsmouth), and other mayors and chairmen of sanitary committees. The secretaries were Councillor J. H. Lloyd and Mr. E. V. Hiley, of Birmingham; the recording secretary, Dr. W. Collingridge.

Dr. J. C. McVail presided over the medical officers of health, who included among their vice-presidents a number of names famous in medical and sanitary science, Drs. S. Barwise (Derby) and A. S. Underhill (West Bromwich) were the secretaries; and Mr. Henry Kenwood (London), recording secretary.

Mr. T. de Courcy Meade, city surveyor of Manchester, presided over the conference of municipal and county engineers, whose vice-presidents were: Messrs. W. B. G. Bennett, Southampton; R. E. W. Berrington; W. Blackshaw, Stafford; A. T. Davis, Salop; J. T. Eays; E. Parnell Hooley, Nottingham; F. J. C. May, Brighton; J. Price, Birmingham; O. Claude Robson, Willeddon; J. Willmot, Warwick; J. E. Worth, district engineer, London County Council; and T. H. Yabbicom, Bristol. The secretaries were Messrs. H. Ashton Hill (Birmingham) and A. D. Greatorex (West Bromwich); and the recording secretary, E. G. Mawbey (Leicester).

Over the Sanitary Inspectors' Conference Mr. W. W. West (Walthamstow) presided; and Messrs. X. Deeks, J. Parker and A. Taylor were the secretaries. There were twelve vice-presidents.

The conference on Domestic Hygiene was "run" by ladies, under the presidency of the Lady Mayoress. The vice-presidents included the Countess of Warwick, Lady Holder, Lady Martineau and others.

In all these divisions of the congress a number of most interesting papers were read, many of them of considerable value from the point of view of the municipal and county engineer. We shall deal with these in due course as space permits. Some special resolutions were also passed. The municipal and county engineers devoted their afternoon

to the practical work of inspecting, under the guidance of Mr. Price, the city surveyor, some of the municipal works of the city, including a public convenience in course of construction, the diversion of the Rea main sewer now in progress, the nearly-finished Edward-street depot, the river Rea improvement works, and the "Queen's Ride." To these, also, we hope to refer more specifically in a later issue.

In the evening a *conversazione* was given in the Council House by the Lord Mayor.

Yesterday was devoted to sectional meetings at Mason University College. Over the first of the three sections—that on Sanitary Science and Preventive Medicine—Dr. Alfred Hill, medical officer of Birmingham, presided. The Engineering and Architecture section met under the presidency of Mr. W. Henman, F.R.I.B.A., the vice-presidents including the following: L. Angell, W. G. Bagnall, C. E. Bateman, Sir A. R. Binnie, H. H. Collins, J. A. Cossins, E. Day, W. Hale, C. Hunt, H. Lea, J. Lemon, W. Martin, E. Pritchard and H. A. Roehling. Messrs. H. T. Backland, S. R. Lowcock and Major Lamoreck Flower were the secretaries. The remaining section—Physics, Chemistry and Biology—was presided over by Dr. G. Sims Woodhead. The Institute has been unusually fortunate this year in securing papers on interesting topics by men who are entitled to be heard, and among the work of the sections many of these contributions were found.

In the evening Dr. CHRISTOPHER CHILDS delivered the usual "lecture to the congress," his subject being "The Prevention of Pollution of our Streams and Rivers." His paper was received with every mark of appreciation and interest.

To-day the work of the sections will be resumed, various excursions have been organised, there is to be a garden party at Eghaston Botanical Gardens in the afternoon, and there will be a formal closing general meeting of the congress. This will not imply, however, that its proceedings are over, for at night the "popular lecture" will be delivered, on "Unnatural Death," by Dr. A. Hill. Further excursions, moreover, will carry the congress on to to-morrow, when some of the members will visit Stratford and Malvern.

In our next issue we shall proceed with our report on the proceedings of the various sections and conferences so far as they are likely to concern our readers, particular attention being given to the conference of Municipal and County Engineers.

THE PRESIDENT OF THE SANITARY INSTITUTE.

Sir Joseph Fayrer, the president of the Sanitary Institute, is the second son of the late Commander Fayrer, of Haverbrack, Westmoreland, and was born in 1824. He was educated privately, at Charing Cross Hospital, London, and at Edinburgh University. He served at the sieges of Palermo and Rome in 1847-48, and in 1850 he entered the Bengal Medical Service, retiring in 1874, becoming surgeon-general in the following year. Sir Joseph took part in the Burmese war of 1852 and in the suppression of the Indian Mutiny, being present at the siege of Lucknow. He was for some time civil surgeon at Rangoon, and Residency surgeon and Assistant Resident, Lucknow, was professor of surgery in the Medical College of Bengal from 1859 until 1874, acted as a magistrate for Calcutta from 1808 to 1874, and was president of the Asiatic Society of Bengal. Sir Joseph, in 1870, accompanied the Duke of Edinburgh in his tour through India, and when the Prince of Wales paid his visit Sir Joseph accompanied him in the capacity of physician to his Royal Highness and chief medical officer to the expedition. He is hon. physician to her Majesty and to the Prince of Wales, Physician in Ordinary to the Duke of Edinburgh, is a F.R.S. of London and Edinburgh, a member of the Academy of Medicine of Paris, and of many other learned societies. Sir Joseph has the third-class Mejidie and Redeemer of Greece, and the second-class of the Order of Conception of Portugal. He has held the position of president of the Medical Board at the India Office, was a member of the Army Sanitary Committee, and is a member of the Senate of the Army Medical School at Netley. He was created C.S.I. in 1868, K.C.S.I. in 1876, and was made a baronet in 1896. In 1855 he married Bethia Mary, the eldest daughter of the late Major-General Andrew Spens, of the Bengal army.

Royal Commission on Sewage Disposal.—The Royal Commission on Sewage Disposal are this week inspecting the works erected at Exeter for the purification of sewage by the "septic" system. Next week they will inspect the sewage disposal works of the town councils of Manchester, Oldham, Chorley and Rochdale. The offices of the Commission have been removed from 16 Victoria-street to 23 Great George-street, Westminster.

Typhoid Fever and Flies.—The commission, consisting of Drs. Lee, Vaughan and Shakespeare, and other medical men appointed to inquire into the cause of the severe epidemics of typhoid which carried off so many men in the American camps during the war, report that the disease was undoubtedly spread by flies, and had it not been for these little pests there would only have been a few isolated cases. They are willing to stake their reputations on these conclusions.

THE BRADFORD CAR ACCIDENT.

BOARD OF TRADE INQUIRY.

Last week, at Bradford Town Hall, an inquiry was opened by Major Cardew, on behalf of the Board of Trade, into the circumstances attending the tramcar accident which we reported in our last issue. At the outset Major Cardew referred to the comments which had been made upon his appointment, inasmuch as he had also made the inspection of the line originally. He pointed out that the construction of the line was determined by Act of Parliament, and if any one believed that the line was not safe and desired to give evidence on the point, he should not be afraid to say so.

Witnesses were first called to prove that when the cars went out that morning they were in perfect order, and were fitted with electric brakes and sand. There was heavy traffic that morning, and two extra cars had been put on. It was in connection with one of those cars that the accident occurred.

Mr. Spencer, the manager of the electric tramways, admitted that he did not regard the brake power as sufficient, and had recommended the committee to attach other brakes, which they agreed to do. He saw danger when the lines were greasy, and accordingly he recommended slipper brakes.

Mr. Cox, city surveyor, expressed the opinion that the cause of the accident was that the hand brake had been applied with such pressure as to stop the wheels, and so put the electric brake out of use.

After hearing other evidence to the effect that the speed of the cars was often excessive, and that the drivers were in some cases incompetent to perform their duties, the inspector adjourned the inquiry.

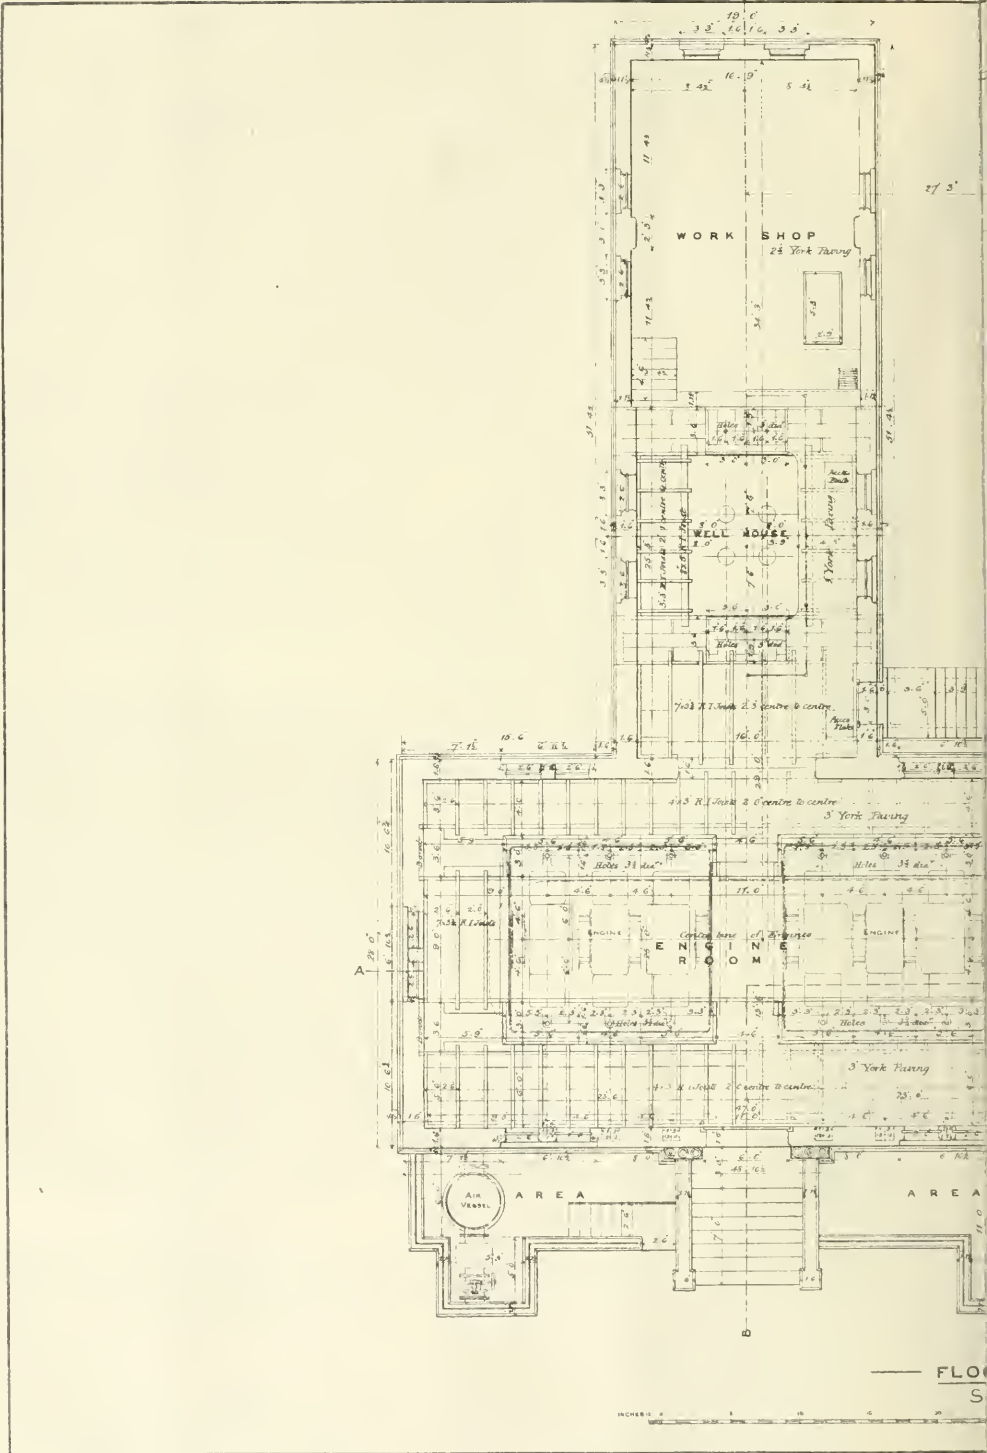

WATER SUPPLY AT CHARD.

Mr. Frederick H. Talloch, M.I.C.E., an inspector of the Local Government Board, held an inquiry at Chard, last week, relative to an application of the corporation to borrow the sum of £2,500 for works of water supply. It was pointed out that the council contemplated laying a new service of water mains in place of the existing mains, which are old and defective. The present water supply is derived from springs just above the centre of the town, and the parts situate above the level of the springs are without any town supply. Opposition was offered to the scheme by residents outside the area of the town supply, on the ground that it would be unfair to charge them a share of the cost of laying pipes from which they would derive no benefit, and it was urged that the town council should carry out a proper scheme of water supply for the whole borough. On the other hand, it was stated that the town council had had various schemes before them, but for one reason and another they had been abandoned. Mr. G. Hodson, C.E., of Loughborough, attended the inquiry, and in very strong terms condemned the present springs from which the town water supply was derived. He declared that he would refuse to be associated with any scheme which contemplated the continued use of water from this source, which he found was liable to contamination at any time. The inspector said one thing was obvious—that there was need for a proper water supply for the whole town, and this would have to be carried out. He strongly commented on the delay and inaction of the town council.

PAVING CHARGES.

WHAT IS A "NEW STREET?"

At the South-Western Court, on Thursday, Mr. John Brett, A.R.A., of Daisyfield, West-bill, Wandsworth, appeared to answer the complaint of the Wandsworth District Board of Works, who sought to obtain the payment of £145 17s. 11d., being the share of expenses for paving Putney Heath-lane. Mr. Michael Brett, barrister, and a son of the defendant, appeared for the defence. He raised the point that the lane was not a new street within the meaning of the Act, and therefore repairable at the expense of the general body of ratepayers. He cited cases showing that the judges had held that in deciding whether a certain thoroughfare was a new street or not attention should be paid to the general character of the houses in the neighbourhood. Mr. Rose concurred. Mr. W. W. Young, who supported the summons, urged that it was a most serious matter for the board. If the contention of counsel were accepted it would amount to this—that a road lined with small houses could be called a street, while a road sparsely lined with large houses of rental of over £100 a year could not be termed a street. Surely his worship could not say that the board would have to wait till the gaps between the large houses were filled before calling on the owners to pay for the paving. Mr. Rose: They can call on the ratepayers to pay. Mr. Young: Well, if you are of that opinion, may I be allowed to withdraw the summons. Mr. Brett objected, and asked his worship to dismiss the summons. Mr. Rose: Yes; it is a question of fact, and I decide, wrongly if may be, but I do not think so, against the board, and I dismiss the summons.

Some Annual Municipal Engineering Records.

ASTON MANOR ; TONBRIDGE ; MIDDLETON.

The last report of the work done in the department of Mr. Harry Richardson, engineer and surveyor to the Urban District Council of Aston Manor, opens with some information concerning the maintenance of the town highways. Main roads have a length of over 2 miles, while the remaining highways measure 40 miles, the exact total length being 42 miles 1 furlong 119 yards. Most of the old roads were constructed without having proper paved crossings at the junction of the carriageways; and it would, in Mr. Richardson's opinion, greatly improve the roads and add considerably to the comfort of pedestrians if all important street crossings were paved. Stone used upon the roads amounted to 6,287 tons and cost £2,052. The carriageways now present a marked improvement on what they were last year, when the expenditure on macadam was very much below the average. Consequently later repairs have been of a rather extensive character.

Mr. Richardson is firmly of the opinion that it is impossible (except at great expense) to maintain busy roads, the centres of which are paved and the sides macadamised, in good condition. The relative hardness of the two materials is so widely different, that unless the macadamised portion is continually under repair a most irregular contour is the result, and until the carriageway is paved from kerb to kerb such roads will always be a source of annually heavy annual expense. Plans and estimates for the paving of the carriageways of the main roads in the district have been submitted to the county council. In the period covered by the report 7,617 loads of mud were carted from the streets to the various tips, as against 9,187 loads last year. It will be noticed from this that the result of not expending the usual quantity of stone upon the roads during 1896 was an increase of 1,570 loads of mud to be removed. As regards the tramways, Mr. Richardson has noticed that the condition of the permanent way of the City of Birmingham Company is in a better condition than that of the Birmingham and Aston Company, this difference being, he thinks, attributable to the fact that, in compliance with his suggestion, the latter company use pitch for ranning in the joints of their paving, while the other still persist in using cement grouting composed of two parts of sand to one of cement, which material Mr. Richardson considers unfit for the purpose. Mr. Richardson has had cause to complain of the worn-out setts which are from time to time re-laid by both companies. Plans were submitted for the council's approval by Mr. W. H. Robins, of Birmingham, of three new streets, proposed to be constructed on the Aston Park estate, in the vicinity of Prestbury and Witton roads. When this work is put into effect nearly all the land available for building in the district will have been opened up. There are, it may be stated, only two urban districts with a larger population than Aston Manor, whose rateable value now stands at £175,929.

For the purpose of street-watering 3,304,546 gallons of water were used. The sum paid to the water department up to December last was £145, which includes rent of hydrants. The price charged per 1,000 gallons is 6d. The total number of hydrants in use for the purpose of street watering and fire extinguishing is 479, for which a rental of 3s. 9d. for each hydrant is paid to the Birmingham water department. When sewers are required to be laid for the drainage of two or more houses the *modus operandi* is as follows: The owner or builder first makes application for an approximate estimate of the cost of the work, and at the same time requests the council, in writing, to execute the work. The cost is then estimated, and a copy of the estimate forwarded to the owner or builder, who on the receipt of it deposits the estimated amount with the accountant clerk. An order, accompanied by a tracing showing position of houses, sewers and drains, together with sizes, gradients and depths, is sent to the council's contractor. The work is then proceeded with and superintended by the staff. All measurements are taken on the works, and afterwards booked and priced-out, a duplicate copy of the measurements being sent to the contractor. Should the actual cost of the work be greater than that estimated, the owner or builder pays to the council the amount of such deficiency. In case the deposit exceeds the cost of the work, the council repay to the owner or builder any excess. Mr. Richardson finds that under this system the work is carried out in a much more uniform manner, and the dangers arising from badly-constructed sewers brought to a minimum, the construction throughout being of a much higher class.

In accordance with instructions received from the Health Committee, plans and estimates were prepared for extensions to the administrative building of the infectious diseases hospital at Upper Witton. These extensions comprised a dining hall, lobby, office, four bed-rooms, linen store, coal store, pantry, verandah, two water-closets, and also one bedroom over the stores for the accommodation of a concubman. The total estimated cost of the works was £1,450.

According to the report of Mr. William Lamorne Bradley, the engineer and surveyor to the Tonbridge Urban District

Council, the great activity in the building trade of the town, which commenced in 1895, still continues to increase. Buildings in course of erection have been inspected from time to time, and only seven notices have been served for breaches of the by-laws. It is satisfactory, says Mr. Bradley, that there has been no occasion to take legal proceedings. There is, it seems, a general willingness on the part of local builders to adopt any reasonable suggestions. The total number of plans approved by the council has been 111, the number of houses certified for occupation being 113, as against fifty in 1895 and 125 in 1896.

Flushing has been carried on in all the main sewers of the town during the year, both by means of the valve chambers and the flushing van. Important new sewerage works have been executed during the year, a Local Government Board inquiry having previously been held concerning an application for sanction to borrow money for the purpose. The surveyor was instructed to carry out the work departmentally without a contractor, tenders being obtained for the supply of materials. In the report it is stated that considerable progress has been made with the work, which is considered to have been executed in a thoroughly substantial manner. In addition to the above work, 3,200 ft. of sewers have been laid in private streets, together with the necessary manholes and flushing chambers. Several new manholes have been built, while six new ventilating shafts have been erected in various parts of the town.

The work of the department dealing with the sewage works and farm has, in the opinion of the surveyor, been carried on in a fairly satisfactory manner. About 800 ft. of new brick effluent carriers have been constructed, these being a very great improvement on the old system. A considerable portion of land has been levelled and underdrained, and an experimental bacteriological filter will be constructed early in the year.

Satisfactory results have been obtained in connection with the scavenging which has been undertaken. Over 3,000 loads of refuse have been deposited at the farm. In this part of the engineer's report, we may remark, the attention of the council is called to the very rapid growth of their district and to the increasing amount of work done in the scavenging department. The report next states that no new work of a constructional nature has been required at the isolation hospital during the year. But new roads, of a total length of about 4,000 ft., have been made up; several also have been taken over by the council. Mr. Bradley is pleased to be able to state that Local Government Board sanction has been granted in respect of an application for sanction to borrow a sum of £9,600 for the purchase of Tonbridge Castle and ground for the purposes of pleasure grounds, public offices, depot, an electric light station and fire-brigade station.

Several other properties have been acquired by the council, including the site of a proposed free library and technical institute, which will, it is expected, in a short time be seen nearing its completion.

In the report of Mr. W. Wellburn, the borough surveyor of Middleton, on the work carried out under his supervision during the year ended March last, it is stated that the area of the district is 4,711 statute acres, the population about 25,600, and the rateable value £71,200. Of main roads there are about 8½ miles, of secondary roads 2 miles 5 furlongs, and of highways over 10 miles. The county council allow towards the maintenance of the main roads £2,350, and for secondary roads £100. During the year 257 visits have been made to new buildings in course of erection, and 136 new dwelling-houses have been certified fit for habitation. The number of times the surfaces of the streets have been opened for drains, gas and water mains has been 258. The number of fresh water-closets in the borough is 257; of slop water-closets there are 651, making a total of 908. This shows that the water-carriage system is making a steady progress and saving a large amount of expense in carting the offensive matter through the streets. This the surveyor has no doubt adds greatly to the comfort of the burgesses. There have been several slop water-closets stopped up during the year, caused by tins, bricks, pots, shoes, lanterns and many other articles being thrown down. There is a great improvement in this respect, as the users of the slop-closets are given to understand that they must not throw these articles into them.

The cost of cleansing and scavenging the highways in the borough has been £417, while £915 has been spent upon draining and other works. There are now 176 manholes, 152 ventilators, and 1,872 street gullies.

Plans for a light railway in the borough have been submitted, and a committee of the Light Railways Commissioners have held an inquiry, but their decision has not yet been given. Should the promoters come to the council's requirements, Mr. Wellburn is satisfied that it would be a benefit to the town at large.

PLYMOUTH WATER SUPPLY.

THE NEW RESERVOIR.

The Mayor of Plymouth on Wednesday week laid the last stone of the dam which has been constructed in connection with the new Plymouth waterworks. Large crowds of people witnessed the proceedings, which were followed in the evening by a banquet, presided over by the mayor.

The history of the water undertaking of the town dates from the reign of Queen Elizabeth, when Sir Francis Drake, under the powers of an Act of Parliament obtained by the corporation, made a leat some 17 miles in length which brought into Plymouth the waters of the river Meavy. In the years 1881 and 1891 serious difficulty was experienced owing to the blocking of the leat by snow and frost, and more recently trouble has arisen from a diminution of the supply by drought. In consequence of this the corporation in 1892 obtained powers to make a storage reservoir in the neighbourhood of the head weir which is the intake of the leat, and also to substitute a pipe line for the open water-course which has served the town for so many generations. The pipe line was completed in 1894, and the reservoir has now been finished.

The reservoir has been made by constructing a dam of masonry across the bed of the Meavy at a point about 1 mile below the head weir, where the river ran through a narrow channel known as Burrator Gorge. This dam rises to a height of 145 ft. from its foundation and 77 ft. above the bed of the river. Its length is 410 ft. along the parapet, or 361 ft. at the water line, and its greatest thickness is 80 ft. The face and top of the dam have been constructed of uncoursed ashlar, consisting of square blocks of granite, and the core of the structure is composed of cyclopean rubble, consisting of large masses of granite embedded in concrete. On the side of the dam which has to resist the water pressure the granite blocks have been rebated to a depth of 6 in., leaving a space $\frac{3}{4}$ in. wide to that depth between each of the blocks. These spaces have been filled in with cement slightly damped and driven in by an iron chisel. By this process an exceedingly hard and watertight joint has been obtained, so as to prevent water percolating into the core of the structure. A secondary dam has been made near the village of Sheepstor, where there was a depression in the ground which had to be filled up. When full the reservoir will contain 650,000,000 gallons of water. Its length will be 12 miles, its greatest width $\frac{3}{4}$ mile, and its greatest depth 77 ft. The work was designed by Mr. Edward Sandeman, the corporation's engineer, and Mr. James Mansergh, consulting engineer, and it has been carried out by the corporation under the supervision of these engineers. The estimated cost was £150,000.

ELECTRIC LIGHT AT HANLEY.

A FURTHER LOAN REQUIRED.

Colonel W. R. Slacke, R.E., on the 14th inst. held an inquiry, on behalf of the Local Government Board, with reference to an application of the Hanley Town Council for sanction to borrow a further sum of £4,000 for electric lighting purposes. Among those present were Messrs. A. Chal-liner, the town clerk; J. Lobley, the borough surveyor; and C. Sutherland and W. Cowell, the electrical engineers.

The Town Clerk explained that the annual rateable value of the borough was £197,912, and the balance of outstanding loans was £216,557. On February 6, 1893, the corporation obtained sanction to borrow £21,000 for electric lighting, repayable in twenty-five years. On June 14, 1894, they borrowed a further sum of £1,100, repayable in ten years; on May 29, 1895, £5,000, on November 28, £19,000, and on July 27, 1897, £14,880, repayable in twenty-five years. The present loan being part of the general scheme, it was desirable that its repayment should be extended over twenty-five years also. They had at present 363 private customers, and these were rapidly increasing. Mr. Cowell produced diagrams, and stated that the private lamps were equal to 25,750 lamps of 8 candle-power. They were supplied from four feeders, and they wanted now to put down a new high-tension feeder to supplement these. Owing to the great demand in the evening the tension dropped to 94 volts, whereas the minimum allowed was 97 volts. It was also explained that the council wished to take advantage of the ground being opened for telephone purposes to lay down some new low-pressure distributing mains. The present application was to meet the estimated requirements during the next twelve months. With regard to a proposal to purchase 100 additional meters to enable the corporation to carry out what was termed the Brighton system, by which they charged 5d. per unit for the first one and a half hours and 2½d. an hour afterwards, a member of the town council remarked that it was the most absurd system that was ever invented.

At the close of the inquiry, which was of a formal character, a vote of thanks was accorded to the inspector; and, in replying, Colonel Slacke said it must be very gratifying that the introduction of the electric light in Hanley had been such a success, and that they could supply electricity at such a rate as to induce so many customers to take it.

SANITATION UP TO DATE.

The accompanying illustration is reproduced from a photo received from Mr. J. Owen Jones, engineer and surveyor to the Biggleswade Urban District Council.

Our correspondent remarks: The pan is earthenware, and the trap outlet is made of lead. How long it had been in use I cannot say, the pan in some parts was worn into small holes. Excreta was well adhered inside the trap and

pipe (of course I need not mention what the stench was like). At point A another closet of the same pattern was connected, and both emptied into a small brick channel in the outer wall, the pipe B being the ventilation pipe from the brick channel. This channel was connected to a 6-in. socket pipe, and carried into the main sewer without an intercepting trap of any form.

SEWER VENTILATION.

DECISION OF THE CAMBERWELL VESTRY.

The Sewers and Sanitary Committee of the Camberwell Vestry reported, at a meeting of that body on Wednesday week that they had again considered the report of the delegates to the recent conference on the subject of sewer ventilation.

The resolutions passed were as follows: (1) That the closing of surface sewer ventilators in response to complaints increases the general evil, the diminution of which is to be attained by the multiplication of the ventilators, both surface and up-cast shafts, at regular frequent intervals. (2) That in connection with any interceptor hereafter fixed on a main house drain it is advisable to carry a ventilating pipe from the sewer side of the interceptor, up the front, side or back of the house, to the satisfaction of the local sanitary authority, and that the outlet drain from the interceptor shall not be flap-trapped in sewer unless required by the local sanitary authority. (3) That pipe ventilators up buildings, or otherwise, where possible should always be adopted, in addition to surface ventilation. (4) That copies of these resolutions be forwarded to the London County Council and the various vestries and district boards, and their co-operation asked for in giving effect to same.

The committee expressed themselves as being entirely in accord with these resolutions, subject to the following words being added to the second recommendation: "And that such ventilating pipes be 3 ft. above and 6 ft. away from the highest window or chimney where possible."

SUPERANNUATION OF MUNICIPAL OFFICERS.

The conference convened by the Municipal Officers' Association, at a meeting held on Thursday, at 117 Holborn, E.C., had under consideration the question of again promoting legislation in the next session of Parliament, and decided to invite all associations and societies representing municipal officers to again send delegates to the conference. The chairman and secretary presented a joint report, together with balance-sheet, showing what had been done last session in promoting the Local Authorities Officers' Superannuation Bill. In order to further the movement, a conference will be held in London at the end of October, to which municipal officers throughout the country will be invited to attend, and a very large gathering is anticipated. Particulars of the place and time of meeting will be announced in due course, and any further information can be obtained by letter from the hon. secretary, Mr. C. J. F. Caruell, 117 Holborn, E.C.

Bloemfontein.—We understand that the town council have adopted a scheme for lighting the town with electricity, and have accepted the tender of Messrs. Roumet & Sons, at £16,500, for carrying out the work.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or bye-laws referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink on paper. Correspondents who do not wish their names published should furnish a non de planis

QUERIES AND REPLIES.

STRIPS OF LAND ADJOINING ROADWAY.—"J. S. C." writes: There is a strip of land on the road side that has not been macadamised up to the present time, about 6 ft. wide, next to the fence. The surveyor of the district is cutting away this ground and macadamising it to the fence, behind which is a clean-water drain that supplies some property. Is the surveyor justified in doing so? The property abuts on the Roehdale and Halifax turnpike road.

Prima facie, strips of land adjoining the highway form part of the highway (per Mr. Justice Crompton in *The Queen v. United Kingdom Telegraph Company*, 31 *L.R.*, 413, 419). Unless, therefore, there is something to rebut this presumption in the present instance it would appear that there is nothing illegal in the action of the surveyor, assuming that he is acting under the instructions of the highway authority. See *Locke King v. Working Urban District Council* (THE SURVEYOR, vol. xii., p. 696).

COMBINED DRAIN: ALTERATION.—"H. M. P." writes: In a combined system of drainage a number of houses are each connected with the "sewer" in the rear by means of a pipe, which enters the sewer through a hole in side of same and cemented round as in Fig. (1). The "sewer" is a fire-clay pipe, and the sanitary authorities have called upon the owners of the houses to re-form the connections (which were made a

few years since under their own supervision) by putting in new junction lengths in the sewer, as in Fig. (2). (1) Is the owner obliged to put in these new lengths in the "sewer" and reconnect with same? (2) As the new lengths, with the junction pieces on same, will form part of the "sewer," are the sanitary authorities bound to put in such lengths themselves?

Assuming the combined system to be a "sewer" and the drains to have been connected therewith in accordance with the regulations of the authority, any alterations in the sewer would have to be made at the expense of the authority.

BY-LAWS.—"X. Y. Z." writes: In 1882 I erected under our old by-laws a suite of offices two storeys high. The old by-laws, made in 1863 under sec. 34 of the Local Government Act, 1853, prescribed a minimum thickness of 9 in. for all external and party walls, and the offices referred to were erected with walls thicker than those prescribed by such by-laws. The old by-laws also required that "where buildings are proposed to be raised the outer walls and the party walls, or separate side or end walls, shall be of sufficient strength, and so far sound and in good repair, as to be fit to bear the proposed additional walls." In 1891 the old by-laws were repealed and new by-laws adopted, under sec. 157 of the Public Health Act, 1875, based on the Model By-Laws of the Local Government Board. B has now deposited plans showing an additional storey to be erected on the top of the existing two-storey office building. This additional storey includes a new suite of offices, which will be connected with the existing offices. Taking such additional storey by itself, the walls comply with the requirements of the new by-laws as to thickness, but if the old and new portions are taken as a whole, then the walls of the existing two storeys are not found to be of the proper thickness to carry the additional storey, but would require thickening in order to comply with the new by-laws. We have Part III. of the Public Health Acts Amendment Act, 1890, in force in the borough, sec. 23 of which enables local authorities to make by-laws to prevent buildings which have been erected in accordance with by-laws made under the Public Health Acts from being altered in such a way that if at first so constructed they would have contravened the by-laws. We have, however, not yet made any by-laws under this section. Having regard to the fact that no such by-law is in existence, can the corporation insist that the walls of the existing two-storey building shall be thickened so as to comply with the new by-laws? And would they be justified in disapproving the plans unless the same show such walls to be thickened, and the old and the intended new part of the building (regarded as a whole) to be made so that the walls thereof comply with such new by-

laws? If your reply is in the affirmative, will you kindly quote cases in support of the same?

The question is whether the proposed addition amounts to the erection of a new building, or merely to an addition to the old building. This would be a question of fact, the decision of the magistrates. I think it is hardly likely that it would be held to be a new building, and, in my opinion, the corporation would not be justified in disapproving the plans.

PUBLIC HEALTH ACT, 1875, SEC. 23.—Mr. Percy Johns, A.M.L.C.E., borough surveyor of Maidenhead, writes: The whole question of the construction to be put on sec. 23 so frequently arises in my district that I should be glad to have your opinion thereon. At present my council is being urged by the waterworks company to compel three large properties, whose otherworks satisfactory system of drainage are connected to cesspools, quite efficient for the purpose, and so constructed and situated in the grounds of each as to be no nuisance to the inhabitants or the public at large. The properties, however, in these particular instances are located on what forms probably a portion of the area which is drained by the water company's wells, and therefore a possible danger by contamination. The company have called the attention of the council to this fact, and have asked that steps may be taken by the council to insist on the drainage of each house being connected to the public sewers, which are available and within the prescribed distance. Will you be good enough to state what power, in your opinion, the council have, if any, to compel the connections being made: (1) In these particular instances, and (2) supposing the question of danger to the public water supply were not a feature in the case.

This section does not justify a local authority in requiring an owner to alter his system of drainage, though it may be sufficient in itself (*Attorney-General v. Clerkenwell Vestry* 1891, 3 ch., 827). If a nuisance arises the authority can proceed under sec. 41.

NEW STREETS.—"Nemo" writes: Eighteen months ago the owners submitted plans of a new street from A to B, ending in a *cul de sac* at B, which are approved by the urban authority. Street C to D is also laid out to the authority's approval. Sewers are put in the centre of street as shown, not being in the *cul de sac*. Buildings are erected in the portions etched. The owner, before proceeding with further buildings, proposes to do away with the *cul de sac* at B, and, instead of

his buildings fronting E and F, to make them front H, and submits plans to alter the street accordingly. Can the urban authority refuse to sanction the amended plan and compel the owner to carry out his original plan, which will thus assist another owner in developing his estate?

In my opinion the authority are not bound to sanction the amended plan.

APPOINTMENT OF DISTRICT COUNCILLOR AS SURVEYOR: DISQUALIFICATION.—Mr. W. Hollingsworth, Ekeington, Sheffield, writes: Will you please inform me if it is legal for a man who is a member of the district council to be appointed surveyor before his retirement from the council or not; also say when he should retire?

Under sec. 16, sub-sec. (b) of the Local Government Act, 1891, the member would become disqualified as a councillor upon being appointed surveyor. He should retire before being appointed.

If "A Young Surveyor" will forward his name and address his query will receive attention. All queries must be accompanied by these particulars, though not necessarily for publication.

Oban.—New municipal buildings, which have been erected at a cost of about £63,000, were recently formally opened by Lord Strathcona, the High Commissioner for Canada.

Municipal Work in Progress and Projected.

Hampstead Vestry is the only metropolitan authority from whom we have information this week of contemplated works of any magnitude. From the provinces, however, comes information of large and important undertakings projected at Halifax, St. Helens, Liverpool, Newcastle-on-Tyne, Scarborough, Leigh, Stratford, Chesterfield and elsewhere.

METROPOLITAN AUTHORITIES. COURT OF COMMON COUNCIL.

The members of the above body held their first meeting after the summer vacation on Thursday, under the presidency of the Lord Mayor. The Streets Committee presented a report relative to the suggested erection, near the City hydrants, of receptacles or cupboards for fire-hose, with key of hydrant, so that the same might be available for use on the first outbreak of fire. A letter from the London County Council was included in the report, and from this document it appeared that the chief officer of the fire brigade was opposed to the suggestion. The committee consequently recommended the discharge of the reference. The recommendation was adopted.—The same committee presented a report on the dispute between the corporation and the Post Office authorities relative to the laying of telephone tubes without the permission of the former body. The committee submitted a letter from the secretary of the Post Office intimating that the provision of wires between exchanges of the National Telephone Company and the houses of their subscribers was not contemplated. The letter further contained an assurance from the Postmaster-General that if his present policy should be departed from he would not construct any telegraphs under consent of the corporation within the City between the exchanges of the National Telephone Company and the houses of their subscribers without conveying to the corporation an intimation that the policy had been changed. The committee stated that, subject to that understanding and to the usual condition that the contractors to the corporation would be employed to make good the pavements disturbed, they had consented to the various applications of the Post Office authorities for permission to open the public ways. The report was adopted.—In reply to a question, Mr. Turner said that water to the amount of about 11,000 gallons daily was being supplied from the artesian well to the Whitechapel district. The water would be supplied as long as it was required.—The Court agreed to an arrangement for acquiring the leasehold interest in 82 Fleet-street for £1,000.—On the motion of Mr. Deputy Johnson, it was referred to the Sanitary Committee to take into consideration the present position of Montague-court, Bishopsgate, and to report forthwith to this Court thereof. Mr. Deputy Johnson pointed out that the present was an excellent opportunity for sweeping away a highly insanitary area, and added that the inhabitants of Bishopsgate-street felt very strongly that the corporation should avail itself of it.

VESTRIES AND DISTRICT BOARDS.

Hampstead.—The Works Committee of this body last week reported that they had given instructions for the London County Council to be informed that they agreed with the suggestion of the council that, where a street lamp was within a few feet of a fire alarm, the lamp-post should be painted a bright-red colour. This was approved.—The Baths and Wash-Houses Committee reported that they had considered the question of the advisability of the vestry applying to the Local Government Board for sanction to raise a loan in respect of expenditure on works carried out or authorised by the vestry to be executed at the Finchley-road baths. The matter was referred to the Finance Committee, with instructions to apply to the Local Government Board for permission to raise a loan of £5,800.

Kensington.—The Works and Sanitary Committee last week reported the consideration of several resolutions, passed at a conference of local authorities, relative to the housing of the working classes. They were of opinion that it was desirable that the vestry should have power to put the particular provisions of the Housing of the Working Classes Act into operation, and they accordingly recommended "that the London County Council be requested to include in their next General Powers Bill a clause giving the sanitary authorities concurrent power with the council to put in force Part III. of the Housing of the Working Classes Act." After some discussion the committee's recommendation was agreed to.—The Vestry of St. Margaret and St. John, Westminster, wrote, stating that they had decided to contribute £5,000 towards the cost of the High-street improvements. It was decided that the clerk should be instructed to write accepting that sum.

St. George's, Southwark.—At last week's meeting of the vestry the Open Spaces Committee reported that the vestry clerk had completed the purchase of the Paragon open space, and had received the following contributions towards the purchase money: London County Council, £1,700; Lord Langatock, £1,000; Newington Vestry, £100. It was agreed that the open space should be laid with Holman's star paving.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Cumberland.—The completion of the new stone bridge over the Irthing at Gilsland was celebrated last week by the members of the county council. The bridge is built on the skew principle, and has cost £1,400, including road diversions. The erection is in substitution of a narrow bridge with a square span and a very awkward approach on the left bank of the river. The bridge has been designed by Mr. G. J. Bell, the county surveyor, and built by Mr. Thos. Telfer, Langholm.

MUNICIPAL CORPORATIONS.

Birmingham.—At a meeting of the Gas Committee of the corporation, on Monday, the progress of the various new works now in course of construction at Salfley was reported upon. The works have now reached a stage at which some idea can be formed of their extent and nature. The committee intend some time next month to invite the members of the council to view the tank which is now ready for the reception of the new four-lift gasholder at Nechells. This will hold 8,000,000 cubic feet of gas. A smaller gasholder has had its capacity doubled by telescoping, and will now hold 4,000,000 ft. The council will have pointed out to it the site of the new retort-house, also the improvements in the sewerage works and the bed of the river Rea, which have been undertaken by the Gas Committee. These and other works form part of the scheme sanctioned by the council in February, last, and the total expenditure on which was estimated at £366,000.

Bristol.—The scheme for providing docks at Portishead, at an estimated cost of £360,000, was, after a long discussion, rejected at the last meeting of the city council. The result of this decision is that Bristol is, officially speaking, once more without a policy of docks extension, and that a further period of twelve months must elapse before steps can be taken for depositing a Bill in Parliament.

Cardiff.—The town council have under consideration a report by the borough surveyor, Mr. W. Harpur, as to the space required for the town hall, law courts, technical college, Welsh University buildings, museum and other institutions which are to be provided for on the site of Cathays Park. They have instructed Mr. Harpur to define the several sites provisionally with flags, and all the members are then to meet the architect, Mr. Lanchester, of London, on the site.

Croydon.—We understand that the Local Government Board have refused, on sanitary grounds, to sanction the town council's scheme of new waterworks at Whaddon. Strong evidence against the proposal was submitted on behalf of the riparian and mill owners on the river Wandie at the inquiry, which was recently held by an inspector of the Local Government Board.

Devonport.—A largely-attended statutory meeting of rate-payers decided on Tuesday, by a considerable majority, to apply to Parliament for compulsory powers to acquire the rights of the Devonport Waterworks Company. The company were recently approached by the Water Committee of the corporation, but refused to treat at the price named by the committee—£350,000.

Gloucester.—The mayor recently laid the foundation-stone of the public free library, which is to be built on a site adjoining the municipal technical schools. The building, with additions to the schools, will cost £9,000. Messrs. Waller & Son, of Gloucester, are the architects.

Halifax.—The town council, at a special meeting on Wednesday last week, decided to proceed forthwith with the construction of the three new reservoirs comprising the Walshaw Dean scheme, at a cost of £157,000.

Harrogate.—The sanction of the Local Government Board has been received by the corporation to the purchase of Harlow Moor, an open space some 52 acres in extent, which has hitherto been rented at a nominal rent from the Earl of Harewood. A loan of £30,500 has been sanctioned for the purchase and lying-out of the moor.

Horsham.—The information which, under this heading, was given in our last issue should, we find, has been included with the proceedings of rural district councils instead of municipal corporations. We regret the error.

Hull.—At a meeting of the Gas Committee, held on the 20th inst., the chairman reported that he and the deputy-chairman had made numerous inquiries with a view to securing a suitable site for the required station meter, and had arranged for the purchase of two houses and shops, with a plot of ground behind, situated on the east side of Dock Office-row, immediately adjoining the north quay of the Queen's Dock basin, and containing an area of 278 square yards, for £2,000. The main to the meter would be carried underneath one of the shops, and as there was sufficient land behind to erect a meter-house, it would not be necessary to interfere

with the shops, which produced an annual rental of £80. They did not think they had done badly, as they would practically get their site for nothing. The report was adopted.

Keighley.—The Health Committee have secured provisionally 9,650 square yards of ground in Lawkholms-lane as a site for a proposed public slaughter-house.

Liverpool.—Plans have been approved by the city council for the extension of the City Fever Hospital, East Mill-lane, Old Swan, and an application is to be made to the Local Government Board for sanction to the borrowing of £10,000 to carry out the work.

Maidstone.—A letter has been received by the town council from the Local Government Board stating that a loan to cover the expenses incurred by the town council in connection with the typhoid epidemic which devastated the borough last autumn can only be granted for three years. The council had applied for sanction to borrow £18,000 and to spread repayments over twenty years. The Local Government Board intimate that they are disposed to grant a loan of £15,000 only. This decision, both as to the amount and period of the loan, has caused great surprise in the borough, to which it means an annual rate of 1s. in the £1 for the three years.

Manchester.—The special committee of the corporation appointed to consider and report with reference to the city telephone service on Thursday resolved to recommend to the city council that authority should be given them "to communicate with the Postmaster-General, the adjoining local authorities and the representatives of any telephone company who may desire an interview; also to make such further inquiries as they may think desirable, and to present a further report to the council." The matter will be submitted to the council at their meeting in October.

Nelson.—At a recent joint meeting of the Health and Gas Committees it was resolved to use the waste heat from the proposed new refuse destructor for the generation of electric energy, and the borough surveyor was instructed to at once proceed with the preparation of the necessary plans, &c.

Newcastle-on-Tyne.—At the last meeting of the Town Improvement Committee of the corporation it was reported that a communication had been received from the Local Government Board sanctioning the loan of £15,500 for the extension of the Oaseburn sewerage scheme. It was agreed that the city engineer, Mr. Law, should take steps to have the scheme carried into practical effect as soon as possible. About five years ago the scheme was first initiated, and the proposal was that the sewage discharged at the bridge, Byker Bank, from Byker, Heaton, Benton and Jesmond, and also that from Gosforth, should be discharged into the river at low-water mark. The carrying out of the scheme will remove a grievance complained of by the residents in the neighbourhood of Byker.—The new branch library at Heaton, erected at the cost of Alderman W. H. Stephenson, and presented by him to Newcastle-on-Tyne, is to be opened by Earl Grey on Thursday. The library will be called the Victoria Library, and it is a building almost identical with the Stephenson Library in Elswick-road, also given to the town by the same donor, and opened by Sir M. W. Ridley.

Plymouth.—At the Municipal Buildings, on Friday, Mr. E. A. Sandford Fawcett, A.M.I.C.E., one of the Local Government Board inspectors, sat to inquire into an application for sanction to borrow £1,325 for police station and fire brigade purposes, £300 for the reconstruction of the urinal at the west of the Promenade pier, and £227 for works of street improvements.

Saffron Walden.—A Local Government Board inquiry was held here on Friday last by Mr. G. W. Willocks, M.I.C.E., with reference to the application of the town council for sanction to borrow £400 for works of street improvements. The town clerk opened the inquiry, and the borough surveyor, Mr. G. William Lacey, produced the plans and gave information as to the work proposed. Some opposition was raised on the ground that the sewerage of the borough should be improved and extended before the work proposed. The inspector inquired closely, therefore, into the question of the sewerage of the streets, as to when the new paving was intended to be done, and also as to the general system of sewers and sewage disposal.

Scarborough.—Plans for the erection of a new isolation hospital, at a cost of £15,000, have been passed by the town council. Thirty-two beds will be provided, sixteen in the scarlet fever block (four private), ten in the typhoid block (two private), two for measles and diphtheria, and two for observation.—A proposal is at present before the town council for the establishment of a system of 14 miles of electric tramways. There is not unanimity of feeling on the subject, and it is expected that the question will give rise to much controversy both in and out of municipal circles. A part of the scheme is to make a circular route of some 6 miles in extent. There is no doubt whatever that the departure would be eminently popular.

Sheffield.—A proposal of the Leicester and Nottingham Corporations to acquire the water of the famous Derbyshire rivers, the Derwent and the Ashup, has created some alarm to the Sheffield Corporation, and the Water Committee of that body have recommended the council to take steps in

defence of their own rights to the water. The scheme of the Midland towns is to construct four reservoirs at Ashopton, one of the most beautiful spots in Derbyshire, and a favourite resort of Sheffield people. Not only is the place within 10 miles of Sheffield but some of the water to be acquired drains from hillsides which are in Yorkshire. A conference between the various local authorities interested in the subject is to be held, and, failing a satisfactory agreement, Sheffield Corporation is advised to promote a Bill to secure a portion of the threatened supply.

Southend-on-Sea.—The Local Government Board have sanctioned the borrowing by the corporation of £3,815 for the construction of the tramway passing-place and new buildings on the pier.

St. Helens.—It was last week reported that the Local Government Board had sanctioned the borrowing of £20,000 for street works, £15,000 of this amount being for street paving. For the paving of Corporation-street £3000 was sanctioned and £5,000 for the construction of the subway in Church-street. With respect to the subway, the borough surveyor read a letter he had received from the Local Government Board requesting the council to construct the brick arch of 9 in. instead of 14 in. The surveyor said that on receipt of this letter he wrote stating that, as the Local Government Board had delayed giving their consent so long, the work had been commenced, and a considerable part had been completed. He pointed out that a large quantity of concrete was being put above the 14-in. arch. The Local Government Board had subsequently given consent to the work.

Sunderland.—Last week the corporation resolved to take steps to obtain powers to work the tramways in the town, which are at present worked by a company. They also resolved to establish the electric overhead trolley wire system of traction in lieu of horse-power.

Swansea.—At a recent meeting of the Sanitary Committee it was decided, upon the recommendation of the medical officer, to add a new wing to the borough fever hospital.

Taunton.—As a result of a visit of the mayor of Taunton to the secretary of the Local Government Board, that body have, it is stated, sanctioned a high-level drainage scheme for the prevention of floods at the north end of the town. The work is to be proceeded with at once.

URBAN DISTRICT COUNCILS.

Audenshaw.—The council have decided to apply for provisional orders for the construction of tramways between Fairfield and Guide Bridge within their district, and also for electric lighting. Mr. J. P. Wilkinson, A.M.I.C.E., of St. Mary's Gate, Manchester, is the engineer.

Bognor.—The district council have decided to erect a new fire brigade station in the High-street, and also a new depot, workshop, stables and cottages for the foreman and head horseman upon land recently acquired in Circus-street. The plans for the buildings have been prepared by Mr. Oswald A. Bridges, the surveyor to the council, and he will supervise the erection of the buildings.

Chingford.—A public inquiry has been held by Colonel Hepper, on behalf of the Local Government Board, with reference to an application of the district council for sanction to borrow £1,350 for sewerage works at Chingford Hatch. No position was offered to the application.

Coves.—It was reported, at the last meeting of the district council, by the manager of the gasworks that, owing to the increasing consumption of gas, it would be necessary to appropriate the present coal store as a retort-house and to erect two benches of sixes there, at an estimated cost of £750. Another coal store would also be necessary, estimated to cost £440.

Crediton.—The council having applied to the Local Government Board for leave to borrow £500 for the purpose of sewerage works at Fordton and the improvement of the drainage in the town, Colonel A. J. Hepper, D.S.O., R.E., has been directed to hold an inquiry into the circumstances. Colonel Hepper has fixed the inquiry to-day, at 11.30 a.m., at the council offices.

Ilford.—At their last meeting the district council resolved to take steps to acquire the undertaking of the Ilford Gas Company, and also the right of supply in that portion of the district at present supplied by the Barking Gas Company.

Ilfracombe.—The Local Government Board have declined to sanction the council's application to borrow £5,000 for an improvement of the vegetable market, on the ground that the approach road on the west side would be but 24 ft. wide, and that on the south side 15 ft. 6 in. This decision has placed the council in a fix, as now they will have to come to terms with the owners on the opposite side, who two years ago offered to give the council the necessary 12 ft. of land throughout, which they declined.

Leigh.—A special meeting of the council was held on Thursday, when it was agreed to apply to the Local Government Board for sanction to borrow £15,000 for works of sewerage.

Landudno.—The loan required by the district council for the purpose of erecting the proposed municipal buildings has

been sanctioned by the Local Government Board, and the contract has been given to Mr. Samuel Warburton, of Manchester, who is carrying out the extension of the Denbigh Aqueduct. The work will be commenced without delay.

Machynlleth.—The Local Government Board have declined to sanction a loan of £3,000 to the council for works of sewerage, being of opinion that the proposed scheme was incomplete and unsatisfactory in many important respects.

Matlock.—Local Government Board sanction to the borrowing of £5,500 for a further extensive improvement scheme is to be applied for by the district council. The scheme comprises the provision of open spaces, promenades and other works.

Morpeth.—Works of water supply have just been completed for the district council, and will be opened shortly. The works, which are situated at Tranwell, have been carried out from plans by, and under the direction of, Mr. A. S. Dinning, of Newcastle-on-Tyne.

New Swindon.—At the last fortnightly meeting of this council it was decided not to entertain the idea of purchasing the New Swindon Gas Company's undertaking. There was a great deal of discussion on the subject, and it was stated that the market value of the gas undertaking was between £90,000 and £100,000. The council have obtained a provisional order to provide electric light for the town, and the members felt they could not go to the extent of purchasing the gas undertaking just now.

Romford.—At last week's meeting of the district council a letter was read from the Local Government Board sanctioning the borrowing of an additional £1,000 for bath purposes.

Ruskington.—A Local Government Board inquiry was held on the 15th inst. by Mr. H. Percy Boulnois, with reference to an application of the district council for sanction to borrow £1,900 to construct waterworks ordered by the Local Government Board.

Saxmundham.—A scheme for the drainage of the town, prepared by Mr. H. J. Wright, of Ipswich, has been adopted by the district council.

Southgate.—The Local Government Board have sanctioned the borrowing of £1,250 for improvement works in the Green-lanes main road.

Stretford.—Colonel W. Langton Coke has held an inquiry, on behalf of the Local Government Board, with reference to an application of the district council for permission to borrow £6,000 to provide a technical institute and free library, and £14,000 for the purchase of a plot of 13½ acres of land, at Pennington-lane, for the purpose of a public recreation ground.

RURAL DISTRICT COUNCILS.

Bridgewater.—At a meeting of this authority, last week, the question of providing a supply of water for the parish of Nether Stowey was again considered, and it was reported that the ratepayers of Stowey had almost unanimously decided to recommend the council to adopt the scheme for obtaining a supply from the Brucemie spring, the cost of which was estimated at £1,000. The council decided to adopt this scheme, and to arrange satisfactory terms, if possible, with Sir Alexander Hoare for obtaining a supply from the source named.

Chesterfield.—A Local Government Board inquiry was held at Chesterfield, on the 16th inst., into an application by the council for sanction to borrow a large sum of money for the purpose of extending the northern water supply system. The authority proposed to apportion the cost as follows: Barlow, £955; Beighton, £11,092; Coal Aston, £850; Dronfield Woodhouse, £950; Eckington, £14,346; Holmsfield, £561; Killmarsh, £4,217; Staveley, £14,551; and Unstone, £1,352. The inquiry was also relative to an application by the Dronfield Urban District Council for sanction to borrow £5,189. After a lengthy discussion, the inspector, Mr. H. Percy Boulnois, said that he would report on the matter in due course.

St. Germans.—Mr. Sandford Fawcett held an inquiry last week, on behalf of the Local Government Board, respecting an application of the district council for permission to borrow £933 for sewerage works for the village of Downdery. Mr. S. Jenkin, engineer of the works, explained the plans.

Stratford-on-Avon.—At a meeting on Friday afternoon, Mr. J. E. Wilcox, of Birmingham, attended to report upon the water supply of Alveston. An artesian well had been sunk, and the works now contemplated, including service mains, &c., were estimated to cost £3,693, which, Mr. Wilcox submitted, was too costly for the parish. He suggested modifications of the plans for a high-level supply to the neighbouring farmhouses by reducing the size of the reservoir and pipes, which would save about £600. After a long discussion Mr. Wilcox's modifications were agreed to. The contract was signed. It was decided to commence the work forthwith. Several members complained that the water from the well had been running to waste for three or four months.

Wem, Salop.—At a recent meeting of this authority a letter was read from the Grinshill Parish Council stating that many of the inhabitants of Grinshill were suffering from

what might be termed a water famine, and requesting the district council to render what assistance they could in the matter. It was stated that they were in a most deplorable state for want of water. The supply from the parish pump had given in, and there was no water at all. They would be glad to obtain the water supply for the neighbourhood from the council, and Mr. Stooke, the engineer, had stated that there was quite sufficient for the purpose, there being almost an unlimited supply at Oreston.

SCOTLAND AND IRELAND.

Aberdeen.—Acting on the instructions of the town council, Mr. Rust, the city architect, has completed the valuation of the different slaughter-houses in the city, in view of the proposal to erect a public abattoir, and the estimate will be submitted to the committee. As it is felt desirable to have the Bill empowering the council to proceed in the matter ready for the ensuing session of Parliament, it is likely that several points in the draft scheme may be left over in the meantime.—An agreement has been entered into by the corporation with the Rubislaw Granite Company to widen Queen's-road, at an estimated cost to the ratepayers of £1,640.

Annan.—The Finance Committee have been instructed by the town council to report on the question of the purchase of the gasworks.

Ayr.—An important decision with reference to the domestic water supply of the burgh was come to by the town council at a recent meeting. The pipe conveying the water from Loch Finlas to the filters at Knockjigger, a distance of 15 miles, is proving too small to convey sufficient water to keep up with the consumption. A number of schemes to increase the supply have been considered; but it has been decided to lay down a pumping plant, at a cost of £4,490, which involves the eventual construction of a storage reservoir, at a cost of £2,650, to pump the water from the old water supply in the Carline reservoir to the filters about a mile distant and at a considerably higher level.

Buckie.—At a special meeting of the commissioners, held recently, plans of the new bridge to be erected across the Buckie burn were submitted to Mr. Barron, C.E., Aberdeen. Three plans were submitted, the estimated cost being £1,500, £1,650 and £1,750 respectively. It was agreed to adopt the plan costing £1,650.

Coleraine.—Mr. Charles P. Cotton, chief engineering inspector of the Local Government Board of Ireland, recently held an inquiry respecting an application of the rural sanitary authority for sanction to a supplemental loan of £1,600 for sewerage works for Portstewart. Mr. W. J. Given, engineer of the works, explained the plans.

Dublin.—A Local Government Board inquiry was recently held by Mr. O'Brien Smyth into an application of the town council for sanction to borrow a sum of £9,000 for the erection of additional class-rooms at the Kevin-street technical schools.—On Thursday last, as a drove of bullocks were passing through Beresford-place, Dublin, four of them fell through a large manhole leading to the main drainage excavation. Two men and a boy who were working below received severe, though not dangerous, injuries from the fall of the bullocks, and were rescued with difficulty.

Dunoon.—The commissioners have at present under consideration a scheme for the electric lighting of the principal thoroughfare of the town. It is also proposed that an application for power to erect a pavilion be inserted in the Bill to be promoted.—It was decided, at the last meeting of the commissioners, to borrow £17,800 for the purposes of water extension, hospital, special sewers, roads and pier.

Helensburgh.—The Burghs Gas Supply (Scotland) Act has been adopted by the town council, and it has been unanimously agreed to apply its provisions to the town. Further consideration of the matter has been deferred until after the forthcoming municipal elections.

Kilsyth.—The commissioners have a new water scheme under consideration, and have appointed Mr. Frew, of Messrs. Kyle, Denison & Frew, Glasgow, to report on the most suitable place on the Gandhill for a reservoir. Sir Archibald Edmestone has agreed to give the ground free of charge under certain reservations, the chief of which is that his tenants along the wayleave must be supplied with water.

Paisley.—The corporation, it is stated, have successfully objected to an application of the British Electric Traction Company for an order to run electric cars in their district. The corporation have arranged with Glasgow for that city to purchase the tramways, control them for twenty-one years, and then hand them over to Paisley for nothing.

Received too late for Classification.

STAINES RURAL DISTRICT COUNCIL.—Wanted, Road Foreman, used to steam roller, tar paving, kerbing and general work. Wages, 27s. weekly.—Apply, stating age and experience, to Mr. G. W. Manning, Surveyor to the Council, not later than the 12th proximo.

Personal.

Mr. Pettitt, of Stanway, has been appointed assistant surveyor to the Braintree Rural District Council, at a commencing salary of £75 per annum.

At a meeting of the Porton and Urban District Council, on Wednesday of last week, Mr. Thomas Harris, of Bootle, was appointed surveyor and sanitary inspector.

We are informed that Mr. R. W. Hartley, of Eccles, has been appointed to the position of third assistant in the office of Mr. T. Hunter, the engineer and surveyor to the Leigh (Lancs.) Urban District Council.

Mr. Gilbert Dickinson, son of Mr. John Dickinson, of Greenbank, Cliverston, Lancashire, has qualified as a graduate of the Institution of Mechanical Engineers. He is articled to Mr. J. W. Bradley, borough engineer of Wolverhampton.

A letter was last week received by the Newton Rural District Council from Mr. S. Seagar, the chief inspector, resigning his position under that body. He has, it is understood, obtained an appointment as architect to a building estate.

Mr. Henry Hewitt Bridgman, a Fellow of the Royal Institute of British Architects and at one time a member of the London Court of Common Council and the City Commission of Sewers, has, we regret to learn, succumbed to a serious illness.

At a meeting of the Court of Common Council on Thursday a letter was submitted from Mr. Walter Swale, announcing the death of his father, Mr. William Swale, late superintendent of cleansins, who in 1892 was granted a retiring allowance of £500 a year.

Mr. Berie Wake, son of Mr. H. H. Wake, engineer to the River Wear Commissioners, while having a trip in a steam launch on Saturday week, on the river Wear at Southwick, with a party of young men, fell overboard and was drowned. His body was recovered shortly afterwards.

A few days ago, according to a contemporary, the Milton-next-Sittingbourne Urban District Council received a letter from Mr. Amos B. Acworth, their surveyor, intimating that he had resigned his post, owing to private reasons. Mr. Acworth was in the service of the council for twelve years.

Mr. William Heston, who for four years has held the post of divisional inspector of highways on the staff of the borough engineer of Wolverhampton, has resigned, in order to commence business with his brother, under the style of Heston Brothers, contractors for public works, St. Helens, Lancashire.

In our reference of last week to the election of district surveyors to the Lancashire County Council, Mr. H. T. Chapman, who is at present a district surveyor of main roads under the Derbyshire County Council, was inadvertently mentioned as being with the Rural District Council of Chapel-en-le-Frith.

The Sandgate Urban District Council, at their meeting on Friday last, presented their surveyor, Mr. A. R. Bowles, with a handsome spirit tanzalus on the occasion of his marriage. They wished him every happiness, and expressed a hope that he might long remain among them. Mr. Bowles thanked the council for the confidence reposed in him and for their kindness.

At the last meeting of the Haltwhistle Rural District Council, Mr. Harry W. Taylor, A.M.I.C.E., of Newcastle-on-Tyne and Birmingham, presented his scheme for the sewerage of West End. The council considered the scheme very satisfactory, and instructed Mr. Taylor to also prepare a scheme of sewerage for Town Foot and report upon the disposal of the whole of the sewage of Haltwhistle.

A special meeting of the Wareham Town Council in committee was held on Tuesday of last week, for the purpose of electing a surveyor in the place of Mr. George Hobbs, who has resigned the office. The salary is £20 per annum. There were four candidates—namely, Messrs. William Laws, W. Pookes, J. Laws and J. Bridle. The voting was as follows: W. Laws, seven; W. Pookes, four; J. Laws, one. Mr. W. Laws was therefore elected.

Yentnor Urban District Council last week recommended that a draft agreement with the surveyor, Mr. E. J. Harvey, be approved, the arrangement being that, in consideration of salaries of £120 as surveyor and £80 as inspector of nuisances, Mr. Harvey would carry out the duties and devote the whole of his time during office hours to the work of the council; he also stipulated to undertake no private practice that would clash with the interests of the council. The report was adopted.

The Finance Committee of the Mile End Vestry on Wednesday of last week recommended that the resignation of Mr. W. F. Loveday, assistant surveyor, who has been appointed surveyor to the South Hornsey District Council, be accepted, and that advertisements be issued inviting candidates for the vacant post, and that the salary to commence with be at the rate of £104 per annum. The resignation was

accepted, but the subsequent portions of the report were referred back to committee.

A special committee dealing with the borough surveyorship of Preston have recommended to the council that Mr. Thomas Cookson, heretofore deputy surveyor, be appointed the borough engineer and borough surveyor during the pleasure of the council, at a salary of £500 per annum. The title of steward is to be transferred to the borough treasurer. It is also recommended that, to ensure efficiency in the engineer's and surveyor's department, there be appointed an assistant surveyor, at a salary after the rate of £200 per annum, and a draughtsman, at wages of 35s. per week.

The remains of Mr. H. Masterton, district surveyor under the Devonshire County Council, whose death, we regret to state, occurred recently at Barnstaple, were on the 22nd inst. removed to London for burial. The deceased gentleman was resident engineer in connection with the construction of the first section of the North Cornwall Railway and the line from Lydford to Devonport, while he was engineer for several important works at Plymouth. He succeeded ten years ago to the business of Mr. J. C. Inglis, engineer, Plymouth, Mr. Inglis being now chief engineer of the Great Western Railway.

The question of appointing a surveyor to the northern, or Finchingfield, division of the rural district of Braintree led, at last week's meeting of the council, to a discussion as to the advisability of continuing the old arrangement of having two divisions, with a surveyor to each, or the appointment of one surveyor to do the whole of the work, with an assistant. The chairman favoured the latter arrangement, and moved the appointment of Mr. G. H. Bright, the surveyor of the southern district, as surveyor and sanitary inspector for the whole district, at an inclusive salary of £200 a year, with an assistant at £75. This was seconded, and eventually agreed to by a majority of thirteen votes to four.

At a meeting of St. George's (Southwark) Vestry, on the 20th inst., the Public Health Committee reported that they had considered a report from the surveyor, drawing attention to the large amount of work in his department, and asking that a permanent professional assistant should be appointed. The committee, taking into consideration that much work had to be done in connection with new public conveniences, new sewers, &c., recommended that an assistant surveyor be appointed, at a salary commencing at £130 per annum, rising by annual increments of £10 per annum to a maximum of £180 per annum, the Public Health and Sewers and Works Committees to make the appointment. The recommendation was adopted.

An interesting ceremony took place at the Shire Hall, on Saturday, when Mr. H. T. Wakelam was presented with an illuminated address and a gold watch by the district surveyors of the county on the occasion of his resigning the surveyorship of Herefordshire to take up the position as county surveyor of Middlesex. Mr. John Parker, city surveyor of Hereford, in making the presentation said it had been subscribed to by the district surveyors and the surveyors of the boroughs and urban authorities in the county. It was with great regret that they looked upon the departure of Mr. Wakelam from their midst. During the time Mr. Wakelam had been associated with them in their work he had found a warm place in their hearts, and they all wished him every success and prosperity in his new sphere of labour. Mr. Wakelam suitably acknowledged the presentation.

Last week, at a meeting of the Bridlington Urban District Council, a letter was received from Mr. J. Freobairn Stow intimating his desire to be relieved of his duties as town surveyor at the end of October. Mr. Stow, as will be remembered, was recently appointed, out of a large number of applicants, to the position of surveyor to the Chertsey Urban District Council. The chairman of the Highway Committee, in moving the acceptance of the resignation, said he had had, officially, a great deal to do with Mr. Stow, who had been at all times both able and willing to perform his duties. He regretted very much his leaving, and he only hoped and trusted that the change he had decided upon would be beneficial to him, and that the appointment might prove all he desired. The motion, which also proposed the granting of a testimonial in recognition of Mr. Stow's past services, was subsequently adopted, the chairman of the council remarking that they all regretted losing such a valuable official. Following upon this business the council proceeded to discuss the appointment of a new official, and decided to issue the usual advertisements inviting applications for the vacant post, the salary being fixed at £160 per annum.

Society of Engineers.—The next ordinary meeting of the above society will be held at the Royal United Service Institution, Whitehall, S.W., on Monday, when a paper will be read by Mr. Sherard Cowper-Coles, A.M.I.C.E., M.E.M.P., M.I.E.E., on "Protective Metallic Coatings for Iron and Steel." The chair will be taken at 7.30 p.m. precisely.

POLLUTION AT STRATFORD.

THE CHANNELESEA RIVER.

Mr. Lewis Angell, borough engineer of West Ham, has submitted the following interesting report with regard to the state of the Channelesea river. He says: "The recurring and continuously-increasing complaints of the condition of the Channelesea has been the subject of many reports by the borough engineer over a long period. The great increase of the populations north of the borough, abutting on watercourses which flow into the north-western parts of West Ham, intersecting the Stratford district, has resulted in an amount of sewage pollution of the most offensive character. Abundant evidence of such pollution was given before the House of Commons Select Committee on Police and Sanitary Regulations, June 15th and 16th, when the chairman, Sir Stafford Northcote, made the remark, page 50: "I must say that the committee accept the fact of the foulness of the brook. The only question is, who is to have jurisdiction?" Further evidence was submitted to the same committee, June 29th, by the borough engineer, pages 116-128, explaining the conditions affecting the offensiveness of the Channelesea, which, omitting details, may be generally stated as follows: The tidal flow from the Thames, which is not in itself pure, is intercepted on the river Lee by gates at the Bromley lock, the Three Mills and the Abbey Mills, above which gates the waters are penned up.

Various "backwaters" connect with the main river Lee—viz., Waterworks river, City Mill river, Pudding Mill river, Three Mills Wall river, Channelesea river, and other streams.

The West Ham sewage is discharged about 1½ miles below the Channelesea tidal gates, and for the last ten years upon the ebb tide only, the discharge being discontinued for about 1½ hours, more or less, before the turn of the incoming tide, the sewage being stored during the interval in extensive tanks. Some time ago the borough engineer made experiments with floats discharged with the sewage, which showed that such floats did not return so high as the Channelesea gates at Abbey Mills. The greatest offensiveness of the Channelesea occurs during neap tides, when tidal waters do not enter the pen above the gates. The penned-up water containing the sewage discharged from the districts above is held up without change for several days, and during warm weather increases in offensiveness. In consequence of the abstraction of water very little, in the absence of rain, flows down the Channelesea; in fact for long periods of dry weather the only flow is the sewage "effluent" discharged from Walkhamstow and Leyton. As neap tides do not reach the Abbey Mill gates by about ¼ mile, even if the West Ham sewage did return upwards from Canning Town, it could not reach the Channelesea. The black sewage "effluent" penned up by the Abbey Mill gates deposits mud or "sludge" along the beds of the Channelesea, producing foul scum and vegetation, which decomposes and emits large volumes of sewage gas, rising in bubbles to the surface.

The flow and accumulation of sewage is a daily-increasing quantity. Neither the water nor the flood-gates are under the control of the corporation. Arrangements are made, by consent of the West Ham Gas Company, to open the gates for the escape of the sewage as frequently as possible, corporation men remove offensive mud deposits and apply disinfectants to the river bed, but no amount of cleansing within West Ham effects any practical good, nothing short of an arrest of the pollution from above will be effectual.

West Ham has been accused of contributing to the pollution, but, as previously stated, in no case can West Ham sewage flow through the Abbey Mill gates during neap tides; during spring tides, when, if at all, it may be thought possible for sewage to flow up the Channelesea, no complaints arise by reason of the volume of water. There is a West Ham storm overflow immediately below the Abbey Mill gates, which acts only at times of storms, and cannot act when the tide flows up the Channelesea, nor do complaints arise at storm times. Rainfall entering the Channelesea, either in Stratford or from the river, reduces its offensiveness.

In less than a year the West Ham sewage will be diverted from the river Lee, but it will take a long period to divert the sewage of Walkhamstow from the Channelesea. The evidence before the Police and Sanitary Committee last month shows that injunctions have been issued, also an order of sequestration (against Walkhamstow) without result. So long as sewage is discharged from the districts above West Ham, Stratford must continue to suffer increasingly.

ELECTRIC TRACTION IN DUDLEY.

DETAILS OF THE SCHEME.

Although the Dudley portion of the proposed electric tramway remains in abeyance pending the corporation and the British Electric Traction Company coming to terms, that portion of the Dudley and Stourbridge line from Hart's Hill to Stourbridge will be in full working order before the end of the year. The generating station at Hart's Hill is being rapidly pushed forward by Messrs. Whitaker & Co. It comprises a car-shed, 102 ft. by 51 ft.; a workshop, 102 ft. by 27 ft.; a boiler-house, 49 ft. by 18 ft.; and an engine-room,

57 ft. by 30 ft. The contract is for £7,000, and over 1,000,000 bricks will be used up. The site has been acquired from the Earl of Dudley, and sufficient space has been obtained to double the operations, if such expansion should be needed. Two large Lancashire boilers will be placed in the boiler-room, capable of working up to 140 lb. pressure on the square inch, whilst two non-condensing compound engines will work the cable of the two electrical generators. There will be nine cars, capable of carrying twenty-eight passengers in each, the cars being worked by two motors rated up to 25 horse-power geared to the axles.

The span-wire system will be utilised. A cable runs from the generating station to the end of the line, and is tapped at every half-mile, and connected to a feeder-box. From the latter cables convey the current to the trolley wires. From the trolley wires the current goes to the controller at each end of the car, and from the controllers to the motors, then to the wheels, and back through the track to the power-house.

Enough power could be generated at the station to work the whole of the original system—viz., from Dudley to Kinver via Kingswinford, from Dudley to Stourbridge via Brierley Hill, and from Dudley to Cradley Heath, as well as providing for lighting if required. At present the line will be 3½ miles in length, and has been entirely reconstructed. It is proposed to run a ten minutes' service.

AMERICAN COMPETITION.

A GLASGOW MUNICIPAL CONTRACT.

The last, it seems, has not been heard of the water pipes contract, and it is said that the muddle is now worse than ever. It will be remembered that the Water Committee recommended the acceptance of the offer of Messrs. Robert MacLaren & Co, Glasgow, to supply 1,000 tons of cast-iron piping, at a cost of £4,958, while Messrs. Wood & Co, Philadelphia, had offered to take the contract for £4,892. This proposal the corporation upset, and divided the contract, giving about two-thirds to the Glasgow firm and one-third to Messrs. Wood. Messrs. MacLaren & Co. have since written stating that they decline to accept the contract on those conditions, having made an overhead price for the whole quantity, or that they will require to be paid an additional 13s. per ton. The matter is in the hands of the town clerk and Mr. Osborne, convenor of the committee; and apparently all that can be done is to re-advertise the contract or give it in its entirety to the American firm.

APPOINTMENTS VACANT.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

FOREMAN OF STREET GAS LIGHTING.—October 1st.—Corporation of Plymouth. £2 5s.—Mr. James Paton, borough engineer and surveyor.

GENERAL ASSISTANT FOR BOROUGH ENGINEER'S DEPARTMENT.—October 1st.—Corporation of Plymouth. £100.—Mr. James Paton, borough engineer and surveyor.

SURVEYOR AND INSPECTOR OF NUISANCES.—October 3rd.—Arleedon and Frizington Urban District Council. £120.—Mr. John Bowly, clerk to the council, Council Offices, Frizington.

ENGINEER AND MANAGER OF SEWAGE WORKS.—October 5th.—Hampton Urban District Council. £3.—Mr. John Kemp, engineer and surveyor to the council.

MEASURING CLERK FOR ARCHITECT'S DEPARTMENT.—October 5th.—London County Council. £100.—The Clerk to the Council, Spring-gardens, S.W.

CLERK OF WORKS.—October 6th.—High Wycombe Corporation. £3.—Mr. T. J. Rushtbrooke, borough surveyor.

INSPECTOR OF NEW BUILDINGS AND DRAINAGE WORK.—October 8th.—Hornsey Urban District Council. £160.—Mr. E. J. Lovegrove, engineer and surveyor to the council.

HARBOUR ENGINEER.—October 10th.—Waterford Harbour Commissioners. £150.—Mr. J. Allingham, jun., secretary to the commissioners, Harbour Office, Waterford.

BOROUGH AND HIGHWAY SURVEYOR, WATER ENGINEER INSPECTOR OF NUISANCES, &c.—October 10th.—Pwllheli Corporation. £140.—Mr. Evan R. Davies, town clerk.

DISTRICT ROAD SURVEYOR.—October 11th.—Derbyshire County Council. £160.—Mr. N. J. Hughes-Hallett, county clerk, County Offices, Derby.

COMPETITIONS.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

REGIATE.—October 6th.—Erection of municipal buildings, fire station, public offices, &c.—Mr. Clair J. Grece, town clerk.

ABEYON.—December 1st.—Extension of the covered market, at a cost not to exceed £5,000. £21.—The Borough Surveyor.

CULBERTBY.—December 23rd.—Sewerage and sewage disposal scheme for the No. 1 and 2 wards of the district. £50, £30 and £30.—Mr. T. R. Harland Chalkcock, clerk to the council.

MUNICIPAL CONTRACTS OPEN.

Advertisements which are received too late for classification cannot be included in these summaries until the following week.

- HARTLEPOOL.**—September 29th.—Erection of a destructor-house, engine and mill house, rockery, iron walls and chimney at the proposed new sanitary depot in Clifton-street.—Mr. H. C. Crumminck, M.E.C.E., borough engineer.
- WEDNESBURY.**—September 30th.—Erection of isolation hospital buildings, boundary walling, &c., on a site in Dungenfield-lane.—Mr. E. Martin Scott, borough engineer and surveyor.
- ROASTON.**—September 30th.—Reconstruction of part of the fence-ment at the north-west corner of Bank-street.—The Borough Engineer.
- RANSWATE.**—September 30th.—Supply of 250 12-ft. lengths of 12-in. gas pipes, and 10 tons of ordinary specials.—Mr. William A. Vinton, engineer of the corporation gasworks.
- WOOD GREEN.**—September 30th.—Making-up of King's-road and Western-road, for the urban district council.—Mr. C. J. Grayson, surveyor to the council.
- ARCKINGHILL (Scotland).**—September 30th.—Construction of a pier or boat-landing stage.—Mr. James Irlins, county clerk, Thurso, N. B.
- CALSTOCK.**—September 30th.—Laying of about 2,800 yards of 3-in. cast-iron socket pipes, from Buddles aid to Hartwell-wood, and 1,200 in the yards from Piggie Dowie aid to Tothowrthy and Albiston, in the yards of Calstock, for the rural district council.—Mr. John P. Blythe, clerk to the council, Callington.
- EAST RIDING.**—September 30th.—Erection of registrar's offices and extension of the county offices at Beverley, for the county council.—Mr. J. J. Bickersteth, clerk to the county council, Beverley.
- HELLY.**—September 30th.—Supply of forty-five electric motor cars, twenty trial cars, two sprinkler cars and two traversing platforms.—Mr. A. E. White, city engineer.
- LEEDS.**—October 1st.—Construction and erection of a wrought-iron roof for the new coal store at the New Wortly gasworks.—Mr. R. H. Townsley, general manager, Municipal Buildings, Leeds.
- BIRMINGHAM.**—October 1st.—Reconstruction of the sewer in Needles-alley, New-street, also the construction of new pipe sewers in a portion of Wentworth-road, Harborne.—Mr. John Price, city engineer and surveyor.
- PENDBROOK.**—October 1st.—Construction of a pumping station and high storage tank and other works at Milton in connection with the water supply of Pembroke Dock.—Mr. W. O. Hulm, town clerk.
- LEICESTER.**—October 1st.—Alterations and additions to the Museum buildings in Hastings-street.—Mr. E. G. Mawbey, M.E.C.E., borough engineer.
- WOLVERHAMPTON.**—October 1st.—Making-up of Hilton-street.—Mr. J. W. Bradley, borough engineer and surveyor.
- LEEDS.**—October 1st.—Extension of Kirkgate market.—Mr. Thomas Howson, M.E.C.E., city engineer.
- BELTON ON-THE-HEATH.**—October 3rd.—Making-up of Eldon-street and Nelson-street.—Mr. George T. Lynam, borough engineer and surveyor.
- HAWKELL.**—October 3rd.—Supply of broken Guernsey or Channel Islands granite during the year ending the 31st March, 1899, for the urban district council.—Mr. Warren S. James, clerk to the council.
- ASTON-UNDER-LYNE.**—October 3rd.—Installation of the necessary wires, fittings, &c., for the electric lighting of the public market.—Mr. John Neal, borough emplover.
- WEMBLEY.**—October 3rd.—Supply of broken granite, granite chip-pings, slag and fine gravel, for the urban district council.—Mr. John Smith, clerk to the council.
- FAIRFIELD (Derbyshire).**—October 3rd.—Supply of 1,035 yards of 6-in. cast-iron socket and spigot pipes, for the urban district council.—Mr. Charles Wain, clerk to the council.
- NORTHAM.**—October 3rd.—Construction of an impounding reservoir at Melbush Moor to hold 30,000,000 gallons of water, with the necessary outlet works, filters, pure water reservoir, diversion of a public road, the fencing, the construction of covered service-reservoir at Northam, the laying of the construction of cast-iron socket pipes, and the supply and fixing of supply aid laying of 12-in. and 18-in. Frechin pipe sewers in Bedford-place, Bon-Accord-terrace, Wallfield-crescent, Albert-street and Walker-road.—Mr. William Dyack, borough surveyor.
- CRUYDON.**—October 4th.—Repair of portions of Crowther, Holland and Dale Park roads.—Mr. E. Mawdesley, town clerk.
- CRUYDON.**—October 4th.—Supply of 10,000 ft. of 12-in. by 8-in. Norway granite kerb and 10,000 ft. of 12-in. by 6-in. Norway granite channel.—Mr. E. Mawdesley, town clerk.
- CLACTON.**—October 4th.—Provision and laying of a 11-in. cast-iron main, about 9½ miles in length, from Great Bentley to the present water-works, for the urban district council.—Messrs. John Taylor, Sons & Co., Santo Crisp, engineers, 27 Great George-street, London, S.W.
- DURLEY.**—October 4th.—Supply of lead-covered cables and underground conduits for the extension of lead-covered cables, for the gas commissioners.—Mr. Theo. Thornton, clerk to the commissioners.
- LAWRENCE.**—October 4th.—Kerbing and tar paving of the footpaths, and channelling and metalling of the roadway of Colfe-road, Forest Hill, for the district board of works.—The Surveyor to the Board.
- URMSTON.**—October 4th.—The flagging and kerbing of various public footpaths, for the urban district council.—Mr. C. O. Hooley, surveyor to the council.
- KENILWORTH.**—October 4th.—Paving, flagging, &c., of Moses, Aaron, Barn, Bee and Fly streets, and a yard off Park-lane.—Mr. W. H. Hopkinson, M.E.C.E., borough engineer.
- LONDON.**—October 4th.—Erection of two blocks of dwellings, to be known as Benson and Abington dwellings respectively, on the Boundary-street area, Bethnal Green, and also the erection of estate dwellings at Brook-street, Limehouse, for the county council.—Mr. C. Stewart, clerk to the council, County Hall, Spring-gardens, London, S.W.
- FRWICK.**—October 5th.—Supply of about 500 tons of best Welsh or other unannealed or hand-picked bars.—Mr. W. H. Huillet Roberts, engineer aid manager of the corporation waterworks.
- HALIFAX.**—October 5th.—Erection of a tramway car-shed at the junction of Free School-lane and Skirret-road.—Mr. Edward R. S. Escott, borough engineer.
- LITTLEHAMPTON.**—October 5th.—Various improvement works in Gloucester-road and Park-lane.—Mr. J. H. Howard, surveyor to the council.
- RATHMINES (Ireland).**—October 5th.—Supply of various electric light plant, for the township commissioners.—Mr. Robert Hammond, consulting engineer, 61 Victoria-street, London, S.W.
- BANGOR.**—October 5th.—Erection of a refuse destructor.—Mr. T. G. Taylor, borough surveyor.
- BLAYDON-ON-TYNE.**—October 6th.—Supply of broken whitestone, limestone and rag as required up to March 31, 1899, for the urban district council.—Mr. W. H. Stephenson, surveyor to the council.
- HALIFAX.**—October 6th.—Private improvement works in Beecher-street, Brewery-street, Briar-street, Bathery's-court and Back Glen View terrace.—Mr. Edward R. S. Escott, borough engineer.
- DAKFOOT.**—October 6th.—Laying of a surface water drain, and the paving of the footways, crossing and channelling a Fallowell-road, for the urban district council.—Mr. W. Hirston, M.E.C.E., surveyor to the council.
- PLYMOUTH.**—October 6th.—Supply of an enclosed (iron-clad) continuous-current motor.—Mr. John H. Rider, borough electrical engineer.
- MACEHARTER.**—October 6th.—Erection of two blocks of conveniences in the Belmont-street recreation ground, also the construction of a new entrance gateway to Philipa Park.—The City Surveyor.

APPOINTMENTS OPEN.

HORNSEY URBAN DISTRICT COUNCIL.
APPOINTMENT OF INSPECTOR OF NEW BUILDINGS AND DRAINAGE WORK.

The Urban District Council of Hornsey require the services of an Inspector of New Buildings and Drainage Work, at a salary of £160 per annum, which will be paid monthly.

Candidates must be between twenty-five and forty years of age and have had some previous similar experience.

Preference will be given to candidates holding certificates of competency from some recognised examining body, such as the Sanitary Institute.

Written applications only, with particulars of past and present employment, and copies of two recent testimonials as to character and competency, with copy of certificates (if any), marked outside "Building and Drainage Inspector," must be received not later than 4 p.m. on Saturday, the 8th day of October, 1898, and be addressed to Mr. E. J. Lovegrove, Engineer and Surveyor, Council's offices, Southwood-lane, Highgate, from whom particulars of the duties to be performed can be obtained.

Original testimonials will not be returned. Canvasing members of the Council will disqualify.

(By Order)

F. D. ASKEY,

Clerk to the Council.

District Council Offices,

99 Southwood-lane, Highgate, N.

September 28, 1898.

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

- Easily and quickly laid by unskilled workmen.
- Perfect alignment of invert secured.
- Joint readily made absolutely watertight.
- Cheapest Patent Joint in the market.

IMPROVED DRAIN CLINOMETER.

THIS Drain Clinometer, which is a thoroughly well-made and reliable instrument, is intended for the use of Builders, Medical Officers of Health, Sanitary Inspectors and others for testing the slope of drain pipes.

The arc is fixed at the extreme end of the Clinometer so as to allow of a close reading and distinct graduation, and is divided on one edge to degrees and quarter degrees, and on the other edge to gradients of 1 in 20, 1 in 30, 1 in 40, 1 in 50, 1 in 60, 1 in 70 and 1 in 80.

The adjustment is by means of a nut and bolt, working against a spiral spring. The "Bubble" is ground and divided.

The Clinometer is made of tank and nicely finished, and measures 12½ x 2½ x 1 in.

PRICE :- With Electrum Fittings, £1 7s. 6d.; With Brass Fittings, £1 2s. 6d.; With Magnetic Compass extra 2s. 6d.

A Complete Illustrated Catalogue of Drawing and Surveying Instruments will be sent post free on application.

Minutes of Proceedings.

Municipal Engineers at Birmingham.

The conference of municipal and county engineers in connection with the congress of the Sanitary Institute at Birmingham, like most of the conferences of municipal engineers, was in every way a complete success. Much of this was, no doubt, due to the excellent arrangements which had been made by the local secretaries, who earned a well-deserved mood of praise for their successful exertions to provide subjects for discussion, and also objects of especial interest to municipal engineers to be viewed. In the latter respect the city surveyor of Birmingham, Mr. Price, with characteristic geniality assisted most materially to arrange at short notice for the inspection of numerous municipal works in progress in Birmingham, so that there was not an idle half-hour spent the whole day. The attendance of municipal engineers was large, and, it appears to us, increases at each successive conference. It is not, we believe, generally understood that the conference is unconnected and quite independent of the Incorporated Association of Municipal Engineers, but such is the case. In view, however, of the undoubted success of these foregatherings, it might, we venture to think, be a matter for the consideration of the council whether the conference should not be officially recognised and arranged by them, to the advantage of the Association. There are, we observe, a considerable number of engineers who attend these conferences who are not members of the Association, and who would be brought into touch with the body, to the benefit of themselves and the Incorporated Association of Municipal and County Engineers. It would further result, we believe, in eliciting papers on a wider variety of subjects interesting to municipal engineers than appears to be now practicable, and it would also appeal to the attention of municipal representatives and others who would at such times attend its meetings and who in many cases would not under ordinary circumstances have the opportunity of doing so. Another point, and one which it will be seen from our report was strongly emphasised at Birmingham. The council of the Sanitary Institute held that it is not practicable to print congress papers beforehand and to place them, if applied for, in the hands of intending speakers at the debates. A congress is an unwieldy function, but, so far as concerns the special section of it with which we are particularly interested, experience has shown that the course suggested is practicable; and, moreover, the local secretaries, given a free hand, could secure its enforcement. The council of the Institute have not seen fit to act upon the resolution passed at the Newcastle congress: it may be hoped they will earnestly consider the similar resolution adopted at Birmingham, as assuredly it is calculated, if put in practice, to increase vastly both the interest in the papers to be read and the value of the discussions upon them. One may, perhaps, be per-

mitted to instance, as a timely illustration, the case of Mr. Moss Flower's paper. It was not even printed before being read, with the result that it was listened to with less interest than it deserved, and comment upon it was conspicuous by its complete absence. And while in the vein of suggestion, it may perhaps be permitted to submit to the council of the Institute that they should in future years mete out more consideration to the Press. The daily struggle for sets of papers, too incomplete to be of use when obtained, is an unnecessary waste of time; the "reporters' room" at the Mason University College was of such a character that not a journalist used it; at the Health Exhibition there was no Press accommodation of any sort; nor was it possible for reporters to work at the conferences or sectional meetings with any degree of convenience. These are but few instances of minor matters which might be remedied with advantage at the next congress, at Southampton.

It will be observed that, in continuing our report of the work of the congress, we give special attention to the proceedings of the conference of municipal and county engineers, as that in which our readers are specially interested, though not a few papers bearing more or less directly on municipal engineering problems were read in other sections. The municipal engineers were presided over by Mr. T. de Courcy Meade, the city surveyor of Manchester; whose able address was evidently kept within rather brief limits owing to a consciousness of the amount of work to be subsequently done. It was generally regretted that the plans which were to have accompanied the address were not forthcoming, but it should be understood the fault was neither with the president nor the local secretaries. After a brief reference to the multifarious duties of the municipal engineer and the necessity thus imposed upon him of an unceasing search after knowledge, the president devoted the remainder of his address to a general but interesting commentary on one or two matters to which he is at present giving special consideration. Practically he confined himself to two topics—the housing of the working classes and the treatment of sewage. With great clearness, brevity and precision he indicated the methods by which the Manchester Corporation have met the difficulties of providing sufficient suitable accommodation at reasonable cost for persons of the working class displaced from insanitary areas, or from areas cleared for street improvements and railway works. The Manchester Corporation are to be equally congratulated on the steady progress which is being made in the substitution of water-closets for pail-closets and privies. The completion of such a work must, as Mr. Meade remarked, be a question of time. In his observations on sewage treatment the president gave some interesting figures as to the cost of treatment and the amount of work done at the Manchester outfall works, and these details

are certainly of interest and value for the purposes of comparison. The solution of the sewage disposal problem is now generally looked for in connection with artificial filtration. Towards the close of his address Mr. Meade referred to the experiments which have been continued at Manchester since 1895 with coke and cinder filters, and gave details of their respective capacities, together with the capacity of a coal filter. Those who are following the experiments in various parts of the country in connection with bacterial treatment will, no doubt, duly note the conclusions and results so pithily expressed by the president in regard to the working of the filters.

Three papers were read and discussed at the conference. Mr. Pickering, engineer and surveyor to the Nuneaton Urban District Council, took for his subject by-laws relating to new streets and buildings; Mr. Moss Flower, engineer and surveyor to the Portishead Urban District Council, dealt with the precautions to be observed in the ventilation of sewers and drains; and, finally, Mr. E. Shrapnell Smith, honorary secretary of the Liverpool Self-propelled Traffic Association, pointed out some of the sanitary and allied advantages attending the introduction of motor vehicles. A paper from Mr. Pickering may safely be anticipated as a thoughtful contribution, and the present occasion was no exception. He was undeniably successful in pointing out some weak joints in the sanitary armour of which we are so proud. He insisted strongly on the initial error involved in the Model By-Laws of the Local Government Board—the error of assuming that there could be drawn up one set of by-laws which would apply to all districts alike, rural and urban. This is probably the only objection that Mr. Pickering sees to making the adoption of by-laws compulsory and not permissive on the part of local authorities. He is strongly in favour of sanitary authorities being obliged to adopt by-laws, but holds with equal firmness that the adoption of a rigidly uniform code throughout the country would be impracticable, if not actually impossible. Certainly it would be difficult to dispute that, as local needs and conditions vary in different districts, the by-laws adopted should be modified in accordance with the needs and conditions of each district. Mr. Pickering's position, then, is that the adoption of by-laws should be compulsory, but that at the same time greater latitude should be given to sanitary authorities to frame by-laws adapted to the circumstances of their own particular districts. Probably the great majority of municipal engineers support the view enunciated by Mr. Pickering. Of course the granting of such discretionary power to sanitary authorities would be on the understanding that it was to be exercised within reasonable limits. Mr. Pickering chose a very effective illustration to enforce his argument when he referred to the risk of checking building operations in, and the growth of, a small district if the by-laws are found oppressive. Among other important points referred to in a suggestive and helpful paper was the necessity of proper facilities being given for the enforcement of by-laws. There is very little to choose between no by-laws at all and by-laws which cannot be enforced. Mr. Moss Flower, who read the next paper, had, like Mr. Pickering, the credit of introducing, in an able and closely-reasoned paper, a problem which provides municipal engineers with many anxious moments. He has long given close attention to the question, and the result was seen in his contribution to the proceedings of the congress. Though the last word has by no means been said, the subject of sewer and drain ventilation, as Mr. Moss Flower admitted, has been exhaustively discussed; but there was room for his paper at such a gathering as that at Birmingham, and also for the discussion upon it which did not take place. Apparently it was considered necessary that the discussion of this paper should be taken together with that on the not

very cognate subject treated by Mr. Shrapnell Smith, and, judging from the results, the topic of motor vehicles seemed to be the more fascinating of the two. Mr. Moss Flower's paper certainly deserved discussion, if only for the reason that it was essentially practical, the object being not to advocate any cut-and-dried method but to suggest certain desirable precautions. Municipal engineers, however, may think that they have discussed the subject sufficiently for the present. So far as London is concerned, the question remains where it was left at the conference last year between Sir Alexander Binnie and the metropolitan officials. It is not necessary in the course of these remarks to examine Mr. Moss Flower's suggestions in detail, but the majority of them will no doubt commend themselves to municipal engineers. Turning to the last of the three papers, it is obvious, from our report of the discussion elicited, that the subject excited no small interest. It cannot be said, however, that the speakers were quite so enthusiastic as Mr. Shrapnell Smith. There was some diversity of opinion, as will be seen from a comparison of the remarks of Mr. Mawbey with those of Mr. Hooley, who thought the paper was "too previous" by about ten years. Mr. Hooley, as becomes a county surveyor, spoke with reference to the adaptability of motors to the highways; Mr. Mawbey and others with reference to the possibility of effecting a saving by the employment of motors in municipal work. The purely sanitary aspect of the question, so much emphasised by the reader of the paper, was largely ignored in the discussion in favour of the other aspects referred to. Taking the proceedings of the conference as a whole, it can safely be said that they reached a high standard of excellence and interest.

The Dover Municipal Tramways.

The results of the first year's working of the Dover electrical tramways are as successful as the most ardent advocate of municipalisation could desire. The report recently presented by the surveyor demonstrates beyond all doubt, as far as Dover is concerned, the success of municipal electrical tramways and the economy of electrical working. The total receipts for the year have been £7,487 15s. 3d.; the receipts averaging per car mile 12s. 39d. The operating expenses per car mile, including all wages for staff, electrical energy, &c., was 6s. 41d. To sum up the result, the Dover Corporation, after payment of interest and instalment on loans, and all expenses of repairs, &c., are £1,300 to the good, which is sufficient evidence of the popularity of the venture. The cost of operating the line, 6s. 41d., is of interest not only to municipal officials, but is of importance so far as electrical engineers are concerned, because it was generally urged, when presenting the claims of electrical traction, that the cost per car mile would not exceed 6d. As a matter of fact, under most arrangements it would have been considerably lower at Dover than really obtained last year, for the undertaking is handicapped by the corporation having to purchase electricity to operate the tramway system. We are not saying that they are not justified in adopting this course with so short a length of line—viz., 3 miles; we merely contend that if electricity had been generated by the corporation themselves, or if they had obtained their supply of electrical energy from a municipal lighting station, it is extremely likely that the cost would not have exceeded 4½d. per car mile. As it is, on account of a maximum and minimum arrangement with regard to the consumption of energy, the cost per car mile would have been 5s. 9d. had it not been that the corporation had to pay £302 for current they did not use. The result of operating this short length of line ought to encourage municipal authorities who are contemplating the adoption of electrically operated tramways.

Theory of Local Government.

We have again pleasure in drawing the attention of our younger readers, and especially those of them who reside in London or within easy reach of it, to the opening of another session of the London School of Economics. We have on a previous occasion referred to the admirable work this institution is doing, though it is entirely the result of private enterprise. A syllabus embodying the arrangements for 1898-99 has recently been issued, and should be obtained and consulted by all who are interested in a good work which, perhaps, does not get all the appreciation it deserves. There is a special course for municipal officials, which includes general instruction in economics and political science, attention being subsequently given to statistics, public finance, constitutional law and the government of London. Mr. F. W. Hirst, B.A., will conduct a class for the study of the structure and working of modern local government, Mr. J. Kemp, M.A., one for the study of the government of London, and the subject of local government will also form part of the course of instruction to be given in the class to be conducted by Mr. G. Lowes Dickinson, M.A., for the study of the structure of the modern State. In addition to the classes, supplementary courses of lectures are given, and among them we observe courses on the problems of local government, foreign municipal government, the principles of local taxation, the theory of local taxation, and the incidence of taxation. Among the lecturers are Mr. Hobhouse, M.P., Mr. R. Cunningham Glen, Mr. G. Laurence Gomme (statistical officer to the London County Council), Prof. Edgeworth, and others. We may mention that the session opens this evening, when the principal, Prof. Hewins, will give the inaugural lecture at the school, 10 Adelphi-terrace, W.C., where all information can be obtained. We may say, in conclusion, that a glance at the syllabus is enough to show that the courses are arranged with marked ability and knowledge.

Another Colonial Appointment.

We have recently had the pleasure of announcing the appointment of two English municipal engineers to important and lucrative posts in South Africa. We refer, of course, to the appointment of Mr. Wynne Roberts, borough engineer and surveyor of Oswestry, to be city engineer of Cape Town, and the appointment, a few weeks later, of Mr. G. B. Laffan, engineer and surveyor to the Twickenham Urban District Council, to be municipal engineer of Pietermaritzburg in the neighbouring colony of Natal. To these a third appointment has now to be added, for we have pleasure in announcing that Mr. R. S. Rounthwaite, borough engineer of Sunderland, has been appointed city engineer of Wellington, the capital of New Zealand, and is expected to leave Sunderland for his new sphere of labour in December. The salary is the same as in the case of Cape Town and Pietermaritzburg—£800 a year. In Mr. Laffan the Incorporated Association of Municipal and County Engineers lose an energetic district secretary, and in Mr. Rounthwaite an enthusiastic supporter. The district meeting held at Sunderland last year enabled some idea to be gleaned of the ability and application Mr. Rounthwaite has brought to bear upon his work, and of the manner in which he is appreciated in the town he has served so long and so faithfully. His work in Sunderland is a good augury for a successful career in New Zealand, and the best wishes of his many friends will accompany him.

An Application as She is Wrote.

As our readers are well aware, singular notions prevail in many quarters as to the qualifications requisite for municipal engineers. The following is a copy of an application received in

connection with a recent vacancy in the office of surveyor, &c.:—

DEAR SIR,

Replying to the advertisement respecting the vacancy *Sanitary Inspector*.

I beg to offer myself as one of the applicants for the vacant appointment as Sanitary Inspector of this Borough age 29 years.

I am grandson to late Mr. ——— this town who was well known to the gentlemen of the Council.

In the of you knowing me personally I should feel greatly indebted you if you would kindly intercede your influence on my behalf.

I am native of the town there are several named gentlemen who speak of my respectability is AM ——— whom I am personally from a boy.

My occupation is Railway Coach Trimmer I am sorry I cant send you my references respecting my ability and experience.

I have written my employers and there are rules is not to grant any workmen there references to carry about with them until written for.

My present employer who has to engaged or appoint to refer to last employers bring letter.

For reference I have enclosed the Pass and Present employers.

Your Influence much esteemed.

Yours obediently.

Qualified Candidates!

A reference to a recent meeting of the Saltburn Urban District Council has just come under our notice, but we sincerely hope the statements are just a little bit exaggerated. The meeting was a special one, held to consider applications for the position of surveyor to the council, and we are told that the applicants were ninety-nine in number and "comprised representatives of nearly every trade, including tinkers, tailors, butchers, plumbers, farmers, lawyers, tobaccoists, joiners, commercial travellers, engine drivers, secretaries, foremen, overseers, schoolmasters, and a grocer and a draper." The list is a formidable one, and, though we have expressed a hope that it may be somewhat exaggerated, there is no doubt that in connection with appointments by district councils applications are often received from singular quarters. The mental condition of some of those applicants, and their conception of a district council surveyor's duties, responsibilities and qualifications are easy neither to imagine or describe. In the preceding paragraph we reproduce an actual *bona-fide* application which was received in connection with a vacancy, not in an urban or rural district, but in a borough. Considering the source from which we have received it, we can vouch for the fact that it is genuine.

* * *

Loughborough Water Supply.

At a meeting of the Loughborough Town Council, on Monday, an important decision was arrived at with regard to the water supply of the borough. It was decided unanimously to proceed at once with the construction of the proposed storage reservoir at Blackbrook, Parliamentary powers having been obtained last year to complete the Blackbrook scheme by impounding the whole of the water flowing off the watershed. The time fixed for the completion of the work was eight years from the passing of the Act. It has been pointed out by the Water Committee that the works must necessarily take several years to complete, even if proceeded with continuously; but, owing to the necessity of depending upon the Blackbrook stream, it may be necessary to suspend the works during the summer months each year, so that a much longer time might be occupied than would otherwise be the case. In moving, at the council meeting on Monday, that the Water Committee be empowered to begin the work at once, Councillor Cartwright, chairman of the committee, explained clearly the necessity for the scheme and also dealt with its financial bearings. In our next issue we shall give an abstract of the elaborate and highly-interesting report which has been prepared by the engineers, Messrs. G. & F. W. Hodson

The Sanitary Institute.

THE SEVENTEENTH ANNUAL CONGRESS.—II.

In our last issue we gave a report of the opening proceedings of the congress last week, together with a brief outline of the sectional proceedings and conferences. We now proceed to deal in greater detail with the papers read and discussed, beginning with the

CONFERENCE OF MUNICIPAL AND COUNTY ENGINEERS.

There were five special conferences—municipal representatives, medical officers of health, municipal engineers, sanitary inspectors, and a conference of ladies on the subject of domestic hygiene. The work of all five conferences began on Wednesday. The municipal and county engineers assembled in the Physics Lecture Theatre, where a large and representative attendance was presided over by Mr. T. de Courcy Meade, M.I.C.E., city surveyor of Manchester.

Among members of the Incorporated Association of Municipal and County Engineers who were present were the following:—

Messrs. Lewis Angell, West Ham; T. W. A. Hayward, Sudbury, Suffolk; T. H. Yabbicom, Bristol; H. Hatch Gammell, Perry Barr; W. L. Sugden, Stoke; T. Caink, Worcester; E. Rushton, Cleethorpes; J. Saville, Heckmondwike; E. Purnell Hooley, Nottingham; W. J. Press, Burnham, Somerset; K. Read, Gloucester; R. M. Gloyne, Eastbourne; H. G. Keywood, Maldon, Essex; W. K. L. Armytage, Yeovil; R. C. Ivy, Ormskirk; J. Chadwick, Blethley, Bucks; T. Biker, Barnoldswick; R. Dickinson, Berwick-on-Tweed; A. A. Turrif, Elgin, N.B.; A. Waddington, Oldham; J. A. Barton, Ryde, I.W.; H. T. Sidwell, Herne, Canterbury; J. Gammage, Dudley; C. W. Shackleton, Cosely, Shropshire; J. E. Willcox, Birmingham; T. Gregory, Newburn-on-Tyne; R. Dixon, Stratford-on-Avon; T. Young, Standerland; G. H. Wild, Littleborough; G. J. Hunt, Dorchester; J. Spencer, Keighley; J. Rushworth, Haworth; A. J. Price, Worcester; F. C. Cook, Nuneaton; G. S. Fraser, Eccleston Park, Prescott; T. Hibbert, Cirencester; C. T. Jenkin, Willonhall; W. F. Y. Molinex, Winchester; A. L. Rodwell, Skipton; W. B. Morgan, Weymouth; F. Massie, Wakefield; J. Munce, Balfast; W. P. Pattison, Benwell and Fenham; G. F. Moody, Grimsby; J. Smith, Ballinasloe; R. O. Wynne Roberts, Oswestry; W. E. A. Williams, Festiniog; J. S. Pickering, Nuneaton; T. de Courcy Meade, Manchester; J. T. Eayrs, Birmingham; J. Price, Birmingham; E. G. Mawbey, Leicester; J. E. Worth, district engineer, London County Council; A. D. Greatorex, West Bromwich; R. Collins, Enfield; W. L. Bradley, Tonbridge; W. R. Prescott, Reigate; W. Boulton, Burslem; F. Mager, Aldridge, Walsall; G. P. Mines, Stroud; W. G. Fletcher, Wimbourne, Dorset; W. F. Bird, Midsummer Norton; T. J. Moss Flower, Portishead; S. Churchward, St. Thomas, Exeter; J. E. Swindlehurst, Coventry.

Of non-members of the Incorporated Association of Municipal and County Engineers the following were among those present:—

Messrs. S. G. Driver, J. Foulds and W. Sugden, Bedford; W. Gane and B. Greaves, Cleethorpes; T. E. Coleman, Gosport; J. Clark, Broughton-in-Furness; J. Wrigley, Lenscale; C. Harper, Bath; F. Bettany, Burslem; S. R. Lowcock, Birmingham; A. Smith, Lowestoft; P. Kit, Lowestoft; J. G. Mills, West Kirby; W. T. Mills, Liscard, Cheshire; J. D. May, Dublin; J. Robinson, Durham; W. Boulton, Burslem; O. C. Apter, Reigate; J. J. Galloway, Royal Engineers, Birmingham; T. Hutchinson, Warrington; J. Chew, Stroud; H. C. Broome, Fallsworth Urban District Council; S. S. Gettings, West Bromwich; H. Vickery, Kingsbridge Rural District Council; G. Price, Harborne; H. Silcock, Wakefield; J. Eastwood, Warley Urban District Council; W. Dawson, Birkenhead; A. Oddy, Pontefract; G. Owen Dunn, Bombay; D. Turson, Warrington; J. Evans, Warrington; J. Denis, Warrington; W. E. Coles, Stratford-on-Avon; J. Actumley, Skipton; R. Pithills, Oxenhope; E. Thomas, Beaumaris; H. Vickery, Kingsbridge; F. W. Mason, Enfield; H. Swire, Skipton; F. Wicks, Walsall; G. F. Moody, Grimsby.

The proceedings of the conference were opened by

THE PRESIDENT'S ADDRESS.

By T. DE COURCY MEADE, M.I.C.E.

With feelings of much pleasure I accepted the invitation of the council of the Sanitary Institute to occupy the chair at this conference, which enables me again to take some part in the excellent work the Institute is annually performing. This is the fifth occasion on which municipal and county engineers have assembled at congresses of the Sanitary Institute. The former meetings took place at Portsmouth in 1892, at Liverpool in 1894, at Newcastle-upon-Tyne in 1896, and at Leeds last year. Upon all these occasions the Incorporated Association of Municipal and County Engineers were well represented by individual members—although not collectively—showing that municipal engineers are ever ready to embrace all opportunities afforded to them of meeting for the discussion of matters appertaining to their profession, for exchange of ideas, and for mutual advancement.

The interest taken in these meetings proves also that the council of the Sanitary Institute were well advised in making this new departure in the programme, which has been, I believe, fully justified by the results. At the first of these meetings the chairman, Mr. H. Percy Boulnois, M.I.C.E., submitted his excellent diagram indicating the duties of the municipal engineer under six heads, which embrace no less than ninety-eight distinct subjects. Is it therefore surprising that the municipal engineer should always be a student, anxious to learn all that is new, and desirous to benefit by the experience of other engineers, and by the discussion of papers and criticisms of the views expressed by the authors? It should not, however, be forgotten that the communities whose representatives we have the honour to serve reap the benefits of the knowledge thus gained; and when this fact becomes better known and generally recognised the attendance of officials at meetings of this character will doubtless be still more numerous. For the information of visitors who may be present, I would add that the Incorporated Association of Municipal and County Engineers was founded upwards of a quarter of a century ago, and numbers among its members the surveyors and engineers of all the principal towns in Great Britain and Ireland, and that meetings of that Association are held annually in one or more large centres of population, when papers are read and discussed and works in progress are viewed.

THE HOUSING OF THE WORKING CLASSES.

It is not the custom to discuss the points raised in the chairman's opening address. I shall therefore refer in very general terms to a few matters that are likely to be of interest to which I am at present giving special consideration, commencing with that well-worn topic—the housing of the working classes. The difficulties of providing sufficient suitable accommodation at reasonable cost for persons of the working class displaced from insanitary areas, or from areas cleared for street improvements and railway works, are in most instances very great, and are generally enhanced by the tendency to overcrowd, which in many cases unduly increases the number of persons to be provided for upon areas already too limited. These difficulties have been met in Manchester by the erection on the cleared sites of (a) blocks of five-storied tenements, approached by a common stairs and balconies; (b) blocks of tenements of two and three storeys, with separate entrance and stairs to each set of tenements; (c) terrace cottages of five rooms each; (d) a model lodging-house. By the kindness of the chairman of the Sanitary Committee of the Manchester Corporation, Alderman Walton Smith, J.P., drawings of all these buildings have been lent for the inspection of visitors to the congress. The Manchester Corporation are also erecting (e) cottage dwellings in the outskirts of the city, about 2½ miles from the cleared areas, where land is less costly. These cottages vary somewhat in character, and contain from five to seven rooms each. The buildings class (a) have been occupied about three years, and are let at rents which yield a moderate return upon the cost of erection. The two blocks (a) of five-storied buildings cost about £87,000 exclusive of the cost of sites. The latter, with old buildings thereon, cost about £54,000. Single-room tenements are let at 2s. 6d. per week, the rent of two or three roomed tenements varies from 2s. to 5s. per week.

In addition to the above-mentioned new buildings, much has been done in the improvement of existing dwellings and has the conversion of "back-to-back" houses into "through" houses. This work, though excellent where it is effected, has a tendency to cause overcrowding elsewhere, as the number of persons that can be accommodated in the converted and improved dwellings is much less than was crowded into the "back-to-back" houses before alteration. Full details of the procedure of insaniating "back-to-back" houses will be found in Dr. Niven's interesting paper on the subject (see "The Journal of the Sanitary Institute," vol. xvi, page 254). That paper is accompanied by plans showing the methods generally adopted in the alteration of "back-to-back" houses. From these it will be seen that in all cases the groups of pan-closets used by the occupiers of one or more blocks of houses are removed, and that each "through" house is provided with a proper water-closet. The substitution of private water-closets for common pan-closets and privies is thus gradually proceeding, but will doubtless be a work of time.

There are at present in the city of Manchester 76,913 pan-closets, 22,990 privies and 13,914 middens, but these numbers are annually becoming less, as water-closets are being provided wherever alterations to property are effected by the corporation. About 900 tons of faecal matter is collected from the pan-closets per week, and about half this quantity is dried and converted into concentrated manure and sold; the remainder is mixed with ashes and rubbish and disposed of among farmers on the corporation estates at Carrington and Chat Moss. These estates have an area of about 3,750

acres, and it is estimated that about 93,000 tons of mixed night-soil can be thus annually disposed of.

THE TREATMENT OF SEWAGE

is a subject of general interest to most of those present, therefore a few particulars of the cost, &c., of treatment at the Manchester outfall works may not be out of place. The population contributing to the sewage system increased from 400,360 on the 1st of January, 1897, to 512,500 on the 31st of December, 1897. The average daily flow during 1897 was 20,426,363 gallons. The flow per head of the population ranged from 39.3 gallons per day in May to 50 gallons per head in December last. The quantity of water supplied by the corporation is about 28 gallons per head per day. It is estimated that about 17 gallons are employed for domestic use, and the remaining 11 gallons for trading and public purposes. The difference between the total quantity of water supplied and the average quantity of sewage reaching the works is largely due to the admission of underground water, which passes into the old sewers and drains through defective joints. The net cost of treatment for 1897 was £19,089 9s. 7d. exclusive of interest and repayment of capital, or £2 11s. 9d. per 1,000,000 gallons treated, apportioned as follows:—

	1897.			1897.		
	Per 1,000,000 gallons.			For 1,000,000 gallons.		
	£	s.	d.	£	s.	d.
Precipitation (labour and chemicals only)	0	13	9.7
Sludge disposal (labour and materials only)	0	14	3.6	0	13	9.7
Filtration (a small proportion only of the sewage was filtered)	0	1	1	0	0	5.9
Coal (this includes all steam-power used on the works, but does not include coal for the steamer)	0	3	11.5	0	2	10.1
Sandries	0	0	8.5	0	0	7.7
Incidental expenses (less credits and receipts)	0	11	5.3	0	13	4.6
Total	£2	14	2.9	£2	11	9.1

The above summary of the cost of treating the sewage for the year 1897 shows a reduction of 2s. 5sd. per 1,000,000 gallons on the cost of treatment for the year 1896. The proportion of chemicals used during the year 1897 was lime, 5.32 grains per gallon; sulphate of iron, 5.29 grains per gallon—total, 10.61. The quantities of lime and coppers used are adjusted by frequently testing the sewage after admixture with chemicals. The effluent is kept as far as possible faintly alkaline. For this purpose the addition of a slight excess of lime is necessary, owing to subsidence and precipitation of carbonate of lime in the tanks. The amount of coppers added varies with the sewage, and is estimated by the character of the precipitation observed. The composition of the sewage varies within wide limits. The sewage begins to attain its maximum strength about noon on each day, and continues strong until midnight or a little after. The composition of the effluent does not vary so abruptly as that of the sewage, owing to the mixture of the sewage in the precipitation tanks. The effluent begins to attain its maximum strength about 2 o'clock in the afternoon.

The average amount of wet sludge precipitated in 1897 was equal to 21.16 tons per 1,000,000 gallons, as against 21.84 tons for the previous year, yielding 7 tons 12 cwt. of pressed cake per 1,000,000 gallons, as compared with 7 tons 18.4 cwt. for the year 1896. One ton of wet sludge equals 33.7 cubic feet, and 1 ton of pressed cake equals 32.12 cubic feet. The average proportion of wet to pressed sludge was at the rate of 2.73 to 1. The amount of lime used in pressing has averaged 1.40 per cent. by weight of wet sludge, and 3.83 per cent. by weight of pressed cake. The amount of sludge cake removed by farmers during 1897 was 14,233 tons, equal to an average of about 39 tons per day. The balance of 11,875 tons was deposited in a tip adjoining the works. The cost of pressing sludge during the year 1897 was 7.7d. per ton of wet sludge for labour, lime, cloths and sandries, but exclusive of cost of tip, repairs to presses, rolling stock and insurance. The cost of conveying the sludge to the sea for the first three months of this year amounts to 6.2d. per ton of wet sludge, and includes wages, insurance of steamer, coal, repairs and incidental expenses and ship canal charges. Experiments have been continued since 1895 with coke and cinder filters. The capacities of these filters and of a coal filter as measured on several occasions are:—

Date of Measurement.	Capacity in Gallons.			Time of resting before Measurement.
	Coke.	Cinder.	Coal.	
At commencement of use, in 1895...	1,750	1,750	—	—

* The filters had been refilled with washed and screened material.

The results of these measurements show that a considerable amount of moisture is retained in the filtering medium, and that this is slowly drained off or evaporated when the filter is allowed sufficient rest before refilling. The cinder filter has throughout given better results than the cake, both as regards the percentage reduction of impurity effected and in non-precipitability.

To-day we shall have the opportunity of hearing several interesting papers read and discussed. I therefore feel that I must not unduly occupy the limited time at our disposal, and will content myself with directing your attention to the drawings before referred to, and to the photograph and models which have been placed here for your inspection.

BY-LAWS RELATING TO NEW STREETS AND BUILDINGS.

Mr. J. S. PICKERING, surveyor to the Nuneaton Urban District Council, read a paper entitled "By-Laws Relating to New Streets and Buildings." He said it was scarcely possible within the limits of a short paper to make any detailed reference to by-laws affecting new streets and buildings. It was more with a view to elicit an expression of opinion on the subject generally that it was introduced. He proposed to refer more particularly to by-laws made in England, under the provisions of the Public Health Acts, rather than to by-laws made under local Acts, but his remarks would, however, apply in some measure to by-laws relating to sanitary matters in general.

THE PUBLIC HEALTH ACT, 1875,

empowered sanitary authorities to make by-laws with respect to new streets and buildings, and repealed previous Acts under which such by-laws were made. It also provided that by-laws made under those repealed Acts were to be deemed by-laws under the Act of 1875, if not inconsistent with the provisions of such Act.

In 1877 the Local Government Board drew up a "Model" series of by-laws for the guidance of local authorities. These had been somewhat amended from time to time, and had been framed with great care and under the best legal advice. What was also of the utmost importance, their provisions were considered to be in accordance with the statutory enactments by which they were authorised. But, notwithstanding these conditions, the Model By-Laws had not been received with general approval. It was true that by-laws made since the passing of the 1875 Act generally adhered closely—and in the greater number of cases almost word for word—to the "Model" series, but this was not so much on account of their general suitability to the districts for which they were adopted, as to the fact that the Local Government Board would not sanction any important departure from their "Model" code. The result was that many authorities did not possess any by-laws at all, others depended upon by-laws of doubtful validity made under former sanitary Acts, while the great majority did not enforce the particular by-laws they had been compelled to include in adopting the "Model" series.

"It is somewhat astonishing," said Mr. Pickering, "that this state of affairs should be allowed to continue with the extension of local government which has taken place in the country, and when there is a general desire on the part of local authorities to carry out the provisions of the Sanitary Acts. The varying circumstances of different districts make it impossible to frame a series of by-laws applicable to all. By-laws, for instance, affecting new streets and buildings in large towns would be altogether unsuited to the requirements of, say, the villages of rural districts. But obvious as this is, it is a matter which is overlooked and accounts for the absence of by-laws in many rural sanitary districts. Sec. 157 of the Public Health Act, 1875, provides that every urban authority may make by-laws with respect to the following matters: The level, width and construction of new streets, and the provision for the sewerage thereof; the structure of walls, foundations, roofs and chimneys of new buildings for securing stability and the prevention of fires, and for the purposes of health; the sufficiency of the space about buildings to secure a free circulation of air, the ventilation and drainage of buildings, and the closing of buildings unfit for habitation. Surely these provisions are of sufficient importance to make their adoption imperative. Possibly twenty-three years ago, when the Act came into force, it would not have been desirable to make the adoption of by-laws compulsory, but, considering the advance of sanitary science since 1875, and the general determination of the community to live in greater comfort, and consequently under healthier conditions, there now appears to be no valid reason against the adoption of proper by-laws in every sanitary area. It is evident that the legislature do not accept this view, or they would not continue to make the adoption of important sanitary measures permissive on the part of local authorities." Spoken of

THE PUBLIC HEALTH ACTS AMENDMENT ACT, 1890,

Mr. Pickering said this Act contained many important provisions affecting the health of the community, but they could not be put into force without months of delay in complying with the wearisome details provided for in the adoption of the Act. Sec. 23 of this Act gave to sanitary authorities increased powers as to making by-laws affecting new streets and buildings. Under this section a by-law might be made with reference to the height of bed-rooms, and other

rooms used for human habitation. It seemed almost incredible that until the passing of the 1890 Act sanitary authorities had no control over the height of such rooms, although many authorities possessed a by-law fixing their minimum height. This was one of many by-laws inconsistent with the provisions of the Public Health Act, 1875, and therefore *ultra vires*, but it had been carried out as though it possessed full legal force. In many of the larger towns by-laws made under the Public Health Act, 1848, the Local Government Act, 1858, and other Acts repealed by the Public Health Act, 1875, had not been amended, though repugnant to the laws of the country, and the authorities possessing them preferred to retain these, trusting to their legality not being questioned, rather than adopt the more modern by-laws as sanctioned by the Local Government Board. This position on the part of local authorities should scarcely be possible; in any case, it should not be a necessary position to take up in order to secure by-laws adapted for the health and convenience of a district, for it must not be overlooked that many of these ancient by-laws, as in the case of the one referred to, were eminently desirable, whatever might be said of their validity from a legal point of view. By-laws made under Acts previous to the Public Health Act, 1875, were, as a rule, so conveniently elastic that this was another reason given for their retention in preference to the rigid by-laws of the present day. The following were specimens of the by-laws in force in a town with a population of upwards of 130,000:—

"The walls of every new building shall be constructed of such thickness as shall be approved by the said council."

"The owner or occupier of every house shall provide proper ventilation in the drainage thereof by means of the rain-water pipe from the roof of the house, or by such other method as the said council shall direct."

These were, Mr. Pickering said, a striking contrast to the detailed by-laws referring to the thickness of walls and the ventilation of drains in the "Model" series, and yet they were only examples of similar by-laws in force in numerous large towns.

Another convenient old by-law was one giving the authority discretionary power with respect to the enforcement of air space at the rear of buildings. The Local Government Board would not now sanction a new by-law which provided for this discretionary power. But most sanitary authorities, nevertheless, did not hesitate to exercise their discretion when an occasion arose, such, for instance, as in the pulling down and re-erection of a building where the provision of the by-law could not be adhered to without considerable sacrifice of property. It might, of course, be contended that the air space was necessary for the health of the occupants of a dwelling wherever the building was situated, and more especially in a populous district, where property as a rule is the most valuable. But an authority had often either to allow a building to be re-erected (and possibly improved from a sanitary point of view) without the requisite air space, or submit to it being altered in such a way that it would not come within the scope of the by-laws as a new building. Discretion in a case of this description seemed desirable, but it must be admitted that any general admission of discretionary power in the by-laws would probably result in frequent acts of indiscretion on the part of some authorities. By-laws of the "Model" series relating to the thickness of walls were seldom carried out in their entirety, especially where they had been adopted in the smaller towns and rural districts, where there was often a feeling that their enforcement might prejudicially affect the desirable growth of the district. So far as by-laws were prepared to meet the varying conditions affecting the thickness of the walls of a building, the "Model" by-laws did not appear to leave much to be desired. Possibly the thickness prescribed for the walls of small houses up to three storeys might be somewhat modified to meet the objections usually raised against them in the smaller districts; but this would always be a difference of opinion as to what should be regarded as the reasonable and necessary strength of a building, and much would, of course, depend upon the quality of the material and workmanship. As the powers and privileges to make (and necessarily to enforce) by-laws under the Sanitary Acts have not been so fully appreciated as the framers of the Acts must have anticipated, it is a question as to the proper course to be adopted to bring about a better state of things. That it was desirable for all sanitary authorities to have proper by-laws affecting new streets and buildings there could be no doubt. However seldom it may be necessary to bring such by-laws into operation, they would be of service at some time or other, even in the most sparsely-populated districts. If, then, suitable by-laws were essential in rural districts, how much more important that populous towns should possess by-laws framed with the highest possible considerations for health and convenience. This, in the author's opinion, would only be brought about by the adoption of by-laws being made compulsory, and a greater latitude being given to sanitary authorities to frame by-laws adapted to their own particular districts. But the possession and value of by-laws would, however, be of little effect if the necessary means were not adopted for enforcing them. Even in districts where there was an apparent desire to see the by-laws strictly carried out the surveyor's staff was generally so inadequate that the necessary amount of supervision could not be given. In the author's opinion no new house should

be occupied without a certificate from the surveyor that it had been erected in accordance with the by-laws, and that it was fit for human habitation. It would be manifestly unfair, however, to expect a surveyor to give such a certificate unless he had satisfied himself by systematic and regular supervision on the part of a competent staff during building operations that such certificate was justified. Then, again, such a certificate could not be given where the by-laws were not enforced. In some of the older by-laws this certificate was required to be given, but it was not probable that a by-law would now be sanctioned to this effect. Indeed, it would scarcely be desirable until the necessity for a better supervision of new buildings was recognised by sanitary authorities.

BY-LAWS VERSUS ACTS.

It appeared to the author that many provisions contained in by-laws might with advantage be incorporated in the Sanitary Acts, making them statutory enactments rather than measures to be adopted at the option of local authorities. It also seemed desirable that by-laws should be made less comprehensive, many matters of detail now included being made the subject of regulations varying according to the requirements of each particular district. Under these conditions a general series of by-laws more acceptable than the present "Model" series could probably be framed, and sanitary authorities would be able to include in their regulations many important matters, which would make by-laws cumbersome and unnecessarily lengthy. In the case of new streets, for instance, the by-laws might very properly lay down the requirements as to widths under various conditions, but the actual method of construction would be better dealt with in detailed regulations, forming a practical specification of the requirements. Then, again, matters connected with the drainage of a building could be more conveniently and in greater detail be referred to in regulations. It would add to the value of such regulations to accompany them with a complete set of descriptive drawings. Many authorities supplemented their by-laws with regulations as to drainage and other matters, but as these were not confirmed by the Local Government Board, and very frequently contained conditions which could not be legally enforced, they could not be said to be wholly satisfactory.

In concluding, Mr. Pickering said that in any revision of the "Model" by-laws, and the Acts under which they were framed, the Incorporated Association of Municipal and County Engineers might afford most valuable assistance. Throughout the Sanitary Acts and the "Model" series of by-laws there were many technical defects which the municipal surveyor could very readily rectify, and thus put an end to much unnecessary litigation. The Local Government Board in 1877 acknowledged the assistance rendered by the Royal Institute of British Architects, in framing the by-laws dealing with new streets and buildings, and they would no doubt equally value the help of a professional body whose members must, by their every-day experience, possess a most intimate knowledge of the subject. It was to be hoped that the time was not far distant when every sanitary authority in the country would be in possession of by-laws which it would be deemed a duty to carry out in the interests of the health of the community.

THE DISCUSSION.

Mr. J. PRICE (Birmingham) proposed a vote of thanks to Mr. Pickering for his paper on by-laws; always, he said, a delicate subject. One would like to know how far the Public Health Acts Amendment Act of 1890 was in force. In very few cases, in his experience, had full advantage been taken of the various clauses, more especially in regard to details in respect of the height of rooms. By-laws might be divided into two classes—one in which they would be general and applicable to every authority, and another in which they were simply applicable to particular districts. Birmingham had one or two of the discretionary by-laws, and he thought they had been carried out with great advantage to the city. After referring to various points of detail concerned with the thickness of walls, Mr. Price expressed his opinion that new by-laws would have to be made for Birmingham, as those in existence were in some respects not sufficiently stringent and in others were oppressive to builders.

Mr. T. LONGDIN (Warrington) said he knew that for the last fifteen or sixteen years the question of adequate by-laws had been before them, but they had not yet been able to get a model set of regulations. He thought something like that might be effected if they could get a consensus of the opinions of municipal engineers.

Mr. J. T. EAVES (Birmingham) said Mr. Pickering had given them a valuable and interesting paper on an important subject. By-laws had been a burning question for many years. He knew that in many districts they were afraid to adopt new by-laws, because the Local Government Board insisted on the Model By-Laws being carried out with very little modification. Local authorities felt that some discretionary power should be left to them, so that they could deal with incidents in their own districts which the Local Government Board would not recognise. He agreed with the author that a series of revised by-laws might be drawn up with advantage. There ought to be powers in them to deal with the strength of timber, as well as the thickness of walls; such powers as Salford had, and, he thought, Manchester also. In 75 per cent. of the cases where the Model By-Laws existed

they were not enforced. It was no use having these restrictions if they were not acted upon; but he wanted to know what power local authorities had to enforce by-laws. It is true they could be compelled by mandamus to exercise them, but who would take this action? A surveyor had not the power, and if he tried to exercise it he would at the next meeting get the — (laughter). "Well, gentlemen, you know what I mean," was Mr. Eayrs' conclusion.

Mr. T. CAINK (Worcester) referred to certain concessions which had been obtained from the Local Government Board as to the thickness of walls for three-storey buildings, and expressed his opinion that others could get similar concessions.

Mr. G. J. HUNT (Dorchester) said that if local authorities had no discretionary power they must either stop building progress or allow building to proceed without taking action. He also dealt with the by-laws as to air space in the rear of buildings and as to the thickness of walls.

Mr. R. READ (Gloucester) said that when his authority had adopted by-laws every regulation they had made was struck out by the Local Government Board, but they had discretionary by-laws which applied to the older parts of the city. When any building there had to be rebuilt they could adopt the same air space as the old building had. The Model By-Laws appeared to have been drawn up on the assumption that all materials were bad, builders unscrupulous, and architects fools. They were altogether out of date, and wanted revising, with the assistance of the Association of Municipal and County Engineers. When this was done he hoped they would be written in English. At present they could only be understood by a Philadelphia lawyer.

Mr. A. J. PRICE (Worcester), as a building inspector, referred to the necessity of providing in by-laws for a proper damp course in basements. He would like to know what was "a new building," as the difficulty of defining "ground floor" left it in doubt. In Liverpool and Brighton they provided in their by-laws a definition of "ground floor" and "ground storey." In close conjunction with this question of new building was that of new drains. In Brighton they insisted upon proper plans being deposited, a course which he thought was followed in a few other places, but not generally. One could sometimes get a plan, but there was nothing in the by-laws which empowered them to insist upon it. Nor was there any power to enable them to deal with high factories in narrow streets as they could with private houses.

The PRESIDENT expressed their obligations to Mr. Pickering for putting before them a subject of so difficult a character that even those who had spoken upon it disagreed in their views for amendment. Some would have discretionary powers given to local authorities, others would not. If they sought the other point of view they would find that architects had difficulties which did not occur to local surveyors.

Mr. PICKERING, in acknowledging the vote of thanks which had been cordially given to him, was sorry his paper had not been distributed before the meeting (hear, hear!). He could not agree with the approval by the Local Government Board, as referred to by Mr. Read, of the same air space in a new building as in the old one taken down (Mr. Read: Within the discretion of the local authority). The very idea of by-laws was to enable new buildings to be improvements upon the old. Mr. Price (of Worcester) had referred to the alteration of drains. It seemed that builders could alter without consulting the authority, and he thought there should be by-laws to prevent that.

AN OFT-REPEATED COMPLAINT.

Mr. T. DE COURCY MEADE, referring to general complaints as to the papers of the conference not being printed before the meeting and as to the mislaying of the drawings referred to in his (the speaker's) presidential address, said that he wished it to be understood that these shortcomings were not due to the local secretaries.

Mr. E. G. MAWBRY (Leicester), as recording secretary to the conference, said he had written to the secretary of the Sanitary Institute pointing out that at the Newcastle congress a request was specially made that their papers should be printed in time to enable them to be properly discussed. If the Association of Municipal and County Engineers could work with the Sanitary Institute in some way, he thought this might be effected.

Mr. J. T. EAYRS pointed out that the early distribution of many of the papers was most important with regard to the Municipal and County Engineers' Association; it was always their practice, as far as possible, to get the papers out and in the hands of members, especially of those who had announced their intention of taking part in the discussion. Mr. Eayrs then intimated that he also had written to Mr. White Wallis, the secretary of the Sanitary Institute, in these terms, and he read a reply in which the secretary said in effect that in the case of the Sanitary Institute congress such a course was "impracticable." Mr. Eayrs, continuing, said he was still of opinion that if a strong view were expressed by the conference the Sanitary Institute might do something.

Mr. C. MASON (Nottingham) cordially supported Mr. Eayrs, and moved that such a resolution should be passed and forwarded to the council of the Sanitary Institute.

After having been seconded by Mr. A. T. DAVIES (Shropshire), the resolution was carried unanimously.

THE VENTILATION OF SEWERS AND DRAINS.

Mr. T. J. MOSS FLOWER, A.M.I.C.E., F.G.S., engineer and surveyor to the Portland Urban District Council, then read a paper, entitled "Precautions to be Observed in the Ventilation of Sewers and Drains." The author at the commencement of his paper apologized for attempting to deal with a subject already well worn and upon which there exists an abundance of literature, but he believed the very great importance of the subject was in itself a sufficient excuse for his dealing with it. He then continued:—

The ventilation of sewers and drains is a matter which during recent years has been discussed controversially by eminent chemists, doctors, engineers and others. It has been dealt with at meetings of the Institution of Civil Engineers, the Association of Municipal and County Engineers, and nearly all of the other professional institutions and associations the members of which are, more or less, brought into contact with sewers and drains. At conferences of the Royal Institute of Public Health, and at former meetings of the Sanitary Institute, the matter has been brought forward, and at the present time it is considered to be a very important question from a ratepayer's point of view, and is being dealt with at ratepayers' meetings in various places in the country. Well may it reasonably be said, then, that this subject has been well nigh exhausted. It would be more presumption on the part of the author to attempt to introduce anything new in connection with the subject, as he is fully aware that among his hearers there are a considerable number of eminent gentlemen who have devoted much time and attention to the ventilation of sewers and drains, and who are past-masters of the art of the application of the principles underlying the successful ventilation of these necessary evils—sewers and drains. It is, therefore, primarily not the author's intention to discuss controversially the various systems in vogue at the present date for ventilating sewers and drains so much as to refer to a few precautions which, in his opinion, should be observed in carrying out this work, so as not only to reduce to a minimum the chances of the gases from the sewers causing injury to health, but also to prevent nuisances arising therefrom. A nuisance is understood to mean something the law does not require to be proved to be injurious to health, but which is disgusting and unpleasant to the olfactory nerve. The author does not quite see where the line of demarcation comes in between something that is "injurious to health" and that which is legally only a "nuisance," for, in his opinion, that which is a nuisance must have more or less a bad influence upon health, and is therefore injurious to health in the true sense of the word.

THE OBJECTS AIMED AT.

In indicating the objects to be aimed at the author said:— Shortly, the object aimed at in ventilating sewers is to prevent as far as possible the evolution of gases; to carry harmlessly from the sewers the gases that cannot, owing to the physical conditions that exist in sewers under the very best of circumstances attainable, be prevented; to prevent such an abnormal increase in the pressure of the sewer air or gas within the sewer as would make the possibility of the water-seal of the traps fixed in connection with drains discharging into the sewers, becoming broken, within reasonable bounds, or cause the sewer air to be forced out at defective or inconvenient points in the sewers and drains where it could be inhaled, and to purify the air of sewers sufficiently to enable men to work in them. Probably it will be said that this latter object can be attained by opening the manholes at each end of that part of the sewer in which the men are to work. No doubt something can be said in support of this argument, yet it is unreasonable, to say nothing of its being most dangerous, to allow men to enter unventilated sewers. By unventilated sewers I mean, of course, sewers where no attempt has been made to ventilate them in the ordinary sense of the word. It is necessary, perhaps, to mention this distinction, as, whether we appreciate it or not, sewers will ventilate themselves, and where no general system of ventilation has been adopted the sewer gas makes its way out of the sewers through weak spots in the system, either at the side of the pavement through untrapped or defective street-gully traps, or into the house through defective drains, or into the subsoil, polluting the subsoil, air and water. There are other objects aimed at in ventilating sewers, but probably those mentioned are among the most important.

It may appear too grotesquely ridiculous and unnecessary, in the light of past experience and having regard to the weighty arguments that have been supported over and over again in favour of sewers being ventilated, for the author to have referred to the necessity for ventilating sewers; but the fact is he comes from one of the greatest cities in the United Kingdom, where no special means are provided for ventilating the sewers. By special means it is to be understood that no attempt is made to ventilate the sewers in his town, and if the air does get in and out the sewers—and get in and out it must do—it must be through unprovided openings and in ways calculated to cause injury to the public health. The objects aimed at in the ventilation of house drains to a very large extent are the same as in the case of sewers. By properly ventilating the drains the traps connected with the various sanitary fittings are relieved from undue pressure caused by the discharge of water-closets and other fittings, and are thus assisted in maintaining their water-seal; and

should any gases from the public sewer by any means pass to the house drain beyond the disconnecting trap, they would be carried harmlessly away, instead of remaining stagnant in the house drain, to pour perhaps into the house through some defect which might at any time occur.

SEWER GAS AND HEALTH.

It is perhaps unnecessary, the author contended, to say anything upon the question of what effect the sewer gases may have upon health. One may say, What has this to do with engineers, since this can only be dealt with by medical men? Certainly engineers are not, properly speaking, entitled to express an opinion, but it is generally admitted by medical men that at least the inhalation of sewer gases by human beings is conducive to ill-health, and that although no specific forms of disease may result from this, that it must produce a low condition of health, and thus more or less predispose persons to an attack of any form of bodily disease. And whilst there is, probably, no doubt in the mind of any person as to the danger and ill-effects of taking into the human system sewer or drain air, the degree of danger in so doing, and as to the possibility of drains and sewers spreading certain forms of disease, are much more debatable points. It is unnecessary in this paper for the author to refer to the many published reports of the investigations of men of eminence, which go to prove that there is, one may say, overwhelming evidence to show that sewer and drain air is injurious to health.

As far as the author's experience goes, he has made a very large number of inspections in almost all classes of houses in which there have been cases of infectious disease and illnesses attributed by the medical attendant to defective sanitation, and without exception he has always been able to prove that drain or sewer air has had a comparatively free ingress into the house, and in most of these cases the medical attendants have deemed the defects brought to light to have in some way or another assisted in producing or aiding the illness, and on several occasions he has found to his own cost the ill-effects of inhaling foul air from bottled-up drains and sewers, in one case causing him blood poisoning which affected his system for months. In one instance, in which there were several cases of very bad blood poisoning, in the house, it was found that the air from an unventilated sewer in an elevated district was discharged directly through an untrapped trompet-mouth waste pipe in a water tank fixed under the window on the landing of the bed-room floor. In this case it was found that the current of air passing up this pipe about mid-day was something extraordinary and sufficient to blow a large piece of paper a considerable distance. In another case a fracture was found in the drain at a spot where a person who had had diphtheria very badly was accustomed to stand many times during the day. This defect was believed by the doctor in attendance to have been the cause of the disease, or, at any rate, to have predisposed the patient to the disease from which he suffered. The house was in an elevated position in the town, and was connected to an unventilated system of sewers. Many other cases could be cited, and this is probably the experience of most men who have to make investigations of this character.

In considering the question of the probability of sewers and drains spreading disease, the elaborate experiments and investigations into sewer air made by Mr. J. Parry Laws, at first by himself and subsequently in conjunction with Dr. F. W. Andrews, and which have been from time to time referred to in several professional papers, will throw some light upon the subject. In one report Mr. Parry Laws says: "The whole of my results point unmistakably to the conclusion that the principal, if not the only, source of micro-organisms in sewer air is the air without the sewer, and not the sewage, and they also tend to prove that there is very little ground for supposing that the micro-organisms of the sewage, in the absence of violent splashing, become disseminated in the sewer air." Mr. Laws in the body of his report also says: "It has been shown by previous experimenters that if the splashing is sufficiently violent to produce a very fine state of division of the sewage, organisms will be carried some distance, even 50 or 60 yards." In his second report Mr. Laws states: "The results of these investigations strengthen very considerably the conclusion I arrived at from previous experiments—viz., that micro-organisms in the sewer air are related to the micro-organisms in the air outside, and not to the micro-organisms of the sewage." Mr. Laws further says: "Although one is led irresistibly to the conclusion that organisms found in sewer air probably do not constitute any source of danger, it is impossible to ignore the evidence, though it be only circumstantial, that sewer air in some instances has had some casual relation to zymotic disease." In the conjoint report of Mr. Parry Laws and Dr. Andrews it is shown that the investigators found by experiment that in ordinary sewage typhoid organisms do not tend to survive, and their death is probably only a matter of a few days, or at most seven to fourteen days. But this degree of resistance may, nevertheless, be sufficient to allow of their being able to produce disastrous results should they gain access to the water supply. It was found that in a drain from a typhoid fever block of a fever hospital, when the stools have not been disinfected for two days, a bacillus can be found which, so far as demonstration can go, is identical with that believed to be the actual cause of typhoid fever:—

Prof. J. F. J. Sykes, M.D., medical officer of health for St. Pancras, in a paper read at a sessional meeting of the Sanitary Institute in April, 1895, in referring to these reports, says that they "show that typhoid organisms do appear in the sewage of specifically-infected drains, and that splashing will cause organisms to be carried considerable distances." Dr. Sykes further says: "What the effect of hot vapour, together with violent splashing—invariable conditions in house drains—may be in the presence of the typhoid bacillus it is not difficult to surmise, and tends to support the opinion of large numbers of medical officers of health and medical practitioners that typhoid may be spread aerially by defective drainage," and further, "if specific organisms do gain access there is a possibility of specific disease being conveyed." It may be reasonably inferred that if specific organisms gain access to drains they will pass on to the sewer, and under certain conditions may travel along the sewer a little way and up the next house drain, connected to which there may be a pipe ventilating the sewer discharging near an opening into the house to which it is fixed, or near the point of connection between the drain and sewer there may be a manhole with an open grating at the top thereof, and if at the time of the discharge of the undischarged excreta from a typhoid patient into the drain the air is passing out from the grating, owing perhaps to its being in an elevated part of the district, a person passing over the grating might inhale the typhoid bacillus and perhaps become infected with the specific form of disease due to this organism.

LEGAL BEARING OF THE SUBJECT.

Having briefly discussed the objects aimed at in ventilating sewers and drains, and referred to the dangers attributed to inhaling the gases from them, the author thought it would be interesting, before briefly referring to the plan most generally adopted in ventilating sewers and drains, and some of the precautions to be observed in connection therewith, to see how the law bears upon the subject. In regard to this he said:—

The Public Health Act, 1875, sec. 19, enacts that "Every local authority shall cause the sewers belonging to them to be constructed, covered, ventilated and kept so as not to be a nuisance or injurious to health, and to be properly cleaned and emptied," and by sec. 15 "Every local authority shall keep in repair all sewers belonging to them." In sec. 13 the following sewers are not vested in the local authorities—viz.,

- (1) Sewers made by any person for his own profit, or by any company for the profit of the shareholders.
- (2) Sewers made and used for the purpose of draining, preserving or improving land under any local or private Act of Parliament, or for the purpose of irrigating land.
- (3) Sewers under the authority of any commissioners of sewers appointed by the Crown.

Consequently, secs. 15 and 19 do not apply to this class of sewer as regards repairing, cleansing and ventilation, and where any such sewers exist and they are unventilated it would be difficult to insist upon their being ventilated. Why there is the omission one is at a loss to know. It may be said that where a nuisance arises in consequence of the non-ventilation of any sewers excepted in sec. 13 they can be dealt with under other sections in the Public Health Act, 1875, or under Acts amending same, but it is difficult to say how far success would attend the efforts of any local authority attempting to make the proprietors of the excepted sewers above referred to ventilate their sewers.

Under sec. 150, Public Health Act, any local authority with urban powers can compel owners to sewer private streets to their satisfaction, and of course can insist upon the said sewers being properly ventilated. The same may be done under the Private Street Works Act, where such has been adopted.

In cases where local authorities do not carry out their duties in providing their district with sufficient sewers, or in the maintenance of existing sewers, or have made default in enforcing any provision of the Public Health Act, 1875, which it is their duty to enforce, appeal can be made to the Local Government Board, which body has the power to enforce performance by the defaulting authority. Considering the frequency with which local authorities make default, the Local Government Board are remiss in not bringing such authorities to task. Probably in matters which are very debatable there is some reluctance on the part of the central authority to insist upon local authorities observing certain duties imposed upon them by the Public Health Acts, yet there does not seem to be any reason why the Local Government Board should not insist upon all sewers and drains being efficiently ventilated.

The Public Health Acts Amendment Act, 1890, sec. 17, enacts that "Every person who turns or permits to enter into any sewer of a local authority, or any drain connecting therewith, (a) any chemical refuse, or (b) any waste steam, condensing water, heated water or other liquid (such water or other liquid being of a higher temperature than 110 deg. F.), which either alone or in combination with the sewage causes a nuisance or is dangerous or injurious to health, shall be liable to a penalty not exceeding £10 and to a daily penalty not exceeding £5." This is a most important provision. Unfortunately, the Act is an adoptive one, and has not therefore been in operation in all districts, and it is doubtful if these provisions are properly enforced at all times. The exclusion

of the above-mentioned matters is an important factor to be considered in providing for the ventilation of any sewer.

The ventilation of drains does not appear to be specially mentioned in any of the Acts of Parliament applying generally to the whole of England. Provision is made for the effectual draining of houses, and under sec. 23 and 27, Public Health Act, 1875 (sec. 23 applies to rural and urban authorities, but sec. 25 to urban authorities only), the surveyor can specify the materials, size, level and fall, but no mention is made of ventilation, and it does not appear that these clauses give power to insist upon special arrangements for ventilating the drains or the materials to be used for such purpose. Sec. 157 of the last-named Act enables urban and rural authorities invested with urban powers to make by-laws which refer to the ventilation of drains. The Model By-Laws of the Local Government Board, which were drawn up upward of twenty years ago, have been adopted in most places where by-laws are in force, but in a very large number of parts of this country no by-laws have been adopted, and where such have been adopted they are by no means properly carried out. The author is of opinion, notwithstanding the useful purpose these by-laws have served, that in the light of past experience, a modification of them in so far as the ventilation of drains is concerned is most desirable, and this matter will be again referred to in dealing with the precautions to be observed in connection with the ventilation of drains.

It may be well said that the law upon this matter is very vague and somewhat difficult of application, and, like most of the law connected with sanitation, requires much modification, and after the Model By-Laws have been revised it should be made compulsory for every local authority throughout the country to adopt them; and not only to adopt them but to insist upon their being enforced. In this connection one may say that it may not be wise to create additional public officers, but the author considers it desirable that there should be a Government staff of officers whose duty it should be to pay periodical visits to every district in the country; to see that local authorities are doing their duty, and I believe much good in this way could be done. In cases of epidemics special officers are sent from the Local Government Board to make inspections and reports, and every now and then a frightful condition of things is revealed. What is wanted is that these inspections should be made prior to the outbreak of epidemics, so that the root of the evil can be struck at before much harm can be done.

SUGGESTED PRECAUTIONS.

In the time given it is impossible to enumerate all the precautions to be observed in providing for the ventilation of sewers and drains, but having seen the necessity of carrying out this work, so that the chances of the sewer or drain air making its exit at points where it is likely to be inhaled shall be reduced to a minimum, we are guided to some extent in arriving at the ventilating methods. The plan to be adopted cannot be the same under all sets of circumstances, and it is probably the endeavour to apply the same plan in all cases that leads to non-success. If success is to be attained, it is useless to consider the question of the ventilation of sewers or drains apart from the question of the construction and maintenance of these sewers and drains and the size of the sewer compared with the work it has to do; the gradients, flushing arrangements, materials of which they are constructed, width of streets and distance across from houses on one side of street to the other, and as to whether there are any manufactory or other injurious liquids into the sewers, for it is pretty certain that no system of ventilation yet devised will give satisfactory result where the sewers are sewers of deposit, or the materials of which the sewers are made are of an absorbent nature, or there are not proper flushing arrangements; and it is practically certain that to attempt to ventilate such sewer by open gratings at the road level or shafts up the side of houses, by both these methods, or even by special columns fixed at suitable spots away from houses (such spots in crowded districts cannot be found) must end in failure. It appears to the author in such cases that, in the absence of total reconstruction of the sewers, nothing can be done unless means are provided for destroying the gas by burning it or by rendering it innocuous by bringing it in contact with some chemical agent that will rob it of its small and destroy its dangerous properties. Either of these plans is bound to be costly; yet, on the other hand, if at a moderate expense such plan can be devised the cost would no doubt be justified. The author has seen public sewers opened which have been nothing more nor less than elongated cesspools, and to have ventilated such sewers with open gratings would have been simply ridiculous, even though the most perfect flushing arrangements had been devised. The only remedy in such cases is to reconstruct the sewer. It is an accepted rule that flushing arrangements must be provided in all cases if the ventilating arrangements are to be successful, and even in cases where the material used in the construction, and the fall and volume of flow are all that could be desired, regular and systematic flushing, although not required to the extent as where adverse conditions exist, is indispensable.

The author recently inspected the sewers of a crowded town much frequented in the summer by persons seeking rest and health, and found the ventilating openings for the most part at the ground level. The district is a hilly one,

the falls for the most part very small, but occasionally such can form a gully. These gratings are fixed on comparatively narrow passages, and the earthing holes are on either side, and in some cases the gratings are in such a position as to be very inconvenient to pass from the roadway. It appears to the author that a very low level grate of a material of the kind referred to above, and which is not subject to being blown up, is best.

The sewer should be kept free from all soil matter and other matter which is liable to decompose, and in a town with good fall, a duty of flushing and papering up the sewer is not to be neglected, and this can be done, the sewer coming from the house, or rather how many openings there may be given for the sewer, and of a cheap and simple nature, and for the sewer. It is desirable to see that the following conditions are observed—

- (1) Sewers of 6-in. diameter to be reconstructed if it is desired to remedy a defect.
- (2) Sewers of 6-in. diameter to be fixed in narrow streets.
- (3) Infix a 6-in. pipe at the level of the foot of the drain to fix it to the street building, 1 1/2 ft. from the end, and connect it to the sewer. It will be used for fixing the shafts to the main delivery at a high level, and will do no harm. The law should allow of low level ventilating being given over to the house.
- (4) The shaft to be carried well above the ridge of the roof, and in such a case should a pipe be fixed to a house and at its highest point it can be fixed clear of all doors and windows. This applies to drains.
- (5) The shaft to be not less than 5 in. or 6 in. diameter and to be surrounded with a cover to prevent down blows.
- (6) The pipe at foot to be provided with a duck's-foot bend, with well at bottom, for the reception of the rain, a chamber or hole being provided, so that any obstruction could be removed.
- (7) The dead end of all sewers to be ventilated by a 6-in. to 9-in. shaft fixed clear of all windows and door openings to house.
- (8) The sewers cut up in sections, so as to prevent the gases from the lower districts getting to the sewers in the higher part of the town.
- (9) To see that, in the event of open gratings being used they shall not be placed near the pavement or near the entrance to dwellings.
- (10) To pay constant attention to the ventilating appliances, to see that they are kept in working order.

With regard to drains, it is desirable—

- (1) That the drain from end to end be properly ventilated, and not, as in the majority of cases in detached and semi-detached villas, by ventilating the soil pipe, which is usually connected about the centre of the drain longitudinally, by fixing a 4-in. pipe on the inlet side of the disconnecting chamber in front of the house, and fixing in front of the 4 in. pipe a piece of freestone with four or five small holes in it, leaving that part of the drain from the foot of the soil pipe to the back of the house unventilated.
- (2) To dispense with the use of mica flap-valves, and if a site for a low-level inlet pipe clear from all doors and windows or places much frequented can be found, to run the inlet shaft from the drain side of the trap to the ridge of the roof, as it seems simply ridiculous to carefully make all the pipes sound and leave a free opening for the discharge of the drain air in front of the larger or drawing-room window, as is so often found.
- (3) To arrange the vent pipes so that the outlets shall not only be clear of the windows, doors and other openings in the house to which the pipe belongs, but also clear of all openings to other houses. This object is seldom kept in view, and much inconvenience and ill-health is believed to be caused by the foul air from neighbour's vent-shafts.

CONCLUSION.

Mr. Moss Flower concluded his paper as follows: The Local Government by-laws bearing upon this subject are very vague and permit inlets at as near the ground level and outlets as low as 10 ft.; and where builders and owners are determined to defy local authorities there is very considerable difficulty in getting them to carry out the ventilating arrangements in a proper manner. They use for the most part the very cheapest kind of material for ventilating pipes, and simply make their joints with a little red lead or something of the sort; the pipes generally are barely carried above the eaves, and every precaution should be taken to prevent this class of work being done. All this could be prevented by the adoption of by-laws specifying in greater detail how the house drains should be ventilated, giving particulars as to the kind of pipe, the joints, &c.

- (1) To see that in exposed positions at least a cover to prevent down blows should be fixed to the top of the soil pipe vent to house. This the author has found to be absolutely necessary after taking an average of four years' experience of the results. He has found that the water runs in the traps of water-closets is very destructive by the wind blowing down the soil pipe ventilator, which will blow a trap up.
- As in the case of a sewer, the construction of the drainage plays a most important part in the success of the ventilation of drains. The drain must be constructed fully, be constructed of proper materials, and be well flushed. The disconnecting trap should be of a self-cleaning nature, although in the

absence of special flushing arrangements, it cannot be expected that the trap can be properly cleaned with the appliances generally in use.

SOME SANITARY AND ALLIED ADVANTAGES ATTENDING THE INTRODUCTION AND USE OF MOTOR VEHICLES.

Mr. E. SHRAPNELL SMITH, honorary secretary, Liverpool Self-propelled Traffic Association, then read a paper with the above title. In the course of it he said:—

The present age is essentially utilitarian in its tendencies, upon which fact we may reasonably congratulate ourselves; yet few of us desire to see custom and sentiment ruthlessly swept aside or sacrificed to a belief which in some instances amounts to nothing less than a fetish. Utility is, no doubt, a good plea for many of the changes which we see being wrought around us, but unless strengthened by the argument of expediency it is by no means a sufficient one.

Years of admirable service rendered by that artist in baulage, the horse, have taught us beyond question that it is a useful and usually a reliable animal; but to-day there are evidences of the revival of a perhaps equally useful and reliable means of locomotion—*vis.*, mechanical self-propelled self-contained vehicles for use on common roads. That these motor vehicles are in their development is, I think, sufficiently attested by their behaviour during the recent competitive trials in France, America and this country, when loads up to 5 tons nett were successfully carried over average roads and up and down more than average gradients, and by the experience gained in quarters where they have been in use for many months under trying conditions. Granting, then, that the motor vehicle is no longer in the experimental stage, we have alternate methods of transport at our command, each of which has proved its practicability and utility, and are led to inquire whether we shall support the old order or the new. If considerations of expediency, under which head? I think matters affecting the public health, convenience and expenditure, are to determine the question. It appears to me to be almost a foregone conclusion that this conference will support the resolution which it is my good fortune to be afforded the opportunity of moving to-day.

The object of this short paper is to lay before the members of the Institute and delegates to the conference, with a view to discussion, some of the advantages which are claimed for motor vehicles by those who have possibly welcomed the automobile movement with too great enthusiasm, a quality commendable in itself but sometimes dangerous. It is not proposed to attempt to discuss the merits or demerits of the several systems now upon the market, but by a brief contribution in somewhat general terms to lead up to a discussion which will probably be the most interesting part of the proceedings. The subject will be considered under two heads, although it is somewhat difficult at times to prevent their merging one into the other, and an endeavour will be made to render apparent some of the advantages which may be expected to accompany the progressive adoption of motor vehicles. The two divisions are—(1) improvements in sanitary conditions; (2) reduction in public expenditure.

IMPROVEMENTS IN SANITARY CONDITIONS.

The most and most obvious advantages as affecting the public health and convenience will be the almost entire elimination of the trouble of dealing with horse manure and the general improvement in the condition of our streets. Manure heaps, with their attendant emanations, will in every case where a service displaces horse-drawn conveyances disappear, and the avoidance of these accumulations is a matter of no small moment. Too frequently are these heaps allowed to grow to large dimensions in centres of dense population, and at least to assault our olfactory nerves, if not to constitute a real danger to those who are obliged to inhale the noxious reducing gases of putrefaction which arise therefrom, especially in hot weather. The problem of dealing with horse manure is not, unfortunately, confined to the vicinity of the stables, in which event the nuisance could be at once localised and treated accordingly in a simple manner, but extends over the whole area covered by the traffic of our towns and cities. Thus we have the droppings exposed to the disintegrating and pounding action of hoofs and wheels, dried under the sun's rays and impartially distributed on the wind, to cause various unpleasant personal consequences and to contaminate articles of food exposed for sale uncovered. In the open, in addition, the nuisance is aggravated by the incorporation of the dust (also largely produced by the horse) with the manure, whereby the total bulk of sweepings is largely augmented, to produce the elusive particles of summer or the troublesome pasty slime of winter. In short, the horse—firstly by reason of its excrementa, and secondly by reason of its padium extrimitates—is the veritable *bête noir* of those who are responsible for the scavenging and cleaning of our streets, and the great cause of all the difficulties which beset them. This matter of street cleansing is undoubtedly recognised as one of the most serious which public health officers have to face, the degree of its importance being proportionate to the traffic, and most intense in the streets of London, the main thoroughfares of our large provincial cities, the neighbourhood of railway or shipping depots, and station approaches or other cab and cart

How many devices exist to combat the nuisance, and how far successful are they? By means of mechanical sweeping, manual scraping and brushing and street-orderly bins, perhaps 90 per cent. of the matter is intercepted, but a considerable quantity is already under the traffic and in a state of transition to the insidious dust before it can be coped with. To this residuum of faecal matter, which is inevitably flattened out upon the road, must be added the whole of the urine, and the characteristics of the resultant compound are too well known to require further words from me. The ordinary methods have in some instances been supplemented by a system of thorough washing of the streets at night, this treatment being practised by certain of the London district boards of works in particular. The mere fact that so much thought and labour are extended in street scavenging and cleansing proves that sanitarians accord this work a high place in the scale of operations which conduce to the improvement of the public health; but, however efficiently the work is carried out, a nuisance must exist during an appreciable part of the twenty-four hours, and even the washing of the foal matter down the gulleys is not always a solution of the difficulty; further, it will probably be admitted that it would be better to avoid as far as possible the necessity for all the elaborate steps named above by materially reducing the source of the nuisance. The introduction of motor vehicles and the gradual extension of their uses in place of horse-drawn vehicles must reduce the filth and dust of our streets to an ultimate minimum, and, quite apart from financial considerations, I submit that any change which contributes to such sanitary betterment is, on the principle that prevention is better than cure, both desirable and expedient as affecting the health and convenience of the community at large.

REDUCTION IN PUBLIC EXPENDITURE.

Economy is always a good reason to put forward in support of any new proposal if it can be put forward and substantiated, and it is perhaps one of the strongest arguments that can be adduced in favour of the change from horse-drawn to self-propelled vehicles, in the conducting of sanitary work more especially. The connection between sanitation and economy is a close one—too close sometimes. Committees have a way of fixing round sums which must not be exceeded, and earnest hard-working officers have a penchant for wanting more and more in order to do what they feel to be necessary, so that my intention to deal at some length with the financial side of the question may be, and I trust is, acceptable to all. I hope to show that a saving can be effected in more than one direction, and think it best to subdivide this section of my subject as follows: (a) Working expenses; (b) road maintenance; (c) congested thoroughfares; (d) means of communication; (e) incidental advantages.

(a) *Working Expenses.*—It is of vital importance in making estimates, before coming to a decision as to the expediency of the change, to know the exact conditions of the work to be done, particularly the light-load contingency, the amount of time idly spent in waiting for loads, and the gradients to be encountered. The necessity for taking these features into account cannot be too strongly emphasised, for the economy to be effected is, owing to the relatively high prime cost of the motor vehicle, chiefly determined by the factors of regular work and steep gradients. The more regular the work and the higher the gradients the more economical does the motor vehicle become. Most corporations will be ready to guarantee regular work, and many of our towns possess irregular contours; hence the advantages of the motor vehicle can be turned to account in refuse and rubbish removal more readily than in many other directions. Speaking, as I do, to those who are directly interested in the efficient conducting of sanitary work, it will suffice to endeavour to establish a comparison between the costs of refuse removal by the two means at our disposal. Assumptions must in any case be made, and the figures given are intended to indicate what might be realised in a town where the gradients are nominal both in number and degree. If any of those present have occasion to know that their dust-carts carry weights differing from those which I have taken as cases of calculation, it will be found a simple matter to make the necessary corrections.

COMPARISON OF COSTS OF WORKING.

Type of Vehicle.	Capacity, Cub. Yds.	Maximum Load, Tons. Cwt.	Daily Mileage.	Work per Annum. Days.
Two-wheeled cart ...	2.5	1 5	16	310
Four-wheeled cart (London) ...	3.5	1 15	12	310
Motor vehicle ...	7.5	3 15	24	300

TWO-WHEELED DUST-CARTS.

<i>Prime cost—</i>			
Four dust carts at £20	£80
Four horses at £60	240
Four sets harness, rugs, &c.	27
Capital outlay	£347
<i>Annual expenditure—</i>			
Interest, at 5 per cent. per annum	£17 7 0
Depreciation, at 15 " "	52 1 0
			£69 8 0

Fodder and litter, at 11s. per horse per week	111 8 0
Horsekeeper's wages	12 0 0
Shoeing, at 5s. per horse per month	12 0 0
Veterinary surgeon, at 20s. per horse per annum	4 0 0
Rent, rates and taxes	14 0 0
Repairs to carts and harness	8 0 0
Four drivers, at 25s. each per week	260 0 0

Total per annum £493 16 0

Say, 80 per cent. of the maximum load is carried,
 50 per cent. of the total distance traversed:
 Work done = $(1.25 \times 0.8) \times (16 \times 310 \times 0.5) \times 4$ nett ton-miles
 per annum = 9920.
 Cost = (£493 16s.) \div 9920 = 11 95d. per nett ton-mile.

FOUR-WHEELED DUST-CARTS (LONDON).

Prime cost—

Four dust-carts at £50	£200
Four horses at £70	280
Four sets harness and rugs	27
Capital outlay	£507

Annual expenditure—

Interest, at 5 per cent. per annum	25 7 0
Depreciation, at 15 ,, ,,	76 1 0
Total	£101 8 0

Fodder and litter, at 15s. per horse per week	156 0 0
Horsekeeper's wages	16 0 0
Shoeing, at 5s. per horse per month	12 0 0
Veterinary surgeon, at 20s. per horse per annum	4 0 0
Rent, rates and taxes	24 0 0
Repairs to carts and harness	16 0 0
Four drivers, at 28s. each per week	291 4 0

Total per annum £620 12 0

Say, 80 per cent. of the maximum load is carried,
 50 per cent. of the total distance traversed:
 Work done = $(1.75 \times 0.8) \times (12 \times 310 \times 0.5) \times 4$ nett ton-miles
 per annum = 10,416.
 Cost = (£620 12s.) \div 10,416 = 14 30d. per nett ton-mile.

MOTOR VEHICLE.

Prime cost £420

Annual expenditure—

Interest, at 5 per cent. per annum	£21 0 0
Depreciation, at 15 ,, ,,	63 0 0
Total	£84 0 0

Fuel.—0.5 gallon kerosine per vehicle-mile:
 $0.5 \times 24 \times 300 = 3,600$ gallons at 5d. per
gallons £75 0 0
10 gallon per diem for raising steam 6 5 0
Methylated spirit 2 0 0

Water.—3.5 gallons per vehicle-mile:
 $3.5 \times 24 \times 300 = 25,200$ gallons at 1s. per
1,000 gallons 1 5 0
Lubricating oil and waste 10 0 0
Rent, rates and taxes 5 5 0
License 5 5 0
Repairs 60 0 0
Driver, at 35s. per week 91 0 0

Total per annum £340 0 0

Say, 80 per cent. of the maximum load is carried,
 50 per cent. of the total distance traversed:
 Work done = $(3.75 \times 0.75) \times (24 \times 300 \times 0.5)$ nett ton-miles per
 annum = 10,125.
 Cost = 8 06d. per nett ton-mile.

Summary.—A motor dust-cart ought, by reason of its greater capacity and speed, to replace four horse-drawn carts. The economies to be effected by the change are approximately as follows:—

	London.	Provincial Cities.
Cost per horse per annum	£155	£123
Cost of same work by motor	85	85
Saving per annum	45 per cent.	31 per cent.

(b) Road Maintenance.—The vagaries of our old friend the traction engine have caused so bad an impression to be formed regarding the effects of mechanical haulage on road surfaces that in many quarters the opinion is held that motor vehicles of all types must do more damage than horse-drawn vehicles, and opponents of the revived locomotion may even now be contemplating an attempt to apply the clause of "extra wear and tear" thereto. Whatever have been the just objections to traction engines, it must be remembered that these ponderous machines possess few, if any, points in common with the motor vehicle and weigh very much more. Again, whilst the traction engine does most harm by reason of its great weight, it is the hoofs of the horse that do most of the damage at the present day. Both these faults are absent in the modern motor vehicle. It is interesting in this connection to recall the treatment meted out to the pre-Victorian steam coach pioneers—James Gurney, Hancock, Church, Macerone and others—in the form of prohibitive tolls, which were ostensibly levied to cover the expense of extra road repairs. A Select

Committee of the House of Commons, which sat in the year 1831 with reference to the heavy steam coaches of that period, and before which a great deal of valuable information was given in evidence by Farey, McNeill, Telford and M'Adam, gave the following as their eighth conclusion, "That, as the roads are not acted on so injuriously as by the feet of horses in common draught, such carriages will cause less wear of roads than coaches drawn by horses." I do not think that it is wide of the mark, or incompatible with the experience of engineers and road surveyors to-day, to accept the proportion of the wear and tear caused by the action of the horses' hoofs as two-thirds of the whole to which our roads are subjected. Personal observation and reflection upon the differences between the effects of the combined anchoring and levering action of the horse and of the mere rolling contact of the wheel tyres must lead one to concur in these findings. The further question arises, however, as to whether the driving contact in the case of a self-propelled vehicle will affect the surface of the road prejudicially as compared with the rolling contact of the wheels of a vehicle which is hauled by an external tractive force. In venturing the opinion that at most an important difference here exists, I desire to point out that the motor vehicle of to-day is not constructed with cross-bars, studs, or other forms of "gripping" contrivances upon the tyres, and, consequently, the adhesion is obtained solely by what may be termed simple contact between the road and the tyres. The difficulty of ensuring sufficient adhesion on greasy surfaces is best met by fitting a sanding-box in front of each driving-wheel. The horse distorts the crown of our macadam roads, causes unequal wear of our set pavements, and disintegrates in a greater or lesser degree any substance that the ingenuity of man can devise, and only so soon as the motor vehicle shall come into more general use in our streets will these troubles begin to grow less. To this end municipal and other authorities, directly as large users and indirectly by encouraging their adoption for hackney purposes, can give the movement a healthy stimulus.

(c) Congested Thoroughfares.—The enormous increase of vehicular traffic in our cities has caused another problem to loom large in the minds of those who watch over our local interests in these closing years of the nineteenth century, and there seems to be no small apprehension that the motor vehicle will serve only to increase the worries of the constable on point duty and to add to the terrors of the crossings where omnibuses, hansoms, four-wheelers, drays, cyclists and other products of civilisation already jostle one another and pedestrians with a considerable degree of confusion. Although the value of wider streets is clearly seen, the value of the frontages is apparently even more clearly seen by the fortunate parties who own the title deeds to these appreciated spots. In the fact that the motor vehicle reduces the longitudinal distance monopolised by each unit of traffic to about 50 per cent. of what we are accustomed to to-day, there is, I think, a possible solution to this pressing question. The available street area will be used to better advantage, more room and less risk will be secured to the harassed pedestrian, less valuable time will be wasted in tantalising blockages and stoppages, and the loans for street-widening purposes will be less numerous.
