had not yet been prepared, and as at least three months would have to be allowed for them to prepare the designs for the new baths, the committee did not deem it necessary to disturb the site before Lady Day next.—The Health Committee presented a report in reference to the unsatisfactory procedure of placing dust receptacles, drain manholes, gullies, and other sanitary conveniences, in idle houses in public streets, contrary to the methods adopted in private houses. The committee recommended that the attention of the Highways Committee should be directed to the matter, with a view to assisting in the modification of the procedure in the direction of improved sanitary arrangements. The recommendation was adopted.—A long discussion ensued on a motion of Mr. Hillyard that the Highways and Works Committee should be instructed not to order any more broken granite until the whole of the streets now lying at the various depots were disposed of. An amendment was moved, and eventually carried, referring the consideration of the question to the Works and Dust Committee. A second proposal by the same member, that clinker from the refuse destructor should be used for all concrete, was lost by twenty-seven to twenty-two votes. During the discussion of the latter proposal it was mentioned that the surveyor already used the clinker on all possible occasions, but that there were cases where it could not be utilised.—A deputation appeared from the London Butchers Trade Society to protest against the action of the London County Council regarding private and public slaughter-houses. After the deputation had withdrawn the Health Committee submitted a report recommending that the London Butchers Trade Society should be informed, in reply to their communications, that the vestry were in favour of the establishment of public abattoirs. The motion was eventually adopted with the addition of the words "but that the vestry did not wish to suppress properly-kept private slaughter-houses."—In a further report the Health Committee recommended the vestry to inform the London County Council that they were in favour of the council including pest litter within the provisions of its by-laws, under sec. 16 of the Public Health (London) Act, 1891, prescribing the hours of removal of offensive matter and the construction of carts for its transport. The proposal was under discussion when, owing to the by-laws, the debate had to be adjourned.

**PROVINCIAL AND GREATER LONDON
AUTHORITIES.
MUNICIPAL CORPORATIONS.**

Bedford.—In reply to an application of the corporation for a license to transact telephone exchange business, the Postmaster-General has written to state that he is unable to accede to their request, as he is advised that municipalities are not empowered to work such businesses.

Birmingham.—The city council last week approved a draft Bill for acquiring the electric lighting undertaking of the Birmingham Electric Supply Company, Limited. The council have to pay the company £120,000, and they propose to borrow £500,000 to carry out the bargain made and provide a reasonable working capital. It is intended to extend the area of present supply. The Bill empowers the corporation to make a profit up to 5 per cent, and to apply it in reduction of rates.

Bradford.—At a recent special meeting the city council adopted a proposal to promote a Bill in Parliament to authorise them to extend the tramways, to transfer the technical college, and to purchase the property of various gas companies in the outside districts and of the memorial rights over Baildon Moor.

Bury St. Edmunds.—As the Local Government Board will not sanction a loan for an electric lighting scheme as originally drawn up, the council have now resolved to adopt a modified scheme, at a reduced cost of £16,000.

Devonport.—The corporation have had a demand made on them by the Admiralty for the prevention of the discharge of sewage into the Hamoaze. The Admiralty consider the present state of things is inimical to the health of the crews on the various ships in the harbour. The effluvia which arises from the mud when the tide recedes from some portions is a pretty good indication of the unsanitary conditions, and the change indicated by the Admiralty will be hailed with delight by those on the ships. The corporation, however, will have to face an enormous outlay. The sewage of the town now practically empties itself into the Hamoaze, and hence the corporation will be called upon to provide a new system of sewerage, which will cost many thousands of pounds.

Exeter.—Messrs. Frederick Burt & Co., 80 Cornhill, London, E.C., have given notice of their intention to apply to the Board of Trade for a provision order, under the Tramways Act, 1870, to empower them to construct, so far as to be worked, and to work and use, the tramways authorised by the Exeter Tramways Act, 1881, by means of electrical power, or the overhead trolley system, or otherwise, or other mechanical power, and either in addition to or in substitution for animal power.—Two important matters came up before the city council at their meeting on Wednesday. The council have complied with the requirements of the Local Government Board's letter of June last, and the three months' notice to the adjoining authorities for works outside the city bound-

aries having expired without their being any application to the Local Government Board, now write giving their final sanction to the loan for works of sewerage and water supply in the electric tramway zone. The sum to be borrowed is £110,000, which will include the cost of land valued at £20,000 and the expenditure on the new infrastructure over from Mr. Daryard, on the City Street, and on Brompton Road, which will be an outlay on subsidiary works outside the city. The water supply is the first of a series of sewerage disposal by the trunk sewerage system of any magnitude, for which the Local Government Board have given permission to borrow. The second matter which occupied the attention of the council was the question of the tramways. The Finance Committee reported favourably on the proposal for the introduction of electric traction for trams by a syndicate or company, and recommended that the council to carry out the scheme as far as possible. A good deal of discussion arose on this subject, and it was eventually adopted. The council thus stand committed to the project of laying new tram rails and the introduction of some method of electric traction; and they are expected to proceed with this project as soon as it is practicable to do so. The present owners of the tramways can block the council until the summer of 1902, but if the council then elect to become the purchasers the old company or syndicate is ousted, and the sale will be based upon and limited to the worth of the rails, &c., then laid in the streets through their system. If the present owners are, however, willing to entertain the question of selling now or at an intermediate date between 1899 and 1902, the council are prepared to treat with them. It has been referred to the committee to see if any arrangement on these lines can be carried out.

Falmouth.—The corporation's scheme for the improvement of the gas and water works, estimated to cost £120,000, has been rejected by the ratepayers by 1,238 votes against 773.

Maidstone.—The result of the poll which was demanded at the recent ratepayers' meeting on the proposal of the corporation to purchase the local water works was declared on Tuesday, as follows: For the purchase, 1,755; against, 2,536—majority against, 561. The result was very different from what was expected a few weeks ago, and the defeat of the corporation's proposal is attributed to a fear entertained by property owners that the purchase price would be so high as to necessitate an addition to the rates of the borough for some years. In 1896, when the previous poll was taken on the question, the ratepayers decided against purchase by a majority of nearly three to one.

Manchester.—An important decision was come to at a recent meeting of the Telephone Committee of the city council. The committee considered the Postmaster-General's reply to a deputation that had waited upon him, and eventually resolved that a report be prepared in due form for presentation to the city council, setting forth the recent communications with the Postmaster-General, and endorsing the general conclusion that, in view of the proposed action of her Majesty's Government in this matter in the next Parliamentary session, it was desirable not to proceed further with respect to the insertion of clauses in the Manchester General Powers Bill for conferring powers upon the corporation to provide and work telephones under license from the Post Office.

Newcastle.—A Local Government Board inquiry has been held by Mr. W. O. E. Meade-King with respect to an application of the corporation for sanction to borrow £750 for the purchase of three freehold houses at the south end of Derby Street and east end of Douglas Terrace, Westgate Hill, for the purposes of improvement, and £7,000 for the improvement of the meat and provision market in Graing's street. Of the last-named amount £3,500 was stated to be for the removal of the roof, which was constructed over fifty years ago.

Salford.—A special meeting of the town council was held recently, to consider and determine the expediency of promoting in the ensuing session of Parliament a Bill for the following (among other) purposes: To empower the corporation to make and maintain additional tramways in the borough, to be worked by animal or mechanical (including electric) powers; to purchase, take lease of, work or run over the tramways in districts outside, but adjoining the borough; to widen and improve streets where requisite for tramway purposes; and to purchase the necessary fixed and movable plant for working the tramways. The present tramways, we may mention, are leased to a private company and have a total length of 2 1/2 miles. The proposed new system will extend to over 35 miles.

Southport.—One of the main objects of the scheme of the Ribble between Southport and Lynton is the opening of a new station. The late proposal had for its object the construction of a structure, 301 ft. long, by which water-borne goods and tramway cars could run. The estimated cost is £200,000. Of the utility of this for the district in question there is no doubt, but it has been found that the advantages of the plan have been somewhat overdone. The houses which are now proposed were last year sold to the famous Bay Breeze Hotel, which is about 2 miles long.

Sheffield.—It is understood that, in consequence of an emphatic protest forwarded by Mr. H. Sayer, the town clerk, on behalf of the City Hospital Committee, the Local Government Board have reconsidered their decision with regard to the loan for the extension of Lodge Moor hospital, and have now consented to sanction the borrowing by the corporation of £24,600, the sum voted by the city council for the provision of additional accommodation. The question of the hospital drainage is not yet settled, however. It is also understood that the sub-committee in charge of the sewage disposal works at Blackburn Meadows are recommending the Highway Committee to retain Mr. James Mansergh to advise them as to the suitability of the land in the neighbourhood of the sewage works which the Local Government Board have suggested that the corporation should acquire for the purpose of treating the effluent by land filtration, and also as to the advisability of extending the present works in order to deal with the increased quantity of the sewage.

Sunderland.—On the 25th ult. a Local Government Board inquiry was held by Mr. W. O. E. Meade King into an application of the corporation for sanction to borrow £10,000 for the erection of a technical college. There was no opposition to the application.

URBAN DISTRICT COUNCILS.

Bridlington.—As the result of an arbitration, the company at present supplying the town with water have been awarded a sum of £66,260 as compensation for the acquisition of their works by the council, but the Water Committee of the latter body have since resolved to recommend that council's opinion should be taken before paying over the money. It is contended that in some way the arbitration award has been invalidated.

Leigh.—On Tuesday, at a meeting of the council, a letter was read from the Local Government Board sanctioning the borrowing of £18,860 for gasworks extensions and of £10,216 for the erection of electricity works.—It was decided to appoint a committee to report fully on the provision of a refuse destructor and to visit such towns as they might deem fit for the purpose of inspecting refuse destructors.

New Mills.—A poll of the ratepayers on the question of sanctioning or otherwise the council obtaining Parliamentary powers to purchase the present waterworks and construct new works, estimated to cost nearly £40,000, has been declared to be favourable to the scheme.

Paignton.—At a recent meeting of this authority it was reported that it had been decided to engage Mr. Baldwin Latham to visit Paignton, with a view to reporting on a couple of schemes for providing the town with a more adequate water supply. One of the schemes is a Dartmoor scheme, and the other refers to a source within 2 miles of Paignton.

Sheerness-on-Sea.—A Local Government Board inquiry has been held in regard to an application of the district council for sanction to a loan for the following works: The construction of a dwarf wall on the Esplanade, new wharves, a tunnel between two wells, at a depth of 275 ft., the raising of the level of Halfway House-road, the fixing of a 10-in. centrifugal pump at the sewage pumping station, the construction of new sewers in the Broadway and James-street, and the paving of twenty-three passages. Plans, &c., for the various works were submitted by Mr. Chas. A. Copland, surveyor to the council. There was no opposition to the application.

Surbiton.—Mr. Robert H. Bicknell, an inspector of the Local Government Board, recently held an inquiry respecting an application of the town council for sanction to borrow £1,950 for works of private street improvement.

Wallasey.—On Wednesday next Major-General H. D. Crevier, R.E., will hold an inquiry at the public offices, Egrement, into an application of the council to the Local Government Board to borrow £12,000 for gasworks purposes and £12,000 for the purchase of a ferry undertaking.

Whitchurch.—A meeting, convened by the district council, was held recently to ascertain the opinion of the ratepayers with regard to the scheme recommended by the council for the purchase of the gasworks at a cost of £57,000. Several members of the council recommended the purchase upon commercial grounds. The scheme was, however, warmly opposed by a number of ratepayers, who pointed out that electric lighting works could be erected at less cost. The meeting, upon a vote, rejected the scheme by an overwhelming majority.

RURAL DISTRICT COUNCILS.

Blackwell. Mr. H. Walker, engineer of Nottingham, has written stating that he has gone through the estimates, which had been made twelve months ago, for the Pixton water scheme, and found that the price of small pipes had abnormally increased. Upon that ground he advised the council to make an application to the Local Government Board for a further loan of £200, which would make the cost of the scheme £1,600.

Landaff and Dinas Powis.—Colonel C. H. Luard, R.E., held an inquiry, on Wednesday week, into an application by the rural district council for sanction to borrow £1,050 for

sewerage works in the parish of Whitchurch. Mr. William Fraser, the engineer to the council, explained the scheme.

Lye.—A special meeting of the council was held recently to discuss the desirability of applying for a provisional order to enable the council to supply electrical energy and electric light in their own district. After some discussion it was resolved that the council apply to the Local Government Board for the order. It was reported that the British Electric Traction Company had abandoned their intention to apply for an order.

Nantwich.—At a recent meeting of this council, a letter was received from the Cheshire County Council asking what progress had been made by the council towards providing general isolation hospital accommodation. It was moved that the council reply that they were of opinion that the suggested accommodation was not required. Several members, including the chairman, counselled moderation, and eventually the motion was withdrawn in favour of a suggestion that the clerk write to the Crewe Cottage Hospital authorities as to the terms upon which they would accept patients from the council's district, and then inform the county council of the arrangement come to.

Tamworth.—It has been reported that the Local Government Board have sanctioned an expenditure of £80 towards the widening of a canal bridge at Glascoate.

Truro.—Mr. H. Percy Boulnois, on Thursday, conducted an inquiry into an application of the Local Government Board for sanction to borrow £5,000 for works of water supply in the parish of St. Agnes. It was stated that the place comprised scattered hamlets to a large extent and there were levels of supply in the scheme. The highest was Higher Bal, and to provide for this a water tower was proposed to be erected. The St. Agnes high level had a population of about 1,200, and these two levels would be supplied from a reservoir and water tower at the seventh milestone on the Truro road. Mount Hawke would be supplied from the same sources, but needed a special service reservoir. For the low level from the shore to Peterville the supply would be by gravitation. Gonninis adit would supply the low level, and the rest of the water would be derived from Penhallow and Gover adits.

Tutbury, Staffs.—The council have instructed Mr. J. E. Willcox, of Birmingham, to prepare a scheme for the sewerage and sewage disposal for the township.

SCOTLAND AND IRELAND.

Edinburgh.—At the meeting of the Electric Lighting Committee of the town council, last week, it was intimated that there has been 7,252 applications for electric light since the 17th October. The committee agreed to recommend the acceptance of estimates for machinery at the M'Donald-road station amounting to £45,000.

Glasgow.—At a recent meeting of the Buildings Regulation Committee of Glasgow Corporation the draft clauses of a proposed new Bill to regulate the height of buildings in Glasgow, which were adopted by the committee on the previous day, were again under consideration, and several modifications were made with the object of encouraging the formation of broad streets. It was agreed that, while 80 ft. to the top of the wall-head should be the absolute height limit for buildings in streets under 40 ft. in width, buildings should not be erected to a greater height than the width of the street, whilst in streets over 40 ft. and under 60 ft. in width the height of the buildings might be the height of the street plus 20 per cent. In streets over 60 ft. in width buildings might rise to any height up to 80 ft. The committee sat for nearly two hours.

Bucks. County Council Report.—We regret that in our summary last week of the annual report of Mr. R. J. Thomas, county surveyor of Buckingham, the word "increase" should have been printed in the fourth line. As the succeeding paragraph clearly shows, the word should have been "decrease."

Society of Engineers.—An ordinary meeting of the above society will be held on Monday, at the Royal United Service Institution, Whitehall, S.W., when a paper will be read by Mr. George Thudicum on "The Bacterial Treatment of Sewage." The chair will be taken at 7.30 p.m. precisely.

Ancient Lights.—A deputation from the Society of Architects waited on the Lord Chancellor, last week, and presented a petition praying that a Parliamentary Committee might be appointed to inquire into the present law regarding "ancient lights," with a view to saving the large amount of money expended in determining the rights of owners in respect of such lights. The society desires the appointment of a Building Act tribunal of the London County Council to deal, before the commencement of building operations, with applications made by building owners to define the limits within which they are entitled to build, having regard to the adjacent properties, and of a similar tribunal for other parts of the country. His lordship, after discussing the subject, informed the deputation that he would give the matter his careful consideration.

Personal.

Mr. S. Edgar Fedden, Municipal Buildings, Greenock, has been appointed electrical engineer to the Greenock Board of Police.

A lecture on "The Engineering Triumphs of our Age" was delivered last night, at the Cripplegate Institute, by Prof. W. H. Goulding.

Mr. F. J. French, one of the inspectors of paving for Toronto, has recently invented an interlocking paving brick, for which he has applied for a patent.

By the will of the late Mr. Christopher Oakley, who left property to the value of £86,707, a sum of £250 is bequeathed to the Incorporated Auctioneers' Benevolent Fund.

Mr. William W. Carter, Eastham, has been appointed surveyor and inspector of nuisances for the southern division of the district, under the jurisdiction of the Tarvin Rural District Council.

Under the presidency of Mr. McKinnon Wood, chairman of the London County Council, a meeting was held last night, at the Hackney Town Hall, to celebrate the completion and adoption of the technical institute scheme.

Mr. Edward John Gammage, son of the borough surveyor of Dudley, has been appointed to the post of assistant in his father's department, at a salary of £120 per annum. He will be engaged in the work of sewerage in the Netherton and Wood-side districts of the borough.

Mr. J. Finlay Peddie, 9 Donegall-square West, Belfast, has prepared a report for the the Kilkeel Board of Guardians on the sanitary condition of Newcastle, co. Down. Mr. Peddie has also, we may mention, been instructed to proceed with a sewerage and sewage disposal scheme next spring for the city of Armagh.

Mr. G. Chatterton, the assessor nominated by the president of the Institution of Civil Engineers for the competition schemes submitted for the water supply of Bricklade, Wilts., has awarded the first premium to Mr. F. Redman, of Swindon, and the second premium to Mr. T. George Caim, of Worcester. The number of schemes submitted was eighteen.

Mr. D. J. Diver, surveyor and inspector of nuisances to the Wirksworth Urban District Council, has resigned his appointment in order to take up a similar position under the Desborough Urban District Council, in the room of Mr. W. T. Streater, who has obtained the appointment of surveyor to the Winton District Council. Mr. Diver has been in the service of the Wirksworth Urban District Council for about three years.

Mr. Edwards, assistant surveyor to the Lambeth Vestry, is recommended by the special committee of the vestry on staff vacancies for the position of surveyor, due to the resignation of Mr. J. P. Norrington. The committee at the next meeting of the vestry will suggest that the appointment should be on probation for twelve months, at a salary of £500, and that Mr. Edwards should have such assistance as may be necessary during that period.

The London Municipal Society, at a meeting on Monday evening, passed a resolution welcoming the announcement that the Government intended to introduce next session a comprehensive measure dealing with the local government of London. Another resolution was also carried, urging that steps should be immediately taken to relieve the congestion of both vehicular and pedestrian traffic in the principal thoroughfares of London.

Mr. J. H. Vasey, who was at one time in the office of Mr. J. H. Pickering, surveyor to the Nuneaton Urban District Council, has succeeded in obtaining the appointment of assistant town engineer of Bulawayo. Since leaving the Midlands for South Africa Mr. Vasey, it is understood, has met with every success, his training at Nuneaton having made him thoroughly familiar with the work of public bodies. His new post is worth £350 per annum.

The town council of Southampton have confirmed a report of the Electric Lighting Committee appointing Mr. S. L. Smith, of London, as third assistant electrical engineer. They have also agreed to the appointment of Mr. F. H. Chaplin, chief assistant to the borough electrical engineer of Portsmouth, as electrical engineer, at a salary of £250 per annum. There were sixty-six applicants for the vacancy, and four of these were interviewed by the committee.

On Monday, before the Royal Scottish Society of Arts, at Edinburgh, Mr. Gilbert Thomson, of Glasgow, contributed a paper on "Drain Testing." He remarked that, although it was very common to find it reported that drains had been smoke-tested and found all right, all that could really be said was that nothing was found to be wrong. This was not the same thing, and might be very different. Mr. Thomson advocated the general use of the air test, which might be made a standard to which all drains and pipes put in under building by-laws might be made to conform.

Fifty-nine applications were last week reported to have been received for the position of surveyor for West

Medina, under the Isle of Wight Rural District Council, and a committee, who had been entrusted with the work of selection, recommended the appointment of Mr. J. A. Harcourt Powell, of Little Bentley, near Colchester, Essex. The recommendation was unanimously adopted, and Mr. Powell, on being informed of the council's choice, briefly returned thanks and promised to do his best to give satisfaction. He will commence his duties on the 1st prox.

No fewer than seventy-five applications for the post of surveyor, rendered vacant by the resignation of Mr. Smeethurst (who has obtained another appointment), were received by the Fulwood Urban District Council. This number was reduced to twenty-one, and several of the candidates subsequently attended a special meeting of the council, when it was decided to appoint Mr. W. Dickson, of Lytham, at the salary hitherto pertaining to the office—*viz.*, £130 per annum, with house, coal, gas, &c. Mr. Dickson, however, has since intimated that he has been appointed surveyor to the Lancaster Rural District Council, and therefore desired to resign the position. He thanked the council for their kindness, and expressed the hope that he would not put them to any undue inconvenience. The resignation was accepted.

On Thursday, at Belfast, Mr. J. G. Zaehly was presented with an address, to mark the occasion of his promotion to the position of chief of the Public Works Department under the Improvement Committee of the Belfast Corporation. The presentation took the form of a solid silver tea and coffee service. Mr. J. C. Bretland, city surveyor, took the chair during the proceedings, and, in the course of a short address, said he heartily joined in the congratulations which they all desired to offer Mr. Zaehly, who had been at his hand for consultation for a great number of years, during which time he had seldom, if ever, found his judgment at fault. Mr. Munce, assistant city surveyor, spoke of the invaluable assistance which Mr. Zaehly had always rendered him, and said he could endorse every word that had been said by the chairman.

The General Purposes Committee of the London County Council announced, at the meeting of the council on Tuesday, that in response to their advertisement inviting applications for the appointment of a chief officer of the council's tramways, at a salary of £1,500 a year, seventy applications were received. These applications were in the first instance considered by a joint sub-committee of the General Purposes Committee and the Highways Committee, who, after seeing nine of the candidates, submitted the names of five. These candidates had been seen by the committee, who, having carefully considered their qualifications, submitted to the council the names of three—Mr. John Young, Mr. A. Baker and Mr. J. Aldworth. The committee were strongly of opinion that Mr. Young was the best-qualified for the appointment, and they accordingly submitted a recommendation that he should be appointed to the position. The recommendation was adopted without discussion. Mr. Young at present holds the position of tramways manager to the Corporation of Glasgow.

A very successful smoking concert was held on Friday evening, under the presidency of the chief road surveyor, at the Great Western Hotel, Birmingham, in order to make a presentation from the officials of the Public Works Department of the Corporation to Mr. Fred. T. Randall, road surveyor for the Edgbaston and Harborne district, who has been appointed superintendent of the Streets Department of the St. Marylebone Vestry. The presentation took the form of a handsome timepiece with a suitable inscription. Before the presentation was made the vice-chairman, Mr. T. Arnall, said that Mr. Randall took with him into his new sphere the best wishes of all, without exception, and that his future prospects ought only to be limited by his own desires and his friends' expectations. It had given widespread satisfaction that the committee had not gone outside the department for his successor. The chairman, Mr. T. J. Orms, apologised for the absence of the city surveyor, Mr. John Price, who would have been present but for a previous engagement. In making the presentation he wished Mr. Randall success in his new undertaking. The previous night he had had the pleasure of presenting him, on behalf of the working men of Mr. Randall's district, with an illuminated address, as a mark of their appreciation, and he was sure he had the good wishes of every man who had signed it. Mr. Randall suitably acknowledged the presentation and thanked all very warmly for the kind things they had said of him. He re-echoed the sentiments expressed that the Public Works Committee had taken a step in the right direction in promoting one of their fellow-officials, without going to foreign parts; and that when it became known that deserving officials might look forward to promotion a better spirit would animate their servants. As far as their new chief road surveyor was concerned, he was sure he had the welfare of the officials under him at heart. The musical programme was contributed by Messrs. A. M. Rose, Randall, W. H. Worthington, J. A. Dale, Farr, Pearce, James, Savage, Smith, Ballard, Chervett, Bowes, Borg, and Richards, while Mr. A. J. Farr discharged the duties of accompanist in his usual efficient manner.

THE EDUCATION AND REGISTRATION OF PLUMBERS

A conference on the subject of the education and registration of plumbers was held on Friday at the Carpenter's Hall, London-wall, E.C. The conference was called by the National Association for the Promotion of Technical and Secondary Education, in response to a suggestion made by Mr. T. W. Russell, M.P., the Parliamentary Secretary of the Local Government Board, to a deputation of educationalists and administrators, who submitted to him certain objections to the Plumbers' Registration Bill introduced into Parliament last session.

After considerable discussion the following resolutions were adopted: "Without prejudice to the question of whether any Bill for the national registration of plumbers should be introduced into Parliament or not, it is resolved that if a Bill be introduced it should provide: (a) That there shall be placed upon the registration council (1) directly-appointed representatives of local municipal authorities aiding plumbing classes at least equal in number to the representatives of the various branches and interests of the plumbing trade, and (2) an adequate number of directly-appointed representatives of teaching institutions and of such additional organisations as are specially interested in the education and registration of plumbers, including the following, among others: City companies connected with the various sections of the building trade, the Sanitary Institute, the Royal Institute of Public Health, the Royal Institute of British Architects, the City and Guilds of London Institute, the Institute of Builders, the London Polytechnic Council, the Association of Technical Institutions. (b) That the registration council be instructed to accept, as qualifying for registration, the certificate of such public examining body or bodies approved by a Government department, and that such acceptance be not withdrawn without due notice nor without the consent of the Government department concerned. (c) That only a small fee for registration be charged to operative plumbers, and that the registration council shall not remove from the register any operative plumber once entered thereon solely by reason of his failing to pay a subsequent fee. (d) That the examination for the purposes of registration should test the candidates' general knowledge of other sections of the building trade in addition to their special knowledge of plumbing. (e) That in any Bill the council created by the Bill should be the actual managing body and have direct charge of the registration, and, further, that the conduct of the Bill should not be left in the hands of any one body."

It was further resolved to transmit the foregoing resolutions to the Local Government Board and to the principal members of her Majesty's Government.

DISSEMINATION OF TUBERCULOSIS BY MILK.

ACTION OF THE LONDONDERRY CORPORATION.

At the last meeting of the Public Health Committee of the Londonderry Corporation, Alderman O'Keefe, M.D., the chairman, moved: "That, owing to the dissemination of tuberculosis by milk, all cows kept in city dairies be inspected periodically by a competent official." He said that the matter came up as a corollary from the report submitted by the deputation at the sanitary congress. Among the various subjects dealt with at the congress there was none that secured a greater share of attention than that dealing with the steps for the prevention of tuberculosis. The old opinion that this disease was beyond tracing to its source, and stamping out by systematic precaution, had been replaced by a more encouraging one. There was no reason why this disease should not be ranked among such as typhoid fever, typhus fever, scarlatina and small-pox, and combated successfully by employing proper precautions. Tuberculosis kills more, many more, than all the zymotic diseases put together. He asked the committee generally to join with him in what was but a first step towards stamping out a disease which was so terrible. He hoped the time would come when the county councils would take up the matter and adopt the precautions on like lines in the rural districts, for the corporation had only power to deal with the area within their own boundary. He considered that if the motion met with the approval of the committee they should appoint a competent official, such as a veterinary surgeon, to go round and make periodic inspections of the cows and ascertain whether any were suffering from tubercle.

The resolution, after further discussion, was carried unanimously, and the Hospital Committee were instructed to report upon the matter at some future meeting.

Erosion of the Sea Coast.—The council of the British Association recently appointed a committee to report on the following resolution, which was referred to them by the General Committee for consideration: That the council be requested to bring under the notice of the Admiralty the importance of securing observations upon the erosion of the sea coast of the United Kingdom, and that the co-operation of the coastguard might be profitably secured for this purpose.

MUNICIPAL LONDON.

AN INTERESTING LECTURE

Mr. G. A. Gomme, M.A., recently delivered a lecture at Toynbee Hall, Commercial-street, E. on "Municipal London." Premising that the government of the City was a subject that should be of great interest to all, he defined "the great place we call London" as the City (which included eighty parishes) added to "what is called the County of London." A parish took the place of the militant township, and in some cases the parish and township were one and had always been one. Previously to the Act of 1855 one parish grew up as it would. Then district boards were formed; this was an attempt to get local government outside the parish. There were formerly fifty-two district boards in the London area; then these increased to eighty-six different boards. The complexity of London government was one of the difficulties of 1855 which was not remedied till 1888. The variety of boards he likened to a kaleidoscope; they interlaced and overlapped each other. Thirty additional local authorities, and no fewer than 116 different local boards, were formed after 1888. But this was far from being an accession of strength. Boundaries were quite anomalous. In Hyde Park there might be seen a stone on one side of which was St. Margaret, Westminster, and on the other side, Paddington. The boundary lines of Holborn were a puzzle; they crossed Charterhouse-street several times. The lecturer called it a zigzag line, cutting in half the railway station and various warehouses and churches. When the Queen on one occasion paid a visit to the "Royal Borough of Kensington," an allusion was made to the "borough" as the place where her Majesty was born; but the remarkable thing was that Kensington was not in Kensington at all, but in the parish of St. Margaret, Westminster. The lecturer, having referred to the central authority of the City Corporation and its administration, said the London County Council had done much good, but was handicapped by the existence of a multiplicity of official areas and local authorities. Speaking of the water authority, the lecturer observed that as they had the "right" to tax us for the supply of water, the least they could do was to do their best to supply the water.

MAIDSTONE SEWAGE WORKS.

THE NEW FILTER-BEDS.

The members of the Maidstone Corporation recently paid a visit to the sewage works of the town, situated at Allington, in order to inspect the filter-beds which have recently been constructed there for the purpose of experimentally dealing with the sewage of the town. The filters are on the lines of those adopted at Sutton, Surrey, and other places on the advice of Mr. W. J. Dillin (late chemist to the London County Council), and they were decided upon by the Maidstone council after consultations with and reports from him, Maidstone being a low-level system of sewerage, the whole of the sewage will have to be pumped for the purpose of filling the filters.

The bacteria beds are two in number, constructed of concrete. They are 81-ft. wide with breeze or clinker, and consist of a coarse and fine bed, the material in the former having been rejected by a sieve having a mesh of 1 in., while the latter has all passed through a 1-in. mesh with the fine dust removed. The beds are 45 ft. long by 33 ft. wide, and 3 ft. 6 in. and 4 ft. 6 in. deep respectively, and hold from 12,000 to 15,000 gallons at one filling. The sewage which is treated upon these beds is conveyed to them in the same condition in which it arrives at the works, without any mixing with lime, in a perfectly crude state. A new sewer had to be constructed through the works from the southern end to the filters, a distance of over 800 ft. The sewage is raised by means of a 4-in. Gwynne's centrifugal pump, which fills the bed in one and a half hours. It is first pumped direct from the coarse bed and spread over its surface by distributing troughs. After filling it is allowed to remain for two hours, when it is gradually drawn off, by opening the penstock at the outlet, and run into the fine bed. The second bed having been filled, it is allowed to stand in the same way for two hours, after which the effluent is drawn off and runs into the main outfall sewer, which empties itself just below Allington locks into the river. The experimental beds deal with about nearly a twentieth part of the Maidstone sewage.

The London Water Companies.—The metropolitan water companies have given notice of their intention to introduce a Bill into Parliament next session for improving and facilitating intercommunication between the mains and works of the respective companies, so as to obviate the possibility of a deficiency in the quantity of water which any one or more of the companies may be able to supply within their districts. The East London Company have given notice of a Bill empowering them to construct new storage reservoirs, aqueducts, &c., and to require the owner of any dwelling-house supplied by them to provide a cistern of such size as they may prescribe.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

VOLUNTARY PASS EXAMINATION.

Notice is hereby given that the twenty-seventh examination for candidates for surveyorships under municipal corporations and district councils will be held at the Institution of Civil Engineers, Great George-street, Westminster, on Friday and Saturday, April 14 and 15, 1899.

The council reserve to themselves the right to hold a second examination in case the entries received exceed the limits of accommodation. Such second examination will be held as soon after the first as circumstances permit. Applications will therefore be accepted strictly in the order of priority.

Application forms, duly filled in by intending candidates, together with entrance fee of £2 2s., must be in my hands on or before the 5th of March, 1899.

THOMAS COLE, Secretary.

11 Victoria-street, Westminster, S.W.

A NEW IRON JOINT FOR STONWARE PIPES.

There have been, as is well known, large numbers of patent joints for stoneware pipes for sewers and drains, some of which have been good, but many of them have been unable to maintain the tests of the sewerage engineer in every-day practice. These joints have been mostly formed by an adaptation of the collar and the addition of a patent composition, and with or without the use of cement. Mr. James Smith, of 82 Coldharbour-lane, London, S.E., has recently brought out a new joint, known as Ernest Smith's Patent Iron Joint for stoneware pipes, which differs entirely from anything we have yet seen in that the stoneware pipe is without the usual stoneware collar, but its place is supplied by a very light iron collar or socket, which is fitted on to the body of the

pipe with a cement composed of sulphur and precipitated gypsum, which is practically imperishable, as testified by the certificate of an eminent chemist, and an iron spigot is similarly fixed upon the opposite or spigot end of the stoneware pipe. The joint, as will be seen from the illustration, is practically the same joint that is used in cast-iron water mains, and is so simple and so easily made that any labourer could make it without any previous experience. The annular space between the spigot and the collar is fitted with a strip of blue lead cut for the purpose and of the proper thickness. The spigot is then pushed home, and a very slight amount of caulking makes the joint perfectly watertight.

We recently had the opportunity of seeing these pipes laid in a difficult piece of ground, for Mr. Capon, the surveyor to the Epsom Urban District Council, and were much interested to notice the expedition with which they were laid and the effective hydraulic test to which they were put, standing a pressure of 160 lb. to the square inch. It is also remarkable that the price at which the pipes can be supplied is not higher than that of most patent jointed pipes now in the market. The advantages claimed from the adoption of the joint are: (1) Excellence of work, strength, neatness and durability being especially pronounced. (2) Saving of time in laying pipes when water test is enforced. The pipes can be charged immediately the last joint is made, there being no necessity to wait for cement setting. Should a joint weep, it can be caulked up while the inspecting officer is present and the ground filled in. (3) Stoneware pipes of any length can be used. (4) The iron spigot and socket can be fixed by an unskilled labourer. (5) The joint can be used with the pipes of any manufacturer. (6) Special adaptability of joint for waterlogged ground, as it may be laid with the pipes partly or entirely under water.

We should not be surprised if the joint comes into considerable favour with sewerage engineers, as it has already been ordered for several important sewerage schemes.

Otley.—The district council are applying to Parliament for an Act to construct a reservoir at Bow beck, near Ilkley, at a cost of from £40,000 to £50,000. Mr. J. Waugh, of Bradford, is the engineer, and Mr. Mansergh has been called in as consulting engineer.

BRYNMAWR WATER SUPPLY EXTENSIONS.

It is stated that the Brynmawr (Brecknock) Urban District Council propose to improve the water supply of the town by increasing the capacity of the present reservoir, near Crickhowell, from 8,500,000 gallons to 25,000,000 gallons, and to substitute 9-in. mains for the 5-in. pipes now in use. Great inconvenience and hardships are stated to have been experienced by the inhabitants of Brynmawr in the matter of water supply during the past summer, and it is considered gratifying to know that the council are taking such energetic action to prevent similar experiences. The work of raising the embankment of the reservoir will entail an expenditure of about £5,000, and the water supply area will be nearly doubled. Application, it is understood, has already been made to the Local Government Board for the necessary sanction to the execution of the works, which, it may be mentioned, include the provision of an additional filter-bed, at a cost of about £500.

APPOINTMENTS VACANT.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

RESIDENT ELECTRICAL ENGINEER.—December 2nd.—Vestry of St. Mary, Islington. £250.—Mr. L. J. Dunham, clerk to the vestry.

GENERAL FOREMAN.—December 2nd.—Corporation of Bridgwater.—Mr. W. T. Baker, town clerk.

GAS MANAGER.—December 3rd.—Corporation of Newbury. £200.—Mr. F. Quekett Louch, town clerk.

HIGHWAY SURVEYOR.—December 5th.—Keynsham Rural District Council. £150.—Mr. Fred. E. Whitnuck, clerk to the council.

ROAD FOREMAN.—December 6th.—Winchester Corporation.—Mr. Walter Bailey, town clerk.

SURVEYOR AND SANITARY INSPECTOR.—December 6th.—Wirksworth Urban District Council. £80.—Mr. J. Gratton, clerk to the council.

MECHANICAL ENGINEER.—December 6th.—Tyne Improvement Commissioners. £250.—Mr. R. Unwin, secretary to the commissioners, Newcastle-on-Tyne.

CONSULTING ELECTRICAL ENGINEER.—December 6th.—Hoylake and West Kirby Urban District Council.—Mr. Roderick Williams, clerk to the council.

RESIDENT ELECTRICAL ENGINEER.—December 6th.—Wimbledon Urban District Council. £250.—Mr. W. H. Whitfield, clerk to the council.

ENGINEER, SURVEYOR, &c.—December 7th.—Chesham Urban District Council. £120.—Mr. Frederick How, clerk to the council.

ASSISTANT ELECTRICAL ENGINEER.—December 7th.—Ashton-under-Lyne Corporation. £130.—The Chairman, Electricity Committee, Town Hall, Ashton-under-Lyne.

CIVIL ENGINEERING ASSISTANT.—December 10th.—Corporation of Hull. £85.—Mr. A. E. White, city engineer.

ASSISTANT FOR THE INSPECTION OF BUILDINGS, &c.—December 12th.—Ilford Urban District Council. £120.—Mr. H. Shaw, A.M.I.C.E., surveyor to the council.

ASSISTANT SURVEYOR.—December 12th.—Corporation of Stockton-on-Tees. £91.—Mr. J. B. Ashwell, town clerk.

SEWAGE FARM MANAGER.—December 14th.—Willenhall Urban District Council. 30s.—Mr. Chas. J. Jenkin, surveyor to the council.

TEMPORARY ARCHITECTURAL DRAUGHTSMAN.—Aston Manor Urban District Council. £2 2s.—Mr. H. Richardson, surveyor to the council.

ENGINEER'S CLERK.—Box 90, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

MUNICIPAL COMPETITIONS OPEN.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

CHIEFSBY.—December 23rd.—Sewerage and sewage disposal scheme for the Nos. 1 and 2 wards of the district. £50, £30 and £20.—Mr. T. E. Harland Chaldecott, clerk to the council.

HULL.—January 1st.—Erection of a central public library in Albion-street. £50, £30 and £20.—Mr. E. Laverack, town clerk.

HARROGATE.—January 2nd.—Erection of a pump-room, &c., at a cost not exceeding £8,000. £50, £30 and £20.—Mr. Samuel Stead, borough surveyor.

BRADFORD.—February 1st.—Erection of a central fire brigade station. £100, £50 and £30.—Mr. George McGuire, town clerk.

MUNICIPAL CONTRACTS OPEN.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in this summary until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

- LANCASTER.**—December 2nd.—Supply and delivery of about 5,600 lineal yards of 7-in. cast-iron water pipes, for the rural district council.—Mr. Joseph Eminon, clerk to the council.
- CHESTER.**—December 2nd.—Execution of various works in connection with the recreation ground in Guildford-road, for the urban district council.—Mr. J. Froehman Stow, surveyor to the council.
- HULL.**—December 2nd.—Supply of about 5,000 super. yards of the best hard Yorkshire 3 in. wood flags.—Mr. A. E. White, city engineer.
- SALFORD (Lincs.).**—December 2nd.—Laying of abut at 2,100 yards of 3-in. cast-iron pipes for the water supply of the village of G east Hulo, for the rural district council.—Mr. Edmund Clements, clerk to the council.
- SHEFFIELD.**—December 2nd.—Construction and erection of animals and wall at lower entrance to Western Park, opposite Clarkson-street.—Mr. Charles F. Wike, city surveyor.
- CORLEBY.**—December 3rd.—Laying of water mains, hydrants, &c., in the townships of Anlerton, Booth, Charnock and Adlington, for the rural district council.—Mr. A. Jolly, surveyor to the council.
- ST. JAMES, WESTMINSTER.**—December 5th.—Construction of underground conveniences for both sexes in Broad-street, Golden-square, for the vestry.—Mr. T. Heenan Munsey, clerk to the vestry.
- GLANGWY.**—December 5th.—Supply and erection of switchboards and instruments at the new electricity works, Port Dundas.—Mr. J. D. Marwick, town clerk.
- PADSTON.**—December 5th.—Supply from Lady Day, 1899, to Lady Day, 1900, of York paving and granite kerbs, for the vestry.—Mr. Frank Dethridge, clerk to the vestry.
- PADSTON.**—December 5th.—Supply of about 6,000 cubic yards of broken granite for repairing roads, for the vestry.—Mr. Frank Dethridge, clerk to the vestry.
- MARGATE.**—December 5th.—Supply of various articles, for the water department during the year ending December 31, 1899.—Mr. G. Food-Kelvey, town clerk.
- FELKEWOOD.**—December 5th.—Sewage diversion scheme, for the urban district council.—Mr. Joseph Tidley, clerk to the council.
- KNOXTON.**—December 5th.—Supply of corrugated-iron roofing and stoneware pipes, for the urban district council.—Mr. G. Edes Eadmus, M.E.C.E., engineer to the council.
- HULL.**—December 5th.—Supply of buff, terra-cotta or artificial stone for the string courses, tracery, &c., of the crematorium.—Mr. A. E. White, city engineer.
- ATCLAND.**—December 5th.—Supply and fixing of sewer ventilating shafts at Clonnon, for the rural district council.—Mr. Sam Adams, clerk to the council.
- CORLEBY.**—December 5th.—Supply of 178 tons of cast-iron pipes for water mains, for the rural district council.—Mr. Alban Jolly, surveyor to the council.
- SOUTHEND-ON-SEA.**—December 6th.—Various private drainage works.—Mr. Alfred Fidler, M.E.C.E., borough surveyor.
- WALSALL.**—December 6th.—Construction of surface-water sewers in Field-street, Bloxwich, and in Sandwell-street.—Mr. John R. Cooper, town clerk.
- REARY.**—December 6th.—Erection of a fire brigade station and stabling in the council's yard, Chapel-street, for the urban district council.—Mr. D. G. Macdonald, M.E.C.E., surveyor to the council.
- LIMERICK.**—December 6th.—Supply and delivery of a steam road-roller.—Mr. Wm. M. Nolan, town clerk.
- BERKSFORD.**—December 6th.—Making-up of Stile Hall-park, for the urban district council.—Mr. Novell Parr, surveyor to the council.
- ACROSS.**—December 6th.—Erection of a refuse destructor, for the urban district council.—Mr. B. J. Ebbotts, surveyor to the council.

- TOTTENHAM.**—December 6th.—Supply of a high-lift plunger and bucket pump at the Hale pumping station, for the urban district council.—Mr. E. Crowne, clerk to the council.
- CRAYFORD.**—December 7th.—Erection of new buildings and additions to the borough hospital at Waddon.—Mr. E. Mawley, town clerk.
- GREENWICH.**—December 7th.—Supply of 3,000 ft. of 3-in. and 3,000 ft. of 2-in. best-boned Yorkshire stone, for the district board of works. The Surveyor to the Board.
- FELKEWOOD AND WILTON.**—December 7th.—Sewering and main drainage of Leopold-road, North and Victoria-street, North and the formation of a path in High-road, High-street and Lower-street, Wilt on, for the rural district council.—Mr. F. B. Jennings, clerk to the council.
- FELHAM.**—December 7th.—Laying of the sewer portions of certain buildings in private premises in various parts of the parish, for the vestry.—Mr. Charles Battenill, M.E.C.E., surveyor to the vestry.
- TRINGHAM.**—December 7th.—Construction of about 150 yards of 6-in. pipe sewer in Rensley, for the rural district council.—Mr. T. W. G. P., surveyor to the council.
- LITCHFIELD.**—December 8th.—Supply of various tools and materials required during the year 1899.—Mr. E. Geo. Mawley, M.E.C.E., borough engineer and surveyor.
- CHATHAM.**—December 8th.—Supply of various materials for the year ending December 31, 1899.—Mr. Charles Day, borough surveyor.
- COLCHESTER.**—December 8th.—Purchase and removal of four road-cast-iron tanks.—Mr. Herbert Goodyear, M.E.C.E., borough engineer.
- LITCHFIELD.**—December 8th.—Supply of granite kerb, setts, ringroads, &c., required during the year 1899.—The Borough Surveyor.
- NOTTINGHAM.**—December 8th.—Supply of various stores and materials during the year ending 31st December, 1899.—Mr. Arthur Brown, M.E.C.E., city engineer.
- CHESTER-LE-STERE.**—December 8th.—Leveling, paving, draining, &c., of the road past Clarence-terrace, for the rural district council.—Mr. G. W. Aytton, surveyor to the council.
- WORSWICK.**—December 10th.—Supply of lead water pipes 4 in. to 1 1/2 in. in diameter, pig lead and block tin during the year 1899.—Mr. T. Chink, M.E.C.E., city engineer.
- KING'S LYNN.**—December 10th.—Supply during the twelve months ending December 31, 1899, of various stores, &c.—Mr. H. J. Weaver, borough engineer and surveyor.
- SOUTHAMPTON.**—December 12th.—Supply of 1,000 tons of granite for macadamizing.—Mr. D. G. Bennett, borough engineer.
- CANNINGTON.**—December 12th.—Supply of about 270 yards of 2-in. socketed stoneware pipes, for the urban district council.—Mr. William Willis Gale, M.E.C.E., surveyor to the council.
- CHURCH.**—December 12th.—Excavating, flagging and paving of Water-street, for the urban district council.—Mr. John R. Redditch, clerk to the council.
- BARNSBY.**—December 12th.—Supply of various electricity supply plant and the erection of tall chimney and engine, dynamo and boiler-house, storerooms and offices in Beckett-square.—Mr. J. Henry Taylor, M.E.C.E., borough surveyor.
- SHROPTON.**—December 12th.—Boring of an artesian well at the electric light station in Cornet-street, Old-street, for the vestry.—Mr. H. Mansfield Robinson, clerk to the vestry.
- DECELS (Lancs.).**—December 12th.—Erection of a bow-house and pavilion, and the construction of a bowling-green on land in Edison-road, Patricroft.—Mr. G. W. Bailly, town clerk.
- WILLESBORO.**—December 13th.—Execution of certain road-making and other works at Willesden Green, between Strand-road and Hawthorn-road, for the urban district council.—Mr. O. Clancie Robinson, M.E.C.E., engineer to the council.
- COVENTRY.**—December 13th.—Construction of five electric light substations.—Mr. J. R. Swinburn, city engineer.
- WEST HAM.**—December 13th.—Erection of a quarter sessions court, police cells and mortuary in West Ham-lane, Stratford.—Mr. Lewis Angell, borough engineer.
- TUNSTALL.**—December 13th.—Various works in connection with the main drainage scheme, for the urban district council.—Mr. A. R. Wood, borough surveyor.

APPOINTMENTS OPEN.

**BOROUGH OF STOKE-UPON-TRENT.
ASSISTANT SURVEYOR.**

The Town Council require the services of an Assistant to the Borough Surveyor.

Salary, £91 per annum.

Candidates must have a thorough knowledge of the duties appertaining to the appointment.

Personal canvassing will be a disqualification.

Applications, in own handwriting, accompanied by not more than three recent testimonials, and endorsed "Assistant Surveyor," to be received by me not later than December 12th.

JNO. B. ASHWELL,
Town Clerk.

Stoke-upon-Trent.
November 24, 1893.

**URBAN DISTRICT COUNCIL OF HOYLAKE
AND WEST KIRBY.**

The Urban District Council of Hoylake and West Kirby invite applications from Electrical Engineers desirous of acting as Consulting Electrical Engineer in connection with the works to be carried out by the Council under their electric lighting order.

Applications to be sent on or before 6th December next, addressed to the undersigned at the Council's offices, Hoylake, Cheshire.

RODERICK WILLIAMS,
Clerk.

November 25, 1893.

ILFORD URBAN DISTRICT COUNCIL.

The Ilford Urban District Council requires in the Surveyor's department an Assistant for the inspection of buildings and other work, at a salary of £120 per annum.

The person appointed will be required to devote his whole time to the discharge of his duties, a list of which can be obtained from Mr. H. Shaw, A.M.I.C.E., the Council's Surveyor, at his offices, 7 Cranbrook-road, Ilford.

Applications, in candidate's own handwriting, accompanied by copies of three recent testimonials, stating age (which must not be under twenty-five or over forty-five), qualifications and experience, endorsed "Application for Surveyor's Assistant," under seal, and addressed to the Chairman, must be sent to me on or before noon on Monday, the 12th December next.

Canvassing, directly or indirectly, is strictly prohibited and will be deemed a disqualification.

(By order)

JOHN W. BENTON,

Clerk to the Council.

Council Offices, Ilford, Essex.
November 25, 1893.

**KEYNSHAM RURAL DISTRICT COUNCIL.
APPOINTMENT OF HIGHWAY SURVEYOR.**

The Council will, at their meeting on Tuesday, the 6th December, 1893, select Candidates for the office of, and will at their meeting on the 20th December, 1893, appoint a Surveyor for the Keynsham highway district (about 10 miles by 7, embracing fourteen parishes), at a salary of £150 per annum. Duties to commence 1st January next. Previous knowledge of road management essential.

The Surveyor will be required to devote his whole time to the duties of his office, must be able to draw specifications for laying stone pavement and gutters, stone, brick and pipe drains, and gratings; to keep a horse or other suitable means of locomotion. Preference will be given to candidates under the age of thirty-five years, with experience as aforesaid.

Candidates must send testimonials as to character and ability (not more than three) by Monday, the 5th December, to

FRED. E. WHITTUCK.

Solicitor.

Keynsham.
November 18, 1893.

HAYWARD'S PATENT SEMI-PRISM REFLECTING-LENS LIGHTS
FOR LIGHTING BASEMENTS, CELLARS AND UNDERGROUND APARTMENTS.

UNDERGROUND CONVENIENCE, CHARING CROSS LIGHTED BY HAYWARD'S PATENT LIGHTS. ALSO AT OVER 100 OTHERS THROUGHOUT THE COUNTRY. Forty in London—at the Law Courts Hyde Park Oxford Circus—South Kensington, &c. And at Liverpool, Manchester, Leeds, Edinburgh, Glasgow, Brighton, Hastings, St. Leonards, Eastbourne, Margate, Bournemouth, etc., etc.

HAYWARD BROTHERS & ECKSTEIN, Ld., Union St., Borough, etc., London.

CITY OF HULL.

The Corporation require a Civil Engineering Assistant in the City Engineer's office, at £85 per annum. It is essential that candidates should be quick and neat draughtsmen.

Applications, stating age, experience and qualifications, are to be addressed to the undersigned, and delivered on or before Saturday, 10th December.

Testimonials need not be sent in the first instance.

(By order)
A. E. WHITE,
City Engineer.

Town Hall, Hull.
November 28, 1898.

BOROUGH OF GUILDFORD.
SUPERINTENDENT OF OUTFALL SEWAGE WORKS.

The Corporation of Guildford invite applications from persons competent to undertake the duties of Superintendent of the Outfall Sewage Works at Bellfields, Stoke-next-Guildford.

The person appointed will be required to devote the whole of his time to the work and to reside in the house provided at the works, and he will act under the directions of the Borough Surveyor.

Candidates must have a thorough knowledge of steam-engines, air compressor, and sludge-pressing plant, and to be able to work this machinery.

A schedule of the duties, and particulars of the salary to be paid, can be obtained, after the 30th inst., on application at the Town Clerk's office.

Applications, with copies of not more than three testimonials of recent date, must be sent to me on or before the 10th December next.

FERDINAND SMALLPEICE,
Town Clerk.

138 High-street, Guildford.
November 24, 1898.

ENGINEER'S CLERK wanted; must be rapid shorthand and type writer, competent book-keeper, and able to read drawings and trace neatly.—Apply, stating age, salary required, and full particulars of experience, to Box 90, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

COMPETITION.

BRADFORD NEW FIRE BRIGADE STATION.

REVISED CONDITIONS OF COMPETITION.

The Corporation of the City of Bradford are prepared to receive competitive designs for the erection of a Central Fire Brigade Station. Three premiums are offered to competing architects—viz., £100, £50 and £30.

Plan of the site, with revised instructions, may be had on application at the City Surveyor's office on payment of 1 guinea, to be refunded after receipt of design, or on return of papers within three weeks.

The designs must be sent in not later than the 1st February, 1899.

(By order)
GEORGE MCGUIRE,
Town Clerk.

Town Clerk's Office, Bradford.
November, 1898.

TENDERS WANTED.

WILLESDEN DISTRICT COUNCIL.
TO ROAD CONTRACTORS.

The Willesden District Council are prepared to receive tenders for the execution of certain Road-making Work, together with Sewer, Surface-Water Drain, Fencing, and other work incidental thereto, at Willesden Green, between Stride-road and Hawthorn-road, and comprising a length of 325 ft lineal or thereabouts.

Plan and specification may be seen, and all further particulars obtained, on and after Monday, December 5, 1898, upon application to Mr. O. Claude Robson, M.I.C.E., Engineer to the Council, Public Offices, Dync-road, Kilburn, N.W.

The tenders, upon printed forms and endorsed "New Road," to be delivered at the offices of the Council not later than 4 p.m. on Tuesday, December 13, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
STANLEY W. BALL,
Clerk to the Council.

Public Offices, Dync-road, Kilburn, N.W.
November 28, 1898.

Sewers made for Profit.

"Sewers made by any person for his own profit" are, as is well-known, excepted by sec. 13 of the Public Health Act, 1875, from the category of sewers which vest in local authorities. The phrase seems simple enough, but this is only one of the numerous instances in which the simplicity disappears when the attempt is made to apply the terms of the statute to the complexities of actual facts; and the cases are numerous in which the Courts have been called upon to decide whether or not a given sewer fell within the exception. Such a case was recently noted in our columns (*Croydsdale v. Sunbury-on-Thames Urban District Council*, p. 458 *ante*); but before commenting upon this it may be of interest to make a brief reference to a few earlier decisions. In one of the earliest of the reported cases a builder had constructed a number of houses fronting on a street which had not at that time become a public highway, and made the following arrangements for their drainage: He made a drain and a cesspool, and connected them with the first house, and as he completed successive houses he continued the drain from one house to the other, carrying the cesspool forward, and finally, when all the houses had been completed, there was a line of pipes or sewer connecting them with the cesspool. It was held that this sewer was not made by the builder "for his own profit" within the meaning of the Act (*Meaton Local Board v. Batten*). In another case the owners of a building estate laid out a street and made a sewer to drain the houses. This sewer was sufficient as long as sewage was allowed to be sent into the Thames, but upon this being prohibited it became necessary to construct a new sewer to carry the sewage in a different direction. It was held that the original sewer was not made by any person "for his own profit," but vested in the local board, who were bound to keep it in repair. Mr. Baron Huddleston in the course of his judgment suggested as an illustration of the mode in which the exception might apply the case of a sewer made for conveying sewage to works, to be utilised for manure, &c. (*Bonella v. Turickenham Local Board*). This decision was affirmed by the Court of Appeal. A similar view was expressed by Lord Justice Lopes in *Farrand v. Hallas Land and Building Company*—namely, that a sewer made for profit means not a sewer made merely for getting rid of sewage for sanitary purposes without utilising it in any way, but one made for the purpose of realising a profit above and beyond and independent of any sanitary purpose. And in further illustration of the kind of sewers falling within the exception, Lord Justice A. L. Smith called attention to the undoubted fact (which is apt sometimes to be overlooked) that the carrying of sewage is not necessary to constitute a sewer. There may be sewers for carrying off rain or surface water collected from different premises and its distribution, on payment among different receivers. Such sewers would be sewers "made for profit."

The sewer in question in that case was held not to fall within the exception, being an intercepting sewer constructed by the defendants and connected with the drains of a row of cottages, the sewage from which was thereby conveyed to a stream. In *Toules v. Colmer* the plaintiffs constructed a sewer in a road adjoining their building estate, and on sale of the building plots charged the purchasers for connecting the drainage systems of their premises with the sewer. The defendant was the owner of a house on the other side of the road, and claimed the right to connect his drains with the sewer without payment. The plaintiffs asked for an injunction, but Mr. Justice Romer dismissed the action, holding that the sewer was not "made for profit," and therefore vested in the local authority, the case not being distinguishable from *Farrand v. Hallas Land and Building Company*. A very different set of circumstances existed in *Minchall Local Board v. Luttrell*, where it was held that the sewers did fall within the exception, and had been made by the defendant for his own profit, although they were not in any way sewers of the class referred to in the judicial illustrations previously mentioned. The facts are probably within the recollection of our readers, but we may briefly remind them that the defendant (who was the lord of the manor and owner of a large part of the town of Minchall) constructed in 1878, at his own expense and with the sanction of the local authority (where necessary), a sewerage system for draining the town, subsequently extending the system from time to time to new streets as required. The greater number of the houses in the town were connected with this system, and a voluntary annual sewage rate of varying amount was paid by the occupiers of these houses to the defendant. The Minchall Local Board unsuccessfully claimed these sewers as being vested in them. We do not know whether the circumstances of this case are absolutely unique, but we should think they are, at all events, very unusual.

In the case to which we referred at the beginning of these remarks (*Croydsdale v. Sunbury-on-Thames Urban District Council*) we get an altogether different, but probably equally unusual, state of things; and the case is very interesting, not only as being (we believe) the latest decision under this section, but because the council relied for their defence in a great measure upon certain provisions of the Public Health Act, 1875, and the Highway Act, 1835, which therefore necessarily received careful examination by Mr. Justice Stirling, before whom the trial took place. The plaintiff was the owner of a field sloping downward from a street and then rising again, and having two ponds in the "dip" or hollow thus formed. In 1858 or 1859 the then tenant of this field laid down a line of pipes connecting these ponds with a ditch behind the field and the street, with the object of getting a better supply of water for his cattle. At the ditch end of the conduit was a grating, from which the highway surveyors from

time to time cleared away accumulations of rubbish, but it was not proved that they ever cleaned the pipes themselves. The plaintiff having removed the pipes, with a view of filling up the ponds, the council entered the field and cut a trench from the ditch to run off the surface water from the street. The Court granted an injunction against the council on the ground that the line of pipes constituted a sewer made by the plaintiff's predecessor for his own profit. This decision, it will be seen, gives a somewhat more extended meaning to the term "profit" than that which it bears in colloquial usage; indeed, Mr. Justice Stirling expressly stated that in his opinion the term was not to be restricted to a direct money payment, but that when the purpose of a sewer was "neither for sanitary nor ordinary drainage purposes, but to enable the land to be occupied more profitably, or to avoid an expenditure which would otherwise have to be incurred in order that the occupation might be equally beneficial," the term would apply. The statutory provisions above referred to, under which the district council sought to justify their action, are secs. 13 to 17 of the Public Health Act, 1875, and sec. 67 of the Highway Act, 1835. Our readers are, of course, familiar with these clauses, but it will, we think, be interesting briefly to consider their bearing on the case in the light of the judgment. Taking first the Public Health Act, sec. 13, which vests all sewers in the authority, with certain specified exceptions, it of course became inapplicable as soon as the sewer in question was held to fall within one of those exceptions. Sec. 14 enables the authority to purchase "or otherwise acquire" from any person any sewer, or the right of making or using any sewer. It was obvious, however, that this was not a case of purchase, and upon the evidence there was no "other acquisition" in this instance. Sec. 15 merely imposes on local authorities the duty of repairing sewers belonging to them, and of making such sewers as may be necessary. Sec. 16 at first sight might have seemed helpful. It empowers a local authority to carry a sewer into, through or under any lands. Setting aside, however, the fact that what the council had done was not to carry a sewer but to cut a trench in the plaintiff's field, the statutory power is, by its terms, only exercisable "after giving reasonable notice to the owner or occupier," and "if on the report of the surveyor it appears necessary." Neither of these conditions had been fulfilled, and therefore, in the words of the learned judge, "whatever might be done hereafter, the defendants had not as yet brought themselves within its terms." As to the provisions of the Highway Act, the section relied on empowers the authority to make, scour, cleanse and keep open all ditches, gutters, drains or watercourses, and also to make and lay trunks, tunnels, plats or bridges in and through any lands or grounds adjoining or lying near to any highway. In the opinion of Mr. Justice Stirling this section, however widely construed, only authorises the making and keeping open of ditches and drains in and through lands adjoining a highway, and does not authorise the discharge of the contents of any ditch or drain on such lands, which was what had been done in the present case. These cases, and others that might be cited, will serve as useful guides in determining whether a sewer has been made for profit. It cannot be supposed, however, that every possible state of circumstances is covered by them, and doubtless in this, as in numerous other instances, there remain problems to be solved at the expense of future litigants.

* * *

The London County Council Housing Policy.

A good deal of unnecessary apprehension seems to have been excited of late in connection with the housing proposals of the London County Council, but the result of Tuesday's debate at Spring-gardens should have a more or less soothing effect. The debate was in continuation of that of last week, and centred round the interesting

report which was some time ago presented to the council by the Housing of the Working Classes Committee. It may be as well to note clearly how the apprehensions of the council's various critics were aroused. Apparently they were due, not so much to the report in question, as to a matter which came before the council at the meeting on the 22nd ult., and which, though it had reference to the housing problem, had no direct connection with the report which has been under consideration at the last two meetings. The question was the erection of dwellings on a specific area in Poplar. To put the matter briefly, difficulties had arisen which prevented the erection of the dwellings in the way originally contemplated, and the committee brought forward a suggestion which excited the fears of a number of people. A company had undertaken to purchase the cleared land and provide the dwellings, but found themselves unable to satisfy the requirements of the Local Government Board. The council are under a legal obligation to provide accommodation for those displaced, and, considering the demands of the neighbourhood, it was inexpedient that there should be any further delay. As the only obvious and practicable way of putting an end to the deadlock, the committee proposed that the council should suspend the very salutary standing order which provides that their dwellings should be self-supporting. A number of people assumed, rather hastily, that this was to be the basis of the entire future policy of the council in connection with the housing problem. Hence the outcry and the denunciations of the infringement of the laws of political economy and of the injury to private enterprise which the council were supposed to be contemplating by drawing upon the rates to cheapen the rents of a favoured few who would be the council's tenants. Alderman Beachcroft is a member of the committee, and he has been at considerable pains to point out that the case of the Poplar area is an exceptional one, and that the council have really no option in the matter. We may now refer to the report which was considered at the last two meetings, and which may be regarded as formulating the council's general policy for the future. Into the details of the report our purpose does not render it necessary to go. The essence of the council's policy was given in the form of three recommendations:—

(1) That housing accommodation should be provided for a number of persons equal to that of the working classes displaced by any scheme under the Housing of the Working Classes Act, 1890, or under the provisions of any Improvement Act, but not necessarily in the immediate neighbourhood of the displacement, due consideration being given to the needs of those living on any particular area.

(2) That all clearances under the Housing of the Working Classes Act, 1890, which involved rehousing be done at the sole cost of the council.

(3) That, apart from the rehousing required in connection with clearance or improvement schemes, the council do approve of action being taken, under Part III. of the Housing of the Working Classes Act, 1890, with a view to the purchase of land and the erection of dwellings thereon for the purpose of supplying housing accommodation.

There is nothing very appalling in the first two recommendations, which were adopted last week, the first with an amendment to the effect that a register be kept of all persons displaced, and that, if possible, such persons should have the first offer of tenancy in the council's buildings. The third recommendation, however, has been more disquieting to a good many people who read it in connection with the suspension of the standing order already alluded to. In the course of the discussion on Tuesday more than one speaker on the Progressive side energetically disclaimed any intention of erecting dwellings which would not be self-supporting and would involve a charge upon the rates, but it will be observed that there was nothing in the wording of the recommendation which would have prevented that being done if at any time a majority of the council thought fit to suspend the standing order. It is better to be on the safe side and above suspicion. So evidently thought Lord Monkswell, who accordingly persuaded

the council to insert after the word "schemes" the words "providing that no charge be placed on the county rate thereby." There should, therefore, no longer be any cause for uneasiness on this particular score. But even as amended the clause will be a matter for misgiving to many people. Alderman Beachcroft, for example, though he felt compelled to support the suspension of the standing order in the specific case of the Poplar area, is by no means in favour of indiscriminate building, and the suggestion that the council should build for the working classes generally is to him so startling that he is tempted to wonder whether it is meant seriously. He suggests as an alternative policy that the council should endeavour to open out communications between the suburbs and the most crowded districts; but unfortunately the artisan and labouring classes have an obstinate preference for getting as near as possible to the scene of their labours, even at the expense of more or less insanitary surroundings. We have no doubt that the proposal of the council is meant quite seriously, and, like Alderman Beachcroft and others, we confess to some misgiving. We have consistently maintained that in this matter of building municipal authorities should avoid needless and undesirable competition with private enterprise, which such a policy must tend to discourage and ultimately drive out of the field. If only as a matter of self-interest, the community, as represented by municipal authorities, may be justified in doing something towards housing the very poorest, whose condition might otherwise become a social danger. It is notorious, however, that this is precisely the class which the London County Council have hitherto failed to reach, and there is nothing in the new recommendations which will remedy the deficiency. The remedy may be found in less expensive construction, but in any case some revision or modification of the lines on which the council carry out their building policy is evidently urgently called for.

Incandescent Gas Lighting in Streets.

In his report for the year ended March 25, 1898, Mr. George Weston, surveyor to the Paddington Vestry, gives the results of his experience with incandescent lamps for street lighting. As the outcome of a second year's experiment with twelve incandescent burners he finds that the success or failure of incandescent lighting from the financial point of view depends entirely on the state of efficiency in which the mantles are maintained. He points out that a mantle is at its best, and gives a maximum of light, when first put on, but that day by day this light is decreasing; and the question then is, When shall the mantle be removed? Mr. Weston adds:—

It follows that the longer the mantles remain unchanged, even after the light is very sensibly diminished, the less will be the yearly maintenance charge; but it is not then fair to state that a light of three to four times that of the ordinary flat-flame burner is obtained at a less annual cost. I desire here to state that it would be easy to so leave the mantles on these lamps that an actual saving, or at least no additional expenditure, could be shown for a year's working, but I am afraid the lighting of the streets would then hardly meet with the approbation of the committee.

In comparing the relative annual cost of a single incandescent burner in place of an ordinary flat-flame burner as used by the vestry Mr. Weston found that a saving in gas amounting to 7s. 11d. in the first year and 9s. 10d. in the second year is effected, but that the additional cost for mantles and the upkeep of incandescent burners generally was respectively £1 9s. 1d. and £1 2s. 1d. for the first and second years. Deducting the amount saved in gas from these items of additional expenditure, Mr. Weston gets for the first year £1 1s. 2d., and for the second year 13s. 1d., as the total increased cost per lamp per annum by the adoption of these burners. Obviously, when the extra cost of mantles does not exceed the amount saved on gas the expenditure will be equal in both cases, and it is estimated that for this to take place the cost of mantles, rods,

chimneys, &c., and extra labour and attention, must not exceed 8s. 10d. per annum—the average of 9s. 10d. and 7s. 11d., the amounts saved in the first and second years respectively. Thus, with mantles costing 1s. 2d. each, should not allow for many breakages in the year. It should be mentioned that the burners on trial are of the earliest pattern, and, as Mr. Weston remarks, many improved patterns have since been introduced which would, no doubt, reduce the number of breakages of mantles. It may be admitted that incandescent burners of any pattern are far behind the ordinary simple burner for withstanding the hard and rough usage of street lighting; but the question is, Does the improved light outweigh any objections which may be urged against the system? To this question Mr. Weston does not seem to give a very definite answer. He points out that to get the best results from incandescent burners only specially-constructed lanterns should be used, those used in Paddington being ill-adapted to obtain the highest efficiency. In one respect the trial was favourable to the incandescent system, the thoroughfare in which the experiment was made having a small amount of light traffic only. Mr. Weston, in conclusion, expresses a decided opinion that the adoption of any of the latest pattern of burners in any quantity would not reduce the cost for mantles and labour to 8s. 10d. per lamp per annum, assuming, that is, that the mantles are kept in a proper state of efficiency. This is equivalent to saying that the lamps fitted with incandescent burners would cost more per lamp per annum than those with ordinary burners, but would give additional light; or, in other words, if the vestry wish to increase the lighting of any street or district by substituting incandescent for ordinary burners they must pay more for it.

Sewage Disposal and Bacteriology.

About two years ago Mr. Thudichum read a paper before the Society of Engineers on "The Ultimate Purification of Sewage." The new methods were not so familiar then as now, and, not having been tested to the same extent, they were viewed with a good deal of scepticism. Wherever there is scepticism there is naturally a certain amount of hostility, and Mr. Thudichum had to face some adverse, and it may be rather harsh, criticism. On Monday he again read a paper before the same society and on the same subject, but dealing, of course, more particularly with recent developments in connection with the septic tank system and that associated with the name of Mr. Dibdin. Among the audience on Monday were some of those who had severely condemned two years ago, but who now found themselves able to view the new methods from a much more favourable point of view. The approval expressed may not have been of a specially enthusiastic order, and was at times accompanied by certain reservations; but, nevertheless, it was significant enough. In this connection the remarks of Mr. Baldwin Latham were specially interesting. The most adverse criticism came from Mr. C. H. Cooper, of Wimbledon, who still maintains an obstinate disbelief in the statement that the Barking filters dealt with sewage at the rate of 1,000,000 gallons per acre in twenty-four hours. But in view of the express, and naturally somewhat indignant, declaration made by Mr. Thudichum on Monday, we think the figures may safely be accepted and the matter allowed to rest. Now that bacteriological methods are meeting with approval from engineers generally, the time may possibly not be far distant when even the Local Government Board will relax somewhat. The verdict of the Royal Commission now sitting will be awaited with no small interest, but one of the speakers on Monday no doubt expressed a very general feeling when he remarked that it was not conceivable that the commission could fix upon one particular system as applicable alike to the needs of every district apart from special local conditions.

The Birmingham Water Scheme. II.

By JAMES MANSERGH, M.INST.C.E.

SUBMERGED DAM CULVERT IN COURSE OF CONSTRUCTION (December, 1896).

CONSTRUCTION OF THE DAMS.

In this country hundreds of impounding reservoirs have been constructed for the storage of water for canal purposes and for town supply, and a very large majority of these have banks of earth supporting an internal wall of puddled clay, which forms the watertight part of the barrier. Underground watertightness is secured by a tongue of concrete 6 ft. thick founded on impervious shale; above, a puddle wall resting in a concrete shoe is carried up to nearly top bank with supporting earth on each side. In this case we had to go down 70 ft., in the middle of the valley and over 150 ft. at the sides to obtain a watertight foundation. There are still only very few stone dams of any great size in England, although many are to be found on the continent of Europe. The Elan and Claerwen valleys were, however, practically adapted for such structures, the dam sites being all on rock, practically to the surface, and plenty of stone for building at no great distance, the material for earth banks being, on the other hand, deficient.

Mr. Mansergh then exhibited views of various dams. The Abbeystead dam is a small work of the class above referred to, and was built by him nearly twenty years ago to take the place of a much smaller structure erected by Sir Robert Rawlinson in 1852. It is the dam of the Lancaster Corporation's compensation reservoir on the river Wyre, the capacity of the reservoir being 180,000,000 gallons and its drainage area 12,000 acres. The water has gone more than 4 ft. deep over the crest of this overflow. The dam of Lake Thirlmere, in connection with the Manchester waterworks, was constructed by Mr. W. Hill, and the Vrynwy dam of the Liverpool waterworks by Messrs. Hawksley & Deacon. In showing interesting cross-sections of the Caban dam, in the Elan Valley, and of the Bonzey dam, near Epinal, in France, which failed three years ago with such disastrous results, Mr. Mansergh drew attention to the relative thickness of the walls at the same depth below the water surface, which, of course, determines the pressure. In the Bonzey dam, continued Mr. Mansergh, the line of stress, instead of being within the middle third of the profile—as it should be—

was very much nearer the downstream face at the point of failure; the weight of the structure was under 130 lb. per cubic foot, and neither the stone nor the mortar of which it was built was of good quality. The failure was, no doubt, due to the fact that when the reservoir was full the water-face of the wall at the point of fracture, owing to the improper form of cross-section, was subjected to a tensile strain which the material was not competent to bear. This strain Prof. Unwin has calculated at $1\frac{1}{4}$ ton per square foot, which was sufficient to make a horizontal tear or rent along the back of the wall. Once this was made the water would enter it and, acting upwards as a wedge, widen the rent and ultimately overturn the part of the wall above, cutting it right across vertically at each end of the disturbed part—a length of about 190 yards.

The structure of all the walls in the Elan valley will be identical in character; they are being formed of blocks of stone ("plums" as the men call them) practically unhewn, varying from 5 yards or 6 yards to as many tons in weight, built so as to avoid horizontal bedding planes, but with good vertical bonding, and embedded in and surrounded by a matrix of high-class Portland cement concrete. Both the *up* and *down* stream faces are being finished with heavy broken coarse and rock-faced grit, or conglomerate blocks closely jointed. The stone weighs about 170 lb. per cubic foot, and the concrete about 146 lb., and we are aiming at getting a little more than half the mass of "plums," so that the finished weight of the dams shall be as nearly as possible 160 lb. per cubic foot.

The design of the walls is such that no effective tensile strain can ever come upon their water faces; but if it did, the structures as put together will resist a tensile strain of at least 12 tons per square foot. When the Caban reservoir is full the total water pressure against the exposed face of the dam will be about 60,000 tons. The work is being so built that there shall be no interstices in it, and that each dam, when furnished, shall be to all intents and purposes a monolith, only movable by some great convulsion of nature. Without reckoning anything for the cohesibility of the structure, but

only considering the weight the factor of safety against overturning (as did the Bourzey) is from three and a half to four. The drainage area above Caban Coch is by far the largest that has been hitherto dealt with in this country in construct-

CRAIG COCH CULVERT OUTLET (February, 1898).

ing works of this character. Deducting the reservoirs, the Manchester Thirlmere area is 11,000 acres, the Liverpool Vyrnwy 22,000, and this is 44,000. The provision to be made for passing flood waters during the execution of the works is consequently a very important matter.

FLOOD WATERS.

Proceeding to describe the way in which they dealt with a flooded condition of the river during construction, and how flood water would be disposed of when they came with all the reservoirs full, Mr. Mansergh said: First of all we cleared out of the bed of the river on and for some distance below the base of the wall a very great number of large boulders and some rocks *in situ*, in order to enable the water to run freely away. We then erected a concrete and timber stank on the Breconshire side of the river, to exclude the water and thus allow of the excavation for the foundation of that end of the wall being got out and the base of the wall and the Brecon culvert built. This has all been done, the wall having been carried up to 730 ordnance datum, or 30 ft. above the bed of the river, the water passing meanwhile along the left side of its old course. We have now completed a similar

stank on the Radnor side, and nearly finished getting out the foundation inside of it, and the building of the wall and the Radnor culvert is being proceeded with. When this is finished a stank of concrete will be erected up to the level of 730, abutting against the wall at the upper and inner end of each culvert.

This stank being finished, we shall be in a position to impound water behind it to the extent of 240,000,000 gallons and to charge the two culverts (which are 16 ft. in diameter) under a head over the centre of 22 ft., and this combined storage and power of discharge through the culverts will enable us to pass a maximum flood without interfering with the conduct of the works. The excavation for the foundation of the central part of the wall can then be got out and the wall be built between the two ends (which are being finished

NANTGWILT.

with vertical joints, dovetailed in plan) up to 730, after which the remaining 92 ft. of the wall can be erected without further trouble. When the wall has been finished to its full height the inlet ends of the two culverts will be closed.

Whilst they are performing their function of passing the river in its normal state and during floods they are fitted with

CAETHON SIPHON STREAM CROSSING, LOOKING EAST (February, 1907).

cast-iron trumpet or bell-mouthed inlets to facilitate the entrance of the water. At the proper time these castings will be removed, and the face plate to which they are attached will then become the seating of a steel caisson, which will be lowered into its place by means of guides previously fixed and drawn home so as to form a watertight junction by bolts inside. These doors, or caissons, are competent to bear the

CAETHON SYPHON STREAM CROSSING, LOOKING WEST
(February, 1897).

pressure due to a full reservoir—viz., about 560 tons—and under their protection the pipes, with their valves, will be laid in the culverts for conveying the compensation water to the measuring chambers outside. Afterwards each of the caissons will be reinforced by a mass of concrete and brickwork inside the culvert, so that there may be no risk of the perfect and permanent soundness and watertightness of the stop.

In connection with the measuring apparatus there will be self-recording gages and testing chambers, and turbines, driven by the compensation water, actuating accumulator pumps for working the hydraulic valves and dynamos for electric lighting. With a full reservoir the passing of the 27,000,000 gallons a day of compensation water will give about 650 horse-power gross. When the reservoir is full the water will overflow the whole 600 ft. length of the wall; unimpeded in any way, at the time of a high flood the depth will be about 3 ft. on the crest. This will be a magnificent sight, which I hope some of us may live to see. On each side of the valley a channel, lined with masonry and concrete, will be constructed in front of the ends of the main wall to conduct the water harmlessly down and train it into the main channel

FRYDD WOOD DINGLE CROSSING (July, 1896).

of the river, which will be enclosed within masonry side walls 150 ft. apart.

At the dams higher up the river similar means are being provided for the passing of flood waters, modified, of course, to meet the circumstances of each case. The Craig Gôch dam is to be built on a curve in plan—all the other main drains being straight—and will have a roadway carried over it on arches. The submerged dam will also have a road over it, and as upon it must be laid a railway for the conveyance of materials up the Claerwen valley, its left bank end must be built on a practicable railway curve.

Before closing this much-condensed description of the general scheme and the works in the valley I should like to say that out of the 45,562 acres of the collecting area probably 40,000 consist of open mountain pasture or moorland, carrying not more than one small sheep per acre. In the lower parts of the valleys there is some cultivated land, which will for the most part be occupied by the reservoirs, roads and railway, the small farmsteads being submerged, and all trees and fences being removed below top-water level of the reservoirs. Practically the whole area will be expropriated, only the cottages of the very few shepherds needed being left. The old manor house of Nantgwilt will be submerged, and also Cwm Eln House, for a while the residence of Shelley, and the very small Nantgwilt church and a Baptist chapel, from the graveyard of which the remains of between

sixty and seventy bodies have been removed and reinterred near a new chapel erected below Caban Côch. The chapel, after having its roof diddled with holes by the blasting operations in the Careg-Ddu trench adjoining, has been repaired and converted into the Cwm Eln Literary Club, supported by the assistant engineers and the book-keeping staff.

THE AQUEDUCT.

I will now shortly describe the course and mode of construction of the aqueduct. As has already been stated, it commences in the side of the Caban Coch reservoir, above the submerged or Careg-Ddu dam, and terminates in the Frankley service reservoir, nearly 74 miles distant. At its inlet there will be a tower containing the controlling valves and simple screens to keep out floating matters. The aqueduct goes immediately into tunnel, $1\frac{1}{4}$ miles in length, through the Foel, and emerges on the side of the hill about 800 yards below the Caban dam. At about $4\frac{1}{2}$ miles it crosses over the Mid-Wales Railway, where that line is in tunnel, and at 5 miles under the river Wye, a little south of the small town of Rhydydder. At 10 miles it passes the village of Nantmill, and at 17 goes under the Central Wales Railway at Dolan, where it enters a tunnel $4\frac{1}{2}$ miles long.

At 26 miles it is just south of Knighton, that point being at the east end of another tunnel, $2\frac{1}{2}$ miles long. At 35 miles it crosses over the river Teme, south of Leintwardine; then runs along Bringwood Chase to just south of Ludlow, where it again crosses the Teme. At $52\frac{1}{2}$ miles it is half a mile north of Cleobury Mortimer, and at 58 miles it crosses over the river Severn 3 miles north of Bewdley, where the pressure

FRYDD WOOD DINGLE CROSSING (July, 1896).

in the pipes will be about 240 lb. on the square inch. At $62\frac{1}{2}$ miles it is just north of Wolverley, and at 68 close to Hagle, reaching the intended Frankley reservoir at 73 miles 54 chains. In addition to the two railways above mentioned, the aqueduct crosses the Shrewsbury and Hereford Railway at 42 miles 10 chains, the Severn Valley Railway at 58 miles 54 chains, the Stafford and Worcester Canal at 62 miles 70 chains, and the Halesowen and Bromsgrove Railway at 72 miles 2 chains. In its course it also crosses the rivers Rea and Stour, and the Teme a third time.

There are altogether $13\frac{1}{2}$ miles of tunnel, 23 miles of cut and cover, and $37\frac{1}{4}$ miles of iron and steel pipes crossing valleys under pressure; a total of $73\frac{3}{4}$ miles.

The meaning of "cut and cover" is that the aqueduct is laid in ground approximately parallel to and slightly higher than the hydraulic gradient line, so that an open trench may be cut, the aqueduct built in it, and the ground filled in and restored over it to its original condition. In tunnel and cut

WYE SYPHON, PREPARING TO LOWER A PIPE
(February, 1897).

and cover the structure consists of blue brick lining on a concrete backing so far as the invert and side walls are concerned, the arch being of concrete only. This conduit is laid almost throughout with a fall of 1 in 4,000, or about 16 in. in a mile, the exception being in the long tunnels, which have slightly better gradients. It will carry, running something under

full, 75,000,000 gallons a day, and the first instalment of 27,000,000 gallons a day will flow about 3 ft. deep and with a speed of 150 ft. a minute, taking about forty-four hours in its passage from the Elan to Birmingham. In crossing valleys below the hydraulic gradient line the aqueduct will consist at first of two 42-in. cast-iron or steel pipes, with a fall of 3 ft. in a mile, or 1 in 1,760. As the demand for water increases a third, fourth, fifth and sixth pipe of similar size will be laid.

FRANKLEY RESERVOIR.

The service reservoir at Frankley is to be divided into two equal parts, each holding 100,000,000 gallons. The surface-water area will be 25 acres, and the depth 30 ft. The side walls will be of concrete faced with blue brickwork, a skin of asphalt coming between them and being laid also on the concrete floor.

Below this reservoir will be built a series of filter-beds sufficient in area at all times to efficiently filter all the water that is required. From a pure-water tank below the filters the gravitation mains will start into the district, and from it will be pumped such water as is wanted for a high fringe of sparsely-populated country too high to be commanded by gravitation.

THE MAINTENANCE OF MAIN ROADS.

AN ARBITRATION CASE AT BOURNEMOUTH.

A long-standing dispute between the Hampshire County Council and the Bournemouth Corporation, as to the amount to be paid by the former in respect of the maintenance of main roads in the borough, was recently submitted to the arbitration of Colonel Slacke, R.E., one of the Local Government Board inspectors. Mr. T. W. Wheeler, Q.C., instructed by the town clerk (Mr. J. Druitt, junr.), appeared on behalf of the town council, and Mr. Balfour Browne, Q.C., instructed by the county clerk (Mr. H. Barber), represented the county council.

THE CASE FOR THE CORPORATION.

Mr. WHEELER, in opening the case for the corporation, said the original dispute went back to 1889, when, on April 4th of that year, the corporation, under sub-sec. 2 of sec. 11 of the Local Government Act, 1888, claimed the right to construct and maintain the roads, and to look to the county council to reimburse them for the outlay. The dispute arose almost immediately after the repair of the roads had been taken over by the corporation. In 1890 the total amount expended on account of main roads, inclusive of footways, was £3,887 6s. 5d. The county council offered the sum of £1,115 in settlement of the claim, but when the case came on for arbitration the town council were awarded £2,608. In the succeeding four years the claims were settled amicably and without arbitration. In 1891 the amount claimed was £6,178 8s. 4d., and the amount received from the county council £4,395; in 1892 the amounts were respectively £4,736 10s. 11d. and £3,650; in 1893 £7,303 7s. 8d. and £4,000; and in 1894 £4,094 8s. 4d. and £3,230. Roughly, in those four years the cost of maintenance came to £22,311, and the amount received from the county council was £15,275, so that the corporation had borne an outlay on their own shoulders of something like £7,000. The first amount now in dispute was as concerned the year 1895, when the sum expended in the maintenance of the road was £2,963 19s. 9d.; in 1896 the total cost was £3,918 11s. 5d., and in 1897 £2,831 12s. 4d., whilst the estimate for 1898 was £4,479 6s. 9d. It would be seen that in the three years there had been expended by the town council a total sum of £9,359 18s. 9d., including a sum of £3,000 for metalling. Payments had from time to time been made on account (without prejudice) and the amount now in dispute was £3,359 18s. 9d. The cost of the repairs to footways, which was not in dispute, but which would have to be included in the award, was, for the three years, £312 12s. 11d. Mr. Wheeler proceeded to describe the character of the main road with Pokesdown and the county gates, and also pointed out that with increasing traffic came the necessity to spend more money on the maintenance of the road. He then called evidence, the first witness being

Mr. F. W. LACEY, borough surveyor of Bournemouth, who said that when he came to the town (in March, 1889) the annual expense of maintenance of main roads was estimated at about £1,300. He soon came to the conclusion that that was too little, and he put the estimated cost for the year ended March, 1890, at £1,800. As a matter of fact the actual expenditure, including establishment charges and the cost of the footways, was £3,887 6s. 5d. Up to that time the road, in his judgment, had been starved. In reference to 1895 (the first year in dispute), he said that his estimate for the repair of main roads in that year was £3,834 6s., and footways £105. The actual outlay was £2,765 7s. 11d. for carriageways, and footways brought the total to £2,922. The difference between the estimate and the actual expenditure was largely due to the weather.

On the conclusion of Mr. Lacey's evidence the proceedings were adjourned until the following day, when the whole of the morning was occupied by the inspector in visiting the *locus in quo*, the hearing of evidence being resumed after luncheon.

A question by the inspector at the onset of the second

day's proceedings elicited from Mr. Barber, who represented the county council in the absence of his learned chief, the main grounds of objection taken by the county council to the claim made by the corporation. The material, said Mr. Barber, were admitted, but the cost of spreading was deemed excessive; the steam rolling was agreed to; the cost of cleansing was deemed excessive; the quantity of water used was accepted, but the cost of distribution was objected to.

Mr. LACEY was recalled and examined as to details in the accounts, after which

Mr. E. PRANELL HOOLEY, county surveyor of Nottingham, was called. He said he had had frequent opportunity of noticing the roads of Bournemouth, and he had looked with a professional eye at the main road. In his judgment it was a well-kept roadway, and he did not think the cost of maintenance at all extravagant. At first £80 per mile per annum appeared a big sum to him, but on going through the items he found that the expenses were cut down to the minimum, and he did not think the road could be maintained as it should be maintained in a town like Bournemouth for less money.

Mr. SANTO CRIMP, who said he had been professional adviser to the local authority at Wimbledon in the matter of the maintenance of main roads and had experience with the London County Council, said the main road of Bournemouth was as well kept as he thought it should be kept, having regard to the nature of the locality. He had been through the items charged by the local authority for the maintenance of the road, and could find no evidence of extravagance in any particular.

At this stage the case was again adjourned until the following day, when Mr. Wheeler concluded his case for the corporation by calling Mr. Weaver, M.C.E., vestry surveyor of Kensington, and Mr. T. de Conroy Meade, M.C.E., city surveyor of Manchester, both of whom considered the expenditure on the main road very reasonable, nothing being extravagant or unnecessary, considering the continual heavy traffic.

THE CASE FOR THE COUNTY COUNCIL.

Mr. BALFOUR BROWNE, before producing evidence on behalf of the county council, briefly addressed the inspector. His learned friend, he said, in opening the case for the corporation claimed the actual cost, but who was to say what the actual cost was? It was almost entirely a matter of estimate, and he should bring forward witnesses whose estimates would differ materially from the estimates put forward by the other side. Where the actual cost was definitely known the amount was not in dispute. Proceeding to deal with the points at issue, Mr. Browne said that the only criticism he had to offer with regard to the spreading of material on the road was as to the cost of the foremen's (or the walking gangers') wages. That, he contended, should be eliminated from this account and put under the establishment charges. If this item was struck out the only items in dispute were the cost of "siding and scraping, including team labour," and the cost of spreading the water. This, he urged, was extravagant. Moreover, the scavenging, cleansing, watering, &c., was largely carried out for sanitary purposes and for the comfort of the inhabitants, and this should be differentiated from watering and scavenging for purely maintenance purposes. The money was no doubt properly expended, but it should not come out of the pockets of the county council.

Evidence on behalf of the county council was offered by Mr. T. Codrington, who was the arbitrator in the dispute between the parties in 1891; Mr. J. E. Swindlehurst, city engineer of Coventry; Mr. J. Fletcher, county surveyor of Dorset; Mr. W. J. Taylor, county surveyor of Ilants; and Mr. E. Bicker, of Messrs. Bicker Brothers & Pettit, accountants, Bournemouth.

A REMARKABLE POISONING CASE.

An extraordinary occurrence was reported at a recent meeting of the Works Committee of the Birmingham City Council. The men who had been employed to clear the streets of snow were supplied with overcoats, which on becoming soaked by the sleet and rain apparently gave off a poisonous gas. As a result, a large number of the men have since suffered from poisoned hands and arms, and have been treated at the hospital. Sir James Smith, chairman of the committee, stated that about sixty of the corporation employees had complained of the effects of the chemical dressings of the coats and overalls. An examination of the coats has been made by Dr. Hill, medical officer of health, who reports that the cloth contains chloride of zinc.

Blackfriars Bridge.—A correspondent of *The Times* writes: "Owing to there being no catch-pits at the end of the northern slope of Blackfriars Bridge, the whole of the dirty water and mud draining from this portion of the bridge in wet weather is allowed to flow across the footpaths leading to New Bridge-street, on to the Embankment on the one side and towards Queen Victoria-street on the other, with a result that (to the annoyance and detriment of hundreds of foot passengers, well and badly shod, have to wade through a stream of water or a quagmire of mud, and the footpaths adjoining become in a like state. Surely this state of things might be altered."

Comparative Reports of General Practice.

XXX.—TRAMWAY TRACTION : WEST BROMWICH REPORT.—IV.

KIDDERMINSTER AND STOURPORT.

The new tramway which has just been opened between Kidderminster and Stourport forms what is known in America as an "inter-urban line." It commences at Somerleyton-avenue, about half a mile in an easterly direction from the Great Western station at Kidderminster. The line passes by the station and traverses the principal streets of the town, and proceeds in a southerly direction along the Stourport-road. The line enters Stourport from the north, and crosses the town ends in Bridge-street close to the bridge over the river Severn.

Permanent Way.—The line is a single track, with numerous passing places, and has a length of $4\frac{1}{2}$ miles, the gauge being 3 ft. 6 in., and the rails are of the girder type, 75 lb. to the yard. In the borough of Kidderminster the line has been laid as an ordinary tramway, upon a bed of concrete 6 in. in thickness. Between the rails and for 18 in. on either side it is paved with 3-in. by 5-in. Clee Hill granite sets. Along the Stourport-road the line, with the exception of one short length, is laid on the north side of the road; and here the rails are laid on transverse cressoted sleepers, and the space between the rails and on each side is made up with macadam. Considerable road improvements have had to be made by the company in order to leave a clear carriageway for the ordinary traffic of the road. This has necessitated the widening of the road and also of three bridges.

Conducting System.—The two trolley wires are suspended at a height of 21 ft. from the ground, at the side of the road, from bracket arms attached to a single line of posts, which are placed at average intervals of 150 ft. These poles are in one length and stand 22 ft. above the ground, and are bedded in concrete to a depth of 6 ft. below the surface of the road. The lengths of the bracket arms vary considerably, the longest being 8 ft. 6 in. and the shortest 2 ft. 6 in. They are of plain but neat design, and were manufactured by Messrs. James Russell & Sons, of Wednesbury.

Rolling Stock.—The rolling stock consists of six closed motor cars with a carrying capacity of twenty-four passengers, and three open cars carrying forty passengers. The motor cars weigh $6\frac{1}{2}$ tons and the trailer cars 4 tons. Each motor car is equipped with two 15 horse-power motors, and they are each lighted with ten 16 candle-power incandescent lamps, arranged in two circuits of five lamps in series. Inside the cars there are three clusters of lamps, one containing four lamps and one containing two lamps, and there is also a headlight projecting above the hood or roof of the car. The cars are mounted on Brill trucks, and this is the first tramway in this country with rolling stock entirely equipped with this kind of truck. There are no top seats to the cars, and on each end of the motor car is an enclosed cab, which presents a very great improvement on the present class of tramway cars. The speed of the cars is 8 miles per hour in Kidderminster, and in certain streets in Stourport the rate is reduced to 5 miles per hour, but 15 miles when travelling between the two towns. They stop when required, but have regular stopping places, and the through fare, a distance of $\frac{1}{2}$ miles, is 3d., with 1d. sections. There is a half-hour service in the morning, and twenty minute service in the afternoon, but on market days and holidays there is a quicker service when necessary. The company carried in Whit-week, the first week it was opened, 47,000 passengers.

Power Station.—The power station and car-shed is about a mile from Kidderminster, and contains two Babcock & Wilcox boilers, two 200 indicated-horse-power engines of the Raworth type, and they are direct coupled to 6-pole compound dynamos manufactured by the Brush Electric Engineering Company. The station is simple in construction, but contains all that is required for the working of the line.

General Notes.—The sub-committee were extremely pleased with the ease, comfort and absence of oscillation when riding in the cars, and believe that cars of this class would be found very serviceable in West Bromwich. The saving of time by using the trailer instead of the old-fashioned type deckers will be no doubt considerable, both for passengers and conductors. This line has been constructed by the British Electric Traction Company, which is the same company at present working the Wednesbury line, and the one proposing to take over the South Staffordshire Company.

COVENTRY.

Permanent Way.—The Coventry overhead electric line commences at the London and North-Western Railway station, and continues to Bedworth, a distance of about 6 miles. It is a single line with passing places, the gauge is 3 ft. 6 in., and the old lines are used, which were originally constructed for steam traction and have been down fourteen years. The rails weigh 55 lb. to the yard. The route is along macadam roads, but in all cases the track is paved across and for 18 in. on each side of the rails.

Conducting System.—The trolley wire is suspended at a height of 21 ft. from the ground by insulators attached to the ends of tubular poles, known as the span-wire system. Side

poles are also used, and in some of the narrow streets the wires are fastened from house to house with rosettes, with the result that the overhead construction is scarcely observable and certainly not offensive. On the other hand, the span-wire system is much more objectionable than the single poles, in that extra poles are required and also more wires. The feeders are also carried above ground from pole to pole. The poles are placed 120 ft. apart, as in other towns, but none are used for street-lighting purposes, the tramway being in the hands of a company who have obtained a lease for another twenty-one years.

Rolling Stock.—The cars are of two sizes. There are six large ones, weighing about 7 tons, and capable of holding fifty-two passengers, and four small ones, to carry forty passengers, and weighing about $6\frac{1}{2}$ tons. They are lighted by means of lamps, and have four lights on top, two at each end. They are mounted on Peckham trucks. The speed is 8 miles per hour, and they stop when required. There is a ten minutes' service, and the fare is about 1d. per mile, the conductor and guard being in uniform.

Power Station.—The generating plant is situated at Foleshill, and consists of two Babcock & Wilcox's boilers and two 125 horse-power Browett & Lindley's engines, coupled by belts to two Westinghouse dynamos. The machinery is rather too small for the work it has to do.

General Notes.—The line has been in operation for two years, and is very popular. No accidents of a serious character have happened, and there has never been a stoppage through breakdown of the machinery. An extension is in course of construction through another portion of Coventry, and this will be a single line of a length of 5·25 miles. In this case side poles are being used. A new power-station, which will be erected, with larger and more modern machinery, to work both lines, will be almost in the centre of the district, and the existing station will be made into a car-shed. The oscillation was very great, so much so as to be uncomfortable at a high speed, and the sub-committee were informed that this was largely owing to the old steam track being used.

BIRMINGHAM (CABLE TRAMS).

The cable line belonging to the City of Birmingham Tramways Company (as is well known to the members of the committee) runs from Snow-hill to New Inns, Handsworth, a distance of 3 miles, and is a double track. The gauge is 3 ft. 6 in., and the rails weigh 92 lb. per yard. The line was constructed in 1888. The paving on each side of the rails is wood, but between the lines granite sets. The motion is obtained by attaching the cars, by means of a gripper worked by the driver, to an endless moving cable formed of steel wires with a rope centre, and running in a conduit laid in the centre of each pair of rails. In the top of the conduit is a slot, with opening $\frac{1}{2}$ in. wide, through which the gripper passes. The action of the gripper somewhat resembles that of the human hand clutching a rope. The cable is guided at curves and angles, or changes of gradient, by pulley wheels fixed at the sides or in the bottom of the conduit. The depth of the conduit is 2 ft. 7 in. from the surface.

Power Station.—The cables pass, near the centre of the route at Hockley brook, into and out of the power-house, where they wind round large drums or pulley-wheels driven by steam engines. There are two single-cylinder horizontal high-pressure engines of 250 horse-power each, both geared on to one set of driving drums. One of the engines is being replaced with a 370 horse-power Calloway's compound condensing engine. Only one engine is used to run the full service of cars (about twenty-seven), except in very heavy snowy weather, when at times it has been found necessary to run both engines. There are two cables, with lengths of 4,066 yards and 6,340 yards, the weight of the two being 27 tons 5 cwt. The cable has to be renewed about every nine months on the city portion and every twelve months on the Handsworth portion, and they cost £300 and £400 respectively.

Rolling Stock.—There are thirty-two cars, each mounted on bogies, and carry forty-four passengers—twenty inside and twenty-four out. They weigh $6\frac{1}{2}$ tons, and are lighted with compressed gas. Cars run every one and a half minutes; the speed is 7 miles per hour in the city and nine miles in Handsworth. The cars stop when required, and the charge is 1d. per mile. Very few accidents have occurred.

General Notes.—The financial results of this mode of traction have been very satisfactory to the company. There is a constant and very observable humming noise in the streets while it is working, and the presence of the third rail is very objectionable; but the objections to the cable system generally are fully set forth in the general conclusions. As the adoption of the cable system was largely experimental, the Birmingham Corporation (who constructed originally all the lines in the city and leased them to the company at a yearly rental, and the cost of repairs is also paid by the company, the work being done by the corporation) were unwilling to incur any financial responsibilities in connection therewith, and it was therefore arranged that the tramway company

should enter into a contract in the usual way for the construction of an ordinary tramway along the route, having permission to adapt the tramway at their own cost to cable traction. The extra cost of so adapting the line—i.e., construction of conduit, pulley pits, manholes, alteration of gas and water pipes, besides the erection of the power station and provision of machinery—being paid for by the company.

BIRMINGHAM (ELECTRIC ACCUMULATOR SYSTEM).

The Birmingham Central Tramway Company possesses the unique distinction of combining under one management tramways worked on four different systems. The Bristol-road electric accumulator system has been in operation since 1890. It extends from a point in Navigation-street, near its junction with John Bright-street, where the steam tramway terminates, and adjacent to the London and North-Western Railway station, through Bristol-street and Bristol-road to Bournbrook, a distance of 3 miles, and is a double track throughout. All the gradients and curves, except two or three, are comparatively easy. The rails are steel girder type, 92 lb. to the yard, and the space between and for a distance of 2 ft. on each side is paved with deal blocks.

Power Station.—The power station, which forms one of the most important features, is situated at Bournbrook. It is built of brick, and covers some three-quarters of an acre. There are three boilers—two of Davey & Paxman's and one of Babcock & Wilcox's. The two engines are compound engines made by Messrs. Davey & Paxman, and there are two Elwell & Parker dynamos.

Rolling Stock.—The cars, of which there are seven, have a capacity of fifty passengers—twenty-four inside and twenty-six out—and weigh, when loaded, 12 tons. The body is mounted on a pair of bogies, on one of which is fixed a 15 horse-power motor. It can be driven from either end, and by means of suitable switching apparatus any required speed or power can be obtained without the use of the resistance, which would entail a loss of energy. The cars are lighted by electric lamps from the accumulators. The accumulators are carried under the seats, and are charged at the depot, the charge being sufficient for a journey of 21 miles. There is a regular ten minutes' service, and the fares range from 1d. to 3d. for the entire distance. The cars travel at a speed of 8 miles per hour, but slower up hills—about 6 miles per hour.

General Notes.—Many minor objections against this system may be named. The vibration rapidly destroys the batteries, and at times causes an objectionable smell. Complaints have been made that the acids have discoloured and destroyed the clothing of passengers, and claims have been made against the company on account of damage sustained from this cause. The acids have a very injurious effect on the cars themselves, and destroy the woodwork—the life of the bottom of the cars being only four years—the ironwork and the floors; and, in consequence of the fumes from the acid, which discolours the paint, it is very difficult to keep the cars from looking shabby. The accumulator system is very far from being a success commercially, the maintenance being very heavy, and the sub-committee do not recommend its adoption in West Bronwich.

GIBRALTAR SANITATION.

Gibraltar is now in possession of a proper system of drainage. The new sewer has involved an immense amount of labour and skill during the two years or so of its construction. It is of solid concrete, and high enough for a man to walk erect through its entire length of 2 miles from the north end of the town to the southern outlet at Europa Point, where all the matter is carried away into the waters of the Mediterranean. The pumping engines and machinery are fine specimens of British handiwork, from the firms of Crossley (Manchester) and Schow (London) respectively, and are situated at the north end of the garrison. By means of a tank of large capacity, fitted with flood-gates, some hundreds of tons of water are discharged with tremendous force through the sewer at each flushing, which is carried to the sea outlet in five minutes. It now remains for the Sanitary Commissioners to see that the catch-pits and connections from the houses to the sewer are kept clean, and then, doubtless, all the bad odours for which "Gib." has been noted in past years in her streets will be a thing of the past, together with the periodical outbreaks of fever that must have increased the death rate, which should be very low in such a mild climate.

Light Railways.—Applications for light railways are received by the Light Railway Commissioners twice a year—in the months of May and November. The applications received in November amounted to fifty-four, under which it is proposed to construct 492½ miles of line, at an estimated cost of £3,344,563. This estimate is for construction only, and does not include the cost of plant and rolling stock for their equipment. This is the largest number of applications that has yet been received by the commissioners in any one half-year. The total number of applications previously received in the four half-years since the appointment of the Light Railway Commission in 1896 amounted to 121 for 1,302½ miles of line, at an estimated cost of £7,555,976 for construction.

IDEAL LONDON.

At Toynbee Hall, on Saturday evening a lecture was delivered by Mr. Frederic Harrison on the subject of "Ideal London."

By "Ideal London" Mr. Harrison said, he meant "London as it might be, as it should be, and as it shall be." The true ideal was no idle dream, but the justification of study and the motive of all useful endeavour. London was his birthplace, and for nearly sixty years had been his home. For two generations he had watched its growth and rebuilding, and as a member of the county council he had experience of the practical difficulties of making improvements. In suggesting the ideal London he should try to keep within the bounds of practical statesmanship; but he was not bound by limits of time or by the exigencies of existing prejudices and legislation. An ideal London should contain all that pertained to pure and perfect citizenship. Now modern civilisation had failed to carry on some of the best elements of city life as known to the ancient and mediæval world. London did not inspire in Englishmen the feelings which Athens, Rome, Florence and Venice excited in their citizens. It was now valued as a market, an exchange, an office, or a playground, though that had not always been the case. But a city that covered 120 square miles of buildings was not a city, but a wilderness of houses, and city life was impossible for a population of 4,000,000 or 5,000,000. People must be within walking distance of the country, or the town became a prison and not a city. Therefore ideal London would not exceed 1,000,000 inhabitants—and it would be better with only 1,000,000—and it would be but a third of its present size. He was no lover of the tenement or flat system, but it was absolutely necessary if a great city were not to grow to unmanageable bulk. London at present had no ideal tenements, and few satisfactory ones; but when spacious, airy, clean and lofty blocks, provided with common libraries, baths, play-rooms and sick-rooms, were available the economy of such wise co-operation would leave room for boulevards, parks, gardens and playgrounds. He repudiated the idea that London would go on increasing at its present rate, for he was sure that the causes which had led to that increase were only temporary. In ideal London the Thames would run as clear as at Henley, and again it would be the great highway of traffic. The bridges would be doubled in number, and the disfiguring railway bridges would have to be suitably treated. Steam engines would probably be prohibited within the City, and the air would cease to be polluted by the poisonous fumes of millions of chimneys. It was really strange how long we had allowed preventable nuisances to choke us. A pure and unlimited water supply would be carried through great aqueducts, as in Rome, from inexhaustible lakes and reservoirs. This would have been done long ago for London but for commercial self-interest, political intrigue and administrative jealousy. Water, no more than fresh air, would be bought from money-making speculators. It was a prime necessity of life, and as such it was the duty of the State to supply it, pure and in abundance. Science and organisation would annually save many thousands of lives now sacrificed by preventable diseases. Already the death-rate of London had been reduced by one-half in the present century, and there was no reason why it should not be reduced very much further. With regard to the question of burial grounds, he believed that London would return to the ancient and honoured practice of cremation. This practice would obviate the danger of infection to the living and the difficulty of visiting cemeteries which could only be reached by a long and fatiguing journey. It was too much forgotten that cremation was only the scientific process of preparing the remains of the dead for disposal. The problem of the reorganisation of London had taken a new phase since London had been broken up into so many Parliamentary boroughs. He did not advocate "tenification," but he looked forward to the different districts of London, while united under a strong central government, having each a separate civic life of its own, available for all citizens within a mile of their homes and within reach of their own influence. The buildings of London, which had now neither permanence nor self-respect, would be changed in character, and be made more worthy of the genius which built Westminster Hall and the Abbey. But through all reconstruction he hoped that the historic associations and landmarks of a city which had an unbroken record of 1,000 years would be preserved, even at the expense of some regularity. New lines of traffic would be created, and the heavy traffic would be diverted to deep electric railways. With easy and open avenues of communication London might become as bright and gay, as full of fountains and towers and statues as Paris and Florence.

At the conclusion of the lecture Mr. Harrison invited questions from the audience, and being asked how he felt the population of London could be brought within the smaller limits which he had contemplated, he replied that the efficient cause would be economic. He did not suggest any legislative restrictions, but he could not believe that London would always continue to occupy its present unique position as the centre of the financial and commercial world.

A vote of thanks to Mr. Harrison for his lecture brought the proceedings to a close.

QUERIES AND REPLIES.

Sketches accompanying Queries should be made separate on white paper in plain black-ink lines. Lettering or figures should be bold and plain.

224. By-Laws as to House Drainage and their Interpretation.—Mr. A. R. Robinson, surveyor to the Clacton-on-Sea Urban District Council, writes: In your "Queries and Replies" for November 25th I notice Query No. 224, by "J. W. M.," relating to building by-laws and regulations. I have no doubt this refers to a case in my district which is now exciting a good deal of local interest, and I should be glad to have a full expression of opinion on the merits of the case. The facts of the case are as follows: A plan for a new building was deposited and recommended for approval by me, and was, in fact, approved at the next council meeting. At a subsequent meeting "J. W. M.," who is a member of my council, contended that the plan should not have been passed, and quoted the opinion of Mr. Winship to prove it; he based his contention on the following two points—*viz.*, (1) That every building is required to have a separate drain, and (2) that the drains, if laid as shown on plan, would form a right-angle junction or worse. A and B on accompanying plan are existing buildings, while C is the proposed new building, all belonging to the same owner. The existing drain is shown by a firm black line and the new drains by dotted lines. The existing drain is furnished with a disconnecting chamber near the sewer, and the inspection chamber shown has proper curved channels. My reply to the first objection is: (a) The buildings are within the same curtilage; but even if they were not I should not recommend a separate

connection with the sewer, with its attendant inconveniences, such as breaking the road and tapping a pipe sewer, for the sake of taking the drainage from two gullies; and (b) the regulation quoted is intended to apply to houses, and not to outbuildings. My reply to the second objection is that branch drains running at right angles, or acute angles, may be joined by the introduction of proper bends, so as to avoid what is known as a right-angle junction. . . . Mr. Martin has not made public his case as sent to Mr. Winship, and on writing to the latter as a fellow-surveyor he declines to give his reasons for his published opinion.

We have pleasure in publishing our correspondent's communication, and in complimenting him upon the able and proper manner in which he has interpreted the by-laws in question. With regard to the opinions (1) and (2), expressed by another engineer, Mr. Winship, we may observe that neither the Public Health Acts nor the Model By-Laws anywhere prescribe "that every building is required to have a separate drain," and, moreover, such a by-law would, if made, be, in our opinion, *ultra vires*. Local authorities frequently provide by their regulations that the drain from each house (not from each building) shall, except where the local authority otherwise approve, be connected to the sewer by a separate drain. But, even when such a regulation is in force, it frequently happens that it is impracticable and detrimental from a sanitary point of view to require separate sewer connections in every instance. If the contention of Mr. Winship were a sound one each building within the

area at the rear of every dwelling-house would require a separate connection to the sewer, which would be absurd. The mode of drainage approved on the recommendation of Mr. Robinson is correct, as the buildings are within the same curtilage. The second objection raised by Mr. Winship, that "the drains if laid as shown on plan would form a right-angle junction, or worse," is also, we are bound to observe, an incorrect one. The new drain from the stable and granary will join the existing drain in the chamber obliquely in the direction of the flow of such drain, and complies with the building by-laws. A reference to Knight's "Annotated Edition of the Model By-Laws" shows a similar mode of connection (illustrated) to that approved.

229. Reservoir Embankments, Pressure of Water on.—"C. D. B." writes: I have to draw your attention to a mistake in the reply to Query No. 229, in your issue of December 2nd. The vertical depth of the centre of gravity of the surface pressed is equal to two-thirds of the depth, and not to one-half of the depth as your reply stated.

We are pleased to have our correspondent's communication. The rule that is given by us is, however, quite correct, and he has evidently fallen into the somewhat common error of confusing "centre of gravity" with "centre of pressure." The centre of gravity of a right line of uniform density is the point which bisects its length; hence it follows that the centre of gravity of a reservoir wall, as stated by us, is situate at a point at half its depth. The centre of pressure, however, in a vertical wall is at a point below the centre of gravity. If the pressure exerted at different depths of a plane side were equal, the point of application of their resultant, the centre of pressure, would obviously coincide with the centre of gravity of the side. But since the pressures increase with the depth, the centre of pressure is necessarily below the centre of gravity. The vertical depth of the centre of gravity, therefore, as already pointed out by us, is at half the depth of the side; but the centre of pressure of the surface pressed is at a point two-thirds of the depth from the surface. Our correspondent has evidently omitted to notice a clerical error in our working of the example which has been kindly pointed out to us by another correspondent, "Index," and is a self-evident error from the rule given. The working should appear thus: Total pressure = 50 (length) × 20 (depth) × 10 (depth of centre of gravity) × 62.5 = 625,000 lb.

THE SMOKE NUISANCE.

AN ASSOCIATION FORMED.

On Monday night the Earl of Meath presided at a meeting held at 6, Onslow-gardens, South Kensington, when the question of the "Smoke Nuisance" was considered. The Chairman said that in the attempt to minimise the evil they were there for the purpose of forming an association to do what seemed best.

Sir W. B. RICHMOND, in supporting the suggestion for the formation of such a society, said the proposed body would not take over the duties already assigned to the local governing authorities, but they could assist those authorities to carry out the law at present dealing with the question. If they could strengthen and encourage the powers that be, in a very short space of time London would be rid of a considerable portion of a very serious and dangerous nuisance. It was not an aesthetic or artistic agitation, but one which was of great interest to every class and section of Society. Sir John Brunner, M.P., had written to him as follows: "My experience as a manufacturer proves to me that the evolution of black smoke could be stopped with profit, simply by taking care to burn coal scientifically. I congratulate you on having initiated this movement at a time when your efforts will be helped by the adoption, now becoming general, of gas-cooking appliances." He had received letters in favour of the movement from the Duke of Westminster, Lord Hobhouse, Mr. Ruskin, and others.

The association was formally inaugurated, after some discussion.

Selkirk.—The question of the water supply was discussed at a recent meeting of the police commission, when a copy of resolutions passed at a meeting of ratepayers favourable to improving and augmenting the present pumping scheme was considered. A deputation from this meeting were present and gave expression to their views, after which it was moved: "That with the view of introducing to the borough a gravitation water supply from Lewinshope, and on the assumption that the estimated cost will be found to be approximately correct, the commissioners resolve to proceed with the scheme and to instruct Messrs. Leslie & Reid, Edinburgh, to forthwith prepare specifications and working plans and take in offers; also that all necessary steps be taken to complete the arrangement with Captain Johnston, of The Hangingshaw (on whose ground the reservoir will be placed), and all others interested." It was pointed out that the commissioners had spent years on this question and had come to the conclusion that a gravitation supply was the best in all respects for the community. Eventually the motion was adopted. The estimated cost of the scheme is over £17,000.

The Bacterial Treatment of Sewage.

By GEORGE THUDICHUM, F.R.S.*

On the last occasion upon which the author had the honour of reading a paper before the society he dealt with the principles involved in the successful biological treatment of sewage effluents, more particularly as deduced from the results obtained from the 1-acre filter-bed at the northern outfall at Barking creek. At the same time he hinted at the advance then being made by the local authority at Sutton, Surrey—viz., the direct treatment of the actual sewage by the same agencies, but under conditions, as regards bed material chiefly, necessarily somewhat altered. The progress in this direction has since that time been remarkable, and very many authorities, all over the kingdom, have followed in the footsteps of the Sutton Council by adopting their method in its entirety.

It is not the intention of the author on the present occasion to deal with the question from its scientific or theoretical aspect; this has lately been fully discussed upon many occasions. It is rather sought to bring before the notice of the members of the society the practical outcome of a large amount of experimental work, and to show how the system can be adapted to meet local requirements in various cases, it being now evident that the general principle of biological treatment, in one form or another, is acknowledged by the majority of those practically concerned in the disposal of waste matters. The author has also no intention of entering into matters of history, claims as to priority of ideas, or even as to the relative merits of the various schemes suggested, except with regard to those two systems which are at present most prominently before the public.

During the last eighteen months the author, together with his partner, Mr. W. J. Dildin, formerly chief of the chemical and gas department of the London County Council, has had numerous opportunities of applying in practice the principles learned during many years of experiment; and it is the general result of such practical experience, illustrated by certain concrete examples, that he now proposes to lay before the society. In addition to dealing with this matter as applied to larger communities, he also proposes to discuss the question of the treatment of the sewage of isolated country houses, workhouses, schools, asylums, or other public institutions, a question which, more especially latterly, has become of the greatest importance.

THREE CONSIDERATIONS.

In attempting to apply the biological method to the treatment of the sewage of any given place three questions of paramount importance have to be considered; these are (1) the available fall, (2) the nature of the soil, and (3) the possibility of the sewage containing ingredients which are hostile to microbial life. The first two questions, those of fall and nature of soil, will in great measure determine, according to the author's views, the method to be adopted in the particular case. In gravitation schemes in which the sewage is delivered at less than 4 ft. above the point at which it must be finally discharged it would appear that the septic or Exeter method possesses some advantages, in that a fall is required into and out of one set of bacteria-beds only, no head being lost by passage through the septic tank, in which the preliminary solution of the solid matter is effected. It must be understood that in discussing arguments of this kind the author is not siding with the septic tank against the Sutton, nor with the Sutton against the septic tank system. He desires merely to point out what are the particular advantages of either according to the local conditions, and the final results produced by either process are in all respects comparable. If the sewage be naturally delivered at a point very near the level of the final outfall it must then be quite evident that a system requiring a fall through one bacteria-bed only has an advantage from an economic point of view over a scheme which necessitates a fall through two beds. If, however, the sewage must in any case be pumped, or is delivered by gravitation at a height above the outfall sufficient to allow of the interposition of two sets of bacteria-beds, it then becomes a matter for consideration as to which of the two should be adopted; and the decision, it appears likely, will usually be arrived at from economic reasons mainly, if not entirely.

The extent of fine-grain bed to be provided will be the same in either case; the difference, therefore, so far as first cost is concerned, will be the difference between the cost of a coarse-grain bacteria bed and of a septic tank. Where the soil is light and porous, so that all tanks and beds must be built of brickwork on concrete bottoms, it is possible that such difference may be extremely small, since the extra cost of covering the septic tank will be compensated by its being of smaller cubic contents than bacteria beds to do the same work, and by its requiring no bed material. Where, however, the nature of the soil is such as to permit of the construction of bacteria beds in the open ground, merely puddling the bottom and sides, the advantage from a pecuniary point of view is entirely with the system adopted at Sutton. On suitable land, such as the heavy clay at Sutton itself, bacteria beds can be made by merely excavating, burning the soil, laying drains on the bottom and returning the burnt ballast; and this has actually

been done at a cost, for a bed 3 ft. in depth, of 3d. per foot super., or £726 per acre. In places where the bacteria beds must be erected above the ground level, but where clay is readily obtainable, such beds can be prepared at a relatively small cost; and in these instances also the first installation will cost less on the Sutton than on the septic system.

With regard to the third point, that of the sewage possibly containing matters hostile to the growth of microbes, the author has found, as a matter of experience, that the majority of trade effluents, especially if diluted with a reasonable proportion of ordinary domestic sewage, will yield to the influence of either aerobic or anaerobic organisms. In a joint paper by Mr. Dildin and the author, read before the Society of Chemical Industry in April, 1897, this question was specially discussed; and it was shown that bacterial treatment was applicable to sewage containing considerable quantities of refuse liquors from many trades, including, as in the case of Leeds, effluents from tanneries, galvanising works, copper works (wet process), and the solid matters from shoddy; in the case of Maidstone, from tanneries and breweries; at West Bromwich, pickle liquor from galvanising works; at Yeovil, from the yards of fellmongers and leather dressers; and in various instances in which the sewage to be treated was highly charged with refuse from sawworks, margarine factories, dairies and distilleries. Taken as a whole, the experience of the last two years goes to prove that in the large majority of cases the manufacturing refuse which may be present in the sewage does not prevent the application of the principles of biological treatment throughout; whilst in cases in which preliminary precipitation or other treatment is necessary the final purification can be best effected by means of the fine bacteria-bed, as described by the author in his paper read before the society in 1896.

A CONCRETE EXAMPLE.

Turning to a concrete example of the advantages possessed by a bacterial process as compared with chemical precipitation and land treatment, the author would point to the Worcester Park outfall works of the Chesham and Cuddington Council, in the area administered by the Epsom Rural District Council. This is one of those cases, alluded to by the author in his previous communication, in which the successful working of the farm is rendered practically impossible by the very nature of the soil, which is a heavy clay, waterlogged in wet seasons, and in dry ones full of cracks which admit of the direct passage of the sewage effluent to the underdrains, whence it escapes, unpurified, into the brook. But it is just in such a soil that aerobic bacterial treatment can be adopted in the most economical manner possible.

The daily quantity of sewage delivered at the Worcester Park farm is about 80,000 gallons, the high-level sewage containing considerable quantities of brewery refuse, the low-level being ordinary domestic sewage. The high-level delivers by gravitation near the highest point of the farm, whilst the low-level, entering at the bottom, is pumped to precipitation tanks about the centre of the area. Two small artificial filters were also provided. The effluent produced was very bad and the general condition of the farm unsatisfactory. It was accordingly determined to establish coarse and fine bacteria-beds on the Sutton method, both sets, since the fall was sufficient, to be excavated, and the bed material to be burnt ballast obtained on the farm itself.

Pending the carrying out of these alterations it was necessary to deal by some temporary means with the high-level sewage, which was responsible for the larger proportion of the effluent complained of. The method adopted for effecting this purpose is highly instructive, as showing the identity of land treatment with so-called bacterial treatment, and at the same time demonstrating the reason for the superiority of the artificial over the natural method of rendering microbial life available for this purpose. A plot of land of about 1 acre in area having been selected, the main effluent drain was locked, and the sewage (which in order to reach the highest portion had to be backed up in the outfall sewer) was allowed to flow on to the land until no more could be received; in fact, the whole plot was considered and treated as a Sutton bacteria bed. This operation occupied about three days. At the expiration of this period the damming of the outfall sewer was stopped, and the sewage allowed to flow freely for a short time into the precipitation tanks, in order to remove any accumulation of sludge from the sewer; the backing up was repeated, and the sewage diverted on to a second plot treated in a similar manner to the first. The valve locking the latter was opened and the water gradually discharged from the plot. The work was continued in this way, using the plots alternately, and the result was a remarkable improvement in the quality of the effluent. That which before was black and stinking was clear, and had only a slight sewage odour, analysis bearing out the conclusions arrived at from inspection by sight and smell.

Such an operation must, of course, not be looked upon as a typical bacterial treatment. The time occupied in filling the

* A paper read on Monday before the Society of Engineers.

bed, and consequently the period during which the organisms are submerged, is far too long, whilst the bed material is so fine that the re-entry of air is necessarily imperfect, and choking of the surface by the suspended matters in the raw sewage would take place probably at an early date. But as an object lesson it is worthy of the most careful consideration. By compelling the intimate contact of the sewage matters with the purifying bacteria, and by ensuring that such contact should be of some duration, work was effected which under the original conditions was impossible. The action of the organisms existing in the soil was controlled as in an artificial bed, and the desired result was arrived at with practically no expenditure whatever.

But, as just pointed out, such a method, however admirable as a temporary expedient, could not be looked upon as a radical cure, since the fitness of the bed material and its softness would infallibly cause a breakdown in the course of time. The bed material must be of a size sufficient to admit the passage, in the case of the coarse beds, of the suspended particles in the sewage; and in both sets of beds of the free admission of atmospheric air as the water is withdrawn. It must also be of a more or less hard and resistant nature, in order that it may retain its original size and shape and not break down into a mud. To provide, therefore, for the permanent treatment of the sewage, coarse-grain beds, having a nited area of 4,500 superficial feet and a depth of 3 ft., were designed, the bed material to be burnt ballast, the whole of which had been rejected by a screen having a $\frac{1}{2}$ -in. mesh; and a similar number of fine beds, with a nited area of 4,950 superficial feet and a depth of 3 ft., the bed material being also burnt ballast, but in this case of a size which would pass a screen having a $\frac{1}{2}$ -in. mesh, the fine dust only being rejected. The beds were constructed by excavating, puddling the bottoms and sides, and laying agricultural drains on the bottom, leading to an outlet controlled by a valve. The cost of the beds to deal with the dry weather flow of 80,000 gallons daily, amounts to £225 only. The result of the work is what was anticipated—namely, the production of a perfectly satisfactory effluent.

A similar method will be found generally applicable on a large number of sewage farms which are at present yielding unsatisfactory results, and it is this facility that constitutes one great advantage of the Sutton system. Existing precipitation tanks can be utilised, in small part as sand traps, in the greater part as coarse beds, being converted into the latter by the simplest form of drainage being laid on the floors and by being then filled with burnt ballast, coke, or whatever material can be readily provided in the neighbourhood. Fine beds can then be constructed as indicated, and the effluent from these can be passed on to the land when desired, or may be discharged directly into a watercourse under the condition of the crops or the soil renders irrigation useless or harmful. The immediate benefits derived from such a conversion of the method of treatment are well marked, the use of chemicals is abandoned, saving both cost of materials and labour. The collection and subsequent treatment of sludge is abolished, since there is no sludge, merely a small quantity of rags, paper, and similar matters collected by the screens, and amounting in ordinary cases to about thirty barrow loads per 1,000,000 gallons, the sludge item also making a marked difference in the working cost. There is at no time danger of nuisance arising from the works, such as is necessarily the case when sludge has to be dealt with and an effluent liable to secondary putrefactive decomposition is spread over the land; and, lastly, the crops can receive the full benefit of the manurial constituents of the sewage at such times as irrigation is wise or needful, without being drowned and compelled to grow in sodden soil by its being always necessary to pass the effluent through the land. The Sutton works themselves form a typical instance of the advantage of conversion. By the time the alterations are completed the whole cost will have been less than £2,000, whilst the annual saving in working expenses already or to be effected amounts to no less than £500, or about 8d. per head of population.

SOME PRACTICAL POINTS.

Practical points requiring further investigation, and which can be elucidated only by the co-operation of engineers, and more especially of borough surveyors, are the questions relating to the trapping of sand, the duration of the working life of the coarse beds, and the degree of fitness necessary for the screens. In the case of the septic tank process the last named requires no consideration, as everything that is organic may be permitted to enter the tank. The sand question, however, remains, and the study of the life of a bed is passed on, though in lesser degree, to the fine beds, since the effluent from the septic tank, taking Exeter as an example, contains considerably more suspended organic matters than that from a coarse bacteria bed.

The duration of the active and useful life of a coarse-grain bed has not yet been determined; the original one at Sutton, which commenced working over two years ago, being still in excellent condition, and treating its proportion of crude sewage daily with results equally as good as those obtained after it had been in operation a couple of months. But certain important observations have been made which tend to show that the water capacity of a bed diminishes according to the time during which it is kept at work, increasing again when rest is allowed, but never equalling that of the bed in

its early stages. A considerable portion of this loss in capacity is no doubt due to organic growth in the interstices of the material, and until a certain amount of such has taken place the purifying powers of the bed are not fully developed. But there must also be a quantity of mineral matter from the sewage deposited in the bed, and much of this can never be brought into solution, and thus carried away with the effluent water. Intimately connected with this question is that of trapping the actual sand carried by the sewage, and so preventing it from getting into the bed. This is not of very great importance in the case of towns provided with a separate system of drainage; but where such does not exist, and the water from the roads is removed by the same channel as that which carries the sewage proper, it assumes proportions which on some occasions are startling. This can be well seen by anyone at the Barking outfall works, where there are thousands of tons of road sand which has been removed from the precipitation channels, having subsided almost as soon as the sewage had passed the penstocks into the channels, and had therefore ceased to flow at a high speed. The amount of such sand brought down and deposited after a single thunderstorm following a period of drought is some hundreds of tons.

It is, of course, obvious that this could not be permitted to pass on to a bacteria bed, as the choking up would only be a matter of a relatively short time; and the question to be solved is, to what rate must the flow be reduced, or how long must the sewage be quiescent in settling tanks, in order that the sand may be deposited and the organic matters in suspension left. Too short a period will allow sand to enter the bacteria bed; too long a one will permit of the subsidence of organic matter, which will result in the production of sludge, a product by all means to be avoided. The life of a fine-grain bed is, of course, not affected by similar considerations. The coarse-bed effluent which passes on to the fine contains only a small amount of suspended solids, principally organic, and silting up of the fine bed would not occur. A certain amount of loss of water capacity, due to growth, always takes place; but when the point of highest efficiency is arrived at the capacity remains practically constant.

An important point in connection with sewage treatment by any method is to minimise the attention required. In many recent cases where the Sutton system has been adopted attendance during the night hours has been dispensed with by providing a pair of beds, coarse and fine, each having a water capacity sufficient to take the whole of the night flow. Syphons are provided, so that if, owing to rain or other cause, the level of the water in the bed exceeds a certain height it is automatically discharged from the coarse bed into the fine, or from the fine on to the land.

PUBLIC INSTITUTIONS AND SMALL COMMUNITIES.

For dealing with the sewage from a small community, such as a public school or an asylum or a small hamlet, one of two biological methods may be employed, according to the fall available. In the first method, which may be either on the lines of the Sutton or of the septic system, or a combination of the two, the sewage is passed continuously through the tank, or for twenty-four hours on to a coarse bed, and then on to fine beds, where it remains for two hours and is then discharged. If bacteria beds only are employed, they should be four in number—viz., two coarse and two fine grain—each being of sufficient capacity to take a whole day's flow. The sewage, or the overflow from the cesspit where such exists, is allowed to pass into one of the coarse beds for twenty-four hours, and is then diverted to the second bed, the effluent from the first being discharged into the corresponding fine bed. Here it is allowed to remain during two hours, and is then finally removed. By this method there is no doubt far more anaerobic action in the coarse bed than is the case when the system is worked normally; but the rest, which is given every alternate day, gives an opportunity for the destruction by oxidation of the organic matters retained by the bed. The attendance required is very slight, and can be readily given by a gardener; it consists merely in turning a few valves, with an interval of three hours between the first and second operations, and in an occasional raking of the surface. If the fall be sufficient to admit of the employment of two sets of beds, the septic tank and the fine beds only can be employed; and in this case the alternating gear used with the latter is essential, as otherwise the attendance would prove a severe tax.

In the second method it is presupposed that the sewage cannot be delivered at or sufficiently near the surface to be passed on to a bed. In this case the best plan is to provide a storage tank, a coarse-grain and a fine-grain bacteria bed, each of the three being capable of containing the sewage of an entire day of twenty-four hours. At a fixed time on each day the sewage should be pumped from the storage tank into the coarse bed, should remain there two hours and then be passed into the fine bed, and after a similar period of rest in the latter be finally discharged.

The sewage from the Claybury Asylum of the London County Council has been treated by a single pair of coarse-grain bacteria beds with perfect success for over three years. At Radley College an installation has recently been completed, in which the overflow from a cesspit is treated by two pairs of beds—viz., two coarse and two fine grain. These beds are constructed by excavating, the sides being of brickwork and

the bottoms of clay puddle. The coarse beds are 16 ft. by 10 ft. by 3 ft. deep each, and the fine 16 ft. by 12 ft. by 3 ft. deep each. The bed material is coke, that in the coarse beds being all rejected by a screen having a $\frac{1}{2}$ -in. mesh, and that in the fine having all passed a mesh of $\frac{1}{8}$ in., with the fine dust removed. The water capacity of each bed is 160 cubic feet, that being the maximum quantity of sewage which they have to deal with daily.

It is a source of much gratification to the author that further experience has caused no alteration of the views expressed by him in the paper read before the society two years ago regarding general principles and methods of working. Much additional knowledge has been gained, and the applications of the bacterial method have been shown to be of wider scope than was at that time generally recognised; but the facts then related still form the basis on which such knowledge is founded, and the theories set forth have been only amplified and verified, without suffering any integral change. The method of working the beds, by alternately filling and emptying, allowing them to stand full for a limited time and empty for as long a period as possible, has been proved over and over again to be the correct one. Where the method of constant flow through a filter is employed the results have so far not been shown to be satisfactory. In many instances, as for example at Wimbledon, the effluent escapes from the burnt-ballast filter, surface-choked and, being cut off from air by its covering of earth, in a semi-putrid and stinking condition. This fact was noticed by many members of the Association of Municipal and County Engineers on the occasion of their visit to the farm. Whatever be the first treatment, the final purification must be aerobic; and, so far as the author has yet seen, this is best accomplished on the lines laid down as a result of the Barking experiments between 1892 and 1896.

DISCUSSION.

Mr. BALDWIN LATHAM said that it almost appeared to be a settled matter that the sewage disposal problem would be solved in the manner suggested by Mr. Dibdin and Mr. Thudichum in the paper read by the latter before the society two years ago. There was no doubt that in this biological treatment of sewage they had an element of success which would provide a means of solving the sewage difficulty by purifying sewage before it was turned into the watercourses. He may have been rather hard on the process on former occasions, but there was no doubt that those gentlemen who were giving their attention to the matter were doing a great work. Both in regard to the septic process and that which relied on aerobic organisms, those engaged in the work were deserving of thanks. He himself had been carrying on experiments in a large manufacturing town in Central England. The result from those, he would not say filters but contact chambers, was that the effluent was equal to that obtained from the best irrigation process ever carried out in this country. The sewage in the town of Bilston was charged with salts of iron and was the colour of mahogany. When the sewage had been reduced to a liquid state by an arrangement corresponding to the septic tank, which need not be a closed vessel, it was passed on to one of those contact filters, and the effect was perfectly marvellous. In the case of the Bilston sewage the amount of albuminoid ammonia has been reduced as much as '03 and '028 grains per gallon, and this from a sewage containing refuse from galvanising works and showing as much as 28 grains of chlorine per gallon. At Friern Barnet the results were not quite so good as those at Bilston. The sewage showed 116 grains of albuminoid ammonia per gallon and '05 in the effluent. In the case of Manchester the sewage contained an enormous amount of trade effluents of all descriptions, especially from chemical and dye works, but after treatment by contact filters the amount of albuminoid ammonia was only '07 grains per gallon, and the improvement was going on. Week by week the experiments showed that a process of purification had been going on throughout the whole period, and final results had not yet been reached. At Friern Barnet the amount of oxygen absorbed in twenty-four hours was reduced from 6.53 to '30, and at Manchester from 5.15 to 1.24. The results showed that sewage could be satisfactorily treated by this method. In the districts he had mentioned there was no land to which sewage could be applied so as to produce such results. In future no chemicals would be required, and their rivers would be purified if the methods were pushed to their ultimate issue.

Mr. MAXWELL LAWFORD asked whether the condition of the Pill Brook was to be attributed to the condition of the Sutton sewage works. He believed it took the whole of the Sutton effluent. When the neighbouring golfers lost a ball in the stream they had to take it out of what could only be described as black sludge; he had, however, been told that many of the houses in Sutton were not connected with the sewers and discharged direct into the stream. That had, no doubt, something to do with the condition of the brook. In regard to the question of sludging up at Leeds, Mr. Dibdin and Mr. Thudichum had recommended, if he remembered right, sedimentation-beds as a preliminary. A similar process had also been recommended at Cheam as a preliminary treatment before the sewage went into the coarse and fine beds respectively. He took exception to the statement that in the case of institutions only two biological methods were available. In addition to the septic tank system and Mr. Dibdin's system there

was the system associated with the name of Mr. Scott-Moncrieff. The success of the new methods all went to show that the late Mr. Bailey Denton was quite right in saying that the final purification was effected by intermittent downward filtration. In the one case land was laid out to deal with the sewage by intermittent downward filtration. In the other case artificial filters were used for the same process. They often heard of the effects of discharging crude sewage into the sea, the sewage sometimes collecting as a seething mass. In a case in which his firm were at present engaged they had arranged, in consultation with Messrs. Dibdin & Thudichum, to put down filters and send a purified effluent into the sea. Some information was wanted as to how biological methods applied respectively to towns drained on the combined system and those drained on the separate system. In the late Mr. Bailey Denton's experience of fifty years no two towns had been treated in the same way, and he did not see that it was any more likely to be so in the future. Filters were of the greatest use to engineers generally, but he did not see that it was possible for any Royal Commission to say that one system should be adopted to the exclusion of others. He congratulated Mr. Dibdin and Mr. Thudichum on having decided to act in a professional and consultative capacity only and keep themselves free from circulars and syndicates.

Dr. RIMEAL said that a comparison of the size of filters and the number of gallons of sewage treated at Leeds and at Exeter respectively showed a slight superiority in favour of the latter place. It was desirable to understand clearly what was meant by a coarse and what was meant by a fine filter. In one case they found that a coarse bed was made up of material that had been rejected by a $\frac{1}{2}$ -in. mesh, and a fine bed of material which would pass a screen with a $\frac{1}{8}$ -in. mesh. In another case the material for the fine bed passed through a $\frac{1}{2}$ -in. mesh. At Exeter the material used passed through a screen with a $\frac{1}{8}$ -in. mesh, and was therefore coarser than that advocated by Mr. Thudichum for the fine bed. It was, in fact, intermediate between the material used by Mr. Dibdin and Mr. Thudichum for their coarse beds and that used for their fine beds. It was also necessary to consider what was meant by screening the sewage before passing it into the coarse and fine beds respectively. The figures given in connection with the Worcester farm was thirty barrow loads per 1,000,000 gallons. That quantity, therefore, would have to be dealt with in some other way. Then there was the question of sand and the utilisation of settling tanks to reduce the flow of the sewage and obtain the deposition of the sand.

Mr. E. G. MAWBEY said that it must be admitted that Mr. Dibdin and others were deserving of thanks for the progress made by them in connection with bacteriological treatment by means of artificial filters. Some of them were tempted to cling to land treatment, which had served them well. At all events they were inclined to support it as a supplement to bacteriological treatment. Great headway, however, had been made in clarifying sewage without chemicals. For about eight years they had treated the sewage of Leicester on clay land, but during the last four years there had been an enormous increase of population, to the extent of 6,000 a year, and they found themselves face to face with the necessity either of increasing the area of the land or of adopting some means of clarification. He himself was in favour of clarification, but wished to find out the best system. By the aid of an illustration on the blackboard Mr. Mawbey then went on to describe the system of preliminary purification adopted at Leicester, consisting of (1) a detritus tank, (2) a settling tank, and (3) coarse filter-beds. Since the adoption of the system they found themselves able to treat 1,000,000 gallons on 22 acres, as against 1,000,000 gallons on 52 acres when land alone was used. For final purification he was in favour of land, when there was plenty of it to be had, but otherwise they should fall back on bacteria beds.

Mr. C. H. COOPER (Wimbledon) said that the Worcester farm was drained to death, as clay grounds usually were, and such a farm must of necessity be a failure. To say that they could not treat sewage on clay grounds was wrong, as was shown by the example of Leicester and other places. He would like to know how the beds at Worcester would deal with extra rains—say five times the dry weather flow. He had had a sample of the effluent taken that day, which he would hand up to the chairman to have a sniff (Laughter). Mr. Cooper concluded by disputing the statement that the filters at Barking had treated 1,000,000 gallons a day per acre. He doubted if they had treated even 500,000, and expressed a regret that the figures given in connection with these matters could not be relied upon.

Dr. THUDICHUM agreed with those who did not think it was possible for the Royal Commission to lay down one system for all cases, but they could consider details and principles. He was glad to find that the system was meeting with so much approval, and spoke of the progress it was making in Germany, in which work he had taken a considerable part. It was one of the greatest advances in our times, but the details of one town would not apply to those of another.

Mr. PENFOLD referred to the remarks of Mr. Cooper, and corroborated the statements that the filters at Barking had treated 1,000,000 gallons per acre a day. The filters were charged twice a day, and had a depth of 6 ft. The sewage was treated chemically before it went into the filter-bed.

Mr. W. BROWN expressed the opinion that this preliminary

treatment made all the difference. He took exception to the statement that there was an economy effected at Sutton of £500 per annum. If the original expenditure was £1,200, and there was a saving of £500, then the annual cost would be £700. But that would compare unfavourably with a system not mentioned in the paper. It was a weakness of the paper that it only recognised two systems. Before the present system had been adopted at Sutton an offer had been made to the local authority not only to treat the sewage but to keep the sewers free from sewer air for £700. The net cost of treating the sewage would have been £600. He agreed that the circumstances of each case must determine the method of treatment. If the particulars of each treatment and cost were fully gone into, the economy would not prove to be so great.

Mr. Dawson spoke of the efficiency of a septic tank installation he had seen at Barhead, near Glasgow. The filters were not working, but the effluent from the septic tank only was better than what he had seen from any precipitating process. The installation at Barhead was on the same lines as that at Exeter. Three things recommended the system. There was a small initial cost, the cost of maintenance was small, and there was no sludge. He hoped that at Leyton they would, in a very short time, follow the example of other places.

Mr. TRUDICHUM in the course of his reply referred at length to the remarks of Mr. Cooper, which, he said, constituted the only adverse criticism he had received. He denied the accuracy of that gentleman's statements in regard to the Barking filters, and strongly insisted on the accuracy of the official figures of the London County Council, for which he had been himself responsible. He thanked Mr. Baldwin Latham and others for the more favourable way in which they were now inclined to express themselves in regard to bacterial methods.

ELECTRIC LIGHTING IN SHOREDITCH.

THE SIGNING OF THE BOARD OF TRADE ACCOUNTS.

We give below the reasons submitted by Dr. Mansfield Robinson, the vestry clerk, at a meeting of the Shoreditch Vestry on Tuesday, for his inability to sign the accounts of the electric light works for the past year. The reasons were stated in a report presented by the Finance Committee and adopted by the vestry:—

(1) The Board of Trade net revenue account does not harmonise with the vestry's net revenue account for the same period printed, together in the last annual report, pp. 363 and 352 (and annexed hereto), the balance of excess of income over expenditure in the account at p. 363 being £781 1s.; whilst in the account at p. 352 it is £2,063 0s. 4d. (which is carried forward to the appropriation account at p. 355 as a balance of £807 12s. 2d.). This appears to arise from treating the entry from "deficit account," at p. 352, of £1,255 8s. 2d. (being the advance by the vestry out of rates to refund the deficit on the years ended 25th March, 1896 and 1897) as income earned by the undertaking from March, 1897, to March, 1898, when no charge for the corresponding expenditure is made on the other side, whereas this is done in effect in the Board of Trade account, at p. 363, by debiting a balance from the last account of £1,281 19s. 4d. I am unable to follow how the above advance from the vestry out of rates to meet deficiencies in the years ended March, 1896 and 1897, can be called income for the year ended March, 1898, although, of course, it is properly entered under the heading of receipts during the latter period.

(2) The chief electrical engineer declined to take responsibility for the Board of Trade accounts before the Lighting Committee, on the ground that some of the items are classed under the wrong heading—e.g., there is no expenditure under the headings of public lamps, (a) to attending and repairs, and (b) to renewals of lamps, whereas it appears from his books that the first item should be £154 10s. 5d. and the second £83 14s. 1d., and, again, that the items relating to wiring and fitting work are inserted in the accounts, whereas the printed Board of Trade form makes no provision for them.

(3) In view of the statements, made at the last vestry meeting, that the electric lighting accounts made up for the year ended June, 1898, were "cooked," on the ground (as I understand) that no charge for steam raised from burning refuse, or for payment of interest on and redemption of bankers' overdraft, was made, it is evident that the same allegation (if correct) is applicable to the Board of Trade accounts up to March, 1898, as there appears to be no charge made in them in respect of those items.

Swansea.—The Water and Sanitary Committee recently had before them the insanitary state of Morrision. It was reported that plans were prepared and approved, and that only the invitation of the tenders was necessary, for the laying down of the remaining main sewers in the locality. A resolution was adopted calling upon the Water and Sewers Committee to proceed with the work forthwith, so that the owners in the private streets might connect their property and the corporation take over the control in accordance with the terms of the Public Health Act.

LONDON LOCAL GOVERNMENT.

PROPOSED MUNICIPALITIES.

At the request of the executive committee of the Westminster conference—a committee on which the parishes of Marylebone, Clerkenwell, Hammersmith, Deptford, Mile End Old-town, Kensington, Westminster, Camberwell, St. Martin's-in-the-Fields, Bermondsey, and Paddington are represented.

Mr. T. W. Wheeler, q.c., the chairman of the conference, has addressed to the Lord President of the Council a letter making certain representations with reference to the memorial recently adopted by another conference at Islington regarding the proposed municipalities for London. The letter points out that thirteen of the vestries of the larger parishes and two of the district boards designedly held aloof from the Islington conference, on the ground that it was unnecessary, and could only go again over the ground already covered by the earlier conference at Westminster. The fifteen authorities represent a population of 2,024,000, and a rateable value of £15,494,000 or 45 per cent. of the population and 42 per cent. of the rateable value of the entire metropolis. The memorial of the Islington conference stated that twenty-six of the forty-two vestries and district boards in London were represented thereat, but Mr. Wheeler's committee explain that seven of the twenty-six authorities were and are members of the Westminster conference, the majority of whom "attended at Islington, not for the purpose of reconsidering their position, but for the purpose of observation only." These seven parishes comprised 794,000 inhabitants and £6,537,000 rateable value, so that the nineteen authorities left could claim to represent at the utmost only 1,500,000 out of the 4,493,000 people in the metropolis, and £9,365,000 out of the £56,571,000 rateable value. The nineteen localities in question—Battersea, Bethnal Green, Hackney, St. George's-in-the-East, St. George-the-Martyr, St. Luke's, Old-street, Newington, Shoreditch, Stoke Newington, Holborn, Limehouse, Lee, Poplar, St. Giles's, St. Olave's, St. Saviour's, Strand, Wandsworth and Whitechapel—comprised the smaller areas with which the Royal Commission of 1894 did not deal. "It is gratifying to find, however," writes Mr. Wheeler, "that they assent to the principle of incorporation, notwithstanding that objections and difficulties might be experienced in treating them on a par with the larger areas." The letter proceeds to discuss details of the proposal for creating new municipalities, and expresses satisfaction that the differences between the two conferences on essential points are so few, the real measure of the differences between Islington and Westminster, it is said, being in truth, "the extent to which the powers of the London County Council are proposed to be interfered with, or even assailed, and this by the later conference."

SEWERAGE AND SEWAGE DISPOSAL AT BUCKLOW.

The application of the Bucklow Rural District Council for sanction to borrow £5,524 for sewerage and sewage disposal works in the township of Dunham, was the subject of the Local Government Board inquiry which was held on Thursday by Mr. Robert H. Bicknell. Among those who attended the inquiry was Mr. J. Mackenzie, surveyor to the district council.

In the course of the evidence it was stated that the land proposed to be acquired was 10 acres 3 roods 9 perches in extent, the cost of which was £540 6s. 5d., which sum included all wayleaves for sewers, right of ways, etc. The existing filters at Oldfield had now been in operation for 20 years, and the lease of 21 years expired in March next. The north-easterly portion of the township was treated by the Altrincham Urban District Council's sewers. The Broadheath portion of the township had rapidly developed latterly, and sewers were urgently required. At the present time between 70 and 80 houses were being treated in a small temporary tank in a field, the effluent from the tank going into a ditch on the roadside, and eventually into Sinderland Brook. A memorial was presented to the Council on September 26th, requesting prompt attention to the existing state of things from residents along Sinderland-lane, Broadheath. It was proposed to abolish the existing outlet at Oldfield, and to continue the main sewer to the new outfall. The total cost of the works would be £4,984.

At the conclusion of the inquiry the inspector visited the site of the proposed outfall.

Private Bills in Parliament.—The time expired last week for depositing at the Private Bill Office, Westminster, and elsewhere, plans and other documents in connection with private Bills to be proceeded with during the ensuing session. The plans deposited number 368, made up as follows: Railways 58, tramways 14, miscellaneous 102, general provisional orders 75, and electric lighting provisional orders 114. The deposits on the corresponding day of last year for the session of 1898 were: Railways 61, tramways 15, miscellaneous 86, general provisional orders 85, electric lighting provisional orders 85; total, 332.

Some Annual Municipal Engineering Records.

WALSALL : FULHAM.

The borough of Walsall, according to the last annual report of Mr. R. H. Middleton, the surveyor, now has an area of 8,711 acres, with a population (1891 census) of 71,789. In September last the total length of sewers was over 60 miles 7 furlongs, and of surface-water drains 5 miles 3 furlongs 210 yards. The length of sewers and surface-water drains constructed and relaid during the year was nearly $\frac{3}{4}$ miles. Since September, 1892, forty-seven ventilating shafts have been erected, the adjoining manholes being closed in order to prevent the recurrence of complaints of offensive smells from the sewers. The shafts were distributed as follows: Against houses, twenty-four; into factory chimneys, twenty; and in other positions, three. The number of private drains laid and connected to sewers from 1897 to 1898 was 125. We may here remark that Mr. Middleton again suggests that all hand-flushed closets should be supplied with an efficient flushing cistern. As regards the sewage farm, the precipitation tanks and filter-beds worked in a very satisfactory manner during the year, and good results were obtained. From the monthly returns of the rainfall, as recorded by the gauge fixed at the Brockhurst farm, it appears that the heaviest falls were experienced in May, when the total reached 5.22 in. Rain fell on twenty-one days, the fall recorded on the 22nd day of the month being 1.25 in.

Streets repairable by the corporation in September measured over 64 miles. The number of loads of materials used and refuse, &c., removed during the past municipal year were as follows: Broken stone, 5,301; gravel, 116; broken cinders, 2,526; fine gravel and binding, 1,466; rough ashes, 1,848; water, 25,966; refuse and street sweepings, 11,582; other materials, including pitching, 3,064. Materials used by contractors are not included in the foregoing. In connection with footpaths, the quantity of paving executed and materials used were: Blue brick paving, 3,817 square yards; flagging, 781 square yards; sett paving in crossings, 1,344 square yards; kerb, new and relaid, 2,128 lineal yards; gutter, 2,454 lineal yards; ashes used on roads and footpaths, 1,769 loads; and ashes used during frosty weather, seventy-nine loads. In addition to the above the following work was carried out: Ashed footways, 765 square yards; blue brick paving, 5,331 square yards; new kerbing, 2,311 lineal yards; new gutters, 2,131 lineal yards; and new asphalt, 138 square yards. Some 4,614 super. yards of asphalt were retopped. At the end of the period under review the total number of gas lamps in the borough, exclusive of those supplied by meter, was 1,183; the cost of lighting and maintaining 1,120 of these being £2 7s. 6d. each; fifty-seven others cost £4 2s. each, and the remaining six £5 16s. each. A sum of £360 is annually spent on electric lighting. This year the number of plans of new buildings approved was 811, as against 677 in the preceding twelve months.

It is interesting to note that the Local Government Board have given their sanction to the first instalment of a scheme for the surface-water drainage of the town, and the preparation of the plans and contract is already in hand. Plans have also been prepared for the construction of three underground conveniences, and instruction given for the necessary application to be made to the Local Government Board for powers to borrow money in order to carry out the work. In addition to these estimates and plans have been prepared for the sewerage of the northern part of the borough, and they are now under the consideration of a committee. Additional stabling and a new depot are also proposed. The rubbish and night-soil department during the year dealt with 24,255 tons of rubbish and 4,756 tons of night-soil, at a cost, including the usual expenses of maintenance, of £3,281. This is equal to an average cost of removal per ton of 2s. 3 $\frac{1}{2}$ d. It may be mentioned that the Streets Committee recently gave their consideration to several schemes for providing a refuse destructor; but efficient tips have since been found, and it has been decided not to erect one for the present. An inventory taken of the horses, carts, implements, stock and furniture in the borough surveyor's department states that there are twenty-seven horses, of a value of £879. The carts, street cleaning machines and harness are valued at £685; the steam engines and machinery at £569; tools, timber, stores, iron-work and loose stock at £199; sanitary pipes and kindred materials at £46; office furniture at £200; and the stock of market timber at £225.

Mr. Charles Botterill, surveyor to the Vestry of Fulham, has presented the twelfth annual report of works carried out in his department. The area of the parish is 1,700 acres, the area of foreshore 56 acres, and the area of tidal waters 99 acres. There is a population of 120,835, for which there are some 18,249 houses. The rateable value of the parish is £642,564. Carriageways measure about 551 miles, and footways nearly 98 miles, there being only 7 miles of public footway without carriageway. Since the year 1886, it may be mentioned, the number of new streets made up and taken over has been 281, these having a total length of 25 miles 2 furlongs 131 yards. Drainage plans submitted to the vestry during the past year have numbered 813, and an in-

creasing amount of "sewer" portions of combined drains have been laid by the latter. This heavy liability, amounting to an annual expenditure of about £3,000, is one (the surveyor thinks) which should never have fallen upon the authority. The work of maintenance, Mr. Botterill feels sure, will be considerable, as the works are nearly all within enclosed premises, over which very little purview can be exercised. Cast-iron ventilating shafts upon the walls of houses, 6 in. by 4 in. in section, have been erected by consent of the owners in various parts of the parish, making a total of 172 shafts erected since March, 1886. Good results, we are told, have been obtained, and wherever a shaft has been supplied complaints of sewer emanations in its immediate neighbourhood have ceased. The difficulty in obtaining consents is in many cases insuperable, and in most cases difficult, involving a good deal of correspondence.

Reference is made to a conference of delegates invited by the Hammersmith Vestry from the various parishes and riparian authorities from Richmond down to Wandsworth, with a view to considering the expediency of constructing a lock and weir across the Thames at a point somewhere between Putney and Wandsworth bridges. A meeting took place, at which Fulham was represented by four delegates, including the clerk and surveyor. Mr. E. Pritchard, of Westminster, was engaged to draw up a report, which he did, and presented it to the conference on October 8, 1897. According to his instructions the site reported on was by Broomhouse Dock, which did not appear to the Fulham representatives a suitable position, and on their initiative, after a view of the river at low water had taken place, a further report was submitted by Mr. Pritchard, showing the site to be below Wandsworth Bridge, at a point between the Vestry's Town Mead Wharf and the West London Extension Railway bridge. This was thought to be better, and reported upon as less expensive, and unanimously adopted by the conference at a meeting held in November, 1897. As to the final outcome of the scheme, remarks Mr. Botterill, prophecy would be futile, but the desirability of the ponding of the river between the points mentioned cannot be questioned. The conference is still at work, and hopeful of a satisfactory result.

The process of night scavenging continues to be a success (although it has been found desirable to slightly increase the number of sweepers to obtain this), and the parish has now established for itself quite an enviable reputation among the drivers of vehicles, who naturally appreciate the cleanliness of the roads in the early morning and the attention which is also given to the work of sanding in frosty weather. Wages paid to the vestry workmen amounted to £15,615 in the year covered by the report, an average of £300 6s. weekly. In connection with the removal of dust, some 27,356 loads have been dealt with, the average loads per horse being 3887. The daily cost of horse and cart hire has been 6s., so that the cost of each horse and cart per load works out at 1s. 6 $\frac{1}{2}$ d. The wages per load were 1s. 9d., and the cost of tip or barge per load 2s. 3d. For the work of street cleansing and slopping the following staff and plant are engaged: Seventy-four day and twelve night scavengers, thirty horses, eight horse brooms, eight horse scrapers, eighteen orderly hand-trucks, six sanding machines, thirty-five slop-carts, twenty slop-carts, twenty-six water-vans, and two water-carts. There are about 2,500 gullies in the parish.

ELECTRIC LIGHTING IN COLCHESTER.

On Thursday evening last a new system of electric lighting, which has been laid down by the Colchester Corporation, was formally inaugurated, and a number of shops in the town were supplied with current for the first time.

The electric light station is centrally situated, at the junction of Osborne and Stanwell-streets, near St. Botolph's station. It is a large red-brick building with white facings, divided, under one roof, into a boiler-house, a battery-house and an engine-house. Mr. Goodyear, the borough surveyor, is responsible for the very suitable design, and the work has been well carried out by Messrs. Grimwood & Sons, of Sudbury. All the appointments are of the most approved pattern, and ample room has been left for a developing business for the enterprise on the corporation's part is essentially a business one, animated by no little public spirit. In the boiler-house are two Davey Paxman economic boilers of 200 horse-power nominal. They are lagged with asbestos and cased with enamel tiles. The arrangements for feeding the boilers are in duplicate, and there is a large condenser-pit in which the waste steam is returned to the boilers. In the engine-house, which immediately adjoins, are three 300 horse-power Penche engines coupled direct to the dynamo of 250 amperes at 250 volts. The dynamo is each capable of supplying 2,000 8 candle-power lamps. It may be mentioned that the corporation intend to, as far as possible, utilise the works during the hours of daylight for supplying motive power, and already several orders have been received in this connection.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XXII.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

TOWN ROADS.

When it is found that the traffic in a road has so increased as to render it more economical and more advantageous to the public convenience, as well as to that of the residents in the road, to provide it with some harder and more durable surface than macadam, the roadway is then usually pitched with stone, paved with either wood, asphalt, brick or other suitable material.

As in the case of macadamised roads, a good and properly constructed foundation is absolutely essential in order to carry the weight of the traffic, the surface material of the roadway being regarded more in the light of a veneer to withstand the wear of the traffic and to preserve the foundation underneath.

The best foundation for paved roadways is that composed of cement concrete. This is prepared in various proportions upon "bankers," or boarded platforms, as follows: Four parts of broken stone or brick are mixed with two parts of clean sharp sand and one part of Portland cement. After being turned over twice in a dry state water is added from a watering-pot fitted with a rose, and the mixture again turned over twice to its wet state. Being thoroughly mixed, it is at once placed in the excavation prepared for the foundation, consolidated by ramming, brought to the proper level, and the surface finished with a shovel. Wood pegs are usually inserted in the roadway surface to guide the workmen in attaining the required contour and heights. The concrete should be in position within a quarter of an hour of the time of mixing.

In Liverpool another method is adopted for laying in this foundation; it is that of the *béton* horizontal wall or slightly cambered arch. Mr. H. Percy Boulnois, formerly city engineer, Liverpool, has described this method as follows*—
"The ground having been prepared in the usual way, and the channel and kerb stones fixed in position, a stratum of stones (which should by preference be of a non-absorbent character), broken so as to pass all ways through a 3-in. ring, is spread evenly over the surface of the ground, and upon this is placed a layer of cement mortar, mixed, in the proportions of one of Portland cement to six of fine, sharp, clean gravel, in the method to be described hereafter. Upon this layer of mortar is placed another layer of broken stone—the whole of the stones in each layer to be thoroughly watered while the work is proceeding—and this stone is forced into the interstices of the first layer by the use of flat beaters of wrought iron weighing 10 lb. each, shaped like square shovels, with handles at an angle of 35°.

"This process is repeated until the proper level and contour is reached, and the surface is finished off parallel to the exact curvature of the carriageway. The foundation thus prepared is left until the concrete is sufficiently set or hardened to receive the pavement, which, if possible, should not be less than ten days, although this period may be shortened where the exigencies of the traffic render it imperative by strengthening the proportion of cement to the gravel, care to be taken in all cases to periodically water the surface of the concrete to assist the ultimate hardening, and in very hot weather it is advisable to cover the surface of the concrete with old cement bags thoroughly saturated with water.

"The proportions of broken stone, gravel and cement used in such a concrete are as follows:—

"Before Mixing.—Broken stone, eight parts; gravel, six parts; cement, one part.

"After Mixing.—Broken stones and gravel, mixed together, seven parts; cement, one part; three parts of gravel having been expended in filling the interstices of the stones.

Another description of foundation is that known as "bituminous concrete"; it is made as follows:—

The ground is excavated to the required depth and contour, and broken stone as used for macadam is laid in for a depth of from 6 in. to 9 in., and levelled and rolled. A boiling mixture of pitch and tar, or creosote oil, is next poured over the surface to fill all interstices, and a thin layer of stone (broken small) is then spread and well consolidated by rolling. The cost per square yard of bituminous concrete foundation in Liverpool, 6 in. deep, including all charges, is about 3s. 6d.

STONE PAVEMENTS.

A pavement of granite sets, laid upon a good cement concrete foundation, makes the most durable carriageway that can be constructed, and is particularly suited to streets of heavy traffic. It can be used upon all ordinary gradients, is suited to all classes of traffic, and affords ease of traction and a very fair foothold to horses. Also, it is easily cleansed, and creates the minimum of dust and mud.

The objections to this class of pavement are that it becomes

greasy and slippery under certain atmospheric conditions and that the incessant noise from the traffic in any busy thoroughfare so paved is a great inconvenience to tradesmen and others. It is also considered that the jar upon the legs and hoofs of horses is injurious to them.

Granite sets of large dimensions (6 in. to 8 in. wide by 10 in. to 20 in. long by 9 in. deep) were at first employed, but subsequent experience has shown that narrow sets, about 3 in. in width, are much to be preferred and afford a much better foothold to horses. The noise nuisance may also be lessened by running the joints with asphaltic composition instead of ordinary grouting.

The following useful table, given by Mr. H. Percy Boulnois,* gives the sizes of pitchers now in general use, and also shows the number of square yards that 1 ton in weight of the different sizes of sets, cubes and blocks will cover.†

Stone.	Depth × Width × Length.	Area in square yards which 1 ton will pave.
Sets	5 in. × 3 in. × 5 to 7 in.	45 square yards.
"	5½ in. × 3½ in. × "	43 "
"	6½ in. × 3½ in. × "	36 "
"	7½ in. × 3½ in. × "	31 "
Cubes	3½ in. × 3½ in. × 3½ in.	67 "
"	3½ in. × 3½ in. × 3½ in.	62 "
"	3½ in. × 3½ in. × 3½ in.	58 "
"	4 in. × 4 in. × 4 in.	54 "
Blocks	4 in. × 4 in. × 6 in.	36 "
"	4 in. × 3 in. × 3 in.	54 "
"	5 in. × 3 in. × 3 in.	44 "
"	6 in. × 3 in. × 3 in.	37 "
"	6½ in. × 3½ in. × 3½ in.	325 "

The suitable width of a stone is to some extent regulated by the size of the horses' hoof, about 4 in. being the maximum. A depth of 7 in. is found sufficient for stability under any class of traffic, and the length should be such as to properly break joint with the adjoining stones. If too long the stones are apt to tilt and work loose. The stones should be well and uniformly dressed, so as to make as close a joint as possible, and should not be allowed to vary but very slightly from the specified sizes. The finer the joints the less will be the noise produced by traffic, and the wear will also be reduced to a minimum. In good work the sets are laid upon a cushion bed of fine sand ½ in. in thickness, so as to provide an elastic bed, and to convey the pressure equally to the foundation.

In regard to the cleaning of old sets for re-use, Mr. H. Percy Boulnois, when city engineer of Liverpool, found that the expense of cleaning off the grouting of bitumen, or cement, by hand with the set-cleaner's hammer cost 10½d. per square yard, as compared with 407d. per square yard when the old sets were boiled in a pitch boiler with creosote oil heated to about 265° deg. Fahr.

Local circumstances often determine the class of stone to be used as paving material, but care should be taken that the stone selected should be hard and durable, and not apt to wear slippery, or brittle. The hard igneous and metamorphic rocks are the best for pavement sets where the traffic is heavy, but where comparatively light millstone grit and other hard sedimentary rocks are used. Carnarvonshire syenite is one of the most durable materials that can be used for heavy traffic, and most of the granites are also largely used. Of the latter, the Balbestic granite is considered the best.

A pitched roadway, consisting of 7 in. by 3 in. Norway granite sets, laid on 6 in. of Portland cement concrete, costs about 17s. per superficial yard in the neighbourhood of London.

Penmaenmawr stone has been much used in the North, but was discontinued in London owing to its slipperiness. It is a hard and durable stone, but wears smooth and is noisy.

Aberdeen blue granite is preferred in London to either Gnersey or Mountsorrel, as it retains a rougher surface, but wears faster. Colonel Haywood's observations showed that in London the wear of Aberdeen granite pavements was from 14 in. to 23 in. per year, whilst the wear of Penmaenmawr and Carnarvonshire sets in the city of Liverpool, under heavy traffic, is said to seldom exceed 02 in. per annum.

The cross-section of a paved street should have a rise to the crown of one-sixtieth the width of carriageway.

Oidbury.—An inquiry has been held, on behalf of the Local Government Board, respecting the council's application for sanction to borrow £3,500 for purpose of sewage disposal.

* "The Municipal and Sanitary Engineers' Hand-Book" (Spots).
† This, of course, will vary with the specific gravity of the stone.

* "The Construction of Carriageways and Footways," by H. Percy Boulnois, C.E. (Biggs & Co.).

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.

Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

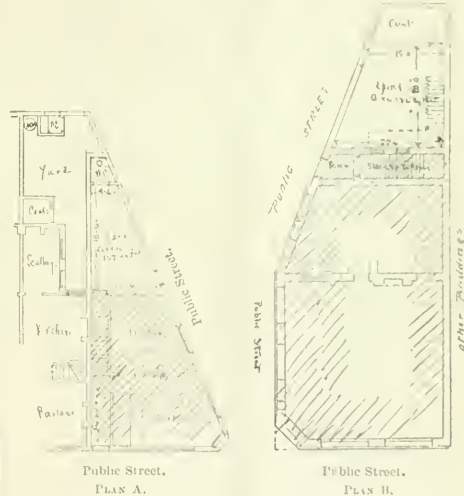

Surveyor. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a non du plumo.

THE MAINTENANCE OF MAIN ROADS: SEA WALL. — The House of Lords, on the 25th November, confirmed the judgment of the Queen's Bench Divisional Court in the case of *Sandgate Urban District Council v. Kent County Council* (noted at p. 517 of vol. xi.), and overruled the decision of the Court of Appeal reversing that judgment. It will be remembered that this was a special case stated by the arbitrator appointed by the Local Government Board (Mr. Thomas Codrington, M.L.C.R.). The points in dispute had reference to the liability of the county council to contribute to the maintenance and repair of part of the main road between Folkestone and Hythe. In the year 1883, when it became a main road, the condition of things was as follows: Commencing at the east end or Folkestone boundary, there was private property lying between the road and the sea up to the coast-guard station. Adjoining the coast-guard station there was a piece of ground, formerly foreshore, which had been leased by the local board, and on which they had erected a platform paved with concrete, and faced on the sea or south side by a concrete wall, to protect it from the sea. This was sublet by the local board for the purposes of a bathing establishment. Westward of this, and between the carriage road and the sea, was what was then, and still is, known as the "Esplanade." It had been made at various times, and was of various widths. Beyond that there was a piece of land between the esplanade and the carriage road, which was laid out ornamentally and planted with shrubs. As early as 1867 the local board had repaired and improved it, for the purposes of a public promenade, by regulating the width, kerbing and paving the same throughout. Throughout the entire length it was faced by a sea wall, the outer edge of the esplanade being on the top of the sea wall. This sea wall had been erected at different times and under different circumstances, and besides protecting the esplanade and ornamental grounds from the inroads of the sea, it helped to protect parts of the carriage road also. By the award (some items of which were in favour of each party) the county council were ordered to pay £6,188 to the district council in respect of the costs incurred in repairing, maintaining and improving the road for four years, ended March, 1895. The Queen's Bench Division having confirmed the award, both parties appealed. The Court of Appeal reversed the confirmation and directed the arbitrator to find for the county council on all points. From that decision the district council appealed to the House of Lords, with the result already stated. In the Court of Appeal Lord Esher indulged in some extremely harsh criticism of the arbitrator, criticism in which the majority in the House of Lords by no means concurred. The Lord Chancellor said that, in his opinion, scant justice had been done to the arbitrator, and those who had criticised him had not sufficiently considered the complex nature of the problem which he was called upon to determine. It was part of the arbitrator's task to deal with a part of the road which was close to the sea. He had found that this part was part of the main road. It was certainly within the arbitrator's jurisdiction to award a contribution in respect of the maintenance and repair of this portion of the road. There was another portion, which, though not actually part of the main road, was necessary for its maintenance, because, if not maintained, the main road itself would be continually in a state of disrepair. The arbitrator was of opinion that what was so necessary for the support of the main road was itself part thereof. These and other questions the arbitrator had treated with great minuteness, and had not contented himself with the determination simply of the total amount to be paid by the county council, and had solved the problem put before him with great care and perfect accuracy. The award had been so divided into its several items that it was possible for the Court to consider each head of contribution on its own merits. One question of law, and only one, had been raised, with which he would afterwards deal; and on that also the arbitrator had afforded materials to enable the Court to put matters right. It was a remarkable fact that the arbitrator had so dealt with every one of the facts of the case that neither party had been able to suggest any omission of which he had been guilty. The arbitrator had conclusively determined against the county council that the road was part of the main road. But it was gravely argued that there was a construction which ought not to be held part of the main road, although if it were not there the road itself would be washed away. To his mind such a contention was absurd. It was common sense that where the obligation was to maintain and keep in repair it was the duty of the persons subject to that obligation to take steps which would prevent the road being washed away. Whatever was necessary for the road the local authority charged with its maintenance and

repair were bound to uphold. The arbitrator had also found that the esplanade was necessary to the road, and that there was a finding of fact with which their lordships were not entitled to interfere. The same observation was to be made in respect of the sea wall and of the groynes and as to the latter, he had been struck with the remarkable care with which the arbitrator had dealt with each groyne separately, so as to give the Court of Appeal the opportunity of discriminating between one item and another. The proposition had been advanced that nothing outside the road could be done, and that the road itself should be allowed to go out of repair every year. But that argument lost sight of the word maintain. The one solitary question of law was with respect to the annual contribution. But on that question also, in his opinion, the arbitrator had been perfectly right. There was no foundation for such an argument, and, in his opinion, the award was a perfectly good one, and the original judgment of the Queen's Bench was right.

QUERIES & REPLIES

BUILDING BY-LAWS: OPEN SPACE: CORNER PLOTS. — "Corner Plot" writes: (1) Model By-Law No. 54 requires the space at the rear of a domestic building to contain 150 square feet, and such space to extend laterally the entire width of the building and to measure across at least 10 ft. &c. This by-law seems difficult to apply to corner plots of land which are not square. The enclosed plan marked A is a case in point. Please say in what way the plan fails to comply, and whether it seems possible to erect a building upon such a plot to fully comply with the by-law; and do you know how the by-law is applied in other towns under similar conditions?

(2) Suppose the premises were made into a lock-up shop, would the same requirements as to space be necessary? The building is proposed to be two storeys and 25 ft. high half way up to the roof. (3) I also enclose a plan, marked B, in which the ground floor is intended for business, and the domestic part provided on the first floor, with the bedrooms on the second floor, the total height being over 35 ft. high. The open space at the rear contains 376 square feet. Does this plan comply with the By-Law No. 54; if not, why?

(1) See reply to "Urban," on p. 346 of vol. xiv. (Apr 11, 1898). The fact is that in framing this by-law originally adopted in 1888, the fact had been taken into account that it was not possible to literally comply with the by-law in the present case; that is, with the buildings as shown in the plan. And it must be remembered that unless by-laws themselves give the authority a discretionary power or discretion the authority are bound by the by-laws and cannot waive their requirements. (Lamb's "Public Health Acts," 4th edition, p. 266). (2) Yes, in my opinion. See the definition of "domestic building" in By-Law 1. (3) I do not think this plan complies with the by-laws, for the following reasons: (a) The open space is not 150 sq. ft. from any front or side wall above the level of the ground. (b) The plan is not clear, unambiguous, and unobjectionable. (c) The plan shows a coal receptacle shown. And although the area of the open space may be sufficient to compensate for the space occupied by this receptacle, the presence of the latter precludes compliance with the requirements that

the distance across the open space from the building to the boundary shall be 25 ft. (b) The open space does not "extend laterally throughout the entire width of such building."

LOCK-UP SHOPS.—"Assistant" writes: Can you oblige me by answering the following queries: (1) Have any legal decisions been given on the point of whether the conversion of portions of existing dwelling-houses (not erected under any by-law) into lock-up shops amounts to erecting a "new building" under the Public Health Acts, the remaining portions of the building being still used as a dwelling-house? If you know of any such decisions, please name them. (2) Would plans of a block of buildings, consisting of lock-up shops at front and dwelling-houses at rear (the houses being attached to the shops, but having no direct communication with them), be in accordance with the Model By-Laws as regards air space unless the amount of space required under these by-laws was provided at the rear of each lock-up shop, thus entailing an open space between back of shop and front of dwelling-house?

(1) The question whether the conversion would amount to the erection of a new building is a question of fact for the decision of the magistrates. I have not been able to find any reported cases in which this particular kind of building has been dealt with. Sec. 159 of the Public Health Act, 1875, provides that the conversion into a dwelling-house of any building not originally constructed for human habitation shall be considered the erection of a new building, but it does not provide for the converse case of the conversion of a dwelling-house (or part of a dwelling-house) into a building to be used as a shop, &c. (2) "Domestic building" is defined in the Model By-Laws as "a dwelling-house, or an office building, or other outbuildings appurtenant to a dwelling-house, whether attached thereto or not, or a shop, or any other building, not being a public building, or of the warehouse class." I think, therefore, that the by-laws as to air space applicable to new domestic buildings would apply to the lock-up shop, whether it be considered as a separate building or as an outbuilding appurtenant to the dwelling-house.

THE SEPTIC TANK SYSTEM AT EXETER.

A DEPUTATION FROM BEDFORD.

A deputation from the Bedford Town Council recently visited Exeter for the purpose of examining the working of the septic tank system, and the event has inspired a local scribe to perpetrate the following paragraphs:—

And it came to pass that certain elders of the city of Bedford journeyed unto Exeter, to look upon the cistern that digested that which the cloaca bringeth thereto. Whereat they marvelled greatly, and said unto the prophet whose device it was, "O prophet! Is it true that the microbes rend asunder base brooms and scrubbing brushes, bones, bottles, and date stones, so that they come to nought?" The prophet spake and said unto them, "Behold this dead dog, to which I attach collar and chain." And he placed it in the cloaca which passeth into the cistern that is called septic. But the elders said, "We are sceptic." Then did they tarry awhile, even for the space of five and twenty minutes. When they came to the mouth of the cistern whence issues the beverage that is called effluent, and they saw two links of the chain and nought of the dog, then did the prophet fill a cruse and say: "Drink! Let them all come!" And they all came and had some. Then they all with one consent said it was good, since which, in the words of that which is written, "they have used no other."

Just so, but, joking apart, it is well that councillors from this district have seen the system in operation. Theoretically, a committee of half a dozen ought to have been enough, but in a disputatious body the remainder would have probably wrangled and wasted money on needless experiments. Even this system, however successful it may seem to be, cannot be adopted without experiment. Some of the senators who have been to Exeter are still sceptical, and, since there is something to pay by way of royalty on the patents or its equivalent, let wholesome scepticism by all means be encouraged. Some of the more enthusiastic believers in the system are talking about an expenditure which is much larger than the amount Exeter has seen fit to ask for in the shape of a loan, even though the Exeter scheme included land and a good deal of sewerage as well.

ASSOCIATION OF BIRMINGHAM STUDENTS OF THE INSTITUTION OF CIVIL ENGINEERS.

At the meeting of this association, held in the Midland Institute, Birmingham, on Thursday last, the first of the special lectures arranged for the present session was delivered by Dr. A. Bostock Hill, county medical officer of health for Warwickshire, on "Some Observations on Sewage and Modern Methods of Treatment," before a large audience. The president, Mr. J. C. Vandrey, M.I.C.E., occupied the chair, and among others present were Messrs. J. E. Wilcox and S. R. Lowcock, past presidents; T. S. Stooke, J. S. Pickering, J. Garfield, R. Angel, H. P. Raikes, A. B. E. Blackburn, and Henry C. Adams, honorary secretary.

Dr. Hill, at the outset, showed how sewage varied according to the construction of the sewers—whether they were old or modern, whether they received the storm water, whether they were constructed on the separate system, or whether they received much manufacturing waste. The variations in quantity also depended largely on whether the sewers received the storm water. Speaking of the Birmingham Tame

and Rea sewage farm at Sattlely, he said it had for years been so overtaxed that it was no exaggeration to say that it might be taken as "an object lesson of how not to purify the sewage." If they did, as had been done on certain portions of the farm, waterlog the land, and turn it into a filthy morass and swamp by letting sewage stand on it for days, and even weeks, it was absolutely certain that purification could not take place. He submitted several analyses of sewage, and then proceeded to deal with his subject historically. He pointed out how the question of the treatment of sewage became important from the time of the appointment of the Rivers Pollution Commission, and went on to show how the old views with reference to the chemical treatment of sewage were false, both in theory and practice, and were only maintained in places into which the more advanced views had not penetrated. He dealt at some length with the disposal of sewage by the modern bacteriological methods, affirming that any system that was opposed to the principle on which the bacteria which produced resolution of the sewage depended was false and must fail.

A good discussion followed the lecture.

LONDON WATER SUPPLY COMMISSION.

The Royal Commission held their thirty-ninth sitting on Monday, at the Westminster Guildhall, under the presidency of Lord Jlandaff.

Mr. REGINALD E. MIDDLETON was recalled and further examined. In cross-examination he said that he had not constructed any large reservoirs or a masonry dam such as that proposed to be constructed by the London County Council on the Upper Wye. No doubt Sir Alexander Binnie's, Sir Benjamin Baker's and Mr. Deacon's experience was greater than his own. He dared say that the whole of the line between Wales and London had been levelled and surveyed by a large staff of engineers. The design of the Staines scheme of the Balfour Commission was that an average of 300,000,000 gallons per day should be taken from the Thames on condition of allowing a minimum of 200,000,000 gallons per day over Teddington weir. He was aware that when the Balfour Commission reported in 1891 the average consumption in the metropolis was 29.73 gallons per head per day, and that their idea was that in 1931 the consumption would be 35 gallons. It was quite possible that since that report of the commission the Chelsea company had increased their consumption per head per day by 9.6 gallons, the Kent by 1.51, the Lambeth by 3.18, the New River by .93, the Southwark and Vauxhall by 11.29, and the West Middlesex by 5.61. He did not think it would be safer to assume that the consumption in 1931 would be 40 gallons per head.

THE LATE MR. HENRY KNOWLES.

It is with regret that we announce the death of Mr. Henry Knowles, the head of the Albion Clay Company, Limited, the well-known firm of sanitary engineers, of Woodville, near Barton-on-Trent. Some time ago Mr. Knowles was seized with a paralytic stroke, from the effects of which he never fully recovered. Our readers scarcely require to be told of the success of the Albion Works, founded by the deceased gentleman, and of the many well-known sanitary manufacturers associated with the name of the firm. It should, however, be remembered that Mr. Knowles was the first to establish works in the provinces for the purpose of supplying the London market, so far as sanitary goods are concerned. Previous to the establishment of the Albion Works the needs of the metropolis in this direction were supplied entirely from works established there. The deceased gentleman, who leaves a widow but no children, was sixty-five years of age. The interment took place at Matlock, where Mr. Knowles was a large property and land owner.

Ottery St. Mary.—At the last meeting of the district council attention was drawn to the bad state of the roads leading from Ottery station to Tipton, with the two branches leading to Metcombe. On the suggestion of the surveyor it was decided to grant a sum of £50 to put the roads complained of in good condition.—Mr. Pope again brought forward the question of repaving the town, and moved that steps should be taken with a view to obtaining a loan in order to provide new pavements throughout the town. After some discussion, however, an amendment was adopted postponing the matter until a public meeting of ratepayers had been held to consider the matter.—A letter was read from the county council asking what steps had been taken with reference to the disposal of the town sewage. The chairman said the septic tank system impressed those members of the council who visited the works in Exeter very favourably, but the Local Government Board would only sanction it under conditions which rendered it more expensive than they at first considered. He suggested that the council should advertise for suitable schemes and plans, and offer a premium to the most acceptable. A resolution to this effect was proposed and carried unanimously.

Municipal Work in Progress and Projected.

Though news is at present rather scarce, we are able this week to publish details of several extensive municipal works, notably those at Gomersall, Runcorn, Wigan, Dudley, Manchester, Blackburn, Bolton and other places.

METROPOLITAN AUTHORITIES.

LONDON COUNTY COUNCIL.

The meeting of the county council on Tuesday was almost entirely occupied by the debate on the report of the Housing of the Working Classes Committee, which was left adjourned at the conclusion of the last meeting. It will be remembered that last week the council came to a decision with respect to the first two recommendations of the committee (in reference to rehousing), so they now had under consideration the third recommendation, which dealt with "housing" as distinguished from "rehousing." At the conclusion of the discussion this third recommendation was passed, but not before several amendments had been adopted, which made it read as follows: "That apart from the rehousing required in connection with clearance or improvement schemes, provided that no charge be placed on the county rate thereby, the council do approve of action being taken, under Part III. of the Housing of the Working Classes Act, 1890, with a view to the purchase of land and the erection of dwellings thereon, and also with a view to purchasing or leasing suitable houses, already or hereafter to be built or provided, for the purpose of supplying housing accommodation." The general question of the council's housing policy, it will be seen, is dealt with in our editorial columns.

Proposed New Fire Station at Wapping.—The Fire Brigade Committee recommended the council to agree to an estimated expenditure of £11,000 for providing a new fire station in Red Lion-street, Wapping. This was agreed to without discussion.

The Works Department.—On the reception of the report of the Finance Committee Mr. Westcott asked when the council might expect to have the statement of works executed by the works department for the half-year ended September 30th last, and whether it was true, as stated in a newspaper, that there had been a loss of £22,000 on the construction of the Lewisham sewer. Lord Welby, chairman of the Finance Committee, replied that the statement was ready, and would be presented next week, when the reports of the executive committees had been received. The statement would contain full information with regard to the Lewisham sewer.

Golders Hill Estate.—The Parks and Open Spaces Committee recommended the council not to let for private use the house and gardens included in the 36 acres forming Golders Hill estate, recently purchased with the object of adding it to Hampstead Heath. The committee suggested that the house should only be let as a refreshment house or for some other public purpose. After some discussion, in the course of which Mr. Shaw Lefevre pointed out that the loss to the council by making no use of the house or gardens would amount to about £1,000 a year, the recommendation of the committee was adopted.

Housing of the Working Classes.—The debate was resumed on the report of the Housing of the Working Classes Committee. When the council adjourned last week Sir Arthur Arnold had moved as an amendment to refer back to the committee their third recommendation, which was as follows: "That, apart from the rehousing required in connection with clearance and improvement schemes, the council do approve of action being taken under Part III. of the Housing of the Working Classes Act, 1890, with a view to the purchase of land and the erection of dwellings thereon for the purpose of supplying housing accommodation." Mr. Antrabus now seconded Sir A. Arnold's amendment, stating that he objected to the proposal of the committee on the ground that it committed the council to a general line of policy, instead of their being allowed to deal with each particular case as it came forward. A long discussion followed, in which Mr. Boulnois, M.P., Mr. Cohen, M.P., and Mr. Bencheroff supported the amendment, and Mr. Taylor, Lord Carrington, Mr. Dickinson, Mr. Phillimore, Mr. Lawson and Mr. Burns, M.P., spoke in favour of the recommendation. Eventually the council divided, with the result that thirty-six voted for the amendment and seventy-eight against. Sir J. Dickinson-Poynder, M.P., then moved a further amendment, that the words "in anticipation of" should be substituted for the words of the recommendation "apart from" the rehousing required. This amendment was also rejected, but, on the motion of Lord Monkswell, another amendment recommending the addition to the recommendation of the words "provided that no charge be placed on the county rate thereby" was adopted, as was a further one by Mr. Campbell, which giving power for the purpose of purchasing or leasing suitable houses already or hereafter to be built or provided. When the recommendation as amended was put from the chair a division was demanded, but as the "noes" failed to appoint tellers the amended recommendation was declared carried and became the finding of the council.

COURT OF COMMON COUNCIL.

The lord mayor presided, on Thursday, at a meeting of the Court of Common Council. It was mentioned that the Streets Committee had made an application to the Board of Trade asking that department to institute a provisional inquiry into the condition of Ludgate-hill station.—The committee had also agreed that a conference on the subject of the granting of a telephone license to the corporation should be held at some convenient date at the Guildhall, and that the local authorities within the London telephone area should be invited to attend. Permission to hold the conference in the Guildhall was subsequently given, it being left to the lord mayor to fix the date.—A petition from a number of ratepayers in and near Salisbury-square, Fleet-street, asking that the existing stone carriage-way pavement should be replaced by either wood or asphalt, was referred to a committee.—Authority was given for the expenditure of £200 upon a small building at Ilford for the storage of carts and fodder, and of £444 for repointing and repairing the boundary walls and fences at the City cemetery.—Relative to the improvement in Upper Thames-street, a letter was read from the London County Council intimating that they were prepared to pay their promised contribution of one-third of the net cost, amounting to £11,413, if the corporation would undertake to complete the improvement by setting back the remainder of the property in front of No. 36 Upper Thames-street at the expiration of the lease. The court at once gave this undertaking.—They decided to accede to certain requests of electric lighting companies for sanction to their (the companies') intended applications for provisional orders for the supply of electricity within the City.

METROPOLITAN ASYLUMS BOARD.

The managers met on Saturday, at the County Hall, under the presidency of Sir E. Galsworthy. A letter was read from the Local Government Board referring to the managers' application for an order authorising the borrowing of a further sum of £2,413 in respect of alterations and additions to the South-Western Hospital, stating that they observed that there had been similar irregularities on the part of Mr. Aldwinckle, the architect, as in the creation of the Brook Hospital, and that they would therefore omit from the order the amount which, under ordinary circumstances, would be due to him as commission on the cost of certain works—namely, £62. The chairman moved that a copy of the letter be forwarded to Mr. Aldwinckle, but it was moved as an amendment that the letter should be referred to the General Purposes Committee for consideration and report. It was, it was stated, a matter of considerable importance. The Local Government Board were taking very strong action in relation to the excessive expenditure, and whenever that department intervened it had always been in the interests of the public. Seeing that Mr. Aldwinckle was engaged in connection with the North-Western Hospital, it was thought that they ought to consider the question of his further employment by the board. The amendment was not seconded, and the chairman's motion was accordingly adopted. A long letter was read from Mr. Aldwinckle in reference to the Local Government Board's report. Although not agreeing with all the conclusions at which Mr. Knollys, the inspector, arrived, he (Mr. Aldwinckle) could not, he said, fail to recognise the inspector's manifest desire to be fair to him. He had carefully classified all the items which were authorised by or executed with the knowledge of the committee, leaving only £12,000 to be accounted for. Only two items, £655 for tank flooring and £903 for ward stoves, were mentioned as having been ordered by him without any justification whatever. There was no suggestion that there had been any waste of public money, and no complaint that the managers had not received full value for the expenditure. He was glad to have the inspector's opinion that in acting as he did he was actuated by the desire to produce a hospital of the best possible type and fitted with all the newest improvements. He did not find in the Local Government Board's letters any evidence of the fair spirit that was displayed by Mr. Knollys. The expression, "grave irregularities," should not be used in relation to an architect of his professional standing, especially as he had done so much important public work, chiefly under the control of the Local Government Board, simply because some items had been ordered by him without authority, while no suggestion was made that public money had been wasted thereby. It was admitted on all hands that the Brook Hospital was a good hospital, completely finished, and in all respects worthy of London. He was, and always should be, proud of being its architect. It was resolved to enter the communication on the minutes, to forward a copy to the Local Government Board, and to circulate it generally.

VESTRIES AND DISTRICT BOARDS.

Bermondsey.—The vestry at the meeting on Monday were recommended by the Sanitary Committee to construct an underground convenience at the junction of Galswell road and Southwark Park-road in accordance with plans prepared by Mr. F. Sumner, the surveyor, at a cost of £1,800. It was resolved to issue advertisements inviting tenders for the work.

—A further report was submitted by the committee in reference to the proposed abattoirs for the county of London. The committee stated that there were only four slaughter-houses in Bernondsey, that these received efficient supervision from the vestry's staff, and that they were not in any sense detrimental to public health.—The Sanitary Committee also announced that intimation had been given of three other sites available for the housing of the working classes, and that information to this effect had been conveyed to the London County Council.—On the recommendation of the Electric Lighting Committee it was resolved to inform the London Electric Supply Corporation that the vestry disapproved of works of laying low-pressure distributing mains on both sides of certain thoroughfares. It was also decided to oppose the application of the County of London and Brush Provincial Electric Lighting Company for a provisional order to supply the electric light in Bernondsey, and to co-operate with Hammersmith in opposing certain of the recommendations of the Parliamentary joint committee on the supply of electrical energy.

Hampstead.—At a meeting of the vestry, on Thursday, the General Purposes Committee reported that they had fully considered the memorial presented by the deputation consisting of the metropolitan superintendent of the National Telephone Company, Limited, and a number of residents of the parish requiring telephonic communication, in support of the company's application to the vestry for permission to lay underground wires in the parish, and, having in view the resolution recently passed by the vestry on the subject—viz., "That no further action be taken at present in the matter of the agreement proposed to be entered into by the vestry with the National Telephone Company on the subject of underground mains"—they saw no reason for departing from the resolution. They therefore recommended that the National Telephone Company should be informed accordingly. The report was adopted.—The surveyor was instructed to prepare an estimate and apportionment of the cost of making-up a new street, known as The Grange, Parkhill-road, at the cost of the owners of the property abutting on the street.—The Works Committee recommended that the making of the roadway over the Metropolitan Railway bridge in West End-lane should be completed by the laying of extra broad paving northwards to Blackbarn-road and southwards to Broadhurst-gardens, at an estimated cost of £150. The recommendation was agreed to.—The Trees and Open Spaces Committee presented a report recommending that, without in any way pledging themselves to the proposed scheme put forward by the London County Council on the subject of the maintenance of the small open spaces in the county, the vestry do appoint a representative to attend the conference with the council on the question. The recommendation was adopted.

Islington.—At the last meeting of the vestry Mr. W. F. Dewey, the vestry clerk, read a letter from the London County Council stating that the Building Act Committee had had under consideration the question of district surveyors employed in connection with the London Building Act, 1894. The committee had come to the following conclusions: That the suggestion that all district surveyors should devote the whole of their time to the duty of district surveying could not be carried out, but that Parliamentary powers would be required for the purpose. At the same time the committee pointed out that the practice was being gradually introduced as fresh appointments were made, and that thirteen district surveyors had already been appointed on that basis. With regard to the question of paying district surveyors by salary, the committee were not prepared to alter the existing system of payment by fees until further experience had been gained. As to the proposal that an office should be provided at the local vestry hall, the committee expressed the opinion that it had much to recommend it, but that they did not see their way to recommend the council to take any steps in the matter, as unfortunately the districts did not coincide with the local government areas, and Parliamentary powers might be required before the suggestion could be carried out. The committee added that notices would in due course be issued to the district surveyors, for posting up in their offices, intimating that they were not concerned with the question of drains, water-closets and other sanitary matters which are under the control of the local authorities. The vestry decided to enter the communication on the minutes.—A letter was read from the Hammersmith Vestry in reference to the recommendations made in the report of the Parliamentary Joint Committee on Electricity Generating Stations. In connection with these the Hammersmith Vestry expressed the opinion that the local authority within the area of supply should have the power to decide the route along which the mains are to be laid, as well as the power of themselves breaking up and reinstating the streets. The vestry strongly objected to the second and third recommendations of the joint committee, and had resolved in the event of any legislation being brought forward on the subject to take up a strong position in opposition, and to use every endeavour to retain its power of veto both in regard to wires for the purpose of traction and applications for provisional orders. In conclusion, the Hammersmith Vestry asked for the co-operation of Islington, with a view to combined action being taken in the matter. It was decided to refer the letter to the Parliamentary Committee for consideration and report.—The vestry clerk submitted a memorial

from the National Telephone Company in regard to the retention of overhead telephone wires in the parish, announcing at the same time that a number of letters had been received from local subscribers to the telephone system protesting against the proposed action of the vestry in regard to the overhead telephone wires. It was decided to refer the matter to the Works Committee. The intended action in question was referred to in a report of the Works Committee, who recommended the vestry to instruct the solicitor to at once institute proceedings against the National Telephone Company for failing to comply with the by-laws made by the London County Council in regard to the length of the spans of overhead wires. The report was, however, withdrawn for further consideration of the question.—The amended motion of the Electric Lighting Committee in reference to the proposed extensions of the electric light station, at a cost of £22,000, was again discussed for a considerable time. It was eventually decided, by forty votes to nine, to adopt an amendment by Mr. Varley referring the report back to the committee with instructions to advertise for builders willing to tender for the carrying out of the work.—The Works Committee reported that they had considered a letter from Mr. H. C. Godtray, 42 Finsbury-square, intimating his intention to apply for powers to construct a light railway from Archway-road, through Finchley to Whetstone, and asking the vestry to request the London County Council to construct a line between Highgate Archway and the metropolitan boundary, so as to afford a direct route of communication. The committee recommended the vestry to again approach the county council on the matter, but on the report being reached the chairman obtained permission to withdraw it without giving any reason for so doing.—The vestry postponed until the next meeting the consideration of various recommendations in respect of wood and stone paving works, involving an expenditure of several thousands of pounds.—The tender of Mr. H. L. Holloway, Union Works, Deptford, amounting to £14,630, was accepted for the enlargement of the Horsey-road baths.—The Works Committee recommended the acceptance of the tender of Messrs. Steavenson & Co. for the supply of sixty-two single bins at £4 15s. each.

Poplar.—The Finance Committee recommended, at a meeting of the district board of works on Tuesday, that an application should be made to the Public Works Loans Commissioners for a loan of £5,000 for the carrying out of sundry sewer and paving works and the purchase of land for public improvements, already approved by the board. The recommendation was agreed to.—The Dust Destructor Committee again submitted their report, which was adjourned at last meeting, in reference to application of forced draught apparatus at the refuse destructor. They recommended that the offer of Goddard, Massey & Warner, which was given in full in the last issue of THE SURVEYOR, be accepted without prejudice, and an order be given to the contractors to proceed with the work. The recommendation was adopted.—On the recommendation of the Sanitary Committee, the board being of opinion that a proper system of inspection and the marking of meat would be sufficient, decided to disapprove the scheme of the Public Health Committee of the London County Council for the abolition of private slaughter-houses in London and the establishment of public abattoirs.—It was decided to refer the question of the provision of an underground convenience, near Gladstone statue in Bow-road, for women to the Works Committee for consideration.—On the motion of Mr. J. R. Smith the following resolution was adopted: "That the surveyor prepare statement of cost that would have been incurred for shooting dust at contractor's shoots, as compared with cost of shooting same at the destructor, from May 25 to November 25, 1898."

Rotherhithe.—A deputation from the London Butchers' Trade Society waited upon the vestry, at their meeting on Tuesday, to urge them to oppose the proposal of the Public Health Committee of the London County Council to establish public abattoirs in London and to abolish private slaughter-houses. The matter was referred to a committee for consideration and report.—A letter was read from the secretary of the Union of Women's Liberal and Radical Association of the Metropolitan Counties, enclosing a copy of a resolution passed by the executive committee of the association, to the effect that the union considers it should be made incumbent upon all vestries to provide at least one free compartment for women at each of their public conveniences.—The County of London and Brush Provincial Electric Lighting Company, Limited, also wrote stating, in reference to the formal notice served upon the vestry in July last, of their intention to apply during the ensuing session of Parliament for a provisional order covering the district of Rotherhithe, that they had duly made application to the Board of Trade, and would therefore be glad to receive the vestry's consent to the grant of an order, and enclosed a pamphlet setting forth the reduced rates adopted by the company for the supply of electric energy. They also stated that they were prepared to enter into a contract with the vestry for the supply of current for all-night public lighting, at an uniform rate of 3d. per unit; and that they would agree that the vestry should have the right to purchase the undertaking, as applied to the district, at any time after the expiration of seven, fourteen or twenty-one years from the date of the order, on terms to be mutually agreed upon. The communication was referred to the General

Purposes and Works Committee for consideration.—A further communication was read from the secretary of the Clinical Research Association, Limited, suggesting that it would be more economical for vestries to join the association than to undertake to pay a yearly subsidy to the support of the municipal bacteriological laboratory which the London County Council propose to establish. The letter was referred to the Sanitary Committee.—On the motion of Mr. Vezey the vestry resolved "to express its satisfaction with the action taken by the London County Council, at its meeting on the 1st November, in relation to the question of a future reliable supply of water to London, and trusts its efforts will have the sanction of Parliament at an early date—as the matter is too urgent to admit of delay." They also decided to send a copy of the resolution to the London County Council; to Mr. Cumming Macdonald, M.P., urging him to give the matter his support in Parliament; and to each London vestry and district board, urging them to take similar action.—On the recommendation of the General Purposes and Works Committee it was decided to accept the tender of Messrs. Boswell & Son, at £50 10s., for the purchase of the vestry's vans and gig.

Shoreditch.—The Vestry, on Tuesday, discussed a report by the Finance Committee covering a statement made by the vestry clerk as to his reasons for not having signed the electricity accounts and his inability to sign them at the present time. As a result of the report, which is given in another column, and after hearing an explanation of the accountant, the committee had resolved to strike out of the Board of Trade return the words "To balance from last account, £1,281 19s. 6d.," as printed in the annual report, and to also strike out "By deficiency of income, £1,255 8s. 2d.," as given in the same report, leaving the balance to be carried forward as £807 12s. 2d.; and to also omit the words "present available surpluses." This report was adopted. In connection with this matter the accountant had asked for instructions as to the sale of copies of accounts in the amended form now resolved upon, and it was decided to sell the unneeded copies. It was also decided to include the accounts for wiring and fitting in the Board of Trade return. The Finance Committee further recommended that, in view of the statements made that the electricity and dust destructor accounts had been "cooked," a firm of chartered accountants should be instructed to audit and report on the accounts for the year as presented to the vestry. After a long discussion an amendment was adopted referring this recommendation back to the committee for further consideration and report.—The vestry clerk reported the receipt of a letter from the Hammersmith Vestry relating to the recommendations made by the Parliamentary Joint Committee on the supply of electrical energy in the last session of Parliament. That vestry opposed those recommendations, and it was resolved to refer the matter to the Lighting Committee for consideration and report.—A letter was read from the Clinical Research Association pointing out the work of the society in regard to the bacteriological examination of material from cases of infectious diseases.—It was announced by the Lighting Committee that they had considered a report by the chief engineer on the quotation of the British Insulated Wire Company for the supply and laying of conduits in the Haggerston district, at a cost of 10s. 5d. per yard. On the recommendation of the committee it was decided to accept that company's tender. It was resolved, at the suggestion of the Works Committee, to inform the Hammersmith Vestry that a letter had already been forwarded to the London County Council protesting against the proposed by-laws for controlling the fixing of lamps overhanging the public footways.—The Works Committee recommended that the carriageways of Hoxton Market should be asphalted and the footways relaid with York stone, at a cost of £500. The recommendation was adopted.—With reference to the proposal to erect a public clock-tower in the High-street, the Works Committee reported having considered various designs submitted by Mr. J. Rush Dixon, the surveyor. The committee were of opinion that the design exhibited in the vestry hall for an iron clock-tower, 30ft. high, with a dial 2ft. in diameter, would be the most suitable, the cost being estimated at £270. The committee recommended the vestry to adopt the design and carry out the work.—A report had been submitted to the Works Committee by the surveyor on the cost of sewer works carried out by the vestry without a contractor. It appeared from the report that the sewer works in Agrave-street had resulted in a nett saving of £122 on the estimate of £841, and on those in Grange-street a saving of £150 had been gained upon an estimate of £613.—The following tenders were considered for providing temporary flooring for the first and second class baths, the figures in parenthesis being those for the second-class baths: Messrs. Thomson & Son, £614 (£260); Taphorne & Co., £571 (£254); E. Houghton & Son, £542 (£240); J. Dolman & Co., £518 (£237); Walter Lawrence, £519 (£235); C. Gray Hill, £490 (£210); and the General Builders, Limited, £440 (£190). The tender of the latter firm was accepted.

St. James, Westminster.—At the last meeting of the vestry the Works Committee recommended, and it was decided to approve, the laying by the St. James and Pall Mall Company and the London Electric Supply Corporation of electric light mains and the construction of street boxes in various streets.—A report was submitted by the Public

Health and Works Joint Committee in relation to the proposal of the Public Health Committee to consent to the construction of soil pipes inside the Carlton Hotel, instead of being arranged on the exterior of the building as required by the by-laws of the London County Council. The joint committee recommended that, subject to the approval of the county council, the arrangements for the additional soil pipes should be accepted by the vestry, and that a communication should accordingly be forwarded to the county council. After considerable discussion the recommendation was unanimously adopted. It was resolved, at the suggestion of the St. James Dwellings Committee, to assent to the extension of the trust in acquiring the Marshall-street site and the erection of dwellings for the poor, and to invite the guardians to appoint representatives to confer with the overseers and the committee with a view to the sale of the property to the vestry for the purpose in question.—The Clinical Research Association wrote in reference to the proposal to establish a central bacteriological laboratory. The association pointed out that it was an undertaking, at very small cost, for many sanitary authorities throughout the kingdom the work for the performance of which it was proposed to erect the new laboratory, and suggested that it would be more economical for local authorities to join the association than to pay a yearly subsidy to support a county council laboratory. The communication was referred to the Public Health Committee.—Notices were read from the St. James and Pall Mall Electric Lighting Company of their intention to apply to Parliament for authority to compulsorily acquire certain property in the parish for the purpose of the company's undertaking, and from the Brompton and Piccadilly-circus Railway Company of intended application to Parliament to empower the company to extend the railway.

St. Marylebone.—The Sanitary Committee, at the last meeting of the vestry, drew attention to the buildings in the area comprised in Nightingale-street, Samford-street, and a portion of Salisbury-street. In the opinion of the committee the bad condition and sanitary defects were of such a nature as to render necessary the demolition of the buildings and the construction on the site of dwellings suitable for the working classes. The committee accordingly recommended the vestry to direct that a scheme should be prepared for the improvement of the area under Part II. of the Housing of the Working Classes Act. Dr. Snape, chairman of the committee, stated that the superficial area was 7,000 square yards and that the number of persons proposed to be displaced and rehoused amounted to 500. As an amendment, Mr. E. White moved that a statement of the facts should be forwarded to the London County Council, with a request that the council would prepare and carry out a scheme for the improvement of the area in question. On being put to the meeting the amendment was adopted by thirty-eight votes to twenty votes.—The Works Committee presented a report recommending that Harley-street, Old Cavendish-street and Upper Berkeley-street should be paved with wood next year, the estimated cost, if yellow deal were used, being £6,930. In connection with this matter the committee stated that Mr. Waddington, the surveyor, estimated the cost of hard wood pavement at 75 per cent. more than that of yellow deal. Being equally divided in opinion as to the relative merits of hard and soft wood paving, the committee left it to the vestry to decide which wood should be used for the thoroughfares, as also in the case of the renewal of a portion of Oxford-street from Horeford-gardens to Edgeware-road, estimated to cost £1,575 in yellow deal. The discussion of the subject was adjourned till the next meeting.—It was decided, on the motion of Mr. E. J. Physick, to refer to the Burials Committee to consider and report on the following arrangements in connection with the Marylebone cemetery: (1) The expensive system of drainage of private earth graves (not brick graves), not known to be adopted in other cemeteries; (2) the placing of common interments both at head and foot of private graves; (3) the waste of ground involved by having a space of 4ft. wide between the rows of private graves, instead of a space from 1ft. 6in. to 2ft. as in other cemeteries.—The following tenders were accepted for the cartage of snow during the winter, the first prices being at per day and the second at per hour: Henry Boyer & Co., 11s. and 1s. 4d.; R. Ballard, 11s. and 1s. 6d.; Robert Bunce, 11s. and 1s. 6d.; A. Salaman & Co., 11s. and 1s. 5d.; and Joseph Latter, 11s. and 1s. 6d.

Whitechapel.—The board have given their approval to a recommendation of the Electric Lighting Committee to lay down an installation for supplying the district with current for lighting and power purposes, at an estimated cost of £60,500.

PROVINCIAL AND GREATER LONDON AUTHORITIES.

MUNICIPAL CORPORATIONS.

Andover.—The formal sanction of the Local Government Board has been received by the town council to the loan for the construction of sewage disposal works on the septic tank system.

Bedford.—A deputation of the members of the corporation recently visited Yeovil for the purpose of inspecting the septic tank system of sewage treatment at work there. The

conditions, says a local paper, were very exacting, inasmuch as the sewage was black with refuse from the tanneries, breweries and factories. The work of purification seemed to be very effectually carried out, as the effluent was perfectly clear.

Blackburn.—On the recommendation of the Health Committee, the medical officer was on Thursday directed to prepare a full report on the question of providing further accommodation at the fever hospital. The gas engineer having recommended that the corporation should purchase their own railway waggon for the conveyance of coal and canal, the council confirmed a resolution of the Gas Committee that the gas engineer should obtain specifications from various firms for the supply of fifty of these vehicles.—On the recommendation of the Finance Committee it was also resolved to borrow a sum of £4,400 for market purposes.

Blackpool.—On Wednesday, at a meeting of the town council, a discussion took place in regard to the overhead system of electrical traction, letters from the Blackpool Tradesmen's Association and from the Blackpool Municipal Reform Union protesting against it being read. Several councillors objected to the system, but any discussion on its merits or demerits was ruled out of order. Some speakers wanted to stop the work of instituting the overhead system on the Promenade until all the councillors had had an opportunity of discussing the whole subject again. However, it was stated that the work was already begun, and that the contractor was bound to finish the work by Easter, under a heavy penalty. One member stated that during his canvass he found his constituents entirely unanimous against the overhead system, and for that reason he rose to give his protest. An amendment referring the whole matter for discussion by the General Purposes Committee was carried by a large majority.

Bolton.—A Local Government Board inquiry has been held respecting an application of the town council for sanction to borrow £10,500 for the extension of the water supply. This had been necessitated by the rapid growth of the population in the Chorley-road district. There was no opposition.

Brighton.—On Tuesday, at the Royal Pavilion, Brighton, Mr. H. Percy Bonhois held an inquiry into an application of the town council to the Local Government Board for sanction to borrow £3,906 for slaughter-house purposes. The surveyor explained in detail the various items which the loan asked for embraced, and referring to the sanitary arrangements, said they were most satisfactory and that there had not been a single drain choked.

Bury.—It has been decided to promote a Bill in Parliament to authorise, among other things, the construction of new waterworks for the borough and other districts within the water limits of the corporation; the compulsory purchase of lands in order to protect the water from pollution, the alteration of charges, and the borrowing of additional moneys.

Doncaster.—The corporation of Doncaster having obtained a provisional order last session for electric lighting, are seeking powers for the construction, in the session of 1899, of 7½ miles of tramways on the overhead trolley system. The tramways will serve not only Doncaster, but the outlying suburbs of Balby, Hexthorpe, Bentley and Wheatley. The corporation, it may be mentioned, are just completing a new isolation hospital for the use of the borough and suburbs.—A new bridge over the river Don, which is being constructed at the joint cost of the West Riding County Council and the corporation, will be opened very shortly.

Dudley.—On Thursday, at a meeting of the town council, the Sanitary Committee reported that they had fully considered plans, produced by the borough surveyor, for the laying-out of certain land at Queen's Cross provisionally decided upon for acquisition as a cemetery, and recommended that the council should make an application to the Local Government Board for sanction to borrow £12,500 for the purchase of the ground. The Public Works Committee mentioned that plans had been produced of land at Netherton and Woodside which would be suitable for recreation grounds.

Lancaster.—The corporation have accepted the tender of Messrs. J. & S. Roberts, Limited, Swan Foundry, West Bromwich, for the supply of about 1,850 lineal yards of 7-in. cast-iron pipes.

Leeds.—New public baths, which have been erected by the corporation in Hunslet, are to be opened on the 17th inst. The premises have cost about £12,000.

Leicester.—The town council, by practically a unanimous vote, recently decided to promote a Bill in Parliament to obtain powers to utilise the extensive watersheds of the Upper Derwent and Ashop rivers, near Derbyshire, for the purpose of securing an additional water supply. The scheme provides for the construction of five immense reservoirs in the Derwent and Ashop valleys; but in the first instance only a portion of this huge undertaking will be proceeded with, the cost of the first instalment being £1,500,000. It is hoped that the Derbyshire authorities, who are promoting a scheme of their own in reference to the same watersheds, will be induced ultimately to co-operate with Leicester.

Manchester.—The Local Government Board have sanctioned the borrowing by the corporation, for public walks and pleasure grounds, of £12,000.

Scarborough.—Mr. H. H. Law, Local Government Board inspector, has held an inquiry into an application of the town council for sanction to borrow £2,879 for the purposes of pleasure grounds, £1,205 for the construction of a bridge, and £340 for the provision of an underground convenience.

Sheffield.—A special meeting of the city council has been summoned for the 14th inst., to consider the various Bills that are being promoted in Parliament for dealing with the waters of the Derwent. The council will be asked to approve the Bill of the Sheffield Corporation for taking the waters of the Derwent, Ashop and other rivers, and to consider the desirability of authorising opposition to the Bills of the Leicester and Derby Corporations. The council will also be asked to approve the Bill of the Sheffield Corporation for the purchase of the markets and the market and fair rights of the city from the Duke of Norfolk.

Wigan.—For some time past the Electric Lighting Committee of the Wigan Corporation have had under consideration the question of having the town lighted with electricity, and deputations have visited Leeds, Bradford and Wakefield. The committee, have now decided that an installation be put down to supply Wigan with electric light. The council are at present waiting the report of the committee, who also have under consideration the running of the trams by electrical traction.

URBAN DISTRICT COUNCILS.

Camborne.—Mr. H. Percy Bonhois, Local Government Board inspector, has held an inquiry respecting an application of the council for sanction to erect a grand stand in the town recreation ground, at a cost of £300. No opposition was offered.

Levenshulme.—At Monday's meeting of the council a letter was read from the Local Government Board sanctioning an application of the council to borrow £2,334 to complete the purchase of land for the purpose of a recreation ground, and a further sum of £1,382 to be expended in laying out the ground, which is about 4 acres in extent.—Notice was given by a member of his intention to move the adoption of the Artisans' Dwellings Act.

Llanely.—A letter has been received from the Board of Trade pointing out that the time allowed for the carrying out of the electric lighting scheme had now expired, and they desired to know whether the council intended to proceed with the work.

Maldstone.—At the last fortnightly meeting of this authority the medical officer, in his capacity as public analyst, reported that the nitrates in the Borealy and Ewell waters were too high. The Cossington water also showed a marked increase in the free ammonia, which was now higher than it had been any time since October, 1897. By comparison with the other water the albuminoid ammonia and the oxygen absorbed were likewise somewhat high in this water. After some discussion it was resolved to request the water company to furnish a monthly analysis of their water.—The Sanitary Committee brought up a report, in which they stated that the result of a deputation to the Local Government Board as to the typhoid loan had been that the Local Government Board had expressed their willingness to sanction the borrowing of £17,500 (being practically the whole of the money expended), in lieu of the £15,000 originally granted.

Northallerton.—A letter has been received from the Local Government Board approving the borrowing of £376 for the purchase of property adjoining the fire station.

Northwch.—The district council, at a recent meeting, agreed to amalgamate with the Northwch Rural Council in the carrying out of a sewerage scheme for the Castle portion of the urban and the Winnington portion of the rural districts. The cost of the work is estimated to be about £30,000.

Redditch.—At a recent meeting of this body the surveyor presented plans and estimates for the alteration of the old police station, which has been purchased for council offices and other purposes. The cost of the work is estimated at £1,600. The plans and estimates were passed, and it was decided to apply to the Local Government Board for permission to borrow the money.

Stretford.—At a recent special meeting of the council a resolution was carried by an absolute majority of the council to promote a Bill in the next session of Parliament to enable the council to work the tramways in their own district, and any adjoining district by agreement with other district councils, by animal, mechanical or electrical power; to enable the council to agree with the Manchester and Salford Corporations, and the district councils adjoining, for the exercise by the council of running powers or the leasing to the council of the tramways in such adjoining districts; to empower the council to borrow money for the purposes of the Bill; and to confer upon the council all such other powers as might be deemed expedient for, or in relation to, the foregoing purposes.

Walker.—A special committee have reported that an electric lighting provisional order had been advertised, and plans prepared in accordance with the rules. A memorial has also been prepared, and will shortly come up for consideration.

Warminster.—On Friday a Local Government Board inquiry was held by Colonel Smith, R.E., relative to an application of the council for sanction to borrow £7,500 for the purposes of a sewerage and sewage disposal scheme.

RURAL DISTRICT COUNCILS.

Bucklow.—Mr. Robert H. Bicknell on Thursday conducted an inquiry, on behalf of the Local Government Board, in reference to an application of the district council for sanction to borrow £2,100 for sewerage works in the township of Halo. Among those present at the inquiry was Mr. J. McKenzie, surveyor to the council. It was explained that the proposed works included the construction of a total length of 3,225 yards of new sewers, these being necessary to cope with the property erected and now in course of erection. It was sought to borrow the money for thirty years in respect of the works along Bank Hall-lane, Broad lane and Handley-lane as far as the Unitarian Chapel, but the laying of the sewers from Yolland-lane to Aldcroft's cottage, at a cost of £600, would be proceeded with as soon as possible, while the remainder would be done as immediate necessity arose.

Gomersall.—Mr. H. H. Law, one of the Local Government Board inspectors, conducted an inquiry last week with reference to an application of the district council for sanction to borrow £10,000 for the purchase of the Gomersall waterworks undertaking and £8,000 for the purpose of works of sewerage and sewage disposal. There was no opposition to the application for sanction to the purchase of the waterworks, and this part of the inquiry was quite of a formal character. With regard to the proposed sewage outfall works, it was contended that the site chosen was building land and that if the owner was paid a proper price for it the scheme could not be carried out for £8,000. Apart from that, the scheme was described as an extravagant one, inasmuch as it was only intended to provide for less than 400 houses.

Runcorn.—At a recent meeting of the council a letter was read from the clerk to the Cheshire County Council intimating to the council that, in the opinion of the Rivers Pollution Committee of the county council, the sewage from their district polluted the rivers and streams therein, contrary to the provisions of the Rivers Pollution Act, 1876, and that whether such pollution created a nuisance injurious to health was immaterial. Unless the district council made arrangements for stopping this pollution the committee would feel bound to advise the county council to put the Act into operation. The clerk was instructed to reply to the communication and inquire what streams were referred to.—The district council are extending the sewers of Frodsham and Frodsham Lordship, at a cost of over £1,000, from plans prepared by Mr. William Diggle, their surveyor. They are also about to carry out a sewerage scheme for the village of Helsby, at a cost of from £4,000 to £5,000.

Sleaford.—A tender of Mr. Skinner, of Heckington, for the construction of waterworks at Great Hale, for £635, has been accepted. It has also been resolved to apply to the Local Government Board for permission to borrow the necessary money.

Wigan.—On Friday a Local Government Board inquiry was held by Mr. G. W. Wilcocks with regard to an application of the rural district council for sanction to borrow £6,700 for works of water supply for a portion of the township of Wriglington.

SCOTLAND AND IRELAND.

Aberdeen.—It has been decided by the Finance Committee to recommend the extension of the fish market building along the Market-street wharf. The cost of the works is estimated at from £3,000 to £4,000.

Coleraine.—A Local Government Board inquiry has been held relative to an application of the town commissioners for sanction to carry out a sewerage scheme for the northern district of the town.

Glasgow.—At a meeting of the Corporation Statute Labour Committee, held on Friday, consideration was given to the question of erecting additional bridges over the Clyde east of Albert Bridge. It was stated that to utilise the materials of the present temporary wooden bridge across the Clyde at Jamaica-street for the erection of two bridges would cost £8,100, being £5,700 for an ordinary cart bridge at Govan-street and £2,400 for a bridge (16 ft. wide), also for carts, at Polmadie-street. To erect a suspension bridge at Polmadie-street would cost £8,600. The former proposal was favourably considered, but no decision was come to in the meantime.

FOREIGN AND COLONIAL.

Toronto, Ont.—Mr. C. H. Rust, the city engineer, has prepared an exhaustive report on the sewage disposal of the city. In concluding the report he recommends the construction of intercepting sewers on the general plan proposed by Messrs. Hering & Gray in 1889, and the provision of purification works in addition. The cost of the intercepting sewers is estimated at \$820,000. Final disposal works are estimated at \$910,000 for intermittent filtration and \$720,000 for chemical precipitation, with filtration of the effluent. The annual charges for filtration would be less than for precipitation. Before deciding on a purification system Mr. Rust advises the employment of a consulting engineer.

Sanitary Inspectors' Association.—A general meeting of the members of the above association will be held at Carpenters' Hall, London-wall, E.C., on Saturday, the 17th inst., at 5 p.m., when a paper will be read by Mr. W. H. Grieg, of Falham, and an election of members and associates will take place. This meeting will be followed, at 8 p.m., by an extraordinary general meeting, at which the following resolution will be submitted on behalf of the council: "That the number of members in the association shall be increased by the addition thereto of seven hundred (700) members beyond the present registered number."

ADVERTISEMENTS.

Received too late for Classification.

BOROUGH OF EASTBOURNE.
ENGINEER AND SURVEYOR'S DEPARTMENT.
The Pleasure Grounds Committee of the Corporation invite tenders for the Construction and Completion of a Public Convenience, situate on the Grand Parade, within the Borough. Plans and specification may be seen and form of tender obtained at my office.

Tenders, sealed and endorsed "Tender for Public Convenience," to be delivered not later than noon on Wednesday, the 21st day of December, 1898.

The Committee do not bind themselves to accept the lowest or any tender.

(By order)

R. M. GLOYNE, ASSOCIATED ENGINEER AND SURVEYOR.

Town Hall, Eastbourne,
December 7, 1898.

BOROUGH OF SOUTHEAST-ON-SEA.
TO GRANITE MERCHANTS AND OTHERS.
The Corporation invite tenders for the supply and delivery at the Railway Goods Station, or alongside at Southend, of about 350 tons of Broken Granite.

Particulars and forms of tender may be obtained on and after Monday, the 12th instant, upon application to Mr. Alfred Fidler, ASSOCIATED ENGINEER AND SURVEYOR, Clarence-road, Southend.

Sealed tenders, marked "Granite," to be delivered at my office on or before Wednesday, the 21st December.

The Corporation will not be bound to accept the lowest or any tender.

(By order)

WILLIAM H. SNOW,
Town Clerk.

Southend-on-Sea,
December 7, 1898.

EDMONTON URBAN DISTRICT COUNCIL.
ENGINEERING DRAUGHTSMAN.

The Edmonton Urban District Council invite applications for the appointment of a Draughtsman temporarily for taking levels, and making surveys, plans and estimates for private street works in their district.

The salary will be £2 10s. per week, and candidates must be prepared to enter upon the duties within one week after notice from the Council's Engineer.

Applications, accompanied with testimonials, to be sent to G. Eccles Eachus, Esq., Town Hall, Edmonton, on or before Monday, the 19th December.

Canvassing will disqualify.

(By order)

WM. FRANCIS PAYNE,
Clerk.

Town Hall, Lower Edmonton,
December, 1898.

LAGOS, WEST COAST OF AFRICA.
INSTRUCTOR FOR TECHNICAL SCHOOL.

required by the Government of Lagos, West Coast of Africa, for Technical School of the Public Works Department of the Colony. Engagement, one to three years. Salary, £300 per annum. Free quarters, or an allowance. Travelling expenses if sent on duty from station.

Free passage out, and home again on expiration of engagement. Leave of absence, if engagement extends beyond one year, six months on full salary, with free passage each way, after every twelve months' continuous residential service if exigencies of service permit.

Candidates must have had systematic training in building construction and surveying, with practical experience.

Candidates must be from twenty-six to forty years old. Character for steadiness and sobriety must bear the strictest investigation. Strict medical examination will be required. Single men preferred, and applicants must state whether they are single or married.

Applications, stating age and experience, and accompanied by copies (not originals) of testimonials as to personal character and qualifications, with the names and addresses of references of whom inquiry can be made, will be received by the Crown Agents for the Colonies, Downing-street, London, S.W., up to 25th December.

The Crown Agents possess no further particulars respecting the above appointment, and cannot therefore undertake to answer inquiries.

Some Recent Publications.

SOME SHORT NOTICES.

THE ELEMENTS OF SANITARY LAW, by Alice Ravenhill, lecturer to the Health Society (The Sanitary Publishing Company, Limited. Price 6d.), has a brief introduction by Sir Richard T. Thorne, K.C.B., F.R.S., LL.D., and will prove of much practical utility to many of our readers who are debarred by various causes from having recourse to the pages of Glen or Lumley. The design and compass of the pamphlet are appropriately set forth in the author's words: "This little book has been compiled with a view to meet a growing demand for some concise and inexpensive summary of the leading points of our existing system of public health law, some items of the most practical value having been selected and presented in a form as simple as is compatible with accuracy, and permitting of easy and rapid reference to any particular subject on which information is desired. For these reasons the alphabetical system of arrangement has been adopted, and great pains have been taken to preserve correctness of interpretation while condensing lengthy sections into simple sentences."

THE GENERAL REPORT OF THE OPERATIONS OF THE SURVEY OF INDIA DEPARTMENT, ADMINISTERED UNDER THE GOVERNMENT OF INDIA, DURING 1896 AND 1897 (Calcutta. Price 3 rupees), has been prepared under the direction of Major-General C. Strahan, K.E., Surveyor-General of India, and is issued from the office of the Superintendent of Government Printing, India. It contains much that is calculated to interest and instruct those persons who are intimately associated with our Eastern empire, as well as many others whose acquaintance with that great country is necessarily limited. Without entering into a minute analysis or detailed account of the valuable, statistical and descriptive information comprised in this folio volume, amply illustrated by maps and plates, we may mention that the first part is devoted to an account of the various surveys undertaken and of the progress hitherto made in each instance, the second to a recital of the operations of several field parties, the third division treats of the work performed at the headquarters offices, and sundry appendices embody reports made by executive officers.

SURVEYING, by T. Baker and F. E. Dixon (Crosby Lockwood & Co. Price 2s.), is a revised edition of a well-known book. Baker's "Surveying" has long been the favourite text-book of the student in land surveying, and we see no reason why the great measure of success it attained should not, under the new editor, be much increased. We are rather surprised to find no mention of the tachometer, an instrument much used as an angle and distance measure, and in future editions we think it would be well, in the interests of students, especially in the colonies, to add some description of it. As in most of the books on surveying, we find the author clings somewhat to the antiquated chain, whereas those constantly at work in the field do not hesitate to decide in favour of the steel band as a more accurate and certainly more convenient instrument. A more lengthy description of the plane-table would be of great use, as, notwithstanding the faint praise accorded it, we have found it extremely accurate, and with reasonable care not easily injured.

"THE ARGUS" GUIDE TO MUNICIPAL LONDON, edited by Mr. Frank J. Higginbottom ("London Argus" office. Price 1s.), will be found a handy medium of reference in all matters of interest connected with the local governing authorities of both the city and county of London. It contains a full list of members of the City corporation, the county council, school board, the administrative vestries, district boards and boards of guardians, with biographical notes and a variety of additional particulars. Special features of this little hand-book are the numerous portraits of prominent persons associated with the various bodies enumerated, and the personal notices concerning the principal members of the City corporation are certain to meet with due appreciation in many quarters. Statistical matters are fully entered into, and a systematic arrangement of details has been strictly adhered to in the several sections.

Mr. P. Latham, the author of THE SANITATION OF DOMESTIC BUILDINGS (The Sanitary Publishing Company, Limited. Price 2s. 6d.), has been fortunate in getting an introduction by so well known a sanitarian as Mr. Baldwin Latham. The book will thus probably ensure a greater measure of success than might otherwise have fallen to its lot as a work on the details of sanitation. It travels over well-worn ground, and nothing that is particularly new is described. The catalogue blocks which are used for illustrating do not add to its appearance, as the variety of scale is confusing; we are so used now to process work, even in small text-books, that these appear rough by comparison. What does "P. Inst. Architects and Surveyors'" mean? Is it a new society?

APPLIED GEOLOGY, Part I, by J. V. Elsdon, B.Sc., LOND. (The Quarry Publishing Company, Limited. Price 5s.), is stated in the preface to be "an attempt to combine such geology as the practical man should know with as much practical detail as should interest the geologist." Although the author advances no claim to originality, and admits that all available sources of information as to facts recorded have been freely utilised in the compilation of this little book, as the result of a careful examination of its contents we unhesitatingly recommend it to the notice of any of our readers

who may be personally or professionally interested in the subject therein treated with marked ability and considerable success.

THE STORY OF THE FARM, by James Long (The Rural Publishing Company. Price 1s.), consists of a series of essays on agricultural economy, some of which have been reprinted from *The Nineteenth Century*, *The Fortnightly Review*, and *The Manchester Guardian*, and it contains an introductory article by the Countess of Warwick, entitled "Women and the Future of Agriculture." A lengthened experience in agricultural matters generally, and an intimate acquaintance with the many social problems discussed, has enabled Mr. Long to treat the wide range of subjects referred to in this little hand-book with clearness, efficiency, and a thoroughly practical insight into all details.

From the EIGHTH ANNUAL REPORT OF THE COUNCIL OF THE PROPERTY PROTECTION SOCIETY, 1897 to 1898, we learn that "during the past session the society was unremittingly engaged in watching what they consider to be confiscatory Bills in Parliament, and took what steps seemed necessary in each case." Among such Bills introduced in the House of Commons were the Agricultural Holdings Bill, the Occupying Tenants' Enfranchisement Bill, and the Workmen's Houses Tenure Bill.

"THE INDIAN AND EASTERN ENGINEER" DIARY AND REFERENCE-BOOK (presented to yearly subscribers of that periodical) contains a considerable amount of practical information specially interesting to those persons for whom it is primarily intended. The matter in the present issue appears to have been kept up to the standard of previous years, and in particular we note the very complete table of metrical equivalents and the singularly convenient manner in which the other varied particulars therein included are arranged.

Any of the Books noted below will be sent post free if the published price be forwarded to the offices of THE SURVEYOR.

"THE LIVE STOCK JOURNAL" ALMANAC, 1899; 268 pp., 9½ in. by 6½ in. Price 1s.

CLASSICAL AND FOREIGN QUOTATIONS, LAW TERMS AND MAXIMS, PROVERBS, MOTTOES, PHRASES AND EXPRESSIONS, in French, German, Greek, Italian, Latin, Spanish and Portuguese, by W. F. H. King, M.A. (new edition); 624 pp., 7½ in. by 5½ in. Price 5s.

UNDER THE SHADOW OF ST. PAUL'S: a page from the history of London, by Henry Johnson; 192 pp., 7½ in. by 5 in. Price 2s. 6d.

HAZELL'S ANNUAL FOR 1899; 676 pp., 7½ in. by 5½ in. Price 3s. 6d.

THE NEW GUIDE TO BRISTOL AND CLIFTON AND THE BRISTOL CHANNEL CIRCUIT, by James Baker, F.R.H.S., F.R.G.S.; 306 pp., 6½ in. by 4½ in. Price 2s.

JUDGES' REPORT OF THE LIVERPOOL TRIALS ON MOTOR VEHICLES FOR HEAVY TRAFFIC, 1898; 126 pp., 9½ in. by 6 in. Price 5s.

NOTES ON WATER SUPPLY, by J. F. Rodda; 140 pp., 11 in. by 8½ in. Price 6s.

THE "COMPLAN" AND UNIVERSAL GUIDE TO HOTELS, &c., 1898; 368 pp., 7½ in. by 4½ in. Price 1s.

TRIGONOMETRY AT A GLANCE, by G. W. Usill, ASSOC. INST. C.E., and F. J. Browne, C.E.; 7½ in. by 10 in. Price 2s.

THE "GLOUCESTER" DIARY AND DIRECTORS' CALENDAR FOR 1899; 300 pp., 6½ in. by 4 in.

AN INQUIRY INTO THE RELATIVE EFFICIENCY OF WATER FILTERS IN THE PREVENTION OF INFECTIVE DISEASE, by G. Sims Woodhead, M.D., F.R.S.E., and C. E. Cartwright Wood M.D., B.Sc.; 136 pp., 8½ in. by 5½ in. Price 2s. 6d.

INSTITUTION OF CIVIL ENGINEERS.

ORDINARY MEETING.

An ordinary meeting of the above Institution will be held on Tuesday, at 8 p.m., when a discussion will be opened on the paper which was read at the last meeting by Mr. Francis Fox, M.I.C.E., on "The Ventilation of Tunnels and Buildings."

STUDENTS' MEETING.

A meeting for the students of the Institution will also be held on Friday, when a paper, entitled "The Kentish Town Widening, Midland Railway," will be read by Mr. Walter Daniel. The chair will be taken at 8 p.m. by Mr. Horace Bell, member of the council.

Surveyors and Bicycles.—At a recent meeting of the Berwick Town Council it was decided to provide Mr. R. Dickinson, the surveyor, with a bicycle.—At the Queen's Hotel, Macclesfield, Mr. Boyd, road surveyor to the Cheshire County Council, was recently presented by Mr. J. Naylor, on behalf of about 200 cyclists in Macclesfield and the neighbourhood, with a handsome bicycle, fully equipped, as a mark of the esteem in which he is held, and in recognition of the admirable condition in which the roads in the Macclesfield district under his charge are kept.

Personal.

The death is announced of Mr. de Witt C. Cregier, ex-city engineer of Chicago.

Worcester City Council have appointed Mr. C. J. Sutherland, of Hanley, electrical engineer, at a salary of £350 per annum.

Mr. G. A. Calder, road surveyor, Dunblane, was recently presented with a handsome escriptoire on the occasion of his marriage.

Peterborough Town Council have selected Mr. J. Partridge Jenkins to fill the posts of borough surveyor and inspector of nuisances.

Mr. A. M. Cutler, the city engineer of Cork, last week delivered an interesting lecture on the subject of "Healthy Dwellings."

Mr. William J. Crawford, of Stirling, was on Thursday appointed assistant borough surveyor of Stirling, at a salary of £80 per annum.

The salary of Mr. E. J. Reynolds, surveyor to the Friern Barnet Urban District Council, has been increased from £225 to £275 per annum.

At a meeting of the Wigmore Rural District Council, held last week, it was proposed by the chairman and unanimously decided to grant the surveyor, Mr. H. W. Bowen, an increase in his salary of £30 per annum.

Mr. Lee, the late borough electrical engineer of Southampton, has been presented with a silver cigar, cigarette and vesta case by some of his friends on the council and the staff at the works, on the occasion of his leaving the works.

Mr. F. J. M. Whittaker, surveyor to the Peterborough Rural District Council, has been selected to carry out a water supply scheme for the parish of Werrington, Peterborough. The boring operations, we understand, have proved very successful.

Mr. Arthur Fuller, burgh electrical engineer, Ayr, has been granted an increase in his salary of £50 a year. The motion for granting the increase was opposed, but the opposition elicited such a volume of testimony in Mr. Fuller's favour that it was withdrawn, and the increase granted unanimously.

Maidstone Urban District Council have increased the salary of their surveyor, Mr. F. F. Bunting, from £250 to £300 per annum. The mayor, on the adoption of the report of the committee recommending the advance, said he was glad that the council had thus recognised that they had in Mr. Bunting a good honest servant.

The Lambeth Vestry have decided to grant Mr. Norington, the surveyor, a testimonial so soon as he asks for one, it being left to a small committee to draw up the terms of the testimonial. They have also decided that Mr. Edwards, assistant surveyor, be appointed chief surveyor for twelve months on probation, at a salary of £500.

We are informed that Mr. W. Taylor, of Clipping Sodbury, Glos., has been appointed surveyor to the Swaffham Urban District Council, in the place of Mr. Cecil Chapman, who has received the appointment of engineer under the Wembley Urban District Council. There were thirty-seven applicants for the vacancy. The salary commences at £100 per annum.

At a meeting of the Fyde Rural District Council, held recently, the chief business was the appointment of a surveyor, in place of Mr. Houshaw. The salary was fixed at £120 per annum. Out of a large number of candidates six were selected to appear before the council, and ultimately the appointment was given to Mr. Henry Swire, assistant surveyor at Skipton.

The death has occurred, somewhat suddenly, of Mr. Thomas Claridge, for eight years surveyor to the Swinton Local Board, for twenty years surveyor to the Stockport and District Highway Board, and up to his decease surveyor to the Disley District Council. He was formerly engaged upon engineering works in Brussels and other Continental cities. He was fifty-eight years of age, and was well known throughout Cheshire and Lancashire.

We hear with regret of the death of Mr. John G. Livesay, which has taken place at Ventnor, Isle of Wight. The deceased gentleman was in 1863 appointed to the Ventnor Local Board as surveyor, and on his resigning that office, eleven years later, he took the position of consulting engineer to the authority. During his tenure of office he inaugurated and carried out an extensive sewerage scheme, extended the sea walls, and undertook several other important public works.

The Long Eaton Urban District Council have shown their appreciation of the services of their engineer and surveyor, Mr. Frank Worrall, by giving him an advance of salary. The vice-chairman of the council, in moving the resolution, remarked that no application had been made by Mr. Worrall for an increase in his salary, but he felt confident that the council would recognise the ability and energy he had displayed in his work during the past twelve months by granting him an increase, and so endeavour to retain his services.

Mr. William Hamilton Bontie, an eminent Scottish architect, whose death has occurred very suddenly at his residence in Edinburgh, was chief expert adviser to the Edinburgh Corporation, and performed important duties of a similar kind for the North British Railway Company. He was also well known as a skilled witness in Parliamentary inquiries, while he was responsible for the design of a large number of important buildings in Edinburgh and elsewhere. Mr. Bontie was highly esteemed, and his death in his prime—he had just reached the age of fifty-five—will be deeply regretted by a very wide circle.

At the last meeting of the St. George-the-Martyr (South-wark) Vestry the Joint Public Health and Sewers and Works Committee reported that they had considered the applications received for the post of assistant surveyor and had selected five candidates to appear before the vestry. After these five candidates had been interviewed the vestry resolved to appoint Mr. R. T. Millar, 37 Hercules-road, Westminster Bridge-road, S.W., to the post. Mr. Millar, who is twenty-five years of age, is at present an assistant to Mr. W. H. Woodroffe, 214 Great Dover-street, S.E., previous to which he was an assistant to another firm.

An arrangement has been made by which the private practice established in Manchester in 1851 by the late Mr. William Radford, M.C.E., and carried on until recently by him in conjunction with his son, Mr. William Harold Radford, under the style of Messrs. William Radford & Son, civil engineers, surveyors and valuers, at 19 Brazennose-street, Manchester, has been transferred to Mr. Joseph Swarbrick, M.C.E., of Temple Chambers, 33 Brazennose-street, Manchester, consequent upon the appointment of Mr. W. H. Radford to the position of brigadier-general for the County of Lancaster, in succession to his father.

On Tuesday, at the meeting of the London County Council, the General Purposes Committee announced that twenty-seven applications had been received in response to the advertisement for an architect to fill the position of superintending architect to the council, rendered vacant by the retirement of Mr. P. Blashill. The committee had especially considered the applications, and nine of the candidates were interviewed, but they regretted to have to report that they could not see their way to submit the names of any of the candidates as possessing, in their opinion, the qualifications necessary for so important a position. They were now considering what course should, in the circumstances, be taken with a view to filling the appointment, which carries with it a salary of £1,500 a year.

At the close of a meeting of the Leighton Town Council, on Thursday, Mr. C. A. Bantow, the late assistant surveyor, was presented with a purse of £40 in recognition of his long and diligent services. The mayor, in making the presentation, alluded to the propriety with which Mr. Bantow had conducted himself during his seventeen years' stay with the corporation, and said he hoped that before long he would attain a high position under the county council. Mr. Bantow, it may be stated, has recently been appointed to the position of highway surveyor under the Stone District Council. Several members of the council also spoke of Mr. Bantow's high abilities as an engineer, while the town clerk, on behalf of the officials, bore testimony to his courtesy and expressed their gratification at his promotion.

At the Hotel Victoria, Northumberland-avenue, S.W., Mr. Baines Dudley, as president, recently delivered an opening address before the Civil and Mechanical Engineers' Society, in the course of which he referred to the various railway extensions in progress in London, especially the underground tubular system originally introduced by the late Mr. Greathead, which he described as a great step forward in the science of practical engineering. Dealing with the bridges over the Thames, he suggested that when a railway company was granted permission to construct a railway bridge over the river it should be on condition that a rail bridge was combined with it. Such a regulation, he understood, already existed in some of our colonies. The stambant trade on the river had greatly fallen off, because the Lud services had improved to an extent which had not been imitated by the river service, but with covered landing stages, movable boats, running at greater speed, at more frequent intervals, there was no reason why an all-year-round service could not be reconstituted. The river was also badly lighted, and the public lost after dusk the advantage of this splendid highway through the centre of the metropolis. Were the landing and banks lighted with diffusive electric arc lamps, it could be carried on by night as well as by day. The proposition closed with a vote of thanks.

Clontarf. Mr. C. P. Cotton, engineering inspector to the Local Government Board, held an inquiry recently in regard to an application of the town commissioners for leave to borrow a sum of £200 for the defrayal of the cost of concreting and kerbing a number of footpaths.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

VOLUNTARY PASS EXAMINATION.

Notice is hereby given that the twenty-seventh examination for candidates for surveyorships under municipal corporations and district councils will be held at the Institution of Civil Engineers, Great George-street, Westminster, on Friday and Saturday, April 11 and 15, 1899.

The council reserve to themselves the right to hold a second examination in case the entries received exceed the limits of accommodation. Such second examination will be held as soon after the first as circumstances permit. Applications will therefore be accepted strictly in the order of priority.

Application forms, duly filled in by intending candidates, together with entrance fee of £2 2s., must be in my hands on or before the 5th of March, 1899.

THOMAS COLE, Secretary.

11 Victoria-street, Westminster, S.W.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.

SPECIAL GENERAL MEETING.

A special general meeting of the above Association will be held at the Westminster Palace Hotel, Victoria-street, London, S.W., to-morrow, for the purposes mentioned below. The chair will be taken by the president, Mr. W. Matthews, M.I.C.E., at 10 o'clock precisely.

PROPOSED ALTERATION OF RULES.

In substitution of Rules 30 and 31:—

Subsequent Councils and Term of Office.

The council shall, after the above date, consist of the president, past-presidents (who are eligible for election as hereinafter provided), two vice-presidents, hon. secretary and treasurer, and ten ordinary members. The president, vice-presidents, hon. secretary and treasurer, and ten ordinary members shall go out of office each year, on the date fixed by the council for the annual general meeting, but shall be eligible for re-election. Voting papers, in a form to be determined by the council, shall be sent to each member by the secretary fourteen days before the half-yearly or winter general meeting, to be returned to the secretary at or before such meeting. Nominations for the vacant offices shall be sent to the secretary thirty-one days before the winter general meeting. Two scrutineers shall be appointed at the said winter meeting to examine and report upon the voting lists. The result of the voting shall, upon the report of the scrutineers, be declared by the chairman. Every past-president shall, at the expiration of five years from the termination of his presidency, go out of office, but shall be eligible for election to the council in the ordinary way.

GENERAL MEETING.

A general meeting will afterwards be held, at 11 o'clock precisely, when the chair will be taken by the president, Mr. W. Matthews, M.I.C.E. Mr. H. Bertram Nichols, M.I.C.E., will read a paper, entitled: "Water Supply from the Lower Greensand and Constructional Works connected therewith at Leighton Buzzard." A discussion will follow the reading of the paper. At this meeting there will be a ballot for election of members and associates whose proposals have been received and approved by the council.

COMBINED DRAINAGE IN LAMBETH.

REPORT OF THE JOINT COMMITTEE.

The Lambeth Vestry have received the following report from the joint committee of the Sowers and Sanitary Committees on combined drainage:—

The committee have taken this subject into their very careful consideration, and after considerable discussion it was resolved to make the following recommendations to the vestry:—

Combined Drainage for New Buildings (excepting Flats).—

(1) That combined drainage, where advantageous, shall be approved; (2) that combined drainage shall not be approved where the plan shows that separate drains can be laid outside each house; (3) that combined drainage shall be limited to a maximum of six houses to drain into one drain, with one interceptor from the main sewer; (4) that in no case where combined drainage is sanctioned shall any part of the combined drain pass under any house without the special consent of the vestry; (5) that the passageway under which the main portion of the combined drain is laid shall be of the minimum width of 4 ft., such passageway being open to the sky; (6) that where the passageway is more than 7 ft. wide, such passageway shall be considered as open to the air, if open at both ends to a minimum height of 10 ft.; (7) that the owner shall sign an agreement, to the satisfaction of the clerk to the vestry, that the passageway shall never be built upon; and (8) that when it is proposed to drain more than six houses by a combined system, for the maintenance and

repair of which the owner or owners are to be liable for all time, a main combined drain shall be placed at the rear of the houses and treated separately as to ventilation, means of access, &c., and into this back line of drainage each house shall be drained separately (with drains outside), and separately intercepted and ventilated.

Combined Drainage of Flats.—That each self-contained block of flats or tenement dwellings shall be drained separately.

Records of Combined Drains.—That the recommendation made by the clerk to the vestry as to a reference-book being kept, such book to contain particulars of each case of combined drainage sanctioned by the vestry (Minutes, p. 1,525), be adopted.

APPENDIX TO REPORT.

The committee resolved to submit the following information, prepared by the medical officer, as an appendix to their report: The medical officer reported to the committee that he had received communications from thirty-five metropolitan districts with reference to the subject of combined drainage, and had tabulated the information received as follows: Five—i.e., 14.3 per cent.—do not allow or approve of combined drainage—two in connection with new, and three with new or old buildings; thirty—i.e., 85.7 per cent.—allow and approve of combined drainage. The only districts that disapprove of and do not allow combined drainage are: (1) In new or old buildings—Fulham, St. George's (Hanover-square) and St. Martin's-in-the-Fields; (2) in new buildings only—Clerkenwell and Bermondsey. The districts that approve of and allow combined drainage are: (1) *Conditionally*—Camberwell, Whitechapel, St. Marylebone, Holborn, Newington, St. George-the-Martyr, Kensington, Clapham, Rotherhithe, Chelsea, St. Olave's, St. Pancras, Islington, Hammersmith, Strand, Westminster, Paddington, Hampstead, Stratham, St. James's, St. Luke's, St. Giles's and St. George's-in-the-East; (2) *Unconditionally*—Hackney, Shoreditch, Bethnal Green, Wandsworth, Limehouse, Woolwich and Poplar.

THE SEPTIC TANK SYSTEM OF SEWAGE TREATMENT AT EXETER.

A great deal of misunderstanding exists as to the terms upon which the Local Government Board have granted the loan applied for by the Exeter City Council for carrying out sewage disposal works by means of the septic tank system. It has been stated that the Local Government Board had allowed the scheme at Exeter, but had attached certain conditions which would involve a very much greater expenditure than the scheme itself—namely, that the effluent should be spread over a certain quantity of land.

It is hardly necessary to inform those who are at all conversant with the subject, says *The Devon and Exeter Daily Gazette*, that this condition is always enforced by the Local Government Board, no matter what system of dealing with sewage is adopted. It is a rule from which they never depart unless the outfall be into a tidal river or direct into the sea. Moreover, the quantity of land which the Local Government Board have required in connection with the Exeter scheme is the minimum quantity which they allow under any circumstances. Again, the requirement that the Exeter City Council shall accept the entire responsibility of the success or failure of the scheme is nothing exceptional, as it is well known that the Local Government Board never accept responsibility for the satisfactory working of any scheme which is laid before them. No matter what kind of a scheme is adopted, if unsatisfactory results followed its operation the Local Government Board would be the first to call upon the authority concerned to rectify it, even though the Board had a year or so before granted a loan for carrying out the works. It will thus be seen that no unusual conditions have been attached to the granting of the loan for carrying out sewage disposal works at Exeter by means of the septic tank system. As a matter of fact, too, it may be mentioned that the loan granted for land represents less than one-fifth of the amount sanctioned for the other portion of the scheme.

Railway Companies and Road Locomotive Traffic.—In view of the provision of clause 6 of the Act of Parliament recently passed at the instance of the Lancashire County Council, that a county council may, if they see fit, contribute, or join with other local authorities in contributing, to the rebuilding, widening or improvement of any bridge in the county belonging to any railway, canal or other company, corporation or person, and to the widening and improvement of the approaches thereto, and that any such contribution of the county council shall be paid out of the county fund and shall be deemed a special county purpose, the executive council of the County Councils Association addressed a circular to county councils requesting information as to whether railway companies have prohibited the passage of locomotives across over-line bridges; and, if so, whether any inconvenience has arisen from such prohibition, and had the council taken any steps in the matter; and also whether in the opinion of the council it would be desirable to promote a Bill applying to counties generally the principles of the clause quoted. Replies to the circular have been received from twenty-eight councils.

THE SURVEYORS' INSTITUTION.

ORDINARY GENERAL MEETING.

The next ordinary general meeting will be held on Monday, when a paper will be read by Mr. Wm. Weaver, entitled "The London Building Act and the Official Supervision of Buildings." The chair will be taken at 8 o'clock.

STUDENTS' PRELIMINARY EXAMINATION, 1899.

Those proposing to enter their names for the students' preliminary examination, to be held on the 18th and 19th of January next, must intimate their intention to the secretary before the last day of November. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London. Irish candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS, 1899.

Students eligible for the proficiency examinations (which will commence on the 20th of March next) must give notice of the sub-division (Table A of Rules) in which they elect to be examined, not later than the 31st inst. Examinations qualifying for the classes of "Professional Associates" and "Fellows" will also commence on the 20th of March next. Names of applicants for these latter examinations to be sent in before the 31st inst. All particulars as to days, subjects and course of examination will be forwarded on application to the secretary. English candidates for the professional examinations will be examined in London. Irish candidates will be examined in Dublin.

APPOINTMENTS VACANT.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

CIVIL ENGINEERING ASSISTANT.—December 10th.—Corporation of Hull. £85.—Mr. A. E. White, city engineer.

ASSISTANT FOR THE INSPECTION OF BUILDINGS, &c.—December 12th.—Hford Urban District Council. £120.—Mr. H. Shaw, A.M.C.E., surveyor to the council.

ASSISTANT SURVEYOR.—December 12th.—Corporation of Stoke-upon-Trent. £91.—Mr. J. B. Ashwell, town clerk.

DISTRICT ROAD SURVEYOR.—December 13th.—Gwyrfa Rural District Council. £150.—Mr. J. Henry Thomas, clerk to the council, Carnarvon.

SEWAGE FARM MANAGER.—December 14th.—Willehall Urban District Council. 30s.—Mr. Chas. J. Jenkin, surveyor to the council.

INSPECTORS OF PAVEMENTS (FOUR).—December 15th.—Corporation of London. £200.—The Town Clerk, Public Health Department, Guildhall, E.C.

WATERWORKS PUMPING STATION ENGINEER, INSPECTOR OF WATER SERVICES, &c.—December 16th.—Newport Pagnell Urban District Council. 33s.—Mr. J. E. Hargreaves, surveyor to the council.

GENERAL ROAD FOREMAN.—December 17th.—Corporation of Cambridge. £2 18s.—Mr. J. E. L. Whitehead, town clerk.

ASSISTANT BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES.—December 17th.—Corporation of Wenlock. £80.—Mr. Godfrey C. Cooper, town clerk.

DISTRICT MAIN ROAD SURVEYORS (FOUR).—December 19th.—Hertfordshire County Council. £130.—Mr. Urban A. Smith, county surveyor, 41 Parliament-street, London, S.W. STREVEYOR.—December 20th.—Lytham Urban District Council.—Mr. Chas. A. Myers, clerk to the council.

HIGHWAY SURVEYOR.—December 21st.—Uxbridge Rural District Council. £200.—Mr. Charles Woodbridge, clerk to the council.

BUILDING INSPECTOR.—December 22nd.—Corporation of Stockport. £2 2s.—Mr. John Atkinson, borough surveyor.

MUNICIPAL COMPETITIONS OPEN.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

CHERTSEY.—December 23rd.—Sewage and sewage disposal scheme for the Nos. 1 and 2 wards of the district. £50, £30 and £20.—Mr. T. E. Harland Chaldecott, clerk to the council.

HULL.—January 1st.—Erection of a central public library in Albion-street. £50, £30 and £20.—Mr. E. Laverack, town clerk.

HARRGATE.—January 2nd.—Erection of a pump-room, &c., at a cost not exceeding £8,000. £50, £30 and £20.—Mr. Samuel Stead, borough surveyor.

BRADFORD.—February 1st.—Erection of a central fire brigade station. £100, £50 and £30.—Mr. George McGuire, town clerk.

MUNICIPAL CONTRACTS OPEN.

Official and all similar advertisements received later than Thursday morning are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

WOLLESELEY.—December 10th.—Supply of cold water pipes, 1 1/2 in. in diameter, pig lead and block tin to cost £2,400 for 1898. Mr. T. Crock, A.M.C.E., city engineer.

KINGS LYNN.—December 10th.—Supply of coal for 1898, ending December 31, 1898, at various stores. Mr. H. H. Weaver, borough engineer and surveyor.

SOUTHAMPTON.—December 12th.—Supply of 1,000 tons of iron nails. Mr. W. B. G. Bennett, borough engineer.

CARLISLE.—December 12th.—Supply of 20,000 yds of 2 1/2 in. socketed stone-ware pipes, for the urban district council. Mr. W. L. Wallis, G.M.C.E., surveyor to the council.

CURION.—December 12th.—Excavating, laying out, and paving of Water-street, for the urban district council. Mr. J. H. R. H. H. H., clerk to the council.

BEARSLEY.—December 12th.—Supply of various materials, plans and the erection of tall chimney and engine, boiler, and house, storage-towers, and oil-tanks in Beckwith-Quay. Mr. J. Henry Taylor, A.M.C.E., borough surveyor.

SHREFFBURY.—December 12th.—Laying of an electric cable with the electric light station in Coronet-street, Old-street, for the vestry. Dr. H. Marshall Robinson, clerk to the vestry.

ECCLES (LANCS).—December 12th.—Erection of a house and pavilion, and the construction of a bowling-green on land in Eden Road, Patricroft. Mr. G. W. Bailey, town clerk.

WILKESDEN.—December 13th.—Execution of certain road-making and other works at Wilkenson Green, between Strid-le-Hay and Hawthorn-road, for the urban district council. Mr. G. Olan-to-Hobson, A.M.C.E., engineer to the council.

COVENTRY.—December 13th.—Construction of five electric light installations.—Mr. J. E. Swallowhurst, city engineer.

WEST HAM.—December 13th.—Erection of a quarter session court, police cells and mortuary in West Ham-lane, Stratford. Mr. Lewis Angell, borough engineer.

TRENTHAM.—December 13th.—Various works in connection with the main drainage scheme, for the urban district council. Mr. A. R. Wood, borough surveyor.

NEW HUNSTON.—December 13th.—Alterations to engine-house and engine foundations, for the urban district council. Mr. J. R. B. Glaser, clerk to the council.

WORKING.—December 13th.—Supply and delivery of one 6-in. steam-pumping machine, for the urban district council. Mr. G. J. Woolridge, surveyor to the council.

HORWICH.—December 13th.—Laying of about 500 square yards of flagging, for the urban district council. Mr. Peter Taberner, clerk to the council.

BARRING (ESSEX).—December 13th.—Erection of eighty-three benches for the working classes in Creeksmouth-lane, for the urban district council. Mr. C. J. Dawson, F.R.S.E.A., surveyor to the council.

FELHAM.—December 14th.—Alterations to the corner's court, Market-road, for the vestry. Mr. Charles Botterell, A.M.C.E., surveyor to the vestry.

BAKESWORTH.—December 14th.—Supply and fixing at the works of one non-condensing steam engine, for the urban district council. Mr. D. E. Garlick, gas and water engineer to the council.

AREDON.—December 14th.—Erection of new council offices on the site of the present offices in Bolton New-road, for the urban district council. Mr. Daniel Schofield, clerk to the council.

HACKNEY.—December 14th.—Supply of gully grates, man-hole covers and other sewer ironwork, for the vestry. Mr. James Lovegrove, surveyor to the vestry.

MAN-FIELD.—December 14th.—Construction of about 500 yards of 9-in. pipe sewer, for the R. Frank Vallance, borough surveyor.

MAN-FIELD.—December 14th.—Construction of about 1,500 yards of brick sewer and storm overflows and 570 yards of pipe sewers. Mr. R. Frank Vallance, borough surveyor.

TWICKENHAM.—December 14th.—Supply of 500 tons of 1 1/2 in. gamic spalls, for the urban district council. Mr. F. W. Pearce, surveyor to the council.

MACEFIELD.—December 14th.—Supply of drain pipes, cast-iron, masonry, cement, bricks, &c., during the year ending 31st December, 1898. Mr. W. Fredk. Taylor, town clerk.

HAMPFIELD.—December 15th.—Removal of slop from the roads and gullies in the parish for one or three years from March 26th next, for the vestry. Mr. Arthur P. Johnson, clerk to the vestry.

PRESTON.—December 15th.—Laying, paving, channeled, &c., of the roads between St. David's road and St. Michael's-arch. The Borough Surveyor.

WALLASEY.—December 15th.—Supply of waste-water meters and fittings, for the urban district council. Mr. H. W. Cook, clerk to the council, Public Offices, Ercrowth.

LEICESTER.—December 16th.—Supply of brushes, &c., as may be required during 1899. Mr. E. Geo. Mawbey, M.C.E., borough surveyor.

ROGHT.—December 16th.—Erection of a fire brigade station and stabling in the council yard, Chapel-street, for the urban district council. Mr. D. Macdonald, A.M.C.E., surveyor to the council.

PETERSEX.—December 16th.—Alteration of the cattle stage at the cattle market, Brook-street North.—The Borough Surveyor.

PRESTON.—December 16th.—Extension of the pillars at the "Beehive Inn" in Fishergate-hill.—The Borough Surveyor.

PRESTON.—December 16th.—Alteration of the ground surface in Cross-street.—Mr. Henry Hamer, town clerk.

HALF.—December 16th.—Laying, macadamising, flagging, &c., of the road between Little Red-street, Thymers-street, and a 1/2 Thicket-street. Mr. A. E. White, city engineer.

BUCKENHAM.—December 17th.—Supply and erection of various electric light plants, for the urban district council. Mr. F. E. Stone, clerk to the council.

GALWAY.—December 17th.—Supply of ironwork for building and construction of a new road near Malm, for the county council. Mr. James Perry, M.C.E., county surveyor, Galway.

NORTH RIDING (YORKSHIRE).—December 17th.—Widening of Donkey and Middlebrough main road from Station Park to Osney Park, for the county council. Mr. Walter Stand, M.C.E., county surveyor, Norththerton.

LONGTON.—December 17th.—Supply of 1 1/2 in. pipe sewer and laying December, 1898, of broken granite, granite tiles, kerb, cast iron work, Portland cement, blue paving bricks, earth, wire pipe, &c. Mr. J. W. Warder, borough surveyor.

LEWIS.—December 18th.—Supply of ironwork for building and construction of a new road near Malm, for the county council. Mr. James Perry, M.C.E., county surveyor, Galway.

MIDWAY (YORK).—December 19th.—Supply of 1 1/2 in. pipe sewer and laying December, 1898, of broken granite, granite tiles, kerb, cast iron work, Portland cement, blue paving bricks, earth, wire pipe, &c. Mr. J. W. Warder, borough surveyor.

PENDLETON.—December 19th.—Supply of ironwork for building and construction of a new road near Malm, for the county council. Mr. James Perry, M.C.E., county surveyor, Galway.

LEAMING.—December 10th.—Supply of 265 tons of cast-iron pipes and special castings, for the rural district council.—Mr. John Austie, engineer, 10 Marchwood-crescent, Kaling, W.

WEST RIDINGS (Yorkshire).—December 10th.—Erection of two new police stations, with cells and officers' residences, at Worsborough Dale and Artery, near Barnsley, for the county council.—Mr. J. Vickers-Edwards, county surveyor, Wakefield.

HORNSEY.—December 10th.—Sewering, levelling, paving, metalting, channelling and making good of Temple-road and Rathcoole-gardens (1st section), for the urban district council.—Mr. E. J. Lovegrove, engineer to the council.

UYEYRSTON.—December 21st.—Supply and laying of about 267 yards of 24-in. turned and bore iron water pipes and the construction of a storage tank, for the rural district council.—Mr. Chas. W. Dean, clerk to the council.

BLACKPOOL.—December 21st.—Various sewerage, levelling, paving, metalting, channelling, &c., works.—Mr. J. Wolstenholme, borough surveyor.

PORTSADE-BY-SEA.—December 22nd.—Construction of stonework and other sewers for the drainage of the district, for the urban district council.—Mr. Charles O. Blaber, M.I.C.E., 64 Ship-street, Brighton.

EXETER (Wales).—December 22nd.—Excavation, masonry and other works in connection with the proposed new bridge over the river Dee at Corveu, for the rural district council.—Mr. Thomas Hughes, clerk to the council, Corveu.

HENSON.—December 22nd.—Extension of the main sewer along the Edgworth-road, Ebbw Vale, for the rural district council.—Mr. F. J. Seabrook, clerk to the council.

LEICESTER.—December 23rd.—Erection of working-class dwellings in Winifred-street.—Mr. James Bell, town clerk.

DAETMOOTH.—December 24th.—Ventilating, painting and other works at the Guildhall.—Mr. T. O. Vesle, borough surveyor.

WILLEMSALL (Staffs.).—December 30th.—Erection of a new span-roof greenhouse, 30 ft. by 12 ft., at the new cemetery at Bentley, for the urban district council.—Mr. Chas. J. Jenkin, engineer and surveyor to the council.

ROTFERHAM.—December 31st.—Supply and erection of sludge-pressing plant, boilers, sewage ejectors and sewage lifts, for the corporation.—Mr. R. F. W. Herington, Bank-buildings, Wolverhampton.

RANSWATE.—December 31st.—Supply of a compound condensing beam engine at the Whitehall pumping station.—Mr. William A. Valon, gas and water engineer to the corporation.

17.—Sanitary Inspectors' Association: Extraordinary meeting, 8 p.m.
18.—Royal Institute of British Architects: Messrs. Bursell and Drake on "The Application of Electric Power to Practical Purposes in Buildings, and the Production and Use of Electricity for Lighting Country Houses," 8 p.m.

Berlin.—The municipal council recently determined to approve of a contract between the municipality and the various Berlin electrical works, according to which these firms and companies will supply electricity to the city of Berlin till the year 1915, while the municipality will participate to a considerable extent in their profits. A violent controversy has raged for some time around the question of the contract. The view ultimately prevailed, however, that the electric industry was still in an early stage of its development, and that new inventions might easily place the capital value of the existing works and machinery in a doubtful position. The contract was finally approved by sixty-six votes to fifty-one votes.

NOTICES.

THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER may be ordered direct, through any of Messrs. Smith & Son's book-stalls, or of any newsgiant in the United Kingdom. Applications to the Offices for single copies by post must in all cases be accompanied by stamps.

The Prepaid Subscription (including postage) is as follows:

Table with 3 columns: Months, Price in £/s/6d. Includes United Kingdom, Continent, Colonies, India, United States, etc.

The International News Company, 83 and 85 Duane-street, New York City; The Toronto News Company, Toronto; and The Montreal News Company, Montreal, have been appointed agents in the United States and Canada for the sale of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER. A thin paper edition is printed for circulation abroad.

APPOINTMENTS OPEN.

WEALDSTONE URBAN DISTRICT COUNCIL.

TEMPORARY ASSISTANT SURVEYOR.

Applications are invited for the above appointment from persons between the ages of twenty-five and thirty-five, who have had good experience in a municipal surveyor's office, in surveying and levelling, are good draughtsmen, and able to prepare accurate working drawings, specifications, bills of quantities, and to assist generally.

Salary at the rate of £125 per annum; at least six months' engagement for satisfactory services. The whole time must be devoted to the duties, which are to be commenced as soon as possible after the appointment is made.

Further particulars may be obtained from Mr. P. J. Hepwood, Engineer and Surveyor, Council Chambers, Wealdstone.

Applications, stating age, present and previous occupation, together with copies of three recent testimonials, to be sent to me and addressed to the Chairman of the Council, and endorsed "Assistant Surveyor," not later than Monday, the 26th day of December, 1898.

R. J. BRYANT,

Clerk to the Council.

Council Chambers, Peel-road, Wealdstone, Middlesex.

BOROUGH OF STOKE-UPON-TRENT.
ASSISTANT SURVEYOR.

The Town Council require the services of an Assistant to the Borough Surveyor.

Salary, £91 per annum.

Candidates must have a thorough knowledge of the duties pertaining to the appointment.

Personal canvassing will be a disqualification.

Applications, in own handwriting, accompanied by not more than three recent testimonials, and endorsed "Assistant Surveyor," to be received by me not later than December 12th.

JNO. B. ASHWELL,
 Town Clerk.

Stoke-upon-Trent.
 November 24, 1898.

ILFORD URBAN DISTRICT COUNCIL.

The Ilford Urban District Council require in the Surveyor's department an Assistant for the inspection of building and other work, at a salary of £120 per annum.

The person appointed will be required to devote his whole time to the discharge of his duties, a list of which can be obtained from Mr. H. Shaw, A.M.C.E., the Council's Surveyor, at his offices, 7 Cranbrook-road, Ilford.

Applications, in candidate's own handwriting, accompanied by copies of three recent testimonials, stating age (which must not be under twenty-five or over forty-five), qualifications and experience, endorsed "Application for Surveyor's Assistant," under seal, and addressed to the Chairman, must be sent to me on or before noon on Monday, the 12th December next.

Canvassing, directly or indirectly, is strictly prohibited and will be deemed a disqualification.

(By order)

JOHN W. BENTON,
 Clerk to the Council.

Council Offices, Ilford, Essex.
 November 25, 1898.

HERTFORDSHIRE COUNTY COUNCIL.
APPOINTMENT OF FOUR DISTRICT MAIN ROAD SURVEYORS.

Applications are invited for the post of District Main Road Surveyor from persons who have had thorough experience in all the duties pertaining to a road surveyor.

Salary, £130 per annum clear of all travelling and office expenses, rising to a maximum of £160 per annum.

Preference will be given to applicants who are cyclists and not more than thirty-five years of age.

The persons appointed will act under the instructions of the County Surveyor, and will have charge of a district comprising about 120 miles of rural main roads. They will be required to devote the whole of their time to the service of the County Council.

Particulars of duties, terms of appointment, and form of application, may be obtained by applying, by letter, to the County Surveyor.

Applications, in candidate's own handwriting, accompanied by copies of not more than three testimonials, must be sent to the undersigned not later than Monday, December 19, 1898.

URBAN A. SMITH, c.e.,
 County Surveyor of Hertfordshire.

41 Parliament street, Westminster, S.W.
 December 7, 1898.

BOROUGH OF WENLOCK.
APPOINTMENT OF ASSISTANT SURVEYOR AND INSPECTOR OF NUISANCES.

The Town Council of the Borough of Wenlock are prepared to receive applications for the appointment of an Assistant to the Borough Surveyor and Inspector of Nuisances for one year commencing from 1st February next, at a salary of £80.

The person appointed will be required to devote the whole of his time to the duties of the office and to reside in Much Wenlock. He must be fully competent to perform the duties of the office and to act under the direction of the Borough Surveyor and Inspector of Nuisances.

Applications, stating age and previous experience, with not more than three recent testimonials, to be forwarded to me, the undersigned, not later than Saturday, the 17th instant, endorsed "Application for Position of Assistant Surveyor and Inspector."

Canvassing any member of the Council is strictly prohibited.

GODFREY C. COOPER,
 Town Clerk.

Much Wenlock.
 December 6, 1898.

CORPORATION OF LONDON.
PUBLIC HEALTH DEPARTMENT.

The Corporation of London hereby give notice that they are about to appoint Four Inspectors of Pavements, at a salary of £200 per annum each, to be increased from time to time, according to merit and ability, to a maximum of £300 per annum.

The appointments will be subject to three months' notice on either side.

The officers appointed will be required to devote their whole time to the duties of their office, and must be prepared to undergo a medical examination.

Applicants must have been accustomed to the superintendence of paving, building and drainage works, and must understand the qualities of building materials.

Applications, in candidate's own handwriting, stating age (not under thirty or over forty-five years), height, whether married or single, with copies of not more than three recent testimonials, must be delivered on or before Thursday, the 15th day of December, 1898, addressed "Town Clerk, Public Health Department, Guildhall."

The Act of Parliament under which the appointments are made requires that the inspectors shall reside within the district to which they are appointed.

Copies of the list of duties may be seen on application at the Guildhall, as above.

MONCKTON.

Guildhall.
 December, 1898.

URBAN DISTRICT OF LYTHAM.
SURVEYOR.

The Lytham Urban Council are prepared to receive applications for the appointment of Surveyor.

The population of the district is 7,200, and the nett rateable value £36,608.

Candidates must have had experience of the duties under a local authority.

All applications must be on the prescribed form, which can be obtained at the offices of the Council by forwarding stamped addressed envelope.

Applications, stating salary required, and endorsed "Surveyor," and addressed "The Chairman of the Council," must be delivered at these offices not later than noon on the 20th instant.

Canvassing, directly or indirectly, will disqualify.

(By order)

CHAS. A. MYERS,
 Clerk to the Council.

Urban Council Offices, Lytham.
 December 5, 1898.

NEWPORT PAGNELL URBAN DISTRICT COUNCIL.

The above Council invite applications for the position of Engineer at their Waterworks Pumping Station, Inspector of Water Services and General Waterworks Fitter.

Applicants must be competent to take full charge of the machinery and have a good knowledge of waterworks fittings, be able to execute ordinary waterworks repairs, and be prepared to undertake not to engage in any other business.

Wages to commence at 30s per week, rising by increments of 1s. per week per annum to a maximum of 33s. per week, with free use of garden at the Water Tower. The engagement will be determinable by one month's notice on either side.

Age not to exceed forty years.

Particulars of duties may be obtained on application to Mr. J. E. Hargreaves, Surveyor to the Council, at his office, Newport Pagnell.

Application, in own handwriting, accompanied by three recent testimonials, endorsed "Waterworks Engineer," to be sent to me, the undersigned, not later than Friday, December 16, 1898.

(By order)

E. P. WARD,
 Clerk.

COUNTY BOROUGH OF STOCKPORT.
APPOINTMENT OF BUILDING INSPECTOR.

The General Purposes Committee invite applications for the appointment of Building Inspector in the Borough Surveyor's department.

Candidates must be thoroughly qualified persons, to be accurate surveyors and levellers, and will be required to undertake the inspection of new buildings and drains, set out and fix levels for new streets, and make surveys of all new houses, buildings and drains, and to keep the necessary records in connection therewith, and to be well up in building construction and the Model Building By-Laws.

Salary, £2 2s. per week. Age to be between thirty and forty years. A list of duties may be obtained on application.

Applications, in candidate's own handwriting, stating age, and accompanied by not more than three copies of recent testimonials, and endorsed "Building Inspector," to be sent to Mr. John Atkinson, Borough Surveyor, on or before Thursday, December 22, 1898.

Canvassing will be considered a disqualification.

WALTER HYDE,
 Town Clerk.

UNBRIDGE RURAL DISTRICT COUNCIL.

The above Council are prepared to receive applications for the appointment of a Highway Surveyor for the Unbridge Rural District.

The district comprises nine parishes and about 90 miles of parish highways.

The Surveyor will be required to devote the whole of his time to the duties, and to reside within the district or in Uxbridge, as may be approved by the Council.

Salary, £200 per annum, to include all travelling expenses, but an office will be provided by the Council.

Applications, in the candidate's own handwriting, stating age, previous experience in road maintenance, and keeping the accounts, &c., relating thereto, accompanied by three recent testimonials as to character and practical knowledge of road work, to be sent to me on or before Wednesday, the 21st December instant.

The person appointed must be prepared to enter into a bond in the sum of £200.

Notice will be sent to any candidate who may be required to attend before the Council.

Canvassing, directly or indirectly, is prohibited.

Any further particulars may be obtained on application to me.

CHARLES WOODBRIDGE,
Clerk.

Council Offices, 38 High-street, Uxbridge.
December 5, 1898.

G WYRFAL RURAL DISTRICT COUNCIL.

WANTED, A DULY-QUALIFIED SURVEYOR.

QUALIFICATIONS.

Competent to discharge the duties of a district road surveyor, and capable of preparing plans, specifications, estimates, &c., to accompany applications to the Local Government Board for sanction to loans for the construction of works as the Council may require.

DUTIES.

To undertake the care of all the roads belonging to the Council.

To prepare plans, &c., superintend works of drainage and water supply that may be constructed by orders of the Council.

To see that the by-laws with respect to new streets and buildings are duly observed.

To attend all meetings of the Council, to submit reports with respect to the roads and sanitary works that he may be overlooking, and to submit the workmen's pay-sheets and

accounts of all expenses connected with the roads and sanitary works.

To keep all accounts and to discharge all duties of road and sanitary surveyors, and to obey all directions of the Council.

CONDITIONS.

Salary, £150 per annum.

To devote all his time to the duties of the office.

To provide security for the proper discharge of the duties in a bond given by a duly-approved guarantee society in the sum of £500.

The person appointed must be conversant with the Welsh and English languages, and must not be over forty years of age.

Canvassing the councillors, directly or indirectly, strictly prohibited, and will be deemed a disqualification.

APPLICATIONS,

with not more than four testimonials of recent date, stating age, qualifications and experience, to be received by me not later than Tuesday, the 13th day of December.

The selected candidates will be asked to attend the meeting of the Council at which the final selection may be made, but no expenses will be allowed.

J. HENRY THOMAS,
Clerk to the Council.

CARRIVON.

Minutes of Proceedings.

The Repair of Main Roads.

The provisions of the Local Government Act of 1888 with reference to main roads have been somewhat fruitful in litigation. Sec. 11 of that Act, it will be remembered, provides for the handing over to the county councils of all main roads, with all the powers and duties of highway boards in connection with them, subject, however, to this qualification, that an option is given to urban authorities to retain their own main roads, with a further provision that where this option is exercised the county council is to make an annual payment "towards the costs of the maintenance and repair and reasonable improvement connected with the maintenance and repair" of the roads retained. The amount of this payment is to be determined (unless agreed between the councils) by arbitration of the Local Government Board. There are further clauses in the section, including a provision enabling the county council to require the district council to undertake the maintenance of any main road in consideration of an annual payment "for the costs of the undertaking," to be determined in the same manner. With these latter clauses, however, we are not immediately concerned, our present purpose being to recall one or two decisions bearing upon those instances in which district councils have exercised the option of retaining the control of main roads. The provision that in such cases the county council is to contribute "towards" the cost of maintenance, &c., at first gave rise to considerable discussion. It was argued on the one hand that the use of the word "towards" showed that the legislature did not intend to make the county council liable for the whole of the cost; whilst, on the other hand, it was contended that the word was used merely to enable the council to dispute improper or unreasonable charges, there being apparently no reason why they should not bear the entire cost (properly incurred) in these instances, just as much as when they themselves managed the roads. This question, however, may now be regarded as practically set at rest in favour of the latter view. In *Wiltshire County Council v. Marlborough Borough Council*, which was a special case stated for the opinion of the Court on several points in difference between these two councils, one of the questions submitted for decision was "whether the obligation of the county council under sec. 11, sub-secs. 2 and 3, is to repay annually to the borough the actual cost (assuming it to be reasonably and properly incurred) of the maintenance, repair and reasonable improvement of the said footpaths during the preceding year, whether such cost be normal or increased by reasonable improvements connected with maintenance and repair, and whether it be defrayed by the borough out of current rates or by means of a loan." The Court (Lord Coleridge and Mr. Justice Day) expressed a very decided opinion that the county council were bound to reimburse the borough council the whole of the cost incurred, and that, in fact, the

term "towards" as used in the section did not necessarily imply something less than the whole. It is manifest that even had the Court felt compelled to construe the term *au pied de la lettre*, an award of the total cost *minus* the smallest coin of the realm would have sufficed to satisfy such a literal interpretation, whilst at the same time giving the borough council in substance all that they obtained by the contrary decision. Another important point which this case settles is as to the mode of reimbursement by the county council where the district council has borrowed the necessary funds for repairing the roads, the loan being repayable by instalments extending over a fixed period. The question, indeed, was raised, as we have seen, whether the liability of the county council arose at all where this method had been adopted. But the point was not contested very seriously, and the Court decided that, although undoubtedly liable, the county council could only be called upon to pay the amount so borrowed by the same instalments and at the same time as the district council themselves were bound to repay it.

Another question which arose in connection with this subject was as to the footpaths of main roads. In ordinary language the word "road" is, it must be admitted, an ambiguous term. When we talk about "the London Road" or "the Brighton Road," and so forth, we refer to the entire highway, comprising both the carriageway and the footpaths (if any). But, on the other hand, scores of instances will occur to the reader in which the term "road" is used of the carriageway only, in contradistinction to the footpath. It was in this latter sense, according to the contention raised on behalf of certain county councils, that the word was used in the Act. It will have been noticed that in the case last referred to the cost of maintaining and repairing footpaths was claimed and allowed, but the point does not appear to have been contested in that case, the dispute being, as we have seen, limited to other matters. One of the first cases in which the question was fully considered was *Warrminster Local Board v. Wilt's County Council*, in which Mr. Justice Charles decided against the narrow interpretation to which we have referred, holding that the footpaths were parts of the road within the meaning of the Act, and that the liability of the county council extended to the cost of their maintenance and repair and reasonable improvement, whether gravelled, paved, or asphalted, &c. This case was followed in *Matlock Urban District Council v. Derby County Council*, and also in *Burslem Corporation v. Staffordshire County Council*. Both these cases, which originally came before the Queen's Bench Division, were taken to the Court of Appeal, where the decision of the Court below was confirmed in each instance. Nevertheless, the county council in the former case had the hardihood to go to the House of Lords. But the result was a confirmation of the view of the Courts below; and this long- vexed question was thus, once for all, definitely set

at rest beyond the risk of overruling, since even the House of Lords itself (as was recently seen in *London Tramways Company, Limited, v. London County Council*) cannot revoke its own decision upon a point of law. There were one or two other points decided in *Warminster Local Board v. Wills County Council* which are worth noting, although they have not aroused the same amount of discussion as those previously referred to. It was held in that case that the liability of the county council extended to the cost of maintaining and repairing paved or pitched crossings, and to the cost of scavenging, cleansing and watering (so far as necessary for maintenance and repair), but not to lighting; and also to the cost of altering the paving of footways (as—e.g., by substituting flagging, pavement, wood, or asphalt, for gravel, &c.) in so far as it is a reasonable improvement connected with maintenance and repair, how far it is so being a question for settlement (in case of dispute) by arbitration.

In *Sandgate Urban District Council v. Kent County Council*, which has just reached its final stage in the House of Lords, the principal bone of contention was whether the county council were liable for the cost of the maintenance and repair of a sea wall, which, though not actually part of the road, protected it from the sea, and was alleged by the district council to be on that account a necessary work of "maintenance." The arbitrator appointed by the Local Government Board made his award in the form of a special case, some items of which were in favour of the county council, others of the district council, the nett result being that the former were ordered to pay a sum of £6,188 towards the cost of the repair of the main road, which sum included costs applicable to some portions of the sea wall. The award was confirmed by Mr. Justice Cave and Mr. Justice Lawrence in the Queen's Bench Divisional Court; but their judgment was reversed by the Court of Appeal, who sent the case back to the arbitrator with the direction to reject the whole of the claim of the district council and to award entirely in favour of the county council. The Court of Appeal, however, have, in their turn, been reversed by the House of Lords, who have restored the judgment of the Queen's Bench Division and confirmed the award in every particular. The case is perhaps as remarkable for the different estimates of the award and of the arbitrator, prevailing in their Lordships' House and in the Court of Appeal, as for the conflicting judicial views of the points of law involved. Lord Esher appeared to feel particularly aggrieved at the length of the award "by this gentleman, who, unfortunately for himself, was called an arbitrator." "I pity the arbitrator," continued his lordship, "because I cannot help thinking that if he had counsel before him it was they who led him into such an abomination as this." The Lord Chancellor, however, took a diametrically opposite view. "In his opinion scant justice had been done to the arbitrator, and those who criticised him had not sufficiently considered the complex nature of the problem which he was called upon to determine." The questions submitted to him "the arbitrator had treated with great minuteness . . . and had solved the problem put before him with great care and perfect accuracy . . . It was a remarkable fact that the arbitrator had so dealt with every one of the facts of the case that neither party had been able to suggest any omission of which he had been guilty." The majority of the other learned lords expressed full concurrence with the Lord Chancellor on this point, and after reading their calm and judicial comments one cannot help feeling somewhat surprised at the very different tone adopted by Lord Esher in the Court of Appeal. This, however, is by the way. The Lord Chancellor was equally emphatic on the main question. "It was gravely argued," he said, "that there was a construction" (i.e., the sea wall) "which ought not to be held part of the main road, although if it were not there the road itself would be washed away. To his mind

such a contention was absurd. It was common-sense that where the obligation was to maintain and keep in repair it was the duty of the persons subject to that obligation to take steps which would prevent the road being washed away . . . The proposition had been advanced that nothing outside the road could be done, and that the road itself should be allowed to go out of repair every year. But that argument lost sight of the word 'maintain.'" The tendency of the Courts, it will be seen from these cases, is to interpret the provisions of the Act in no narrow spirit, but liberally and from a common-sense point of view.

* * *

**Sanitation in
West
Bromwich.**

In 1895 Dr. G. S. Buchanan, on behalf of the Local Government Board, made an inquiry into the sanitary condition of West Bromwich. In his report he recommended, among other things, (1) that thorough and systematic attention should be given to insanitary premises in the borough, especially with reference to houses unfit for habitation, premises with drains improperly constructed, unpaved or insufficiently paved yards, and nuisances arising from the accumulation of refuse and excrement; (2) that a satisfactory system for the removal of dry refuse and excrement should be substituted for the present objectionable privy middens and pit privies in the borough, water carriage being adopted where possible, and (3) that a fresh series of by-laws, based on the "model" series of the Local Government Board, should be adopted. In May last he was again instructed to visit the district, and in his report, recently issued, he is able to state that on the whole the corporation have, during the three years under review, shown greater activity than before in dealing with insanitary conditions, but that a variety of conditions will continue to demand careful consideration and sustained effort on the part of the sanitary authority of the borough. A few points may be referred to in greater detail. Some progress has been made in remedying dilapidations of houses, overcrowding of persons, faulty paving and drainage of yards, objectionable middens, want of eave spouting, and other unwholesome conditions. But owners called upon to make repairs are apt to do so in a makeshift fashion. Thus the demand for the proper drainage of common yards is still met by the provision of open channels, roughly constructed of brick, laid without regard to level, and having right-angled bends in their course. New paving in these common yards often turns out to be an insufficient patch of brickwork, which has not been carried as far as the midden, and in consequence pollution of the soil is apt to continue. Dr. Buchanan, on being told that the town council doubted their powers to compel more thorough action, pointed out that by-laws might be adopted under sec. 23 of the Public Health Acts Amendment Act, 1890. As to the substitution of water-closets, the report is that proposals to that effect meet with opposition from those who are interested in the numerous small properties in the borough, and that the opposition has been in a large measure successful. He cites the case of an owner who was called upon to demolish an ashpit and two privies situated about 10 ft. from dwellings, but who pleaded successfully to the stipendiary that the structures complained of had been erected twelve years before with the approval of the town council, and called tenants to express their satisfaction with the existing arrangements. The enlightened stipendiary was not satisfied that the structures in question did constitute a nuisance, and said that even if he had been he would have hesitated to order the provision of a water-closet. Under such circumstances it is not surprising to find a corporation rather discouraged. "Dry refuse" is tipped on waste ground within the borough, but the council have been urged, so far in vain, to provide a refuse destructor. The town clerk and the borough engineer have drafted new by-laws. Officials, how-

ever, may draft new by-laws, but only the council can adopt them. In his former report Dr. Buchanan said that sewage was discharged on a farm at Friar's Park, "of large area, but comprising much land covered by old pit mounds and little suited for sewage treatment." In his later report, however, he was able to say that the town council had recently applied to the Local Government Board for sanction to a loan for the purpose of providing tanks for the bacterial, or as an alternative the chemical, treatment of sewage, and of laying out 35 acres of land for irrigation. He was also able to report that during the interval between the two inspections the council had carried out some satisfactory street improvements, enlarged the public baths and wash-houses, paved a considerable number of footpaths, and had made desirable additions to the public parks and recreation grounds. We are glad to observe that Dr. Buchanan does not forget to point out that sanitary improvements in the Black Country are carried out in the face of exceptional difficulties, and demand "judicious and resolute action from those who undertake the duty of safeguarding the public health of their districts." Therefore such progress as has been made in West Bromwich is the more commendable.

District Surveyors under the London Building Act.

We agree with one of the speakers at the Surveyors' Institution, on Monday, who thought that Mr. Weaver, the well-known surveyor to the Kensington Vestry, was a bold man in bringing up before

such an audience so contentious a question as the position and functions of the officials appointed by the London County Council under the London Building Act and known as district surveyors. Most, if not all, of these gentlemen are members of the Surveyors' Institution, and it was only to be expected that they would vigorously defend the maintenance of the *status quo* as superior in every way to anything that Mr. Weaver might suggest. It was a pity, however, that Mr. Weaver's proposals should have been misinterpreted, as they were by one or two speakers. He does not propose that the present district surveyors should simply be swept aside and their duties handed over to the surveyors to the local bodies. He simply puts forward the broad contention that the duties of the surveyor to the local authority and those now carried out by the district surveyors might and ought to be combined in and discharged by one official, as is the case in the large provincial cities and towns. There is nothing preposterous in the proposal that the present surveyors to the vestries and district boards should, where competent, discharge the duties in question, as borough engineers do in the provinces, with satisfactory results. The present position is certainly anomalous, and Mr. Weaver had no difficulty in demonstrating the inconvenience and delay that result from the divided jurisdiction which now prevails, one official acting under the London Building Act and another under the Public Health (London) Act. This civil of divided jurisdiction has been in no way diminished by the decision of the London County Council some years ago to debar district surveyors appointed after the passing of the order from engaging in private practice. It was asserted by more than one speaker on Monday that the surveyors to the local authorities are more engineers than architects, but, as a matter of fact, the majority of them have a very considerable architectural training and experience. Again, surely the engineer requires as intimate an acquaintance with materials and construction as the architect. In view of the intention of the Government to bring in a Bill to reorganise the municipal work of the metropolis, Mr. Weaver and the Surveyors' Institution have done well to bring this important matter to the front. As the discussion will be resumed at the next meeting of the Institution, we may be able to refer to the question in greater detail.

Honorary Surveyors.

The Urban District Council of Phillack, in Cornwall, find themselves floundering in a position which is probably unique in its way. About six months ago their surveyor resigned, and ever since the duties of the office have been performed (?) by three members of the council. This noble triumvirate, we are given to understand, are carrying out their duties gratuitously, and, like the Greeks of old, they no doubt expect that their public-spirited and self-sacrificing devotion will secure the approbation of their fellow-citizens. For do they not save the latter from the unpleasant necessity of paying the pampered official's salary, which, we believe, reached the colossal figure of £50 per annum? Whether each of these amateur, but self-confident, surveyors takes charge of some special district or branch of the duties, or whether they meet in solemn conclave to discuss important questions before taking action, we know not. At all events, the arrangement is a remarkable one and has certainly the merit of originality, and it remains to be seen whether the ratepayers do not suffer in proportion to the inexperience of their self-elected officials. It may be doubted, however, whether such an arrangement is in accordance with sec. 189 of the Public Health Act, 1875, which says: "Every urban authority shall, from time to time, appoint fit and proper persons to be medical officer of health, surveyor, inspector of nuisances, clerk and treasurer." Unfortunately, however, we are not aware of any legal machinery by which such an administrative scandal as this at Phillack can be prevented. Could not that august body, the Local Government Board, be persuaded to do something in the matter if it were brought to their notice? But who will undertake the task of moving the Local Government Board? The question is one that directly affects the interests of surveyors to local authorities, and possibly the council of the Association of Municipal and County Engineers may see their way to take some action.

* * *

Councillor and Surveyor.

There has been an instructive but somewhat melancholy episode at Chertsey. A member of the urban district council has been convicted for infringing the building by-laws and mulcted in penalties. Among those who gave evidence for the council was the late surveyor, and naturally the convicted one and his friends on the council did their best to prevent the payment of the surveyor's bill, but, fortunately, without success, though a fair-minded member of the council felt compelled to make a spirited protest against black-guarding an official after he had gone, at the same time pointing out that two guineas was a recognised fee for attendance, and that the remainder of the charge was not too much for expenses. Nor was the present surveyor to the council, Mr. J. Freebairn Stow, allowed to escape without some unpleasantness; but when the matter came up for discussion he did not hesitate to speak to the point. He stated that only since he had entered upon office had the work been done by the offending councillor, "who had threatened to take out a mandamus with respect to one of the chimney backs." Still no certificate could be granted, because there was reason to believe that some of the walls were built brick-on-edge, and that the bay windows were not in accordance with the plans. Mr. Stow took exception to the remarks of a councillor who had said that a surveyor was not a professional man, in the same sense as a lawyer for example, and reminded the council that if he had not been a duly-qualified civil engineer they would not have appointed him. Finally, he pointed out the mischievous results that must ensue if the council did not support him adequately in the discharge of his duties. We have ourselves been for years insisting on the necessity of proper relations between officials and authorities, but the need for agitating the matter seems as great as ever.

The Birmingham Water Scheme.—III.

By JAMES MANSERGH, M.INST.C.E.

CUT AND COVER WORK.

THE ELAN VILLAGE.

I should like now to be allowed to say a few words about the arrangements which have been made by the Elan Supply Committee—with whom I am in constant touch—for the housing and general well-being of the bulk of the men engaged on the works in the Elan Valley and of their families. At my recommendation the committee determined to undertake the construction of the reservoirs and all collateral works in the valley under the direct administration of their own staff and without the intervention of contractors. This is not the time nor the place either to defend or apologise for this decision; suffice it is to say that up to the present time the method is giving complete satisfaction.

Having thus decided, the question arose of how the people were to be kept together in close proximity to the works, and it was answered by the erection of a village below Caban Coch with sufficient accommodation for about 1,000 people. The houses are of wood, and are built of different types to suit varying grades; thus, there are huts for officials such as the missionary and schoolmaster, for gangers, for married workmen and for navy lodgers. In the latter there is a good kitchen and living-room, rooms and offices for the hut-keeper, his wife and family, and a larger room for lodgers. It has been not unusual on public works to put twenty-four men into such a hut, sleeping in pairs in twelve beds; and where work was going on day and night I believe there have been occasions when these beds have not had time to get cold. This, to say the least of it, is not nice. The committee needed no pressing from me to sanction the erection of the huts above described. In the larger the eight men sleep in one large room, but each man has his own separate cubicle and single bed.

Water is laid on under pressure throughout the village; the drainage is as good as can be, and there is a fire brigade. There is also a canteen, where good beer and aerated waters are to be had at certain hours and under strict regulations; schools for infants and older children, with one male and two female teachers, these rooms being used on Sundays for religious services. There is also a large recreation hall, with gymnasium games, writing accommodation and a circulating

library, and in the hall are given concerts, theatrical entertainments, and last winter a ball. Then there are baths and wash-houses and a general and accident hospital in the village, and another for infectious diseases far away up the hillside. The baths are, of course, patronised principally on Saturday afternoon and Sunday morning. When first opened there was only one charge—viz., 1d. It was soon found that this would not do. Account had to be taken of different grades. If a nipper or ordinary tramp labourer—who is not a proud man—paid 1d., the legitimate navy demanded to pay

SPECIMEN OF CUT AND COVER WORK (February, 1898).

more, so as to be select. The foreman posed on a still higher platform. Now a warm bath, soap and one towel costs 1d. Ditto with two towels 1½d. Ditto, ditto, and high-class toilet soap, 2d. There are, of course, ladies' days, but into the particulars of their prejudices I have not ventured to inquire.

To keep out infectious diseases there is also a "doss-house" on the opposite side of the river to the village, in which men tramping in search of work are taken in. They are made to take a warm bath and their clothes are disinfected; and for

ELAN VILLAGE (April, 1895).

a week they sleep here, and are under the supervision of the doctor before being allowed to take up their quarters in the village. These arrangements have hitherto proved successful, and whilst two years ago small-pox was epidemic in many parts of South Wales, and especially on some large public works, we escaped.

With the permission of Mr. Leas, the highly esteemed and most competent secretary of the Water Committee, I will now quote from a lecture he has delivered with great success on several occasions in the city:—

"The village is on the opposite side of the river to the road, and access is given to it by a suspension bridge constructed across the river by the corporation. The position of the village in that it has to be approached by this bridge, and that it is erected on private ground to which there is no public right of way is unfortunate, in that the corporation thereby have the means of exercising a beneficent supervision which would be impossible were it in the ordinary sense of the word a public place. Nor is the supervision of the corporation merely nominal. No strangers are allowed in the village without permission. Every tradesman who wishes to deliver goods is required to furnish himself with a pass, on which somewhat stringent regulations are laid down. For instance, the owner undertakes he will not deliver any intoxicating drinks within the village, and the Sunday quiet and rest of the inhabitants are protected by a regulation that, with the exception of milk, no goods shall be delivered or sold on that day; and these regulations are not a dead letter, for at the end of the bridge on the village side a gate is situate at which the bridge-keeper is constantly in attendance and examines the contents of every cart before it is permitted to proceed.

"Fire hydrants are fixed on the water mains throughout, fire-extinguishing appliances are provided at convenient points, and in the middle of the village there is a small fire station surmounted by a fire bell. This is the rendezvous of the fire

brigade, some members of which are on duty every evening. The village is perambulated throughout the night by two watchmen. All of the butts are, moreover, inspected weekly by the village superintendent, with a view to the removal of all refuse and the prevention of the use of oil lamps of dangerous type, and other articles likely to occasion an outbreak of fire.

"The village day school is placed under the Education Department, the school manager being the chairman of the Water Committee with three officials, two of whom are resident at the works and one in Birmingham. The buildings are certified by the department as sufficient for the accommodation of 168 scholars. At first considerable difficulty was experienced in bringing the navvies' children under the discipline of regular instruction, but now good progress is being made, and at the last examination by the Government inspector the general school earned the highest possible grant."

THE CANTEN AND ITS SOCIAL RESULTS.

I must now refer to the canteen. To this institution a special interest attaches, as we have here an experiment embodying some of the suggestions thrown out for the regulation of the liquor traffic. In point of fact, the canteen is a municipal public-house, and is, I think, the only instance of the kind in the United Kingdom. On the question of the drink traffic there were the three proverbial courses open to the Water Committee: (1) To do nothing, and allow any enterprising publicans who could obtain licenses to set up their establishments and conduct their trade in the usual manner. (2) To attempt to prohibit the traffic altogether. (3) To undertake the provision of beer for the use

STREET IN ELAN VILLAGE.

of the community, but under such regulations as should render it least hurtful.

The objection to the first course is obvious. The navvies—in common, alas, with many others—readily yield to temptations when they have the means of gratifying the appetite, and during the summer months, when regularity in the gangs is of the utmost importance, and at the same time when earnings are highest, there would be the greatest likelihood of the demoralising and disastrous effects of drunkenness asserting themselves. To the second course the objection was none the less marked. The people, rightly or wrongly, will have their beer, and without facilities to obtain it in a legitimate manner they would decline the place altogether or resort to illicit means to supply themselves. It was held, therefore, to be impolitic to attempt prohibition; and I think it would have been unwise to prohibit altogether the sale of beer.

The third alternative course, then, was that adopted—namely, to provide beer under stringent regulations. The canteen is placed in charge of a manager, in whose name the license stands. The manager has no interest whatever in the sale of the drink. His salary is fixed, and is sufficiently liberal to command the services of a thoroughly reliable and respectable man. The points against which he must guard himself is incivility towards customers on the part of himself or his assistants, lack of cleanliness in the house and drinking vessels, selling out of hours, and disorder and drunkenness on the part of his customers. If he is able to avoid offence in any of these respects he is thought no worse of if the takings fall off, and no better of if they increase.

To promote the objects in view stringent regula-

THE DOSS-HOUSE JUNCTION (April, 1895).

tions have been enacted; and the regulations are not merely printed and hung on the walls, but are actually enforced. The sale of drink is refused to men who show signs of having had enough, or who have already been supplied up to the stipulated limit. No women or children are permitted in the bar. Even in the outdoor department no woman under twenty-one years of age is served and no boy under sixteen. The house is closed every night at 9 o'clock, and the inspection and co-operation of the police are courted in every way. Every effort is made to sell a thoroughly wholesome and pure beer. A regular system of sample taking and testing is carried out, samples being taken without notice from time to time and forwarded to Birmingham for analysis in cases marked with numbers only, so that the analyst cannot tell from what brewers the beers are purchased.

Now as to the social results. While we cannot say that by our attempt to regulate the drink traffic we have created a "Utopia," we may firstly say—and indeed we claim—that we have reduced the evil results of drinking to a minimum, taking into consideration the fact that on the opposite side of the river, within a mile of the village, another public-house exists, which is conducted on the usual lines. Persons qualified to judge speak in the highest terms of the results of the experiment.

One of the declared bases of the Elan village canteen is that the profits are devoted to the social well-being of the community. First, the whole of the cost of the day school beyond the Government grant, and including the cost of the building, is provided from the canteen profits; in other words, the profits take the place of what, in an ordinary community, would be the school board rate. Secondly, the cost of erecting and maintaining the public hall, with the library, gymnasium, reading-room, &c., is provided from the same source. Recreation grounds for the workmen and clerical staff, the deficit on the bath-house and occasional help to charitable institutions are all defrayed from the canteen profits.

The men are taken up the valley from the village early in the morning, and brought back after their work in railway carriages, so as to save time and their exposure in open trucks, and the children from the upper works huts are brought down to school and returned home in the same way. With this ride in view the parents have no trouble in getting them away to their lessons.

For the series of smaller half-tone illustrations used for the elucidation of Mr. Mansergh's lecture in this and the two previous issues we are indebted to the kindness of Mr. Thomas Barclay, formerly a member of the Water Committee of the Birmingham City Council, and the author of an admirable volume, entitled "The Future Water Supply of Birmingham," in which work the illustrations to which we have referred first appeared along with others. Those who wish for more details than Mr. Mansergh could compress into his lecture cannot do better than obtain Mr. Barclay's book, which is published by Cornish Brothers, 37 New-street, Birmingham, and Simpkins, Marshall & Co., Limited, London, at 3s. 6d. nett. The main features of water supply schemes for large towns can be more clearly indicated by following the details of some typical concrete example than by mere theoretical disquisition. The Birmingham scheme is not only typical but is in some respects unique, and is being carried out on a gigantic scale. From this point of view Mr. Barclay's volume, with its maps, plans and other illustrations, the lucid explanations and painstaking accuracy of the writer, is a distinctly valuable contribution to the literature of water supply. The first five chapters deal with the present supply, the conditions of a suitable supply, the cost of the necessary works, the action of moorland water on lead, and the answering of objections to the scheme. The subsequent chapters give particulars of the passing of the Act, the provision made for the interim supply of Birmingham, and a description of the works in the Elan valley, showing the progress made in the construction of the reservoirs on the watershed and at Frankley and what had been accomplished on the line of aqueduct at the time of writing. The last chapter is devoted to interesting and useful notes on the Liverpool, Manchester and London water supplies, embodying information which the reader can turn to account for purposes of comparison.

Salford.—In view of the doubt as to the liabilities thrown upon local authorities by the Workmen's Compensation Act, 1897, the corporation are attaching the following clause to all specifications, forms of tender, contracts, &c.: **NOTE.**—The contractor shall pay to the corporation any sum or sums of money, and all costs, claims and damages whatsoever, which the corporation may, in pursuance of proceedings brought against them under sec. 4 of the Workmen's Compensation Act, 1897, have to pay as compensation to any workman employed by the contractor in respect of any accident arising out of and in course of his employment, and in default the corporation may recover the amount thereof by action at law, or may deduct the same from any moneys due to the contractor for the execution of the works under this contract, any certificate of the amount payable to the contractor in respect of such works, or any clause of this agreement, or any submission or reference therein contained, or any other matter or thing notwithstanding.

THE SANITARY INSTITUTE.

EXAMINATIONS IN LONDON.

At an examination in practical sanitary science, which was held by the above Institution, at Parkes' Museum, Margaret-street, London, W., on the 2nd and 3rd insts., six candidates themselves, and Mr. William Ord, 17 Cambridge-gardens, Hanwell, was granted a certificate. The following were the questions set for answer in writing: (1) What is the law relating to the diffusion of gases? What bearing has this on the ventilation of living-rooms? (2) Describe the wet and dry bulb thermometers. State how the relative humidity of the atmosphere can be arrived at by means of this instrument. (3) What is meant by "ground air" and "ground water"? What circumstances affect the movements of each, and how may they get polluted? (4) Specify the construction and materials of a fireproof floor, 60 ft. long and 20 ft. wide, capable of bearing a distributed weight of 25 tons. (5) How can a school-room best be ventilated? What should be the size of inlets and outlets provided, and what should be the relative positions of these openings. (6) Describe briefly a refuse destructor and its uses. What temperature is usually maintained to destroy ordinary town refuse, and what percentage of clinker remains after cremation. (7) In what state of combination does the largest proportion of nitrogen exist in fresh town sewage? Shortly describe the treatment you would recommend for defecating the sewage and utilising the nitrogen compounds in solution. (8) A drain with a fall of 1 in 40 has a velocity of flow of 3 ft. per second; what velocity would be secured if the same drain is relaid with a fall of 1 in 30?

On the same days an examination was held for inspectors of nuisances, at which 125 candidates presented themselves, seventy-four of whom were certified, as regards their sanitary knowledge, competent to discharge the duties of inspectors of nuisances. The following were the questions set for answer in writing: (1) Describe briefly how to lay domestic drains from house to sewer. Give plan to scale of 8 ft. to 1 in., and state diameters and fall to sewer. (2) In a case of typhoid fever occurring in a crowded tenement dwelling, describe in detail what steps you would take to prevent the spread of the disease with respect to the following points: (a) The sick; (b) the healthy members of the family; (c) the bedding, clothing, and other articles exposed to infection; (d) the rooms; and (e) the drainage. (3) Give a list of the offensive cargoes most frequently carried by canal boats, and state the precautions that should be taken to prevent nuisance. What are the chief regulations as to cargoes made by the Local Government Board under the Canal Boats Acts. (4) Define "hard" and "soft" water. State the action of the latter on lead, and how such action may be prevented. (5) Describe the appearance of mealy pork, and the effects when eaten by men. (6) What are the cubical contents of a circular rain-water tank, 11 ft. diameter and 12 ft. deep, with a flat bottom? State the weight of the water that it would contain. (7) What are the provisions of the Sale of Food and Drugs Acts with regard to the purchase of samples for analysis? (8) Sketch a good form of slop sink for domestic use, and show the method of connecting the waste from the slop sink, situated on the first floor, to the drain.

ELECTRIC LIGHTING IN THE CITY.

A memorial, signed by over 5,000 ratepayers and others, has been addressed to the Lord Mayor and Corporation of the City of London in opposition to an application made to the Board of Trade for a provisional order enabling the Charing Cross and Strand Electricity Supply Corporation, Limited, to supply electric energy within the City of London. The grounds for the memorial are set forth as follows: (1) That monopoly of supply by any one company is adverse to the interests of the ratepayers and the public; (2) that the rate charged for supply of electric energy by the corporation is very considerably less than that charged within the city by the present supply company; (3) that the service of the corporation is a more economical, steady and efficient service; (4) that the low tension distributing system is a safer system for many reasons, among others the avoidance of fireproof transformer-rooms or apparatus on the premises supplied with energy; (5) that the low-tension direct-current system appears, *inter alia*, to be the best adapted for arc lighting and motive power purposes. The memorial is signed by twenty-nine banks, as well as by eighty-one insurance companies and eighty-two newspapers.

Notice of Removal.—Messrs. Sheath Brothers, india-rubber, gutta-percha, general manufacturers and patentees, have informed us that they have removed to 87 City-road, London, E.C. These new premises, we understand, have been built specially commodious to meet the requirements of their largely-increasing trade, and to enable them to keep a much larger stock of their regular and special manufactures for india-rubber and gutta-percha manufacturers and dealers, ironmongers, coach builders, saddlers, upholsterers and the building trades.

Comparative Reports of General Practice.

XXX.—TRAMWAY TRACTION : WEST BROMWICH REPORT.—V.

PRESCOT.

The borough surveyor, being in the neighbourhood of Prescott on other corporation business, availed himself of the opportunity, by the courtesy of Mr. B. Cookson the secretary of the company (to whom acknowledgement is also due for the useful information on the subject), of closely inspecting the experimental line of the "simplex conduit electric tramway" and inserted trolley system laid down at Prescott, near St. Helens, and the following is a description of the short experimental line and the advantages claimed for this system:—

The line has been laid down in the grounds of the British Insulated Wire Company at Prescott, and is one-quarter of a

"SIMPLEX" TRAMWAYS.—CROSS-SECTION AT HATCHWAY, SHOWING CARRIER ARM AND COLLECTOR.

mile of single track, and includes some particularly difficult conditions, besides presenting continuous and varying gradients. For about half of the distance there is a gradient of 1 in 25. It includes a curve having a radius of about 45 ft.

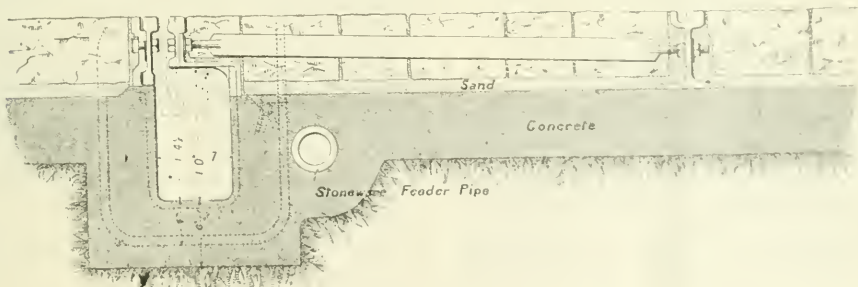

The conduit is constructed of concrete, taking the form of the inner surface of cast-iron yokes, as in the case of conduits for cable tramways. These yokes are placed at intervals of 4 ft., except at the end of the rails, where a pair are placed only 18 in. apart. This arrangement is made to give greater support to the rails, which rest upon and are bolted to the yokes. The yokes are embedded in and are supported by the floor and walls of the conduit, which are 6 in. thick. The traction rail weighs 50 lb. per yard, and has the section shown in the illustration, while the inner rail of the conduit weighs 43 lb. per yard. At the surface the slot measures about 1 in., but as one of the rails projects slightly to form a groove, the actual width of the slot is reduced to $\frac{3}{4}$ in., or even $\frac{1}{2}$ in. Below the rails the conduit broadens out to 8 in. in width, so that, including the walls and concrete bottom, we have a total

removable. Bolted to this bar is a large insulator supporting a curved steel-carrier bar, $\frac{1}{2}$ in. in diameter, on which rests the cable. These bars are used only on straight sections of line and on slight curves. At all sharp curves modified appliances are necessary. Under tension at curves the cable would, of course, tend to assume a straight line. To prevent this and to secure the cable upon its insulated support when a collector is passing, a device of considerable ingenuity has been brought into play. The hatch boxes are placed at shorter intervals on sharp curves, the space between them decreasing on very sharp curves to 8 ft., and to the square iron bar let into the box are bolted two insulators, which support a carrier box swivelling vertically, to which is attached a carrier arm. The object of the device is to secure freedom for a vertical rise of the cable while allowing no lateral motion. As the cable is firmly secured in the carrier arm, it moves with this, and the swivel is so hung that it can rise or fall with perfect ease as the collector passes along underneath the cable, but it cannot move laterally, so that the alignment of the cable is maintained.

An even strain is kept on the cable throughout by a tension arrangement resembling somewhat the tension gear on a cable tramway. The conductor consists of a flexible wire cable, made by the British Insulated Wire Company. Owing to its great flexibility, it can be conveniently handled, and it can be removed and replaced, should this be necessary for any reason, with facility. For the return circuit the rails are employed, and they are bonded in the usual manner. Reference has been made to the collectors, by which current is conducted from the cable to the car. A hollow shank gives space for the passage of a conductor, properly insulated to a shoe of brass, which forms the rubbing surface. On this rests the cable, which is lifted from its support as the shoe passes beneath it, and again falls back on the insulating arms. The shoe has quite as smooth a passage along the conductor as has the trolley wheel or bar in the overhead system, and no difficulty is to be apprehended on this score. The shoe is attached to the truck of the car just in front of the wheels, and, while allowed free lateral motion in relation to the car, it is very firmly secured, so that it easily clears the slot of any stones or other matter that may be lodged there.

Any type of electric car can, of course, be used with this system. For the line at Prescott a small but neatly-designed car has been built, which weighs 5 tons 13 cwt., and has seating accommodation for twenty persons, the two motors being 15 horse-power each.

The advantages claimed by the promoters for this system are: (1) Freedom from street obstruction, such as poles and overhead wires; (2) high permanent insulation; (3) accessibility of electric fittings for repairs and renewals over ordinary electric conduit systems; and (4) economy in construction and simplicity. As the system has not been as yet adapted

"SIMPLEX" TRAMWAYS.—CROSS-SECTION OF TRACK AND CONDUIT BETWEEN HALF-RAILS.

width of 1 ft. 5 in., with a total depth of 1 ft. 10 1/2 in.; not a large excavation as tramway conduits go. In special cases, as, for instance, in crossing bridges, the total depth can be reduced to 12 in.

But the distinctive features of the system are the use of a flexible cable and the arrangements for supporting it in the conduit, and to these we now turn, taking first the ordinary insulator or carrying bar, on which the cable is loosely supported (see illustration). These occur on straight runs at intervals of 3 ft.—i.e., there is an insulator at the junction of every pair of rails. At these points hatchways are let into the conduit between the yokes, which are here 18 in. apart. A box or mud-hole is thus formed, with a framework and cover of cast iron. In the framework of each box, a little below the cover, there is a socket, into which a square bar of iron is dropped without any fastening, so that it is instantly

removable. Bolted to this bar is a large insulator supporting a curved steel-carrier bar, $\frac{1}{2}$ in. in diameter, on which rests the cable. These bars are used only on straight sections of line and on slight curves. At all sharp curves modified appliances are necessary. Under tension at curves the cable would, of course, tend to assume a straight line. To prevent this and to secure the cable upon its insulated support when a collector is passing, a device of considerable ingenuity has been brought into play. The hatch boxes are placed at shorter intervals on sharp curves, the space between them decreasing on very sharp curves to 8 ft., and to the square iron bar let into the box are bolted two insulators, which support a carrier box swivelling vertically, to which is attached a carrier arm. The object of the device is to secure freedom for a vertical rise of the cable while allowing no lateral motion. As the cable is firmly secured in the carrier arm, it moves with this, and the swivel is so hung that it can rise or fall with perfect ease as the collector passes along underneath the cable, but it cannot move laterally, so that the alignment of the cable is maintained.

SUMMARY.

Having briefly described the various electric tramway lines in the places visited, the sub-committee before drawing conclusions wish to draw your attention to the following summary, and it may be advisable to state that, in addition to the information obtained as to the various systems of mechanical traction, the department learned a great deal as to general arrangements, which cannot fail to be of use

and which could not have been obtained without personal investigation. The sub-committee wish to emphasise the fact that they approach the consideration of the conclusions to be arrived at solely on the merits of the question, with but one aim and object in view—the general well-being, development and interest of the town.

THE CABLE SYSTEM.

Advantages.—The chief advantages of the cable system are: (1) The absence of overhead apparatus in the streets. (2) The regular speed and the freedom from accidents which might be caused by the driver losing control of the car. (3) The adaptability of a cable line to the demands of an increasing traffic. If extra cars are required at any time the extra cost and power required are comparatively small in proportion to the number of cars so required. (4) Economy of working. (5) Cleanliness.

Disadvantages.—The great objections to this system are: (1) Its great cost of construction and the prolonged interference with the streets during construction and repairs, when the traffic and business is greatly impeded. (2) The inflexibility of the traffic conveyed by it. If time is lost it cannot be regained, the speed of the cable limiting the speed of the car, and a car cannot be run back if required. (3) The objection to the slot, which, although much narrower than with the electric conduit, is still objectionable; and the noise from the cable running in the pulleys below the ground is found to be a constant annoyance to residents on the route. (4) The fact that any breakdown of the engines or cable stops the traffic entirely on that particular section.

Sub-Committee's Recommendations.—The sub-committee are not prepared to recommend the adoption of the cable system in West Bromwich, as on account of the very heavy cost in construction it is prohibitive for the entire line. If the entire route were laid on the cable system it would be an enormous expense, two power stations at least would be necessary, and the difficulty of getting over canal and railway bridges would have to be faced as in the conduit system, and if the portion from Carters Green to the New Inns, Handsworth, were laid down for the cable system it would, they are informed, cost at least £75,000. There would then remain the difficulty of changing at Carters Green for passengers to Great Bridge and Hill Top.

A BUSINESS AMALGAMATION.

We are informed that the well-known business of the Patent Gully Company, Limited, Nottingham, has been amalgamated with that of Messrs. Ames, Crosta & Co., Limited, sanitary engineers, Nottingham. The business will henceforth be conducted under the title of the Ames-Crosta Sanitary Engineering Company, Limited, at City Chambers, South-parade, Nottingham. The Patent Gully Company was formed to place upon the market Crosta's patent surface-water gully, which is now well known to engineers and surveyors, and is being largely used in London and the principal towns and health resorts throughout the United Kingdom. This gully has on each occasion when it has been exhibited been awarded the medal of the Sanitary Institute of Great Britain.

The Ames and Crosta patent pipe joint is also now being largely adopted. This joint, which was placed upon the market by Messrs. Ames, Crosta & Co., is designed to dispense with composition rings, and to ensure a perfect water-tight joint, with a true invert, at a low cost. That company have also recently brought out an improved manhole cover, (patented by Mr. R. Ames), which appears to combine many excellent points, and has, we understand, already found great favour among engineers and surveyors. In addition to these specialities, the new company propose to deal in all kinds of sewer ironwork and stoneware sanitary materials. With their present extensive connection and the assistance of an unusually strong board (among whom we notice the late surveyor to St. Martin's Vestry, Mr. Charles Mason, A.M.I.C.E.) the amalgamated firm should rank high among the first sanitary engineering firms in the country.

* Presented to town.

IMPORTANT IMPROVEMENT AT SHEFFIELD.

THE ERECTION OF BALL BRIDGE.

The erection of a new bridge over the river Don at Ball-street, Sheffield, which is to take the place of the old foot-bridge that for many years has afforded a scanty and, during the last period of its existence a rather risky, convenience to the people living in that locality, is progressing favourably, and it may safely be stated that in a comparatively short time an old and unsatisfactory state of things will have been replaced by a useful and much-needed means of communication between two busy parts of the city. That there is a necessity for a cartbridge over the river at this point is without a doubt. The two nearest places at which the Don is crossed are Corporation Bridge on the one hand and Ratland Bridge on the other. The bridge now in course of construction will stand almost midway between these, and will provide a means of communication between the two districts of Shalesmoor and Neepsend.

The dilapidated state of the old iron footbridge was frequently brought before the notice of the city council up to a short time ago, and the city surveyor, Mr. C. F. Wike, on being instructed to examine it, found the ironwork so corroded that he deemed the bridge unsafe, and advised the committee to close it. It was in three spans, and was only 10 ft. wide, and representations as to the desirability of having a wide bridge had been made for a considerable time. The council decided to build such a bridge, and, at the same time, to widen Ball-street on the Shalesmoor side. A quantity of old house property has been purchased on the side of the street opposite Messrs. Dixon's works, and the width of the street will be increased from 21 ft. to 40 ft. Unfortunately, the whole of the street cannot be so improved. For the last 100 ft. the approach to the bridge will remain at its present breadth, but, apart from this, there will be a good road, 40 ft. wide, both on the bridge and on each side of it.

ENGINEERING DETAILS.

The design submitted by Mr. Wike, and accepted by the council, is for an iron bridge of an ornamental and substantial character. The river here is about 200 ft. wide, and the bridge will rest on two central piers and an abutment on each bank. There will thus be three spans, each about 70 ft. long. They will be arched, and the segments of the arches fastened with buckle plates. From each pier will rise a heavy stone pilaster, the top of which will be nearly 15 ft. above the water line. From the crown of the arch to the waterway the space will be 6 ft. 6 in. The balustrades will be of handsome open ironwork running the whole length of the bridge except where interrupted by the stone pilasters. The bridge will be paved with wood, and there will be a footpath on each side, with a roadway 24 ft. wide between. Messrs. Braithwaite & Co., of Leeds, whose tender to do the work for £9,500 was accepted, have progressed very satisfactorily. The new bridge is being built at the same point as the old one, and a temporary footbridge has been erected a few yards awry. This work occupied a month, and since August, when it was completed, the piers for the iron bridge have been put down, and built clear of the water line. On one pier the iron spring blocks are now ready to receive the ironwork, and all the work is so well assured that a flood in the river could scarcely affect it.

The method adopted of building the piers was that of constructing coffer dams. A number of piles are driven into the bed of the river, placed close together, and forming a circle. Outside these a second series of stakes are placed, and the space between the two circles is filled up with clay. The water thus enclosed is pumped away, and the men are able to work in the bed of the river. Some water, of course, finds its way into the enclosure, and pumping operations have to be carried on constantly. The river bed has been excavated for the concrete foundations, and these have been sunk to a depth of 3 ft. 6 in., resting on solid blue bind. On the top of the concrete is the stonework, which has now reached a height of about 7 ft. The stone is Asblar, supplied from the Worrall and Horsforth quarries.

The work is not without one or two serious difficulties. One of these is caused by the fact that the pier nearest Mowbray-street has to be built on a weir. At the other end the abutment of the bridge adjoins the famous Cornish-place Works of Messrs. James Dixon & Sons. This building is very high, and in digging the foundations of the abutment great care has to be exercised lest anything should be done to imperil the stability of the works. Another obstacle to progress at this point is the great quantity of water that finds its way into the workings, notwithstanding the coffer dam. When the foundation at this end has been put in it will not be very long before the stonework of all the piers will be sufficiently high to receive some of the iron ribs for the bridge. The abutment at the Mowbray-street end, which is placed close to Messrs. John Bedford & Sons' works, does not give so much trouble.

Jarradale Jarrah.—The *Menelaus*, with 400 loads, and the *Ursus Minor*, with 600 loads, of Jarradale jarrah have arrived in London, and the *Bona Fide*, with 510 loads, at Hull, all to the order of the Jarradale Jarrah Forests and Railways, Limited.

British Association of Waterworks Engineers.

GENERAL MEETING IN LONDON.

Mr. William Matthews, president of the British Association of Waterworks Engineers, occupied the chair at a general meeting of that body, held on Saturday morning, at the Westminster Palace Hotel, Victoria-street, S.W.

The following other gentlemen were present:—

MEMBERS OF COUNCIL: Messrs. F. J. Bancroft, Hull; J. Cook, Lancaster; A. Davidson, Perth, N.B.; J. Deas, Warrington; J. B. Fenwick, East Retford; W. C. Finch, Luton, Kent; C. Gilby, Bath; W. W. Gray, Cambridge; G. Greenslade, Southampton; F. Griffith, Leicester; J. T. Harvey, Ryde, I.W.; T. W. A. Hayward, Sudbury; H. A. Hill, Birmingham; T. L. Hughes, Wigan; W. Ingham, Torquay; J. Johnstone, Brighton; C. E. Jones, Leyton; W. Jones, Pontypridd; J. Lees, Tonbridge; J. W. Lewis, Farnham; W. G. Peirce, Richmond; J. S. Pickering, Nuneaton; C. H. Priestley, Cardiff; H. Preston, Grantham; H. Roberts, Ipswich; J. T. Rodda, Eastbourne; C. Sainty, Windsor; E. Sandeman, Plymouth; J. Shaw, Boston, Lines; E. J. Silcock, King's Lynn; R. H. Swindlehurst, Bolton; H. Turner, Folkestone; W. Watts, Sheffield; J. W. Way, Newport, I.W.; A. Wells, Lewes; and E. A. B. Woodward, Wolverhampton.

ASSOCIATES: Messrs. C. J. Hobbs, London, W.; W. G. Kent, London, W.C.; R. Macintyre, London, S.E.; G. D. Robertson, London, W.C.; G. Watson, London, S.W.; and W. Whitaker, Croydon.

VISITORS: Messrs. D. Gore and C. A. Matthews were also among those present.

Previous to the commencement of the ordinary business of the meeting, it should be stated, the members held a special meeting, in order to discuss a proposal to substitute the following for the existing Rules 30 and 31:—

Subsequent Councils and Term of Office.

"The council shall, after the above date, consist of the president, past-presidents (who are eligible for election as hereinafter provided), two vice-presidents, hon. secretary and treasurer, and ten ordinary members. The president, vice-presidents, hon. secretary and treasurer, and ten ordinary members, shall go out of office each year, on the date fixed by the council for the annual general meeting, but shall be eligible for re-election. Voting papers, in a form to be determined by the council, shall be sent to each member by the secretary fourteen days before the half-yearly or winter general meeting, to be returned to the secretary at or before such meeting. Nominations for the vacant offices shall be sent to the secretary thirty-one days before the winter general meetings. Two scrutineers shall be appointed at the said winter meeting to examine and report upon the voting lists. The result of the voting shall, upon the report of the scrutineers, be declared by the chairman. Every past-president shall, at the expiration of five years from the termination of his presidency, go out of office, but shall be eligible for election to the council in the ordinary way."

The proposal was eventually adopted, on the understanding that the new rule should not come into operation until after the next annual meeting.

On the opening of the ordinary meeting the minutes of the previous meeting of the association were read by Mr. W. H. Brothers, the secretary. Balloting was shortly afterwards proceeded with, and the whole of the names of the gentlemen down for election were agreed to. They were as follows: **MEMBERS**—Messrs. J. R. Downes, Redhill; F. W. Talbot, Farnborough; W. A. Valon, Ramsgate; and C. L. N. Wilson, Bilston. **ASSOCIATES**—Messrs. J. H. Parkin, Fisher Tarn, Kendal; and H. C. Rawethorne, Bolton. Mr. J. H. Teague, of Lincoln, was transferred from the Associates to the Member class.

On the invitation of the chairman, a paper was then read out the

WATER SUPPLY FROM THE LOWER GREENSAND AND CONSTRUCTIONAL WORKS CONNECTED THEREWITH AT LEIGHTON BUZZARD

By Mr. H. BERTRAM NICHOLS, A.M.I.C.E.

[Mr. H. Bertram Nichols was bred to his father, Mr. George Benjamin Nichols, F.R.S., with whom he served until he was taken into a junior partnership in the year 1880, before which time he underwent a short course of study at Mason Science College. In 1880 he passed the Sanitary Institute examination for surveyors, and was elected a member in 1882. He commenced to practice on his own account in the beginning of 1885, and during a varied and extensive practice he has been engaged on several water and sewerage works in different parts of the country; also arbitration, riparian cases and Parliamentary work. In the course of his professional career he has been successful in obtaining many water and sewerage schemes by competition, which he has successfully carried out. His scheme has been adopted for bringing the water from Dartmoor by gravitation for the supply of the town of Teignmouth. Among the works he has carried out are the Leckford waterworks, Matlock Bath waterworks, the Leighton Buzzard water and sewerage works—completed at a cost of £21,240—and Redruth waterworks, completed at a cost of £10,500. The Redruth waterworks are now being carried out at his hands, at a cost of £9,700; also the Broy-hills sewerage scheme and other works. Mr. Nichols' offices are in Corporation-street, Birmingham. During the present year he has been called in to prepare schemes for the improvement of the water supply

to the towns of Mallow and Newry, Ireland, at a late date, successful in winning in open competition the Government contract.

estimated cost of which is over £60,000. He is an Associate Member of the Institution of Civil Engineers. Our portrait of Mr. Nichols is taken from a photo, by Moul & Fox.

The lower greensand is an important siliceous formation immediately underlying the gault, composed of soft yellowish sands with ferruginous seams, and invariably contains a large proportion of solid impurity in solution, nearly all of a saline nature, which, although imparting some hardness, is not injurious to health. Both the upper and lower greensands are of porous and oxidising strata, which rapidly destroy or remove the organic matter contained in the water percolating through them, leaving but mere traces behind; the proportion of organic elements in these waters is therefore almost invariably very small. Among their constituents they contain protoxide of iron, which probably exercises a reducing effect upon the nitrates and nitrites present in the water, thus removing their oxygen and transferring a portion of their nitrogen into ammonia, whilst the remaining nitrogen escapes as gas. Even the sulphates present in the water are in some cases attacked, and sulphuretted hydrogen generated. The evidence of previous animal contamination is thus diminished, or even obliterated altogether, whilst the water acquires a considerable proportion of ammonia.

The waters from the lower greensand are frequently slightly turbid, owing to the friable character of the water-bearing stratum; they are palatable, and generally of a moderate degree of hardness; occasionally they have a slight odour and flavour of sulphuretted hydrogen when first raised to the surface, these, however, soon disappear when the water is exposed to the atmosphere.

In connection with the water supply to the town of Leighton Buzzard a well and boring has been sunk into the lower greensand. The well is 8 ft. internal diameter, lined with cast-iron cylinders in segments carried down to a depth of 45 ft., and below this the well has been deepened a further 16 ft. with 7-ft. diameter cylinders. Beneath the well the bore pipes are carried down to a total depth of 200 ft. from the surface, the tubes varying from 10 in. to 8 in. in diameter. A great deal of difficulty was met with during the construction of the works, in consequence of the sand blowing below the depth of 45 ft. from the surface. Down to this depth stiff gault clay was met with, but below this level sand, some of a very loose nature, with bands of varying thickness of grey sandstone, congealed stone, pebbles and sand, and some very hard stone. Owing to the difficulties experienced, the well sinking and boring operations from beginning to finish took about two and a half years to complete, many stoppages having occurred and difficulties of an unforeseen nature having arisen.

The water above the depth of 175 ft. from the surface is entirely shut out from the well, as upon analysis by Prof. Atfield, F.R.S., in November, 1892, although he reported the water as being most remarkably pure and among the slightly hard or comparatively soft class of well waters, he mentioned its slight but temporary fault of content of iron, when first pumped, a little iron in solution; and it was decided to take it to a lower depth, in the hope of finding the iron eliminated from the water. At the depth of 200 ft. the water was again tested by Prof. Atfield, who reported, in July, 1893, that the water was of good quality for all drinking purposes:—

"The sample contains a red ferruginous sediment. There was no trace of iron in solution. Poured off from the sediment—which is what everybody would do before drinking the water, and which is what I did before analysing—the water is, as I have said, of good quality for all drinking purposes. I assume, however, that this ferruginous sediment was originally in solution; exposure to the air and the

shaking in transit causing its deposition. If that be so, consideration must be given to the question of due exposure in reservoir or otherwise, and arrangements for periodical removal of the sediment if the water is to be used for supplying a town. Such depositing iron ensures purity in the drawn-off water."

Upon this report of the analyst the author of this paper suggested that an aerating spiral trough should be fixed

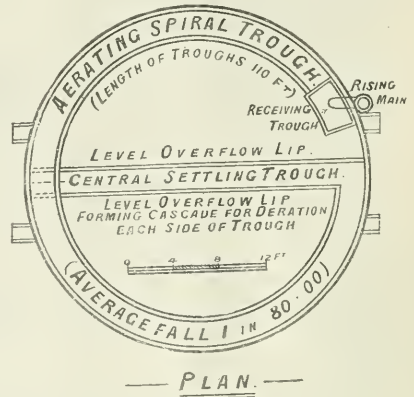

After the works were completed, at the end of 1896, and the water had been regularly supplied to the consumers for some time, sentimental objections arose from a number of the townspeople with respect to the colour of the water, so Prof. Atfield was again resorted to in October, 1897, when he reported in a similar manner as before on the sample submitted to him: "It (the sample) contains a perfectly harmless trace

LEIGHTON BUZZARD WATERWORKS: SECTION OF WELL AND BORING, SHOWING GEOLOGICAL STRATA.

above the surface of the water in the circular tank in the tower, having level overflow lips each side the channel across the centre of the tank, to ensure spray action, and this was incorporated in the scheme of water supply.

In consequence of the severe frost in the winter of 1894 the then local board decided to protect the outside of the tank with felt, on account of its extent of surface and exposed situation. The material used for this purpose was the best hair felt, and it may be of interest at this point to give particulars as to the method of protection adopted. The hair felt was of a weight of 48 oz. to the foot, and was placed on in separate layers, each layer being glued to the tank in the first place, and the second layer glued to the back of the first, so that no twine or any other contrivance was necessary to keep it in position. Sixteen uprights were fixed from the concrete floor (which formed a passage round the tank), and on the outside of these uprights six oak hoops, 3 in. wide and $\frac{3}{4}$ in. thick, were screwed, in order that the wood lagging to protect the felt could be securely fixed. These laggings were made of American redwood grooved and tongued boards, $5\frac{1}{2}$ in. by 21 ft. deep, enclosed by four wrought-iron hoops, 2 1/2 in. wide and $\frac{1}{4}$ in. thick, each belt or hoop put on in four sections, wrought-iron joint ends having been made for 2-in. bolts, in order to tighten if the necessity arose. The result of this protection, which necessitated boarding over the top of the tank, was that the spiral trough arrangement did not answer so well as was previously anticipated under the former conditions.

of iron, which soon settles, while settling the water is un- sightly; on the other hand, the iron affords a guarantee against organic impurity. I should prize such water as a town supply, but more especially if the iron could be deposited by exposure in reservoirs or otherwise before delivery to consumers."

ANALYTICAL DATA.

One gallon contains the following number of grains and decimal parts of a grain of the respective substances:—

Total suspended solid matter, dried at 250 deg. Fahr.	traces
Total dissolved solid matter,	20.5
Ammoniacal matter, yielding 10 per cent. of nitrogen (equal to ammonia per 1,000,000, 0.150.)	0.09
Albuminoid organic matter, yielding 10 per cent. of nitrogen (equal to ammonia per 1,000,000, 0.070.)	0.04
Nitrites	none
Nitrates, containing 17 per cent. of nitrogen (equal to grains of nitrogen per gallon, 0.04.)	0.22
Chlorides, containing 60 per cent. of chlorine (equal to grains of chlorine per gallon, 1.15.)	1.9
Hardness, reckoned as chalk grains or degree—	
Removed by ebullition	11.0
Unaffected by ebullition	3.0
Total hardness	14.0
Lead and copper	none
Physical examination, a faint brownish tinge (iron).	
Oxygen absorbed in three hours (by iron)	0.16

The discolouration of the water still remaining a source of trouble to the urban district council, they consulted Mr. Holme, the manager of the waterworks at Hornsea, near Hull, at which place the water was stated to be of a similar nature and had been satisfactorily treated at his hands. He reported that the water when pumped from the well was clear and bright, but when delivered from the rising main emitted a sulphurous smell, and that this arose from the gas dissolving the oxide in the water, which, when exposed to the air, deposited in the pipes and domestic utensils. He recommended

SECTIONAL ELEVATION OF AERATING TROUGH.

a method of precipitation by breaking the water up and exposing it to the atmosphere, and then to pass it through filters of coarse gravel and sand which should retain the oxide, and then store it in a reservoir sufficient to hold one day's supply. From the report of a deputation which visited Hornsea, accompanied by Mr. T. Hughes, (the council's waterworks manager, they found there was a great difference between the water at Hornsea and that at Leighton. At Hornsea the water practically remained clear the whole time, and there seemed to be no difference in the colour of the water after exposure; at the same time there was a deposit of iron after standing only a short time, and this deposit was easily retained by the filters. It was considered, however, better

to allow the Leighton water to stand in settling tanks and deposit before passing through the filters, as the Hornsea would not take out the iron by working continuously. The deputation recommended that the council provide an aerator, settling tanks of sufficient capacity so as to allow ample time to deposit, afterwards passing the water through a sand filter into a reservoir, to allow a sufficient body of water for the pumps to draw on.

Mr. Hughes' opinion on the subject is that exposing the water to the atmosphere does not remove the iron; still, that it is necessary that it should be exposed before it can be

LEIGHTON BUZZARD WATER TOWER: GENERAL VIEW.

removed. When the water is pumped up from the well it is perfectly clear before its exposure to the atmosphere, but after being exposed it becomes very much discoloured, and this gives cause for numerous complaints. Mr. Hughes has fixed up an apparatus at the tower for the purpose of ascertaining whether aeration and filtration would remove the iron, and the experiment has proved successful, but in consequence of his leaving the town to take up a more lucrative appointment the experiments have been suspended. The water was first passed through an aerator, which consisted of a pipe carried up a height of about 25 ft., and on this pipe was fixed three perforated discs, placed one above the other and about 18 in. apart. The water, falling through these discs in the shape of rain, allowed the air to be thoroughly mixed with the water, which was afterwards conveyed into a tank through a trough, which again acted as an aerator. In this tank the water became much discoloured, owing to oxidation taking place as a result of the aeration. After this treatment the water was passed through a grave, and sand filter, when it became perfectly clear and bright, and did not show the least sign of discoloration after being exposed to the air for fourteen days. Mr. Hughes, from continued observation, considers it necessary that the water should remain some time in the settling tank, otherwise it would oxidise in the filter, with the result that the iron would be found near the invert of the filter, necessitating great expense in cleaning out. It would be found much better if it were allowed to stand twenty-four hours after aeration; the iron would be found at the top of the filter and could readily be removed; the water would then be freer from impurities.

The council are about adopting a scheme on the above method to remove the discoloration of the water, and this will probably form one of the first measures to be taken in hand by their new waterworks manager. The water from the well is raised into the wrought-iron tank, 30 ft. in diameter and 19 ft. 3 in. in depth, carried on the walls at a height of 62 ft. above the ground level. The tank is divided into two parts for a depth of 5 ft. from the bottom of the tank. This division was made in order to allow the whole of one side of the tank to be cleaned out; while there would remain on the

other side of the division a sufficient supply of water for the ordinary purposes of the town. The capacity of the tank is 80,350 gallons, the depth of water with this quantity being 18 ft. 3 in. The arrangement of the engine and pumps is in duplicate. Two 9-horse-power nominal Crossley gas engines work the two sets of three-throw pumps, and on the same floor there are fixed two other gas engines, with air compressors for working the ejectors in connection with the town's sewerage scheme.

The Leighton Buzzard water tower is an octagonal building, with buttresses and recesses in a Gothic character, the dimensions being 27 ft. 6 in. internally of the square. The average thickness of brickwork is about 2 ft. 8 in., but this is widened out in the bottom, immediately above the footings, to a width of 5 ft. 4 in., under which are the footings, spread out to 10 ft. The brickwork is carried on 5 ft. 6 in. of cement concrete, which extends some distance outside the footings all round the building. The detail work is of a solid character, enriched with terra-cotta mouldings, and special facing bricks from the Heather Brick and Terra-Cotta Company have been used throughout. The front and entrance of the tower faces toward the town, and the manager's residence is to the left looking from the town. There are two octagonal towers at the sides of the entrance, one carried up above the main tower, and having a spiral staircase for access to the various floors and to the top of the tank and balcony, the other being utilised as a meter-house. The total height of the brickwork above the ground floor is 82 ft., and on the top of this a strong framed octagonal roof covered with red tiles is constructed with a balcony on the summit.

In connection with the discolouration of the water the "Fischer" system of water filtration is being considered by the council, and Mr. Hughes, the waterworks manager, has submitted proposals in conjunction with the experiments he has made, by which he estimates the required desiccation of the iron from the water could be arrived at by an expenditure of about £800.

For the water supply of small towns situated on the lower greensand, and where they are dependent upon a supply from this strata, it becomes a serious matter to abstract the iron from the water, necessitating, as it appears to do, additional machinery and pumping the water to an elevated tank after it has been raised from the well or bore-hole into the settling tanks or other apparatus requisite for its treatment.

Where the water passes over or through the chalk or other calcareous stratum the hardness is sometimes excessive, as at the Barton boring, near Cambridge, where the total hardness reached 44 deg. 3. Generally speaking, however, the waters from the lower greensand are good and wholesome for drinking and cooking purposes, but in many instances are too hard for washing.

The above observations are brought under the notice of the British Association of Waterworks Engineers in the hope that the discussion following them will elicit some important information relative to treating the difficulty mentioned in the paper.

DISCUSSION.

Mr. W. G. PEIRCE (Richmond) wished to draw attention to the question of cost. They always liked to know that, especially in well-sinking; and in the present case it was desirable that the author should state whether the work had been carried out by contract or under the supervision of the local authority. Also, as the pumping had been done by means of gas engines, he thought it would be interesting if Mr. Nichols could state the cost per 1,000 gallons, together with the quantity of water obtained daily.

Mr. W. COLES FISCH (Luton, Kent), following a question in regard to the ordnance datum of the water at the Leighton Buzzard works, asked whether in the opinion of Mr. Nichols it would not be possible for waterworks engineers to do their own boring. Personally he thought he could do it himself, and he would be glad to know if Mr. Nichols considered it necessary to engage professional men. The work was exceedingly profitable, the gain often amounting to 40 per cent. Tools, he remarked, could be bought at reasonable prices, or hired.

Mr. FRANCIS J. BANCROFT (Hull), referring to the question of yield, and he would like to know whether any test was made when the well spoken of by the author was put down. The difficulty of working in the lower greensand was, of course, due to the running in of the sand. The Hornsea water, to which reference had been made, should have been treated both chemically and mechanically. The work, in his opinion, was not tackled on a scientific basis, as the process of aeration had been carried out first. A sample should have

been taken under water. The settling tank, he noticed, was boarded over at the top.

The CHAIRMAN: What sort of filter is used?

Mr. BANCROFT: Sand. Continuing, he said he would like to ask the cost of the wrought-iron tank. It seemed to him that the raising of the water to a tank was useless, and if the money had been spent on aerating machinery instead it would have been better. At Hornsea they had now done away with cloth filters, and were devoting themselves entirely to sand filtration. The water, after analysis, only required to be treated in that way and he believed that success would follow.

Mr. W. W. GRAY (Cambridge) drew attention to the statement that at the Barton boring, near Cambridge, owing to the calcareous stratum over which the water passed, the hardness reached over forty degrees. He wished to know whether the author was sure that it was the Barton near Cambridge. The hardness of the water at Cambridge never reached such a surprising figure, and Barton was only 2 miles away. At his own works they experienced no difficulty, except with the buckets; and they found that the salt water acted on the gun-metal fittings of the machinery.

Mr. E. J. SILCOCK (Kings Lynn) said he would be glad if the author would give some further information in regard to the illustration showing the geological strata of the well and boring at the Leighton Buzzard works, as that contained in the diagram did not agree with the figures in the letterpress. Then the 7-ft. cylinders spoken of did not appear in the illustration. He agreed with the observation that some

details of cost might with advantage be introduced; and he suggested that the inclusion of figures in reference to the population supplied would also be of value to the members. No information of this character had been given. He quite agreed that where engineers were in the neighbourhood of their works boring should be done by administration. Personally, he had experience both ways. Prices asked for boring were generally excessive, but in the event of an engineer deciding to undertake the work himself he should purchase a plant outright, and not hire one, as it could be sold immediately on the completion of the work. The purchase of plant was not an expensive matter, even if a diamond rock drill were included. It did not follow, continued Mr. Silcock, that because water came from greensand it contained iron; neither did it follow that it contained iron simply because it was clouded. It would, he thought, be easy to arrange for the aeration of water by the adaptation of the air-compressing machinery of waterworks. That could be carried out at a very small cost indeed. Mr. Silcock then concluded with a request for some information respecting the manner in which Mr. Nichols had put down his bore tubes. He had, he mentioned, gathered that long lengths of blowing sand were passed through, and he would therefore be glad to know something of the methods employed.

Mr. T. W. A. HAYWARD (Sudbury) put a question in regard to the price of gas at Leighton Buzzard. The price varied a great deal, being in some towns 2s. 3d. per 1,000 cubic feet, and in others, notably his own, over 4s. He then went on to speak of the great uncertainty which always attended the work of well-boring, and related an instance in which the contractor, who was being paid at the rate of 12s. 6d. per foot, broke no less than three tools, his profit being of necessity swallowed by the purchase of new implements and the cost of the delay which resulted. That showed the extent of the loss to which the council would have been subjected had they themselves undertaken the boring.

Mr. W. WHITAKER (Croydon), in a reference to certain typographical errors which had crept into the paper, said he had to protest against the treatment of the names of the various geological formations. He asked how the author himself would like it if his name were spelt wrongly. But printers, he remarked, never would do these formations justice. He, however, hoped that Mr. Nichols would amend the statement that the upper and lower greensands consisted of porous and oxidising strata which rapidly destroyed or removed the organic matter contained in the water percolating through them; it was only in certain districts—for example, Keat. The same remarks applied to Mr. Nichols' description of the greensand itself. Mr. Silcock had anticipated some remarks of his concerning the illustration of the well and boring, which he also considered required something to make it agree with the text. The expression "congealed stone," which was included in the diagram, was not to his liking, and he thought the well sinkers' term should be adhered to; besides, there could not be such a thing as "congealed stone." Anything that would help to make the diagram perfect he would, he assured them, be glad to do; at present he considered it imperfect. The top sand was probably not a part of the lower greensand, but a part of the gault. He did not quite understand why there should be any difficulty in dealing with the analyses of Prof. Atfield. They had constantly before them expressions of people that it was only necessary to sink in the lower greensand to get good supplies of water, but the fact was a great deal more trouble was experienced with those waters than with the supplies from the limestone. As to the influx of sand, that was the usual result when attempts were made to pump from a bore-hole in sand. In his analytical data Mr. Nichols had omitted to give the percentage of iron contained in the water, and it was important that that should have been included. He presumed that the oxide (shortly afterwards alluded to) was of iron, but failed to understand the phrase "breaking up of water"; it probably only meant the mechanical breaking up of water, but, nevertheless, might easily mislead. Then they were not told where the Hornsea water came

LEIGHTON BUZZARD WATER TOWER.

from—the chalk or the lower greensand—and that also required clearing up. He could not understand the statement that where water passed over or through the chalk or other calcareous stratum the hardness was sometimes excessive; neither was he able to understand the hardness of that particular water. A hardness of forty-four degrees was enormous, and there must be, he thought, some special reason for it; but it was interesting to get such a figure recorded. In his opinion the charges for boring were not excessive. But in America, in spite of the higher wages which were paid, this class of work was done very cheaply. Referring to the accidents spoken of by Mr. Hayward, he could only suggest that the contractor was not provided with a sufficient amount of tackle. But (continued the speaker amid laughter) it was not considered to be a finished work unless some tool was left in, though they had in the case recorded by Mr. Hayward started rather early.

Mr. CHRISTOPHER SAINTY (Windsor) asked for an explanation of the paragraph in the paper relating to the shutting out of the water from the well above the depth of 175 ft. He thought it must get in.

Mr. JONES (Leyton), speaking in regard to the samples of water submitted for analysis, considered that it would have been more scientific if the water had been followed in its various stages. The iron, he took it, could be precipitated. He would aerate the water by compressed air, atmospheric aeration being slow and expensive compared with that method, while it required time and space to carry it out. Then by charging the water with air more satisfactory results would be obtained. Regarding the analyses in the paper, he would, he said, be glad to know where the sulphuretted hydrogen came from, as he did not see how it could be accounted for. It would also be desirable to know the population supplied, the amount supplied to each person, and the birth and death rates of the town. He suggested that those points should be given in the paper before it was out of the printer's hands. He had also the idea that it would be much more satisfactory if the hardness of the water at Leighton Buzzard was reduced, and he would be glad to know if milk of lime was used in its treatment. People nowadays had a preference for clear waters, and disliked those discoloured with iron; but in many places the inhabitants habitually used brown water, and quickly became inured to it. Iron, if not present in excess, had a beneficial effect on the system, and people often went hundreds of miles to obtain sulphuretted water. It was very useful in some cases of medical treatment, but he did not like to imbibe it himself. They were all, he remarked in conclusion, glad to have information of the nature contained in Mr. Nichols' paper, the works of small towns being as interesting as those of the larger ones. He thought the exceptions which had been taken to the diagrams were certainly well founded.

Mr. J. S. PICKERING (Sneaton) remarked that he had been interested in the paper, as he himself had to deal with works somewhat similar to those of Mr. Nichols. He would therefore watch with close attention the progress of the experiments in connection with the removal of the iron from the water. The method, however, was certainly an expensive one for small towns. The objections made to the discoloured water were of course only sentimental, but for all that people could hardly be expected to drink such waters. They would, he admitted, rather drink clear, and probably impure, waters from wells. The remedy was to aerate the discoloured waters and allow them to settle, after which they should be filtered. In his own case he had proposed to use sand in the filters; but it was subsequently suggested that gravel should be tried instead; sand, however, gave better results. Following filtration, the next thing was to discharge the water into a service reservoir, and from thence distribute it to the town. He would be very glad to communicate with Mr. Nichols if that gentleman desired any further information from him, but at present he was not quite prepared to say more. The water at his works, he mentioned in concluding his address, was perfectly clear and sparkling on being pumped.

Mr. S. H. NORMAN (Burgess Hill), in the course of a few remarks, stated that for many years past he had successfully treated the water at Burgess Hill by aeration and sand filtration, and met at any time had there been the slightest complaint. He also would be glad to supply any additional information to the author if the latter so desired.

Mr. J. SHAW (Boston, Lines), said he had listened to the paper with interest, but the analyses of the water had struck him as curious, and he had to say the hardness was very high. Paris went into the lower greensand for water, and the supply of that city, when unpolluted, never rose above 9 deg. of hardness. Another point in the analysis to which he wished to draw attention was the excessive amount of albuminoid organic matter. That, he would mention, when supplied to a town in any appreciable quantity, was looked upon with suspicion. But nowadays, he confessed, it was a fact that people drank with their eyes, and could not by any means be convinced that the consumption of a particular kind of water was likely to be beneficial to them.

Mr. W. WATTS (Sheffield), upon the invitation of the chairman, next contributed some remarks to the discussion. He had, he said, been hoping that he would be allowed to remain a quiet listener, as Mr. Nichols' paper dealt with matters in which he had had but little experience. The idea, he went on, had struck him that in clarifying water it would be best to

have as great a bulk as possible, in order to give it more exposure to atmospheric action. He quite agreed that corporations might themselves carry out works of boring; and he spoke from experience. Many years ago a boring company undertook to sink a certain well at the price of £3 per foot, on condition that the owner paid the actual expenses of the work. He (the speaker) thereupon offered to sink a shaft for £4 10s. per yard, the shaft to be 4 ft. in width, and the boring was subsequently carried out at that price. Referring to Mr. Nichols' statement in regard to the passing of water through a pipe, 25 ft. in height, for purposes of aeration, it seemed to him that when the water left the pipes it would be blown away in spray. Then he failed to understand how the water rose to such a height.

Mr. H. ASHTON HILL (Birmingham) said that as so many remarks had been made respecting borings, he would have liked to have struck out in another direction. But he thought that engineers of waterworks should well consider the question before embarking upon those operations. Engineers with plenty of time on their hands might safely undertake the work, but he was speaking with his knowledge of boring companies when he said that they rarely paid a dividend exceeding 10 per cent. And that could scarcely be grudged them considering the risky character of their business. Therefore he was not of opinion that public officials should hamper themselves with such matters. It was easy to get low quotations for borings, the proper thing being to draw out plain specifications, with the end in view of getting tenders only from firms of the highest standing. He himself had just recently completed a boring, and now had others in hand, so that he was specially interested in the subject. But, he remarked in closing, he did not think that such large profits resulted from the work as was generally supposed; the real profit was as near as possible 10 per cent. Mr. Watts' prices for the sinking of shafts were extremely low.

Mr. J. JOHNSTONE (Brighton) said he desired to know, as it was specially interesting, whether Mr. Nichols had tried the yield of the Leighton Buzzard well—which was completed in 1896—during the present year, and, if so, what was the result. Although it might yet be impossible to discern any change, it was all the more important that steps should be taken to discover any because of the unusual dryness of the past few months. He was particularly anxious to know, because there had been a fall-off in the supply of underground water; but his opinion was that the dryness would not yet be felt in the lower greensand. At Brighton they had easily overcome the difficulties in connection with oxide of iron.

Mr. PERCE, referring to the question of labour, said he must certainly say that for the benefit of the engineer in charge it was preferable that work should be placed in the hands of the contractor, although sometimes that course was impossible. In driving adits on one occasion he commenced with a contractor, but afterwards found it would be so expensive that it would be necessary to drive it himself, and he therefore bought the contractor's plant. If they had had to pay the contractor the cost would have been ruinous.

Mr. C. H. PRIESTLEY (Cardiff) at this stage added a few words in reference to the profits of contractors, and gave it as his opinion that a company might happen to lose money in the carrying out of one work, but would easily compensate themselves by the unfair profit which would accrue from some later contract.

The CHAIRMAN said that one thing that had struck him was the enormous time taken to sink the well described in the paper, and because of that he would have liked to have known more about the difficulties met with. Either the well was of an extraordinary character or the work was abandoned for a time. The most perplexing part of the paper, however, was that dealing with the suspended matter. Only traces of suspended matter were said to have been found, and that appeared to answer the question as to whether sand was brought up in the boring. Regarding the figures in reference to the ammoniacal and albuminoid matters present in the water, he had, as many of those present also had, to deal with a medical officer of health who would make a long face if they had similar results. He felt convinced that the amounts were too high, and the excessive figure of 14 deg. of hardness suggested that there was a communication between the chalk and the greensand. It was a very simple matter to deal with this water. Continuing, he said he wished to know the reason for building a tank of the description mentioned by Mr. Nichols of wrought iron instead of steel, by which a considerable saving in weight would have been effected. The tank would also have been very much stronger. After commenting on the use of the term "nominal" in connection with the gas engines referred to by the author, the chairman then formally moved the accordance of a hearty vote of thanks to Mr. Nichols, and brought his address to a close.

The motion having been seconded, it was subsequently put to the meeting and adopted unanimously.

Mr. BERTAM NICHOLS then proceeded to make his reply. He would, he said, endeavour to answer a number of the questions which had been put. He had not anticipated such a large discussion, and would, as he was unable to carry in his mind all that had been said, reply to the remaining questions at a future date. Mr. Hughes, the waterworks engineer to the Leighton Buzzard Council, he had hoped would have been present. He had said he would, and he (the speaker)

was exceedingly sorry that he was not, as the information which might otherwise have been supplied was very valuable. Mr. Hughes would have dealt with the scheme from its start. Since the completion of the work his information had been derived partly from memory, from the local press, and from individual conversations with members of the council. If Mr. Hughes had been present it would have been easier to answer; but he would take the questions *seriatim*. The population of Leighton Buzzard had not been included in his paper, because the latter had been drawn up, not with the object of giving such points, but of getting some information which would help to overcome the difficulties which the townspeople had experienced. He would, however, mention that the population was about 7,000, and was not increasing very rapidly, or expected to. The total cost of the works was £22,500, the sinking of the well and boring absorbing about £1,350 of that sum; but the figures might not be quite accurate. The presence of the perforated tubes in the well he would explain. On reaching a certain depth the water was found to be impregnated with iron, in order to obliterate which a lining was put in, and the tubes were thereupon carried to a depth of 200 ft. When the first testing was made they pumped for a number of days. The quantity raised per day at the present time was 12,000 gallons. As to whether the supply had decreased since the time of the completion of the works, he would state that that pumping had been carried on constantly, but it had been found that the water had risen higher in the well, and at the present time stood higher than ever; the total rise was between 4 ft. and 5 ft. They did not pump directly from the borehole. The supply appeared to be quite sufficient for the present population as well as for a larger population in the future. Treatment by filters seemed to him a reasonable method if the water could be raised to high ground. That, however, had not been possible, there being no hill within reasonable distance to which the water might be pumped; and to his mind the only way out of the difficulty had been to build a water tower. There had, he ought perhaps to explain, been three analyses of the water, and he was sorry that he had not included them all, as they had differed from those given in his paper. The whole of the boring had been carried out by Messrs. Isler & Company. As to the delay in its execution, that had been due to the local board, who stopped the works for six or seven months and then went on with them again; that was the explanation. At the start a large amount of sand was encountered, but at the present there was little coming from the borehole. His information regarding the hardness of the water had been extracted from the Sixth Report of the Rivers Pollution Commissioners. Milk of lime had not been tried at Leighton Buzzard. The analyses, he would state, had not been taken only from samples of water drawn from the well, but also from samples from the mains. He would be glad, he said in conclusion, to avail himself of Mr. Pickering's kind offer, and also to amplify, to some extent, the matters contained in his paper.

SCAVENGERS' POISONOUS OVERCOATS.

The effects of the poisoning upon the Birmingham scavengers are more serious than was at first anticipated. About seventy men were invalided in consequence of the poisonous effects of the overcoats and the overalls which they were wearing, and it was stated at the time that the skin eruption which the poisonous dye had caused was only such that in the majority of the cases the men would soon be at work again. Inquiries, however, show that quite half the number of men are still under treatment as out-patients at the hospitals, and that in many cases their injuries have been of a very painful character. The dye or solution of chloride of zinc which was discharged from the overcoats and overalls set up an acute irritation of the skin on certain parts of the body, principally about the arms, wrists, thighs and legs. It was hoped and believed at the time that the epidemic irritation would pass away in a few days, but it now appears that the acid had a cauterising effect upon those portions of the skin with which it came into contact, and either destroyed the epidermis or created nasty blisters and sores. It is likely to be some time yet before all the men are back at work again.

Sewer Accident at Barcelona.—The brickwork of a large sewer in course of construction fell-in this afternoon, says a *Router's* telegram, dated the 11th inst., burying a number of men engaged on the work. Eighteen bodies have already been recovered from the *débris*. The accident is believed to have been caused by the infiltration of water.

Sanitary Inspectors' Association.—A general meeting of the members of the above association will be held at Carpenters' Hall, London-wall, E.C., to-morrow, at 6 p.m., when a paper will be read by Mr. W. H. Grigg, of Fulham, and an election of members and associates will take place. This meeting will be followed, at 8 p.m., by an extraordinary general meeting, at which the following resolution will be submitted on behalf of the council: That the number of members in the association shall be increased by the addition thereto of seven hundred (700) members beyond the present registered number.

QUERIES AND REPLIES.

We cannot undertake to reply to any queries which are not accompanied by the writer's name and address. These are required as a guarantee of good faith and not for publication. Sketches accompanying queries should be made separate on white paper, in plain black ink lines. Lettering or figures should be laid out plain.

224. By-Laws as to House Drainage, and their Interpretation.—Mr. J. W. Martin, Station Chambers, Clacton-on-Sea, writes, enclosing plan of new building which was referred to in our last issue under this heading, and which we also reproduced. He points out (1) that fences to the two existing houses have been newly erected, diminishing the open space considerably from that which the premises enjoyed before; (2) the new granary has a basement 4 ft. 6 in. below the ground, but no provision is made for draining same, as required; (3) that the junction of the new drain with the old drain creates the latter into a public sewer; (4) copy of a letter from Mr. George Winship, borough surveyor, Abingdon, certifying that the proposed drainage of the new buildings is not in accordance with the regulations for drainage as set forth in Form A and in force within the district of the Clacton Urban Council; (5) an extract from or another journal, that the plan submitted to them has a very ugly curve in it, and which appears to be unprovided by an inspection chamber; that it is connected with an old drain at right angles; and, according to the by-laws, each house must be connected with the sewer by a separate drain; (6) that Mr. Martin has no connection with the said plan, neither is he interested in any way with the matter, only to see his town properly drained and kept in a sanitary condition.

Several of the points urged by Mr. Martin have been already anticipated and answered by us in our last issue (December 9th). Taking them in the order given, we have to observe that (1) the erection of the fences named do not appear to have any bearing on the drainage of the building or the plan submitted and approved. (2) The drainage of the basement cannot be enforced under the by-laws, as is erroneously suggested. (3) We are of opinion that the drain has not been converted into a public sewer by the connection of the outbuilding to the existing drain. (4) See our reply of last week, which dealt with the points named. (5) These criticisms are scarcely worthy of serious notice, and we are of opinion that the writer has not read the by-laws. The by-laws do not prohibit (a) such a curve as that shown (b) nor require an inspection chamber (although such is provided); (c) the drain is not connected with the existing one at right angles, but obliquely in the direction of the flow, as required by the by-laws; and (d) the by-laws do not require that each house must be connected with the sewer by a separate drain. (6) We are obliged for Mr. Martin's avowal. Our experience and observation, however, teach us that municipal surveyors, with very few exceptions, may be depended upon, and are much more deeply concerned, in securing the proper drainage and sanitary condition of a town than individual members of a local authority, who, in the nature of things, have not the requisite experience and knowledge of the subject that a municipal surveyor possesses.

225. Osiers, Damage to by Sewage Effluent.—“W. H. H. D.” writes: With reference to your reply to this query (December 2nd), and as to recommending the name of a person who is an authority on osier cultivation, I beg to say that Mr. J. Brown, 7 North-end, Wisbech, is an authority on the subject. Mr. Brown wrote a report for the Royal Commission on Agriculture upon osiers, and this report was printed in pamphlet form. He also reported to the Dublin Science and Art Committee and the Committee of the Herbarium at Dublin upon osiers—their kinds, cultivation, commercial value, &c., and he has been engaged in many similar respects throughout the kingdom.

We are much obliged to our correspondent for the information.

230. Sewage Farms in the United Kingdom: Particulars Required.—“Borough Surveyor” writes: Would you inform me of the name of any work or official publication giving the number of sewage farms in the kingdom worked by local authorities or let to farmers?

The querist would, we think, most probably be able to obtain the necessary information from the Local Government Board. If we remember rightly, a return of the description named was compiled by the Board a few years ago. Possibly Messrs. Eyre & Spottiswoode, Queen's printers, East Harding-street, London, E.C., may have published the return, but we are unable to trace it.

231. Appointments for Engineers and Surveyors: Advertisements as to Foreign Vacancies.—“Alpha” writes: Will you kindly inform me whether there is any special paper which advertises foreign appointments, and could you give me any information respecting them and how to hear of them?

There is not, so far as we are aware, any journal which is specially selected as a medium for the exclusive advertisement of foreign vacancies. THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, having a circulation in all the colonies, will probably be found to contain advertisements or particulars of most of the vacancies.

THE WIDENING OF PARLIAMENT-STREET.

THE ACTION OF THE LONDON COUNTY COUNCIL.

The Improvements Committee of the London County Council have prepared a report in reference to the application of Her Majesty's Office of Works for a contribution from the council towards the cost of the widening of Parliament-street. It appears that the council were asked to join in a conference at the Office of Works to determine the nature and extent of the contributions to be made by the council and the Westminster Vestry. To this request the Improvements Committee assented, and departed their chairmen and their vice-chairman to wait upon the First Commissioner, having previously ascertained, however, that the vestry had resolved to take no part in the conference, as they had decided not to make any contribution towards the cost of the improvement. At the conference it was stated, on behalf of the Office of Works, that it was proposed to widen Parliament-street by setting back the line of frontage of the public buildings to be erected there so as to give a width of at least 135 ft., instead of about 60 ft. as at present. At the same time it was proposed to do away with King-street and to utilise its site in connection with the new public offices. The difference between the area of the land to be added to Parliament-street and that to be appropriated for buildings in King-street would amount to 17,858 square feet. It was contended that this widening of Parliament-street would be a great public improvement, relieving altogether the congestion of traffic there, and adding greatly to the dignity of the approach to the Houses of Parliament and Westminster Abbey. It was suggested, therefore, that the London County Council might properly contribute out of the county fund to this improvement, and that the proper measure of such contribution would be the value of the land thus added to Parliament-street, after accounting for that appropriated in King-street. If the value of this land to be given up were put at £10 per square foot the amount would be £178,580, but the First Commissioner freely admitted that as the Office of Works would not lose the frontage value of the lands, inasmuch as they would retain the frontage to the widened thoroughfare, the value should more properly be estimated at £6 per square foot. This would make the value of the land given up to the public way about £107,000, to which should be added the cost of the paving works of the widened street. It was further pointed out that it was proposed to double the width of Charles-street, which would also be a public improvement. Incidentally it was mentioned by the First Commissioner that the clearance of the block of buildings bounded by Parliament-street, Charles-street, King-street and Great George-street, had cost the Office of Works the sum of £405,000, which included £100,000, the value of land forming part of the Westminster Bridge estate, owned by the Office of Works.

After stating what has in the past been done in connection with the widening of Parliament-street, the committee mention that the clause authorising the council and the Westminster Vestry to contribute was not originally in the Public Offices (Westminster) Site Act, 1896, but was inserted during the progress of the Bill through Parliament without the council or the vestry being consulted in the matter. Neither was the council asked for a contribution until arrangements had been made for the acquisition of the land. These and other facts were stated by the chairman of the committee at the conference, and he suggested that the inference to be drawn from them was that the improvement about to be effected by the Government would not entail any cost when the commercial value of the land was taken into account. While admitting the very great public importance of the improvement in the widening of Parliament-street, he felt doubtful whether the council would be justified in making a contribution towards the acquisition of the land for the widening of the street, though he expressed the opinion that the cost of making up the roads would be a matter for consideration.

Since the conference the Improvements Committee have very carefully considered the whole subject, and now report: "It appears to us that the council would not be justified in making a contribution to a public improvement unless it were clearly shown that it was being carried out at a loss. As the Office of Works in 1882 so strongly represented to the Metropolitan Board of Works that in their opinion a scheme exactly similar to that now being undertaken by them could be carried out without loss, and as a body of private promoters were in 1896 also prepared to carry out this same scheme at their own cost and under the belief that they would make a profit thereby, it cannot be shown that the Government is incurring a loss by the transaction. Moreover, it must not be forgotten that the Office of Works are retaining for the purpose of the public offices the very valuable frontages to the widened thoroughfare of Parliament-street. We consider, therefore, that the council should not be asked to make a contribution towards the cost of the acquisition of the land needed for the scheme. We fully recognise the value of the scheme about to be carried out by the Government in the widening of Parliament-street and the improvement of the approaches to the Houses of Parliament and Westminster Abbey. We think that the council, as the central authority in London for carrying out large street improvements, may well desire to show their appreciation of the value of this work to the extent of taking upon themselves the cost of making the widened roads in

Parliament-street and Charles-street. We think that a reasonable estimate for the two thoroughfares would be £12,000, and we consider that the council would do well to offer to contribute that amount." The committee accordingly submit a recommendation to this effect.

LONDON WATER SUPPLY COMMISSION.

Another meeting of the commission was held on Monday, Lord Llandaff presiding, as before.

Mr. R. E. MIDDLETON was recalled and further examined by Mr. Balfour Browne. Asked to give the estimation on which witness based the cost of the Staines scheme, he said that he had given the contract price, and he did not think it was fair to give the details. He did not think this flood-water brought down an enormous amount of manure from ditches and farms. The population of the Thames Valley watershed was about 1,000,000, and the population of the watershed of the proposed Welsh scheme was only 3,700. It was necessary to purchase in the latter case, because in the cases of Liverpool, Manchester and Birmingham they had purchased their watersheds, and the water companies now paid rent to the Thames Conservancy, which was equivalent to purchase.

Mr. WALTER HUNTER, engineer and director to the Grand Junction Water Company, and joint engineer with Mr. Middleton to the Staines scheme, was the next witness examined. In reply to the chairman, the witness said the principle of the Staines scheme was to store the Thames water in large reservoirs as it came down the Thames. Whether the companies were purchased or not, either a Staines scheme for the added supply of the Thames must be adopted or the water must be got from Wales. The question for the commission to determine was what the cost of each of those two schemes would be likely to turn out. In his judgment the Staines scheme would be much the less costly. He thought two days' rejection of flood water would leave sufficient time to cleanse the surface of the land and wash out the ditches. Although he thought that two days were sufficient, he had taken six days, so as to agree with Mr. Middleton's statement. In Sir William Crookes' and Prof. Dewar's report it was said that no advantage was gained by the rejection of the flood-water. The water contrasted favourably with that from mountain sources. If the Londoners had the brown water drawn from Wales and Thirlmere there would be an outcry.

Mr. BALFOUR BROWNE.—Sir William Crookes and Prof. Dewar said in their report of November, 1898: "It has been said over and over again in these reports on the bacteriological quality of the London water supply that it does not depend upon the rejection or use of flood water, but upon the proper regulation of filtration. The direct use of water may result in a little additional vegetable matter, but in the last fifteen years none of the London water supply in that respect has equalled that of Thirlmere, Loch Katrine, or the Welsh lakes."

Witness said it was part of the Staines scheme that the companies should not draw any water at all to induce the flow to be less than 100,000,000 gallons at Teddington weir when their storage works were completed. It would not let the companies dry up the Thames.

At the sitting on Tuesday,

Mr. HUNTER, being asked whether he thought it desirable in the interests of London to take any steps to secure a fresh watershed in case of the need arising hereafter, expressed the opinion that it might be desirable if it could be shown that it was really wanted. That depended upon the growth of London. Some people believed that London would not increase in the future as it had increased in the past, and that therefore the Welsh water would never be wanted at all. The view which he took with reference to the utilisation of Thames water in preference to water taken from a distant watershed might be summed up somewhat in this way. Having a river at our feet with an average daily flow of something like 1,300,000,000 gallons, it was suggested that we should go to Wales and open up a supply from a watershed which at the outside would afford 415,000,000 gallons a day. If the county council, who were the promoters of that scheme, carried out what was at first their avowed intention of discharging the Thames altogether, what would happen would be that within a certain period (16-6 115,000,000 gallons a day) would be used up, and then, after having incurred all the expense of bringing water from Wales, the county council would have to come back to the Thames, which previously they had affected to despise, and make up the additional water which would then be wanted from the Thames. In these circumstances he felt that it was a question of expense as between the two schemes, and that, if the supply of good water from the Thames could be further developed at less expense, it would be absurd to go to a distant watershed until compelled to do so.

Sir FREDERICK BRAMWELL, F.R.S., who was the next witness, being asked by the CHAIRMAN whether he considered that purchase of the undertakings of the water companies by one or more authorities was financially desirable, gave it as his opinion that it was not explicit that the companies' undertakings should be acquired, in the interests either of the water consumers or of the ratepayers, because he felt convinced that the purchasing authority could not afford to make a less charge for water than at present.

SHEFFIELD ELECTRIC TRAMWAYS.

THE NEW POWER STATION AT KELHAM ISLAND.

Of all the work of various kinds that is being carried on at Sheffield preparatory to the change in the system of tramway traction, the erection of the electric-power station on Kelham Island, from which all the power for driving the cars will be obtained, is considered to be the most important. As a centre for a power station Kelham Island is said to be admirable. It fulfils the essential conditions of being within a short distance of the lines, so that the current may be conveyed with as little waste as possible, and of providing space for any extensions of buildings that may be required in the future, as the tramway system is gradually enlarged, and lines cover all the principal streets of the city.

The buildings are so contrived that they can at any time be extended by additions to one end. The site of Crowley's Foundry premises, which the corporation have bought, is very large, and hardly half the land is at present being used for the provision of a station which is calculated to supply power to all the present lines and as many more as will be ready when it is completed. As a matter of fact, by no means the whole of the ground has been cleared, and the large portion of the old buildings left standing are being used as temporary stables and stores. The station consists of two large oblong buildings, the largest of which, the engine and dynamo house, occupies about 5,000 square feet, and the smaller, which is for the boilers, about 3,500 square feet. Thirty or forty men have been at work since the beginning of July, and very good progress has been made. The buildings are of brick, plain and neat, substantial, and in character with the kind of work for which they will be used. The most tasteful-looking elevation will be that on the south side, where the wall, 40 ft. high, will be pierced by two rows of windows, those in the lower storey placed together in pairs, and those higher in groups of three. This will be the wall of the engine-house, the inside measurement of which is 100 ft. by 50 ft.

The heavy foundations have been carried down to a depth of 10 ft. below the ground line, and afford space for six engines. At first only three engines are to be put in. These will be of 300 horse-power, supplied by Messrs. Allis, an American firm, and will be coupled to dynamos having a capacity of 225 kilowatts, and so arranged that they can be used independently or all worked together. A short time ago it was anticipated that one dynamo would probably prove sufficient to work the traffic, but the corporation seem now disposed to push on the extensions of the lines at a greater speed, and it is not unlikely that additional engines will be required before the house has been long in use. As already explained, however, it will not be necessary to extend the building for the first additions to the stock, as the beds of three more engines are already outlined. When extensions are needed the east end will have to be removed, and it will be possible to go on lengthening the building for a long time before all the land is covered. The same means will be adopted for enlarging the boiler-house, which adjoins the engine-house, standing nearer the river. This is at present 76 ft. long by 40 ft. 6 in. wide, and will hold three boilers, each of 300 horse-power, manufactured by Messrs. John Brown & Co., Limited, and fitted with patent induced draught supplied by fans working in the power-house. The boilers will be 10 ft. square at the base.

The brickwork of the engine-house is being filled into a skeleton of steel framework as large as any recently used in Sheffield. Ten upright steel stanchions are fixed, eight of which are 50 ft. high, and the others 10 ft. or 15 ft. lower. Across these are laid steel beams, which will support the roof trusses, and to which can also be fixed a travelling crane, by means of which any portions of the machinery can be removed without unnecessary delay. It was at first intended to have steel framework for the boiler-house as well, but there was a difficulty in obtaining the material, and this part of the design had to be abandoned. As it was, the work was considerably delayed by the slow arrival of the stanchions for the engine-house. The boiler-house will be lined with salt-glazed bricks, so that the sanitary measure of washing the sides can be taken from time to time, and glazed bricks of yellow will line the engine-house. The height of the two buildings from the floor to the eave of the roof will be about 40 ft. Along the roof of each will be a long lantern, which will admit sufficient light. The side of the boiler-house will be lined with coal bunkers some 12 ft. wide, and at one end there will be a tower for the tanks. Lavatories are provided in the building. Such good progress has been made with the work that if there is a continuance of fine weather the building will probably be completed by the end of March.

The work is being carried out under the supervision of Mr. C. F. Wiko, the city surveyor. Mr. John Fishelby, of Sheffield, is the contractor for the buildings, his tender amounting to about £7,100; while the roofs will be supplied from the Phoenix Iron Foundry, Derby.

Clayton-le-Moors.—Application has been made by the district council for Local Government Board sanction to a loan of £5,075 for the purpose of paving, flagging, kerbing and channelling portions of the main roads in the district.

THE VENTILATION OF BUILDINGS.

In the course of a paper on "The Ventilation of Tunnels and Buildings," which was read by Mr. Francis Fox, M.I.C.E., at an ordinary meeting of the Institution of Civil Engineers, last week, the author animadverted on the inconsistency of keeping houses clean, streets swept, and sewers flushed, with the object of preserving the air in a pure condition while allowing it to become absolutely foul and putrid for want of proper ventilation. Air that had passed through human lungs had, he said, been well designated "air-sewage." It was highly poisonous, and the breathing of it over and over again was fraught with the gravest consequences to health. It had been asserted by Dr. Ransome, F.R.S., that 70,000 deaths occurred annually in Great Britain from tuberculous disease, nearly all of which could be saved were the subject of fresh air both understood and acted upon by the community. Competent medical authority considered that the quantity of carbon dioxide in the air of rooms should not exceed 10 parts per 10,000, equivalent to about 16 cubic feet per head per minute. In French hospitals 50 cubic feet per patient per minute was allowed. Mr. Fox considered, however, that 20 cubic feet per minute would be sufficient for ordinary purposes. Tables were given of the impurity in the air of schools with different systems of ventilation, of that in dwelling-houses, and of that in sewers, from which it appeared that the latter was the least impure of the three.

Proceeding to consider the ventilation of particular public buildings, Mr. Fox illustrated his views by reference to special cases which had come within his experience. The fact should not be lost sight of, he said, that the air in a room might be quite cold and yet very foul; whilst, on the other hand, it might be warm and yet perfectly fresh. To avoid draught the air should enter through a large number of small orifices, so as to thoroughly diffuse the current. This was done by gratings, but unfortunately these seriously diminished the volume of air passing through, owing to the friction of the bars. The same remark applied to extracting flues. He was of opinion that no large building could be successfully ventilated without some mechanical force, furnished by steam, electricity, falling water, or other such agency. These fans could be worked with certain results, whereas automatic extractors not infrequently became inlets, thus reversing the whole system. The inlets should be by Tobin or similar tubes, about 5 ft. above the floor. In one American State legislation building the warmed fresh air entered on the level and in front of the desks of each member. In conclusion, Mr. Fox urged the desirability of educating the public to the value and merits of fresh air.

VENTILATION OF THE NEW NEWTON ABBOT HOSPITAL.

At the opening of the new hospital at Newton Abbot, on the 29th ult., the Right Hon. Charles Seale-Hayne, M.P., referring to the ventilation of the building, which is on the Boyle natural system, said: "I am a firm believer in what may be termed the philosophy of health. I believe also that it would be an excellent thing if in our primary schools greater attention was paid to instruction in hygiene. God has endowed us and blessed us with bodies that are wonderful machines, therefore it is our duty to take care that these machines are kept in proper working order. This hospital seems to be admirably designed and well constructed, reflecting credit on both architect and builder. In presence of the crowded and distinguished company which I have the honour of addressing, I need not say, because the temperature attests it, that the ventilation of this hospital is upon the best and most scientific principles. I said just now how important was the subject of hygiene, and in no respects is it more valuable or necessary than in the subject of securing for our public buildings the necessary amount of fresh air. But if a pure atmosphere be necessary for us, who are in health by the blessing of Providence, how much more necessary is it that our afflicted fellow-creatures, stricken down by accidents or disease and denied for the time the blessings of outdoor exercise, should have secured to them the healthiest possible surroundings. I am glad, therefore, as I say, that in this new hospital the committee of management, or the architect acting on their behalf, have selected and adopted what I believe to be absolutely the best system of airing a public building that is known to sanitary science."

London Local Government.—The following letter has been received from the Lord President of the Privy Council in reply to the memorial addressed to him at the instance of the Islington conference on London Local Government: "DEAR SIR, —I am directed by the Duke of Devonshire to acknowledge the receipt of the memorial which you left here on the 29th inst. The memorial has been laid by the Lord President before his colleagues. The Bill dealing with London government will be introduced in the House of Commons; and the Lord President will consider, with the member of the Government in charge of the Bill, whether there would be any advantage in receiving a deputation on the subject of your memorial before the meeting of Parliament.—I am, yours faithfully, RIVERSDALE WALTON.—W. F. Dewey, Esq."

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.

Solicitor of the Supremo Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or ordinances referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a non de plume.

QUERIES AND REPLIES.

ANCIENT LIGHTS.—"Lancastrian" writes: My council propose erecting the building coloured pink on the accompanying plan and section. The new building is sufficiently far away from the existing buildings to allow an angle of 45°

from the sills of the ancient lights. At the rear of the private passage is a shop which has been erected within twenty years from this date. Would the owner have any chance in restraining the council or of being successful in an action for compensation in a court of justice?

Under the Prescription Act (2 and 3 Will. IV., c. 71) the actual enjoyment of the access of light without interruption for twenty years gives an absolute right, unless the light is limited by agreement in writing. Nothing is to be deemed an interruption which has not been submitted to or acquiesced in for one year. If, therefore, the shop has been erected nineteen years and a day, the owner would have an inchoate right, which would become absolute when the period of twenty years is complete, interruption for a year not being possible. He may also have acquired a right by implied grant or implied reservation if both plots of land at any time belonged to one owner. Whether he has

acquired such a right depends upon the facts. Assuming him to have acquired a right, either (a) under the Prescription Act or (b) by implied grant or reservation, the question would arise whether the obstruction of his light caused by the proposed building was sufficient for the Court to interfere, and whether it was a matter for an injunction or for damages, the general rule being that the Court will not interfere by way of injunction where damages will afford adequate compensation. If, however, the right is only an inchoate right under the Prescription Act, the Court would not grant an injunction (see *Lord Butterfield v. Commissioners of Sewers*, vol. viii., The Surveyor, p. 259). But the owner could probably recover damages if he brought an action the moment the twenty years' period expired and if he could prove substantial damage.

BY-LAWS: NEW STREET: HOUSE DRAINAGE.—"Cubis" writes: A builder has deposited plans for a building estate of 20 acres (edged green on plan) which, physically speaking, lies low, being several feet below the main sewer in Sand Cross-lane, which is shown in blue. A portion of this estate has a frontage to Whitehall-lane of 1,960 ft., which is an old highway and averages 15 ft. wide (see A to B). Will the building of houses change the character of this old lane and transmute it into a new street, thereby enabling the corporation to ask for it to be made of the prescribed width in the by-laws—viz., 36 ft. wide? The owner has offered to surrender the strip of land coloured blue to make Whitehall-lane 36 ft. wide, providing the corporation lay a new sewer from A to B, and so connect to the existing system in Sand Cross-lane; as the land lies low, the laying of this sewer will entail a great outlay, the sewage having to be lifted by means of compressed air. If the corporation decline the offer the owner declares he will leave Whitehall-lane at its present width and construct cesspools for the property. Sec. 23, Public Health Act, 1875, stipulates that property within

100 ft. of a public sewer should be drained into it. May I ask if this section does not apply in this case for the whole estate, as a portion the roof fronts on Sand Cross-lane, which is provided with a sewer. Can we compel the owner to make Whitehall-lane 36 ft. wide in the event of building operations being commenced?

(1) It is a "question of fact" whether the carrying out of the building scheme would constitute the laying-out of Whitehall-lane as a new street, so as to entitle the authority to require it to be made 36 ft. wide. This question of fact would have to be decided by a magistrate in any proceedings to enforce the by-law (see *Taylor v. Metropolitan Board of Works*, L.R. 2, Q.B., 213; *Robinson v. Boston Local Board*, 21 Q.B., 166, and *Lumley's v. Public Health Acts, Btts. cases*, pp. 293, 27). This seems to me to be a case in which the authority might not anticipate the decision of the question of fact in their favour. (2) In my opinion the authority could, under the section referred to, compel the owners or occupiers of such houses on the estate as were within 100 ft. of the sewer in Sand Cross-lane to make drains emptying into that sewer, but this power would not extend to houses beyond that distance.

GAS EXPLOSION: LIABILITY.—"Gas Explosion" writes: I am the owner and occupier of a house abutting on a 36 ft. street. When the property was built, some three or four years ago, an old lane was filled up (about 10 ft.). The settlement of this filled-up stuff caused a sinkage in the footpath—under which the gas main lay—exactly opposite my frontage, and resulted in the gas main being fractured, the gas escaping from the main under the house, and igniting at the lighted chandelier in back room caused an explosion, doing damage to the amount of £200, besides personal injuries and shock. The gas company deny liability, not being responsible for the state of the street, their pipes being stated to be of the usual and sufficient strength, &c. The street has not yet been declared a highway, and so has not been taken over by the corporation. The property was built by contract for a Building Company, Limited, who sold the houses and land freehold to the first purchasers. I am the third owner of this particular house. I may add that the water main in the centre of the street was broken some few weeks ago through the same cause—the settlement of street over the site of the old lane. It appears to me that the responsibility must rest with some party, and I shall be glad of your opinion in the matter.

I am afraid this is one of those cases in which it would be extremely difficult to fix liability anywhere. In order to render the gas company liable it would be necessary to prove negligence in the laying of the pipes, which would be difficult enough in any case, and especially so in this instance, seeing that the accident was really due to the subsidence of the road. The local authority would not be liable for merely mending the road; it would have to be shown that they had been guilty of some active negligence—"misfeasance," as distinct from "nonfeasance." I presume, as the road has not been taken over, that the authority have not interfered with it in any way; also, that the road was made and the old lane filled up by the building company, who, in that case, would seem to be the real culprits. But here, again, it is in my opinion, very doubtful whether an action would be against them, as the damage would be too remote. Although not declared a highway, the road probably has been informally dedicated, and thus actually becomes a highway; and there is, so far as I am aware, no precedent for holding the landowner who lays out a road liable for accidents resulting from its subsidence.

NEW BUILDING.—"Surveyor" writes: About nine days ago, when visiting a part of my district, I found a new building was being erected—viz., a stable containing three or four loose boxes and a harness-room, and being built to join the gable end of the present block of stables, &c. I wrote to the builder asking him to submit plans for my committee, and to cease the works till the same were approved or otherwise; he wrote back saying that the architect considered this was a simple addition and not a new building, and therefore the plans would not be submitted nor the works cease. The architect has written to our clerk to this effect, also saying he was prepared to defend the action. Our clerk has given the builder notice to cease the works, which was delivered on November 29th, and they have not done so. We are taking action, which will take place on the 5th or 6th of December. As all these cases are a matter of fact for the justices to decide, can you give me the most recent case that will help our case. I will send you full particulars of the decision in due course, as I feel sure it will be interesting to your readers. Our by-laws are the model ones, which thought of by the Local Government Board, and of which you have a copy.

I am unable to refer to any recent cases which will assist. In *Lee v. James v. Byles* (31 L.T. N. S., 237) Lord Chelmsford laid down the general principle on which the "question of fact"—viz., whether a building is a new building or not—is to be decided, as follows: "If a building seems merely to be taken away as then rebuilt, it is clearly not a new building; on the other hand, it is quite clear that it is a new building, if, say a door, the building would not thereby become a new building. Between these two extreme cases there may be innumerable cases, and it would be impossible to give a definition in each particular case as to what is or is not a new building, and it must be left to the discretion of each judge to decide for himself what is a new building."

Municipal Work in Progress and Projected.

The paragraphs under the headings of Morley, Manchester, Taunton, Worthing, Portslade-by-Sea and other places contain the chief information that has come to hand this week in regard to municipal works in the provinces. In the metropolis, St. Marylebone and Strand seem to be the only authorities that have any extensive works in hand.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

The county council evinced keen interest on Tuesday in the urgency report of the Highways Committee with regard to the refusal of Mr. John Young, manager of the Glasgow Corporation tramways, to accept the position of chief officer of the council's tramway department. The members tried to find out why he had refused the position, which carries with it a salary of £1,500 per annum, but they were unsuccessful. Mr. Benn, chairman of the Highways Committee, explained all he knew in connection with the matter, and also read the letter which his committee had received from Mr. Young. In the end the report of the committee, which recommended that Mr. Baker, manager of the Nottingham Corporation tramways, who was second on the list of three submitted by the General Purposes Committee a fortnight ago, should be appointed to the managership, at a salary of £1,000 per annum, was adopted. Full particulars are given in our "Personal" column.

Loans for Public Works.—Upon the recommendation of the Finance Committee it was agreed to lend the Hammersmith Vestry £11,020 for electric lighting purposes; the Newington Vestry £10,000 for the same purpose; and the St. Giles' District Board of Works £17,100 for the purchase of land as a site for a depot.

The Council's Water Bills.—The Parliamentary Committee brought up a report with reference to the draft Bills to be introduced in the ensuing session of Parliament. The first was the London Water (Purchase of Companies) Bill, the arbitration clause being known as the "Plunket" clause; the next was the London Water (Welsh Reservoirs and Works) Bill; and the next the London Water (Aquaducts and Works) Bill. Mr. Cornwall, in moving the reception of the report, said there was only one alteration in the estimates for the Welsh scheme. Sir Alexander Binnie had asked that the estimates should be raised from £16,500,000 to a round figure of £17,000,000. It had been found impossible to get the whole of the plans of the aqueducts finished in time to comply with the standing orders, but it was hoped that Parliament would see their way, after learning the circumstances, to suspend the standing orders and allow the Bills to proceed. The report was adopted.

The Holborn to Strand Improvement.—The Parliamentary Committee also presented the draft of the London Improvements (Holborn to Strand, Southampton-row widening, High-street, Kensington, and other works) Bill, and recommended that the seal of the council should be affixed to a petition for leave to bring in the Bill. Mr. Campbell moved as an amendment to insert in the recommendation words declaring that provision should be made for the interest on money raised to pay for the purchase of property under the Bill, and generally for effecting the improvements, to be for the first few years before the completion of the improvements treated as part of the expenses payable out of the money borrowed. After a lengthy discussion, the amendment was rejected, on a division, by seventy-two votes to forty. The draft of the Bill was then approved, as well as the draft of the London County Council (General Powers) Bill.

Housing of the Poor at Poplar.—The Housing of the Working Classes Committee presented a report dealing with the provision of working-class dwellings on land known as the Cotton-street site, Poplar. This matter has already been the subject of several discussions in the council. A proposal to sell the land for the erection of dwellings was rejected. The committee found themselves unable to build on the land without incurring a charge on the rates, and now asked to be authorised to take no further action with regard to the erection of buildings on the site. After discussion an amendment was accepted to the effect that the recommendation should be referred back to the committee, with an instruction to see whether plans could not be prepared for erecting dwellings upon this site which should not involve any charge on the county rate.

The Widening of Parliament-street.—The Improvements Committee presented a report with reference to the proposed contribution to the widening of Parliament-street now being undertaken by Her Majesty's Office of Works. A summary of the report will be found in another column. The committee reported against any contribution being made to the cost of the acquisition of the land needed, but recommended the council to contribute £12,000 in respect of the making-up of the widened streets. A long discussion followed, during which two amendments were negatived, but eventually the recommendation of the committee was adopted, with a verbal amendment that the sum contributed should not exceed £12,000.

COURT OF COMMON COUNCIL.

The Lord Mayor presided on Thursday at a meeting of the above body called specially to clear off the arrears of business left over at the last ordinary meeting. A letter was received from the London County Council relative to the application made by the court for a grant towards the cost of widening London-wall and Blomfield-street. The Improvements Committee of the council stated that, after full consideration, they did not see their way to recommend the council to entertain the suggestion for widening the thoroughfare to 60 ft. With regard to the proposal to widen it to 50 ft., they understood that the trustees of the Bridge House estates were the owners of the property in the vicinity, and had arranged to undertake the widening in connection with the sale of part of their property. Under those circumstances the committee did not feel prepared to recommend the council to accede to the request made by the corporation for the contribution. The letter was referred to the Finance and Improvement Committee.—Mr. Moojen asked whether a report had yet been received from the engineer with reference to the condition of the footways and parapets of London Bridge. Mr. B. Turner, chairman of the Streets Committee, replied that he hoped a report from the engineer would be presented at the next meeting of his committee.—In reply to another question by Mr. Moojen, Mr. Turner stated that he was unable to say when the conference between the local authorities of the metropolis on the subject of telephones would take place. It was not necessary that there should be a preliminary inquiry, and when they had satisfied themselves on certain points the Lord Mayor would be approached for the purpose of convening the meeting of the conference.

VESTRIES AND DISTRICT BOARDS.

Battersea.—The Finance Committee reported to the vestry on Wednesday that the County of London and Brush Provincial Electric Lighting Company had deposited plans in reference to their proposal to apply for powers to produce and supply electricity in the parish. It was decided to refer this matter, together with other plans submitted in regard to Parliamentary schemes, to the special committee on Parliamentary subjects.—The same committee also announced the receipt from the Local Government Board of sanction to borrow £34,370 for the erection of baths and wash-houses in Battersea Park-road, and £1,380 for the sinking of artesian wells at the Latchmere-road baths.—It was further reported by the committee that application had been made to the London County Council for a loan of £1,200 for the reconstruction of the sewer in Stewart's-road.—A letter had been received from the London County Council on the subject of district surveyors, stating that the Building Act Committee could not recommend the council to take any steps at present in respect of the duties and payment of district surveyors, whom the vestry had suggested should devote the whole of their time to their duties and be in the salaried employment of the county council.—A long discussion took place on the presentation by the Health Committee of a report dealing with cases of diphtheria in No. 2 sanitary district, the cause of the disease in twenty cases being attributed to insufficient ventilation of sewers and defective gullies in the streets. The committee found that the low-level sewer was inadequately ventilated, and they recommended that the attention of the London County Council should be drawn to the matter, with a view to the more efficient ventilation of the sewer. The recommendation was adopted. With regard to the ventilation of the local sewers, the vestry decided to fit automatic flushing chambers to the stump ends of the sewers in various streets, to connect the local sewers at the stump ends with the sewers in the adjacent streets where practicable, to ventilate the sewers at their highest point by 9-in. upcast shafts, and to provide inlet and outlet ventilation to each sewer in the district.—It was decided to reconstruct the sewers in Alfred-street and five other thoroughfares.—The Works Committee reported that they had had under consideration a letter from Mr. J. Pilditch, the surveyor, relating to the responsibility for the carrying out of contracts by the Works Department. The committee stated that they had decided to relieve the superintendent of works of the supervision of all building works estimated to cost £700 or more, and to engage a general foreman for any building work estimated to cost £700 or more, such foreman to have all control of the men engaged on the work, with full power to engage and discharge men. The committee had settled the duties and responsibilities of such foreman, and they recommended that on large jobs, such as the erection of the new baths and wash-houses, the foreman be paid a salary of £5 per week, and be provided with a timekeeper to keep the men's time, check all material, and generally to assist him in carrying out the duties.—On the motion of Mr. Manser it was resolved to refer the report back to the committee.—On the recommendation of the Works Committee it was decided to invite tenders for the supply, among others, of bricks, cement, lime, granite, stone-ware pipes and street lamp columns.—It was resolved to approve plans prepared by the surveyor for the erection of dwellings for men employed at the Morden cemetery. The cost was estimated at £1,550.

Camberwell.—A meeting of this body was held, on Wednesday, when an adjourned report of the General Purposes Committee, recommending the approval of plans for the carrying out of various alterations at the vestry hall, at an estimated cost of £500, was received. The report was, however, subsequently withdrawn. — The Finance Committee stated that all necessary arrangements had been made for the purchase of ground in Grove-vale for the purpose of a depot, and now proposed the drawing of a cheque for the sum of £8,100, the balance of the purchase money for a similar site in Peckham Park-road. This was agreed to.—The committee also reported that they had given further consideration to a report of a conference, convened by the Bermondsey Vestry, on the housing of the working classes, and recommended that the approval of the vestry be given to the five resolutions adopted at the meeting which was subsequently held; they, however, took slight exception to the wording of the first resolution. It was decided to adopt the committee's recommendation, together with another suggesting that the surveyor should be instructed to at once cleanse and put in a sanitary condition a number of roads which had recently been taken over, until such time as they were made up.—On the recommendation of the General Purposes Committee, the vestry resolved to empower the surveyor to invite tenders for the carrying-out of work in connection with the heating and ventilating of the vestry hall and offices.—A number of other recommendations were presented by various committees, but were opposed after 10 o'clock. The vestry rose at a very late hour.

Lambeth.—At the last meeting of the vestry a lengthy report was submitted by the Baths Committee giving the explanations of Mr. Hessel Tiltman, architect, on the subject of the extra expenditure incurred over the estimates of the Kenning-road baths.—The General Purposes Committee presented a report recapitulating the objections raised by the Hammersmith Vestry to the recommendations of the Joint Parliamentary Committee on the Supply of Electrical Energy. On the recommendation of the committee it was resolved to agree with the Hammersmith Vestry in submitting that the local authority within the area of supply should have the power of deciding the route the mains are to be laid, and the power of opening and reinstating the streets. It was also decided to concur in the view that the local authority should use every endeavour to retain its power of veto, both in regard to overhead wires for the purposes of traction and applications for provisional orders.—A special report was received from the Lighting Committee relating to the desire of the South London Electric Supply Corporation to submit a scheme for the lighting of some of the principal streets in Lambeth. By clause 20 of the transfer deed from the vestry to the company the latter undertook to supply electrical energy free of charge for twenty-five arc lamps. The company suggested that in addition to the twenty-five free lamps the vestry should agree to the erection of 225 other lamps, at an annual cost of £22 10s. per lamp, or a total yearly expenditure of £506. This proposal was, however, not entertained, but the vestry clerk then suggested that in addition to the twenty-five free lamps the company should erect twenty-five others, to be charged at the rate of £20 per lamp per annum for a trial period of twelve months. The company, with the exception of the price, which was adhered to at £22 10s. per lamp, consented to this scheme, and the Lighting Committee accordingly recommended its adoption. The subject was discussed at some length, but eventually an amendment was carried, by forty-two votes to eleven, adhering to the vestry clerk's suggestion, and instructing the committee to report as to the cost of the lamp standards and the relative cost of lighting the parish by electricity charged by meter as compared with the price asked by the company, or any other company.—The following tenders were received for repairs to Arlington Lodge: Messrs. H. Boulter, £239; J. Parsons, £530; Edwards & Medway, £543; J. P. Ford, £562; and T. Lecks, £580. Since sending in his tender Mr. Boulter had asked leave to amend it to £284, but the Sanitary Committee declined to accede to the request. Considering all the circumstances of the case, and as £300 had been settled as the price of the work, the committee recommended and the vestry decided not to entertain any of the tenders, but to have the contract carried out under the direction of the surveyor.—The underrated tenders were also received for the supply of six new sand-bins, 8 ft. long, 2 ft. wide, 3 ft. high in front and 1 ft. 6 in. high at back, with sliding door and linged lid. The prices are, for bins without bottom: Messrs. Gibb & Co., £1 11s.; Knox & Co., £6 10s.; Boshier & Co., £7 8s. 6d.; Pontifex & Co., £7 8s. 6d.; Hammond & Hussey, £8; and Pfeil & Co., £7 12s. 6d. The tender of Gibb & Co. was accepted.

Strand.—On the recommendation of the Wharf Committee it was decided, at a meeting of the board of works on Wednesday last week, to affix the seal of the board to a contract with the Horsfall Furnace Syndicate, Limited, for the erection of one of their dust destructors at the board's wharf. The contract provides that each furnace shall consume not less than 12 tons of refuse per day, which shall be so reduced by fire that a residue of not more than 33 per cent. is left. The contract price is £10,241.—The Improvements and Parliamentary Committee presented a report with reference to the necessity of making Little Newport-street a uniform width of 40 ft., as a further improvement, consequent on the adop-

tion of the scheme for the closing of Earl's Court. The report states that on the 12th October the committee announced that they were unable to present a conclusive report, as the negotiations, having for their object the reduction of the cost of the improvement, were incomplete. They now reported that they had still been unable to come to any definite agreement to effect the improvement. The only method left of effecting the widening of the street as suggested, therefore, appeared to the committee to be by serving the statutory notices under sec. 73 of the Metropolitan Management Amendment Act, 1862. They accordingly recommended that, if the board were still of opinion that the improvement should be carried out, the matter should be referred back to them, so that the necessary statutory resolutions could be framed and submitted to the board. The consideration of the report was adjourned.—The same committee announced that they had received a letter from Mr. H. S. Samuel, M.P., enclosing the draft of a Bill which he proposes to introduce in the next session of Parliament dealing with the London water question. The Bill provides for the connection of the mains of the various water companies, and makes provision for inspection as to quality, quantity and pressure of water, with liability to penalties in case of default. The committee stated that they had adjourned the consideration of the Bill until such time as the whole of the Water Bills come up before them.

St. George-the-Martyr, Southwark.—On the recommendation of the Public Health and Sewers Committee, the vestry, at their meeting on Tuesday, resolved to construct five surface ventilators in connection with the sewer in Southwark Bridge-road, at a total cost of £35.

St. Marylebone.—At the last meeting of the vestry the official seal was affixed to the petition asking for permission to introduce a Bill to authorise the vestry to establish electric supply works for the parish.—A letter was read from the London County Council in reference to the representation made to the council on the subject of district surveyors. The letter pointed out that the Building Act Committee were not prepared to recommend the council to take any action in regard to the duties and payment of district surveyors, and that on some points it would perhaps be necessary to obtain Parliamentary powers to accomplish the objects aimed at in the representations. It was decided to enter the communication on the minutes.—An hour and a half were occupied in discussing a report by the Works Committee relating to proposals for the extension of wood paving next year in Harley-street, Old Cavendish-street, and Upper Berkeley-street, the estimated cost being £6,330 for yellow deal. The committee stated that they were equally divided as to the merits of hard and soft wood paving, and left it to the vestry to decide which kind of wood should be used for those streets. Mr. Dennis, chairman of the Works Committee, stated that they now had an inspector to examine the wood blocks delivered to the vestry, and that as a result the supply of inferior soft wood had and would in future be prevented. The use of soft wood would be much cheaper than hard, but if the latter was adopted it would mean that wood paving would be restricted to fewer streets, owing to the large expenditure. Mr. Garrold said that from a return submitted to the vestry it appeared that metropolitan surveyors stated that no complaints had been made of hard wood paving on the ground of being noisy and slippery. In reply to questions, Mr. Waddington, the surveyor, expressed the opinion that the cost of soft wood was approximately three-fourths of the total cost of paving, and that hard wood had not been laid down sufficiently long to determine its durability. The only way to test the two woods was to lay them down in the same thoroughfare, subject to the same traffic, and laid in the same manner. The vestry eventually agreed to adopt yellow deal in the thoroughfares in question.—On the recommendation of the Sanitary Committee it was resolved to instruct the surveyor to reconstruct a portion of the sewer in Little Welbeck-street, at a cost of £50.

PROVINCIAL AND GREATER LONDON AUTHORITIES.

MUNICIPAL CORPORATIONS.

Brighton.—Mr. H. Percy Bonhous, M.A.C.E., one of the Local Government Board inspectors, held an inquiry, on the 6th inst., with reference to an over-expenditure upon the public abattoir. The town clerk and Mr. F. J. C. May, the borough engineer, explained how the over-expenditure, amounting to £3,396, had been incurred, and the inspector afterwards viewed the locality.

Coventry.—The contract for the erection of certain buildings at the proposed two new sewage pumping stations, on the side of the main road from Coventry to Daventry, has been let to Messrs. Wingrove & Stanley, of Northampton, who have offered to carry out the work for £11,276.

Darwen.—A special meeting of the Darwen Town Council was held on Monday to consider the question of purchasing the undertaking of the tramways company running between Blackburn and Darwen, in conjunction with the Blackburn Corporation. The town clerk explained that the appointed price for Darwen's share of the tramways was £26,000, in which was included £2,000 for the depot, which would be the

property of Darwen. As the Darwen Corporation were only applying for powers to work the system, a lease would be granted to the Blackburn Corporation, who would work the line and pay Darwen £85 per quarter for the repairs of the rails, &c., and £916 10s. by way of rent. The mayor proposed a resolution authorising the purchase of the tramways, and this, after some discussion, was carried.

Crimbsby.—The following questions have been placed in the hands of the Highways Committee for consideration: To widen and improve certain public thoroughfares, in order to remedy the serious inconvenience and loss to the public in passing from east to west of the town, owing to the level crossings. To purchase the gasworks and undertaking. To purchase the waterworks and undertaking. To acquire certain properties for the future improvements of the town. To acquire further powers for enforcing by-laws for promoting better sanitation. That a committee be appointed to consider the promotion of an Omnibus Bill in Parliament, or such other methods as they may be advised are necessary to further these objects, and complete their report to the council.

Liverpool.—The arbitration between the corporation and the docks board as to the amount which the former body are to pay for the portion of the site of George's Dock, taken for city improvements, will take place about the beginning of next month.

Manchester.—It was reported at a meeting of the corporation Rivers Committee, on Monday, that the chairman (Sir Bosdin Leech) and the deputy chairman (Dr. Dreyfus) had had an interview in London with Mr. Adrian, of the Local Government Board, with reference to the sewage difficulty. The experts appointed by the corporation some months ago have presented an interim report, and in view of their recommendations the committee asked for an extension of the time laid down by the Local Government Board for fulfilling certain requirements. An inquiry was suggested, and it was stated that the evidence to be produced would probably justify the board in granting the borrowing powers required by the corporation to the extent of £160,000. Mr. Adrian gave the deputation to understand that an inquiry would be held early in January.—The Gas Committee report that during the past year there has been a large increase in the consumption of gas within the area of supply of the Manchester Corporation. This has been brought about by the increased demand for gas-cooking appliances, and to some extent also by the use of prepayment meters. During the last week of November the total consumption reached 129,467,000 cubic feet, as compared with 120,262,000 in the corresponding week last year.

Morley.—Recent minutes of the town council contained a report of Mr. W. E. Putman, the borough engineer, upon his inspection of a leakage in the Victoria service reservoir, and his suggestions as to the best method for making good the reservoir. He thought that the council would be unwise to abandon the site, and he suggested that the whole of the puddle should be taken out, and that other work should be done. He estimated the cost at £3,175. The committee recommended that they should be empowered to proceed with the repair of the reservoir, in accordance with Mr. Putman's report. A short discussion ensued upon the motion, which, however, was eventually approved.

Newcastle-under-Lyme.—The Executive Sanitary Committee of the corporation have decided to proceed at once with the scheme of replacing the present isolation hospital with a permanent structure for the treatment of infectious diseases on the same site. Messrs. J. Lewis, of Newcastle, and F. Emery, of Stoke-on-Trent, have been appointed joint architects and will prepare the plans.

Plymouth.—Alderman J. Pethick, the mayor, last week opened the first block of workmen's dwellings erected by the corporation in Vauxhall-street. The block comprises seven houses to be let at a weekly rental of 5s. seven at 4s. 6d., and seven at 4s. The total cost of erection has been £5,847, and the price of the land was £760 10s. They have been built from plans by Mr. J. Paton, the borough surveyor, the contractors being Messrs. Wakelam Brothers.

Retford.—At the last monthly meeting of the town council the corporate seal was affixed to a contract with Messrs. Jenkins & Co., Limited, of Retford, for erecting a new retort at the gasworks. This was the lowest tender received.

Salford.—Numerous inquiries having been made respecting the Agecroft cemetery competition, we are authorised to state that twenty-two sets of plans were sent in, but they have not been opened pending the receipt of sanction to use the land for cemetery purposes. This has been delayed owing to the opposition raised by the local authority in whose district the site is situated. The Home Office inspection of the land was made as long ago as July 15th.

Taunton.—Colonel A. G. Durnford, R.E., yesterday attended at the town hall to hold an inquiry, on behalf of the Local Government Board, with reference to an application of the corporation for power to borrow £18,520 for the conversion of the existing precipitation works into an installation on the septic tank system. The sum mentioned includes the cost of the land, pumping, and all contingent expenses.

Wednesbury.—The tender of Mr. Jehu Mackay, Smethwick, at £537, has been accepted for the widening of the

bridge over the Birmingham canal on the Holyhead road near Moxley.

Worthing.—A Local Government Board inquiry was held on the 8th inst., by Mr. H. Percy Boulnois, M.I.C.E., into an application of the town council for permission to borrow £889 for laying tar paving on the Esplanade and for £550 for laying new mains. After hearing evidence from the town clerk and the borough surveyor, Mr. F. Roberts, the inspector visited the Esplanade and also the waterworks. The large service reservoir at these works has recently been covered, on the advice of Mr. Roberts, in order to prevent a weed growth which used to formerly take place at certain seasons of the year. The water is pumped from a deep well in the chalk, and since the reservoir has been covered there has been no recurrence of this growth.

URBAN DISTRICT COUNCILS.

Aston Manor.—At the ordinary monthly meeting of the district council, on Tuesday of last week, it was reported that the surveyor had been instructed to engage additional temporary assistance for the purpose of pushing forward the preparation of the plans, &c., in regard to the erection of additional cells at the refuse destructor.—The Highways Committee recommended that the surveyor should be instructed to prepare plans and estimates for the laying of storm-water sewers in Aston and Lichfield reads, from the city boundary to Salford Bridge, and the roads abutting thereon, and also in Witton-road. The recommendation was agreed to.—It was decided to direct the surveyor to make such alterations and do such work as may be necessary for the widening of the road opposite the new premises of the National Provincial Bank of England at Six Ways.—The Baths Committee reported that, in order to provide additional first-class slipper bath accommodation at the baths, they had resolved to purchase the dwelling house and premises adjoining the baths, at a price of £425.—The tender of Messrs. Butcher & Son, of Aston-road, Aston Manor, was accepted for the supply of two mud carts, at a cost of £15 10s. each.

Dukinfield.—At the last monthly meeting of the council a recommendation was received from the General Purposes Committee suggesting that an application should be made to the Local Government Board for sanction to borrow £11,361 for the erection of a new town hall and municipal buildings. It was decided to consider in committee a proposal to add a large hall, at a further cost of £5,000.

Herne Bay.—A Local Government Board inquiry was held on Saturday in reference to an application of the district council for sanction to a loan of £40,000 required for the renewal of the sea wall and parade, which was so extensively damaged in the great gale in November of last year. The clerk to the council, in the course of his evidence, said the damage was at that time caused to the whole of the sea-front and the lower part of the town, some 200 houses being affected. The sea front was temporarily repaired, at a cost of £700. It was explained by Mr. Baldwin Latham that the new sea wall would be 1,924 yards long and 20 ft. to 25 ft. high, being so constructed that it would allow of the promenade being widened by 15 ft. Evidence in support of the scheme and in opposition having been heard, the inquiry was closed.

Littlehampton.—Mr. H. Percy Boulnois, M.I.C.E., an inspector of the Local Government Board, held an inquiry on the 9th inst. with reference to the application of the district council for sanction to borrow £1,000 for street works, consisting of various paving, channels, kerb, &c. The surveyor, Mr. Howard, gave evidence, after which the inspector closed the inquiry, and then proceeded to inspect all the streets proposed to be dealt with.

Llanidloes.—The Local Government Board have sanctioned a loan of £7,326 for carrying out the water supply scheme which has been prepared by Messrs. Frok, Beesley & Son, of 11 Victoria-street, London, S.W.

Oldbury.—An inquiry has been held, on behalf of the Local Government Board, respecting the council's application for sanction to borrow £3,500 for the purpose of sewage disposal.

Portslade-by-Sea.—This small village, not far from Brighton, is going ahead. Quite recently a new sewerage scheme has received the sanction of the Local Government Board, and last week an inquiry was held as to an application of the district council for permission to borrow £4,500 for the purchase and the laying out of land for a recreation ground or public park. "Sanitation first and pleasure afterwards" appears to be the motto of this local authority, and it seems to be a very good motto too. The water supply comes from Brighton, and, of course, is excellent.

Rawmarsh.—A special meeting of the council was held recently, in order to adopt by-laws for the district, about which communications have been passing between this authority and the Local Government Board for some time. The question at issue has been in regard to the construction of dwelling-houses, the model by-laws of London authority insisting upon a better class of structure, with stronger division walls and more precautions against fire, &c., than was deemed necessary by the local authority. The negotiations have, however, been brought to a conclusion, and the wishes of the Local Government Board complied with. A resolution was

passed adopting the by-laws, which will immediately come into operation.

Waterloo-with-Seaforth.—Messrs. Killick & Cochran, 51 and 53 Seel-street, Liverpool, have obtained the contract for the supply of sixteen electric arc lamp columns and carriers for the district council.

Workshop.—At a recent meeting of the district council a letter was read from Messrs. Hodding & Co., solicitors, Workshop, offering, on behalf of Mr. Thomas Turner, of Sefton House, Workshop, to sell to the council a portion of the land required for street improvements fronting Park-street and Westgate. The portion proposed to be sold was about 80 yards, and the price £500. It was resolved not to accept the offer.

RURAL DISTRICT COUNCILS.

Cuildford.—At the last meeting of the district council it was decided to take over from the contractors the works of sewerage and sewage disposal at Shere, which are now completed. The works have been carried out under the supervision of and from plans prepared by the council's surveyor, Mr. Jas. Dewhurst. It was also decided to extend the system of sewers to the village of Gomshall, according to the plans prepared by Mr. Dewhurst, and to apply to the Local Government Board for sanction to borrow £1,700 to carry out such extension.

Hollingbourne.—A Local Government Board inquiry was recently held by Colonel A. G. Darnford, R.E., in reference to an application of the district council for permission to borrow the sum of £3,755 for the provision of an efficient water supply for Headcorn and the adjoining hamlet of Grafton Green. The engineers of the scheme are Messrs. Stephenson & Burstal, of Westminster.

Romford.—The district council have obtained the sanction of the Local Government Board to adopt building-by-laws for their district under the Public Health Act, 1875, and the Public Health Act Amendment Act, 1890. Formerly building by-laws were in force only in the parishes of Hornchurch and Dagenham. The council have further obtained urban powers for the purpose of making-up certain new streets under the Private Street Works Act, 1890.

Tending.—The district council have accepted the tender of Mr. T. Canham, High-road, Wooley, amounting to £198, for the construction of about 450 yards of 9-in. pipe sewer at Romsey.

DUNDEE TRAMWAYS.

OVERHEAD SYSTEM ADOPTED.

At a recent meeting of the Dundee Town Council, attention was called to recommendations of the Tramways Committee suggesting that the overhead system of traction should be adopted. A member, in moving the adoption of the minute, said that no person denied the utility of the overhead system, and the danger of it was comparatively nil. Besides, the Glasgow Corporation were going in for further extensions of the system. So far as he knew, no corporation in Britain had resolved up to the present to adopt the conduit system. They could not afford to experiment with that system, because it was too costly. Even supposing the conduit system was a success, and the initial expense was not less than between £5,000 and £6,000 a mile more than the overhead system, was anyone prepared to recommend the adoption of that system? Besides, after a few years, if the conduit system were proved a success, what would they lose by meantime adopting the overhead system and subsequently introducing the conduit in the centre of the city? This would simply mean the removal of the posts and wires to some suburban portion of the lines, and the saving in the first year by the adoption of the overhead system would be sufficient to enable them to meet any loss they had made by having first erected the overhead system and then had to take it down. The minute was eventually adopted by a large majority.

CORRESPONDENCE.

The Late Mr. Henry Knowles.—Messrs. John Knowles & Co., 38 King's-road, St. Pancras, N.W., write: In your obituary notice of the late Mr. Henry Knowles we observe you have made one slight mistake. You have credited his firm with being the first to supply the London market from the provinces, but when we inform you that the deceased gentleman was connected for some years with our works before he commenced business on his own account, and that before he thus commenced we had depots in London of many years' standing we hope you will allow this correction to be made.

Surveyors' Institution Meetings.—We regret that, owing to the amount of matter it has been necessary to deal with this week, we have been compelled to hold over the interesting paper, read at the Surveyors' Institution on Monday, by Mr. W. Weaver, on "The London Building Act and the Official Supervision of Buildings." It will be given in our next issue, together with some notes of the discussion.

INSTITUTION OF CIVIL ENGINEERS.

ORDINARY MEETING.

An ordinary meeting of the above Institution will be held on Tuesday, at 8 p.m., when the paper which was read by Mr. Francis Fox, at the last meeting, on "The Ventilation of Tunnels and Roadways," will be further discussed. Time permitting, a paper will be read by Mr. John H. "Judy" Dalry, A.M.I.C.E., on "High-speed Engines."

SPECIAL GENERAL MEETING.

A special general meeting (of corporate members) will also be held on Tuesday, at 9.15 p.m., to consider a list of proposed enact, a supplementary by-law.

STUDENTS' MEETING.

A meeting for the students of the Institution will also be held to-night, when a paper, entitled "The Kentish Town Widening, Midland Railway," will be read by Mr. Walter Daniel. The chair will be taken at 8 p.m. by Mr. Horace Bell, member of the council.

ADVERTISEMENTS.

Received too late for Classification.

BOROUGH OF CAMBRIDGE.

GENERAL ROAD FOREMAN.

Wanted, by the Corporation, a Foreman, to take charge of the whole of the men, horses, plant, &c., in the Highway Department, under the Borough Engineer and Surveyor.

Applicants must have a thorough knowledge of pavement and masons' work, the setting-out of new and the maintenance of old roads, and none but those who have been previously employed in a similar capacity need apply.

Wages, £2 10s. per week, with an additional 4s. per week for superintending the erection and removal of the market stalls.

Applications, accompanied by copies of not more than two recent testimonials, to be sent in to me not later than the 23rd instant.

Canvassing, either personally or by letter (except by circular enclosing testimonials), will be viewed with disfavour.

Candidates must state in their applications the earliest date they would be prepared to enter on their duties.

J. E. L. WHITEHEAD,

Town Clerk.

Guildhall,

December 5, 1898.

WANTED. Two Temporary Engineering Assistants, to supervise the Laying of Underground Telephone Works and show the works on the progress plans. Salary, £3 3s. per week.

Applications, accompanied by copies only of three recent testimonials, and endorsed "Temporary Assistants, Telephone Works," to be addressed to the City Surveyor, Town Hall, Manchester, and sent in not later than Tuesday, the 27th December.

BOROUGH OF PENZANCE.

APPOINTMENT OF BOROUGH SURVEYOR.

The Penzance Corporation are prepared to receive applications for the appointment of Borough Surveyor.

Salary, £200 per annum, with residence. List of duties, &c., can be obtained from the undersigned, to whom applications must be addressed, endorsed "Borough Surveyor" and delivered at the Town Clerk's office on or before the 4th January, 1899.

Canvassing members of the Council will be a disqualification.

T. H. CORNISH,

Town Clerk.

Town Clerk's Office, Penzance

December 14, 1898.

MALDON RURAL DISTRICT COUNCIL.

PURLEIGH DISTRICT WATER SUPPLY WORKS.

TO IRONFOUNDERS AND OTHERS.—CAST-IRON WATER MAINS.

The Maldon Rural District Council invite tenders for the Supply and Delivery of about 800 tons of 6-in., 4-in., 3-in., and 2-in. Cast-Iron Water Mains, and Special Castings required for the above works.

A copy of the specification and form of tender may be obtained on deposit of 5 guineas (which sum will be returned on receipt of a tender) on application at my office.

Sealed tenders, endorsed "Water Mains," to be sent to Mr. J. C. Freeman, the Clerk to the Council, Gate Street, Maldon, Essex, not later than Monday, January 9, 1899.

The Council do not bind themselves to accept the lowest or any tender.

(By order)

HORACE G. KEYWOOD, F.R.S.E.,
Engineer

Maldon, Essex.

December 14, 1898.

Some Recent Publications.

SANITARY ENGINEERING.

The phrase "sanitary engineering" is by no means synonymous with "municipal engineering." The latter expression may be said to include the former, but it is at the same time much wider in scope, inasmuch as it embraces many branches of work which are not, strictly speaking, regarded as coming under the description of sanitary engineering. The phrase "sanitary engineering" must also be clearly differentiated from the more vague and elastic term "sanitation." It is not too much to say that students of sanitary engineering have awaited with no small interest the appearance of the promised work, entitled *SANITARY ENGINEERING*, by Colonel E. C. S. Moore, R.E. (London: B. T. Batsford, 94 High Holborn. Price 30s. nett). The author was formerly instructor in estimating and construction at the School of Military Engineering, Chatham, and has already published a smaller book, entitled "Sanitary Engineering Notes." It may be said at once that his more recent work amply justifies the interest with which it has been anticipated. The sense in which Colonel Moore employs the expression "sanitary engineering," and what he intends his title to connote, can be seen in his sub-title, which runs thus: "A Practical Treatise on the Collection, Removal and Final Disposal of Sewage, and the Design and Construction of Works of Drainage and Sewerage." To this is added "a special chapter on the disposal of house refuse and sewage sludge, and numerous hydraulic tables, formulae and memoranda, including an extensive series of tables of velocity and discharge of pipes specially computed by Ganguillet and Kutter's formula." It will therefore be seen that the title of the book is practically synonymous with sewerage and sewage disposal, with the addition of some closely related questions, such as dust destruction, for example.

We hope it will not be gathered from the preceding remarks that we are either finding fault with the meaning which Colonel Moore attaches to the title of his book or with its scope. A glance either at the contents or the appearance of the volume, is quite enough to convince the reader that the field is certainly wide enough for a single volume or a single writer when the subject is treated so comprehensively and so thoroughly as Colonel Moore has treated it. The volume is of the kind that is usually described as "portly," extends to over 600 pages, and is provided with no fewer than 534 illustrations and seventy large folding plates. Colonel Moore points out that no attempt had previously been made to deal comprehensively with the subject as a whole, that is to say, in the course of a single work, a fact which may be taken as additional evidence of the extent of ground to be covered. Of course many able works have been published from time to time dealing with special branches of the subject, but Colonel Moore's object has been, in his own words, "to bring together, in a concise and practical manner, such information as I believe is most needed for the guidance of those engaged in the important work of preparing and carrying out schemes for the efficient sanitation of our cities, towns and villages, whether as engineers, surveyors, medical officers of health, municipal authorities and sanitary inspectors." The result is a work of reference which is likely to find its way into every sanitary engineer's library. The subjects to which chapters are devoted comprise collection and removal, sewerage, the flow of liquid in pipes and open channels, hydraulic memoranda, the application of the formulae of D'Arcy and Bazin and also of Ganguillet and Kutter, construction and materials, ventilation, traps, latrines and water-closets, urinals, lavatory fittings, &c., surface-water collection, subsoil drainage, sewage disposal, and the disposal of sludge and household refuse. The extensive improvements of recent years have led the author to devote special attention to two subjects—sanitary apparatus and appliances, and the methods of sewage purification and disposal. Colonel Moore, like the Local Government Board, has not ventured to discriminate between the various systems of sewage disposal, on the grounds that no one system has so far established a claim to universal acceptance, and that special cases will always demand special treatment. He adds, however, that the progress that has been made during the last few years in the system of biological treatment tends to show that in this direction the ultimate solution of this troublesome problem will be found.

In discussing the subject of sewerage, the "absolutely separate" system is recognised as undoubtedly the most perfect when carried out in its entirety, but the author's conclusion is that the "partially separate" system commends itself, if judiciously applied, and if the principles on which the absolutely separate system are based are carefully kept in view. The chief sewage lifting systems—those of Shoue, Liernur, and Adams—are described, but, as in the case of sewage disposal system, and sanitary appliances, the author generally contents himself with a careful description of each system and appliance, leaving the reader to draw his own conclusions as to merits or defects. It is only natural that a considerable portion of the book should be occupied with the discussion of hydraulic formulae and memoranda, and with tables giving the velocity and discharge of sewers, pipes and conduits (circular and egg-shaped); the tables, as we have mentioned, being based on the formula of Ganguillet

and Kutter. In connection with the size of sewers, we should have expected some reference to the formula of Kuichling. The chapter on construction and materials is long and fairly exhaustive. Writing on sanitary appliances is at times a thankless task, in connection with which it is impossible to please everybody, as manufacturers and patentees are sure to have very different ideas from the writer of a sanitary text-book as to what ought and ought not to be mentioned, approved or censured. There is no doubt, however, that on the whole Colonel Moore has carried out his task thoroughly well. In the chapter on ventilation the sewer gas question is discussed, though we are not carried further than the general conclusion that it is undoubtedly a predisposing cause in the spread of disease, through the lowering of vitality. The chapter closes with a full account of the Reeves system, which has been attracting so much attention of late. The contents of the remaining chapters are equally interesting, but it is impossible to deal with them in detail. A remarkable amount of information has been crammed into the chapter on sewage disposal, with reference to the numerous systems that have been brought forward, and especially the rapid advance of bacterial methods. To the author's general conclusions we have already referred. The final chapter deals with the disposal of sludge and refuse. As the author is no doubt aware, some additional information has now been forthcoming in regard to the Shoreditch combined scheme, and the figures have been subjected to a good deal of adverse criticism. Owing to the wealth of materials contained in the book a review might easily run to great length, but we must bring our remarks to a close. We may say, in conclusion, that we know of no single volume on this subject which contains such a mass of well-arranged information. The personal note of the author is, of course, not conspicuous, as the work is intended to be rather in the nature of a text-book and a work of reference. In this respect it is encyclopaedic, and should take its place as a standard book on the wide and important subject with which it deals.

ESTATE MANAGEMENT.

THE *YOUNG ESTATE MANAGERS' GUIDE*, by Richard Henderson, contains an introduction by R. Patrick Wright, F.R.S.E. (W. Blackwood & Sons. Price 5s.). The contents of this practical little manual indicates the number and variety of the branches of work which fall to the lot of an estate manager. Whilst realising that a due knowledge of the majority of these is only to be acquired through "actual experience in field and forest, in the workshop or yard, on the road and at the homestead," we endorse the author's views that it must prove detrimental to the higher interests of agriculture to have no institution in this country where an initiatory training, sufficient to embrace all the subjects indicated in the useful volume before us, can be adequately imparted. The aim of the present work, we are told, is "to instruct the beginner in estate management in the principles which lie at the root of the various departments, so that he may thereafter come to understand for himself their due application in practice, the plan adopted being first to take each branch of building by itself, commencing with the work of the mason and bricklayer, and to bring upon the stage the other tradesmen as they follow each other in due course. After this the nature and the relation of the respective buildings with regard to one another are dealt with, and next follow chapters devoted to other branches of work connected with estate management." Prof. Wright informs us that "the number of new text-books and other works relating to agricultural science that have been issued from the British press in the past few years has been unusually great; yet, rapid as has been their increase, it cannot be said that there exists any superfluity. Till within quite a recent period," he adds, "the literature of agricultural science in Britain was amazingly inadequate, and numerous as have been the additions made to it within the past decade, they have not yet nearly sufficed to fill up the wide blank that existed." Mr. Henderson's book forms a desirable contribution to our stock of agricultural reading, and the practical method of treatment enhances the value of the work. That most interesting, but somewhat neglected, branch of estate management comprised under the term of forestry, receives adequate treatment; and although the estate agent cannot aspire to be a forester, or be supposed to master the arts of the builder or the crafts of the drainer and the fencer, still a practical knowledge of these and numerous other subjects is indispensable; and this book may be commended to those aspiring to estate management as a profession. We may conclude our notice by quoting the following remarks from Prof. Wright's introduction to the volume. "No work," he says, "that deals with details of which many are well known can be altogether original, but the special value of this book lies in the fact that it is a record of the results of prolonged experience, of observation, and of reflection by a man whose education, and whose familiarity, both with the science and the practice of agriculture, have given him exceptional qualifications, and who has had ample opportunities of submitting his conclusions to the test of actual trial. It is especially noticeable all through the work that the facts that come under Mr. Henderson's observation have been made the sub

ject of careful consideration in their relation to all other facts bearing on the same subject. Whether his conclusions are in all cases sound or not, they have always been carefully formed, and are entitled to be received with respect and attention." The quality of the illustrations, type and paper render the general appearance of the volume attractive.

SOME SHORT NOTICES.

GAS AND PETROLEUM ENGINES, by A. H. Elliott, B.Sc. (Whittaker & Co. Price 2s. 6d.), is translated and adapted from a French work by M. Henry de Graffigny, and forms one of "Whittaker's Electro-Mechanical Series." Although internal combustion motors have for many years been steadily gaining favour, and at present hold an assured position in the industrial world, their great and increasing importance is perhaps as yet scarcely realised by the general public. Hence we can confidently recommend this carefully compiled and well-illustrated little volume to the non-technical reader who may desire to keep abreast of the times in matters of universal concern and interest. One chapter is devoted exclusively to an elucidation of the theory of the gas engine, but, as mathematical reasoning is as far as practicable avoided, the lay reader need not hesitate to enter upon its perusal, as he will not, we feel assured, experience much difficulty in following the author's lucid expositions, and thus clearly understand the deductions drawn and conclusions arrived at. We entertain no doubt that Mr. Elliott will be afforded opportunities for realising his anticipations by embodying later results in a future edition.

LOWESTOFF IN OLDEN TIMES, by Francis D. Longe, barrister-at-law (Dostoev & Todd, Lowestoft. Price 1s.), embodies a course of lectures delivered by the author at the St. Margaret's Institute, in that town, with such additions as were considered desirable so as to render the narrative of historical facts more complete and interesting. We are accustomed to associate with Lowestoft of the present day a good harbour, a fine fishing fleet and pleasant marine terraces; but these nineteenth century features are linked with the past by the retention of the old town on the cliff as the nucleus of its largely-developed modern extensions. Mr. Longe's compilation is founded on materials furnished by leading authorities of early and recent periods, and he imparts a vast amount of entertaining historical lore associated not only with the annals of Lowestoft, but also with those of Yarmouth, in a pleasant narrative style; and the publishers deserve much credit for the acceptable form in which they have issued a volume which must be considered a marvel of cheapness.

THE PROCEEDINGS OF THE ASSOCIATION OF ONTARIO LAND SURVEYORS embraces the annual reports of the council and several committees, with the minutes of the yearly meeting of that incorporated body, held at Toronto in 1898; and also includes a selection of papers of more than usual interest read by prominent members, accompanied by a record of the salient points of discussions that ensued.

Any of the Books noted below will be sent post free if the published price be forwarded to the offices of THE SURVEYOR.

- A HAND-BOOK OF HYGIENE AND SANITARY SCIENCE**, by George Wilson, M.A., M.D., LL.D., EM.D., F.R.S., EM.D., D.P.H., CAMB. (eighth edition); 798 pp., 8½ in. by 5½ in. J. & A. Churchill. Price 12s. 6d.
- THE PURIFICATION OF SEWAGE**, by Sidney Barwise, M.D., LOND., D.P.H., CAMB.; 150 pp., 7½ in. by 5 in. Crosby Lockwood & Son. Price 5s.
- THE XMAS NUMBER OF "THE PROCESS PHOTOGRAM";** 9½ in. by 6½ in. *The Photogram, Limited.* Price 6d.

SUPERANNUATION.

MEETING OF THE CONFERENCE.

Mr. C. William Tagg, presided at a meeting, held on Thursday, at 117 Holborn, E.C., when there was a good attendance. The sub-committee—consisting of Messrs. C. W. Tagg, Dr. Dudfield, G. Chaloner, W. P. Hunter, and the hon. secretary—appointed to confer with the Metropolitan Local Government (Officers') Association submitted the following report as the result of its deliberations with that body.

"That this conference, consisting of representatives of the Metropolitan Local Government (Officers') Association and the conference convened by the Municipal Officers' Association, agrees to recommend to the several associations as under—viz., (1) That metropolitan officers to whom the provisions of the Superannuation Act of 1866 apply be omitted from the Local Authorities Officers' Superannuation Bill. (2) That the efforts of both associations be mutually directed to assisting each other in regard to the two Superannuation Bills to be brought before Parliament, it being understood that precedence shall be given to the Superannuation (Metropolis) Bill, inasmuch as the circumstances connected therewith are the same as those of the Poor Law Officers' Superannuation Act, of 1896."

The hon. secretary (Mr. Carnell) stated that he was unable to attend the meeting when these resolutions were agreed to, and protested against the omission of the officers to whom the provisions of the Superannuation Act of 1866 applies from the Local Authorities Officers' Superannuation Bill, and

pointed out that it (the Metropolis Bill) did not provide for counting service from one authority to another in the area to which it applied, and he knew of a number of cases where officers will be years of service, and he could see no reason why this could not be provided for as in the case of the Poor Law Officers' Superannuation Act, 1896 (sec. 4) and a clause inserted to the following effect—"all service by an officer or servant under any authority to whom this Act applies shall be credited and reckoned for the purpose of this Act, whether the service has been continuous or not, and whether his whole time has been devoted to the service or not," and also to add, "and any contribution he may have made under the provisions of this Act shall be transferred and paid over to the local authority in whose service he shall enter," and all service under any local authority or under any other body whose duties and powers shall have been transferred to any local authority to whom this schedule applies shall be aggregated and reckoned for the purposes of this schedule." The report was ultimately adopted without alteration.

The conference also had under consideration the Local Authorities Officers' Superannuation Bill, and inserted a clause to provide for nurses contracting out if they so desire, and with this exception and the omission of the metropolitan officers to whom the Act of 1866 applies, decided to introduce the measure as in the last session.

It was decided to send a copy of the Bill to all local authorities to whom the Bill applies, asking them to pass a resolution in its favour, and also to do its utmost to get the officers themselves to petition their own local authorities to assist in the passing of the measure.

The hon. secretary (Mr. Carnell) writes to say that delegates were present from the associations representing metropolitan officers, who agreed to the exclusion of the officers who come under the 1866 Act from the general Bill, and he points out that should such officers feel aggrieved later on, through losing service by reason of holding office in more than one local authority, he did his best to safeguard their interests.

The Bill, having now been finally settled, will be ready for publication very shortly, and it only remains for the officers to make a liberal response to the appeal for financial support in order than an active campaign may be promoted. Subscriptions to the "Special Superannuation Conference Fund" should be sent to the Hon. Secretary (Mr. C. J. F. Carnell), 117 Holborn, London, E.C.

MEETING OF THE EXECUTIVE COUNCIL OF THE MUNICIPAL OFFICERS' ASSOCIATION.

At a meeting, on Tuesday, the executive council of the Municipal Officers' Association had under consideration the report of their delegates to the above-mentioned conference, who submitted the resolutions which were adopted by that body.

A long discussion took place on the report, and the following resolutions, moved by the hon. secretary (Mr. Carnell), were carried by a large majority: (1) That, having heard the report of the delegates appointed to represent this association at the superannuation conference, this executive council is of opinion that the clauses referring to metropolitan officers should be reinstated in the Local Authorities Officers' Superannuation Bill, and that the Metropolitan Local Government (Officers') Association should be asked to insert the following clause in the Superannuation (Metropolis) Bill: All service by an officer or servant under any local authority or authorities, or under any other body whose duties and powers shall have been transferred to any local authority to whom this schedule applies, shall be aggregated and reckoned for the purposes of this schedule, whether the service has been continuous or not, and whether his whole time has been devoted to the service or not, and any contribution he may have made under the provisions of this Act shall be transferred and paid over to the local authority in whose service he shall enter. (2) That a copy of the above resolution be sent to the superannuation conference, to the Metropolitan Rate Collectors' Association, to the Incorporated Society of Medical Officers of Health, and to the Sanitary Inspectors' Association, asking them to take similar and immediate action in the matter and instruct their delegates to act in accordance with the foregoing resolutions. (3) That the Metropolitan Local Government (Officers') Association be informed of the action taken.

St. Marychurch, Devonshire.—At a recent meeting of this authority it was reported that it had been decided to approve a scheme for the drainage of the borough, and to make an application to the Local Government Board for sanction to borrow £7,500 to carry out the necessary work. The scheme as proposed is to improve the present drainage in St. Marychurch and to provide a drainage system for Barton and other parts. Dr. Winter said the council adopted the report of Mr. Worth, of London, who had examined the drainage and reported upon it, the cost being £9,000. Subsequent upon an interview with Mr. Worth, that amount had been reduced to £7,000. He said it was inadvisable that this scheme should be carried, as St. Marychurch depended upon its visitors, and it was necessary to have the place in a thoroughly sanitary condition. Eventually it was decided that the work be carried out.

Personal.

Mr. Edward Charles Griffiths, of Gnosall, has been appointed surveyor to the Gnosall Rural District Council.

We understand that 126 applications have been received for the vacant borough surveyorship of Folkestone.

Harrogate Town Council have increased the salary of Mr. E. W. Dixon, their waterworks engineer, by £100, making it now £400 a year.

Mr. William Clough, of the borough surveyor's office, Haslingden, has been appointed surveyor to the Andenshaw Urban District Council.

The Town Council of Wokingham have adopted a resolution agreeing to a proposal to increase the salary of their borough surveyor, Mr. J. Manley.

Mr. Robert M. Evans, assistant in the borough surveyor's office, Stafford, has been appointed second assistant in the office of Mr. Joseph Lobley, borough surveyor, Hanley.

The Southborough Urban District Council have voted their surveyor, Mr. Hamer, £150 for extra work in connection with planning and superintending the erection of the Victoria Hall, which has just been opened, in the town.

A letter has been received by the South Darley Urban District Council from their inspector, Mr. E. F. Lowe, stating that, having been appointed surveyor to the North Darley authority, he wished to resign his present appointment. The resignation was accepted.

Mr. W. H. Preece, C.B., was the guest of the evening at a dinner of the Whitehall Club on Monday, when Sir Charles Scotter occupied the chair. Mr. Preece was thus entertained in recognition of his occupying this year the important position of president of the Institution of Civil Engineers.

Mr. F. Rodley, who has held the position of surveyor and inspector to the Whitworth (Lancs.) Urban District Council for the last sixteen years, recently tendered his resignation. The resignation was accepted at the last monthly meeting of the district council, and will take place in three months' time.

The Pontardawe Rural District Council, at their last meeting, decided to increase the salary of Mr. John Morris Thomas Williams, their assistant surveyor. Mr. Williams, we may mention, was appointed about eighteen months ago, and is the son of Mr. Dawkin Williams, engineer and surveyor to the Ogmore and Garw Urban District Council, with whom he served his articles.

Mr. Edwin O. Sachs, of 11 Waterloo-place, Pall Mall, S.W., on Tuesday completed the first section of the new electrical stage installation at Drury-lane Theatre in time for the impending pantomime. The present works principally refer to the stage floor and its movability in sections above and below the footlights. The total area now already movable by mechanical power exceeds 1,200 square feet, and arrangements have been made for every possible safeguard against accident.

Mr. Frederick J. Dixon, who has for the last three and a half years held the appointment of district highway surveyor to the Spilsby (Lincs.) Rural District Council, was on Thursday presented by a few friends with a handsome set of electric drawing instruments in an oak case and a gun-metal parallel ruler, 2ft. in length, in a mahogany case, on the occasion of his leaving Spilsby to take up his residence in Lincoln, he having recently been taken into partnership by Mr. James Thropp, county surveyor of Lincoln.

At a meeting of the Penzance Town Council recently a letter was received from Mr. J. H. Small, the borough surveyor, stating that he had accepted an appointment at Port Elizabeth and asking the council's acceptance of his resignation at the end of December. He expressed to the council his grateful thanks for the many acts of kindness and consideration shown him during his long connection with the borough. The mayor said during the twenty-four years Mr. Small had been with them he had been a trustworthy and respected officer of the council. They must all congratulate him on his abilities being recognised in a manner so entirely satisfactory to himself. Everyone who knew his true worth to the town would experience the liveliest regret that they were about to lose his services. Mr. J. Caldwell, chairman of the Highways Committee, in moving the acceptance of the resignation, said he was surprised at Mr. Small remaining with them for so many years, for a man of his ability who had carried out works so successfully was deserving of a better position than that at Penzance. The motion was eventually adopted, it being referred to the General Purposes Committee to appoint a successor.

At the last monthly meeting of the Darwen Town Council the Highways Committee recommended that the salary of Mr. R. W. Smith-Saville, the borough engineer and surveyor, should be increased from £300 to £400 per annum. Councillor Halliwell moved an amendment that the increase should be to £350, and not to £400. He said he had not a single word to say in complaint of Mr. Saville, but the question was whether the raising of Mr. Saville's salary from £300 to £400

was not going too fast. If the corporation were to go on at this rate they would soon be in a difficult position. With regard to the expenses of the borough surveyor's department, he found that in 1884 the surveyor was receiving £350 a year, and that a clerk was employed at £39 a year—those were the expenses of the whole department. Now, for the last half-year they had been £627, which meant that the expenses for the current year would be £1,250. A long discussion ensued, several members speaking in very high terms of Mr. Saville's services. Eventually the council divided, with the result that only three votes were recorded for the amendment. The recommendation of the committee was, therefore, adopted by a large majority.

The forty-fifth annual general meeting of the Society of Engineers was held on Monday, at the rooms of the society, 17 Victoria-street, Westminster, S.W. The chair was occupied by Mr. William Worby Beaumont, the president. The following gentlemen were duly elected by ballot as the council and officers for 1899: As president, Mr. John Corry Fell; as vice-presidents, Messrs. Henry O'Connor, Charles Mason and Percy Griffith; as ordinary members of council, Messrs. J. Patten Barber, Joseph Bernays, D. B. Butler, G. A. Pryce Cuxson, R. St. George Moore, Nicholas J. West, Joseph William Wilson and Maurice Wilson; as hon. secretary and treasurer, Mr. George Burt; as hon. auditors, Messrs. Alfred Lass, F.C.A., and Samuel Wood, F.C.A. It was announced that, owing to the increase in his private practice, Mr. Pryce Cuxson, F.R.S.I., had been compelled to resign his position as secretary to the society, and a very flattering tribute was paid to him for the services which he had rendered to the society. It was also announced that Mr. Perry F. Nurse had been appointed to fill the vacancy, and will take office on the 1st of January next. The following were elected honorary members of the society: Sir J. Wolfe Barry, K.C.B., LL.D., F.R.S., M.I.C.E., Prof. A. B. W. Kennedy, LL.D., F.R.S., M.I.C.E., Mr. W. H. Preece, C.B., F.R.S., M.I.C.E., and Mr. Alexander Siemens, M.I.C.E. The proceedings were terminated by a vote of thanks to the president, council and officers for 1898, which was duly acknowledged by the president. On Tuesday evening the society held their annual dinner in the Victoria Hall of the Hotel Cecil. Mr. W. Worby Beaumont, the president, presided, and among the guests were Sir Benjamin Baker, Sir J. Durston, General Sir O. Tanner, Mr. W. H. Preece, Mr. W. H. M. Christie (Astronomer Royal), Mr. Alex. Siemens, Mr. J. W. Swan, the Hon. C. S. Rolls, Mr. John Aird, M.P., Mr. J. C. Fell, and the secretary, Mr. G. A. Pryce Cuxson. The last-named gentleman during the evening was presented, on his retirement from his office after ten years' zealous work, with an address on vellum and a tea and coffee service. Following the usual loyal toasts, "Prosperity to the Society of Engineers" was proposed by Mr. A. J. Walter and responded to by the president. Mr. Preece, president of the Institution of Civil Engineers, proposed "Engineering Enterprise," and Sir B. Baker responded.

At the London County Council meeting on Tuesday the Highways Committee brought up an urgency report with reference to the refusal of Mr. John Young to accept the position of chief officer of the tramways department. The committee stated that they had received a letter from Mr. Young declining, for reasons given, to accept the appointment conferred upon him by the resolution of the council. In view of all the circumstances, they were of opinion that it was advisable that for the present the appointment of the chief officer of tramways should remain vacant; but having regard to the fact that the council would take over at the end of the year the undertaking of the London Tramways Company, it was important that provision should be made for the proper administration of that system after that date. They therefore recommended that Mr. A. Baker, the manager of the Nottingham Corporation tramways, who was second on the list of three submitted by the General Purposes Committee a fortnight ago, should be appointed the manager, at a salary of £1,000 a year. Mr. Benn, chairman of the committee, read Mr. Young's letter, which was to the effect that he had hoped that the appointment would be made so as to admit of the council having the advice of the chief officer of the new department from the beginning of the arrangements. During the past few days it had gradually, but irresistibly, been borne upon his mind that the position would be so different from what he anticipated, and what he had been so long accustomed to, that it would be a mistake for him to come to London. Commenting on this letter, Mr. Benn said that Mr. Young saw the clerk at the outset, and was fully acquainted with all the particulars before he sent in his application. Replying to questions, Mr. Benn further said that Mr. Young made no stipulation as to the appointment of a second officer. He did ask that he might be allowed to bring his chief assistant with him, but was informed that the matter would have to be considered by the committee in the first instance before it was submitted to the council. The committee, however, did not offer any opposition to the suggestion that this officer should also be appointed, at £250 a year. No inducement had been made to Mr. Young, so far as he knew, to apply for the position. The report of the committee was adopted.

ELECTRIC LIGHT FOR ROCHDALE.**LOCAL GOVERNMENT BOARD INQUIRY.**

At Rochdale, Colonel A. J. Hepper, R.E., last week held an inquiry, on behalf of the Local Government Board, in reference to an application of the Rochdale Corporation for sanction to borrow £30,000 for electric light purposes. Among those present were Mr. S. S. Platt, the borough surveyor, Mr. T. B. Ball, the gas manager, and Mr. E. M. Lacey, of London, the consulting engineer.

From the evidence it appeared that it was proposed to erect electricity works to supply the whole area of the borough, as well as the motive-power for tramway traction in the event of that system of traction being adopted when the tramway came into the possession of the corporation, as they will do in 1901 and 1902. The site of the works, which comprises 2,838 square yards, is in close proximity to the gasworks, and is believed to be very well and centrally situated for the purpose of an electric light station. A plan was submitted showing the streets where the light is first to be introduced, and it was explained that the corporation do not think it necessary to have subsidiary feeding stations in different parts of the town. The one at the generating station was thought sufficient, at the start at any rate. The corporation would be bound by their provisional order to complete works enabling them to supply electric light within a certain limited area within two years from the date of the order. The estimate of £30,000 was made up as follows: £9,500 for buildings; £4,700 for engines and dynamos; £1,000 for boilers, economisers, condensers and pumps; £1,000 for switchboards; £1,000 for accumulators; £5,600 for cables and laying them; £1,000 for meters and service; £1,000 for superintendence and legal expenses; and £2,000 for contingencies. It was proposed to charge 5d. per unit for the light, and it was anticipated that a profit of £800 would be obtained when 1,200 8 candle-power lamps were connected.

There was no opposition to the application, and, on the conclusion of the inquiry, the inspector visited the site of the proposed station.

APPOINTMENTS VACANT.

Official and all similar advertisements received later than Wednesday evening are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

GENERAL ROAD FOREMAN.—December 17th.—Corporation of Cambridge. £2 14s.—Mr. J. E. L. Whitehead, town clerk.

ASSISTANT BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES.—December 17th.—Corporation of Wenlock. £80.—Mr. Godfrey C. Cooper, town clerk.

SEWAGE FARM OVERSEER.—December 19th.—Corporation of Cheltenham. £100.—Mr. E. T. Brydges, town clerk.

DISTRICT MAIN ROAD SURVEYORS (FOUR).—December 19th.—Hertfordshire County Council. £130.—Mr. Urban A. Smith, county surveyor, 41 Parliament-street, London, S.W. SURVEYOR.—December 20th.—Atherton Urban District Council. £160.—Mr. Danl. Schofield, clerk to the council.

SURVEYOR.—December 20th.—Lytham Urban District Council.—Mr. Chas. A. Myers, clerk to the council.

HIGHWAY SURVEYOR.—December 21st.—Uxbridge Rural District Council. £200.—Mr. Charles Woodbridge, clerk to the council.

FOREMAN OF PUBLIC WORKS.—December 21st.—Corporation of Canterbury. £2 2s.—Mr. Henry Fielding, town clerk.

ELECTRIC LIGHT MAINS SUPERINTENDENT.—December 21st.—Corporation of Hull. £120.—Mr. A. S. Barnard, city electrical engineer.

ASSISTANT TO THE CITY ARCHITECT.—December 21st.—Corporation of Dublin. £150.—Mr. Henry Campbell, town clerk.

BUILDING INSPECTOR.—December 22nd.—Corporation of Stockport. £2 2s.—Mr. John Atkinson, borough surveyor.

CLERK OF WORKS.—December 22nd.—Corporation of Rotherham. £3.—Mr. H. H. Hickmott, town clerk.

ASSISTANT FOR WATERWORKS ENGINEER'S OFFICE.—December 22nd.—Corporation of Cardiff. £80.—Mr. C. H. Priestley, A.M.I.C.E., waterworks engineer to the corporation.

INSPECTOR OF WEIGHTS AND MEASURES.—December 24th.—Corporation of South Shields. £120.—Mr. J. Moore Hayton, town clerk.

BUILDING INSPECTOR.—December 27th.—Corporation of Sutton Coldfield. 30s.—Mr. W. A. H. Clarry, A.M.I.C.E., borough surveyor.

APPOINTMENTS OPEN.

COUNTY BOROUGH OF STOCKPORT. APPOINTMENT OF BUILDING INSPECTOR.

The General Purposes Committee invite applications for the appointment of Building Inspector in the Borough Surveyor's department.

Candidates must be thoroughly qualified persons, to be accurate surveyors and levellers, and will be required to undertake the inspection of new buildings and drains, set out and fix levels for new streets, and make surveys of all new houses, buildings and drains, and to keep the necessary records in connection therewith, and to be well up in building construction and the Model Building By-Laws.

Salary, £2 2s. per week. Age to be between thirty and forty years. A list of duties may be obtained on application. Applications, in candidate's own handwriting, stating age,

and accompanied by not more than three copies of recent testimonials, and endorsed "Building Inspector," to be sent to Mr. John Atkinson, Borough Surveyor, on or before Thursday, December 22, 1898.

Canvassing will be considered a disqualification.

WALTER HYDE,
Town Clerk.

ATHERTON URBAN DISTRICT COUNCIL.

The above-named Council invite applications from duly-qualified persons for the office of Surveyor to the Council.

Salary, £160 a year, increasing to £180 by two advances of £10 each on the completion of the first and second years' service.

Candidates may obtain forms of application and a statement of the terms of the appointment from the undersigned, to whom the applications (with copies of not more than three testimonials of recent date) are to be delivered not later than Tuesday, the 20th December inst.

Personal canvassing of members of the Council will be deemed a disqualification.

DANL. SCHEFFIELD,
Clerk.

Atherton, near Manchester.

December 9, 1898.

CORPORATION OF CANTERBURY. FOREMAN OF WORKS.

Wanted, a qualified Foreman of Public Works, to work under the immediate direction of the City Surveyor. Must be experienced in the special department of municipal work consisting of road and paving formation and maintenance, also sewer and drain construction, and the management of Corporation workmen. Commencing wage at the rate of 42s. per week.

Applications, with copies of three testimonials of recent date, to be sent to me, the undersigned, not later than Wednesday, the 21st inst., at 10 a.m.

Canvassing members of the Council will disqualify.

HENRY FIELDING,
Town Clerk.

Town Clerk's Office,

15 Bargate-street, Canterbury.

December 7, 1898.

LAGOS, WEST COAST OF AFRICA.

INSTRUCTOR FOR TECHNICAL SCHOOL
required by the Government of Lagos, West Coast of Africa, for Technical School of the Public Works Department of the Colony. Engagement, one to three years. Salary, £300 per annum. Free quarters, or an allowance. Travelling expenses if sent on duty from station.

Free passage out, and home again on expiration of engagement. Leave of absence, if engagement extends beyond one year, six months on full salary, with free passage each way, after every twelve months' continuous residential service if exigencies of service permit.

Candidates must have had systematic training in building construction and surveying, with practical experience.

Candidates must be from twenty-six to forty years old. Character for steadiness and sobriety must bear the strictest investigation. Strict medical examination will be required. Single men preferred, and applicants must state whether they are single or married.

Applications, stating age and experience, and accompanied by copies (not originals) of testimonials as to personal character and qualifications, with the names and addresses of references of whom inquiry can be made, will be received by the Crown Agents for the Colonies, Downing-street, London, S.W., up to 29th December.

The Crown Agents possess no further particulars respecting the above appointment, and cannot therefore undertake to answer inquiries.

BOROUGH OF SUTTON COLDFIELD.
BUILDING INSPECTOR.

A Building Inspector is required, to inspect new buildings and drains and to assist in the office generally.

Salary, 30s. per week; engagement subject to a month's notice.

Written applications only, stating age and experience, and enclosing copies of not more than three recent testimonials, to be sent to the undersigned, endorsed "Assistant," before noon on December 27, 1898.

W. A. H. CLARRY, A.M.I.C.E.,
Borough Surveyor.

Town Hall, Sutton Coldfield.
December, 1898.

UXBRIDGE RURAL DISTRICT COUNCIL.

The above Council are prepared to receive applications for the appointment of a Highway Surveyor for the Uxbridge Rural District.

The district comprises nine parishes and about 90 miles of parish highways.

The Surveyor will be required to devote the whole of his time to the duties, and to reside within the district or in Uxbridge, as may be approved by the Council.

Salary, £200 per annum, to include all travelling expenses, but an office will be provided by the Council.

Applications, in the candidate's own handwriting, stating age, previous experience in road maintenance, and keeping the accounts, &c., relating thereto, accompanied by three recent testimonials as to character and practical knowledge of road work, to be sent to me on or before Wednesday, the 21st December instant.

The person appointed must be prepared to enter into a bond in the sum of £200.

Notice will be sent to any candidate who may be required to attend before the Council.

Canvassing, directly or indirectly, is prohibited.

Any further particulars may be obtained on application to me.

CHARLES WOODBRIDGE,
Clerk.

Council Offices, 38 High-street, Uxbridge.
December 5, 1898.

CITY OF BIRMINGHAM.

Required, immediately, in the Sewers Department of the Corporation of Birmingham, a Temporary Assistant, at a weekly salary of £2 5s. Age not to exceed twenty-six. Preference given to candidates holding certificates of the Association of Municipal and County Engineers.

Applications, stating age and full particulars of experience, with copies of recent testimonials, to be sent to the undersigned.

JOHN PRICE,
City Engineer and Surveyor.

Council House, Birmingham.

CARDIFF CORPORATION WATERWORKS.

The Cardiff Corporation are prepared to receive applications for the appointment of an Assistant in the Waterworks Engineer's office. Salary to commence at £80 per annum, rising by annual increments of £10 to £110 per annum.

Preference will be given to candidates having a good knowledge of drawing, levelling and surveying; they should also be well acquainted with estimates and cost accounts usual in waterworks administration.

Further particulars as to duties may be obtained on application to Mr. C. H. Priestley, A.M.I.C.E., Waterworks Engineer, Town Hall, Cardiff.

Applications, in candidate's own handwriting, stating age, past and present employment, and accompanied by copies of not more than three recent testimonials, to be sent to me, endorsed "Assistant, Waterworks Engineer's Office," on or before Thursday, the 22nd inst.

Canvassing, directly or indirectly, will be a disqualification. (By order)

J. L. WHEATLEY,
Town Clerk.

Town Hall, Cardiff,
December 12, 1898.

TENDERS WANTED.

COUNTY OF SOUTHAMPTON.

COUNTY LUNATIC ASYLUM, KNOWLE, NEAR FAREHAM.—CONTRACT No. 1.

TO BUILDING CONTRACTORS.

Persons desirous of tendering for the Construction of Concrete Foundations, the Erection of Brick, Steel and Concrete Superstructures of New Infirmary Wards, Sanitary Blocks, Boiler-House, Tall Chimney Shaft, and sundry other works connected therewith, at the County Lunatic Asylum, Knowle, Fareham, may see the plans and specification, and obtain bills of quantities and all other information, on application at the office of Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on and after Monday, December 12th next, between the hours of 9 a.m. and 5 p.m.; Saturdays between 9 a.m. and 1 p.m. A deposit of one £10 Bank of England note will be required for each bill of quantities, and will be refunded on receipt of a *bona-fide* tender.

The foundations are to be commenced in February, 1899, and the superstructures in March, as the weather may permit.

Tenders, strictly in accordance with forms supplied by the County Surveyor, to be delivered to me on or before Monday, January 16, 1899.

The Committee of Visitors do not bind themselves to accept the lowest or any tender.

JOHN R. WYATT,
Clerk to the Committee of Visitors.

Knowle,
November 30, 1898.

**BOROUGH OF SOUTHEEND-ON-SEA.
TO GRANITE MERCHANTS AND OTHERS.**

The Corporation invite tenders for the supply and delivery at the Railway Goods Station, or alongside, at Southead, of about 350 tons of Broken Granite.

Particulars and forms of tender may be obtained on and after Monday, the 12th inst., upon application to Mr. Alfred Fidler, Assoc.M.I.N.S.T.C.E., Borough Surveyor, Clarence-road, Southead.

Sealed tenders, marked "Granite," to be delivered at my office on or before Wednesday, the 21st December.

The Corporation will not be bound to accept the lowest or any tender.

(By order)
WILLIAM H. SNOW,
Town Clerk.

Southead-on-Sea,
December 7, 1898.

**TWICKENHAM URBAN DISTRICT COUNCIL.
TO GRANITE MERCHANTS.**

The Council invite tenders for about 800 ft. of 6-in. by 12-in. Norway Granite Edge Kerb, to be delivered alongside Church Drawdock, within the parish of Twickenham.

Forms, on which tenders only will be received, and full particulars may be obtained from Mr. F. W. Pearce, Surveyor to the Council, Town Hall, Twickenham.

Tenders, endorsed "Granite Kerb," must be sent to me on or before Wednesday, the 21st inst. The person whose tender is accepted will be required to enter into a contract.

The Council do not bind themselves to accept the lowest or any tender.

(By order)
H. JASON SAUNDERS,
Clerk to the Council.

Town Hall, Twickenham,
December 10, 1898.

URBAN DISTRICT COUNCIL OF BROMLEY. DIVERSION OF CULVERT, &c.

The Urban District Council of Bromley is prepared to receive tenders for certain works of Diversion of the Culvert in Homesdale-road, and other works connected therewith, within their district, in accordance with plans, sections, &c., which may be seen at the office of the Council's Surveyor.

The bill of quantities, specifications and form of tender may be obtained on payment of 1 guinea, which will be returned on receipt of a *bona-fide* tender.

Tenders, endorsed "Tender for Diversion of Culvert, Homesdale-road," must be delivered to me not later than 3 o'clock p.m. on Tuesday, the 27th day of December, 1898.

The Council do not bind themselves to accept the lowest or any tender.

(By order)

FRED. H. NORMAN,
Clerk to the Council.

District Council Offices, Bromley, Kent.
December 12, 1898.

COUNTY BOROUGH OF WOLVERHAMPTON. NEW STREET WORKS.

The Streets Committee invite tenders for the Forming, Levelling, Sewering, Draining, Metalling, Paving, Kerbing, Channelling and Completing Raby-street extension (Melbourne-street to All Saints'-road) and Lever-street (Greenlane to Raby-street).

Plans and sections can be seen, and specifications with bill of quantities and form of tender obtained, on application at the Borough Engineer's office, Town Hall.

Sealed tenders, addressed to the Chairman of the Streets Committee, and endorsed "Tender for New Street Works," to be delivered at the Town Clerk's office not later than January 9, 1899.

The contractor will be required to enter into an undertaking to pay not less than the minimum standard rate of wages of the district, and to observe certain hours of labour in accordance with the resolution of the Town Council.

The Committee do not bind themselves to accept the lowest or any tender.

J. W. BRADLEY, C.E.,
Borough Engineer and Surveyor.

Town Hall, Wolverhampton.
December 8, 1898.

CITY OF BIRMINGHAM.

HAROLD-ROAD EXTENSION.

TO ROAD CONTRACTORS AND OTHERS.

The Public Works Committee of the Council of the said city are prepared to receive tenders for Forming and Metalling the Carriageway, and Kerbing, Channelling and Concrete Flaggings, the Footpaths in Harold-road and Noel-road.

The drawings and specification may be seen, and forms of tender obtained, at the undermentioned office, where tenders, sealed and endorsed "Harold-road Extension," are to be delivered not later than the 21st instant.

The tender of any person or firm paying less than the minimum standard rate of wages current in the district will not be accepted.

The lowest or any tender not necessarily accepted. The contractor whose tender may be accepted will be required to provide satisfactory security for the due performance of the contract.

JOHN PRICE,
City Surveyor.

City Surveyor's Office,
The Council House, Birmingham.

Building By-Laws and their Administration.

It may readily be admitted that the existing state of affairs in connection with building by-laws is in some respects not so satisfactory as it might be, and that those who suffer inconvenience thereby are justified in their endeavours to trace out the causes and indicate possible remedies. It will, however, be a matter for regret if this cannot be done without attempts being made to place the responsibility on the wrong shoulders, and without the publication of statements which have no apparent justification and which may cause undeserved annoyance and injury to a class of officials who are, as a rule, able and conscientious in the discharge of their duties. When such statements come from a source which may lead them to be accepted without question by the public it would certainly be a mistake to allow them to pass unchallenged. At a recent joint meeting in Birmingham of the Royal Institute of British Architects and the Birmingham Architectural Association the subject of discussion was "Building By-Laws and their Administration." It was explained that the subject had been selected by the local association because the Birmingham City Council are about to frame new building by-laws and had promised to submit the draft to the association, and that the members hope to have the assistance of the Royal Institute of British Architects in considering these by-laws and in obtaining greater uniformity in the by-laws of Birmingham and the surrounding districts. These objects are laudable enough, and it may well be that the absence of uniformity between the building by-laws of Birmingham and those of the surrounding districts causes a good deal of difficulty and annoyance. If within the range of possibility, it is certainly desirable in the interests of all concerned—builders, property owners, architects, and the community generally—that the by-laws of a large city should be uniform with those of the districts bordering on it, for it is not wise to perpetuate a system which may check industrial development and cause loss to the public. At the same time it should be remembered that a distance of a very few miles may mean an entire change of conditions, and that the by-laws of a district may require to be formulated in accordance with special needs. Such general considerations, however, affect only the system in operation. Like so much else in this world, that system is no doubt far from perfect, and criticism is in every way desirable; but to criticise a system is one thing, to attack the officials who administer that system, and to level at them a number of sweeping and general charges without any attempt to substantiate them by specific evidence, is quite another thing, and in every way reprehensible. This, in effect, is what has been done by an architect so well known as Mr. W. Henman, who opened the discussion to which we referred above. That gentleman has been president of the local association, and our readers will remember that he

acted as chairman of the Engineering and Architecture section at the recent Birmingham Congress of the Sanitary Institute. His professional eminence may therefore secure for his random, and by no means kindly, utterances a prominence they would not otherwise obtain, and it is therefore desirable that the unfairness of some of his statements should be pointed out.

Mr. Henman began by drawing a very dark picture indeed of the existing condition of things, and of what the future would hold if something is not quickly done. We note that he expressly excluded the metropolis from consideration, on the ground that the new Building Act "was administered by an experienced body of men, who, he believed, were generally architects or had had architectural training, while there was power of appeal to the London County Council." Mr. Henman apparently has not studied this subject closely enough to be aware that the "district surveyors," to whom he refers, carry out their duties under one Act, but that the sanitary equipment of new buildings in the metropolis is regulated by quite another Act—the Public Health (London) Act, 1890, and by another set of officials—the surveyors to the vestries and district boards. Mr. Henman, moreover, is apparently not aware that loss and inconvenience arise from this dual and often overlapping jurisdiction, and that many people, including not a few influential architects, would prefer to see the duties amalgamated in one official, provided he has the necessary qualifications; in other words, would prefer the system in operation in the large provincial towns and cities. It is with this system that Mr. Henman deals. In one sentence he admits that some latitude is required to meet local requirements, and then complains of the confusion that results from petty variations and of the annoyance and inconvenience caused to architects by having disapproved in one district plans which would be passed in another without question. There is, no doubt, a good deal of truth in this, but we fear that a certain amount of inconvenience is inevitable, and that architects can scarcely expect by-laws to be drafted and interpreted with an eye to their exclusive convenience. We are also convinced that the critic is anything but fair when he says that the trouble arises largely from the different interpretations surveyors put upon the same by-law or regulation. There is, no doubt, plenty of scope for variety of interpretation, but it is seldom that this scope is taken advantage of to an unreasonable extent. Then it is probably the fault of the by-laws rather than of the official who administers them, and who is probably only doing his duty. Mr. Henman asserts the desire of architects to comply with by-laws or regulations that are uniformly and reasonably enforced. He might therefore give some credence to what we know to be the general desire of borough and district surveyors—namely, to avoid causing unnecessary trouble or annoyance to others consistently with the conscientious

discharge of their duties. He has, perhaps, some force on his side when he says that the so-called "model" by-laws of the Local Government Board are confused in their arrangement, go too much into detail on matters of minor importance or matters on which knowledge is as yet imperfect, omit reference to matters of structural importance, the neglect of which in some buildings might be a definite source of danger, and are wrapped up in unnecessary legal jargon and excessive verbiage. Hence the confusion and trouble, as by-laws sanctioned by the Local Government Board must be based on the "model" series. Obviously Mr. Henman's main grievance should be against the Local Government Board. As for regulations not so sanctioned, an architect should be aware that they cannot be legally enforced. The borough and district surveyor, however, is evidently Mr. Henman's *bête noir*, and in the course of his remarks he committed himself to statements which cannot be too severely reprobated, and should not have been made unless in connection with specific cases which the speaker was prepared to prove. But in the first place we must dispute the absurdly incorrect remark that, apart from the larger cities, surveyors to local authorities are usually selected from a class of men trained to road surveying and sewer laying and with little knowledge of building construction or architectural propriety, and the equally preposterous idea that they regard architects as their natural enemies, who should be hampered in every possible way. Even in smaller towns and districts the surveyor is probably a comparatively young man who has been trained in the office of a municipal engineer of a town of considerable importance; and given average intelligence, such an apprenticeship is impossible without obtaining a very considerable architectural knowledge and experience. In the more populous districts, according to Mr. Henman, the surveyors are assisted by building inspectors, who are endowed with still less knowledge and discretion. Now come the gravest of his various charges. In connection with them it is to be regretted that he has jumbled up surveyors and inspectors, but we take it that he means his remarks to apply indiscriminately. We may quote the following passage as reported:—

Dwellings for the working classes were still erected in the most flimsy fashion by the jerry builder, who generally went Scot free, while architects who desired to build scientifically and well were continually harassed by unreasonable restrictions and requirements. Too many members of district councils were interested, directly or indirectly, in building operations, and the surveyor could serve such in many ways, and in turn obtained their support. Inspectors were but mortal, and were generally underpaid. It was therefore not surprising that some of them came under the influence of the speculative builder, and little credit accrued to them by drawing attention to his irregularities, but *clat* was gained when an architect was reported as having contravened a by-law or regulation.

This can only mean one of two things. Either borough surveyors and building inspectors are accused of succumbing to bribery by speculative builders who are members of their councils, or they are accused of not carrying out their duties conscientiously and without fear or favour. The words are obviously those of a man who is speaking at random, and Mr. Henman can scarcely be congratulated on having achieved a courteous or considerate performance. In our columns cases have been reported of surveyors who have lost appointments through the conscientious discharge of their duties. As to remuneration and qualifications, we believe that no building inspector in Mr. Henman's own city has less than £150 a year, and probably all would bear favourable comparison with assistants in architects' offices and can boast of greater practical knowledge. We believe we are correct in saying that the building surveyor to the Birmingham Corporation is an Associate of the Royal Institute of British Architects and was trained in offices of the highest class.

Before concluding, Mr. Henman had something to say on the subject of borough surveyors carrying

out buildings of an architectural character, such as isolation hospitals, baths, libraries, markets, town halls and council houses. Rarely, we are told, have they received suitable training for such work, and by their doing it architects are deprived of legitimate employment. The latter is, no doubt, the sore point, but we doubt if it can be regarded as otherwise than a matter of opinion and sentiment. There is really no reason why borough surveyors should not do such work if their other duties permit, and if they have the necessary training and capacity, as many of them undoubtedly have in spite of what Mr. Henman may say to the contrary. If otherwise, we should soon hear of it, and the practice would die a natural death. As it is, there is certainly a saving to the ratepayers. The buildings designed and carried out by borough surveyors are not, as a rule, of very great magnitude, and there should be plenty of other work for architects. The matter, we think, is one for compromise, say, on the lines suggested by a speaker from Leicester, where the corporation have decided that an outside architect should be engaged for all work over a certain amount. Mr. Henman's theory of the employment of architectural hacks by borough surveyors when some work has to be carried out is too ridiculous and offensive for serious consideration, and we should like him to advance some proof in support of another very sweeping and very general statement—that the actual outlay on buildings carried out under the control of borough surveyors is generally far in excess of what it would be under a "qualified architect," by which phrase we take it that Mr. Henman means an architect in private practice. Another matter that was exaggerated to absurd dimensions is the permission sometimes given to official surveyors to undertake private work, in which case it is at once assumed that the official abuses his position to obtain commissions. Mr. Henman has even "heard" of difficulties being thrown in the way of building proprietors and architects for the purpose of diverting work into the hands of the surveyor. "Heard" is good, but rumour has been described as a lying jade. We regret that anyone in Mr. Henman's position should assist in doing her work. How many borough or district council surveyors are now allowed to undertake private practice? He must know as well as anyone that the tendency, especially in populous districts, is to discountenance the system. If an official surveyor is allowed to take private work there is every probability that his plans are passed because he takes care to comply with the by-laws, and that if other plans are rejected the reason is that they do not so comply.

We may note some of the remarks made in the course of the discussion on Mr. Henman's paper, as that discontented gentleman occasionally suffered something like flat contradiction from members of his own camp. Mr. W. Woodward assured him that the same difficulties in regard to by-laws and their interpretation were equally applicable to London, to which Mr. Henman had pointed as an example. Thus, the architects who officiate as building surveyors in the metropolis are no more successful than other people, though they generally contrive to make out a very eloquent case in support of the present system. A second speaker said he had experienced no difficulty with surveyors, and in Birmingham, if the surveyor did not think a by-law was sufficiently elastic to justify him in taking the responsibility of meeting a special case, an appeal could be made to a committee of the council. Two other speakers testified that they had experienced little or no difficulty with official surveyors, either in Birmingham or elsewhere, the present city surveyor of Birmingham being specially mentioned. One of the speakers referred to expressed the very reasonable opinion that, while by-laws should vary to suit local conditions, uniformity is desirable in what is really one large town; but Mr. P. Gordon Smith, architect to the Local Government Board, pointed out that as Birmingham

had special powers under the Consolidation Act the suburban districts could not exactly copy the Birmingham by-laws. He made the sensible suggestion that the neighbouring local authorities might appoint a joint committee to frame a common code of by-laws. He was sure that such a conference would receive every encouragement and assistance from the Local Government Board, who would probably point out to them what they could and what they could not do. Speaking in defence of the "model" by-laws, he said the Local Government Board could not enforce the adoption of any one of them; that they had stood the test of the courts very well, and that if their phraseology was obscure there was no objection to the local authority printing explanations or illustrations with them. The last remark provoked laughter. It cannot be denied, however, that the "model" by-laws might be still more "model," if we can employ degrees of comparison in such a case, and that they can best be improved by the Local Government Board listening to the advice of those who have the greatest experience. Needless to say, we include borough surveyors in that category, though Mr. Henman would no doubt deny their title. It is not possible that officials and architects should always see eye to eye. Borough surveyors, we have no doubt, appreciate the compliment with which Mr. Smith closed his remarks. He, at all events, has found them excellent officers and very amenable to reason, and he added that in many of the larger towns the surveyors are simply splendid men.

We certainly sympathise with Mr. Henman in the small amount of support he received in his somewhat distempered and misdirected crusade, which is likely to do more harm than good to what the resolution adopted at the meeting described as "the action that is being taken by the Birmingham Architectural Association as to the framing and administration of by-laws in Birmingham and the surrounding district." We have ourselves had occasion to point out some of the defects of the present system, and in some of the objects he aims at we have no doubt that Mr. Henman would command the support of most of those whom he regards as his natural enemies. He may count on a good deal of sympathy when he confines himself to principles and methods, and when he advocates changes which are not in themselves unreasonable. Revision of the "model" by-laws, the restriction of official control within reasonable limits, the sanctioning of only such regulations as are necessary to secure health and safety, a greater approach in adjoining urban districts towards uniformity in essential matters, and the establishment of easily-accessible courts of appeal—these are demands for which there is, no doubt, a good deal to be said. It may also be admitted that there is at times too much official control, and that now and again the surveyor to the local authority is apt to be over-zealous and fussy, but that is something very different from the exaggerated state of affairs which Mr. Henman depicts so gloomily, and which he would fain persuade us really exists. When he resorts to gratuitous and offensive charges against an estimable and deserving body of officials, and commits himself to reckless and inaccurate statements, marked equally by want of discretion and want of consideration for other people's feelings, he is more likely to injure his own cause than those whom he attacks. To make sweeping generalisations from conditions which only arise occasionally in individual cases is neither fair nor logical, and nothing is more significant than the fact that the members of Mr. Henman's own profession who were present on the occasion abstained from endorsing his charges. Architects who have listened to a discussion of by-laws on the part of municipal engineers are aware that these officials are by no means blind to existing defects, and that they are, as a rule, earnestly desirous, consistently with the proper discharge of their duties, to avoid anything detrimental to the interests either

of the community in general or of any particular class. Some architects, however, speak as if they should be given an absolutely free hand. That experiment, we may safely say, would not be in the public interest.

**The Overhead
versus the
Conduit System
of Electric
Traction.**

There is little doubt that the quasi-official report which was recently submitted to the London County Council on the various systems of electric tramways has caused quite a flutter among those corporations that were contemplating adopting an overhead wire system. The effect in some cases has been so great that work which was practically in progress has been actually stopped until further information was obtained on the working of the conduit systems. It is, however, satisfactory to find that the Manchester Corporation have had the courage to proceed in the course, which it adopted some time ago, of laying down electric tramways on the overhead wire system. The corporation committee who have charge of this matter are fortunate in possessing a mechanical engineer as its chairman, for Mr. Higginbottom has apparently considered almost every system of electric tramways in use at the present moment, and, while we cannot altogether agree with all the arguments and estimates which he put forward in favour of the overhead wire system, it is interesting to quote them for the benefit of other municipalities. He stated that the reasons in favour of the overhead trolley systems were:—

(1) That the first capital cost per mile of track was £2,135, against £11,491 for the conduit system; or, for the 67 miles required in Manchester, £144,000, against £773,897.

(2) The working cost per car mile was 1d. more for the conduit system, or £14,000 per year.

(3) Difficulties of construction of the conduit system in the narrow and congested Manchester streets.

These are arguments that will apply to a good many towns, and it is sincerely to be hoped that municipalities will recognise that the figures relating to such a special undertaking as that of the New York conduit system, on which most arguments are now based, will not apply to many places in this country. The Glasgow Corporation, after laying down its experimental overhead system, went very carefully into the system of the conduit, prompted, no doubt, by the report to which we have already alluded, but it was speedily discovered that the conduit system was quite impracticable in Glasgow, and the future extensions (some of which are already being undertaken) will be carried out on the overhead wire system. As we have previously pointed out, there is no difficulty in working the conduit system, but it needs some very special reasons to justify the extraordinary expense that such a system involves.

**Automatic
Gas Meters and
Cookers.**

Our readers will, no doubt, peruse with interest the communication we publish this week from Mr. Edward A. Harman in reference to the success which has attended the adaptation of the penny-in-the-slot system for gas distribution. The Huddersfield Corporation are always to the fore in useful work of this kind, and it is gratifying to hear of the success which has attended their efforts in this particular direction. We have not now the space at our disposal to enter into the subject at length, in spite of its undeniable interest, but Mr. Harman's letter brings out clearly the essential points. He quotes figures to demonstrate that the system is practicable from a financial point of view, and enters at length into the future possibilities of the popular pennyworth, which certainly bids fair to simplify life a good deal, especially for those of straitened means. Nor must we lose sight of the fact that, by the extended use of gas for heating and cooking purposes, we may to a very large extent abolish the smoke nuisance, which so vexes the soul of Sir W. B. Richmond, B.A.

Principal Features of Electric Lighting Systems.—X.*

SYSTEMS OF DISTRIBUTION (continued).

THE FIVE-WIRE SYSTEM.

Some reference was made in the last article to what may be termed an extension of the three-wire system. It is, so far as its operation in this country is concerned, due entirely to the late Dr. John Hopkinson, who patented, simultaneously with Edison, applications of many wire systems, among which was included the five-wire method. In its first application, which was probably at Temesvar, in Hungary, a dynamo working at 400 volts was employed. It had five main wires in the distribution network, lamps being placed between the first and second wire, the second and third, the third and fourth, and the fourth and fifth. This practically gives four groups of lamps which would be in series with each other; but the important point about this arrangement is that each group of lamps would only receive current at a pressure of 100 volts, so that each group would be receiving a voltage the sum of which would be 400, in other words, the difference of pressure between the two outer mains would be 400 volts, while between one of the outer mains and the nearest inner one the difference of pressure would be only 100 volts, and there would be the same difference of potential between any two adjacent wires. The importance of this system was that it enabled the distance which could be operated economically from a low-tension station to be increased to four times the distance that could be accomplished with an ordinary two-wire system, or twice the distance that could be economically supplied by a three-wire system having 200 volts between the two outers. A still more notable five-wire system was that employed in Paris in connection with the central station, known as the "Secteur Clichy." In this case the armatures of the four separate dynamos were connected together on one common shaft and were coupled in series across the feeders. The two outer terminals of the combined set of machines and the three intermediate terminals were connected one to each of the five distributing wires. The important point was that all the dynamos were compelled to turn at the same speed, consequently any difference of pressure between any of the feeders would be equally divided between the four armatures so long as the resistance in each of the lamp circuits was equal. If it happened that one circuit was receiving too much pressure, because there were too few lamps, then the pressure on the dynamo corresponding to that group would be greater than the other four machines; and, consequently, that particular dynamo would be compelled to act as a motor and be driven at a higher speed than if it were out of the circuit. The consequence of this greater speed is to raise the pressure in all the other burning circuits, and thus in those circuits where there is least pressure the dynamos would act as machines generating electricity, and in those groups where there were fewer lamps they would act as motors, absorbing power and helping to drive the other machines. This system has been employed for a considerable period, but it was felt long ago that it was somewhere uneconomical, especially in the method of compensating for the difference in pressure on the different circuits. Consequently it is not surprising to find that the system has been almost completely abandoned.

The five-wire system adopted in Manchester was a very notable departure from the one adopted in Paris, and, moreover, it has successfully met extraordinary developments in the demand for electricity that has arisen in Manchester during the past few years. In this case the dynamos are of somewhat varying voltages. This one machine would be wound for 400 volts, and would feed on the two outer wires, while others on lower voltages would act as compensators. The flexibility of the Manchester arrangement has been very marked, and instead of the difficulties of regulation and compensating for varying pressures, which were held at one time to be insuperable, the system has gone steadily ahead, meeting the demand for electricity in the middle district of Manchester with unqualified success. It is true that during the past two or three years it has been necessary to supplement the original system with a battery sub-station, and to arrange also, at two or three different points of the city, two motor-dynamo sub-stations, which successfully meet any fall of pressure that might arise. It was felt that the difference of pressure between the two outer mains of 400 volts might be dangerous, but, so far from that being the case, it is interesting to mention that the whole five wires have been taken into some of the largest buildings, such as the town hall and other municipal buildings, without causing the slightest trouble whatever.

INSULATING MATERIAL.

The next point that one might satisfactorily consider is that of the material which is mostly employed for insulating electric light cables. In the opinion of many engineers the substance that is put before all others for its high insulating qualities is pure rubber, and it is not too much to say that for a long time, at any rate, the majority of distributing systems in this country depended upon rubber. Obviously high insulation is necessary in all systems of distribution. It is not everything, however, because a cable must be able to withstand a good deal of rough usage without showing very

marked signs of deterioration. Again, it must be sufficiently flexible that it can be bent and coiled readily, and, what is of equal importance, it should be able to withstand differences of temperature without showing any permanent injury. A matter of very great moment in those systems employing very high pressures is that the cable should be able to prevent to a very great extent what is known as disruptive discharge. Although later experience in some instances has tended to show that rubber cables have occasionally exhibited signs of weakness, it is not precisely clear at the moment whether this is due to any inherent fault in the insulator itself, or whether the troubles have been caused by carelessness in laying the cables. Speaking generally, it has been considered that rubber, when of good quality and applied properly, gives very high resistance and is probably incomparable in withstanding high pressures. Moreover, it is able without apparent signs of injury to withstand very great variation in temperature. The whole question, however, at the present moment is whether it is durable. It is quite true that while some engineers complain that rubber cables have given them considerable trouble, it is not difficult to find as many, or probably more, engineers to come forward and declare that rubber cables which have been in continuous use for some years have developed a minimum number of faults. It would be easy to quote instances which demonstrate that rubber cables have lasted for electric lighting purposes ten and eleven years without showing any signs of deterioration. The method of insulating a copper conductor would be to wrap round layers of pure rubber tape, and on this compound rubber tape would be applied, after which other strips of prepared rubber tape would be bonded round and the whole vulcanised. A general practice nowadays is to place on the rubber cable a covering of lead, which affords very marked mechanical protection; but occasionally on the top of the lead covering a sheathing of galvanised-iron tapes may be laid on, and the complete cable could be then laid direct in the ground, or, if necessary, drawn into a pipe or conduit.

One of the best-known forms of cable employed for electric lighting purposes in this country is known as the bitumen type of cable, and in spite of the fact that it might be open to some objection from a mechanical point of view, many miles have been laid down in this country by the Callender Company, and the cables are giving extreme satisfaction. The insulating material in this system consists of a preparation of bitumen, and it is occasionally wrapped in some form of yarn or fibrous material served on tape. It is then covered with some insulating compound, again taped, and it is afterwards covered with hemp yarn. Very frequently this cable is laid in trenches, which are filled up solid with bitumen compound, or, as is very frequently the case, it may be drawn into what is known as Callender-Webber casing, which is practically a case containing a number of ducts, into which the cables are drawn. Previous to being drawn into position, however, the cases are joined together by means of bitumen compound, and this gives almost all the advantages of a solid system, coupled with the advantage of being able to draw in the cables as required.

Another interesting type of cable which is very greatly used in this country at the present moment is what is known as the paper cable. In this class of cable the wire is insulated by means of paper, which is wrapped round in place of cotton or jute. Usually the paper is wound round the conductor in strips, and as each spiral of paper is laid on the wire is passed through a die, which presses it into a compact mass. After being exposed for some time the cable with its paper covering is passed through a special bath of compound, and it afterwards passes direct to a lead-covering press. This type of cable is the one which is made by the British Insulating Wire Company in this country, and, as we have already pointed out, it is very extensively used.

(Of the many forms of conduit which are in use, one of the most durable is that known as Doulton ware casing, and, as this is used in very many systems, it may be interesting to mention the principal features of it. As a matter of fact, it consists practically of a conduit possessing a varying number of ducts. In the case of Belfast, the most recently completed system in which Doulton casings are employed, the conduits have two, three and six rectangular ducts, each 2½ in. by 2½ in.; and an interesting feature of this is that the joints between the lengths of conduit have been made by means of cast-iron clamp collars in two portions bolted together. The interior of the collars is recessed, and the upper piece is provided with an aperture, through which is poured rapidly-setting bituminous compound. This entirely surrounds the ends of the lengths, but it is prevented from entering the ducts by expanding joint mandrels, one of which is inserted in each duct while the joint is being made. Perfect continuity of the ducts is thus secured. Branch cable connections are provided for as follows: At suitable intervals in the line of conduits special lengths are laid,

* The ninth article of this series appeared in our issue of December 2nd.

which are grooved during manufacture in such a way that, while strength is preserved, a longitudinal division can be made by means of a chisel when desired. When a T connection is required the upper portion of the split length is detached, giving access to the cables. The cable joints having been completed, a junction cover, made for the purpose, is substituted for the piece which has been detached. This cover is fitted with a cast-iron socket piece to take the service pipe.

COST OF MAINS.

It may be interesting, before closing this article, to give a few figures relating to the cost of mains. It is not an easy thing, however, to obtain very reliable figures as to the exact cost per yard of many systems, but in the case of Kensington and Knightsbridge it was stated, when the system had been in operation for some time, that the cost was as follows:—

	Per yard.
	£ s. d.
Five Pipes.—Four of 2 in. and one of 1½ in., with three cables ¾ in. and two cables ¾ in. ...	3 2 2
Three Pipes.—Two of 2 in. and one of 1½ in., and three ¾ in. cables ...	1 8 6½
15-in. culvert, including three strips 1 in. by ¼ in. ...	1 3 9
20-in. culvert, including five strips 1 in. by ¼ in. ...	1 9 0
24-in. culvert, including seven strips 1 in. by ¼ in. ...	1 14 2

In another case the cost of supplying and laying Callender-Webber casing with three 2-in. wires, including all charges, with straight-forward work was 6s. 6d. per yard; or, including the draw and service boxes, 8s. 9d. per yard. The usual cost of connecting a house varies from £10 to £15.

It is interesting to quote from a paper relating to the cost of underground mains by Major-General Webber, who stated, comparing the cost of insulated cable with bare copper strip, that he came to the conclusion as regards the economical aspect of the use of insulated conductors, "that practice shows in any position that where a small section of copper in each

ELECTRIC LIGHTING AT ECCLES.

OPENING OF WORKS.

Alderman Kendall, chairman of the Electric Lighting Committee of the Eccles Town Council, last week performed the opening ceremony in connection with the new electric-lighting works of the corporation.

The generating works occupy a modest block of brick buildings in Cawdon-street, Patricroft, and the whole scheme has been carried out under the direction of Mr. S. V. Clirehugh, of the firm of Messrs. Lacy, Clirehugh & Sellar, consulting engineers. The plant consists of two Lancashire boilers and two steam alternators, each of 200 horse-power, and capable of supplying together about 10,000 8 candle-power lamps. It is only intended to run one alternator at a time, the other being held in reserve in case of a breakdown. The engines are of the marine inverted type, running at 200 revolutions a minute, and direct coupled with the alternators. Accumulators are provided which will maintain 1,000 8 candle-power lamps for seven hours. These accumulators are charged off the alternators by means of motor generators, which in their turn are run by the accumulators and supply direct to the mains. The high-tension alternating-current system of distribution is adopted. The current is at a pressure of 2,000 volts, which is reduced at the consumer's premises to 200 volts. This system has been introduced in consequence of the scattered nature of the district to be supplied. It is intended to light the whole borough by electricity, which will involve a supply of some 1,700 lamp columns. Generally speaking, the existing gas-lamp columns will be utilised. At the present moment there are about 5 miles of mains laid in the district, and applications have already been received for over 4,000 8 candle-power lamps. The whole district contains about 30 miles of streets. The storage apparatus embraces separate accumulators capable of supplying 700 8 candle-

conductor in the same line only is required, other conditions alike, it is much cheaper to use insulation of the character of bituminous compound in ducts or ways of a small size and economical material than to look for insulation to non-conducting supporting surfaces, with a large surrounding of air space subsisting in a subway of which the minimum first cost must be represented by a substantial figure." Again, he says, "Generally speaking, if the section of copper in a pair of conductors is 1 in. and under, then a main constructed with insulated cables in separate ways is cheapest, increasingly so with small conductors between 1 in. and 1½ in. The comparison varies, according to circumstances, over 1½ in. of section. Then insulated copper bears away the prize for economy."

Some figures contributed by Mr. Crompton to the discussion on Major-General Webber's paper are interesting, and although they are by no means new they are of some significance even at the present moment, and we have therefore reproduced them in the above table.

ARBITRATIONS AND AWARDS.

The arbitration between the North Metropolitan Tramways Company and the London County Council to determine the price to be paid by the council to the company for the tramways recently acquired by the council was opened at the Surveyors' Institution, Savoy-street, recently. Lord James of Hereford was the sole arbitrator. Sir Edward Clarke, G.C., M.P., Mr. Charles Matthews and Mr. F. Richardson appeared for the tramways company; while Mr. Dickens, G.C., and Mr. Daldy appeared for the London County Council. At the outset of the proceedings Sir Edward Clarke, addressing the arbitrator, said he and his friend Mr. Dickens, representing the two parties, had agreed that, as the question to be decided was quite a private matter, it would be better if the proceedings were conducted in private. Lord James said the question was entirely in the hands of the two parties, and he must ask the representatives of the Press to withdraw. Sir Edward Clarke: And the witnesses also. The witnesses and the representatives of the Press then withdrew. The arbitration lasted some days.

power lamps for ten hours. In order to save expense these will be requisitioned during the day time and also after midnight. The apparatus for subdividing the currents and registering the quantity of energy distributed is of the newest kind.

GAINSBOROUGH WATERWORKS EXTENSIONS.

A new reservoir and water tower, which form part of the Gainsborough water extension scheme, were opened on the 14th inst. by Mr. John Dixon, the chairman of the urban district council, who has, it may be mentioned, taken a great share in promoting the artesian borings and in the development of the scheme generally.

The total cost of the tower, reservoir and rising main will be approximately some £7,000. The length of the rising main from the artesian well to the tower is 2,000 ft., with a total rise of 103 ft. The pipes were made by the Stanton Iron Company. The reservoir is a fine piece of work, the walls and floor being of concrete, with salt-glazed bricks supplied by Messrs. Outes & Green, of Halifax. The depth is 16 ft., and the capacity if 1,004,350 gallons. The wall tower is a hexagonal structure 75 ft. in height. It is ornamental in design, and, taken in conjunction with the reservoir, forms a very pleasing feature in the landscape. The tank will hold about 7,200 gallons of water—sufficient to supply the town for three or four days. An automatic recorder constructed on scientific principles has been supplied by the Glenfield Iron Company. The whole of the works have been carried out under the supervision of Mr. H. Riley, engineer and surveyor to the council, and the contractor was Mr. Benjamin Roberts, of Gainsborough.

Merthyr.—Recently Colonel A. C. Smith, R.E., one of the inspectors of the Local Government Board, held an inquiry at the public offices, Merthyr, relative to an application made by the urban district council for sanction to borrow £1,115 for the construction of new sewer tanks at Troedryhiw. Mr. Harvey, the surveyor, explained that it was proposed to close the existing tanks and to put the new ones lower down, nearer to the river.

Municipal Authorities and Public Slaughter-Houses.*

The importance of the question to municipalities of the establishment of public slaughter-houses is not appreciated as it should be in this country, and it is only recently that we are giving that consideration to the subject which it deserves. Other countries, especially Germany, have gone a long way ahead of us, and it behoves those who have the health of the public largely in their hands to pay increased attention, not only to the sanitary question as to how a private slaughter-house affects the health of the inhabitants of the neighbourhood in which it is located, but to the securing of a large and wholesome food supply for the people, and to ensure that animals are prepared for food under sanitary conditions and with efficient supervision by meat inspectors. We are slow to move in this country, but, having once grasped the importance of the subject, I hope shall make up for lost time. It is a large question, and it is impossible for me to go into much detail with the time at my disposal.

There are four main divisions to consider: (1) The establishment of public slaughter-houses or halls, with all modern appliances, and with the sanitary arrangements as perfect as possible; (2) the efficient inspection of meat by qualified persons; (3) proper facilities for keeping dead meat; and (4) mode of killing.

On the first point there is no doubt that the existence of so many private slaughter-houses, often in a very insanitary condition and placed in the midst of a dense population, is one of the greatest drawbacks we have in England in dealing with the whole subject. Our Parliamentary powers are insufficient to deal with them. In the case of new communities and new areas in this country no doubt it can be and is being dealt with, but in our large towns vested interests are so sacred, and the number of registered and licensed slaughter-houses so numerous, that it presents an almost impassable barrier to those who desire to see things altered for the better. In Germany, again, it is quite different. There the public powers are amply sufficient to deal with any nuisance arising from private slaughter-houses. It is no uncommon thing to find in the large towns that powers are exercised in abolishing the private slaughter-house, and erected in their place in a suitable position outside the town, with good railway accommodation, fine new establishments, comprising market-halls for cattle, sheep and pigs, slaughter-halls, refrigerators, laboratories, destructors, refreshment-rooms, offices, and all appliances necessary for a complete market.

THE LAW IN GERMANY.

In Germany the town council where the General Slaughtering Act has been applied by means of a local Act has power to erect and carry on public slaughter-houses. The town council may issue an order prohibiting the slaughtering of animals anywhere within the limits of their district, except at the public slaughter-houses. The prohibition may also be applied to the carrying on of all trades intimately connected with the slaughter of animals for food. The council may prohibit a further use of private or other slaughter-houses, except those erected or carried on by an association or guild of butchers.

The council may, after they have erected public slaughter-houses, make regulations for the examination by experts, both before and after slaughter, of all animals brought to the public slaughter-houses, in order that the condition of such animals may be ascertained, and for the examination of all fresh meat not slaughtered in the public slaughter-houses, by duly appointed experts, before it is offered to the public for sale. A fee shall be payable by the owner of the meat to the council for such inspection. They may enact that fresh meat brought from outside the area of the town, and disposed of at restaurants, hotels, &c., shall not be prepared for food until it has been inspected. They may altogether prohibit the importation of prepared meats, and decide that in public markets, shops, &c., the flesh of animals which have not been slaughtered in the public slaughter-houses shall be kept and exposed for sale separate from that which has been slaughtered. They may order that no meat shall be sold in any public market-hall which has not been slaughtered, &c., at the public slaughter-houses and that butchers shall not offer meat for sale which has been slaughtered outside the area and within a prohibited district or radius.

The council may make and publish regulations as to the examination of meat, and fix the fees to be taken for such examination. Regulations as to the inspection of meat not slaughtered in the public slaughter-houses shall direct that all meat shall be submitted to the inspector—in the case of large animals in sides or quarters, and in the case of small animals in whole carcasses. The fees to be charged for the inspection of meat shall not in the aggregate exceed the cost of such inspection. Various lines and restrictions are laid down as to how and under what circumstances these regulations are to be carried into effect. The regulations of a local authority require the approval of the Provincial Government. The town council may close all private slaughter-houses after giving six months' notice of their intention so to do. It is within their discretion to allow a longer period to elapse. After the issue of such notice it is illegal to erect any new private slaughter-houses.

Compensation shall be paid by the council to the proprietors and tenants of the private slaughter-houses which are closed in pursuance of the council's orders, such compensation being for real damage or loss which can be proved by the aforementioned persons on account of the closing of their places, such places having been built for slaughtering purposes. In calculating the compensation to be paid the amount which may be realised from the properties and fixtures when used for other purposes shall be deducted. No compensation shall be paid for the extra trouble there may be involved by reason of a butcher having to slaughter away from his own place of business. Where the premises to be closed are held by the occupier on a lease, such lease shall terminate at the same time as the notice issued by the council. No claim shall stand as between landlord and tenant on account of such termination of a lease. It is necessary for the owners and tenants of premises to be closed to give notice to the Provincial Government of their intention to claim compensation within six months, or their claims will not be allowed. This Government appoints an arbitrator, who, with the assistance of two others—one to be appointed by the claimant and one by the town council—shall inquire into the claim that has been made. The above is a short description of German law on the question of inspection and private slaughter-houses.

The Royal Commission on Tuberculosis, in their report to our Parliament this year, recommend: (a) When the local authority in any town or urban district in England, Wales and Ireland have provided a public slaughter-house, powers be conferred on them to declare that no other place within the town or borough shall be used for slaughtering, except that a period of three years be allowed to owners of existing private slaughter-houses to apply their premises to other purposes. (b) That local authorities be empowered to refuse all meat slaughtered elsewhere than in a public slaughter-house and brought into the district for sale to be taken to a place where such meat may be inspected, and that the authorities be empowered to make a charge to cover the costs of such inspection. (c) Inspectors shall be engaged and shall stamp the joints of all carcasses passed as sound. (d) The commission further recommends that it shall not be lawful to offer for sale the meat of any animal which has not been killed in a duly-licensed slaughter-house.

These are drastic recommendations, but it is what other countries have had to do, and we shall be compelled to do likewise if we are to deal effectively with the question. It is worthy of the notice of other municipalities that the Public Health Committee of the London County Council are recommending the council to inform the Local Government Board that they are prepared to carry out the recommendations of the commission if the power be given to them by Parliament. In Germany, on the closing of private slaughter-houses compensation is paid to the owner and tenant, a definite procedure for ascertaining the amount being laid down by Act of Parliament. In Leipzig the prohibition of all private slaughter-houses and the provision that all slaughtering shall be done only in the public slaughter-houses is very stringent.

EFFICIENT INSPECTION.

Equally important with having a suitable public slaughter-house is the question of efficient inspection of meat. This is conducted in a most scientific manner in Germany, and from all we learnt is most successful. So thorough especially is the microscopical examination of pork, that one of the members of our deputation which visited Germany was led to remark, "Well, after seeing the way they examine pork in Germany, I should have no hesitation in eating German sausages." In England there is no compulsion to have meat inspected at all. It is left to the conscience of the butcher, if he has any doubt about the quality, to call in the inspector, or to the perseverance and sharp eyes of that official to discover cases of inferior meat offered for public sale. In Germany it is compulsory that all meat should be inspected and stamped before it is used for the food of man. Our inspectors may be very vigilant, but in consequence of the large number of private slaughter-houses it is impossible for them to visit them all when the process of killing is going on.

The question of stamping meat has recently come up for discussion in this country, and there seems a great amount of prejudice against it, but in Germany it is exactly the reverse. Many stamps are placed on each carcass, and these stamps are a guarantee of soundness, and without them people there would hesitate to purchase. In Leipzig all cattle brought into the market are examined by experts. The staff consists of a director, who is the supreme officer, and acts, with the consent of the Minister of the Interior, as official veterinary inspector for contagious diseases in cattle for a given area and is responsible for all inspection. Besides the director there are the two veterinary surgeons, two assistant veterinary surgeons, the chief of the microscopical department, and microscopical assistants, and the officers engaged in taking the samples of meat. The chief officers are sworn in by taking the oath, and bind themselves to truly and con-

* A paper read at the Birmingham Congress of the Sanitary Institute, by Mr. E. Parkes, M.P., Chairman of the Markets and Fairs Committee of the Birmingham Corporation.

scientifically execute the work of meat inspection, to carefully watch the slaughtering of all animals by slaughtermen, and to observe the ordinary by-laws. Attached to all the large markets is a staff of veterinary and microscopical inspectors. In Berlin, for instance, we were told that there were 240 persons engaged in the microscopical examination of meat, ninety of whom were women.

There is no doubt that we are very much behindhand on the question of meat inspection in England, and without attempting to go into it as thoroughly as described above, there is a great deal that we might and ought to do to make inspection more thorough. A veterinary surgeon with a practical training is the ideal inspector, and the time is coming, no doubt, in this country when some such a law will be enacted. The opinion of such men will be taken generally without any question by the butchers, but an unqualified or inexperienced man is often the cause of a great deal of friction and unpleasantness in carrying out his work. In some districts in England, especially in country districts, the system of inspection is most lax, and the inspectors have often the flimsiest qualification to perform their duties. The whole question requires to be put on a different basis, and not left, as it often now is, to men with a mere smattering of knowledge and who have been able to answer a few questions at a sanitary science examination. There should be more uniformity of practice, the recommendation of the Royal Commission being very useful in this respect, and officers of different localities should work together, so that it would not be possible, as it sometimes is now, for dealers in bad meat to be driven out of a district or town where inspection is efficient and establish themselves over the border where inspection may be very lax. The whole question of meat inspection and public and private slaughter-houses requires the immediate attention of municipalities and of the legislature, with a due consideration, not only for the public health, but also for the interests of the traders concerned.

I think it is well that I should give some idea of the magnitude of the German establishments. In Berlin, with a population of 1,700,000, the general slaughtering law was applied in 1883, and that same year the markets in that city were opened for use, at a cost of £600,000; immediately after that date all private slaughter-houses in the city were closed. The cattle markets and slaughter-houses are in the outskirts of the city, and cover an area of 90 acres, 28 acres of which is reserved for railway sidings, including land for their extension. The cattle market-hall is a huge building, 240 yards by 80 yards wide, or about 4 acres in area. The population of Hanover is 126,000. The markets cost £140,000, and are situated about 1½ miles from the centre of the city; the area of site being about 17 acres. The population of Leipzig is 330,000. The cattle markets and slaughter-houses are nearly 2 miles from the centre of the city. The area, 29 acres. A main line of railway runs at the side of the markets, and tramways also into them. The total cost, including land and railway siding, was £235,000. These markets were erected in 1888, and are among the most complete of any in Germany. The population of Spandan is 35,000. The area of the markets was nearly 4 acres. The cost of building was £49,000.

The markets in Germany generally include market-halls for live cattle, sheep and pigs; slaughter-halls for the different animals, including one for horse-slaughtering; cold storage; bad meat destructors; ice-making plant; rooms for tripe-dressing; fat and tallow departments; and last, but not least, the inspection department. We generally noticed the scrupulous cleanliness and order which prevailed in these establishments, and everywhere they were laid out on a large scale, with plenty of room for each department. This is only possible where land is taken outside the city, and from what we saw it is certainly the best way of dealing with the problem; but in Germany they have Parliamentary powers to enable them to carry out their ideal, and they seem to have unlimited money to spend in the building of their markets. In Germany the whole question has been grasped boldly, thoroughly and successfully.

On the question of killing I do not know that it is necessary I should say much. We found that generally in Germany the pole-axe was used, as with us; in the case of beasts a mask was sometimes put over the face of the animal. In the slaughter of pigs a small cylinder, enclosing a pin and controlled by a spring, was used, a large wooden mallet being used to strike the pin when placed on the animal's head, which is really a spring pole-axe. We have tried several new methods of slaughtering animals, but generally there are drawbacks to the use of each of them, and in the hands of a duly-qualified slaughterman the pole-axe is as sure and expeditious as any other method.

THE BIRMINGHAM BUILDINGS.

In Birmingham a few years ago we were confronted with the problem of building new market-halls, slaughter-houses, &c., and after visiting many Continental and English markets, and giving the matter a great deal of thought, we decided upon the erection of the present buildings, which have now been opened about nine months. The plan shown and elevation will give some idea of the result of our labours. It is not exactly ideal, inasmuch as it is placed in the centre of the town, but we had no alternative, the land having been purchased some years ago.

We had about 12,000 yards of land to deal with, and our business was to make the best use of it. On the ground that we have placed the large meat market, twenty separate slaughter-houses for whole and half butchery, the slaughter-hall, the offices, the fat stores, &c. On the upper floor we have placed the lairage for cattle and sheep, and the tripe-dressing, blood and gut-cleaning departments. In the basement we have the cold stores, the engines for electric lighting and for cold storage, &c., and steam boilers. The main hall is 305 ft. long, by 95 ft. wide by 65 ft. high to centre of roof. Over the stalls, in the centre of market, are thirty-four offices, approached by two staircases, for the use of the slaughtermen. We have two hydraulic lifts connecting the market-hall with the cold stores below; the meat market-hall is fitted to hang about 3,000 sides of beef. We have a complete system of overhead travelling-gear connecting the slaughter-houses and halls with general market and cold stores.

We have a very complete electric lighting system, the motive power being supplied by four large gas engines of 85 break horse-power each, running 2,000 revolutions per minute. Hot water and steam is conveyed to the different departments all over the site, there being hot and cold water taps in all the slaughter-house departments. We have a tripe outlet with all necessary appliances, rooms for fat and livers, ropes, blood, &c. We have also, in addition to separate slaughter-houses, a slaughter-hall for lambs, sheep and calves, 250 ft. long by 40 ft. broad. In Germany, as already explained, the system is to slaughter in open halls. They like it best for many reasons, and perhaps it is the best system on the whole. We could not very well adopt this system in its entirety—there was some feeling against it by the trade—but have adopted the two systems, but ere long I expect that the slaughter-halls will be extensively used. The pig slaughter-hall is 96 ft. by 40 ft., and is fitted with six scalding-tubs.

The cold stores and chill-rooms have been constructed by the Lindo Refrigeration Company, who have leased a portion of basement from the corporation, and have constructed rooms which will store about 25,000 carcasses of mutton and 300 sides of beef. Accommodation is being provided for the slaughtermen in the shape of a mess-room, another room being allotted for the salesmen. The Birmingham Coffee House Company have a shop on the premises. A water tower is erected on the Bradford-street end of the site, in which is placed two large tanks, one of which contains a reserve of water (about 20,000 gallons) in case of a temporary shutting-off of the mains. The action of the corporation in erecting these premises has been fully justified, seeing that, although the area of the meat market-hall is six times that of the old market, nearly every stall is let. Nineteen out of the twenty separate slaughter-houses are let, and killing is now being carried on in the slaughter-halls. The total cost of the scheme, including the site, which was an expensive one, will be about £120,000.

Birmingham justly feels that in regard to its meat market and public slaughter-houses we have premises which are constructed on the most modern principles, due regard having been observed to a good hot and cold water supply, efficient lighting and ventilation, drainage arranged to prevent the escape of solids into the sewers, the manure, &c., being carted right out on to farms. The premises are capable of being properly cleansed, and it has been our endeavour to ensure that the surroundings of the fresh-killed meat shall be pure and clean, and that as little handling of the meat as possible shall take place. Although our new market-hall is six times the area of the old one, we find it none too large, nearly every stall at the present time being let. Since the premises have been erected many other municipalities who are moving in this matter have sent deputations to inspect the premises and arrangements here, and the Markets and Fairs Committee will be pleased at all times to arrange for such inspections and to give any useful information which they can on the matter.

The discussion on the paper brought several contrary opinions to light, though it appeared to be the general opinion that there should be more municipal control over the slaughtering of animals for food, about some of the speakers considered the German system unnecessarily costly. Dr. Marsden (Birkenhead) argued that the measures in Germany were carried to extremes, and that we could attain a result practically as good for our purposes without anything like the amount of paraphernalia and expense. Dr. W. C. Cambridge differed entirely from Mr. Parks as to the ideal inspector, and contended that the medical officer of health ought to be responsible for the work of meat inspection. Mr. Edwards (superintendent of the Birmingham markets) thought a veterinary surgeon, with a staff of trained inspectors, would do the work best.

The Royal Commission on Sewage Disposal. The Earl of Aldersleigh presided last week at two meetings of the above commission, when there were present General Carey, Prof. Ramsay, Prof. Foster, Mr. Kibick, Colonel Harbord, Dr. Russell and Mr. P. J. Willis (secretary). The witnesses examined were Sir E. Frankland, Mr. Scott Moncrieff and Mr. Garfield.

The Surveyors' Institution.

THE LONDON BUILDING ACT AND THE OFFICIAL SUPERVISION OF BUILDINGS.*

In submitting the following short paper to the Surveyors' Institution I am desirous of drawing attention to the London Building Act and the manner in which it is carried out or enforced, with the view of considering the desirability of extending to London the system prevailing under the Public Health Act in the provincial towns throughout England. Included in the membership of the Institution are a majority of the surveyors connected with the development and management of estates, both in London and the country, and such members especially should, from their experience, be in a position to institute a comparison between London and provincial procedure in matters of the kind.

Recent unfortunate events in London have had the effect of directing public attention to the Building Act and its alleged shortcomings, and although the aid of the law has been invoked in several cases since January 1, 1895, when the new Act came into operation, I consider it would be a slur on the many professional associations (including the Surveyors' Institution) which gave so much time and consideration to the Act when in Bill form to admit that its provisions, if efficiently enforced, are not sufficient for the general attainment of the end for which they were devised. Members are aware of the many alterations made in the Bill, as the result of the consideration given to it, and the very different appearance which it presents in the form of an Act, and it may be fairly assumed that even if the same amount of consideration were given to the amendment of the present Act, the resulting measure would still fall short of perfection, and afford ample opportunity for the exercise of legal acumen and expert skill in the interpretation of its provisions.

I am of opinion that the remedy for the defects of the present official system of building supervision in the metropolis must be sought, not so much in the direction of amendments to the Act itself as in the system of supervision adopted in enforcing it; and it is to this view of the question that I would particularly call attention. During my thirty-nine years' official connection with the parish, Kensington has developed from fields and market gardens into one of the most important districts of the metropolis, and very exceptional opportunities have thus been afforded of acquiring practical acquaintance with the subject under consideration, not only in the particular district referred to, but in the metropolis generally.

THE DISTRICT SURVEYOR: HIS POSITION AND FUNCTIONS.

In the report of the London County Council for 1897 it is set forth that for the purposes of the Building Act the county of London is divided into sixty-four districts, each superintended by a district surveyor, whose duty it is (according to the said report) to see that all new buildings and all alterations and additions to buildings "are carried out in accordance with the law." This statement is not correct, for, as I shall point out, the district surveyors exercise no supervision outside the statutes governing their appointment.

The report of the council further states that a standing order of the council requires each district surveyor newly appointed or reappointed to devote the whole of his time to the duties of his office, and not to engage directly or indirectly in private practice. Of the existing district surveyors, forty-one can take private practice, twelve are precluded from private practice in their own districts, and the remaining eleven are, under the standing order above referred to, entirely precluded from private practice. The district surveyors are remunerated by fees in accordance with schedules attached to the Building Act, and during the year covered by the council's last report these fees amounted to the sum of £47,748 10s. 4d. The council has power, under sec. 158 of the Act, to substitute a fixed salary in lieu of fees, abolishing the latter and charging the salary to the county fund.

Prior to the passing of the order prohibiting private practice the office of district surveyor was sought, not so much for the direct income attaching to it, but for the opportunities afforded for enlarging the private practice of the official. A district surveyor acting as architect for a building in his own district is required to give notice of the fact to the London County Council, who appoint another district surveyor, generally from an adjoining district, to see that such building is erected in conformity with the provisions of the Building Act. After a short interval the positions are possibly reversed, and the first-mentioned district surveyor finds himself officially supervising the work of the *pro tem* district surveyor in his district. There can be no doubt that it is bad in principle for any public official to be allowed to engage in private practice in any way connected with his official work, and doubtless the London County Council acted wisely when they passed their resolution prohibiting district surveyors thereafter appointed from engaging in private practice. It is somewhat curious, however, to observe how this restriction actually works. When a new district surveyor is required candidates for the position are invited by advertisement, and in response applications and testimonials are sent in to the council. Each candidate must have passed the qualifying Royal Institute of British Architects' examination; but be-

yond that equal gauge the comparative merits of the candidates are assessed upon the skill and ability they have shown in the past exercise of their profession, and, in the result, an architect is appointed who has established some reputation for designing and planning buildings, and the situation does appear somewhat ironical when it is considered that the newly-appointed surveyor must no longer exercise the talents which have secured him the appointment, but must, as it were, wrap them in a napkin and relegate them to unprofitable burial.

The man who has gained a name for designing a good elevation and getting but a clever plan is forthwith to stifle his own aspirations and inspirations, and be content with looking after the height and thickness of walls, &c., and other dry provisions of the Building Act. It is to be presumed that such self-sacrifice is loyally acquiesced in, but this castration of professional ability is for some reasons to be deplored. The training necessary for the production of a good architect is not required for and should be different from that of a building surveyor, in whose case the skill to plan and design, which is a necessity in the architect, is not so much required as a thorough acquaintance with building materials. A knowledge of strains and thrusts and of workmanship is much more desirable than expertness in the more artistic branches of the architect's profession.

A SUGGESTED TRANSFER OF POWERS.

In 1885, in response to an order of my board, I presented a report embodying suggestions for improving the local public work of the metropolis. Most of these suggestions have subsequently been carried into effect by legislative enactment, but among the recommendations awaiting adoption is one for the transfer to the local authorities of the metropolis of the duties now discharged by the district surveyors. I am of opinion that public benefit and administrative economy would result from the adoption of this recommendation, and I strongly urge that, in any scheme for the reform of the local government of the metropolis, the proposed district councils should be entrusted with the supervision of building operations in their several districts.

The policy of the proposed transfer has received the endorsement of the metropolitan vestries, as will be seen from the following statement of past action in the matter. As a result of two meetings, convened by thirty-four metropolitan vestries and district boards, and held at the Town Hall, Chelsea, a memorial was forwarded, on August 5, 1890, to the Prime Minister, stating (paragraph 4): "That, in the opinion of this conference, the office and functions of the district surveyor under the Building Acts should be in the hands of the local boards and their officers, with an appeal to the London County Council."

On February 28, 1896, a conference took place between delegates from the London County Council and from the several vestries and district boards to consider, in view of contemplated changes in the government of London, what powers should be allocated respectively to the central and district authorities, and a resolution was carried similar in effect to that set forth above. The London County Council representatives did not vote on this resolution, and the committee of the council subsequently reported adversely to the view adopted by the conference, and that recommendation of the committee has since been confirmed by the full council. This line of action, however, was only to be expected, as the council has always been opposed to parting with power, whilst showing a ready disposition to undertake new functions—the more important the better. On March 16, 1894, in giving evidence before the Royal Commission on the Amalgamation of the City and County of London, I submitted (*inter alia*) the following statement:—

"Upon the occasion of the delegates from the conference on the Public Health (Amendment) Bill waiting upon the Local Government Board, on June 25, 1891, the Right Hon. C. T. Ritchie stated that it was his desire and intention in the District Councils Bill, which he hoped shortly to introduce, to enlarge the scope of usefulness and responsibilities of the local authorities. In connection with such statement it may be fitly asked, What duty more desirable and important can be cast upon the local authority than the responsibility of seeing that the buildings within its district are erected in a sound, substantial manner, suitable for human occupation, with due regard to fire risks and health risks of the general community? As urged in the memorial above referred to, all such work should be vested in the local authority, as is the case in provincial towns. Drawings for each new building should be deposited, the intended drainage, depth of foundation, line of frontage, open spaces, water supply and sanitary arrangements should be clearly shown. Upon the said drawings being approved the work should be executed under the supervision of the local authority, and on satisfactory completion a certificate given, which could be

* A paper read by Mr. William Weaver, M.E.C.E., F.S.I., before the members of the Surveyors' Institution on the 12th inst.

affixed inside the building. Such certificate would be of great advantage, both to the owner and the individual contemplating residence in the house. Unauthorised alteration of the drains or sanitary arrangements, when completed as aforesaid, should be punishable at law. At the present time, after a drain has been completed, tested and passed by the vestry's officials, there is nothing to prevent the occupier or other person making, without notice, some alteration which may entirely destroy the perfection of the drain.

"In effecting any change on the lines hereinbefore advocated, Parliament would, of course, take care that no injustice should accrue to the present district surveyors, and the work of the future would have to be safeguarded by precautions being taken to ensure proper knowledge and experience on the part of the officials undertaking the transferred duties. One of the risks under this head is in the case of small districts where the work is not sufficiently extensive or responsible to justify the appointment of a properly-qualified man at a sufficient salary to give the whole of his time to his public duties. No public surveyor should be allowed to practise privately; the defects of such a dual system are well known and need not be dilated on here.

"The above difficulty (as to small districts) may be met by uniting two or more together, so as to create districts with a population of about 200,000 each. Such an enlarged district could afford to pay for the whole time of a properly-qualified surveyor or engineer, who would have no difficulty in finding ample scope for the useful employment of his skill. The work of a fairly large district can be better and more economically executed than that of a very small district, especially where the local authority performs its own work instead of executing it by the aid of contractors."

It will be seen from the preceding extract that my desire was to protect the present district surveyors from any unjust treatment; and I would take this opportunity of assuring those gentlemen—many of whom I am pleased to count as personal friends—that I have always been careful when advocating the transfer of their duties to emphasise the necessity of protecting their interests in the event of any change of the kind being effected.

It is possible, of course, that some individual cases of hardship may occur, but to anyone acquainted with the building work of London it must be apparent that the duties of district surveyor and parish surveyor should be discharged by one official corresponding to the borough engineer and surveyor in the towns throughout the rest of England. If the two offices were amalgamated, the district surveyor would in some parishes probably be the best man to discharge the duties of the combined office, and in other parishes the present engineers and surveyors would be fully equal to the task. At any rate, individual interest must not be allowed to stand in the way of public advantage, and if the latter demands a change there will be no more difficulty in getting qualified engineers and surveyors for the London district councils than is experienced in the large towns throughout the kingdom.

These points I strongly urged when reporting to my board on the London Streets and Buildings Bill, as the following extract will show:—

"It is a bad system to have two district surveyors, one responsible to the council and the other serving the local authority, and both going over the same ground and to a certain extent over the same work. The two officers should be rolled into one, responsible to the local authority, and discharging the same duties as now performed by the borough surveyors throughout the kingdom. The vestry will understand that the suggested amalgamation of offices is not proposed in the interests of the professional class of which I am a member, but is simply made in the interest of the government of the metropolis. Many of the district surveyors are better qualified to undertake the work of the local surveyors than the latter are to absorb the functions of the former, but, whenever such assimilation of officers does take place, properly-qualified men would be appointed to each locality, and that without injustice to any present surveyor, district or local."

SOME ARGUMENTS.

In view of the general unanimity of the present local authorities on the question, the members of this Institution can hardly fail to be convinced that it is for the advantage of the public generally and for the convenience of the profession itself that the proposed change of administration should take place. In support of the policy of change I would submit the following considerations which have induced me to propose the suggested transfer of powers and amalgamation of duties under the Building Acts and Metropolitan Management Acts.

I am distinctly of opinion that anyone desirous of developing an estate or erecting a building should be able to ascertain at the town hall of the district everything required by the public authorities relative to such building or estate. At the present time an applicant is informed, on attending at the town hall, that he must give the vestry seven days' notice before commencing the excavation of foundations, and must give concurrent notice to the district surveyor as to the commencement of building operations, and submit drawings of the proposed buildings for the approval of the district surveyor; but the local authority has no power to call for such drawings, the seven days' notice to them being only required in order to afford an opportunity of serving a counter-

notice to keep the foundations up to a certain level, so as to insure proper drainage.

Should the applicant desire to develop some building land, he is referred to the London County Council to whom he must first submit (in duplicate) plans of intended roads. The county council forward one of the copies to the vestry, and, guided more or less by their recommendations, approve or refuse them. Having received sanction to his plan for laying out the roads, the applicant becomes anxious to construct sewers, and is then told to send in duplicate plans to the vestry, who upon approving them forward one copy to the London County Council for their sanction. After this double reverse process, generally taking considerable time, the applicant, having succeeded in getting his plans of roads and sewers passed, proceeds to build, generally constructing the sewer first, this work being carried out under the supervision and to the satisfaction of the vestry. The foundations of the buildings are then proceeded with, the vestry surveyor attending to look after the level and fringe line. Simultaneously the district surveyor attends to look after the foundation site, with regard to the necessity for concrete and the thickness of walls and spread of footings.

The attendance of the vestry surveyor then ceases until the house drainage work is commenced, of which seven days' notice has to be given to the vestry, under whose supervision the whole of the work (in addition to water supply) has to be satisfactorily carried out. In alterations to buildings and in the erection of blocks of flats, building work and sanitary work will be found progressing simultaneously, and the district surveyor may be found looking after the proper construction of a wall, while the vestry surveyor is seeing to the soil pipe attached to it. Generally speaking, in the majority of buildings the drainage work is executed after the erease of the building is completed, and it may be found, as in past cases, that the building, though erected in accordance with plans passed by the district surveyor under the Building Act, does not conform to the by-laws framed under the Public Health Act by the London County Council, and enforced and supervised by the vestry. Several such cases having occurred in Kensington, the London County Council were requested (March 16, 1894) to furnish the district surveyors with copies of the by-laws under the Public Health Act, with an instruction not to approve plans submitted to them under the Building Act when such plans showed intended violations of the council's by-laws. The council, in reply (April 14, 1894), considered it inexpedient to give such instructions to the district surveyors, whose duties were prescribed by the Building Acts. In consequence, at present it occasionally occurs that notice has to be served by the vestry requiring a newly-built structure to be altered and amended in order to meet the requirements of the council's by-laws.

Further overlapping supervision and occasional clashing arise with respect to lines of building frontage and the laying out of new streets, and also in relation to arches or vaults under public ways. With regard to the former, the district surveyor is entitled to special fees under sec. 155 of the Act, and as to the latter the fees are fixed under Schedule 3, Part I, of the Act.

Concurrently with the district surveyor's supervision of frontage lines and of the laying out of new streets, the vestry's surveyor is exercising similar supervision, with the additional work of setting out the levels of the new streets and their intersections. With regard to vaults under footways, the district surveyor's duty is limited to looking after the brickwork in relation to the span of the arch, and he has no power to disapprove any work provided it fulfils the conditions laid down in the Building Act; but the vestry's requirements, which *their* surveyor has to enforce, vary demand 50 per cent. thicker head walls, set back 2 ft. from the kerb line, backed up with concrete, with 2 ft. of space for electric, gas and water mains, &c., left between the crown of the vaults and the paving.

Again, with regard to setting back buildings to be erected on open spaces within 20 ft. of the centre of the road, both the district surveyor and parish surveyor have corresponding duties, and it occasionally happens that the former, in approving building plans submitted to him, loses sight of the fact that the abutting highway is under the full width, and the parish surveyor has afterwards to stop the building work in progress.

If the work of the proposed new district councils for London followed the course of procedure adopted in all other towns throughout England these difficulties and cases of overlapping jurisdiction would not occur. In Leeds, Birmingham, Manchester, &c., by attending at the borough town surveyor's office, anyone can obtain all information necessary for his guidance in carrying out any building operations, and the advantages of this simplicity of procedure should not be denied solely to the metropolitan districts, many of which at the present time exceed in population and rateable value most of the provincial towns possessing the advantage of self-government.

Another difficulty under the present system in London arises from the district surveyor having no knowledge of or responsibility as to the sewers. Plans for buildings at the rear of old houses are approved by the vestry, notwithstanding the existence of sewers running under the site of the new building, which it is illegal to erect in such position, but which

unless discovered by the vestry within six months from completion cannot be demolished. The connection of the district surveyor with any new building ceases on its completion and the payment of his fees; there is no subsequent periodical inspection to detect violations of the law after the completion of the building. If such inspections were made I suspect that many infringements of the Building Act would be discovered, notably the erection of sheds and buildings in back yards, with consequent increased fire risks and reduction of air space. If the Building Act was administered by the local authorities the drawings of each building would be lodged with them; such drawings would show the situation and construction of the building, its drainage, sanitary adjuncts, water supply, and open spaces attached to the premises, and the present officers to the local authorities, in making their regular inspections at short intervals, would be able to note any recent alterations to the premises.

As before stated, the district surveyors are remunerated by fees, out of which their assistants have to be paid, and it is unreasonable to expect the surveyor to provide and pay a body of perambulating assistants to the serious diminution of his net income. I believe I am correct in stating that most of the cases of dangerous structures are notified to the district surveyor by the vestry surveyor, and it must be borne in mind that the district surveyor is not entitled to charge his fee for surveying any dangerous structure until directed by the council to make such survey, as under sec. 103 of the Act the existence of the dangerous structure must be notified to the council before an instruction for its survey is given by them. Under the present system, too, much is left to chance; it is nobody's duty to find out or discover dangerous structures, and the collapse of a building may be the first intimation of its dangerous condition.

I am of opinion that no fees should be charged in respect of new buildings or dangerous structures. At the present time the supervision of drainage and sanitary work, water supply, and regular sanitary inspection, are undertaken by the local authority and the expense thereof borne by the rates, and I fail to see any sound reason why one principle should not apply to the whole work of supervision.

METROPOLITAN LOCAL AUTHORITIES.

In amending the local government of the metropolis it is very desirable that the responsibilities and duties of the district councils should be enlarged beyond their present scope and limitations, in order to dignify the position of the members and raise the status of the chief officials. The latter should not, of course, become the masters of the councils, but at the same time they should be able men, fitted to discharge their duties fearlessly without any sacrifice of independence.

In support of my opinion as to the desirability of raising the tone of local administration, I would refer to the report of the Royal Commission on London Government (hereinafter alluded to), and to the remarks made on June 25, 1891, by the Right Hon. C. T. Ritchie on receiving a deputation of delegates from a conference on the Public Health (Amendment) Bill. Mr. Ritchie (as I have mentioned) stated that it was his desire and intention in the District Councils Bill, which he hoped shortly to introduce, to enlarge the scope of usefulness and responsibilities of the local authorities. The report aforesaid of the Royal Commission states (page 17):—

"P. 47.—We have now to consider what the functions of the new corporation should be and its relations to the subordinate local authorities, especially to that of the Old City. As we have already intimated, we think the re-estimation of the government of the Old City should be made on lines which are capable of being more or less rapidly adopted in the other component parts of London, so that the organisation may be regarded as an example to be followed."

"P. 48.—In developing this principle we think that everything possible should be done to maintain the strength, authority and dignity of the local bodies of London; and that in the partition of functions between the Corporation of London and local authorities the former should be relieved of all administrative details for which its intervention is not really necessary, and the latter should be entrusted with every duty they can conveniently discharge. In case of doubt our inclinations would lean to the allotment of functions to the local bodies, and we believe that in cases where uniformity of action is necessary this may often be best secured by giving to the corporation the authority to frame by-laws which should be locally administered, with provision, however, for the intervention of the corporation to secure their enforcement should they be neglected."

I therefore submit that the interests of the community would be served by casting upon any new district councils to be created for the future local government of London the duties now discharged by the district surveyors under the London Building Acts, and that the cost of carrying out such duties should be a charge upon the general rate of each district.

Finally, I beg to assure the members of the Institution that in recommending the foregoing alterations or reforms I have no personal object to gain—my official career is rapidly approaching its termination—and I simply place my views on record as honest convictions resulting from a life's working experience; and I am strongly of opinion if the District

Councils Bill for the improvement of the local government of the metropolis is shortly introduced (as promised) into Parliament, it should provide for the single, complete, systematic and regular supervision of all buildings on the lines I have advocated.

DISCUSSION.

Mr. T. BLASHILL, superintending architect to the London County Council, said that in proposing a vote of thanks to Mr. Weaver he wished to recognise that gentleman's experience and the way in which he had brought it to bear upon that particular question. At the same time he was bound to disagree with much in the paper. The contention seemed to be that the Building Act was badly carried out by the district surveyors, and would be better administered by the surveyors to the vestries and district boards. He was disappointed with Mr. Weaver's evidence, for the points put forward were chiefly matters of opinion. Mr. Weaver might have enlarged more upon the available evidence, for no man had had a larger experience. He wished to refer to some points in the paper one by one. It was true that the district surveyors had the duty of supervising buildings, and he was quite convinced that anything that did not come under their cognisance in connection with building details was quite unimportant. The number of district surveyors now debarred from private practice was thirteen out of sixty-five. The change had been made by the London County Council about eight or nine years ago, after the most careful consideration. He was astonished to find the remark that "prior to the passing of the order prohibiting private practice the office of district surveyor was sought, not so much for the direct income attaching to it, but for the opportunities afforded for enlarging the private practice of the official." Mr. Weaver must have been misinformed. He (the speaker) had been a district surveyor for eleven years, and he had only once taken a job in his own district, and he had always regretted it. The advantage derived by district surveyors in this way was not worth considering. Mr. Weaver's remarks about one district surveyor supervising the private work of another in an adjoining district could only mean that they played into each other's hands. If the remarks did not mean that they meant nothing, the remark had also been made that district surveyors were appointed for their proficiency in design. His own experience was that the men who went in for the work were skilled not so much in design as in the more practical kinds of work. The idea that the training of an architect was not necessary for a district surveyor was really fallacious. There was really no ground for it. What had the district surveyor to do? He must have a good knowledge of architectural and building work, to begin with, and buildings had to be erected to his satisfaction. The recent Building Act had enlarged his responsibilities. To put such work into the hands of anyone not an architect would be wrong. How the parish surveyor would deal with the work he did not know, nor could he imagine how he would appear before the tribunal of appeal, which was composed, not of three engineers, but of three architects and surveyors, one of whom also combined the qualifications of a barrister. Mr. Weaver had also referred to the action of the London County Council in connection with the conference of delegates from that body and from the vestries and district boards in regard to transfer of powers. He (Mr. Blashill) ought to know as much of that as anyone, and he could assure those present that the officers of the London County Council had been distinctly instructed by the committee to examine the whole question carefully, to see if there was anything that could be handed over to the smaller authorities. The committee desired the help of the officers, not to retain the work in their own hands, but to hand it over to the vestries and district boards. He quite agreed with Mr. Weaver that the districts should be large, but he disputed the statement that there were two district surveyors. There was one only, for the surveyor to the vestry or the district board was not a district surveyor. He did not see much in the objection that the builder had to give notice in two different places. Nobody complained, so far as he knew. The duties of the two classes of officers were entirely distinct, and he did not see any sufficient reason why there should not be two. The same mistake was made in speaking of the frontage line. The district surveyor looked after the frontage of individual buildings, and the other surveyor looked after the frontage line of the street—two entirely different things. In the event of any infringement of the building line the surveyor to the local authority could complain. He would be sorry to say anything that would reflect upon parish surveyors, but only one out of forty-five belonged to the Royal Institute of British Architects, and only eight out of forty-five belonged to the Surveyors' Institution. Mr. Weaver had spoken slightly of the examination of the Royal Institute of British Architects for district surveyors, but surely it was the most important of all examinations for them. What examinations did the parish surveyors pass to demonstrate their fitness to undertake the duties of district surveyors? One of the great advantages possessed by district surveyors was that they were independent—a qualification to which both Parliament and the Local Government Board attached great importance. The same could not be said of the parish surveyor. After giving the details of a case in illustration of this point, Mr. Blashill went on to say that it was not

merely a case of the fitness of the surveyor to the local authorities, but of those bodies themselves. Vestries and district boards had before now tried to get rid of spaces in front of houses, merely for the sake of increasing the rates. As to dangerous structures, Mr. Weaver seemed to be afraid that a good many buildings fell down without notice, but he (Mr. Blashill) did not know of anything that had happened which could have been prevented by the district surveyor. Officials going about looking for dangerous structures would become an unbearable nuisance. He thought that the fees should certainly be paid by the builder, and this applied particularly to dangerous structures, for why should the owner of a block of slim buildings get off scot free? He did not know if the parish surveyor was prepared to do the work himself. There was no point that Parliament and the London County Council were more anxious about than that this work should not be done by a clerk or a low-paid official. How was the parish surveyor to survey these buildings himself? The London County Council had taken steps to ensure that the district surveyor would attend to the work personally. The parish surveyor would have a very disagreeable work to do without the consolation of the fees drawn by the district surveyor.

Mr. ALEXANDER PAYNE, district surveyor for South-East Hackney and North Bow, seconded the vote of thanks, but said that from the first word to the last he entirely disagreed with the paper. Mr. Weaver seemed to mix up two totally distinct offices. The parish surveyor was more of a civil engineer, whose duty was to look after sewerage, roads, and other matters, most important duties no doubt, but entirely different from the carrying out of the Building Act. Mr. Weaver was evidently of opinion that the duties of a surveyor did not require the systematic training of an architect; but in disproof of that statement it was only necessary to point to sec. 78, sec. 5 (27), and other sections. Was it possible for anyone without the training of an architect to be responsible for these matters? The duties could not be carried out by a sanitary engineer. They would have to be delegated to an assistant. How would the architects of public buildings care to have their work supervised by the parish surveyors? Was the parish surveyor qualified to carry out the legal part of the work, and could the supervision of dangerous structures be entrusted to those who had not a life-long experience? The author of a paper assumed that the present system of supervision was bad, though he was evidently of opinion that it was due, not to the law, but to the method of carrying it out. They should remember, however, that the system had been in operation for about fifty years, and had given every satisfaction. Dr. Longstaff had said that serious accidents were uncommon, owing to the skill of the men who had carried out the Act, and Sir John Hutton had expressed the opinion that the system had worked very well. He emphatically denied Mr. Weaver's statement that district surveyors took office with the object of increasing their private practice. There had scarcely been a single charge of corruption on the part of district surveyors during the past fifty years. One peculiarity about the work of district surveyors was the great variation in the fees, and the author had proposed population as a basis. But in an outlying district which was being opened up there might be far more building going on than in a thickly-populated district, and thus population was no test. It was a great mistake to alter the status of a district surveyor from that of a practising architect. He had never heard any objections to the present system. They rarely, if ever, heard of a district surveyor who was too busy with private work to carry out his duties under the Building Act, and in any case he could be asked to resign. It would be the fault of the individual rather than of the system. They were told that the object of the author's proposals was to raise the status of the parish officials and dignify the local bodies; but would these objects justify them in altering a system that had worked well for fifty years and attempting an experiment which could only end disastrously?

Mr. WM. WOODWARD said there was a general opinion in favour of the relaxation of rules if building operations were not to be hampered. He certainly thought Mr. Blashill and Mr. Payne had entirely and absolutely misapprehended the object of the paper. Mr. Weaver had not said that parish surveyors should take the place of district surveyors, and he did not condemn the latter. As a practical architect he (Mr. Woodward) could appreciate the advantage of going to one central authority. Why should not an architect be able to carry out the duties now carried out by the vestry surveyor? Mr. Weaver had not said that the district surveyor or the official proposed should not be an architect. There was no necessity for an art architect to supervise buildings. The ordinary practical architect was quite capable of doing that. He had had large experience of district surveyors, three of whom had continually hampered him, not for substantial reasons, but for trivialities. They simply pointed to the Act, and said "That is the Act we have to administer." If that was so they might just as well have a clerk of works, and he could not understand why Mr. Payne should have attacked Mr. Weaver so vigorously. Of course it was not to be expected that district surveyors would sit quietly and allow themselves to be wiped out. Mr. Weaver's proposal, as he understood it, was that the whole thing should be centralised. The reference to salaries might have been left

out, but with that exception he agreed with every word, and thanked Mr. Weaver for his paper.

Mr. H. H. COLLINS, district surveyor for the eastern division of the City, after an expression of personal regard for the writer of the paper, whom he had known for a great number of years, regretted that the paper should have been written at all, and that it should have contained so many misapprehensions and innuendoes. The title of the paper might have been "The Desirability of Transferring District Surveyors to the Local Authorities," and it seemed to have originated in the Westminster accident. As he was engaged in that case he could give them the exact details, and he assured them that the district surveyor had nothing whatever to do with it. An erroneous view had been taken of the powers of the county council and the district surveyor under the Act. He regretted that the remarks in regard to the motives of district surveyors in taking office had ever been made, especially when he thought of the eminent men, such as Donaldson, Kerr, Atchison, Wyatt and others, who had held office. He admired Mr. Weaver's courage in appearing there, for the council of their institution had expressed the strongest opinions in favour of maintaining the original status of the district surveyor. Similar views had been expressed by the Royal Institute of British Architects and the Institute of Builders. Surely those bodies represented the interests chiefly involved. He had heard no complaint except from Mr. Weaver. The present policy of the London County Council was most illegal, and he would like to see it tested. No complaints had been made as to the remuneration of district surveyors by fees. Then why should they change, simply for the sake of a change? Mr. G. M. FREEMAN, Q.C., had stated before the House of Commons' Committee on the London Building Act that the district surveyors were independent of the London County Council. That body made the appointments, but were not responsible for the actions of the surveyors. No one but a practical architect could know the difficulties that were constantly arising, and what was required was an architect and building surveyor rolled into one. Mr. Weaver's suggestions had been before the public for twenty years. It had been stated in the paper that the district surveyor had no chance of seeing the work again after approval, but within fourteen days after completion the district surveyor had the right of interfering with anything he thought wrong. Under sec. 163 the district surveyor was bound to give notice to the London County Council if he found anything done in contravention of the Act, and the council took action. The functions of the district surveyor were clearly laid down. Many recently-appointed district surveyors had applied for the position now held by Mr. Blashill, but were not considered fit to take his place. Thus it seemed that the district surveyors now appointed were scarcely equal to those appointed under former conditions. Mr. Collins concluded by proposing a motion condemning the views expressed in Mr. Weaver's paper, but the president said the motion was unnecessary, as the institution was in no way committed to the views in question.

On the motion of Mr. DOUGLAS MATTHEWS, district surveyor for Stoke Newington, seconded by Mr. H. LOVINGROF, district surveyor for South Islington, Shoreditch and Norton Folgate, the discussion was adjourned until January 9, 1899.

MEETING IN GLASGOW.

A meeting of the members practising in Scotland was held in the Masonic Halls, Glasgow, on Wednesday last, when there was a good attendance, over which Mr. Thomas Binnie, president. It was reported that the membership had been largely increased since last meeting, and now included surveyors, estate factors and valuers practising in various districts of Scotland—from Orkney to Dumfries—and the number was expected to be further augmented before the 31st inst., after which it will be necessary to qualify for admission by examination. Records of legal decisions, statistics and other items of professional information are being published for the use of members.

Mr. Binnie afterwards delivered an interesting address, in which he referred particularly to the responsibility of surveyors and the large interest involved in advising clients as to matters connected with heritage. He referred, as an instance, to the case of Glasgow alone, where the annual rateable value is now above £4,000,000 and the total capital value about £100,000,000. The rental of the city, increasing at the rate of £10,000 per annum, represents a capital increase of probably more than £2,000,000. Besides the growth of the city, several other causes were referred to as leading to changes in the value of properties, such as the changes in mode of locomotion, improvements on the river Clyde, and the operations of the city improvement trustees and railway companies. Mr. Binnie gave many interesting reminiscences, and then drew particular attention to the concentration of traffic, owing to the principal railway stations being situated in such close proximity, and the necessity following thereon to increase the height of central buildings. He hailed with satisfaction the attempt now being made to set some limit to the height of business premises, and to secure that business shall be conducted under conditions consistent with health and safety. Mr. Binnie was cordially thanked for his instructive and valuable paper.

CORRESPONDENCE.

Automatic Gas Meters and Cookers.—Mr. Edward A. Harman, Corporation Gasworks, Huddersfield, writes: As a side issue to the engineering world, the rapid development of the penny-in-the-slot system, which has astonished the millions, demands something more than a passing notice. Perhaps one of the most surprising adaptations is that for gas distribution. The enormous success of this system is possibly due mainly to the reasonable desire of the public for knowing what they are buying, the cash payment, and also to the immense popularity of the pennyworth. To such a state of perfection have automatic gas meters been brought, that it is impossible to foresee to what extent they will be ultimately extended. It is probable in the near future that different rooms, workshops, offices, &c., of the same institution will control the consumption of what is required for lighting and heating purposes by automatic interception meters, rather than allow an indefinite quantity of gas to be used without regard to cost, as in many cases existing at present. Such waste not only affects the cost of production of materials, but also the health of the workers, which is of the first importance. It may be found advantageous, where rooms are let as apartments in houses or hotels, to allow each tenant to be responsible for their own amount of gas, in preference to the unsatisfactory fixed charges so generally made. For internal arrangements in workshops slot meters might be employed by a mutual arrangement with the head of the department and the employees. Of course in such a case the meter would be the property of those directly concerned. The meters, being fixed in a passage or landing, can easily be available for examination and collection from time to time. In cases of illness the ready check afforded upon the consumption of a bed-room stove is a satisfactory element. Applications for automatic meters are so numerous that few gas undertakings can afford to be independent of the assistance afforded by them. It is not so much the financial side of the matter, as revenue earners, that has to be considered as the popularising of gas in every home, office or workshop. It has recently been pointed out that for city and town offices a gas fire is perhaps as useful a system of heating as can well be used, no attention being required from the time the stove is lit in the morning to when it is turned off at night, thus saving not only time in this, but avoiding annoyance of too large or too small a fire and other attendant inconveniences. For bed-rooms gas fires are becoming increasingly popular. Where properly fixed and connected by a fine direct into the chimney this method of heating is peculiarly suitable. The temperature of a room can be maintained most evenly night and day, which in severe cases of illness is of immense importance, while the necessity for making the fire up, and thereby disturbing a patient, are dispensed with. There is, moreover, the additional important consideration that the fire is always available. To those affected with asthmatical, bronchial or kindred complaints this cannot afford to be disregarded, especially considering the liability of a sudden attack, which often occurs in the middle of the night, when some hours must frequently necessarily elapse before a coal fire can be got ready. If this notice were from a medical point of view, instead of from an engineering one, much might be said upon this subject. The omission of reference to the convenience obtainable in cases of illness would, however, render any notice of gas fires incomplete. Many gas undertakings are now recognising the importance of giving every facility for supplying gas fires, and are fixing them free of cost, only making a nominal annual charge for the stove. The undertaking of which I have the honour to be the engineer is doing this with good results. In consequence of what has come to be known as the "fixed free" stove business, numerous stove and meter makers have been inundated with orders, the delays occasioned in consequence being vexing alike to the consumer and the gas officials. The method of calculating the desirability of adopting this penny-in-the-slot system is most simple. My experience is that for an ordinary automatic meter for lighting purposes only the annual gas consumption therefrom equals 10,000 cubic feet, and where a small cooker is supplied this consumption is doubled. This quantity of gas at the profit or cost of manufacture per 1,000 ft. will furnish the income available as interest on the small original outlay, depreciation, and the extra cost of collection. From 20 to 35 cubic feet of gas for 1d. is the general charge. An ordinary flat-flame burner, consuming 5 ft. per hour, will thus last from four to seven hours, or where an incandescent burner is used consuming from 3 to 4 cubic feet per hour the time the pennyworth will last is proportionately longer. Generally speaking, gas undertakings supply fittings, burners, meter and stove free of cost, so that the consumer's maximum liability is only 1d. The addition of a small cooking stove is as great a convenience comparatively in small-class property as in large, where gas cooking stoves are considered well nigh indispensable. Such a development in one of the branches of the great engineering profession is truly astounding.

The Sewerage of Johannesburg.—"Young Natalian" writes: I notice a footnote in your paper of October 25th, in which you say that "the Transvaal Government has arranged to inaugurate an adequate sewerage scheme for Johannesburg," and that "the sewerage contract has been granted, &c."

As your information has been culled from *The Standard and Diggers' News*, a Government organ, I am not by any means surprised at the ingenuous manner in which this "latest vile bit of jobbery" has been published; but, lest you or any of your many readers should be deceived, I hasten to give you the facts of the case. At the outset it must be understood that nearly all public works in the Transvaal are carried out by those who have had concessions granted for this purpose; the usual method of securing a concession is by bribery. It is purely a matter of "the highest bidder gets the job." To tender for work on the approved system which obtains in Great Britain is useless in the Transvaal, for the whole system of Government is against this. Bribery is rife from the President to the postboy. Mr. Editor, I hardly need to point out to you that to secure a good road, for instance, one at least must employ independent supervision. What think you, then, of a contractor who secures a concession for carrying out a sewerage scheme and acts as his own engineer as well? If it were a less serious matter one might surely laugh to think of a contractor laying to "bone" and jointing (?) pipes in waterlogged ground and then "passing" these pipes himself! Moreover, not only has a contractor this power, but a right to compel every owner of property to connect with his sewers and pay his own price for the work, no person having authority to choose his own plumber or workman at a reasonable figure, but he must submit to this iniquitous system imposed upon him merely for the purpose of filling the pockets of Government officials! Here are a few clauses in the new agreement: (a) £5 per year for each water-closet containing not more than one collecting trough or pail, and £5 for every additional pail; (b) £5 per year for the removal of bath water or dirt; (c) the foregoing tariffs under (b) shall be applicable to private buildings containing not more than seven apartments—in the case of larger buildings and hotels, boarding-houses, theatres and other buildings the tariffs shall be increased *pro rata*; (d) all Government offices shall be served without payment. How truly noble and unselfish the Government are is revealed in this clause (d). Mr. Editor, you have in brief outline (for I fear to encroach further on your valuable space) an account of what has occurred between the Transvaal Government and its contractors. The concession is known throughout South Africa as the "latest bit of vile jobbery."

DISTRICT SURVEYORS.

The Bermondsey Vestry were informed by the General Purposes Committee on Monday that the London County Council had forwarded a letter on the subject of district surveyors. The council stated that the Building Act Committee, who had had under consideration the representations made by different local authorities, had arrived at the following conclusions upon the points raised:—

(1) That the suggestion that all district surveyors should devote the whole of their time to the duties of district surveying could not be carried out without obtaining Parliamentary power; the committee would, however, point out that the principle advocated is being gradually adopted by the council as fresh appointments are made, thirteen district surveyors having already been appointed who give their whole time to the duties of their office.

(2) That the question of paying district surveyors by salary having been considered by the council on two occasions, the committee are not at present prepared to alter the existing system of payment by fees until they have had further experience of its working.

(3) That although the proposal that an office should be provided for the district surveyor at the local vestry hall has much to recommend it, the committee do not see their way to recommend the council to take any steps in the direction indicated, as, unfortunately, the districts do not coincide with the local government areas, and Parliamentary power might be required before the suggestion could be carried out.

(4) That a notice should be printed and posted up in the office of each district surveyor explaining that the authority of the district surveyor does not extend to drains, water-closets, or other sanitary matters, which in accordance with the Metropolitan Management Acts, and the Public Health (London) Act, 1891, are under the control of local authorities. This notice will be provided and issued by the council to the district surveyors in due course.

The General Purposes Committee expressed the opinion that the fourth clause would be of little use, as in the majority of cases builders do not personally attend at the office of the district surveyor, and that even if they did so, the notice would probably not be read. The committee had therefore suggested to the county council the desirability of having a short notice printed on the letter paper of the district surveyors, giving such an explanation.

Coole.—At a statutory meeting of the Goole Urban District Council, held lately, it was decided to promote a Bill in the next session of Parliament authorising the council to construct new waterworks and to borrow money for the same, also for the gas undertakings and other purposes.

Comparative Reports of General Practice.

XXX.—TRAMWAY TRACTION : WEST BROMWICH REPORT.—VI.

THE ELECTRIC CONDUIT SYSTEM.

The sole advantage of the electric conduit system seems to be that the overhead wires and poles are removed, while the principal objections to it are the great expense, more expensive than the cable system, the prolonged interference with the streets during construction and repairs, when the traffic and business is greatly impeded, the difficulty in locating any defects in the underground part of the system, the difficulty and expense of carrying out any sewerage work in streets in which there are conduits, the danger to traffic through the presence of a slot in the street varying in width from 3 in. (the slot is wider than with the cable system), the difficulty and expense in keeping the conduit clean and maintaining satisfactory insulation, and the liability to stoppage through storms.

If the apparatus in the conduit should require repairing the work is of necessity much more difficult and expensive than with the overhead wires. No matter what precautions may be taken to ensure efficient drainage of the conduit in ordinary rain, in times of heavy storms, when the drains become overcharged, the conduit would be filled with water and mud and the tram service stopped, and could not be restarted until the water and mud had been cleared away.

Should a conduit or cable system be decided upon, it would be objectionable as regards the gas and water pipes, which are very near the surface, the concrete foundation would also be disturbed, and there would be considerable difficulty in certain parts of the town in draining the conduits, owing to there being no surface-water drains, and the sinking caused through mining operations would very considerably interfere with the conduits. With regard to the chief objection against the cable and conduit systems, it is impossible to disguise the fact—a fact which must be patent to all—that the cable and conduit systems are most expensive in construction. It may be fairly and legitimately argued that the matter of construction and the cost necessarily entailed thereby is a matter for consideration by the directors of the tramway company, as being the parties most directly interested, and not for the corporation or the ratepayers, who are but indirectly affected, and that consequently the argument as to the cost is not applicable.

In the first instance, the question of cost is one which more particularly affects the company, seeing that the obligation to provide the necessary capital rests upon the company; but the sub-committee would point out that the fact is important, as the cost of construction may eventually be a serious and very important matter to the ratepayers, seeing that upon the termination of the concession the undertaking may be purchased at its "then value," and the capital to be provided to meet the "then value" of a cable or underground conduit system would surely be considerably in excess of that to be provided for the system of overhead wires.

On the other hand, should the corporation determine to municipalise the tramways, the extra cost in construction on either of these two systems would have to be borne by the ratepayers. With regard to the objection—namely, the expense involved in maintenance and keeping the system in a thorough state of efficiency and good working order—here, again, this objection appears to be equally fatal with the first as regards the two systems named. As regards the time taken to reconstruct the lines under these two systems, there is no doubt it would take considerably longer than the overhead system, and the inconvenience would therefore be greater.

With reference to the difficulty experienced in speedily locating any defect in the conduit system, this objection is very important and one which demands earnest consideration. If the apparatus in the conduit should need repairing—and repairs at times are imperative—the work is of necessity rendered much more difficult and more expensive than with the overhead wires, and the utility of the tramway system is frequently seriously imperilled, and in order to get access to the conduit the provision of a very large number of man-holes, &c., is rendered absolutely necessary.

In connection with the conduit system the hitherto insurmountable difficulty in securing and maintaining efficiency in all weathers has also to be carefully considered. In this connection it may be stated that it is not necessary to flood a conduit to bring down the insulation of the electric cable, and so cause leakage. The insulators by which the electric cable is held in position are composed of either earthenware or porcelain. These in themselves when clean are perfect insulators, that is to say, there is practically no leakage over them, but whenever they become covered with even a slight coating of moisture the insulation immediately falls and leakage begins. Again, the traffic is likely to be interrupted through the lines being blocked by snow.

The conduit system has not as yet had an extensive trial in England, Blackpool being the only town where it has been laid down; and, in forunately, the limited experience already acquired has not been very happy or assuring, either to corporations or companies, to its ultimate success. Mr. W. G. Laws, city engineer of Newcastle-on-Tyne, in reporting to

the corporation states that at Blackpool, where the conduit system was laid and promised well for a time, when taken over by the corporation it gave so much trouble, owing to excessive leakage and consequent deterioration of the apparatus generally, that for some time it has to be worked by horses. A moist climate is unfavourable to the rather delicate apparatus and promotes leakage of energy by keeping the conductors damp, and would presumably require very close attention to keep the tubes clean.

Taking, therefore, all the circumstances into consideration, and weighing the same with strict impartiality, the sub-committee have to report that they cannot see their way to recommend the adoption of any conduit system for West Bromwich.

OVERHEAD ELECTRIC.

Advantages.—The special advantages of the overhead electric system, as compared with other forms of electric traction, are: (1) Cheapness and simplicity, the latter all-weg any necessary repairs to be effected with a minimum of trouble, delay and expense). In case of an accident to a trolley wire on any part of the system, which is most unusual, only that section (a ½-mile length) is thrown out of use, and it is very quickly repaired. The units of power employed in the engine-house are all coupled together, sending current through feeders to all sections of the trolley wire. An accident to one engine does not affect the running of the cars, as another spare engine can immediately be run to take its place. (2) The rapidity with which the lines can be reconstructed and the comparatively small interference with the surface of the streets and traffic, as compared with the conduit system. (3) The overhead system is less liable to leakage than the underground system. (4) The overhead system is the most efficient, taken as a whole, of mechanical traction, which has hitherto been demonstrated by practical working.

Disadvantages.—The disadvantages and objections usually urged against this system are: (1) The unsightly and objectionable appearance of the poles and wires. (2) The danger of overhead telephone wires, &c., breaking and falling on the highly-charged trolley wires. (3) The danger of the highly-charged trolley wires breaking and coming into contact with persons passing near them; but the trolley wires are very strong and breakages are almost unknown. These dangers can, however, be completely guarded against by the exercise of due precautions and the use of proper appliances. The sub-committee only heard of one case of wires breaking in the places visited by them. (4) The danger of the electrolysis of gas and water mains, owing to the return current being taken by the rails. This would also refer to the conduit system.

Remarks.—With regard to the unsightly and objectionable appearance of the poles and wires, the deputation are of opinion that the advantages outweigh the disadvantages, and with neat and ornamental poles indiciouly used for electric lighting they rather add to than detract from the appearance of the streets, and they can be erected so as not to offend the eye; and the sub-committee feel convinced that the public will soon become reconciled to the poles and wires, and will cease to notice them as soon as they become acquainted with the advantages afforded by this mode of traction. The overhead system of tramways has been carried through the principal streets of Rome, and particularly through the magnificent ruins of the Capitol, without causing any adverse comment. At Milan the overhead system has been admitted almost into the precincts of its magnificent cathedral. If this system has not destroyed the beauties of these places, residents in West Bromwich and surrounding districts need not fear that the appearance of any street in this district will be spoiled. We started our investigations more or less in sympathy with this objection, but where the system is carried out in the most approved manner we found that the wires gave only the very slightest offence to the eye, and that a few hours' familiarity removed the objections previously held. The simplicity which characterises the overhead system must be self-evident to anyone impartially studying the question. It is essentially clean, safe and comfortable in its application, as well as being under perfect control. It has distinctly passed the experimental stage in every particular and in every detail. The very simplicity of the system enables any necessary repairs to be effected with a minimum of trouble, inconvenience, delay or expense, being under all circumstances the most accessible for purposes of maintenance and repair. The rapidity with which the lines can be constructed or converted, and the comparatively small interference with the surface of the streets and general street traffic, is another argument which strongly demonstrates the superiority and efficiency of the system over the conduit system. Again, where standards of artistic design, with ornamental arms or brackets on either side of the centre pole, are placed in the centre of the roadway, arc lamps can be attached and the poles used with much advantage for the electric lighting of the streets from the same station as would supply the power for working and lighting the tramcars, thus removing the

necessity for another set of poles on the canseways or in the roadway. This would certainly be an advantage in more senses than one. There is little or no leakage from this system, and it is very little affected by either rain or snow, except that the rails must be kept clean, as they must be in any system of tramways. The municipal authorities of the most important cities in England and Scotland have, we are informed, after exhaustive inquiries and consideration decided in favour of overhead electric traction—for instance, Liverpool, Manchester, Sheffield, Bradford, Hull, Leeds, Glasgow, Birkenhead, Nottingham and Bristol. The sub-committee are of opinion that this system is the best adapted for West Bromwich.

THE PARLIAMENT-STREET IMPROVEMENT.

The demolition of the houses on the western side of Parliament-street, which has been proceeding for some months, is now nearly complete. So far have the operations for the purpose of widening the thoroughfare leading from the Local Government Board offices on the north side of Charles-street to the Houses of Parliament proceeded, that the formation of the site into a carriageway has been commenced. On Monday a large number of labourers were at work filling in the basements of the demolished houses, and before evening this work had so far advanced that several heavy four-horse rollers and a steam roller were engaged in smoothing the surface. The new roadway will be made and paved with wood before the meeting of Parliament. Already the effect of the improvement can be gauged. An uninterrupted view of Westminster Abbey can now be had from Whitehall, and Parliament-square, lying to the north of the abbey, is now seen to advantage.

INSTITUTION OF CIVIL ENGINEERS.

ORDINARY MEETING.

An ordinary meeting of the members of the above Institution will be held on Tuesday, the 10th January, 1899, at 8 p.m., when Mr. John Handsley Dale, A.M.I.C.E., will read a paper on "High-speed Engines." At this meeting a ballot for members will be taken.

STUDENTS' MEETING.

At a meeting for the students of the Institution, on the 13th January, 1899, Dr. Archibald Barr, M.I.C.E. (Professor of Civil Engineering and Mechanics in the University of Glasgow), will deliver an address on "The Application of the Science of Mechanics to Engineering Practice." Dr. Alex. B. W. Kennedy, F.R.S. (member of council), will take the chair at 8 p.m.

* Experimental.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

NEW MEMBERS.

At a meeting of the council, held on Saturday, the 17th inst., the following gentlemen were elected

As Members—

- Frederick Ball, borough surveyor, Southwold, Suffolk.
- Alfred S. Cartwright, surveyor to the urban district council, Wimslow, Cheshire.
- Thomas J. Guilbert, surveyor to the States of Guernsey.
- Daniel Hinchcliffe, surveyor to the rural district council, Dorchester.
- Ernest R. Matthews, surveyor to the urban district council, Bridlington.
- Warden A. Moller, engineer and surveyor to Woosang, China.
- Fred. W. Pearce, surveyor to the urban district council, Twickenham.
- Robert M. Reid, road surveyor to Stirlingshire County Council.
- Julius Spencer, surveyor to the Oakworth, Haworth and Oxenbope Urban District Councils.
- George E. Vint, surveyor to the urban district council, Holmfirth.

As Graduates—

- Bertram Bell, city engineer's office, Carlisle.
- James P. Bennett, council offices, Watford.
- C. Arthur Brown, borough engineer's office, Derby.
- David Ellison, Darwen.
- Ernest H. Essex, engineer's office, Kettering.
- Charles G. May, engineer's office, Ipswich.
- George Mitchell, county engineer's office, Aberdeen.
- J. Walker Smith, engineer's office, Barton-on-Trent.
- John Taylor, borough surveyor's office, Colne.
- W. Whitworth, Cradley Heath, Staffordshire.
- Mr. Robert Henry Bicknell, A.M.I.C.E., engineering inspector to the Local Government Board, was elected an honorary member of the association.

LONDON WATER SUPPLY COMMISSION

The forty-third sitting of the Royal Commission on the Metropolitan Water Supply was held on Monday, Lord Llandaff presiding.

Mr. CHARLES HAWKESLEY, a member of the council of the Institution of Civil Engineers, examined by the chairman, said that he was largely concerned in the designing and construction of waterworks both for local authorities and for water companies. He estimated that the population of the metropolis in 1941 might be 13,231,000, and the daily quantity of water required 463,085,000 gallons, and was decidedly of opinion that the Thames could supply all the additional water required, and considerably more. It would not be necessary to go to Wales, at any rate, for a 100 years; and it would, in his opinion, be an unnecessary precaution to secure ground without going to the expense of constructing works. In the course of further evidence he said he approved the project described to the commission by Mr. Hunter and Mr. Middleton (the engineers now engaged in carrying the authorised Staines reservoirs into execution) to enable a daily average of as much as 400,000,000 gallons to be taken from the Thames for the supply of Greater London and the outlying parts of Water London without reducing the flow at Teddington weir, so far as any increased supply of water was concerned, below 200,000,000 gallons a day, except during a drought of abnormal severity. There appeared to be a prevalent misconception in respect to the effect of the drought of this year on the findings of Lord Balfour's Commission in regard to the Thames storage scheme, but the only effect had been to necessitate a larger amount of storage than had been previously anticipated and to show that the minimum flow originally suggested of 200,000,000 gallons a day at Teddington weir was unnecessarily large. He expressed his strong preference for management by companies as compared with management by public bodies, and his belief that no advantage would result, either to the water consumer or the ratepayer, from the transfer of the water supply of London from the water companies to a public body, especially in view of the fact that control already existed to a greater extent in London than in any provincial town. He was convinced that if the precautions for the prevention of waste which were taken in provincial towns were adopted in London the consumption would be reduced to 30 gallons per head per day in a few years. He defended the existing method of levying the charges for water by a rate based on rental as compared with a supply by meter, and stated that the rates charged by the London companies compared favourably with those charged by provincial corporations.

The next meeting of the commission has been fixed for January 9th, when the examination of Mr. Hawkesley will be continued.

The Dwellings of the Poor.—The monthly meeting of the Mansion House Council on the Dwellings of the Poor was held last week. The report showed that the number of houses inspected during the month was 557. Of these 191 were reported to the authorities.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XXIII.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

TOWN ROADS (continued).

I am indebted to the courtesy of Mr. John A. Brodie, M.I.C.E., city engineer, Liverpool, for the following particulars of standard specifications for paving of streets in that city, and which will serve as excellent examples of how this class of work should be carried out in districts of this character.

FIRST-CLASS SPECIFICATION.

Excavate or fill in the ground, as the case may be, to the requisite level, and remove all surplus material. Properly form and trim off the surface and thoroughly consolidate

The channel stones to be of granite or syenite, of a quality to be approved by the city engineer, and to be not less than 3 ft. in length. The upper surface, if not self-faced and perfectly true, must be accurately worked out of winding, the bed even and parallel to the face, the sides and ends truly square; the stones to be bedded on cement concrete, and the joints to be filled with clean shingle and grouted in a similar manner to the paving.

The curb stones to be granite or syenite, straight or circular as required, 6 in. thick at top, 7 in. thick at 5 in. below, and not less than that thickness for the remainder of the depth;

FIG. 34.—“FIRST-CLASS STREETS,” LIVERPOOL.

same, and then lay a foundation of not less than 6 in. of Portland cement concrete, corporation standard. The paving shall consist of granite or syenite sets, 3½ in. wide by 6½ in. deep, from North Wales or other approved quarries, laid in regular, straight and properly-bonded courses, with close joints, and to be evenly bedded on a layer of fine gravel ¼ in. in thickness. After the paving is laid the joints shall be filled with hard, clean, dry shingle; the sets shall then be thoroughly rammed, and additional shingle added until the joints are perfectly full. The joints shall then be carefully grouted until completely filled with a hot composition consisting of coal pitch and creosote oil, and finally the paving is to be covered with ¼ in. of sharp gravel.

The crossings shall consist of three rows of 16 in. by 8 in.

to be not less than 12 in. deep, nor less than 3 ft. in length; to be carefully dressed on top, 8 in. down the face and 3 in. down the back; the remainder of each stone to be hammer-dressed; the heading joints to be neatly and accurately squared throughout the entire depth.

SECOND-CLASS SPECIFICATION.

Excavate or fill in the ground, as the case may be, to the requisite level, and remove all surplus material. Properly form and trim off the surface and thoroughly consolidate the same, and then lay a foundation of (a) not less than 6 in. of Portland cement concrete, corporation standard, or (b) not less than 6 in. of bituminous concrete, consisting of clean and angular broken stone, grouted with a hot composition con-

FIG. 35.—“SECOND-CLASS STREETS,” LIVERPOOL.

granite crossing stones, and the remaining space shall be paved on each side of the crossing stones, to the full width of the footway, in a similar manner to the carriageway. The crossing stones shall be of granite of a quality to be approved by the city engineer, dressed perfectly true, and out of winding on the face; the sides and joints to be perfectly square and accurately dressed throughout their entire depth; the stones to be bedded on cement concrete, the joints to be filled with shingle and grouted in a similar manner to the paving. A triangular groove, 1 in. wide by ½ in. deep, to be formed along the upper surface of each stone. No stone to be less than 3 ft. in length.

sisting of coal pitch and creosote oil, covered with chippings and thoroughly consolidated by rolling with a roller of sufficient weight. The paving shall consist of granite or syenite sets 3 in. wide by 5 in. deep, or of granite or syenite, 4 in. by 4 in. cubes, from North Wales or other approved quarries, laid in regular, straight and properly-bonded courses, with close joints, and to be evenly bedded on a layer of fine gravel, ¼ in. in thickness. After the paving is laid the joints shall be filled with clean, hard, dry shingle; the sets shall then be thoroughly rammed, and additional shingle added until the joints are perfectly full. The joints shall then be carefully grouted until completely filled with a hot composition con-

FIG. 36.—“THIRD-CLASS STREETS,” LIVERPOOL.

The footways shall be paved with Lancashire (“Best Barna”) or Yorkshire flags of the best quality, not less than 3 in. thick. No flag to measure less than 2 ft. in width nor to be of less area than 6 ft²; to be solid, free from laminations, the upper surface to be true and free from windings or hollows; the joints to be squared the whole thickness. The flags to be laid on a bed of fine gravel, with close, neat joints flashed in mortar, and in uniform courses breaking bond. The joints to be dressed after laying, where necessary.

sisting of coal pitch and creosote oil, and, finally, the paving shall be covered with ¼ in. of sharp gravel.

The crossings, footways, channels and curbs shall be the same as specified for first-class streets.

THIRD-CLASS SPECIFICATION.

Excavate or fill in the ground, as the case may be, to the requisite level, and remove all surplus material. Properly form and trim off the surface, and thoroughly consolidate the

same, and then lay a foundation of hand-pitched rock, 10 in. in depth, set on edge in the manner of a rough pavement. Over this a coating of gravel is to be laid of sufficient thickness to fill in the interstices and to form a smooth surface to the foundation, which must be thoroughly consolidated by rolling with a steam roller before the paving is laid. The paving shall consist of 4 in. by 4 in. granite or syenite cubes, from North Wales or other approved quarries, laid in regular, straight and properly-bonded courses, with close joints, and to be evenly bedded on a layer of fine gravel, $\frac{3}{4}$ in. in thickness. After the paving is laid the joints shall be filled with clean, hard, dry shingle; the setts shall then be thoroughly rammed, and additional shingle added until the joints are perfectly full. The joints shall then be carefully grouted, until completely filled up, with a hot composition consisting of coal pitch and creosote oil, and, finally, the paving shall be covered with $\frac{3}{4}$ in. of sharp gravel.

The crossings, footways, channels and curbs shall be the same as specified for first-class streets.

FOURTH-CLASS SPECIFICATION.

After excavating the area of carriageway to a depth of 17 in. below the finished surface line, hand pitch the same with hard rock set on edge with the broadest sides downwards, 10 in. deep, break off the irregular corners of the

FIG. 37.—"FOURTH-CLASS STREETS," LIVERPOOL.

stones, and fill in the interstices of the pitching with these fragments as well as with similar rock broken small. Consolidate the foundation thus formed by passing over it a steam roller until the whole is firm and compact. When this is done spread over the surface evenly to a depth of 7 in. broken screened macadam free from slaty or flat fragments. This macadam to be durable granite or trap rock from the quarries of North Wales or from other approved quarries having similar class of rock. A layer of 2 $\frac{1}{2}$ -in. gange stones to a depth of 3 $\frac{1}{2}$ in. to be first spread and rolled until solid with a steam roller, then a layer of 2-in. gange stones to the finished level consolidated in a similar manner. Where binding is necessary, it should be sparingly used and must consist of granite clippings, preferably of the same rock as the macadam.

Lay channel stones over the hand pitching on each side of the carriageway of granite or syenite, of a quality approved by the city engineer, in lengths not less than 3 ft., in depth not less than 7 in., in width 12 in. The upper surface, if not

off after laying where necessary, but great care to be exercised in bedding the flags, so as to prevent the necessity for the after flogging. Natural asphalt upon concrete, granolithic or other artificial paving may be laid in substitution of flags at the discretion of the city engineer, and in accordance with his directions in each case.

Lay crossings, where required, consisting of three rows of 16-in. by 18-in. granite of a quality approved by the city engineer, and in lengths not less than 3 ft., dressed true and out of winding on the face, the sides and joints square, and accurately dressed throughout their entire depth; the joints to be filled with clean shingle, and grouted with pitch and creosote oil; a V groove, 1 in. wide and $\frac{3}{4}$ in. deep, to be cut along the surface of each stone.

FIFTH-CLASS SPECIFICATION.

(Specification for passages or back streets 9 ft. wide and upwards.)

After excavating the area of carriageway to a depth of 17 in. below the finished surface line, hand pitch the same with hard rock set on edge, with the broadest sides downwards, 10 in. deep, break off the irregular corners of the stones, and fill in the interstices of the pitching with these fragments as well as with similar rock broken small. Consolidate the foundation thus formed by passing over it a steam roller until the whole is firm and compact.

The paving shall consist of setts of Haslingden grit stone of the best quality, uniformly ganged to a depth of 6 in., laid in courses 6 in. wide, with a fall towards the centre of 1 in. in 48. Two courses to be laid longitudinally, to form a channel. After the paving is laid the joints shall be filled with hard, clean, dry shingle; the setts shall then be thoroughly rammed, and additional shingle added until the joints are perfectly full. The joints shall then be carefully grouted until completely filled with a hot composition consisting of coal pitch and creosote oil, and finally the paving is to be covered with $\frac{3}{4}$ in. of sharp gravel.

The "Euston" Pavement was one of the first good granite pavements laid down in London. It derived its name from the fact of having been laid down (1843) at the departure side of the Euston station (London and North-Western Railway). It was laid in the following manner: The ground was excavated to a depth of 16 in. below the finished surface of the pavement and shaped to the proper road contour. Upon this bed a layer of coarse gravel, 4 in. thick, was spread and

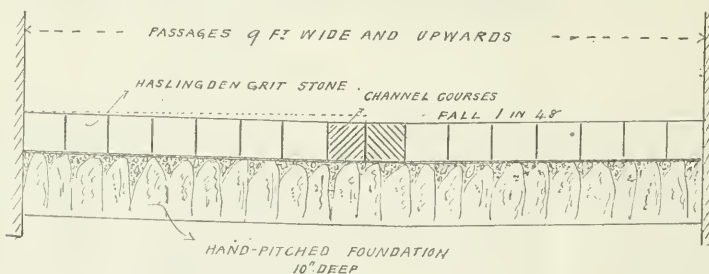

FIG. 38.—"FIFTH-CLASS STREETS," LIVERPOOL.
(Passages 9 ft. wide and upwards.)

natural faced and perfectly true, must be accurately worked out of winding, the bed as far as practicable parallel to the face, the sides and ends truly square, and the joints filled with clean shingle grouted with melted pitch and creosote oil.

Lay granite or syenite curb stones of a similar quality to that specified for channels, straight or circular as required, 5 in. thick at top, 6 in. thick at 5 in. below, and not less than that thickness for the remainder of the depth; to be not less than 12 in. deep, not less than 3 ft. in length; to be carefully dressed on top, 8 in. down the face and 3 in. down the back; the remainder to be hammer dressed, the heading joints to be squared throughout the entire depth.

Parse the footways with "Best Barns" Lancashire flags, or Yorkshire flags of the best quality, not less than 3 in. thick, 2 ft. in width, not less than 6 ft. superficial area in each flag, which must be solid, free from laminations, windings, or hollows on the surface; the joints to be squared the full thickness; the flags to be truly laid on a bed of fine gravel, with close joints flushed with hydraulic lime mortar and in uniform courses, breaking bond; the surface to be flogged

well rammed. A second layer, 4 in. thick, consisting of gravel mixed with chalk or hoggin, to blind it, and again well rammed was next spread. A similar layer consisting of the same kind of materials but of finer quality was placed upon this, and again thoroughly well rammed to a solid surface for receiving the stones, which were bedded upon 1 in. of fine sand. The stone used was Mountsorrel granite, neatly dressed, and squared and well jointed, and measuring 3 in. in width by 4 in. in length and about 4 in. deep. The whole surface of pavement was then thoroughly well rammed with a rammer, 55 lb. weight, and afterwards sprinkled with screened gravel, which entered the joints and so increased the rigidity of the pavement. The cost of the Euston pavement, including foundation, is given at 12s. per square yard.

Kirkham.—It has been decided by the council to make an application to the Local Government Board for sanction to borrow £500 to cover the cost of certain sewerage works and the erection of a new fire engine station and offices.

Law Notes.

EDITED BY J. B. REIGNER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Office of THE

SURVEYOR. Where possible, copies of local Acts or laws should be referred to should be enclosed. All explanations should be drawn and lettered in black ink only. Correspondents should not wish their names published should forward them the plan.

BUILDING BY-LAWS: "NEW BUILDING."—Although a magisterial decision on a "question of fact" cannot be regarded in the light of a precedent, the recent case of *New Winchester Rural District Council v. Hattings* (Winchester County Bench, December 17th) is of interest as an illustration of such an addition to an existing building as the magistrates considered to amount to a "new building" within the meaning of the by-laws in force in the district. The following evidence was given: Mr. W. F. Y. Molyneux, surveyor to the council, stated that on November 15th he visited the premises in question (which were known as Brunbridge Lodge) and found that a new wing was in course of erection, consisting of a stable containing three or four loose-boxes and a harness-room, these additions being built to join the gable end of the existing block of stables, &c. In cross-examination he admitted that he saw nothing to object to in the additions, except that no plans had been submitted, as required by the by-laws. On being asked to define a "new building," he said "that is a matter of fact for the justices"; and in reply to the further question what led him to form the opinion that these additions amounted to a new building, explained that in his view any addition necessitating footways, walls, ventilation and drainage amounted to a new building, requiring the control of the sanitary authority and the supervision of their surveyor. For the defence Mr. W. J. Jennings, architect, of Canterbury, said he was instructed to make the additions in question to Colonel Little's stable. The existing building consisted of a coach-house, harness-room and three stalls, and, as this was not sufficient, the plan was for accommodation for four horses, with communication on the ground floor and above. When asked for plans by the district surveyor he pointed out to him that the work was only an addition, and not a new building, and offered to meet him on the works and explain to him what was being done. In witness's opinion it was an extension of an existing building. Mr. J. B. Colson, architect, of Winchester, said he had seen the building and the plan. In his opinion the work was clearly an addition to an old building. For the defence the case of *Shiel v. Sunderland Corporation* (30 L.J., M.C., 215) was cited, in which a building erected partly on the site of an old coach-house and stable attached to a house, and partly on adjoining ground, was held not to be the erection of a new building, but only an addition to an old building. The Bench, however, decided the "question of fact" in favour of the council, finding that the proposed additions constituted a "new building," and that plans ought to have been deposited, and the defendant was ordered to pay 15s. costs.

QUERIES AND REPLIES.

PRIVATE STREET WORKS.—"Subscriber" wishes to know whether it is possible to enter out private street works under sec. 150 of the Public Health Act, 1875, for the urban district council, the said council having already adopted the Private Street Works Act, 1892, but has never yet put it in force?

Ans. See 160 of the Public Health Act, 1875, does not apply to any district in which the Private Street Works Act, 1892, is in force. See sec. 25 of the latter Act.

PRIVATE STREET WORKS: VENDOR AND PURCHASER.—"E. A. S." writes: Purchaser agrees to buy a property fronting a private road, but before sale is completed the corporation serve a "private street works" notice on the vendor. Is the vendor liable for the amount of the apportionment of expenses, or will the purchaser be held responsible. The notices were issued after the purchaser agreed to buy, and the works will probably be commenced before the sale is completed. I think there has been a decision in a similar case within the last few months, and that it appeared in THE SURVEYOR, but I am unable to find reference of it.

There are two phases of this question to be considered—(1) As between the local authority on the one hand and the vendor or purchaser on the other hand, and (2) as between the vendor and purchaser. As to (1), I assume that the Private Street Works Act, 1892, has been adopted (since a "private street works notice" has been served). In that case "the owner for the time being" is liable under sec. 14, and under sec. 13 the apportionment is a charge on the property. So far as the local authority are concerned, therefore, the vendor is liable up to the time of the completion of the purchase, from which time the purchaser will be liable (see *Ford London & Waterworks Company v. Aikman* (1892, 2 Q. B. 72)). If the final apportionment is made before the date fixed for completion the vendor would, in my opinion, be held, as between himself and the purchaser, to discharge it, because it is a charge on the premises, unless, of course, there is anything in the agreement to the contrary. If the final apportionment is not made until after the date fixed for completion the case is not quite so clear, and may depend on the wording of the agreement for sale. In *Talbot v. Hyatt* (1897, 1 Q. B. 74), the vendor had agreed to clear all "outgoings" to May 8th, before that date a "dangerous structures" notice was served by the local authority, which was not complied with. After May 8th the authority took down the buildings and demanded and re-

ceived the expenses from the purchaser. It was held that the purchaser was entitled to recover the expenses he had incurred from the vendor. Having regard to this decision, I am inclined to think that in the present case, assuming the agreement to contain the usual clause by which the vendor is to clear outgoings up to the date fixed for completion, that he would be liable.

BY-LAWS: LAYING-OUT A NEW STREET.—Mr. G. Fenwick Carter, engineer and surveyor to the Melthorough Urban District Council, writes: A public road runs from our township to a village about 2 miles away, and there are a few houses dotted along its course, but in all probability it will soon be laid out as a building road. A plan is submitted for a villa, and the forecourt wall is shown to butt up to the stone fence wall, leaving the road about 19 ft. at this point. My council think that before any more buildings are erected a street plan should be submitted to the new street by-laws, and a frontage line shown to make a 36-ft. street. They have therefore rejected the plan. The owner intends to build in defiance, leaving the stone wall up and putting railings on top. Kindly let me have your advice in the matter, as it is a very important point to many authorities round here. If the owner on the other side was to claim 3 ft. from the centre of his hedge it would only make a 16-ft. street.

As a general rule the question whether a new street is being laid out is a question of fact for the magistrates, and if there is any evidence to justify the latter in finding that a street is a new street the Court will not inquire into its sufficiency. There are several reported cases, however, in which the Court have considered the question of what does and what does not amount to laying out a new street (see *Lynch v. Public Health Act*, 111 L.J., 2d ed., p. 298, 47 Q. B. 201; see also observations of Lord Esher in *Robinson v. Burton Local Board*, 21 Q. B. D., p. 636). If, however, this is a solitary building and no such intention to make a street can be inferred, I think it is very doubtful whether there is evidence to justify a finding that a new street is being laid out. See *Hilliers v. Powning* 42 J. P. 489, where the building of six cottages on one side of a lane, 250 ft. long and 6 ft. wide (there being no other houses in the lane), was held not to constitute the laying out of a new street.

GENERAL DISTRICT RATE: WATER RATE.—"J. H. M." writes: I own and live in a house which lets at 6s. per week clear, or £15 12s. per year. I pay—general district rate, £1 5s. 4d.; poor rate, £1 10s.; water rate, 18s. 9d.; fire insurance, 3s.; chief or ground rent, £2 2s.; total, £6 2s. 1d. per year. I have not made any allowance for repairs, painting, &c. I enclose poor and general district demand note for reference. Could you give me any information whether these demands are correct? I also enclose Private Waterworks Acts for reference, showing their scale of charges (rule page 3, 192, sec. 31, of their 1861 Act). Am I, in your opinion, overcharged? Enclosed are also the Union Assessment Committee Acts, 1862 and 1864?

(1) As to the general district rate, the demand note shows that the premises are assessed at £11 5s. In sec. 1 of the statute 6 and 7 William IV., cap. 36, the "net annual value" is defined as "the rent which the property might reasonably be expected to let from year to year, free from all usual tenant's rates and taxes, and the rent charge (if any), and deducting therefrom the probable average annual cost of repairs, insurance and other expenses, if any, necessary to maintain in a state to command such rent." The section has reference to rates for the relief of the poor, but the Union Assessment Committee Act, 1862, sec. 15, expressly preserves this definition of "net annual value." It is not stated whether on the rental of 6s. per week the landlord or the tenant would pay the rates and taxes, and although he refers to the rental as "clear" (which would imply that the tenant pays them), the enumeration of them as deductions which (as parity) he considers should be made from the rent for the purpose of the assessment. Assuming that the landlord would pay rates (as pointing to £3 14s. 10d.) it would appear that the assessment is too high, as there is a margin of 2s. 10d. for rates for repairs, insurance and other expenses. It is referred to in the Act of William IV. If, on the other hand, the rates would be payable by the tenant, I do not think the assessment is too high, unless the state of the property is such as to require a proportionally large and out-of-the-ordinary expenditure on repairs. The ground rent cannot be deducted in estimating the rateable value. £2 2s. is the water rate, sec. 31 of the Local Waterworks Act provides that where "the annual rack rent or value" of the premises shall not exceed £20 per annum, the rate shall not exceed 4s. 6d. per cent. £15 12s. per cent. £15 12s. is 101 per cent. £12 12s. in this case is 88.4d. = 71 per cent. at £12 12s. If the premises are also entitled to further allowances for any water supply, the tenant and for any private bath, as to which no information is furnished, probably, as the house is apparently a small one, the rate would be still one water closet and no bath. In that case the question is whether £12 12s. represents the "annual rack rent or value." In my opinion, it does not, the special Act in the case contains an endorsement of the "rack rent or value" of the premises, and the words of the Act which are cited were held that the rate should be calculated on the "net annual value" (*Horwath v. London & Waterworks Company*, 9 Q. B. 114, 116). Applying the well-known dictum of *Lynch v. Public Health Act*, 111 L.J., 2d ed., p. 298, 47 Q. B. 201, the question is whether the net annual value is the same as the "net annual value" as defined by the statute of William IV., already referred to. I think, therefore, that the tenant or the present occupier is only liable to charge upon the "net annual value" as so defined. If, however, the assessment is based on the "gross annual value," the company's charges, based on a value of £12 12s., are excessive.

QUERIES AND REPLIES.

We cannot undertake to reply to any queries which are not accompanied by the writer's name and address. These are required as a guarantee of good faith and not for publication. Sketches accompanying queries should be made separate on white paper, in plain black ink lines. Lettering or figures should be bold and plain.

224. By-laws as to House Drainage and their interpretation.—Mr. Geo. Winship, Borough Buildings, Abingdon, writes us on this subject, stating (1) that we have given his name somewhat unusual prominence, and more than is usually the case when any engineer differs from another in professional practice; (2) that the matter does not hinge upon the adaptability of the plan published; and (3) that the plan submitted to him was put with a question as to whether it was in accordance with the provisions and regulations as to drainage now in force within the district of the Clacton Urban District Council.

(1) We are sorry we are unable to sympathise with Mr. Winship in his disappointment that his name has been brought forward, but this is no fault of ours, but that of his client, who, we presume, paid for the use of it; and (2) and (3) we really cannot follow Mr. Winship's contention. He has advised that the plan is not in accordance with the by-laws and regulations as to house drainage, and to say that the matter does not hinge upon the adaptability of the plan published leaves us to infer that it was not upon the conformity or otherwise of the plan to the by-laws and regulations whereon he gave his opinion, which is a statement not reconcilable with his former written opinion. We feel it necessary also to add that considerations of professional etiquette do not appear to have been considered so fully as might have been expected, and it is most exceptional, and, for the advantage of surveyors generally, we trust it will remain so, for a municipal surveyor of one authority to advise an individual member of another local authority on cases such as this for purposes which are, to say the least of it, not conducive to satisfactory administration. Mr. Winship has had the opportunity to explain the reasons on which he based his opinion in this column in the same manner as Mr. Martin, but he has not done so, for reasons best known to himself. Further correspondence on the subject, so far as we are concerned, cannot be accepted for publication.

230. Sewage Farms in the United Kingdom: Particulars Required.—Mr. Robert Green, A.M.I.C.E., writes: Referring to the query in your last issue, Prof. Henry Robinson, in his book "Sewerage and Sewage Disposal," states on p. 153 that a return was obtained by the Local Government Board from towns in which sewage precipitation works were in operation to ascertain if the precipitant was soluble; 234 places are given in the return, from which it will be seen that only at thirty places was anything obtained for the sludge, the amount varying from 1s. to 2s. 6d. per ton.

We are much obliged to Mr. Green for the information, which will, we are sure, be useful.

232. Bridges: Wing Walls and Abutments.—"F. A. D." writes: Will you kindly define which are the wing walls in

A is the wall carrying road on to bridge crown (composed of rubble);
B is brickwork.

the sketch herewith, which roughly represents a canal bridge over which passes a highway?

Inasmuch as the querist appears to have an imperfect knowledge of the term "wing walls," &c., it may be useful if we give a few particulars relating thereto and to bridge abutments. In the construction of stone or brick built

bridges four forms of abutments are more or less used: (1) A plain wall parallel to the current, as shown in Fig. 1, with or without the wings A D F and B E G. The slopes may be finished with an inclined coping, as A D, or by an offset at each course, as B E. This form is termed the straight abutment or wings. (2) The wings or abutment

may be swung around into the bank at any angle, as shown in plan in Fig. 2. The angle is usually about 30° . This form is known as the wing abutment. (3) When the angle of 30° becomes 90° we have Fig. 3, which is called the U abutment. (4) When the wings, as in Fig. 3, are moved to the centre of the head wall we get Fig. 4, which is known as the T abutment. The abutment of an ordinary bridge has two objects to perform—viz., (1) To support one end of the bridge, and (2) to keep the earth embankment from sliding into the water. In Figs. 2 and 3 the portion D E performs both offices, while the wings A D and B E are merely retaining walls. In Fig. 4 the "head," D E, supports the bridge, and the tail or stem, A, B, carries the road, hence the whole structure acts as a retaining wall, and also supports the load. From the sketch which the querist has submitted it will be seen that the form of abutment is similar to that in No. 4 above. Strictly, the parts marked A A in his sketch are not wing walls, but merely retaining walls to carry the road. The querist will find Baker's "Treatise on Masonry Construction" (Wiley & Sons. Price 21s.) from which we have copied a portion of the lucid definitions given above, most useful.

THE I. V. O. C.

"Invincible Veterans and Old Comrades," it has been suggested, are indicated by the above mystic letters. They stand, however, for the Islington Vestry Officers' Club, which held one of its social evenings on Wednesday, under the presidency of Mr. W. F. Dewey, the vestry clerk, at the Islington Vestry Hall. Comrades, indeed, are the members of the club, and we heartily commend their unity and good fellowship, and their methods of expressing these qualities in practice, to the staffs of local authorities the country over. Veterans some of them are, but length of service hath not dimmed their loyalty to their chiefs, their zest for work as public officials. Invincible they are not, for this year the representative team of the club failed, through the temporary indisposition of one of their most valiant swimmers, to bear off the national shield of the Life-saving Society. But they triumphantly bore away the Southern Counties Life-saving Championship shield, and on Wednesday Mr. Guy Campbell, chairman of the executive of the Life-saving Society, gracefully presented that trophy to the team which wrested it from the London and India Docks representatives, who had held it for the two preceding years. In addition, the four Islington champions were the recipients of the gold medals which accompany the shield, and for their prowess at Birmingham, where, as already mentioned, they were the runners-up for the national shield, they were awarded bronze medals. Moreover, Mr. J. R. Leggatt, who had trained the members of the team, was presented by them with a handsome silver cup in recognition of his services. Then came a scene of even greater enthusiasm. Mr. G. J. Eldridge, the most modest member of the Islington staff, was at Great Yarmouth in August last, no doubt studying the details of the sanitary administration there. He heard the despairing cries of a youth who had sunk for the third time at some distance from the shore. Mr. Eldridge swam out, dived, rescued the then insensible body, and not only brought it ashore but scientifically put into practice the theory of resuscitation which he had learnt at Islington's public baths. Pluckily, unostentatiously and effectively he performed the noblest deed it is given to man to achieve—he saved a fellow-creature's life. For this he deservedly received on Wednesday the honorary testimonial of the Royal Humane Society, which was presented to him, on the society's behalf, by Mr. Dewey, amidst the vociferous cheers of his colleagues. The setting of these inspiring incidents in a "pleasant evening all too swiftly sped" was a varied programme to which many well-known entertainers contributed. The mere names of the veteran Clarence Holt, Prof. Lindsay, and Messrs. Charles Gardner, Willie Rouse, Frank Maitland and Harold G. Thompson are sufficient to suggest the quality of this programme.

Leyton.—The urban district council are favourably considering the adoption of the septic tank system of sewage treatment. It was stated, at a recent meeting of the council, that the new system would cost £3,000 a year less than the present method.

Bridges in the Lake District.—A correspondent of *The Times* writes: In consequence of the county council repudiating all responsibility for the bridges in the Keswick neighbourhood, the state of the roads is almost incredible in this nineteenth century. The inhabitants of the Portinscale district have now no safe access to church or market, nor to any railway station. Within 14 miles from Keswick, on the main road to Cockermouth, there are four bridges. The Greta bridge has large gaps in the parapet mended with wooden fencing and an old door. The Crossing bridge has a large hole in it, where an accident took place lately. The Portinscale bridge has large gaps in the parapet, and the water in flood pours in torrents through the pier, and half of the Powe bridge is entirely swept away. Other bridges are in a most dilapidated state, some entirely destroyed. Is there no law in the land?

Municipal Work in Progress and Projected.

We have this week received information in reference to several extensive municipal works which are being carried out at Accrington, Wolverhampton, Canterbury, Stafford, Ledbury, Glasgow and other places. The metropolitan authorities also seem to be more than usually busy, as a glance at the paragraphs relating to Islington, St. Marylebone and the Court of Common Council will prove.

METROPOLITAN AUTHORITIES. LONDON COUNTY COUNCIL.

On Tuesday the London County Council sat for five and a half hours, after which they adjourned over the Christmas recess until January 24th. Among the large amount of business disposed of was the important report of the Housing of the Working Classes Committee in respect to the erection of working-class tenement houses in several districts of London. The total cost of the proposed works was estimated at £40,500. After some discussion the whole of the estimates were approved, except one, the approval of which would have involved a charge upon the rates. This one was rejected. Several other more or less important matters were also dealt with, the chief of which we give below.

Housing of the Poor.—The Housing of the Working Classes Committee submitted a report asking for the passing of supplemental estimates of £950 and £2,030 in respect of the erection of Benson and Abingdon buildings, on the Boundary-street area. In the case of these buildings the works manager declined to accept the original estimates, and accordingly tenders were advertised for, but none were received, and the committee now recommended that the work should be given to the Works Department at an increased estimate of £2,980. After some discussion the recommendation was adopted. The committee further asked the council to approve a supplemental estimate of £1,502 in respect of the erection of cottages in the Brook-street, Limehouse, scheme. The facts in this case were much the same as in the previous one, with the exception that in this instance the enhanced cost would entail a small charge on the rates. Mr. Bonnois, M.P., moved as an amendment that the recommendation should be referred back to the committee, with an instruction to offer the site to the Industrial Dwellings Company without any other condition than that the approval of the Home Secretary must be obtained to the plans of any buildings which might be placed on the site. A long discussion followed, but eventually a vote was taken, with the result that Mr. Bonnois' amendment was negated by a large majority. The recommendation was then, on a division, rejected by fifty-six votes to forty-seven. Subsequently an estimate of £13,024 was approved in respect of the erection of Leighton and Millais buildings, Millbank estate, on condition that if the works manager found himself unable to undertake the work at that figure tenders should be invited for it.

Sewer Ventilation in Chelsea.—The Main Drainage Committee recommended the council to sanction an expenditure of £750 for the erection of nine ornamental ventilating columns on the northern low-level sewer in Cheyne-walk and Chelsea-embankment. The committee reported that their attention had from time to time been called to offensive emanations from the sewers in this neighbourhood, and their present suggestion was in order to obviate any further cause of complaint. Objection was taken by several members to the suggestion, on the ground that the columns would be detrimental to the neighbourhood from an æsthetic point of view. After the rejection of several amendments, the recommendation was adopted.

A Magnificent Gift to the Council.—In reply to Mr. Phillimore, Mr. Bruce, chairman of the Housing Committee, stated that since the last meeting of the committee Sir Samuel Montagu, M.P., had called at the council offices and intimated his intention of making a gift of 25 acres of land at Edmonstone for the purpose of the erection of working-class dwellings, subject to conditions which were now under consideration.

Proposed Electrical Tramway Traction.—On the recommendation of the Parliamentary Committee it was agreed to seek powers in the next session of Parliament, either by a separate Bill or by the insertion of provisions in the General Powers Bill, to enable the council to use electrical traction on all or any of their tramways.

The Proposed Telephone Conference at the Guildhall.—The Highways Committee reported that they had had before them a letter from the town clerk of the City forwarding a copy of a resolution, as follows, passed by the Court of Common Council on November 17th: "That application be made for a license to establish a telephone service in conjunction with the London County Council and other local authorities within the London telephone area," and asking the council to appoint six representatives to attend a conference at the Guildhall to consider the subject; and, if possible, to settle the necessary arrangements. They were of opinion that the council should give every assistance in their power in furtherance of the object which the corporation had in view in arranging for the conference, and they accordingly recommended that the invitation of the City corporation should be accepted. This was agreed to.

Tenders.—Reporting on the list of tenders sent in for the

separate items in respect to the construction of dwellings in Southwark, the Housing Committee resumed the Standing Order No. 195 being applied so that tenders to the extent of 80 per cent. of the value of the work were made to the contractors for general works and plumbing in respect of the dwellings to be erected on the Boundary-street area, Southwark; that the tender of Messrs. Bevan, Smith & Bonfield for the general works, amounting to £15,157, be accepted, that the offer of Mr. J. Bickley to carry out the plumbing work for the sum of £1,681 be accepted, that the tender of Mr. N. Porteus for the excavation of foundations, amounting to £1,923, be accepted; that the tender of Messrs. W. H. Lascelles & Co. for granolithic work, amounting to £771, be accepted; that the tender of Messrs. Yates, Heywood & Co. for chimney-pieces and iron railings, amounting to £408 10s. and £569 5s. respectively, be accepted; that the tender of Messrs. J. Wedgwood & Sons, Limited, for tiling work, amounting to £544 12s., be accepted; that the tender of Messrs. Shanks & Co. for water-closet apparatus and wash-tubs, amounting to £227 17s., be accepted; that the tender of Messrs. Homan & Rodgers for fireproof floors, amounting to £1,456, be accepted; that the tender of Messrs. Ewart & Son for dormers, amounting to £111 3s. 11., be accepted. The report was adopted.

COURT OF COMMON COUNCIL.

A meeting of the Court of Common Council was held on Thursday, when the Lord Mayor presided.—Mr. Edward Leo presented a petition from the Charing Cross and Strand Electricity Supply Corporation, particulars of which we published in our last issue (p. 762), stating that they were desirous of supplying electrical energy within the city, and asking the court, notwithstanding their inability to consent to the application made to the Board of Trade, to permit the memorial to be put upon their records. Mr. Leo moved that the memorial should be referred to the Streets Committee for consideration and report, and after a prolonged discussion the motion was carried unanimously.—In reply to a question, Mr. Turner said the Streets Committee had received no further communication from the Board of Trade in reference to the proposed inquiry into the state of Ludgate-hill station.—The Improvement and Finance Committee submitted for adoption an arrangement for setting back the premises in Lothbury, between Old Jewry and Princes-street, at a cost of £36,586, to include all interests, the vaults being constructed at the expense of the corporation. This was agreed to.—The court also agreed to an arrangement for acquiring the ground needed to widen the public way in front of 82 to 86 Fenchurch-street and 1 Aldgate for the sum of £300.

METROPOLITAN ASYLUMS BOARD.

A meeting of the managers was held at the County Hall, Spring-gardens, on Saturday, Sir E. H. Galsworthy presiding.—A claim for £24,445 was forwarded by Messrs. Mackrell, Maton, Godlee & Quincey, solicitors, on behalf of Messrs. Kirk & Randall, contractors, in respect of the increased cost entailed upon them owing to the delay that arose in connection with the erection of the Grove Hospital consequent on the non-supply of drawings and the supply of imperfect drawings by the board's architect. It was stated that further claims were in course of preparation and would be sent in due course. After some discussion the letter was referred to the Works Committee, with instructions to take the advice of the board's solicitors.—The General Purposes Committee reported that, acting under the authority accorded to them at the board meeting on July 2nd, they had instructed the Statistical Committee to assist the Social Science Sub-Committee of the Royal Commission of the Paris Exhibition of 1900, who were preparing a collection of exhibits illustrative of social science, by compiling for them a general report on the work of the Metropolitan Asylums Board from its commencement, and by showing at the exhibition certain models of the board's hospitals, asylums, ambulance stations, ambulances, &c. They had also instructed the Statistical Committee to submit estimates for giving effect to that decision. The architects of the North-Eastern Hospital, Messrs. A. & E. Harston, were instructed to prepare and submit to the Works Committee a plan and specification for the erection of a new laundry, together with the necessary additional boiler and engine-house, at the North-Eastern Hospital.

VESTRIES AND DISTRICT BOARDS.

Hampstead.—The Lighting Committee, at a meeting of the vestry on Thursday, submitted a long report, in which they stated that they had had under consideration the question of the great increase in the number of consumers of electric current, and they were of opinion that the time had now arrived when it was necessary to make provision for the extension of the buildings at the central station, to enable them to cope with the probable increase in the demand for current in the future. They recommended that they should be authorised to prepare and lay before the vestry plans for the extension of the central station, with a view to the provision of additional plant of 1,000 horse-power for both engines and boilers. The report was adopted. In a further

report the same committee recommended the vestry to construct a transformer pit on Parliament Hill, at a total cost, including transformer, cable, &c., of £156, and also to support the action of the Hammersmith Vestry in reference to the report of the Joint Committee of both Houses of Parliament on the subject of electrical energy (generating stations and supply), and the question of breaking up of streets, route of mains, wires for traction, applications for provisional orders, &c. Both recommendations were adopted.—On the recommendation of the Works Committee it was decided to make-up the new street, known as Mackeson-road, at the cost of the owners of the property abutting on it.—The Public Libraries Committee recommended that the vestry clerk should be instructed to take the necessary steps for completing the purchase of the site for the branch library at West End. This was agreed to.—The Public Health Committee reported that they had carefully considered the question as to whether the present system of ventilating the sewers in the parish was the best that could be devised, and they had come to the conclusion that the system of ventilation by open grids, assisted by up-cast shafts at the ends of the sewers were necessary, was the best and the most practicable. They accordingly recommended: "(a) That up-cast shafts be used, only as heretofore, in some cases to assist the surface ventilators, especially at the ends of sewers; (b) that open grids be employed in the place of the wooden manhole covers in the centre of the roads; and (c) that the surveyor should gradually replace the smaller gratings in the lower parts of the parish with larger ones of 60-in. aperture." The report was adopted.

Islington.—At the last meeting of the vestry a letter was read from the Rotherhithe Vestry announcing that that authority had passed a resolution expressing their satisfaction with the recent action of the London County Council in deciding to seek powers to provide for the future water supply of the metropolis. The vestry hoped that the Bill would receive the sanction of Parliament at an early date, as the matter was too urgent to admit of delay. It was resolved to instruct the vestry clerk to communicate to the Rotherhithe Vestry the resolutions already passed by the vestry on the subject of the London water supply.—The Parliamentary Committee were instructed to report on the notice served upon the vestry by the East London Water Company of their intention to apply to Parliament for an Act to authorise them to construct additional storage reservoirs and other works.—In a letter received from Mr. C. B. Clay, district superintendent of the National Telephone Company, exception was taken to some statements made in a report by the Works Committee. The writer said that he had not stated to the committee that the company had no statutory powers to place their wires underground. He thought, however, the company had such powers subject to the approval of the necessary authorities, and that if he had failed to satisfy the vestry on the point he trusted the committee would look into the matter further. If that was done Mr. Clay opined they would come to the conclusion of other authorities, and notably Kensington, and consent to the telephone wires being placed underground. The letter was referred to the Works Committee for report. In connection with this matter it was resolved, on the motion of Mr. Argyle, to tender the thanks of the vestry to Messrs. J. Howell Williams and Torrance for their action in inducing the London County Council to postpone until after the Christmas vacation a report by the Highways Committee dealing with the same question relating to overhead telephone wires in Islington.—The Works Committee reported that they had had under consideration the necessity for repaving the margins of the carriageway of Holloway-road between the Great Northern Railway bridge and the Seven Sisters-road. The committee recommended that the work should be carried out with hard wood, at an estimated cost of £6,500, and that the amount should be raised by loan. An amendment was moved by Mr. Tomkins in favour of the substitution of granite cubes for wood, but on a division this was rejected by thirty-seven votes to thirty-three. The committee's recommendation was then adopted.—On the motion of the Baths Committee it was decided to apply to the Local Government Board for sanction to borrow £4,000 to meet the deficiency arising from the extensions of the Galedonian-road baths.—The Public Health Committee presented a report on the question of dealing with nuisances occurring owing to the absence or insufficiency of urinal accommodation in connection with public-houses in the parish. Having regard to the great difficulty experienced in dealing with the subject, the vestry, at the suggestion of the committee, decided to ask the London County Council to promote legislation with a view to powers being conferred upon the council to act in the matter.—It was resolved to endorse the views of the Hammersmith Vestry in objecting to certain recommendations of the Parliamentary Joint Committee on the Supply of Electrical Energy, especially in regard to the breaking up of streets for the laying of mains, the use of overhead wires, and applications for provisional orders. A long report was submitted by the Works Committee relating to the failure of the National Telephone Company to comply with the by-laws made by the London County Council under the London Overhead Wires Act, 1891. It was eventually decided, in consequence of the inconvenience which would otherwise be caused to the public, to allow the company to retain such

existing overhead wires as do not conform to the by-laws for periods ranging from six to twelve months.

St. James's, Westminster.—The Health Committee reported, at the last meeting of the vestry, that they had considered a letter from the Clinical Research Association in reference to the work of the society in undertaking the bacteriological examination of material from cases of infectious diseases, the work being carried out, at small cost, for many sanitary authorities throughout the kingdom. The association suggested that it would be more economical for local authorities to join the society than to pay a yearly subsidy to support a laboratory as proposed by the London County Council. On the recommendation of the committee it was decided to acknowledge the receipt of the letter.—The Parliamentary Committee announced that they had considered the notice given by the St. James's and Pall Mall Electric Lighting Company of their intention to seek permission to introduce a Bill to authorise the company to acquire compulsorily property in the parish for the purposes of the undertaking. It was decided by the committee to defer the consideration of the subject until a copy of the Bill was obtainable.—In reply to an application made by the London Hydraulic Power Company for an extension of the hydraulic main from Bridle-lane to Marshall-street, it was resolved to inform the company that the vestry were prepared to assent to the proposal on the payment of an annual rental of £2 2s. Among the letters read was one from the London County Council stating the conclusions at which the Building Act Committee had arrived upon the points raised after consideration of the letters from local authorities on the subject of district surveyors employed in connection with the London Building Act, 1894.—A further letter from the county council was considered, announcing that application had been made to the council for approval of plans of proposed alterations adjoining St. James's Hall. The council asked the views of the vestry as to whether it would be desirable to use the opportunity to arrange for the widening of Piccadilly at the spot in question. It was decided to convene a special meeting of the vestry to consider the question.

St. Marylebone.—The vestry at their last meeting discussed a formal motion, proposed by Mr. T. H. Brooke-Hitching, chairman of the Electric Lighting Committee, to apply to Parliament for the grant of a special Act to empower the vestry to establish electric supply works. At the suggestion of Sir Edwin Galsworthy it was decided to adjourn the debate until after the recess, but in the meantime it was agreed to deposit the Bill.—It was decided to use hard wood in the case of the renewal of the carriageway of Oxford-street between Hereford-gardens and Edgware-road, and creosoted deal for the paving of Marylebone-road between York-place and Northumberland-street. The cost was estimated at between £3,000 and £4,000.—The Sanitary Committee reported that they had had under consideration a letter from the solicitors to Lord Portman on the subject of the proposed erection of an underground convenience in East-street by Marylebone-road. On the recommendation of the committee it was resolved to inform the solicitors that the vestry felt justified in adhering to the site in question.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

Middlesex.—A meeting of the county council was held on Thursday, when the Finance Committee recommended the council to approve a plan of the proposed court-house at Harlesden. This was agreed to, and the surveyor was directed to prepare detailed drawings and specification and the Finance Committee authorised to obtain tenders for the erection of the building.—It was decided to borrow £49,831 for the purchase of the Napsbury estate for the purposes of the proposed new county asylum, and to apply to the Local Government Board for permission to raise loans of £1,800 for road improvements at the Wandsworth asylum.—On the motion for the reception of the report of the Highways Committee a question was raised as to wool paving in Brentford. In reply the chairman of the committee stated that the whole question of wool paving in relation to the different local authorities was about to be considered by the committee.—The Highways Committee further reported upon applications received from various local authorities for contributions towards the carrying out of paving works. It was decided to grant £270 to Tottenham, £220 to Willesden, £517 to Hendon, £415 to Edmonton, and £625 to Teddington.—The Highways Committee recommended, and it was decided, that tenders should be obtained for not less than six firms for making good and restoring Hauxton Court main road in accordance with a specification prepared by Mr. Codrington, and to engage a clerk of works at a salary not exceeding £3 10s. per week.—A report was submitted by the General Purposes Committee on the proposed new lock in the Thames below Wandsworth Bridge. On the recommendation of the committee it was resolved to take no action in the matter until it had been conclusively proved before an independent commission by the best hydraulic and engineering evidence that, while benefiting a particular district up stream, an extension of shoal ground and prolonged low water, with increasing difficulties to navigation, would not be brought

about in the river below the intended new lock when erected.—It was resolved to formally oppose various electric lighting and light railway schemes in the county, in order to give the council a *locus standi* for the protection of their interests.—The Technical Education Committee recommended the council to contribute £1,800 towards the purchase of land and the building of a technical school at Harrow, provided that the remainder of the money required for the purpose be obtained from local sources. This was agreed to.—The following tenders were accepted: For the rebuilding of Kendal Bridge—George Bell, of Tottenham Hale, at £1,229; for the widening of Turkey-street bridge—George Bell, £927; and for works at Stratford Bridge—Fassnidge & Son, £87.

MUNICIPAL CORPORATIONS.

Accrington.—At a recent meeting of the Health Committee it was unanimously decided to proceed with the erection of a destructor. It is estimated that the work will cost about £7,000.

Batley.—The town council have accepted the tender of Messrs. H. & W. Barraclough, Brighouse, for the execution of levelling, paving, flagging, channelling, &c., works in Brown's-street at a cost of £320 and Grafton-street at £563.

Bradford.—Recent minutes of the Waterworks Committee recommended that an agreement, dated June 12, 1871, between the corporation and Messrs. John & William Briggs as to supplying water to Crosslills be terminated, that an offer be made to them to purchase the service pipes according to their present value, and that the waterworks engineer be instructed to take the necessary steps to continue the supply direct to the consumers upon the termination of the notice. The minutes were passed.—On the recommendation of the Markets and Fairs Committee it has been decided to accept tenders, amounting to £5,722, for the extension of the Lawson-place markets.

Burslem.—The Local Government Board, it has been stated, have agreed to sanction the borrowing of a sum of £760 for the purposes of street improvements, and point out that in cases where it is proposed to defray expenditure by means of borrowed money the board's sanction should be obtained to the loan before the expense is incurred, and that any agreement which may be entered into for the purchase of land should be made conditional upon the board's sanction being obtained to the loan.

Burton-on-Trent.—At the last monthly meeting of the town council the tender of Messrs. Moberley & Bailey, of Stourbridge, for the whole of the articles and goods required at the gasworks during the year was accepted, as was also that of Messrs John Fowler & Co., of Leeds, for a new engine, at £2,965.

Canterbury.—On the recommendation of the Lighting Committee it was recently decided to apply to the Local Government Board for sanction to a loan of £12,000 to cover an increase of expenditure and the cost of a proposed extension of plant.—At the same meeting the Guildhall Committee reported the receipt of a letter from the Local Government Board with reference to the proposed guildhall and municipal offices, to the effect that they were of opinion that the accommodation proposed was quite inadequate—no police station, offices for the medical officer of health, city surveyor and water engineer, sanitary inspector, rate collector, &c., being shown—while the offices intended for the town clerk's use appeared very inadequate. Under these circumstances the board could not consider the present proposals, and requested that a revised scheme should be submitted.

Carmarthen.—The council have agreed to the erection of a large market hall in the provision market, by putting the existing crockery and green-stuff sheds under one roof, instead of two as at present. The surveyor's plans show that the building would be 125 ft. long and 67 ft. wide, the seating accommodation being for 1,500 to 1,800 people. On extraordinary occasions, such as the holding of *estiddofodau*, they could find accommodation for considerably over 2,000. By using the available material such a structure would cost about £1,400.

Dover.—On Tuesday of last week, at a meeting of the town council, the surveyor brought up plans for the building of a waiting-room and public convenience adjoining the market place, with accommodation for ladies and gentlemen, the estimated cost being £850. The plan was referred to a small committee to confer with the surveyor as to the best mode of arranging the entrances, &c. Another report, on the lighting of the police station, the court hall and the council chamber by electricity, and the erection of two ventilating fans, was adopted.

Harrogate.—The tender (amounting to £5,620) of Mr. J. L. Hampton-Matthews, Kout-road, Harrogate, has been accepted by the corporation for the laying of about 2½ miles of surface-water drains and culverts in certain districts in the borough and in the parish of Bilton.

Leeds.—Recently, at a meeting of the Washburn Lands Purchasing Committee, it was decided to purchase certain farms in the Washburn valley, with the view of preventing the city's water supply from being polluted. So far the committee have purchased twenty-two farms, including two licensed houses and five blocks of cottage property, and con-

prising some 617 acres, for £32,474. This has been accomplished without having to go to arbitration.

Plymouth.—Reference was recently made to a proposal to purchase from Messrs. Pethick Brothers a hopper barge for £500, for conveying refuse to sea, and it was stated that when the destructor was erected and in working order, which might be within the next two years, the discharge of refuse into the sea would be discontinued. Since they had the disposing of the refuse they had been paying £5 a week for a hopper, and in that way about £100 has been spent. The recommendation was adopted.

Ratford.—At a recent special meeting of the town council it was decided to affix the seal of the council to an application to the Board of Trade for a provisional order, under the Electric Lighting Act, 1882 and 1885, to enable the council to supply electric energy for public and private purposes within the borough.

Salford.—An inquiry was held at the town hall, on Thursday, by Mr. H. H. Law, of the Local Government Board, with respect to an application of the corporation for sanction to borrow £2,500 for technical instruction purposes and £1,500 for street improvements. The proceedings were of a very formal character, there being no opposition to the proposals.

Scarborough.—The Local Government Board have written to the Scarborough Corporation with reference to the application of the town council for approval of the borrowing of £33,575 for the purchase of the St. Nicholas House estate, asking to be furnished with full information respecting the accommodation provided by the existing town hall and public offices, and also a statement showing in detail the loans sanctioned in respect of the town hall and offices. It is proposed to convert the house into municipal offices and the gardens into public grounds.

Southampton.—The contract for the supply during the next three years of sluice valves, fire hydrants, air valves, surface covers, &c., as may be required by the corporation's waterworks department, has been let to Messrs. J. Blakeborough & Sons, of Brighouse.

South Shields.—At the town hall, on Thursday, Mr. R. H. Bicknell held an inquiry, on behalf of the Local Government Board, into an application of the council for sanction to borrow £1,304 for the erection of an underground lavatory in the Market-place, £635 for improvement purposes, and £336 for additions to the manure straths in Wapping-street.

Stafford.—A Local Government Board inquiry has been held by Colonel Langton Coke with respect to an application of the town council for sanction to borrow £5,000 for gasworks purposes. The loan, it was stated, was required for the extension of the works plant, which were necessary on account of the rapid increase of the department, and was made up as follows: Condensers, £1,250; sulphate of ammonia house and plant, &c., £1,750; river boundary wall, £300; amount already expended on purifying plant, £317; and extensions of mains during the past five years, £1,390; proposed further extensions of mains, £500; new meters, &c., £93; making a total of £5,600, from which the cost of sulphate house, &c., £300, had to be deducted. The town clerk added that at the time the corporation took over the works the price of gas was 4s. 2d. per 1,000 cubic feet, and customers were charged for meters, but the average price now charged was 2s. 6d., without meter rent.

Taunton.—Last week, at a meeting of the town council, the Electric Lighting Committee reported that on the evening of November 21st one of the improvements at the works happened to frame the alternator by contact with his hand, which was badly burnt, and the result was that the armature short circuited and put the lights out on No. 1 sub-station, and the arc set fire to the internal casing of the armature wires. The staff at the works, with great promptitude, switched over the lights to the other machine in half a minute, so as to work on the alternator, and not only saved it from destruction, but had it running again by 1 o'clock in the morning.

Wolverhampton.—The corporation will make application during the ensuing session of Parliament for powers to construct and work 2½ miles of tramways. The system adopted is the electrical overhead, with side bracket poles. The borough surveyor's estimate, which has been approved by the council, amounts to £136,000 for track construction and electrical bonding and £90,000 for generating station, car depots and equipment.

URBAN DISTRICT COUNCILS.

Basinstoke.—A committee have been appointed to report on the advisability of adopting the Housing of the Working Classes Act. It is proposed to build about 100 houses, at a cost of £20,000.

Blackburn.—The corporation, who recently acquired the tramway system of the borough and adopted electric traction on it, on Monday agreed to join with the Darwen Corporation in purchasing the steam tramways connecting the two towns and owned by the Blackburn and Over Darwen Tramways Company. The purchase money is £48,500, Blackburn's contribution being £23,000.

Bournemouth.—The council are applying to the Board of Trade for a provisional order for powers to supply electric

light, and the surveyor has been empowered to consult an expert for assistance in preparing the necessary estimates.

Christchurch.—The town council are to have a special meeting shortly to consider the question of the drainage of the town, when the name of the engineer to be consulted will be decided on.

Fails-worth.—Mr. Herbert H. Law, one of the inspectors of the Local Government Board, held an inquiry at the Fails-worth town hall recently into the application of the Fails-worth District Council to borrow the sum of £4,200 for purposes of sewerage and sewage disposal. It was explained that from the start of the works to the finish exceptionally bad ground had been met with. In consequence of this it had been found impossible to complete them at the estimated cost. With regard to the land which had been secured for intermittent filtration, it was not thought to be of any use, and the council had not therefore thought it advisable to go to the expense of underdraining. If, however, it was found necessary in the future, they would ask for a further loan. The loans previously sanctioned by the Local Government Board were £28,810 on October 26, 1893, and £2,132 on January 12, 1897. The inspector put a number of questions, with a view of clearing up certain discrepancies in the statements made at this and the previous inquiry, and subsequently visited the outfall works.

Heston and Isleworth.—At last week's meeting of the district council it was decided to oppose the application for an order for the construction of a light railway through the district, but at the same time it was decided to interview the engineer of the company with a view to settling clauses favourable to the council which are to be inserted in the order.—It was also agreed to oppose the Bill of the West Middlesex Waterworks Company which sought to confer powers to lay mains through roads in the district.—Mr. Enton moved that the council should adopt sec. 3 of the Housing of the Working Classes Act, pointing out that there were many houses in the council's area which were unfit for habitation and should be demolished. The chairman said that owing to the financial condition of the council, with the prospective liability, it would be unwise to adopt an Act which would probably cause the spending of thousands of pounds. Colonel Clarke considered that the council should see if a profit could be derived from workmen's dwellings, and, on the motion of Mr. Loinez, the question was deferred for six months.

Heywood.—Local Government Board sanction has been received by the town council to the borrowing of £1,700 for the purchase of land required by the town hall site. The corporation have also applied for borrowing powers for a new town's yard, fire station, firemen's dwellings, mortuary, &c., but nothing has yet been heard in regard to this application.

Ledbury.—Colonel W. Langton Coke, inspector of the Local Government Board, held an inquiry recently respecting an application of the council for sanction to borrow £5,500 for the execution of various works of water supply. The scheme, it was stated, provided for the pumping of the water from a well at Massington to a reservoir, capable of holding 37,000 gallons, to be erected at the Cross Hands, 1 mile from Ledbury, at a sufficient altitude to supply to the whole of the district by gravitation from the proposed new reservoir. The existing reservoir would be utilised, and either both or only one could be used, or one could be used whilst the other was cleaned out.

Margam.—Lieut. Colonel Smith, R.F., held an inquiry at Taibach last week in reference to an application of the council for sanction to borrow £6,011 for a new market at Port Talbot.

Portsmouth.—The town council have adopted the following resolution: "That it be an instruction to the Tramway Committee to report at an early date the advisability of an extension of the system to other districts of the borough, with an estimate of the cost and probable income." They have also agreed to a recommendation of the Electric Lighting Committee that application be made to the Local Government Board for their sanction to borrow £18,000, being a further portion of £40,000 which was previously sanctioned by the council for the purchase of additional machinery and plant at the electric light station.

Richmond.—Upon the recommendation of the Highway Committee it has been decided to make an application to the Local Government Board for sanction to borrow £800 to cover the cost of laying a surface-water sewer.

Rugby.—The urban district council having applied to the Local Government Board for sanction to borrow a sum of £2,823 for works of private street improvement, Mr. G. W. Wilcocks has recently held the usual inquiry. Mr. D. G. MacDonald, the surveyor, detailed the work it was proposed to carry out. There was no opposition.

Sutton-in-Ashfield.—The Local Government Board have given their sanction to a proposal of the council to borrow a sum of £8,000 for works of water supply.

Tonbridge. On the 15th inst. Colonel A. J. Hepper, U.S.O., R.F., conducted an inquiry, on behalf of the Local Government Board, in reference to an application of the district council for sanction to borrow £1,500 for the purchase of the old town hall (and its subsequent removal for

street improvements), and a strip of land for the improvement of the Slade and the council's castle property; and £1,075 for the purchase of a Shone ejector, &c., for raising the sewage to the high-level tanks. The plans for the works were fully described by Mr. W. Lawrence Bradley, engineer to the council, and there was no opposition offered to the application.

RURAL DISTRICT COUNCILS.

Cwyrfa.—On Saturday, at the usual monthly meeting of the council, it was mentioned that a report of Mr. E. Evans, the county surveyor, on a comprehensive scheme for supplying the villages within the area of the council with water, had been received. It was decided to refer the report to a special committee.—The Local Government Board, it was also stated, had given their sanction to an application to borrow £2,000 for works of water supply at Port Dinorwic.

Gloucester.—The rural district council, at a recent special meeting, agreed unanimously to the following resolution: "That this council is entirely opposed to any scheme which largely diminishes the mileage of roads to be under the control of the rural district council. The present mileages are only sufficient to keep up the necessary staff of clerks and surveyor and to keep the steam roller going, any diminution of which would practically leave to the district council the payment of establishment charges out of all proportion to the actual work to be done. This council considers also the supervision which could be given to the roads by a district council would be much more effective than any which could be given by the county council to the great mileage and work under their supervision."

SCOTLAND AND IRELAND.

Glasgow.—The Statute Labour Committee have resolved to recommend that two bridges be erected across the Clyde east of the Albert Bridge, one for vehicular traffic at Govan-street, and another, for pedestrians only, at Polmadie-road. The estimated cost of the bridges is about £8,000, and they are to be constructed out of the materials of the temporary wooden bridge spanning the river at Jamaica-street.

St. Andrews.—At a recent meeting of this body a report in regard to the proposed improvement of the water supply of the city was read from Messrs. Belfrage & Carrae. The report recommended the formation of a reservoir in Langraw and Lamboletham Den to hold 13,000,000 gallons of water, and an additional clear-water well and filters upon a higher level than the present filters, &c., so as to give the requisite addition of pressure into the town. The estimated cost of reservoir, land and wayleave is £8,000. The provost explained that the proprietors were willing to give the commissioners every facility for the erection of the works, and some of them had promised wayleave at a nominal fee.

FOREIGN AND COLONIAL.

Nice.—A most important step in the right direction has been taken by the Mayor of Nice, who has appointed a representative commission of all the local medical men to report on the sanitary condition of Nice, and the best means to take in order to effect satisfactory improvements. The English colony will be represented by Dr. Allen Sturge, and he says that the municipality are prepared to spend some millions, provided the commission agree that the expenditure is necessary. Some eight years ago £1,000,000 was spent on getting a supply of water on to the hill where the chateau stands wherewith to flush the old town, and five years ago nearly the same amount was granted for mending the drains. If a scheme proposed by Masson, of Paris, is adopted now the municipality will have to find 5,000,000 to 10,000,000 francs, which, it is understood, they are willing to do. Nice will then be a model town from a sanitary standpoint.

Business Announcements.—We have been informed that the business of Henry Hope, which has been established since 1818, has been converted into a private limited company, under the title of Henry Hope & Sons, Limited. The board of directors are composed of Messrs. Henry Hope (chairman), H. D. Hope, J. A. Hope and J. S. Nettlefold, and it will be the aim of the board to maintain, and if possible improve, the reputation of the firm for first-class work. The old-established conservatory and heating engineering business will be carried on, as before, under the personal superintendence of Mr. Henry Hope.—The Horsfall Furnace Syndicate have established a London office at 35 Great George-street, Westminster, S.W., where they will deal with inquiries for their well-known specialities—viz., refuse destructors and forced-draught boiler furnaces. It may be interesting to note that the firm is at present engaged upon a number of important contracts, among which are refuse destructors for the following: The Corporations of Ashton-under-Lyne, Huddersfield, Ramsgate, West Hartlepool and St. Helier's (Jersey); the County Councils of Lunenburg and Cheshire; the Vestries of St. Luke and Fullham; the Strand Board of Works, and other authorities. Most of these works include complete steam-raising plant for use in connection with electric light and power stations.

Some Recent Publications.

MOTOR-CARS.

PETROLEUM MOTOR-CARS, by Louis Lockhart (Messrs. Sampson, Low, Marston & Co., Limited), forms the third section of a "Treatise on Auto-Cars on the Road" designed by the author to occupy four volumes, of which those treating of "Cycles" and "Steam Motor-Cars" have been already published, and that relating to "Motor-Cars worked by Electricity" has yet to appear. The book furnishes internal evidence of French sympathies and influence, the style of writing adopted is somewhat profuse, not to say inflated, and there is introduced much extraneous matter that must be deemed superfluous alike to the student and the general reader. Apart from these blemishes, a large amount of useful information on an interesting subject is afforded; and the letterpress is interspersed with an abundance of illustrations representing every variety of vehicle referred to in the text, as well as by diagrams of the different kinds of machinery, and the sundry appliances utilised in their construction or associated with their use. M. Ballif, president of the Touring Club of France, writes an introduction to the book, and in triumphant accents remarks: "People who two years ago would have been horrified at the very mention of travelling at a speed of 30 kilometres (18½ miles) an hour on a steam car now look on calmly, if not with envy, as they see careering along omnibuses, brakes and victorias built by Serpollet, Lavassor or Pengoot." A perusal of this volume would, however, induce us to endorse the views expressed by M. Lockhart when discussing the future of auto-locomotion. "The application of motors worked by hydro carburets to the propulsion of auto-motor-cars, as well as the construction of these motors, more especially petroleum motors, is," he says, "at present, in an initial stage; it is therefore no easy task to write on a subject as yet undefined, and which is just in that state of indecision and uncertainty that when we have started we find that we have acquired just sufficient experience about direct-combustion motors to enable us to fully recognise their defects and to feel the necessity for introducing improvements. It is no exaggeration to say that, of all the motors now in use for propelling horse-less carriages, there is not one that gives complete satisfaction or is perfectly adapted to the purpose for which it is intended." The author at a later stage enters on more debatable ground when he contends that "auto-locomotion remains pre-eminently a French industry," and further declares that "it is French both by origin as well as by the relative perfection of the results obtained in our country (France), where it has certainly achieved the highest degree of development hitherto reached." These opinions are somewhat inconsistent with the information contained in a carefully-prepared and well-compiled volume that has reached us, and which describes in detail recent proceedings in this country. We refer to the **JUDGES' REPORT OF THE LIVERPOOL TRIALS OF MOTOR VEHICLES FOR HEAVY TRAFFIC, 1898**, edited by E. Strajpell Smith (Winsorley & Watkins, Liverpool, Price 5s.). The Self-propelling Traffic Association (Incorporated), under whose auspices these trials were conducted, has as its president Sir David Salomons, Bart., and numbers among its supporters many prominent persons whose names have been long identified with successful scientific experiments. The sections of the report preceding the general account of the trials give full particulars of the origin of the competition and the organisation of the preliminary arrangements, as well as a very complete description of the various vehicles that took part in the contests. A subsequent section deals with actual results relative to the cost of working those respectively, the calculations being determined to the nett ton-mile and the rate of speed per hour obtained. And here we may note that, apart altogether from the question of perfection or defect in construction and of success or failure in the practical working of self-propelling motor vehicles, the initial cost and the annual expenditure involved must for some years at least prove a serious obstacle to the general adoption of this convenient and desirable method of transit. From a series of estimates we learn that the prime cost of the vehicles engaged in these competitions ranged from £375 to £750, and that the annual working expenses, including interest on the purchase money and due allowance for depreciation, varied from £367 to £589. Diagrams on large folding sheets are introduced to illustrate in section the distances accomplished, with the various altitudes attained throughout each route. The clear letterpress and excellent reproductions of photographs are very attractively presented to us on fine art paper, and the report as a whole reflects credit on all who were concerned in its production.

SOME PERIODICALS.

Cassier's Magazine (1s.) has always a good variety of interesting engineering matter. This month we observe such topics as luxury in American railway travelling, the Vesuvius cable railway, articles on aspects of military, naval and railway engineering, and an interesting speculation as to the transportation and lifting of heavy bodies by the ancients. There is a portrait and biography of Mr. John A. F. Aspinall, chief mechanical engineer to the Lancashire

and Yorkshire Railway Company.—It is needless to repeat what we have said on previous occasions as to the general set-up of *The Architectural Review* (1s.). The contents, both literary and artistic, are always chosen with care and ability. Theatre goers and readers of the elder Dumas will turn with interest to the first of a series of articles on the castles of "The Three Musketeers," a beginning being made with the Pierrefords of the immortal Porthos. Restoration, the architecture of Michel Angelo, the arts of ancient Egypt, the work of G. F. Watts, and the architecture and antiquities of Cyprus, are also among the chief subjects dealt with. The special plates, including a photogravure, need no praise.—The chief contents of our American contemporary, *The Sanitarian*, are an article on theatre sanitation and a report of the proceedings at the last meeting of the American Public Health Association.—Those of our readers who wish to read something lighter than matters of engineering and sanitary interest should find something to their taste in *The Cornhill* (1s.). The Rev. W. H. Pritchett continues his stirring "Fights for the Flag" the Bishop of London discourses on heroes, there is another instalment of the interesting Etchingham Letters; Mr. Garratt Fisher has a "Study in Imposture," Cavendish explains the game of "bridge," "Some Significant Acts of Parliament" are commented upon, and Mr. E. G. Hensham gives an assortment of "Humours of Speech and Pen." These constitute not a bad programme for one number.—*The North American Review* (2s. 6d.) is of rather heavier calibre. "The Reorganisation of the Naval Personnel" is discussed by some well-known citizens of the United States, Max O'Rell gives us the first of a series of "Studies in Cheerfulness," Lieut. Winston Churchill writes on "The Fashoda Incident," The prevention of yellow fever, the proposed Nicaragua canal, the Atlantic fisheries question, and ethics and etiquette, are among the other subjects which form the themes of articles.—*The Christian Booksetter* (1s.) should be consulted by all who have any occasion to buy books at the festive season for presents or for their own use.—In *Bully* (1s.), "Borderer" deals with the etiquette of field sports, "F. G." lifts "the curtain of the past," and Mr. G. H. Underhill has another sketch of a "sporting celebrity." There is the usual monthly record and comment, which, with other features, contribute to make this periodical so excellent an organ of field sports.—*The American Review of Reviews* provides an admirable monthly survey of the world's progress, with special reference, of course, to America and its problems, especially some recent ones of an Imperial character. There are some comments on the tasks that await American engineers in the new possessions. Many English municipal engineers and others will turn with sympathetic interest to Dr. Albert Shaw's appreciative notice of the life and work of the late Colonel Waring.—In *Longwalk* (6d.) there are instalments of two serials, one by Mr. Rider Haggard.

Mrs. Lecky describes the coming of age of the Queen of the Netherlands, and Mrs. Clement Parsons an etiquette-book of the seventeenth century, and Mr. Andrew Lang is still in evidence.—*The Journal of State Medicine* (2s.) is largely occupied with the subject of tuberculosis, the chief contribution being Sir Richard Thorne Thorne's "Harben" lecture. In an editorial article objection is taken to the combining of the duties of surveyor and sanitary inspector.—The chief articles in our instructive contemporary, *Knowledge* (6d.), deal with volcanoes and "The Christmas Customs of Shakespeare's Greenwood."—Among the subjects dealt with in *Work* (6d.) for December are photography, engine indicators, metal-plate work and railway waggon.—We observe that our enterprising monthly contemporaries, *The Quarry* and *The Builders' Magazine* are to be amalgamated, and may soon be published as a fortnightly. We have no doubt the venture will meet with success.—We have also to acknowledge *The Journal of the Royal Colonial Institute* (6d.), *The Sanitary Inspector's Journal* (6d.), *The Journal of the Clerks of Works' Association* (2d.), *The Analyst* (1s.), *The Journal of the Society of Estate Clerks of Works, Great Thoughts, and Chums*.

Any of the Books noted below will be sent post free if the price is enclosed and forwarded to the office of THE SURVEYOR.

THE PROCEEDINGS OF THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS, VOL. XXIV, 1897-98, edited by Thomas Cole, A.M.I.C.E., 388 pp., 8 in. by 5½ in. E. & F. N. Spon.

THE TWENTY-SEVENTH ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD, 1897-98 (medical supplement), 344 pp., 9½ in. by 6 in. Her Majesty's Stationery Office. Price 4s. 11½d.

THE EFFECT OF FIRE: A Report of the Home Building Fire, Pittsburgh, U.S.A., with fourteen plates and illustrations; 30 pp., 8½ in. by 5½ in. The British Fire-prevention Committee. Price 2s. 6d.

REPORT OF THE MORELAND BY SEWERAGE SURVEY, BY H. Bertram Nichol, A.M.I.C.E., 12 pp., 8½ in. by 5½ in. Hodgkiss, Limited. Price 6d.

Personal.

On Saturday the Metropolitan Asylums Board decided to appoint an assistant engineer, at a commencing salary of £300 per annum.

We learn that Mr. J. T. Battersby, of Ambleside, has been appointed to the post of gas and water manager to the Ambleside Urban District Council.

Mr. T. H. Yabicom, city engineer of Bristol, has been transferred from the class of "Associate Members" of the Institution of Civil Engineers to that of "Members."

At the last ordinary meeting of the Sheffield Society of Architects and Surveyors, Mr. Beresford Pite, of London, delivered a lecture on "Michael Angelo's Architecture."

Whitechapel District Board on Monday appointed Mr. Wright, electrical engineer to the Brighton Corporation, to carry out the electric lighting of the Whitechapel district, at a salary of £600 per annum.

Keynsham Rural District Council have selected Mr. James W. Hawkins, who is at present surveyor to the Weobley Rural District Council, to fill the post of highway surveyor, at a commencing salary of £150.

Mr. Harry Holmes, late assistant in the borough surveyor's department, Burton, has been successful in obtaining an appointment under the Works Department of the Birmingham Corporation, at a salary of £175 per annum.

Mr. Charles Henry Lawton, of Silverdale, North Staffs., has been appointed surveyor to the Wirksworth Urban District Council, and will commence his duties early in January. There were twenty-three applicants for the post.

Mr. G. Mellarg, surveyor of highways under the Stoke Rural District Council, was, at a meeting of that authority, held last week, granted an increase of salary, several members bearing testimony to the satisfactory way in which he had discharged his duties.

Captain R. G. B. Crompton, who has been appointed major in command of the Electrical Engineer (Royal Engineers) Volunteers, in place of the late Dr. John Hopkinson, is not only a well-known electrical engineer, but served as an officer in the Rifle Brigade in the sixties.

Mr. R. E. W. Berrington, the late borough engineer of Wolverhampton, has been unanimously elected to the position of chairman of the Health Committee of the corporation. His experience as a specialist in sanitary engineering work should prove of great service to the borough.

Mr. W. A. Nicholson, who has for over two years acted as surveyor to the Brightlingsea Urban District Council, has submitted his resignation. Mr. Nicholson, it is understood, has been appointed to the position of chief assistant surveyor to the Tendring Hundred Rural District Council.

In consequence of inability to find a candidate to fill the position of superintending architect to the London County Council, the General Purposes Committee recommended, at a meeting of the council on Tuesday, that Mr. Blashill should be asked to retain the position until March next. This course was adopted.

At an adjourned meeting of the Court of Common Council, on Thursday week, the City Lands Committee asked for authority to retain the services of Prof. Atchison, R.A., president of the Royal Institute of British Architects, in connection with the preparation of designs for the rebuilding of the Sessions House, Old Bailey, at an honorarium of 400 guineas. This was agreed to.

By a large majority the Penzance Town Council last week adopted a resolution of the General Purposes Committee, recommending that a testimonial should be presented to Mr. Small, the retiring surveyor, and that the corporation should head the list with a sum of £100. A committee is to be appointed to collect further subscriptions and to carry out the testimonial, the mayor acting as secretary.

Mr. J. E. Blackwell, a late pupil of Mr. E. Purnell Hooley, county surveyor of Nottinghamshire, was last month appointed to a district surveyorship under the Derbyshire County Council, and on Tuesday Mr. C. Hodges, an improver in Mr. Hooley's office, was appointed by the Highways Committee of the Bedfordshire County Council district surveyor, subject to the approval of the county council.

Mr. Rupert M. Evans, senior assistant in the office of Mr. W. Blackshaw, borough engineer and surveyor of Stafford, has been the recipient, on the occasion of his leaving Stafford, of a case of drawing instruments, as a slight mark of the esteem and respect in which he is held by the office staff. Mr. Evans is about to take up similar duties on the engineering staff of the County Borough of Hanley, under Mr. J. Lobbey, the borough engineer.

At last week's meeting of the Plymouth Borough Council the chairman of the Works Committee raised the question of the appointment of a general assistant in the surveyor's department—a subject which provoked much discussion at a previous meeting—and emphasised the importance of the vacancy being filled. It was ultimately decided that one of

the assistants to the water engineer should be appointed temporarily to the post.

There were forty candidates for the appointment of electrical engineer to the East Ham Urban District Council, and of these nine were selected to attend the final meeting of the council. Mr. W. C. Ullmann, who is at present engaged by the British Thomson-Houston Company, Limited, as resident engineer, superintending the construction of the city of Sheffield electric tramways, was subsequently appointed. He has had a varied practical experience, both in this country and abroad.

Consideration was, on Thursday, given by the Folkestone Town Council to the appointment of a surveyor in succession to the late Mr. J. White. Out of 126 applications seven were ultimately selected for interview, and after seeing these gentlemen and considering their applications and testimonials, the council, after further deliberation, reduced the number to three. All these ran one another close in qualification, but it was eventually decided to appoint Mr. A. C. Nichols, of Leeds, to the vacant post.

The *North China Daily News* states that on the 3rd November, at the Holy Trinity Cathedral, Shanghai, Mr. Charles Henry Godfrey, assistant municipal engineer of Shanghai, was married to Mary Elizabeth, daughter of Mr. James Reynolds Hewlett, of Chicago, U.S.A., and adopted niece of Mr. Daniel Hewlett, of Barnwood Court, Gloucester, England. The wedding presents, we understand, included a solid silver tea service from the members of the Shanghai Municipal Council in their private capacities.

An enjoyable evening was spent by the staff of the Willenden Urban District Council on Thursday, when the third annual dinner was given at the Frascati Restaurant. The chair was occupied by Mr. O. Claude Robson, and among those present were Messrs. Stanley Ball (clerk), H. H. Humphreys (deputy engineer), B. Haylor (assistant surveyor), H. Northcroft (quantity surveyor), and W. L. T. Brown and E. Willis (building surveyors). In responding to the toast of "The Chairman," Mr. Robson said they had been fortunate in possessing a local board and district council, not only willing to do justice to the public, but also to the officials, and it was due to this spirit of justice that the latter had ever a desire to do their work thoroughly and promote the prosperity of the district.

On the presentation of the report of the Highways Committee, at a meeting of the London County Council on Tuesday, Mr. Benn, chairman of the committee, stated, in reply to a number of questions, that it was the case, as reported, that Mr. A. Baker, who was last week appointed manager of the council's tramways, had written to say that the Nottingham Corporation had refused to relieve him from his duties in Nottingham for six months, or to give him facilities for attending to the work of the council. Mr. Baker added that great inducements had been offered to him to remain in Nottingham, but he had informed the corporation that he was pledged to the council, and he now left himself in their hands. Mr. Benn stated that the Highways Committee had felt it necessary to take this matter into immediate consideration. They felt they had to face some little difficulty, but he thought that after a few letters had passed between the council and the Nottingham Corporation the difficulty would be overcome. In the meantime, and for the protection of the council's interest, the committee had decided to appoint a special sub-committee, consisting of five members of the council, to undertake, on January 2nd, the management of the tramways.

Mr. Alfred Baker, the manager of the Nottingham Corporation tramways, who was last week appointed to a similar post under the London County Council, is a Lincoln man, but has spent nearly the whole of his life in Nottingham. During the last twenty years he has been on the staff of the tramway company there, and was appointed manager of the undertaking in 1891. In 1897, when the undertaking was municipalised, the corporation retained Mr. Baker's services, and he has since then had the absolute control of the system. Its owners have had under consideration the question of mechanical traction, and have visited all the principal towns in the United Kingdom for the purpose of inspecting the best systems and of finding out all that could be done to improve their possession. In these and other visits they have been accompanied by Mr. Baker. They have finally decided to make extensions of over 40 miles in length on the overhead electrical system. This scheme, as the town clerk, Sir Samuel Johnson, pointed out in recommending Mr. Baker for the London appointment, involved an outlay of over £500,000, and yet the corporation had not felt it at all necessary to call in expert advice. They were quite content to accept the recommendations of their manager. The people of Nottingham are sorry to lose Mr. Baker's services, and it is said that efforts have been made to induce him to stay, but at present the position of the tramways department there is not strong enough to justify its committee in increasing the salary of the post to such an extent as would offer him a strong inducement to reconsider his resolution.

MAIN ROAD MAINTENANCE DISPUTE AT GAINSBOROUGH.

LOCAL GOVERNMENT BOARD INQUIRY.

Colonel Slacke, R.E., recently held an inquiry at Gainsborough, on behalf of the Local Government Board, respecting the dispute between the urban district council and the Lindsey County Council as to the payment for main road improvements at Morton. In reference to the north section of the road leading from the vicarage to North Marsh-road, the county council argued that it was new work and was of purely urban benefit; and with respect to the southern section, from near Elm Cottage to Love-lane, that the widening was also on new ground, and that the work done was not in connection with reasonable repair and maintenance of the main road proper; that this also was of urban benefit solely, and, further, when the district council meditated undertaking the work they should have obtained the sanction of the county council if they wished them to pay for it as a main road charge. The contention of the district council was that the work was not new, but was in the nature of an improvement; that as the thoroughfare was one of the chief arteries for ingress and egress between the country and the town, the work was beneficial to the public at large.

THE CASE FOR THE DISTRICT COUNCIL.

Mr. D. M. ROBBS, clerk to the district council, said the dispute between the two authorities was the question of the pavement of the two sections of the main road which was known as Morton-road. The expenses were incurred in the financial year ended on March 31, 1897. Dealing more particularly with the north section, he said the road was an awarded road under an Act of Parliament dated in the time of George III. He proceeded to argue that there could be no enlargement or widening of the Morton-road, because it was staked out in the award as 60 ft., and it was that distance to-day. The question in dispute, he said, was as to who should pay for the work which had been done to the road. The county council objected to pay any portion of the costs, on the grounds that being new works solely required in consequence of the erection of new houses within the urban district they were not liable for repayment. He maintained that it was not a new work. The district council had made a substitution or an improvement where a footway had existed. He then quoted written judgments and definitions by several well-known authorities in support of his contention that county councils were responsible for similar work to that done by the district council. As to the argument that the footway was of a purely local benefit, Mr. Robbs submitted statistics of the traffic on the road, and stated that it was the only artery leading into and out of the town by which persons coming from the northward could enter Morton, Walkerth, Stockwith, Wildsworth, Laughton and Blyton were all within 6 miles, and the agricultural population on that side fed the town through that artery with all their country produce in the same way as which the town fed the country with town-made goods, &c. Therefore there was a constant journey backwards and forwards along the road. In reference to the south section, he held that old streets under certain circumstances, such as the erection of houses, &c., became new streets. When the new houses were built under their by-laws the road was bound to be made to the width of 40 ft. Prior to the widening it was only 30 ft. to 31 ft. from fence to fence, and was dangerous to traffic. It became congested, and people driving along it complained, while hundreds of cyclists now used it. It was dangerous to come from a road 60 ft. wide into a bottle-neck as it were.

Mr. CHARLES SCORER, clerk to the county council, here stated that it might shorten the proceedings if he admitted that the widening was a reasonable work for the district council to carry out.

Mr. ROBBS, continuing, impressed upon the Court that the improvement, if paid for or not, had been carried out on the most economical lines, because the landowner gave them the land required and also a contribution of £26 towards the cost of making the new footway. He then went on to show that the improvements had a distinct connection with the maintenance of the roads. In conclusion, he said that he had witnesses to prove the statements he had made, and he would also give the statistics if necessary. He then called

Mr. HENRY RILEY, surveyor to the district council, who said that when he was appointed to his position (in 1894) the north section of the road in question had no proper footpath. It was formed of cinders and road scrapings, and was 2 yards wide. The condition of the path in winter weather was very bad, almost impassable after a heavy frost. The drainage was by means of pipes leading into a field ditch. He subsequently channelled, asphalted and kerbed the road, in fact, did the work, for which payment was now claimed from the county council, at a cost of £148 in the north section, while in the south section he did similar work at a cost of £118. The work was done by contract, was fair and reasonable, and would reduce the future cost of repair and maintenance. He therefore considered that it was a proper improvement to be carried out.

Two ratepayers, who had resided in the road for a number of years, next gave evidence, after which

Mr. McBRIDE, city surveyor of Lincoln, was called. He

said he thought the works very reasonable and necessary. They were of a permanent character, and, in his opinion, were properly included in the maintenance and repair of a main road. If the traffic increased to a certain degree he thought the county council ought to pay for the necessary widening.

THE CASE FOR THE COUNTY COUNCIL.

Mr. CHARLES SCORER, clerk to the county council, then stated his points in justification of the county council for the non-payment of the cost of the works. There was no question, he said, as to the reasonableness of the expenditure, but a very much larger question arose as to the liability of the county council for the payment of any portion of these works. If it were decided that the county council were liable, he submitted that the repayment should be extended over a considerable number of years. The Act did not say that the county council must pay for enlargement. The district council should keep their roads as originally maintained, or come to the county council and ask them for a contribution. The proceedings of that day would not terminate the difficulty, for they had received an intimation that a similar application would shortly be made in respect of another section of the same road lying between the two sections in question. The district council had determined that they were masters of the situation, and seemed bent on making the county council pay.

Mr. THORPE, county surveyor, said the road was made in 1883, and at that time it was in a fair condition. For traffic north of Morton-road the old footpath on the east side was sufficient. The improvements were more for the benefit of the town than of the adjoining district. He thought the work must be regarded as an enlargement rather than as an improvement. In cross-examination, witness said the county council had had slight differences with other urban authorities. They had had three arbitrations. It was not wise and necessary, from the county council standpoint, to have the road widened. He thought there was space sufficient for the traffic. Before the alterations on April 7, 1896, witness presented a report to the county council in which he said he did not think there was any course open to the Highways Committee but to recommend the consent of the county council to the expenditure in respect of the south section. He also reported that the increased width of the roadway would give more room for the heavy traffic, and cause that part of the road to be maintained at a comparatively less cost. Further, in his report he said that the north section was an entirely new work, and it might be open to question whether the county would have to pay the whole or any of the cost, but he feared the county council would have to pay the expense. If the district council had intended to widen their roadway without constructing a footway in the south section, the county council would not have allowed it.

Mr. CODRINGTON, formerly an inspector of the Local Government Board, took the view that no part of the works in the south section constituted an improvement connected with maintenance and repair, and no part was chargeable to the county council. The point had often arisen in disputes, and had been decided in favour of the county council whenever there had been any widening that had not been paid for by the county council.

Mr. ROBBS objected to the witness quoting his own decision in a number of cases of arbitration. It was not etiquette for Mr. Codrington to come there as a professional witness and to use the experience he had gained in the service of the Local Government Board. He asked the inspector to take note of his objection.

Mr. W. EMLETON FOX, chairman of the Lindsey County Council, was the next witness, and the evidence closed.

Mr. SCORER informed the inspector that the Lindsey County Council were prepared to take a case to the High Court to test the question as to the liability of the county council for the cost of construction of works completed by the district council upon land added to the road. He knew it was contrary to the practice of the Local Government Board to give reasons for their decisions, but he hoped they would be able to gather from the award the grounds upon which the decision was made.

A vote of thanks to the inspector brought the proceedings to a close.

Private Bill Legislation.—Saturday night was the latest time for depositing in the office of the Clerk of the Parliament copies of private or local Bills which it is proposed to introduce when the two Houses assemble in February. Plans in connection with these Bills requiring them were, it will be remembered, deposited at the Private Bill Office at the end of last month, and it was the measures themselves, some of which do not require plans, and were therefore not included in the former list, that were handed in on Saturday. The Bills of interest to London include the London County Council (General Powers), London Improvements (Holborn to Strand, Southampton-row Widening, High-street, Kensington, and other works), London Water (Welsh Reservoirs and Works), London Water (Aqueducts and Works), London Water (Purchase of Companies), and the London Water (Finance). The Scotch measures include the Glasgow Corporation Telephones Bill. The total number of Bills handed in was 267, as compared with 219 last year.

EAST-END WATER SUPPLY.

SOME EFFECTS OF THE DROUGHT.

In certain parts of the district which they cover the East London Water Company had already resumed the constant supply of water. The whole district did not, however, receive a constant service till Wednesday. It was on Monday, August 22nd, that the supply was first restricted to six hours a day, and on September 3rd the supply was still further reduced to two periods of two hours in each day. Assuming that all consumers obtained a full supply on Wednesday, it follows that the short service has been extended over about sixteen weeks. It was an immense effort to maintain even the restricted service.

The Grand Junction, Kent, New River, and Southwark and Vauxhall companies gave assistance by transferring water to the East London Company, the magnitude of this assistance being shown by the fact that during the month of October alone the quantity so transferred was no less than 359,160,000, an average of over 11,500,000 gallons a day. The supply of the East London Company, however, still fell short by 10,000,000 gallons a day, as compared with the supply they were able to furnish in the corresponding month of last year.

As to the effect of the drought upon the quality of the water, Sir William Crookes and Prof. Dewar make some interesting observations. They describe the drought as the most severe for forty years, but say that the average condition of the raw, unfiltered Thames and Lea waters continued exceptionally good. "The condition of the filtered water supplied to London," they say, "excellent, and in the case of the East London supply the quality was substantially the same as during similar seasons, when the supply of water was ample." Again, they remark, that the large rainfall in October had the effect of suddenly washing into the rivers organic matter accumulated in the watershed during the drought; and as the reservoirs of the East London Company were almost empty at the end of September, the company were forced in October to use the Lea, without the advantage of purification resulting from proper storage in the reservoirs. During that critical time Sir W. Crookes and Prof. Dewar took extra pains to ascertain the character of the East-End supply. "They report with satisfaction that, 'in spite of the severe strain thus thrown on their filtering appliances, the clear water supplied to East London has been bacteriologically better than it was during the months of August and September.'"

STOCKPORT WATER SUPPLY.

PROPOSED MUNICIPALISATION.

At an extraordinary meeting of the proprietors of the Stockport District Waterworks Company, last week, the chairman reported on the negotiations between the directors and the Corporation of Stockport, which had resulted in an agreement for the sale and transfer of the undertaking of the company to the corporation. The agreement having been read and explained, a resolution approving and adopting it was passed on the motion of the chairman. It is understood that the cost to the Corporation of Stockport will be nearly £800,000 for the transfer, to be followed by a large outlay on developments. Although the price is considered by many somewhat high, yet there is a general feeling of satisfaction in the town that the corporation, after various efforts extending over a long series of years, is likely to obtain control of the water supply. The area of supply extends also to Alderley, Wilmslow, Cheadle, Bredbury, Heaton Chapel, Reddish, Hazel Grove, Disley, &c.

Electric Light in the City.—*The City Press* state that they understand, on the very highest authority, that there is every possibility of a conference taking place in the near future between the Streets Committee of the corporation and the City of London Electric Lighting Company with reference to the purchase by the corporation of the company's undertaking. The directors, it is understood, are quite prepared to sell their property if the terms offered are sufficiently tempting. Naturally they are unable to give any indication of what the views of the board are as to the sum they will feel disposed to accept.

A New Incandescent Electric Lamp.—It is stated that a new form of incandescent electric lamp has been invented by Prof. Nernst, of Göttingen. Instead of a carbon filament in an exhausted bulb, it has a block of magnesia heated to an enormously high temperature. The principle relied upon is the fact that when magnesia is heated above 3,000 deg. C. it becomes a good conductor of electricity and will retain its brilliant incandescence without much expenditure of current. To start the lamp, however, it is necessary first to heat the magnesia up to a certain temperature, and this is effected by Prof. Nernst by placing it in the focus of a reflector, on the inner side of which is a spiral of platinum wire, which is readily brought to bright heat. As soon as a current starts in the magnesia the platinum wire is cut off. It is claimed that the new lamp is economical, and that it gives a purer light than the carbon filament; but this remains to be proved.

THE SURVEYORS' INSTITUTION.

ORDINARY GENERAL MEETING.

The next ordinary general meeting of the above Institution will be held on Monday, January 9, 1899, when the adjourned discussion on the paper read by Mr. Wm. Weaver at the last meeting, entitled "The London Building Act and the Official Supervision of Buildings," will be resumed. The chair will be taken at 8 o'clock.

JUNIOR MEETING.

The second of four meetings of examinees and students of the Institution, authorised (subject to certain conditions) by the council to be held during the present session, will take place on Monday, January 30, 1899, when a paper will be read by Mr. H. M. Rogers on "Land and Land Tenure." The chair will be taken at 7 o'clock.

STUDENTS' PRELIMINARY EXAMINATION, 1899.

Those proposing to enter their names for the students' preliminary examination, to be held on the 18th and 19th of January next, must intimate their intention to the secretary before the last day of November. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London. Irish candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS, 1899.

Students eligible for the proficiency examinations (which will commence on the 20th of March next) must give notice of the sub-division (Table A of Rules) in which they elect to be examined, not later than the 31st inst. Examinations qualifying for the classes of "Professional Associates" and "Fellows" will also commence on the 20th of March next. Names of applicants for these latter examinations to be sent in before the 31st inst. All particulars as to days, subjects and course of examination will be forwarded on application to the secretary. English candidates for the professional examinations will be examined in London. Irish candidates will be examined in Dublin.

PROPOSED SPECIAL-CERTIFICATE EXAMINATIONS (FOR MEMBERS), 1899.

Notice is also given that the next special-certificate examinations in forestry, sanitary science and land surveying and levelling are proposed to be held on Tuesday, Wednesday and Thursday, the 13th, 14th and 15th of June. Particulars of these examinations can be obtained from the secretary.

Proposed Electric Ferry across the Thames.—A novel scheme for a new ferry, by which passenger and vehicular traffic may be conveyed from Greenwich to Millwall, has, according to *The City Press*, just been completed. In the ensuing session of Parliament power will be sought to incorporate a company to construct and work the ferry by electricity or other power on submerged rails across the river. The line will run from a point near the site of Brewhouse-lane to the western boundary of the Island Gardens, Poplar. It is proposed to take power to sell or lease the undertaking to the corporation, the London County Council, or any corporate body.

APPOINTMENTS VACANT.

Official and all similar advertisements received later than Wednesday evening are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

INSPECTOR OF WEIGHTS AND MEASURES.—December 24th.—Corporation of South Shields. £120.—Mr. J. Moore Hayton, town clerk.

BUILDING INSPECTOR.—December 27th.—Corporation of Sutton Coldfield. 30s.—Mr. W. A. H. Clarry, A.M.I.C.E., borough surveyor.

BUILDING INSPECTOR.—December 27th.—Corporation of Sutton Coldfield. 30s.—Mr. H. Clarry, A.M.I.C.E., borough surveyor.

TEMPORARY ENGINEERING ASSISTANTS (TWO) FOR UNDERGROUND TELEPHONE WORKS.—December 27th.—Manchester Corporation. £3 3s.—*The City Surveyor*.

TOWN ENGINEER AND SURVEYOR.—December 30th.—Town Council of Ayr, N.B. £300.—Mr. A. G. Young, town clerk.

ASSISTANT ENGINEER.—December 31st.—Carlisle Corporation. £130.—Mr. C. D. Burnett, city electrical engineer.

ASSISTANT ENGINEER FOR TRAMWAYS DEPARTMENT.—December 31st.—Manchester Corporation. £200.—Mr. Wm. Henry Talbot, town clerk.

TEMPORARY ENGINEERING ASSISTANT FOR TRAMWAYS DEPARTMENT.—December 31st.—Manchester Corporation. £2 10s.—Mr. Wm. Henry Talbot, town clerk.

MANAGER AND BALIIF OF SEWAGE FARM.—January 1st.—Corporation of Banbury. £100.—Mr. Oliver J. Stockton, town clerk.

TEMPORARY ASSISTANT.—January 2nd.—Morley Corporation. £2 2s.—Mr. W. E. Putman, A.M.I.C.E., borough engineer and surveyor.

SUB-INSPECTORS OF NUISANCES (Two).—January 2nd.—Bradford Corporation. £80.—The Town Clerk.

INSPECTOR OF ROADS.—January 2nd.—Vestry of St. Mary, Islington. £2 10s.—Mr. J. Patten Barber, chief surveyor to the vestry.

BOROUGH SURVEYOR.—January 4th.—Corporation of Penzance. £200.—Mr. T. H. Cornish, town clerk.

DISTRICT ROAD SURVEYOR.—January 5th.—Norfolk County Council. £2.—Mr. T. H. B. Hoopool, county surveyor, Norwich.

ASSISTANT COUNTY ROAD SURVEYOR'S CLERK.—January 5th.—Worcestershire County Council. £52.—Mr. S. Thornely, county clerk, Shiro Hall, Worcester.

ASSISTANT SANITARY INSPECTOR.—January 9th.—West Bromwich Corporation.—Mr. Alfred Cuddick, town clerk.

INSPECTOR OF NUISANCES.—January 9th.—West Bromwich Corporation. £150.—Mr. Alfred Cuddick, town clerk.

TEMPORARY CLERK OF WORKS.—£3 3s.—Box 95, office of the Surveyor, 24 Bride-lane, Fleet-street, London, E.C.

TEMPORARY ASSISTANT.—Southend-on-Sea Corporation. £3 3s.—Mr. Alfred Fidler, A.M.I.C.E., borough engineer and surveyor.

PUPIL.—Mr. Alfred Fidler, A.M.I.C.E., borough engineer and surveyor, Southend-on-Sea.

MUNICIPAL COMPETITIONS OPEN.

Official and all similar advertisements received later than Wednesday evening are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

CHRETSKY.—December 23rd.—Sewerage and sewage disposal scheme for the Nos. 1 and 2 wards of the district. £50, £30 and £20.—Mr. T. E. Harland Chaldecott, clerk to the council.

HULL.—January 1st.—Erection of a central public library in Albion-street. £50, £30 and £20.—Mr. E. Laverack, town clerk.

HARROGATE.—January 2nd.—Erection of a pump-room, &c., at a cost not exceeding £8,000. £50, £30 and £20.—Mr. Samuel Stead, borough surveyor.

BRADFORD.—February 1st.—Erection of a central fire brigade station. £100, £50 and £30.—Mr. George McGuire, town clerk.

KNUTSFORD.—February 25th.—Laying out of a plot of land at Tabley Hill for a cemetery, and also the erection of a chapel and caretaker's lodge there, for the urban district council.—Mr. W. J. Downes, surveyor to the council.

MUNICIPAL CONTRACTS OPEN.

Official and all similar advertisements received later than Wednesday evening are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

LEICESTER.—December 21st.—Erection of working-class dwellings in Witford-street.—Mr. James Bell, town clerk.

CARLISLE.—December 23rd.—Extension of the present water mains from Camwhinton to Cocklakes, &c., for the rural district council.—Mr. George Armstrong, surveyor to the council.

SWINTON.—December 24th.—Repairing of Swinton Hall-road with 6-in. by 3-in. Welsh granite sets, for the urban district council.—Mr. Henry Bewdley, surveyor to the council.

DARTMOUTH.—December 24th.—Ventilating, painting and other works at the Guildhall.—Mr. T. O. Venle, borough surveyor.

BACUP (Lancs.).—December 26th.—Excavating and sewerage of Baldwin-street, Hugh-street and Taylor-terrace.—Mr. Francis Wood, borough surveyor.

BIRMINGHAM.—December 27th.—Making-up and extension of Bradley-road.—Mr. F. W. Lacey, borough surveyor.

WYDNEMERE.—December 27th.—Erection of offices, for the urban district council.—Mr. J. T. Bowness, clerk to the council.

BROMLEY.—December 27th.—Widening of a portion of Homedale-road, for the urban district council.—Mr. Fred. H. Norman, clerk to the council.

BROMLEY.—December 27th.—Diversion of the culvert in Homedale-road, for the urban district council.—Mr. Fred. H. Norman, clerk to the council.

CARLISLE.—December 27th.—Extension of the water main from Wetheral Pasture to Smell Head, for the rural district council.—Mr. John Little, sanitary engineer, 3, Market-chambers, Carlisle.

PENZANCE.—December 27th.—Supply of cast and wrought iron work, granite, blue lime, &c., during the year ending December 31, 1899.—Mr. T. H. Cornish, town clerk.

WATKINOWITH-SHEPHERT.—December 27th.—Sewering, paving, flagging, kerbing, channelling, &c., works in Cornisham-street, Roman-street, Lion-street, Dorset-street and various lanes in the district, for the urban district council.—Mr. F. Spencer Yates, A.M.I.C.E., surveyor to the council.

PERTH.—December 28th.—Supply of about 25 tons of 4-in. cast-iron water pipes, for the urban district council.—Mr. Wm. Speddy, surveyor to the council.

ISLINGTON.—December 28th.—Enlargement of the electric light station in Edengrove, Holloway, for the vestry.—Mr. Wm. F. Dewey, clerk to the vestry.

OWALDTRILEE (Lancs.).—December 21st.—8-wire main, for street paving and flagging of Watson-street, and the sewerage of Monk House meadow-street.—Mr. R. N. Hunter, borough surveyor.

WARRHAN.—December 25th.—Extension of the water main at Great Donkey, near Rufford, for the rural district council.—Mr. J. Oswald Biny, clerk to the council.

TODMORRIS.—December 25th.—Paving, &c., of 1 1/2 acres of a portion of Victoria-road.—Mr. C. R. Pease, borough engineer and surveyor.

BAINBRIDGE.—December 28th.—Waltering of Victoria-street. A 11-in. construction of a new electric conduit (with 36 ft. wire)—Mr. George Fittler, borough surveyor.

LEES.—December 29th.—Supply of (a) 100 ft. of 1/2-in. cables and (b) switchboards, &c., in connection with the extension of the electric tramway system, for the city council.—Messrs. H. J. & A. T. Telford, electrician, Leeds.

EMLEY (near Wakefield).—December 29th.—Laying of about 1,772 yards of 4-in. and 5 1/2-in. cast-iron water pipes, for the urban district council.—Mr. F. C. Heath, clerk to the council.

LEAMINGTON.—December 29th.—Laying of about 400 yards of the paving and about 1,300 yards of kerb and channeling.—Mr. W. C. Norman, borough engineer.

MIDDLERSHROUGH.—December 29th.—Reconstruction of Belford-street and Abingdon-road, and the temporary paving of the car-driveways to Lincoln and Innes streets.—Mr. Frank Inker, borough engineer.

SURBEHLAND.—December 31st.—Supply of the 125-kw. watt direct current high-speed steam dynamo, 460 volts. Mr. J. F. C. Smith, A.M.I.C.E., borough electrical engineer.

HULL.—December 31st.—Supply of steel roof trusses, bed-plates, &c., in connection with the erection of car sheds for the electric tramways.—Mr. A. E. White, city engineer.

HULL.—December 31st.—Erection of two car sheds and other buildings (area about 4,000 square yards) in connection with the electric tramways.—Mr. A. E. White, city engineer.

HULL.—December 31st.—Supply of pipes, fittings, &c., for the power station in connection with the electric tramways.—Mr. A. E. White, city engineer.

WILMINGTON (Staffs.).—December 31st.—Erection of a new tram road for the 1st 1/2 in. at the new corner of St. Dunstons, for the urban district council.—Mr. Chas. J. Jenkin, engineer and surveyor to the council.

ELGIN.—December 31st.—Supply of road metal during the year ending May 15, 1900, for the various divisions of the county highways, for the county council.—Mr. Alexander Hogg, county road surveyor, 25 Academy-street, Elgin.

WEST SUSSEX.—December 31st.—Supply of picked surface iron, ballants, local stone, and 2 1/2 in. broken granite or stone, from April 1, 1899, to March 31, 1900, for the county council.—Mr. W. H. Purser, county surveyor, 31 Bedford-road, Hove, Brighton.

DUNDEE.—December 31st.—Supply of 500 2-in., 1,000 3-in., 500 4-in., and 500 5-in. turned and bored cast-iron pipes, for the water commissioners.—Mr. George Baxter, engineer and manager to the commissioners, 93 Commercial-street, Dundee.

ROTHESHAM.—December 31st.—Supply and erection of steam-resisting plant, boilers, safety ejectors and sewage lifts, for the corporation.—Mr. R. E. W. Berrington, Bank-buildings, Wolverhampton.

RMSGATE.—December 31st.—Supply of a compound condensing beam engine at the Whitehall pumping station.—Mr. William A. Vasey, gas and water engineer to the corporation.

St. George, H. Laverock Square.—December 31st.—Supply of various materials for one year from March 25, 1899, for the vestry.—Mr. George Livingstone, surveyor to the vestry.

FOLKESTONE.—December 31st.—Supply of 1,000 to 2,000 yds. of 2 1/2 in. York stone.—Mr. A. F. Kidd, town clerk.

BARNHURST.—December 31st.—Erection of stone boundary walls and public entrance on the reclaimed land, North-parade and Magpie's-avenue, for the urban district council.—Mr. T. O. Venle, surveyor to the council.

TAUNTON.—January 1st.—Construction of a sewer, about 1,300 yds. long, from Railway-street to the site of the sewage outfall works in the Thicket Field.—Mr. James H. Smith, borough surveyor.

PAISLEY.—January 2nd.—Supply of two dust-tipping vans, of iron slop-tipping vans and five pairs of wheels, for the vestry.—Mr. Frank Deirdrie, clerk to the vestry.

STIRLING.—January 2nd.—Supply of various electric lighting plants, for the commissioners.—Prof. A. B. Kennedy, 17 Victoria-street, London, W.

LEAMINGTON.—January 2nd.—Erection of an entrance lodge to Victoria Park, for the corporation.—Mr. Fredk. G. Cundill, 41 Parade, Leamington.

EASTBOURNE.—January 2nd.—Relaying of the Tideswell-road at low-level sewer.—Mr. R. M. Gloyne, A.M.I.C.E., borough engineer.

WILMINGTON.—January 2nd.—Making-up of Malvern-road, for the urban district council.—Mr. W. H. Whitfield, clerk to the council.

LIMBOROUGH.—January 2nd.—Relaying the paving of Galt-street and parts of Rhodeswell-road and Belgrave-street, for the district board works.—Mr. S. G. Ratcliff, clerk to the board.

ROTHESHAM.—January 2nd.—Supply and delivery at the electric light works in Malvern-road of a switch-board and busbars, for the urban district council.—Prof. A. B. Kennedy, 17 Victoria-street, London, W.

BOOTLE (Lancs.).—January 2nd.—Certain private improvements works in College-view and various passages in the borough.—The Borough Engineer.

RYDE (I.W.).—January 3rd.—Supply of two new pumping engines, overhaul of the Asylum-road (western) pump-house, and the new pumping station, near Newchurch.—Mr. C. G. Vincent, town clerk.

GLASGOW.—January 3rd.—Supply and erection of generating plant at one of the new electricity works, for the corporation.—Mr. W. A. Chamen, 75 Waterloo-street, Glasgow.

HANDEDWORTH (Staffs.).—January 3rd.—Making-up of part of the road, for the urban district council.—Mr. E. Keowdry, clerk to the council.

EPPING (Essex).—January 3rd.—Construction of about 4,000 yds. of 12-in. and 9-in. iron and stoneware pipe sewers and the preparation of the outfall land, for the rural district council.—Mr. G. C. C. 1, 1, 1, to the council.

HOVE.—January 4th.—Road-making and other works in St. Peter's-street and Moleworts-street.—Mr. H. H. Scott, borough surveyor.

MIDDELTON (Lancs.).—January 4th.—Sewer and drainage of Haworth and Wade streets.—Mr. W. Wilson, borough surveyor.

JOHNESBURG, S.A.—January 6th.—Supply of a 100-hp. portable engine, for the corporation.—Messrs. Robert Wylie & Co., 22 Bury-street, St. Mary Axe, London, E.C.

BRIMBORNE.—January 6th.—Installation of a 10-hp. portable engine with coal and coke elevators and conveyors at the Mill Farm, &c.—Mr. James Parkinson, town clerk.

WYNNFORD, January 6th.—Making-up of Merton-road (western) and other portions of the Asylum-road (western) pump-house, for the urban district council.—Mr. Wm. Blewett, clerk to the vestry.

WEST HAN.—January 7th.—Enlargement of the house for St. Margaret, Plaistow, E.—Mr. Fred. E. Henry, town clerk.

CARMARTHEN.—January 7th.—Supply of 11,400 yards of 9-in., 2,100 yards of 6-in., 1,500 yards of 4-in., and 4,500 yards of 3-in. cast-iron water pipes.—Mr. F. J. Fingth, borough surveyor.

STURTON.—January 7th.—Making-up of St. James', Gladstone and Southborough roads, Southborough, and Orchard-road, Hook, for the urban district council.—Mr. Samuel Mather, a.m.i.c.e., surveyor to the council.

TEMBINGR VILLS.—January 9th.—Construction of filter-beds at the water-works at Pembury.—Mr. W. G. Cripps, town clerk.

WOLVERHAMPTON.—January 9th.—Leveling, paving, channelling, sewerage, metalting, kerbing and completion of Baby-street extension (Melbourne-street to All Saints' road) and Lever-street (Green-lane to Baby-street).—Mr. J. W. Bradley, borough engineer and surveyor.

BUCKINGHAM.—January 9th.—Making-up of Border-crescent, for the urban district council.—Mr. F. Stevens, clerk to the council.

SOUTHAMPTON.—January 9th.—Construction of certain precipitating tanks, storm-water overflow and other works.—Mr. W. B. G. Bennett, borough engineer.

BECKENHAM.—January 9th.—Paving works in Trinity, Arthur and Craydon-roads, for the urban district council.—Mr. John A. Angell, surveyor to the council.

MALDON (ESSEX).—January 9th.—Supply of about 550 tons of 5-in., 4-in., 3-in. and 2-in. cast-iron water mains and special castings for the Paruleigh district waterworks, for the rural district council.—Mr. Horace G. Keywood, engineer to the council.

SOUTHAMPTON.—January 9th.—Private street works in Brighton-road.—Mr. W. B. G. Bennett, borough engineer.

BAENES.—January 10th.—Erection of a new fire station in High-street, Mortlake, for the urban district council.—Mr. G. Bruce Tomes, M.I.C.E., engineer and surveyor to the council.

BEWLEY.—January 10th.—Supply and delivery at the electricity supply station of underground cables.—Mr. W. R. Wright, borough electrical engineer.

SELBY.—January 11th.—Erection of public baths, for the urban district council.—Mr. Jno. Hy. Banfolt, clerk to the council.

HORSLEY.—January 11th.—Alteration and extension of the heating system at the isolation hospital at Muswell Hill, for the urban district council.—Mr. E. J. Levergrove, engineer to the council.

ISLINGTON.—January 11th.—Demolition of buildings abutting on the site of the electric light station in Eden-grove, Holloway, for the vestry.—Mr. William F. Dewey, clerk to the vestry.

KIDDERMINSTER.—January 11th.—Erection of a fire engine station.—Mr. Arthur Cooper, borough surveyor.

SOUTHAMPTON.—January 16th.—Construction of concrete foundations, erection of brick, steel and concrete superstructures of new infirmaries wards, sanitary blocks, boiler-house, tall chimney shaft, and sundry other work at the county lunatic asylum at Knowle, near Fareham, for the county council.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

BEWSEY.—January 16th.—Supply of 60,000 bricks, for the vestry.—Mr. Frank Sumner, surveyor to the vestry.

LONDON.—January 24th.—Construction of a tunnel for pedestrian traffic under the river Thames from Greenwich to Poplar, for the county council.—Mr. G. J. Stewart, clerk to the council, County Hall, Spring-gardens, S.W.

SHANGHAI.—March 15th.—Construction and working of about 23 miles of electric tramways on the trolley system, for the municipal council.—Messrs. J. Pook & Co., 8 Jefferys-square, St. Mary Axe, London, E.C.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

*ACCEPTED.

BROMSGROVE.—For the construction of stoneware pipe sewers comprised in the scheme of sewerage for the parish of Peckmore, for the rural district council.—Mr. H. D. Holloway, clerk to the council:— J. Biggs, Birmingham £4,310 G. Trentham, Huddersworth 2,951 G. Law, Kidderminster 2,482 T. Vale, Stourport 2,474 W. H. Meredith, Gloucester 2,291 J. Mackay, Smethwick* 1,994

CARSHALTON.—For the supply of about 2.0 yards of 21-in. socketed stoneware pipes, for the urban district council.—Mr. William Willis Gale, a.m.i.c.e., surveyor to the council:—

Duckett & Son, Burnley s. d. 8 9 per yard. Boulton & Co., Lambeth (less 2½ per cent.) 9 0 " Oates & Green, Halifax 7 9 " Albion Clay Company, Now Bridge-street, E.C. (less 2½ per cent.) 7 6 " Wragg & Sons, Swadlowclote (less 2½ per cent.)† 7 6 " † Order divided between Albion Clay Company and Wragg & Sons.

CHATHAM.—Accepted for the supply of various materials for the year ending December 31, 1899.—Mr. Charles Day, borough surveyor:— Trechmann, Weekes & Co., Rochdale.—Portland cement, £1 14s. 6d. per ton. Chitenden & Co., West Malling.—Crushed ragstone, 10s. 0d. per yard. E. Sengers, Chatham.—Gravel, 3s. 4d. per yard; sand, 3s. 6d. per yard; Thames ballast, 3s. 8d. per yard. Thompson & Co., Chatham.—Coal, 41 3s. 3d. per ton; coal, 18s. per ton; coke, 13s. per chaldron. Gibb & Co., Fenchurch-street, London.—Brooms with handles, £1 5s. per dozen; shovels, 16s. 6d. per dozen; picks, 4s. 4d. per dozen. APPOINTMENTS OPEN.

BOROUGH OF PENZANCE. APPOINTMENT OF BOROUGH SURVEYOR.

The Penzance Corporation are prepared to receive applications for the appointment of Borough Surveyor. Salary, £200 per annum, with residence. List of duties, &c., can be obtained from the undersigned, to whom applications must be addressed, endorsed "Borough Surveyor," and delivered at the Town Clerk's office on or before the 4th January, 1899.

Canvassing members of the Council will be a disqualification.

T. H. CORNISH, Town Clerk.

Town Clerk's Office, Penzance. December 14, 1898.

COUNTY OF WORCESTER. APPOINTMENT OF A CLERK TO AN ASSISTANT COUNTY ROAD SURVEYOR.

The Worcestershire County Council invite applications for the appointment of a Clerk to the Assistant County Road Surveyor for the No. 1, or Northfield, main road district of the county, at a commencing salary of £52 per annum, payable monthly, from persons between eighteen and twenty-five years of age.

Only persons need apply who possess a good knowledge of shorthand, and preference will be given to those candidates who have had experience in a surveyor's office.

The duties of the person appointed will comprise office correspondence, keeping of accounts, and the general office routine of a road surveyor's office.

The officer will be required to reside near the main road

depot at King's Norton, and to devote the whole of his time to the service of the Council.

Applications, stating the candidate's age, where educated, present occupation and previous experience, must be made in the applicant's own handwriting, on paper of foolscap size, accompanied by not more than three recent original testimonials, addressed to the undersigned, and marked "Clerkship to Assistant County Road Surveyor," to be received by 9 a.m. on Thursday, the 5th January. Any applications afterwards received will not be entertained.

The person elected will be appointed subject to the graduated scale of pay and advancement applicable to the junior clerks in the County Council's employ, particulars of which will be furnished on application to the undersigned.

The appointment will be held subject to three months' notice on either side, which may be given at any time.

Cavassing in any form will absolutely disqualify.

Selected candidates will be required to attend at the Shire Hall, Worcester, on a date to be fixed. The person appointed must be prepared to enter upon his duties forthwith, and to undergo a medical examination by an approved person.

S. THORNELEY,

Clerk of the County Council.

Shire Hall, Worcester.
December 20, 1898

BOROUGH OF MORLEY. TEMPORARY ASSISTANT.

The Council of the Borough of Morley invite applications for the appointment of a Temporary Assistant from persons who have had good experience in a municipal engineer's office.

Candidates must be neat and expeditious draughtsmen, able to survey and level, prepare accurate working drawings and quantities.

Preference will be given to those having had experience in the construction of sewage works.

The whole time must be devoted to the duties, which are to be commenced as soon as possible after the appointment is made.

The engagement will be at least for three months for satisfactory service, and the salary will be at the rate of 2 guineas per week.

Applications, stating age, present and previous occupation,

together with copies of not more than three recent testimonials, to be delivered to Mr. W. E. Putman, Assoc. M. Inst. C.E., Borough Engineer and Surveyor, Town Hall, Morley, endorsed "Temporary Assistant," not later than noon on January 2, 1899.

MANCHESTER CORPORATION TRAMWAYS DEPARTMENT.

The Tramways Committee of the Manchester Corporation require a competent Engineer to assist the City Surveyor in carrying out the engineering work required in connection with the permanent way. He must have a thorough knowledge of tramway construction, and be capable of preparing plans for and supervising the construction of all new lines, and the alteration and reconstruction of the existing track necessary in view of the introduction of electric traction. Salary, £200 per annum.

The Committee also require a Temporary Engineering Assistant. He must be a neat and expeditious draughtsman, and able to survey and level accurately. Wages, 50s. per week.

Applications, stating age, qualifications, and enclosing copies of recent testimonials, to be addressed to the Chairman of the Tramways Committee, Town Hall, Manchester, endorsed "Engineer" or "Engineering Assistant," and must be received on or before Saturday, December 31, 1898.

WM. HENRY TALBOT,

Town Clerk.

Town Hall, Manchester.
December 16, 1898.

VESTRY OF ST. MARY, ISLINGTON. INSPECTOR OF ROADS.

The Works Committee of this Vestry are prepared to receive applications for the appointment of Inspector of Roads in one of the divisions of the district.

Candidates must have a practical knowledge of levelling, masons' and paviors' work, repairing roads, setting out and measuring up works, squaring dimensions, and making estimates, and none but those who have been engaged in a similar capacity need apply.

The person appointed will be required to devote the whole of his time to the duties of the situation, particulars of which can be obtained on application to the Chief Surveyor, Mr. J.

December 20, 1898.

BOROUGH OF SOUTHEND-ON-SEA.

Wanted, a Temporary Assistant; must have had experience in preparing schemes for main sewerage and sewage disposal works. Salary, £3 3s. per week.

Apply to Mr. Alfred Fidler, Assoc. M. INST. C.E., Borough Engineer and Surveyor, Clarence-road, Southend-on-Sea.

THE Borough Engineer of Southend-on-Sea has a vacancy in his office for a Pupil.—Apply, Mr. Alfred Fidler, Assoc. M. INST. C.E., Clarence-road, Southend-on-Sea.

WANTED (Lancashire), for about nine months, Clerk of Works, to take charge of reconstruction of large brick main outfall sewer in deep cutting and headings. Must have had similar experience. Salary, £3 3s. per week.—Applications, with testimonials, to Box 95, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

WANTED, by a firm of waterworks contractors, one or two young men who have had experience in laying water mains, and who are capable of making their own drawings, getting out costs and controlling labour.—Address, stating experience, age and salary required, with copies of testimonials, to "S. 21," care of C. Birchall, Advertisement Contractor, Liverpool.

TENDERS WANTED.

BOROUGH OF HOVE.

Tenders are invited for Executing Road-making and other works in Suffolk-street and Molesworth-street.

Further particulars may be obtained and plans and specification seen at the office of the Borough Surveyor (Mr. H. H. Scott), Town Hall, Hove.

The lowest or any tender not necessarily accepted.

Tenders, on forms supplied, addressed to the undersigned, and endorsed "Tender for Suffolk-street," or "Molesworth-street," as the case may be, will be received up to 6 o'clock on Wednesday, the 4th day of January next.

H. ENDACOTT,
Town Clerk.

Town Hall, Hove.
December 19, 1898.

HORNSEY URBAN DISTRICT COUNCIL. TO ENGINEERS, CONTRACTORS, &c.

The Hornsey Urban District Council are prepared to receive tenders for Alteration and Extension of the Heating System, at the Council's Isolation Hospital, Muswell Hill.

Plans and specifications may be seen, and forms of tender and all information obtained, on application to Mr. E. J. Lovegrove, Engineer to the Council, at the offices mentioned below, on any morning between the hours of 10 and 12 o'clock, on a sum of £2 being deposited with the Clerk to the Council, which sum will be retained by the Council and deemed to be forfeited if a *bona-fide* tender is not made by the depositor.

If a tender is made which is not accepted the sum deposited will be returned, and if a tender is accepted such sum will be retained by the Council until the contract has been executed by the depositor, and will be forfeited in the event of his or his sureties failing or neglecting to execute such contract, or the bond accompanying same, within seven days after he or they respectively shall have been requested to execute the same.

No tender will be considered except on the prescribed form.

Sealed and endorsed tenders are to be deposited in the tender-box in my department not later than 4 o'clock p.m. on Wednesday, the 11th day of January, 1899.

The Council reserve to themselves the right to decline all, or any, or any portion, of the tenders so sent in.

(By order)

F. D. ASKEY,
Clerk to the District Council.

Offices: Southwood-lane, Highgate, N.
December 21, 1898.

PLACE'S PATENT LOCK JOINT

The composition being cast on the lower half of the pipe in the form of a ball and socket joint, it necessarily follows that immediately the pipes are put together and fastened with a wedge at the top the lower half of the pipe is absolutely watertight and perfect alignment of invert is secured.

POINTS:—

Easily and quickly laid by unskilled workmen.
Perfect alignment of invert secured.
Joint readily made absolutely watertight.
Cheapest Patent Joint in the market.

Minutes of Proceedings.

Municipal Water Supplies. Those who are interested in the municipalisation of water supplies and wish to study the question in detail will find a great wealth of *data* in an elaborate return which has been prepared for the London County Council by their statistical officer, Mr. G. L. Gomme. The returns are presented in three groups—(1) county boroughs, (2) non-county boroughs, and (3) urban districts. The number of county boroughs is comparatively small, and for this, among other reasons, the information forthcoming in regard to them is more comprehensive than in the case of the other classes of authorities. Of the sixty-four county boroughs in England and Wales, forty-three have the water supply in their own control, and in practically every case a surplus revenue remains from the water rates and charges upon water consumers after paying for maintenance and other annual expenditure. The first table deals with income and expenditure, and the second gives much interesting information as to the various ways in which the surplus revenue is applied. In a number of cases there is a deficit after the payment of loan charges, but as a rule there are special circumstances to account for the fact. The third of the series of tables, constituting an analysis of county borough water accounts, deals with capital and capital expenditure, and subsequent tables set forth general statistics, the terms on which undertakings have been acquired, a comparison of charges made by county boroughs with those made by the London companies, and the system of charges for supplying water to outside areas. From his survey of the actual facts of municipal water supply Mr. Gomme concludes that not only do the majority of municipal water supplies yield a surplus revenue from the water rentals imposed, but that the corporations do more with the revenue derived from the consumers, in the interests of the consumers, than the water companies do. These extra services are stated as follows:—

- (1) Repayment of debt, and hence a considerable cheapening of the water service as soon as the debt is paid off.
- (2) Supply of water for municipal purposes, as at Liverpool, Birmingham, Glasgow, Edinburgh, Dundee, &c., and for charitable purposes as at Glasgow and Edinburgh.
- (3) The security of a sufficient supply both as to quantity and quality.
- (4) The economical expenditure of capital moneys on the keeping up of works in a high state of repair and efficiency to meet exceptional circumstances.

Even in cases of deficit revenue Mr. Gomme finds, wherever he has been able to make specific inquiries, that there is sufficient explanation afforded by the policy adopted by the corporation in the management of its water supply to show that the deficit, or apparent deficit, is not due to questions of management as between municipal and private supplies, but to different methods of administering the supplies in the interest of the public—methods which the public authority alone has the power to initiate. In any one case of deficit revenue shown by the figures

in his return Mr. Gomme would hesitate to challenge it as an extra cost to the consumer. If it is extra, he points out that it is less cost in the municipal rate or there are more advantages to the consumers which the corporation has deliberately decided that it is necessary to provide.

Mr. Gomme then goes on to consider how far the financial results shown by the accounts have been attained by charges upon the water consumer which bear comparison with the charges imposed by water companies. That object, he thinks, can best be accomplished by ascertaining (1) whether the corporations have maintained the same charge as that levied by the companies whose undertakings they purchased, whether they have decreased or have increased the charge; (2) whether there are services included in the charge which were not included in the companies' charge. From the facts he presents Mr. Gomme deduces that generally water rates have been reduced as a consequence of municipal administration, and that the advantages, financial and administrative, which have accrued to the ratepayers have not been accomplished at the cost of increased charges upon consumers. His figures point to the fact that both general ratepayers and water consumers have gained by the transfer of water undertakings from private companies to public authorities, even though in the first instance the ratepayers have had to pay heavily for transfer. Mr. Gomme's comparison of the charges made by the London water companies with those made by the corporations of the large provincial towns is given under three forms: (1) A rough comparison of the scale of charges; (2) the result in respect of houses of particular values, assuming certain extras in each; and (3) a comparison of the charge per 1,000 gallons, arrived at by taking the income received and the total water supplied by the companies and the corporations respectively. The result of the comparison is to show that there are fewer charges for extras, and that in some cases no extras are charged at all; in many cases the charge is itself less than the London charges. It is pointed out, however, that the rental upon which the charges are levied is about one-half the rental of London.

The general effect of purchase is summed up by Mr. Gomme under two heads—(1) in respect of works executed by the companies, the creation of a perpetual annuity to the shareholders of the companies at a rate of interest generally higher than the dividends being paid at the date of purchase; and (2) in respect of works executed by the municipal authority after the date of purchase, the payment of a low rate of interest and the provision for redemption of capital. The general conclusion is that, according as the purchase was made, early or late, the effect is proportionately beneficial to the public, in spite of the high price paid for the purchase, but it is beneficial in every case. The particulars of the financial effect of purchase show, Mr. Gomme considers, that although recent cases of

purchase are more beneficial to the companies, it has been beneficial to the consumers that the companies' control of water capital has been brought to a close. It has enabled the corporations to proceed with the necessary extension of works at a cost to the consumers very much less in amount of interest paid for capital, and Mr. Gomme is troubled with very little doubt that very much more care is exercised as to expenditure out of capital, both in amount and in application. Among the general advantages claimed for municipal waterworks is a smoother administration, that is to say, less friction and irritation between consumers and the administering authority. In illustration of this Mr. Gomme mentions that in the extremely poor borough of Middlesbrough there have been only three summonses for water rates since the company's undertaking was purchased in 1878. Consumers, remarks Mr. Gomme, pay attention to the rules of the corporation, because they are conscious of the fact that the water supply is their own. The special advantages of municipalisation, consisting of services not undertaken by companies but performed by municipalities for the benefit of the consumers, are thus stated:—

- (1) The repair of supply pipes under the pavements and up to the joint inside the premises of the consumer, as at Manchester, Liverpool and other places.
- (2) The registration of a body of plumbers who do their work to some extent under the eye of the corporation officials, as at Manchester, Birmingham, Nottingham and elsewhere.
- (3) Facilities to traders and manufacturers using water in large quantities, as at Middlesbrough, for example.
- (4) The settlement of the scale of charges in accordance with circumstances, such as residence, shop occupation, trade purposes, shipping purposes, &c., down regard always being paid to the particular interests of the town.
- (5) Greater inspection and saving of waste water, to the advantage of the place generally and of the water administration.
- (6) The keeping up of the works in a perfect state of repair, the repayment of capital, and the economical expenditure of capital moneys.
- (7) The securing of the necessary pressure to force water up to the highest required point both for fire protection and for domestic use.
- (8) The securing of the purest and most copious supply.

Part II. of this interesting and valuable return deals with the municipal waterworks controlled by the corporations of boroughs other than county boroughs. The financial statistics of these undertakings are given in tabular form, and these, taken in conjunction with the population at the last census, serve to indicate the size and importance of the water supply. As it was not possible to obtain information from each individual borough, Mr. Gomme availed himself of the official figures as published in the Local Taxation Accounts for the last available year (1895-96). He points out, however, that these are far from complete, as the charge on the water undertakings in respect of interest and repayment of capital is not stated, so that the financial results to each corporation cannot be more than approximately gauged. But in nearly all cases the amount of the loans outstanding is given, and from this it is possible to calculate roughly what the charge for interest and repayment is, and therefore from the financial result of the water undertaking on the year's working. In spite of any defects that may be urged, the information is undeniably useful as showing to what extent the supply of water is now a local government service and the relative importance of the water undertakings of the authorities throughout the country. The figures also give some indication of the financial result of the management of the undertakings, though Mr. Gomme admits that without further particulars as to the policy of the authority in respect of the system of charge a surplus or a deficit cannot be regarded as so much absolute profit or loss, as the authority may, and in the case of some county boroughs does, adopt a scale of charge purposely insufficient to meet all the expenses of the water undertaking, allowing the balance to fall on the borough rates. Of the 241 non-county boroughs in England and Wales, 139 appeared to have a regularly established system of

water supply under their control. For the purposes of his return Mr. Gomme has included only those towns which are known to have the management of their water supply, or which, owing to the fact that they have incurred indebtedness under the head of waterworks or show a material amount of receipts and expenditure, can be safely assumed as undertaking the provision of the water supply for their areas so far as such a supply is necessary. By a comparison of waterworks receipts with the receipts from other undertakings and from rates and all other sources of revenue Mr. Gomme illustrates the importance of this branch of local government work in the hands of these lesser municipalities. The receipts and expenditure from waterworks, though second to those from the gasworks, form a large proportion of the transactions of these corporations, while the indebtedness of the boroughs in respect of waterworks amounts to more than one-third of the total indebtedness for all purposes. By means of notes appended to the figures in each case Mr. Gomme indicates how these municipal waterworks came to be instituted; that is to say, whether by the corporation originally, or by the purchase of existing waterworks in the hands of companies. Where possible, the Parliamentary authority is given, and the terms of purchase when purchase has taken place. It can readily be understood, however, that without a very elaborate inquiry it is not possible to give full and reliable details of all these cases. But the information supplied is sufficient to show how the process of municipalisation of water undertakings goes on from year to year until the cases of water supply in the hands of companies are assuming comparatively small proportions throughout the country. Mr. Gomme's tables deal with the position up to the early part of 1896, but during the past three years the process of transfer has been quickened rather than retarded. It is to be regretted that the name of the town of Maidstone does not figure among recent cases of proposed purchase.

The final section of the report deals with urban districts, and the figures for these as for non-county boroughs are taken from the Local Taxation Accounts, the same general remarks applying in each case. Of the 766 urban district councils which existed at the beginning of 1895-96, 356 appear to have regularly established waterworks for the supply of their districts. A comparison of the work of the councils under this head with the other local government services shows that the receipts and expenditure of the councils in connection with their waterworks form a very large proportion of the total transactions of the councils, and the loans under this head amount to nearly one-fifth of the loans for all purposes. In the great majority of the urban districts in which the local authorities control the water supply the works have been established by the authorities; but a few cases of purchase have occurred. It will readily be understood that in a large number of cases the water supply of urban districts is obtained in bulk from corporations, generally county boroughs. In most cases these districts appear to be outside the compulsory limits of the corporation supplying them, and the system appears to have been adopted as the most convenient means of providing a water supply. We need only say, in conclusion, that Mr. Gomme has prepared a return which has remarkable interests for students of local government and its legitimate developments.

* * *

**The Dorchester
Main Road
Arbitration.**

We recently made some comments on the subject of the repair of main roads, and took occasion to notice some of the questions which have from time to time arisen in connection with them and some leading legal decisions. We now propose, in continuation of the same topic, to make

a brief reference to the Local Government Board award in the recent arbitration between the Dorchester Town Council and the Dorsetshire County Council. From the report of the proceedings before the arbitrator (Colonel Slack, R.E.) it appears that the amount of the contribution by the county council towards the cost incurred by the town council in respect of main roads was in former years regulated by a written agreement, under which the county council agreed to pay for maintenance and repair of the roads a maximum sum of £450 per annum, together with certain fixed sums in respect of scavenging, watering, tools, &c., and half the cost of improvements. This agreement, however, was terminated by the county council by notice expiring in March, 1896, and certain overtures which they afterwards made to renew it on terms slightly more favourable to the town council were declined by the latter, who intimated that they should in future expect payment of the whole of their expenditure as shown by their accounts. In due course the town council sent in their claim for the year ended March, 1897, amounting altogether to £849 4s. 1d., of which the county council disputed items amounting in the aggregate to £197 8s. 9d., leaving £651 15s. 4d. only admitted. The disputed items consisted of charges for siding, cleaning, watering, repair of tools and improvements. Some of these items the county council rejected *in toto*—*viz.*, the improvements of the roadways, as distinct from improvements of footpaths and repair of tools—whilst as to others they offered to pay a portion of the amount expended. The improvements of footpaths were of three kinds—*viz.*, (1) The substitution of brick paving for gravel, (2) the substitution of tar paving for gravel, and (3) the removal of tar paving, the total cost being £166 10s. 2d., of which the county council were willing to pay one-half only. For siding and cleaning, out of £113 10s. 8d. expended they offered £45, and for watering a like sum out of £69 2s. 6d. expended, while for "establishment charges" £30 was offered out of £40 8s. 9d. charged, the latter sum being something less than 5 per cent. on the total outlay. By his award the arbitrator allowed £821 8s. 2d. out of the £849 4s. 1d. claimed by the town council (or 96½ per cent. of the total claim), payable as to £163 16s. 8d. by ten annual instalments, and as to the balance forthwith. The award does not, of course, show how these figures were arrived at, but we think it may be assumed that the £163 16s. 8d. ordered to be paid by instalments represented the amount allowed in respect of the claim of £166 10s. 2d. for improvements to footpaths. In the case of *Wiltshire County Council v. Marlborough Borough Council*, referred to in our previous remarks, it was laid down that as to improvements the benefits of which may endure for more than one year the whole of the actual cost for any one year is not necessarily repayable by the council in that year, they being only bound to make such payment towards the sum as may be agreed or settled by arbitration. This case was quoted at the hearing before the arbitrator by Mr. Maemoran, q.c., on behalf of the county council, and it is evident that it is in pursuance of the principle referred to that the payment of this item has been extended over a period of ten years. The further reductions may probably be regarded as having reference to the items of scavenging and watering, which were very keenly contested. It was contended by the county council that a distinction must be drawn between watering for the purpose of maintenance and watering for the sake of the amenity of the public; whilst as to the cleaning charges, it was alleged that they were excessive and had been going up from year to year. The reduction comes to a trifle over 15 per cent. on these items, which cannot be regarded as very serious. On the whole the award appears to be quite as satisfactory as could have been expected from the point of view of the town council, and it is to be hoped that the result will tend to restrict future differences between county and district councils

anent this subject to somewhat narrower dimensions, and thus obviate the necessity in many cases of recourse to expensive arbitration or legal proceedings.

The Intercepting Trap.

The intercepting trap occasionally meets with condemnation in America, as here. At the last annual meeting of the American Public Health Association, at Ottawa, Mr. J. W. Hughes, Montreal, read a paper entitled "The Intercepting Trap in Private Sewers." In his opinion minute investigation has shown that when a main intercepting trap is used it not only modifies the speed and partly obstructs the flow of sewage, but it prevents any of the air carried down by the soil and other waste-water pipes from discharging into street sewer, "where its aerating functions are so necessary to commence the purification of the sewage in the drains and assist in preventing sewer gases generating in the sewers." He is also of opinion that "when the main intercepting trap is omitted there is a superior and self-cleansing flow of sewage, and that large volumes of air pass forward to the street sewer, creating a healthy atmosphere and circulation of air down the soil pipe through which the fluid is passing, and up other soil pipes that are at the time standing idle." Mr. Hughes added that his observation had led him to believe that in houses in which there is an absence of drain pipes having intercepting traps there is freedom from odours and diseases that could be traced to sewer-gas poisoning, while, on the other hand, those cities which have adopted the principle of intercepting traps have often quite the reverse, and of disease a great deal is found among the inhabitants who happen to live in modern-built houses where the intercepting scheme has been installed. Mr. Hughes adds that this state of affairs prevails "in spite of the fact that the same towns often spend large sums of money in flushing the drains and artificially ventilating the street sewers, a thing which is never necessary if the sewers are laid down properly and the right, unobstructed system is adopted." Certainly a lot of trouble and expense would be saved if every town and city could be from the first drained and sewerod on the most modern principles, but the mischief done in the past is not to be quickly or easily remedied, nor can we hope that the mistakes and carelessness of the past will be completely avoided in the future.

The Work of the Coming Year.

As we have announced in our advertising columns, we shall, in the course of the next few weeks, bring out our customary Special Annual Issue, one of the chief features of which will, as in former years, be an exhaustive forecast of works projected for the coming year by municipal authorities throughout the country. We have again to thank engineers and surveyors to local authorities for the gratifying extent to which they have forwarded information in regard to works about to be undertaken. There still remain, however, a number of places, more or less important, in which considerable municipal activity must always prevail, and from which some particulars might naturally be expected. We should therefore be glad if our readers would note that for the purposes of our special issue we can still avail ourselves of any information that may reach us; but it must come to hand not later than the end of next week. Our new year's number will, as before, provide us with an opportunity of reviewing the progress of municipal engineering during the past year, and of referring to our efforts to assist in that development to the best of our power. In the meantime, having come to the end of another year, we wish to take this opportunity of thanking our readers for the support—more emphatic than ever—accorded during the past twelve months, and to wish them every prosperity during the year on which we are about to enter.

Municipal Work in Birmingham.

SOME DETAILS OF PROGRESS.

Not the least interesting part of the programme arranged in connection with the recent Sanitary Institute Congress at Birmingham were the visits to various municipal works of interest in the city. The number of valuable papers in which our readers were likely to be interested was so great that we have not until now been able to refer to the visits, but the illustrations and brief descriptive notes now given will no doubt be interesting.

For those attending the conference of Municipal and County Engineers it was arranged that on the afternoon of Wednesday, September 28th, visits should be paid to the public convenience in course of construction in the Bull Ring; to Saltley to inspect the diversion of the Rea main sewer (7 ft. circular), in course of construction; to the Edward-street depot, in course of completion; to the river Rea improvement works, recently commenced, and to Queen's Ride.

CONVENIENCES AND DEPOT.

The public convenience in the Bull Ring is being constructed by Mr. George Jennings, of Lambeth Palace-road, London, the amount of the contract being £1,977. A similar structure is being erected in the Old Square by Messrs. Doulton, of Lambeth, the amount of the contract in their case being £1,762 10s. Ample provision is made in each case for both sexes. The walls are 18-in thick, faced on the inside with white glazed bricks; the floors are laid with black and white tiles; and all wood fittings are carried out in polished teak. Mr. George Jennings supplies his "1892" patent radial urinals, and Messrs. Doulton their white glazed semi-circular backed urinals and No. 300 E closets. The Bull Ring convenience is ventilated by means of a water-driven air propeller and the Old Square convenience by air gratings. The refuges above are supported on steel joints on iron columns, the conveniences being lighted by prismatic pavement lights. The drainage is being carried out as shown on the drawings. The entire work is being executed in accordance with the designs of the city surveyor. Needless to say, they were examined with much interest by the visitors, who then proceeded to inspect the works in connection with the diversion of the Rea main sewer before proceeding to visit the depot at Edward-street, Balsall Heath.

This corporation depot provides houses for a storekeeper and a horsekeeper, and offices for the foreman and sanitary inspector. The stables consist of two twelve-stall buildings, provision being made for a future stable (above to accommodate sixteen horses), which will be reached by the inclined way already provided, the floor of which, together with that of the gallery, is constructed with disused tram rails placed at 2ft. centres filled in with fine concrete, topped with 4 in. cubes. A combined mess and harness room is provided, on the ground floor adjoining the stables, with hot water, &c., the mess-room above being used in the meantime as a store. There are also two loose boxes, a shoeing-shed and a large cart-shed, together with a two-stall nag stable and coach-house, with loft and store-rooms. The manure pit and men's water-closets and urinals are arranged at the top end of the yard, near to the inclined way, under which is a lock-up-store. Protection against fire is insured by the provision of a fire hydrant, placed in a central position in the yard. The bricks for the stables, &c., are best local commons, those for the storekeeper's house being best local face bricks, with Hollington stone dressings. The drainage is carried out on the separate system, as shown on the plan, and the yard is paved with granite setts. Mr. T. Johnson of Great Brook-street, Birmingham, was the builder, the contract price being £3,538, and the buildings have been erected from the designs of the city surveyor, Mr. J. Price, M.L.C.E.

SALTLEY SEWAGE FARM.

On the following Friday, on the invitation of Alderman Baker (chairman of the Birmingham, Tame and Rea Drainage Board), a party of about 100 members paid a visit to the sewage farm at Saltley. Alderman Baker, who was accompanied by Alderman Barratt, Councillors Nixon and J. Wilkinson, Mr. W. Harris (clerk to the board), and others, conducted the party over the works at Saltley, and thence over the farm to Tyburn, where an inspection of the buildings and the produce grown on the farm was made. In proposing a vote of thanks to Alderman Baker and his colleagues, Dr. Hewitt (Cheshire County Council) said that the farm over which they had been conducted was probably unique in England. They had seen efficient to impress upon them the great difficulties the board had in dealing with the sewage of Birmingham and the district, and he was glad to know that the operations of the board were successful. Alderman Baker, in replying, said they had been trying to do their best with the difficult question they had to deal with, and had followed the advice of the first experts of the country.

The following account of the sewage question in Birmingham has been given by Mr. Robert K. Dent, in his work entitled "The Making of Birmingham":—

"The first note of a long and tedious discussion on the

pollution of the streams into which the sewage of Birmingham was poured was sounded in 1854, when the Earl of Bradford, Lord Leigh and other landowners called attention to the fouling of the river Tame, as the result of the formation of a sewer outlet at Saltley in 1852. This was followed a few years later by still louder complaints from Mr. C. E. Adderley (now Lord Norton), through whose park the river ran, and from the residents on Gravelly Hill, in whose neighbourhood the corporation had made an ineffectual attempt to deal with the sewage matter by irrigation on a plot of land about 200 acres in extent. Injunctions were obtained against the corporation by both parties in 1870, and the question began to assume a serious and perplexing aspect, involving the possibility of a writ of sequestration in case the injunctions were not complied with. An elaborate report was presented to the council by the Public Works Committee, recommending a scheme involving an expenditure of £275,000. The council, however, felt that the subject had not been fully considered by the committee and that their scheme was impracticable, and thereupon a special committee was formed to consider and report on the best mode of dealing with the sewage. The result of the committee's inquiries was published in 1871, in a volume of nearly 300 pages, which has been regarded by engineers and authorities on sanitary subjects as a most important contribution to the question. As a result of the recommendations of the special committee the corporation decided upon the gradual abolition of middens in the town and the substitution of a new privy system, whereby a weekly collection of the contents might be practicable; the acquisition of a larger area of land whereon the sewage matter might be treated by a system of filtration through the soil, so that the liquid before being turned into the stream might be rendered comparatively pure and unobjectionable; the establishment of a large sewage farm 'converting what was at present a dismal swamp into a thriving market garden'; and the formation of a joint drainage board upon which all the adjacent districts draining into the river Tame might be represented. A Bill was introduced into Parliament during the session of 1872 empowering the corporation to carry its scheme into execution, but it was defeated on the third reading, mainly through the exertions of Sir Charles Adderley and Sir Robert Peel, who objected to it as likely to prove injurious to their property. Matters continued in an unsettled condition until 1877, when a joint drainage board was formed under a provisional order of the Local Government Board, constituting the borough of Birmingham, the urban districts of Aston Manor, Balsall Heath, Handsworth, Harborne, Smethwick and West Bromwich, and the unions of Aston, King's Norton, Solihull and West Bromwich a united drainage district, with eleven representatives from Birmingham, two from Aston, and one each from the other districts. A larger area of land was secured at Tyburn, forming a sewage farm 807 acres in extent, and the necessary designs were prepared by the borough engineer and the farm manager for its utilisation and culture and for conveying and distributing the sewage over the land, the total cost of the estate, of the construction of conduits, and the erection of farm buildings thereon, amounting to £188,000. Thus the corporation in attempting a satisfactory solution of the sewage difficulty entered upon a new department of work as farmers and market gardeners on a large scale, and have been as successful in the one direction as in the other, as well in the raising of satisfactory crops of all kinds as in dealing with one of the greatest difficulties which they have ever been called upon to face."

The points to which special attention was paid during the visit to the sewage farm were the precipitation works and the method of treating the sludge at the outfall, the irrigation lands at Tyburn, the farm buildings, stock, &c., at Tyburn, and the new works at Plant's Brook. The farm occupies an area of 1,240 acres, and is being increased by a further 1,200 acres. It extends from Saltley to below Water Orton, a distance of more than 6 miles. It is held and managed by the Birmingham Tame and Rea District Drainage Board, and deals with the population of 725,000, spread over an area of 47,000 acres. The volume of sewage dealt with daily in dry weather is about 22,000,000 gallons. The process of purification employed is a combination of precipitation in tanks with subsequent irrigation.

WHITACRE PUMPING STATION AND FILTER-BEDS, AND SHUSTOKE RESERVOIRS.

During the congress visits were also paid to the Whitacre pumping station and filter-beds and Shustoke reservoir. These works constitute the most important source of the present water supply of the Birmingham Corporation. The small reservoir at Whitacre adjoining the pumping station is for the storage of the waters of the river Blythe, and was constructed by the late Birmingham Waterworks Company in 1872. The two Cornish engines were erected at the same time. This reservoir has a water area of 101 acres and a total capacity of 32,000,000 gallons. The Cornish engines

perform the double duty of (1) raising the water from the reservoir to the filter-beds, and (2) pumping the filtered water on to Birmingham. In addition to the two Cornish engines, there are three small steam pumps available for raising the water from the reservoirs to the filter-beds.

The reservoirs at Shustoke are two in number. They impound the waters of the river Bourne, and together constitute the principal storage of the corporation. Their united area is 98½ acres, with a total capacity of 443,000,000 gallons, about 300,000,000 gallons of which is available for consumption. The powers for constructing the Shustoke works were obtained by the late waterworks company in 1870, when the powers for the construction of the Whitacre works were granted; but as regards Shustoke, beyond acquiring some of the land, no further steps were taken by the company. The reservoirs were constructed by the corporation immediately after the transfer of the undertakings in 1876. In connection with the Shustoke reservoirs the two compound engines at Whitacre were erected. These engines, in common with the Cornish, are employed in pumping the filtered water through the mains connecting the station with Birmingham. The water flows from the Shustoke reservoirs to the filter-beds by gravitation. The filter-beds have a total area of over 153,000 square feet, and are large enough to allow as much as 10,000,000 gallons per day being pumped from this station. The station is connected with Birmingham by a single line of 36-in. pipes in direct communication with the reservoir at Erdington, giving a pumping head of over 220 ft.

The next four years in Birmingham—that is to say until the first instalment of the Welsh water is available—are expected to be somewhat anxious ones for Birmingham, and especially for the corporation and the Water Committee. Everything tends to show that the Welsh scheme was not undertaken a moment too soon. Every available local source is now drawn upon for all it is worth, and every effort that ingeniously can devise is being put forth to prevent waste and to make the existing supply hold out; but the water-consuming constituency has grown and is growing with a rapidity which at certain seasons renders a water famine in Birmingham a danger by no means to be despised. The prolonged drought of last autumn caused an unprecedented drain upon the reserve of water, and a similar danger will not be averted until the Welsh water arrives in 1902. The storage reservoir at Shustoke, which was opened in 1883, and, as we have mentioned above, has a capacity of 400,000,000 gallons of water, derived from the river Bourne, is a beautiful sheet of water 1½ miles in circumference, and at the time it was formed the Water Committee no doubt flattered themselves that they had provided for the wants of the city for a good many years to come.

The increase of population in the water district, to which reference has been made, has amounted during the last four years to no less than 60,000, or 15,000 a year. Owing to economies in administration and to the steps taken for the prevention of waste, the whole of this additional population have been supplied with water without any augmentation of the aggregate amount of water pumped; their needs have, in short, been met by the use of water that previously was wasted. The waste in question was chiefly due to defective fittings, and has been very sharply looked after by house-to-house visitation and by nocturnal observations. It is felt, however, that all the saving that can be got by administrative measures in these directions has been practically reached, and that any further economy depends entirely upon a perception of the liability by the water consumers as a whole and by their local co-operation in the endeavour to keep their consumption of water as low as possible. These considerations, of course, are especially urgent during times of drought, but they are likely to apply more or less forcibly at all seasons until the new supply is poured in from the Elan valley.

SANITARY PROGRESS IN BIRMINGHAM.

In a paper read by Alderman W. Cook, J.P., chairman of the Health Committee of the Birmingham City Council, some interesting details were given of sanitary progress in the city. The sanitary history of Birmingham, Alderman Cook explained, might be said to have commenced with the appointment of a medical officer of health and a health committee in 1873. Until then little attention had been paid to sanitary matters, and the condition of the town was decidedly bad. There were 60 miles of streets and roads unsurfaced, and only 4 miles of road surface out of a total of 190 miles were properly paved. The drinking water was largely obtained from shallow wells, almost all of which were badly polluted, and a large part of the closest accommodation was on the ash-pit-privy system. In certain parts of the town there was a large number of old and crowded houses, and very little was done to prevent the spread of infectious diseases. In the first five years after the appointment of the Health Committee the death rate was 218 per 1,000. In the second five years (1878-82) it was 21.6, and in the succeeding five years it was reduced to 20.7. The zymotic death rates for the same periods were 5.3, 3.8 and 3.2 respectively. At the present time, out of 262 miles of streets, Birmingham had 33 miles paved with granite or wood and 83 miles partially so paved. The remaining ash-pits, a large proportion of which were in the recently added parts of the city, were being gradually abolished. The number of water-closets was over 50,000, and of pan-privies over 30,000. A large number of old and

unhealthy houses had been demolished, and extensive provision now existed for the isolation of cases of small-pox and scarlet fever and for the disinfecting of houses and their contents. The refuse disposal in Birmingham was conducted partially on the conservancy system and partially on the water-carriage system, the latter having been for many years past the only system allowed for new buildings. The water supply of the town was at present derived from streams and deep wells, being well filtered before delivery, but the corporation was now engaged in obtaining a more abundant supply from Radnorshire. Practically the whole of the small-pox cases and 80 per cent. of the scarlet fever cases now obtained treatment at the city hospitals. Much remained to be done in Birmingham, as in other places. Evils that had been growing up for generations could not be overtaken in a day. If they could start and plan a town as they did a hospital they might do something fairly satisfactory from a sanitary point of view. But our large towns had grown up without system and without much sanitary control, and they had to take things as they were and make the best of them.

SEWAGE DISPOSAL AT MANCHESTER.

BACTERIAL SYSTEM APPROVED.

On the 19th inst., at a meeting of the Rivers Committee of the Manchester Corporation, the preliminary report of Messrs. Baldwin Latham, Percy F. Frankland and W. H. Perkin, junr., the experts appointed by the council last spring, was read. It was also announced that the Local Government Board had determined to hold an inquiry into the working of the bacteriological system of sewage treatment in Manchester, when the experts may be expected to give evidence. This inquiry will be held on January 12, 1896. It is proposed that the scope of the inquiry shall be confined to the main principles determining the treatment of the sewage at Davyhulme, and that an adjournment shall then be made for the purpose of preparing plans, estimates, &c. These are to form the subject of a later inquiry. The report is as follows:—

"Knowing that you are desirous of having a preliminary report from us with reference to the purification of the sewage of Manchester, we beg to inform you that since entering upon this inquiry, in June last, we have not only visited a number of sewage works presenting features of novelty in different parts of the country, but we have also instituted experiments of our own, with a view to determining the best mode of dealing with the sewage of Manchester so as to obtain an effluent of sufficient purity to comply with the requirements of the Mersey and Irwell Joint Committee.

"Our inquiry has already reached such a stage that we are able to say without hesitation that from the results obtained with the double-contact beds constructed according to our instructions at Davyhulme by your city surveyor, and the experiments carried on by us, which have been directed to the treatment and purification of settled and crude sewage without the use of any chemicals, we are of opinion that the bacteriological system, notwithstanding the particular nature of the Manchester sewage, will purify that sewage and will yield an effluent which will comply with all the requirements of the Mersey and Irwell Joint Committee, and which, when discharged into the Manchester Ship Canal, will, in our judgment, be the means of greatly improving the waters of the latter.

"We must point out that further time is now required for us to determine as carefully as possible by experiment the precise form and details of the method which will be the most suitable to carry out works on such a large scale as will be required at Manchester, so as to make the proposed works a complete success.

"We should like to say that every request for experimental plant and other facilities which we have made to you has been promptly complied with to our entire satisfaction, and that the large amount of analytical work which our experiments have necessitated has been most efficiently carried out by Mr. Gilbert J. Fowler (your chemist) and his staff of assistants.

"We are anxious to express our sense of the value of the assistance of Sir Henry Roscoe's experimental filters, constructed and worked for some time under the direction of Mr. Scudder, for treating the tank effluent. We also think it desirable that the reports of Mr. Fowler, showing the progress which has been made in the purification of the sewage during the period the experiments have been going on, should be appended to our report."

Carlisle.—Recent minutes of the committee contained the report of the sub-committee upon various systems of electric traction in operation in a number of towns, and also the committee's resolution recommending the adoption of the overhead trolley system, following closely the lines of that in operation at Dover, provided the tramway company undertook to obtain the electric current from the corporation upon terms to be hereafter agreed upon, and subject also to such other conditions as the town clerk might consider necessary in the interests of the city. The council have had a long discussion respecting the trolley system, and the recommendation of the committee has been adopted.

The Liverpool Municipal Electric Tramways.

As soon as the Liverpool Corporation decided to acquire the somewhat extensive systems of horse tramways in the city they immediately gave careful consideration to the question of adopting mechanical traction, and early last year a special committee was appointed to inquire into and report their recommendations as to the best means of improving the tramway service.

PRELIMINARY INQUIRIES.

The first step of the committee was to place themselves in communication with three of the most eminent engineers having experience of tramway matters, for the purpose of obtaining independent reports. The engineers selected were Mr. Graham Harris; Mr. T. S. Pearson, engineer-in-chief of the largest street traction corporation in New York; and Mr. Granville C. Cunningham, who had had great experience in Canada. It was obvious that in solving the problem as to the system of traction to be applied in Liverpool, involving an early outlay of over £1,000,000, very great care was necessary on the part of the municipality. Very early in the inquiries, however, the committee found a complete unanimity of opinion that electricity appeared to be the best form of motive power, both as regards efficiency and cost. To some extent the committee were guided in their course of procedure by a report from Mr. Pearson, in which he estimated that the cost of operation per car mile would be—on the overhead trolley, 3'6sd.; the slotted conduit, 4'0sd.; and compressed air, 5'0sd. As compared with these figures, Sir David Radcliffe had stated that on the same data the cost at that time of horse traction in Liverpool was 7'19d. per car mile. The recommendations of the engineers were in complete accord as to the overhead wire system being the cheapest and most satisfactory system to adopt.

In addition to the assistance provided by the experts, most exhaustive inquiry was made by a deputation of the committee upon actual systems in use on the Continent, and for that purpose the various systems of mechanical traction at Hamburg, Berlin, Dresden, Vienna, Buda-Pesth, Zurich, Brussels, Milan, Genoa, Turin, Geneva, Vevey and Paris were visited. In selecting the system of mechanical traction for the Liverpool tramways the deputation thought the following conditions should be duly considered:—

- (a) The steep gradients that existed in Liverpool.
- (b) The exceptionally heavy character of the road traffic.
- (c) The necessity of avoiding any system which would be a source of danger to the lighter traffic.

Moreover, it was necessary that they should fulfil the following conditions:—

- (a) To have a small time interval between the cars.
- (b) The cars to be of such a design as to save time in loading and unloading.

The deputation very speedily came to the conclusion that self-contained cars, whether propelled by steam, compressed air or electric accumulators, would be inconveniently heavy and uneconomical in working. They were considerably impressed with the advantages of the underground conduit system, but their inspection and investigations soon convinced them that the mechanical construction of the conduit was unsuitable for Liverpool roadways, with their heavy and crowded traffic. The evidence collected by the deputation showed conclusively that in no case had an underground system been adopted or continued where an overhead system could be constructed. Even in Buda-Pesth, which is one of the most favourable examples of the underground conduit system, and where the road traffic is exceptionally light, the overhead system had been preferred and adopted where possible. The deputation were more and more convinced, as their tour of inspection proceeded, that as regards good mechanical construction, elasticity of work, freedom from breakdown, facility of repair and economy, the overhead system was without a rival. The report of the deputation also stated that the system had the merit of being much less expensive to construct and maintain than a conduit system, the capital expenditure for a conduit system being at least 50 per cent. greater than for the overhead trolley line.

AN EXPERIMENTAL LINE.

Before embarking upon any large expenditure, or coming to a final conclusion as to the mode of electricity or the character of the rolling stock to be employed, it was desirable that a trial should be made with one part of the tramway system. For that purpose arrangements for laying and equipping a service of electric traction were made, and a line from St. George's Church to The Dingle, via Park-lane and St. James's-street, on the overhead system was undertaken. This route was selected because it would not interfere with the working of any other lines in the city, and because it was thought that the only fair trial of mechanical power would be on lines which were not used by horse traction. It was thought that by this means the public would have an opportunity of forming an opinion as to the advantages or otherwise of the system. The effect of the overhead wires would then be better appreciated, and at the same time a means be afforded for instructing the staff in the management of mechanically-propelled cars. It is this experimental line which has just been completed, and it is more than usually interesting.

SOME ENGINEERING DETAILS.

That the experiment is being conducted on fairly liberal lines is evident from the fact that the system includes over thirty cars, and it is proposed to have a four minutes' service. The complete length of line, including the branch section now under construction, is a little over 3 miles. As already indicated, the system commences in the centre of the town and passes out to one of the southern suburbs, known as The Dingle. Although not specially difficult, the route traversed is by no means an easy one, and certainly affords a fair test of the capabilities of electric traction. The most conspicuous feature of the system is that which relates to the housing of the electric cars. For this purpose most extensive car-sheds have been erected at the end of the line, which will give accommodation for probably seventy or eighty vehicles. As a matter of fact, they constitute the largest sheds in the country, and it is a point of some importance to mention that the whole of this building has been designed by corporation officials and carried out under their supervision. There are no unusual features in the method of the track. A very heavy type of rail is used, in accordance with the practice commonly adopted in this country, and for the most part 100 lb. rails are bedded on concrete. The rails are bedded together by means of Chicago crown bonds, and it is interesting to mention that a system of continuous rail may be eventually adopted on other portions of the tramways that are equipped for electrical work. One of the most objectionable features of an overhead trolley system is the necessity of employing a complete system of guard wires, which are placed above the trolley wire proper and its supports in such a way as to prevent telephone and telegraph wires coming into contact with the live trolley line. In Liverpool the guard wires have been dispensed with completely, and at places where telegraph and telephone wires cross the streets a light piece of wood has been clipped on to the trolley wire, and it is claimed that this will prevent any wire coming into contact with the live wire, and also permit the trolley passing by in the easiest possible manner. For the most part the system known as the span-wire suspension has been adopted, although at some portions of the route, where curves are considerable, double-arm bracket posts have been placed in the centre of the track, but, generally speaking, side posts placed on each side of the street, some 40 yards apart, support the trolley wire by means of a span wire. In some of the streets these poles are replaced by rosettes attached to the walls of buildings. It is generally conceded that the overhead work in Liverpool has been most effectively carried out, and we believe the feeling prevailing in the locality is that the wires are less objectionable and noticeable than was supposed.

ROLLING STOCK.

The chief experiment that has been carried out is in the rolling stock. There are two types of cars employed—one that is of purely American design and the other of the German type. So far as electrical details are concerned there is no very wide difference between these, but the German cars are usually run in pairs, one being a motor-car, having a trailer attached to it. The motor-cars are equipped with a series parallel controller and two motors. The controller is in some respects similar to what is employed in the Westinghouse system, and it is possible by operating the controller in the reverse direction to make the motors act as a kind of brake. What really happens is that the motors are short-circuited and act as generators, thus exercising a pulling effect upon the car axles. As a further safeguard, however, the trailer, which can only be used when attached to a motor-car, is also supplied with a special form of brake, which can be operated by the man on the motor-car. This is an emergency brake, and consists of electro-magnetic apparatus, which is operated by current from the trolley line. The American car is very similar to the one employed on the Glasgow tramways. It is of the double bogey type, 34 ft. in length. This type of car is divided into two compartments, entrance being obtained from the middle of the car; one portion is reserved exclusively for smokers, and in consequence is not provided with windows. The bodies are mounted on wheel trucks, which have 30-in. driving wheels and 20-in. trailing wheels.

ELECTRICAL EQUIPMENT.

The electrical equipment has been supplied by Messrs. Dick, Kerr & Co., and consists of two four-pole motors, connected to the car axles by a single reduction gearing. The frame of the motor consists of two semi-cylindrical castings, the pole pieces being laminated, thus economising copper on the field coils and reducing the current necessary for exciting the fields. An important improvement has been made in regard to bearings, which are carried outside the cases, and thus waste oil is prevented from getting into the motors. The motors are suspended in a special manner, the end away from the axle being suspended on a cross-bar which is able to rotate on its own axis. At the axle end of the motor spiral springs are used, which, it is claimed, exercise a cushioning effect, and thus prevent a heavy hammer blow affecting the electrical apparatus. It need hardly be added that the series parallel type of controller is employed, and the sparks

coated between the brushes and the segments are blown out by means of solenoids, which are excited when the controller is in operation. There is also provided a reversing cylinder, which enables the driver to short circuit the motors and thus become an emergency brake. But what is of unusual interest on the American cars is the use of the "Standard" air brake. For this it is necessary to employ an air compressor, which is geared to the axle, and is automatically put in and out of action by the variation of the air pressure.

The committee, in suggesting the introduction of electric tramways into Liverpool, were convinced of the economy of combined stations for supplying electrical energy for lighting and tramway purposes, and being the owners of an extensive lighting system, it was thought desirable to obtain the necessary electrical energy required for the tramways from the existing lighting station, and, as a matter of fact, the whole of the power now required for operating a tramway system is obtained from the Paradise-street electricity works, which have been in existence for some time as a lighting station. For the tramway purposes it has been necessary to erect special plant, which consists of three Willans engines, directly connected to Siemens' dynamos of 250 horse-power each. In addition to those machines, a very large battery has been provided, which will to a great extent serve to meet the sudden fluctuations that are usually encountered in the operation of a tramway service. As a matter of fact, the battery is of unusual size, even for tramway purposes, but it will no doubt prove extremely valuable in meeting the sudden rise and fall in demand. The type of machines and dynamos employed do not differ very materially from the machines that have been already used for lighting purposes in Liverpool, except so far as regards voltage. A special switchboard has been erected, on which are placed the usual measuring instruments and automatic circuit-breakers, to protect the dynamo and battery. An interesting feature is the use that is made of a motor dynamo for raising the pressure of the current at the ends of the system, and this machine serves also the purpose of preventing an extreme drop of potential in the return circuits, thus precluding the possibility of electrolytic troubles.

The work has been carried out to the designs of the late Dr. John Hopkinson, and under the personal supervision of Mr. Talbot, of the city engineer, and of Mr. Bromley Holmes the city electrical engineer. There can be little doubt of the result of this experiment, for already extensions are in hand, and we may shortly be able to announce that the Liverpool Corporation have decided to undertake a very large addition to the present system. It would not be incorrect to say that probably the whole of the future work will be left entirely in the hands of Mr. Brodie, the city engineer, and of Mr. Bromley Holmes, who are in a great measure responsible for some of the excellent features that abound on the recently-opened system.

ASSOCIATION OF BIRMINGHAM STUDENTS OF THE INSTITUTION OF CIVIL ENGINEERS.

At the Midland Institute, Birmingham, Mr. H. R. Thomas, n.e.c., recently read a paper before the above association on "Axles for Road Carriages and Motor-Cars, and their Manufacture."

The first form of axle known was, said Mr. Thomas, without doubt fixed to the wheels, and revolved in a very primitive form of journal. The most primitive axle met with now was used in parts of South America and Australia, and made of wood, whence comes the name of axletree. The simplest form of iron axle in everyday use was found in ordinary carts, and consisted of a short bed or tail, which was bolted to the wooden axletree, and an arm or bearing of conical shape. Better-class axles underwent a process of "steeling," which was done by driving two small pieces of steel, about 2 in. by 1 1/2 in., into the hot iron on the underside of the arm, one near the end and the other near the shoulder, these being the parts which had the most wear. The steel being thus hardened considerably lengthened the life of the axle.

Drabble's patent, Collinge's, the Mail, Longmore and other axles were referred to. Ball bearings were not applicable to cart or carriage axles, as it was very difficult to properly harden the large bearings necessary, and either the ball races or the balls themselves were soon crushed by the excessive weight. Roller bearings had a great future before them, as in this case the rollers ran the whole length of the arm. Axles were manufactured from piled scrap iron, from faggotted bars and common bars. A faggotted axle consisted of from seven to nine pieces of iron welded together under a steam hammer into one solid bar, and then the collar is welded on. The advantage of this was that, should there be a flaw in any one piece of iron, it could not affect the strength of the finished axle to any extent. American axles were not so good as English ones, as they were only made to last one or two seasons, while English axles had to last a lifetime. Before the axles were finished the arm had to be case-hardened, which was done by keeping it at a bright red heat in contact with some carbonaceous substance for about three hours, and then dipping it in potash and quenching it. Of the cast-iron boxes there were two distinct kinds—the case-

hardened box and the chilled box. The former were made from haematite pig iron. The annealing process took about twelve hours, the boxes being put into iron pans and kept at a bright red heat, after which they were ready for machining. The hardening was accomplished by filling the boxes with anionic charcoal, such as burnt leather, bone dust, &c., the ends being stopp'd with clay to prevent the charcoal from being consumed in the air. The boxes were then placed in a specially-constructed furnace, and heated to a cherry red, and maintained at that temperature for a considerable time to enable the surface to absorb a certain amount of carbon from the charcoal. The theory advanced to support this method was that in the class of iron used a large proportion of the carbon existed in a free uncombined state as graphite. This left the iron free to combine with the charcoal and form a thin coating of steel on the inner surface of the box, which was hardened by being quenched in cold water.

The best axles were made from grey cold-blast iron. The sand core is replaced by a chill of cast iron, the effect of which was to form an extremely hard surface on the inside of the box, which did not require machining. The chill or core was driven out as soon as the metal was set. The hard lining was caused by the sudden cooling of the grey iron in contact with the chill and its consequent change into granulated white cast iron, which was the hardest variety known. The depth of the hardening can be varied by altering the temperature of the chill, the warmer it was before the metal was poured the thinner being the hardened surface. Case-hardened boxes were weakened somewhat by the repeated heatings; chilled boxes could therefore be made lighter.

Wheels were built conical to resist the strain set up in the spokes in turning corners. The centre line of the axis was bent down until the spokes were vertical to the ground at their point of contact. As an example of the dip required, a wheel 3 ft. in diameter and disled 2 in. (that is the height of the cone, of which the hub is the apex), and having an arm of 8 in. on the axle, the arm should be dipped $\frac{8}{10} \times 2$ in.

= nearly $\frac{1}{2}$ in. In addition to this, some manufacturers "foregather" the arms, that inclining them forward $\frac{1}{4}$ in. or $\frac{1}{2}$ in. This was supposed to cause the wheels to run against the collar rather than against the out, but it interfered with the easy running of the vehicle. The method of testing axles was a cantilever. Axles for motor-cars, with special arrangements to facilitate turning corners, and other interesting points were described.

The president, Mr. J. C. Vandrey, M.I.C.E., occupied the chair, and after the discussion and vote of thanks to the author read a letter he had received from Mr. Henry C. Adams, who tendered his resignation of the post of hon. secretary after five years' service. The president referred in very complimentary terms to the progress of the association during Mr. Adams' long term of office, and proposed a hearty vote of thanks for his services, stating that it was with much regret that they allowed him to sever his official connection with the association. Mr. W. Bayley Marshall, M.I.C.E., past-president, seconded the vote, which was carried unanimously.

Mr. G. J. de Bissac Phelps, B.A., STUD. INST. C.E., was then appointed hon. secretary in Mr. Adams' place.

PROPOSED ELECTRIC TRAMWAYS FOR LINCOLN.

Last week, at a meeting of the Lincoln Corporation, it was reported that at a meeting of the whole council in committee the following resolution, adopted by the directors of the Lincoln Tramways Company, had been considered: That the directors, having under consideration the desirability of introducing (as in other towns) electricity as the motive power in working their tramway system, and the necessity of meeting the reasonable demands of the public for an extension of the system, as also the possibility of the tramways being taken over by the local authority, are of opinion that under these circumstances the company would not be justified in incurring the heavy capital expenditure which these improvements and extensions would involve without first conferring with a representative committee of the council on the subject, and the directors accordingly ask the council to appoint such a committee at an early date. The committee had resolved that it was desirable to enter into negotiations with the tramways company with a view to the tramways being taken over by the corporation at an early date, and several members had been appointed as a committee to confer with the directors on the subject. The minutes were confirmed.

Weston-super-Mare.—Mr. H. Percy Boulton, Local Government Board inspector, last week held an inquiry touching an application of the council for sanction to borrow £14,000 for the purpose of erecting a public pavilion, £1,000 for erecting extensions at Knightstone baths, and £131 for additional furniture in connection with public offices. On the termination of the proceedings the inspector intimated that he would visit the sites of the proposed improvements and present his report to the Local Government Board at an early date.

Comparative Reports of General Practice.

XXX.—TRAMWAY TRACTION: WEST BROMWICH REPORT.—VII.

PROPOSALS OF THE BRITISH ELECTRIC TRACTION COMPANY.

Early in June the British Electric Traction Company, as arranged at the conference with Major Marindin, of the Board of Trade, submitted a statement of the arrangements entered into with the South Staffordshire Tramways Company and their proposals for the adoption of electric traction. From this statement we quote the following paragraph: "By the agreement with the South Staffordshire Company we are working that section of their tramways which is already electrically equipped, and in consideration of our providing the necessary capital for the purposes specified in the agreement we have the option of taking a lease of the whole of that company's lines, with a view to the adoption of electric traction; also on that section of the South Staffordshire Company's lines at present worked by steam. We have undertaken, as part of such agreement, to introduce into Parliament, in the name of the South Staffordshire Tramways Company, and to use our best endeavours to secure, the passing of a Bill to confirm the said lease, and to give power to the lessees to reconstruct and convert to electrical working the whole or any part of the tramways. We propose to introduce this Bill in the next session of Parliament, in the hope of being able to facilitate the introduction of an improved tramway service in the district at as early a date as is practicable. Our proposal is to unite the tramways of the South Staffordshire Company with those of other companies in the neighbouring districts, our object being to connect the greater part of the important district known as South Staffordshire and to provide an efficient and uniform service of electric tramways. The scheme is a comprehensive one, and embraces the tramways of the Dudley-Stonbridge Company, Wolverhampton Company, the light railways to Kinver, Kingswinford and Cradley, and its accomplishment cannot fail to prove of great benefit to these thickly-populated districts."

The company then proceeded to refer to the proposed insertion in their Bill of the various clauses inserted in existing Acts for the protection of the local authorities. It was pointed out that the system had been developed at different periods, and that, owing to the variety of Acts and provisional orders, the clauses were so complicated and conflicting as to render their assimilation quite impossible without creating further complications. It was therefore proposed that a new set of clauses, which the company considered adequate, should take the place of all the previous clauses relating to the electrical equipment and working of the lines. Incidentally it was pointed out that the company would be subject to the standard regulations enforced by the Board of Trade in the case of every electric tramway, and that these afford every possible protection to the interests of public and private undertakings. It was also suggested that a conference should be arranged at West Bromwich before the Bill was introduced to obtain the views of each local authority, in order that suitable arrangements might be made, if possible, whereby the Act might be obtained without increasing its cost through opposition in Parliament. The clauses, of course, were to be subject to such modifications as might appear desirable to this conference. The following were the company's proposals in regard to the system of traction to be adopted:—

"The system we propose to adopt for the equipment of the whole of the lines is that known as the overhead system of electric traction, which has been so successfully adopted on the Continent and in America, and has been favourably reported upon by the corporations of Glasgow, Manchester, Liverpool and Belfast. We cannot recommend the adoption of any other system, and although we do not say that other systems of electric traction are impracticable, yet the expense of constructing and maintaining the same, on the conduit system for instance, is entirely incompatible with the character of the district and with the amount of traffic to be served.

"We are prepared to instal the overhead system of electric traction in such manner as to embody all the latest improvements, and in view of the fact that other neighbouring lines, which we hope to run in connection with the tramways of the South Staffordshire Company, are proposed to be equipped on the same system, we trust that our proposal will receive your favourable consideration.

"We propose to abandon cars with top seats as far as possible, and to introduce small cars upon a more frequent service. The delay which is occasioned by passengers leaving the car from the top seats minimises to a great extent the advantages which are to be derived from the use of electric traction."

THE SUB-COMMITTEE'S RECOMMENDATIONS.

The sub-committee having considered the above proposals, and also the question of municipalisation, submitted the following recommendation:—

"Your sub-committee, taking into consideration the fact that the corporation have lately obtained a provisional order to generate and supply electricity within the borough, and that the two schemes—namely, electric lighting and tramways, could be worked to the advantage and benefit of the

town, unanimously recommend the town council to purchase the part of the tramway undertaking within the borough of West Bromwich on the expiration of the present lease, under sec. 31 of the Tramways Act, 1870, and to apply for the necessary power to equip and work the said tramways when taken over."

In the event of the corporation not deciding to municipalise the tramways, the sub-committee recommended as follows:—

(1) *Permanent Way.*—That the permanent way of the whole of the existing system within the borough of West Bromwich requires reconstructing, including the sets paving. This work should under any circumstances be carried out by the town and leased to the company on terms to be arranged. The dual control, which causes continual annoyance, would then be done away with.

(2) *Form of Traction Advised.*—As to the form of mechanical traction to be adopted, your sub-committee have given the subject most careful consideration, and have unanimously come to the conclusion that overhead electric traction is the best known system of traction, having due regard to efficiency and cost, for West Bromwich.

(3) *Position of Poles.*—That in adopting this system the poles, which must be of design to be approved by the corporation, should be placed in the middle of the roads where the width from kerb to kerb is not less than 36 ft., and that the corporation should be allowed to use them for arc lighting of the streets free of charge. In the case of Boar-lane, Leeds, the average width from kerb to kerb is 38 ft. 3 in., and in Easton-road (east of Gower-street), London, which has an immense traffic, centre poles have been adopted for electric street lighting every 240 ft. apart; here the width is from 38 ft. to 40 ft. from kerb to kerb. Your sub-committee have not met with any street more suitable for the adoption of centre poles in the towns visited by them.

(4) *Current.*—That arrangements should be made to supply the electric current to the company by the corporation from their proposed electric light station.

(5) *Cars.*—The adoption of small cars of the most modern type, with a gangway inside of at least 2 ft. 8 in. (cars lighted by electricity are far more comfortable and convenient for passengers and a very great improvement to the badly-lighted cars at present in use), and a frequent service at popular prices, which will be a very great benefit to the citizens. Your sub-committee recommend a five minutes' service from the New Inns to Carters Green, with a ten minutes' service from Carters Green to Great Bridge and Hill Top; also that the conductors and drivers should be provided with proper and suitable uniforms.

A conference of local authorities (through whose districts the South Staffordshire tramways run) was held on June 25th to consider the proposals of the company. The bodies represented were the corporations of West Bromwich, Wednesbury and Dudley, and the urban district councils of Handsworth, Tipton and Darlaston. After a long discussion the following resolution was adopted: "That, having regard to the views expressed by the Midland Electric Traction Company with regard to the acquisition of the tramways undertaking, this meeting be adjourned, to enable the various local authorities to consider the suggestion of municipalisation."

The conference was resumed on July 20th, when the chairman, Councillor Pitt, J.P., mayor of West Bromwich, stated that the matter had come before the West Bromwich Town Council, who referred it to the General Purposes Committee, and after full consideration they had decided to take over the tramways in their own district. They had not decided upon any system, or as to sub-letting their rights to any company, but simply to purchase and leave the working to the future. They had also received a communication from Wednesbury, Darlaston and Tipton, who had held a private conference and had passed a resolution affirming the desirability of taking over the tramways in their respective districts. Ultimately it was resolved: "That in the opinion of this conference it is desirable that all the local authorities within the district of the South Staffordshire Tramways Company should take steps with the view to purchasing the tramway lines within their respective districts, and also to oppose the proposed application to Parliament of the British Electric Traction Company for a Bill to confirm the lease of the tramways to that company, and that a copy of the resolution be sent to each local authority."

When the report of the sub-committee was before the council reference was made to the able manner in which it had been compiled by the borough surveyor.

Business Announcement.—In consequence of the retirement of Mr. Fothergill, to-morrow, from the management of the London and Lancashire Fire Insurance Company, we have been informed that the directors have appointed the present sub-manager, Mr. F. W. P. Rutter, to be the manager and secretary as from the 1st prox.

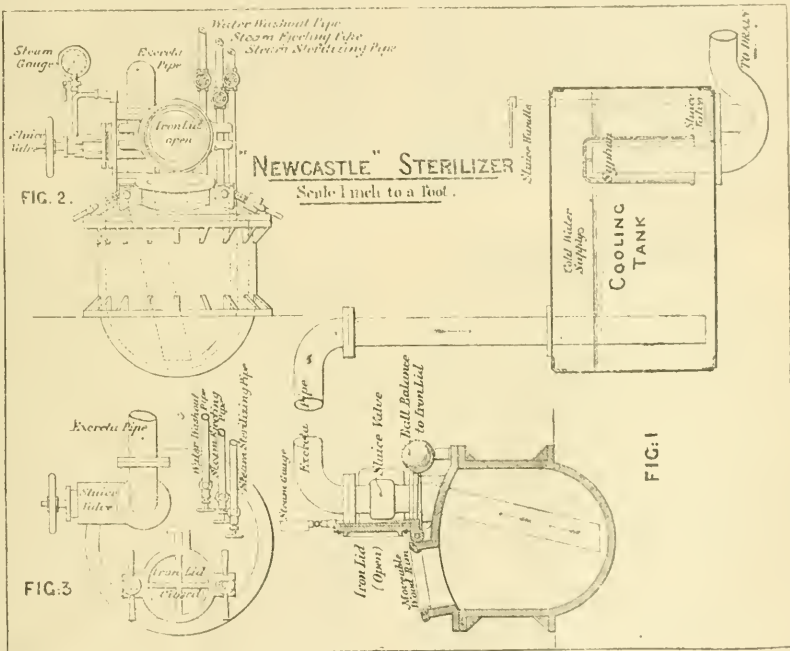

The Disinfection of Excreta.

By HENRY E. ARMSTRONG, M.B., Medical Officer of Health, Newcastle-upon-Tyne.*

It has long appeared to the writer that our methods of dealing with the excreta of diseases known to be most readily communicable through the medium of alvine discharges is a weak point of preventive medicine. In one class of ailment the surface of the body is disinfected with the most scrupulous care and prolonged attention. In another the respiratory passages are treated in like manner. The segregation of the sick in all infectious diseases is practised wherever the nature of these diseases is understood. So highly is this mode of preventive treatment valued in one malady—small-pox—that hospitals for its isolation are required by the authorities to be located at a distance of half a mile from human habitations. Infected rooms and clothing, bedding, &c., exposed to infection are each rendered safe by special modes of treatment.

Are we equally careful and certain in our disinfection of the bowel discharges in cholera and enteric fever? In these diseases—whether treated at home or in the hospital—the evacuations, from their offensiveness, are liable to summary treatment. So long as the patient is in bed they are generally voided into a bed-pan containing more or less of some disinfectant solution. More disinfectant is perhaps added, and the contents of the pan are thrown down the closet or slop-sink, or buried in the ground as quickly as possible. The proportion of disinfectant used in such cases is seldom suffi-

at St. Petersburg during the outbreak of cholera in 1894. The evacuations and other infected liquids from the different cholera pavilions were conveyed in pipes to a large general boiler, into which steam was turned after the lid had been closed and fixed. This process had the disadvantage of allowing the liquids to leave a pavilion for disinfection at a considerable distance, thus giving rise to continual infection and fouling of a large amount of pipe. This defect is avoided in the apparatus devised for the cholera hospital of the corporation of Newcastle-upon-Tyne by their city engineer, Mr. W. George Laws, and the writer, in which a small steriliser is provided for each ward. A model of the apparatus was shown in the exhibition of the congress of the Sanitary Institute at Liverpool, and a paper describing the steriliser was read before the congress of the British Medical Association at Newcastle in 1892 by Dr. C. U. Laws.† The appliance having been found fairly to answer its purpose at the cholera hospital, others have lately been fixed in off-shoots of the enteric wards of the city hospital for infectious diseases. The steriliser, a circular cast-iron vessel about 2 ft. 6 in. in diameter and holding 30 gallons, stands on the floor of a chamber containing also a slop-sink for rinsing soiled linen, bed-pans, &c. The waste pipe from this sink is attached by a swivel joint, so that it can be turned up when not in use. When turned down it conveys the slops into the steriliser. The bed-

cient. If, for instance, the agent used be perchloride of mercury, an ounce or two of a 1 in 500 solution to, say, 1 lb. of stool, is generally considered ample, whereas the evacuation itself requires for its proper disinfection 1,500th its weight—i.e., 76·80 grains of the dry perchloride, or 500 times the amount of solution (i.e., about 4 pints). The excreta and the disinfectant must of necessity be intimately mixed if the disinfection is to be perfect. But who can rely on this being done, even when the evacuation is liquid? In the solid state such mixture is not to be expected, being indeed hardly practicable. The rinsings of soiled linen, &c., at the slop-sink require disinfection equally with the discharges caught in the bed-pan. But they are too often sent direct into the drain, with a flush of disinfectant thrown in after to overtake them as it may. The infected dejecta of convalescents from either of the diseases in question are commonly voided down the water-closet, often without the pretence of disinfection.

HOSPITAL ARRANGEMENTS.

Burning the discharges after mixture with sandst not be considered free from danger. The quickest, safest, most thorough and most certain way to disinfect excreta is by boiling them under steam pressure, a method requiring special apparatus not hitherto available for domestic use. Sterilisation of excreta by steam was practised in a hospital

at St. Petersburg during the outbreak of cholera in 1894. The evacuations and other infected liquids from the different cholera pavilions were conveyed in pipes to a large general boiler, into which steam was turned after the lid had been closed and fixed. This process had the disadvantage of allowing the liquids to leave a pavilion for disinfection at a considerable distance, thus giving rise to continual infection and fouling of a large amount of pipe. This defect is avoided in the apparatus devised for the cholera hospital of the corporation of Newcastle-upon-Tyne by their city engineer, Mr. W. George Laws, and the writer, in which a small steriliser is provided for each ward. A model of the apparatus was shown in the exhibition of the congress of the Sanitary Institute at Liverpool, and a paper describing the steriliser was read before the congress of the British Medical Association at Newcastle in 1892 by Dr. C. U. Laws.† The appliance having been found fairly to answer its purpose at the cholera hospital, others have lately been fixed in off-shoots of the enteric wards of the city hospital for infectious diseases. The steriliser, a circular cast-iron vessel about 2 ft. 6 in. in diameter and holding 30 gallons, stands on the floor of a chamber containing also a slop-sink for rinsing soiled linen, bed-pans, &c. The waste pipe from this sink is attached by a swivel joint, so that it can be turned up when not in use. When turned down it conveys the slops into the steriliser. The bed-

HOME TREATMENT.

The foregoing observations refer only to the sterilisation of the discharges of patients in hospital. But the necessity for similar disinfection in cases under treatment at home is quite

* A paper read at the Birmingham congress of the Sanitary Institute. † Our readers may remember that this apparatus was fully described in a paper prepared by Mr. W. George Laws for the annual meeting of the Incorporated Association of Municipal and County Engineers in London in 1894, and reported in our issue of July 5, 1894. We reproduce the illustration there given.

as great as in hospital. In private houses, and still more so in tenement dwellings, the night-soil and slops are apt to be thrown into the ash-pit or down the sink without the addition of a disinfectant. The soiled linen is frequently left lying for days before it is purified. In a household of ten persons, six of whom are at present in hospital at Newcastle with enteric fever, the spread of infection was due to the neglect of instructions to disinfect and purify the bed-clothing.

To prevent the danger from these causes special arrangements for disinfecting the excreta and slops from cases of enteric fever, &c., not removed to hospital are required. This may be done either (1) by receiving the discharges into airtight vessels and removing them daily to a sterilising station for treatment, or (2) by sterilising them on the premises where they are produced. As in the hospital, the nearer the steriliser to the ward the better; so, *prima facie*, in private practice, sterilisation on the spot appears preferable to that of removal for treatment at some distance, however small. In this view the idea of a household steriliser first suggested itself, and the writer accordingly applied to Messrs. Goddard, Massey & Warner, of Nottingham, the makers of the hospital steriliser, for plans for a portable apparatus for use on private premises to be worked by an official of the local authority. A capacity of 2 gallons was thought sufficient, and lightness of weight for convenience of transport was a desideratum. It was proposed that steam should be generated by means of a coal fire or a ring of gas burners beneath the receiver. The appliance was to be provided with a seat for the use of convalescents, and suitable means for tilting and discharge of contents into a drain.

The impracticability of heating by means of gas in tenement premises, and the length of time required to generate steam, may be difficulties in the way of the satisfactory general working of this appliance. These objections are avoided if the liquids to be disinfected are removed to a central steriliser, a proposal suggested by Mr. Laws and endorsed by the writer. An ordinary 30-gallon steriliser, with small steam boiler, cooling tank, &c., would probably be found enough for the requirements of a district of half-a-mile radius. The number of such stations would, of course, depend on the area of the town. The infected liquids may be received into tin canisters, with hermetically closing lids, and removed daily for disinfection. In cases beyond the radius, or when found preferable for other reasons, the portable household steriliser would be found useful.

ELECTRIC LIGHT AT POPLAR.

PROPOSED EXPENDITURE OF £79,000.

At the last meeting of the Poplar District Board of Works the Electric Lighting Committee presented a report in which they stated that they had considered the several reports of Mr. A. Blackburn, the electrical engineer, in reference to the public electricity supply of the district, and had carefully deliberated upon the suggestions contained in them. They submitted the following recommendations for the approval of the board:—

That the low-tension continuous-current three-wire system, with a pressure of 460 volts between the outside wires, and supplying energy to consumers at either 460 or 230 volts pressure, be adopted. That the generating plant, to commence with, consist of two 100-kilowatt and two 200-kilowatt generating plants, consisting of four high-speed engines, coupled direct to four shunt-wound dynamos, and four boilers, together with a main switchboard, balancing transformers, storage battery, "Booster" dynamos, steam pipes, hot wells, cold water tanks, pumps, economiser, and other necessary adjuncts. That a light iron tramway be constructed from the edge of the Limehouse Cut, across the board's depot and Yeo-street, to the proposed boiler-house. That arrangements be made for taking a supply of cooling water for surface-condensing purposes from the Limehouse Cut. That water-tube boilers be the type of boilers adopted, fitted with mechanical stokers. That a travelling crane, capable of lifting 15 tons, be provided in the engine-room. That the mains be laid in stoneware casing, filled in solid with bitumen or similar compound. That where gas lamps now exist in the roads and streets not to be lighted by arc lamps and through which mains are to be laid, such lamps be utilised for incandescent electric lights. That fifty-four 10-ampere arc lamps and seventy-one 7½-ampere arc lamps be provided, to be replaced at midnight by incandescent electric lamps, and that the existing gas lamp-posts in the streets to be lighted by arc lamps be removed. That the charges to consumers be 5d. per unit for the first hour of the maximum demand per day, 4d. per unit for the second hour, and 3d. per unit for all further consumption for lighting, and 3d. per unit for the first hour of the maximum per day, and 1½d. per unit for all subsequent consumption for power. That the board undertake the wiring of private premises where desired by consumers, payment for the same to be made in one sum or by instalments, at the option of the consumer. That the engineer be instructed to forthwith prepare the necessary specifications, founded on the foregoing, that tenders for the required plant and machinery be invited, and that the necessary application be made to the London County Council for permission to carry out the works, to which the consent of

that authority is required. That it be referred to the Finance Committee to consider the question of applying to the London County Council, or other authorities, for the necessary loans for the undertaking, including the wiring of consumers' premises, the estimated amount being £79,000.

The consideration of the report was adjourned till the next meeting.

ARBITRATIONS AND AWARDS.

An arbitration of considerable importance to the borough of Brighton has just been settled by agreement, after the proceedings had extended over three days. In order to perfect the water supply, the Brighton Corporation decided to acquire compulsorily 47 acres of land at Shoreham, belonging to Messrs. Bridger. The latter claimed £10,000 for the land, a further sum of £57,000 for a stream of water which traversed it (based on twenty-five years' purchase for royalties on water calculated to be drawn at 1d. per gallon), together with an additional sum of 10 per cent. as compensation for the compulsory purchase. Sir E. Clarke and Mr. Boyle appeared before the under-sheriff on behalf of the claimants, whilst the case for the corporation was argued by Mr. Pember, q.c., Sir William Marriott and Mr. J. E. Banks. At the conclusion of Sir Edward Clarke's speech the under-sheriff and jury proceeded to Old Shoreham to view the property. Sir John Whittaker Ellis (Farebrother, Ellis, Clark & Co., London) gave evidence on behalf of the vendors. He valued the land to be compulsorily acquired at £9,500, and the rights in the water at £62,727. Mr. Pember, q.c., for the corporation, contended that the vendors had no property in the water, but were only entitled to compensation as riparian owners who had rights of using the stream and no more. It was decided, however, as a point of law, that the jury were to assume a property in the water, which might be contested after the verdict; but on the third day of the hearing the arbitration came unexpectedly to a close, a compromise being agreed to under which the Brighton Corporation pay £6,000 for the land compulsorily acquired, and the vendors, Messrs. Bridger, are to receive a royalty of 1d. per 1,000 gallons on all water pumped along the mains to any point outside the Shoreham district of supply.

THE SANITARY INSTITUTE.

EXAMINATIONS AT MANCHESTER.

At an examination in practical sanitary science, held at Manchester on the 16th and 17th inst., six candidates presented themselves, and Mr. William John Ball, 17 Wellfield-street, Warrington, was granted a certificate. The following were the questions set for answer in writing: (1) Describe the action of the so-called lift and force pump. From what depth is it theoretically possible—with the barometer standing at 30in.—to raise water with a simple lift pump? (2) What is the average usual rainfall in the North, South, East and West of England respectively? What are the chief geographical conditions modifying the rainfall? (3) How would you define hardness of water? Describe in detail a method suitable for softening water for a general public supply. (4) What methods have been proposed for the treatment of sewage? Upon what principles do they depend? Describe any one method in detail. (5) Contrast the advantages and disadvantages of open fireplaces, and warming by hot air, hot water, and steam. (6) What is the best position for a fresh-air inlet to enter a disconnection chamber as regards the disconnecting trap? Illustrate by sketch and give the size of air inlet in relation to the sectional area of the upcast shafts of the drains. (7) What is meant by an infectious disease? Give two examples and detail the chief precautions to be taken when an infective fever occurs in a house. (8) What weight of water would be discharged per second through a circular orifice of 1-in. diameter, under a pressure of 1,000 lb. per square foot, neglecting friction?

On the same days an examination was held for inspectors of nuisances, at which 121 candidates presented themselves, of which fifty-six were certified, as regards their sanitary knowledge, competent to discharge the duties of inspectors of nuisances. The following were the questions set for answer in writing: (1) The purity of a well water is questioned. What steps should be taken by an inspector in ascertaining whether the suspicions are warranted or not? (2) A person who has purchased from a butcher's stall a pair of kidneys that are obviously diseased, brings them to you as an inspector. Describe in detail how you would act. (3) Describe a good form of waste-water closet, and enumerate the advantages and disadvantages of this form of closet. Under what conditions would you recommend their adoption? (4) In tracing the origin of an outbreak of diphtheria, what would you inquire into and how would you proceed? (5) Describe briefly the structure and drainage of a model slaughter-house. (6) What are the general provisions of the Model By-Laws of the Local Government Board with respect to house drainage? (7) What is the area of a room of the dimensions shown? (8) Describe and draw to scale (1 ft. to 1 in.) the following joints in lead pipes—a "wiped" and a "copper-bit." State which is the stronger joint, and why?

SEWAGE DISPOSAL IN LEEDS.

THE BACTERIAL EXPERIMENTS AT KNOSTROP.

The details of the experiments carried out at Leeds under the direction of Mr. W. J. Dibdin have been put together in the form of a report compiled by the Lord Mayor (Alderman T. W. Harding) and Mr. T. Hewson, the city engineer. After estimating the population of Leeds at 410,618, the compilers, says *The Yorkshire Post*, point out that the city possesses an abundant supply of good water, the present consumption being at the rate of 15,000,000 gallons per day, 4,000,000 of which are supplied for trade purposes. Almost the whole pours into the sewers. The volume of sewage varies from hour to hour. Apart from rainfall, the maximum flow occurs at about mid-day and the minimum flow at night. The rate of flow rises to over 22,000,000 gallons in the day and falls to below 8,000,000 gallons in the night.

A lengthy description is given of the old works, with details of working expenses. With the increase in the volume of sewage since 1874 the old settlement area was found to be insufficient, and the effluent from the precipitation tanks was generally turbid and unsatisfactory, while as soon as the normal mid-day flow was expanded to more than double by rain it was found impossible to deal with it with the present machinery, and the excess of sewage, diluted by the rain, then flowed untreated into the channel leading to the river. Reference is made to the serious difficulties encountered in connection with the production, storage and removal of sludge. Although a biological scheme to deal effectively with the huge volume of Leeds sewage would involve a large outlay, the committee felt that the expenditure would be much less than that required by broad irrigation, for which, indeed, no suitable land appears to be available within 21 miles of Leeds.

In July, 1897, the committee called in Mr. W. J. Dibdin, the eminent chemist, to advise them, and he undertook to make some laboratory experiments on small-coke filters with samples of average Leeds sewage, and with samples of specific trade effluents, notably effluents from tanneries and the iron liquor from chemical works. He found, in dealing with iron liquor by itself, that there was at first a considerable oxidation of the iron salts; but this result was obtained at the expense of the efficiency of the beds, which soon became unfit for further work. With samples of average Leeds sewage, containing iron liquor, tan refuse and other trade effluents, diluted with domestic sewage, good results were obtained on the small experimental beds, giving 80 per cent. of purification as the measure of the work of the double beds. In the case of tan liquors alone, undiluted by sewage, it was found that the effect of this double treatment, first on a coarse and then on a fine bed, gave nearly 80 per cent. purification and removed the solids in suspension. Encouraged by this report, the committee decided to proceed to a practical experiment on bacterial treatment at the Knostrop works, and the council having approved, Mr. Dibdin was asked over to Leeds in the beginning of September last year to advise upon the matter. Acting upon his suggestions, a coarse bed and a fine bed were constructed, each of about one-eighth of an acre. The coarse bed was filled with coarse coke not less than 3 in. diameter, and the fine bed with coke not less than $\frac{1}{8}$ in. diameter and not more than $\frac{1}{4}$ in. diameter. The floors of the beds are paved with old bricks grouted with cement, and are formed with a fall to the outlet end of the beds. Upon them are laid 3 in. agricultural tile drains, 2 ft. apart, connected at their low ends with a brick collecting drain, which conveys the drainage to outlet valves.

The sewage was first turned on to the beds on October 2, 1897. Absolutely crude sewage was used, and the beds were worked in this way for four months. The amount of purification shown by the final effluent after the beds had become established is considered satisfactory, and proves that, notwithstanding iron liquor and other trade effluents mixed with the sewage of Leeds, it can be treated on bacteria-beds so as to produce a really good effluent. The effluents from the fine bed had no smell, except at times a slight earthy odour. The first flow was always cloudy, and in some cases turbid, but it cleared more or less according to the varieties of sewage being treated. The latter part of the flow was always very clear. In order to make a physiological test of the effluent, some carp were put into the effluent basin. More than half died within a month, but this was apparently due to the rush of the effluent carrying them against the outflow grating. Provision was then made to protect the fish from the full pressure of the rush, and the three carp that were living at the time this was done are still alive, having been continuously in the effluents, good and bad, which have passed through the basin for a year.

Good results having been obtained in the final effluent, it remained to consider whether the beds were really digesting the large quantity of suspended matter brought down in the sewage or whether this was accumulating in the beds. The gross capacity of the rough bed is 174,800 gallons, and the net or liquid capacity, after filling in the cake, is estimated to be 83,300 gallons. When the beds were considered to be in good working order a careful measure of capacity was made, which showed that the rough bed had been reduced to 63,400 gallons. From the analysis of a large number of samples of crude sewage taken daily for two and a half months (October 2 to December 15, 1897) it appears that the average amount of matter in suspension in the crude sewage

of Leeds is 37.2 grains per gallon. The analysis of the effluent from the rough bed during the same period gave 11.9 grains per gallon as the amount of solids in suspension; so that 25.3 grains per gallon were kept back by the rough bed. Chemical changes set up by allowing the beds to remain empty for a fortnight were found beneficial, and the experiment points to the possibility of treating the crude sewage and consuming the sludge if periods of rest are provided, say, two weeks out of five in winter and one week in four in summer.

Experiments with screened sewage were begun on March 4th of the present year. Considerable trouble arose from the large volumes of strong dye which came down pretty regularly at about the time for filling the beds. The dye discoloured the whole volume of the sewage, and occasionally astonishing volumes of foul trade effluents have to be dealt with. In one recent instance a large quantity of what was apparently printing ink actually choked up the pumps. It will be necessary, the report continues, to maintain a systematic inspection of the trade effluents flowing into the sewers, with a view to their regulation. It is possible that in some cases the flow is the result of waste unnoticed by the manufacturers themselves. The experiments with screened sewage were carried on for six months, from March 14th to September 8th, with seven days' rest, from April 27th to May 4th, and an enforced rest of thirty-eight days, from June 16th to July 25th. The number of fillings during the whole period was 315. The average of the fillings was 16,000 gallons, and the total passed over the bed during the six months was 14,400,000 gallons; and, after making allowances for the solids screened off, it is estimated that about 51,000 gallons of sludge were retained by the rough bed. The capacity on March 2nd was 52,100 gallons, and on September 8th 41,000 gallons; net loss of capacity, 11,100 gallons. Deducting this from the estimated amount of 51,000 gallons retained by the rough bed, we have 40,000, or about 80 per cent., as the amount of sludge consumed in this period by the rough bed. The fine bed retained 16,700 gallons of sludge, the whole of which was consumed, the capacity of the bed not having been decreased. The total consumption by the two beds was 56,700 gallons of sludge. The effluent from the fine bed during the six months, except for the first fortnight after the long rest and during the heavy flow of dye, continued satisfactory.

After referring to experiments with settled sewage, some general observations are made on the biological experiments. It is pointed out that the action of the bacteria beds give something beyond mere filtration—namely, a chemical action upon the organic matters in solution, and evidently a much greater purification than is represented by the mere withdrawal of suspended matters; and, in addition, it digests the organic solids left behind, a process which, if incomplete, can probably be completed by adequate periods of rest. The effluent from precipitation, with or without lime, is known to give rise to decomposition and putrefaction. The effluent from the bacteria-beds improved on keeping, and in no case did subsequent putrefaction arise. From the experience gained during the year from treating Leeds sewage on bacteria-beds it was found that the effluents were much superior to those from lime precipitation, and superior to these obtained in some cases from land filtration. They were proved capable of sustaining the life of coarse fish for a long period, and showed no signs of putrefaction on keeping. Their chemical analysis gives results which are generally well within the limit of 1 grain per gallon oxygen absorbed in four hours, and 1 grain of aluminoid ammonia, which has in recent years been generally accepted as a provisional standard of purity for effluents going into a stream not used for drinking purposes.

Dealing with the extension of the experiments authorised by the city council in June last, the report states that new beds are being constructed, and clinkers from the destructors are being used instead of coke. It is proposed to make a series of trials with different volumes of sewage, with sewage under different conditions as regards matter in suspension, with different periods of rest, with filtering of material of different sizes, and with varying arrangements as to drainage, &c. The question is raised as to whether an experiment should not be made without delay to ascertain the effect of the septic tank treatment for the destruction of the solids in suspension; also to see how far an open septic tank, or upward septic filtration through coarse material covered with a layer of sand, would be effective in destroying the sludge, and so far relieving the filter-beds. Experience in Leeds shows that either a first filtration or a septic tank, or both, must precede the fine bacteria-bed. Intermittent flow and intermittent aeration are also necessary.

In concluding, the compilers of the report say: "The subject is a complex one, but the whole drift of modern scientific thought in regard to sewage treatment is in the direction of biological treatment. It is, in fact, a return to Nature's methods in disposing of animal and vegetable decay by means of the countless organisms in the upper layers of the soil, the chemical action of which is being year by year increasingly investigated and understood."

Limohurst.—A loan of £8,500 has been sanctioned by the Local Government Board for the carrying out of the district council's sewage scheme.

For Assistants and Pupils.

THE CONSTRUCTION OF ROADS AND STREETS.—XXIV.

By WILLIAM H. MAXWELL, Assistant Engineer and Surveyor, Leyton Urban District Council.

BRICK PAVEMENTS.

The paving of carriageways with bricks has received but little attention in this country, although they have been somewhat largely used for footways. In Holland the use of brick for this purpose has prevailed for some 150 years, and in America and other countries "vitrified brick" is also very largely employed for carriageway traffic.

In England the experience derived from the use of brick upon footways shows this class of pavement to be particularly apt to wear unevenly, owing to the varying quality of the bricks. The want of attention of English municipal engineers to the use of this material has been pointed out by Mr. J. T. Eayrs, M.L.C.E., in a very interesting paper, entitled "Brick Paving for Carriageways,"* in which he says in America "It is claimed that neither granite, asphalt nor wood can offer so many advantages as vitrified brick as a paving material, and that, if properly laid, it is as noiseless as any other kind of pavement: the surface is smooth without being slippery; it offers a minimum amount of resistance to the passage of traffic, and inflicts a minimum amount of wear and tear on horses and vehicles; it is practically impervious, and therefore perfectly sanitary; is easily cleaned, and requires less scavenging than any other paving; it can be washed without injury or becoming slippery when wet; is readily taken up and relaid; reasonable in first cost and maintenance; and has a life which compares favourably with other materials, such as asphalt, wood, &c."

The city engineer of Chicago says, "Comparing brick pavements with asphalt, I believe that for general use shale brick, properly burned and of the right size, properly laid on a hydraulic cement concrete foundation, is superior to asphalt, as to its first cost, facilities and cheapness for repairs, its sanitary qualities, its ease upon horses, and last, but not least, its durability. . . . Brick can be laid on a grade where it is out of the question to lay asphalt. Brick can be washed continually without injury. . . . Brick when wet is not more slippery than when dry; asphalt is always dangerous, and if wet is more slippery than when dry, and when a horse is down on asphalt it is with difficulty that he regains his feet. Brick is not more noisy than asphalt, and as it can be continually sprinkled it is far less dusty."

In selecting a suitable brick for paving purposes the points to which the attention should be directed are—the nature of the clay from which they are manufactured, the uniformity of shape and size, absorption, specific gravity, transverse and crushing strength and abrasion.

In regard to the quality of the clay, Mr. Eayrs, in the paper above referred to, points out, "The composition of this varies very considerably in different districts, but most bricks are made from a hydrated silica of alumina, generally containing traces of magnesia, iron, lime and potash. Lime in excess is very injurious to paving brick, as it is changed to caustic lime in burning, and a small amount of moisture will cause it to slake and disintegrate the brick. A small amount of magnesia aids in producing vitrification. Iron is not injurious, but in a brick to resist high temperature an excessive quantity would be fatal. Alumina gives elasticity, and renders the material tough and binding. The alkalis act as a flux in chemical combination with the silica and alumina. One writer states that from an analysis of a large number of clays, most of them carboniferous, he finds, after averaging one with another, the alumina, silica and water make up about 85 per cent. of the material, leaving 15 per cent. for lime, potash, soda, iron and other impurities. Clays with a low percentage of these impurities, and more especially of potash, soda and iron, are fire-clays. Alumina and silica are practically infusible alone, but the presence of even 3 per cent. of potash or soda renders the whole mass easily fusible. The presence of these so-called impurities is absolutely essential where vitrification is desired. The ease with which a clay will vitrify depends largely upon the percentage of the respective impurities which act as fluxes. A clay may have so large a percentage of fluxing material as to make it too-easily fusible."

In America the sizes of paving bricks vary between $\frac{7}{8}$ in. by $\frac{3}{4}$ in. by 2 in. and $\frac{9}{16}$ in. by $\frac{3}{8}$ in. by $\frac{3}{4}$ in. by $\frac{3}{8}$ in., but the size mostly used is 9 in. by 4 in. by 3 in. They are made both with square edges and rounded nosings and with rounded tops. The square edges are mostly used, make better joints, and are more easily scavenged.

Paving bricks should not absorb more than from $\frac{1}{3}$ to $\frac{3}{4}$ per cent. of moisture in twenty-four hours. The degree of absorption is an important factor in determining the life of the pavement, as the succession of wet and dry weather, and of frost and thaw, tend to disintegrate the brick. Where the specific gravity of a brick is specified, it is required in

American specifications to be from 2'00 to 2'30. A transverse strength of about 2,000 lb. is also required, and a crushing resistance of from 10,000 to 12,000 lb. per square inch.

The greatest amount of wear on a road surface is caused by the pounding produced by horses' feet, so that paving bricks which will withstand an abrasion test will have the longest life. For this test the bricks are usually placed in a "tumbler" or "rattler," either with or without other materials. The tumbler, consisting of an iron barrel mounted on trunnions, is made to revolve at a certain speed and for a certain time, and in so doing rattles the bricks together with iron castings, or other materials placed inside with the bricks, so as to abrade the surfaces. The bricks under test are weighed before being placed in the tumbler, and again after rattling for a specified time, and the loss is then noted.

In laying brick pavements in America the only foundation adopted in many instances consists of either macadam, broken ballast, slag or gravel rolled down. In some cases the bricks have been laid without foundation, except the rolling of the natural ground and spreading a bed of sand. The necessity of a stronger foundation, however, is now being recognised, and the larger cities are adopting a Portland cement concrete foundation with a cushion, 1 in. to 2 in. in thickness, of clean, dry sand to bed the bricks upon. About seven days are allowed for the concrete to set before the bricks are laid.

The bricks are laid in straight courses at right angles to the curb, or diagonally at an angle of 60°. They are usually laid close together, without leaving spaces for joints, the irregularity in shape of the bricks being of itself sufficient for this. In some instances the bricks are even forced up towards the curb with the aid of a lever, and then wedged up with a closer; but this practice seems likely to cause the paving to lift and arch, or to displace the curbs in the event of expansion.

The bricks are next either hand-rammed or rolled with a steam or horse roller drawn by men. In ramming, a plank of 1 in. or more in thickness is frequently placed between the bricks and the rammer.

The pavement is grouted with either cement or pitch and sand. The sand used is clean, sharp river sand. In pitch grouting a semi-elastic watertight joint is aimed at, such as will not crack in winter or "spew" up in the hot season. The cement grout is mixed with sand in the proportion of from one to one and one to one and a half. The pitch or cement grouting is applied by means of a filler or funnel-shaped instrument, so that the grout is not allowed to run over the pavement, but simply to fill the joints. The curvature of cross-section of the pavement varies with the gradient, but is the same as that adopted in wood paving.

The pavement is finally covered with clean, coarse sand ($\frac{1}{2}$ in. to 1 in. in thickness), and allowed to so remain, with traffic passing over it, for about a fortnight, when it is cleared off.

This pavement is usually laid under contract, including maintenance after completion for periods from one up to five years. The life of brick paving in America is given as ranging from fifteen to twenty years under ordinary conditions, and its use for carriageways appears to be rapidly increasing.

The provincial instructor in road-making to the Ontario Department of Agriculture, in his report on "Road and Street Improvement in Ontario" for the year 1896, contains some instructive observations on the question of the use of vitrified brick for street pavements in that province. He says—

"The only competitor of asphalt is vitrified brick. This pavement has come in a most timely way to take the place of the decayed cedar-block pavements, which are disgracing the streets of so many towns and cities. Vitrified brick is becoming popular, and presents features which tend to cause it to become more so. It offers a better foothold for horses than does asphalt. The surface is not so smooth, and in consequence radiates less heat and light, is quite as sanitary, with less liability to become dusty. Among bicyclists it is much more popular than the asphalt. If the joints are filled with suitable cement brick pavement is but little more noisy than asphalt."

"The majority of failures which have occurred with brick have been traced to defects which the material or better construction could have obviated. Its ease of construction and repair offers a great advantage over asphalt, ordinary labourers being easily taught to do the work. Few repairs are needed if good brick is used, and in the first cost as well as in maintenance brick should be, and generally is, cheaper than asphalt."

"Although brick is one of the oldest paving materials, it has been used on this continent for only about a quarter of a century; and only within the last ten years has it attracted widespread attention. In the United States it has been used

* "Proceedings of the Association of Municipal and County Engineers," vol. xxiii.

very extensively, but in Ontario experience with the modern vitrified brick is very limited.

"Of its success as a paving material little remains in question. Brick pavements have been in existence in the United States for eighteen years, remaining in good condition. It was feared that the climate of northern countries, with severe frosts and rapidly-alternating conditions of moisture and temperature, would be unfavourable to its use, but the experience of various northern cities shows that vitrified brick of a good quality is a most valuable addition to our list of paving materials.

"The best vitrified brick is made of shale or clay, or a mixture of the two. It is not "vitrified," as the name indicates, but is raised by intense heat just to the point of fusion. More than this fuses or melts the clay, permits it to run together, and the product is then glassy or vitrified, and brittle in consequence. The process of cooling must be very gradual. A brick if too rapidly cooled or "annealed" will be brittle, but with a thoroughly pulverised and well-mixed shale, brought to the proper temperature and then slowly annealed, the resultant brick should be sufficiently hard and tough to scratch steel. . . . The chief tests used are—that of absorption, representing the probable effect of atmospheric action, the rattler test, showing the effect of impact and abrasion as found in the chipping of horses' hoofs and the grinding of wheels, the transverse strength, showing the power to resist the breaking strain of heavy loads. Other tests are sometimes used, such as to determine the crushing strength, and the depth to which oil will penetrate the surface, &c.

"Where in towns the facilities for performing these experiments are not available, and only short sections of pavement are to be constructed, the experience of cities will generally afford a safe guide in choosing between different makes of brick. A further safeguard may be had by requiring the contractor or manufacturer to maintain the pavement up to a certain standard for at least five years.

"There is a tendency to endeavour to reduce the cost of brick pavements by the use of a weak foundation or no foundation at all. Brick pavements laid on gravel and sand have been successful, but this has been the case only when the subsoil has been of such a kind as to be very porous, easily drained and naturally firm. The experiment in Ontario, in view of Fall and Spring conditions, with alternate freezing and thawing, is a very dangerous one, a lesson which has been strongly impressed by the experience with cedar blocks. While a brick pavement may give satisfaction for a few years on sand and gravel foundation, there is every probability that the brick will settle irregularly, and rendered thereby more susceptible to wear and strain, the bricks will be broken and the life of the pavement very much shortened.

"A concrete foundation should almost invariably be employed. A 4-in. layer will, where a brick surface is suitable, be sufficiently durable. This forms a stiff monolith base, which distributes the weight of the traffic. There cannot be irregular settlements of brick, as is the tendency with yielding materials, such as sand and gravel. It also prevents water percolating beneath the road—not a very important feature in the South, but in freezing climates a matter of considerable importance.

"Between the bed of cement and the surface covering of brick a thin cushion of sand is necessary. By this means the brick can be laid evenly, a certain amount of spring is obtained, which lessens the effect of blows on the brick, and it overcomes the rumbling noise otherwise created. It is a common practice to merely fill the joints of the brick with sand. While this is not at all objectionable, by the use of a cement composed of pitch and sand the pavement becomes less noisy, absorbs less street filth, and corners and edges of the brick are strengthened."

"McDongall's Patent "Combination Set Pavement."—This consists of a highly vitrified blue paving brick, 10 in. by 4½ in. by 5 in., containing recesses into which square wooden plugs, 2 in. long by 1 in. square, are driven, thus giving it the character of a wood pavement rather than brick. The plugs, which are previously creosoted, are intended to remain always about ¼ in. above the surface of the brick. The advantages claimed for this type of paving are: That it is not slippery and affords a good foothold for horses, that it is durable, non-absorbent, wears evenly, is cheap, and readily hauled and laid. It is laid on a concrete foundation with close joints, and grouted with hot pitch or a bituminous mixture. This pavement has been used at Cheltenham, Oxford, Preston, Manchester, Bootle and elsewhere.

At an annual meeting of municipal engineers, held in London in July, 1897, Mr. J. Hall, borough surveyor, Cheltenham, said: "I have laid several crossings with McDongall's patent bricks, and after two years' experience a motion has been adopted by the council to the effect that no other material is to be used anywhere for street crossings. The first crossing has been under observation by the police, and no record of any horse falling upon it has been made during that time, though previously it was a common experience to have two or three horses down upon a granite set crossing in the same place in a week. The cost is about the same as granite."

Largs.—The commissioners have let the work connected with their new drainage scheme to Mr. Hastie, of Ayr, the price being about £1,200.

METROPOLITAN IMPROVEMENTS.

A GROSS EXPENDITURE OF £7,591,800.

Among the local Bills already lodged at the Parliament House are the several measures prepared and approved by the London County Council. These include a measure to empower the council to make a new street from Holborn to the Strand and a widening of Southampton-row, a widening of High-street, Kensington, and to make other street improvements and works in the county of London, involving altogether a gross expenditure of something over £5,500,000.

The works in connection with the proposed new thoroughfare to the Strand are to consist of a new central street, to commence in High Holborn opposite the southern end of Southampton-row, and to terminate at or near the northern corner of the site now occupied by the Olympic Theatre; a curved street to connect the new central street with the Strand at two points, the eastern end of such curved street to form a junction with the Strand, as proposed to be widened, at or near the point where Wych-street and Holywell-street now open on the roadway west of St. Clement Danes Church, and the western end to form a junction with the Strand between Catherine-street and Wellington-street. In connection with these central and curved streets subsidiary streets or junctions are to be made with Little Wild-street, Lincoln's Inn-fields, Great Wild-street, Kemble-street, Clare-street and Clare Market, Houghton-street, and a new street is to be formed on the site of that part of Exeter-street which is situate between Wellington-street and Catherine-street. The widening of Southampton-row is to be on the eastern side thereof, commencing at Vernon-place and Theobald's-road, and terminating at Holborn; and there is to be a widening of Holborn on the northern side, commencing at the southern end of Southampton-row, and to extend some 50 yards eastward from the centre of that thoroughfare. There are also to be two new streets, one commencing in Kingsgate-street at the western end of Fisher-street and the other at Engle-street, Kingsgate-street, both to be continued into Southampton-row. The estimated cost of the whole scheme for the new street from Holborn to the Strand is £1,862,500, and of the Southampton-row widening £272,000; but the estimates in these cases and in the case of other improvements included in the Bill are calculated to cover the original cost of purchasing lands and executing the works without any allowance in respect of returns from resale or letting of lands which will be ultimately available for that purpose, and from which there should, indeed, be a very considerable return.

The other improvements proposed in the Bill are of very much less magnitude, though interesting to the localities concerned. High-street, Kensington, for instance, is to be widened on the northern side near St. Mary Abbott's Church, and a new roadway is to be constructed from Clarence-mews to the High-street, the estimated cost in this case being £308,500. Provision is made in the Bill as to accommodation for persons of the labouring classes who may be displaced in effecting the improvements.

STREET LIGHTING.

Mr. C. R. Bellamy, superintendent of street lighting to the Liverpool Corporation, has presented to the Lighting Committee of that body a report on street incandescent gas lighting. He points out the improvements and economy effected since the corporation gave attention to street lighting in 1891, resulting in a total reduction in cost to the city of £9,500, which enabled the committee to increase the number of lights in the city. Improvements in gas lighting had also been effected in the added areas since 1895. The lighting of the streets by incandescent gas could be extended, and by regulating the illuminating powers between certain hours during the night a saving could be made of 38 per cent. per lamp. He recommends that the system be extended at a rate which the surplus funds at the disposal of the committee would cover, which would provide for the equipment of 2,500 lamps in each year. This would obviate the opening of a capital account and the raising of £20,000 to £25,000, while the work could be carried out by the present staff, and the entire lighting of the city—apart, of course, from the streets lighted by electricity—with incandescent gas would be completed in four years. At the end of that period the lighting throughout the city would be increased by nearly three times where the single-burner lamp is adopted and by over five times with the double lamp, with a reduction of the permanent charges of between £3,000 and £4,000.

Bolton.—It is stated that Mr. Arthur White, the borough electrical engineer, and the electricity works staff are now busily engaged extending the electricity works in order to accommodate two 1,000 horse-power engines and two 500 horse-power ditto, together with two 600 kilowatt and two 300 kilowatt continuous-current generators for tramways and lighting purposes. It is intended to charge over portions of the town to continuous current, leaving the present alternating-current plant to supply the residential districts. This will take place during next summer. It is hoped to have the trams running next year (35 miles of track).

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C.,
Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the Offices of THE

SURVEYOR. Where possible, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only. Correspondents who do not wish their names published should furnish a nom de plume.

STREET ACCIDENT: LIABILITY OF LOCAL AUTHORITY.—In *Thurrold v. Vestry of St. George's, Hanover-square* (Queen's Bench Division, Mr. Justice Wills and a special jury, December 6, 1898), the plaintiff, a cab driver, sought to recover damages for injuries to himself and his horse and cab incurred under the following circumstances: He was driving a fare to Hyde Park-gardens on March 8th, about 8 p.m. When in Belgrave-square he passed on the right-hand side of a refuge, with the intention of going along Grosvenor-crescent, but just at that point his fare told him to go by way of Wilton-crescent, whereupon the plaintiff turned sharp to the left, in order to go through Wilton-crescent. In doing so he drove very near the refuge, and the cab was upset by a heap of sand and gravel lying close to the refuge. The gas lamp near the spot was out at the time, and while it was admitted that the lamp was not under the control of the vestry, the plaintiff contended that if they put this heap in the road they did so at their peril. The cab was thrown over, the shafts were broken, and the horse was cut. The plaintiff, who was driving, was thrown from his seat, and he had his head and wrist injured. Plaintiff admitted that on the refuge there was a notice, "Keep to the left," but he had kept to the right. This notice had been put up by the Commissioner of Police, but it appeared that the place in question was not within the "special limits" defined by the Metropolitan Streets Act, 1867, and that therefore the police had no statutory authority to put up the notice. The sand, which was required for wood paving, was now put in a tin bin on the pavement, and plaintiff said that there would have been no accident if that precaution had been adopted before. For the defendants it was contended that the plaintiff must show that the accident was brought about substantially by the defendants' negligence, and by that alone. Under the Metropolitan Management Acts the vestry had the duty of lighting the streets, and they had made a contract with a gas company to do the lighting, and through no fault of either the vestry or the gas company the lamp went wrong. It was submitted that there was no negligence in a gas lamp being out for an hour, the defect having been remedied as quickly as possible. It was the duty of the vestry to maintain the streets, and they had put the gravel where it could be most easily got at. Mr. Justice Wills, in summing up, said that the question was whether the vestry had taken all reasonable precautions to render the heap safe. If the place was not a fit one, there was carelessness. If the place was a fit one, but was not properly lighted, it was a question of negligence. He did not think that the vestry was in any better position by giving the contract for lighting to the gas company. It was the duty of the vestry to light the heap, and want of light was evidence of negligence. The jury must take into account how the traffic was likely to go. Was there any negligence in the way of putting the heap there or in its being unlighted, and, further, was there any contributory negligence by the plaintiff? The jury found that there was negligence on the part of the defendants, and that the plaintiff was not guilty of contributory negligence, and upon these findings judgment was entered for the plaintiff.

QUERIES AND REPLIES.

THE CLEANSING OF CESSPOOLS: PUBLIC HEALTH ACT, 1875, SEC. 42.—"W. A. F." writes: The owner of eighteen houses, each having a privy and two privies draining into one cesspool, has called on the urban council to empty the cesspools. Our by-law No. 13 seems only to refer to cesspools in connection with buildings to accommodate animals. The above houses, although in the urban district, are more than half a mile from the nearest sewer. There is no contract for the removal of night-soil, and only an ordinary contract for the removal of refuse. There is no sewage rate levied, but a general rate. (1) Are the local authority under any obligation to empty the cesspools? (2) Can you quote a case?

By sec. 42 of the Public Health Act, 1875, it is provided that every local authority may, and when required by order of the Local Government Board shall, themselves undertake or contract for (under the) the cleansing of cesspools. Unless, however, they have undertaken or been required by the Local Government Board to undertake this work, there appears to be no obligation on their part to perform it. I am not aware of any case on the subject.

STORM-WATER SEWER: PUBLIC HEALTH ACT, 1875, SEC. 150.—"Surveyor" writes: Have an urban district council power to enforce the payment for the construction of a storm-water drain or sewer in a private street under the provisions of the Public Health Act, 1875? At present there is a sewer which takes the sewage and storm water in the street, and the council ordered notices to be served upon the owners, under

sec. 150, and to disconnect the storm water from the sewer and to lay a separate drain for storm-water purposes.

This depends upon whether the authority have expressed satisfaction with, or were in fact satisfied with, the existing sewer; and this is a question of fact to be decided on the evidence (*Barrow-in-Furness Corporation v. Dawson*, cited in Lumley's *Public Health Acts*, fifth edition, p. 178). And if after a reasonable time after the vesting of such an authority they do nothing, and express no views on the subject, it must be taken to be conclusive as a matter of fact that at the time the sewer was originally constructed they were satisfied with it for the purpose for which it was then used (*Bonella v. Teikevhan Local Board*, 18 Q.B.D., 577). And although in *Burry and Cadoxton Local Board v. Parry* (THE SURVEYOR, vol. vii., p. 404) it was decided that a street has been declared to be a highway repairable by the inhabitants at large the powers of sec. 150 may be exercised over and over again, as occasion requires, sewers were expressly excepted from the scope of this decision, as being in a different category from paving, &c., under secs. 13 and 15 of the Act.

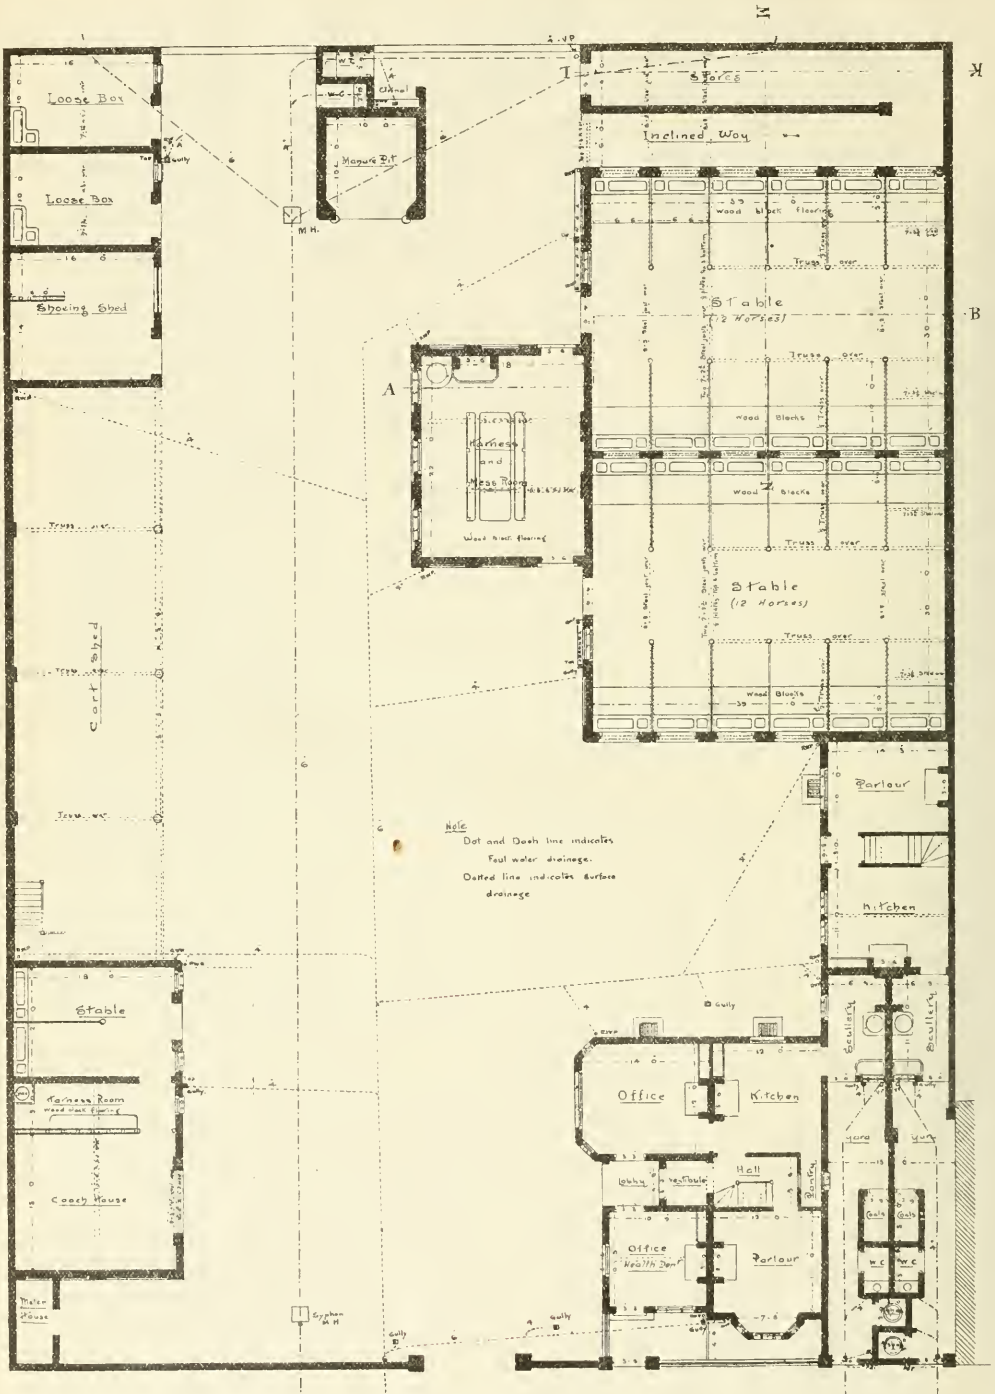

WATER-CLOSETS: FLUSHING APPARATUS.—"Dubious" writes: A certain owner of a row of old cottages in a rural district has drained the same into a new public sewer recently constructed in my district. Prior to such re-drainage the cottages were supplied with pail privies. The owner has now provided, in place of the privies, new water-closets; but without flushing cisterns or the laying on of water for flushing purposes, trusting to the tenants occasionally throwing down water from a pail or other vessel. Water is laid on to the cottages for domestic purposes. The owner refuses to do more and defies the council. Can the rural district council compel the laying on of water for flushing these closets and the provision of flushing cisterns? Would sec. 36 of the Public Health Act, 1875, apply, or could you suggest any better enactment under which to proceed?

Yes, sec. 36 of the Public Health Act, 1875, undoubtedly applies. *Sherborne Local Board v. Bogle* (46 J.P., 675) is a case precisely in point. The defendant was the owner of several houses, each having a water-closet without a flushing apparatus. The surveyor having reported that the water-closet accommodation was insufficient, the local board gave notice to the owner to provide sufficient water-closet accommodation, and on his default executed the necessary works and summoned him for the cost. The magistrate made an order against him, refusing to go into the question of the necessity for his works; and the Queen's Bench Division held that the magistrates were right, as it was for the local board to determine whether the works were sufficient, upon the report of their surveyor, subject only to the right of appeal to the Local Government Board under sec. 208.

COMBINED DRAINAGE: LOCAL ACT.—"Austious" writes: Enclosed please find copy of sec. 57 of the Edmonton Urban District Council Act, relating to combined drainage, and also a copy of a resolution adopted by the council. (a) Is such a resolution in conformity with the section? (b) Is a separate resolution required for each set of drains to be constructed? The following is a copy of the sections referred to: "If it appear to the council that two or more houses, plans for which have been approved after June 1, 1898, may be drained more economically or advantageously in combination than separately, and a sewer of sufficient size already exists or is about to be constructed within 100 ft. of any part of such houses, the council may order that such houses be drained by a combined drain, to be constructed either by the council, if they so decide, or by the owners, in such manner as the council shall direct, and the costs and expenses of such combined drain and the repair and maintenance thereof shall be apportioned between the owners or occupiers of such houses in such manner as the council shall determine, and may be recovered by the council from such owners or occupiers in a summary manner." The following is also a copy of the resolution of the council: That in future all combined back drains be constructed by the council in accordance with the Edmonton District Council Act, at the cost and expense of the owners, and that all parties submitting plans be informed at the time that all drains are so to be done.

I think it is doubtful whether the section empowers the council to make a general order applicable to all future cases. It has been held in several cases that a local authority cannot, under sec. 36 of the Public Health Act, lay down a general rule for the conversion of privies into water-closets, but that each individual case must be considered and resolved upon separately (See, among others, *Wood v. Corporation of Huddersfield*, THE SURVEYOR, vol. xii., page 210). It would be far safer to make a separate order in each case.

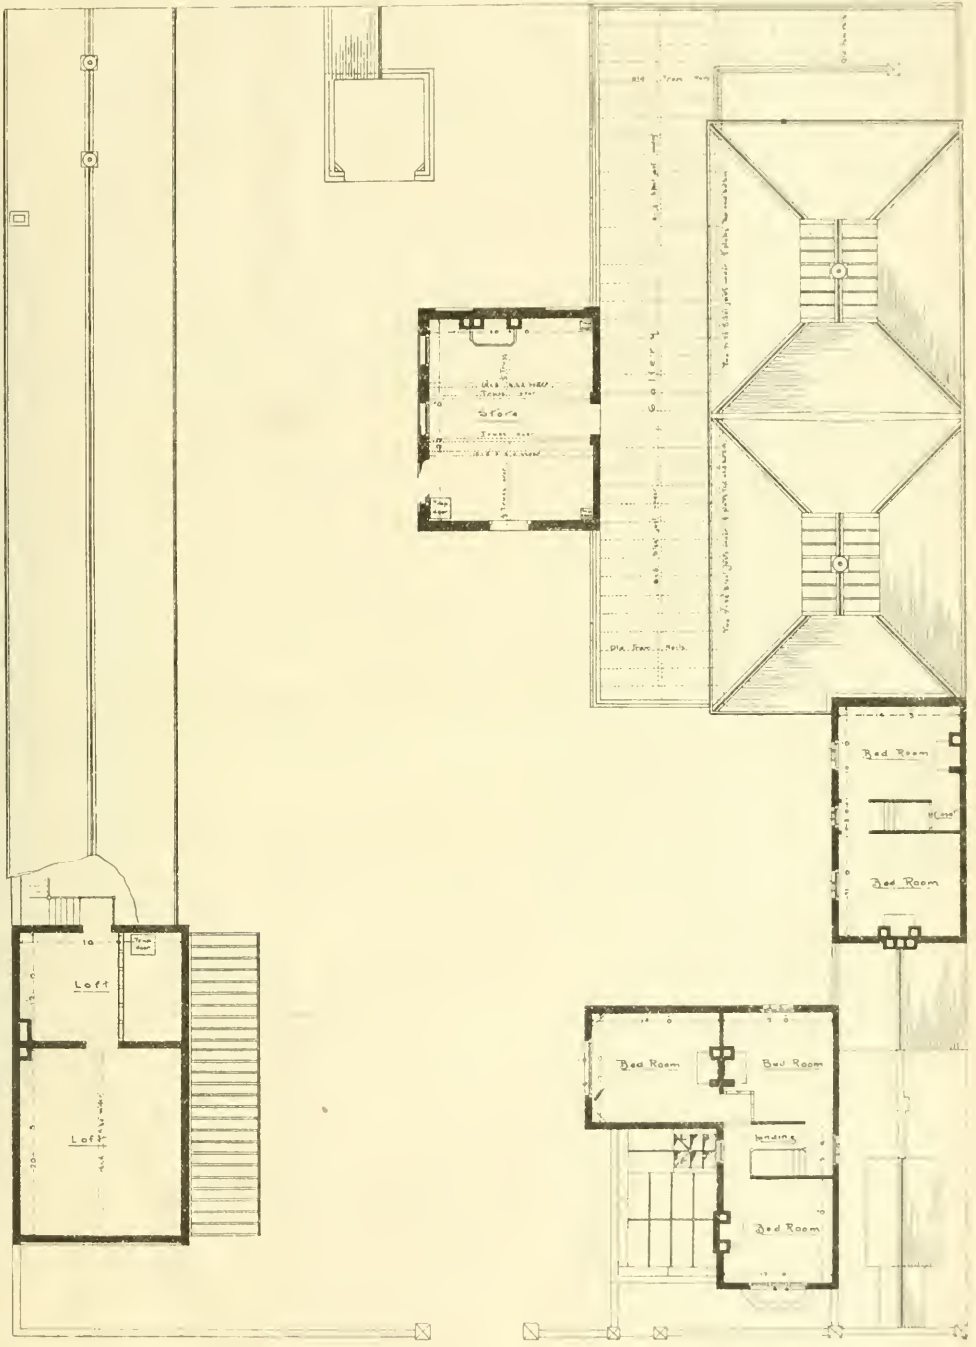

STORM-WATER SEWER: PUBLIC HEALTH ACT, 1875, SEC. 150.—"Surveyor" writes: Has an urban district council power to enforce the payment for the construction of a storm-water drain or sewer in a private street under the provisions of the Public Health Act, 1875? At present there is a sewer which takes the sewage and storm water of the street, and the council served notice upon the owners, under sec. 150, to put the street into a proper state of repair, and to disconnect the storm water from the sewer, and to lay a separate storm-water drain so as to discharge into the storm-water system of the town.

— 1st Floor Plan. —

*W. H. P. & Co. Architects
City Engineer & Surveyor.*

If the local authority have expressly, or by implication, expressed satisfaction with, or, in fact, been satisfied with, the present sewer (which is a question of fact), they cannot compel the frontagers to bear the expense of any further sewer. If after the lapse of a reasonable time after the vesting of sewers in a corporation they had done nothing and expressed no view on the subject, it must be taken to be conclusive, as a matter of fact, that at the time the sewer was originally constructed they were satisfied with it for the purpose for which it was then used. (*Bonello v. Trickerham Local Board*, 18 Q.B.D., 577; *Barnes-in-Purton Corporation v. Tuzen*, December 1, 1898; *Hornsey Local Board v. Davis*, 1893, 1 Q.B., 756.)

BUILDING ON DITCH.—"J. S. P." writes: In roads immediately outside the town there is a ditch on each side of the road. The owners of land abutting on to the road claim 4 ft. from the edge, which includes the ditch. We frequently have plans submitted showing buildings proposed to be erected 4 ft. beyond the hedge, that is over the ditch. The ditch in many cases receives the surface water from the road. Can the council refuse to pass plans where the ditch is shown to be built over? If the council are compelled to pass plans, can they call upon the owners of buildings to substitute a proper drain in lieu of the ditch?

By sec. 67 of the Highway Act, 1835, the council, as highway authority, have power to scour, cleanse and keep open all ditches; and by sec. 68 of the same Act, if any owner, &c., shall alter, obstruct or in any manner interfere with any such ditches after they shall have been made or taken under the charge of the authority without their consent he is chargeable with the cost of reinstating in addition to penalties. In *Rhodes v. Thomas* (3 J.P., 117) the appellant, having an orchard opening into a turnpike road, made an access from the orchard to the road across a ditch at the side of the road. He laid pipes in the ditch, which, being insufficient to carry off the water, obstructed the waterflow. It was held that he was properly convicted under the General Turnpike Act, 1862, of obstructing the ditch. Having regard to these enactments and this decision, I think the council would be justified in making the passing of the plans conditional upon proper provision being made for the continued unobstructed passage of water along the ditch, whether by the substitution of a proper drain or otherwise.

SURVEYORS AND INSPECTORS.

It is generally admitted that in our rural districts the sanitary administration is not so efficient as in the urban districts, and that in the former numerous insanitary conditions abound which in the latter are rarely tolerated. These nuisances, says *The Journal of State Medicine*, are due either to lax supervision or administration, or to both. If the inspectors of nuisances have done their duty these nuisances have been detected and reported, and continue to exist merely because the sanitary authorities have not followed up the inspectors' reports by insisting upon their being abated. Where an inspector is not supported in his authority the supervision naturally becomes lax, since it is useless detecting and reporting nuisances which the district council will not make an effort to have removed. There can be no doubt that in too many cases the inspectors are not encouraged in the discharge of their duties, and an energetic officer often receives a hint, which he cannot mistake, that his energies would be better employed than in detecting what we have heard rural district councillors call "little petty-fogging nuisances."

One of the most effectual ways of preventing sanitary improvements in rural districts is that of constituting the same person "surveyor and inspector." Such an officer soon discovers that so long as he keeps the roads in order and attends to nuisances reported by persons aggrieved, that he is neither expected nor desired to make any other inspections for the discovery of insanitary conditions. This dual appointment, however, is a most economical one from the district councillor's point of view. The apportionment of the salary paid rests with the district council, and as half the salary of the inspector of nuisances is refunded by the county council, naturally a very considerable proportion is allotted for the office of sanitary inspector—in fact, the payment is inversely proportioned to the work which has to be performed. This condition of things is nothing less than a public scandal, and we are glad to hear that the Local Government Board have at length recognised it as such, and are refusing to sanction all fresh appointments to the dual office. Since the formation of rural district councils, the latter have become highway authorities and are responsible for the maintenance of all public roads except the main roads, which are under the charge of county councils. In the great majority of rural districts the charge of these roads fully occupies the time of a surveyor, and as other sanitary matters of the roads must be neglected, the sanitary condition of the district suffers.

There are numerous instances also in which men not only occupy the dual position of surveyor and inspector, but have other duties imposed upon them as well, such as rate-collecting. They may also be required to act as engineers and architects, and as clerks of works whenever any sanitary work is undertaken. This is a condition of things which the Local Government Board should carefully consider, with the object of devising some way in which it can quickly be ended. Re-appointments should not be sanctioned in any district in which the district council have control of more than a certain length of road, nor in which the surveyor and inspector is also required or permitted to hold other offices. Until this is done there is very little hope for any improvement in the sanitary condition of our rural districts. The arrangement not only prevents the performance of the duties of the nuisance inspector, but it practically removes that officer

from the control of the medical officer of health, and seriously diminishes the usefulness of that official. The reason usually urged for combining the two appointments is that the surveyor has constantly to visit every parish in the district, and that at such times he can always look round and attend to any sanitary matters which come under his notice. However plausible this may be in theory, it is lamentably inaccurate in fact. The duties which now devolve upon an inspector of nuisances are so numerous and varied, and so frequently of such a character as to require immediate attention, that it is utterly impossible for them to be satisfactorily discharged by a surveyor who has a number of labourers under his control and who must do his systematically if he is to do it satisfactorily. The subject is of the greatest importance in the interest of rural sanitation, and whilst the action of the Local Government Board in refusing to sanction fresh dual appointments is to be commended, the board might fairly consider every case of reappointment, and refuse to sanction all such where it appears impossible for both duties to be discharged satisfactorily by the same person.

NEW LONDON WATER BILLS.

Among the private Bills relating to new water schemes other than those promoted by the London County Council is one promoted by the West Middlesex Waterworks Company. This company have deposited a measure to confer further powers upon themselves with respect to the construction of works, taking of water from the river Thames, raising further capital, and for other purposes. The preamble of this Bill declares it to be expedient that, pending the completion of the works authorised by the Act of 1896 and the Staines Reservoirs Act of 1898, the company should be empowered to draw from the Thames a further quantity of 24,500,000 gallons, which they are now entitled to draw, on any one day. The company may, if the Bill becomes law, raise additional capital, not exceeding in the whole £250,000, by the creation and issue of debenture stock. Another of the measures is the Metropolitan Waterworks Company's Bill. Under this measure it is proposed, "with the view of obviating the possibility of a deficiency in time of drought, or by reason of accident, or in cases of emergency in the quantity of water which any one or more of the metropolitan water companies may be able to supply within their district or districts, that provision should be made for improving and facilitating inter-communication between the mains and works of those companies respectively, and that such obligations shall be imposed upon those companies and such powers given to the Local Government Board, and such provisions made as is in the Act contained." The Local Government Board are to be empowered to sanction such quantity of water to be taken temporarily from the Thames and its tributaries as in the opinion of the board may be necessary for preventing any deficiency in the supply of water within the district of any of the companies. The East London Waterworks Company have deposited a Bill to enable them, with the sanction of the Local Government Board, to take further water from the river Thames in cases of exceptional drought and other emergencies, and another Bill to authorise them to construct additional storage reservoirs and other works, and to enable them to raise further capital by the creation and issue of debenture stock in a sum or sums not exceeding in the whole £1,500,000.

PROPOSED LONDON MARKETS.

The copy of a Bill which will be introduced into Parliament next session has been deposited for the purpose of incorporating a company with powers to establish markets at Millwall and Shoreditch. The Millwall market, which will adjoin the Millwall dock, is intended to be "for the sale of cattle, horses, sheep, pigs, poultry and other live-stock imported from Ireland," whilst the market at Shoreditch is proposed to be confined to "the sale of British, Irish and colonial butchers' meat, fish, poultry, game, eggs, corn and other cereals, hay, straw, fodder, roots, fruit and vegetables, and other produce." The capital which it is estimated will be required to carry out this scheme is £3,000,000, of which £600,000 will be raised by mortgages on the markets.

Auctioneers' Institute.—The third meeting of the session of the above Institute will be held on Tuesday, January 3, 1899, at 7.45 p.m., when a paper will be read by Mr. Walter Simms, F.A.I., F.S.I., on "The River Thames." The chair will be taken by the president, Mr. Edward Dobson.

Kilsyth.—The police commissioners last week considered a report by Mr. Frew, of Messrs. Kyle, Denison & Frew, Glasgow, on a proposal to increase the present water supply by about 200,000 gallons per day by erecting a reservoir at Corrie, on the Campsie Hills. The scheme is to cost between £7,000 and £8,000, and the principle being adopted, it was remitted to a committee to see what compensation rates would require to be given.

Municipal Work in Progress and Projected.

Hard and steady work seems to be the order of the day with the majority of the provincial authorities, as will be seen from the paragraphs relating to East Sussex, Lancaster, Barry, Chester, Shrewsbury, Southend-on-Sea and other towns. The metropolitan authorities, too, appear to have their hands full.

METROPOLITAN AUTHORITIES. VESTRIES AND DISTRICT BOARDS.

Bernoudsey.—The Finance Committee recommended the vestry, at their last meeting, to purchase 300 additional dust-pails, as they were greatly needed. The recommendation was adopted.—The Electric Lighting Committee reported the receipt from the Lee Board of Works of a letter stating that it would be convenient for representatives of the local authorities affected by the application of the County of London and Brush Provincial Electric Lighting Company for a provisional order to meet in conference to consider the proposal. The board pointed out that the authorities concerned by the application were those of Bernoudsey, Deptford, St. Paul's and St. Nicholas, Deptford, Lambeth and Lewisham, and they suggested that one of the members and the clerk should attend the proposed conference on the 5th proximo. Having, however, already decided to oppose the company's application, the Electric Lighting Committee announced that they had informed the Lee Board of Works that no benefit would accrue by being represented at the conference.—The General Purposes Committee reported the receipt from the London County Council of a letter announcing that the Parker's-row improvement scheme, together with a number of others in various parts of the metropolis, would be taken into consideration by the Improvements Committee in February next.

Lambeth.—The Sanitary Committee reported to the vestry, at their last meeting, that they had reconsidered the proposal of the Public Health Committee of the London County Council in regard to the establishment of public abattoirs, and a letter on the subject from the Clerkenwell Vestry. On the recommendation of the committee the vestry resolved to co-operate with the Clerkenwell Vestry in protesting against the proposal of the county council to abolish private slaughter-houses and erect abattoirs at the expense of the ratepayers.—In a report submitted by the Sewers Committee it was stated that Mr. Spicer, the delegate appointed to represent the vestry at the conference of metropolitan local authorities to consider combined drainage, had informed them that the conference had held their final meeting. It had been decided to promote a Bill in the ensuing session of Parliament to amend the law relating to combined drainage, and a draft of the Bill would be sent to the clerk of each vestry and district board.—On the recommendation of the General Purposes Committee it was decided to pave Electric-avenue with wood as soon as possible, at an estimated cost of £1,020.—The Lighting Committee presented a report in reference to a communication received from the Lee Board of Works drawing attention to the proposal of the County of London and Brush Provincial Electric Lighting Company to obtain a provisional order to lay trunk mains through Bernoudsey, Rotherhithe, Deptford, Lambeth and Lewisham. The board pointed out that it would be convenient for representatives of the local authorities to meet in order to consider the proposal, and invited the vestry to nominate delegates to attend the conference. It was decided to postpone the consideration of the question, but in the meantime to object to the company's application.—A further report was submitted by the Lighting Committee in regard to the resolution passed at the previous meeting, desiring to have twenty-five arc lamps erected in the positions determined some time ago in accordance with an arrangement made with the South London Electric Supply Corporation. With reference to the cost of the standards for the twenty-five lamps, the committee stated that they intended at the proper time to invite tenders, by advertisement, for the supply of the columns.—After a long delay, the vestry considered the question of appointing a committee to inquire into the statements and charges made on the subject of the transfer of the electric lighting provisional order. Mr. Cooper, who intended to propose the members of the committee, stated that as the Progressive party had declined to serve on the committee, he would not proceed with the motion, which was accordingly dropped.—The following tenders were considered for the construction of a thirteen-stall animal in the Upper Marsh: McDowell, Stevens & Co., 4 Upper Thames-street, E.C., £84; W. McAuliffe & Co., Saracen Foundry, Glasgow, £105; and G. Smith & Co., San Foundry, Glasgow, £170. The tender of the first-mentioned firm was accepted.

Paddington.—In reference to the letter from the Union of Women's Liberal and Radical Associations of the Metropolitan Counties requesting that a free compartment be provided in all public conveniences for women, the Works Committee announced, at the last meeting of the vestry, that they had informed the associations that a free compartment was provided for women in the Wallerton-road lavatory, that being the only public lavatory in the parish constructed for the accommodation of both sexes.—It was resolved, on the

recommendation of the Works Committee, that the existing sewer in Elgin-mews should be reconstructed with 9-in. pipes, at a cost not exceeding £375.—On the recommendation of the Electric Lighting Committee it was decided to concur with the views expressed by the Hammersmith Vestry to the effect that, in the event of legislation being brought forward on the lines indicated in the report of the Joint Committee of both Houses of Parliament upon the subject of electrical energy (generating stations and supply), they had decided to take up a strong position in opposition thereto.

Poplar.—At a meeting of the board of works, last week, the Works Committee recommended, and it was agreed, "that the plan of the surveyor for a public convenience for women, in Bow-road, at the rear of the Gladstone statue, be approved, and the work of constructing such convenience be carried out by direct labour, at an estimated cost of £650; and that the consent of the Local Government Board be asked to the necessary borrowing."—It was also decided to inform the London County Council, in reply to their inquiry, that the board were willing to contribute £500 towards the cost of the scheme known as Carpenter's-road improvement, under the conditions named by the council.—The Works Committee recommended the board to carry out the construction of the additional bath, &c., accommodation at Brouley depot by direct labour, at an estimated cost of £99 17s. The recommendation was adopted.—The Electric Lighting Committee submitted an important report in reference to the proposed electric supply scheme for the district, but its consideration was adjourned till next meeting, as was also a report of the Works Committee embracing a long list of carriageways and footways which required to be paved or repaired. The total cost of these latter works was estimated at £43,851, while £79,000 was the estimated total cost of the electric supply scheme. Full particulars of this latter scheme will be found in another column.

Rotherhithe.—At the last meeting of the vestry consideration was given to a report of the General Purposes and Works Committee on the subject of the abolition of private slaughter-houses, and it was eventually decided to protest against the proposal which is now before the London County Council in connection with the matter.—A resolution of the same committee, suggesting that the vestry's support should be given to the Bill for the amendment of the law relating to workmen's trains, was adopted, it being at the same time resolved to forward copies of the motion to the Government and the Parliamentary representative of the division.—Consent was refused in the case of a proposed application of the City of London Brush Provincial Electric Lighting Company to the Board of Trade for a provisional order to supply electricity in the parish.—The consideration of various matters relating to London local government was adjourned, it being understood that a special committee would be formed shortly after Christmas to deal with them.—Agreement was expressed with the views of the Hammersmith Vestry in regard to the report of the joint committee of both Houses of Parliament upon the subject of electrical energy.—No decision was arrived at in regard to a proposal to construct an underground convenience in the vicinity of Southwark Park-road, but the clerk and surveyor were directed to give the matter their joint attention and report at an early date.—As the vestry had already signified their approval of the proposed establishment of bacteriological laboratories by the county council, no action was taken respecting a letter on the subject from the secretary of the Clinical Research Association, Limited.

Shoreditch.—At the last meeting of the vestry it was decided to apply to the Local Government Board for sanction to borrow £2,025 for the construction of the Hoxton-street underground convenience.—The Finance Committee recommended that application should be made to the London County Council to borrow £11,582 for paving and sewerage works and for additions to the Flanning-street depot. This was agreed to.—A letter was read from the clerk to the Holborn Board of Works drawing attention to the draft Bill prepared with a view to an amendment of the law relating to combined drainage, and stating that the principle of the Bill was approved by Parliament in the case of the West Ham Corporation Bill passed last year. The Holborn board asked the vestry to support the Bill, and it was decided to do this and to urge upon the local members of Parliament to render assistance, and, if necessary, to bring forward the Bill in question.—After a consideration of the question of abattoirs and of letters received on the subject from the London Chamber of Commerce and the Butchers' Trade Society, the Public Health Committee recommended the vestry to make representations to the London County Council in opposition to the proposed establishment of public slaughter-houses. It was, however, decided to take no action in the matter.—The Lighting Committee reported that they had considered reports from the vestry clerk and the chief electrical engineer on the question of acquiring a site for the erection of a new electricity generating station. As a result the committee submitted the following recommendations: (1) That it is desirable that an additional site should be acquired, of sufficient size, and in such a

situation in regard to railway or canal accommodation, as to be suitable for meeting the increasing demands for electric light and power; (2) that the vestry clerk be instructed to approach the Ironmongers' Company with a view to the purchase of their property known as the Ironmongers' Almshouses; and (3) that a specification be prepared by Messrs. Kincaid, Waller & Manville, in conjunction with the chief electrical engineer, with a view to obtaining tenders for two 750 kilowatt sets of engines and dynamos, with necessary boilers and switch gear, &c., in preparation for the new station. These recommendations were discussed by the vestry in committee.—It was decided to pave Mill-road with asphalt and to improve the sewer in that road, at a cost of £1,145.—The tender of the British Insulated Wire Company, of Prescott, was accepted for the supply of electric cables for the Haggerston district.

St. Mary, Stoke Newington.—The vestry met on Tuesday last week, when the General Purposes Committee brought up a recommendation in reference to the Cheap Trains Bill. They suggested that the vestry, while not agreeing with all the provisions of the bill, should express their agreement with the opinion that further facilities in relation to workmen's trains were urgently required, and this was agreed to.—Sanction was given to a proposal to appoint four delegates to attend a conference of the various boards affected by the decision of the London County Council to apply to Parliament for the transfer to the local authorities of the duty of maintaining main and distriknipked roads.—Approval was given to a recommendation that in replying to a letter from the county council in reference to the London Overhead Wires Act, 1891, the vestry should state that nothing had as yet been done in this connection, and that they did not at present consider any action necessary.—It was resolved to oppose an application for an electric lighting provisional order which the County of London and Brush Provincial Electric Lighting Company shortly proposed to make.—The county council, it was stated, had declined, on the ground that the improvement did not appear to be of a character to justify their so doing, to contribute to the suggested widening of Wordsworth-road, but it was decided, in view of its importance, to carry out the work at the sole cost of the parish.—The establishment of public abattoirs was, in the opinion of the Sanitary Committee, both unnecessary and inexpedient, and would not meet the end desired. They further considered that an efficient official inspection of meat could be obtained without such provisions. The vestry concurred.—It was decided to receive a circular letter on the subject of district surveyors from the London County Council.

St. Pancras.—At the last meeting of the vestry it was announced by the Baths Committee that Mr. A. H. Tiltman, F.R.I.C.A., had placed before them draft instructions and conditions for the guidance of architects competing for the new baths to be built in the Prince of Wales-road. The committee had carefully gone into the matter and had finally settled the instructions, which, on the recommendation of the committee, the vestry decided to approve.—On the recommendation of the Electricity and Public Lighting Committee it was decided to apply to the London County Council for a loan of £30,000 for the purposes of extensions at the Regent's Park electric light station. The committee reported that they had been in communication with the Board of Trade respecting the supply of electricity to consumers whose premises were situated on the border line of the parishes of St. Pancras and Islington. The board stated that they had no power to authorise the erection of overhead wires, as suggested by the vestry, and that the question was a matter for arrangement between the two local authorities. The Electricity Committee considered that an arrangement for dealing with that and similar cases that would from time to time arise should be made, and at the suggestion of the committee it was decided to ask the Islington Vestry to appoint a small committee to meet the St. Pancras committee with the object of promoting a reciprocal agreement dealing with cases of the kind incidental to the Beckenhook and York roads.—It was resolved to co-operate with the Hammersmith Vestry in opposing any legislation proposing to give effect to certain recommendations of the Parliamentary Joint Committee on the Supply of Electrical Energy, especially in regard to the opening of streets for the laying of mains and the granting of provisional orders.—The chairman of the Health Committee consented to withdraw for further consideration a report relating to the acquisition of additional lands in connection with the Llantomic-place and Prospect-terrace improvement schemes.—It was decided, on the recommendation of the committee, to affix the seal of the vestry to petitions to the Local Government Board for the holding of a local inquiry for carrying into effect the Chapel-grove and Eastnor-place improvement schemes.—At the suggestion of the Highways Committee the vestry decided to repave with hard wood the carriage-way of Goady-street from Tottenham Court-road to the parish boundary, at an estimated cost of £1,000.—A long discussion took place on the presentation by the Works Committee of a report dealing with the proposal made by Mr. Hillyard that no more broken granite should be ordered until the whole of the sets now lying at the various depots were disposed of. Although the committee were not prepared to entirely agree with the proposition, they recommended that no further granite should be bought until the stock of granite

had been removed from Bangor Wharf alone. In connection with this matter a letter was read from Mr. W. N. Blair, the engineer to the vestry, stating that if the committee's recommendation was adopted it would mean the discharge of more than half of the macadam labourers. The recommendation was, however, adopted.—It was resolved, in the event of the cargoes not arriving in time to permit Messrs. Palfreman, Foster & Co. to supply smaller wood blocks at a reduction in price, for the paving of Guilford-road, on condition that the company would undertake to defray the extra cost of laying the blocks.—The following tenders were received for alterations to the first-class swimming bath at the Whitehall Terrace establishment: Messrs. H. M. Dove, 131 Euston-road, £88; E. R. Jones, 137 Albany-street, N.W., £94; W. Titmus & Sons, Grafton-street, W.C., £16 15s.; and P. Bedford Pitch, 5 Fitzroy-street, W., £55. The tender of Mr. H. M. Dove was accepted.

Strand.—At last week's meeting of this board a letter was read from the Gas Light and Coke Company in regard to the complaints made of the quality of the gas supplied in the Strand district, respecting which a petition was received from tradespeople and ratepayers in the locality calling attention to the indifferent lighting of Charing Cross-road from Cranbourn-street to Cambridge-circus. The gas company contended that as the inspectors of the London County Council were satisfied with the quality and illuminating power of the gas supply in the Strand that should be sufficient. It was decided to forward the letter to the London County Council.

St. Saviour's, Southwark. The district board of works have accepted the tender of Messrs. E. H. Bayley & Co., Newington-causeway, S.E., for the supply of three stop-valves, at a cost of £40 each.

PROVINCIAL AND GREATER LONDON AUTHORITIES. COUNTY COUNCILS.

East Sussex.—Last week, at a special meeting of the county council, the vice-chairman submitted the report of a committee on a new asylum. This recommended that the preliminary plans and estimates should be approved as submitted and as provisionally approved by the Local Government Board, and that the necessary steps be taken to give effect to this resolution, and to authorise the architect, Mr. Hine, to proceed with the preparation of detailed plans, &c. The vice-chairman dealt with the question of expense, and said that it had been put down at £200,000. Allowing £90,000 as the sum to be received from Brighton for the Haywards Heath asylum, that would leave £110,000 to be provided. The report was subsequently adopted unanimously, after which it was resolved to adopt a report of the Finance Committee recommending an application to the Local Government Board for permission to borrow the necessary money.

MUNICIPAL CORPORATIONS.

Barnsley.—The council last week adopted recommendations of the Park and Lighting Committees: That, subject to the consent of the Local Government Board to borrow money for electric lighting being obtained, the following tenders be accepted: For plant, boilers, &c.—Messrs. W. Arnold & Co., £3,260; engines, dynamos, plant, &c.—Messrs. Johnson & Phillips, £8,030; storage batteries, &c.—Messrs. Pritchett & Gold, £1,310, and £70 per annum for maintenance of batteries; electrical mains—The British Insulated Wire Company, £6,322 1s. 2d., and £110 per annum for maintenance. Buildings: Tall chimney—Messrs. Mellor, £200; bricks—Messrs. masons', &c., work—Messrs. J. K. Taylor & Sons, £1,242; carpenters' and joiners' work—Messrs. Robinson & Sons, £385; plasterers' and slaters' work—Messrs. Fleming, £57 and £113; plumbers' and glaziers' work—Mr. S. Rushforth, £57; smiths' and foundry work—Messrs. Newton, Chambers & Co., £166 19s. 8d.; painters' work—Mr. Thomas L. Stephenson, £10.

Bootle.—The town council have decided to extend the electric supply mains, at an estimated cost of £1,175.

Cardiff.—The purchase by the corporation of Cathays Park from the Marquis of Bute has been completed, a cheque for £160,000 having been paid over. The area of the park is about 60 acres.

Choster.—Mr. C. A. Sandford Fawcett, M.P., recently held an inquiry, on behalf of the Local Government Board, in reference to an application of the town council for sanction to borrow £20,000 for electric light extensions.

Chorltonfield.—Negotiations are proceeding in connection with a proposal to purchase a strip of land and half the river course on the west side of the corporation land at the mouth of the slaughter-houses, and the Markets and Public Baths Committee have approved of recommendations of the Cattle Markets Committee that the council purchase certain land adjoining the proposed cattle market and supported the adoption of the recommendation and instruction of the committee.

Congleton. The corporation are about to erect new technical school premises, and have appointed Messrs. Wm. Sturden & Son, F.R.I.C.A., Beck and Hanley, to be their architect.

Codmanchester.—A Local Government Board inquiry was held recently in respect to an application of the corporation

for sanction to borrow £1,000 for enlarging and repairing the municipal buildings.

Cravesend.—The new borough market, which has been entirely rebuilt, was recently opened by the mayor. The walls of the market inclose a space 135 ft. by 48 ft. It has a floor space of 7,000 ft., in addition to 1,600 square feet available for fish sales. Its main roof is formed by sixteen wrought-iron principals resting on thirty-two iron standards, one long skylight forming a ridge of the roof. The cost of the building, including municipal offices at the side, was £3,000. Accommodation is provided for fifty-nine general, nine meat, and sixteen fish stalls.

Hasiingden.—The mayor has stated that, if the electric lighting scheme proved a success, it was proposed to extend the use of electricity to the running of the trams. Consequent on the proposal of the Accrington Town Council to buy out the company, there has grown among the Hasiingden Town Council a feeling that, inasmuch as the several corporations through whose boroughs the company run have certain powers of purchase, the company ought, when the time comes, to be bought out by the corporations jointly.

Ipswich.—The corporation have decided to extend and relay the sewers in various outlying parts of the town, in accordance with plans prepared by the borough surveyor, Mr. E. Buckham, at an estimated cost of £3,000, and also to widen Short-lane, St. Helens and St. Clements, at a further cost of £1,445. A scheme for the widening of the narrow portion of the main thoroughfare known as the Butler Market, at an estimated cost of £8,000, has been referred back to the committee.

Keighley.—The town council last week decided to invite competitive plans from architects for the new municipal offices which it is proposed to erect at a cost of £5,000.

Lancaster.—At the last monthly meeting of the town council it was resolved to make an application to the Local Government Board for sanction to borrow £30,000 for the purchase of the King's Arms Hotel, £3,500 for alterations thereto so as to provide a vegetable market, and for sanction to sell 2,000 square yards of land to the railway company for new station purposes.

Leeds.—The purchase by the corporation of the Yorkshire House-to-House Electricity Company's business was completed on the 15th inst. The total amount of money transferred for the undertaking was £222,987.—The Markets Committee of the corporation have instructed Mr. Thomas Hewson, the city engineer, to prepare a ground plan of the new market hall which it is proposed to erect in Vicar-lane, so as to enable them to advertise for competitive designs from architects.

Liverpool.—At a recent meeting of the Baths Committee it was reported that during the present year close upon 1,000,000 persons had availed themselves of the privilege of bathing at either the enclosed or the open-air corporation baths. Of this number upwards of 600,000 had paid admission fees, and it is not surprising that, while the expenditure was about the same as last year, the receipts so far show an excess of £200.

Newport, Isle of Wight.—Much interest was manifested at Newport, Isle of Wight, on Wednesday of last week, on the occasion of the opening of new waterworks, constructed at a cost of about £21,000. The ceremony of turning on the new supply was performed by the mayors, in the presence of a large assembly. Princess Henry of Battenberg, the governor of the island, was represented by the deputy-governor. The source of supply is on land belonging to Sir Charles Seely, who has afforded the corporation many facilities. Mr. Baldwin Latham, the engineer of the works, stated that the supply was sufficient for several towns the size of Newport, and the absolute purity of the water was attested by the highest analytical authority.

Norwich.—The city council have referred to a special committee the consideration of the desirability of erecting a town hall, the guildhall in the market place now in use, and built five centuries ago, being utterly inadequate for municipal purposes.

Ripon.—At the last meeting of the city council the mayor submitted for confirmation the minutes of the Gasworks Committee, which recommended that the tender of Messrs. W. & C. Holmes, of Huddersfield, for a new gas-holder and brick and puddle tank be accepted at £3,016, but that if, when the excavation is completed, the foundations be found unsuitable for a brick and puddle tank the same firm's tender for holder and steel tank at £3,499 be adopted instead. The recommendation was unanimously adopted.

Sheffield.—Profiting by the experience of Bradford, the Sheffield Tramways Committee has been seriously considering the question of brakes, in order to minimise the difficulties of steep gradients and curves occurring on the Walkley electric line. In addition to the ordinary brakes there will be slipper brakes employed, and these are considered sufficient to overcome all difficulties.

Shrewsbury.—Local Government Board sanction has been received by the corporation to the borrowing of £30,463 for the purchase of the Shropshire electric light works.

Southampton.—One of the inspectors of the Local Government Board recently held an inquiry respecting an application of the corporation for a provisional order under the Public Health Act to borrow additional money for the purposes of their waterworks undertaking. Mr. W. Matthews, waterworks engineer to the corporation, explained that the £124,500 already sanctioned and borrowed was practically exhausted. During the next five years the corporation would require £25,000 for the purpose of executing additional works in order to meet the increasing demands for water for domestic and sanitary purposes, owing to the continued increase and development of the borough.

Southend.—A Local Government Board inquiry has been held by Mr. W. O. E. Meade-King concerning the applications of the council to borrow the following sums—viz., £5,500 for cemetery purposes; £8,200 for a stores depot; £3,280 for new underground conveniences; £1,162 for works in connection with the pier, including the new electric cars; £916 for works of sewerage; and £254 for private street improvements to Clifton-drive.

Southport.—The Electricity Committee have decided to recommend the town council to apply to the Local Government Board for power to borrow £3,500 for the provision of a condensing reservoir for the electricity.

Sunderland.—It was reported, at a recent meeting of the town council, that the Local Government Board had, after some considerable delay, eventually issued an order confirming the Hat Case area improvement scheme, so that now the corporation would be allowed to erect dwellings for 325 instead of 450 persons, as originally proposed, and to demolish the whole of the buildings before any of the new dwellings were erected.

Walsall.—Consideration is being given by the council to the following resolution: "That in the opinion of this council it is desirable that, wherever practicable, works of street-making, sewerage and other similar works should be carried out by workmen in the direct employ of the corporation, under the supervision and direction of the staff in the borough surveyor's department; and that the Streets Committee be requested to take the matter into their consideration, and, if practicable, carry out as an experiment a portion of the works in connection with the proposed surface-water drainage scheme."—The tender of Mr. James Atkins, Ryecroft, Walsall, has been accepted by the town council for the construction of surface-water sewers in Field-street and Sandwell-street, at a cost of £99 12s. and £50 10s. 6d. respectively.

Welshpool.—The council have decided to proceed with the construction of new filter-beds and other works. They have also instructed Messrs. Beloe & Priest, of Liverpool, to prepare specifications, and have further decided to make an application to the Local Government Board for sanction to borrow the necessary money—£2,000.

Yarmouth.—The Yarmouth and Gorleston Tramway Company recently wrote asking the corporation to supply current for traction purposes, on the basis of 2d. per unit up to 150,000 units, at 1½d. between that limit and 200,000 units, and exceeding 200,000 units at 1½d. per unit; and also asking that the time within which the tramways became purchasable should be extended to twenty-one years, making twenty-seven years from the present time. The Lands Committee recommended the council not to entertain the application. When the matter came before the council, last week, an amendment referring it back to the committee was negatived.

URBAN DISTRICT COUNCILS.

Barry.—The Public Works Committee of the council have decided to borrow £13,000 for new street and other works.—The following new loans have been sanctioned by the Local Government Board: £2,936 for widening Cardiff-road, £541 for Palmerstown-road, £489 for St. Nicholas-road, and £3,298 for roads around Cadoxton Common; but it was decided to defer these works for the present, notwithstanding a protest that the roads were in a disgraceful condition.

Carshalton.—The two following tenders were received by the district council for the making-up of Denmark-road in accordance with plans and specifications prepared by Mr. W. Willis Gale, surveyor to the council: Mr. A. Jenner, Sutton, £1,417, and Messrs. Free & Son, Maidenhead, £2,200. The first-named tender has been accepted. The surveyor's estimate for the work was, we may mention, £1,452.

Epsom.—A contemporary states that the Lighting Committee of the district council recently visited Harrow for the purpose of obtaining reliable information in regard to electric lighting, as the population of that town is nearly the same as at Epsom, and came to the conclusion that electric lighting was desirable for Epsom. Mr. Hawtayne's 1896 report to the council was looked up. In that report the estimated cost of the undertaking was given as £14,980, and the estimate of the probable receipts £2,178. The plan as arranged would be of ample size to deal with the whole of the public lighting in addition to providing 5,000 private lamps, and room would be left for putting in an additional plant when required. The committee recommended that Mr. Hawtayne be instructed to prepare specifications of the necessary works to be carried out in all the streets mentioned in the compulsory area, and the whole of the district as at present lighted by public lamps.

that tenders be advertised for. In view of the importance of the matter, a special council meeting was to be held yesterday to consider it.

Hornsey.—On the 19th inst. the Works Committee reported that at the last meeting of the committee the tender of Mr. J. A. Dunmore for the construction of a proposed new road through Queen's Wood, for £3,278, had been accepted, subject to approval of tenders and to the execution of the usual contract and bond. The surveyor submitted plans and an estimate, which were approved and passed, for the making-up of Prince's-avenue, Muswell Hill.

Idle.—The district council have decided to purchase a plot of land for £2,300 as a site for the proposed Thackley sewage works.

Kingswood.—On Thursday last Mr. H. Percy Boulnois held an inquiry, on behalf of the Local Government Board, in reference to an application by the Kingswood Urban District Council for sanction to borrow £2,700 for work of private street improvement and £320 for the purchase of certain sanitary appliances. No objection was raised to the proposed loans.

Llandudno.—Upon the recommendation of the Finance Committee it has been decided to apply to the Local Government Board for sanction to borrow a sum of £1,170 for hospital extension purposes.—A long statement was made at the last monthly meeting by Mr. W. Williams, chairman of the Sanitary Committee, as to the sanitary condition of the town. This, he said, was excellent, there being not a single house unfit for human habitation.

Padiham.—The contract for the supply and delivery of 530 yards of unclimbable iron hurdle fencing and 760 yards of wire fencing, for the district council, has been let to Mr. James Starkie, of Preston.

Portishead.—The contract for the construction of main drains throughout Portishead has just been completed for the district council. Mr. Moss Flower, C.E., late surveyor to the council, designed and superintended the execution of the works, and Messrs. J. & T. Binns were the contractors.

St. Anne's.—The Local Government Board have sanctioned the borrowing by the district council of £7,340 for sewerage works in the north-western portion of the district.

Waterloo.—At their last meeting the district council resolved to apply to the Local Government Board for sanction to a loan of £550 for electric lighting purposes.

RURAL DISTRICT COUNCILS.

Aberystwyth.—The council have resolved to apply to the Local Government Board for sanction to borrow £692 for the supply of water to the village of Llanbadan, which lies outside the town of Aberystwyth.

Betts-y-Coed.—An inspector of the Local Government Board recently conducted an inquiry in reference to the application of the district council for permission to borrow £265 for sewerage works and £91 for water supply works in the parish of Trofriw.

Bury.—On the 21st inst., at a meeting of this authority, the clerk drew attention to the two Water Bills which were proposed to be promoted in the next session of Parliament by the Bury and Rawtenstall Corporations respectively. The proposed Rawtenstall waterworks would be partly in the Bury rural district and partly in the Ramsbottom rural district, and Rawtenstall proposed to separate themselves entirely from Bury. The loss of the revenue now derived from Rawtenstall would be a serious loss to Bury, and it was proposed that the Bury Rural District Council should appoint two representatives to a standing committee, consisting of representatives from Radcliffe, Ramsbottom and Whitefield Urban District Councils and the Bury Rural District Council, to watch the progress of both the Bury and Rawtenstall Bills.

Crimsby.—The Louth Rural District Council have written to the effect that they agreed to the proposals of the council with regard to certain temporary repairs to the Hamberstone and Tenney bridge, and were prepared to pay half the cost. They thought it best to postpone the work of building a new bridge until spring.

Landaff.—The excavations made by the council at Maindy in connection with certain sewerage works have resulted in the unexpected discovery of springs which yield a copious supply of water. The original intention of the council was to make a large cesspit, 40 ft. by 20 ft., to receive the drainage from Pontcanna and to pump from thence to a higher level. The depth of the pit was to be 17 ft. The subsoil was soon cleared out and solid rock reached. When a depth of some 30 ft. had been attained water began to ooze up at one corner of the pit. As the work went on the water accumulated quickly, and by the time the pit had been deepened to 30 ft. three other springs were tapped, and the water flowed in so abundantly that operations had to cease. Since then a powerful pumping engine has been at work almost continuously, but the pit still has nearly 30 ft. of water in it. The water has also flooded the landing along which the Pontcanna sewage was to have been conveyed into the cesspit. The water is beautifully fresh and pure when

the river is low, but after rain it becomes discoloured, the result doubtless of a certain backflow into it from the Taff. The mouth of the largest spring is nearly 2 ft. in diameter, and is at the northern end of the pool.

Newton.—At last week's meeting of the council Messrs. C. Isler & Co. reported that in boring for water they had reached limestone, which extended to a considerable depth. They had bored 22 ft., and might have to go to a tremendous depth. The matter was referred to committee.

Northwich.—At a meeting of the council on Friday the representatives of the Marston and Wincham district, where the greatest of the Cheshire salt abundances have occurred, reported that Wincham-lane, which forms part of the main road between Northwich and Warrington, has sunk no less than 2 ft. within the month. So continuous has been the subsidence in this locality that it is feared that it may at any time become imperative to open a new road. Orders were given for the repair of Forge-lane, to serve as an alternative route, and other measures of a protective character are to be taken.

SCOTLAND AND IRELAND.

Arbroath.—At a recent meeting of the Committee of Management of the Gas Corporation a draft of a proposed electric lighting provisional order was submitted. The various schedules were read, and from these it appeared that powers were sought to expend a sum of £9,950 on the works, made up as follows: Buildings and appliances, £1,000; generating plant, £2,900; private lighting, mains, feeders, &c., £4,450; public lighting and mains, £850; legal and expert services and contingencies, £750. The draft order was approved, and the treasurer was authorised to deposit the requisite sum of £50 with the Board of Trade.

Limerick.—For years back the condition of the Irish town and English town has been one of ruin and decay, houses that were once the residences of the nobility and gentry being but in too many instances masses of tottering masonry dangerous to pedestrians. The corporation recently gave the matter their careful consideration, and decided upon an important step. They resolved to clear the sites, and the Local Government Board, approving the scheme submitted, held an inquiry and advanced a loan of £5,000 towards the project, refusing, however, to advance any more until the finances of the corporation were improved. Several of the leading merchants in the city have, however, promised to contribute towards the scheme, which is to include the erection of houses for the working classes.

ADVERTISEMENTS.

Received too late for Classification.

BOROUGH OF MORLEY.

TEMPORARY ASSISTANT.

The Council of the Borough of Morley invite applications for the appointment of a Temporary Assistant from persons who have had good experience in a municipal engineer's office.

Candidates must be neat and expeditious draughtsmen, able to survey and level, prepare accurate working drawings and quantities.

Preference will be given to those having had experience in the construction of sewerage works.

The whole time must be devoted to the duties, which are to be commenced as soon as possible after the appointment is made.

The engagement will be at least for three months for satisfactory service, and the salary will be at the rate of 2 guineas per week.

Applications, stating age, present and previous occupation, together with copies of not more than three recent testimonials, to be delivered to Mr. W. E. Putman, Assoc. M. Inst. C.E., Borough Engineer and Surveyor, Town Hall, Morley, endorsed "Temporary Assistant," not later than noon on January 2, 1899.

URBAN DISTRICT COUNCIL OF HENDON.

MILL HILL SEWERAGE CONTRACT, No. 4.

The above Council hereby invite tenders for the execution of certain works of Sewerage at Highwood Hill, Mill Hill, within their district, comprising about 965 yards lined of 9-in. pipe sewer, together with manholes, ventilators, flushing chambers, and other works in connection therewith.

The drawings and specification may be seen and forms of tender obtained on application to Mr. S. S. Grimley, Engineer to the Council, at the Public Offices, The Burroughs, Hendon, N.W., on deposit of 2 guineas, which will be returned on receipt of a *bona-fide* tender with the detailed estimate attached thereto fully priced out.

Sealed tenders, on forms supplied by the Council only, endorsed "Mill Hill Sewerage, Contract No. 4," addressed to the Chairman of the Council, to be sent to meet not later than 5 p.m. on Monday, the 16th day of January, 1899.

The Council do not bind themselves to accept the lowest or any tender.

Dated this 29th day of December, 1898.

HENRY HUMPHRIS,

Clerk to the Council.

Public Offices, The Burroughs, Hendon, N.W.

Some Recent Publications.

AN INQUIRY INTO THE RELATIVE EFFICIENCY OF WATER FILTERS IN THE PREVENTION OF INFECTIOUS DISEASE is a reprint of a special report to *The British Medical Journal* by Dr. G. Sims Woodhead and Dr. C. E. Cartwright Wood, and is issued, at the price of 2s. 6d., from the office of the British Medical Association. "The investigation," as stated by the authors in their preface, "was undertaken at the desire of the late Mr. Ernest Hart, editor of *The British Medical Journal*," and they further note that "as in the case of so many other questions affecting the public health, Mr. Hart recognised the danger to which the public were exposed through the use of inefficient filters and knowing that so much attention had not been directed to the question in this country as in France and Germany, he suggested that they should examine and report upon the efficiency of a number of filters in general use in this country and abroad in preventing the spread of water-borne disease." Drs. Woodhead and Wood may be congratulated upon the eminently satisfactory results attending their united inquiries and experiments. These are best summarised in their own words: "As the outcome of this investigation we believe that we are warranted in concluding that we have been able to settle the principle on which must be based the method of testing the efficiency of filters in preventing the transmission of water-borne infective disease. The method had already been suggested by Gruber and his pupils, but we have been able to carry out experiments on so many types of filters, and over such prolonged periods, that we may now hope that this vexed question has been finally set at rest." Want of space precludes us from entering into a detailed review of many important matters treated with skill and judgment in the volume under consideration, but we have no hesitation in recommending it to our numerous readers who are privately or professionally interested in the subject of water purification.

WATER SUPPLY.

NOTES ON WATER SUPPLY, by J. T. Rodda, A.M.I.C.E. (King, Sell & Ralton. Price 5s.), contains references, tables, useful memoranda and detailed advertisements relating to waterworks engineering, and also an illustrated description and prices of apparatus, appliances, tools and materials usually required. These notes and references, originally written for *The Journal of Water Supply*, gave rise to useful discussion at the time of their first appearance, and the author, in now issuing them, with additions, in book form, hopes that they may prove of some benefit to a wider circle of readers. Although Mr. Rodda does not advance any pretensions to having compiled a treatise on the subject, the book is no doubt well adapted to fulfil the design he had in view—viz., "to point out to the specialists from whom valuable information may be obtained, and to indicate the best waterworks appliances now in the market, with notes on the same and their usefulness in modern distribution of water supply."

SOME SHORT NOTICES.

The opening chapter of *THE NEW GUIDE TO BRISTOL AND CLIFTON AND THE BRISTOL CHANNEL CIRCUIT*, by James Baker, F.R.H.S., F.R.G.S. (J. Baker & Son. Price 2s. 6d.), gives an historical and a descriptive sketch of Bristol and Clifton, and appears to be an expanded reprint of an article contributed to a publication of more general character than the present. In the second chapter Prof. Lloyd Morgan treats of the physical features and local geology in an interesting manner. In the following chapter Mr. J. W. White, F.L.S., deals with the botany of the Bristol district. The remainder of the volume is devoted to topographical descriptions, first of Bristol and Clifton, and afterwards of various places bordering on the Bristol Channel that afford attractions for visitors and tourists. Probably the most unsatisfactory feature of this hand-book is the method of illustration adopted. Many of the views are very indistinct renderings of places referred to in the text, and in several instances their size do not harmonise with the limits of the page. As Mr. Baker claims to have adhered to Baedeker's plan in the arrangement of preliminary matter, we would suggest an improvement also on the lines of Baedeker—namely, the omission of interleaved advertisements in future issues of the book.

A comprehensive and useful manual for all who require a practical knowledge of ornamental lettering is *ALPHABETS, OLD AND NEW*, by Lewis F. Day (B. T. Batsford. Price 3s. 6d.). The work furnishes a complete series of 120 different examples of alphabetical letters, thirty of numerals, and numerous facsimiles of ancient dates, &c., carefully selected and arranged, with a short preliminary account of alphabets. It thus appeals to a wide circle, among whom we may include architects, designers, sculptors, masons, sign writers, brass and seal engravers, heraldic stationers, draughtsmen, bookbinders, and many others. In the varied succession of alphabets displayed here we find about 100 ancient examples reproduced with such care as to faithfully preserve the spirit of the originals. This selection ranges from the earliest historical period to the eighteenth century, and is arranged in chronological order. The section devoted to the illustration of modern work embraces selections from the highly-artistic productions of Walter Crane, Patten Wilson, the author, and

others, whilst the architectural branch represents designs of lettering by A. Beresford Pitt, J. Cromer Watt and Roland W. Paul.

BLACK'S GUIDE TO CANTERBURY AND THE WATERING PLACES OF EAST KENT (price 1s.) appears in a remodelled and improved form under the editorship of Mr. E. D. Jordan, B.A. Those who indulge in home or foreign travelling, even to a limited degree, are so well acquainted with many of the admirably compiled and eminently practical series of portable hand-books bearing the imprint of Messrs. Black that words of commendation with respect to them appear almost superfluous at this time of day. The volume now before us is entirely new, both as regards text and maps. The latter are well engraved in a clear and intelligible manner, and a special feature of all the section maps, which considerably enhances their utility, is that they are printed in coloured contours, to show the elevations of the different localities above the sea level. The book should be useful to those who have occasion to visit a district not without historical associations or attractive scenery.

THE "COMPLÉAT" AND UNIVERSAL GUIDE TO HOTELS, APARTMENTS, BOARDING-HOUSES, &c., 1898 (Simpkin, Marshall & Co. Price 1s.), constitutes one of that extensive series of publications, portable and otherwise, issued at recurring periods with a view of affording all desirable information relative to "the general accommodation which is daily required by travellers, tourists, sportsmen and many others." We must leave our readers to form their own private opinion as to whether a new compilation is at present required for this purpose, and will merely add that the editors in a prefatory note state that they "seek to gratify a long-felt want by placing in a complete and accessible form full information where it is known that accommodation at hotel, boarding-house, apartments, school, &c., can be obtained either in town, the seaside, the provinces or abroad."

As may be anticipated from previous editions, the 1899 issue of *"THE LIVE STOCK JOURNAL" ALMANAC* (Vinton & Co. Price 1s.) is replete with interesting matter for all who are attached to a country life and are fond of rural pursuits. In the abundantly-illustrated annual now lying before us we remark the usual breeders' tables, lists of societies, fairs, statistics, and other particulars of importance in connection with the farm and the country house; and these are followed by forty-eight special articles relating to nearly every variety of British live stock. A prominent feature always appreciated is the annual breed histories, which are invariably contributed by gentlemen well qualified to furnish reliable information.

THE "GLOUCESTER" DIARY AND DIRECTORS' CALENDAR FOR 1899 is published at the instance of the Gloucester Railway Carriage and Wagon Company, Limited, by F. J. Brooke, of that city. In addition to a conveniently-arranged diary, interspersed with well-executed illustrations of the different types of vehicles and miscellaneous articles produced by the company mentioned, it includes brief notes descriptive of such local features as are calculated to interest visitors. A list of mayors and a general calendar are new features introduced into the present issue.

TRIGONOMETRY AT A GLANCE, by G. W. Usill, A.M.I.C.E., and F. J. Browne, C.E. (G. Philip & Son. Price 2s.), affords, by means of novel and somewhat ingenious contrivances and simple arrangements, a graphic demonstration of the various functions of an angle and its complement. Precise directions as to the proper use of the diagrams and attached appliances are duly specified, and for purposes of class instruction, as well as of private study, the methods adopted may prove of considerable value in facilitating the solution of numerous complicated calculations.

Any of the Books noted below will be sent post free if the published price be forwarded to the offices of THE SURVEYOR.

- THE EVOLUTION OF THE ENGLISH HOUSE*, by Sydney Oldall Addy, M.A.; 224 pp., 7½ in. by 5 in. Swan, Sonnenschein & Co., Limited. Price 4s. 6d.
- CARPENTRY AND JOINERY*, by Frederick C. Webber, 320 pp., 7½ in. by 5 in. Methuen & Co. Price 3s. 6d.
- PITMAN'S POPULAR GUIDE TO JOURNALISM*, by Alfred Kingston, F.R.HIST.S.; 112 pp., 7½ in. by 5 in. Sir I. Pitman & Sons, Limited. Price 1s. 6d.
- VINTON'S AGRICULTURAL ALMANAC, 1899*; 108 pp., 9½ in. by 7½ in. Price 6d. Vinton & Co.
- PRACTICAL MASONRY*, by Wm. R. Purchase; 142 pp., 9½ in. by 6½ in. Crosby Lockwood & Son. Price 7s. 6d.

Watford.—Local Government Board sanction has been received by the district council to the borrowing of £1,220 for street improvement works.

The Sanitary Inspectors' Association.—A general meeting of the above association will be held at Carpenters' Hall, London-wall, E.C., on Saturday, January 7, 1899, at 6 p.m., when the president, Sir John Hutton, L.C.C., J.P., will deliver a "New Year's" address. An election of members and associates will also take place.

Personal.

Glamorgan County Council have appointed a bacteriologist, at a salary of £250 a year.

Mr. Wm. Benvan, surveyor to the Gelligaer Rural District Council, has been granted an increase of salary.

The appointment is reported, as assistant to the burgh surveyor of Stirling, of Mr. William J. Crawford.

Mr. J. E. Cooke, of the city engineer's department, Coventry, has received an increase of salary and also a bonus.

Mr. H. W. Bowen, surveyor to the Wigmore Rural District Council, has had his salary increased from £120 to £150 per annum.

The salary of Mr. J. T. Robinson, surveyor to the Chesterfield Rural District Council, has been increased by £25 per annum.

Ashton Town Council have adopted a resolution proposing the appointment of an assistant electrical engineer, at a salary of £130.

Mr. C. C. Fowler, superintendent of the electricity mains of the Brighton Corporation, has had his salary increased to £225 per annum.

Mr. G. Halfour recently read a paper before the Edinburgh Architectural Society on electric lighting. Mr. A. R. Scott occupied the chair.

Mr. Wm. Richard Dewey, of Redhill, Surrey, has been appointed gas manager to the Corporation of Newbury, at a salary of £200 per annum.

Wenlock Corporation have appointed Mr. W. E. Woolam, of Whitechapel, as assistant borough surveyor and inspector of nuisances, at a commencing salary of £80 per annum.

Mr. Cecil S. Hodges, of the county surveyor's office, Nottingham, has been appointed main road inspector under the Bedfordshire County Council, at a salary of £160 per annum.

Mr. Andrew Paterson, district surveyor of Aclod District Board on the Norfolk County Council, has accepted an appointment as surveyor under the Staffordshire County Council.

Mr. Thomas Nuttall, of Bury, has resigned the surveyorship of the Prestwich Urban District Council, and his son, Mr. William Nuttall, of 20 Market-street, Bury, has been appointed resident surveyor.

The death is announced of Mr. John Paterson, who for many years held the appointment of inspector of lighting and cleansing in Edinburgh. The deceased, who retired some time ago, was in his eightieth year.

Mr. John Rutherford Blackie, of 11 Melville-road, Redlands, Bristol, has been appointed resident engineer at the electricity supply station of the Newington Vestry. There were seventy-seven applications for the post.

Mr. J. Hewett, of the firm of Messrs. Hewett & Duffield, has been appointed consulting engineer to the Chatham Town Council for the electric lighting of the new town hall, now in course of erection on the Military-road.

A memorial tablet to the late Sir Joseph W. Bazalgette is about to be erected by a committee of eminent engineers and Lady Bazalgette. The tablet will be attached to the wall of the Victoria-embankment, at a point facing the end of Northumberland-avenue and near the Charing-cross pier.

The Liverpool Corporation have appointed Mr. Jonathan Roberts Davidson as assistant engineer, in place of the late Mr. R. T. Martin, late superintendent of the Rivington water-works, at a salary of £208 a year, with the use of the corporation's house at Horwich and coal and light free.

Mr. J. C. Mollis, M.I.C.E., has been appointed consulting engineer to the Goole Urban District Council in reference to the carrying out of new waterworks from the designs of Mr. Matt. Dunn, the gas and water engineer to the council, for which Parliamentary powers have been applied for.

At the last meeting of the Middlesex County Council the Highways Committee were authorised to advertise for two assistant surveyors, at a salary of £250 a year each; an assistant surveyor, to take charge under the county surveyor of the duties as to rivers, at £250 per annum; and a draughtsman, at £175 a year.

At the last monthly meeting of the Urmsott Urban District Council a letter was read from Mr. C. C. Hooley, resigning his position as surveyor to the council. He thanked them for the courtesy which he had received at their hands. No reason was given for the resignation. The letter was referred to the General Purposes Committee.

Mr. Thomas Blashill, F.R.S.E.A., gave a dinner at the Cafe Monaco, Regent-street, W., last week, to the members of the architectural staff of the London County Council and a few friends. General satisfaction was expressed by those present that Mr. Blashill had acceded to the request of the county council and had postponed his retirement until the 31st March.

Mr. George Stevens, surveyor to the Alverton Urban

District Council, has been commissioned to supervise the carrying out of a new water scheme and cemetery, and to act in the capacity of engineer to the council, at a salary of £300 per annum, for three years, the stipulation being that at the completion of the work his salary will again be considered.

At the last monthly meeting of the Abercrombie and Preston Urban District Council it was intimated that since the previous meeting, when it was decided to appoint a person to fill the combined offices of surveyor and inspector of nuisances, a large number of ratepayers had expressed their disapproval of the action of the council in the matter. Some two thirds of the ratepayers were understood to be opposed to the appointment, and the revision of the minutes was therefore proposed. A discussion ensued, but the minutes were eventually confirmed by a large majority.

At a recent meeting of the Sunderland Town Council it was decided to adopt a report of the Tramways Committee recommending the payment of 100 guineas to Mr. Snell for services rendered and to be rendered until the decision of Parliament on the Tramways Bill. Upon the passing of the measure Mr. Snell's present engagement will be terminated, and he will be re-elected borough electrical engineer upon the following terms: First year, £600; second year, £700; third year, £750; fourth year, £800; fifth and last year, £850. The report of the committee included a proposal to also grant the sum of 100 guineas to the borough surveyor for extra services rendered.

We very much regret to record the death of Mrs. John Elkford, wife of the borough surveyor of Poole, which occurred under distressing circumstances on Thursday evening last. Deceased was returning from a visit to some relatives when, while crossing the level foot-crossing on the railway near Poole station, she was knocked down by the Weymouth and London express and killed. At the coroner's inquest, which was held on the following evening, it transpired that while crossing the railway her foot caught between the rails and the wooden platform by the side, and before she could release herself the train cut her down. A verdict of "accidental death" was returned.

The Shrewsbury Corporation received at their last meeting a report from a committee stating that in response to an advertisement for plans for a science and art school to be erected, at a cost of £3,500, on a site in St. Julian's Friars, given by the Horticultural Society, five sets of plans were sent in, and the committee had selected two. The plan placed first was signed "Daylight," and that placed second "Sphinx." The report was adopted after a discussion consequent on a proposal, which was defeated, to select another site for the school, but the names of the competitors were not stated. The premiums offered were £20 and £10, and the competition was limited to architects practising in Salop.

The special committee of the Manchester Corporation appointed to arrange for the erection of the four fountains presented to the city by the late Alderman Clay have adjudicated upon the designs which have been sent in at the invitation of the committee. There were twenty-four competing architects and sculptors, and the committee selected the two designs submitted by Mr. J. W. Beaumont, architect, of St. James's-place, Manchester, and two fountains of each design will be erected. Each design consists of a canopy covering a basin of water, from the centre of which will spring a jet or jets of water, the basins for drinking purposes being placed on the outside of the base of the canopy. Small drinking troughs for dogs are also provided. The fountains will stand on three steps, and the ground round them is to be laid out for grass and flowers. In both designs the base will be of granite, in one case grey and in the other red, and the superstructure will be of red sandstone from the Cosehill quarries. The fountains are to be erected at a cost of £700 each.

At a recent meeting of the Institution of Junior Engineers, Mr. E. A. Heath read a paper on "British Cable Tramways and their Construction." For towns in hilly districts requiring tramway communication the author claimed that cable haulage had no rival. Being independent of rail adhesion, the steepest gradient could be ascended or descended with absolute safety, provided that for descending an emergency brake was employed which would grip the slot rails. A brake of this description was fitted to the cars on the Douglas tramway, of a gradient of 1 in 10, and on those of the Matlock line, with a gradient of 1 in 4½. The system of constructing the track and cable tube was described in detail. A very good fish-joint for track rails was shown, which formed practically a continuous running surface for the car wheels. Approximate figures were given for calculating the horsepower required to haul the cable; to arrive at anything approaching the actual figure nature experience had to be applied of the various conditions under which the tramway was to be operated. The special features in the construction of Highgate tramway, Streatham, Douglas, Matlock and others, were reviewed, particulars being furnished. A discussion followed the reading of the paper.

VESTRY AND WATER COMPANY.

Last week, at the Lambeth Vestry Hall, Mr. A. A. Hopkins, the magistrate for Lambeth, renewed the hearing of the summons issued by the Lambeth Vestry against the Southwark and Vauxhall Water Company, to revise the price to be paid by the vestry for water supplied by the company for the purpose of watering streets. Mr. Bodkin and Mr. Lindsey Smith appeared for the vestry, and Mr. Claude Baggalay, q.c., and Mr. Gore Browne for the company. It appeared that in 1853 the price for water supplied was fixed by Mr. Chance, the then magistrate, at 8d. per 1,000 gallons, the price to continue for five years. The vestry had continued to pay that sum; but, in view of the improved position of the company and the fact that the water was supplied to the public baths of the vestry at 6d. per 1,000 gallons, the vestry now asked that the price should be revised. The magistrate said he would give his decision some day next month.

INSTITUTION OF CIVIL ENGINEERS.

ORDINARY MEETING.

An ordinary meeting of the members of the above Institution will be held on Tuesday, the 10th January, 1899, at 8 p.m., when Mr. John Handsley Dalcs, A.M.I.C.E., will read a paper on "High-speed Engines." At this meeting a ballot for members will be taken.

STUDENTS' MEETING.

At a meeting for the students of the Institution, on the 13th January, 1899, Dr. Archibald Barr, M.I.C.E. (Professor of Civil Engineering and Mechanics in the University of Glasgow), will deliver an address on "The Application of the Science of Mechanics to Engineering Practice." Dr. Alex. B. W. Kennedy, F.R.S. (member of council), will take the chair at 8 p.m.

THE SURVEYORS' INSTITUTION.

ORDINARY GENERAL MEETING.

The next ordinary general meeting of the above Institution will be held on Monday, January 9, 1899, when the adjourned discussion on the paper read by Mr. Wm. Weaver at the last meeting, entitled "The London Building Act and the Official Supervision of Buildings," will be resumed. The chair will be taken at 8 o'clock.

Radcliffe.—The council have adopted a resolution recommending that an application should be made to the Local Government Board for sanction to borrow a sum of £16,000 for the electric lighting of the district.

DOVER ADMIRALTY HARBOUR.

The first pile of the Admiralty pier extension, forming the western arm of the new national harbour at Dover, was driven on Wednesday of last week. The piles that are being used are the largest employed in any marine work in the kingdom, being 105 ft. long and 20 in. square. All the requisite machinery is in position. On the top of the turret which contains the 80-ton guns a powerful crane, specially constructed for the purpose, is being used in connection with the pile-driving. The works at East Cliff, where the marine railway and reclamation wall are being constructed, are proceeding rapidly, and at the works on the shore near Shakespeare's Cliff good progress is observed. The contractors' new cliff railway from Martin Mill to Dover is also being rapidly constructed.

NEW PUBLIC PARK FOR EALING.

A special meeting of the Ealing District Council was held on Saturday morning, under the presidency of Sir Montagu Nelson, to consider the advisability of accepting the offer of Sir Spencer Walpole to sell to the council, for the purposes of a public park, the Walpole property, including a mansion, grounds and park, covering in all about 31 acres, for the sum of £40,000. The mansion was for many years the residence of the late Right Hon. S. H. Walpole, who died there a few months ago. Some slight opposition was offered to the purchase, on the ground that Ealing at the present juncture would not be justified in incurring the expenditure; but on a vote being taken a motion in favour of the purchase was carried *nem. con.*, fourteen out of sixteen members being present.

QUERIES AND REPLIES.

We cannot undertake to reply to any queries which are not accompanied by the writer's name and address. These are required as a guarantee of good faith and not for publication. Sketches accompanying queries should be made separate on white paper, in plain black ink lines. Lettering or figures should be bold and plain.

230. Sewage Farms in the United Kingdom: Particulars Required.—In this query, which appeared in our last issue (page 806), for the word "soluble" (seventh line down) read "saleable."

Cwyrfa.—The district council, at their last meeting, received a letter from the Local Government Board empowering them to borrow £2,000 for the purpose of supplying Port-dinorwic with water. Before deciding to advertise for contracts, however, the council decided to consider plans of proposed waterworks for the supply of Saron Bethel, Capel Saelon and Port-dinorwic, the total cost of which was estimated at £6,600.

APPOINTMENTS VACANT.

Official and all similar advertisements received later than Wednesday evening are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

ASSISTANT ENGINEER.—December 31st.—Carlisle Corporation. £130.—Mr. C. D. Burnet, city electrical engineer.

ASSISTANT ENGINEER FOR TRAMWAYS DEPARTMENT.—December 31st.—Manchester Corporation. £200.—Mr. Wm. Henry Talbot, town clerk.

TEMPORARY ENGINEERING ASSISTANT FOR TRAMWAYS DEPARTMENT.—December 31st.—Manchester Corporation. £2 10s.—Mr. Wm. Henry Talbot, town clerk.

TEMPORARY ASSISTANT.—January 2nd.—Morley Corporation. £2 2s.—Mr. W. E. Putman, A.M.I.C.E., borough engineer and surveyor.

SUB-INSPECTORS OF NUISANCES (Two).—January 2nd.—Bradford Corporation. £80.—The Town Clerk.

INSPECTOR OF ROADS.—January 2nd.—Vestry of St. Mary, Islington. £2 10s.—Mr. J. Patten Barber, chief surveyor to the vestry.

SURVEYOR, INSPECTOR OF NUISANCES, &c.—January 4th.—Tarpotley (Cheshire) Urban District Council.—Mr. Thomas Cawley, clerk to the council.

BOROUGH SURVEYOR.—January 4th.—Corporation of Penzance. £200.—Mr. T. H. Cornish, town clerk.

DISTRICT ROAD SURVEYOR.—January 5th.—Norfolk County Council. £2.—Mr. T. H. B. Heslop, county surveyor, Norwich.

ASSISTANT COUNTY ROAD SURVEYOR'S CLERK.—January 5th.—Worcestershire County Council. £52.—Mr. S. Thornely, county clerk, Shire Hall, Worcester.

CLERK OF WORKS.—January 5th.—Islington Vestry.—Mr. Wm. F. Dewey, clerk to the vestry.

ROAD FOREMAN.—January 6th.—Axbridge Rural District Council.—Mr. George Cook, district surveyor.

SURVEYOR AND INSPECTOR OF NUISANCES.—January 7th.—Whitworth Urban District Council.—Mr. Owen Mareh, clerk to the council.

WORKING FOREMAN.—January 7th.—Wath-upon-Dearne (Yorks.) Urban District Council. 27s.—Messrs. Saunders & Nicholson, clerks to the council.

ASSISTANT SANITARY INSPECTOR.—January 7th.—Paddington Vestry. £100.—Mr. Frank Dethridge, vestry clerk.

SANITARY INSPECTOR.—January 9th.—Islington Vestry. £150.—Mr. Wm. F. Dewey, clerk to the vestry.

ASSISTANT SANITARY INSPECTOR.—January 9th.—West Bromwich Corporation.—Mr. Alfred Caddick, town clerk.

INSPECTOR OF NUISANCES.—January 9th.—West Bromwich Corporation. £150.—Mr. Alfred Caddick, town clerk.

ROAD INSPECTOR.—January 10th.—Sale Urban District Council.—Mr. D. Hallowell, clerk to the council.

ASSISTANT MARSH BAILEY.—January 10th.—West Ham Corporation.—Mr. Fred. E. Hickey, town clerk.

ASSISTANT FIRE BRIGADE OFFICER.—January 11th.—London County Council. £300. Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, S.W.

TEMPORARY CLERK OF WORKS.—£3 3s.—Box 55, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, London, E.C.

TEMPORARY ASSISTANT.—Southend-on-Sea Corporation. £3 3s.—Mr. Alfred Fidler, A.M.I.C.E., borough engineer and surveyor.

PUPIL.—Mr. Alfred Fidler, A.M.I.C.E., borough engineer and surveyor, Southend-on-Sea.

RESIDENT ENGINEER.—Mansfield Corporation. £1. Mr. R. Frank Vallance, borough surveyor.

MUNICIPAL COMPETITIONS OPEN.

Official and all similar advertisements received later than Wednesday evening are too late for classification and cannot therefore be included in these summaries until the following week. No advertisements received after 3 p.m. on Thursday can be inserted until the following week.

HARROGATE.—January 2nd.—Erection of a pump-room, &c., at a cost not exceeding £8,000. £50, £30 and £20.—Mr. Samuel Stead, borough surveyor.

BRADFORD.—February 1st.—Erection of a central fire brigade station. £100, £50 and £30.—Mr. George McGiare, town clerk.

KNUTSFORD.—February 25th.—Laying out of a plot of land at Tabley Hill for a cemetery, and also the erection of a chapel and caretaker's lodge for same, for the urban district council.—Mr. W. J. Downes, surveyor to the council.

LONDON.—February 28th.—Design for a dust-cart and cover for use in connection with the collection and disposal of house refuse. £25.—Mr. C. J. Stewart, clerk to the council, County Hall, Spring-gardens, S.W.
