### Noncitrus Fruit

For most noncitrus fruits, 1970 crops likely will be significantly smaller than last year's large crops, but early indications are for adequate supplies of most important items. Indicated peach production is a tenth below 1969. The prospective crop of apricots is off 29 percent and pears off 22 percent from 1969 but only slightly below the recent 5-year average. Sweet cherry production may drop somewhat, but the tart cherry crop is larger. Three percent less strawberry output is estimated. The apple crop appears fairly promising, but may not match 1969's large crop. Crop conditions for grapes are mixed.

Plums and prunes are exceptions to the outlook for generally smaller supplies. Although weather has damaged plums and prunes in Idaho and in parts of Washington and Oregon, production of both plums and dried prunes in California, which typically accounts for the bulk of the crop, is indicated to be sharply larger than last year. Almond production is forecast sharply above 1969, but walnuts are below last year's large crop.

More deciduous fruit was processed in the 1969 season than in the previous season, and carryin stocks were relatively large. Prices for many important items have been below last season and movement into consumption appears to have been generally good. Even so, remaining processor stocks of canned items are substantially above year-ago levels. Stocks are particularly large for California clingstone peaches, pears, fruit cocktail, and applesauce.

### Citrus Fruit

Citrus production in 1969/70 is estimated to be about 1 percent above the previous season. Orange production will be little changed, and fresh market f.o.b. prices in mid-June were moderately above last year. Prices of oranges for processing are below a year ago. More fruit moving to processors and a more normal

The Fruit Situation is published in January, July, September, and November.

juice yield per box--than last year's low yield--are boosting the pack. Harvest has been proceeding more rapidly this year, partly because production of early and midseason varieties was up, while output of the later maturing Valencias was down. By June 1 about 83 percent of the orange crop had been harvested. This left 20 percent less fruit remaining for harvest compared with a year earlier. With smaller remaining supplies of fruit, mostly Valencias, prices for fresh market supplies this summer likely will average above year-earlier levels.

Grapefruit production is down 1 percent. Processor demand has been particularly strong, and both fresh and processing prices are sharply higher than last year. At the end of May, 44 percent less grapefruit remained for harvest. Lemon production is up 6 percent. Fresh sales are up, but processing utilization is down, leaving much more for harvest on June 1 than a year earlier.

Early season prospects for the 1970/71 citrus crop appear generally good in all production areas.

Through June 1 the utilization of oranges for processing was up moderately from last year, and grapefruit up slightly. Movement of most products into consumption was above last season, and except for frozen concentrated orange juice, stocks are not above a year ago. The pack of frozen concentrated orange juice in Florida was 23 percent larger--partly because of a higher juice yield--and stocks are sharply higher. The total canned citrus pack in Florida through May was up 9 percent with grapefruit juice up 25 percent. The chilled pack of Florida orange juice was up 19 percent.

The f.o.b. price of frozen concentrated Florida orange juice has been relatively steady the past few months, at levels somewhat under a year ago. Prices of canned grapefruit juice in early June were sharply above a year earlier.

## RECENT DEVELOPMENTS AND OUTLOOK

### PEACHES

The 1970 peach crop is indicated at 1.65 million tons as of June 1. This is 10 percent below last year and 8 percent below 1968. (See table 18.)

Early Supplies Down Markedly; Prices Higher. Production of fresh market peaches in the South appears about 15 percent below last year and a fourth below 1968. The California freestone crop is expected to be about 8 percent below last season. In mid-June f.o.b. prices were substantially above a year ago both in the South and in California. (See chart on page 9.)

The North Atlantic States expect a 16 percent smaller crop than last year, and prospects in the North Central States are down 6 percent. California clingstone production, mostly for canning, is down 9 percent from last year--this estimate is before this year's "green drop" under the State marketing order. Stocks of both canned clingstones and fruit cocktail are record large for this time of year.

### PEARS

Smaller Crop Indicated. Pear production is forecast at 553,000 tons, 22 percent below last year and also sharply under 1968. Bartletts in Washington, Oregon and California--which provide most of the pears for canning--are off about 20 percent; and other pears are off about 25 percent. (See table 19.) However, stocks of canned pears are very heavy, and processor demand for fruit may be slow. Oregon's and California's production are both indicated to be down substantially, but Washington's production is almost a fourth larger. (See chart on page 9.)

### APPLES

Good Crop in Prospect. The U.S. apple crop appeared promising on June 1 but may be a little short of last year's very large crop. In the Eastern and Central States prospects are down slightly from last year, while conditions in the West vary considerably by area. All western States except California expect to

produce fewer apples than last year. Frost damage cut production prospects in Washington's Lower Yakima Valley, but trees in the Upper Valley and the entire North Central area of the State have good sets. USDA will release a production forecast on July 10.

Storage Supplies Large. Stocks of fresh apples in cold storage--more than half of them in controlled atmosphere--on May 31 amounted to almost 192 million pounds, about 40 percent more than a year earlier. Markets have been under heavy pressure. Prices to producers the first 4 months of this year were well below average and only slightly more than half those of a year earlier.

## CHERRIES

Sweet Cherry Prospects Down. National sweet cherry production is forecast at 116,000 tons, 8 percent below last year but above both 1968 and average. (See table 20.) Indicated production is down from last year in the Western States except Montana and Utah. For the Lake States, Michigan's crop is indicated larger; however, a heavy cut for New York reduces the area's total.

More Tart Cherries. This year's tart cherry crop is estimated at 156,850 tons, about 3 percent above the fruit utilized from last year's crop. All of the increase is in the Great Lake States. Michigan's crop, which accounts for about two-thirds of the area total, is down 1 percent from last year's utilization. The State reports a thin set of cherries on older trees, and north of Traverse City light rainfall and below normal surface moisture. But indicated production is much larger in New York, Wisconsin and Ohio, and substantially larger in Pennsylvania. Output in the Western States is down sharply due to freeze damage and generally unfavorable weather.

Stocks of both canned and frozen tart cherries are sharply above both last year and the average of recent years. Thus, the larger indicated production in the Lake States, if realized, may result in some downward pressure on prices.

## PLUMS AND PRUNES

Production High in California. Both plum and prune production has advanced sharply this

year in California, which typically accounts for more than four-fifths of the U.S. total. The plum crop is estimated at 110,000 tons, up more than 60 percent from last year's small crop and a little above 1968. Prices for plums in the first 3 weeks of June were generally below a year earlier.

The indicated crop of California prunes, at 180,000 tons (dried basis), is 38 percent above last year and almost a fifth above 1968. The fruit set is unusually heavy in all producing districts.

Prospects Less Favorable in Other States. Estimates for 1970 plum and prune crops in other States will not be available until July 10. In North Central Washington the fruit set is excellent, but in the Yakima Valley it was severely hurt by spring frost; and Oregon's Willamette Valley suffered from rain, cool weather and some frost. In Idaho, too, the cool spring and poor pollination caused a below-normal set.

## APRICOTS

Production Below Last Year. The crop of apricots is estimated at 163,000 tons, sharply under last year and substantially below average. California, which produces most of the crop, is expecting a 30 percent smaller output. But this decline will be partly offset by heavier carryover stocks of dried, frozen and canned fruit. Washington's production is expected to be nearly double last year's while Utah's crop was sharply reduced by frost.

## GRAPES

Prospects Variable. Official estimates of grape production are not available until July 10. However, early reports indicate mixed crop conditions in California, which normally produces about 90 percent of total tonnage. Raisin variety grapes in the San Joaquin Valley of California are developing normally. Of the table varieties, the Emperor crop is normal, but frost severely damaged the Tokay crop. Early season prices for table grapes have been relatively high.

Frost damaged wine grapes in some areas, but the lower San Joaquin Valley escaped with little or no damage.

## BANANAS

Imports Down. During the first 4 months of 1970, imports of bananas totaled about 1.3 billion pounds, a little below a year earlier. Retail prices averaged over 5 percent above 1969 and the highest since 1963.

## STRAWBERRIES

Crop Smaller. The 1970 strawberry crop is estimated at 471 million pounds, 3 percent under last year. (See table 21.) California acreage is up slightly, but indicated yield is down. Combined acreage in other spring producing States is down moderately, but yields are expected to average higher.

Prices of California strawberries have been running close to 1969 levels, and total fresh shipments through May 30 were 10 percent above last year.

Imports of fresh strawberries from Mexico during the first 4 months of 1970 were almost 12 percent above 1969, and record high.

Fresh Strawberry Imports from  
Mexico (Jan.-Apr.)

	<u>1,000 lb.</u>
1966	7,592
1967	14,017
1968	18,885
1969	35,794
1970	39,955

\* \* \*

## ORANGES

Supplies Smaller. Supplies of oranges will be substantially smaller this summer than last. The 1969/70 crop, at 184.1 million boxes, was slightly larger than last season. But fruit remaining for harvest on June 1 was 31.6 million boxes, 20 percent less than a year ago. (See table below.) The faster pace of harvesting this season was due mainly to increased production of Early, Midseason, and Navel varieties in California and Florida, while output of the later-maturing Valencias is down substantially in California and up only slightly in Florida. (See table 22.) Utilization so far this season has been up about 5-1/2 percent with all of the increase in processing; fresh sales are down slightly. Through May processing had taken 77 percent of total oranges marketed.

Price Lower for Processing Fruit. U.S. on-tree prices for processing oranges averaged \$1.13 per box in May, a third below this time last year. The larger volume of fruit moving to processors this season and about a tenth higher juice yield per box in Florida are resulting in larger supplies of product and putting pressure on prices. Fresh packed orange prices also have been generally lower in Florida. But prices in California in the third week of June averaged moderately above a year ago. With most of the shipments in the next few months coming from California, prices for fresh market supplies are expected to average above last summer.

Fresh Imports Down. For the period November-April, imports of fresh oranges amounted to 0.9 million boxes, about a fifth below last year. Most of our imports are from

Citrus Crops - Utilization to June 1

Crop	1968-69				1969-70			Remaining for harvest
	Utilization			Remain- ing for harvest	Utilization			
	Fresh	Processed	Total		Fresh	Processed	Total	
	<u>Thousand boxes</u>							
Oranges	34,876	109,490	144,366	39,514	34,700	117,827	152,527	31,573
Grapefruit	19,771	27,784	47,555	6,615	21,274	28,801	50,075	3,725
Lemons	5,338	5,823	11,161	4,649	5,500	4,550	10,050	6,750

Mexico and Israel. U.S. exports of fresh oranges and tangerines during the period were 4 million boxes, 2 percent more than last year.

## GRAPEFRUIT

Production Lower; Prices Higher. Indicated 1969/70 grapefruit production is 53.8 million boxes, about 1 percent below last year's large crop. The decrease is largely in Florida seeded grapefruit. Output is up in Texas, Arizona, and California. Heavy utilization this season of Florida's early maturing crop left some 44 percent less grapefruit remaining for harvest on June 1 than a year ago.

Demand for grapefruit has been good all year, and prices have been above year-earlier levels in all producing areas. In early June Florida f.o.b. prices for fresh packed Indian River grapefruit were \$3.45 to \$3.75 per box, about 65 percent above the relatively low prices of a year earlier. Prices for processing grapefruit delivered to Florida plants were \$2.35 to \$2.50 per box, more than double a year ago.

Exports of fresh grapefruit during September-April 1969/70 totaled 2.2 million boxes, about the same as a year ago.

## LEMONS

Crop Larger; Processing Sluggish. The indicated 1969/70 lemon crop is 16.8 million boxes, about 6 percent above last year. The increase is coming from California; Arizona production is down. (See table 22.) Total utilization to June 1 was 10 percent below last year--fresh use is up but processing is down sharply. On June 1 about 45 percent more fruit remained for harvest than a year ago.

In May, f.o.b. prices for fresh pack lemons were about 10 percent below May 1969, but processing prices were about the same. During November-April 1969/70, exports of fresh lemons, at 1.5 million boxes, were 11 percent over that period last season.

## NEW CROP CITRUS CONDITION

Early season prospects for the 1970/71 citrus crop are generally good. In Florida

most groves are showing considerable new growth. In Texas, the fruit set is fair to good and is sizing well. Prospects are good in Arizona, and California groves are generally in good condition.

## TREE NUTS

Record Almond Crop. California's almond crop is forecast at 140,000 tons in-shell, 15 percent above last year and nearly double the small 1968 crop. U.S. exports of shelled almonds during August-April 1969/70 were 24,000 tons--more than 3-1/2 times the low level in same period last year. Exports of unshelled almonds--which are a relatively minor item--were almost 50 percent above last year. Imports of shelled, unblanched almonds during the August-April period were about one-fourth the volume last year, and only a small fraction of the quantity exported.

Walnut Crop Smaller. California is expected to produce 98,000 tons of walnuts in 1970, about 5 percent below last year. Poor weather caused the lower forecast. During the first part of the 1969/70 season, U.S. exports of walnuts were up sharply, while imports were much lower.

## PROCESSED NONCITRUS FRUIT

Utilization for Processing Up in 1969. Over 7 million tons of noncitrus fruit was processed in 1969, significantly more than in 1968. (See table 1.) The fruits having the largest percentage increases over last year in processed tonnage were apples, apricots, and sweet and tart cherries. Processed pears also were up, while peaches were down. (See table 2.) Due to large crops and increased packs of many items, average prices received by growers for processing fruits generally were lower in 1969. (See table 13.)

Larger Canned Supplies. The total pack of canned noncitrus fruits in 1969/70 was up about 6 percent over last season. With a larger carryin, the total supply was around 10 percent greater. Fruits with large increases over the previous year included applesauce, apricots, cherries, figs, mixed fruit, purple plums, and clingstone peaches.

Despite generally good movement into consumption, stocks of many fruits on June 1 were

up sharply. Among major items, remaining supplies are particularly large for fruit cocktail, applesauce, California clingstone peaches, and pears. (See table 4.)

Canned Exports Up. Exports of canned noncitrus fruits have been larger than in 1968/69. The big items showing an increase over 1968/69 are peaches and fruit cocktail. Canned peach exports through April were more than double a year earlier. (See table 11.)

Canned Noncitrus Fruit Juices. Of the major canned noncitrus fruit juices--apple, grape, pineapple, prune, and fruit nectars--the only 1969/70 pack data available are for apple and pineapple juice. The pack of apple juice in 1969/70 came to 13.4 million cases (basis 24/2's), 43 percent greater than the preceding season. (See table 7.)

The pack of canned single strength pineapple juice during June-April 1969/70 was 13.4 million cases (24/2's), slightly more than last year. Shipments were below the level of 1968/69, leaving stocks of 3.9 million cases on May 1 compared with 2.4 million last year. (See table 6.)

The pack of concentrated pineapple juice during June-April 1969/70 was 1.8 million cases (basis 6/10's), 45 percent over a year ago. Stocks on May 1 were 638,000 cases compared with 544,000 last year.

Dried Fruit. Prunes and raisins typically account for 85 to 90 percent of the total pack of dried fruit. California's prune crop is forecast at 180,000 tons for 1970, well above the last 2 years. The supply of dried prunes for the 1969/70 season was 12 percent below the preceding season. Unshipped "free" supply remaining on April 30 was 6 percent under a year earlier. Dried prune exports during September-April 1969/70 were 11 percent less than last year. (See table 12.)

Raisin production from the 1969 grape crop was 253,000 tons, 4 percent smaller than 1968. Raisin exports during 1969/70 have been slightly above last year.

Frozen Fruit Pack Down. The 1969 frozen fruit pack, at 678 million pounds, was 7 percent below last year but still above 1967. Strawberries accounted for much of the reduc-

tion in pack, but on a percentage basis there were large reductions in grapes and peaches. The frozen apple pack was up slightly while cherries were about the same. Most of the berries except strawberries had a larger pack in 1969. (See table 8.)

Because of the larger carryin for 1969, the supply of frozen fruits totaled about the same as last season. Fruits in greatly larger supply were apples and cherries. Those with much lower supplies were grapes, peaches, and strawberries. Disappearance of frozen fruits to May 31 was 5 percent below a year earlier, so remaining supplies were about a tenth larger.

Combined 1970 Oregon-Washington strawberry production--used mostly for freezing--is estimated to be a little above last year. Acreage is down slightly, but yields are expected to be up. Through June 20 California deliveries of strawberries for freezing totaled 39.6 million pounds, 1 percent more than at that time last year. During the first 4 months of 1970, frozen strawberry imports from Mexico were 55 million pounds, 18 percent larger than last year.

## PROCESSED CITRUS FRUIT

More Processed Oranges. To June 1 of the current season processors had used 118 million boxes of oranges, 7.6 percent more than last year; and 20 percent fewer oranges remained for harvest than a year ago. With the main processing season winding up earlier than last year, total oranges processed this season probably will be up only slightly from last season. Yield of 45° Brix frozen concentrated orange juice (FCOJ) in Florida for the 1969/70 season was estimated at 1.24 gallons per box by the USDA on June 1. This is about a tenth above the low level of last season but below both 1967/68 and 1966/67. Grapefruit utilization for processing to June 1 had been slightly above last year; lemon utilization ran below. (See table on page 6.)

Frozen Concentrate Pack Much Larger. Through May, the pack of frozen concentrated orange juice (FCOJ) in Florida was 106 million gallons, 23 percent more than last year. (See table 9.) Packers' stocks of FCOJ on May 30 were about 67 million gallons, sharply higher than in 1968 or 1969.

The Florida pack of frozen concentrated grapefruit juice through May was 18 percent less than last year and May 30 packers' stocks were down 36 percent. The frozen tangerine juice pack was smaller this season but stocks on May 30 were larger due to heavy carryin at the beginning of the season.

**Canned Citrus Pack Up Substantially.** The canned citrus pack in Florida for October-May 1969/70 totaled 33.7 million cases (24/2's), up 9 percent from last year. The increase came in grapefruit juice which was up 25 percent. For most other canned citrus products packs were smaller. (See table 10.) On May 30, packers' stocks of canned grapefruit juice were 5 percent above a year ago and grapefruit sections were up 26 percent.

**Chilled Citrus Pack Up Sharply.** The chilled citrus pack in Florida during October-

May 1969/70 totaled almost 101 million gallons, a 19 percent increase from last year. The big increases came in orange juice, up 19 percent; grapefruit juice, up 27 percent; and orange sections, up 220 percent. Packers' stocks on May 30 were much larger for chilled orange juice and sections. (See table 10.)

**Prices and Movement.** F.o.b. prices of frozen orange juice concentrate were reduced in late winter by Florida packers; prices since have remained fairly steady at levels around a tenth under a year earlier. Movement to May 30 was almost 58 million gallons, 7 percent ahead of last season.

Demand for canned grapefruit juice has been particularly strong. Movement to May 30 was 13.2 million cases (24/2's), 11 percent above last season. F.o.b. prices have averaged substantially above a year earlier.

Table 1.--Total noncitrus fruits: Production and use, United States, 5-year averages, 1940-54, annual 1955-69 1/
